Vehicle: Description and Operation
Service Information Notes

Manual

About this manual

The instructions in this manual are designed as support for mechanics with basic training as per Volvo's competence standard.
It is extremely important that the user of the instructions first read through the general safety instructions tied to most function groups.

Writer philosophy

As of 2006, a new writer philosophy has been introduced to the instructions in the mechanic section. In previous instructions, detailed text was written and supplemented with figures. In the new method, we do the opposite.
From 2006, the instruction focuses on the figure and text is only used when it is impossible to show the complete work method in figures.
Warning texts indicate any hazards applicable to a procedure. Warnings mean risk of personal injury if the instructions are not followed.
Caution texts indicate that there is a risk of damage to the vehicle or equipment if the instructions are not followed.
Note texts provide important additional information that is required in order to carry out a repair.

Environment

Always follow local safety regulations when disposing of environmentally hazardous waste or pyrotechnic (SRS) components.

Technical content

Illustrations in the information may be reused from previous models and may therefore deviate as regards the background's motif. The technical content relevant to the operation is, however, always correct.
Screws coated with friction-generating or sealing elements as well as lock nuts are screws used with lock nuts shall always be replaced unless the instructions specify reuse of the original screw or nut.
Screws or nuts that have been angle-tightened shall always be replaced with a new one.
Gaskets and O-rings shall always be replaced unless the instructions specify reuse of the original gasket or O-ring.
A new decal shall always be affixed after replacement of a component with safety decal. No decals may be painted or permanently covered in any other way.
All tools and equipment used in the instructions are in Volvo's aftermarket standard (A10 - Tools, Equipment & Information). (E10=English, A10=Swedish).
The instruction shall contain links to or all necessary information to perform the operation in a manner that ensures quality and personal safety.
If the spare part is a repair kit, the entire contents of the kit shall be used.

Links

The philosophy is to avoid having information on a specific component in more than one spot in the system. To do so, the instructions often use links that take the user directly to the correct information for the component to which the link refers.
After having followed one or more links and carried out the respective measure, the user can always return to the previous method by using VIDA's "Back" function.

Vehicle: Description and Operation
Symbols in Service Information

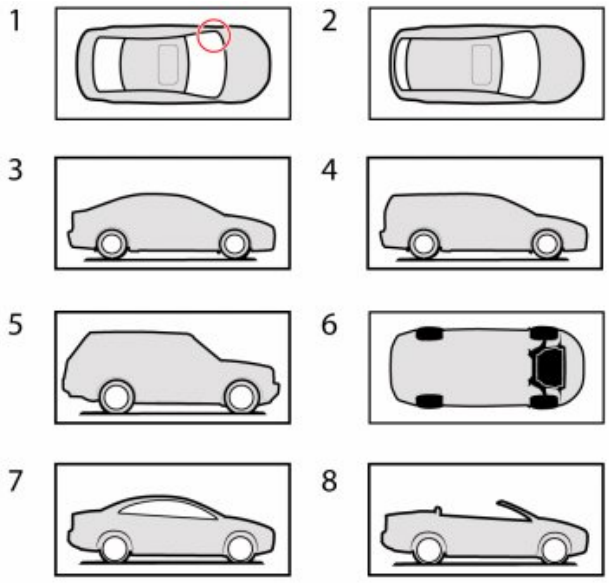
Symbols

Symbols

Symbols are used to supplement or provide further details about the procedure.
Symbols contribute to reducing the amount of text. These are designed to be easy to understand and prevent misunderstandings.
In order to clarify the meaning of the symbols an explanation is also provided.

Localization symbols

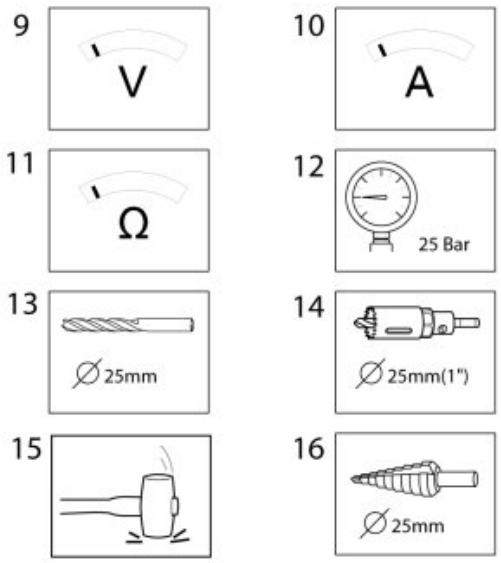
Localization symbols are used to simplify localization in the procedure.
As the images are reused, the silhouette may not correspond with the selected vehicle model.



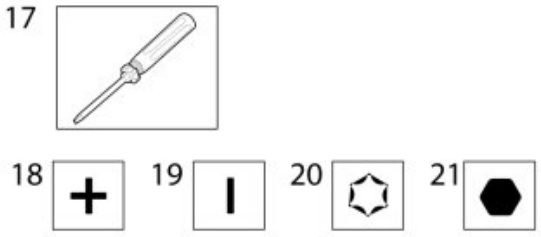
1. Sedan/coupe/convertible view from above. A red circle or a line indicates a focused area.
2. Station wagon, SUV, view from above
3. Sedan, view from side
4. Station wagon, view from side
5. SUV, view from side
6. View from below
7. Coupe/convertible, view from the side (roof closed)
8. Convertible, view from the side (roof open)

Tools

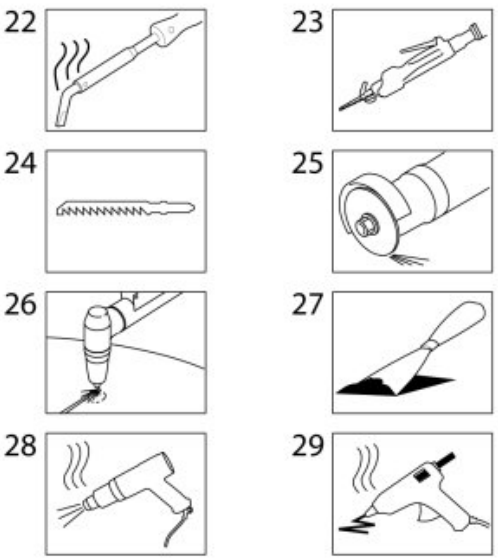
The symbols denote that a specific measurement instrument or tool is recommended for the working procedure.



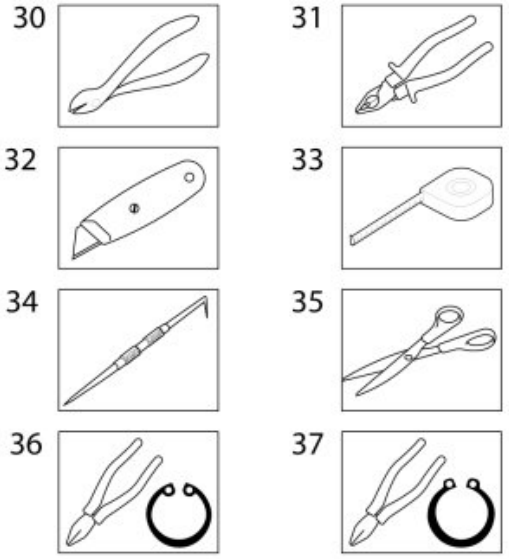
9. Use a Voltmeter
10. Use an Ammeter
11. Use an Ohmmeter
12. Use a pressure gauge, the value states the target value
13. Use a drill with the stated size
14. Use a hole saw with the stated size
15. Use an appropriate impact tool
16. Use a step drill, drill to the stated size



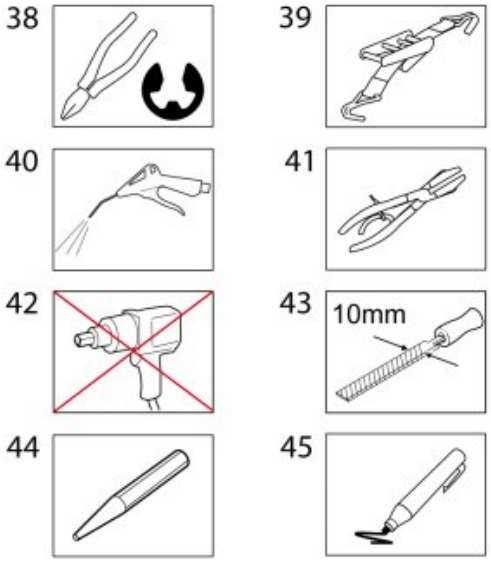
17. Use a suitable screwdriver. The symbol is used together with one of the different head types below.
18. Crosshead screw
19. Slot screw
20. Torx screw
21. Socket head cap screw



22. Use a soldering iron/soldering pen
23. Use a keyhole saw
24. Saw
25. Use a cutting disc/grinding disc
26. Use a plasma cutter
27. Scrape off
28. Use a hot-air gun
29. Use hot-melt adhesive



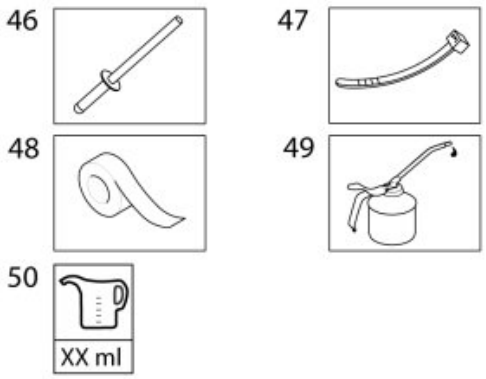
30. Use suitable nippers
31. Use suitable pliers
32. Cut
33. Measure
34. Scribe/mark up
35. Cut
36. Use suitable pliers for internal circlips
37. Use suitable pliers for external circlips



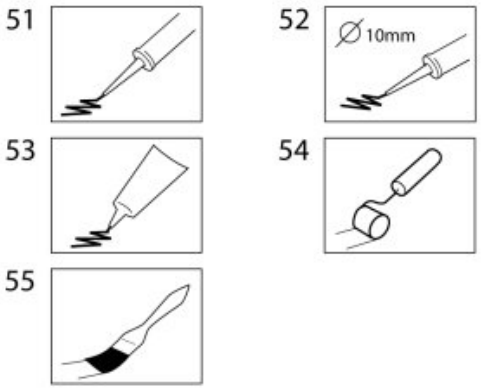
38. Use suitable tool to remove/install the retainer rings
39, Use a load strap
40. Blow clean using compressed air
41. Use pliers
42. Do not use impact screwdriver/wrench
43. Use a 10 mm wide file
44. Use driver punch
45. Mark using a pen

Materials:

The symbols indicate that some form of material is to be used in the procedure.

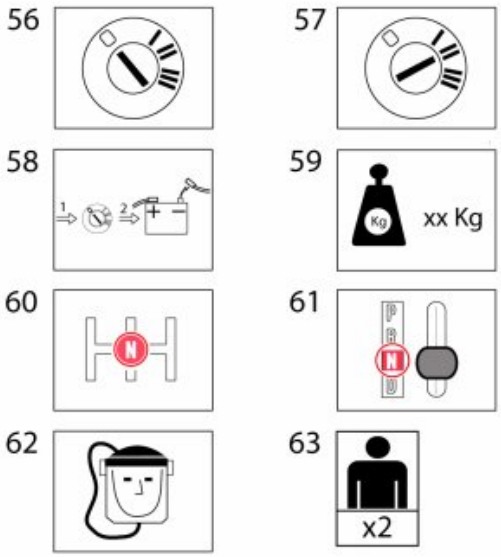


46. Use a pop rivet
47. Use a cable tie
48. Use tape
49. Use oil for lubrication
50. Add a liquid, the type of liquid is indicated by the context or is stated in the procedure.



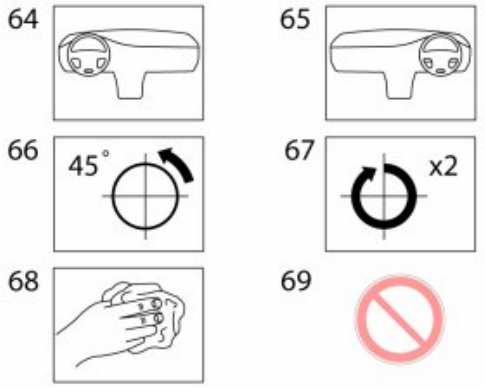
51. Apply, what is to be applied is evident from the context.
52. Apply to a diameter stated in the image, what is to be applied is evident from the context.
53. Apply, what is to be applied is evident from the context.
54. Apply using a roller, what is to be applied is evident from the context.
55. Apply using a brush, what is to be applied is evident from the context.

Other symbols

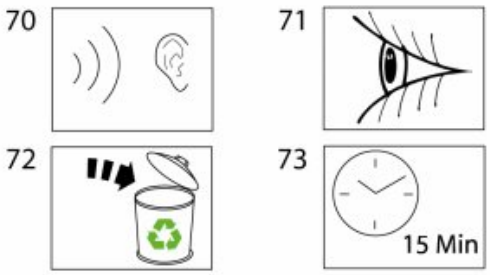


56. Ignition off, ignition to the 0 position
57. Ignition on, ignition to the 2 position
58. Disconnect the battery negative terminal
59. Add pressure with the stated number of kg

60. Engage the stated gear position, manual transmission
61. Engage the stated gear position, automatic transmission
62. Use a fresh air mask
63. Two people are required for this task.



64. Applies to left-hand drive vehicles. The symbol can also be used as a localization symbol, then with a red ring or a line in the symbol.
65. Applies to right-hand drive vehicles. The symbol can also be used as a localization symbol, then with a red ring or a line in the symbol.
66. Turn the component XX degrees in the direction of the arrow, the number of degrees is evident from the image.
67. Rotate the component XX turns in the direction of the arrow, the number of turns is evident from the image.
68. Wipe off
69. Used in combination with other symbols and then has the meaning "do not use XX"



70. Listen for noise
71. Check/Ensure
72. Component is used. Replace with new
73. Wait the specified time

Vehicle: Description and Operation
Screwed Joint, Torque/Angle Tightening

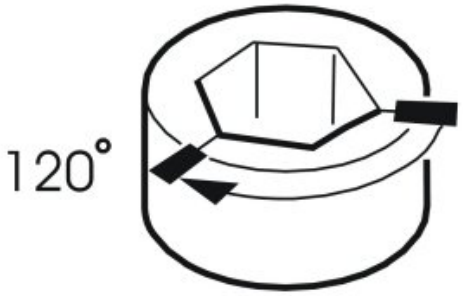
Screwed joint, torque/angle tightening

Special tools:

951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor

Screwed joint

There are a great number of torque spanner systems available on the market where the spanner grip can be replaced with other types. These wench grips are normally ideally suited to torque tightening screwed joints in poorly accessible places.
There may be occasions when torque tightening of a screwed joint must be followed by angle tightening and space does not allow the use of protractor (part number 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor). In these cases, use either a nut, a screw head or a tool. These are usually hexagonal and each corner is **60°**. If there are twelve edges, each corner is **30°**.



To angle tighten, mark the material and nut for example as illustrated and then tighten so that the markings are opposite each other.

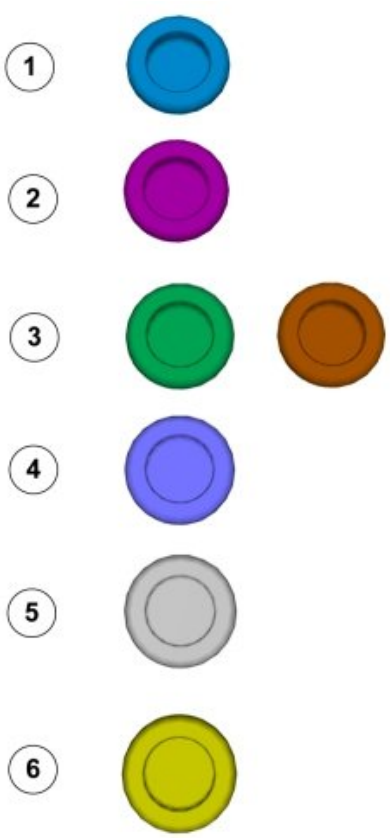
Vehicle: Description and Operation
Images in Service Information

Images

Image philosophy

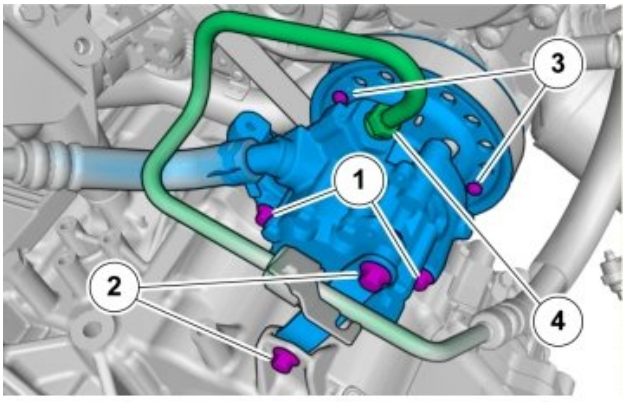
A new image philosophy has been introduced in 2006 for instructions in mechanical working procedures. In previous instructions a detailed text was supplemented with images.
In the new instructions it is the opposite.
From 2006 the instructions focus on images and text is only used where it is not possible to show the entire working procedure in images.

Color symbols



1. Used for focused component, the component with which you will do something.
2. Used for retaining elements or components to be removed/installed. Can be screws, clips, connectors, etc.
3. Used as extra colors, which needed to show or differentiate additional components.
4. Used for standard tools and special tools.
5. Used as background color for vehicle components.
6. Used when the component is not fully removed from the vehicle but only hung to the side.

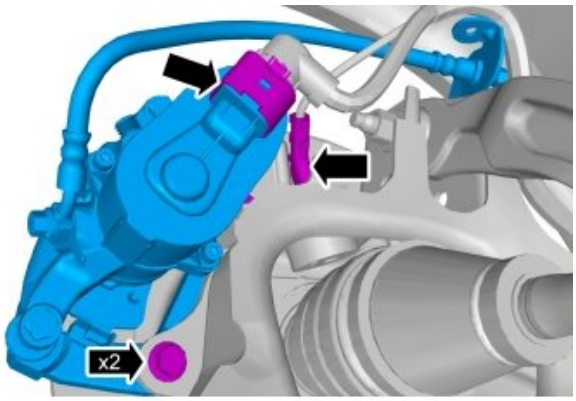
Order number



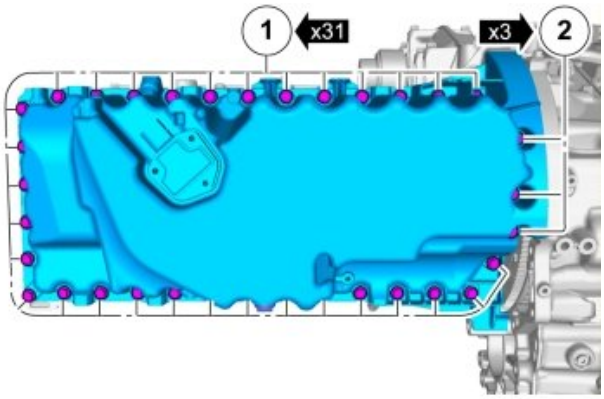
A figure in a circle denotes the order in which the different stages in the image are to be carried out.

Types of arrows

Identification arrows

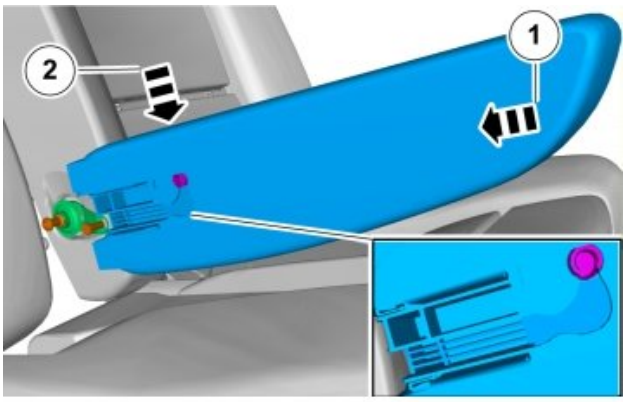


Arrows that identify parts to be removed.
The numbered arrow denotes that they are two screws to be removed to release the brake caliper.

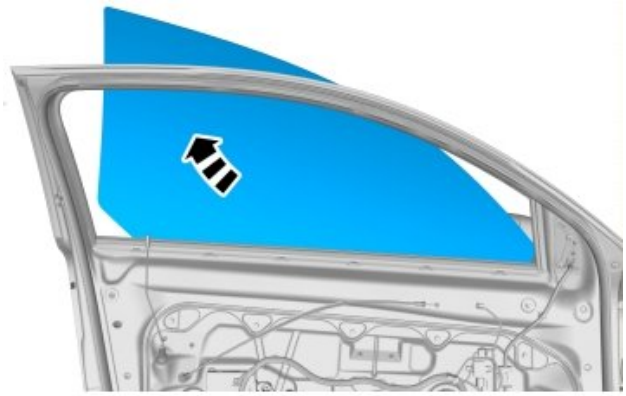


The numbered arrow denotes the number of retaining elements to be removed
All retaining elements embraced by a numbered arrow are of the same type and size.

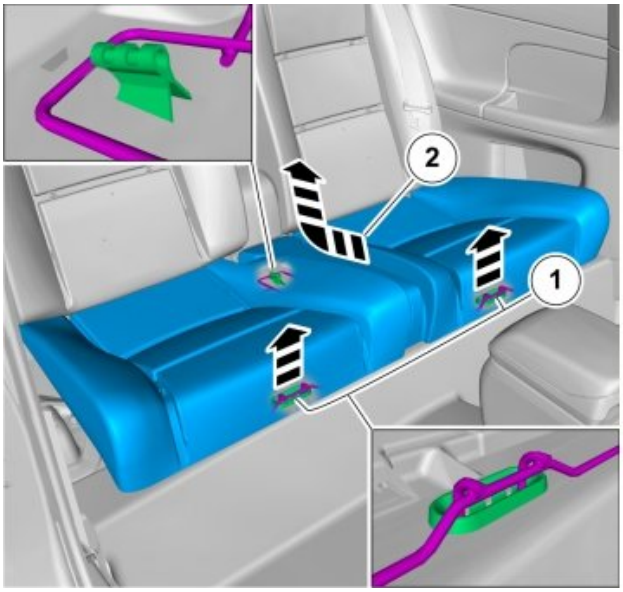
Movement arrows



Movement arrows indicate pushing or pulling in the direction of the arrow.
In this instance the movement arrows are numbered to denote the order in which you should push or pull the component.

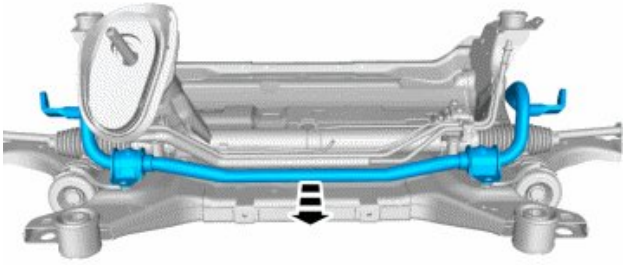


Rotation arrows denote that the component must be turned in the direction of the arrow.
The rotation arrow indicates that you should turn the component to release it.



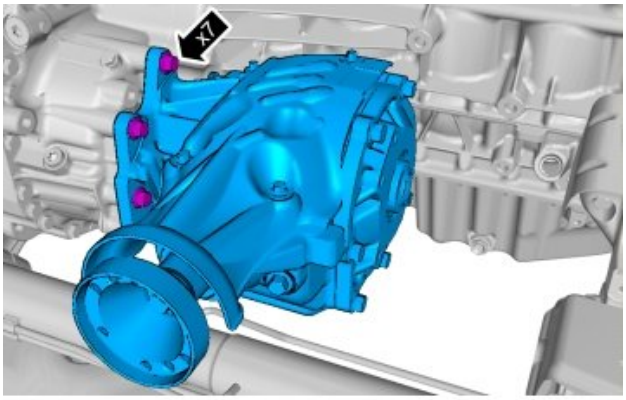
Angled movement arrows denote that the component should first be moved in one direction, and then in another direction.
The angled arrow (2) shows that you should first push the cushion backward and then upward to release it.

Background components



Background components are often taken away in order to improve the clarity of an image.
Parts that are not relevant in order to put across the instructions in the image have been omitted.

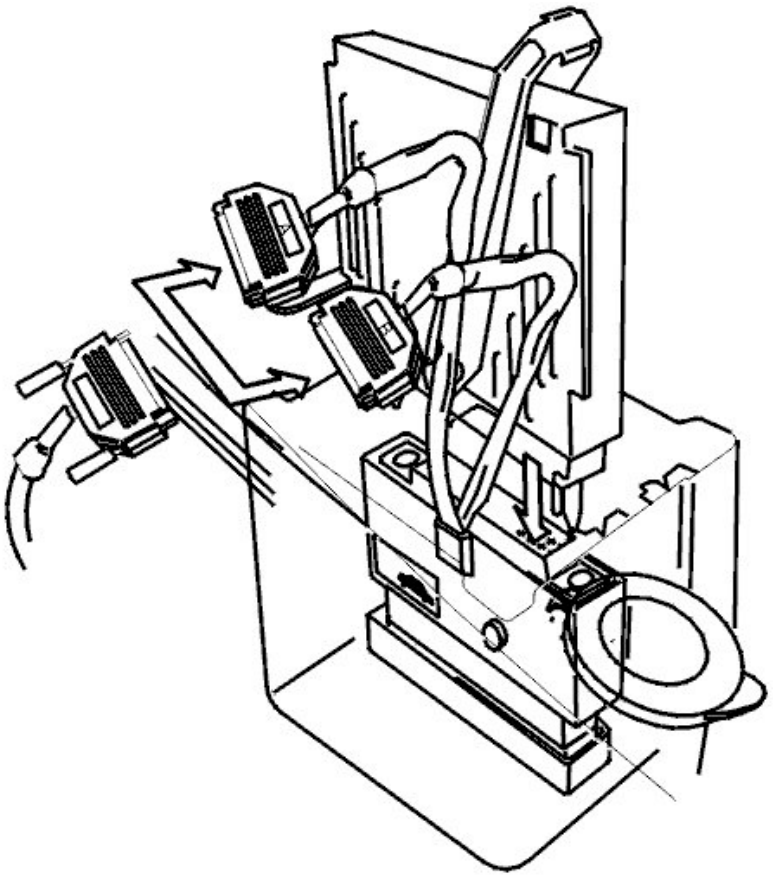
Views



Views are sometimes chosen that show components from another angle and which do not correspond with how you see the components when working on the car to make the images clearer. For example, this is done to show concealed screws.
When working on the bevel gear it is possible that you see it from this angle when installed in the car.

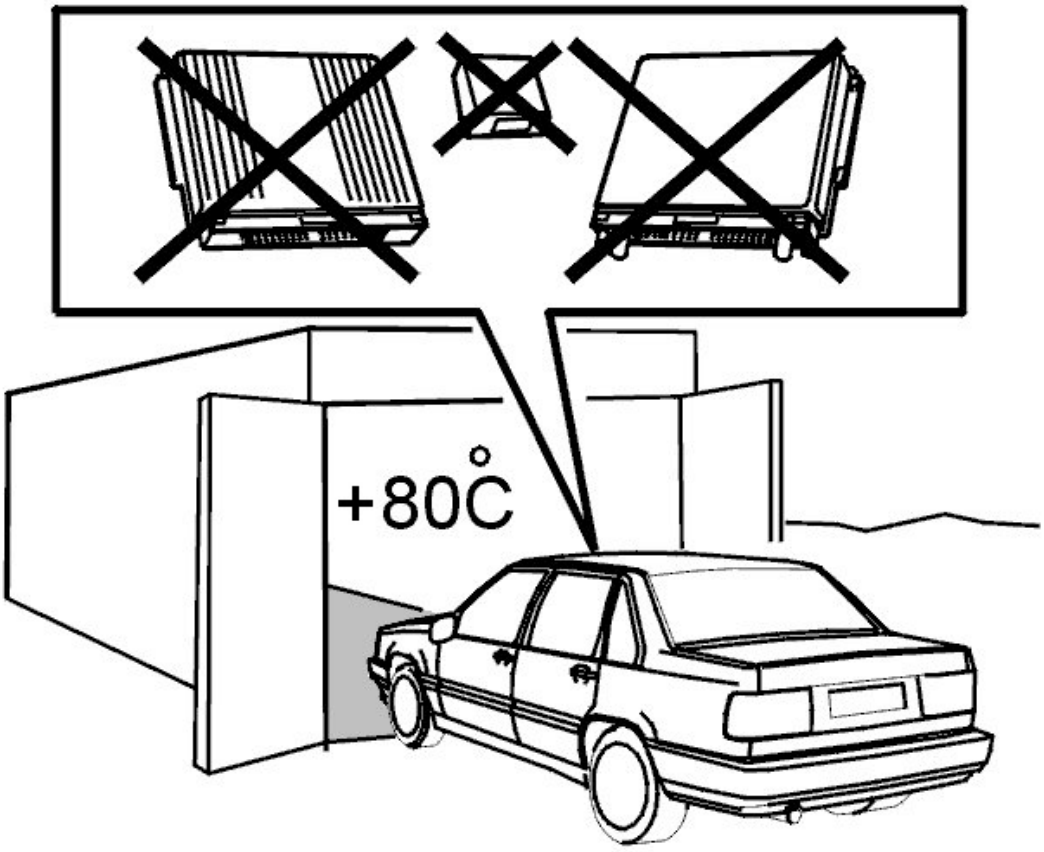
Vehicle: Service and Repair

Control modules



Connecting and disconnecting control modules

Always switch off the ignition before connecting and disconnecting control modules, connectors and the breakout box.
The ignition must be switched off when taking readings with an ohmmeter.



Temperature

The control modules must not be heated to above 80°C. Remove control modules when stoving for example.

Arc welding

Always disconnect the battery negative lead to prevent a short-circuit.
Position the welding ground as close to the welding site as possible, otherwise different ground potentials may be generated in different components.
When welding close to an electronic module, the unit **must** be removed to avoid heat damage.

Replacement

Do not replace a control module without checking its wiring and components. Otherwise the new component may be damaged in the same way as the old one.

Engine: Removal and Replacement

Engine/Transmission, Installing

Engine/transmission, installing

Special tools:

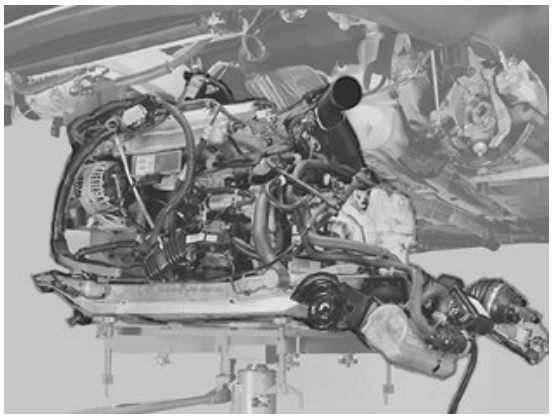
951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor
999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Note! For tightening torques, see Tightening torque See: Specifications/Tightening Torque

Note! To ensure that there is no exhaust leakage, see: Flanged joint, assembling See: Exhaust System/Exhaust Pipe/Service and Repair.

Installing the engine and transmission unit



Raise the engine and the transmission unit. Use a lifting table with locating pins.
Stop when the sub-frame is approximately 15 cm below the frame members.

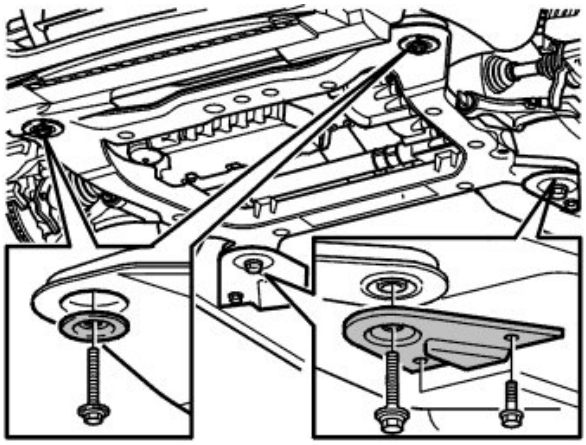
Install (left and right-hand sides)

- the drive shaft to the hub. Install the center screws. **Do not tighten yet!**
- the ball joint to the control arm. Install the nuts. **Do not tighten yet!**

Note! Ensure that the mating surfaces on the ball joints and control arms are clean.

Twist the engine block heater (option) into position. Check that the air conditioning (A/C) compressor is correctly positioned.
Check that the tie rod is in the correct position. Check that the transmission cable is routed between the steering shaft and the firewall.
Align the steering shaft joint on the steering gear.
Lift the engine and transmission unit up to the frame members.

Note! Ensure that no hoses, wiring or anything else catches.



Install

- a new screw in the lower steering shaft joint. Tighten to **20 Nm**
- new screw in the sub-frame. Lubricate the screws
- the washes at the front edge and the support plates at the rear edge of the sub-frame.

Tighten the screws for the sub-frame. Tighten to **105 Nm**. Angle-tighten **120°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor. Start on the left hand side of the sub-frame. Continue with the right hand side.
Tighten the screws for the brackets at the rear of the sub-frame. Tighten to **50 Nm**.
Remove the lifting table.

Installing the propeller shaft (all-wheel drive (AWD) only)

Install the propeller shaft (all-wheel drive (AWD) only). See Pinion seal bevel gear, replacing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Seals and Gaskets/Service and Repair/Pinion Seal Bevel Gear, Replacing.

Installing the three-way catalytic converter (TWC) (all-wheel drive (AWD) only)

Lubricate the studs where the exhaust system separates downstream of the three-way catalytic converter (TWC). Use paste 116 1408.

Warning! Avoid skin contact with the paste.

Lift up the exhaust system and connect it to the rear system. Use a new gasket and new nuts.

Hint: Use a mobile jack with universal plate 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture as a support.

Note! The routing of the heated oxygen sensor (HO2S) wiring over the brake pipe.

Install the screws holding the SIPS member to the bodywork. Tighten the screws.
Press the brake pipe into place in the holders on the SIPS member.

Installing the front exhaust pipe

Lubricate the studs on the turbocharger (TC). Use paste 116 1408.

Warning! Avoid skin contact with the paste.

Install the front exhaust pipe on the turbocharger (TC). Use new nuts. Tighten to **30 Nm**.

Clamp the wiring for the rear heated oxygen sensor (HO2S) into place at

- the bracket at the rear of the sub-frame
- the clips on the power steering pipe at the steering gear
- the clamp at the right-hand side of the steering gear.

Connecting fuel lines

When assembling the fuel lines, see also: Fuel system, quick-release connectors See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Line Coupler/Description and Operation.

Connect the quick-release connector and the fuel line to:

- the motor
- the engine block heater (option).

Press the EVAP line together at the rubber joint.

Assembling the spring strut

Install

- the tie rods. Use new nuts. Tighten to **70 Nm**
- the link rod to the anti-roll bar. Use new nuts. Tighten to **50 Nm**. Counterhold with Tx27
- the bracket for the brake pipe to the body.

Tighten

- the nut for the ball joint and control arm. Tighten to **80 Nm**. Counterhold using Tx40
- the center screw in the drive shaft. Tighten to **50 Nm**.

Cars with engine block heaters (option)

Connect the heater connector at the vehicle wiring.
Ensure that the connector and wiring are secured at the body.
Rivet the fender liner to the fender edge.
Check that the quick-release fuel line connector is secure at the engine block heater.

Installing the air conditioning (A/C) compressor

Install the 4 screws whilst the compressor is loose.
Raise the compressor and screw it into place.

Note! Handle the compressor carefully. Ensure that there are no kinks in the air conditioning (A/C) pipes.

Connect the one-pin connector to the compressor magnetic clutch.

Installing components

Connect the engine wiring to the control module box. See Central electrical unit, engine compartment, replacing See: Maintenance/Fuses and Circuit Breakers/Fuse Block/Service and Repair/Central Electrical Unit Engine Compartment.

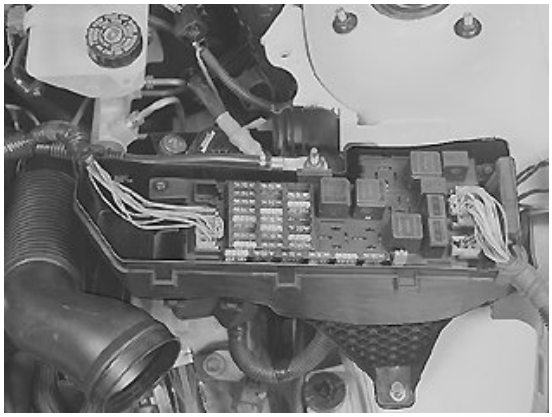
Install

- the ground lead to the ground terminal at the right fender edge in the engine compartment
- the auxiliaries belt
- the intermediate piece for the control module box
- the control modules. See Engine control module (ECM), replacing See: Powertrain Management/Computers and Control Systems/Engine Control Module/Service and Repair
- the cover for the control module box
- expansion tank. Connect the radiator breather tube to the expansion tank. Tighten the clamp. Connect the connector for the level sensor in the expansion tank
- servo oil reservoir. Check that the hoses are correctly positioned.

Clamp the ABS cable to the power steering hose.

Install
- the heat deflector plate above the turbocharger (TC)
- the 2 ground strips on the top of the cylinder head.

Clamp the wiring for the front heated oxygen sensor (HO2S) to
- the coolant pipe
- the heat deflector plate above the manifold
- the turbo control hose at the plastic intake pipe for the turbocharger (TC).

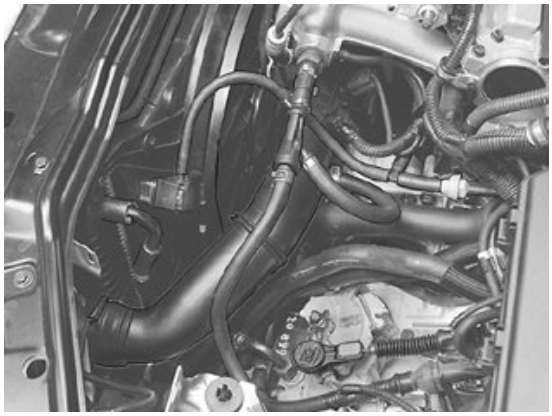


Install
- the positive lead for the starter motor
- the connector for the engine wiring
- the cover over the central electrical unit.

Installing the transmission cable

Automatic transmissions: Install the screws holding the bracket and transmission cable to the transmission.
Manual transmissions: Install the transmission cable. Assemble the clutch cable.

Installing the engine coolant fan (FC)

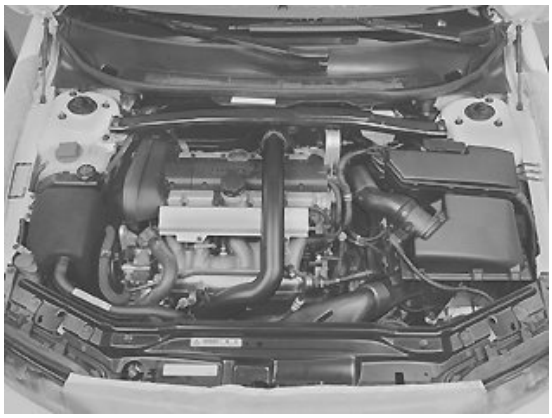


Install
- the lower engine coolant hose to the radiator. Tighten the clamp
- the lower oil cooler hose for the transmission to the radiator (automatic transmissions only). Use new O-rings
- the plastic charge air pipe between the throttle body (TB) and the charge air cooler (CAC). Only connect the plastic pipe at the throttle body (TB). Do not tighten the clamp.

Remove radiator protection 999 5474

Install

- the engine cooling fan (FC). Tighten the screws securing the fan shroud to the front panel
- the plastic charge air pipe to the connection at the charge air cooler (CAC). Tighten both the clamps. Connect the connectors for the temperature and pressure sensors in the plastic pipe
- the canister purge (CP) valve to the bracket at the fan shroud. Secure the EVAP hose to the clip at the lower section of the fan shroud
- the brake vacuum hoses
- the upper oil cooler hose for the transmission to the radiator (automatic transmissions only). Use new O-rings.



Press down the right side of the cooler unit. Pull the wiring for the pressure switch (Pressostat) into the drier bottle.

Connect the connectors to

- the engine cooling fan (FC) (x2)
- the canister purge (CP) valve.

Secure

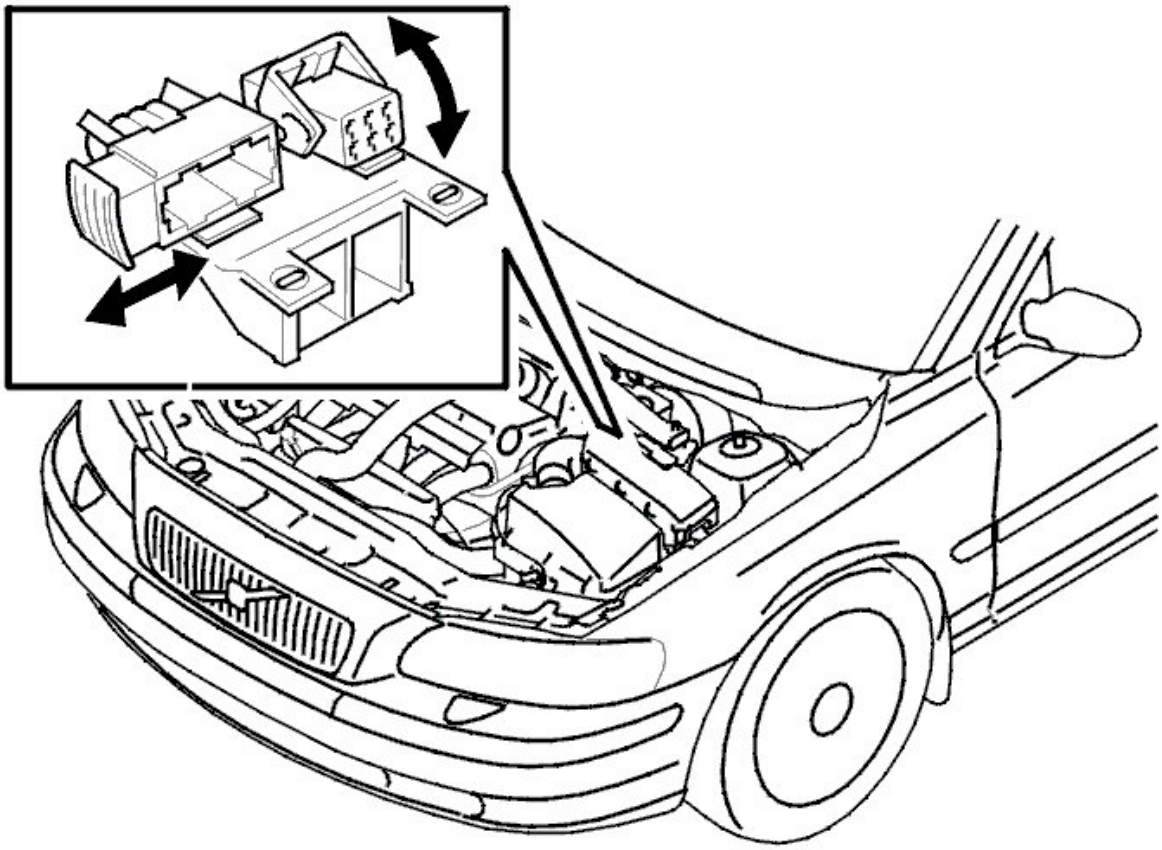
- the breather tube for the radiator at the top of the fan shroud
- the wiring at the lower right corner and at the top of the fan shroud.

Install

- the rubber hose to the inlet side of the charge air cooler (CAC)
- the plastic charge air pipe above the engine. Tighten all clamps. Secure the pipe on the engine
- the upper coolant hose. Tighten the clamp
- the ventilation pipe between the control module box and fan shroud
- the air cleaner (ACL) assembly. Connect the plastic hose to the mass air flow (MAF) sensor. Tighten the clamp
- the air cleaner (ACL) intake pipe.

Connect the connector to the mass air flow (MAF) sensor. Secure the wiring at the front of the air cleaner (ACL) housing.
Install the support brace between the suspension turrets. Secure the servo hose to the right mounting on the support brace.

Finishing



Connect the connector to the pressure switch (Pressostat) in the drier bottle. Secure the wiring.
Tighten the lower screw on the cooler unit.
Connect the connectors to both the heated oxygen sensors (HO2S).

Install

- the splash guard under the radiator
- the splash guard under the engine
- the front wheels. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair
- the battery negative lead. Also read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Final check

Top up

- coolant
- engine oil
- power steering fluid.

Start the engine.
Warm up the engine until the thermostat opens.
Check for leakage.
Check the oil and coolant levels. Adjust if necessary.
Check the transmission oil level (automatic transmissions only). Top up if necessary.

Engine/Transmission, Removing

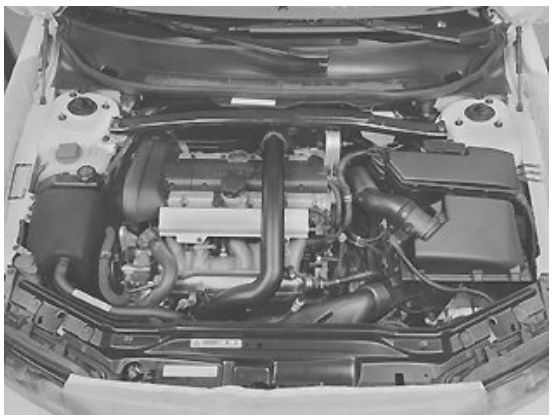
Engine/transmission, removing

Special tools:

999 5474 RADIATOR PROTECTION See: Tools and Equipment/999 5474 Radiator Protection
999 5722 Wrench See: Tools and Equipment/999 5722 Wrench

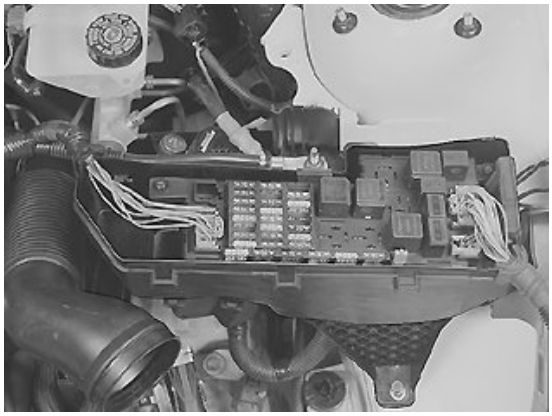
Note! Since the illustrations in the information are used for different model years and/or models, there may be some deviations. However, the essential information is always correct.

Preparation



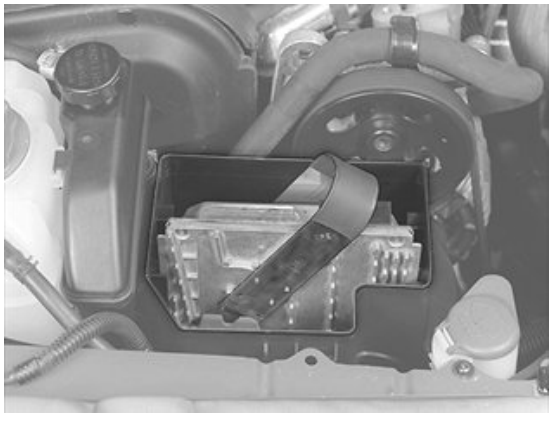
Remove

- the negative battery cable. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.
- the cross stay between the suspension turrets
- the air cleaner (ACL) assembly. Seal the opening in the plastic pipe for the turbocharger (TC)
- the plastic charge air pipe above the engine. Seal the openings
- both the ground strips at the top of the cylinder head.



Remove

- the cover over the central electrical unit
- the connector for the engine wiring from the central electrical unit
- the positive lead for the starter motor from the terminal block.



Remove

- control module unit cover
- the control modules. Use tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench. See also Engine control module (ECM), replacing See: Powertrain Management/Computers and Control Systems/Engine Control Module/Service and Repair.

Separate the control module box. Disconnect the engine wiring. Also see Central electrical unit, engine compartment, replacing See: Maintenance/Fuses and Circuit Breakers/Fuse Block/Service and Repair/Central Electrical Unit Engine Compartment.
Remove the ground terminal for the engine wiring at the right wheel arch.

Removing the engine cooling fan (FC)

Remove

- the brake vacuum hose from the ejector valve
- The canister purge (CP) valve from the mounting on the fan shroud. Disconnect the connector.

Expose the wiring and the breather tube for the radiator.
Disconnect the connectors for the engine cooling fan (FC).

Remove

- the screws securing the fan shroud to the front panel
- the dip stick
- the upper oil hose for the transmission at the connection to the radiator (automatic transmissions only). Seal the openings.

Lift up and remove the engine cooling fan (FC).

Remove

- the connectors for the pressure sensor and temperature sensor in the plastic charge air pipe between the charge air cooler (CAC) and the throttle body (TB)
- the rubber hose at the intake for the charge air cooler (CAC)
- the brake vacuum hose at the intake manifold
- the plastic pipe between the throttle body (TB) and the charge air cooler (CAC)
- the lower oil hose for the transmission at the connection to the radiator (automatic transmissions only). Seal the openings.

Install radiator protection 999 5474 RADIATOR PROTECTION See: Tools and Equipment/999 5474 Radiator Protection.

Removing the transmission cable

Automatic transmissions: Remove the screws for the transmission cable bracket at the transmission.
Manual transmissions: Separate the clutch cable and remove the transmission cables.
Tie up the cable(s) to the central electrical unit.

Draining the fuel line

Drain the fuel line. See Fuel system pressure release See: Cylinder Head Assembly/Fuel Pressure Release/Service and Repair. See also: Fuel system, quick-release connectors See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Line Coupler/Description and Operation.
Remove the cover from the expansion tank.

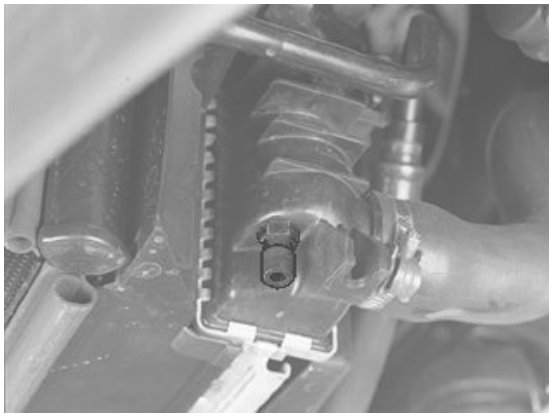
Removing components

Raise the car.

Remove

- the left and right front wheels
- the splash guard under the radiator
- the splash guard under the engine.

Draining coolant



Position a container under the radiator drain cock.
Drain the coolant.

Warning! Avoid skin contact with the coolant.

Close the cock.

Cars with engine block heaters (option)

Drill out the first three blind rivets at the right mounting for the fender lining to the fender edge, seen from the front edge and upwards.
Bend the fender liner out of the way.
Disconnect the connector from the engine block heater.

Preparations for removal of the drive shafts

Remove on the left and right-hand sides

- the tie rod from the wheel spindle
- the link rod from the anti-roll bar
- the screw that holds the brake pipe bracket to the bodywork
- the nut holding the control arm to the ball joint
- the center screw from the end of the drive shaft.

Separating the fuel line

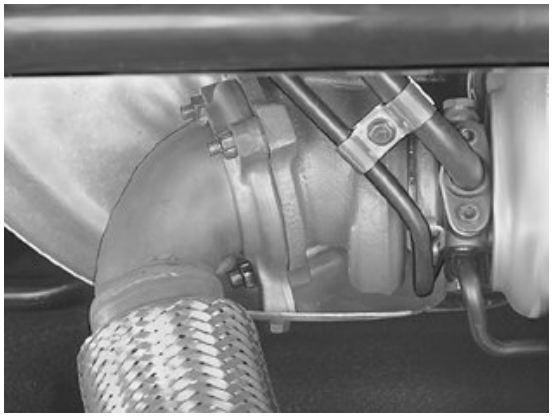
Note! If an engine block heater is installed, mark the position of the fuel lines.

Separate the quick-release connectors for the fuel pressure line and engine block heater (option). See also: Fuel system, quick-release connectors See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Line Coupler/Description and Operation.

Hint: Use tool 999 5666 Wrench See: Tools and Equipment/999 5666 Wrench.

Pull apart the EVAP line at the rubber joint behind the rear right mounting for the sub-frame.

Separating the front exhaust pipe



Remove the screw from the wiring clamp that holds the wiring for the heated oxygen sensor (HO2S) at the right side of the steering gear. Remove the wiring from the clips at the power steering line on the steering gear.

Remove

- the screw for the wiring clamp at the bracket at the rear edge of the sub-frame
- the lower screw that holds the heat deflector plate over the turbocharger (TC)

- the three nuts that hold the front exhaust pipe to the turbocharger (TC).

Tie up the front exhaust pipe at the right suspension turret (cars without All-wheel drive (AWD)).

Removing the air conditioning aggregate

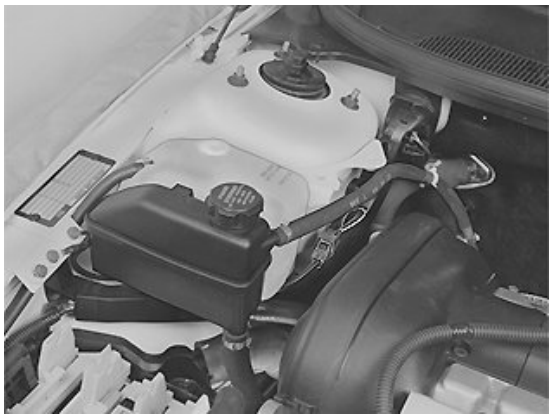
Disconnect the connector from the pressostat in the air conditioning (A/C) receiver drier.
Slacken off the lower right screw for the cooling unit.
Pull the cooling unit down. Carefully pull the wiring for the pressostat through the cavity at the mounting for the cooling unit.
Release the lower ventilation pipe for the control module box from the sub-frame.

Exposing the air conditioning (A/C) compressor

Remove the upper radiator hose.
Remove the auxiliaries belt.
Disconnect the one-pin connector for the compressor magnetic clutch.
Remove the four screws holding the air conditioning (A/C) compressor to the engine.
Tie up the compressor in the front cover plate.

Note! Handle the compressor carefully to make sure that there is no bending of the AC-pipes.

Removing components



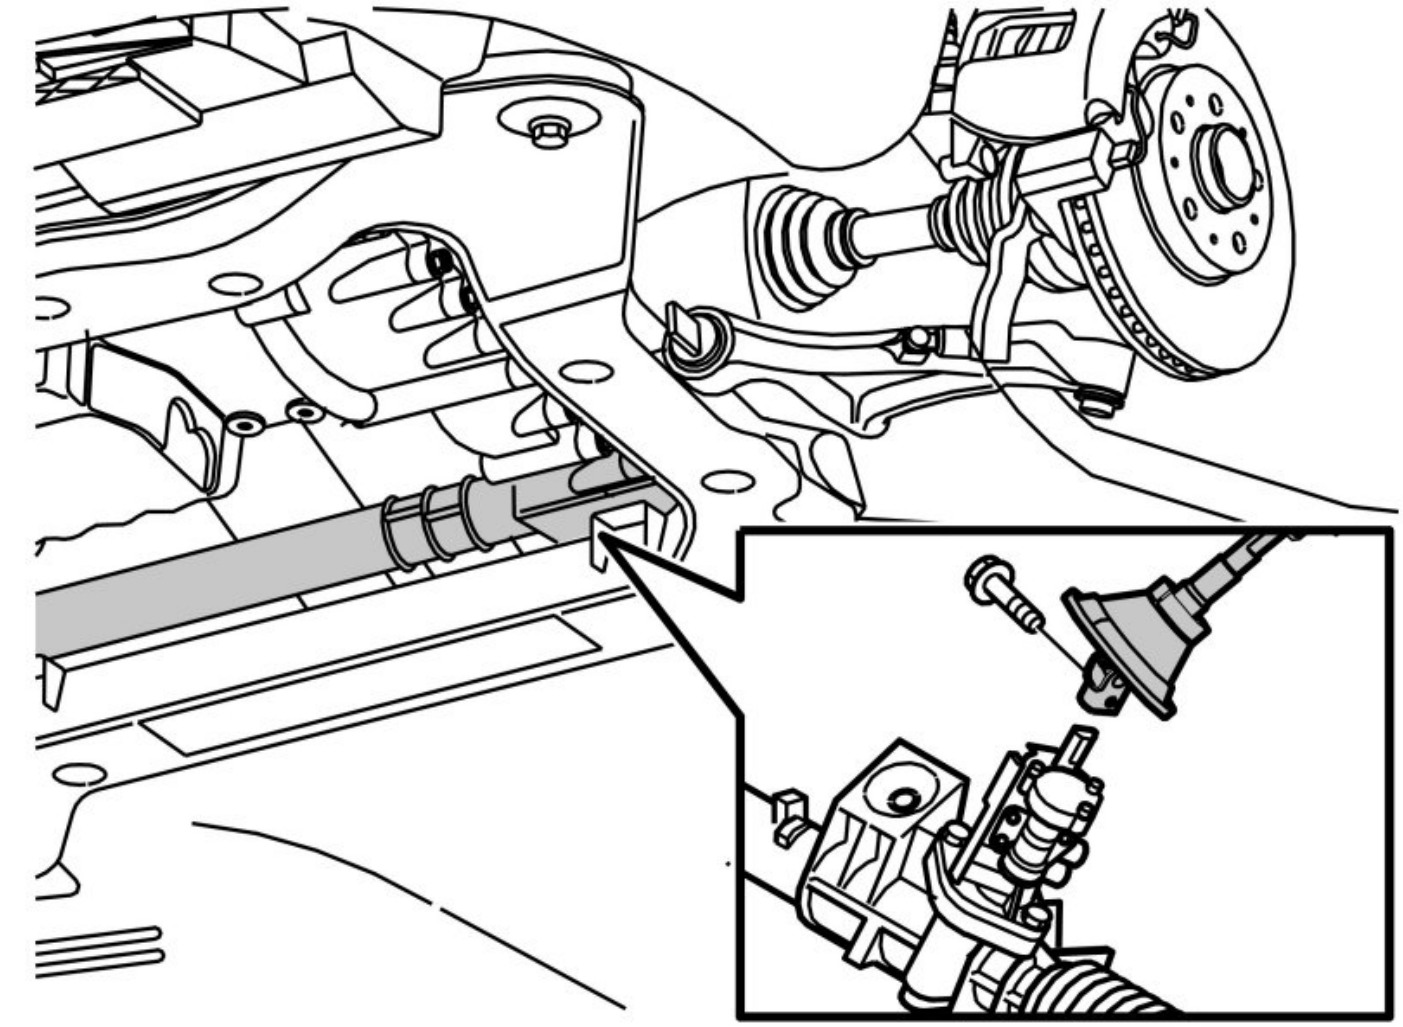
Expose the wiring for the front heated oxygen sensor (HO2S).
Disconnect the connector for the level sensor in the expansion tank.

Remove

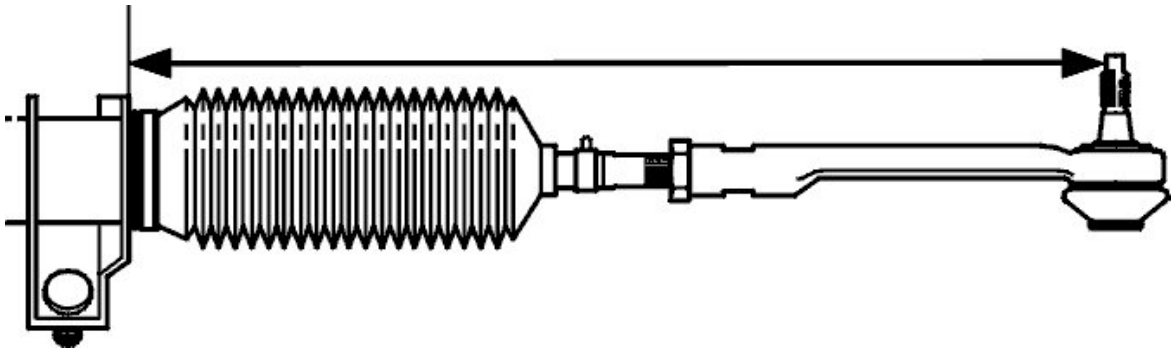
- the heat deflector plate above the turbocharger (TC)
- the hoses for the heater unit at the terminal in the firewall
- the bleed hose for the radiator at the expansion tank
- the ABS line and clips and the power steering hose.

Lift up the power steering fluid reservoir and the expansion tank. Place them on top of engine.

Separating the steering shaft



Remove the ignition key.
Remove the screw from the joint between the steering gear and the steering shaft.



On one side, measure the length of the track rod in relation to the steering gear housing. Note the measurement.
Press up the joint from the steering gear.

Caution! The steering shaft must not be turned. The contact reel in the SRS system could be damaged.

Removing the three-way catalytic converter (TWC) (all-wheel drive (AWD) only)

Remove

- the nuts where the exhaust pipe divides downstream of the three-way catalytic converter (TWC)
- the screws securing the SIPS member to the bodywork.

Remove the brake pipe from the holders on the SIPS member.
Lift off the front exhaust pipe from the turbocharger (TC) and the rear system.
Lower and pull back the three-way catalytic converter (TWC) with the SIPS member.

Note! The routing of the heated oxygen sensor's cable harness over brake pipe.

Removing the propeller shaft from the transmission and drive distribution box (all-wheel drive (AWD) only)

remove the propeller shaft from the transmission and drive distribution box (all-wheel drive (AWD) only). See Pinion seal bevel gear, replacing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Seals and Gaskets/Service and Repair/Pinion Seal Bevel Gear, Replacing.

Lowering the engine and transmission

Use a post hoist with a lifting table and stud guides.
Position the lifting table against the sub-frame.

Note! Make sure that the lifting table is centered under the sub-frame for optimal weight distribution. Check that the lifting table is correctly applied against the sub-frame.

Remove

- the sub-frame brackets screws
- the screws for the sub-frame.

Lower the engine and transmission approximately 15 cm so that the drive shafts describe a horizontal line between the hub and transmission.

Caution! Make sure that no hoses, wiring or anything else catches when the engine/transmission unit is lowered.

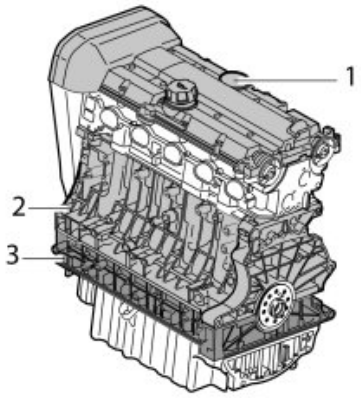
Unhook the control arms from the ball joint pinion.
Hold the constant velocity joint. Pull the drive shaft off the hub. Let the drive shafts rest against the control arms.
Turn the engine block heater out of its position.
Check that the air conditioning (A/C) compressor is hanging free.
Continue lowering the engine and transmission unit.

Engine: Overhaul

Caulking

Caulking

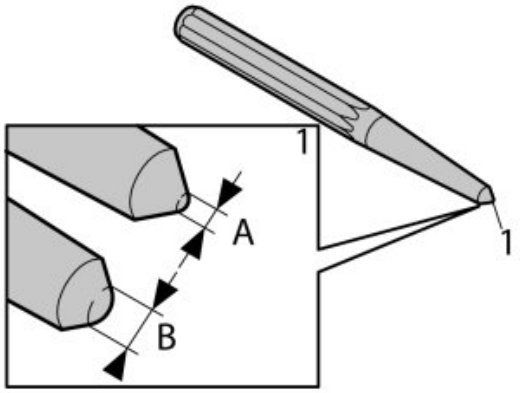
Note! Some variation in the illustrations may occur, but the essential information is always correct.



On engines manufactured of aluminium the camshaft bearing housing (1) cylinder block (2) and the intermediate section (3) may be caulked.

Note! The cylinder heads that are chill-cast may not be caulked.

Each individual case is assessed as to whether caulking can be carried out or not depending on the location of the oil leakage.

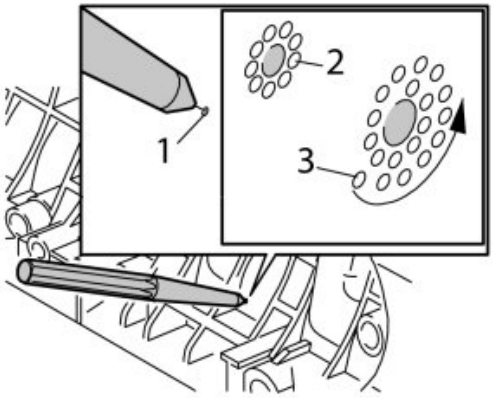


Caulking involves in the event of leakage knocking the material together using a special caulking tool.
Two caulking tools are required. Use centre punches (1). Grind down the tips so they become round. One is to be ground so the rounded tip (A) is 2 mm. The other is ground so the rounded tip (B) is 4 mm.

Note! Use the protective goggles supplied with the leak tracing kit.

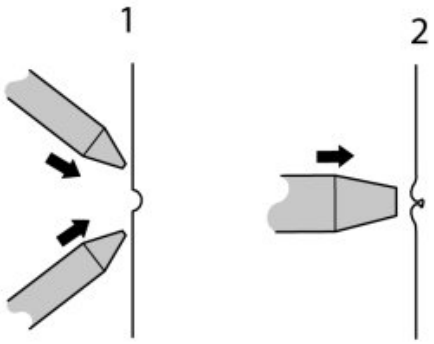
Use: Isopropanol, 1161721

Use an UV light to localize the pore. Carefully wash round the pore with Isopropanol. Check with a UV light that all the oil has been removed.



Warning! Use protective goggles.

If the pore is small, it is sufficient to place the tool (2 mm) directly on the pore and hit it with a copper or plastic hammer. If the pore is larger, angle the tool (2 mm) and drive the material in a circle toward the pore (2). If there is a lip around the pore, caulking (tool 4 mm) should be carried out in a spiral form toward the pore (3).



Drive the material toward the pore (1) using the 2 mm tool. Seal using the 4 mm tool (2).

Use: Isopropanol, 1161721

Wash with Isopropanol. Check with a UV lamp that there is no oil around the leakage point.
Test drive for 45 minutes as set out below to reach an oil temperature of about 80°C.

1. Allow the engine to idle for 20 minutes.
2. Test drive the car for 15 minutes.
3. Allow the engine to idle for a further 10 minutes.

Check using a UV light that the sealed area no long leaks. If leakage remains, repeat the caulking.

Crankshaft Axial Play

Crankshaft axial play

Operation number: 21685-2

Note! Some variation in the illustrations may occur, but the essential information is always correct.

Special tools	
	**T9995971 PLATE (FOR MAGNETIC BASE)** **Tool number:**T9995971 **Tool description:**PLATE (FOR MAGNETIC BASE) **Tool boards:**

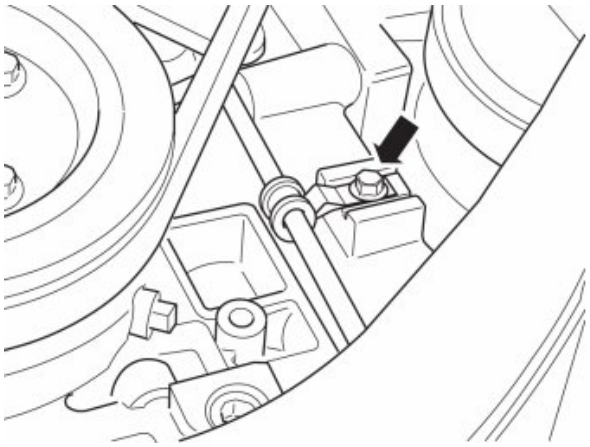
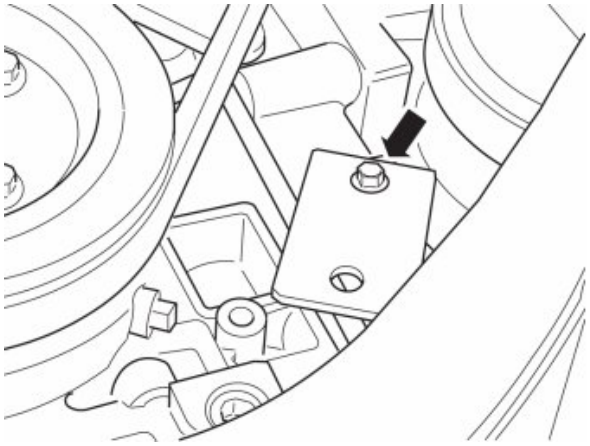
Removal

Note! Removal steps in this procedure may contain installation details.

Remove the right front wheel.
When installing Refer to: Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair
Fold away the wheel arch liner and tie it up.



Remove the clamp screw on the fuel line. Move the clamp upward.
Torque: M7, 17 Nm



999 5971 PLATE See: Tools and Equipment/999 5971 Plate
Torque: M7, 17 Nm

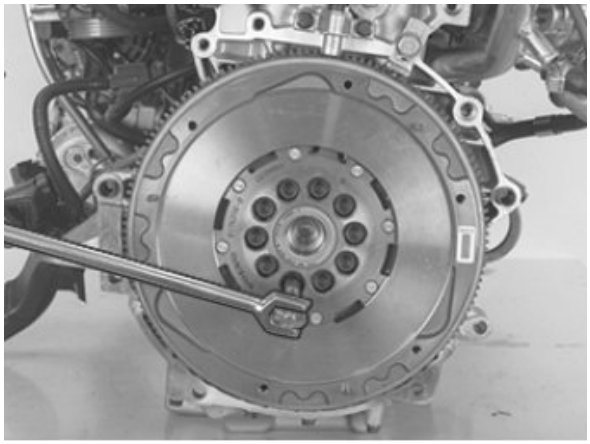
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the gearbox

Hint: Remove the lower screws (these are difficult to access) between the gearbox and engine before removing the engine and gearbox unit. The engine and gearbox unit must be placed on a suitable surface.
Relieve the transmission. Loose the remaining screws and remove the transmission **carefully**.

Remove the clutch.

Removing the flywheel and carrier plate



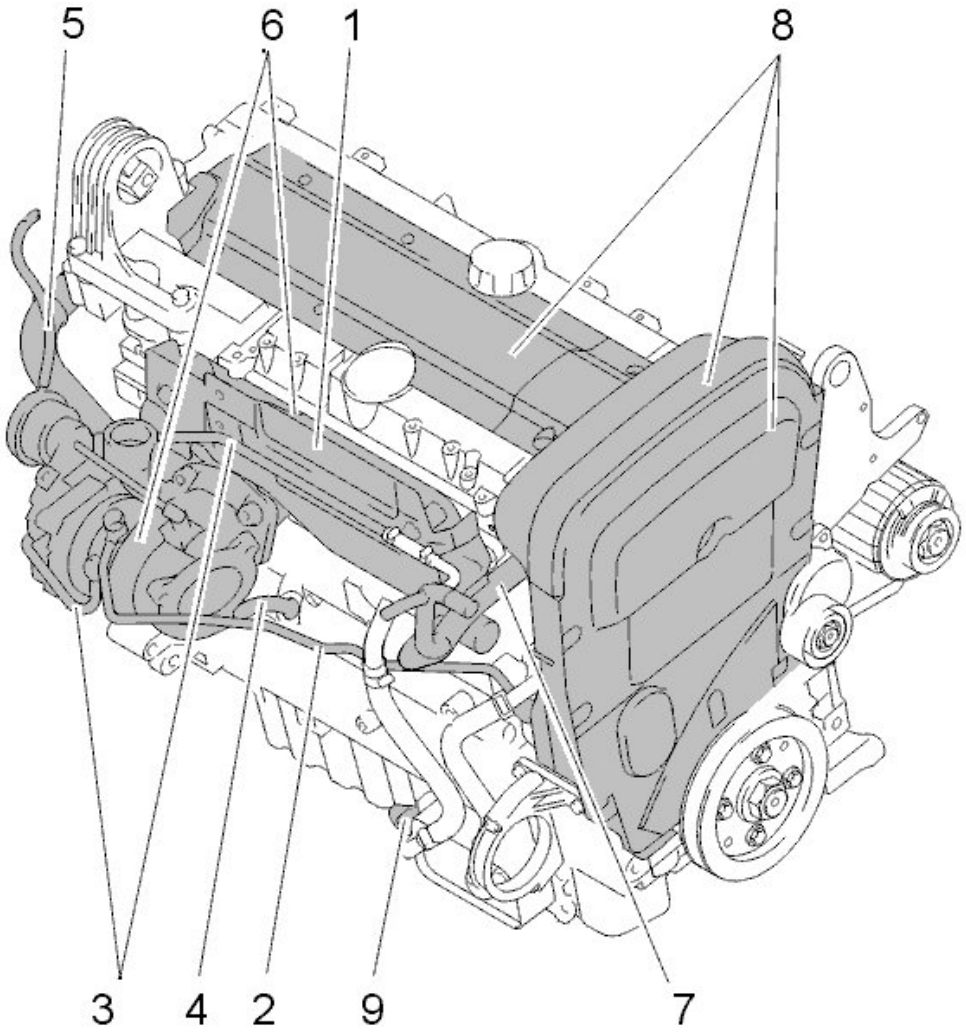
Install gear sector 999 5112 GEAR SECTOR See: Tools and Equipment/999 5112 Gear Sector.
Remove all screws except for the uppermost screw which secures the flywheel to the crankshaft. Slacken off the uppermost screw. Leave it in place, screwed in a few turns.

Carefully work the flywheel and carrier plate loose. If necessary, use 2 groove-cut chisels. Apply these between the cylinder block and the flywheel and carrier plate.
Hold the flywheel and carrier plate and remove the final screw.

Install the engine in a stand

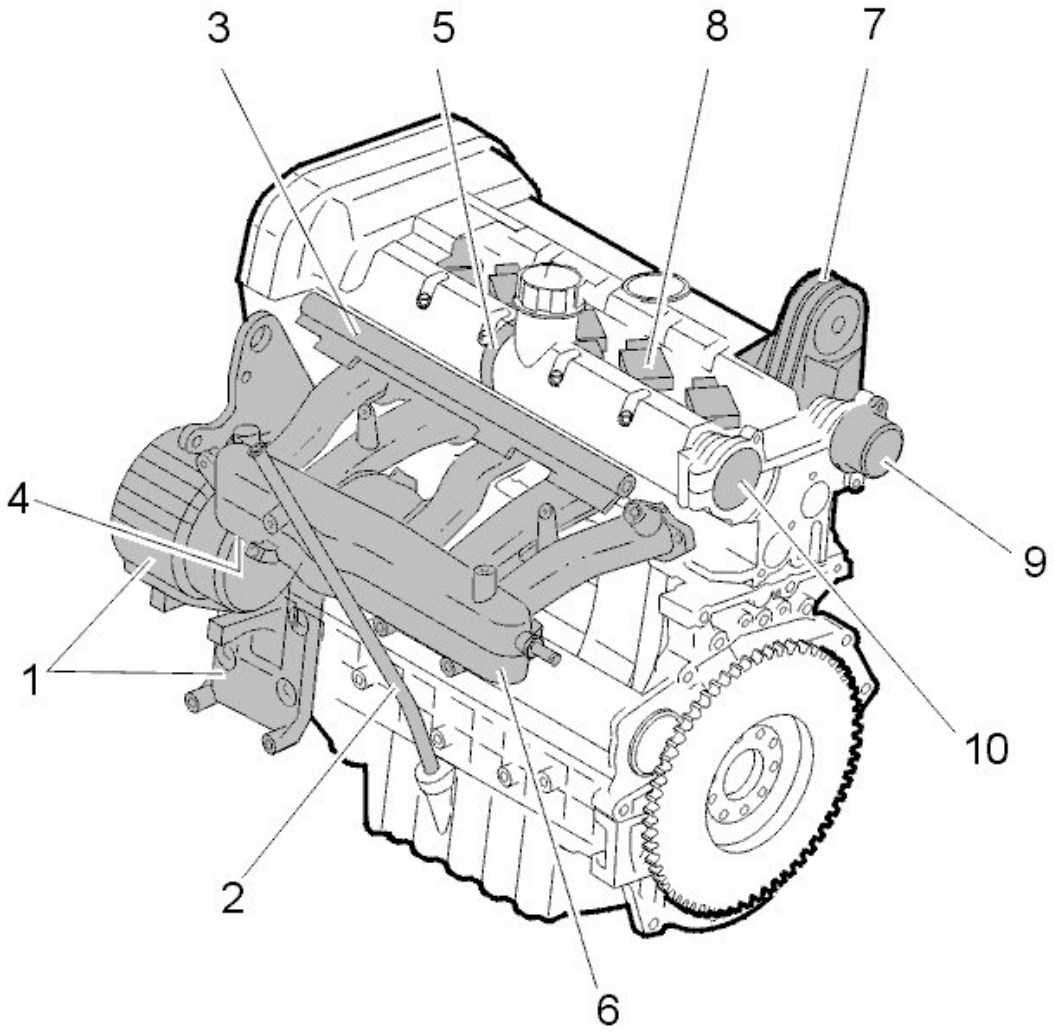
Use mounting stand 999 2520 FLOOR STAND See: Tools and Equipment/999 2520 Floor Stand , fixture 999 5297 ENGINE FIXTURE See: Tools and Equipment/999 5297 Engine Fixture and screw set 998 9721 SCREW SET See: Tools and Equipment/998 9721 Screw Set.

Exposing the engine



Remove

1. The heat deflector plate.	6. The exhaust manifold including the turbocharger (TC).
2. The oil pressure pipe.	7. The coolant pipe (water pump inlet).
3. The coolant pipes, (turbocharger (TC) inlet / outlet).	8. The upper and front timing covers and the cover over the ignition coils.
4. The oil return line.	9. Drain the engine oil.
5. The turbocharger (TC) control hoses and the valve.	



Remove

1. The generator (GEN) and the auxiliary equipment bracket.	7. The torque rod bracket.
2. The dipstick pipe.	8. The engine wiring assembly.
3. The fuel rail.	9. The ignition coils.
4. The pipe screw for the water heated crankcase ventilation.	10. The camshaft position sensor (CMP) housing and trigger wheel.
5. The crankcase ventilation hose on top of the camshaft cover.	11. The cover.
6. The intake manifold.	

Engine Block, Installing Components

Engine block, installing components

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Installing engine block components

Note! Always use new seal washers and gaskets!

Install

- thermostat housing (B52x4x)
- knock sensor (KS)
- flame trap
- the pipe screw for the water-heated crankcase ventilation.

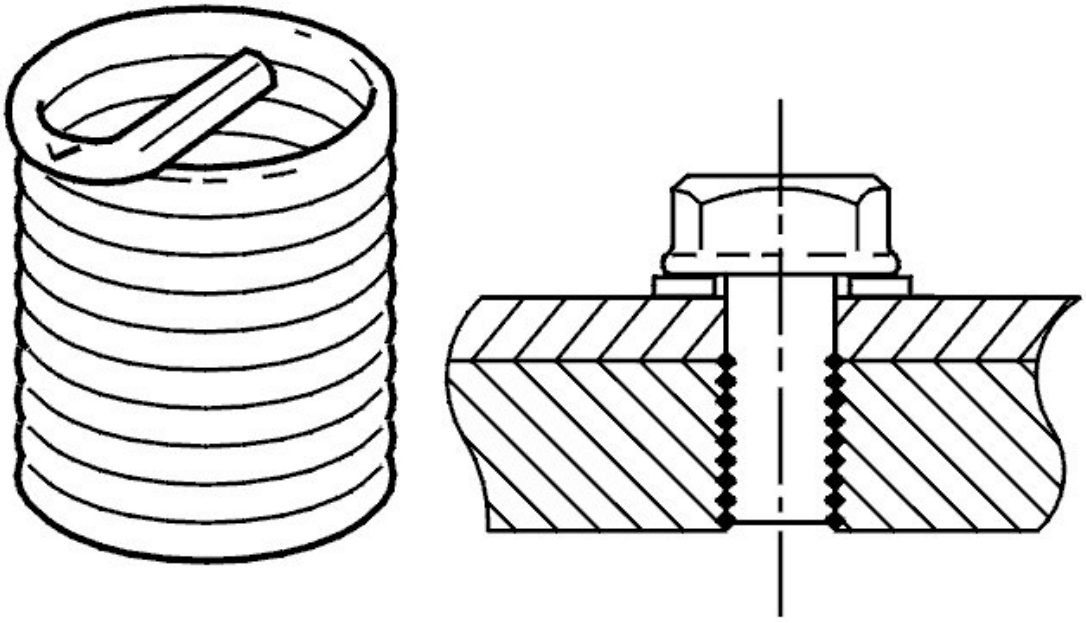
Threads

Threads

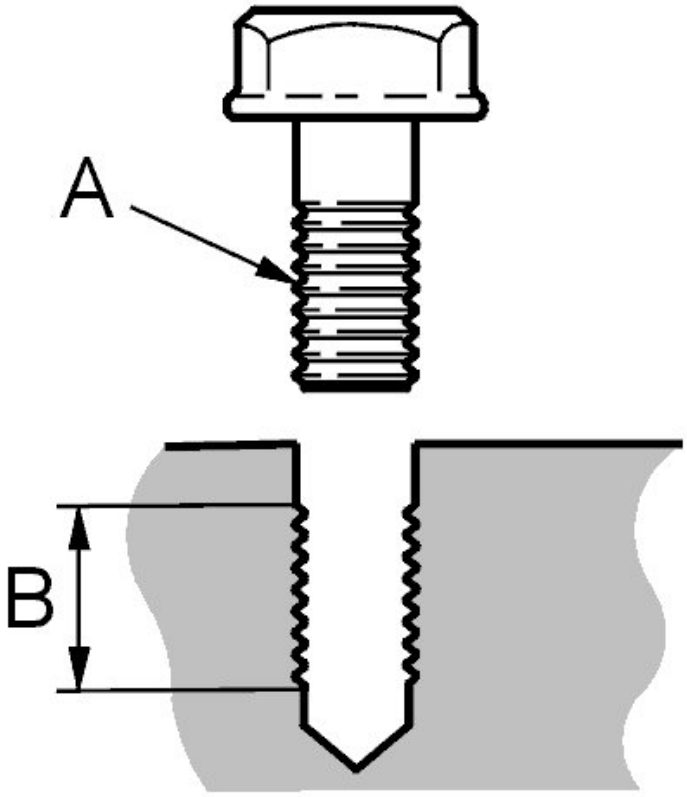
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Thread inserts, general



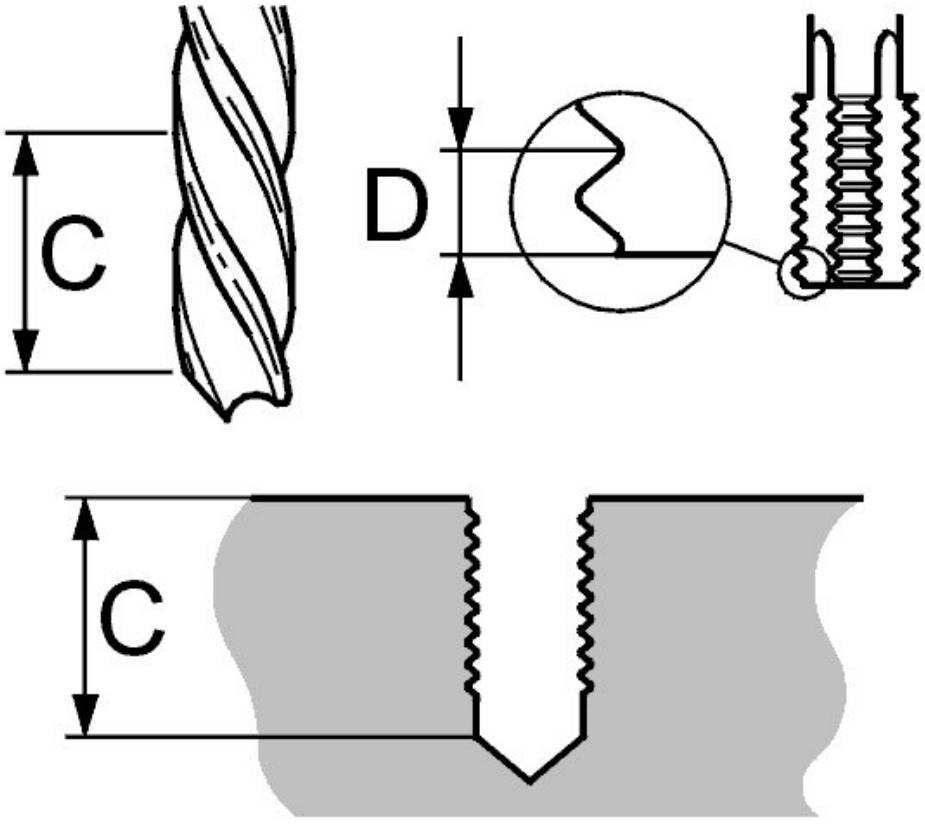
Damaged threads can in most cases be reconditioned using HELICOIL thread inserts.
Thread inserts are available in a variety of sizes, pitches and lengths. A correctly reconditioned thread will generally increase the strength of a joint.

Designation of thread insert



Measure the old threads and thread length in the hole.
A: Thread.
B: Thread length.

Drilling and tapping new thread in the hole

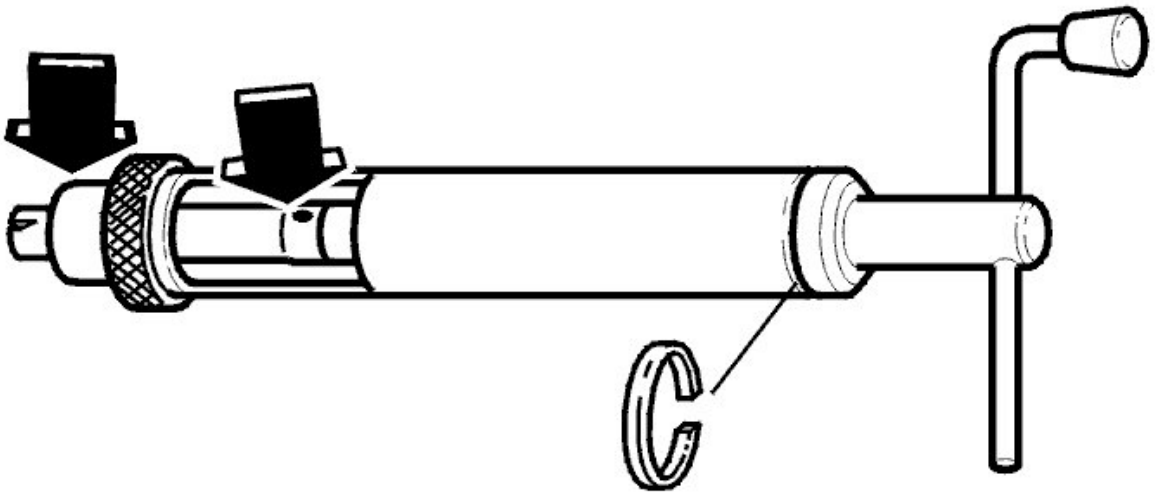


Drill out the old threads using the correct diameter drill bit. Blow the hole clean.
Tap the new thread using the correct tap.

Note! The thread taps referred to in the text are specially made for use with the HELI-COIL system.

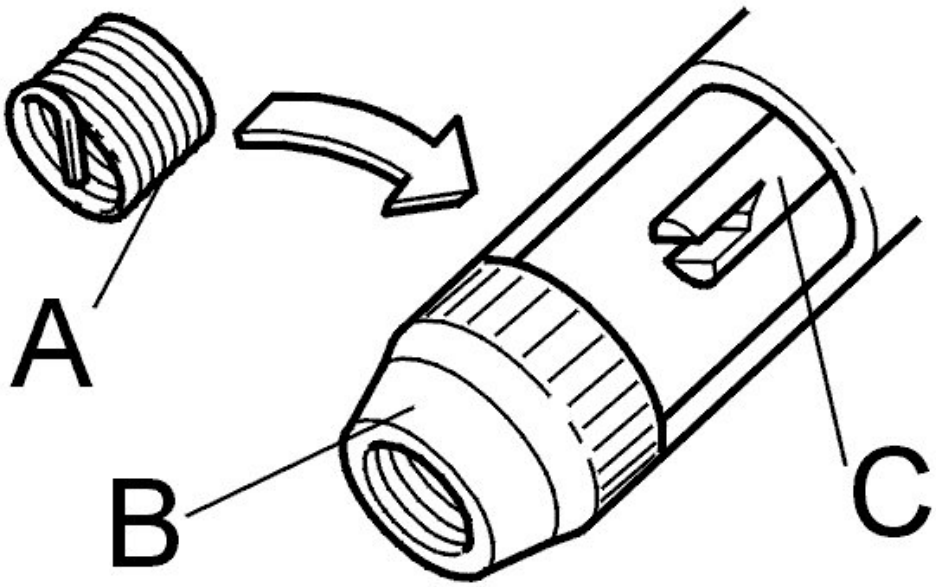
Use methylated spirit or similar to lubricate the threading operation in aluminium. Thread longer threads in stages, backing out the tap and blowing the tap and the hole clean in between.
Thread the hole to the proper depth (or through if it is to be threaded throughout).
C: drill depth.
D: cutting phase.

Tools required for installation



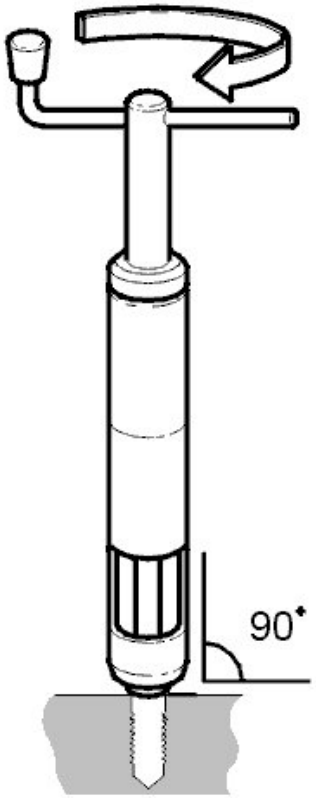
The installation tool (illustrated) is used for threads **M6 - M14**. During some operations the tool must be disassembled by removing the locking ring, for example with countersunk threads.
For threads **M16** and larger the specific tool for each thread size must be used The guide and mandrel are included.

Installing the thread insert in the installation tool



Locate the thread insert with the tang facing down in the tool.
Turn the spindle until the tang engages in the recess.
Screw the thread insert into the guide, do not apply pressure, until the first turn of the thread insert is flush with the guide opening.
A: Tang.
B: Guide.
C: Mandrel.

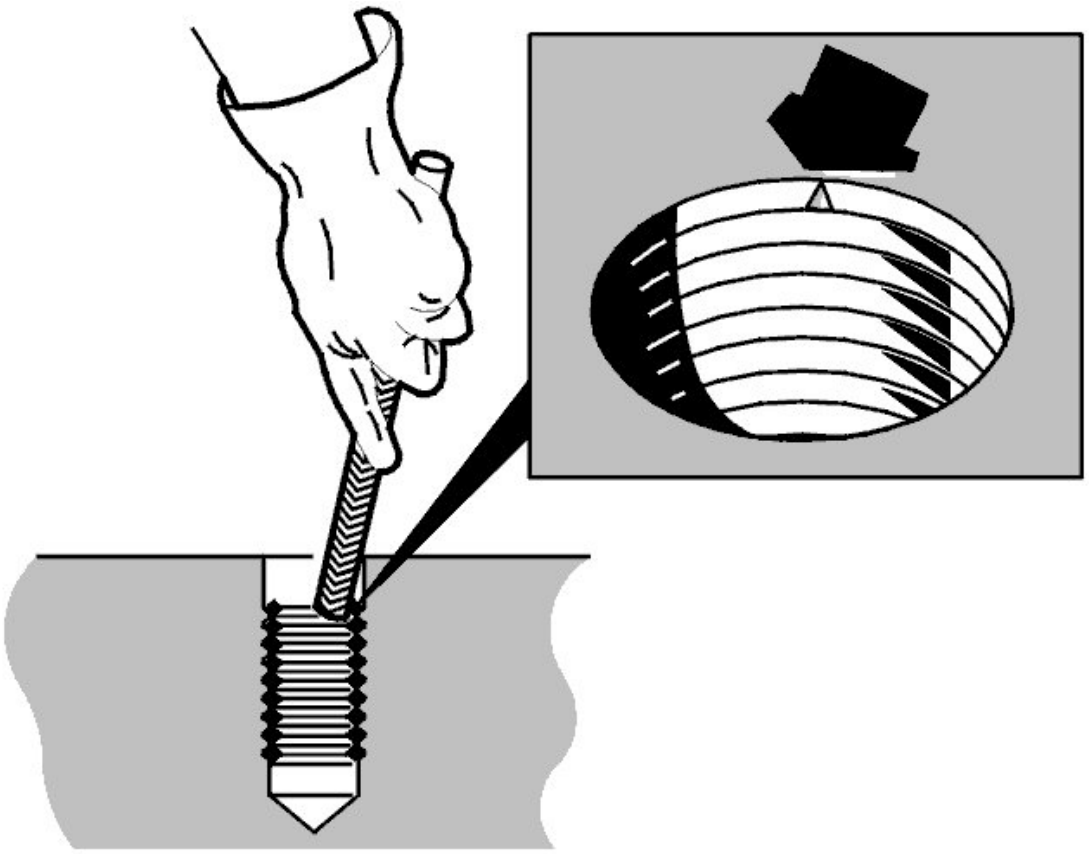
Installation of thread insert



Hold the installation tool straight above and centered over the hole. Screw in the insert without applying pressure on the spindle handle. Screw in

until the end of the insert reaches at least half a thread revolution into the thread.
The insert must not touch the bottom of the hole or stick out of the other side if it is a through hole.
Break off the tang with the proper tang breaker. For **M14** threads and coarser, use a pair of flat-nosed pliers or similar and break downwards.

Extraction of damaged thread insert



Alternative 1

File a notch in the thread insert, about a quarter turn in from the end. Do not file through the insert.

Note! Do not damage the thread in the material.

Use a triangular scraper or similar to extract the insert by rotating it.

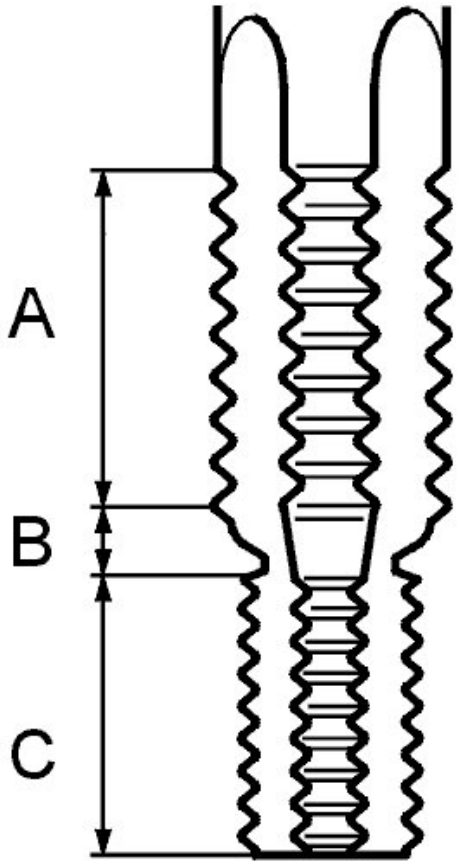
Alternative 2

Carefully expose the end of the thread insert. Use flat-nose pliers to pull the thread insert out.
Clean out the threads in the hole using the thread tap and blow clean.
Install a new thread insert.

Reconditioning sparkplug threads

Note! Reconditioning of spark plug threads must be carried out with removed cylinder head.

Tapping thread in sparkplug hole

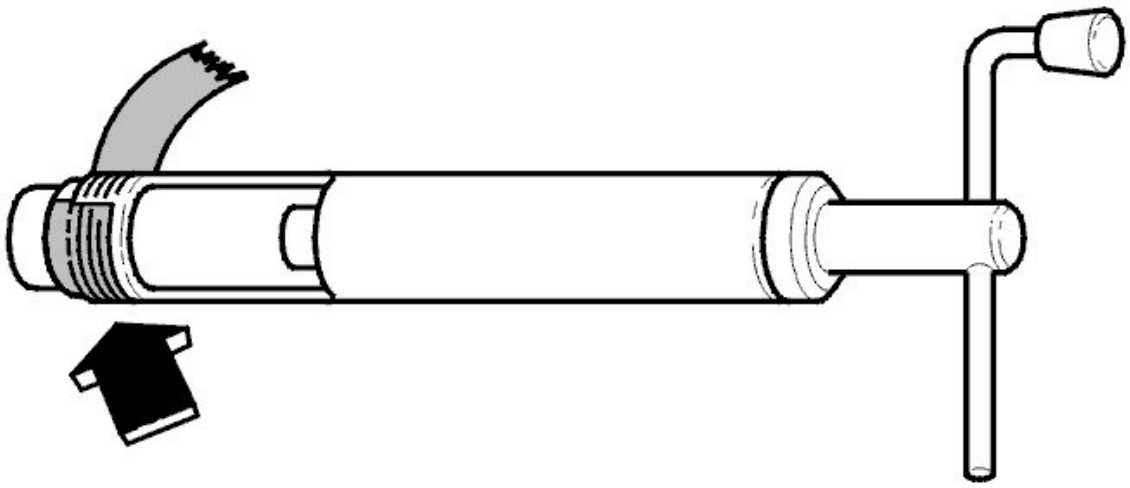


Use combination tap 998 5823-5 and thread repair inserts for spark plug thread **M14x1,25**.

Note! Do not drill out spark plug threads.

Combined tap
A: Tap.
B: Reamer.
C: Steering.

Installation of thread insert



There are times when the cap nut cannot be used because of space restrictions. On these occasions the guide should be taped into place.

Note! As the thread insert for the spark plug thread is thinner (finer) than usual it is extra important to not pressure on the pin when inserting the thread insert (both in the nozzle and the material).

Twist the thread insert down and check that the upper thread is at least a half thread down into the thread and that none of the insert protrudes into the combustion chamber.
If the insert has been screwed in too far it must be turned until it is all the way through. If it is not deformed it can be inserted again.
Break off the tang with a pair of flat nose pliers. Check the thread. Install a sparkplug.

Thread table

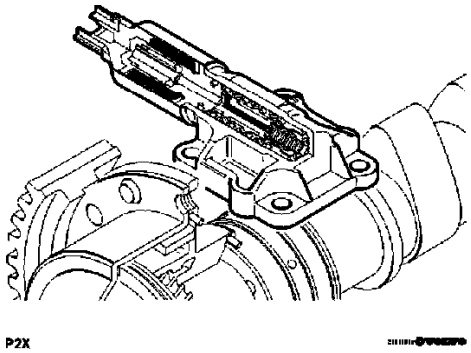
Values in mm		
Thread dimension	**Drill - diameter**	**Examples of areas of use**
M6x1	6.3	Oil pump
M7x1	7.3	Sump to cylinder block, Intermediate section to cylinder block, Water pump to cylinder block
M8x1.25	8.4	Studs at the exhaust ports
M10x1.5	10.5	Intermediate section to cylinder block, Gearbox to engine
M12x1.5	12.5	
M14x1.25		Spark plugs
M14x1.5	14.2	Oil pressure switch. Oil pressure outlet engine / turbocharger unit.
M18x1.5	18.5	Oil drain plug in the sump.

Threads which must not be reconditioned

Coolant outlet for the drain nipple, heat exchanger / oil cooler.
Plug hole for crankshaft setting.
Screw holes for cylinder head screws.

Variable Valve Timing Actuator: Description and Operation Camshaft Control (CVVT)

Camshaft Control (CVVT)



When the camshaft is set at the factory, it is aligned with the position of the crankshaft. The position of the camshaft in relation to the crankshaft is designated the camshaft 0 position.

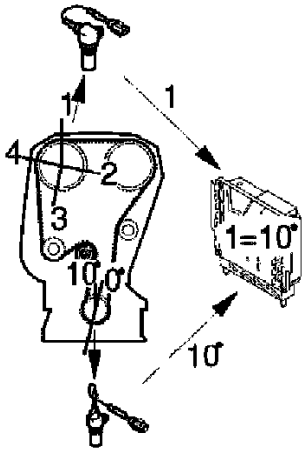
During camshaft control (CVVT) the camshaft 0 position is offset. The value of the 0 position offset is called the cam timing. The cam timing is 0 degrees if the camshaft is not being controlled.

By controlling the cam timing (the camshaft is deployed from its 0 position) the performance of the engine is increased, the idle speed quality is improved and the emissions are reduced.

In order to detect the cam timing, the engine control module (ECM) uses the signals from the engine speed (RPM) sensor (the position of the crankshaft) and from the camshaft position (CMP) sensor (the position of the camshaft). By comparing these two signals, the control module is able to determine the cam timing (the number of degrees the camshaft is from its 0 position).

There are diagnostic for this function. See also Camshaft diagnostics (CVVT).

Camshaft cam timing



The camshaft (A) is divided into four flanks per revolution of the camshaft (flanks 1-4). The angle between flanks 1-2 = 103 degrees, flanks 2-3 = 90 degrees, flanks 3-4 = 90 degrees and flanks 4-1 = 77 degrees. The angle between the flanks is different, allowing the control module to determine which flank it is detecting and therefore determine which combustion cycle the cylinders are in.

The crankshaft has four reference positions, one for each camshaft flank. The camshaft turns at half the speed of the crankshaft. This means that two reference positions are detected for each turn of the crankshaft. Therefore two engine revolutions are required to detect all flanks on the camshaft. For example (may vary between different engine variants): flank 1 at 0 degrees, flank 2 at 206 degrees, flank 3 at 386 degrees and flank 4 at 576 degrees (flanks 3 and 4 are detected during the second engine revolution).

The reference positions of the crankshaft coincide exactly with each camshaft flank if the camshaft cam timing is 0 degrees. If the cam timing deviates from 0 degrees, i.e. the flanks deviate from the reference positions of the crankshaft, the control module calculates the number of crankshaft degrees by which the flank is deviating.

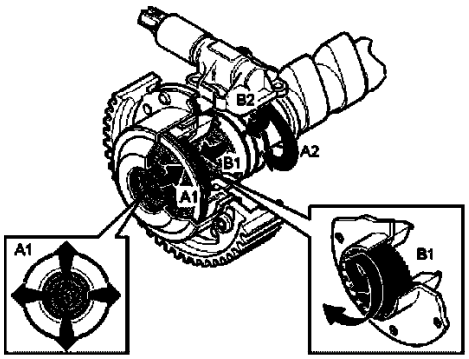
The control module detects the reference positions for the camshaft flanks using the signal from the engine speed (RPM) sensor.

Example:
If camshaft flank 1 is detected at 10 degrees from the crankshaft reference position for flank 1 (0 degrees +10 degrees), the cam timing is 10 degrees. If the cam timing is the same (10 degrees), flank 2 is detected at 216 degrees (206 degrees + 10 degrees), flank 3 at 396 degrees (386 degrees + 10 degrees), and flank 4 at 586 degrees (576 degrees + 10 degrees). The cam timing can be positive (+) or negative (-) depending on

whether the flank is detected before or after the different reference positions for the crankshaft.

The engine control module (ECM) controls the camshaft reset valve smoothly in order to regulate the camshaft cam timing. The valve controls the flow of engine oil to the continuous variable valve timing (CVVT) unit which is affected by the oil pressure that builds up. Also see Design.

Control



Control takes place as follows when deploying the camshaft:

1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) grounds the valve, the position of the piston in the valve changes and the oil is guided to the continuous variable valve timing (CVVT) unit chamber (A1) via the duct (A2) in the camshaft
3. The continuous variable valve timing (CVVT) unit hub is pressed backwards by the oil pressure. The continuous variable valve timing (CVVT) unit then rotates the hub and the carriers are joined by twisted splines
4. The oil flows to the engine oil pan via the outer ducts on the hub and the reset valve's return hose.

Control takes place as follows when returning the camshaft:

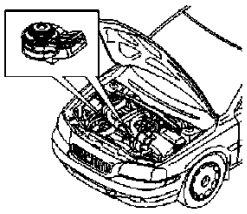
1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) breaks the ground connection for the valve. The piston in the valve is then pressed back by a spring. The oil flows to the continuous variable valve timing (CVVT) unit chamber (B1) via a duct (B2) in the camshaft
3. The hub of the continuous variable valve timing (CVVT) unit is forced forward by the oil pressure that is created. The continuous variable valve timing (CVVT) unit will rotate back to the nondeployed position
4. The oil flows to the engine oil pan via the center duct on the hub and the reset valve's return duct.

The above takes place very quickly. The engine control module (ECM) controls the deployment and return of the reset valve continually at high frequency. This results in rapid and exact control.

The extent of camshaft control (the change of cam timing) varies depending on the engine variant and the model year.

Variable Valve Timing Actuator: Description and Operation
Knock Control

Knock Control



Knocking occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

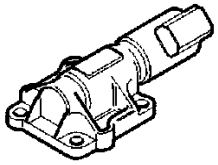
If any of the cylinders knock there is a specific type of vibration in the cylinder block. These vibrations are transferred to the knock sensors (KS) which are screwed into place in the cylinder block. The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. The engine control module (ECM) can then determine which cylinder is knocking with the help of the camshaft position (CMP) sensor and the engine speed (RPM) sensor.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.

If the knock sensors (KS) detect knocking in the engine over a certain threshold value, the ignition timing is first retarded and then the fuel / air mixture is enriched to eliminate knocking.

Variable Valve Timing Actuator: Description and Operation
Camshaft Reset Valve

Camshaft Reset Valve (Continuous Variable Valve Timing (CVVT))



The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).

The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the cam timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). Also see Function.

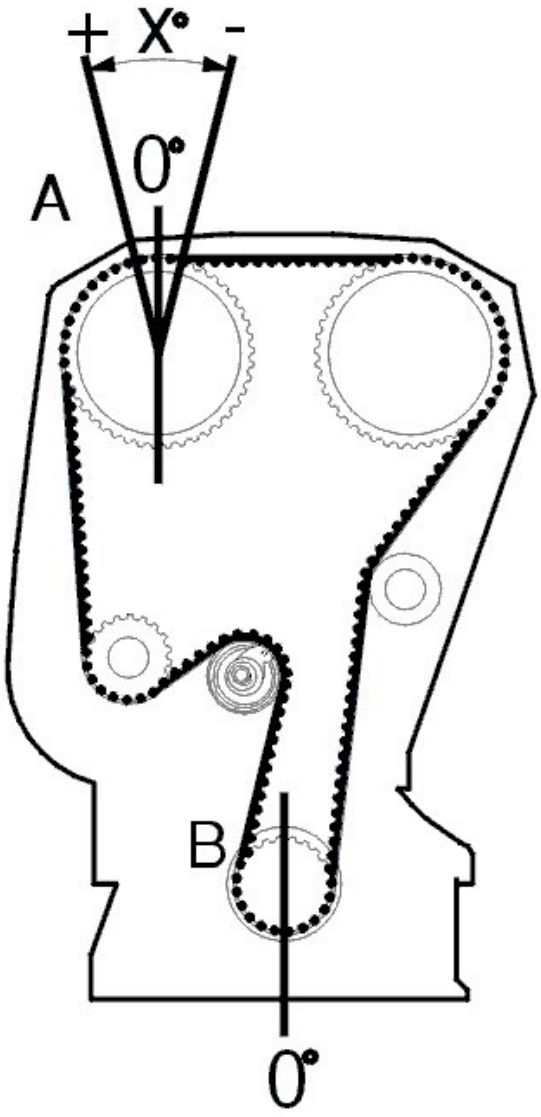
The system relay supplies the reset valve with voltage. The valve is grounded (control stage) in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be controlled to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the cam timing to be changed precisely and steplessly.

The engine control module (ECM) can diagnose the camshaft reset valve.

The valve is on the cylinder head above the camshaft with camshaft control.

Variable Valve Timing Actuator: Description and Operation
Variable Valve Timing Control

Variable valve timing control

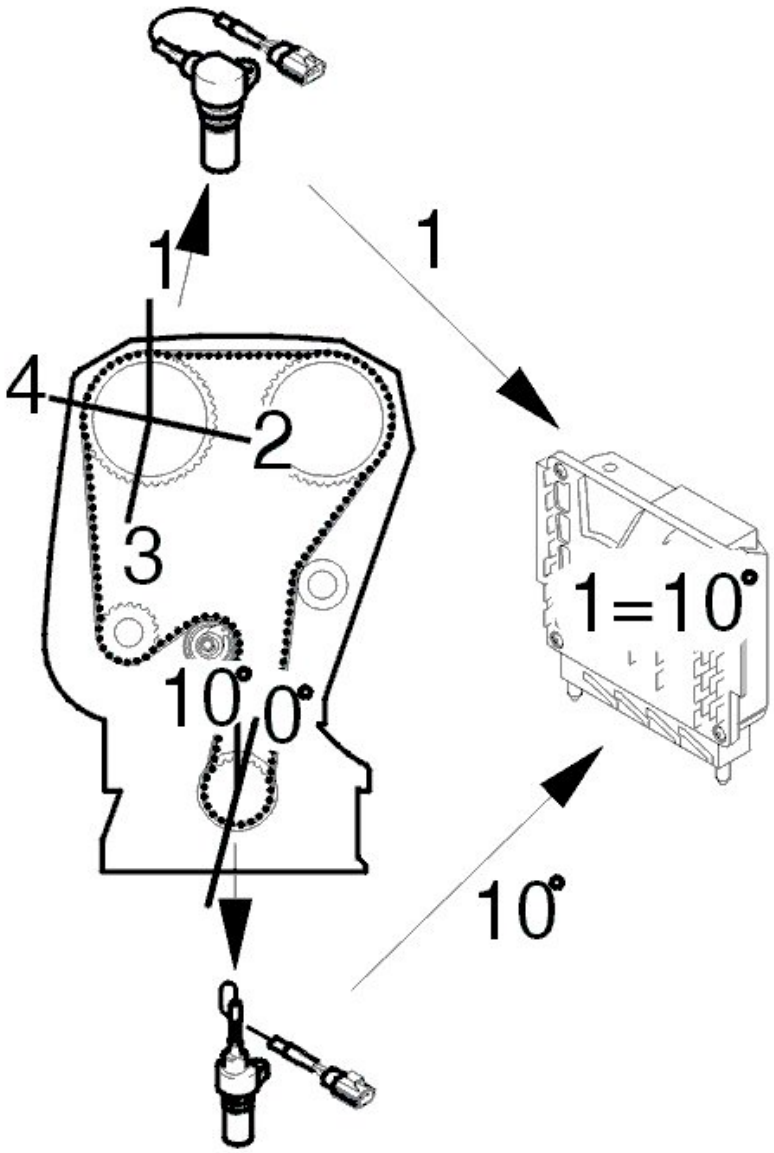


Continuous variable valve timing (CVVT) control, general

The engine combustion can be improved by changing the shift angle of the camshaft. This reduces emissions, gives lower fuel consumption and better performance. The shift angle of the camshaft is controlled by the control module which changes the pulse ratio of the reset valve. The pulse ratio of the reset valve affects the variable valve timing unit which changes the camshaft position compared to the crankshaft position (CKP). This ensures quick and precise control of the shift angle of the camshaft.
°

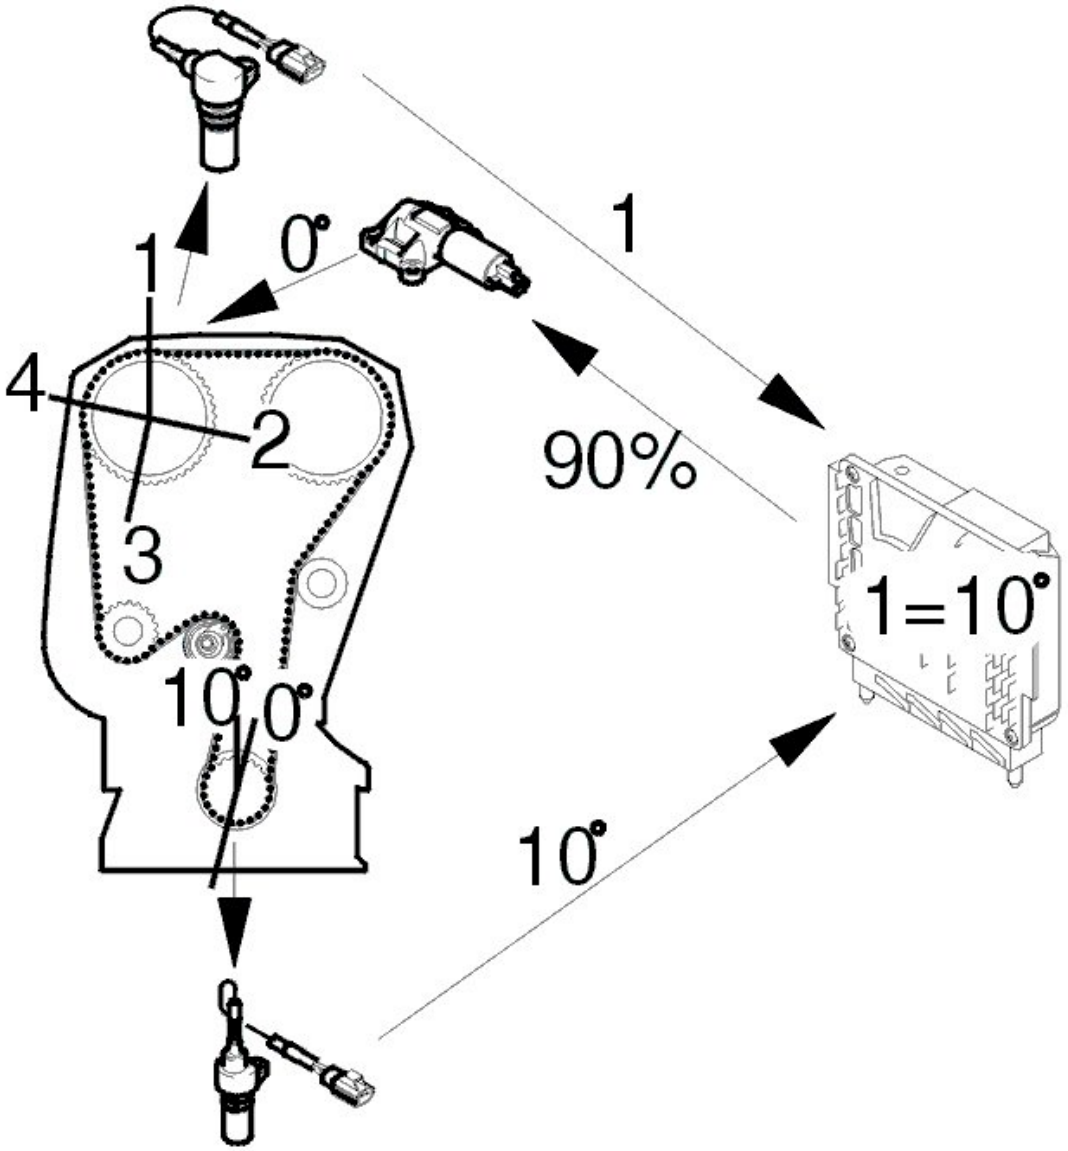
Definition of "Camshaft shift angle" (X)

When the camshaft (A) is set at the factory it is aligned to top dead center (TDC) on the crankshaft which is 0° (B). The camshaft position when aligned to the crankshaft TDC is the camshaft 0 position (0°). With continuous variable valve timing (CVVT) the camshaft 0 position is offset, the value of the offset of the camshaft 0 position is the camshaft shift angle (x°).



The control module interpretation of camshaft shift angle
(The illustration shows the camshaft shift angle at 10°)

The camshaft shift angle is checked by the control module by comparing the position of the crankshaft with the position of the camshaft.
The camshaft (A) is divided into 4 flanks per camshaft rotation (flanks 1-4). The angles are: between flanks 1-2 = 103°, flanks 2-3 = 90°, flanks 3-4 = 90° and flanks 4-1= 77°. The difference in angle between the flanks allows the control module to determine which flank is currently detected and therefore which cycle the camshaft is in. The control module detects the flanks using the signal from the camshaft position (CMP) sensor.
The crankshaft has four reference positions, one for each camshaft flank. Two reference positions are detected for each crankshaft rotation. Two engine rotations are required to detect all the camshaft flanks: flank 1 at 0°, flank 2 at 206°, flank 3 at 386° and flank 4 at 576° (flanks 3 and 4 are detected during the second rotation of the engine).
The reference positions on the crankshaft correspond exactly to the respective camshaft flank when the camshaft shift angle = 0°. The control module detects the reference positions for the camshaft flanks using the engine speed (RPM) sensor signal.
If, for example, the camshaft shift angle is +10°, the flanks correspond to the crankshaft reference positions for the respective camshaft flank and +10° from the crankshaft reference positions.
Example:
If the camshaft flank 1 is detected at 10° from the crankshaft reference position for flank 1 (0° +10°), the camshaft shift angle is 10°. If the camshaft shift angle is the same (10°), flank 2 is detected at 216° (206° + 10°), flank 3 at 396° (386° + 10°), and flank 4 at 576° (586° + 10°). The shift angle can be positive (+) or negative (-) depending on whether the flank is detected before or after the different crankshaft reference positions.



Adaptation of the camshaft shift angle, flanks 1-4
(The illustration shows the adaptation of the camshaft shift angle at 10°)

When the engine has the "basic setting", the ideal value for the camshaft adaptation value is 0°. The different camshaft flanks correspond exactly with the reference positions for the respective flanks. These values may deviate because of tolerances in the materials and installation. By adapting these deviations the camshaft shift angle can be exact.
Adaptation is carried out as follows:
Camshaft control not active, the pulse ratio on the camshaft reset valve is set to approximately 90% by the control module. This means that the camshaft 0 position (mechanical resting position) is assumed and the camshaft angles (x°) for flanks 1-4, which are then detected by the control module, are the adaptation values which are stored. (The adaptation values will be 0° if the camshaft adjustment in relation to the crankshaft is exact). When the control module operates the camshaft to a particular target value, the stored adaptation value is added to the control module's target value.
Example: The control module has adapted flanks 1-4 to an average value of +10° (as the result of an incorrectly set camshaft for example). When the control module needs to operate the camshaft to +10° (target value), the adaptation value is added to the target value which then gives a target value of 20° (10° +10°=20°).
The control module can adapt ±20°. A diagnostic trouble code (DTC) is stored in the control module if the adaptation is higher or lower than ±10°.

Other information:

- If the timing belt is incorrectly positioned by one tooth on the variable valve timing unit, this corresponds to approximately 17° on the crankshaft. This gives a theoretical adaptation value of 17°.
- If the timing belt is incorrectly positioned by one tooth on the variable valve timing unit, this corresponds to approximately 34° on the crankshaft. This gives a maximum adaptation value (20°)
- The setting of the variable valve timing unit in relation to the camshaft and crankshaft affects the adaptation value (between -20° and +20°)
- If the slide in the camshaft reset valve has jammed, the camshaft will be operate at maximum angle. This which will give an adaptation value at the maximum limit (+20° or -20°)
- The function of the variable valve timing unit affects the adaptation value (between -20° and +20°).

Variable Valve Timing Actuator: Testing and Inspection

Variable valve timing unit, checking and adjusting

Special tools:

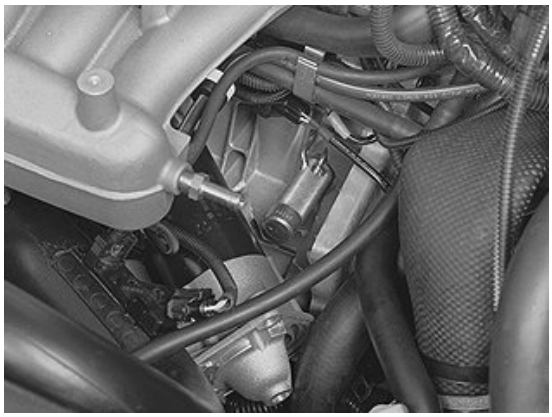
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Installing and adjusting the variable valve timing unit/timing gear pulley on the camshaft

Note! This procedure must be carried out with precision as any deviation could generate a fault symptom.

Installing the crankshaft adjustment tool

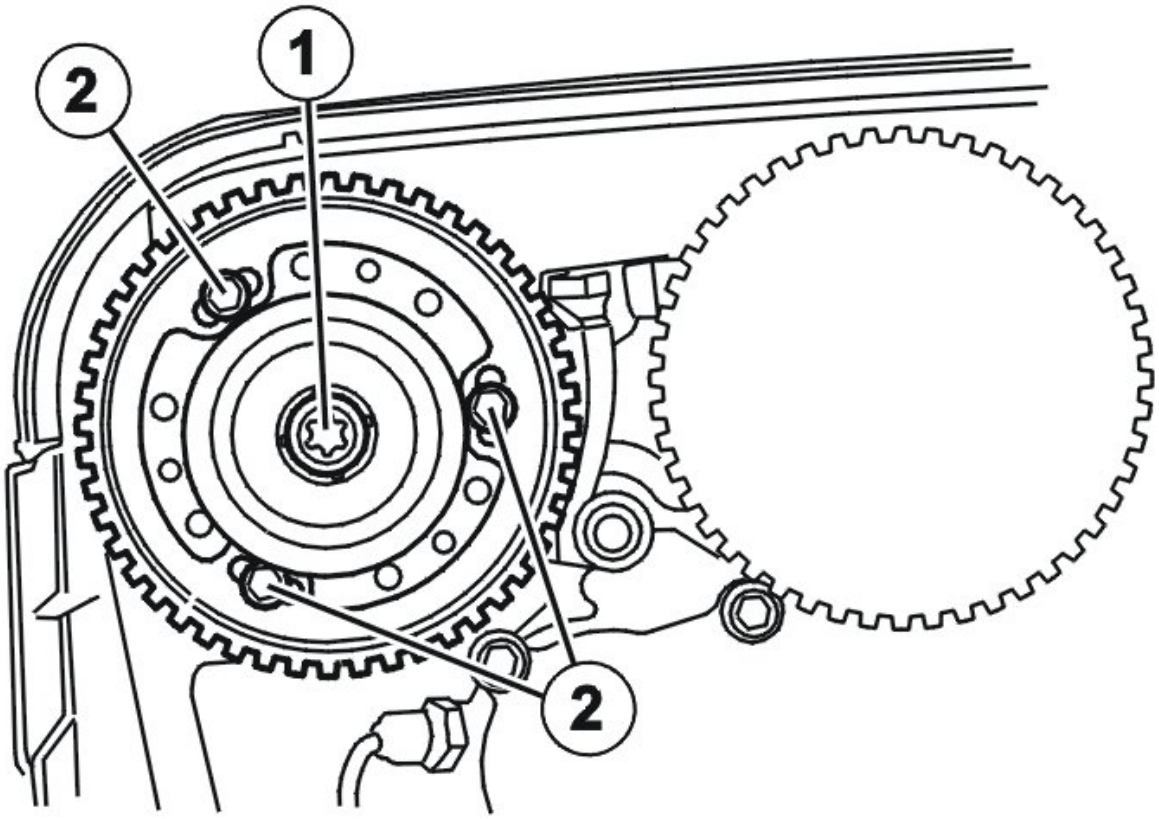


Remove the mounting screws for the starter motor.
Pull out the starter motor and place it to one side.
Remove the blind cover plug from the hole for the adjustment tool.
Turn the crankshaft clockwise slightly.
Install: 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Ensure that the tool bottoms out against the cylinder block.

Aligning the crankshaft

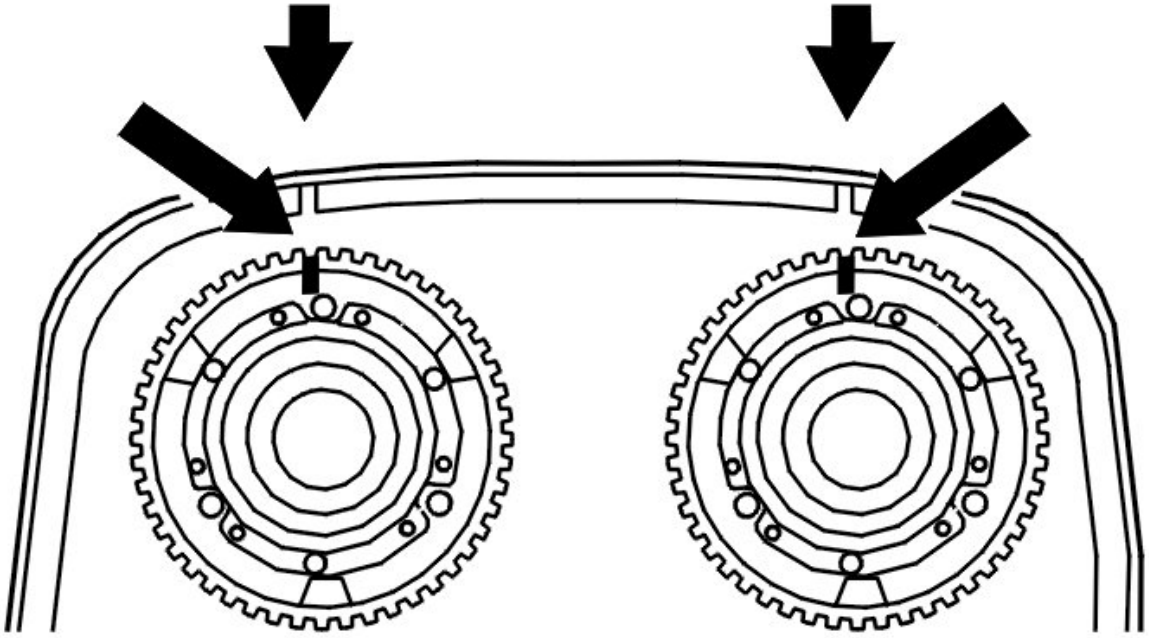
Turn the crankshaft counter-clockwise until it stops against the adjustment tool.
Check that the marking on the crankshaft timing gear pulley corresponds to the marking on the oil pump.

Installing the variable valve timing unit on the camshaft



Note! Oil the center screw before installation

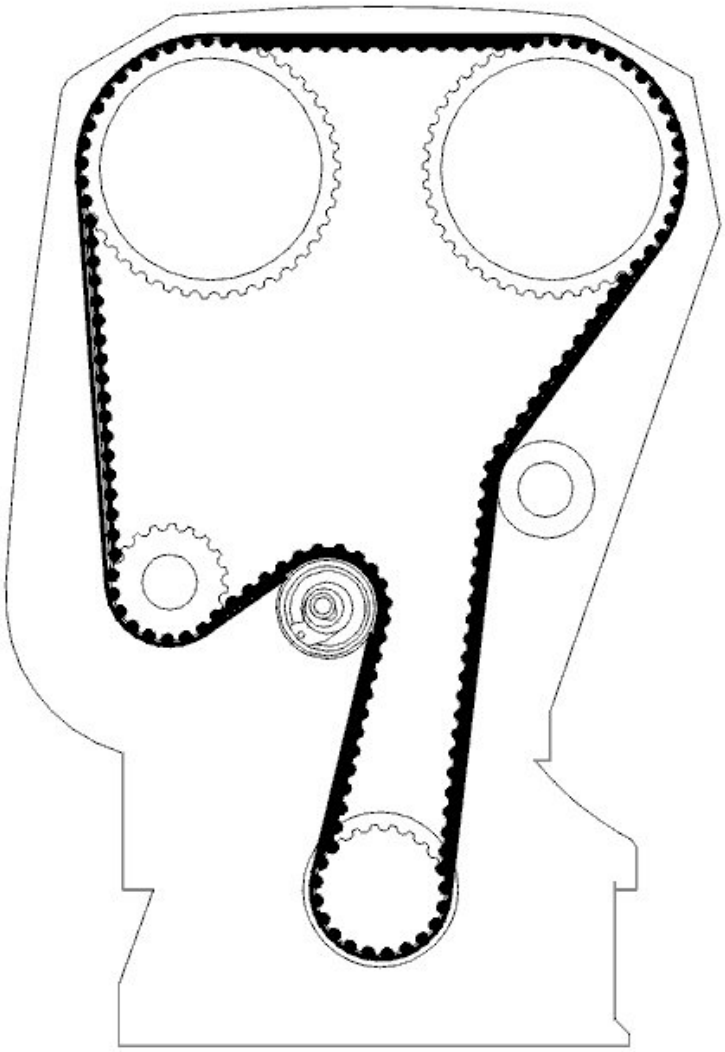
Push on the variable valve timing unit/timing gear pulley on the camshaft.
Install the center screw (1) which secures the variable valve timing unit to the camshaft. Tighten slightly.
Slacken off, but do not remove the screws (2) which secure the timing gear pulley to the variable valve timing unit.
Turn the timing gear pulley until the screws at the oval holes are in the center position. Tighten the screws (2) slightly.
Turn the variable valve timing unit clockwise to its limit position so that the unit is in its end position.
Position the upper timing cover



Undo the center screw and continue turning clockwise until the timing gear pulley marking aligns with the marking on the upper timing cover.

Tighten the center screw in the variable valve timing unit. Tighten. See: Tightening torque See: Specifications/Tightening Torque.

Installing the timing belt

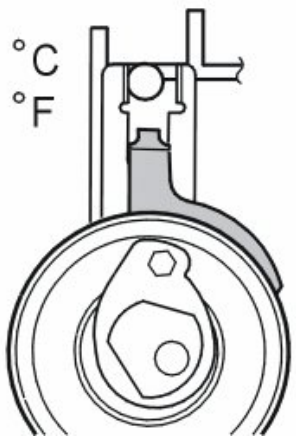


Note! Variable valve timing units do not have return springs and are easily thrown out of position when the camshaft belt is installed. Check that the markings align.

Install the belt in the following order:

- the idler pulley
- intake cam
- exhaust cam
- water pump
- tension pulley.

Tensioning of cambelt

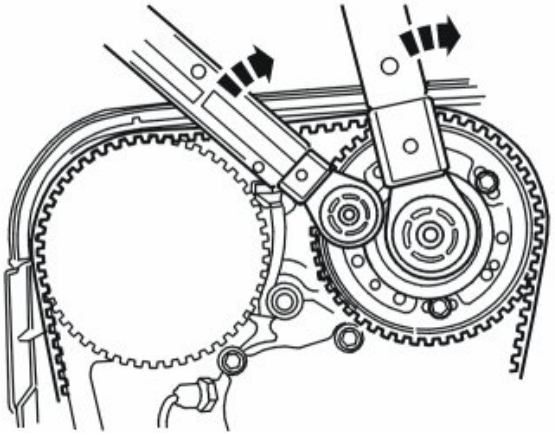


This adjustment is to be made with a cold engine.
A suitable temperature is approximately 20 °C/68 °F.
At a higher temperature, for example with a warm engine or a higher ambient temperature, the needle is further to the right.
The illustration shows the position of the indicator when aligning the timing belt tensioner at approximately 20 °C/68 °F.

Note! There are two different tensioners depending on model year.

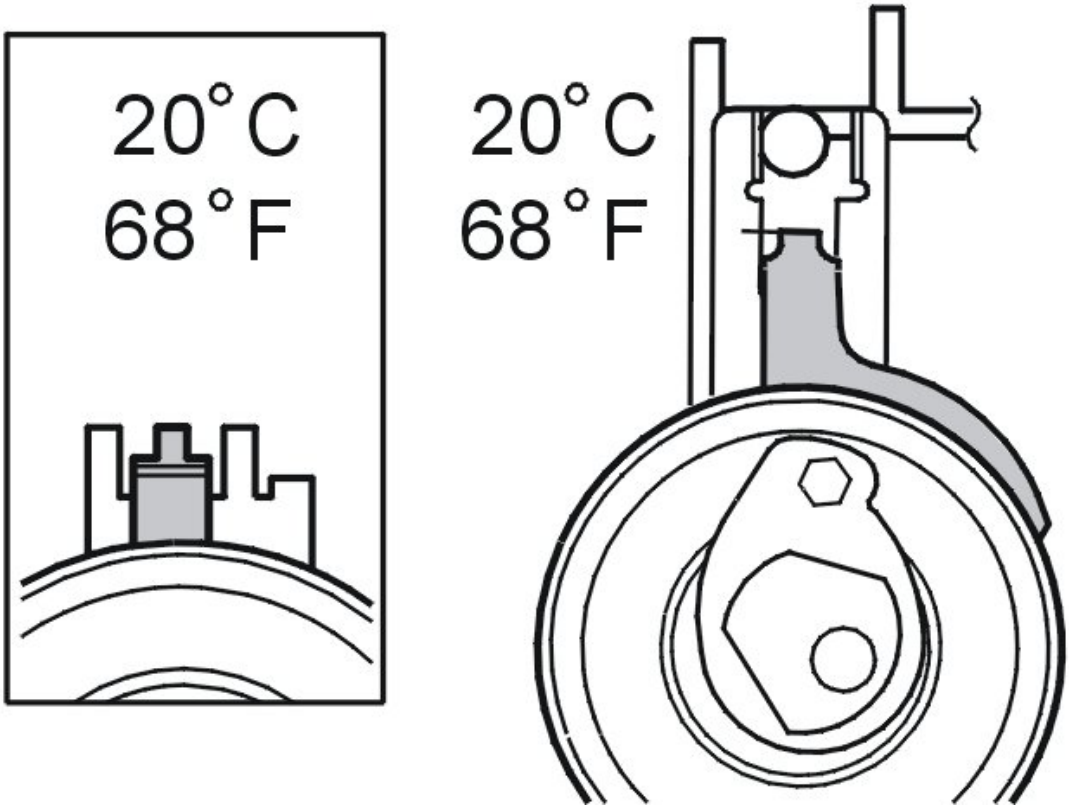
Fix the belt tensioner center screw in position and turn the belt tensioner eccentric clockwise until the tensioner indicator passes the marked position and reaches the end position. Then turn the eccentric back so the indicator reaches the marked position illustrated. Tighten the center screw. See Tightening torque See: Specifications/Tightening Torque.
Check that the indicator is in the correct position.

Tightening



Slacken off the 3 x screws for the timing gear pulley slightly (applies to both timing gear pulleys).
Install the center plug in the variable valve timing unit. Tighten. See: Tightening torque See: Specifications/Tightening Torque.
Hold the center plug at 25 Nm at the same time as tightening the 3 x screws on the camshaft timing gear pulley to: Tightening torque See: Specifications/Tightening Torque.
Tighten the 3 x screws on the timing gear pulley for the intake camshaft. See: Tightening torque See: Specifications/Tightening Torque. This is to ensure that the variable valve timing (VVT) unit is in its end position when the timing gear pulley is tightened.

Final check



Remove:

- 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool from the rear of the camshafts
- 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Install new plugs with new sealing washers. Tighten. See: Tightening torque See: Specifications/Tightening Torque.

Checking the markings and belt tension.

Position the upper timing cover.

Turn the crankshaft 2 rotations. Check that the markings on the crankshaft and timing gear pulleys correspond.

Remove the upper timing cover.

Variable Valve Timing Actuator: Adjustments

Variable valve timing unit, checking and adjusting

Special tools:

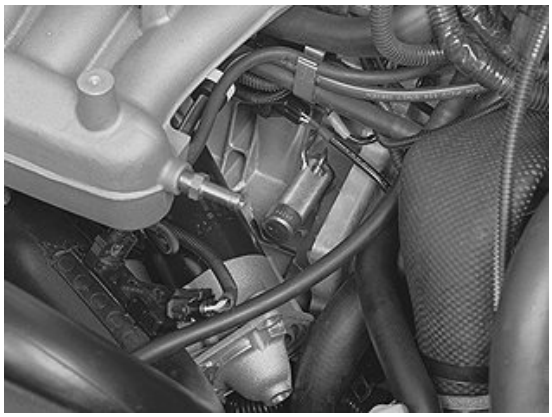
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Installing and adjusting the variable valve timing unit/timing gear pulley on the camshaft

Note! This procedure must be carried out with precision as any deviation could generate a fault symptom.

Installing the crankshaft adjustment tool

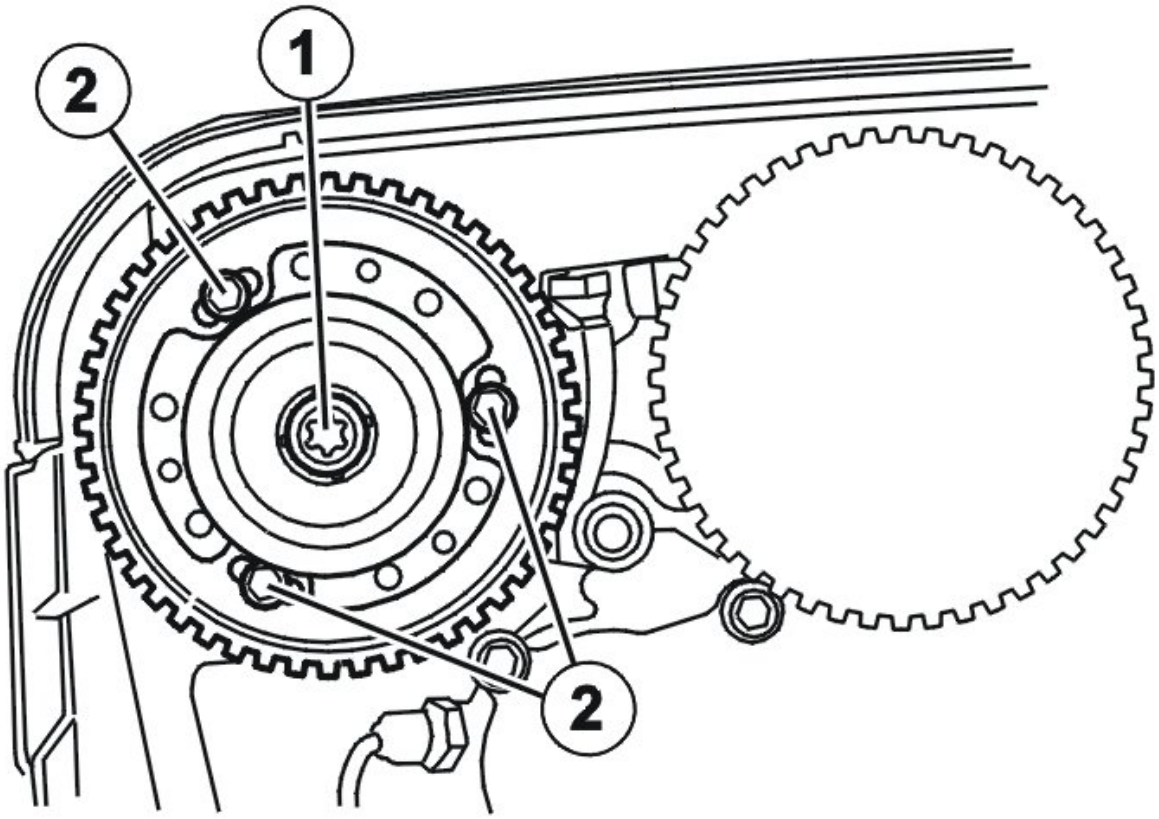


Remove the mounting screws for the starter motor.
Pull out the starter motor and place it to one side.
Remove the blind cover plug from the hole for the adjustment tool.
Turn the crankshaft clockwise slightly.
Install: 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Ensure that the tool bottoms out against the cylinder block.

Aligning the crankshaft

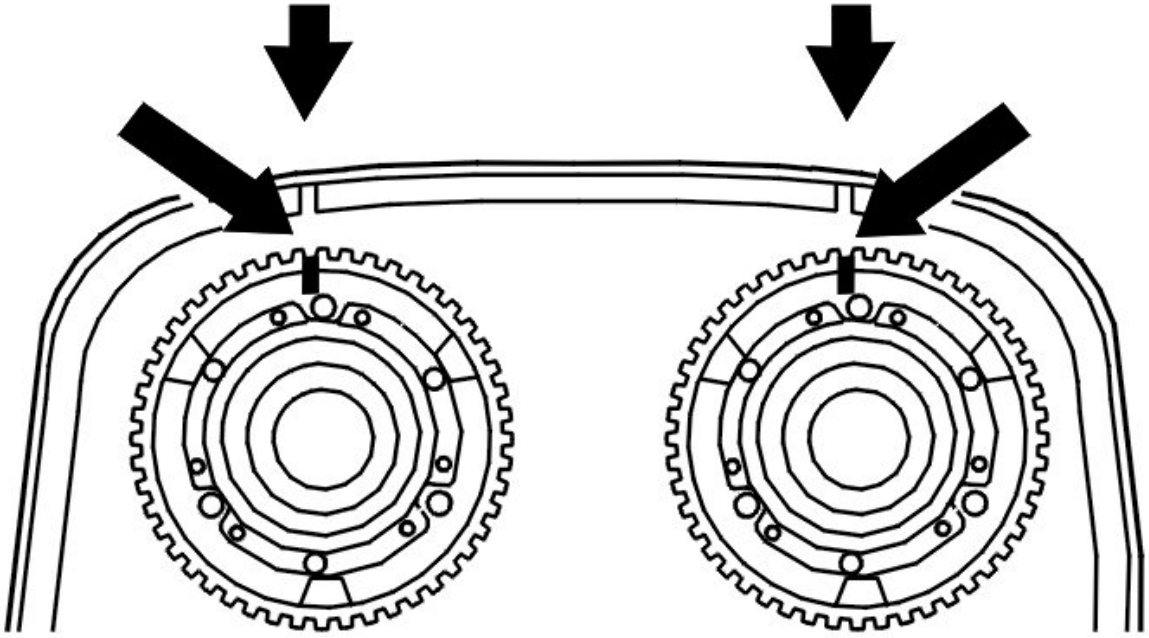
Turn the crankshaft counter-clockwise until it stops against the adjustment tool.
Check that the marking on the crankshaft timing gear pulley corresponds to the marking on the oil pump.

Installing the variable valve timing unit on the camshaft



Note! Oil the center screw before installation

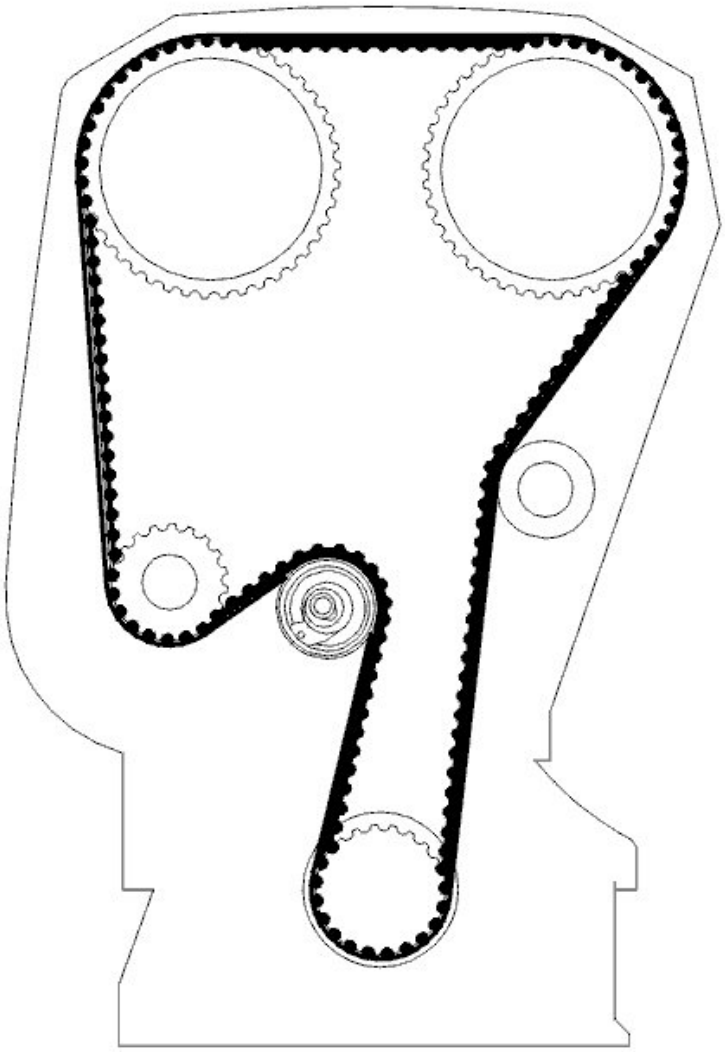
Push on the variable valve timing unit/timing gear pulley on the camshaft.
Install the center screw (1) which secures the variable valve timing unit to the camshaft. Tighten slightly.
Slacken off, but do not remove the screws (2) which secure the timing gear pulley to the variable valve timing unit.
Turn the timing gear pulley until the screws at the oval holes are in the center position. Tighten the screws (2) slightly.
Turn the variable valve timing unit clockwise to its limit position so that the unit is in its end position.
Position the upper timing cover



Undo the center screw and continue turning clockwise until the timing gear pulley marking aligns with the marking on the upper timing cover.

Tighten the center screw in the variable valve timing unit. Tighten. See: Tightening torque See: Specifications/Tightening Torque.

Installing the timing belt

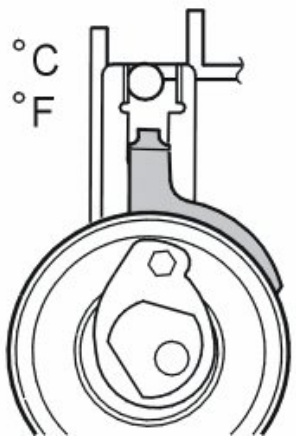


Note! Variable valve timing units do not have return springs and are easily thrown out of position when the camshaft belt is installed. Check that the markings align.

Install the belt in the following order:

- the idler pulley
- intake cam
- exhaust cam
- water pump
- tension pulley.

Tensioning of cambelt

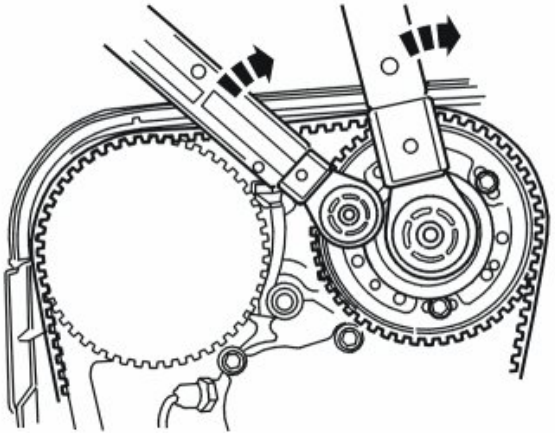


This adjustment is to be made with a cold engine.
A suitable temperature is approximately 20 °C/68 °F.
At a higher temperature, for example with a warm engine or a higher ambient temperature, the needle is further to the right.
The illustration shows the position of the indicator when aligning the timing belt tensioner at approximately 20 °C/68 °F.

Note! There are two different tensioners depending on model year.

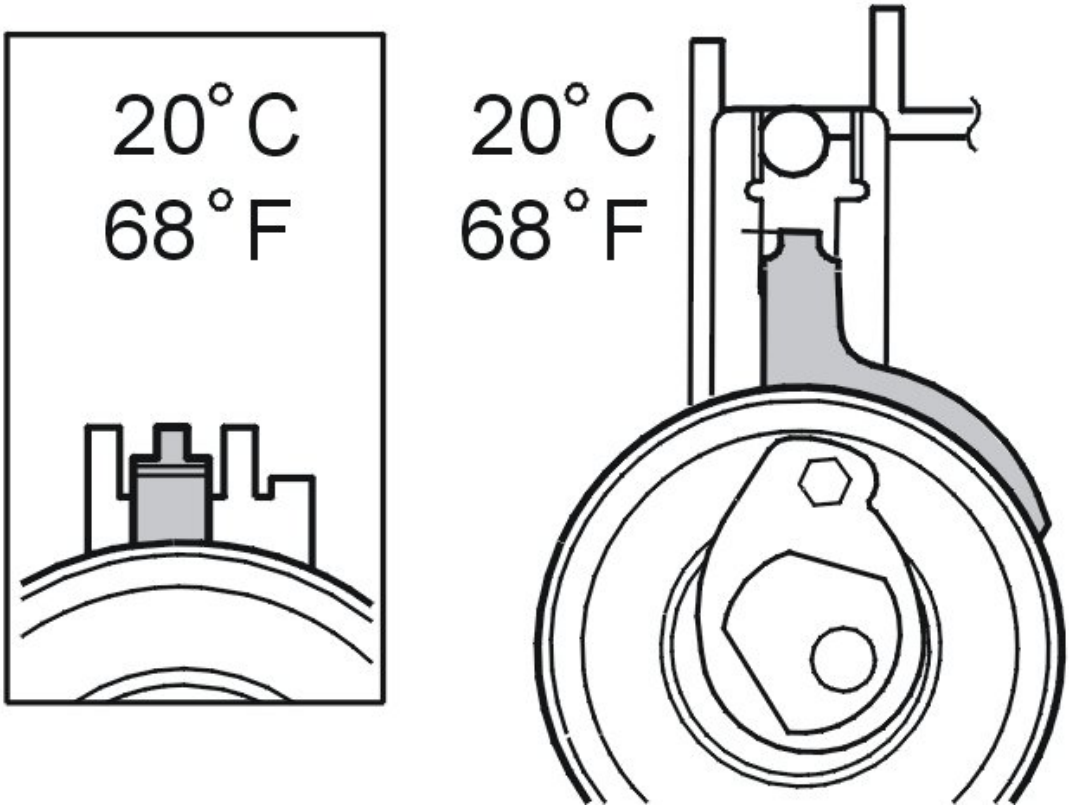
Fix the belt tensioner center screw in position and turn the belt tensioner eccentric clockwise until the tensioner indicator passes the marked position and reaches the end position. Then turn the eccentric back so the indicator reaches the marked position illustrated. Tighten the center screw. See Tightening torque See: Specifications/Tightening Torque.
Check that the indicator is in the correct position.

Tightening



Slacken off the 3 x screws for the timing gear pulley slightly (applies to both timing gear pulleys).
Install the center plug in the variable valve timing unit. Tighten. See: Tightening torque See: Specifications/Tightening Torque.
Hold the center plug at 25 Nm at the same time as tightening the 3 x screws on the camshaft timing gear pulley to: Tightening torque See: Specifications/Tightening Torque.
Tighten the 3 x screws on the timing gear pulley for the intake camshaft. See: Tightening torque See: Specifications/Tightening Torque. This is to ensure that the variable valve timing (VVT) unit is in its end position when the timing gear pulley is tightened.

Final check



Remove:

- 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool from the rear of the camshafts
- 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Install new plugs with new sealing washers. Tighten. See: Tightening torque See: Specifications/Tightening Torque.

Checking the markings and belt tension.

Position the upper timing cover.

Turn the crankshaft 2 rotations. Check that the markings on the crankshaft and timing gear pulleys correspond.

Remove the upper timing cover.

Variable Valve Timing Actuator: Service and Repair
Camshaft Seal/Variable Valve Timing (VVT) Unit, Replacing

Camshaft seal/variable valve timing (VVT) unit, replacing

Special tools:

999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool
999 5651 Extractor See: Tools and Equipment/999 5651 Extractor
999 5719 Drift See: Tools and Equipment/999 5719 Drift

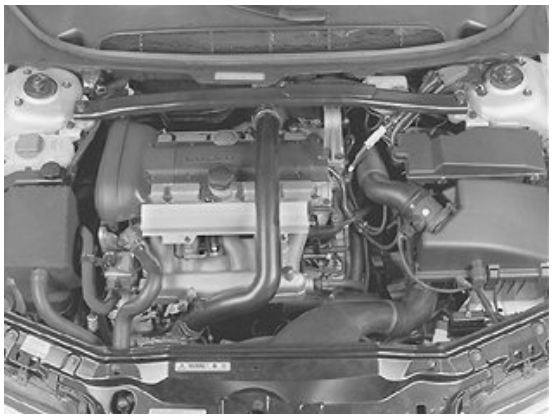
999 5474 RADIATOR PROTECTION See: Tools and Equipment/999 5474 Radiator Protection
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5919 PULLER See: Tools and Equipment/999 5919 Puller
999 5450 PUNCH See: Tools and Equipment/999 5450 Punch

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removal

Caution! There are a number of versions of the variable valve timing unit. Therefore it is extremely important to always read the information referring to the engine variant/model year to be remedied.

Removing the camshaft seal



Note! Crankshaft and camshafts must not be turned more than is stated in the method description! If the shafts are turned in any other way the valves may be damaged.

Remove:

- the cable from the battery negative terminal.

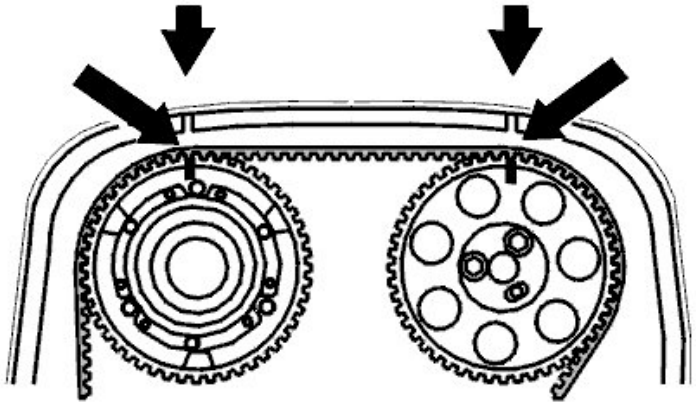
First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

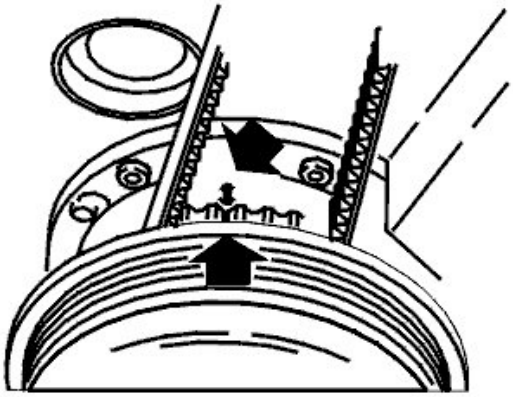
- the cross stay between the suspension turrets
- the air intake hose for the turbocharger (TC) from the air cleaner (ACL) cover. Put to one side
- the upper timing belt cover
- the cover over the ignition coils
- the upper engine stabilizer brace
- the camshaft position (CMP) sensor housing
- the trigger wheel
- the servo reservoir and the expansion tank. Lift up and place on top of the engine.

Warning! Ensure that no power steering fluid is spilled. Extremely flammable.

- the auxiliaries belt
- the front timing belt cover.

Aligning the engine according to the marking





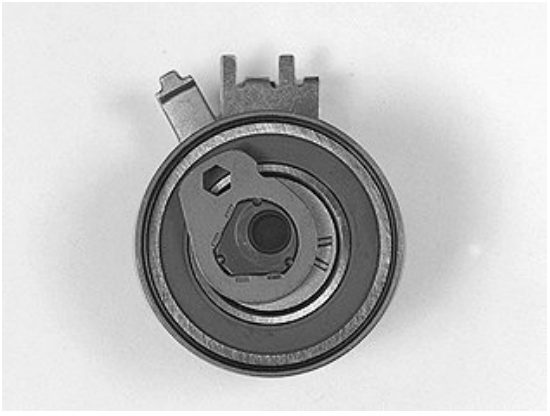
Raise the car.

Remove:

- the right front wheel
- the nuts for the cover in the wing liner.

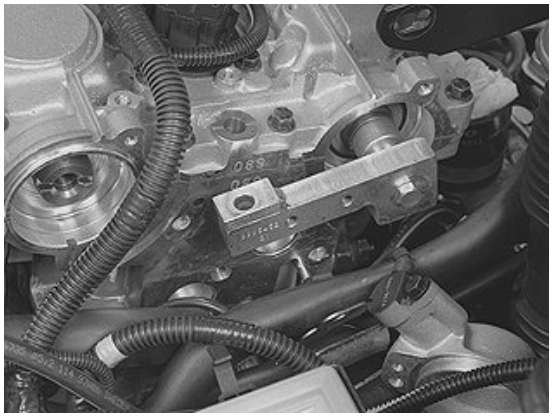
Install the upper timing belt cover.
Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulley correspond.
Turn the crankshaft a further 1/4 of a turn clockwise, then turn back counter-clockwise until the markings correspond.
The markings are illustrated.
Remove the upper timing belt cover.

Removing the timing belt



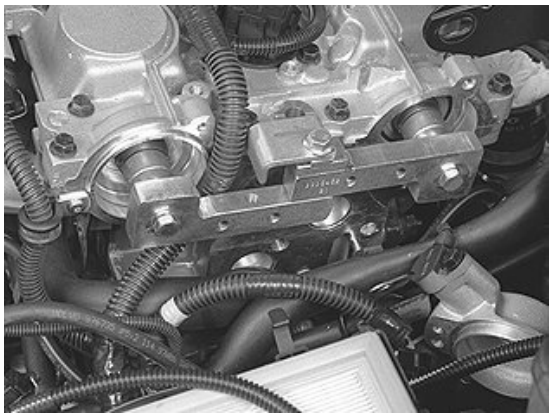
- Slacken off the belt tensioner
- Slacken off the centre screw for the belt tensioner slightly
- Hold the centre screw still. Turn the tensioner eccentric clockwise to 10 o'clock using a 6 mm Allen key
- Remove the timing belt from the camshaft pulleys.

Removing the timing gear pulley with the variable valve timing unit



Use camshaft adjustment tool:

- Install camshaft adjustment tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.
- First screw in the part of the tool intended for the exhaust camshaft (drilled hole)
- Then carefully turn the exhaust camshaft clockwise with the camshaft adjustment tool until the intake camshaft tool can be applied (threaded hole)
- Install the intake camshaft adjustment tool.



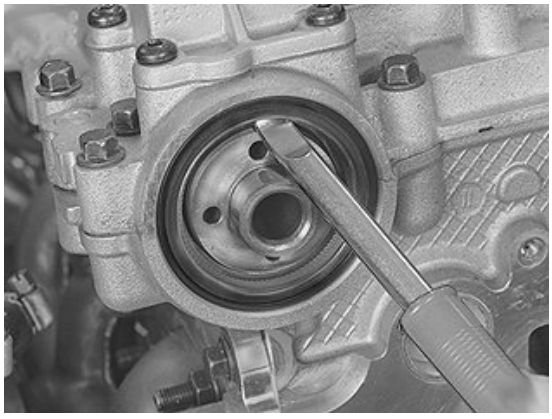
Screw the camshaft adjustment tools together.

Remove:

- the plug at the front edge of the variable valve timing unit (TORX 55)
- the centre screw in the variable valve timing unit (TORX 55). Carefully pull out the timing gear pulley with the variable valve timing (VVT) unit.

Note! Use paper to collect any spilled oil under the variable valve timing units.

Replacing the camshaft seal



Carefully press in tool 999 5651 Extractor See: Tools and Equipment/999 5651 Extractor between the sealing ring and the camshaft. Carefully pry out the seal.

Cleaning

To clean the shaft journal and mating surface, use emery cloth P/N 951 1024.

Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

Lubricate the new seal. Install the new seal for the exhaust camshaft. Use drift 999 5718 Drift See: Tools and Equipment/999 5718 Drift.

Installation

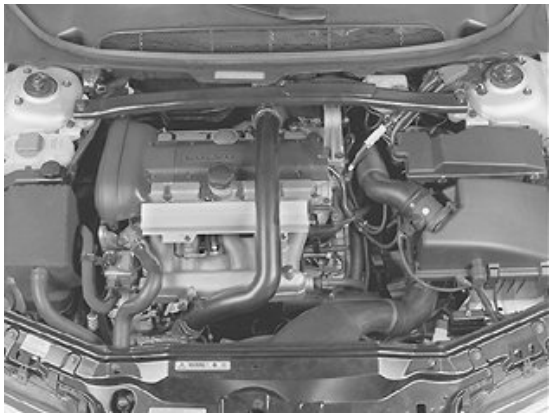
Checking and adjusting the variable valve timing unit

Check and adjust the variable valve timing unit.

Installing components

Install:
- the front timing belt cover.
- the torque rod bracket
- the cover over the ignition coils
- the upper timing belt cover
- the auxiliaries belt
- the expansion tank
- the servo reservoir. Check that the hoses are correctly positioned

- the starter motor. Tighten the screws at the gearbox to **40 Nm**. Tighten the support bracket screw to **25 Nm**
- the charge air pipe between the throttle body (TB) and the charge air cooler (CAC).



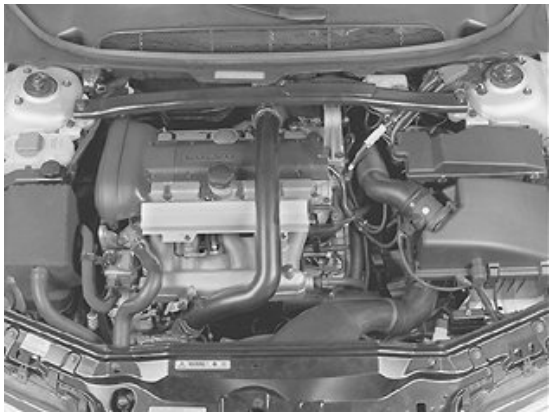
Install:

- the trigger wheel
- the camshaft position (CMP) sensor housing and a new cover
- the intake air hose between the turbocharger (TC) and the air cleaner (ACL) cover
- the engine stabilizer brace. Tighten the screws at the suspension turrets and the screw for motor bracket
- the negative battery cable. **First read** Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Checking the engine

Test drive the car to check the function of the engine.

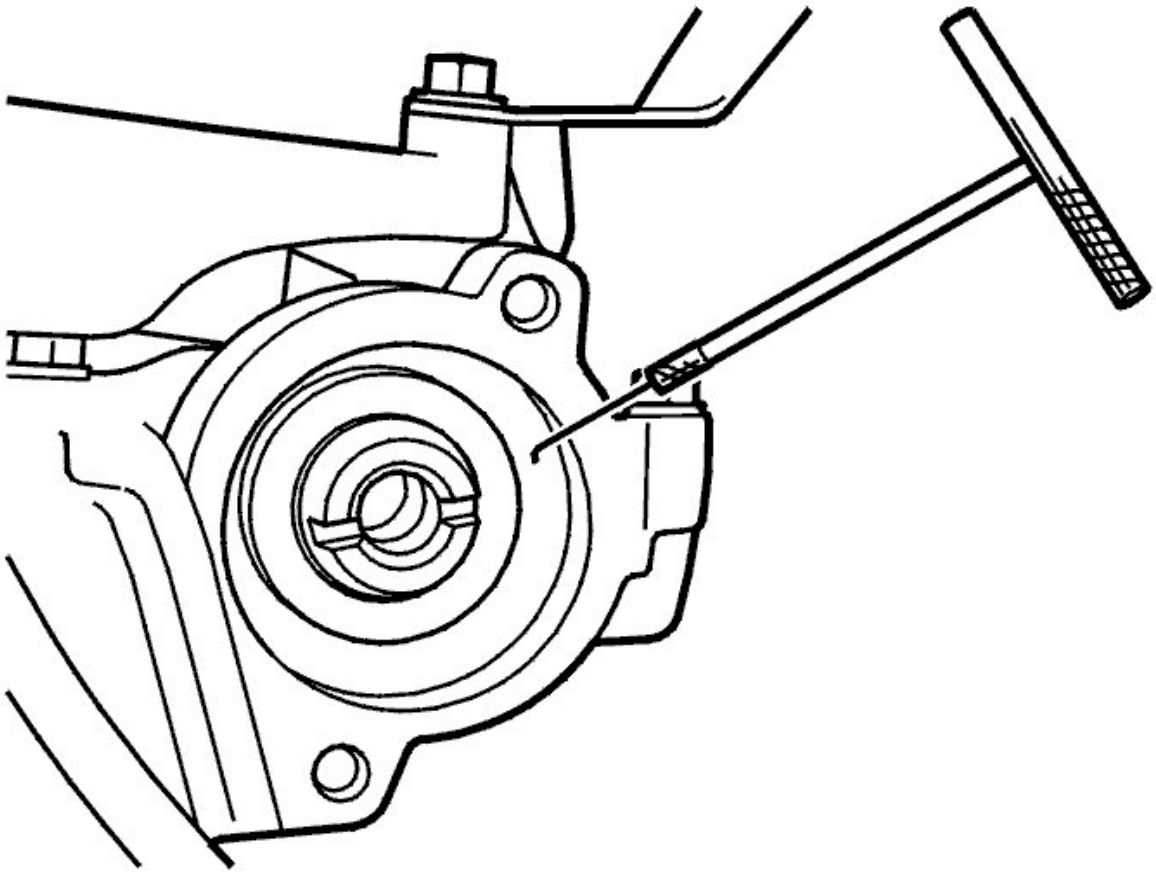
Replacing the rear seal



The following components must be removed when replacing the rear seal:

- the cross stay between the suspension turrets
- the air hose from the air cleaner (ACL) to the turbocharger (TC). Place to one side. Seal the openings
- place the air cleaner (ACL) cover to one side
- the charge air pipe over the engine. Seal the openings
- the cover over the ignition coils
- the upper torque rod bracket
- the camshaft position sensor (CMP) housing and trigger wheel.

Replacing the rear camshaft seal



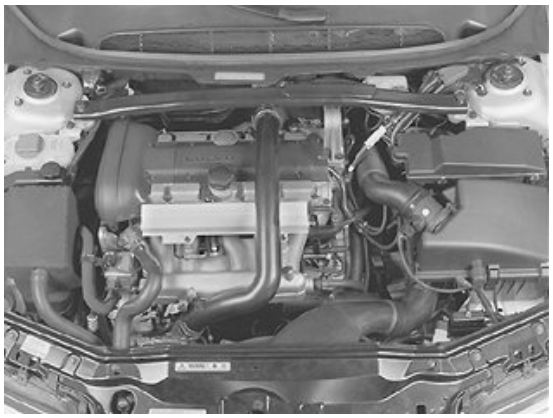
Pull out the seal. Use puller 999 5919 PULLER See: Tools and Equipment/999 5919 Puller. Use emery cloth 951 1024 to clean the shaft journal and mating surface.

Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

Lubricate the surface of the seal that the camshaft rotates against. Install the camshaft seal. Use drift 999 5450 PUNCH See: Tools and Equipment/999 5450 Punch.

Note! The seal is normally pressed in so that it is level with the internal bevelled edge.If the shaft journal is showing signs of wear, the seal can be pressed in 2 mm deeper by turning the drift socket.

Installing components



Install:

- the trigger wheel
- the camshaft position (CMP) sensor housing and a new cover
- the torque rod bracket. Tighten
- the cover over the ignition coils
- the charge air pipe over the engine. Remove the seals
- the air cleaner (ACL) cover and the intake air hose
- the engine stabilizer brace. Tighten the screws at the suspension turrets and the screw for motor bracket

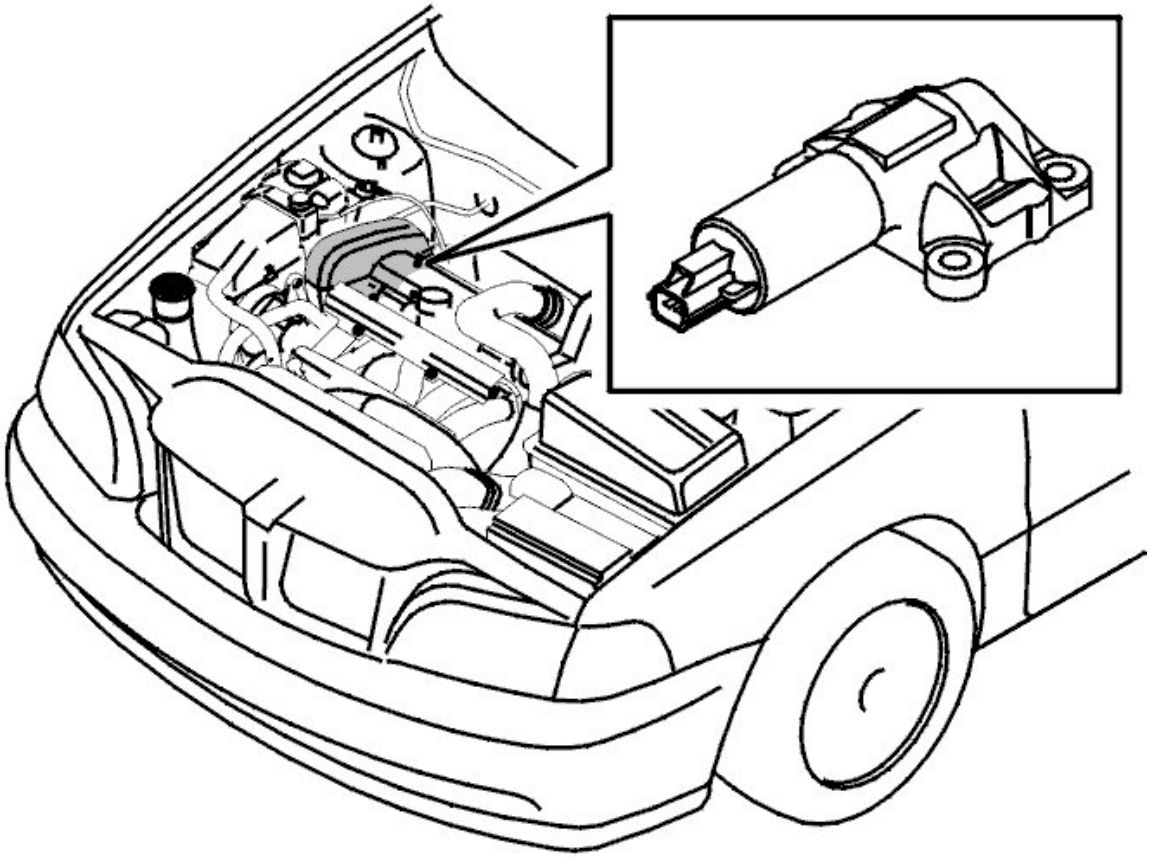
Check the engine compartment. Wipe the engine compartment clean.

Variable Valve Timing Actuator: Service and Repair
Variable Valve Timing Solenoid, Replacing

Variable valve timing solenoid, replacing

All models

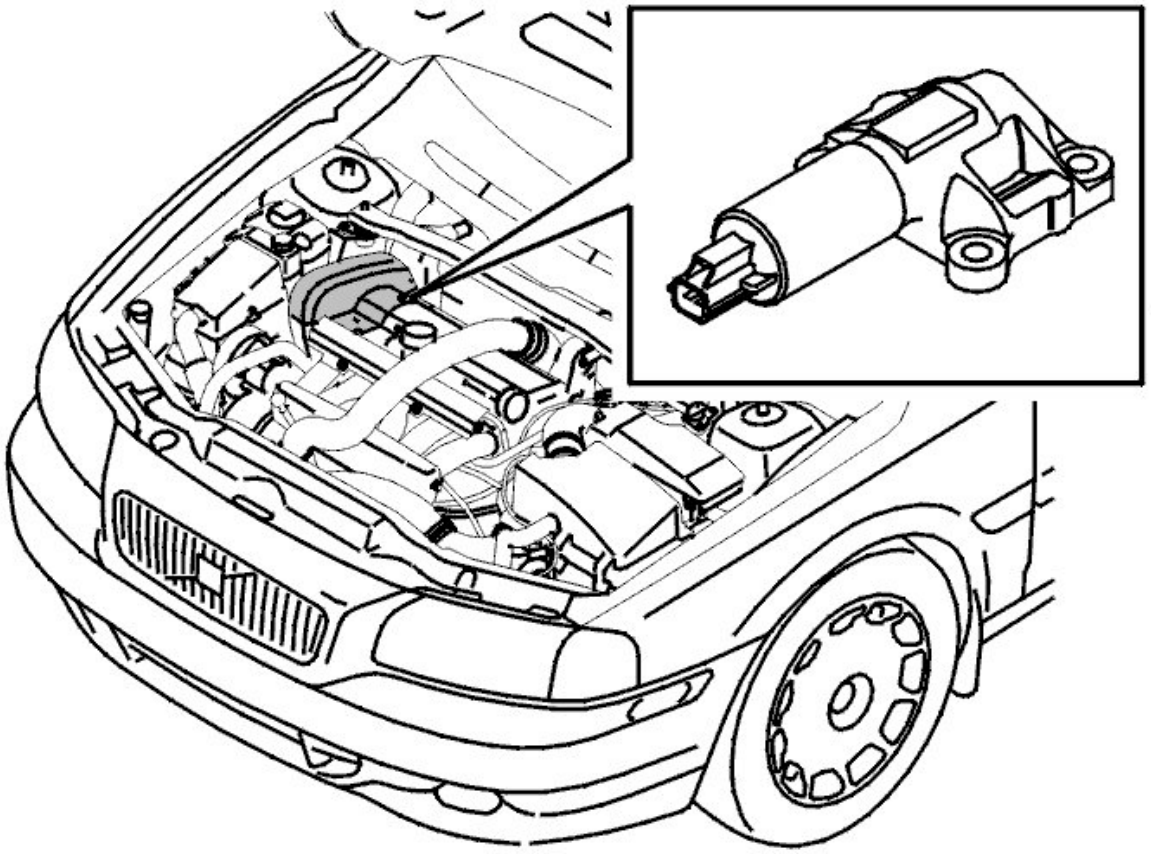
Removing the variable valve timing (VVT) control valve



Remove

- the upper timing belt cover.

Note! Clean the area around the variable valve timing (VVT) valve thoroughly to prevent anything else than clean oil from entering the channels/ variable valve timing (VVT) valve.



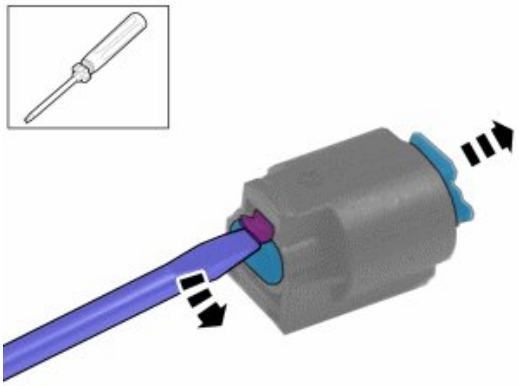
- the connector for the check valve
- the screws holding the valve
- the control valve and the gasket.

Applies to B5244Sx model years 1999-2001

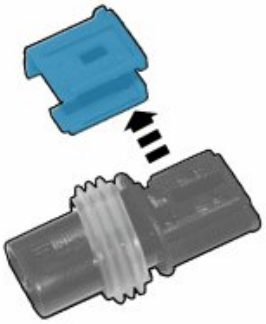
A modified VVT-solenoid is now available as spare part for **B5244Sx model years 1999-2001**. This means that the connector on the cable must be replaced. Note! Note the position of the electric connections. Cut the cables next to the connector.

Note! Note the position of the electric connections.

Cut the cables next to the connector.



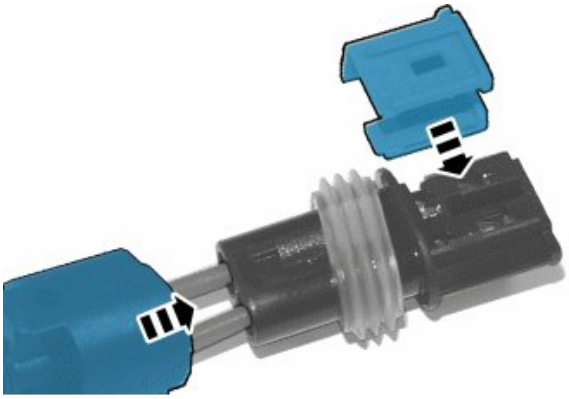
Press up the lock tab and pull out the seat for the connector pins from the casing.



Remove the lock

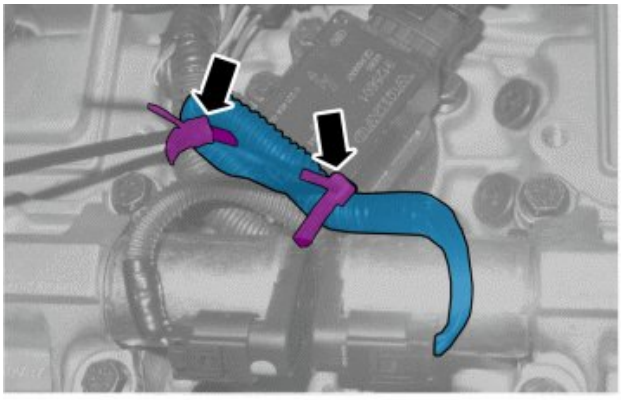
Caution! Make sure that the connector pins end up in the correct position.

Install the connector pins in the seat so that the locks on the pin end up in the opening on the side of the seat.



Install the catch.
Install the casing.

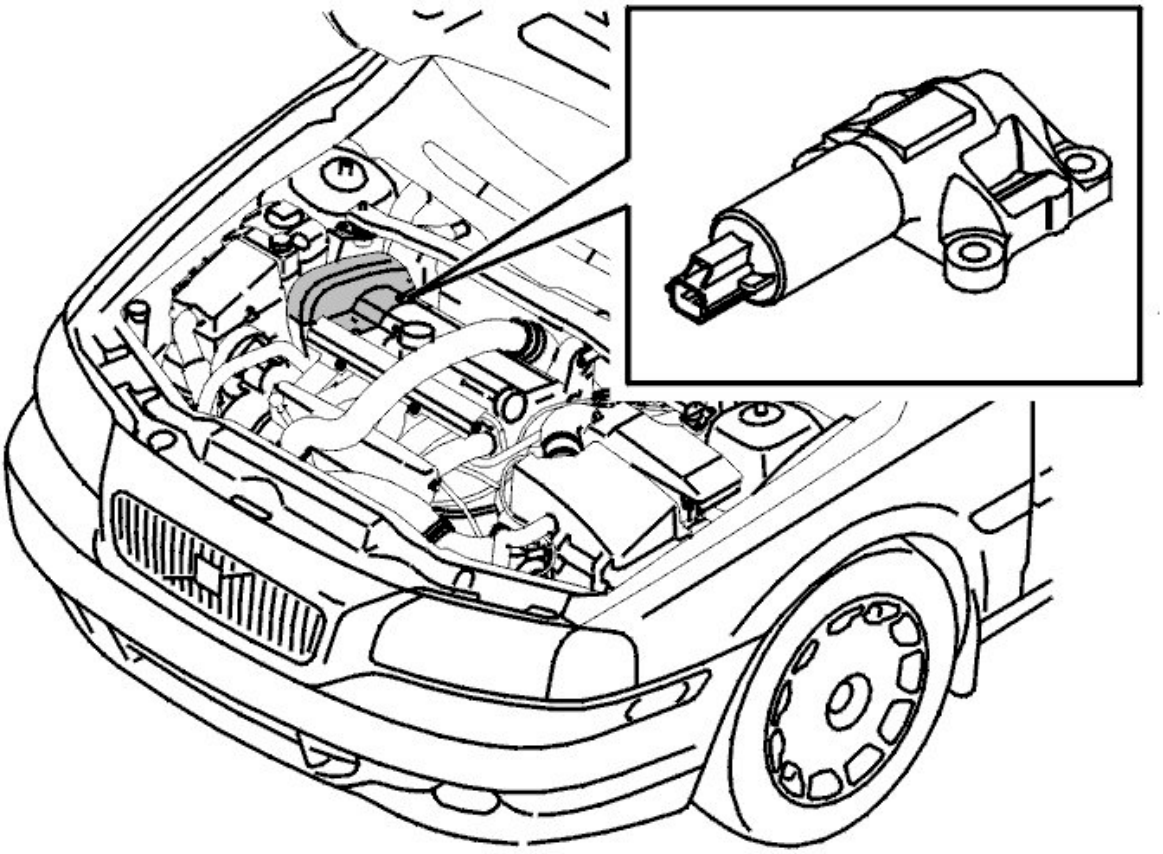
Splice the cables. Refer to: Joining the cables See: Cooling System/Coolant Level Sensor/Diagrams/Diagnostic Aids/Wiring/Joining the Cables



Caution! Make sure that the cable cannot enter the timing gears by clamping any excess cable with cable ties.

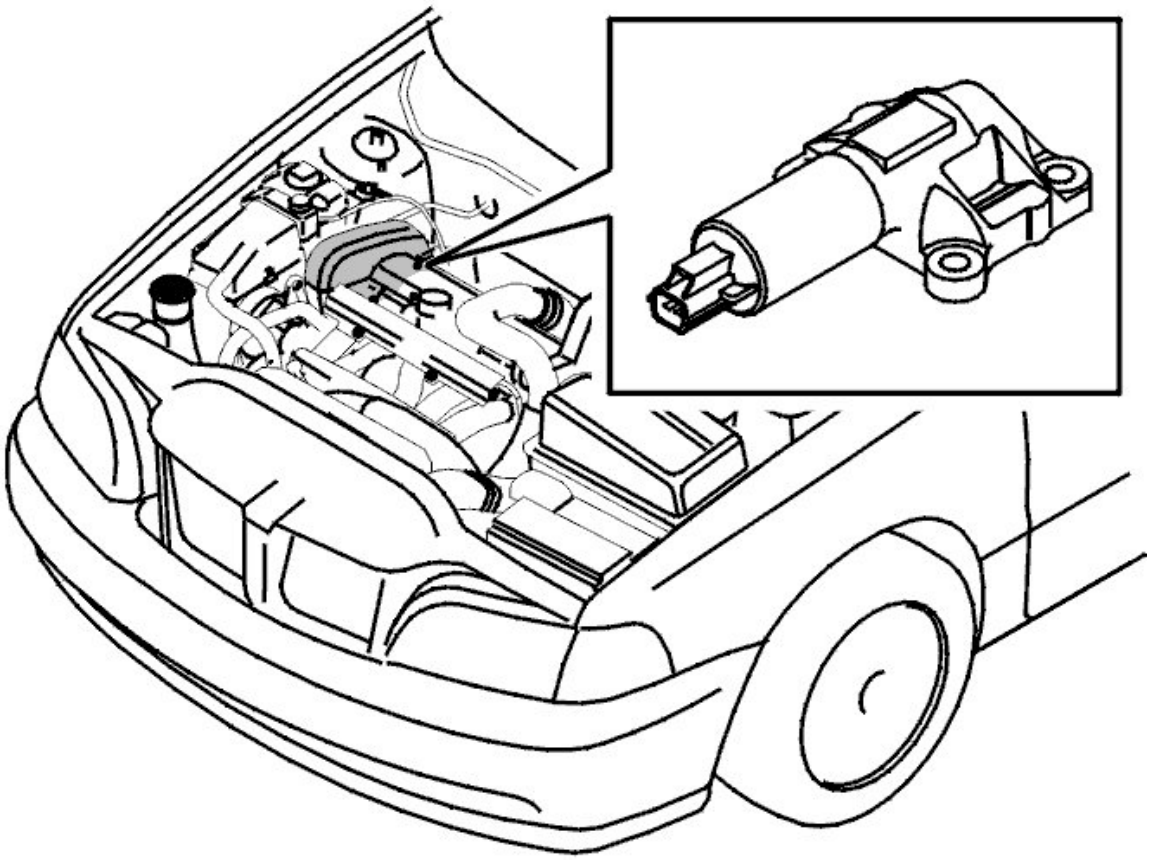
Applies to all: Installing VVT-control valve

Clean the gasket faces. Note the cleanliness requirements above.



Install a **new gasket**.
Install a new control valve. Tighten the control valve crosswise. Tighten to **10 Nm**

Connect the connector.



Install the upper timing belt cover.

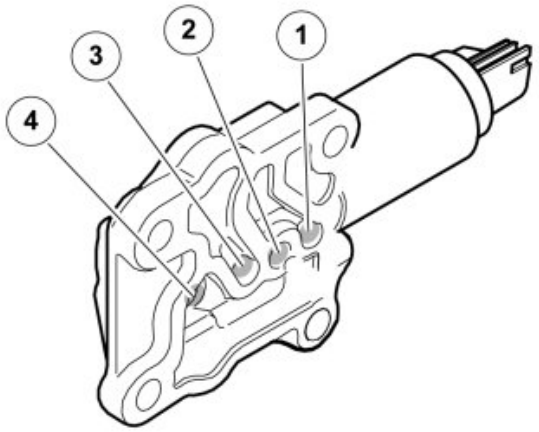
Variable Valve Timing Solenoid: Procedures

VVT Solenoid, Cleaning

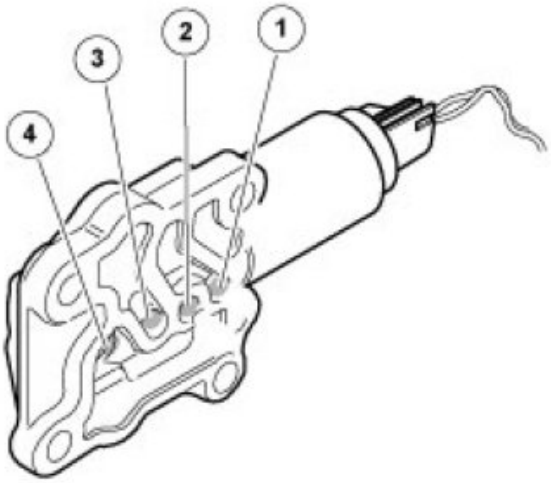
VVT solenoid, cleaning

Note! Some variation in the illustrations may occur, but the essential information is always correct.

Check

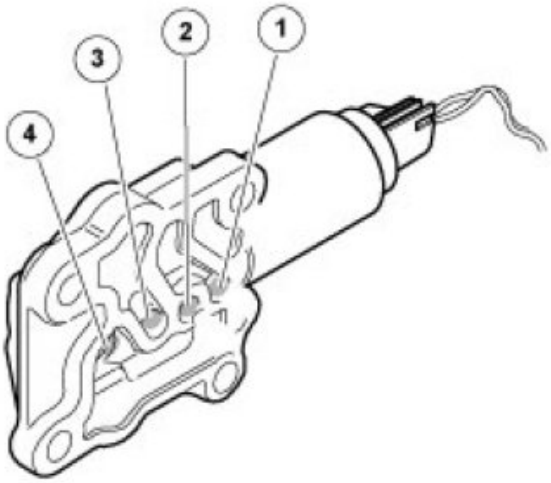


Remove the VVT solenoid.
Blow compressed air into the oil feed hole (2). Air should come out through the B port (1)
If the duct seems to be blocked, go to the cleaning step.



Connect current to the solenoid.
The solenoid should click. It may be easier to hear the click with the solenoid in your hand.
Blow compressed air into the oil feed hole (2). Air should come out through the A port (3). If the piston jams or the solenoid does not work, the direction of flow will not change. If the duct seems to be blocked, go to the cleaning step.

Cleaning



Use: cleaner, 1161826 (1161828 US)
Allow to act for 5 minutes.
Blow compressed air into all holes from both directions and look for contamination. Carry this out with current on and off to ensure that no dirt remains in the ducts.
Rinse with cleaning agent.
Use: cleaning agent, 1161721.
Blow again.
Lubricate the solenoid with engine oil to prevent it jamming.
After cleaning, check the function by repeating steps 1 and 2 again. If the solenoid still does not work after cleaning twice, replace the solenoid.

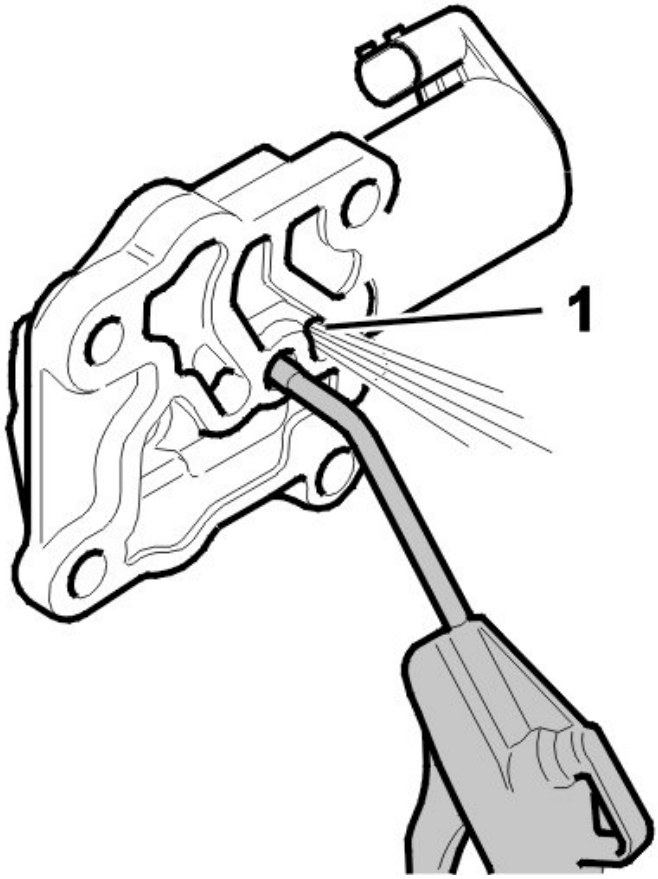
Test driving and checking

Erase Diagnostic Trouble Codes (DTCs).
Test drive the car.
Check that no new DTCs have been stored.

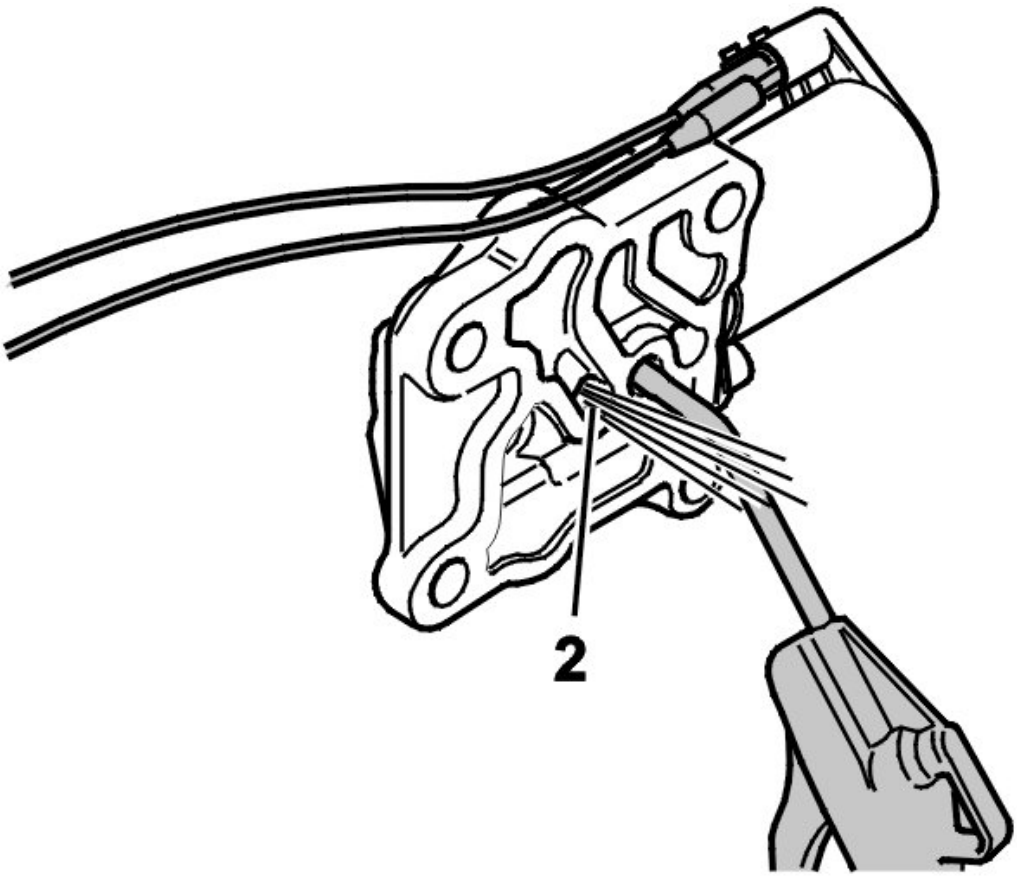
VVT Solenoid, Inspection and Cleaning

VVT solenoid, inspection and cleaning

Inspection

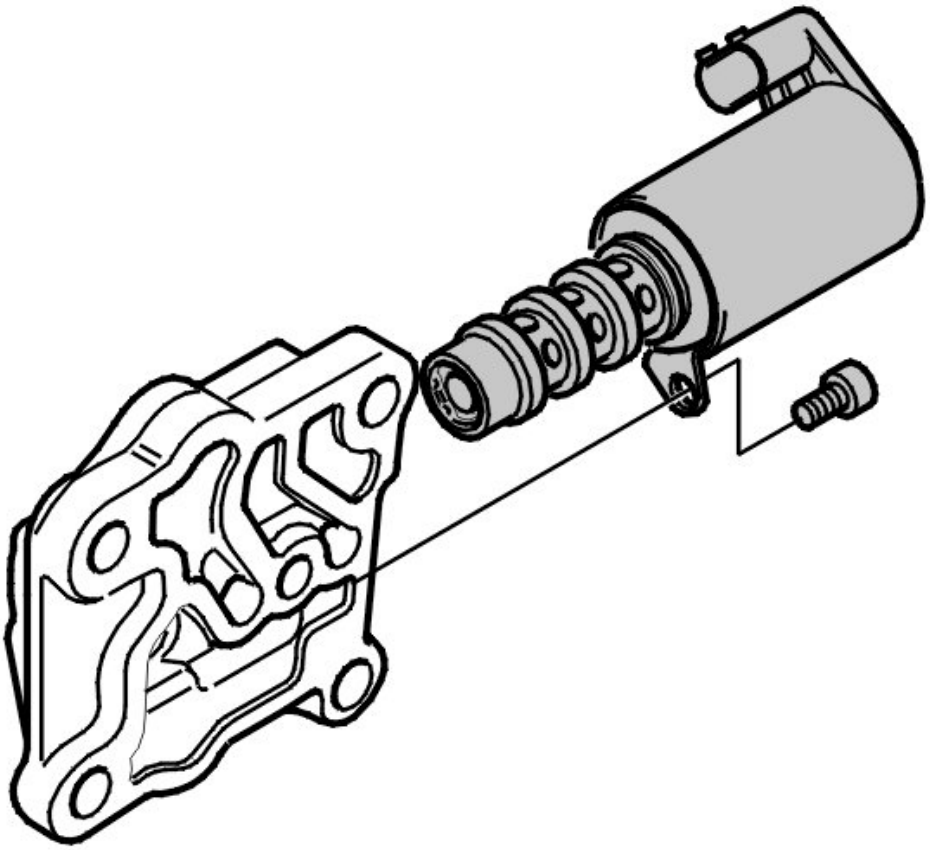


Remove VVT solenoid from camshaft cover.
Blow through center hole with compressed air.
Air should emerge from inner hole (1) nearest coil.

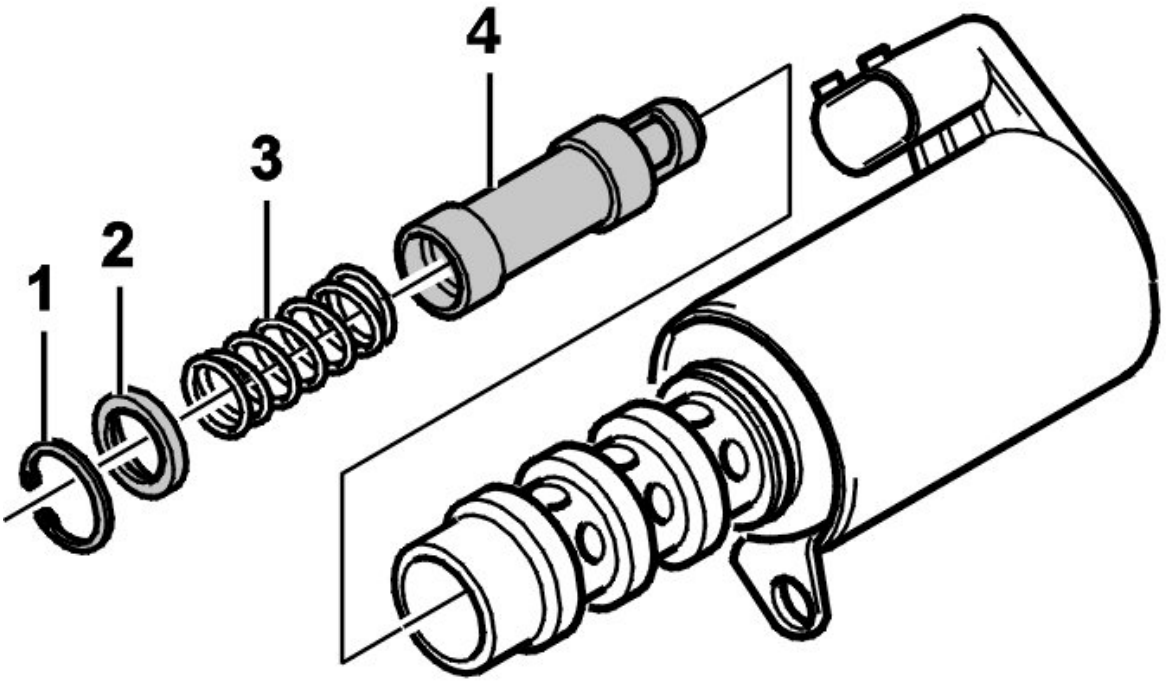


Connect power to solenoid. Solenoid should click.
Blow through center hole with compressed air.
Air should emerge from outer hole (2).
If plunger is sticking or solenoid fails to operate electrically, the direction of flow will be unchanged from step 1.

VVT solenoid, cleaning



Remove solenoid from aluminum housing.



Remove:

- snap ring (1)
- washer (2), spring (3) and plunger (4).

Inspect and clean all parts.
Blow out aluminum housing.
Oil parts with engine oil.
Reassemble solenoid.

Check operation as described in operations 1 and 2.
Reinstall solenoid in car using new seal.

Testing

Erase diagnostic trouble codes.
Test-drive car.
Check that no new diagnostic trouble codes are displayed.
If new codes are displayed, continue troubleshooting as per VIDA.

Compression Check: Testing and Inspection
Compression Test

Compression test

Special tools:

999 9689 COMPRESSION METER See: Tools and Equipment/999 9689 Compression Meter
115 8540 EXTENSION See: Tools and Equipment/115 8540 Extension

Ignition system

A check for cylinder leakage (also called "leak down") can be carried out instead of a compression test. Cylinder leakage test See: Testing and Inspection/Cylinder Leakage Test

Caution! The ignition system operates at high ignition charges and produces dangerous voltages in both the low and high voltage circuits. There is dangerous voltage throughout the entire ignition system including connectors etc.

Conditions

Note! The engine compression must always be checked with wide open throttle (WOT) and engine at operating temperature.

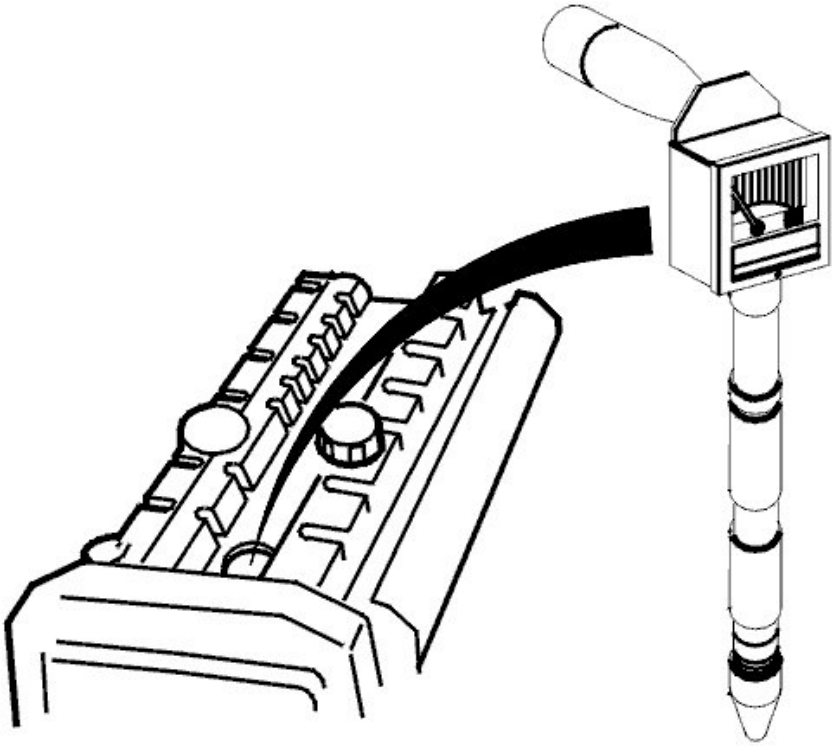
Preparations

Remove:
- the charge air pipe over the engine to improve accessibility.
- the upper timing belt cover.
- the cover over the ignition coils.
- the ignition coils.

Mark up and put to one side without disconnecting the connectors.
- the spark plugs.

Note! Separate the connector for the engine speed (RPM) sensor.

Compression testing



Note! Compression testing should always be carried out at wide open throttle (WOT) and with the engine at operating temperature. Diagnostic trouble codes (DTCs) will be stored because the engine speed (RPM) sensor and (where applicable) the camshaft position (CMP) sensor have been disconnected.

Have an assistant hold the accelerator pedal (AP) depressed at wide open throttle (WOT) during the compression test.
The starter motor is activated with the ignition key.
The ignition must be switched off after each cylinder has been compression tested.

Note! It will no longer be possible to control the throttle if the ignition is on for longer than 2 minutes.The throttle function is controlled by the control module.

Use compression meter 999 9689 COMPRESSION METER See: Tools and Equipment/999 9689 Compression Meter
with extension sleeve 115 8540 EXTENSION See: Tools and Equipment/115 8540 Extension.

Engine type:	Normal value MPa:
Turbo	1.1 - 1.3
Turbo type LT	1.2 - 1.4
Normally aspirated engine	1.3 - 1.5

Install

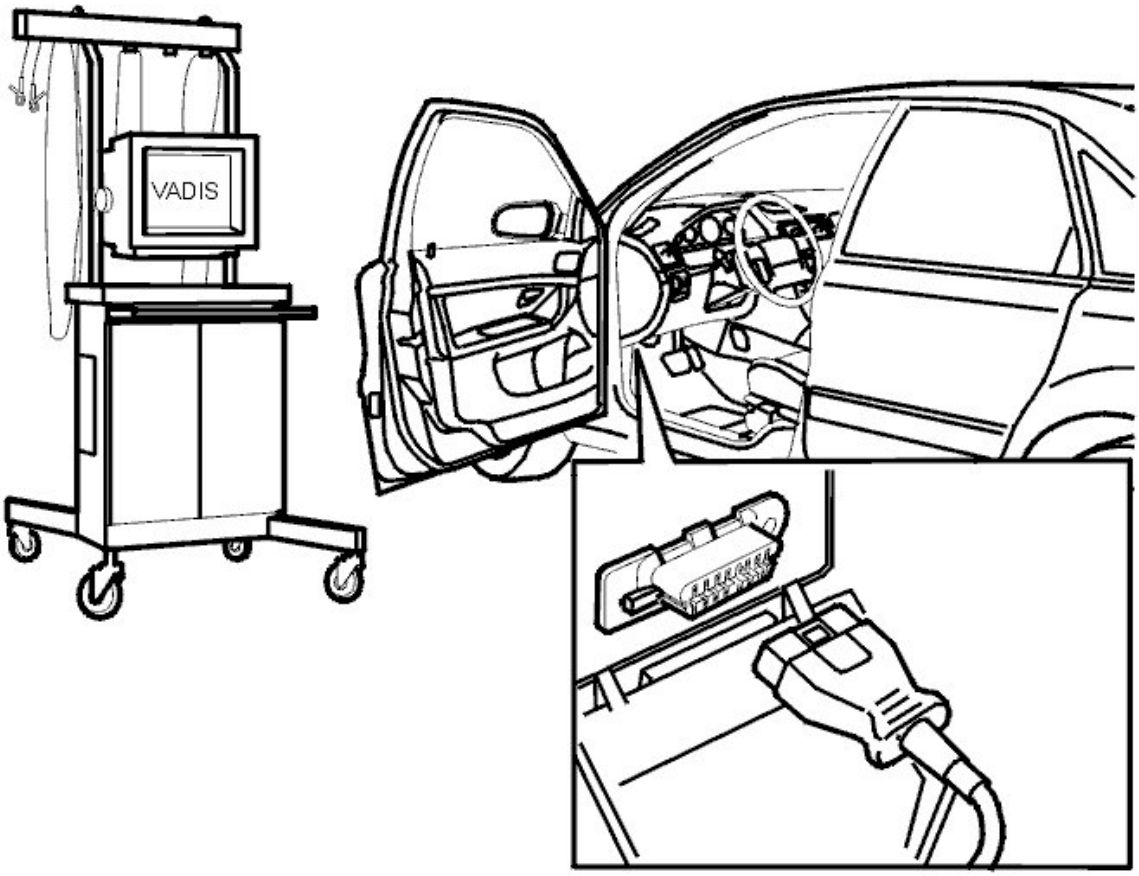
Install:
- the spark plugs.

Tighten to **25 Nm**.
- the ignition coils according to the earlier markings.

Tighten to **10 Nm**.
- the cover over the ignition coils.
- the upper timing belt cover.
- the disassembled connectors.
- charge air pipe.

Remove the seals.
Tighten the mountings and hose clamps.

Erase diagnostic trouble codes (DTCs) and check



Erase diagnostic trouble codes (DTCs):

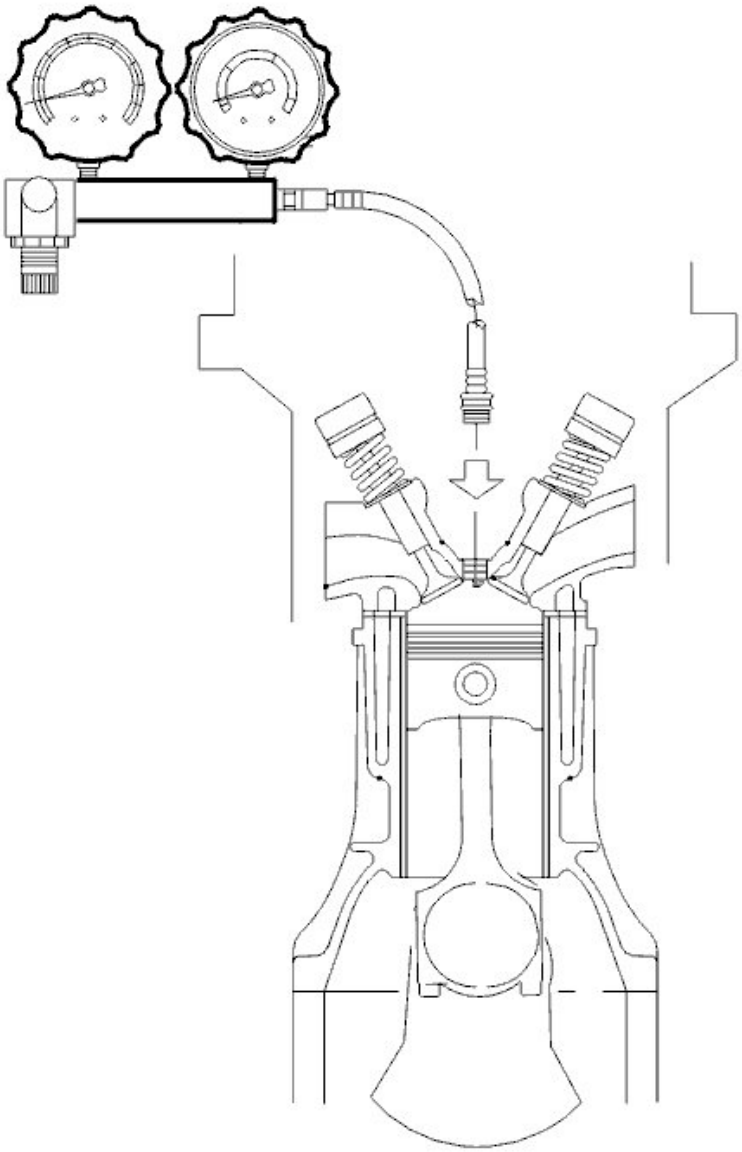
Start the engine. Check that the engine is functioning normally.
Use VIDA vehicle communication to check which diagnostic trouble codes (DTCs) have been stored.
Erase the diagnostic trouble codes (DTCs).
Check the engine compartment. Wipe the engine compartment clean.

Compression Check: Testing and Inspection
Cylinder Leakage Test

Cylinder leakage test

General method description

The cylinders can be checked for leakage as an alternative to a compression test



Using this method, the amount of leakage at the engine cylinders is measured and it is possible to locate the source of any leaks.
A similar check can be performed using a compression gauge by injecting oil in the cylinder. However, this can cause a build-up of coke!
The result will not always be decisive or precise.
In addition, the VIDA station or the Volvo System Tester (VST) must always be connected afterwards to erase any diagnostic trouble codes (DTCs).

How is the cylinder checked for leakage?

- The engine should be run to operating temperature so that the thermostat is open
- The piston in the cylinder that is being checked must be set to top dead centre (TDC) at the compression phase
- A metered air pressure is connected to the relevant cylinder via an adapter that is secured in the spark plug / glow plug well
- A gauge is used to measure the size of the leakage from the cylinder.

This is a pressure sensor with a regulator and displays the size of the leak expressed as a percentage.
This allows the extent of any problem to be determined.

Fault-tracing

The source of a leak can be located by analyzing sound at the following points.

Exhaust pipe	Faulty exhaust valve
Intake manifold / throttle body (TB)	Faulty intake valve
Dip stick hole / Crankcase ventilation	Faulty piston / piston ring
Adjacent cylinder	Faulty cylinder head gasket
Radiator	Faulty cylinder head gasket / cracked cylinder wall. Also check for bubbles in the expansion tank.

A mechanic's stethoscope or a rubber hose can be used as a listening device.

Note! There is leakage at the piston rings even on a perfect engine.This is the only place where a small leak is permissible.

Check

If a leak is detected that is assumed to come from the valve system, first check that the piston in the relevant cylinder is at top dead centre (TDC). Then try to set the piston just prior to top dead centre (TDC) and redo the test.
When repeating the leak test on the same engine, there are usually variations in the results of the measurements.
This is due to changes in the engine coolant temperature (ECT) and the piston not reaching the same position as in the previous test, and is affected by the amount of oil on the piston rings at the time.

Other information

Use: 951 2775 Cylinder leak tester See: Tools and Equipment/951 2775 Cylinder Leak Tester.
For D5244TX diesel engines, use: 999 7222 Adapter See: Tools and Equipment/999 7222 Adapter.

Crankshaft: Service and Repair
Crankshaft Axial Play

Crankshaft axial play

Operation number: 21685-2

Note! Some variation in the illustrations may occur, but the essential information is always correct.

Special tools

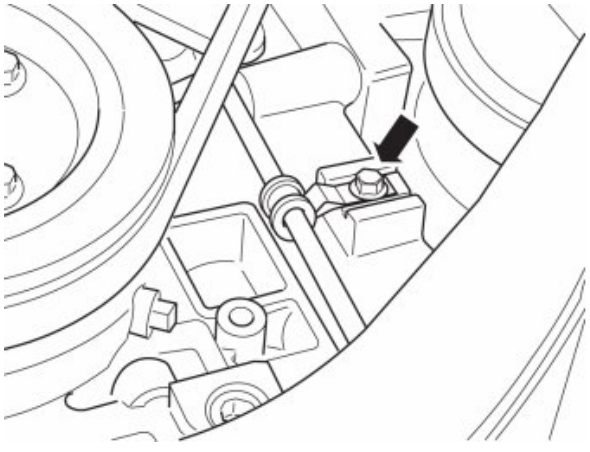
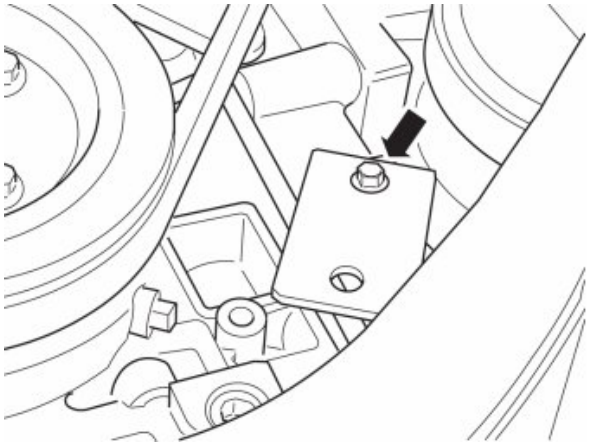
Removal

Note! Removal steps in this procedure may contain installation details.

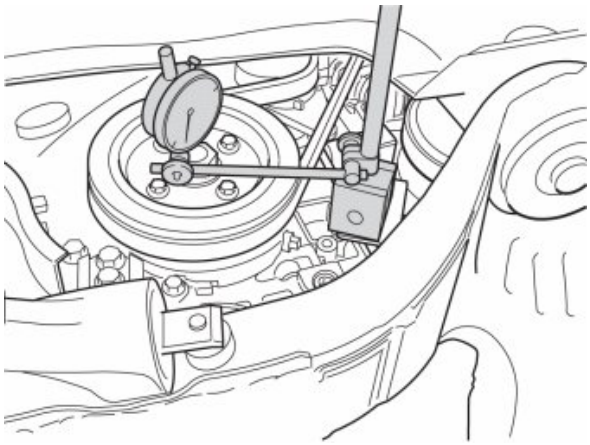
Remove the right front wheel.
When installing Refer to: Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair
Fold away the wheel arch liner and tie it up.



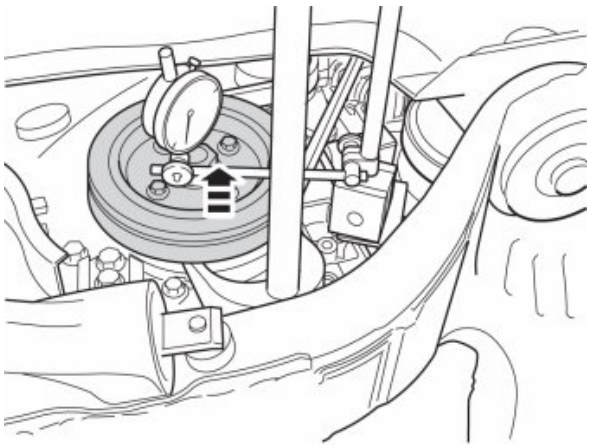
Remove the clamp screw on the fuel line. Move the clamp upward.
Torque: M7, 17 Nm



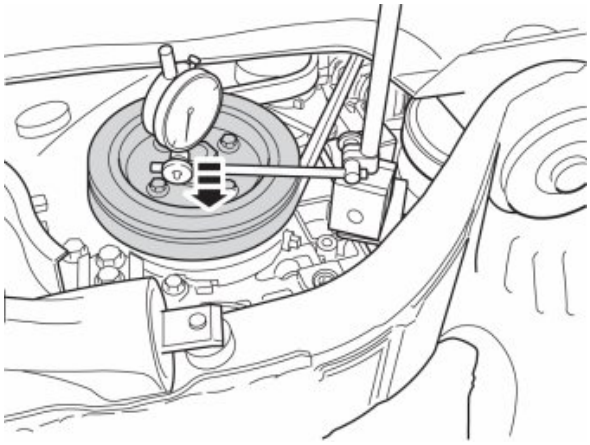
999 5971 PLATE See: Tools and Equipment/999 5971 Plate
Torque: M7, 17 Nm



999 9696 MAGNETIC BASE See: Tools and Equipment/999 9696 Magnetic Base
981 3134 DIAL INDICATOR See: Tools and Equipment/981 3134 Dial Indicator
Measure the crankshaft nut or the oscillation damper's inner ring.



Pry out the crankshaft.999 5462 Jimmy tool See: Tools and Equipment/999 5462 Jimmy Tool
Zero the dial indicator.



Push in the crankshaft. Use both hands and press hard. In the event of problems moving the crankshaft toward the gearbox, run the engine warm and use a crowbar placed between the oscillation damper and the member. Use protective blocks.
Read the dial indicator. Max permitted play 0.25 mm.
Repeat the procedure several times.

Installation

Remove the test equipment.

To install, reverse the removal procedure

Crankshaft: Service and Repair
Crank Mechanism, Dismantling

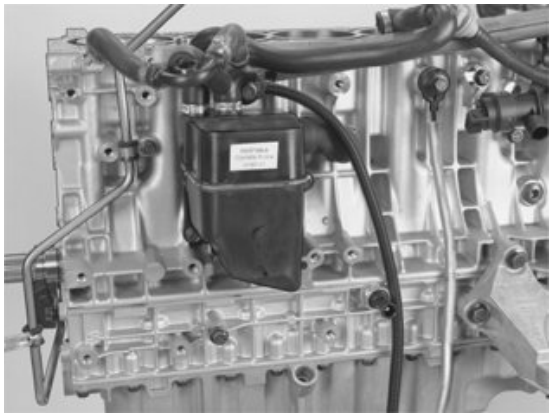
Crankshaft assembly, disassembling

Special tools:

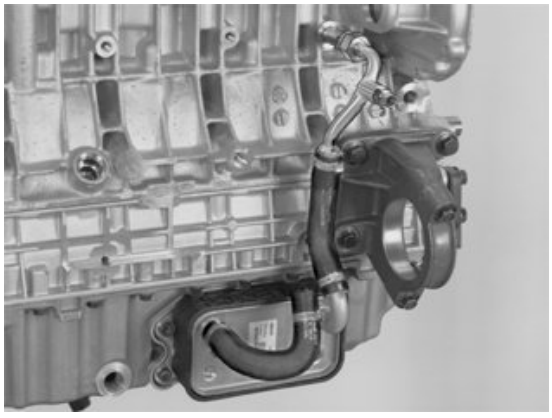
999 5458 KEY See: Tools and Equipment/999 5458 Key
999 5679 Oil filter spanner See: Tools and Equipment/999 5679 Oil Filter Spanner

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation

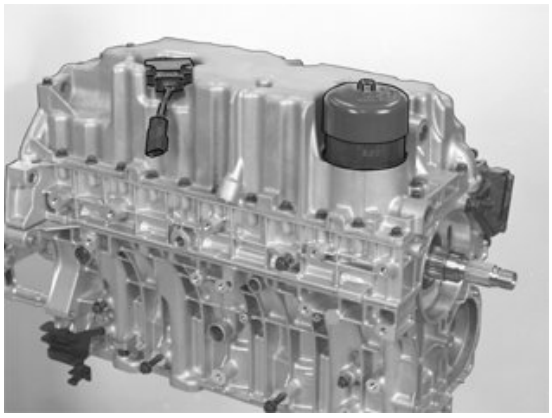


Remove:
- the oil trap
- the knock sensors (KS)
- the front engine mounting
- the oil pressure switch
- Evaporative emission system (EVAP) valve with hoses.



Remove:
- the bearing retainer for the right drive shaft
- the oil cooler and the rubber seals including hoses and pipes.

Removing the oil filter and oil pan

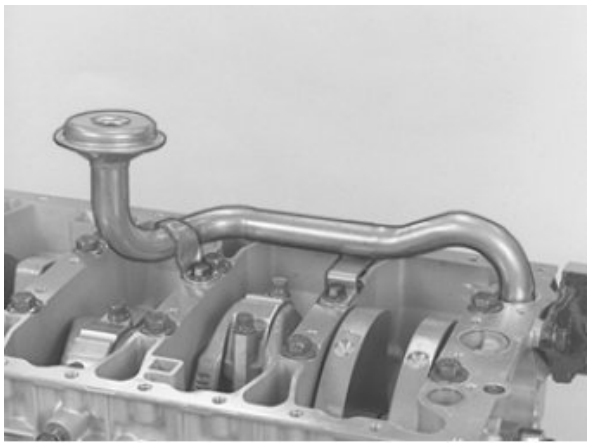


Remove:

- the oil filter. Use tool 999 5679 Oil filter spanner See: Tools and Equipment/999 5679 Oil Filter Spanner
- the screws holding the oil pump to the intermediate section.

Carefully tap the side of the oil pan with a rubber mallet.
Lift out the oil pan.

Removing the suction pipe from the oil pump

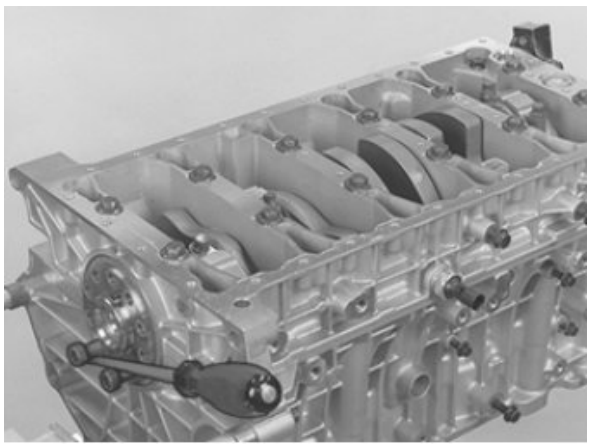


Remove:

- the O rings for the oil ducts
- the retaining screws holding the suction pump to the intermediate section. Work / lift out the suction pipe
- the O-ring for the suction pipe.

Check the pipe and the strainer. Check for cracks and impurities.

Checking markings



Install the two old screws for the flywheel and carrier plate at the rear edge of the crankshaft.
Turn the crankshaft so the piston in cylinder 1 is at bottom dead center (BDC).
Check that there are markings on the cap and connecting rods. Check which way the markings are positioned (exhaust and intake side). Make a note of this.
If necessary mark with a center punch or a number punch. See Crank mechanism, assembling, B5244T5, B5254T2 See: Crank Mechanism, Assembling.

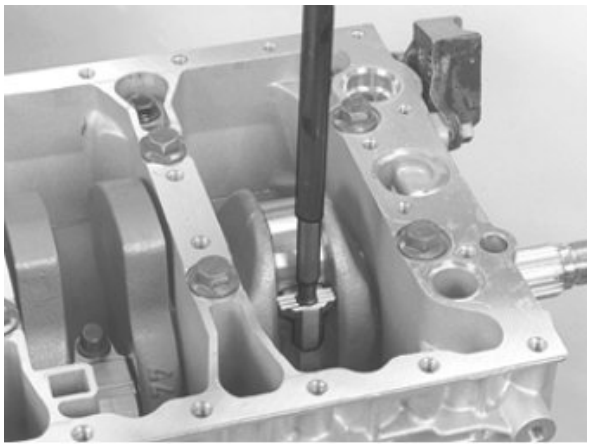
New connecting rod

A new connecting rod has been introduced on certain engines.
The mating surface between the cap and the connecting rod is not machined. It is aligned through a dedicated fracture surface.

Caution! If the cap is turned the wrong way and tightened, the structure of the fracture surface will be damaged and the connecting rod must then be discarded.

Note! Blow the fracture surface clean using compressed air before installing the cap.

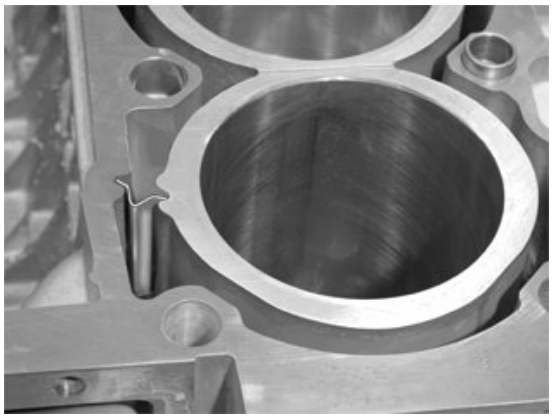
Removing the pistons from the cylinder block



Caution! The bearing covers are not interchangeable. Also note the position of the bearing caps in relation to the rotation of the crankshaft .

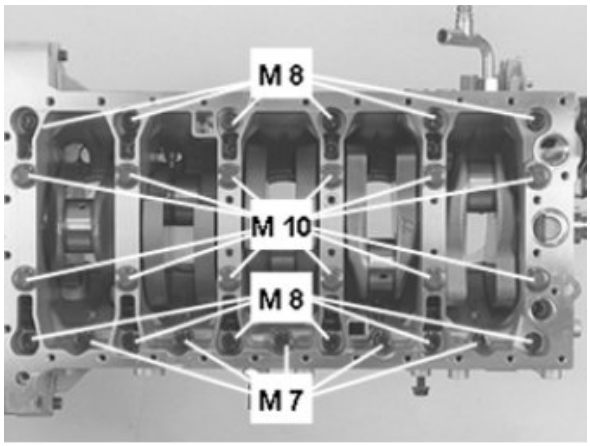
Remove the screws for the connecting rod cover.
Lift off the cover. Ensure that the bearing cover comes with it.
Install tool in the connecting rod. Press out the connecting rod and piston.
Hold by hand so that the piston does not fall to the floor. Ensure that the bearing cover comes with it.
Place the piston and connecting rod in such a way that they will be reinstalled in the correct cylinder.
Continue with cylinders 2, 3, 4 and 5 as above.

Check



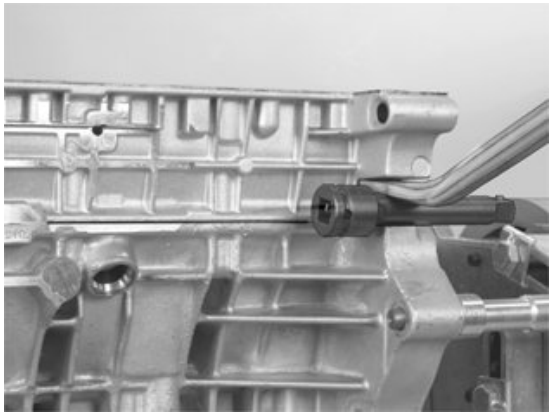
Check that the coolant guide is in place. Secure if necessary.

Removing the screwed joint from the intermediate section



First remove the M7 screws from the intermediate section.
Then remove the M8 screws. Start at the outer edges and work alternately towards the center.
Remove the M10 screws in the same way.

Separating the intermediate section from the cylinder block



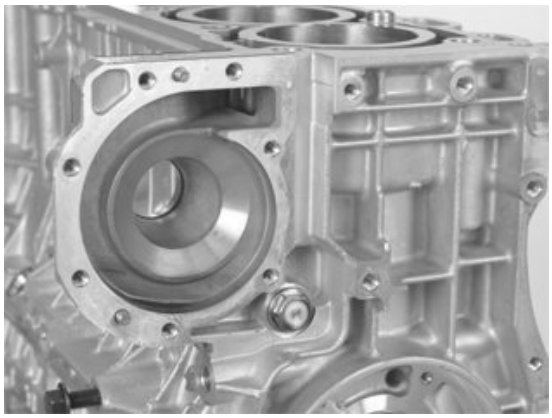
Caution! The bearing covers are not interchangeable.Also note the position of the upper half of the axial bearing for the direction of rotation of the crankshaft.The crankshaft must not rotate.

Carefully pry the intermediate section from the cylinder block so that there is a gap of approximately **6-8 mm**.
Then carefully tap off (on the exhaust side) the intermediate section with a rubber mallet.
Lift out the intermediate section. Ensure that the bearing covers for the intermediate section come with it.

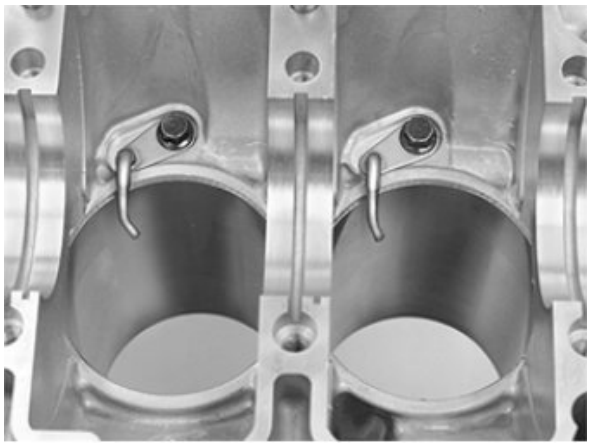
Note! The bearing covers for the different bearing recesses are not interchangeable.

Ensure that the screws for the flywheel and carrier plate, which were installed earlier, are properly tightened. Lift them and the front of the crankshaft.
Carefully lift the crankshaft straight up.
Remove the remaining bearing covers.

Removing the piston cooling valve and nozzles

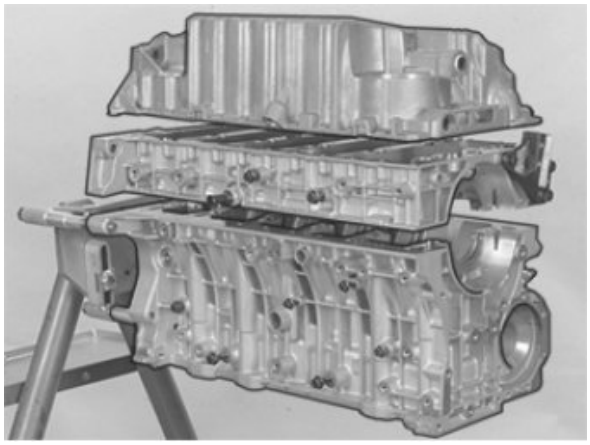


Remove the piston cooling valve at the front of the engine.



Remove the piston cooling nozzles.

Cleaning



Warning! A fume hood or extractor must be used when using gasket solution.

Clean the gasket surfaces on the cylinder block, intermediate section and oil pan.
Use a razor blade or a gasket scraper and / or gasket solvent (**P/N 116 1440**).

Crankshaft: Service and Repair
Crank Mechanism, Assembling

Crank mechanism, assembling

Special tools:

951 2767 Roller See: Tools and Equipment/951 2767 Roller
999 1801 STANDARD SHAFT See: Tools and Equipment/999 1801 Standard Shaft
999 5676 Drift replaced by 9997174 See: Tools and Equipment/999 5676 Drift Replaced By 9997174
999 5746 Holder See: Tools and Equipment/999 5746 Holder

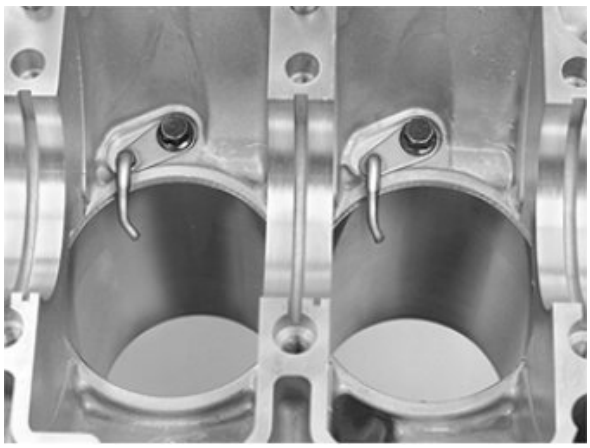
Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Note! For tightening torques not in the text, see Tightening torque See: Specifications/Tightening Torque.

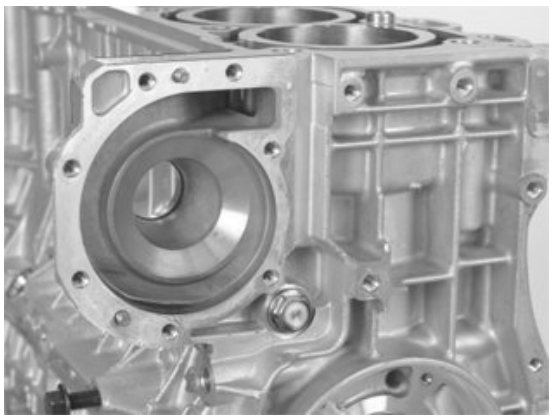
Cleaning

Ensure that the all components are **completely** clean.
Blow clean the oil ducts in the block, intermediate section and sump.

Installing the piston cooling valve and nozzles

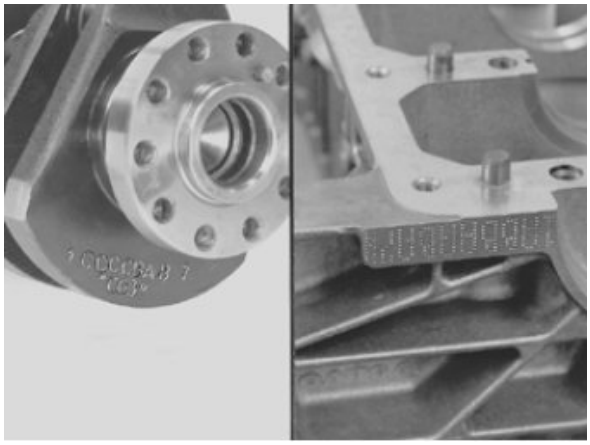


Install the piston cooling nozzles. Tighten the screws.



Install the piston cooling valve. Use a seal washer. Tighten. See Tightening torque See: Specifications/Tightening Torque.

Classification of main bearings



Wipe clean the bearing recesses in the block and the intermediate section.
Check that the components are clean and undamaged.
Check the classification of the block and crankshaft.
The classification marking is at the rear edge of the block and the crankshaft. The classification is read from digit 1 to 7. The first letter after digit 1 is the classification of main bearing 1. The bearing recesses are numbered starting at the front of the engine.

Selecting bearings

Note! Always use new bearings.

Bearing halves with grooves are always installed in the engine block.
Install the main bearings in the cylinder block and the intermediate section. See the table. The axial bearing is positioned at bearing recess 5

2 \ 1	A		B		C	
A	Y	Y	Y	B	B	B
B	R	Y	Y	Y	Y	B
C	R	R	R	Y	Y	Y

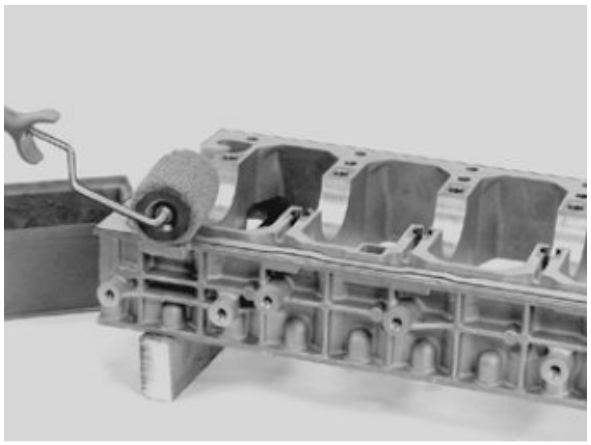
Y	R	R	R	Y	R	Y
Z	R	R	R	Y	R	Y
	3	4	3	4	3	4

1. Classification cylinder block
2. Classification crankshaft
3. cylinder block
4. Intermediate section

Example. The marking on the block at bearing position 1 is B. The marking on the crankshaft at the corresponding bearing position is C. This gives a red marked bearing in the block and a yellow marked bearing in the intermediate section.

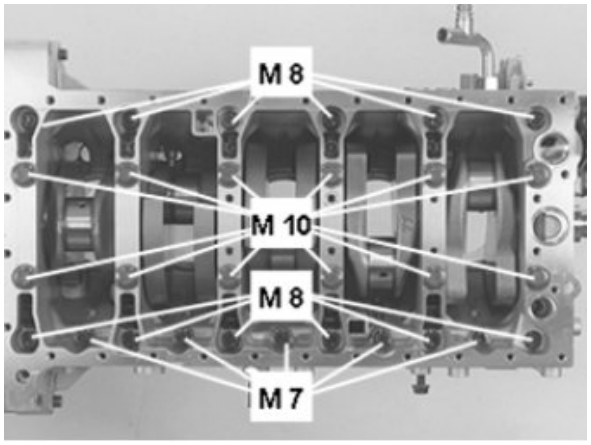
Note! The thickest of the bearing halves shall always be installed in the intermediate section. This is to keep the centre line as straight as possible.

Applying liquid gasket



Wipe the surfaces dry. Apply liquid gasket 11 61 059 to the intermediate section.
The surface must be completely covered without any excess. Use roller 951 2767 Roller See: Tools and Equipment/951 2767 Roller. Thoroughly lubricate all the bearing shells and the thrust bearing's surface.

Tightening the intermediate section



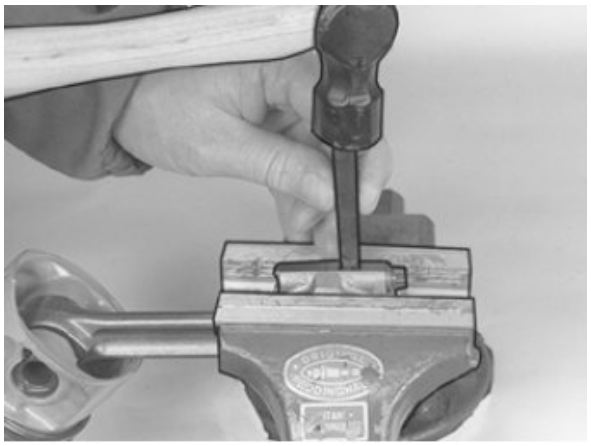
Install the two old screws for the flywheel and carrier plate at the rear edge of the crankshaft. Lift these and the front of the crankshaft.
Carefully position the crankshaft in the block. The crankshaft must **not** be turned before the intermediate section has been torque tightened. Position the intermediate section. Lubricate and install all the screws.

Note! Use new M10 bolts.

Caution! The M8-bolts on the exhaust side have two lengths.

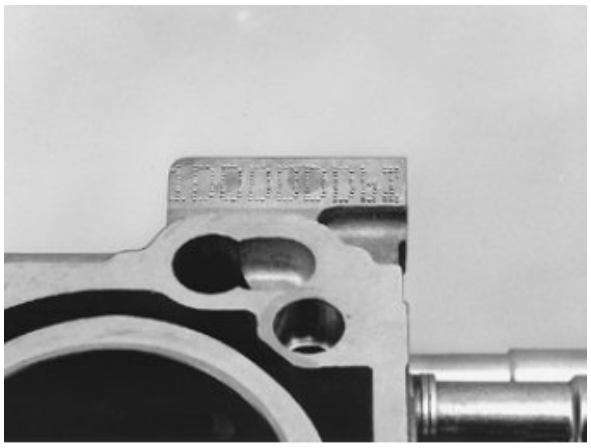
Install the intermediate section and the screws on the exhaust side at bearing recesses 2 and 5.
Pull down the intermediate section. Tighten the screws. See Tightening torque See: Specifications/Tightening Torque.

Marking the connecting rod (where applicable)



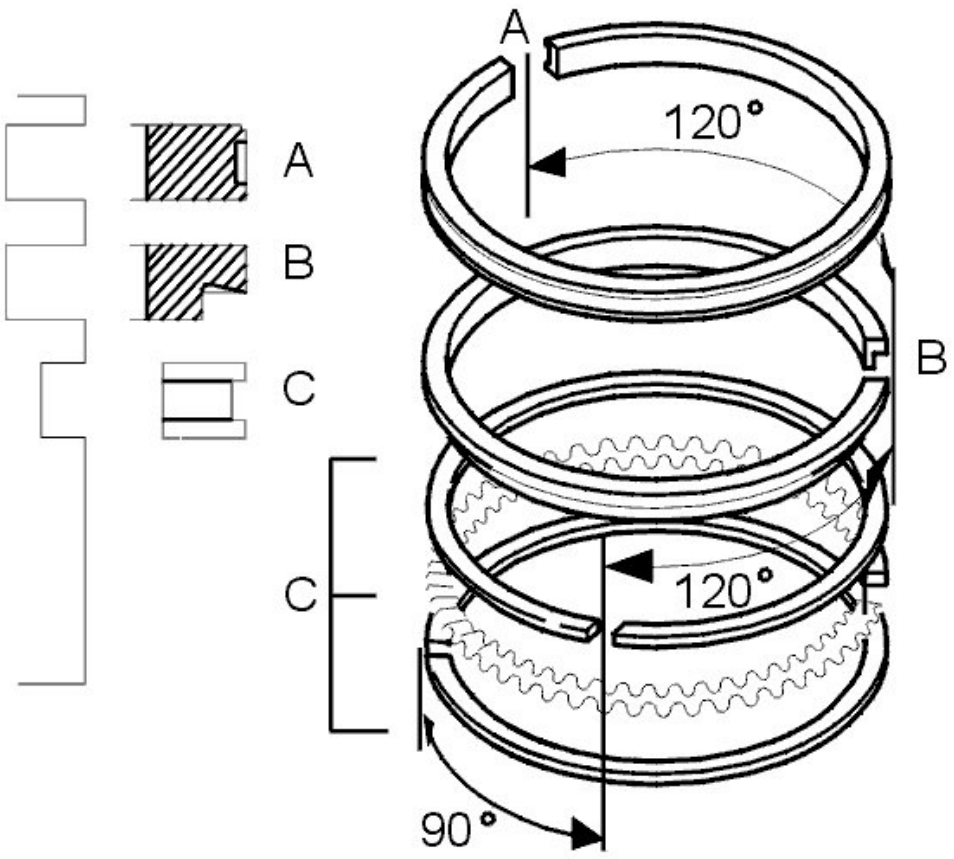
Assemble the connecting rod. Check that the cover is facing the correct direction. Tighten to **20 Nm**.
Secure the large end of the connecting rod in a vice with soft jaws (copper or aluminium). Mark both halves with the cylinder number. Use a centre punch or number punch.

Selecting piston



For every cylinder there is a classification letter stamped (C, D, E) on the top of the engine block.
First letter after the digit 1 corresponds to the classification of the cylinder bore in cylinder 1 and is then followed by cyl. 2, 3, 4, 5.
Cylinder selection is determined by the classification of the cylinder bore. For example: Cylinder class D must have pistons marked D etc.

Installing piston rings

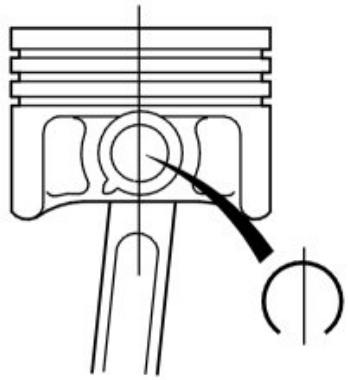


Caution! Make sure that the piston rings are not stuck and that they turn easily.

Note! Incorrect positioning may result in higher oil consumption.

Use piston ring pliers. Turn the piston rings so that the openings are offset as illustrated.
A=Compression ring. The text on the piston ring must be upwards.
B=Scraper ring. Chamfered edge must face downwards.
C=Oil ring. Three sections, identical on all sides. First install the expander ring (C), then the two other rings over the expander ring.

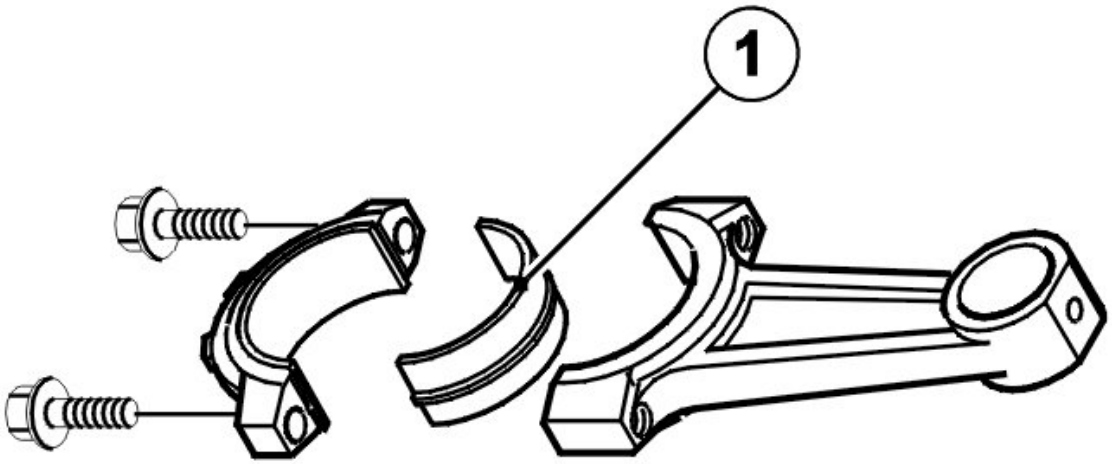
Assembling pistons and connecting rods



Warning! The lock ring can easily fly off. Wear protective goggles

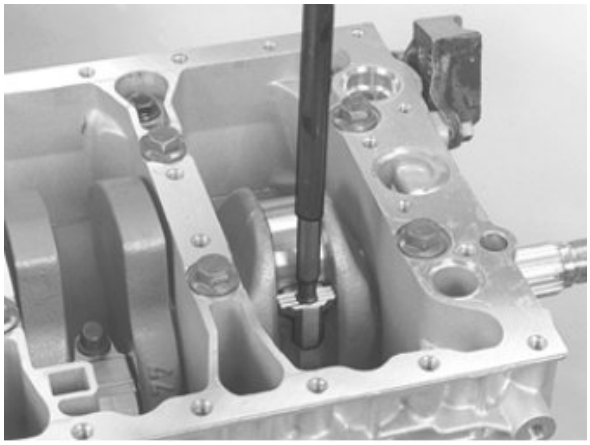
There is an arrow marking on the upper side of the cylinder. This must be turned forwards in the cylinder block.
The connecting rods are symmetrical and can be turned freely. Marked rods however must be turned in the same direction.
Assemble the connecting rod and piston with the piston pin. Check that the classification and any numbering for each cylinder/piston diameter and connecting rod correspond.
Install both the snap rings on the piston pin. Check that the snap rings are positioned correctly in the piston. The opening must be vertical.
Wipe clean around the bearing recess in the connecting rod and the cap.

Installing the main bearing shells



Always use new bearings.
Check these for colour marking. The bearing shell with a black colour coding on the side (1) must be installed in the connecting rod.

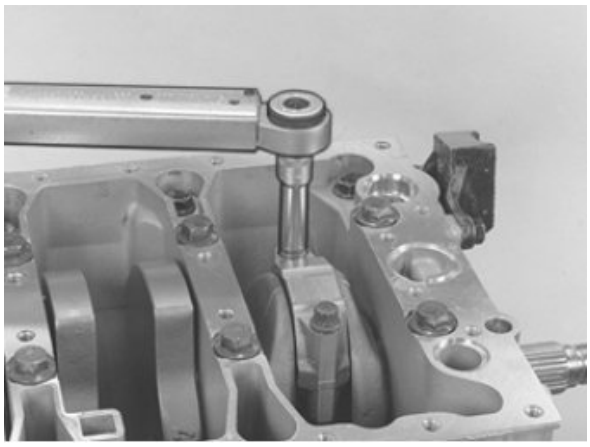
Installing the pistons in the cylinder bores



Note! The arrow (top of the piston) must point forwards, and make sure that the classification matches.

Use a cylinder ring compressor.
Lubricate the cylinder bore, the pistons and the bearing shells.
Turn the crankshaft so that the connecting rod pin is at bottom dead center (BDC) for the cylinder the piston is to be inserted in.
Ensure that the engine is in a position where the cylinder bore forms as vertical a line as possible.
Carefully press or tap the piston down (using the shaft of a hammer or similar). When the piston releases from the piston ring compressor, turn the engine **180°** in the stand.
Install tool 999 5746 Holder See: Tools and Equipment/999 5746 Holder in the connecting rod. Pull the connecting rod until it secures against the big end journals.

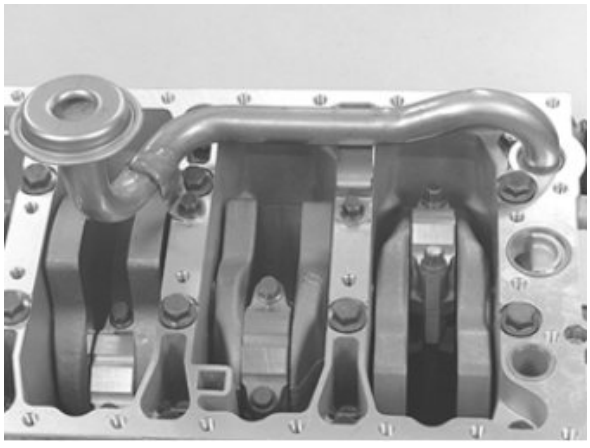
Tightening the connecting rod cover



Note! The crankshaft must not be rotated before the connecting rod cap has been tightened.

Install the cap. Check that any markings correspond.
Lubricate and install new screws. Tighten the screws. See Tightening torque See: Specifications/Tightening Torque.
Check that the connecting rod can be moved sideways.

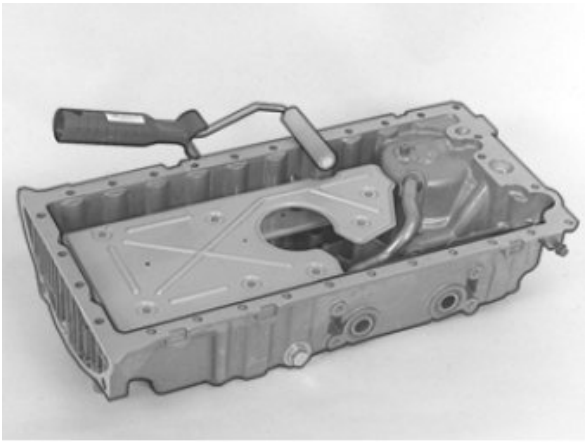
Installing the oil pump suction pipe



Install a new seal ring on the suction line.
Carefully press the suction pipe down into the intermediate section. Check that the sealing ring is correctly positioned.

Tighten the screws. Install new sealing rings for the oil ducts to the sump.

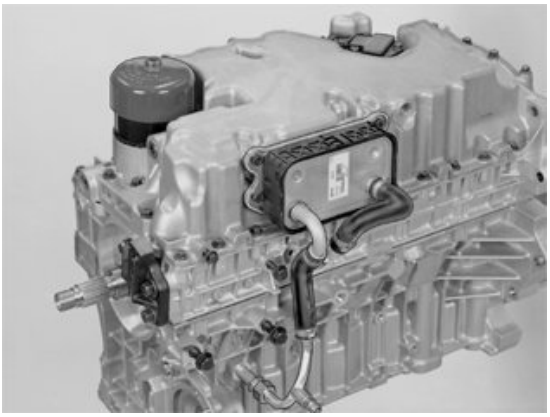
Installing the sump



Caution! Check that the rear edge of the oil sump is in line with the rear edge of the engine block. Permitted tolerance± 0.025 mm. Use a steel ruler and feeler gauge.

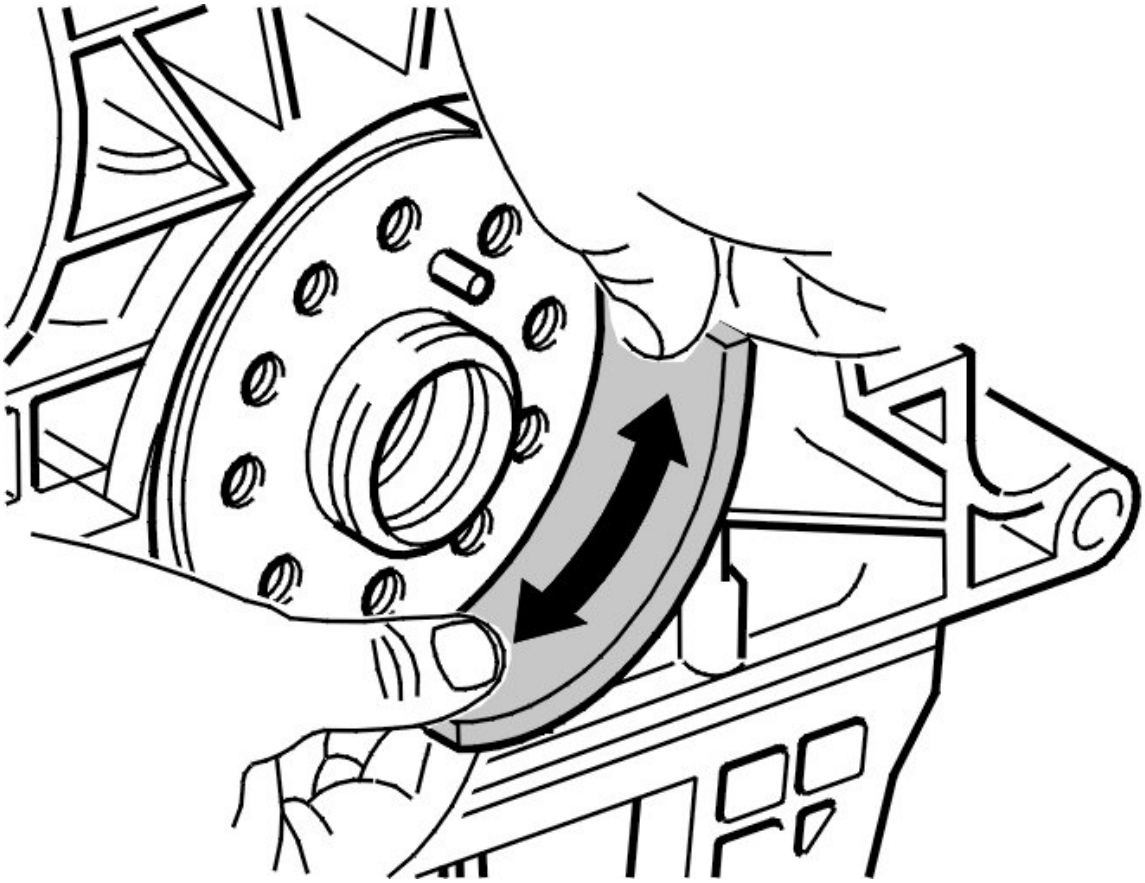
Wipe the surfaces dry.
Apply liquid gasket 11 61 059 on the oil sump. Use roller 951 2767 Roller See: Tools and Equipment/951 2767 Roller. The surface must be completely covered without any excess. Install the oil sump and install all bolts.
Tighten the screws. Start with the rear edge of the sump and work alternately forwards.

Installing the oil cooler



Install:
- new sealing rings in the oil pan
- the oil cooler. Tighten the screws
- the oil filter.

Cleaning

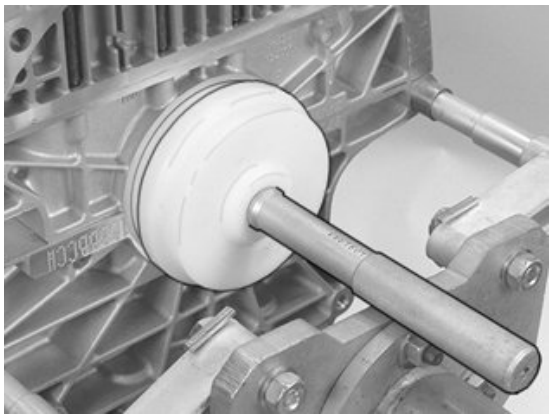


Caution! Cleaning shall always be done in the direction around the flange, not in and out. No grinding tools or similar may be used. It is extremely important that there is no remaining thread sealant or other dirt, as this may cause leakage.

Note! Use emery cloth 9511024 to clean the crankshaft end.

If necessary, wash off the oil on the rear cylinder block surface. Blow clean using compressed air.
When cleaning, work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

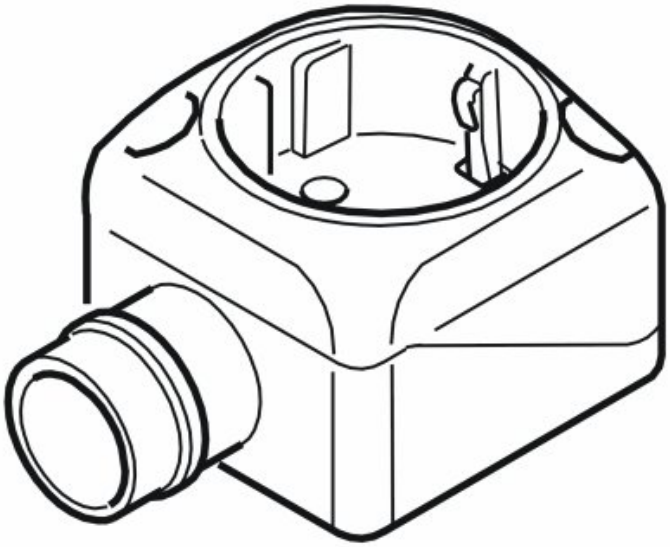
Installing the rear crankshaft seal

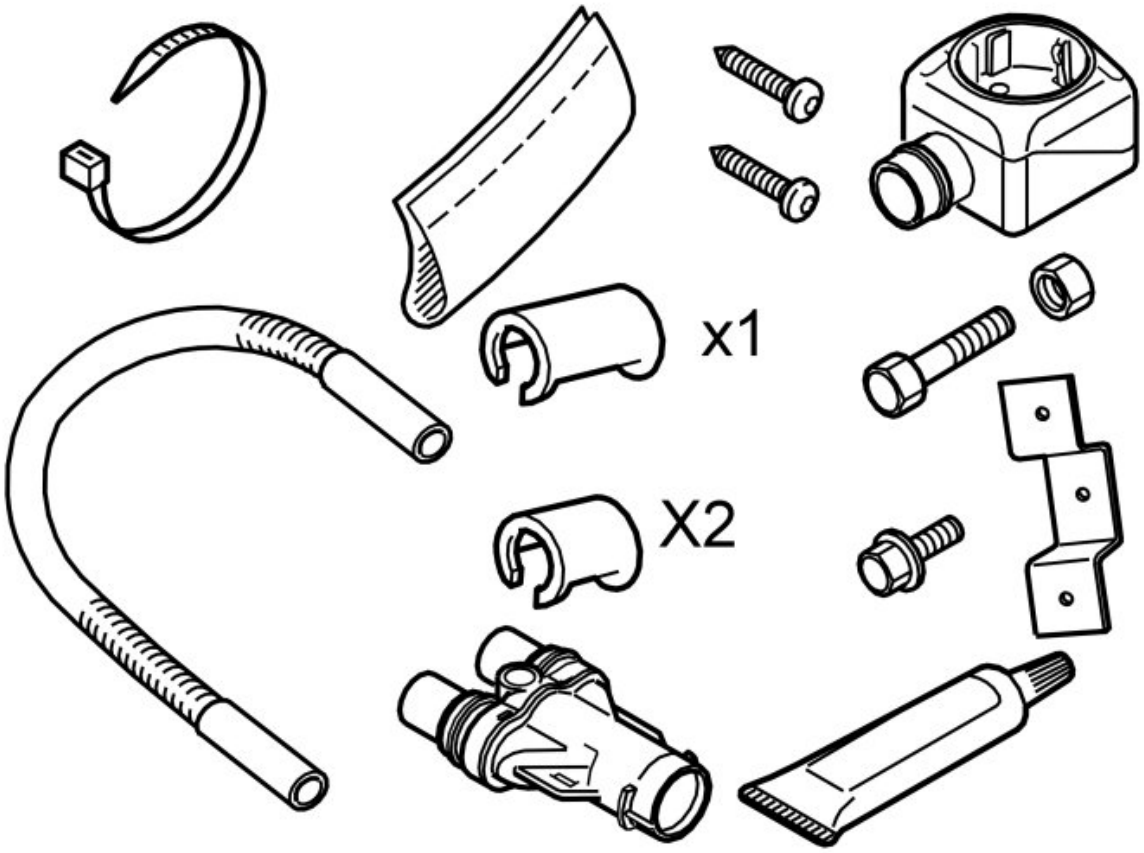


Use standard handle 999 1801 STANDARD SHAFT See: Tools and Equipment/999 1801 Standard Shaft and drift 999 5676 Drift replaced by 9997174 See: Tools and Equipment/999 5676 Drift Replaced By 9997174.
Lubricate the drift face. Thread the seal onto the drift. Tap in the seal until the drift bottoms against the block.

Engine Block Heater: Service and Repair
Passenger Compartment Connector Socket

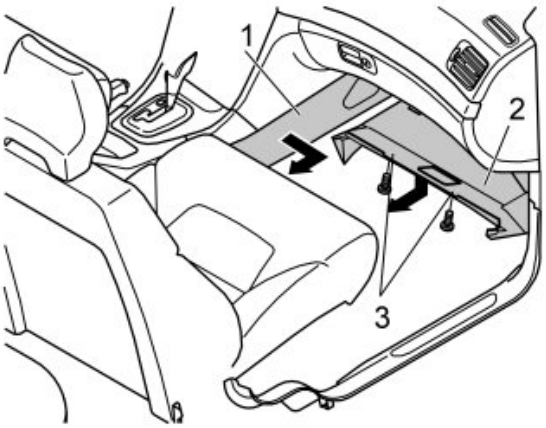
Passenger compartment connector socket





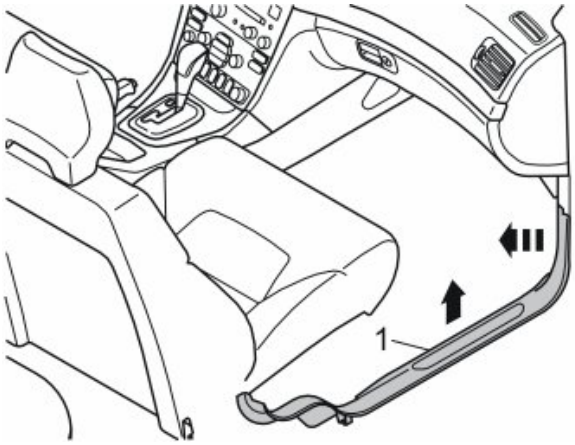
Passenger compartment connector socket

Preparations

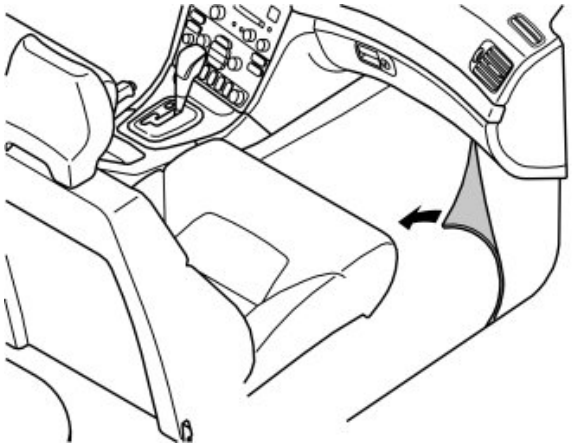


- Remove the centre console's right-hand side panel (1) by first turning the clip in the rear edge Â¼ turn anticlockwise, then pull the panel out at the rear edge and pull it away backwards.
- Remove the sound barrier (2) on the right-hand side by first unscrewing the two screws (3) in the rear edge.

Prize away the sound barrier at the rear edge so that the clips there release.
Remove the sound barrier.

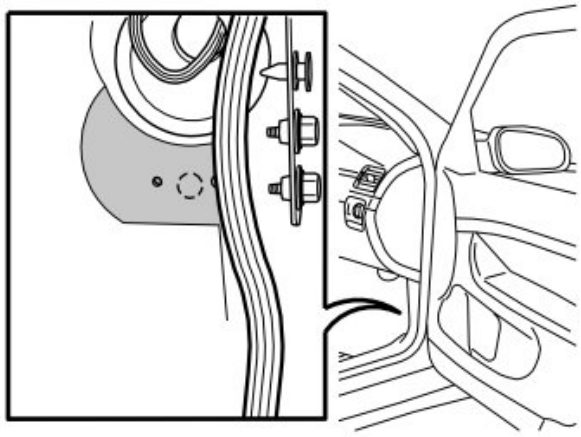


- Remove the sill moulding (1) by pulling it away starting at the front edge, until the clip there releases. Following which, pull it up until the clips on the underside release. Detach it from the B-pillar panel.

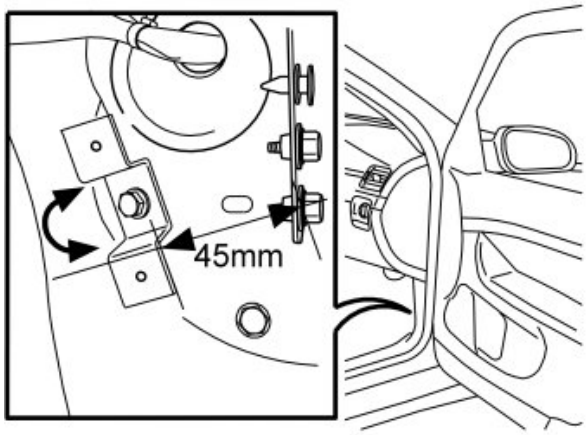


- Fold the carpet to one side.

Installing the bracket

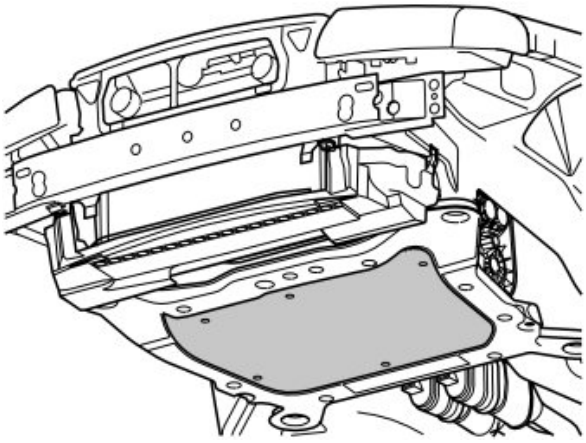


- Cut away a section of the soundproofing at the A-pillar (the shaded area in the illustration).

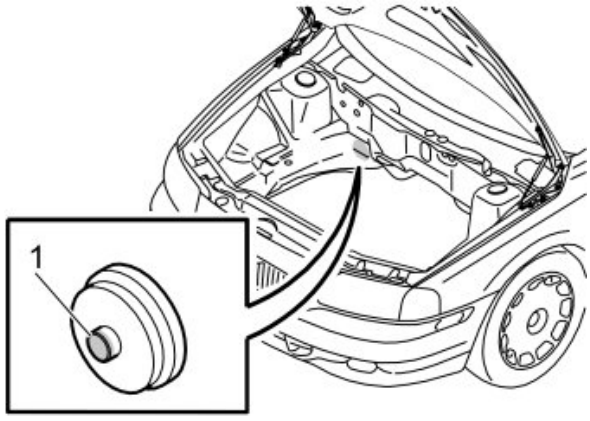


- Take the short flanged screw and the bracket from the kit.
- Remove the tape concealing the weld nut.
- Install the bracket with the screw in the weld nut as illustrated, but do not tighten the screw yet.
- Turn the bracket to maintain a distance of **45 mm** between one corner of the bracket and the centre of the hole for the lower ground screw. See the illustration.
- Tighten the screw.

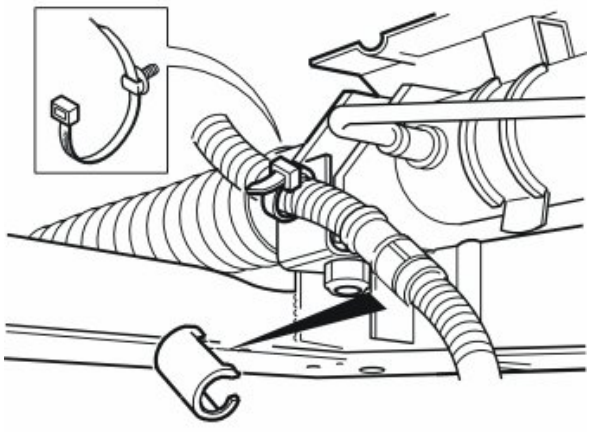
Installing the junction connector



- Remove the engine splash guard.

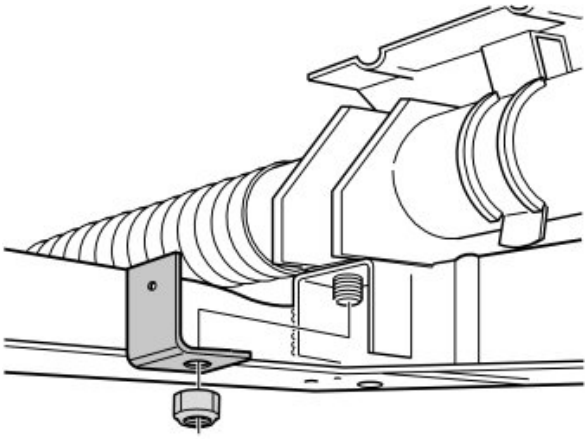


- Cut away the engine compartment insulation at the punched metal on the right-hand side down in the engine compartment.
- Remove the rubber grommet (1) inside the insulation.
- Cut off the top of the rubber grommet (1).



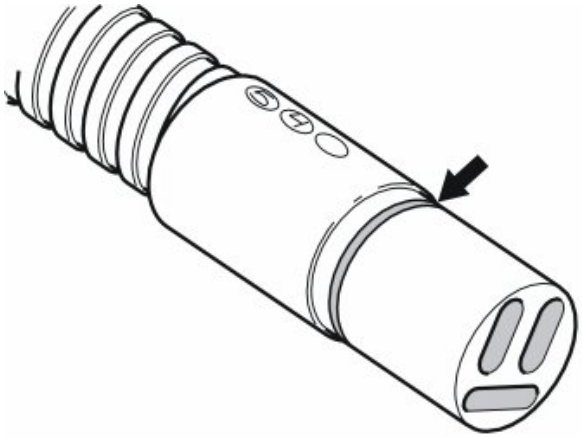
If an engine block heater is installed

- Remove the connectors for the engine block heater and the front engine block heater socket from the bracket on the steering gear.
- Remove the locking sleeve over the connectors and pull apart both cables.



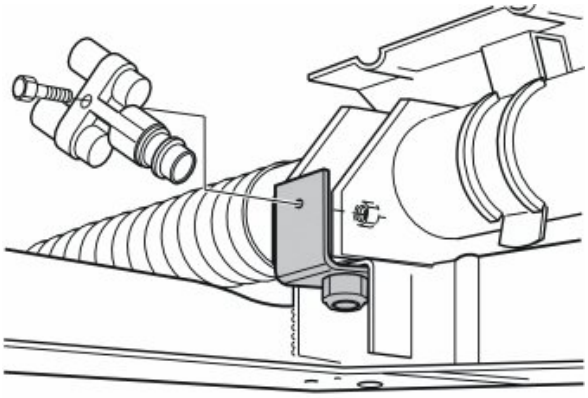
If an engine block heater is not installed

- Remove the nut from the right-hand side of the steering gear.
- Install the bracket with a new nut from the kit.
- Tighten the nut. Tighten to **50 Nm (35 lbf.ft.)**.



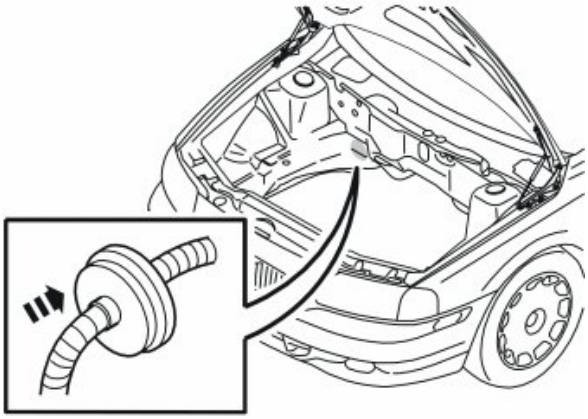
- Grease in the O-rings on the cables and on the branch connector using low temperature grease, part no. 1161417-9.

Note! Ensure that no grease gets onto the connector surfaces.



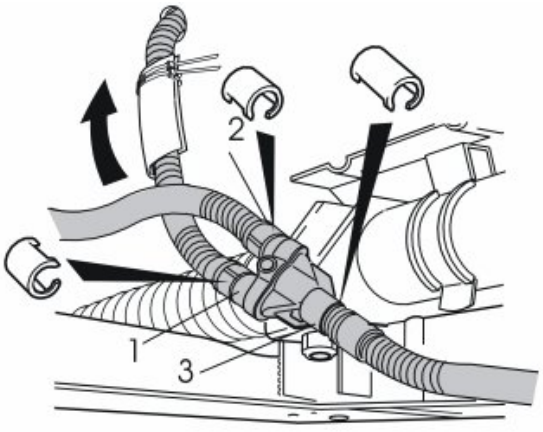
- Install the branch connector on the bracket with a screw and nut from the kit. Make sure that the screw does not catch the pipe to the steering assembly on the rear. If this is the case, swap the places for the screw and nut.

Do not tighten the bracket yet, the cables and locking sleeves must be installed first.



- Grease in the rubber grommet with low temperature grease, part no. 1161417-9 in order to ease the cable through and to locate it in the hole in the body more easily.
- Thread the cable for the passenger compartment connector socket through the rubber grommet.
- Guide the cable for the passenger compartment connector socket through the hole in the body.

Hint: Pull the rubber grommet into place from inside the passenger compartment using the cable if it is difficult to position it from the engine compartment side.

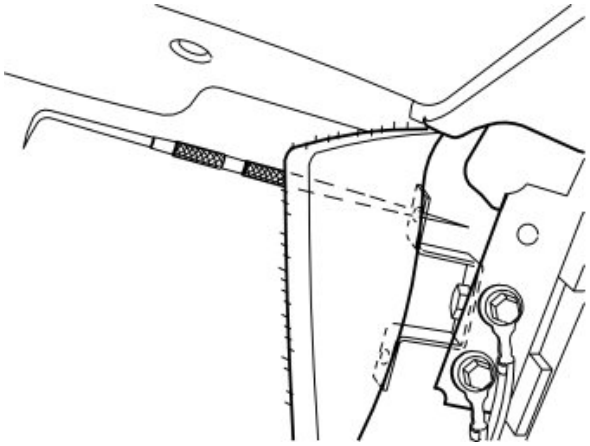


- Pull out a part of the cable for the passenger compartment connector socket from the passenger compartment. Any excess cable should be concealed behind the carpet in the passenger compartment.
- Take the heat deflector hose and two tie straps from the kit and thread it onto the cable for the passenger compartment connector socket. Pull the heat deflector hose right up to the rubber grommet. Secure the heat deflector hose with both tie straps. If the heat deflector hose is too long, cut it down to a suitable length.
- Install the cable for the passenger compartment connector socket to socket (1) on the branch connector from the kit.
- Connect the cable from the engine block heater to the socket (2) on the junction connector.
- Connect the cable from the front engine block heater socket to the socket (3) on the junction connector.
- Press the locking sleeves (from the kit) over the cable splices. The larger locking sleeve must be on the socket (3).
  Note! Check that the cables do not chafe against sharp edges or moving parts in the engine compartment.

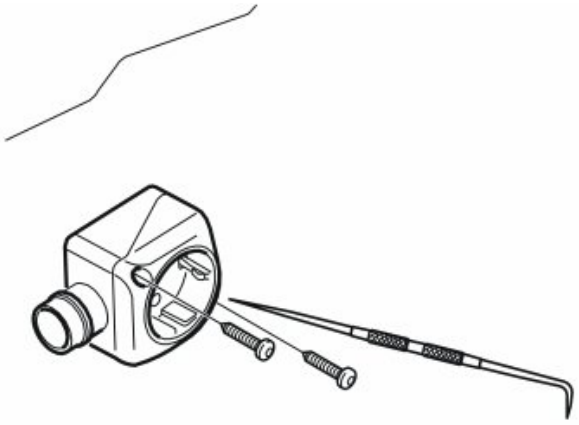
Tighten the branch connector to the bracket.

- Reinstall the engine splash guard and torque tighten the screws to **24 Nm (18 lbf.ft.)**.

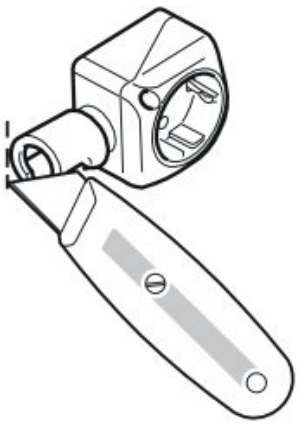
Installing the passenger compartment connector socket



- Partially fold the carpet back over the bracket.
- Make a hole in the carpet opposite the upper mounting hole in the bracket using a double ended scriber.



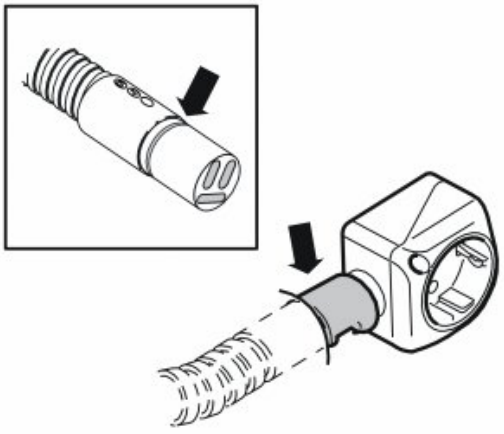
- Take a screw and the passenger compartment connector socket from the kit. Tighten the passenger compartment connector socket to the bracket in the upper mounting.
- Insert the double ended scriber into the lower mounting for the passenger compartment connector socket. Make a hole in the carpet opposite the lower hole on the bracket.
- Tighten the lower mounting for the passenger compartment connector socket using a screw from the kit.



- Press a locking sleeve (from the kit) onto the passenger compartment connector socket. Slide the locking sleeve as far along the terminal for the passenger compartment connector socket as possible.
- Take a carpet knife and cut a slit in the carpet just in front of the locking sleeve. Make the cut as long as the diameter of the locking sleeve.

Note! Do not damage any wiring and hoses under the carpet.

- Remove the passenger compartment connector socket from the bracket and fold the carpet to one side.



- Thread the cable through the hole in the carpet.
- Grease in the O-ring with low temperature grease (part no. 1161417-9).

Note! Ensure that no grease gets onto the connector surfaces.

- Connect the cable to the passenger compartment connector socket. Press a locking sleeve (from the kit) over the joint.
- Fold the carpet back into position and install the passenger compartment connector socket using both the screws.
- Reinstall the sound barrier, the centre console's side panel and sill moulding.

Engine Block Heater: Service and Repair
Electric Engine Block Heater, 110V

Electric engine block heater, 5-cyl. 110V

INTRODUCTION

- **NOTE! Read through the whole installation instruction before starting the work.**
- The front page gives the date of this edition and the edition it replaces
- The second page shows the tools needed for the installation and the contents of the installation kit
- The illustrations display the procedure in order of operation. The order of operation is repeated in the text section
- Cut out the text page in order to follow the illustrations and text at the same time.

Electric engine block heater, 5-cyl. 110V

Preparations, applies to the S60/V70/S80

Image A applies to the S60 and V70

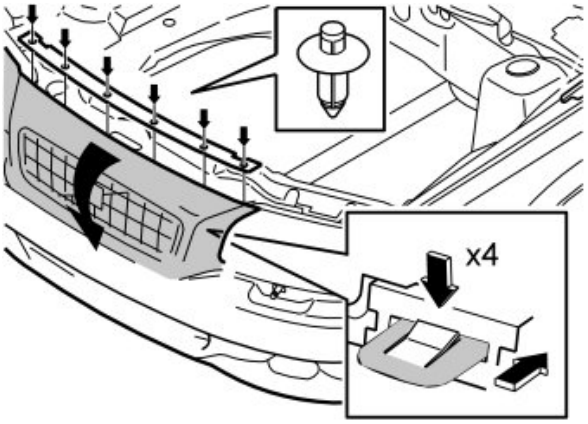

Image B applies to the S80 up to and including model year -2003 (CH -334999)

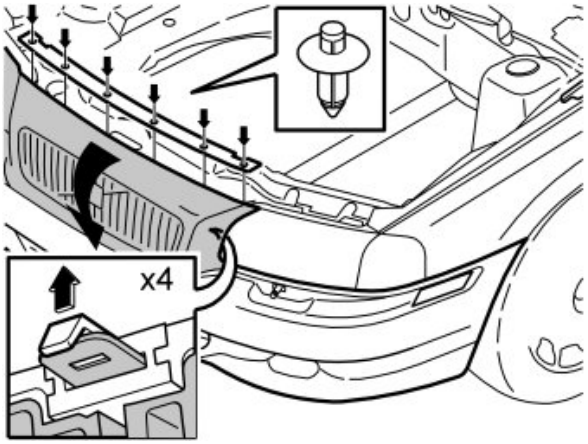
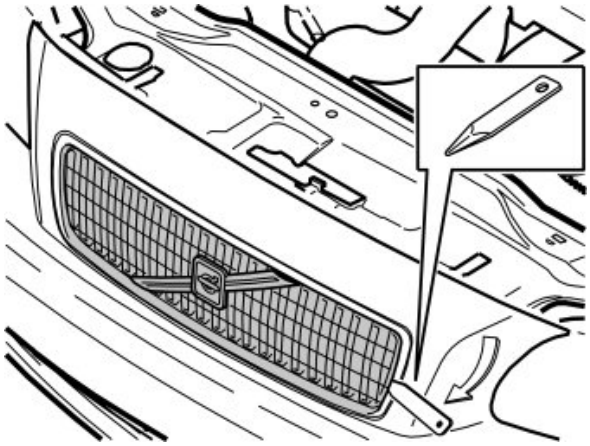


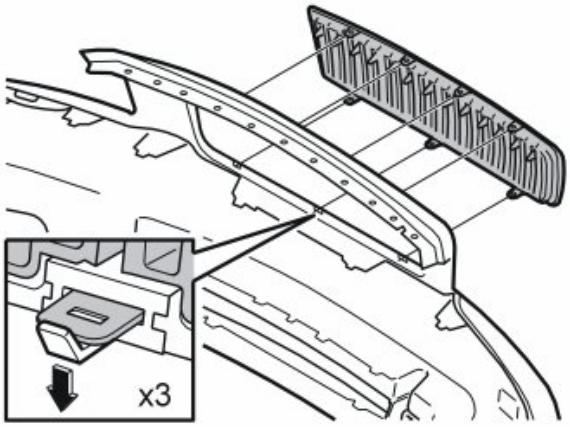
- Press in the centers of the six clips until a click is heard. Remove the clips.
- Pull the top edge of the front forward.
- Insert a hand inside and press the four catches that are evenly distributed along the upper edge up/down. Use a plastic weatherstrip tool.
- Pull the front grille at the top until the catches release.

Image A applies to the S60 and V70



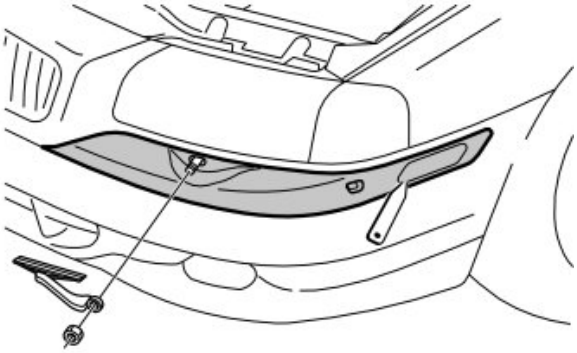
- Take a weatherstrip tool and insert it between the front grille and bumper cover, and carefully prize the front grille away along the whole of the bottom edge. It is secured with three clips.

Image B applies to the S80 up to and including model year -2003 (CH -334999)

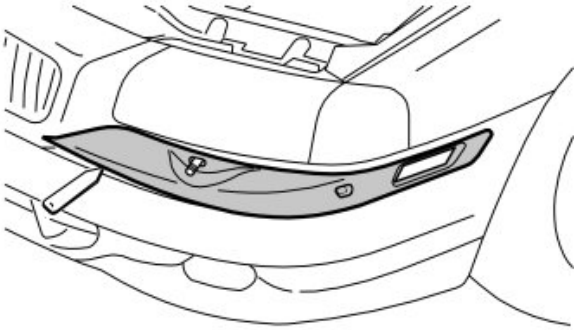


- Depress the three catches at the lower edge of the front grille using a small screwdriver or similar, remove the front grille.

Steps 3-6 apply to the S80 from model year 2003- (CH 335000-)



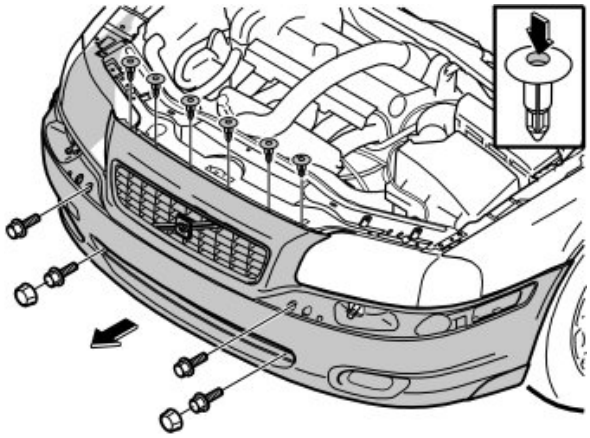
- Remove the nut and wiper arm for headlamp washing.
- Detach the hose for washing at the existing joint.
- Carefully pry off the parking lamp at the front edge. Use a plastic weatherstrip tool.
- Detach the connector and place the position lamp to one side.
- Repeat the operation on the other side.



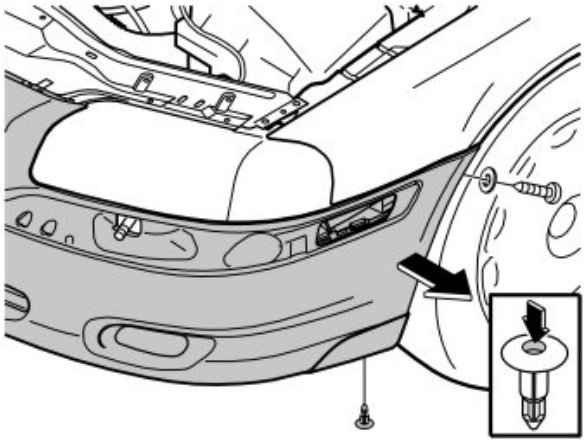
- Remove the molding under the headlamp. Use a weatherstrip tool.

  Note! Do not damage the paintwork.

- Repeat the operation on the other side.

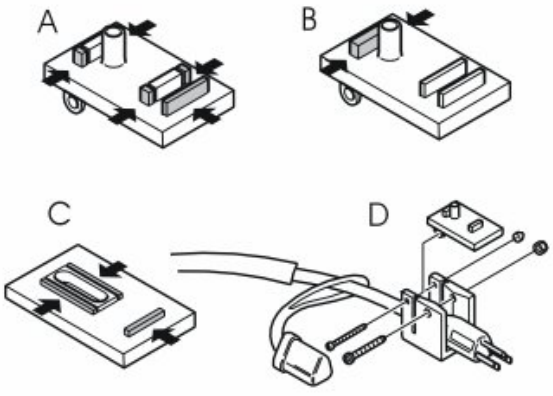


- Press in the center of the clips at the top edge of the bumper cover and remove them.
- Remove the covers in front of the bumper cover's lower screws.
- Remove the screws in the bumper cover.



- Press the center of the clip at the lower edge/side of the bumper and remove it.
- Remove the screw in the rear/top edge of the bumper cover.
- Repeat the operation on the other side.
- Carefully pull away the end face of the bumper cover from the body. It is fitted with four catches on the inside in the top edge and two in the bottom edge.
- Repeat the operation on the other side.
- Pull the bumper cover forwards, detach the connectors for the fog lamps if fitted.

Assembling the front intake



Applies to the V70, and S80 up to and including model year -2003 (CH -334999)

- Cut off the shaded sections on the mounting plates as illustrated in figures A and C.

Applies to the S80 from model year 2003- (CH 335000-)

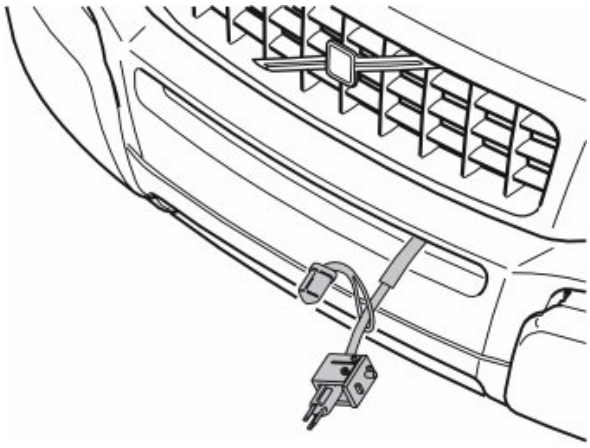
- Cut of the shaded section on the mounting plate as illustrated in figure B.

Applies to the XC90 up to and including model year -2006 (CH-327999), and S60/V70/S80

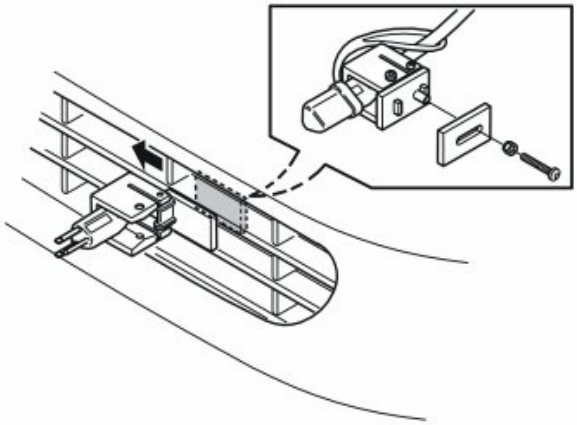
- Assemble the front intake according to figure D.

Installing the front intake, applies to the XC90

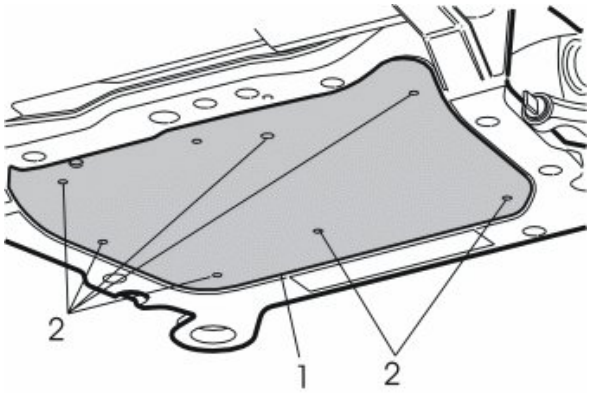
Steps 8 - 10 applies to the XC90 up to and including model year -2006 (CH-327999)



- Guide the front socket's cable in through the center hole, next furthest to the left in the grille.

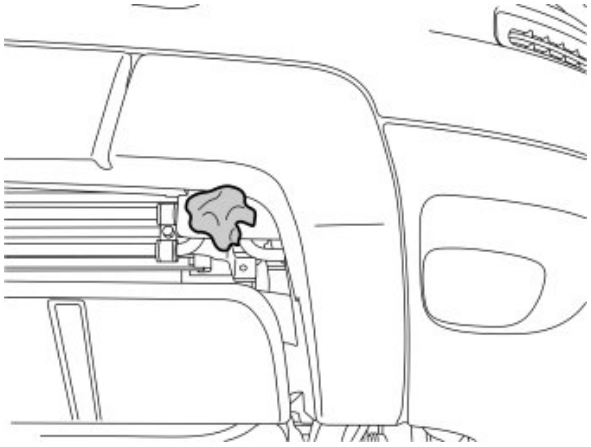


- Take a screw, washer and attaching plate from the kit and install the front socket. Push it as far to the left as possible and tighten it.
- Pull the cable to the left, in through the rubber seal on the left-hand side of the radiator, continue down by the left front side, on the right-hand side.

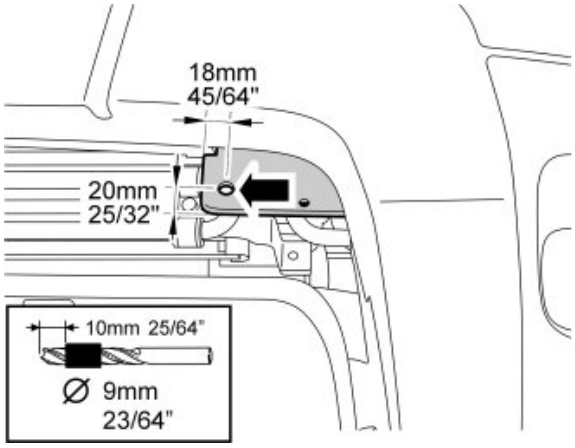


- Remove the engine splash guard (1) by first removing the screws (2).

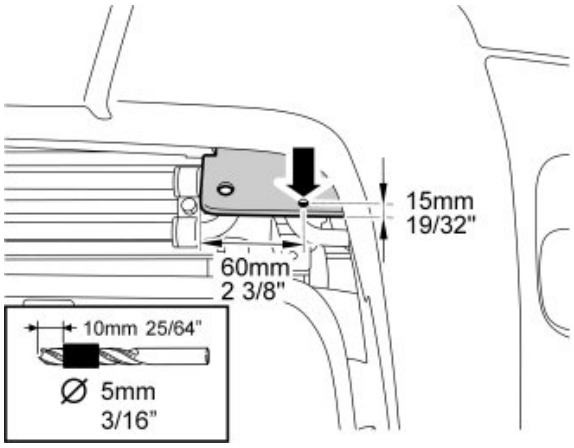
Steps 11- 23 apply to the XC90 from and including model year 2007- (CH 328000-)



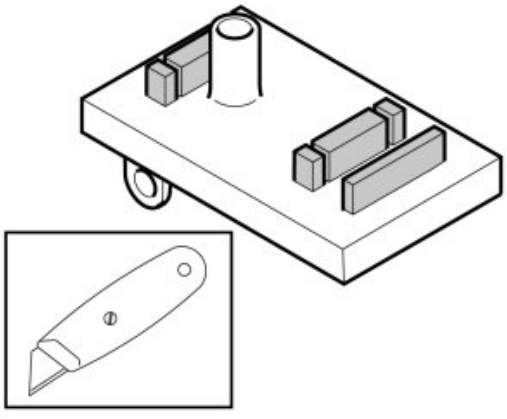
- Clean the surface where the front engine block heater socket will be secured.



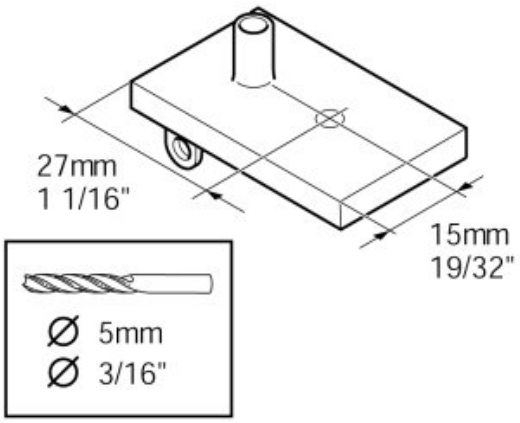
- Drill a hole for the guide to the front engine block heater socket's mounting plate.
- File down the edges of the holes.



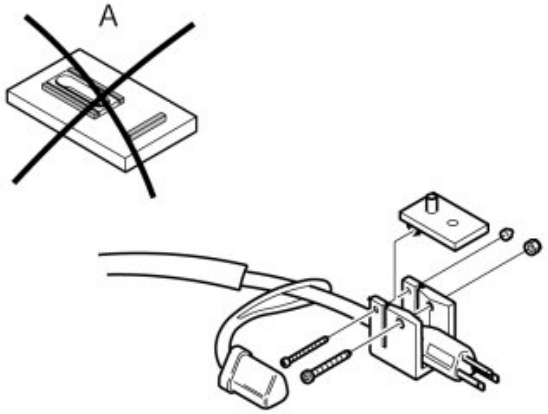
- Drill a hole for the tie strap for the front engine block heater socket's cable.
- File down the edges of the holes.



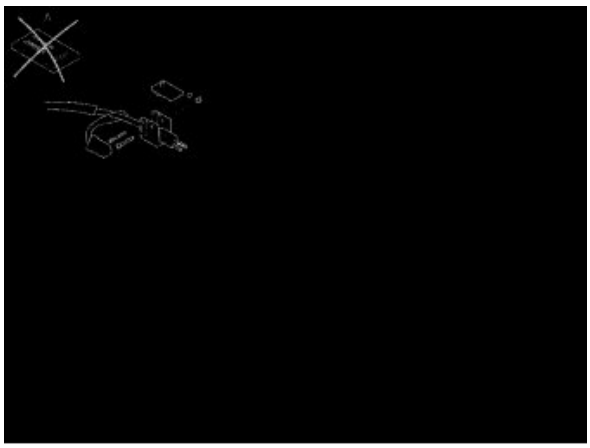
- Cut-off all shaded sections on the mounting plate so that only the cylinder shaped section remains.



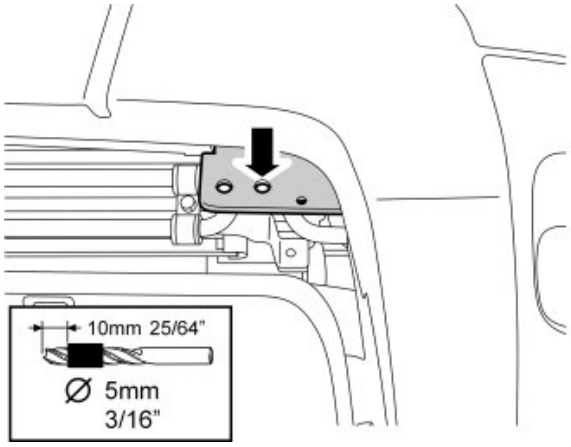
- Drill a **-5 mm (3/16 ")** diameter hole in the mounting plate.
- File down the edges of the holes.



- Assemble the front intake as illustrated. The mounting plate (A) must not be used.

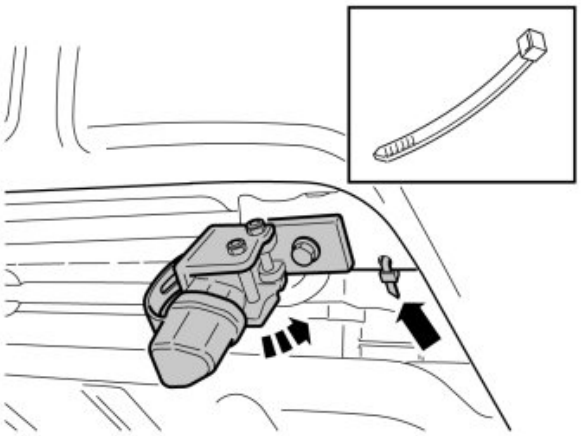


- Install the front engine block heater socket with the guide pin in the large hole.
- Route the cable in so that it runs down on the inside of the left-hand bracket for the skid plate.
- Align the front engine block heater socket so that the long sides of the mounting plate are parallel with the edges of the surface into which the mounting plate shall be screwed.
- Mark out for drilling the hole for the screw for the mounting plate.

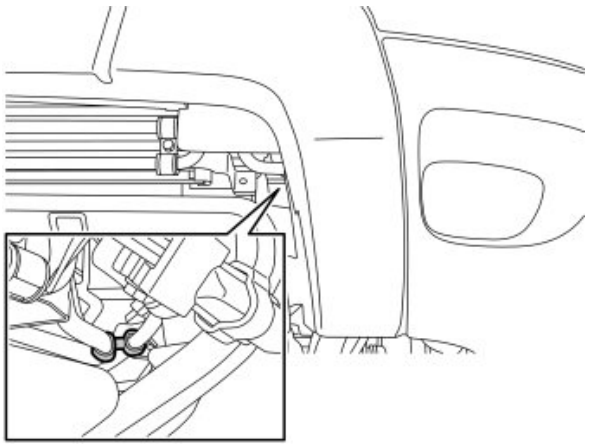


- Drill a hole with a **- 5 mm (3/16 ")** diameter drill bit for the screw for securing the front engine block heater socket's mounting plate.

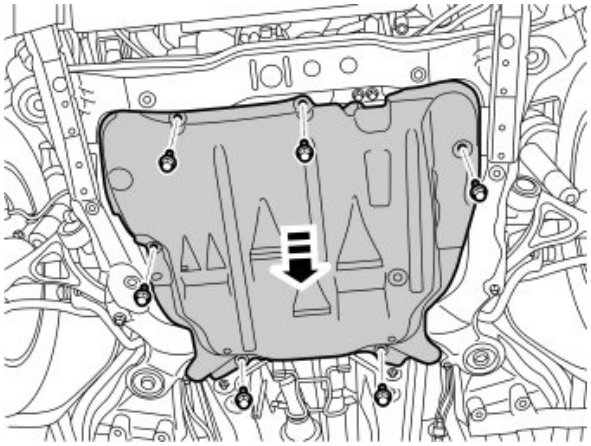
- Secure the front engine block heater socket with a screw and nut in the drilled hole and tighten.



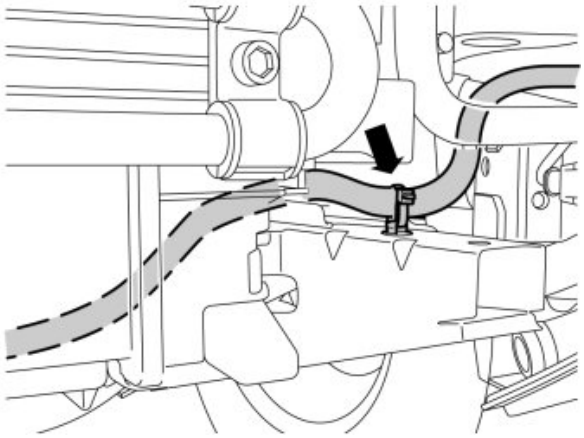
- Secure the tie strap in the hole around the front engine block heater socket's cable.
- Fold in the connector so that the cable adopts the correct length in the tie strap before it is tightened.
- Tighten the tie strap.



- Clamp the cable in at the pipe for the air conditioning using a double tie strap.



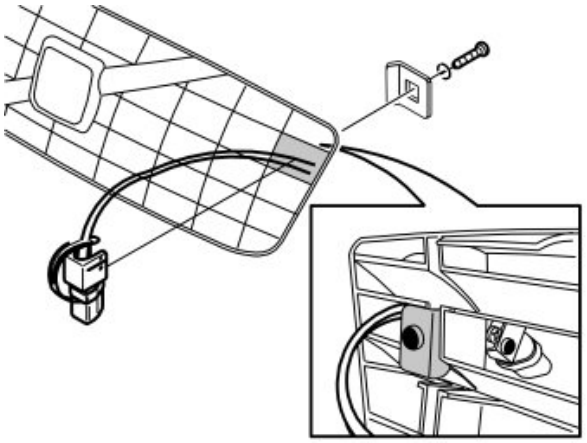
- Remove the engine splash guard.



- Pull the cable from the front intake over the skid plate, above the inside of the front left-hand side corner of the subframe, and down to the inside of the left-hand side of the subframe.
- Take the tie strap equipped with clip and press it into the hole on the top of the left-hand bracket for the skid plate.
- Tighten the cable with the tie-strap.

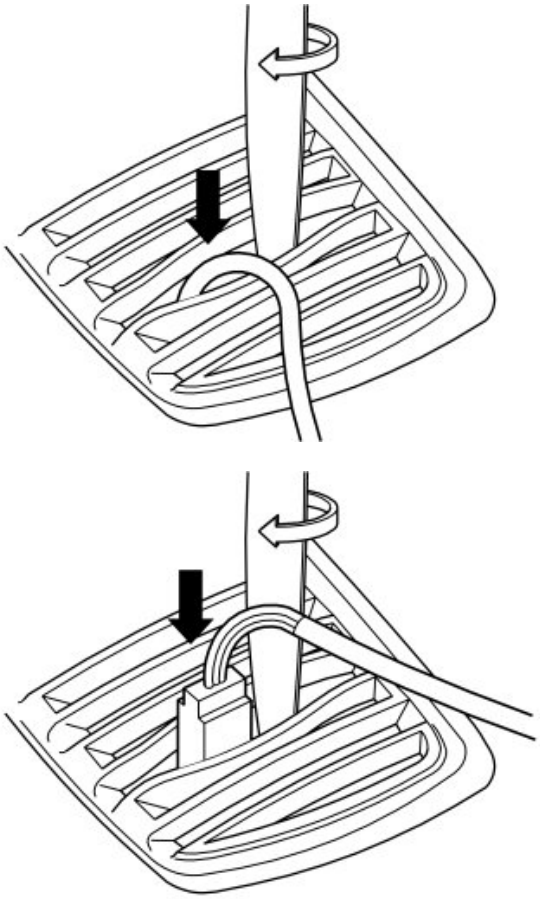
Installing the front intake, applies to the S60/V70/S80

Image A applies to the S60 and XC70



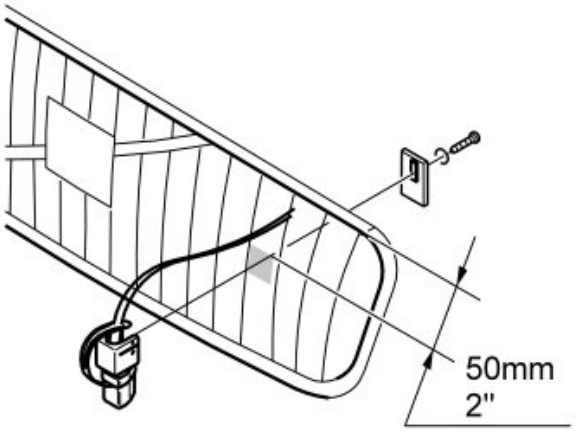
- Insert the cable through the next upper hole along to the left in the front grille. The cable must be inserted inside the weatherstrip at the edge of the front grille.
- Reinstall the front intake and tighten it with the screw.

Image B and C apply to the V70, and S80 up to and including model year -2003 (CH -334999)



- Place the front grille with the front facing upwards on a table, as illustrated.
- Place a weight on one end of the front grille so that it remains still.
- Take the electrical cable from the kit.
- Take a plastic weatherstrip tool or similar and insert it down into the fourth compartment in the left-hand side of the front grille, and turn the tool carefully so that the plates in the front grilled are separated from each other. Turn so that the cable's connector can be inserted through the front grille.
- Carry out the same procedure with the cable's black joint section, but do not bend the plates more than the join section can pass between them as this can damage the plates.

Image D applies to the V70, and S80 up to and including model year -2003 (CH -334999)

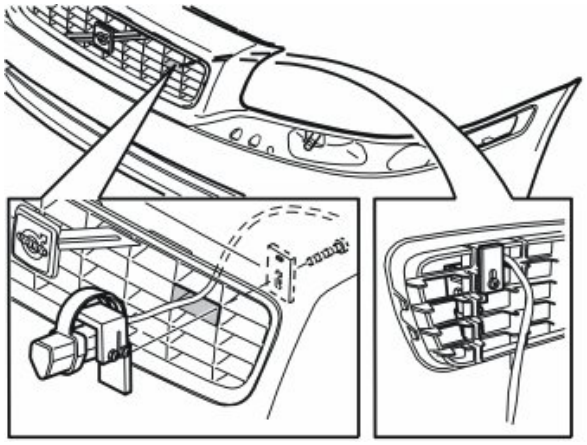


- Install the front intake 50 mm (2") from the upper edge of the front grille, and tighten using the screw.

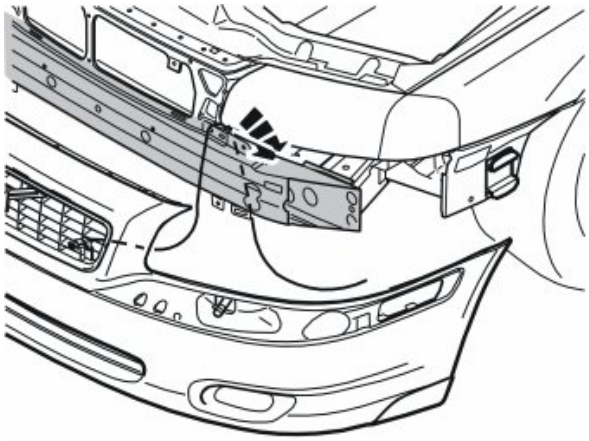
Applies to the S60, V70, and S80 up to and including model year -2003 (CH -334999)

- Reinstall the front grille and clips at the upper edge on the front.

Steps 26-27 apply to the S80 from model year 2003- (CH 335000-)

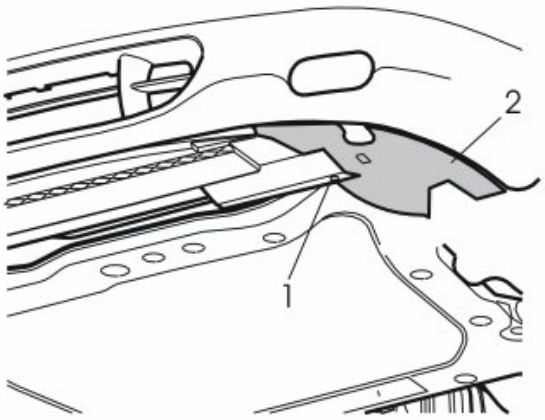


- Guide the front intake's cable in through the uppermost hole in row, next furthest to the left in the grille.
- Take screws and mounting plate from the kit. Install the front intake and slide it to the left as far as possible. Tighten.



- Insert the cable from the front intake on the upper side and rear side of the collision member on the left-hand side of the radiator and allow them to hang down.
- Reinstall the bumper cover to the body using screws and clips. Align the length of the cable by the front edge/left side of the rubber seal.
- Tighten the four M8 screws to **24 Nm (18 lbf.ft.)** and reinstall the covers.

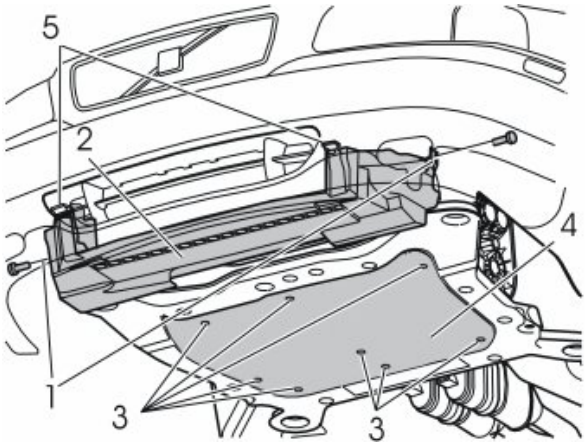
Steps 28 - 30 apply to the S60, V70 and S80



- Raise the car.

Applies to cars with side air baffles

- Remove the screw (1) from the left-hand air baffle (2), and remove the air baffle by pulling it backwards.
- Carry out the same procedure on the right-hand air baffle.



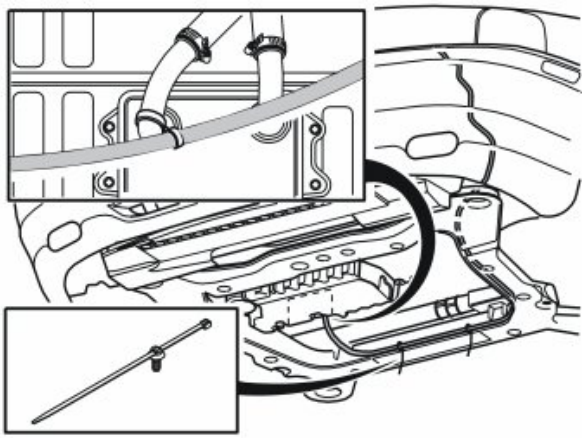
Remove:

- the air baffle (2) by undoing the screws (1), pressing up the catches (5) and moving the air baffle down and back.
- the splash guard (4) by undoing the screws (3).

- Move the cable from the front grille down to the left, passing the radiator and under the car to the air pump. (Also see image in point 30).

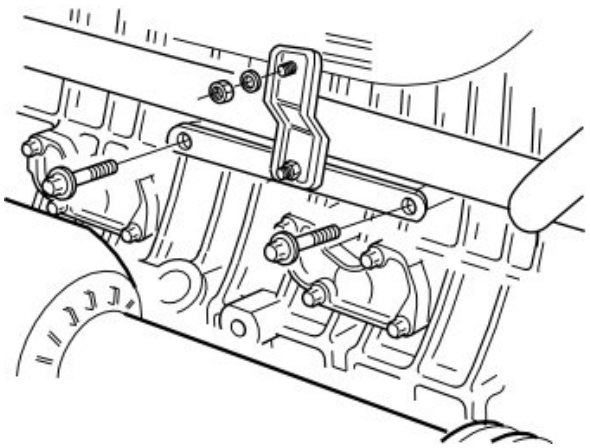
Installing, engine block heater

Applies to models



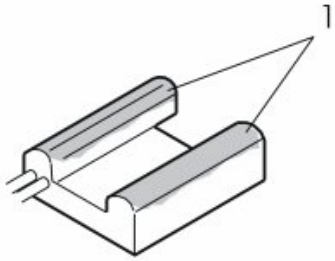
- Pull the cable above the subframe and on the inside of its left front mounting, along the left-hand side and up towards the engine.
- Clamp the cable using tie straps in the existing holes and with double clamps at pipes on the oil cooler.

Caution! Do not clamp the drive axle, and ensure that the cable does not chafe against sharp edges.



Applies to cars with T stay, as illustrated

- Remove the stay.



Applies to models

- Apply heat conducting paste, (P/N 9499205), on the surfaces (1) of the heater body that are in contact with the cylinder block.

Caution! The heat conducting paste must be applied as illustrated. This is to prevent damage from overheating.

Image A applies to cars with T stay, as illustrated

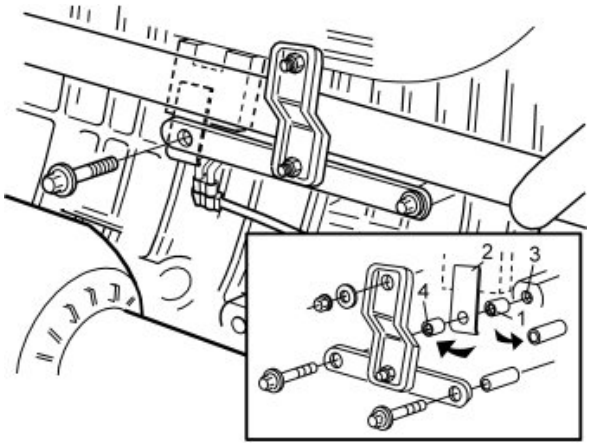


Image B applies to cars without T stay

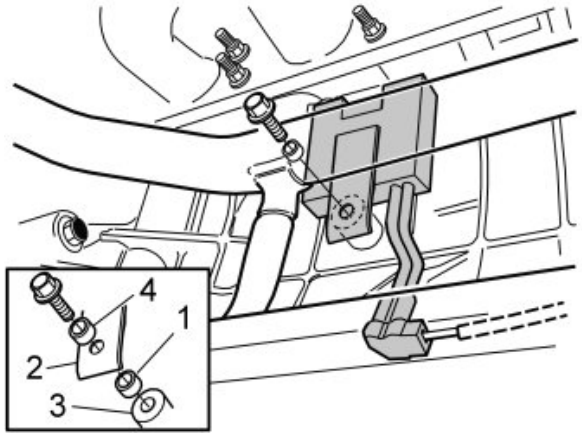


- Clean the area where the heater is to be installed. This ensures optimal heat conduction to the cylinder block. Also clean the internal threads.
- Connect the cable supplied to the heater.
- Install the heater on the engine block, as illustrated.
- Install spacer washer (1) **(t=10 mm (25/64"))** between the mounting bracket (2) and mounting hole (3) in the engine block. The outer spacer washer(4) **(t=32 mm (1 1/4"))** is inserted between the mounting bracket (2) and the T stay, if applicable.
- Tighten the heater using the screws from the kit. Tighten to **16 Nm (12 lbf.ft.)**.

Applies to cars with stay for the turbocharger from model year 2005-

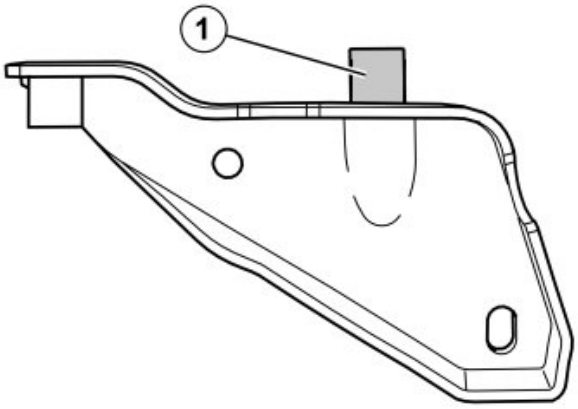
Note!

- S60 CH 425000-
- V70 CH 459000-
- XC70 CH 173000-
- S80 CH 390000-

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

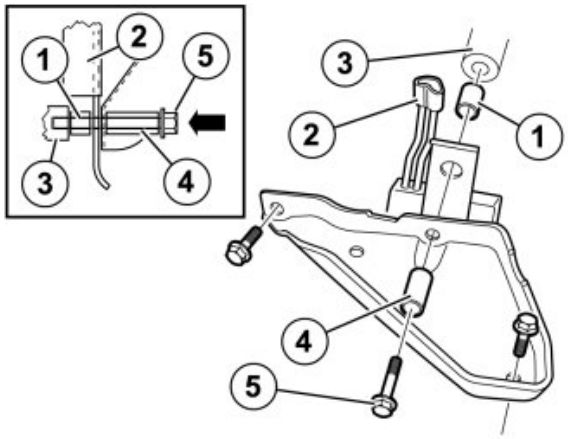
- XC90 CH 134000-

Illustration A



- Knock off the spacer (1) from the stay. Grind off the welds if the spacer is secured too tightly.

Illustration B



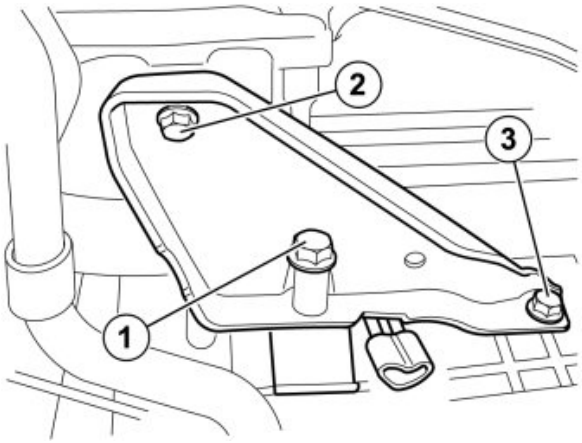
- Carefully clean the surface where the heater is to be located to provide good heat conduction to the engine block. Also clean the internal threads.

Hint: To facilitate the installation of the heater on the engine block, first secure the tensioner (2) by the heater using a small piece of butyl tape and then also secure the spacer sleeve (1) on the rear side of the tensioner using a small piece of butyl tape.

Note! The bent section of the tensioner must point away from the heater.

- Install space washer (1)**(t=10 mm (25/64"))** between tensioner (2) and the mounting in the engine block (3). Install the outer spacer washer (4) **(t=32 mm (1 1/4"))** on the outside of the bracket.
- Thread through the long screw (5) so that everything is held together.

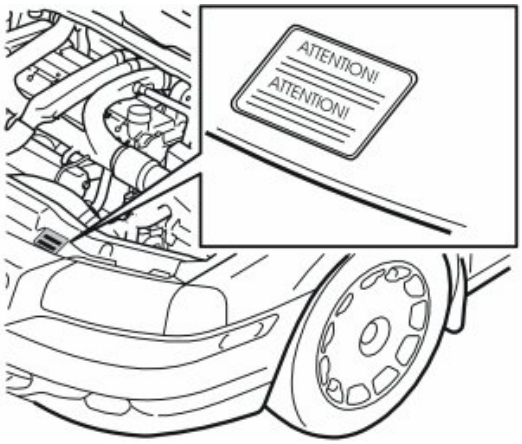
Illustration C



- Thread the heater and the tensioner. Install the turbocharger stay and screw using the three screws as follows:

- Screw the turbocharger stay into place through the tensioner in the mounting in the engine block, with the long screw (1).
- Screw the turbocharger stay in the turbocharger with the short screw (2) and into the other mounting in the engine block with the screw (3).

- Tighten the screws to **16 Nm (12 lbf.ft.)**.
- Take the radiation protection and cable from the kit. Thread the radiation protection onto the cable and connect the cable to the heater
- Install the locking sleeve on the heater's connector.



Install:

- air baffle
- the splash guard. Tighten the screws to **25 Nm (18.5 lbf.ft.)**.
- the decal from the kit.

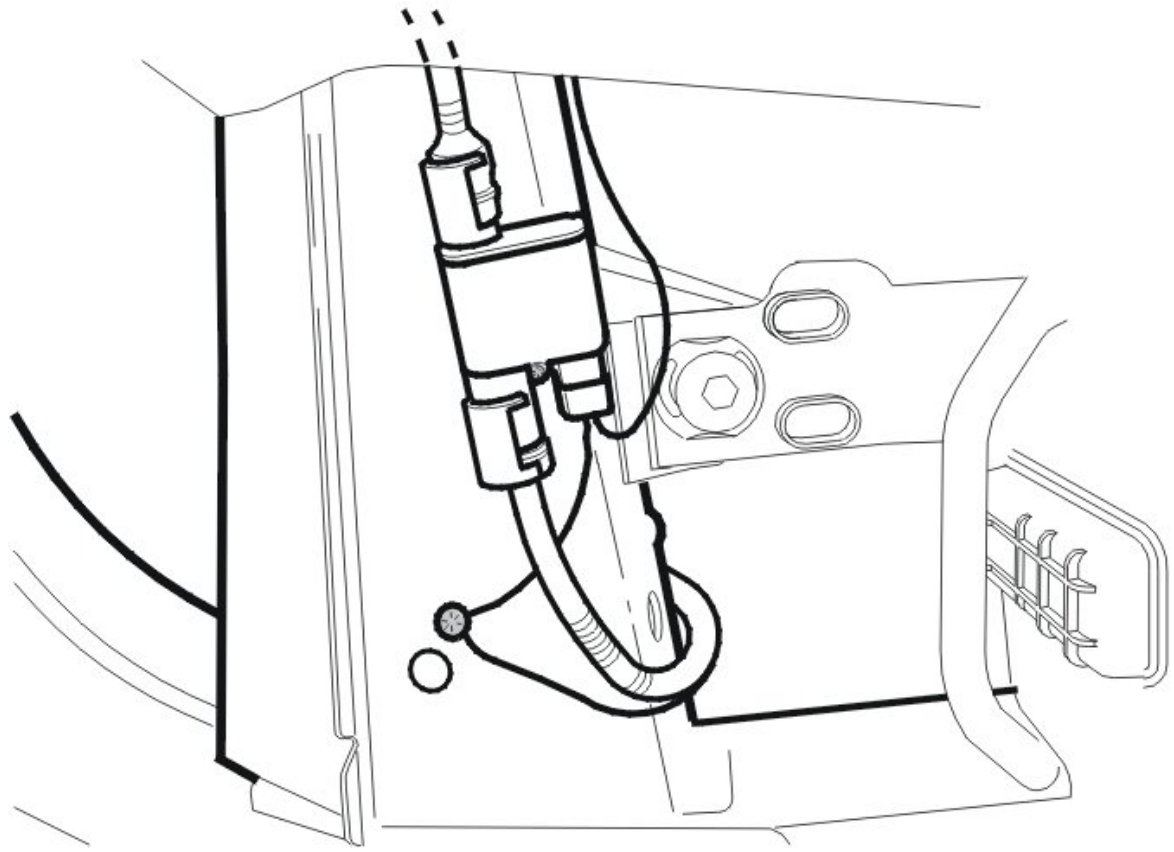
Engine Block Heater: Service and Repair
Replacing the Relay For the Electrical Engine Block Heater

Replacing the relay for the electrical engine block heater

Note! There is a relay for the accessory electronic module which is positioned on the underneath of the left front member. This may be positioned on its own or connected via an adapter socket for a charger or electrical engine block heater.

Removal

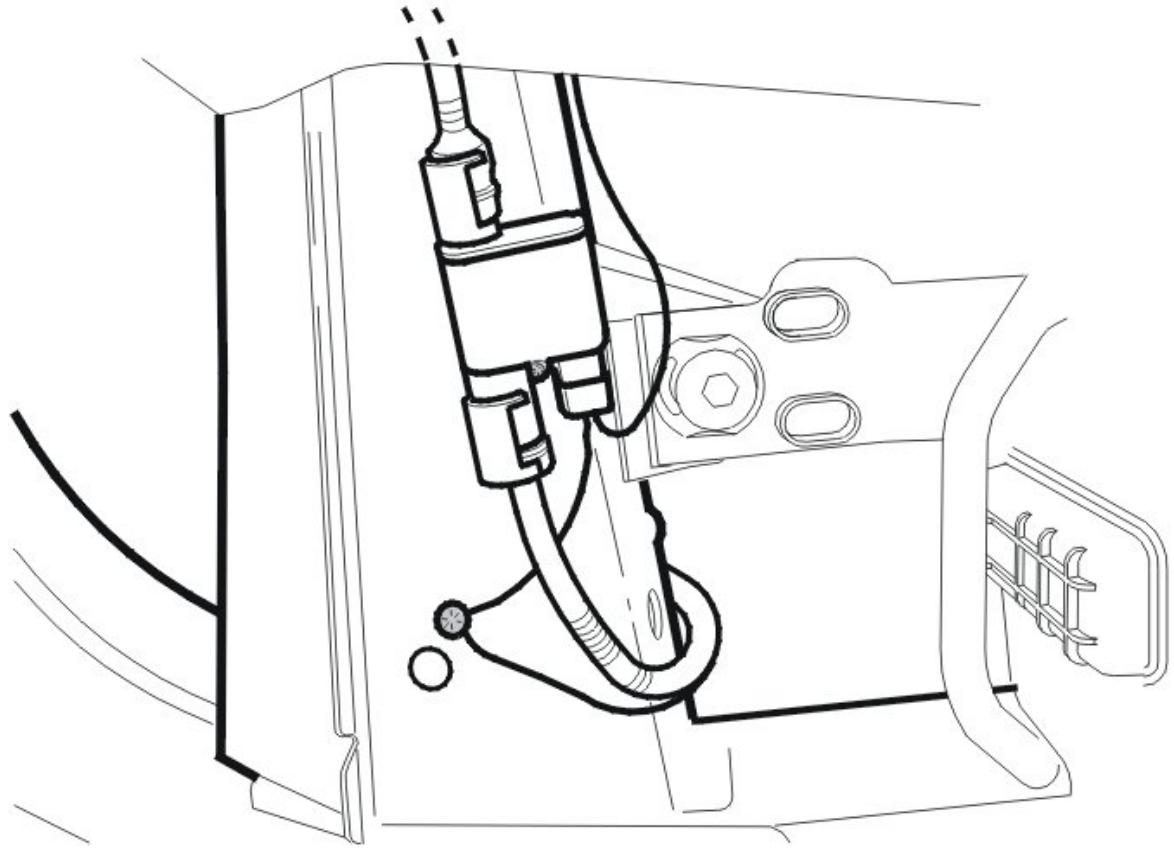
Removing the relay



Slacken off the screws for the relay.
Disconnect the connector.
Detach the relay (from the adapter socket if applicable).

Installation

Installing the relay



Connect the connector.
Reinstall the relay (reconnect it to the adapter socket if applicable).
Tighten the screw.

Cylinder Head Assembly: Removal and Replacement

Cylinder Head, Removing

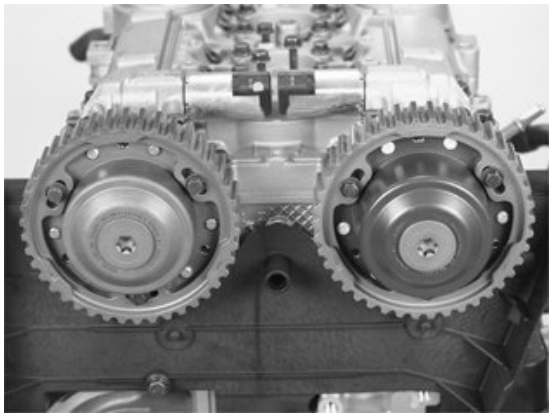
Cylinder head, removing

Special tools:

999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool
999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool
999 5670 Pliers See: Tools and Equipment/999 5670 Pliers

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the camshaft pulleys



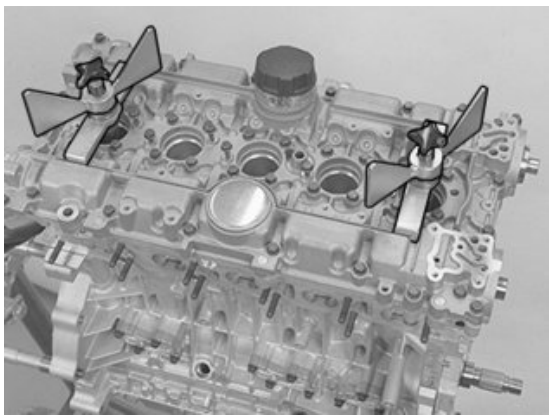
Caution! The camshafts must not be turned when the timing belt has been removed.

Install tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.
Slacken off the screws securing the timing gear pulley to the variable valve timing unit.
Remove the plug at the front edge of the variable valve timing unit (Tx 55).
Remove the center screw from the variable valve timing unit (Tx 55).
Carefully pull out the camshaft pulley with the variable valve timing unit.
Continue with the next variable valve timing unit.

Remove:

- rear timing cover
- tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool.

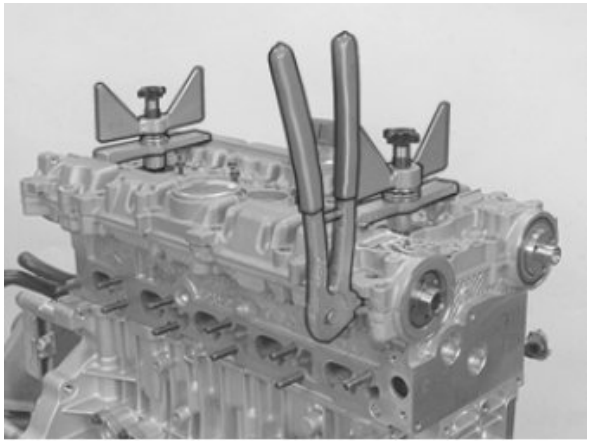
Removing the camshaft cover



Remove:

- the control valves for the variable valve timing units
- the spark plugs for cylinders 1 and 5.

Install tool 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool (2 x). Leave a **2-3 mm** gap to the camshaft cover.
Ensure that the screw in the spark plug well is tightened as far as it will go.
Remove all the screws securing the camshaft cover to the cylinder head.



Remove:

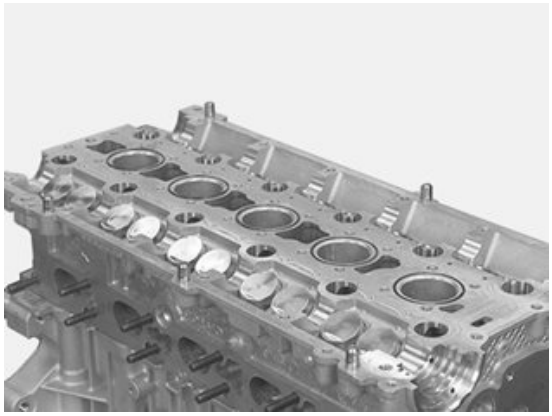
- camshaft cover with pliers 999 5670 Pliers See: Tools and Equipment/999 5670 Pliers at the stop lugs. Start with cylinder 1 and work alternately backwards
- the wing nuts approximately 2 turns. Repeat the procedure with the pliers.

Note! Do not damage the axial bearings.

Remove:

- tool 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool
- the camshaft seals at both the front and rear edges
- the camshaft cover
- the camshafts. Work loose and lift at the same time.

Removing the cylinder head



Note! Do not damage the mating surface.

Remove the pipe screw for the water heated crankcase ventilation at the rear edge of the cylinder head.
Slacken off the screwed joint for the cylinder head. Start at the sides and work alternately towards the center.
Lift out the cylinder head.

Cylinder Head, Installing

Cylinder head, installing

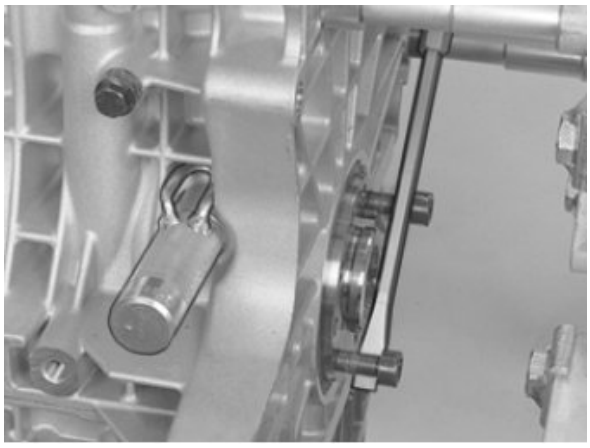
Special tools:

951 2767 Roller See: Tools and Equipment/951 2767 Roller
999 5450 PUNCH See: Tools and Equipment/999 5450 Punch
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool
999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool
999 5718 Drift See: Tools and Equipment/999 5718 Drift

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

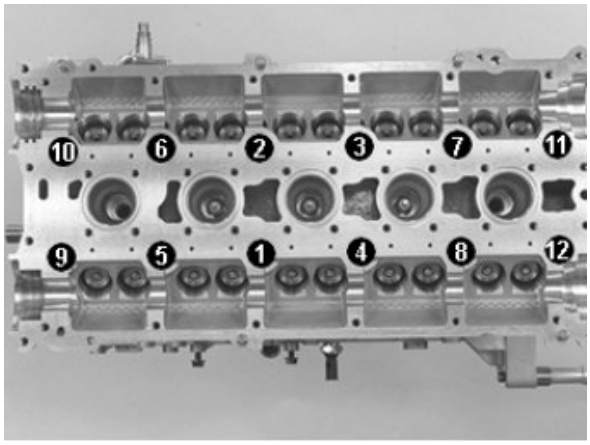
Note! For tightening torques not in the text, see Tightening torque See: Specifications/Tightening Torque.

Aligning the crankshaft



Turn the crankshaft **counter-clockwise** (viewed from the rear of the engine) until the piston in cylinder 1 reaches top dead center (TDC).
Continue turning **counter-clockwise** until the piston in cylinder 1 is approximately 2-3 cm before top dead center (BTDC).
Install the crankshaft stop999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool Ensure that it bottoms out against the cylinder block.
Now turn the crankshaft **clockwise** (viewed from the rear of the engine) until the crankshaft counter-weight is in contact with the crankshaft stop.

Installing the cylinder head

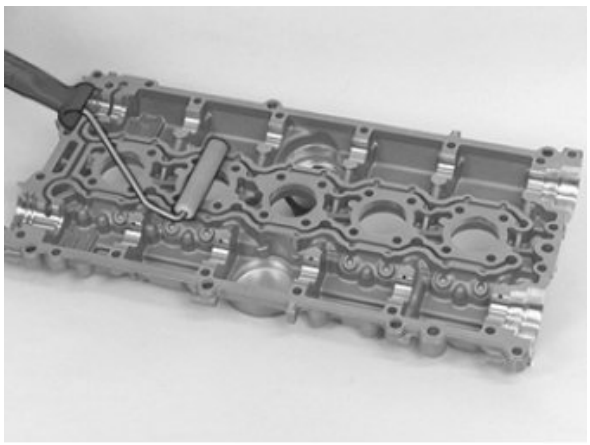


Install a **new cylinder head gasket**.
Install the cylinder head.
Use **new screws**.
Lubricate and install all the screws.
Tighten. See Tightening torque See: Specifications/Tightening Torque.

Installing valve lifters and camshafts

See Valve clearance See: Valve Clearance/Adjustments.

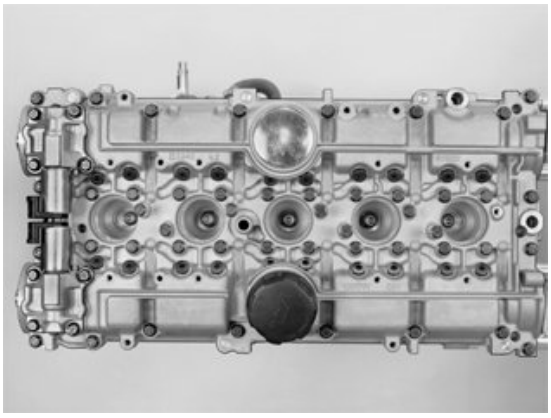
Applying liquid gasket



Wipe the oil film off the mating surfaces on the camshaft cover and cylinder head.
Install **new O-rings** around the spark plug wells at the cylinder head.
Apply liquid gasket 11 61 059 to the camshaft cover. **The surface must be completely covered without any excess.** Use roller 951 2767 Roller See: Tools and Equipment/951 2767 Roller

Note! Ensure that no liquid gasket gets in to the oil ducts.

Installing the camshaft covers



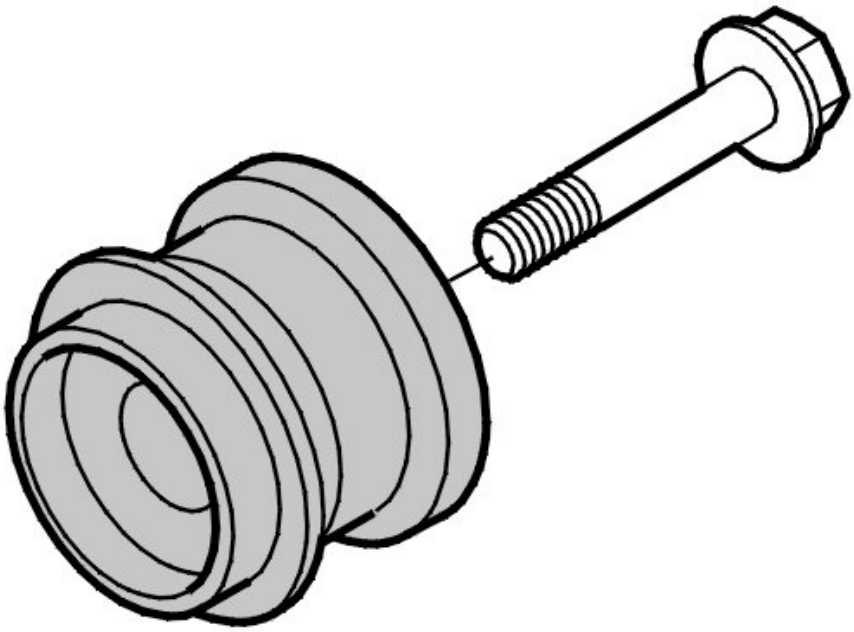
Lubricate the camshaft lobes, the camshaft bearing surfaces and the valve lifters.
Install the camshaft cover.
Install 2 press tools 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool.
Tighten the camshaft cover screws alternately, keeping it parallel to the cylinder head using the press tools.
Install all the screws and tighten.
Remove the press tools.
Install the spark plugs. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Install the control valve for the variable valve timing unit with a new gasket. Tighten.

Cleaning

To clean the camshaft journal and mating surface, use emery cloth P/N **951 1024**.

Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

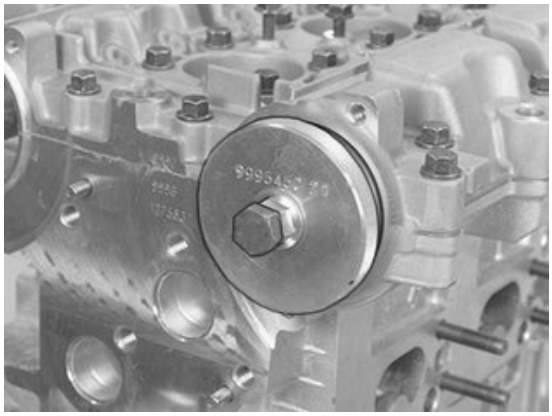
Installing the front camshaft seal



9995718

Use drift 999 5718 Drift See: Tools and Equipment/999 5718 Drift.
Use new seals.
Lubricate the surface of the seal that the camshaft rotates against.
Tap in the seal until the drift bottoms against the end of the camshaft.

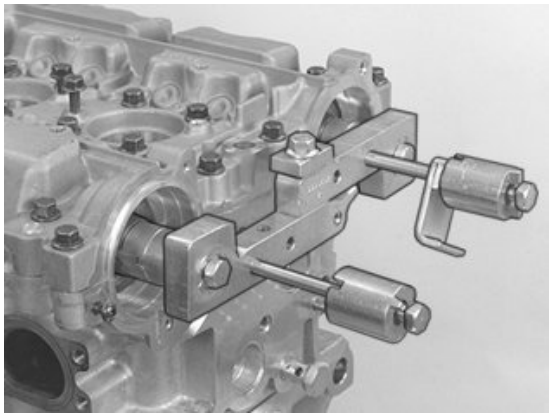
Installing the rear camshaft seal



Use drift 999 5450 PUNCH See: Tools and Equipment/999 5450 Punch.
Lubricate the surface of the seal that the camshaft rotates against.
Install the seal.
Press in the seal until the drift bottoms out.
Continue the work with the next sealing ring.

Note! If there are grooves on the camshaft, the seal can be pressed in a further 2 mm by reversing the sleeve.

Securing the camshafts



Use camshaft adjustment tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool.

Note! The camshafts must not be turned more than is listed in the text below. The valves may be damaged!

Screw the adjustment tool sections together into one.
Check that the screws retaining the adjustment tool to the camshafts and the screws holding the tool together are well tightened.

Cylinder Head/Gasket, Replacing

Cylinder head/gasket, replacement

Special tools:

999 5718 Drift See: Tools and Equipment/999 5718 Drift
999 5719 Drift See: Tools and Equipment/999 5719 Drift

Note! Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Note! There are a number of versions of the VVT-unit (variable valve timing). Therefore it is extremely important to always read the information referring to the engine variant/model year to be remedied.

Removal

Preparation

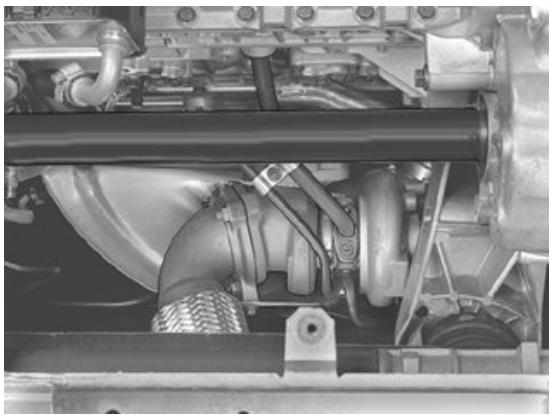
Remove

- the radiator breather tube from the expansion tank. Install lock grip pliers
- the battery negative lead. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- the right front wheel.

Draining coolant

Raise the car.
Remove the splash guard under the engine.
Open the engine nipple.
Drain the coolant into a container.
Close the nipple.

Removing components



Remove:

- the clamp between the oil pressure pipe and the oil return line at the turbocharger (TC)
- the pipe screw that holds the oil pressure pipe to the connector on the cylinder block
- the oil return line. Seal the opening in the cylinder block
- the lower screw that holds the heat deflector plate over the turbocharger (TC)
- the nuts for the front exhaust pipe connection to the turbocharger (TC). Lift off the exhaust pipe and tie it up. Seal the opening in the exhaust pipe

Note! The metal hose for the front exhaust pipe is easy to damage if it is twisted. Handle it with care to avoid leakage.

Depressurizing the fuel system

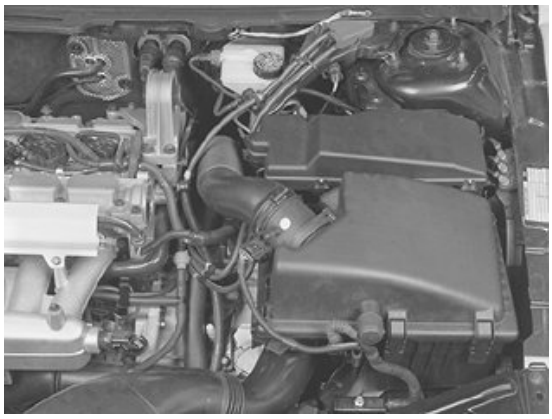
Lower the car.
Depressurize the fuel system according to: Fuel system pressure release See: Fuel Pressure Release/Service and Repair.

Removing components

Remove

- the engine stabilizer brace between the suspension turrets
- the ground strips between the engine and the firewall
- the heat deflector plate above the turbocharger (TC)
- the plastic charge air pipe above the engine. Seal the openings
- the cover over the nozzle pipes
- the cover over the ignition coils
- the upper engine coolant hose for the engine and radiator
- the screw holding the dip stick pipe to the intake manifold
- the brake vacuum hose from the intake manifold.

Undo the clamp holding the plastic charge air pipe to the electronic throttle module.



Remove

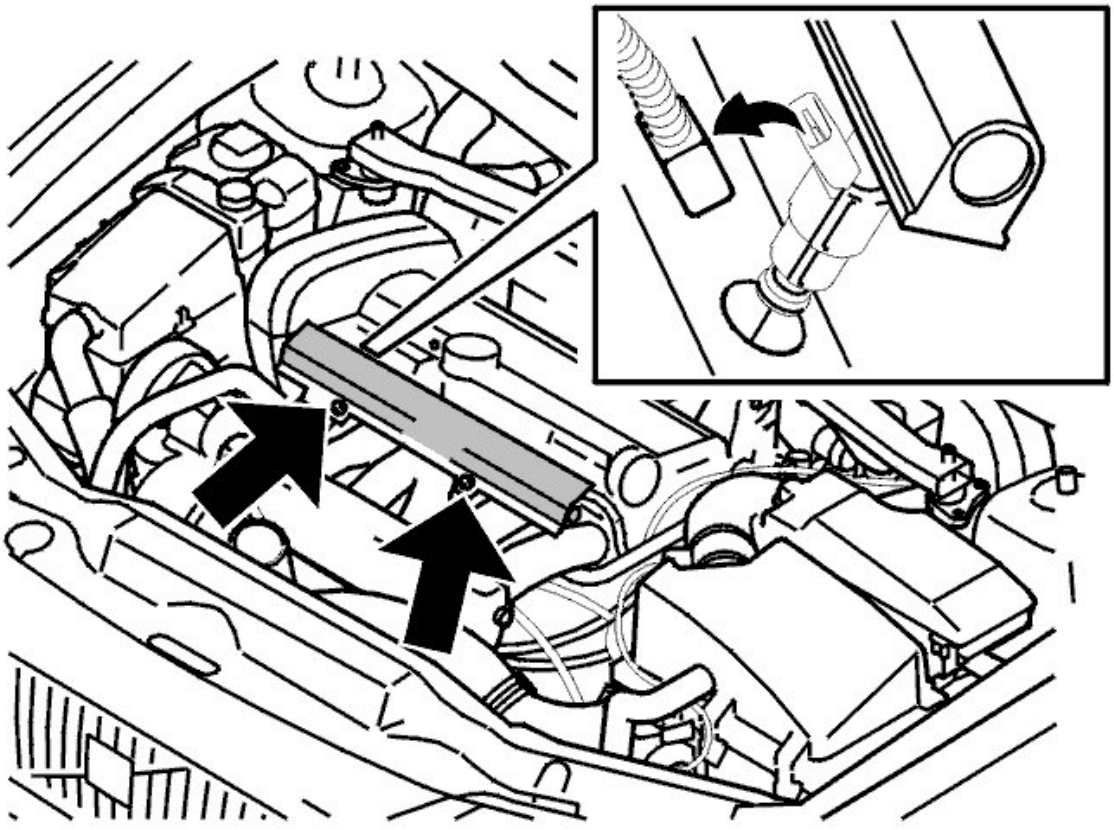
- the connector from the mass air flow (MAF) sensor
- the intake hose from the mass air flow (MAF) sensor. Seal the opening.

Release the hoses from the bracket at the rear of the cylinder head. Remove the bracket.

Remove

- the clamp for the positive lead at the rear of the cylinder head
- the torque bracket
- the pipe screw for the water-heated crankcase ventilation.

Removing the fuel rail



- Remove the clamp for the injector wiring at the rear of the cylinder head
- Detach the wiring from the injectors
- Remove the fuel rail mounting screws
- Spray universal oil or similar around the injector connectors on the intake manifold
- Gently work the fuel rail and injectors loose
- Separate the quick-release connector for the fuel line. See Fuel line, lock See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Rail/Service and Repair.
- Carefully put the fuel rail to one side.

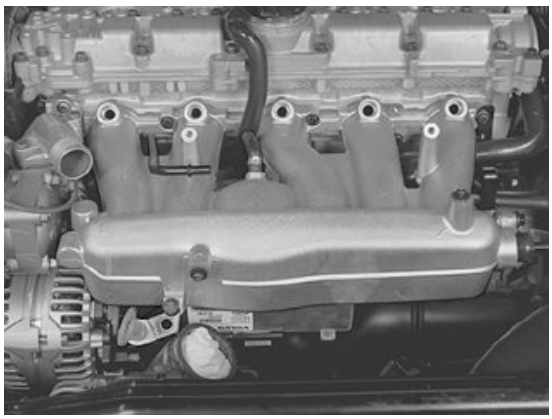
Removing ignition coils

- Mark up the ignition coils so that their original positions can be established
- Remove the mounting screws for the ignition coils and the screws at the two ground terminals
- Disconnect the connector for the variable valve timing solenoid
- Lift up and place the ignition coils and wiring to one side.

Remove:

- the crankcase ventilation hose from the top of the camshaft cover
- the camshaft position sensor (CMP) housing and trigger wheel.

Removing intake manifold



Remove:

- The EVAP hose from the intake manifold
- the by-pass valve vacuum hose. Disconnect the connector for the electronic throttle module (ETM)
- the upper row of screws holding the intake manifold to the cylinder head. Slacken off the lower screws. Lift up the intake manifold. Remove the pipe screw for the water heated crankcase ventilation underneath the intake manifold
- the pipe screw for the crankcase ventilation from the underside of the intake manifold.

Lift up and remove the intake manifold.

Note! Make sure that the fuel pressure pipe is not damaged.

Removing components

Disconnect the connectors for the ABS sensor and level sensor in the expansion tank.
Lift up the expansion tank and servo oil reservoir. Place them on top of the engine.

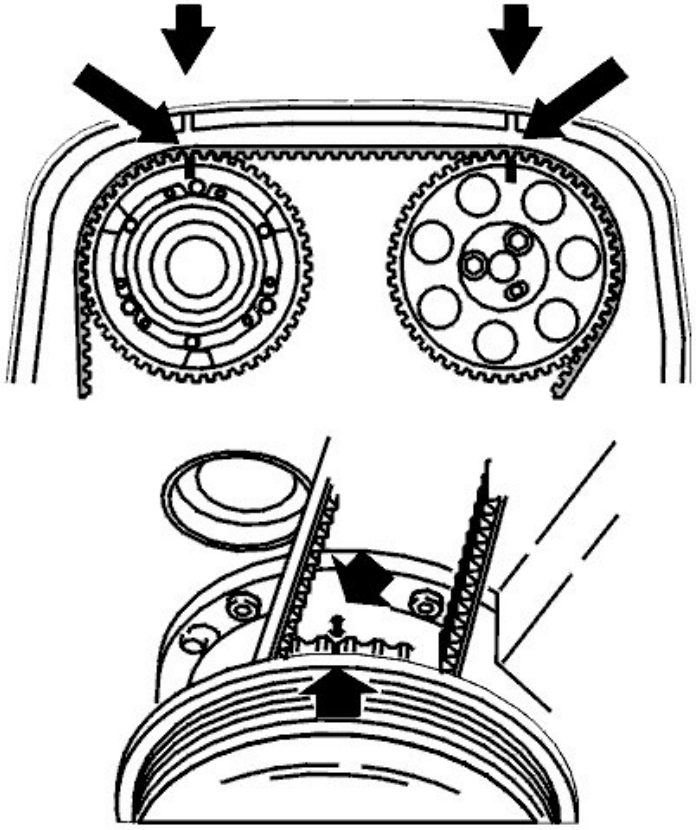
Note! Make sure that oil does not leak from the breather hole in the filler cap.

Remove the auxiliaries belt.

Remove:
- front timing cover
- the hose for the water-heated crankcase ventilation from the thermostat housing.

Separate the connector for the engine coolant temperature (ECT) sensor.

Setting up the engine



Remove the nuts from the cover on the fender liner.
Turn the crankshaft clockwise until the markings on the crankshaft and camshafts correspond.
Remove the upper timing cover.

Removing the timing belt

Slacken off the center screw for the belt tensioner slightly.
Hold the center screw secure and turn the tensioner eccentric clockwise with a 6 mm Allen key to 10 o'clock.

Remove:
- the timing belt from the timing gear pulley

- the screw that holds the inner timing cover to the cylinder head.

Install tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.

Removing the timing gear pulley

Remove the cable duct from its mountings on the right-hand suspension turret.

Note! Do not damage the paintwork.

Hold the cable duct out of the way and remove:

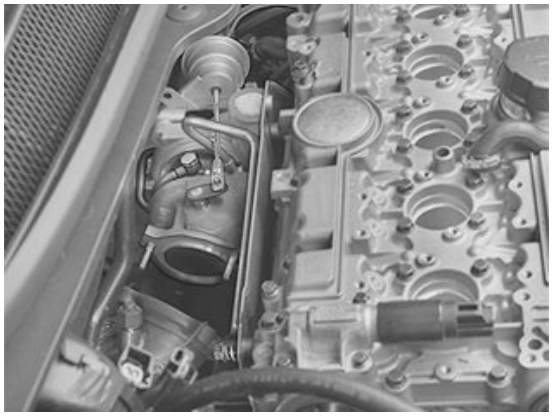
- the plug at the front of the variable valve timing unit (TX55).

Note! Use paper or similar to absorb oil that drains.

- the center screw in the variable valve timing unit (TX55).

Carefully pull out the timing gear pulley with the variable valve timing (VVT) unit.
Remove tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool.

Removing components from turbocharger (TC)

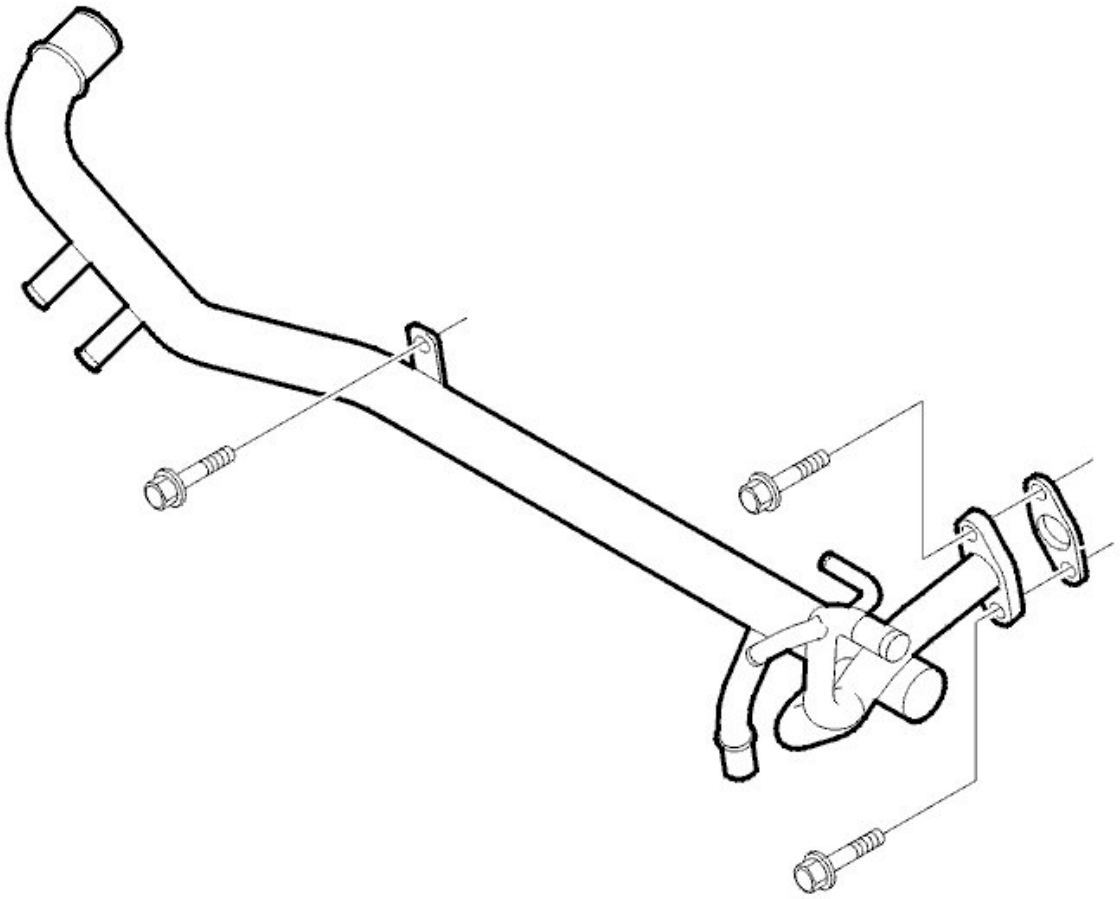


Remove:

- the heat deflector plate above the manifold
- the upper engine coolant pipe. Place it to one side
- the oil pressure pipe for the turbocharger (TC)
- the pipe screw at the lower coolant pipe for the turbocharger (TC). Put the pipe to one side
- the nuts and washers holding the manifold to the cylinder head.

Lift off the turbocharger and manifold. Carefully put them on top of the transmission.

Releasing the inlet pipe for the coolant pump



Remove:

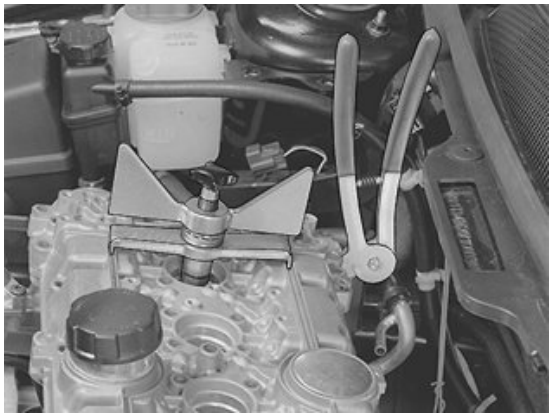
- the screw that holds the coolant pump intake pipe to the engine block a few turns. Leave the screw in place
- the two screws for the connection between the coolant pipe and the bypass channel. Carefully turn the pipe to remove it from the cylinder block.

Removing the camshaft cover and cylinder head

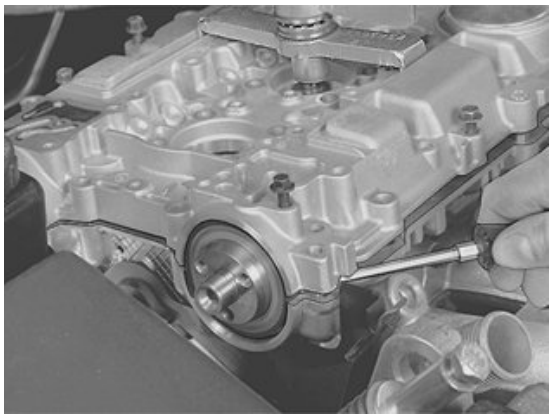
- Remove the spark plugs from cylinders 1 and 5
- Install 2 tools 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool. Leave a 2-3 mm gap to the camshaft cover.

Note! Make sure that the screw in the sparkplug thread is fully tightened. VVT-solenoid (variable valve timing).

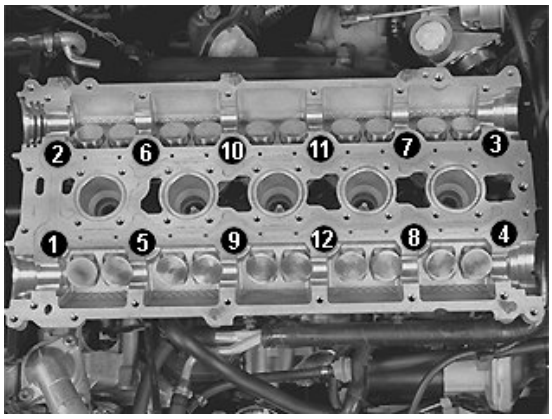
- The variable valve timing solenoids.
- Remove all the screws securing the camshaft cover to the cylinder head.



- Use pliers 999 5670 Pliers See: Tools and Equipment/999 5670 Pliers to lift the cover from the cylinder head.
- Install the pliers at the stop lugs. Start with cylinder 1 and work alternately backwards
- Slacken off the wing nuts approximately 2 turns. Repeat the procedure.



Carefully press out the front and rear camshaft seals.



Remove:

- tools 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool
- the camshaft cover
- the camshafts
- the screws holding the cylinder head onto the cylinder block. Start at the sides and work alternately towards the center.

Get some help and lift of the cylinder head. Place the cylinder head on two wooden blocks.

Note! Work carefully to avoid damaging the contact faces.

When replacing or working on the cylinder head

Lift out the valve lifters. Use a magnet or suction cup.
Remove the thermostat housing and transfer it to the new cylinder head.

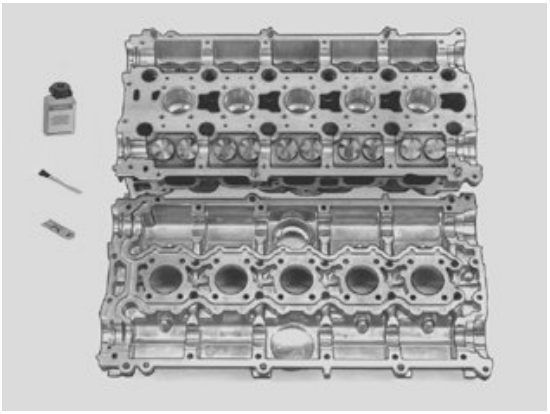
Note! Work carefully to avoid damaging the contact faces.

Installation

Note! For tightening torques, see: Tightening torque See: Specifications/Tightening Torque.

Note! To ensure that there is no exhaust leakage, see: Flanged joint, assembling See: Exhaust System/Exhaust Pipe/Service and Repair.

Cleaning



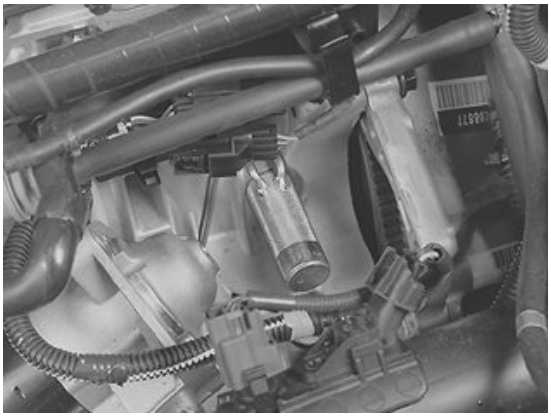
Warning! Use a fume hood or extractor when using gasket solvent!

Clean the gasket faces for:
- the manifold. Check that the studs are tightened
- the coolant bypass channel
- the thermostat housing
- the intake manifold
- the cylinder block
- camshaft cover.

Blow the oil ducts clean.

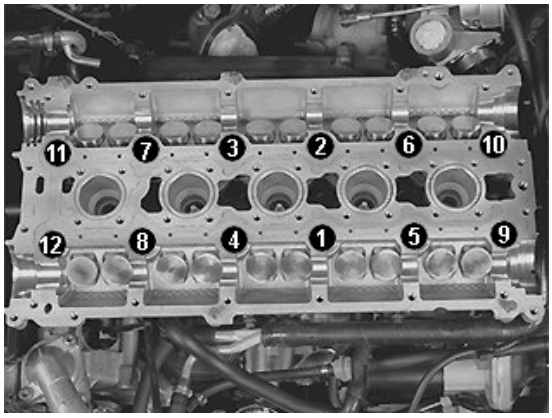
Note! Use a razor blade or a gasket scraper and gasket solvent P/N 1161 440.

Setting up the engine



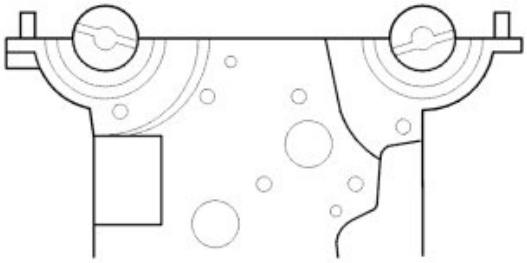
- Position the crankshaft
- Remove the starter motor mounting screws. Pull out the starter motor and place it to one side
- Remove the blind cover plug
- Turn the crankshaft slightly **clockwise**.
- Install crankshaft stop 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Ensure that it bottoms out against the cylinder block.
- Turn the crankshaft **counter-clockwise** until it stops against the crankshaft stop
- Check that the marking on the crankshaft timing gear pulley corresponds with the marking on the oil pump.

Installing the cylinder head



- Ensure that all studs at the exhaust ports are tightened
- Lubricate the studs with paste **116 1408.**
- Install a new cylinder head gasket
- Install the cylinder head
- Lubricate and install all the screws (use new screws).
- Tighten the screws as illustrated. Tighten. See Tightening torque See: Specifications/Tightening Torque. Use protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor.

Installing valve lifters and camshafts

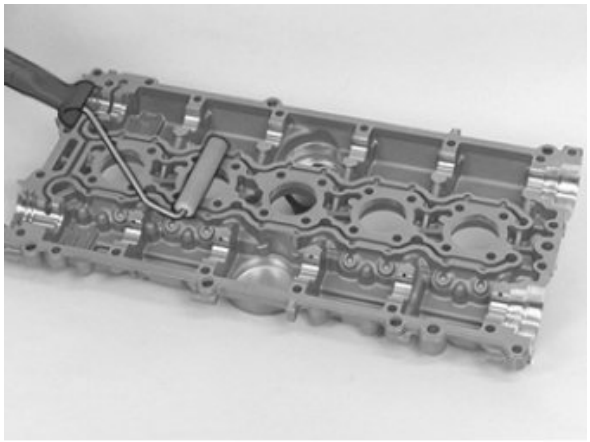


- Lubricate the valve lifter wells.

  Note! If the cylinder head has been replaced, the valve clearance must be adjusted. See Valve clearance, B5244T5, B5254T2 See: Valve Clearance/Adjustments.

- Install all valve lifters
- Lubricate the camshaft bearing positions
- Install the intake camshaft. Ensure that the groove at the back of the camshaft is **above** an imaginary center line
- Position the exhaust camshaft. Ensure that the groove at the back of the camshaft is **below** an imaginary center line.

Applying liquid gasket

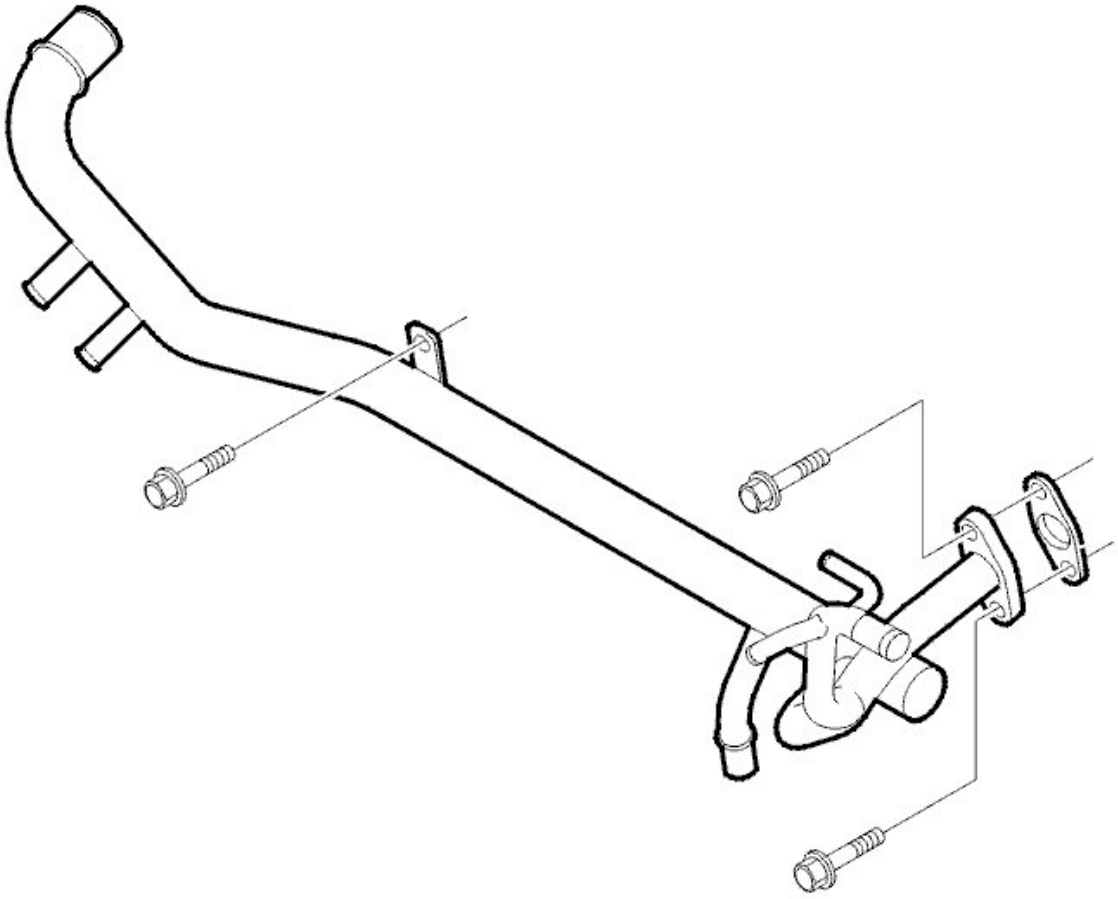


Install new O-rings around the spark plug wells at the cylinder head.
Apply liquid gasket **1161 059** to the camshaft cover.
Use roller 951 2767 Roller See: Tools and Equipment/951 2767 Roller. The surface must be **covered without any excess**.

Note! Make sure that no liquid gasket ends up in the oil channels.

Installing the camshaft cover

- Lubricate the camshaft lobes, the camshaft bearing surfaces and the valve lifters
- Install the camshaft cover
- Install press tool 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool (2x).
- Tighten the camshaft cover screws alternately, keeping it parallel to the cylinder head using the press tools
- Install all the screws. Tighten the screws from the middle and outwards
- Remove the press tools.



Install:

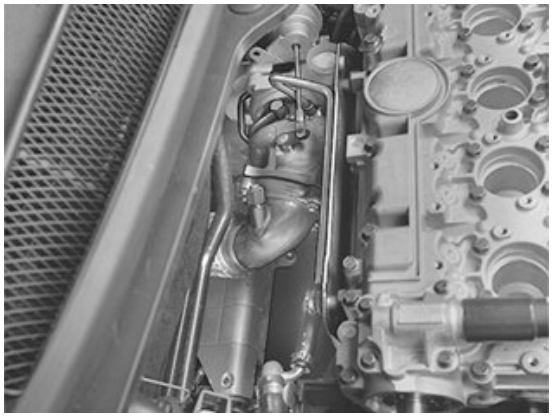
- the variable valve timing (VVT) solenoid. Use a new gasket.
- the spark plugs. Tighten. See Tightening torque See: Specifications/Tightening Torque
- the hose for water-heated crankcase ventilation to the thermostat housing. Tighten the clamp.

Connect the connector for the engine coolant temperature (ECT) sensor.
Install the inlet pipe for the coolant pump on the cylinder head. Use a new gasket.

Note! Apply thread sealant, 116 056 to the screw threads.

Tighten the screw for securing the coolant pump inlet pipe to the cylinder block.

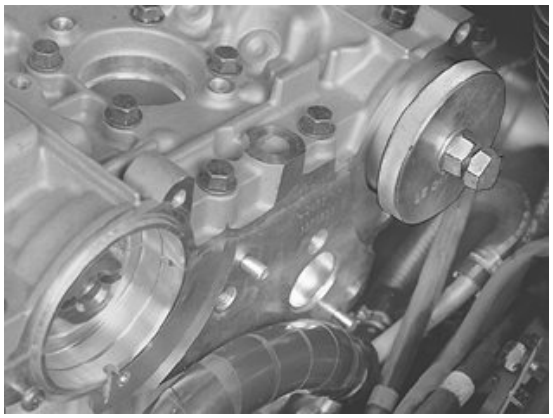
Installing the manifold and turbocharger (TC)



Install:
- new gaskets. Lift and install the manifold and turbocharger (TC)
- the nuts and washers holding the manifold to the cylinder head
- the upper and lower turbocharger (TC) coolant pipes. Tighten the clamp on the rubber hose
- the pipe screws for the coolant pipes. Use new seal washers. Tighten
- the oil pressure pipe
- the pipe screw holding the oil pressure pipe to the turbocharger (TC). Use new seal washers. **Do not tighten!**

Lubricate the studs on the turbocharger (TC). Use paste **116 1408**.
Install the front exhaust pipe onto the turbocharger (TC). Use new nuts. **Do not tighten!** Install the heat deflector plate over the manifold.

Installing the rear camshaft seal



To clean the shaft journal and mating surface, use emery cloth P/N 951 1024.

Note! For cleaning, work around the shaft journal - not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new seal ring is installed.

Use drift 999 5450 PUNCH See: Tools and Equipment/999 5450 Punch.
Lubricate the surface of the seal that the camshaft rotates against.
Press in the seal until the drift bottoms out.

Note! If there are grooves on the camshaft, the seal can be pressed in a further 2 mm: Reverse the sleeve.

Install camshaft adjustment tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.
Ensure that the screws retaining the adjustment tool to the camshafts and the screws holding the tool together are well tightened.

Installing the front camshaft seals

- Use drift 999 5718 Drift See: Tools and Equipment/999 5718 Drift.
- Lubricate the surface of the seal that the camshaft rotates against.
- Use the variable valve timing unit / timing belt pulley mounting screws. Tighten the screws until the drift bottoms out
- Remove the drift
- Install the screw holding the inner timing cover to the cylinder head.

Checking and adjusting the variable valve timing unit

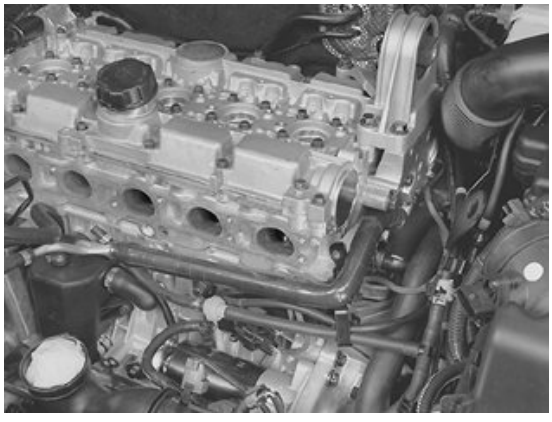
Check and adjust the variable valve timing unit. See: Variable valve timing unit, checking and adjusting, B5244T5, B5254T2 See: Actuators and Solenoids - Engine/Variable Valve Timing Actuator/Testing and Inspection

Installing components

Install:

- front timing cover
- the cable duct to the mountings on the right suspension turret
- the auxiliaries belt
- the expansion tank
- the servo oil reservoir
- the bleed hose to the expansion tank. Tighten the clamp.

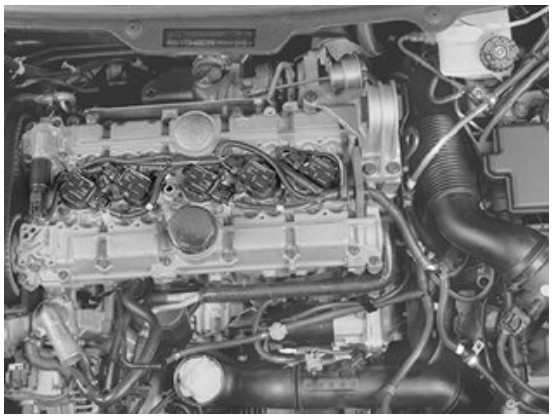
Check that the hoses are installed correctly.
Connect the connectors for the ABS sensor at the right suspension turret and for the coolant level sensor in the expansion tank.



Install:

- the starter motor
- the pipe screw for the water heated crankcase ventilation at the rear of the cylinder head. Use new seal washers. Tighten to **26 Nm**

- the camshaft position sensor (CMP) housing and trigger wheel
- the lower engine stabilizer brace bracket in the cylinder head
- the upper engine stabilizer brace.



Install:

- the bracket and lifting eyelet for the engine stabilizer brace bracket
- the ignition coils and ground terminals according to earlier markings. Connect the connector for the variable valve timing solenoid
- the clamp for the positive lead at the lifting eyelet bracket
- the plastic intake pipe to the mass air flow (MAF) sensor. Tighten the clamp.

Connect the connector to the mass air flow (MAF) sensor. Use a clamp on the wiring at the front of the air cleaner (ACL).

Installing intake manifold

Clean the intake manifold gasket face to the cylinder head.
Install a new gasket on the cylinder head. Secure with the two screws in the lower row.
Lower and twist the intake manifold so that the fuel pressure line goes through the cavity in the intake manifold.

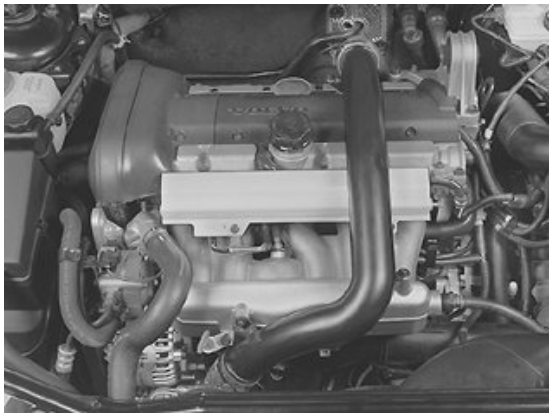
Note! Work carefully to avoid damaging the fuel pressure pipe.

Route the crankcase ventilation hose through the cavity in the intake manifold.

Install:

- the pipe screw for the crankcase ventilation on the underside of the intake manifold. Use new seal washers. Tighten to **26 Nm**
- the rest of the screws holding the intake manifold to the cylinder head. Tighten to **19 Nm**
- the hose to the canister purge (CP) valve
- the control hose for the turbocharger (TC) by-pass valve
- the brake vacuum hose
- the crankcase ventilation hose to the top of the camshaft cover. Use a new clamp
- the cover over the ignition coils
- the upper timing cover
- the upper engine coolant hose for the engine and radiator. Tighten the clamp
- the screw holding the dip stick pipe to the intake manifold. Connect the connector to the electronic throttle module (ETM)
- the charge air pipe between the throttle body (TB) and the charge air cooler (CAC). Remove the seal. Tighten the clamp.

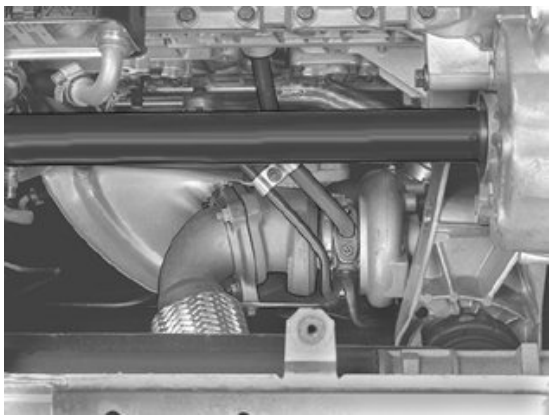
Installing the fuel rail



Install:

- the fuel rail. Use new screws. Press the quick-release connector for the fuel pressure line until it clicks. See Fuel line, lock See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Rail/Service and Repair
- the clamp for the injector wiring at the rear of the cylinder head
- the protective cover over the injector connectors
- the charge air pipe over the engine. Tighten the pipe using the three screws on the engine. Tighten the clamps.

Installing components



Raise the car. Install:

- the pipe screw that holds the turbocharger (TC) oil pressure pipe to the engine. Use new seal washers. Tighten. See Tightening torque See: Specifications/Tightening Torque
- the turbocharger (TC) oil return line. Use a new gasket and sealing ring. Tighten. See Tightening torque See: Specifications/Tightening Torque
- the clamp between the oil pressure pipe and the oil return line. Tighten the three nuts that hold the front exhaust pipe to the turbocharger (TC). See Tightening torque See: Specifications/Tightening Torque.
- the lower screw for the heat deflector plate over the turbocharger (TC)
- the splash guard under the engine
- the plastic nuts for the hatch in the right fender liner
- the right front wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Lower the car.
Tighten the pipe screw for the turbocharger (TC) oil pressure pipe. See Tightening torque See: Specifications/Tightening Torque.

Install:

- the ground strips between the cylinder head and the firewall

- the engine stabilizer brace between the suspension turrets Clamp the servo hose at the right-hand engine stabilizer brace mounting
- the negative battery lead. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Check

Replace the oil and oil filter if necessary.

Check:

- the engine oil level
- the servo oil level
- the coolant level.

Warm up the engine until the thermostat opens.
Check the engine for leaks.
Top up the coolant if necessary.

Cylinder Head Assembly: Overhaul

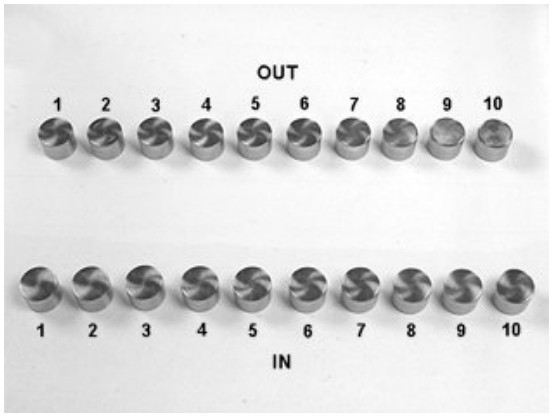
Cylinder head, dismantling/assembling

Special tools:

998 6052 VALVE SPRING B21 D16 D24 See: Tools and Equipment/998 6052 Valve Spring B21 D16 D24
999 5219 GRIP TOOL See: Tools and Equipment/999 5219 Grip Tool
999 5748 Valve compressor B 4164-B 6304 See: Tools and Equipment/999 5748 Valve Compressor B 4164-B 6304
999 7012 Drift valve stem seal diesel See: Tools and Equipment/999 7012 Drift Valve Stem Seal Diesel

Note! The illustrations in this service information are used for different model years and / or models. Therefore there may be some variation. However, the essential information in the illustrations is always correct.

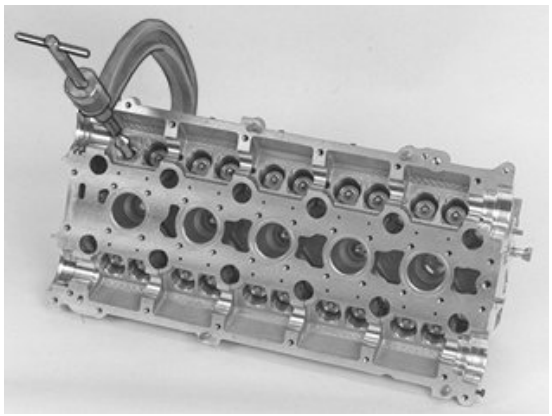
Removing tappets



Note! Magnets must not be used when lifting out the tappets.

Lift out the tappets. Mark up the tappets so that the original positions can be established.
Use a suction cup to remove the tappets.
Check for wear on the tappets.

Removing valves

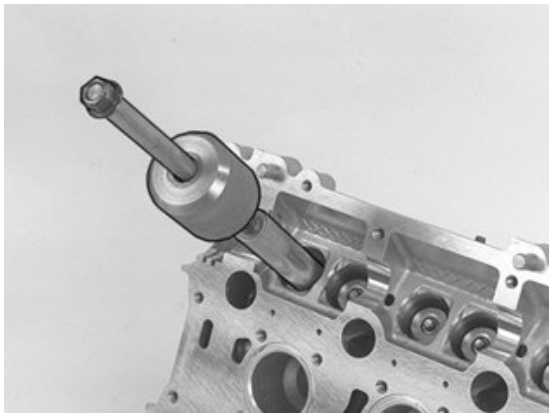


Use valve spring compressor 998 6052 VALVE SPRING B21 D16 D24 See: Tools and Equipment/998 6052 Valve Spring B21 D16 D24 with attachment claw 999 5748 Valve compressor B 4164-B 6304 See: Tools and Equipment/999 5748 Valve Compressor B 4164-B 6304.

Remove:
- the valve locks
- the upper valve collars
- the valve springs
- the valves.

Note! Keep careful track of the position of the moving parts.

Removing valve stem seals

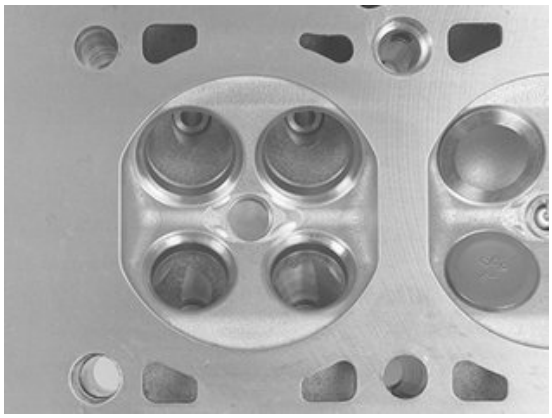


Use tool 999 5219 GRIP TOOL See: Tools and Equipment/999 5219 Grip Tool.
Remove the valve stem seals and the lower valve collars.

Clean the cylinder head:

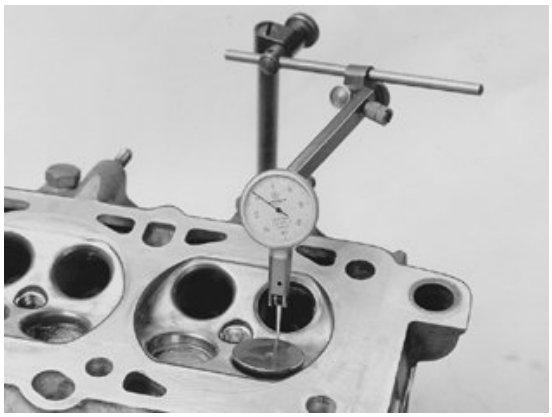
- the gasket faces
- the combustion chambers
- the inlet and exhaust ports
- the valve seats.

Checking the cylinder head



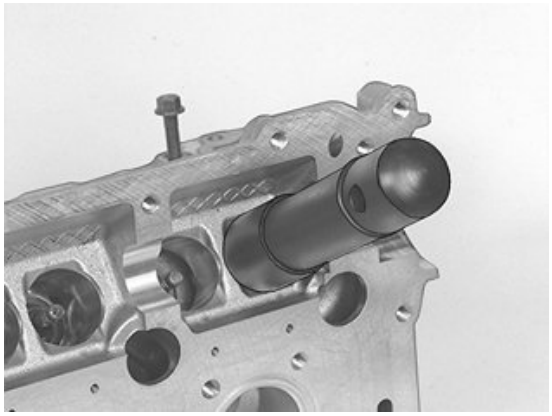
Clean the spark plug threads (tap M14 x 1.25).
Clean the valves, valve springs and collars.
Visually check for damage.
If you are unsure, replace the cylinder head.

Checking for wear in the valve guides



Measure the wear in the valve guides. Use a dial indicator and magnetic holder. Lift the valve approximately **2-3 mm** from the seat when carrying out the check.
Clearance between the valve and valve guide:
Clearance between new components: Inlet/Exhaust: **0.03 -0.06 mm**.
Maximum play for used components: Inlet/Exhaust: **0.15 mm**.

Installing valve stem seals

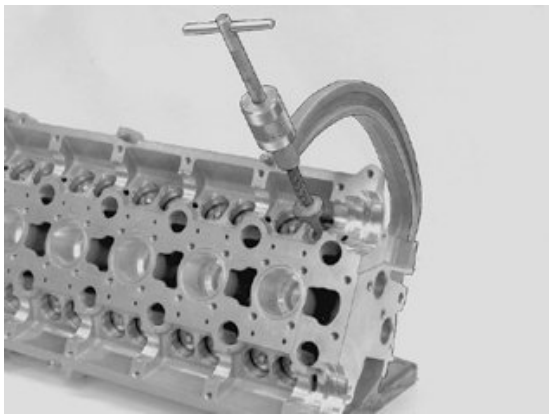


Lubricate:
- the upper end of the valve guides
- the valve stem seal.

Install:
- the lower valve spring collars
- the valve stem seal.

Press down the seal. Use tool 999 7012 Drift valve stem seal diesel See: Tools and Equipment/999 7012 Drift Valve Stem Seal Diesel. Press with hand force until the tool stops against the lower valve spring washer. Remove the tool.
Repeat the procedure with the remaining valve stem seals.

Installing the valve / valve springs



Lubricate the valve stem.

Install:
- the valve
- the valve spring
- the upper valve spring washer.

Caution! Do not compress more than is absolutely necessary, the valve stem seal may be damaged.

Compress the valve spring so that the three valve lock tracks are visible.
Use valve spring compressor 998 6052 VALVE SPRING B21 D16 D24 See: Tools and Equipment/998 6052 Valve Spring B21 D16 D24 and press foot 999 5748 Valve compressor B 4164-B 6304 See: Tools and Equipment/999 5748 Valve Compressor B 4164-B 6304. Install the valve collets. Check that valve collets are in the correct position when the spring is not loaded.
Repeat the procedure with the remaining valves.

Valve Clearance: Adjustments

Valve clearance

Special tools:

951 2767 Roller See: Tools and Equipment/951 2767 Roller
999 5450 PUNCH See: Tools and Equipment/999 5450 Punch
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool

999 5752 Feeler gauge See: Tools and Equipment/999 5752 Feeler Gauge
999 5765 Holder camshaft See: Tools and Equipment/999 5765 Holder Camshaft

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Note! There are a number of versions of the variable valve timing unit. Therefore, it is extremely important to always read the information referring to the engine variant/model year to be worked on.

Preparation

Remove the cable from the battery negative terminal. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.
Check the valve clearance. See Information See: .

Note! Note the valve clearance in the inspection form!

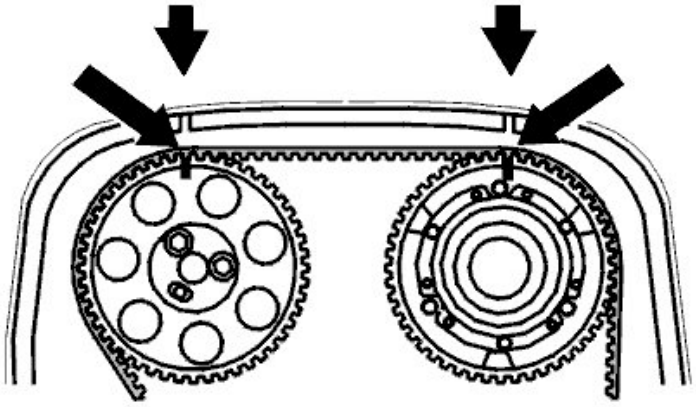
Remove

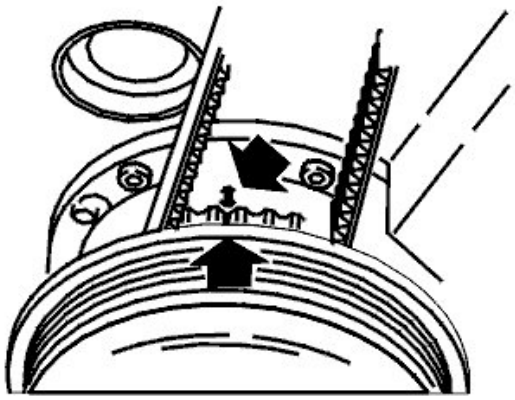
- the cross stay between the suspension turrets
- the ground strip from the cylinder head
- the upper engine stabilizer brace
- the cover in the cylinder head at the rear of the exhaust camshaft
- the crankcase ventilation hose from the top of the camshaft cover
- the radiator breather tube from the expansion tank. Install lock grip pliers.

Lift up the brake fluid reservoir.
Disconnect the ABS sensor connector.
Place the brake fluid reservoir over the engine.

Warning! Make sure that no fluid is spilled on the engine. It is extremely flammable!

Disconnect the connector for the level sensor in the expansion tank.
Lift up and place the expansion tank on top of the engine.





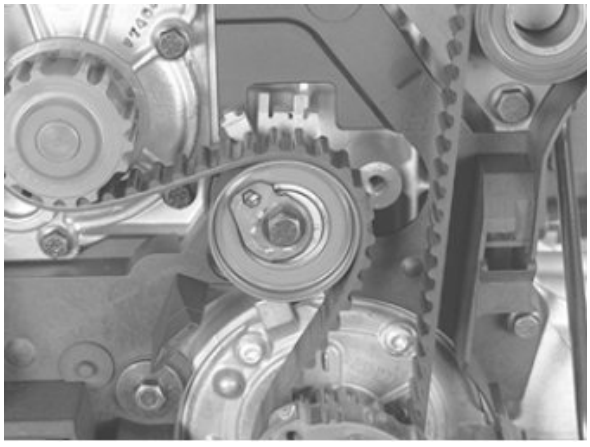
Remove

- the auxiliaries belt
- the front timing cover.

Position the upper timing cover.
Turn the crankshaft clockwise until the markings on the crankshaft belt pulley and the timing belt pulley are aligned with the markings on the oil pump and the upper timing cover.
Remove the upper timing cover.

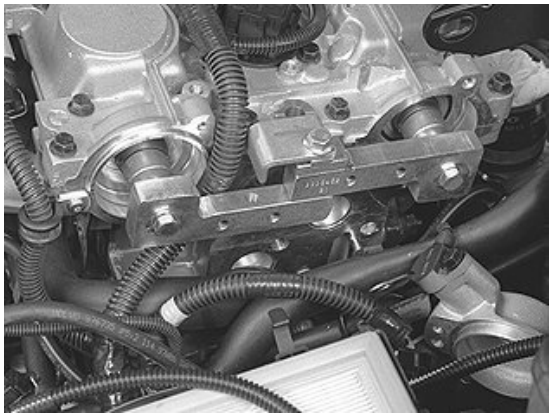
Caution! Crankshaft and camshafts must not be turned more than is stated in the method description. If the shafts are turned in any other way the valves may be damaged.

Removing the timing belt



Slacken off the center screw for the belt tensioner slightly.
Hold the center screw still. Turn the tensioner eccentric clockwise to 10 o'clock using a 6 mm Allen key.
Remove the timing belt from the camshaft pulleys.

Removing the timing gear pulley



Install gauge 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.
Check that the screws securing the adjustment tool to the camshafts and the screw holding the tool together are well tightened

Remove (timing gear pulley with variable valve timing unit)

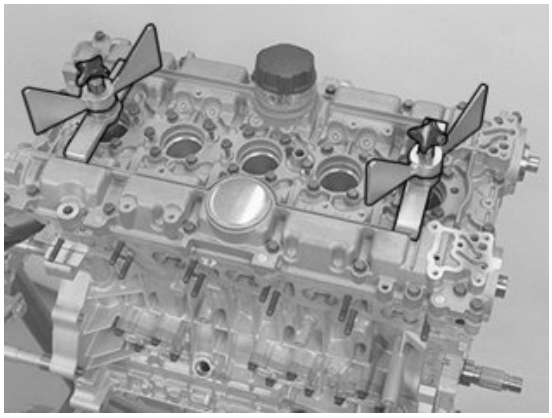
- the plug at the front of the variable valve timing unit (Tx55)
- the center screw in the variable valve timing unit (Tx55). Carefully pull out the variable valve timing unit with the timing gear pulley.

Remove (timing gear pulley without variable valve timing unit)

- the screws securing the timing gear pulley on the camshaft
- the timing gear pulley.

Remove tool 999 5452.
Reinstall the expansion tank and the brake fluid reservoir at the wing liner.

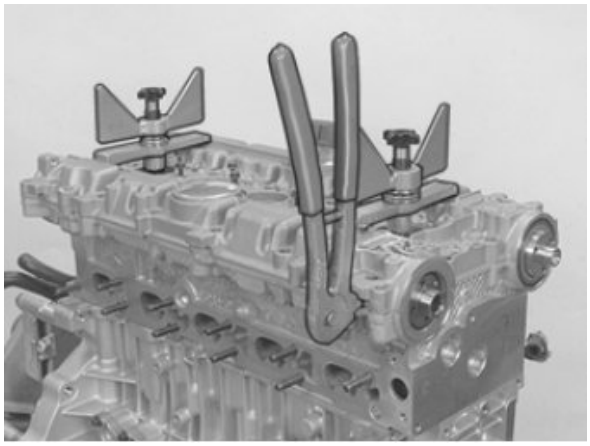
Removing the camshaft cover



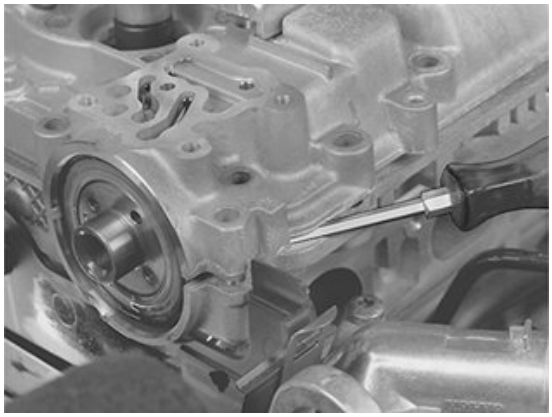
Remove

- the variable valve timing (VVT) solenoid
- spark plugs for cylinders 1 and 5.

Install tool 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool (2 pcs.) with 2-3 mm gap to the camshaft cover.
Ensure that the screw in the spark plug well is fully tightened.
Remove all the screws securing the camshaft cover to the cylinder head.

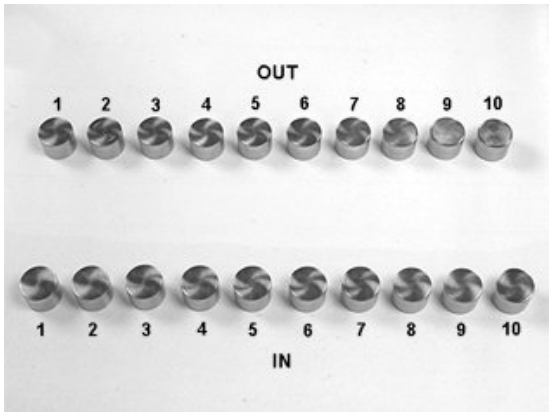


Use pliers 999 5670 Pliers See: Tools and Equipment/999 5670 Pliers to lift the cover from the cylinder head.
Install the pliers at the stop lugs. Start with cylinder 1 and work alternately backward.
Slacken off the wing nuts approximately 2 turns. Repeat the procedure with the pliers.



Carefully press the camshaft seals free.

Note! Be very careful to not damage the sealing surfaces on the camshafts.



Remove

- tool 999 5454
- the camshaft cover
- the camshafts.

Lift out the tappets. Mark up the tappets so that the original positions can be established.

Cleaning

Use a razor blade or a gasket scraper and gasket solvent P/N 1161 440 on the camshaft cover.

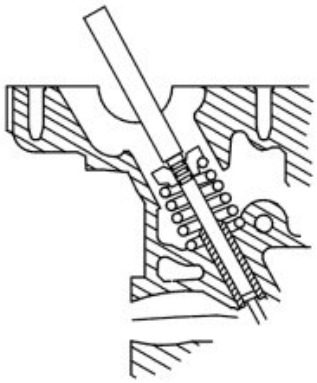
Warning! Use a fume hood or extractor when working with gasket solvent!

Use only a gasket scraper or razor blade on the cylinder head.

Caution! Be very careful around the oil channels for the variable valve timing solenoid. This applies to both the camshaft cover and the cylinder head. The solenoid is extremely sensitive to impurities.

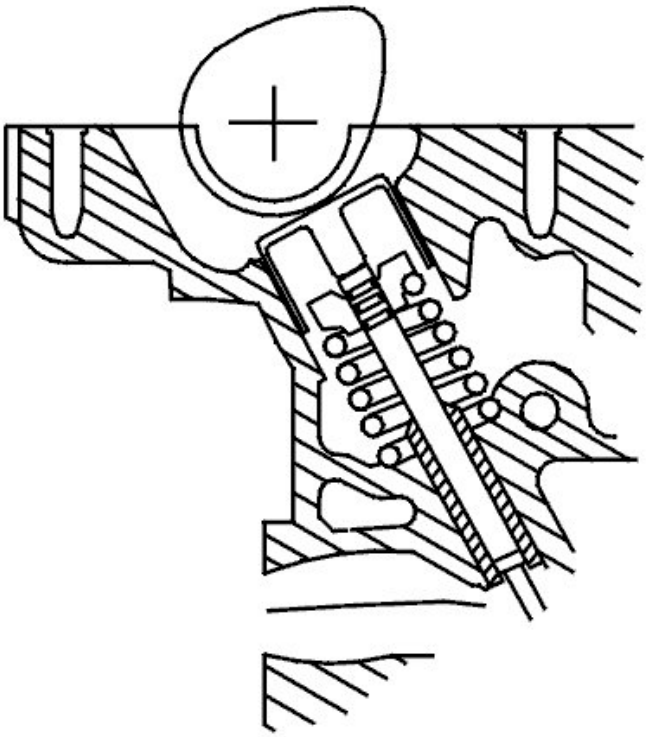
Dry and blow all surfaces clean.

Preparations



Carefully tap the end of the valve stem to ensure that the valve is correctly located in the seat.
Use a plastic, aluminum or brass drift to protect the valve and the surface of the tappet.
The sound made by tapping reveals if the valve is correctly seated.

Installing the camshaft and tappet



Install both the tappets for the inlet valves at cylinder 1.
Check the notes made earlier. Select new tappets if necessary.

Note! Only install two tappets. The tappets should be placed by the same cylinder!

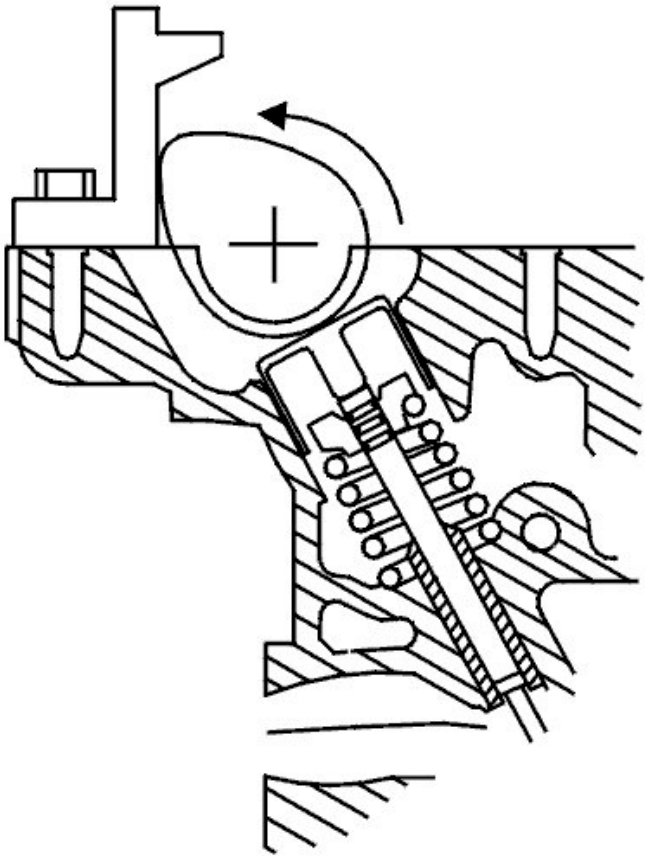
Other tappets are available as replacement part / replacement part kits.

Inlet valve: 0.20 ± 0.03 mm.
Exhaust valve: 0.40 ± 0.03 mm.

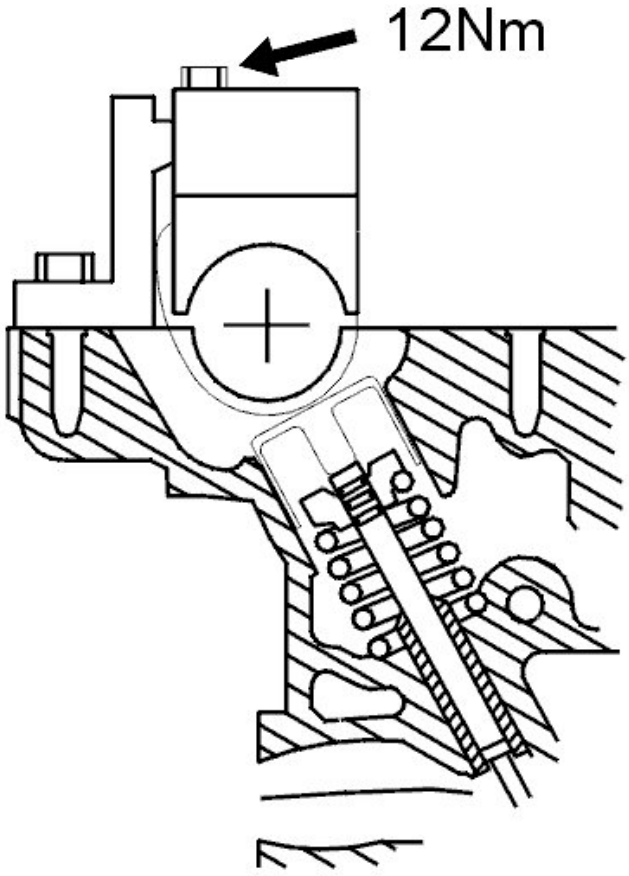
Note! The tolerances are less when setting! When checking the valve clearance through the plug hole, the tolerances are larger.

Position the intake camshaft. Ensure that the lobes at cylinder 1 point upwards.
Apply a little oil to the cam lobe and the upper side of the tappet to facilitate later measurement.

Installing the camshaft press

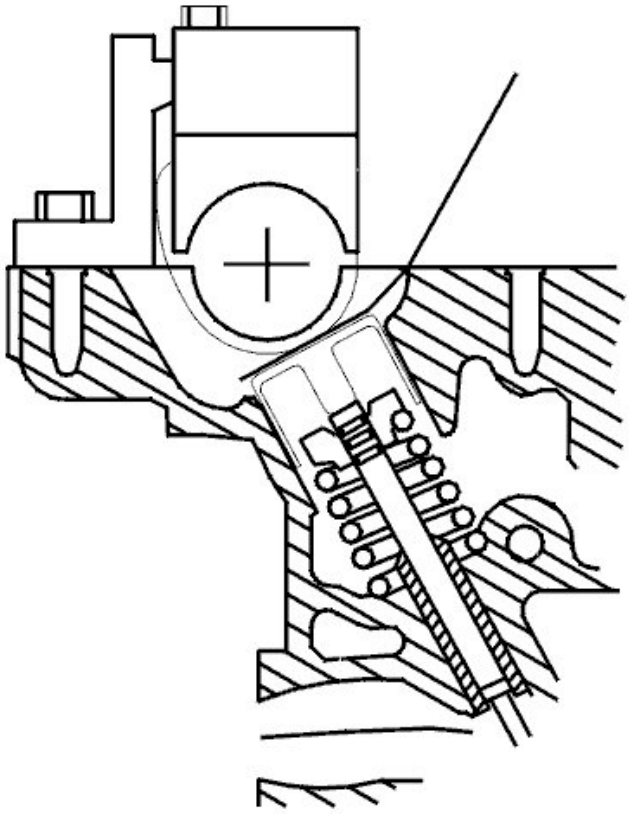


Install the lower section of camshaft press 999 5765 Holder camshaft See: Tools and Equipment/999 5765 Holder Camshaft by the inlet valves for cylinder 1.
Tighten the tool against the cylinder head. Tighten to 17 Nm.
Turn the camshaft until it stops against the camshaft press.



Install the upper section of the camshaft press.
Tighten the screw which tensions the camshaft. Tighten to **12 Nm**.

Checking the valve clearance



Note! Measurements should only be taken on a cold engine. A suitable temperature is approximately 20 °C.

Use feeler gauge 999 5752 Feeler gauge See: Tools and Equipment/999 5752 Feeler Gauge.
Press with a finger so that the feeler gauge lies parallel to the upper side of the tappet (see illustration).
Move the feeler gauge sideways when taking the reading in order to obtain as accurate a measurement as possible.

Inlet valve: 0.20 ± 0.03 mm.
Exhaust valve: 0.40 ± 0.03 mm.

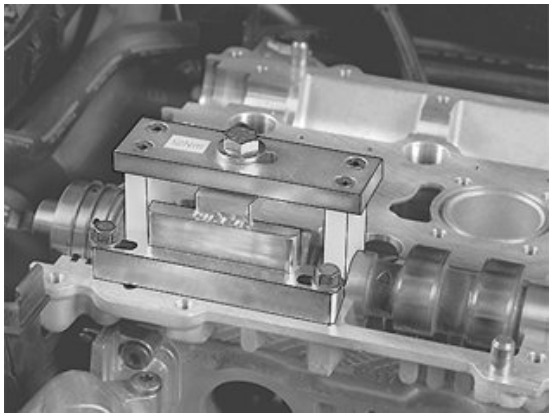
Note! The tolerances are less when setting! When checking the valve clearance through the plug hole, the tolerances are larger.

- 0.01 mm at 15 °C
+ 0.01 mm at 25 °C
+ 0.02 mm at 30 °C
+ 0.03 mm at 35 °C
+ 0.04 mm at 45 °C

Correcting measured clearance

Lift out the upper section of the press tool.
Lift out the camshaft.
Adjust the play by replacing the tappets.
Other tappets are available as replacement part / replacement part kits.
Reinstall the camshaft and the upper section of the press tool. Tighten to **12 Nm**.
Take a new measurement. See Checking the valve clearance.

When the correct valve clearance is reached



Remove

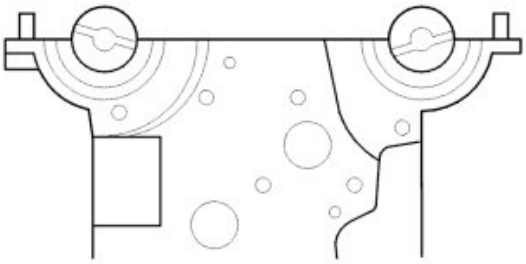
- the press tool 999 5765
- the camshaft
- the tappets.

Note! Carefully mark the tappets so that exact reinstallation can be carried out.

For example:	Intake side:	**I1, I2, I3.....I10.**
	Exhaust side:	**A1, A2, A3.....A10.**

Repeat the procedure for measuring the valve clearance for all cylinders on both the intake and exhaust sides. See Checking the valve clearance.

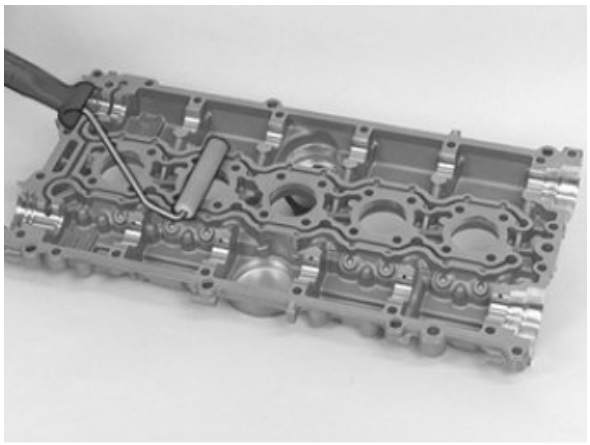
Installing tappets and camshafts



Note! For tightening torques not in the text, see Tightening torque See: Specifications/Tightening Torque.

Lubricate the valve guide wells.
Install all the tappets.
Lubricate the camshaft bearing seats and the upper sides of the tappets.
Position the intake camshaft. Ensure that the groove at the rear edge of the camshaft is **above** an imaginary center line.
Position the exhaust camshaft. Ensure that the groove at the rear edge of the camshaft is **below** an imaginary center line.

Applying liquid gasket



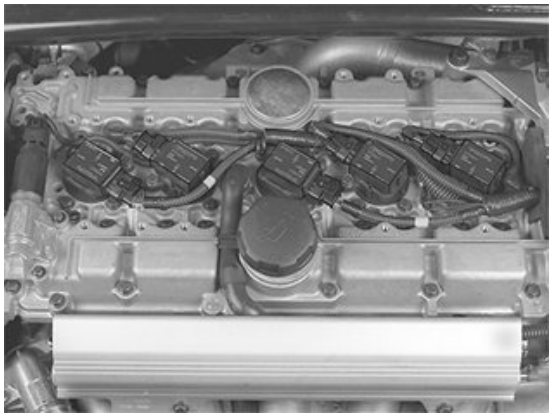
Wipe the oil film off the mating surfaces on the camshaft cover and cylinder head.

Install new O-rings around the spark plug wells at the cylinder head.
Apply liquid gasket 1161 059 on the camshaft cover. Use roller 951 2767 Roller See: Tools and Equipment/951 2767 Roller.

Note! The surface must be completely covered without any excess.

Caution! Make sure that no liquid gasket ends up in the oil channels.

Installing the camshaft covers

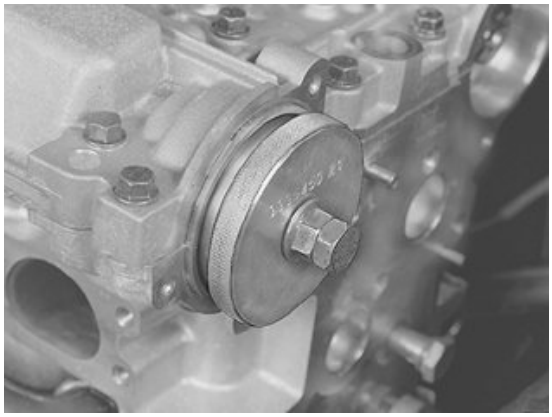


Lubricate the camshaft lobes, the camshaft bearing surfaces and the tappets.
Install the camshaft cover.
Install press tool 999 5454 PRESS TOOL See: Tools and Equipment/999 5454 Press Tool (2x).
Tighten the camshaft cover screws alternately, keeping it parallel to the cylinder head using the press tools.
Install all the screws. Tighten the screws from the middle and outwards.
Remove the press tool 999 5454

Install

- the variable valve timing (VVT) solenoid. Use a new gasket
- the spark plugs. Tighten to **30 Nm**.
- the plugs for the test holes. Tighten to **20 Nm**
- the crankcase ventilation hose to the top of the camshaft cover
- the ignition coils according to the earlier marking
- the ground terminals between the ignition coils.

Installing the rear camshaft seal



To clean the shaft journal and mating surface, use emery cloth P/N 951 1024.

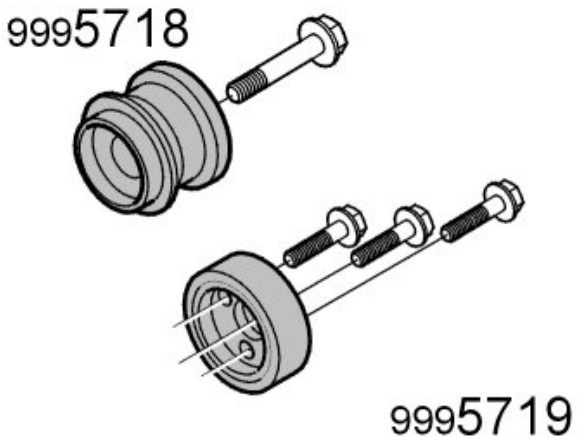
Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new seal ring is installed.

Use drift 999 5450 PUNCH See: Tools and Equipment/999 5450 Punch.
Lubricate the surface of the seal that the camshaft rotates against.
Press in the seal until the drift bottoms out.

Note! If there are wear grooves on the camshaft, the seal can be pressed in another 2 mm by reversing the tool's sleeve.

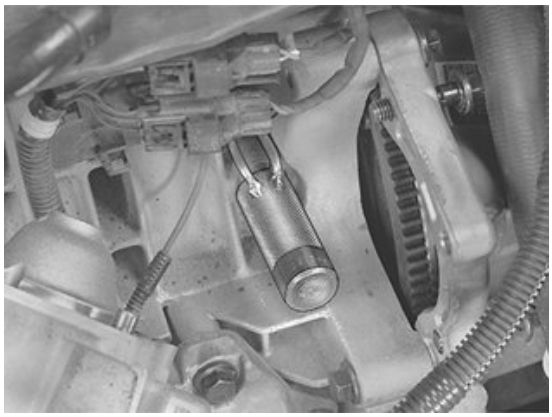
Install camshaft adjustment tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts.
Check that the screws securing the adjustment tool to the camshafts and the screws holding the tool together are well tightened.

Installing the front camshaft seal



Lift up and position the brake fluid reservoir and the expansion tank on top of the engine.
Use drift 999 5718 Drift See: Tools and Equipment/999 5718 Drift for camshaft with variable valve timing unit and drift 999 5719 Drift See: Tools and Equipment/999 5719 Drift for camshaft without variable valve timing unit.
Use new seals and lubricate the surface of the seal that the camshaft rotates against.
Use the variable valve timing unit / timing belt pulley mounting screws. Tighten the screws until the drift bottoms out.
Remove the drift.

Fixing the crankshaft position



Remove

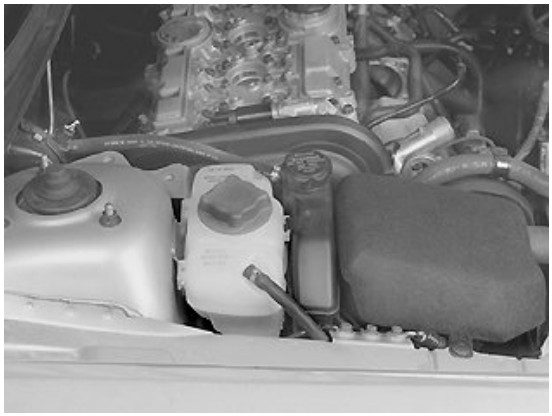
- the mounting screws for the starter motor. Pull off the starter motor. Place the starter motor to one side
- the blind cover plug and the seal washer.

Turn the crankshaft slightly **clockwise**.
Install the crankshaft stop999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool. Ensure that it bottoms out against the engine block.
Turn the crankshaft **counterclockwise** until it stops against the crankshaft stop.
Check that the marking on the crankshaft timing gear pulley corresponds with the marking on the oil pump.

Installing and adjusting the VVT unit/timing gear pulley on the camshaft

Install according to: Variable valve timing unit, checking and adjusting, B5244T5, B5254T2 See: Actuators and Solenoids - Engine/Variable Valve Timing Actuator/Testing and Inspection

Finishing



Install

- front timing cover
- the auxiliaries belt
- the expansion tank
- the servo oil reservoir
- the bleed hose for the expansion tank.

Close the clamp and check that the hoses lie correctly.

Connect the connectors for the

- The ABS sensor by the right suspension turret
- the coolant level sensor in the expansion tank.

Install

- the starter motor
- the plastic nuts for the cover in the wing liner
- the right front wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Install

- the trigger wheel.

Note! Make sure that the trigger wheel is correctly positioned against the camshaft.

- the camshaft position (CMP) sensor housing
- the cover at the rear of the exhaust camshaft
- the screws holding both the ground strips from the bulkhead to the cylinder head
- the upper engine stabilizer brace
- the cover over the ignition coils
- the upper timing cover
- the crankcase ventilation hose on the inlet hose
- the inlet hose between the air cleaner (ACL) and throttle body (TB)
- the engine stabilizer brace between the suspension turrets. Secure the servo hose at the right mounting for the engine stabilizer brace in the bodywork
- the cable to the battery negative terminal. Also read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Check

Check the level in the expansion tank and the brake fluid reservoir.
Test drive the engine until the thermostat opens and check for any leakage.

Fuel Pressure Release: Service and Repair

Draining the fuel system

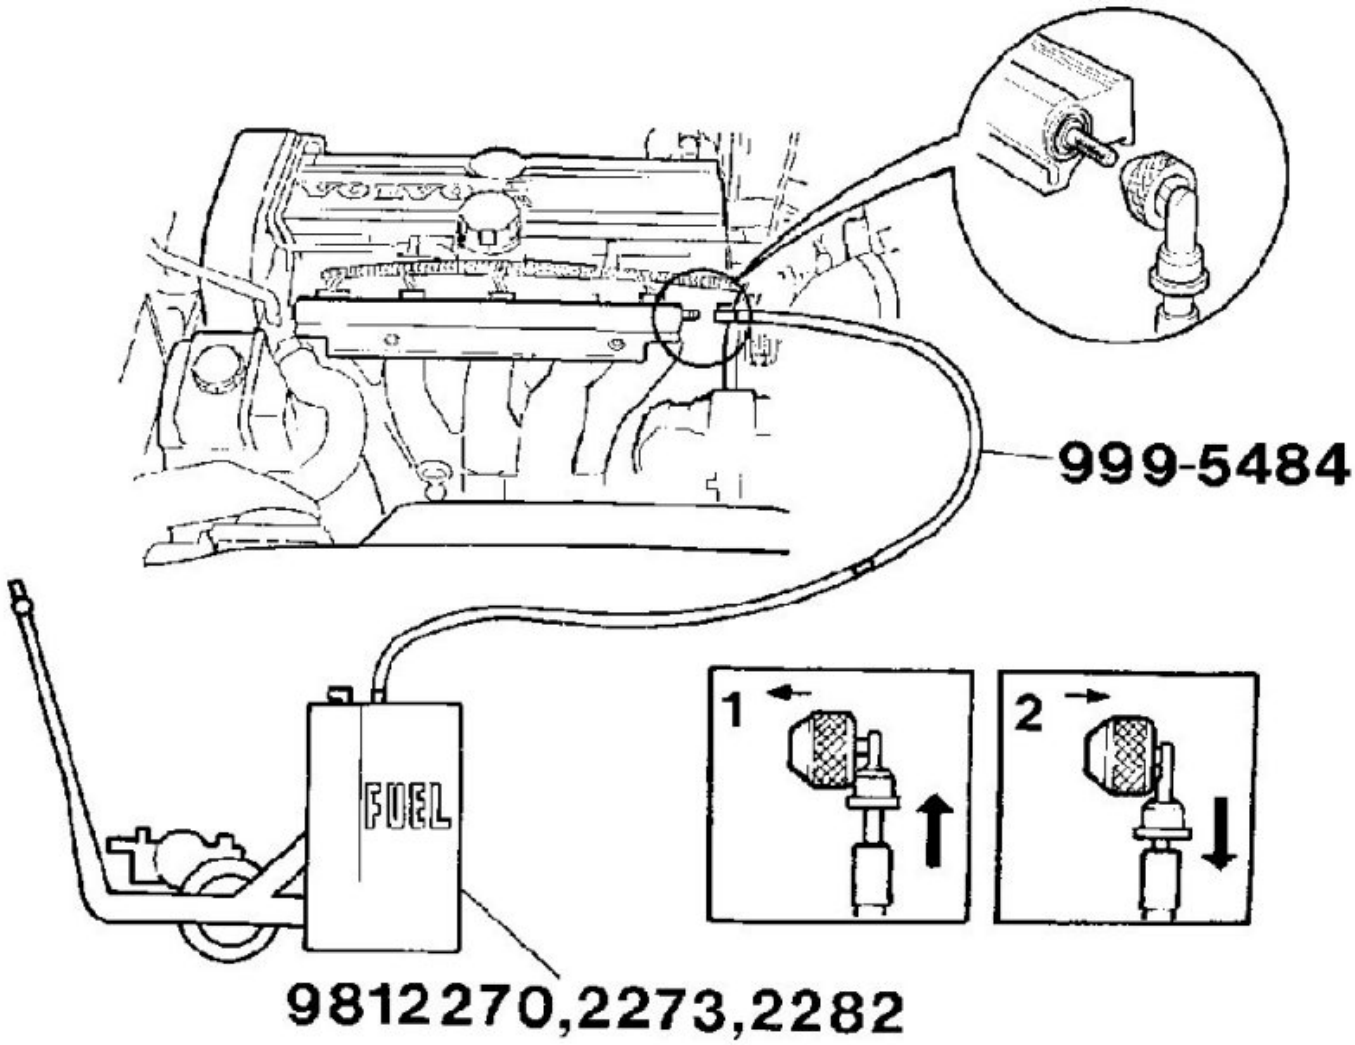
Special tools:

981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley
981 2273 PUMP See: Tools and Equipment/981 2273 Pump
981 2282 Tank See: Tools and Equipment/981 2282 Tank
999 5480 Adapter See: Tools and Equipment/999 5480 Adapter
999 5484 Adapter See: Tools and Equipment/999 5484 Adapter

Safety

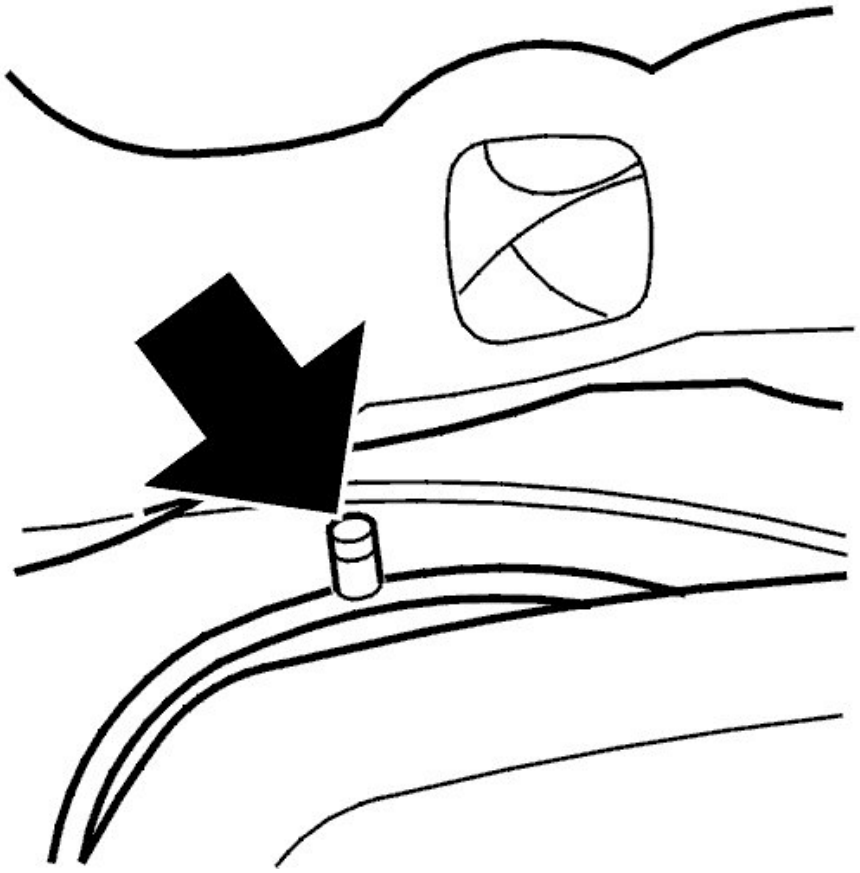
See Safety regulations for handling fuel See: Powertrain Management/Fuel Delivery and Air Induction/Service Precautions/Safety Regulations for Handling Fuel.

Engagement



Remove the cover on the valve which is positioned on the fuel rail.
Connect adapter 999 5484 Adapter See: Tools and Equipment/999 5484 Adapter to fuel draining unit 981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley , 981 2273 PUMP See: Tools and Equipment/981 2273 Pump and 981 2282 Tank See: Tools and Equipment/981 2282 Tank.
Connect the adapter to the valve on the fuel rail in the **locked** position (figure 1, valve closed).
Start the fuel drainage unit.
Unlock the adapter (illustration 2 valve open).
Raise the car.

Draining the fuel system



Remove the cover on the valve cap positioned at the fuel filter.
Connect venting hose 999 5480 Adapter See: Tools and Equipment/999 5480 Adapter to the valve prior to the fuel filter.
It takes approximately **2 minutes** to evacuate the system.

Installation

Reinstall the components in reverse order.

Caution! Do not forget to reinstall the valve caps.

Drive Belt: Service and Repair

Auxiliaries belt / belt tensioner, replacing

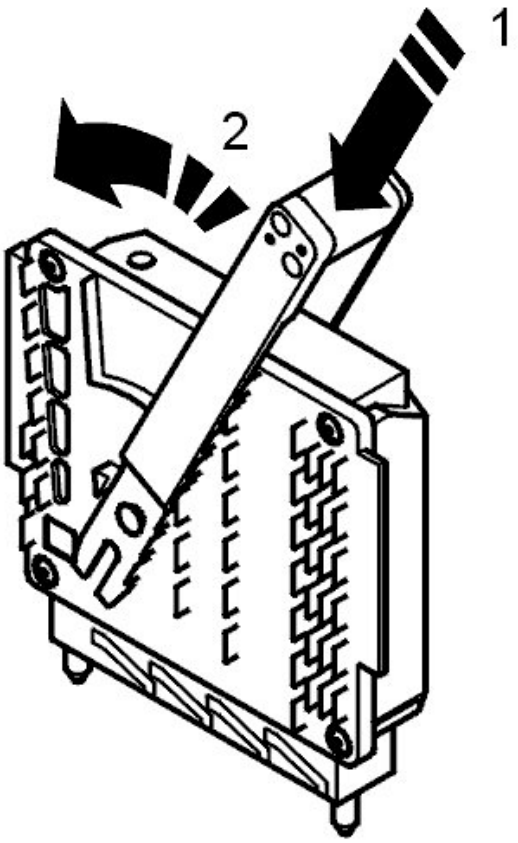
Special tools:

999 5722 Wrench See: Tools and Equipment/999 5722 Wrench
999 7109 Wrench See: Tools and Equipment/999 7109 Wrench

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removal

Removing the engine control module (ECM)

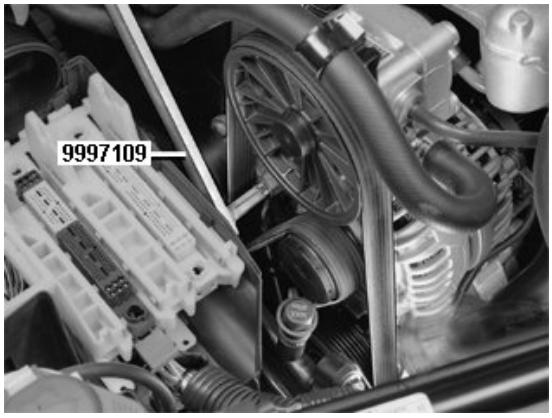


Ignition off. Wait 2 minutes.

Caution! Do not touch the terminal pins on the engine control module (ECM) with your fingers. Static electricity may damage components in the control module.

Remove the cover over the control module box. Put the cover to one side.
Insert tool: 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module. Move the upper section of the tool backwards as far as it will go. Pull up the tool. Carefully pull up the control module.
For vehicles with automatic transmissions repeat the above work.
Remove the surround from around the control module box.

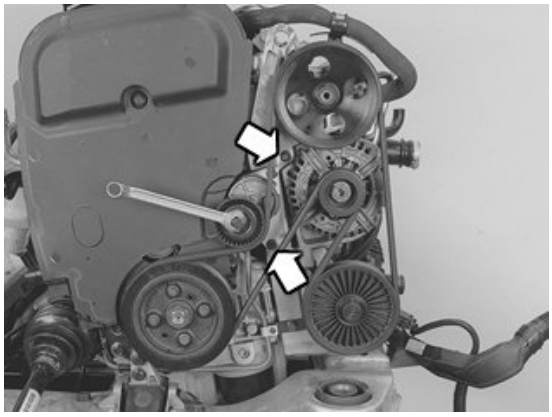
Removing the auxiliaries belt



Note! Make a note of the routing of the belt.

Remove the auxiliaries belt. Use: 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench.

Replacing the belt tensioner



Remove:

- both mounting screws from the auxiliaries belt bracket for the belt tensioner
- the belt tensioner.

Install:

- a new belt tensioner
- the screws for the belt tensioner. Tighten.

Installation

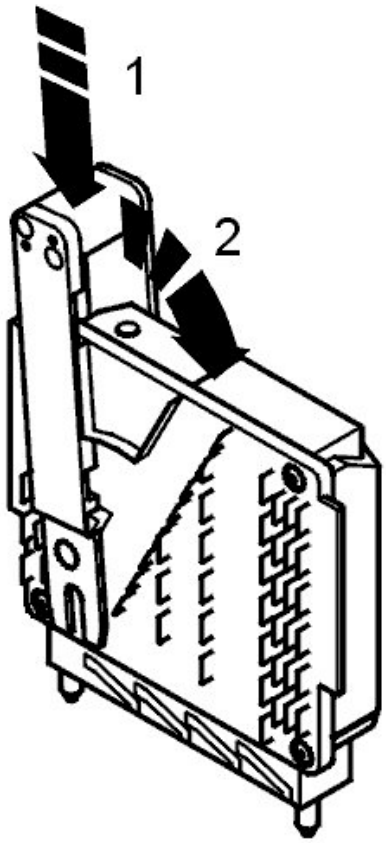
Note! For tightening torques, see: Tightening torque See: Specifications/Tightening Torque.

Installing the auxiliaries belt

Note! Ensure that the auxiliaries belt is correctly positioned on all the pulleys.

Install the auxiliaries belt. Use: 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench.

Installing the engine control module (ECM)



Caution! Check that no pins or sockets are damaged on the connector.

Install the surround for the control module box.
Carefully press the engine control module (ECM) down into the grooves on the inside of the control module box. Press down all the way.
Install the tool: 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
Move the upper section of the tool forwards as far as it will go. Pull up the tool.
Press the cover into place over the control module. Check that the air ducts are correctly positioned.

Finishing

Start the engine and check the function.

Engine Mount: Service and Repair
Engine Mount, Front, Replacing

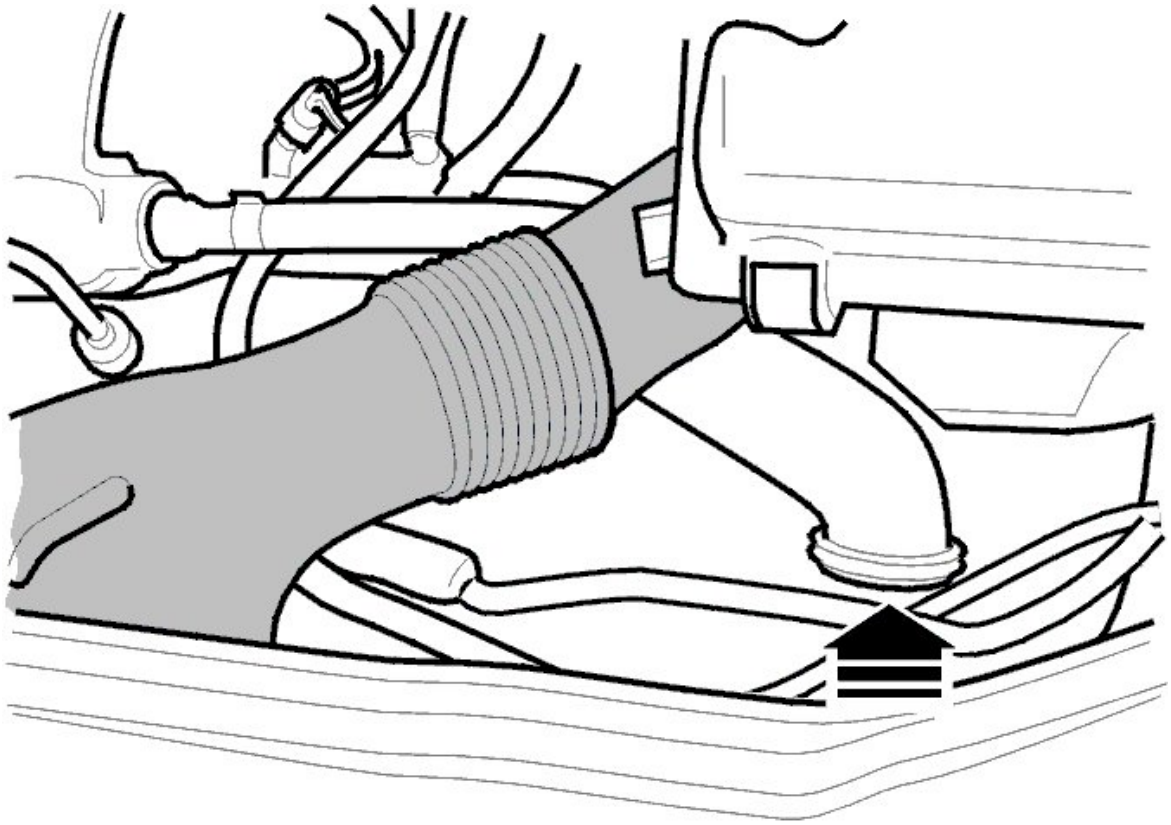
Engine mount, front, replacing

Removal

Removal

Remove

- the battery lead.See Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- the torque rod. See Replacing the torque rod See: Engine Torque Strut/Service and Repair/Replacing the Torque Rod.

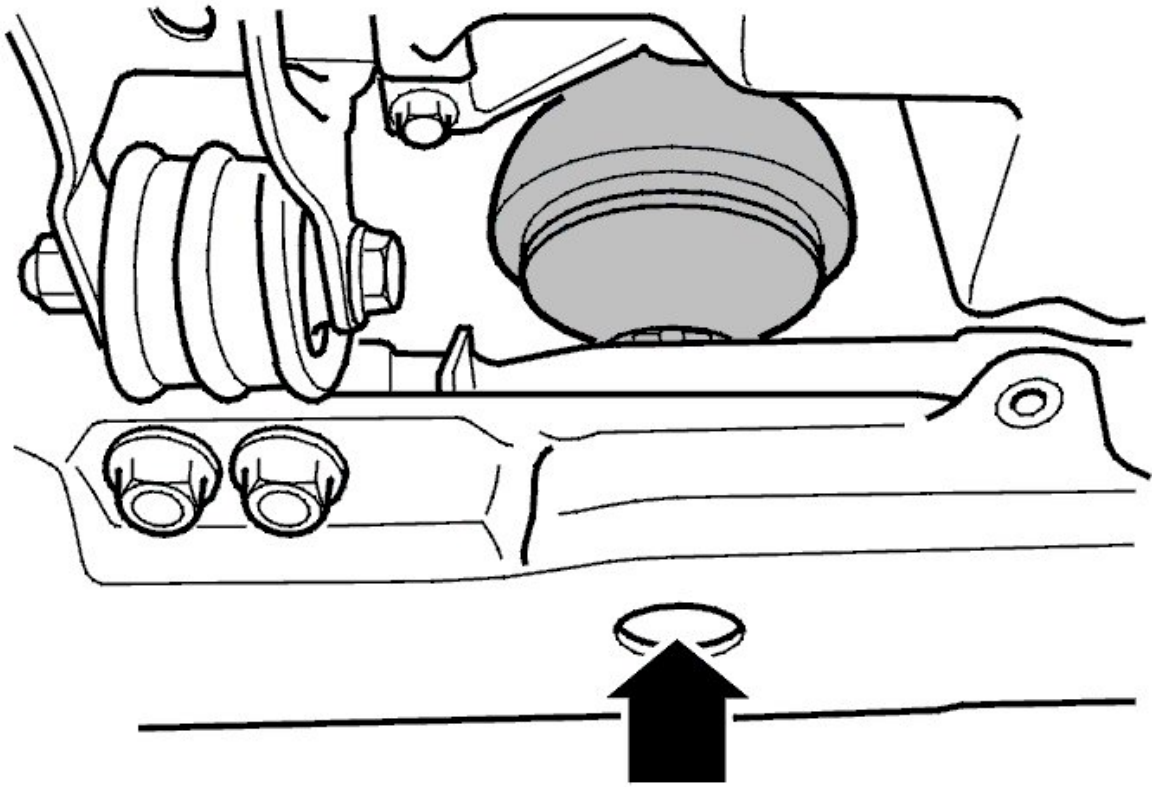


Remove

- the air intake between the air cleaner (ACL) and the front panel
- the charge air pipe from the charge air cooler (CAC) are on the left-hand side. Heat the charge air pipe using a hot-air gun. This will make removal easier.

Remove

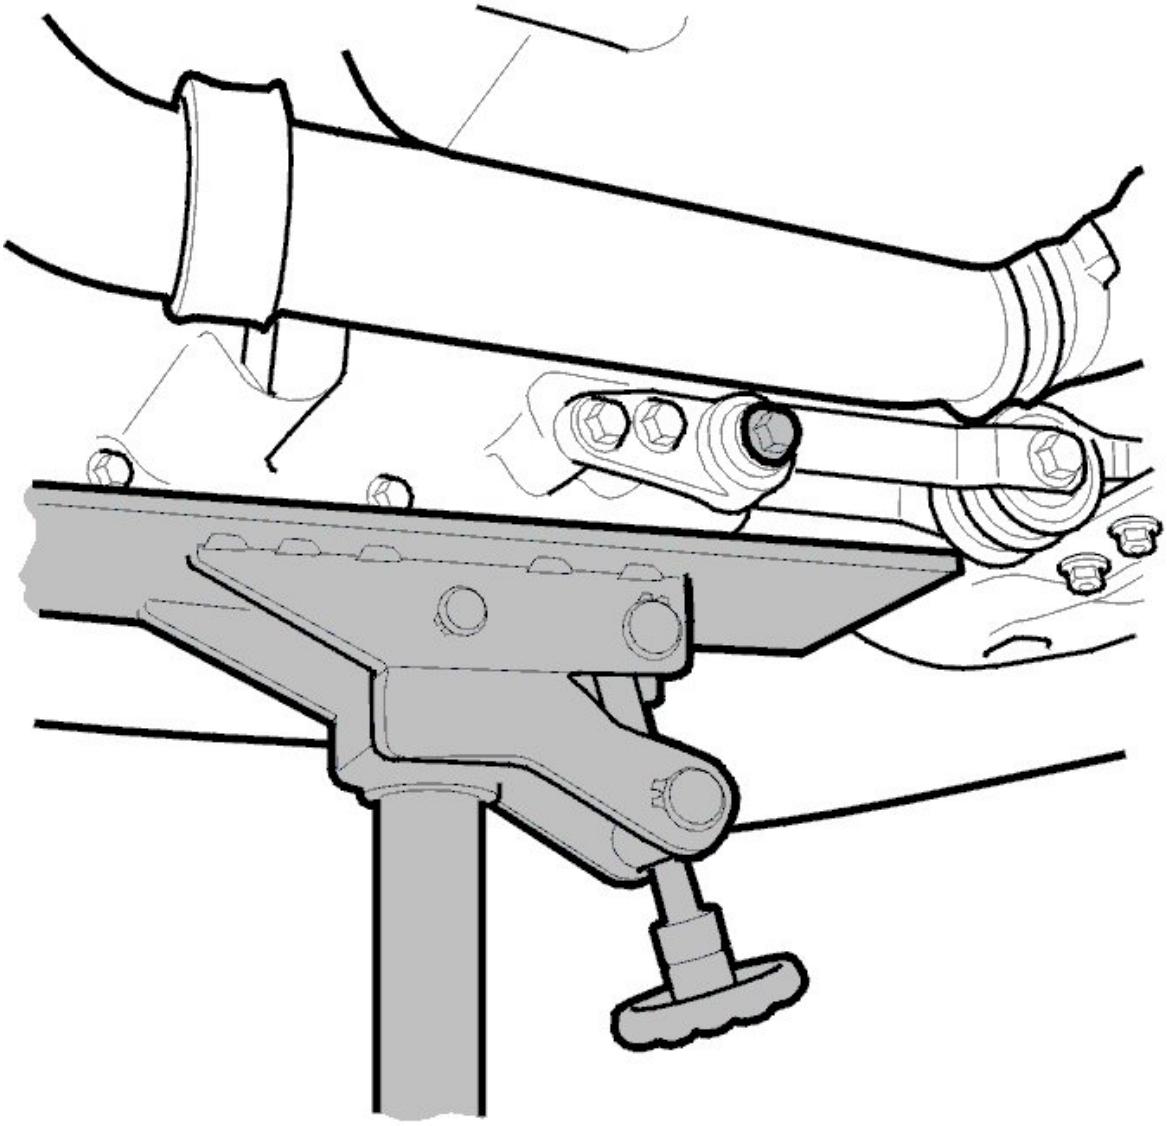
- the nut on the top for the engine pad
- raise the car.



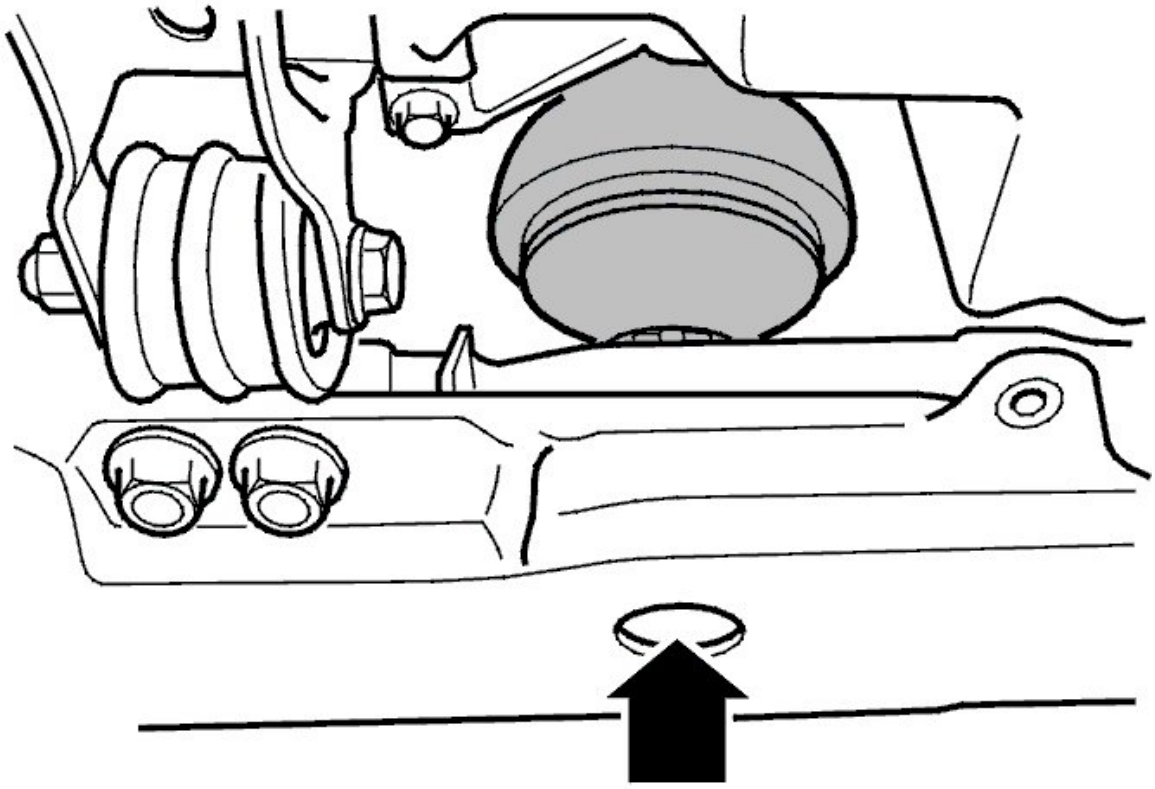
Remove

- the splash guard and the air intake cover under the engine
- the screw for the engine pad.

Replacing the front engine pad



- Remove the screw and nut at the lower torque rod mounting to the bracket on the transmission
- position a mobile jack with universal plates 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture under the transmission
- Check that the plate does not catch in the sub-frame
- carefully lift up the engine so that the engine pad can be replaced.



- install a **new screw** in the lower mounting for the engine pad. **Do not tighten yet**
- carefully lower the engine
  Note! Ensure that the guide pin at the top of the engine pad locates correctly.

- remove the mobile jack.

Installation

Installation

Finishing

- Use a **new screw and nut** on the lower torque rod. Tighten to **35 Nm**. Angle-tighten **90°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor
- Tighten the lower screw in the engine pad. Tighten to **50 Nm**
- install the splash guard and the air intake cover under the engine
- lower the car.

Install

- the nut on the top of the engine pad. Tighten to **50 Nm**
- the charge air pipe to the charge air cooler (CAC)
- the air intake between the air cleaner and the front panel
- the torque rod. See Replacing the torque rod See: Engine Torque Strut/Service and Repair/Replacing the Torque Rod
- the battery lead.See Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting

Engine Mount: Service and Repair
Engine Mount, Rear, Replacing

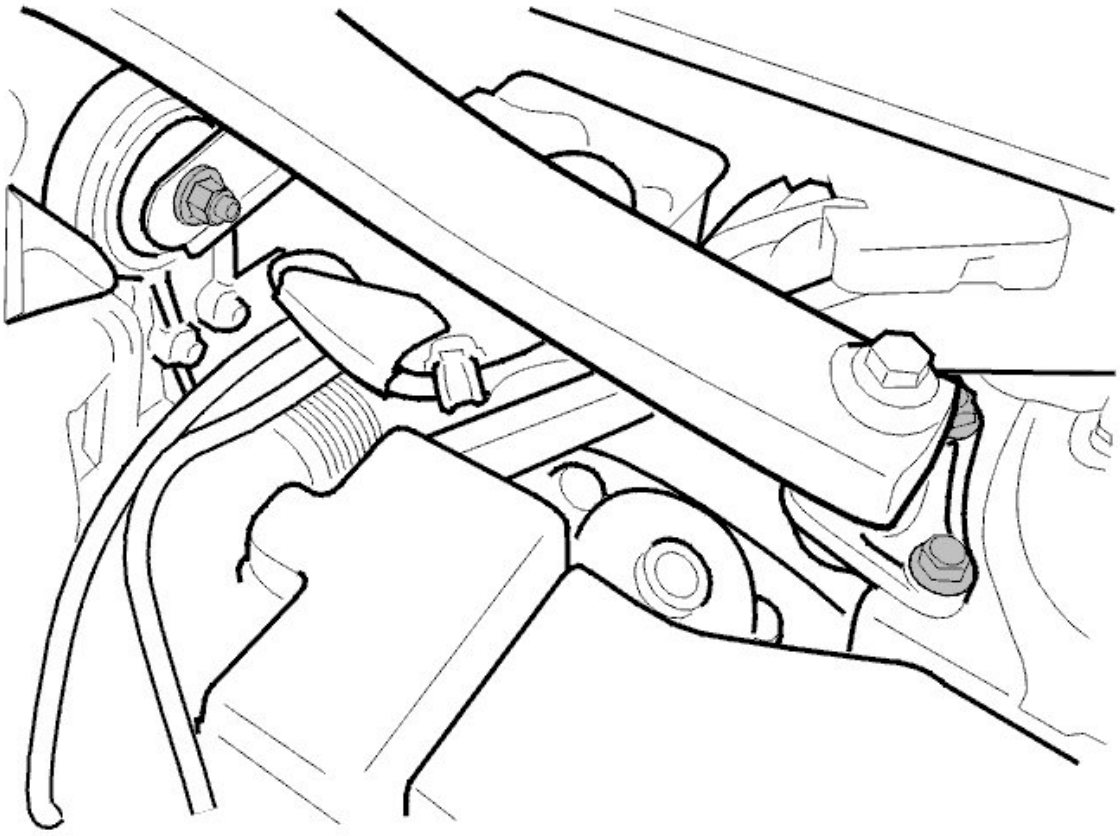
Engine mount rear, replacing

Special tools:

951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor
999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

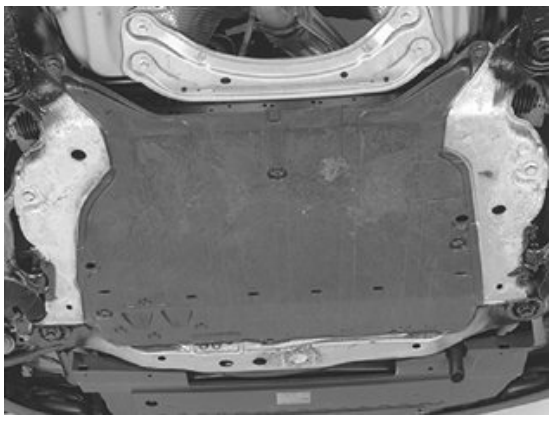
Removal

Preparation



Remove

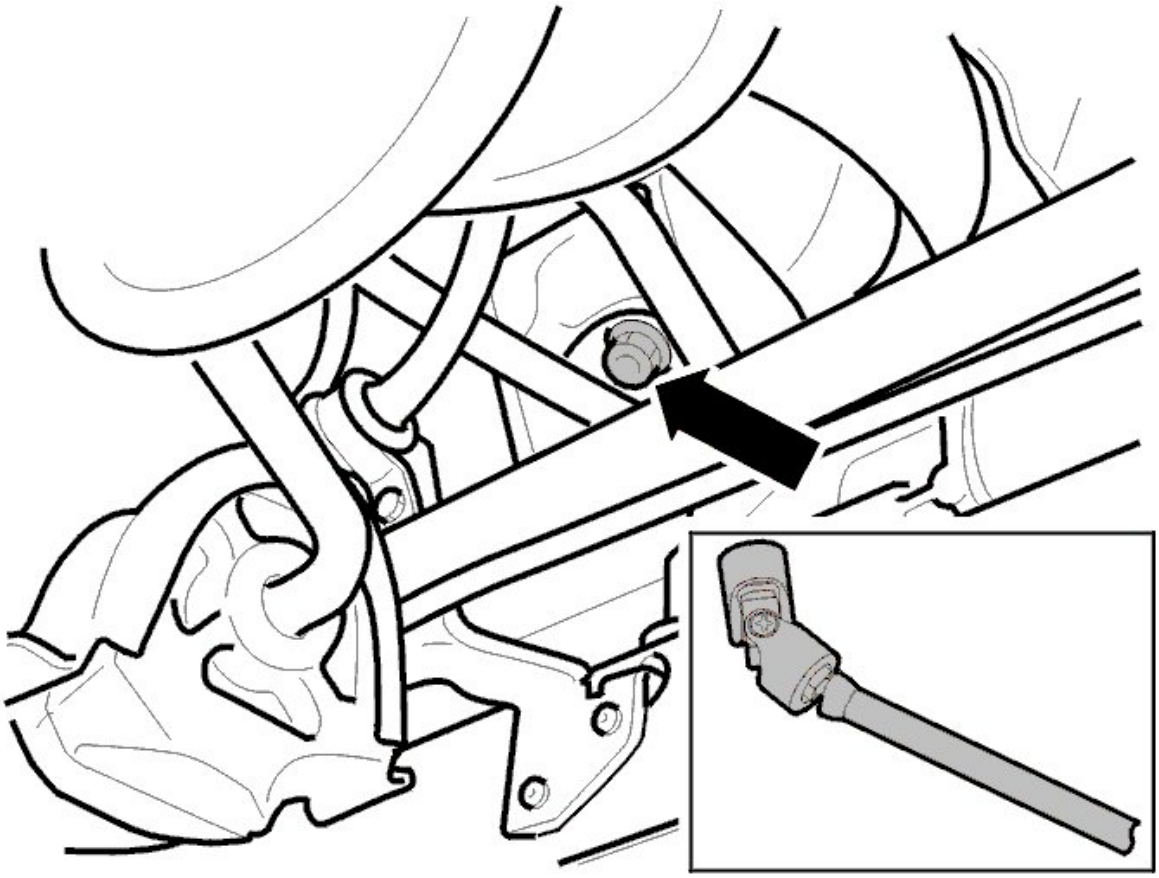
- the screw holding the mounting for the torque rod at the bracket on the engine
- the screws for the torque rod mounting at the wheel arches
- the engine stabilizer brace
- the upper nut for the rear engine pad.



Raise the car

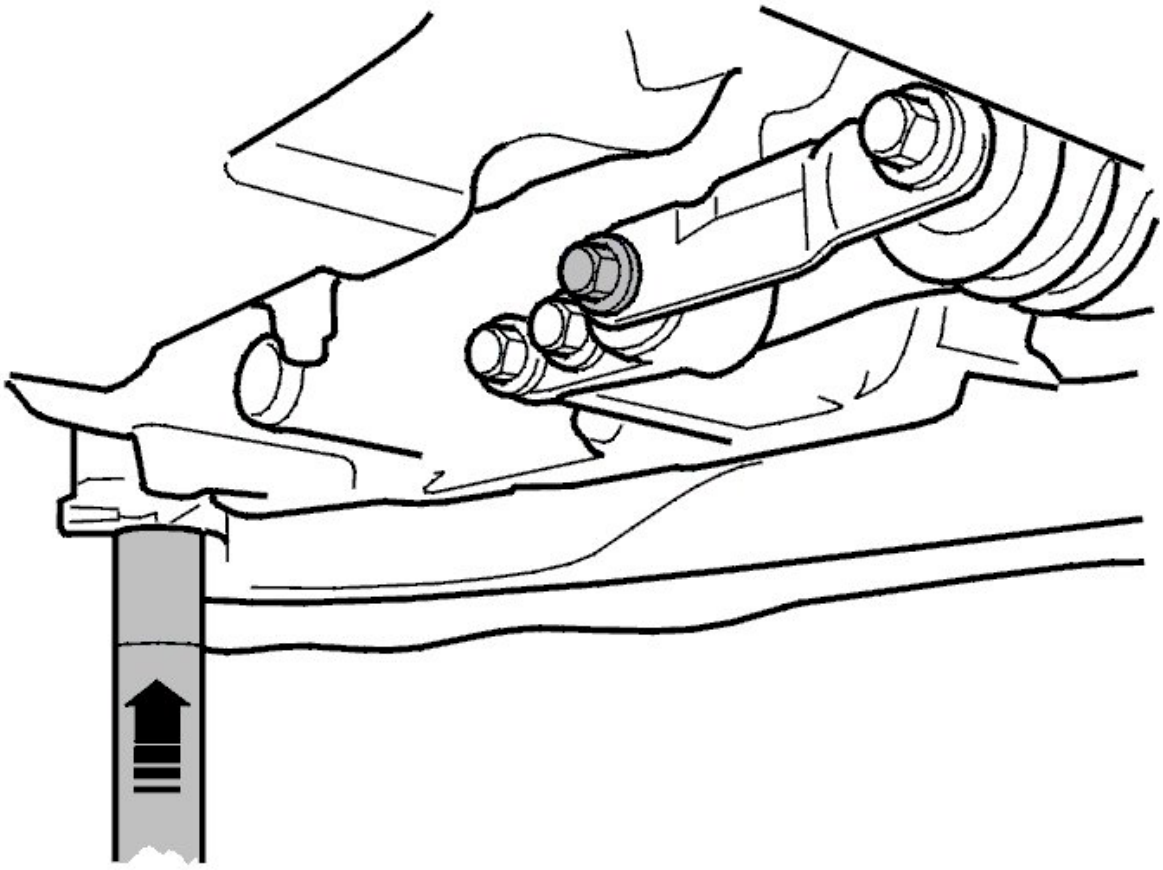
Remove

- the splash guard under the engine.



- Remove the lower screw for the engine pad
- remove both the screws for the mountings holding the three-way catalytic converter (TWC)
- fold the mountings forward.

Replacing the rear engine pad



- Remove the screw and nut at the lower torque rod mounting to the bracket on the transmission
- position a mobile jack under the transmission
- carefully lift up the engine so that the engine pad can be replaced

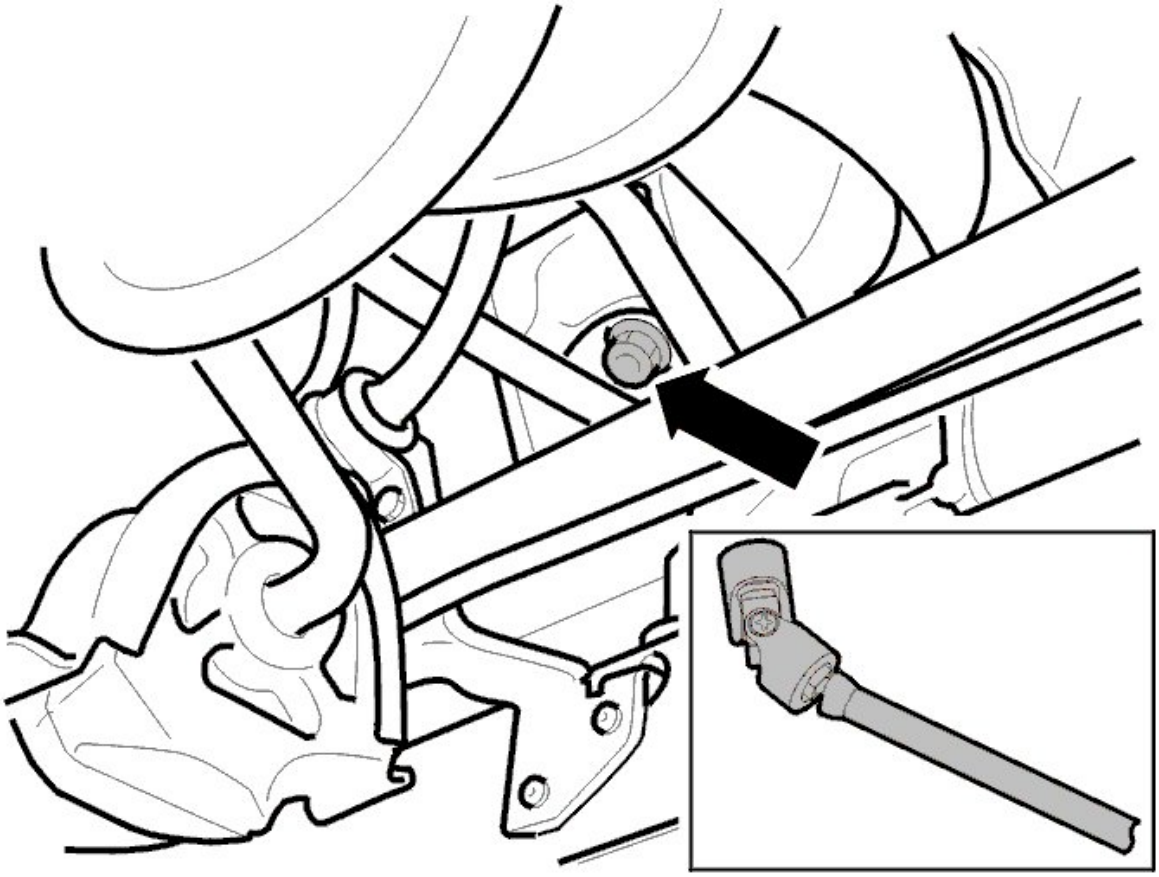
- remove the engine pad by pulling it forwards between the bevel gear and the transmission.
- Install the new engine pad
- install a **new screw** in the lower mounting for the engine pad. **Do not tighten yet**
- carefully lower the engine
  Note! Ensure that the guide pin at the top of the engine pad locates correctly.

- remove the mobile jack.

Installation

Finishing

- Install a **new screw and nut** on the lower torque rod. Tighten to **35 Nm**. Angle-tighten **90°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor.

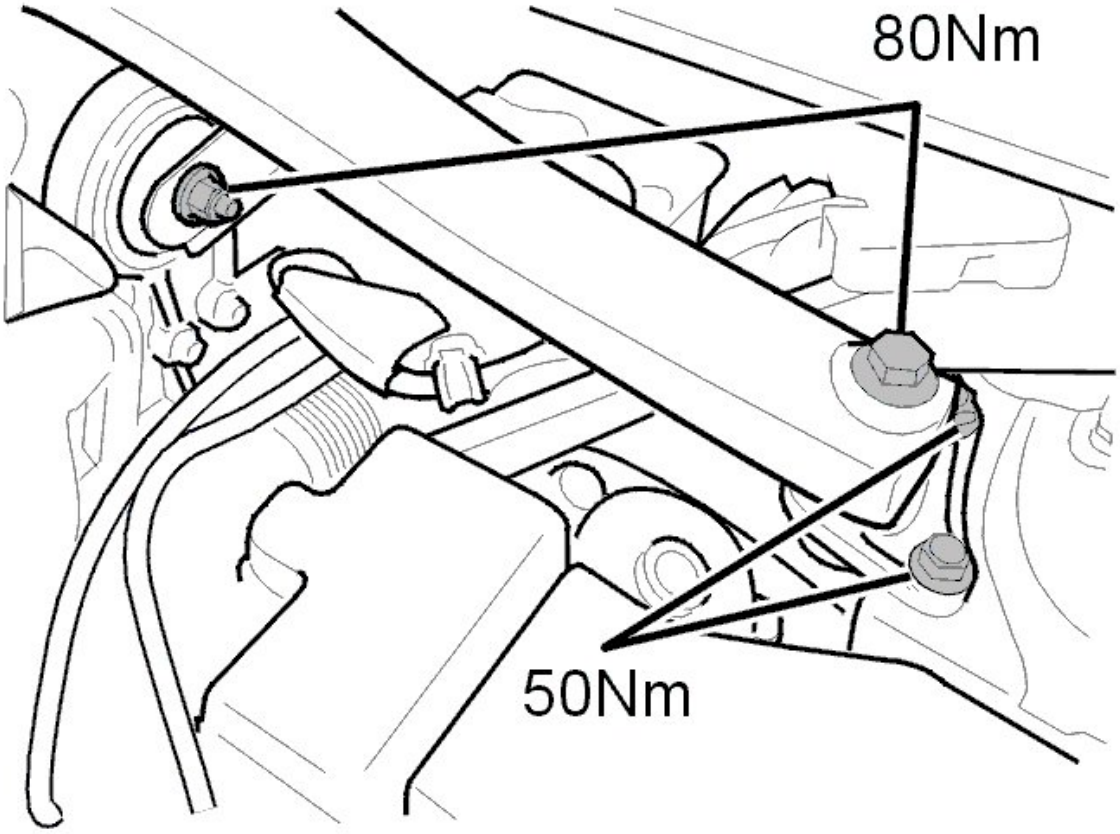


- Tighten the lower screw in the engine pad. Tighten to **50 Nm**
- install both the screws for the mountings for the three-way catalytic converter (TWC). Tighten to **10 Nm**
- install the splashguard under the engine. Tighten to **25 Nm**.

Lower the car.

Install

- A **new nut** in the upper mounting for the engine pad. Tighten to **50 Nm**.



Install

- the engine stabilizer brace between the suspension turrets. Tighten the four screws. Tighten to **50 Nm**
- the screw for the torque rod mounting at the torque bracket on the engine. Tighten to **80 Nm**.

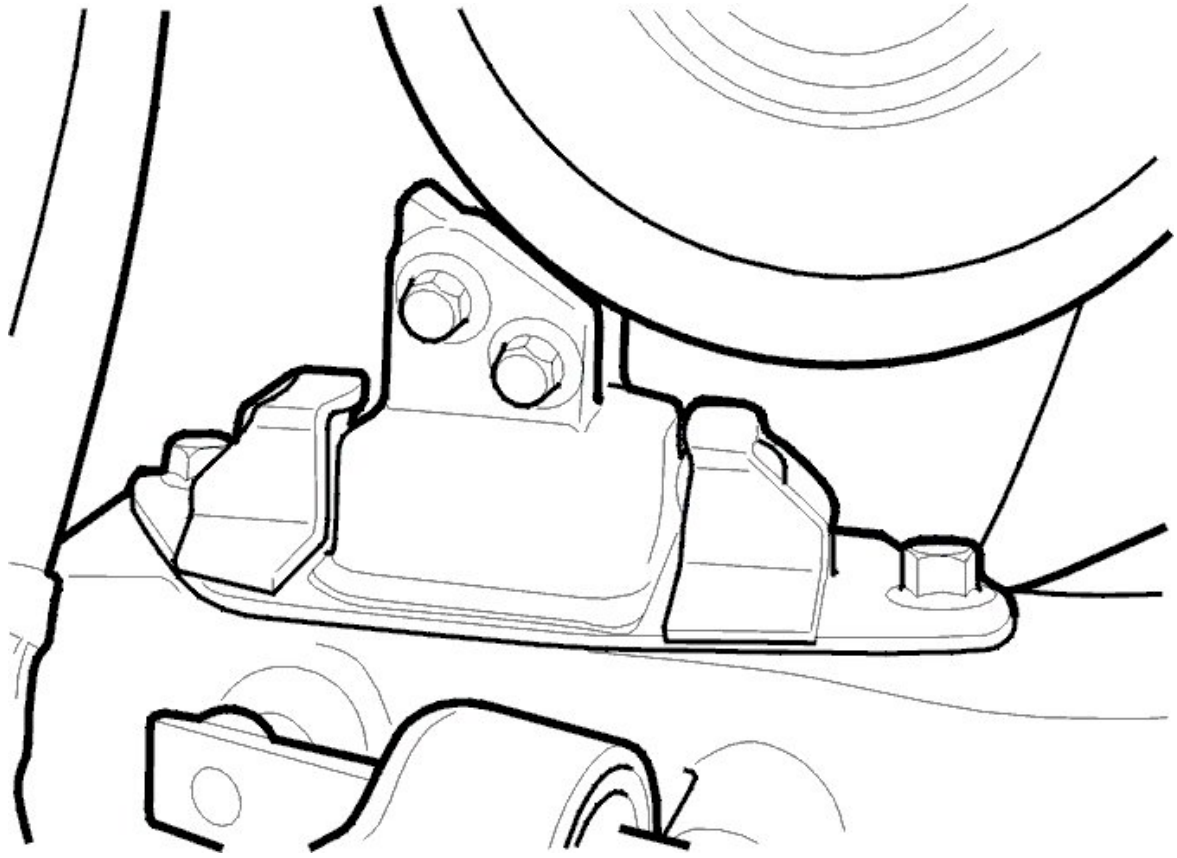
Engine Mount: Service and Repair
Engine Mount, Right, Replacing

Engine mount, right, replacing

Special tools:

951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor
999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

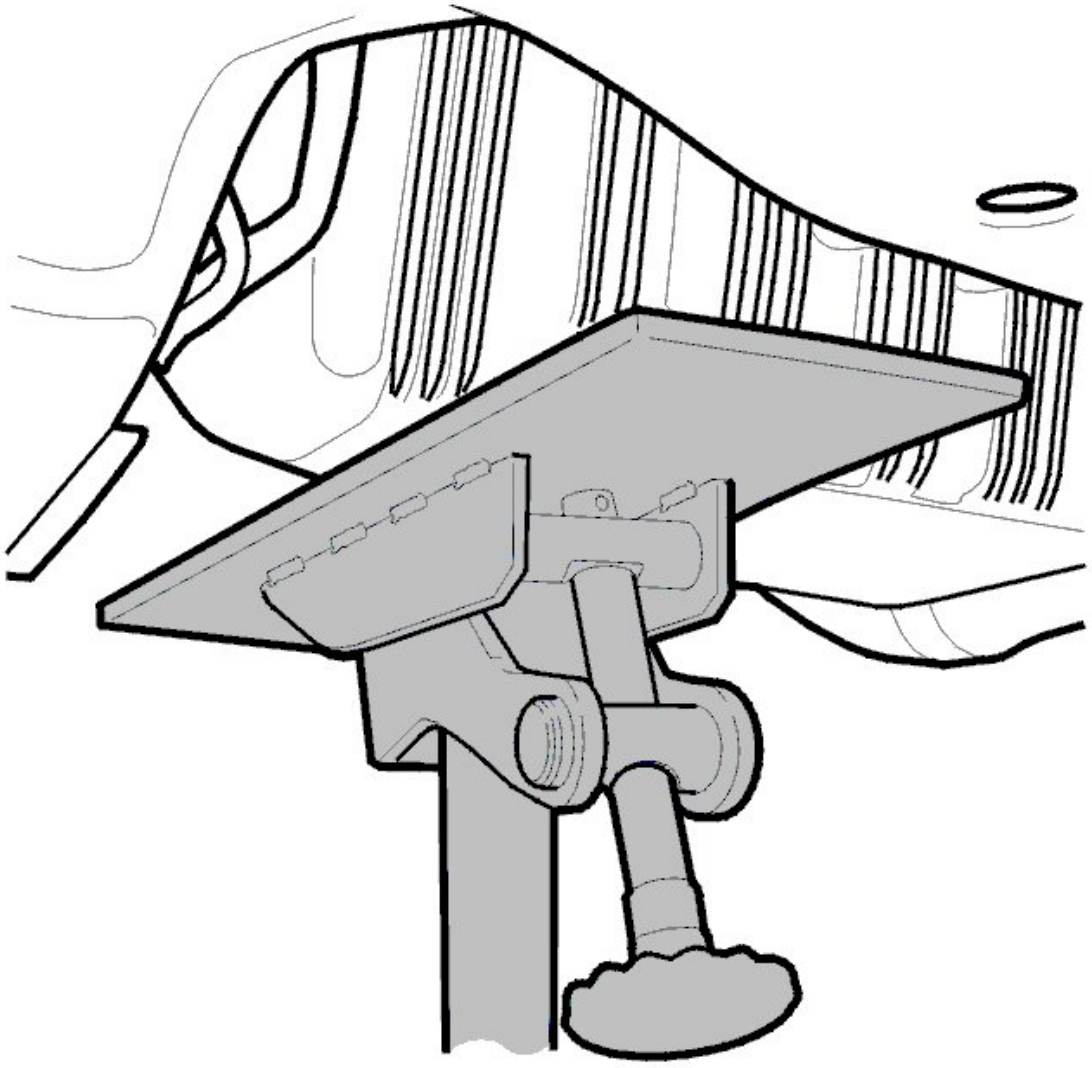
Removal (the illustrations may be slightly different for different models)



Raise the car.

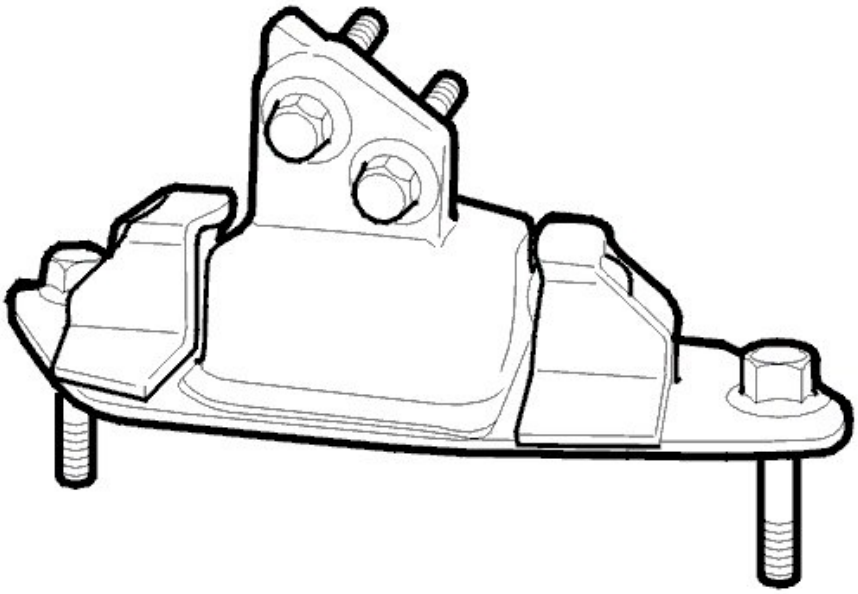
Remove

- the right front wheel
- both the plastic nuts and the reinforcement panel holding the cover in the right fender liner. Bend the fender liner out of the way
- the four screws for the right engine pad
- the splash guard under the engine.



- Position a mobile jack with universal plate 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture under the oil pan on the right side of the engine
- Check that the plate does not catch in the sub-frame
- Carefully lift the engine slightly so that the engine pad can be removed.

Installation



Install

- the new engine pad
- use **new screws** for the mounting in the sub-frame and engine. **Do not tighten yet**.
- Carefully lower the engine and remove the mobile jack
- Tighten the screws against the engine. Tighten to **35 Nm**. Angle-tighten **90°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor
- Tighten the screws to the sub-frame. Tighten to **65 Nm** and angle-tighten **60°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor.
- the splash guard under the engine. Tighten to **25 Nm**
- both the plastic nuts and the reinforcement panel holding the cover in the right fender liner
- the right front wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair

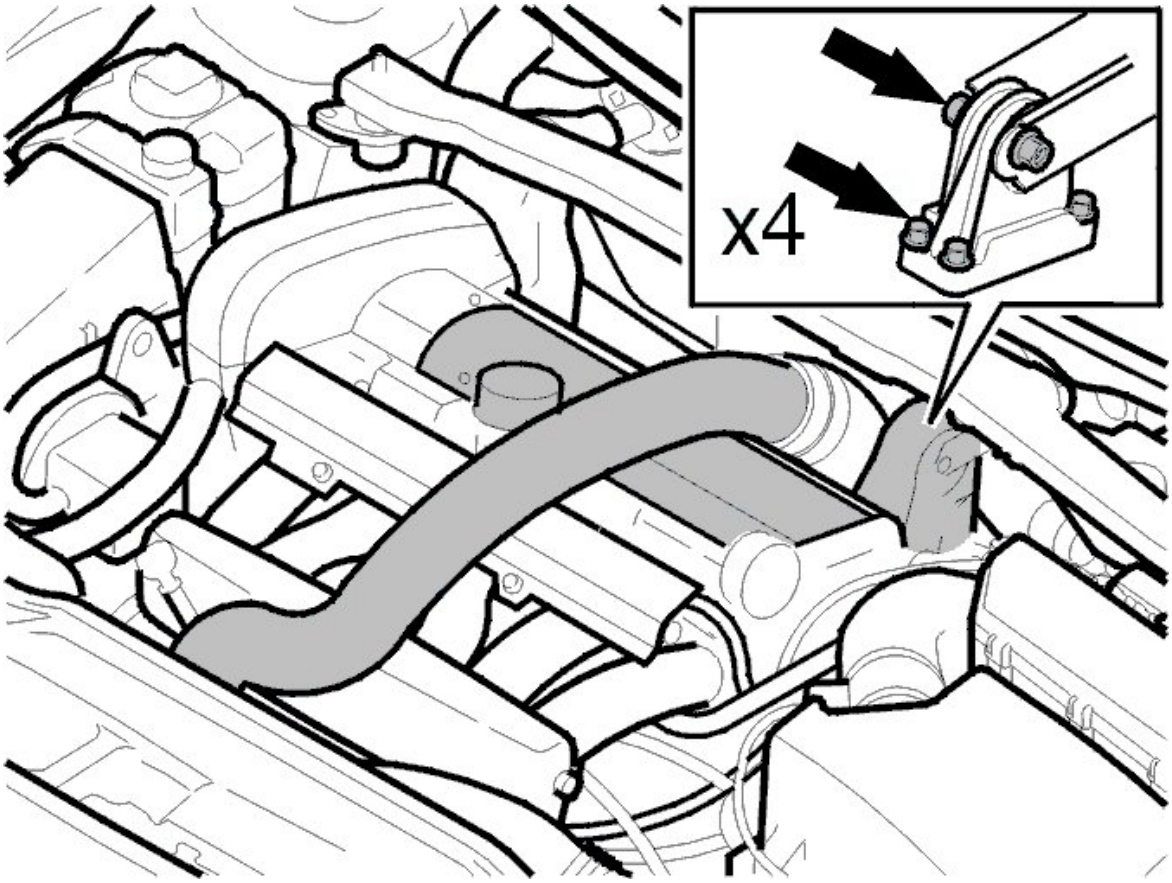
Engine Torque Strut: Service and Repair
Replacing the Engine Torque Bracket

Replacing the engine torque bracket

Removal

Removing the torque bracket

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

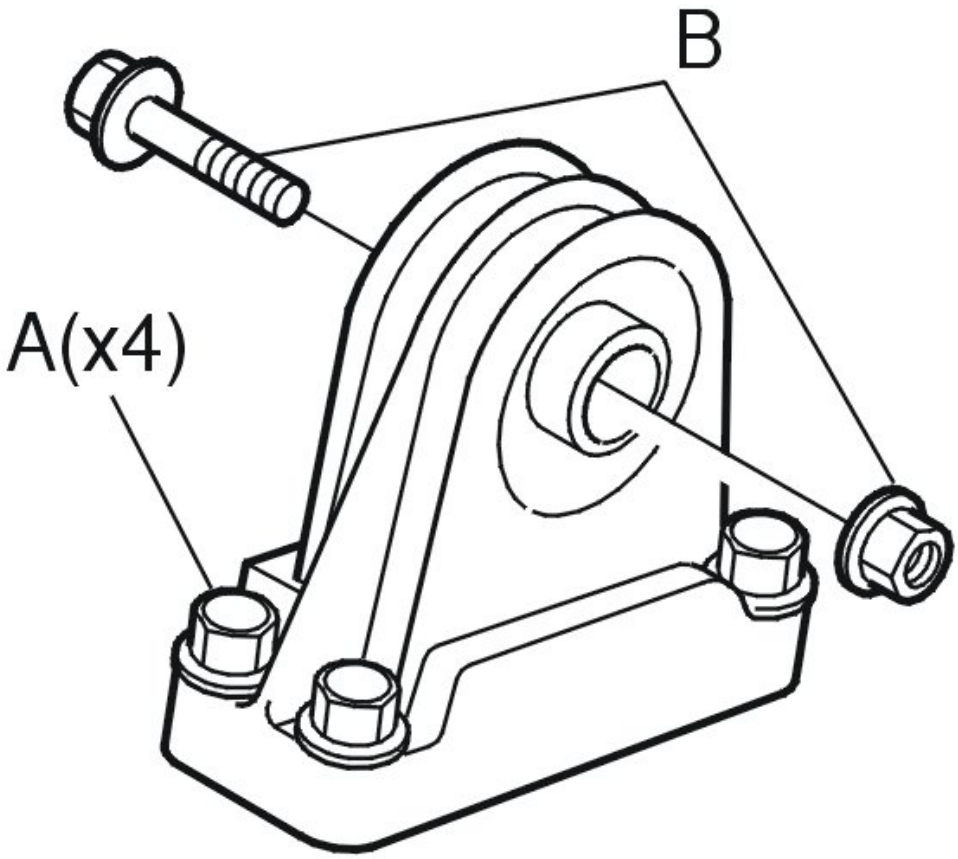


Remove

- the engine stabilizer brace
- the charge air pipe (only turbocharged (TC) engines)
- the screw for the dip stick pipe (6 cylinder automatics only)
- the oil filler cap
- the cover over the ignition coils
- the torque bracket.

Installation

Installing the torque bracket



Install

- the torque bracket. Tighten the screws (A). Tighten to **50 Nm**
- the screw for the dip stick pipe (6 cylinder automatics only)
- the cover over the ignition coils
- the oil filler cap
- the charge air pipe (only turbocharged (TC) engines)
- the engine stabilizer brace.

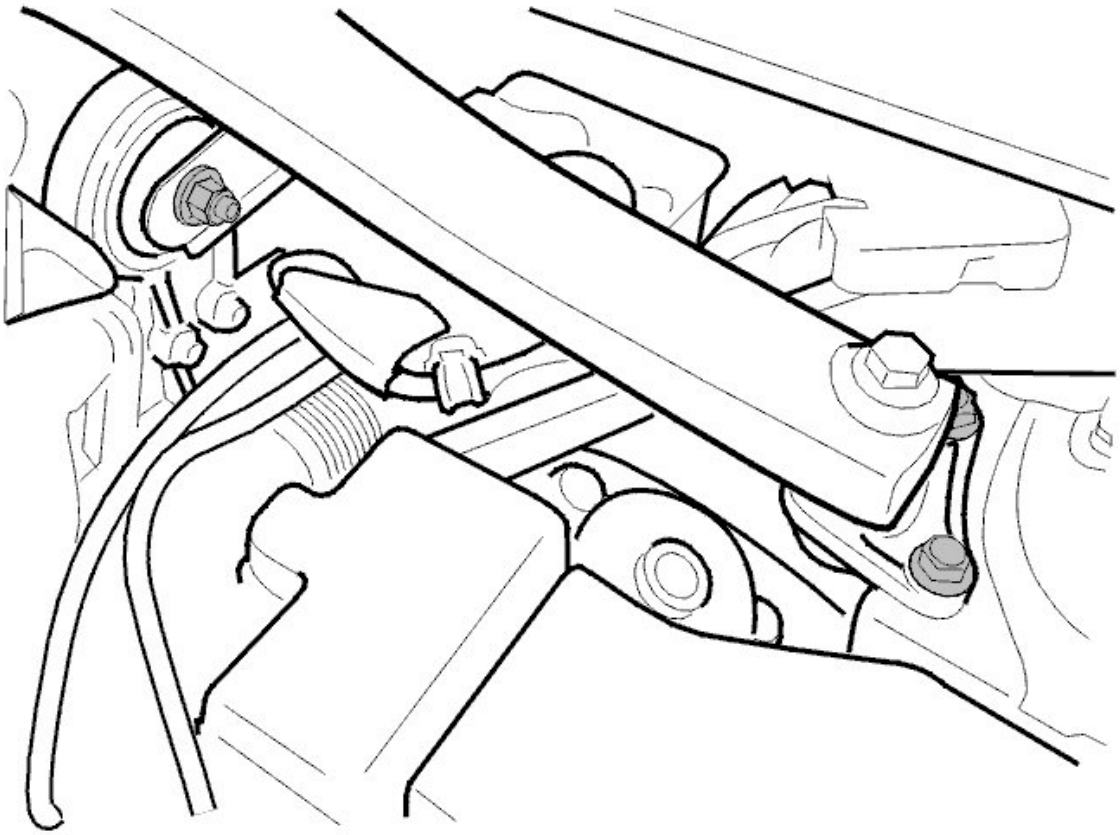
Tighten the screws on the suspension turrets. Tighten to **50 Nm**.Tighten the screw in the torque bracket (B). Tighten to **80 Nm**.

Engine Torque Strut: Service and Repair
Replacing the Torque Rod

Replacing the torque rod

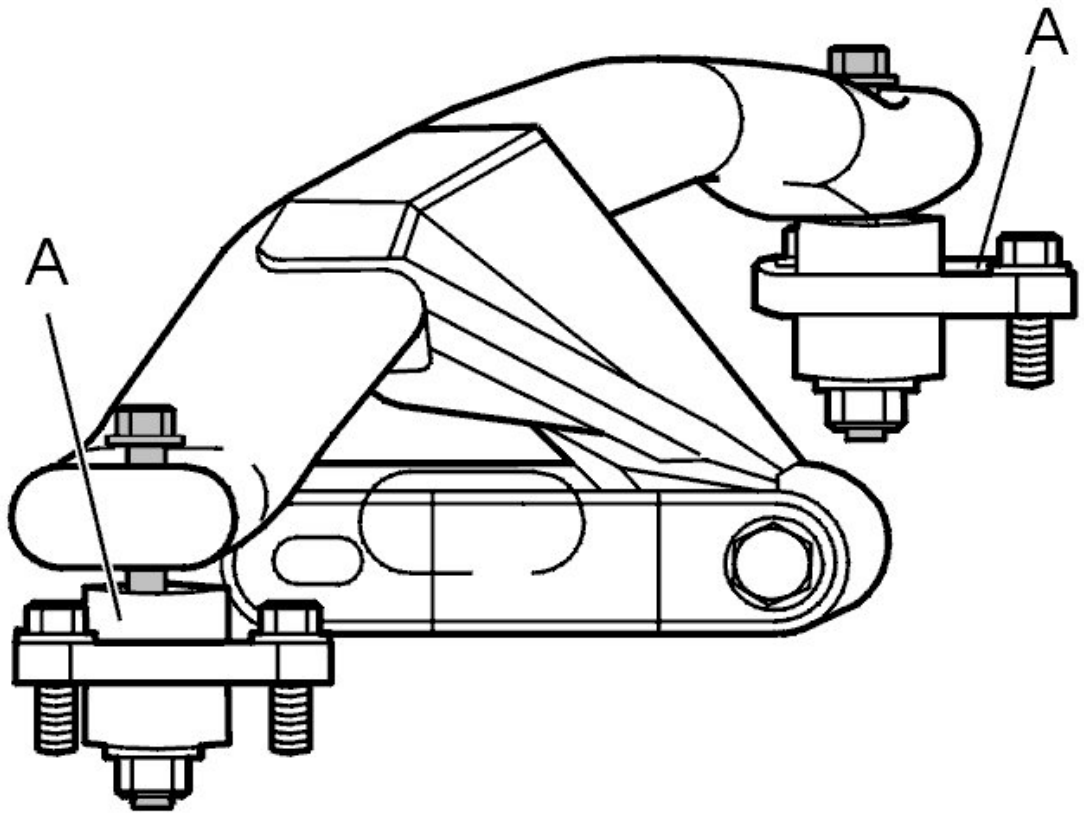
Removal

Removing the torque rod



Remove

- the screw for the torque rod mounting in the torque control arm and bracket on the engine
- the screws at the suspension turrets
- the torque rod.

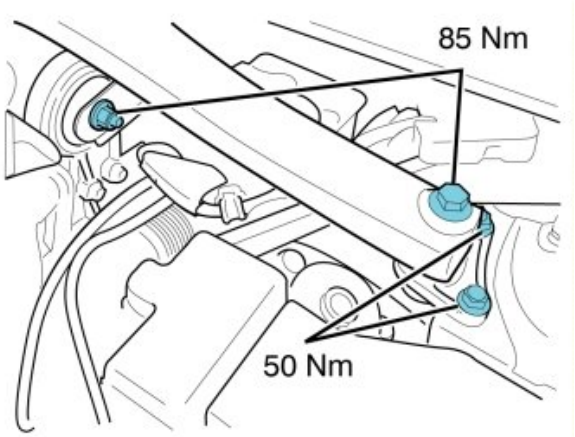


Transfer

- the brackets (A) on the left and right-hand sides to the new torque rod. Do not tighten yet.

Installation

Installing the torque rod



Install

- the torque rod
- the screws for the brackets at the suspension turrets. Tighten to **50 Nm**.
- the screw and nut for the torque rod mounting in the torque control arm/bracket on the engine. Tighten to **85 Nm**.

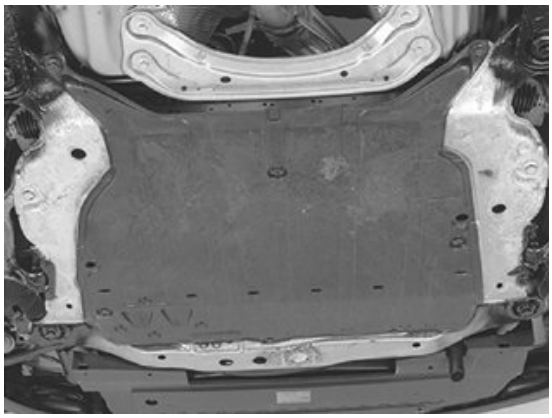
Tighten the torque rod to the brackets to **85 Nm**.

Engine Torque Strut: Service and Repair
Torque Rod, Lower, Replacing

Torque rod, lower, replacing

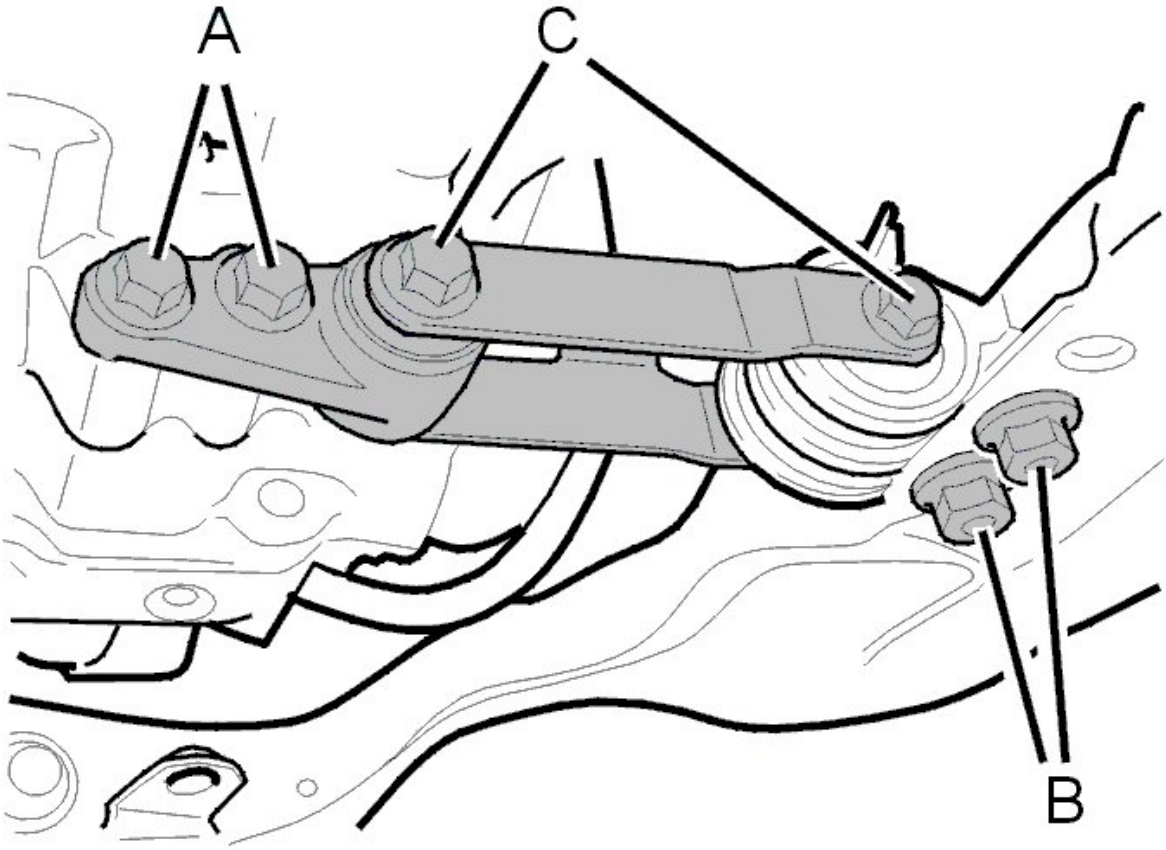
Removal

Removing the lower torque rod



Raise the car.

Remove
- the splash guard under the engine
- the torque rod from the transmission and sub-frame.



- install the new torque rod
- Tighten the screws (A) to the transmission. Tighten to **35 Nm**. Angle-tighten **40°**
- tighten the nuts (B) to the sub-frame. Tighten to **65 Nm**. Angle-tighten **60°**
- Tighten the nuts (C). Tighten to **35 Nm**. Angle-tighten **90°**.

Engine Lubrication: Testing and Inspection
Checking Oil Pressure

Checking oil pressure

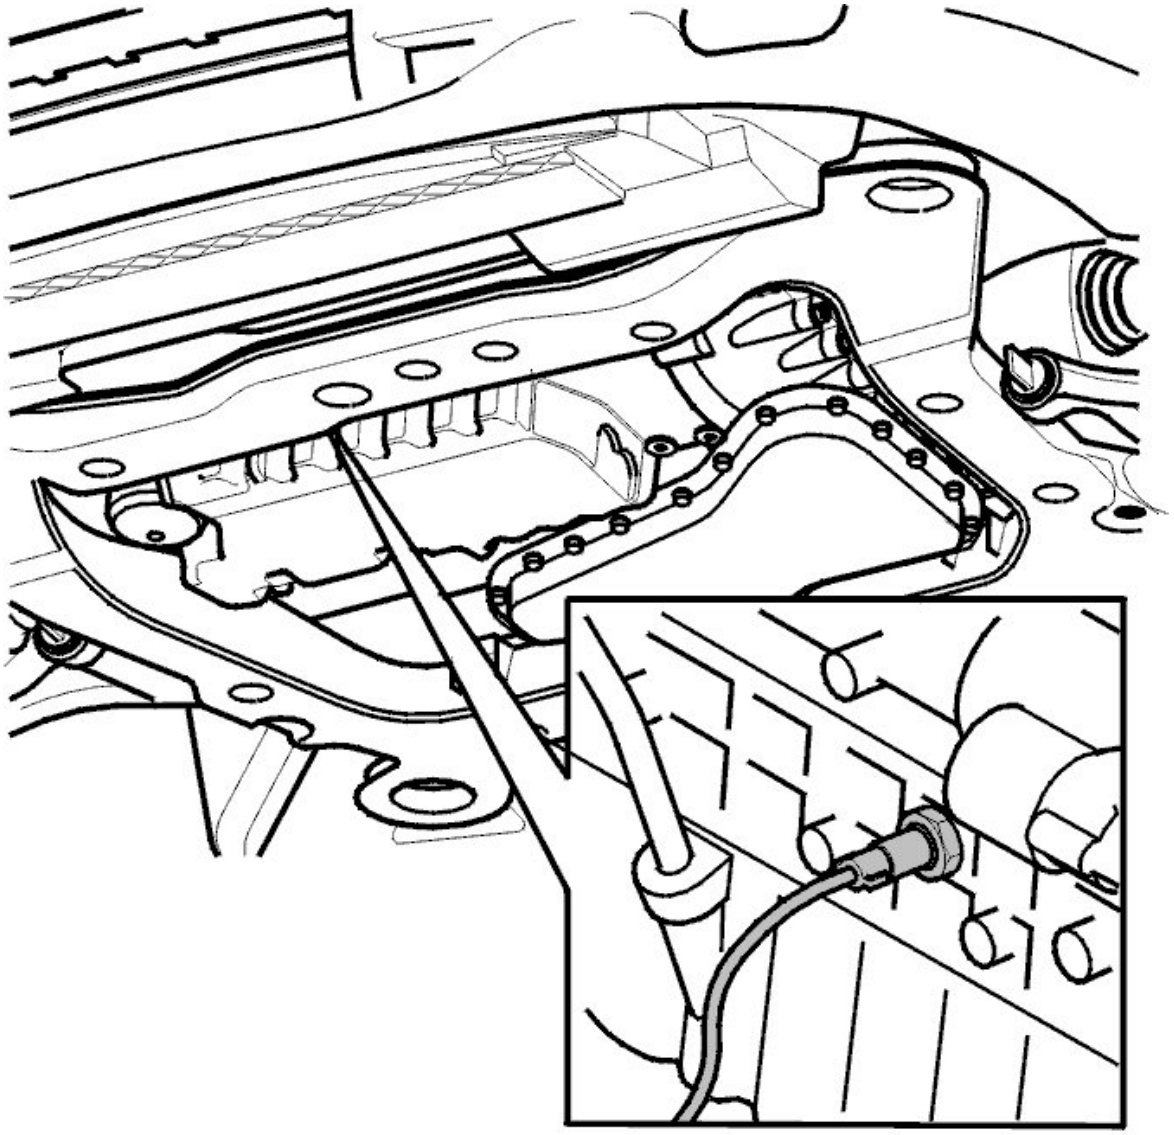
Special tools:

999 5270 OIL PRESSURE METER See: Tools and Equipment/999 5270 Oil Pressure Meter

Tightening torques

For tightening torques not in the text, see
B52x4x Tightening torque See: Specifications/Tightening Torque
B6xx4x Tightening torque See: Specifications/Tightening Torque

Checking the oil pressure sensor



Note! When checking the oil level and oil pressure, the engine should be at normal operating temperature which corresponds to 15 minutes normal driving (100°C / 212°F). If the oil quality and type or oil filter condition cannot be determined, replace the oil and filter.

Remove
- the air baffle on both sides
- the center air baffle under the engine.

Check
- the cable and connectors
- type and function. Try a new sensor
- any cable faults between sensor and warning lamp.

Note! Use a new gasket when the new sensor is installed.

Checking the oil pressure

Use instrument kit 999 5270 OIL PRESSURE METER See: Tools and Equipment/999 5270 Oil Pressure Meter. Connect to the oil pressure sensor duct on the cylinder block. Start the engine and read off oil pressure at different engine speeds (RPM).

Oil pressure B52x4x

13.3 r/s (800 rpm)	min 0.10 MPa
66.7 r/s (4000 rpm)	min 0.35 MPa
Maximum oil pressure (relief valve opens)	0.48 MPa

Oil pressure B6xx4x

12.5 r/s (750 rpm)	min 0.10 MPa
66.7 r/s (4000 rpm)	min 0.35 MPa
Maximum oil pressure (relief valve opens)	0.65 MPa

Engine Lubrication: Testing and Inspection
Oil Consumption Test

Oil consumption test

General

Some oil consumption is normal when an engine is running. The oil consumption varies depending on different factors:
- The condition of the engine (how well the engine is maintained)
- Blocked or damaged air filter
- Driving conditions - large loads, or excessive idling
- Oil grade and viscosity
- Cylinder capacity - in general a larger motor consumes a greater amount of oil than a smaller engine
- Engine power - a stronger engine consumes more oil than a smaller powered engine
- Oil level - too high a level (above the maximum mark on the dip stick) results in increased oil consumption.

Normal oil consumption
Running-in period

The oil consumption can be as much as 1 liter per 1,000 km during a running-in period of approx. 5,000 km if the engine is new or replaced (replacement of piston ring).
Driving between 5,000 and 150,000 km

Normal driving: up to 0.25 liters per 1,000 km is considered normal oil consumption.
Driving at high speed/with heavy trailer: up to 0.40 liters per 1,000 km is considered normal oil consumption.
Mountain/alpine driving: up to 0.50 liters per 1,000 km is considered normal oil consumption.
The above stated values for oil consumption can be used as guidelines if there is a suspicion that oil consumption is unusually/abnormally high.

Note! The oil consumption can be as much as the following at 150,000 km. The oil consumption can be approx. 0.35 - 0.55 liters per 1,000 km under all conditions.

To determine the exact oil consumption a test drive of at least 1,000 km must be performed under controlled conditions. The oil must be weighed before and after the test drive. This way the exact oil consumption can be calculated.

Abnormally high oil consumption

If the customer points out that the car consumes an abnormal amount of oil, the checks below must be carried out before carrying out corrective action.
- Ask the customer what their driving conditions are (see General causes of high oil consumption)
- Check for oil leaks
- Check that the crankcase ventilation is not blocked
- Check that the correct dip stick is in the engine. Check that the dip stick is pushed down as far as possible
- The car must be parked on level ground when measuring the oil. The engine should be driven at normal operating temperature on the road (not idling) for 30 minutes. The engine must then be left for 15 minutes before noting the oil level.

General causes of high oil consumption

Overfilling

If the oil has been filled above the recommended maximum level, oil is forced up against the cylinder walls and is ejected through the crankcase ventilation. The oil level must not be filled above the maximum mark on the dip stick!

Oil grade

Using a non Volvo recommended oil grade can cause increased oil consumption. The oil contains a larger amount of volatile molecules if the oil is too thin. Thin oil has difficulty in maintaining a comprehensive oil film on the cylinder walls at higher temperatures. This results in increased engine wear and increased oil consumption

Hard driving

Long and continuous driving at high engine speed (RPM) causes high engine temperature. The oil thins and consumption increases. Hard cornering at high engine speed (RPM) causes the oil to be forced against the side of the cylinder block and against the cylinder walls, resulting in increased oil consumption.

Mountain driving

Numerous and long periods of regular engine braking also causes high engine temperature. More oil is sucked into the cylinders due to an increased negative pressure in the intake pipe.

Idling

Driving the car in urban traffic conditions, where the engine may be running for long periods but only covering short distances, does not necessarily increase oil consumption but the ratio of oil consumption to distance travelled may be misleading.

Climate

In hot climates, the engine is required to work harder at a higher temperature. This increases oil consumption.

Mechanical causes of high oil consumption

Leaks

Worn crankshaft and crankshaft seal, external leakage, for example leaking gaskets.

Crankcase ventilation

Overpressure in the crank case caused by blocked crankcase ventilation.

Pistons and piston rings

Worn piston ring groove. Worn, scratched, broken or damaged piston rings. Blocked scraper rings. Incorrectly installed piston rings.

Cylinder walls

Worn or scratched cylinder walls.

Valves

Worn valve guides or valve stem. Worn, damaged or missing valve stem seals.

Cylinder head

Internal leakage between the oil ducts and leakage to the combustion chamber.

Measuring the oil consumption

General

There are two methods of determining the oil consumption. The oil is measured using a dip stick in the first method, before and after driving a test distance of 2000 km. This gives a sufficient first indication of the oil consumption. The second method consists of weighing the oil in the sump after driving 1000 km.
To reach as a correct result as possible, with both methods, the car must be driven to normal operating temperature (not idling) for 30 minutes before noting the oil level or draining the oil. Change the oil and replace the oil filter to ensure that a Volvo approved oil is used in the engine during the test period. Also replace the air cleaner (ACL) before measuring. The car must be standing on a flat surface and in the same position when measuring or weighing before and after the driven test distance.

Measuring using the dip stick

Replace the oil, oil filter and air cleaner. The oil must be Volvo approved.
Drive the car to operating temperature for 20-30 minutes (not idling). This is so that the oil reaches normal operating temperature.
Switch off the engine. Leave the engine switched off for 15 minutes.
Check the oil level. Top up with oil if necessary. Fill to the maximum mark on the dip stick.
Run the engine for 5 minutes so that the existing oil and the additional oil mix.
Switch off the engine for 15 minutes. Note the oil level on the dip stick. Note the odometer setting and vehicle data on the included form, Form for measuring oil consumption.
Drive the car 2000 km, or until the oil level has dropped to the minimum mark on the dip stick.
Drive the car to operating temperature for 20-30 minutes (not idling). This is so that the oil reaches normal operating temperature.
Switch off the engine. Leave the engine switched off for 15 minutes.
Measure the oil level on the dip stick using a sliding gauge. Note the result.
Complete the information on the form.

Weighing

Drive the car to operating temperature for 20-30 minutes (not idling). This is so that the oil reaches operating temperature.
Drain the oil from the oil trough for 15 minutes. A large amount of oil is collected in the cylinder head when the car is running. This factor, together with the design of the splash guard in the oil pan, means that it takes a long time for the oil to drain out of the engine. The oil must**not**be reused.

Warning! Take care when draining the oil. Use protective goggles and protective gloves. Hot oil can cause personal injury!

Replace the oil filter and air cleaner.
Fill with the specified amount of Volvo approved engine oil.
Drive the car to operating temperature for 20-30 minutes (not idling). This is so that the oil reaches normal operating temperature and the oil filter fills.
Carefully weigh an empty clean container (± 1 gram).
Drain the oil from the oil trough into the container for 15 minutes.

Warning! Take care when draining the oil. Use protective goggles and protective gloves. Hot oil can cause personal injury!

Carefully weigh the container + oil.
Fill the engine with the weighed oil. Ensure that as much oil as possible leaves the container.
Weigh the empty container. The container may weigh more than it did the first time due to the remaining oil film. The difference in weight is taken from the weighed oil weight.
Note the oil weight odometer setting and vehicle data on the included form, Form for measuring oil consumption.
Drive the car 1000 km, or until the oil level has dropped to the minimum mark on the dip stick.
Ensure that the engine is at normal operating temperature. Drive to normal operating temperature if necessary for 20-30 minutes (not idling).
Carefully weigh an empty clean container (± 1 gram).
Drain the oil from the oil trough into the container for 15 minutes.

Warning! Take care when draining the oil. Use protective goggles and protective gloves. Hot oil can cause personal injury!

Carefully weigh the oil + container. Deduct the weight of the container.
Complete the information on the form
If abnormal oil consumption is discovered when measuring, the engine needs to be remedied as follows.

Corrective action for high oil consumption

Conditions

A new and improved type of piston ring was introduced for naturally aspirated engines from model year 1999 inclusive and for turbocharged engines from model year 2000 inclusive. From model year 2000 inclusive the same piston rings are used on both naturally aspirated engines and turbocharged engines.
A car with an engine with the new piston rings can be expected to use 0.05-0.15 litres of oil every 1000 km.
A car with an engine with the earlier piston rings can be expected to use 0.10-0.20 litres of oil every 1000 km.
If the engine consumes more than 0.4 litres of oil every 1000 km, the following checks must be carried out to check whether the oil consumption problem is in the cylinder head, crankcase ventilation or piston ring and sleeve surface.

Check

Remove the intake manifold.
Check to see if there is an oil film or drops of oil in the cylinder head intake passage and/or oil on the valve stem and top of the valve crown.

Conclusions

If there is not an abnormally large amount of oil in the intake passage and valves and the oil consumption gradually, from being acceptable, begins to quickly increase, or consumption is between 0.30-0.80 litres per 1000 km, the problem is in the piston, piston ring or cylinder sleeve surface.
Faults in valve stem seals for example, or internal leakage in the cylinder head cannot be completely ruled out.
If the oil consumption has always been high, or there are traces of oil in the intake passage and valves, or the oil consumption is above 0.80 litres every 1000 km, the problem is probably in the cylinder head.
The cause could be leaking valve stem seals, internal leakage in the cylinder head or a fault in the crankcase ventilation (other than a blockage).

Corrective actions

If the problem seems to be in the crankcase ventilation, this must be thoroughly checked and remedied if necessary, before reconditioning or replacing the cylinder head.
If the problem seems to be with the piston, piston ring or cylinder sleeve surface, the engine should be reconditioned or if necessary, replaced.

Reconditioning

Replacing piston rings

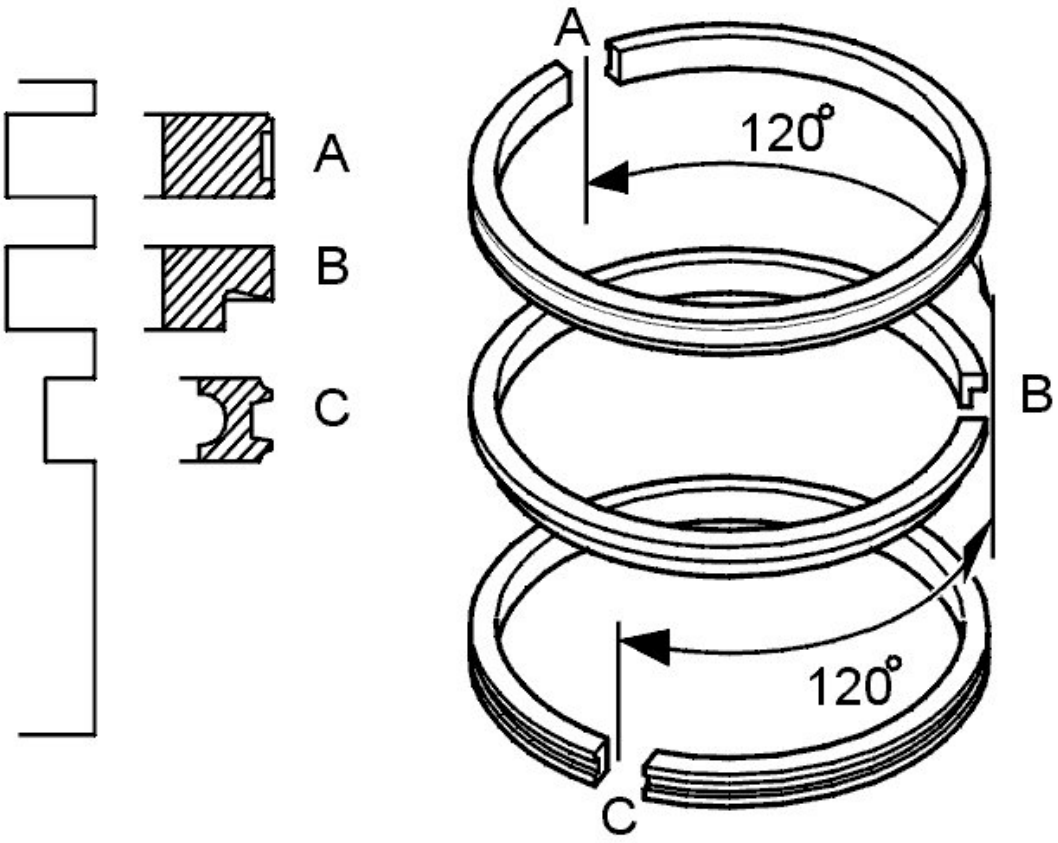
A corrective action is to replace the two lower piston rings (scraper ring and oil ring).
If the upper piston ring (compression ring) is undamaged it must not be replaced. Increased oil consumption may result if the compression ring is replaced.

Caution! Check that the upper piston ring (compression ring) faces the right way (see below)!

It is important that the uppermost and centre rings are installed the correct way up.
The lower ring can be installed any way up.

Distribute the piston ring openings as follows.

Early version



A. Compression ring

This is marked with text or with a circle. The marking must be facing upwards! It may be difficult to read the text, a magnifying glass may be required.

B. Scraper ring

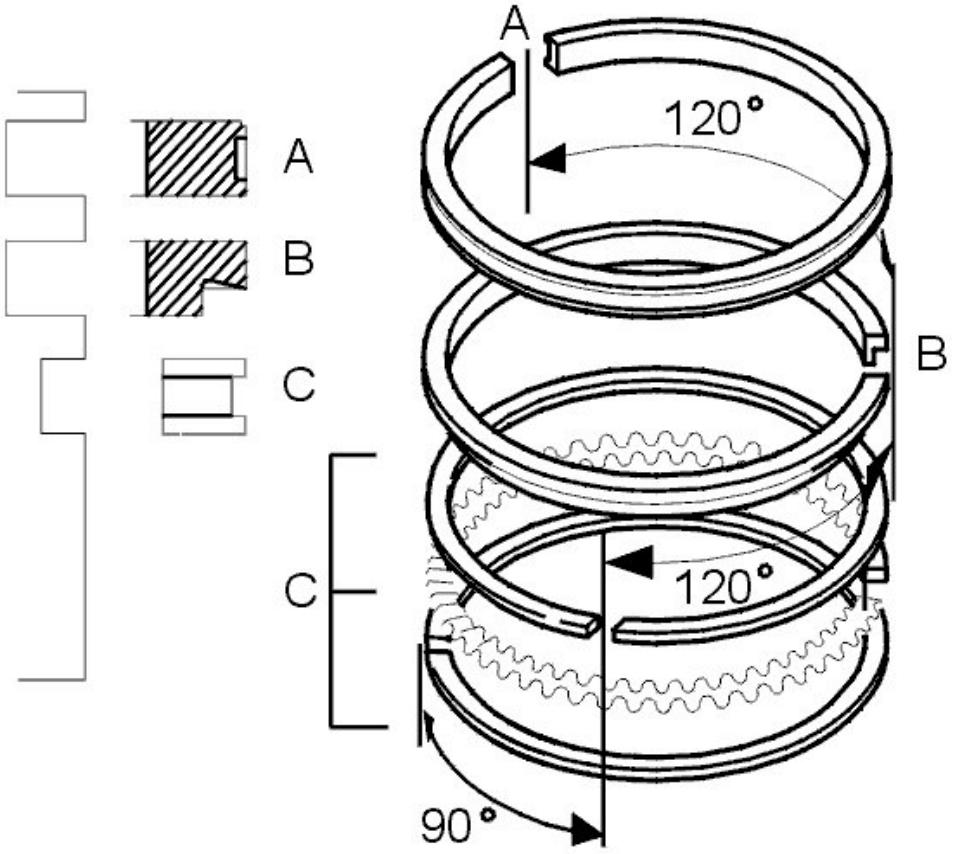
The cut out must be turned downwards. The text must be on the top of the ring.

C. Oil ring

Earlier versions of the oil ring are not marked and can be installed any side up.
Later versions of the oil ring are divided into 3 sections. These slotted rings can be installed with either side facing up.

Caution! New versions of the piston ring assembly cannot be combined with earlier versions of the piston!

Late version



Conclusions for corrective action

Replacing piston rings

As a first corrective action the piston rings should be replaced. Normally only the scraper ring and the oil ring must be replaced. The compression ring should only be replaced if absolutely necessary.

Replacing valve stem seals

If traces of oil are found on the valve crowns, in the ducts or on the valve stems, the valve stem seals should be replaced.
Thoroughly check the cylinder head. Check for internal leakage.

Replacing the cylinder head

If traces of oil (described above) are found and faults are found on the cylinder head, internal leakage for example, the cylinder head must be replaced.

Replacing the cylinder block and pistons

If damage is found in the cylinder block (worn cylinder bore, deep scratches etc.) the cylinder block, pistons and piston rings must be replaced.

Replacing the engine

The engine must be replaced if the problem cannot be remedied using the above corrective actions.

Form for measuring oil consumption

Chassis type:
Chassis number:
Engine number:
Date of arrival:
Odometer reading (km):
Checks carried out by:

1. Mileage	
Odometer reading, before check	(km)
Odometer reading, after check	(km)
Mileage driven "A"	(km)

2. Weighing	
Weight of oil before test drive	(gram)
Weight of oil after test drive	(gram)
Consumed oil weight	(gram)
Volume of consumed oil "B", (870 gram = 1 litre)	(litres)

Volume of consumed oil per 1000 km	
Volume of consumed oil "B" divided by the test drive distance "A" multiplied by 1000 = consumed amount (B / A x 1000 = consumed amount)	(litres/1000km)

Engine Oil Pressure: Testing and Inspection

Checking oil pressure

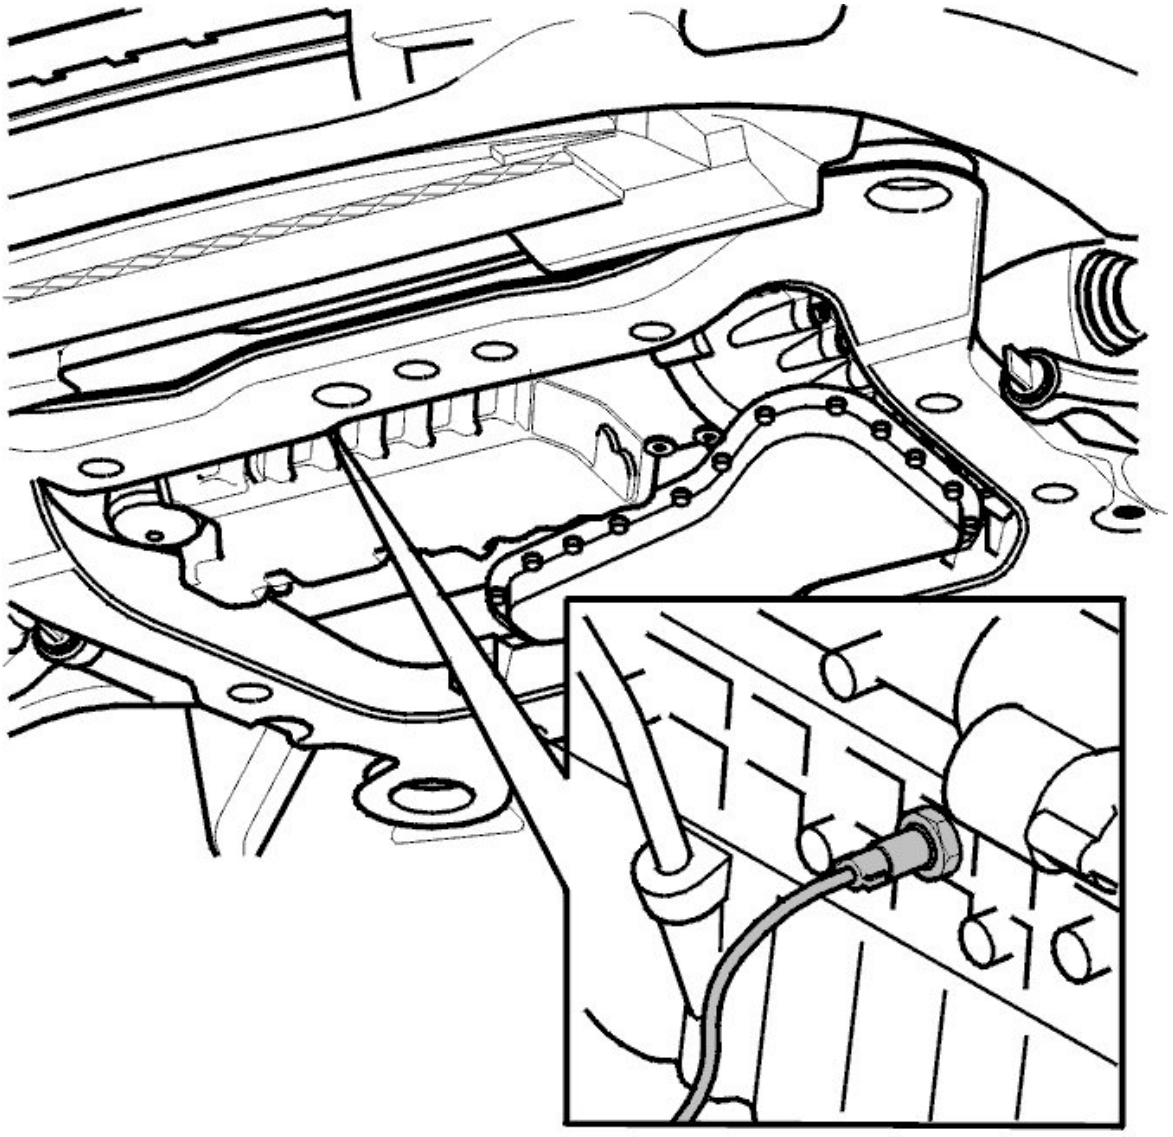
Special tools:

999 5270 OIL PRESSURE METER See: Tools and Equipment/999 5270 Oil Pressure Meter

Tightening torques

For tightening torques not in the text, see
B52x4x Tightening torque See: Specifications/Tightening Torque
B6xx4x Tightening torque See: Specifications/Tightening Torque

Checking the oil pressure sensor



Note! When checking the oil level and oil pressure, the engine should be at normal operating temperature which corresponds to 15 minutes normal driving (100°C / 212°F). If the oil quality and type or oil filter condition cannot be determined, replace the oil and filter.

Remove
- the air baffle on both sides
- the center air baffle under the engine.

Check
- the cable and connectors
- type and function. Try a new sensor
- any cable faults between sensor and warning lamp.

Note! Use a new gasket when the new sensor is installed.

Checking the oil pressure

Use instrument kit 999 5270 OIL PRESSURE METER See: Tools and Equipment/999 5270 Oil Pressure Meter. Connect to the oil pressure sensor duct on the cylinder block. Start the engine and read off oil pressure at different engine speeds (RPM).

Oil pressure B52x4x

13.3 r/s (800 rpm)	min 0.10 MPa
66.7 r/s (4000 rpm)	min 0.35 MPa
Maximum oil pressure (relief valve opens)	0.48 MPa

Oil pressure B6xx4x

Engine Oil: Service and Repair

Oil/oil filter, replacing

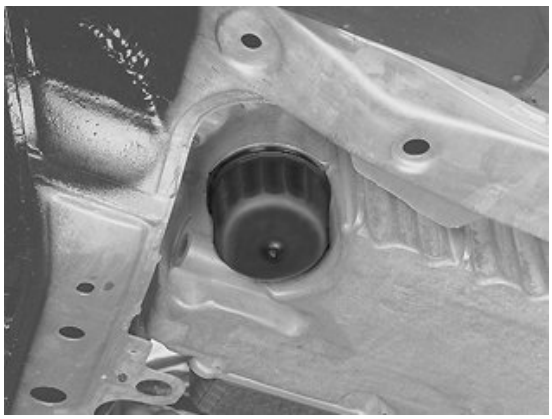
Special tools:

999 5679 Oil filter spanner See: Tools and Equipment/999 5679 Oil Filter Spanner

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Replacing the oil and oil filter

Draining the oil



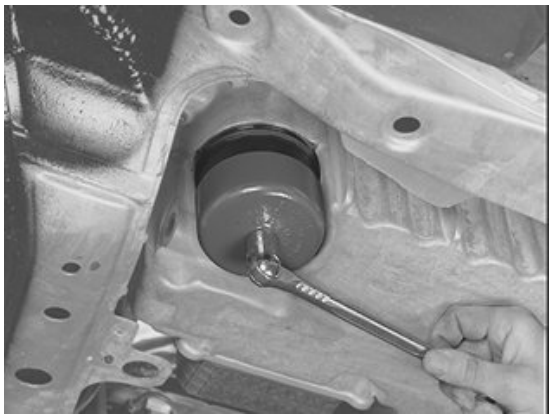
Warning! Hot oil can scald.Avoid skin contact with engine oil, particularly if the engine oil is dirty.Immediately wash hands and any skin that has been in contact with oil. Use a suitable cleaning agent and warm water.Wear protective gloves when working with engine oil.

Raise the vehicle. See: Jacking points, body See: Maintenance/Vehicle Lifting/Service and Repair and position an oil container.

Hint: The engine should be at operating temperature for the oil to drain more easily.

Remove:
- the lower splash guard. Position the container under the engine oil pan
- the oil pan plug. Discard the gasket. Drain the engine oil.

Removing the oil filter



Position the container under the oil filter.
Remove the oil filter housing. Use tool: 999 5679 Oil filter spanner See: Tools and Equipment/999 5679 Oil Filter Spanner.
Reinstall the oil plug again. Tighten. See Tightening torque See: Specifications/Tightening Torque. Always use a new sealing washer.

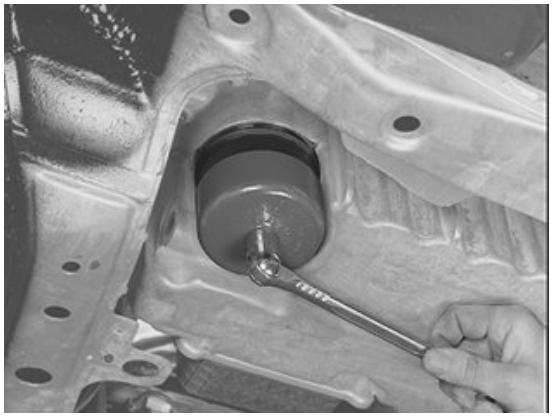
Replace the oil filter insert

Remove:

- the filter insert from the housing
- the O-ring that seals between the housing and the oil trough.

Allow the filter insert to drain and then discard it in an approved place.

Installing the oil filter



Caution! Clean the housing.

Install:

- a new filter insert
- a new O-ring. Lubricate the O-ring
- the oil filter housing. Tighten to Tightening torque See: Specifications/Tightening Torque.

Install the lower cover.

Filling with engine oil

Lower the vehicle and fill with oil.

Check:

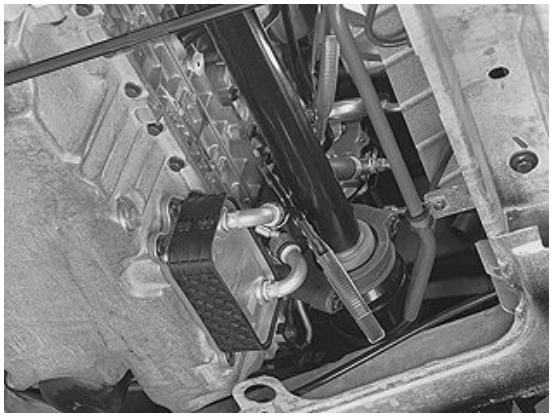
Start the engine and check for oil leakage.
Stop the engine and give the oil time to run down into the oil pan.
Then check the oil level. Top up if necessary but do not overfill. Wipe the engine compartment clean. Ensure that the steering wheel and the gear selector lever are clean.

Oil Cooler: Service and Repair

Oil cooler, replacing

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Oil cooler, removing:



Raise the car.

Remove:
- the lower splash guard.

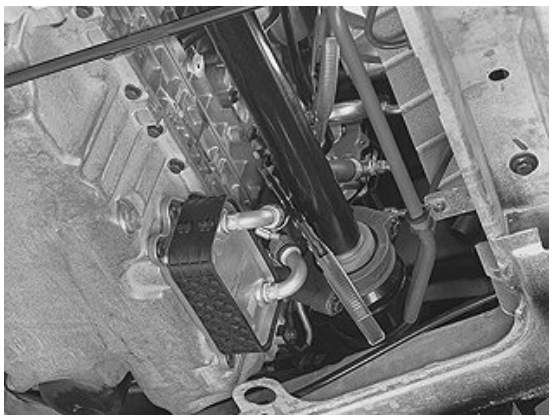
Clamp both the oil cooler coolant hoses together with lock grip pliers.

Remove:
- the coolant hoses from the oil cooler
- the oil cooler mounting screws.

Note! Collect the oil that drains from the oil cooler and any coolant.

Lift down the oil cooler.

Oil cooler, installing:



Use new seals.
The seals must be greased prior to installation.

Install:
- the oil cooler.

Screw the 4 oil cooler screws into place.
Tighten to: **17 Nm**
- the coolant hoses.

Remove the lock grip pliers.
Screw the splash guard into place.

Check

Check:
- the engine oil level

- the coolant level.

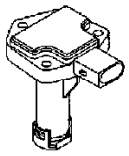
Check for leakage:

- start the engine and run to operating temperature
- then check that there is no leakage.

Check if the oil or coolant needs topping up.

Oil Level Sensor: Description and Operation

Oil Level Sensor (2004-, Certain Markets And Models Only)



The oil level sensor provides the engine control module (ECM) with information about the quality and temperature of the engine oil and the oil level in the oil trough. Which of these functions is used by the sensor varies between different car models.

All three functions are combined in one unit with a sensor section and an electronics section. There are no moving parts in the sensor.

The sensor consists of:
- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

The oil level sensor is supplied with **5 V** by the engine control module (ECM). The oil level sensor generates a PWM signal for the engine control module (ECM). Also see Function.

The engine control module (ECM) can diagnose the functions of the oil level sensor. Also see Oil level sensor, diagnostics.

The oil level signal can be read out in VIDA parameter read out.

Oil Level Sensor: Service and Repair

Oil level sensor, replacing

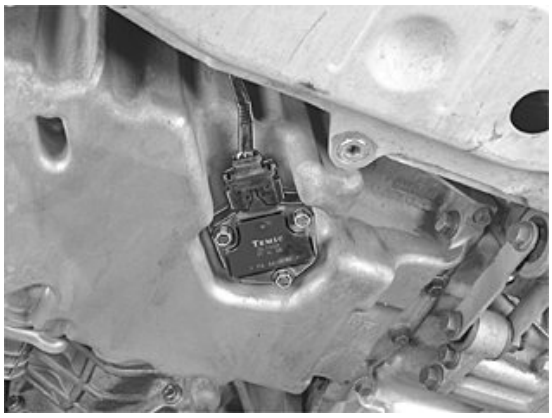
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removal and Installation

Removing the oil level sensor

Warning! Hot oil can scald. Avoid skin contact with engine oil, particularly if the engine oil is dirty. Immediately wash hands and any skin that has been in contact with oil. Use a suitable cleaning agent and warm water. Wear protective gloves when working with engine oil.

Remove the splash guard under the engine. Only applies to cars with automatic transmissions.
Position the container under the engine oil trough.
Remove the oil plug.
Drain the engine oil. It is easier to drain the oil if the engine is at operating temperature.

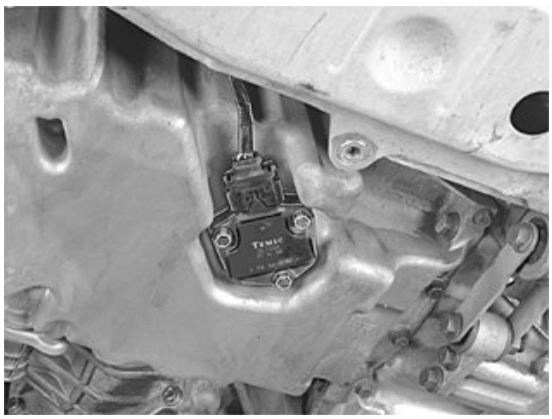


Remove:

- the screws for the sensor. Disconnect the connector for the sensor
- the sensor.

Installing the oil level sensor

Note! For tightening torques, see Tightening torque See: Specifications/Tightening Torque.



Install:

- the sensor
- screws for the sensor. Tighten. Connect the connector to the sensor
- the oil plug.

Finishing

Fill with engine oil. Run the engine to operating temperature. Check for any oil leakage.
Install the splashguard under the engine. Only applies to cars with automatic transmissions.
Check the oil level. Top up if required.

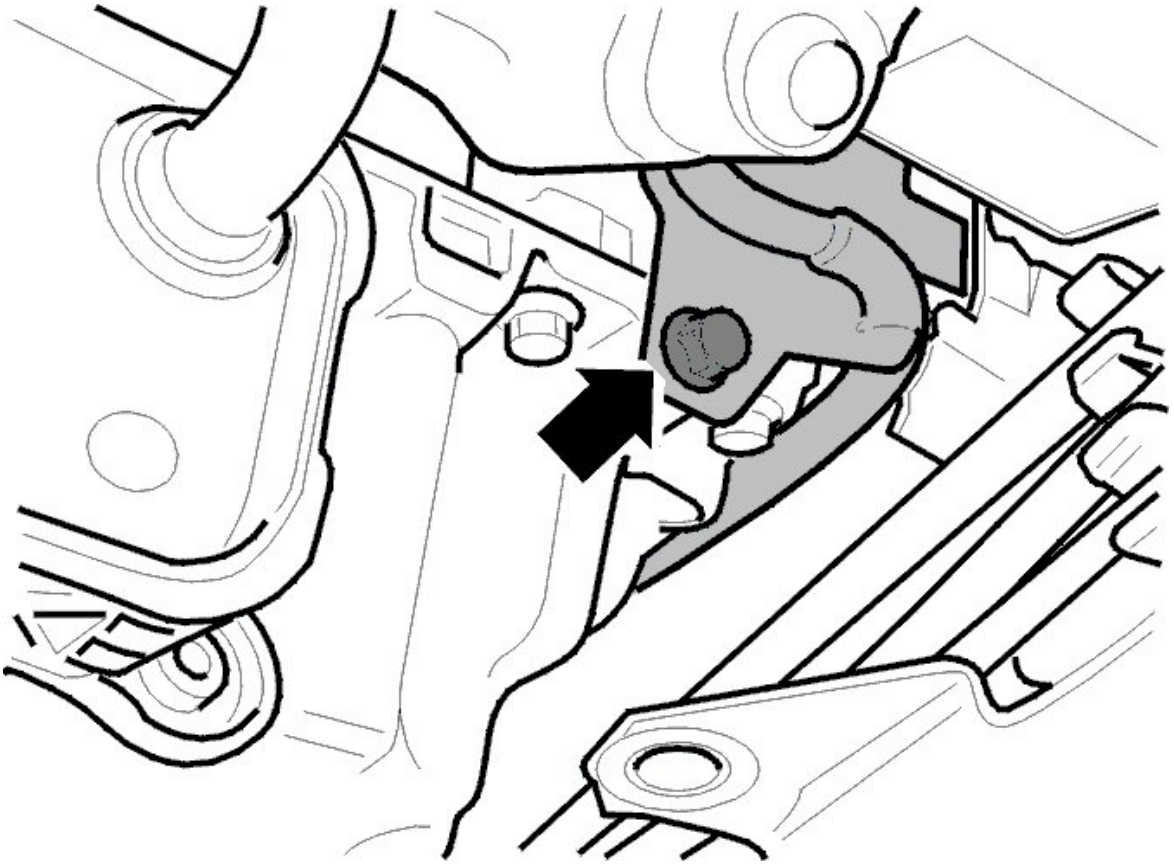
Oil Pan: Service and Repair

Oil sump replacement

Special tools:

951 2767 Roller See: Tools and Equipment/951 2767 Roller

Preparation



Remove

- the oil dipstick and its pipe.
- the splashguard under the engine.

Drain the engine oil and remove the oil filter.
Release the oil cooler from the sump. Hang up at the rear.
Remove the screw from the bracket for the fuel line.

Removing the oil sump

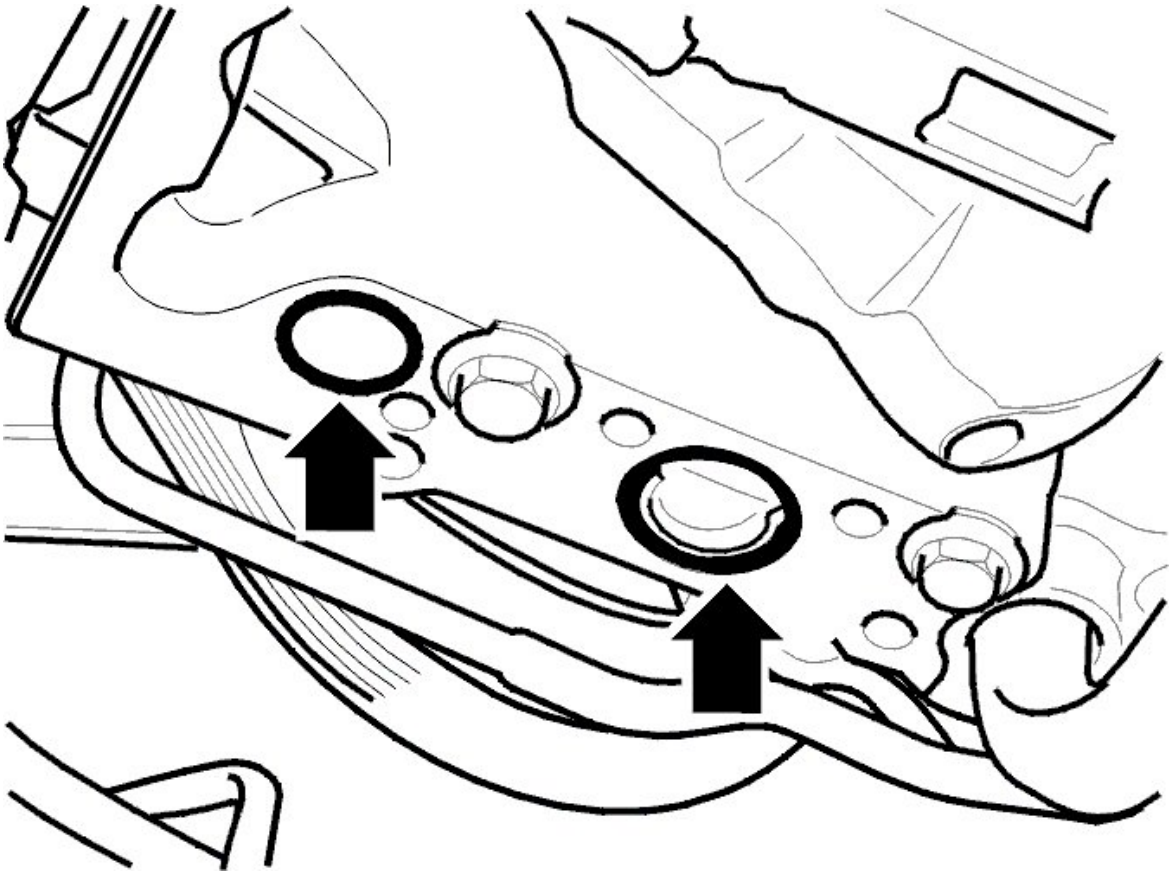
Slacken off all screws holding the oil sump.
Remove all screw except for four. It is recommended that the four screws in the corners of the sump are left in place.
Carefully tap the sump with a rubber mallet until the joint and its liquid gasket releases.
Remove the four remaining screws.
Remove the sump.

Cleaning

Clean the gasket surfaces on the oil sump and cylinder block. Use a razor blade or a gasket scraper and gasket solvent P/N 1161 440.

Warning! Use a fume hood or extractor when using gasket solvent.

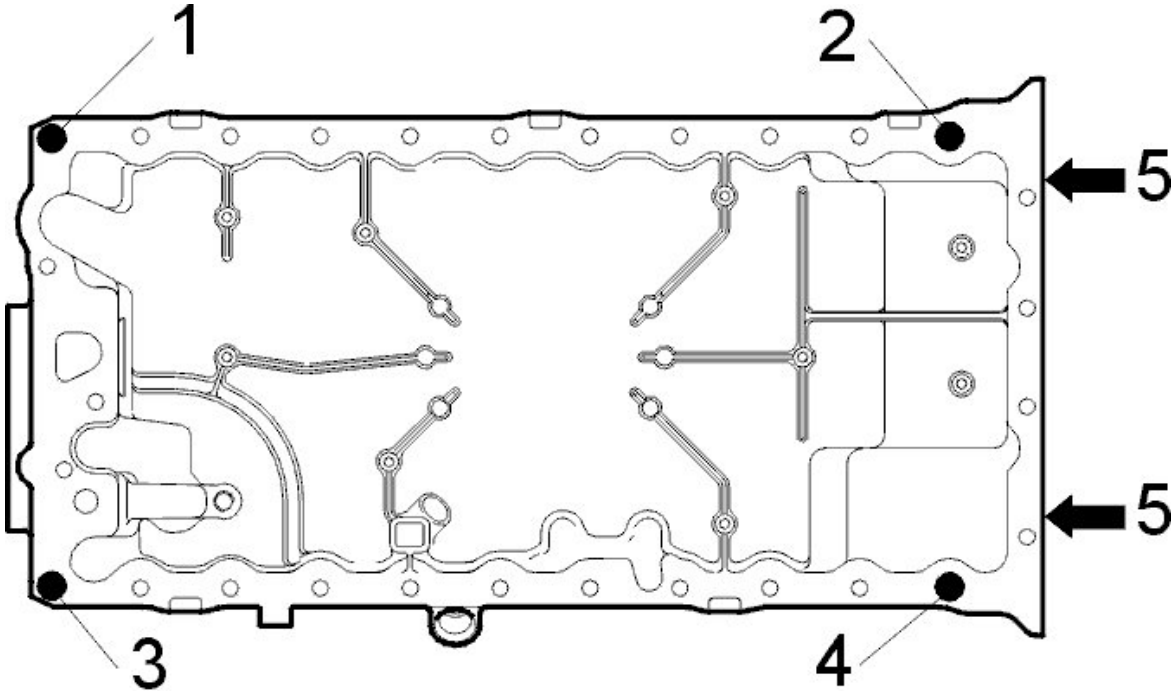
Installing the oil pan



Apply liquid gasket 1161 059-9 to the sump. Use roller951 2767 Roller See: Tools and Equipment/951 2767 Roller.

Install

- new O-rings.
- the oil sump. Secure it loosely with a few screws.
- the remaining screws loosely.



Press the sump against the transmission. Tighten the screws (1), (2), (3) and (4) to **3 Nm**. First tighten the screws (5) to **25 Nm**. Then tighten to **48 Nm**.
Tighten all screws in the sump joint to 17 Nm. Start at the transmission and continue forwards in pairs.
Install the screw for the bracket for the fuel line.
Connect the oil cooler to the sump. Use new O-rings. Reinstall the pipe on the sub-frame.

Install

- a new oil filter.
- the oil plug with a new gasket.

- the oil dipstick and its pipe. Use a new O-ring.

Note! Check that the O-ring is correctly positioned.

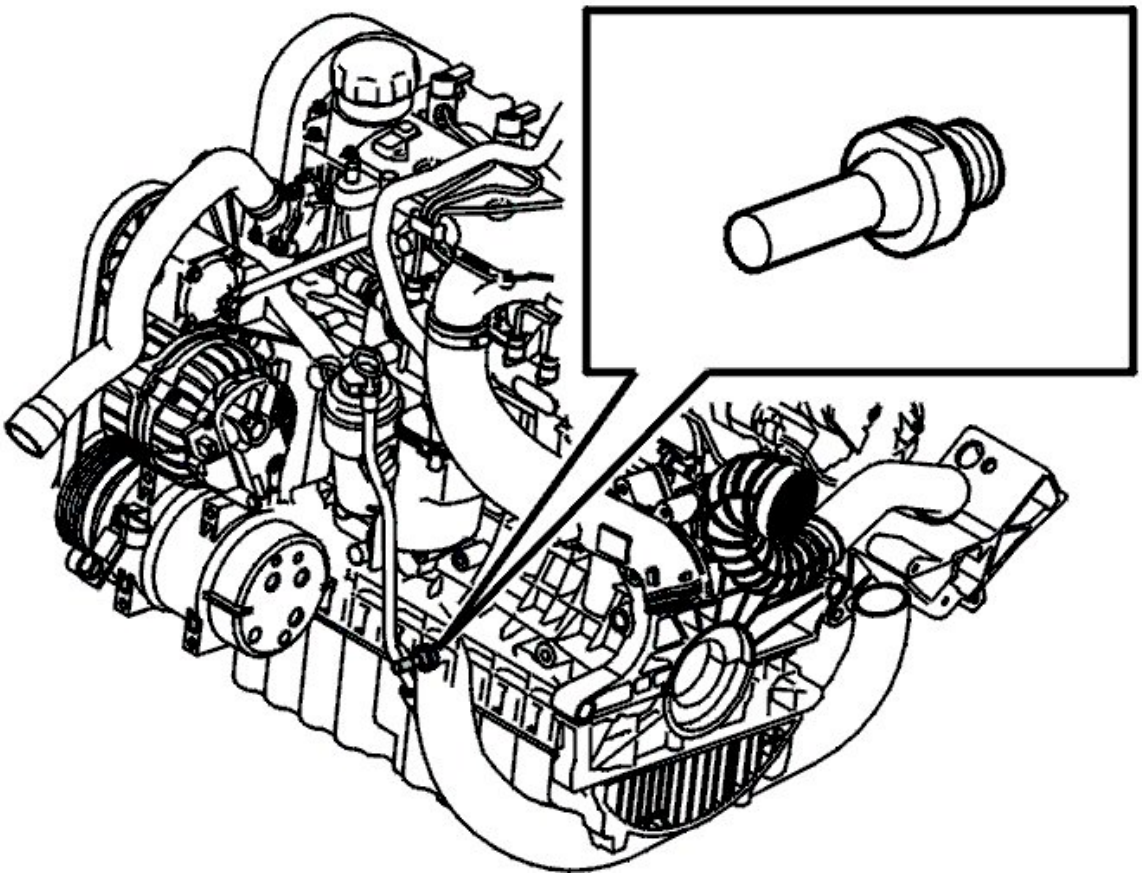
Fill with engine oil. Run the engine to operating temperature.
Check for oil leaks from the oil sump or oil cooler.
Install the splashguard under the engine.
Check the oil level. Top up if required.

Oil Pressure Sensor: Service and Repair
Replacing the Oil Pressure Sensor

Replacing the oil pressure sensor

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removing the oil pressure sensor

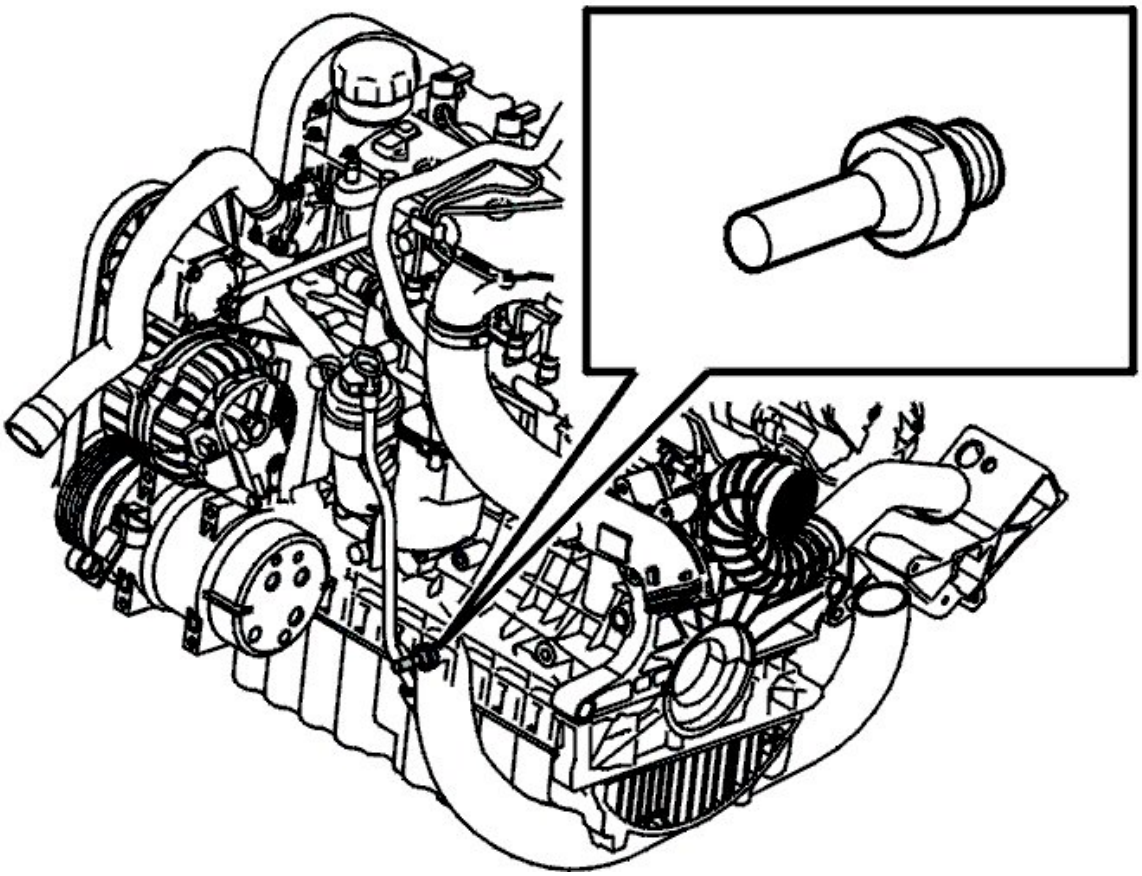


Remove the hose from the charge air pipe.

Remove:
- the screw for the charge air pipe in the cylinder block
- the connector from the oil pressure sensor
- the oil pressure sensor. Use a long 24 mm socket.

Place paper underneath in case of oil leakage.

Installing the oil pressure sensor



Install:

- the new pressure sensor
- the connector
- the screw for the charge air pipe in the cylinder block
- the hose on the charge air pipe.

Oil Pump: Service and Repair

Oil pump / crankshaft seal, front, replacing

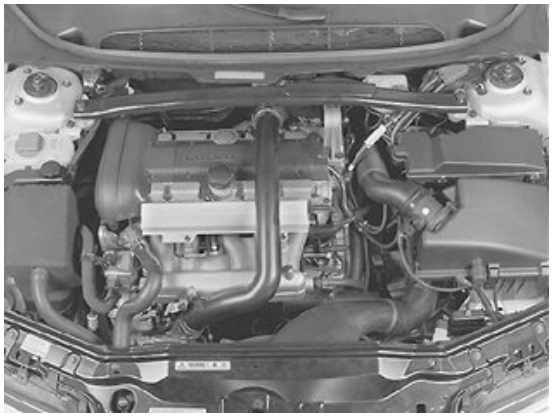
Special tools:

999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
998 6187 UNIVERSAL PULLER 100 See: Tools and Equipment/998 6187 Universal Puller 100
999 5919 PULLER See: Tools and Equipment/999 5919 Puller
999 5455 PUNCH See: Tools and Equipment/999 5455 Punch
951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Note! If the oil pressure is low or if there is possibly a fault with the oil pump, measure the oil pressure according to: Service information Section: 2 (21).

Remove engine components



Caution! Remove the ignition key.

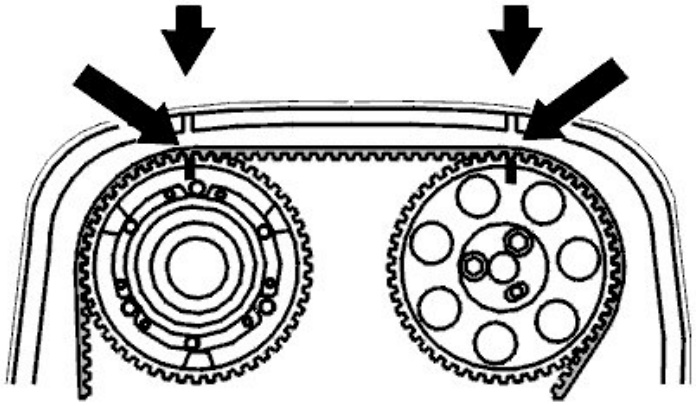
Remove

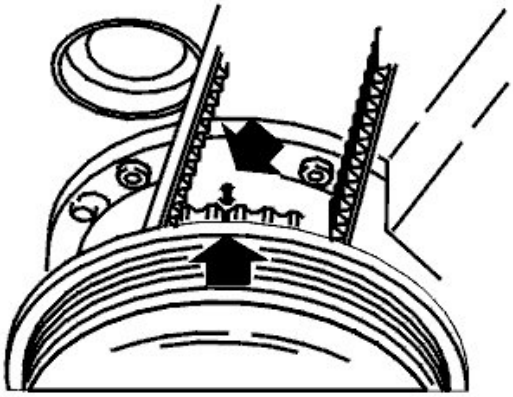
- the cross stay between the suspension turrets
- the upper timing belt cover
- the servo reservoir and expansion tank. Lift up and place on top of the engine.

Warning! Ensure that no power steering fluid is spilled. Extremely flammable.

- the auxiliaries belt
- the front timing belt cover.

Position the engine according to the marking

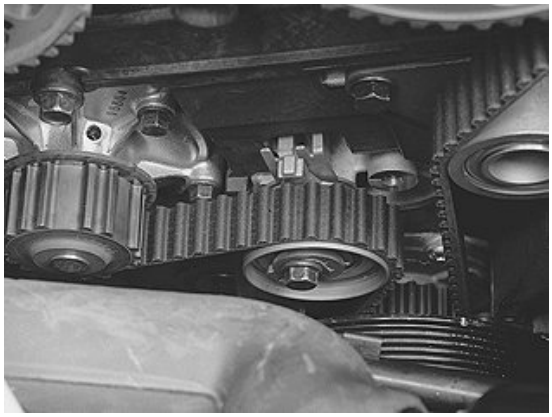




Raise the car

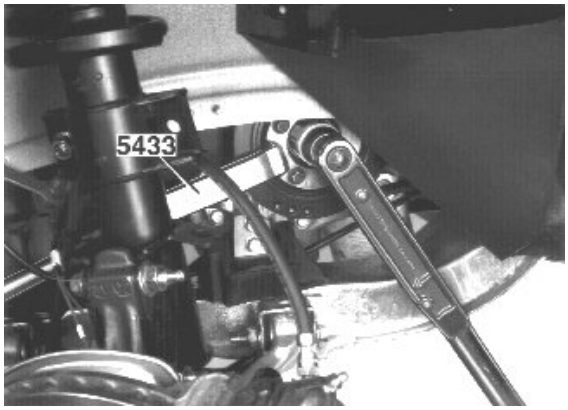
- Remove the right front wheel
- Install the upper timing belt cover
- Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulley correspond
- Turn a further 1/4 turn clockwise and then back counter-clockwise until the markings correspond
- Remove the upper camshaft cover.

Remove the timing belt



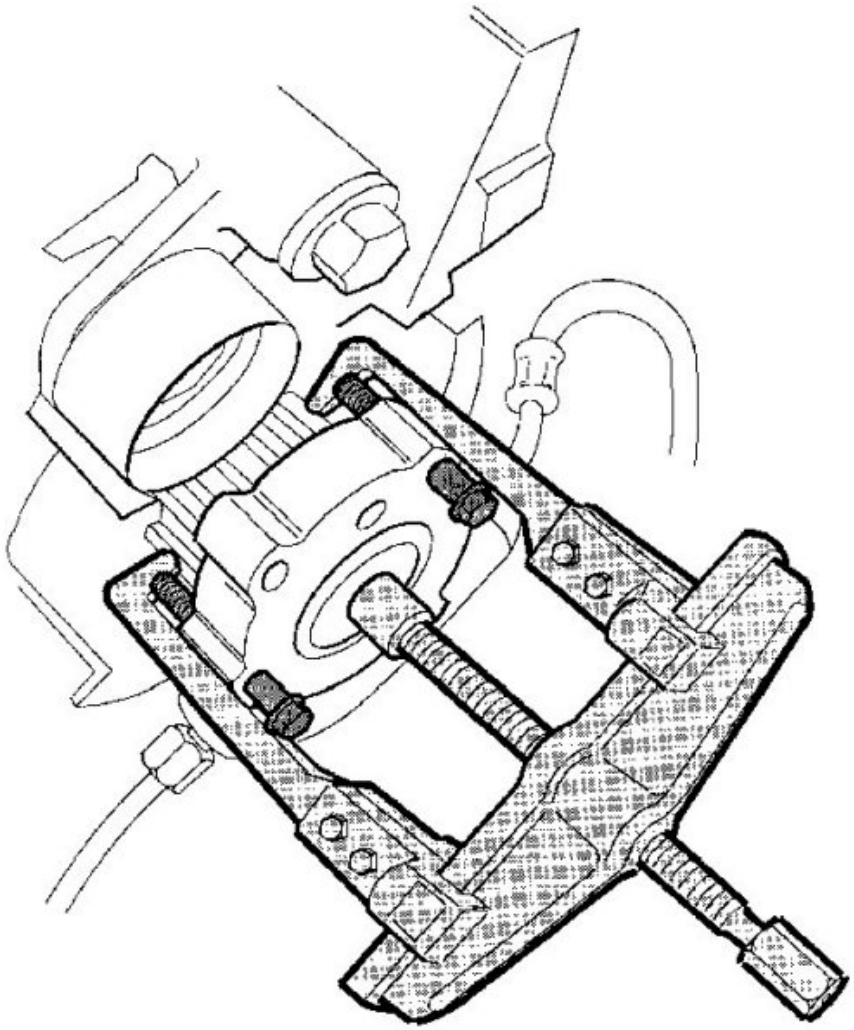
- Slacken off the center screw for the belt tensioner slightly
- Hold the center screw secure. Turn the tensioner eccentric clockwise with a 6 mm Allen key to "10 o'clock"
- Remove the timing belt.

Remove the vibration damper



- Install counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
- Counterhold and remove the crankshaft center nut
- Work the vibration damper loose and remove by hand
- Remove the camshaft belt.

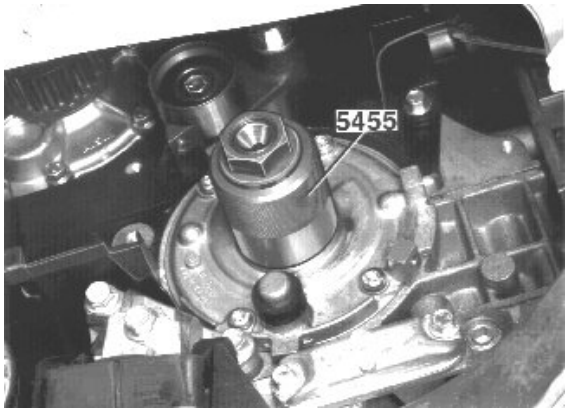
Remove the crankshaft timing gear pulley



- Use universal puller 998 6187 UNIVERSAL PULLER 100 See: Tools and Equipment/998 6187 Universal Puller 100 and two of the vibration damper screws
- Tighten both the screws by hand to stop in the pulley
- Install the puller so that the claws engage in the screws, not in the camshaft pulley.

Note! Ensure that the tool claws do not damage the pulley teeth.

When only replacing the front crankshaft seal



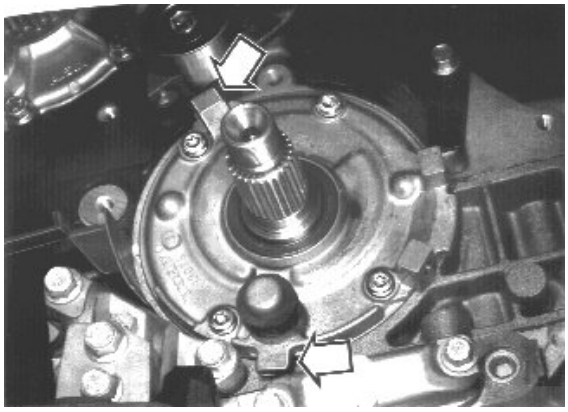
- Remove the old seal using a groove-cut chisel or: 999 5919 PULLER See: Tools and Equipment/999 5919 Puller
- Clean the mating surface
- Grease and install a new seal.

Use tool 999 5455 PUNCH See: Tools and Equipment/999 5455 Punch

- Press in the seal using a drift and the crankshaft center nut. As illustrated.

Note! Ensure that the crankshaft does not rotate when pressing in the crankshaft seal.

Remove the oil pump



- Remove the four oil pump screws
- Remove the oil pump.

Use a groove-cut chisel and **carefully** break at the stop lugs

- Clean the gasket face and the mating surfaces.

Install the oil pump

Install new oil pump

- Install a new gasket
- Carefully insert the oil pump over the end of the crankshaft.

Note! Ensure that the sealing ring in the oil pump is not damaged during installation

- Install 4 new screws as guides
- Pull in the oil pump with drift 999 5455 PUNCH See: Tools and Equipment/999 5455 Punch and the crankshaft center nut.

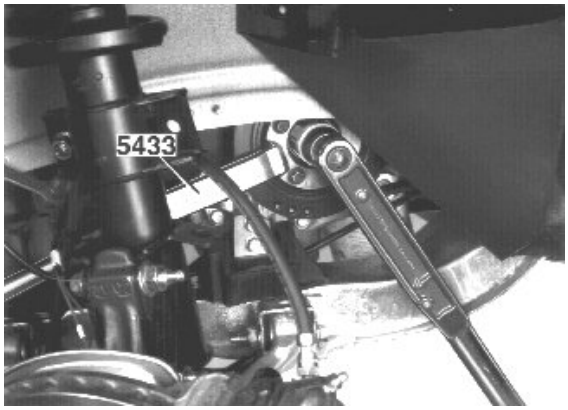
Note! Ensure that the crankshaft does not rotate when drawing in the pump.

- Tighten the screws crosswise. Tighten to **10 Nm**
- Install the crankshaft timing gear pulley.

Carefully tap alternately around the pulley until end position is reached.

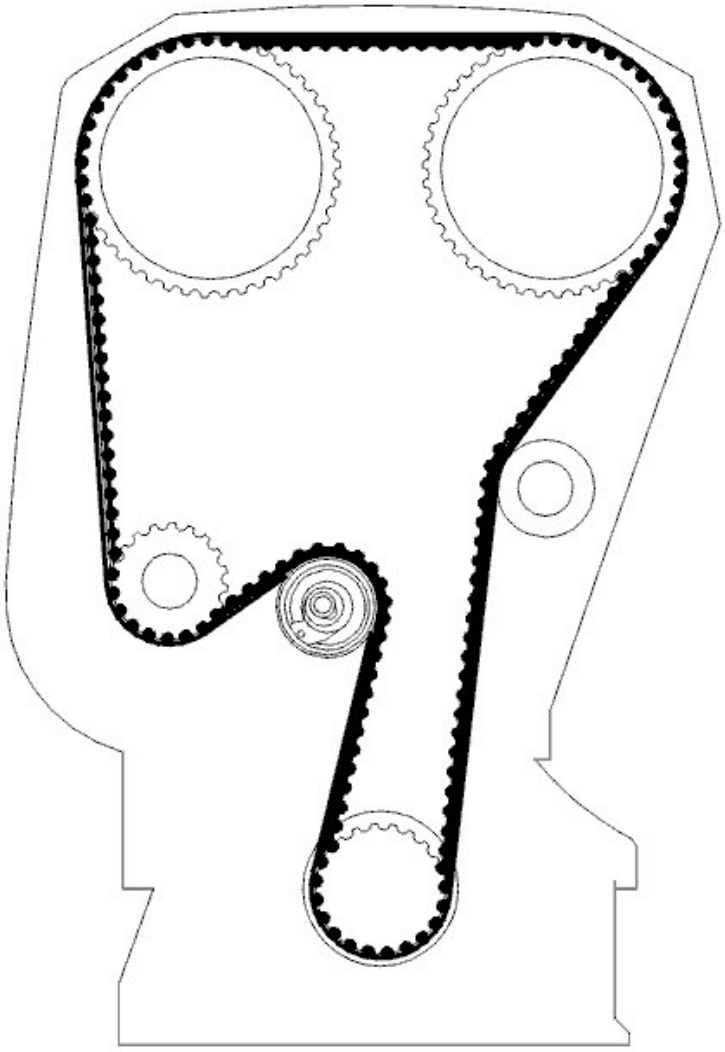
Note! The timing gear pulley can only be in one position on the splines on the end of the crankshaft.

Install the vibration damper



Install the vibration damper.
Tighten the center nut. Tighten to **180 Nm**.
Use counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold.
Remove the counterhold. Tighten the screws. Tighten to **25 Nm**.
Angle-tighten **30°**. Use bevel protractor 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor.

Install the timing belt

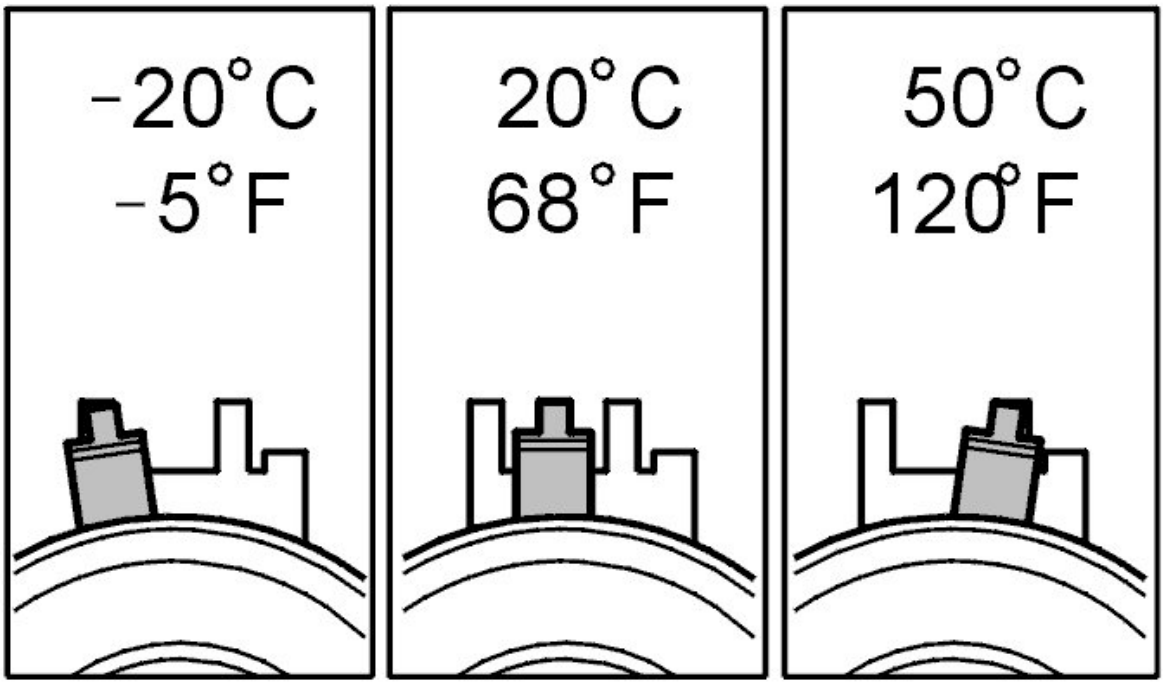


Install the upper timing belt cover.
Check that the markings on the crankshaft and camshaft timing gear pulley correspond.

Install the belt in the following order:

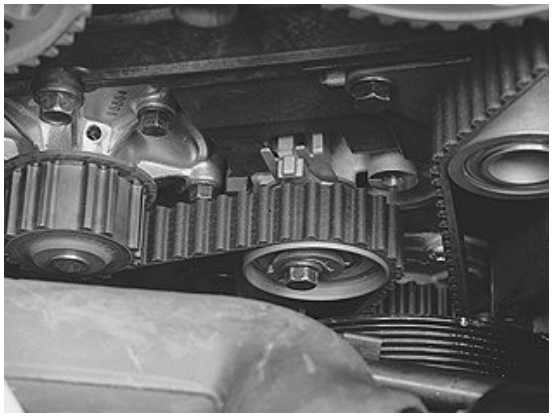
- crankshaft
- the idler pulley
- intake camshaft
- exhaust camshaft
- water pump
- belt tensioner.

Tighten the timing belt

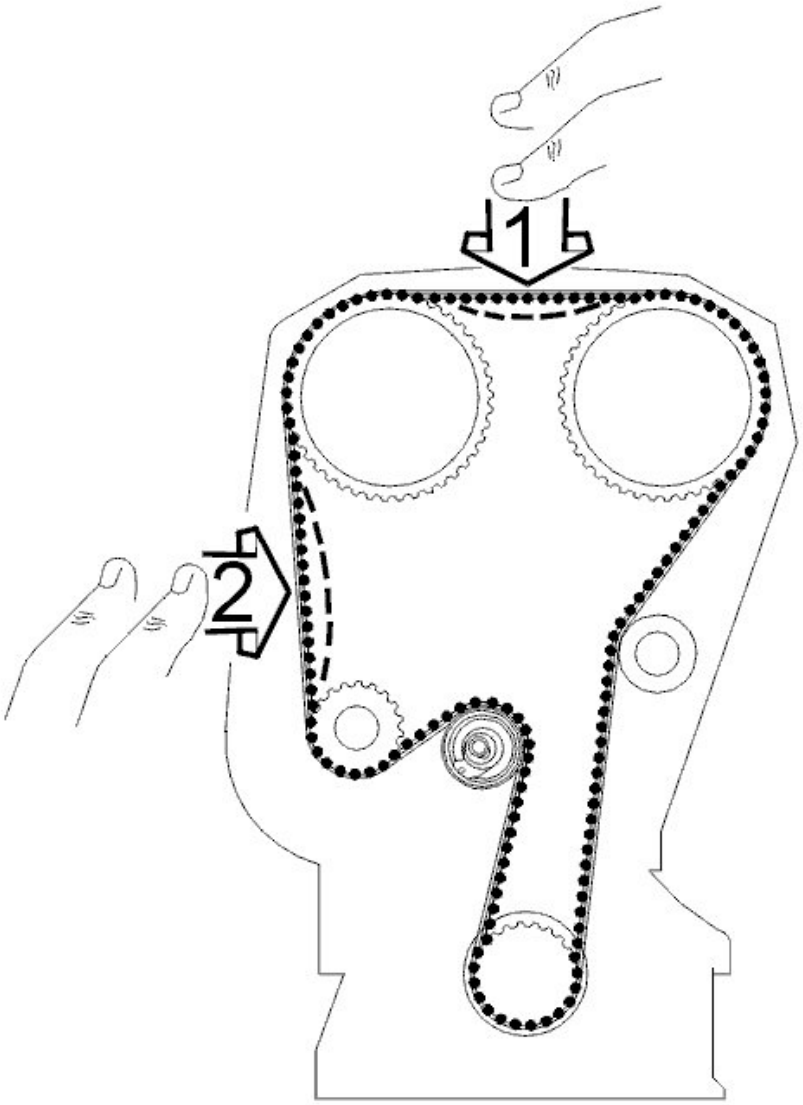


This adjustment is carried out on a cold engine. A suitable temperature is approximately 20°C/68°F.

At higher temperatures (with the engine at operating temperature or a high outside temperature for example) the indicator is further to the right. The illustration shows the position of the indicator when aligning the timing belt tensioner at different temperatures.



Carefully turn the crankshaft clockwise until the timing belt is in the tensioned position (tensioned between the intake cam, idler pulley and crankshaft).
Hold the belt tensioner center screw secure. Turn the belt tensioner eccentric counter-clockwise until the tensioner indicator passes the marked position. Turn the eccentric back until the indicator reaches the marked position in the center of the window.
Hold the eccentric secure and tighten the center screw. Tighten to **20 Nm**. Ensure that the indicator is in the correct position.

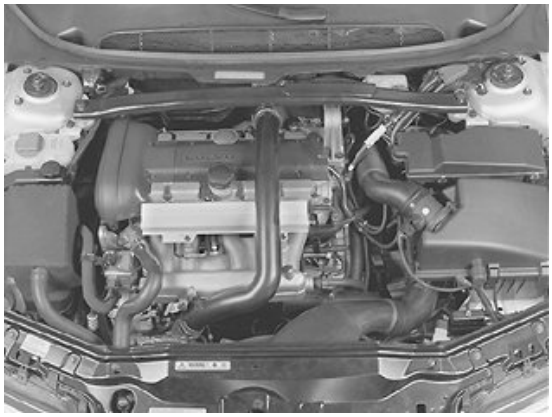


Press the belt to see that the indicator on the tensioner moves easily.
Position the upper camshaft cover.
Turn the crankshaft two turns. Check that the markings on the crankshaft and camshaft pulley correspond.
Check that the indicator on the belt tensioner is within the marked position.

Install

- the nuts for the cover in the fender liner
- the wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Finishing



Install:

- front timing belt cover.

Tighten to **12 Nm**

- the upper timing belt cover
- the auxiliaries belt

- the expansion tank and servo reservoir.

  Note! Ensure that the hoses are correctly positioned.

- the engine stabilizer brace. Tighten the screws at the suspension turrets. Tighten to **50 Nm**. Tighten the engine bracket screw. Tighten to **80 Nm**.

Carry out a function test

- Check the oil level and top up if required
- Start the engine
- Check that there is no oil leakage.

Stop the engine and give the oil time to run down into the oil trough.
Then check the oil level.
Top up if necessary.
Wipe the engine compartment clean.
Ensure that the steering wheel and gear selector lever are clean.

Oil Spray Jet: Service and Repair

Piston cooling valves, replacing

Affected engines: B52xxxx

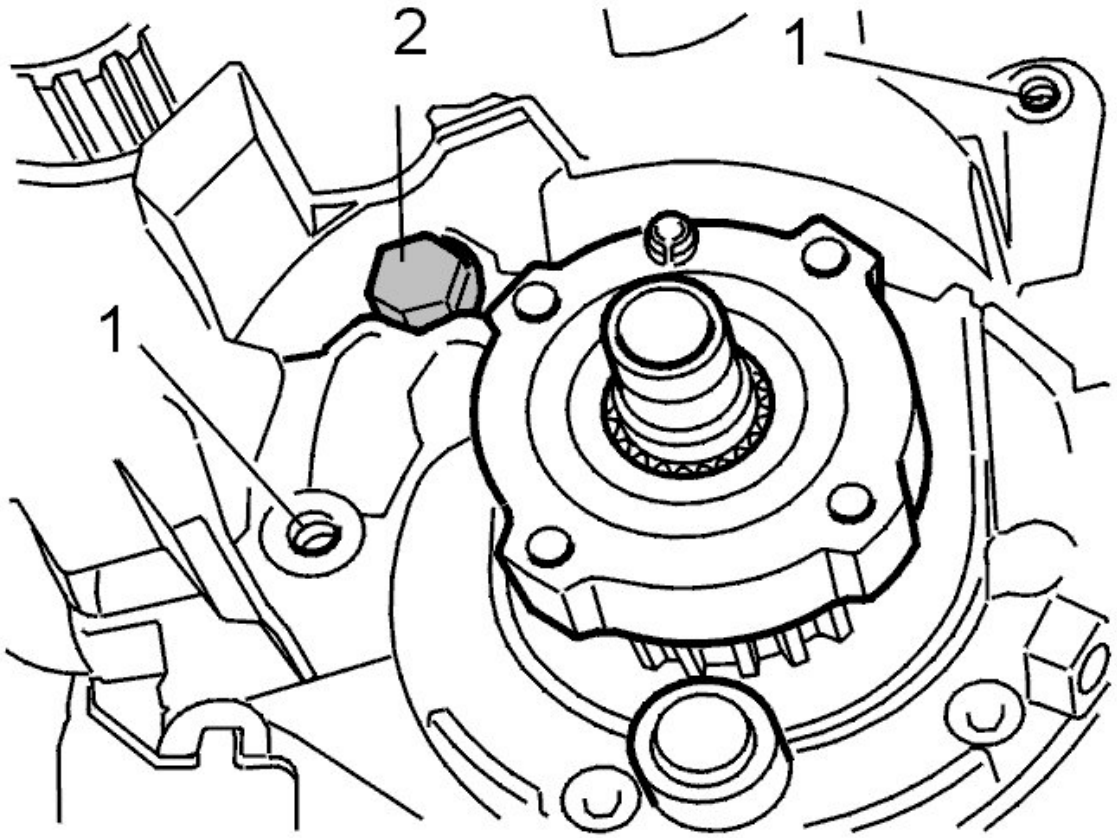
Removing the timing belt and mechanical timing belt tensioner

Remove the timing belt. See: Timing Components/Timing Belt/Service and Repair

Remove the timing belt tensioner. Remove the idler pulley. Remove the screw securing the inner timing cover to the cylinder head.
Raise the car. Continue with method: Timing belt, replacing. See: Timing Components/Timing Belt/Service and Repair

Remove the vibration damper.

Removing components

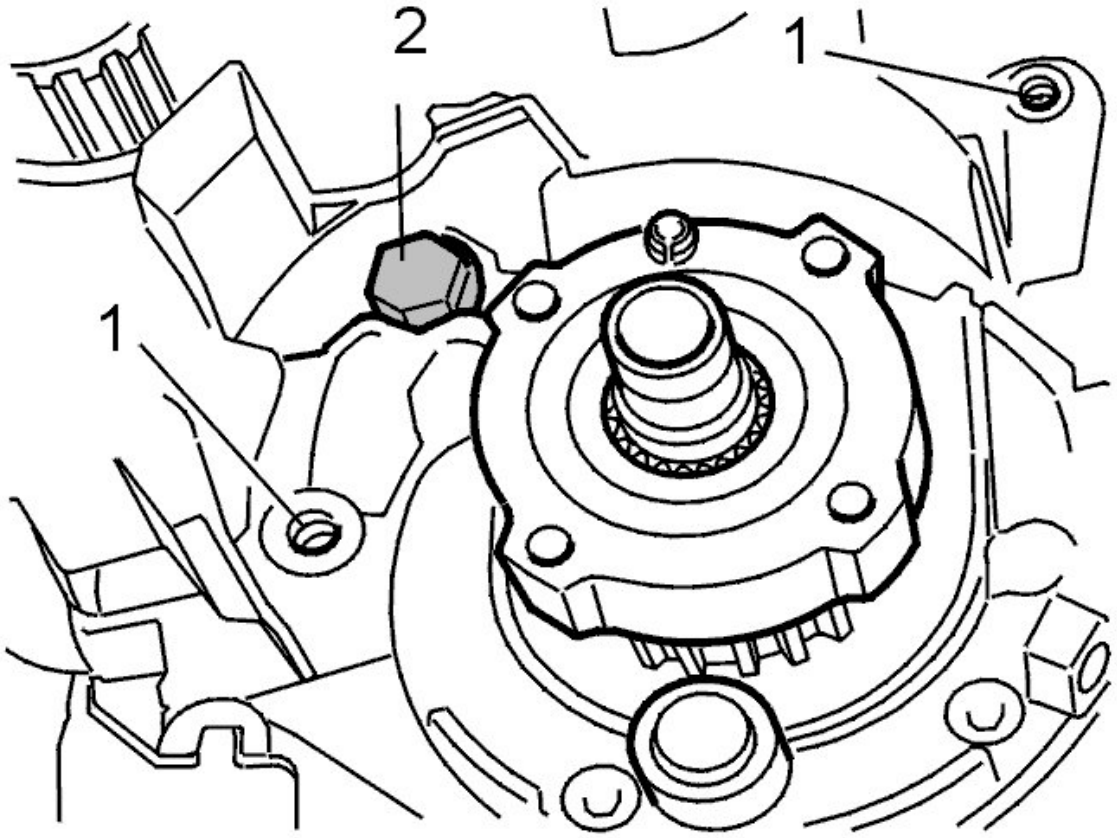


Remove:

- the two screws (1) securing the inner timing cover to the cylinder block
- the lower belt guard at the oil pump housing.

Press the inner timing cover off the flange around the coolant pump. Start at the lower edge of the pump.
Hold the cover out of the way. Remove the piston cooling valve (2) and the seal washer.

Installing components



Install:

- a new piston cooling valve (2) with a new seal washer. Tighten to **35 Nm**
- the inner timing cover. First press the cover into place over the flange at the top of the coolant pump. Then press the remaining section of the cover into place over the flange around the pump. Check that the cover is correctly positioned
- the two screws (1) securing the inner timing cover to the cylinder block
- the lower belt guard.

Installing the timing belt

Install:

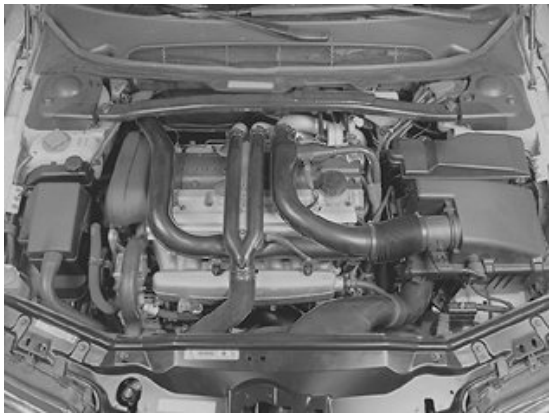
- the screw securing the inner timing cover to the cylinder head
- the idler pulley. Tighten to **25 Nm**
- the timing belt tensioner. Screw in the center screw by hand. Ensure that the fork on the tensioner centers above the cylinder block rib. Check that the Allen hole on the eccentric is at "10 O'CLOCK".

Continue with the method in: Timing belt, replacing, See: Timing Components/Timing Belt/Service and Repair, from and including: Installing the timing belt.

Affected engines: B62xxxx

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation



Caution! Remove the ignition key.

Remove

- the screw holding the engine stabilizer brace to the bracket on the engine
- the screws holding the engine stabilizer brace to the suspension turrets
- the engine stabilizer brace.

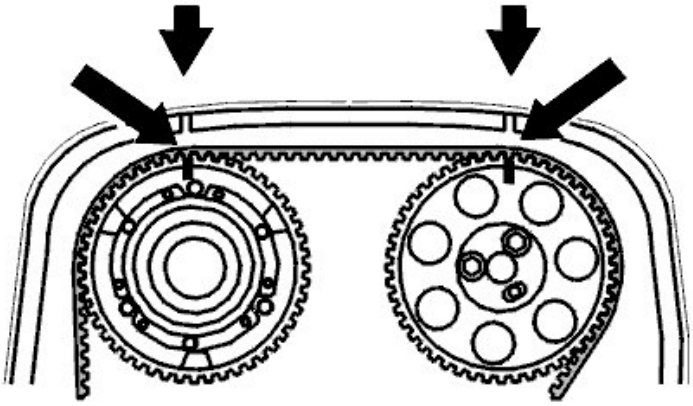
Applies only to B6xx4T engines:

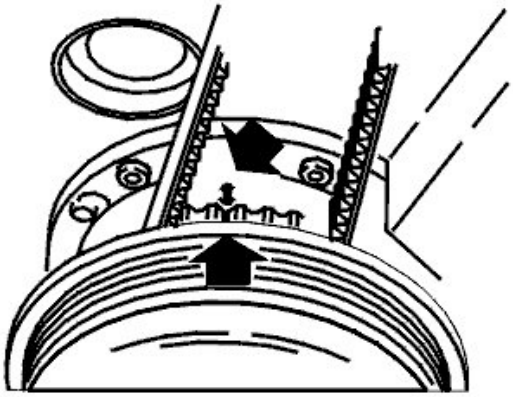
Remove the plastic pipes between the turbocharger (TC) and charge air cooler (CAC) and between the air cleaner (ACL) and turbocharger (TC). Put them to one side.
Remove the clamp from the intake manifold for the turbocharger (TC) for cylinders 1, 2 and 3. Turn the upper section of the pipe towards the firewall.

Relieve the load from the belt tensioner. Remove the auxiliaries belt.
Remove the upper timing belt cover.
Remove the front timing belt cover.
Lift up the servo reservoir and place it on top of the engine.

Note! Ensure that the oil does not leak from the ventilation hole in the filler cap.

Seal the hose between the expansion tank and the radiator. Disconnect the hose at the tank.
Lift up the expansion tank and place it on top of engine.





Raise the car.

Remove
- the right front wheel
- the plastic nuts on the cover in the fender liner.

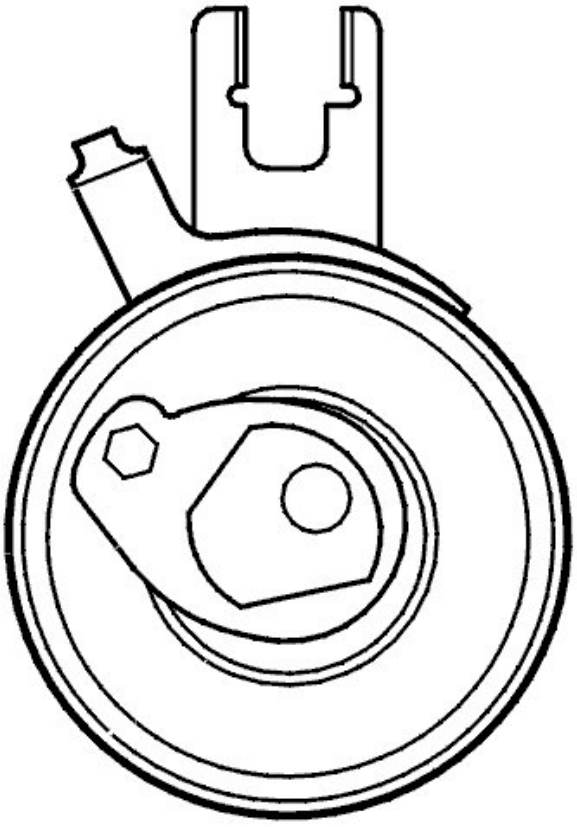
Install the upper timing belt cover.
Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulleys correspond.
Turn the crankshaft a further 1/4 turn clockwise.
Then turn back counter-clockwise until the markings correspond.
Remove the upper timing belt cover.

Remove the 4 vibration damper screws. Counterhold the crankshaft central nut.

Remove
- the vibration damper
- the auxiliaries belt
- the belt cover behind the crankshaft pulley for the auxiliaries belt.

Spray universal oil or similar around the rubber sleeve on the underside of the oil pump.
Remove the rubber sleeve.

Removing the timing belt



Slacken off the belt tensioner

Slacken off the center screw for the belt tensioner slightly.
Hold the center screw still. Turn the tensioner eccentric **counter-clockwise** using a 6 mm Allen key. Turn to 10 o'clock.
Unhook and remove the timing belt.

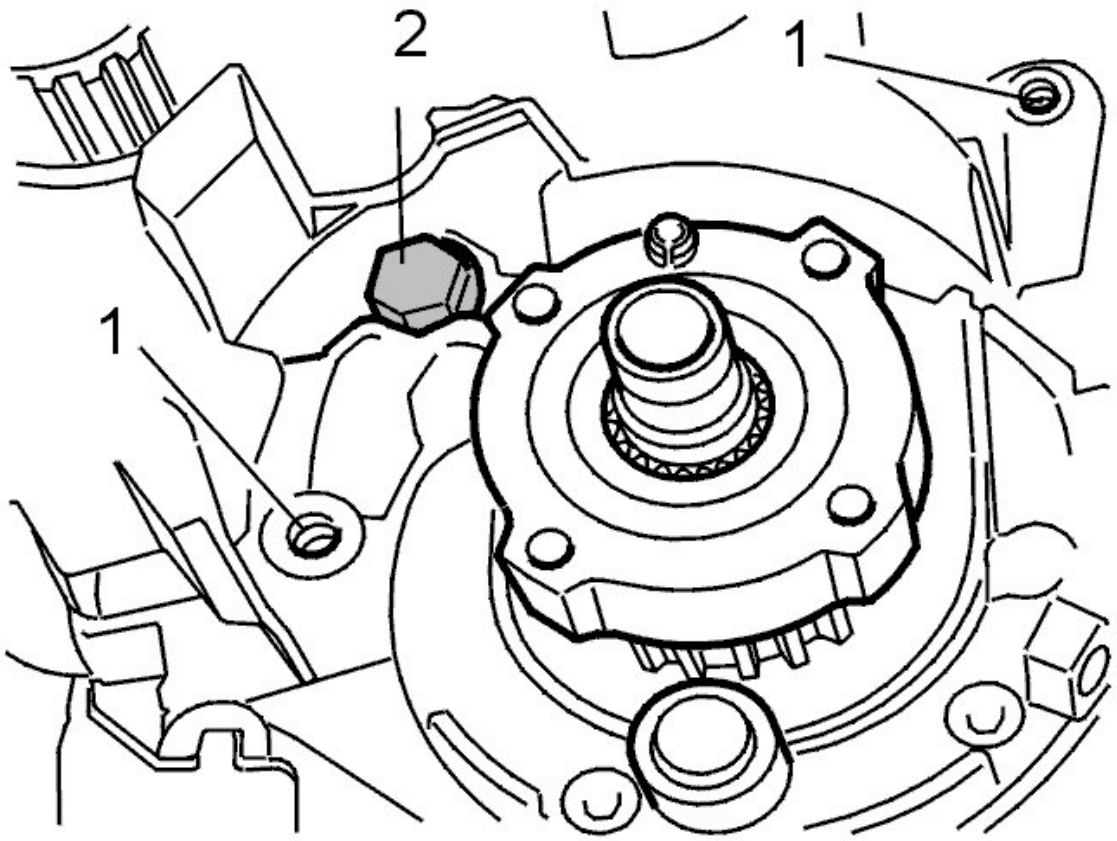
Caution! Do not turn the camshafts or the crankshaft when the timing belt has been removed.

Removing the timing belt tensioner and idler pulley

Remove the timing belt tensioner. Remove the idler pulley. Remove the screw securing the inner timing cover to the cylinder head.
Raise the car.

Removing and installing components

Removing components

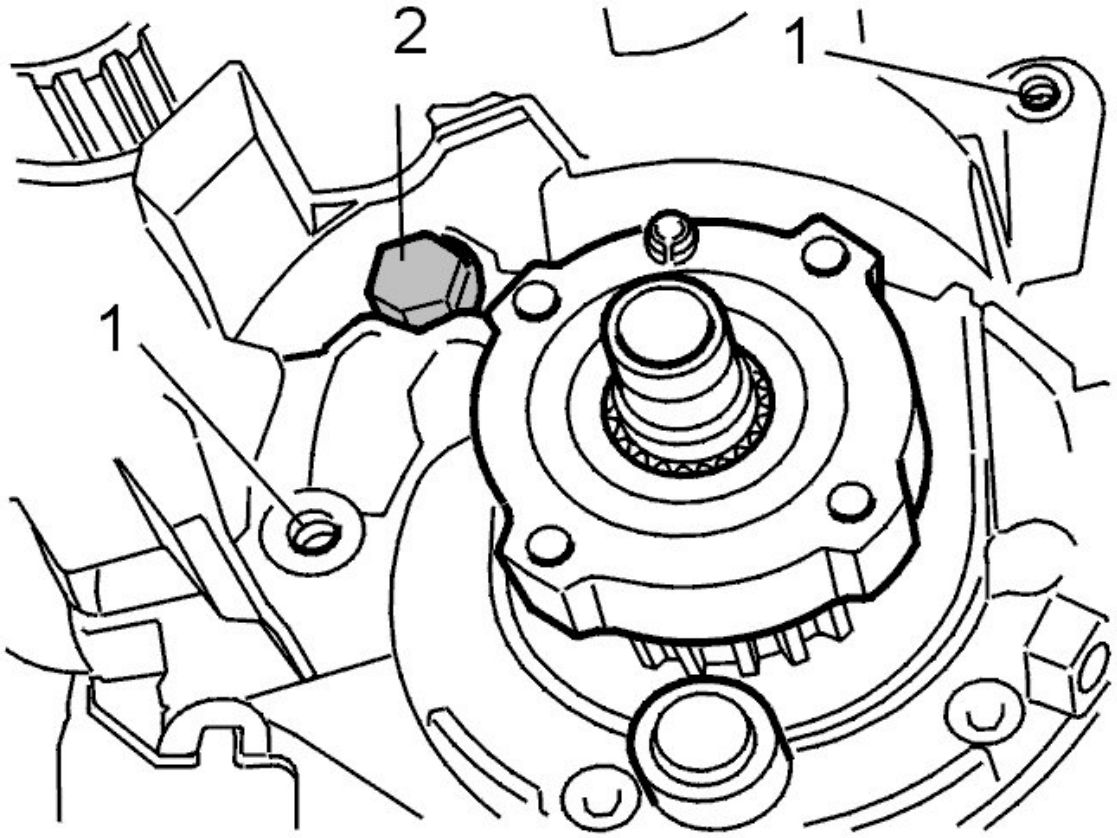


Remove:

- the two screws (1) securing the inner timing cover to the cylinder block
- the lower belt guard at the oil pump housing.

Press the inner timing cover off the flange around the coolant pump. Start at the lower edge of the pump.
Hold the cover out of the way. Remove the piston cooling valve (2) and the seal washer.

Installing components



Install:

- a new piston cooling valve (2) with a new seal washer. Tighten to **35 Nm**
- the inner timing cover. First press the cover into place over the flange at the top of the coolant pump. Then press the remaining section of the cover into place over the flange around the pump. Check that the cover is correctly positioned
- the two screws (1) securing the inner timing cover to the cylinder block
- the lower belt guard.

Install the timing belt tensioner

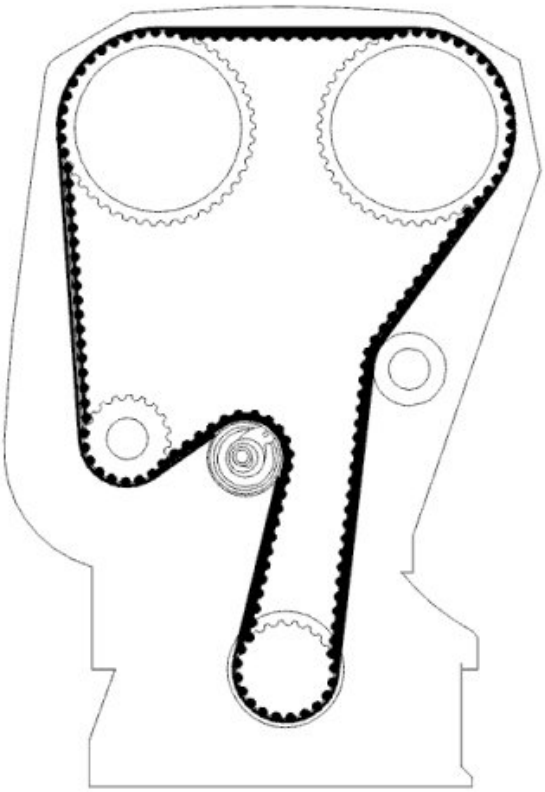
Install:

- the screw securing the inner timing cover to the cylinder head
- the idler pulley. Tighten to **25 Nm**
- the timing belt tensioner. Screw in the center screw by hand. Ensure that the fork on the tensioner centers above the cylinder block rib. Check that the Allen hole on the eccentric is at "10 O'CLOCK".

Installing the timing belt

Installing the timing belt

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

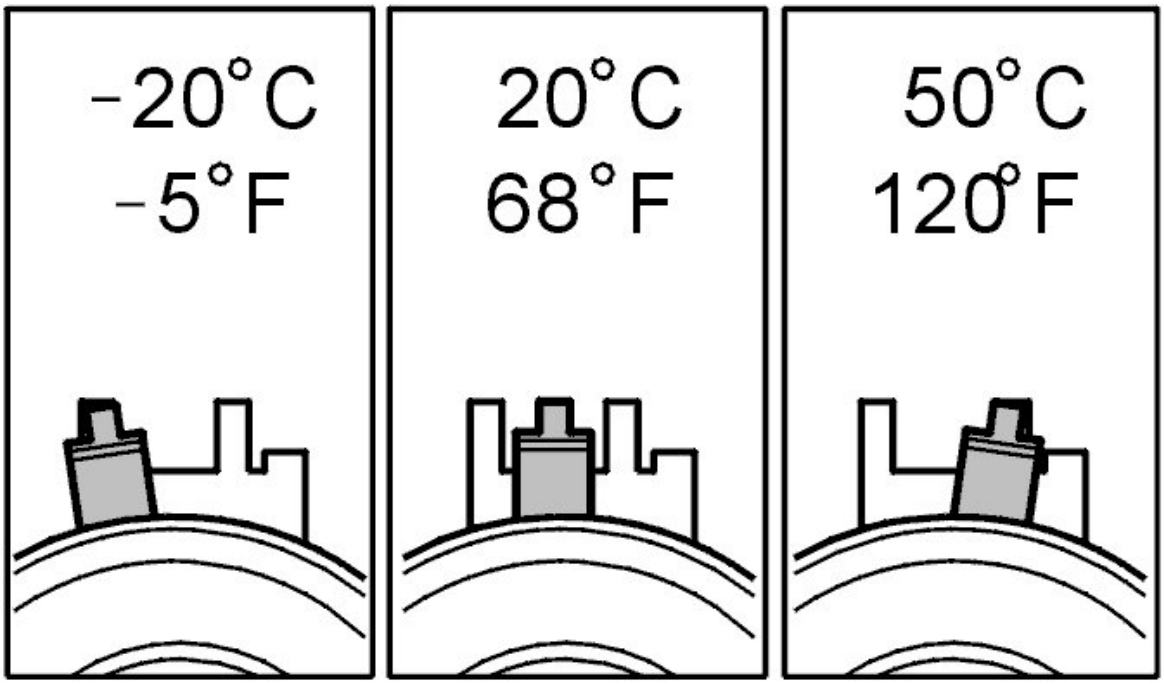


Install the belt in the following order:

- crankshaft
- the idler pulley
- intake cam
- exhaust cam
- water pump
- tension pulley.

Note! The variable valve timing unit on B6304S engines does not have a return spring. The unit is easily dislodged when reinstalling the timing belt.

Tensioning the timing belt



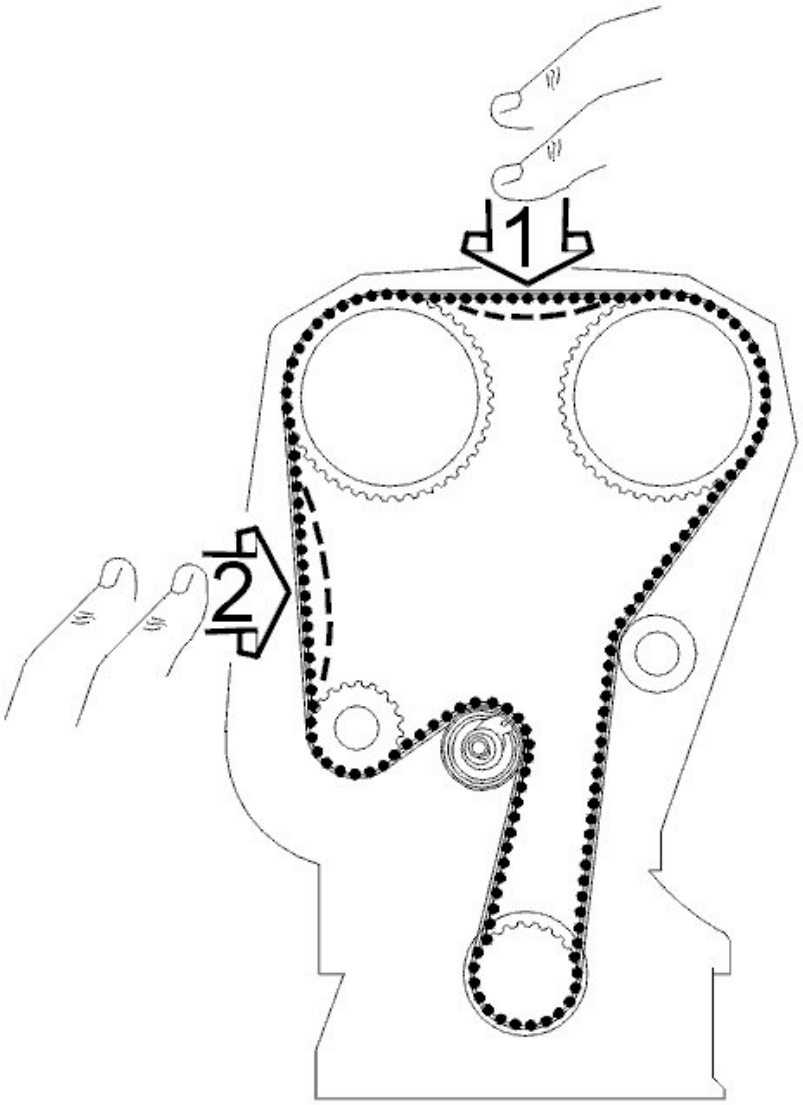
This adjustment is carried out on a cold engine. A suitable temperature is approximately20 ° C / 68 ° F.

At higher temperatures (with the engine at operating temperature or a high outside temperature for example) the indicator is further to the right. The illustration shows the position of the indicator when aligning the timing belt tensioner at different temperatures.

Carefully turn the crankshaft clockwise until the timing belt is tensioned. The belt must be in tension between the intake camshaft pulley, the idler pulley and the crankshaft.
Hold the belt tensioner center screw secure. Turn the belt tensioner eccentric **clockwise** until the tensioner indicator passes the marked position. Then turn the eccentric back so that the indicator reaches the marked position in the center of the window.
Hold the eccentric secure. Tighten the center screw to **25 Nm.**

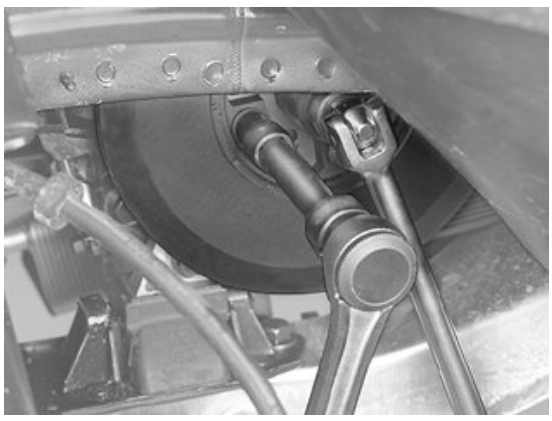
Check that the indicator is in the correct position.

Check



Press the belt to check that the indicator on the tensioner moves easily.
Install the upper timing belt cover.
Turn the crankshaft 2 turns. Check that the markings on the crankshaft and camshaft pulley correspond.
Check that the indicator on the belt tensioner is within the marked area.

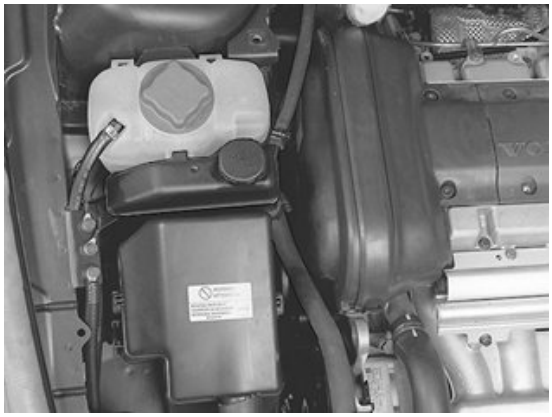
Finishing



Install the auxiliaries belt around the pulley on the crankshaft.

Install

- the rubber sleeve on the underside of the oil pump
- the vibration damper. Use **new screws**. Tighten to **35 Nm**. Angle-tighten **50°**. Use the crankshaft center nut as a counterhold
- the plastic nuts for the cover in the right-hand fender liner
- the right front wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.



Lower the car.

Install
- the front timing belt cover.

Tension the auxiliaries belt.

Install
- the expansion tank
- the hose between the expansion tank and the radiator. Remove the lock grip pliers
- the servo reservoir
- the upper timing belt cover.

Applies only to B6xx4T engines:

Twist the intake pipe for the turbocharger for cylinders 1, 2 and 3 into position. Tighten the clamp.
Install the plastic hoses between the turbocharger (TC) and the charge air cooler and between the air cleaner (ACL) and the turbocharger (TC). Tighten the hose clamps.

Install
- the engine stabilizer brace. Tighten to **50 Nm**
- the screw holding the engine stabilizer brace to the bracket on the engine. Tighten to **80 Nm**.

Final check

Check and top up if required
- coolant level
- the servo fluid level.

Test drive the engine.

Intake Manifold: Service and Repair
Intake Manifold/Gasket, Replacing

Intake Manifold/Gasket, Replacing

Removal

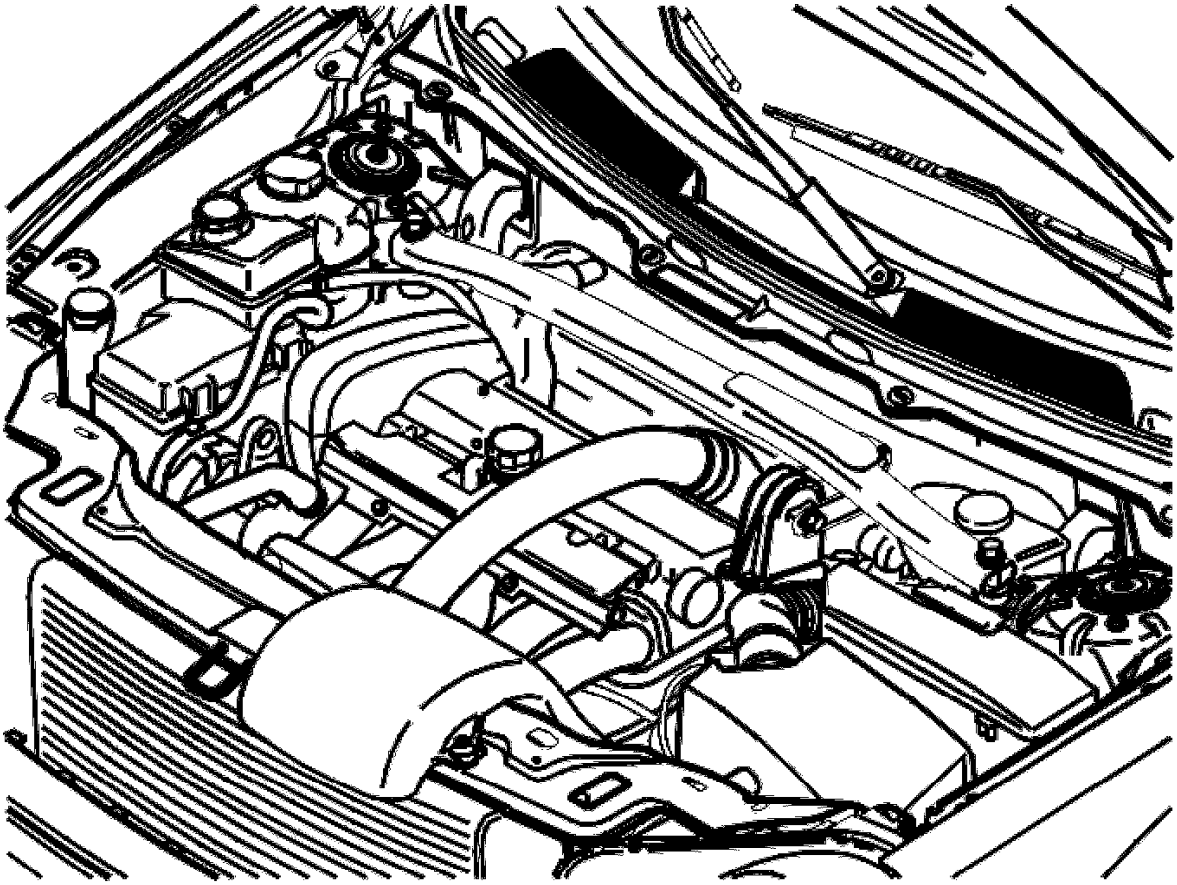
NOTE: As the illustrations in this service information are used for different model years and/or models, some variation may occur. However, the essential information is always correct.

Removing the intake manifold and gasket
Disconnect the battery negative lead.

Remove the fuel injection system.

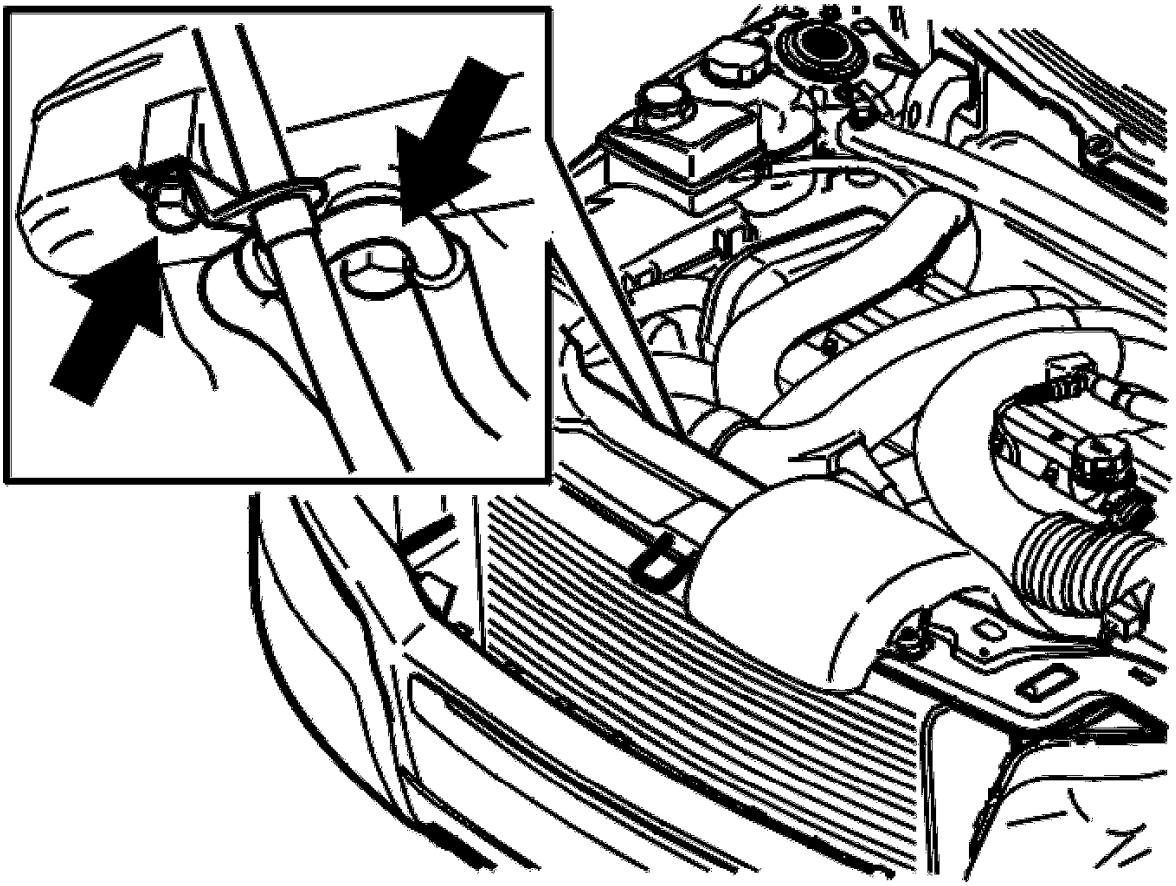
Drain the fuel injection system.

Remove:



- the charge air pipe over the engine
- the cover plate over the connectors from the injectors
- the fuel rail mounting screws. Spray universal oil or similar around the injector nozzle at the terminal on the intake manifold. Gently work the fuel rail and injector nozzles loose. Separate the fuel line quick release connector.
- Separate the throttle body (TB) connector
- Remove the plastic charge air pipe between the throttle body (TB) and the charge air cooler (CAC)
- Seal the openings. Mark up and remove the vacuum hoses from the intake manifold.

Remove:
- the oil filler cap
- the cover over the ignition coils
- the hose from the flame trap to the cam cover at the terminal in the cam cover.



- Disconnect the dip stick pipe
- Slacken off the lower screws for the intake manifold a few turns
- Remove the mounting screws in the upper row and the outer screws in the lower row
- Remove the intake manifold by lifting it approximately **20 mm**
- Remove the nipple for the water heated crankcase ventilation.

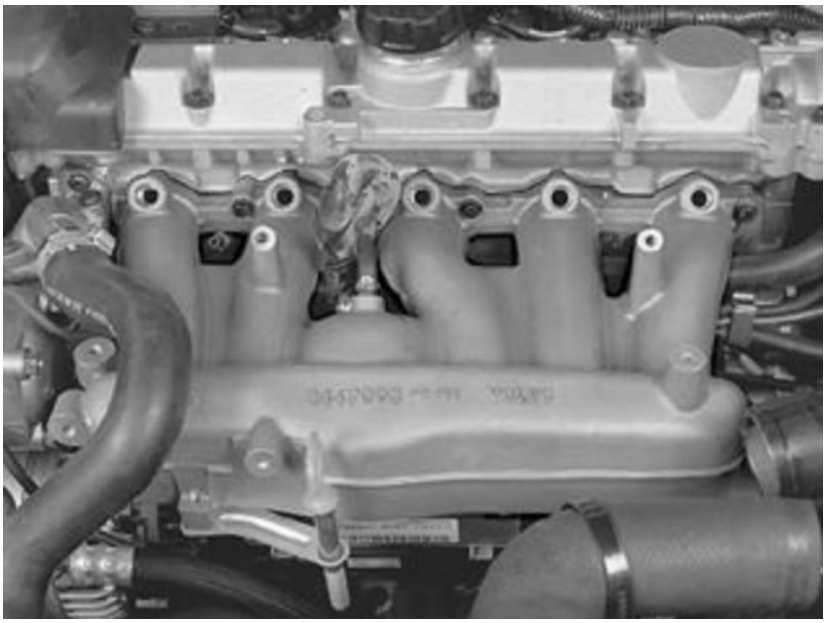
Allow the crankcase ventilation hose to run through the intake manifold without disconnecting it from the flame trap.

Transferring components when replacing the intake manifold

- Transfer the electronic throttle module.
- Use a new gasket.
- Tighten.

Installation

Installing the intake manifold and gasket



NOTE: Ensure that the gasket faces are clean.

Install:

- a new gasket held in position by the lower screws for the intake manifold. Do not forget the clamp for the fuel line at the screw in the lower row.
- the nipple for the water heated crankcase ventilation
- the intake manifold. Do not forget the crankcase ventilation hose. The hose must be inserted up through the gap between the second and third ducts
- the 3 upper screws. Torque tighten all the screws starting from the center.

Finishing

Install

- the fuel rail. Press together the quick-release connector. Use new screws.
- injector connectors
- the protective cover over the fuel rail
- the vacuum hoses according to the earlier markings
- the plastic charge air pipe between the throttle body (TB) and the charge air cooler (CAC)
- the connectors to the throttle body (TB)
- the dip stick in the intake manifold.

Final check

Test drive the car. Check the following:

- that there is no fuel leakage
- that the engine operates normally.

Check that everything is in position. Clean the engine compartment.

Intake Manifold: Service and Repair
Intake Pipe/Gasket, Replacement

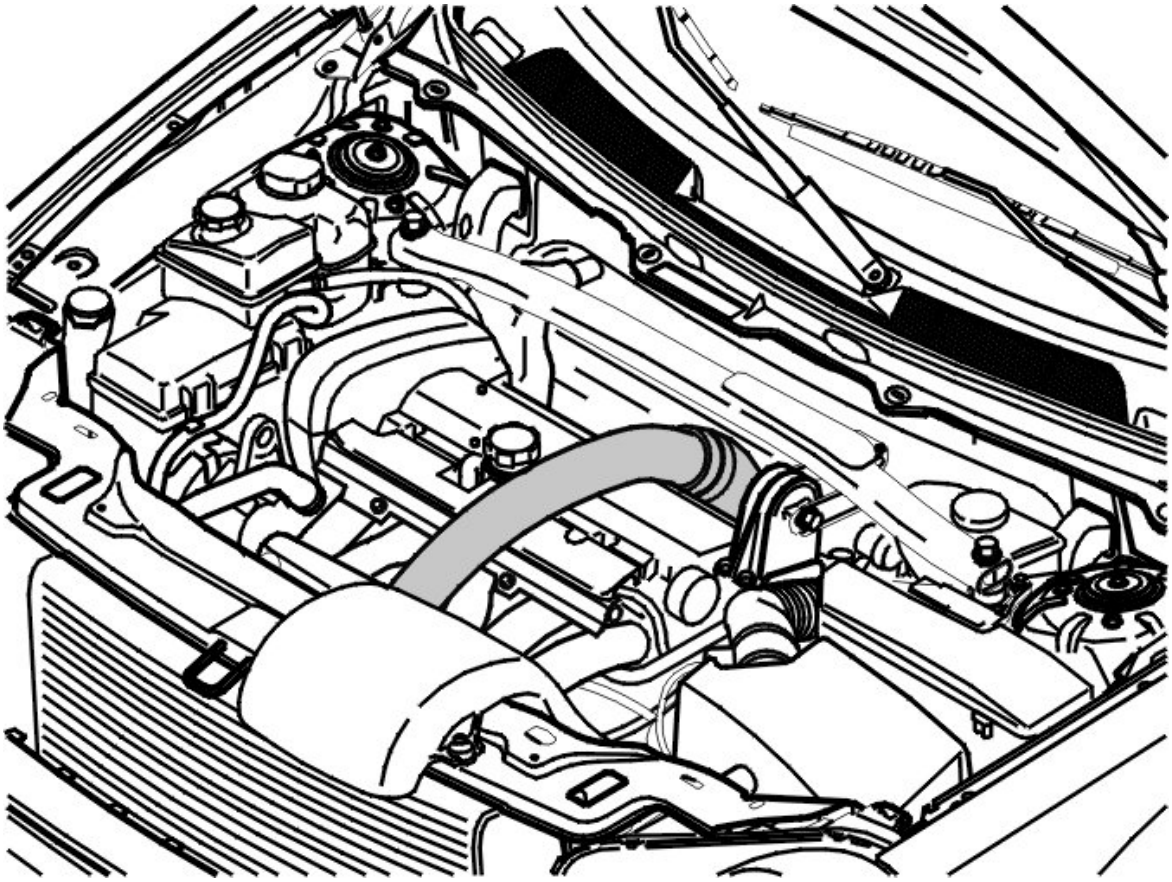
Intake pipe/gasket, replacement

Removal

Note! Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removing the intake manifold and gasket

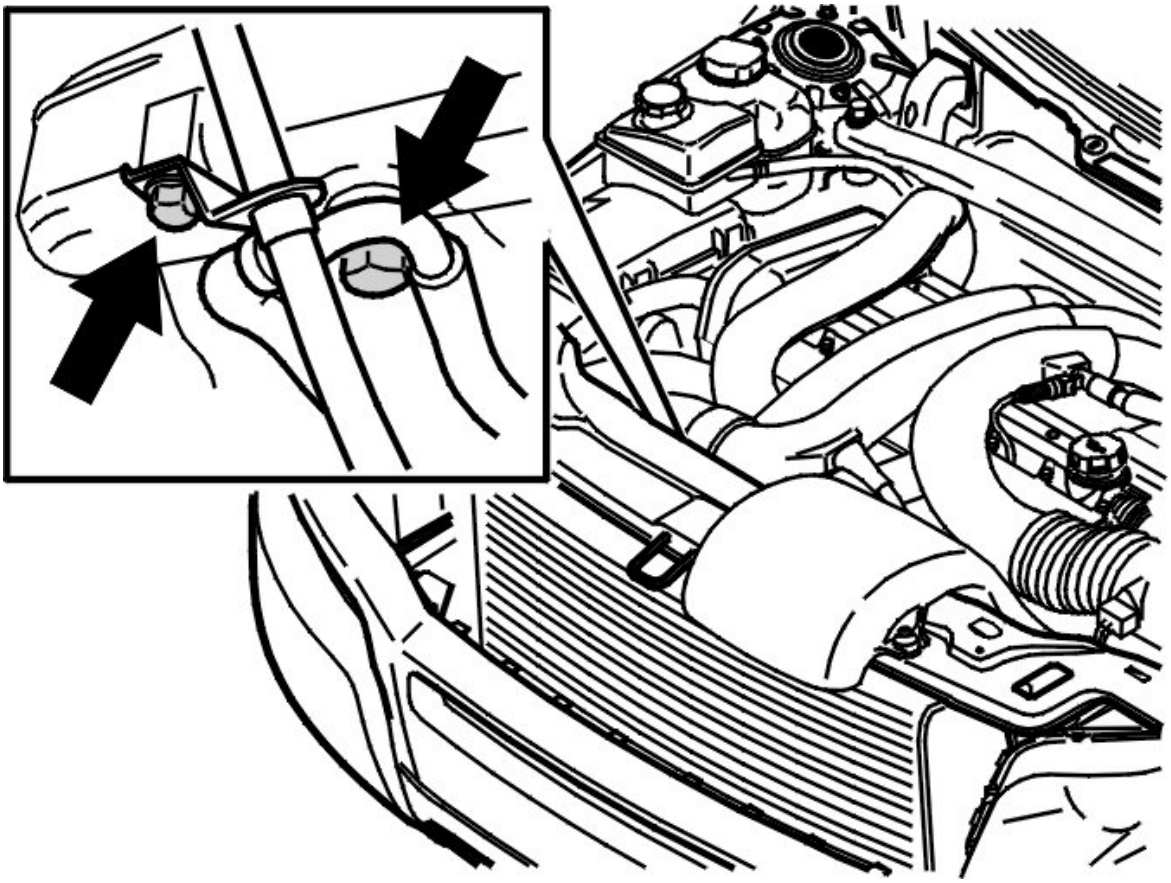
Disconnect the battery negative lead. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.



Depressurize the fuel system according to: Fuel system pressure release See: Cylinder Head Assembly/Fuel Pressure Release/Service and Repair.

Remove:
- the charge air pipe over the engine
- the cover plate over the connectors from the injectors
- the fuel rail mounting screws. Spray universal oil or similar around the injector nozzle at the terminal on the intake manifold. Gently work the fuel rail and injector nozzles loose. Separate the fuel line quick-release connector. See: Fuel line, lock See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Rail/Service and Repair.
- Separate the throttle body (TB) connector
- Remove the plastic charge air pipe between the throttle body (TB) and the charge air cooler (CAC)
- Seal the openings. Mark up and remove the vacuum hoses from the intake manifold.

Remove:
- the oil filler cap
- the cover over the ignition coils
- the hose from the flame trap to the cam cover at the terminal in the cam cover.



- Disconnect the dip stick pipe
- Slacken off the lower screws for the intake manifold a few turns
- Remove the mounting screws in the upper row and the outer screws in the lower row
- Remove the intake manifold by lifting it **approximately 20 mm**
- Remove the nipple for the water heated crankcase ventilation.

Allow the crankcase ventilation hose to run through the intake manifold without disconnecting it from the flame trap.

Transferring components when replacing the intake manifold

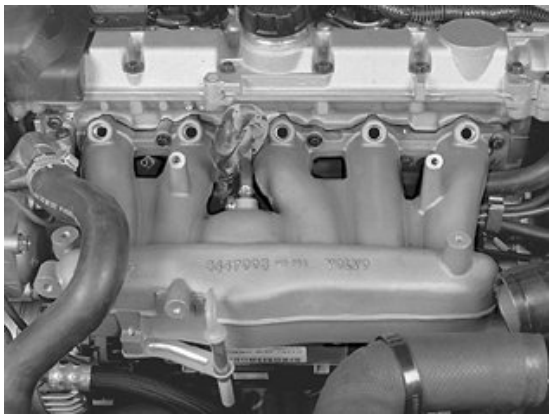
Transfer the electronic throttle module.
Use a **new gasket**.
Tighten.

Installation

Installing the intake manifold and gasket

Note! For tightening torques, see Tightening torque See: Specifications/Tightening Torque.

Note! Make sure that the gasket faces are clean.



Install:

- a **new gasket** held in position by the lower screws for the intake manifold. **Do not forget the clamp for the fuel line at the screw in the lower row.**
- the nipple for the water heated crankcase ventilation

- the intake manifold. Do not forget the crankcase ventilation hose. The hose must be inserted up through the gap between the second and third ducts
- the 3 upper screws. Torque tighten all the screws starting from the center.

Finishing

Install

- the fuel rail. Press together the quick-release connector. Use **new screws**, see also: Fuel line, lock See: Powertrain Management/Fuel Delivery and Air Induction/Fuel Rail/Service and Repair
- injector connectors
- the protective cover over the fuel rail
- the vacuum hoses according to the earlier markings
- the plastic charge air pipe between the throttle body (TB) and the charge air cooler (CAC)
- the connectors to the throttle body (TB)
- the dip stick in the intake manifold.

Final check

Test drive the car. Check the following:

- that there is no fuel leakage
- that the engine operates normally.

Check that everything is in position. Clean the engine compartment.

Camshaft Oil Seal: Service and Repair
Replacing the Camshaft Seals / Variable Valve Timing Unit

Replacing the camshaft seals / variable valve timing unit

Removing the front camshaft seal

Note! The illustrations in this service information are used for different model years and / or models. Therefore there may be some variation. However, the essential information in the illustrations is always correct.

Caution! There are a number of versions of the variable valve timing unit. Therefore it is extremely important to always read the information referring to the engine variant/model year to be remedied.

Replacing the rear camshaft seal

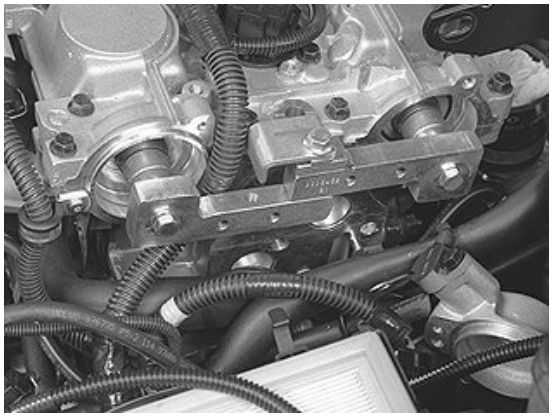
See Removing/Installing the rear camshaft seal.

Preparation

Caution! Interrupt the current: Disconnect the battery negative lead. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

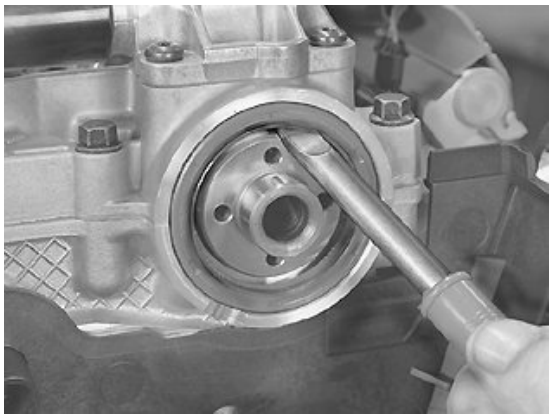
Remove the timing belt from the timing gear pulley for the camshafts.
Check the tensioner and idler pulleys.
Remove camshaft position (CMP) sensor housing and the trigger wheel.
Remove the cover at the rear edge of the camshaft.

Removing the variable valve timing unit / timing gear pulley



Install adjustment tool 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool at the rear of the camshafts. Screw the adjustment tool sections together into one. Remove the plug from the front edge of the variable valve timing unit (Tx55).
Remove the centre screw from the variable valve timing unit (Tx55). Carefully pull out the variable valve timing unit with the timing gear pulley.
The following applies to timing gear pulleys without variable valve timing:
Remove the screws. Remove the timing gear pulley.

Removing the front camshaft seal



Carefully press in tool 999 5651 Extractor See: Tools and Equipment/999 5651 Extractor between the seal and the camshaft. Pry out the seal.

Installing the front camshaft seal

Note! The purpose of the "Installing the VVT unit/timing gear pulley" section described here is to ensure that the VVT unit is correctly positioned and to reset the camshaft timing gear pulley to the correct position using the markings made at the factory. This is to ensure that the conditions are correct for any later fault-tracing.

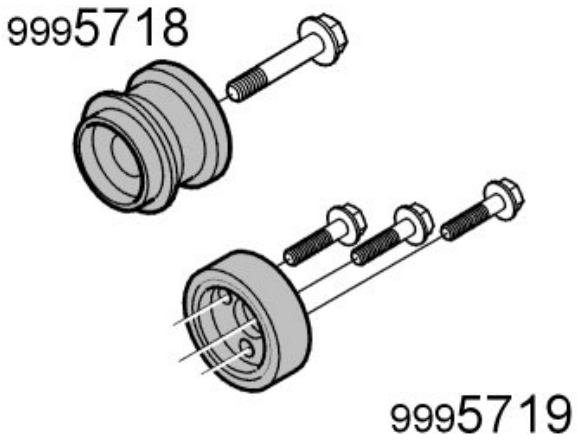
Note! For tightening torques, see Tightening torque See: Specifications/Tightening Torque.

Cleaning

To clean the shaft journal and mating surface, use emery cloth P/N 951 1024.

Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

Installing the front camshaft seal



Lubricate the surface of the seal that the camshaft rotates against. Install the camshaft seal. For camshafts with variable valve timing:
Use drift 999 5718 Drift See: Tools and Equipment/999 5718 Drift.
Use the mounting screw for the variable valve timing unit. Tighten until the drift bottoms out. for camshafts without variable valve timing:
Use drift 999 5719 Drift See: Tools and Equipment/999 5719 Drift.

Checking the variable valve timing (VVT) unit

Check the variable valve timing (VVT) unit.

Finishing

Install:
- the starter motor. Tighten screws at gearbox. Tighten. See Tightening torque See: Specifications/Mechanical Specifications/Starting and Charging
- the screw at the support bracket for the starter motor. Tighten
- the trigger wheel. Tighten the screw
- the camshaft position (CMP) sensor housing. Tighten the screws
- a new cover at the rear edge of the camshaft.

Install the auxiliaries belt around the pulley on the crankshaft.

Install:
- the plastic nuts for the cover in the right-hand wing liner
- the right front wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Install:

- front timing cover. Tension the auxiliaries belt. Check that it is correctly positioned on all pulleys
- the expansion tank
- the hose between the expansion tank and the radiator. Remove the lock grip pliers
- the servo reservoir
- the upper timing cover.

Install:

- the engine stabilizer brace. Tighten the screws
- the screw holding the engine stabilizer brace to the bracket on the engine. Tighten
- the battery negative lead. Also read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Final check

Check and top up if required:

- coolant level
- the servo fluid level.

Test drive the engine.

Removing/Installing the rear camshaft seal

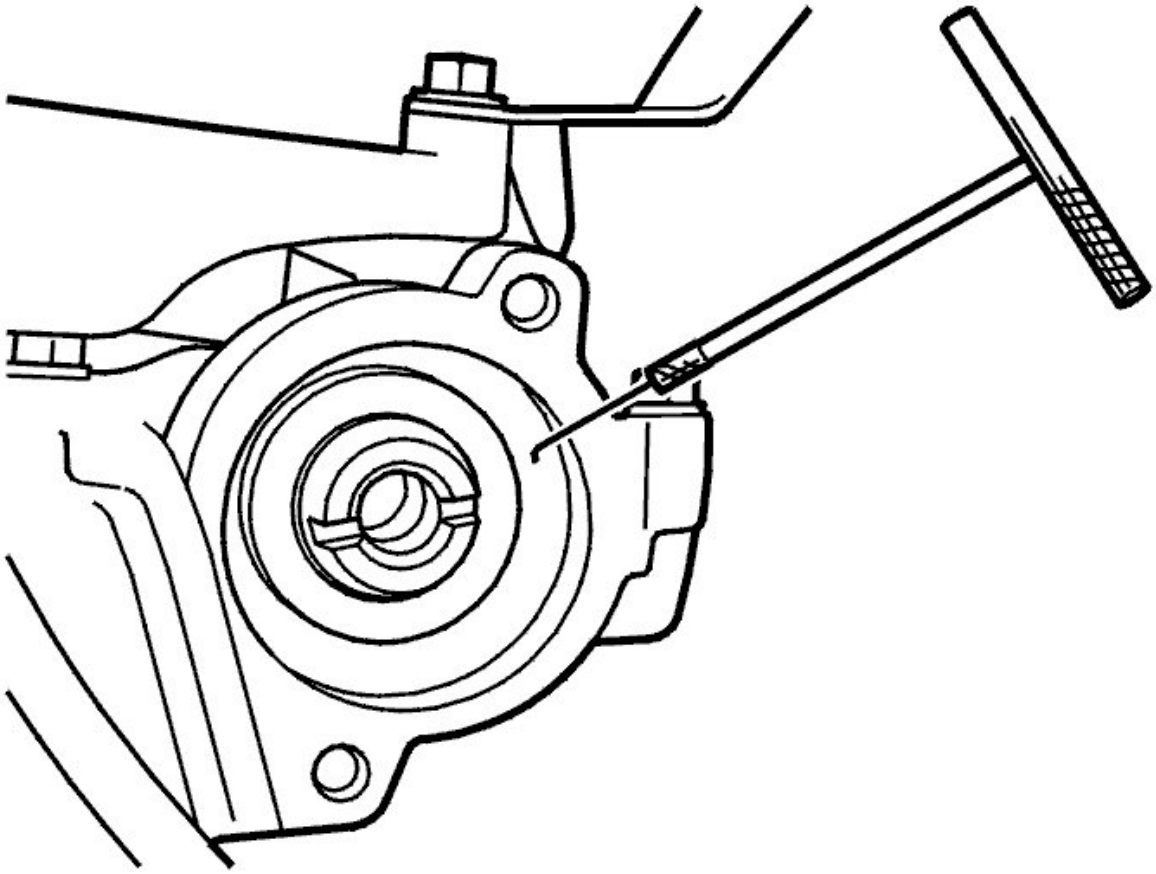
Preparation

Remove:

- the intake manifold between the electronic throttle module (ETM) and air cleaner (ACL) cover

- the air cleaner (ACL) cover. Place it to one side
- the camshaft position (CMP) sensor housing and the trigger wheel.

Removing the rear camshaft seal



Pull out the seal. Use puller 999 5919 PULLER See: Tools and Equipment/999 5919 Puller. To clean the shaft journal and mating surface, use emery cloth P/N 951 1024.

Note! When cleaning work around the shaft journal, not in and out. It is essential that any residue from the emery cloth and any other contaminants are completely removed before the new sealing ring is installed.

Lubricate the surface of the seal that the camshaft rotates against. Install the camshaft seal. Use drift 999 5450 PUNCH See: Tools and Equipment/999 5450 Punch.

Note! The seal is normally positioned at the same level as the internally bevelled edge. If the shaft journal is showing signs of wear, the seal can be pressed in a further 2 mm: Turn the drift socket.

Finishing

Install:

- the trigger wheel. Tighten the screw
- the camshaft position (CMP) sensor housing. Tighten the screws
- the air cleaner (ACL) cover
- the intake manifold between the electronic throttle module and the air cleaner (ACL) cover.

Test drive the engine.

Crankshaft Main Bearing Seal: Service and Repair

Crankshaft seal rear, replacing

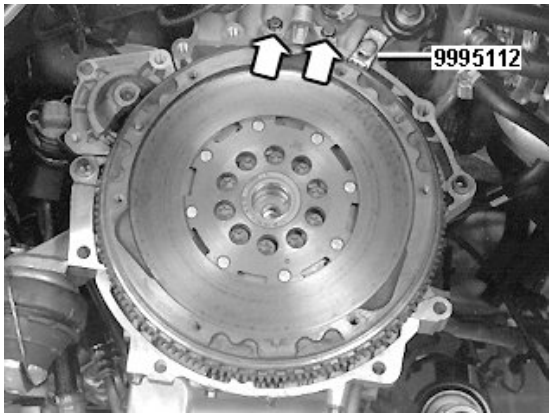
Special tools:

999 5112 GEAR SECTOR See: Tools and Equipment/999 5112 Gear Sector
999 7174 Drift See: Tools and Equipment/999 7174 Drift
999 1801 STANDARD SHAFT See: Tools and Equipment/999 1801 Standard Shaft
999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removal

Removing the flywheel and carrier plate

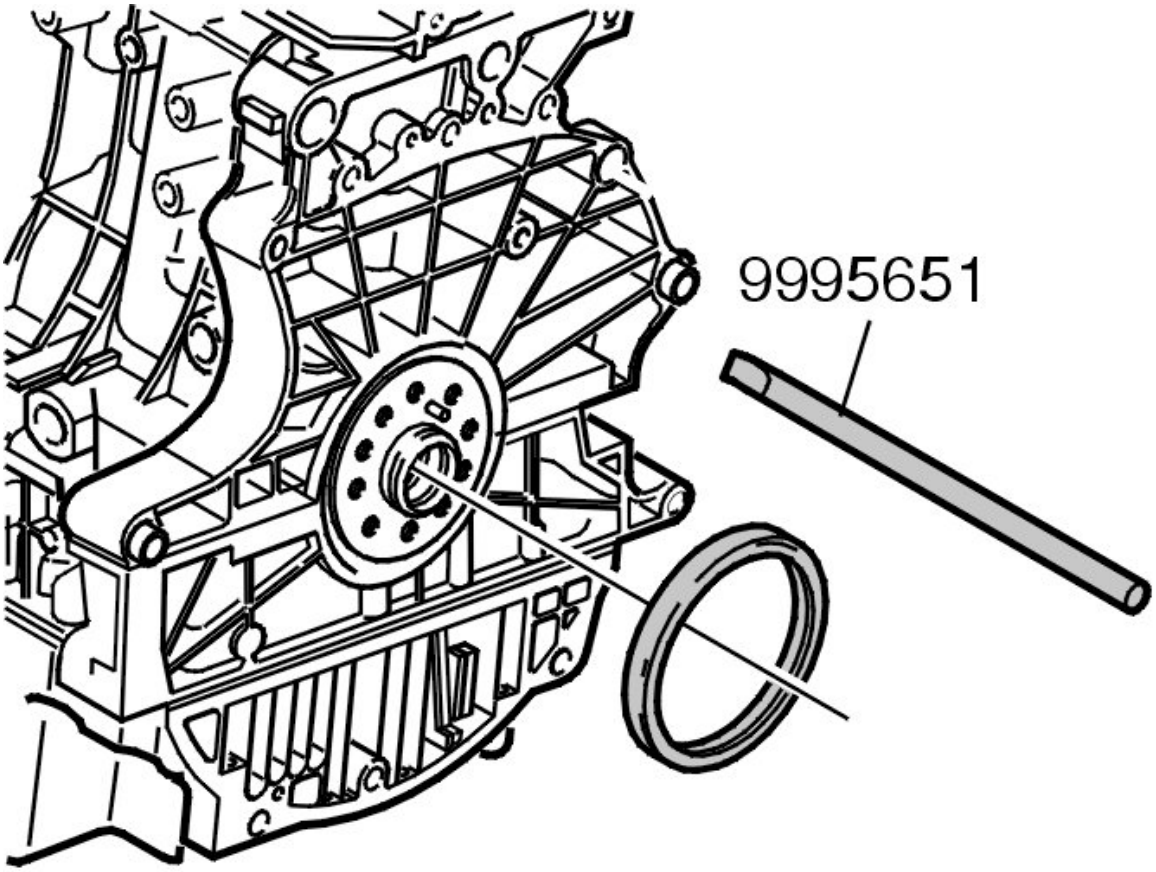


Remove the gearbox:

- **manual transmissions**. See Transmission, removing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Service and Repair/Removal and Replacement/Transmission, Removing.
- **automatic transmissions**. See Gearbox, removing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Service and Repair/Removal and Replacement/Transmission, Removing.

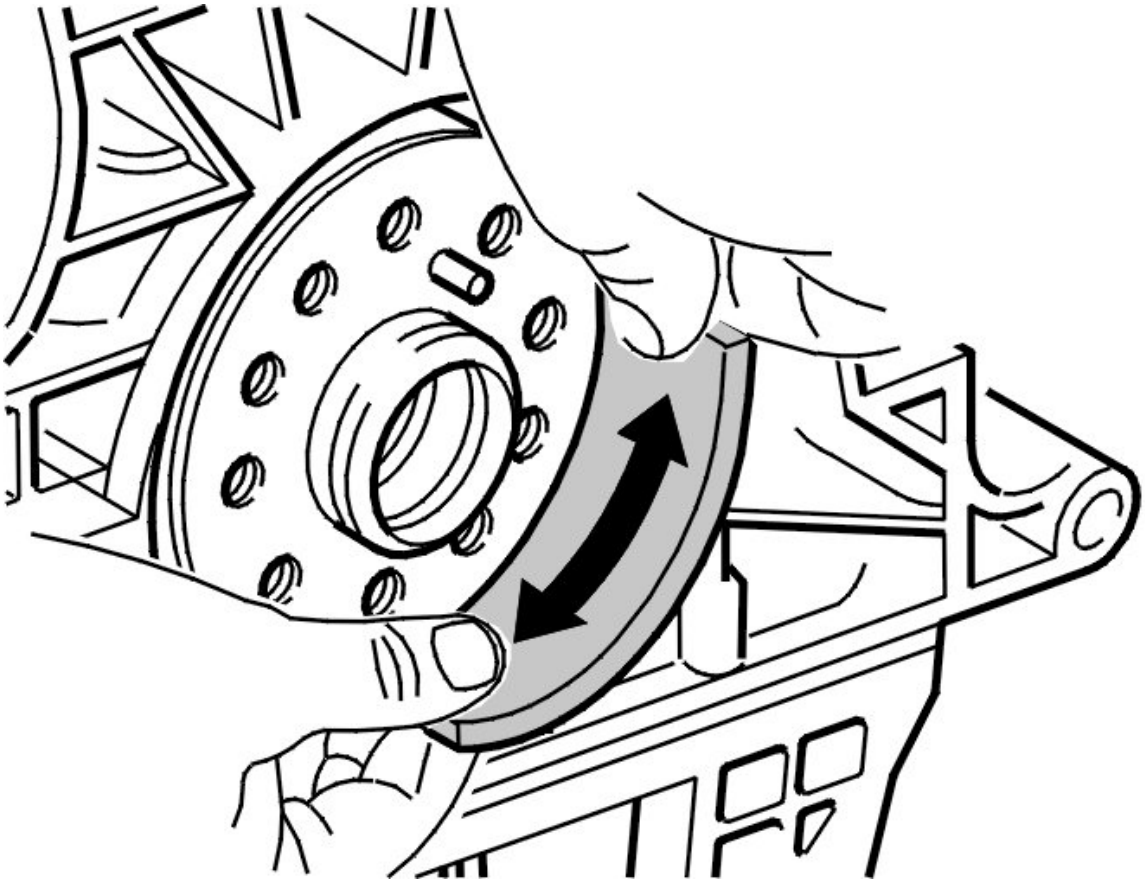
Remove the flywheel / carrier plate. Use gear sector 999 5112 GEAR SECTOR See: Tools and Equipment/999 5112 Gear Sector as a counterhold when slackening off the screws.

Removing the seal



Note! Do not damage the mating surfaces of the crankshaft and cylinder block

Remove the old seal using extractor 999 5651 Extractor See: Tools and Equipment/999 5651 Extractor.
Clean around the crankshaft flange at the front and rear. Remove any thread sealant residue from the screw holes.
If necessary wash off the oil on the rear cylinder block surface and the gearbox clutch housing. Blow clean using compressed air.



Caution! When cleaning work around the flange, not in and out. No grinding tools or similar may be used.It is extremely important that there is no thread sealant residue or other dirt. This could cause leakage.

Note! To clean the crankshaft, use cloth 9511024.

Installation

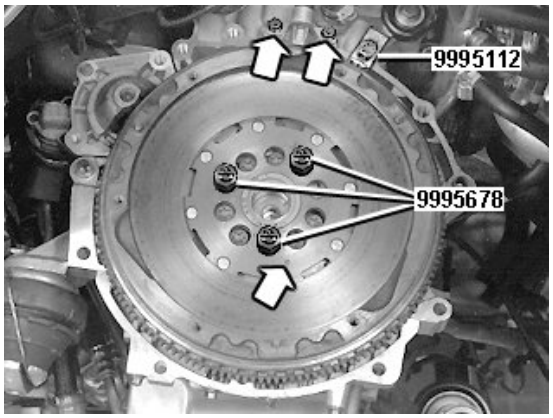
Installing the sealing ring

Caution! Only Volvo approved engine oil may be used. Grease must not be used at all. It attracts dirt and results in the build up of coke.

Lubricate the sealing ring mating surface against the cylinder block and the lips of the seal.

Thread the seal onto the bevelled part of the inner section of 999 7174 Drift See: Tools and Equipment/999 7174 Drift with the felt side of the seal outward.
Screw the drift onto the crankshaft (2 screws) of the flywheel.
Pull in the seal with the outer part of the drift, 999 7174 Drift See: Tools and Equipment/999 7174 Drift , using the screw in the center of the tool.
The seal is in place when the outer drift bottoms against the inner drift. Remove tool 999 7174 Drift See: Tools and Equipment/999 7174 Drift.
Scrap the old flywheel screws.

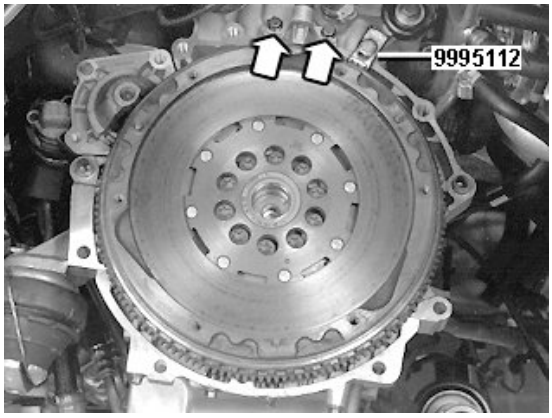
Installing flywheel and carrier plate



Caution! Ensure that the surface of the crankshaft and the mating surfaces for the flywheel / carrier plate are clean. Ensure that there is no thread sealant residue in the screw holes.

Install:
- the flywheel and carrier plate
- the 3 studs 999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw distributed as illustrated. Turn the short thread length towards the crankshaft.

Note! Check that the locating pin on the crankshaft is positioned opposite the hole in the flywheel / carrier plate. The position of the guide hole is marked.



Caution! It is important that the flywheel and carrier plate bear on the crankshaft flange before the other screws are installed.Always use new screws. Ensure that the thread sealant on the new screws is intact. If not apply a few drops of sealant 1161056 to the thread.

- Align gear sector: 999 5112 GEAR SECTOR See: Tools and Equipment/999 5112 Gear Sector.
- Pull the flywheel / carrier plate towards the crankshaft using the 3 nuts on special tool 999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw. The turned section of the nut must be turned towards the flywheel / carrier plate.
- Install the other screws. Tighten. See Tightening torque See: Specifications/Tightening Torque.
- Replace the 3 special screws with new standard screws. Tighten. See Tightening torque See: Specifications/Tightening Torque.
- Then angle-tighten all 10 screws crosswise. Use 951 2050 BEVEL PROTRACTOR See: Tools and Equipment/951 2050 Bevel Protractor. Tighten. See Tightening torque See: Specifications/Tightening Torque.
- Ensure that the flywheel sensor and bracket are installed. Install the clutch driven plate and clutch.

Installing the gearbox

Install the gearbox:
- **manual transmissions**. See Transmission, installing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Service and Repair/Removal and Replacement/Transmission, Installation.
- **automatic transmissions**. See Gearbox, installing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Service and Repair/Removal and Replacement/Transmission, Installation.

Checking the engine:
Test drive the car to check the function of the engine and the gearbox.

Timing Components: Service and Repair
Belt Drive, Dismantling

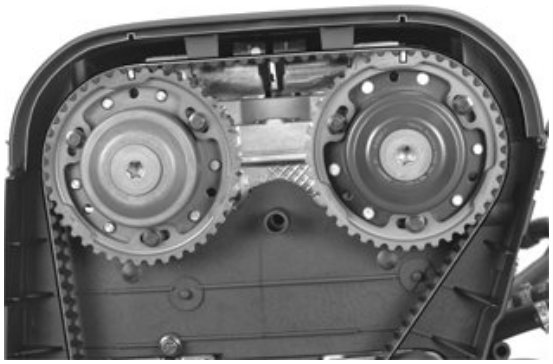
Belt drive, dismantling

Special tools:

999 5304 SEPARATOR See: Tools and Equipment/999 5304 Separator
999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
999 5747 Socket See: Tools and Equipment/999 5747 Socket

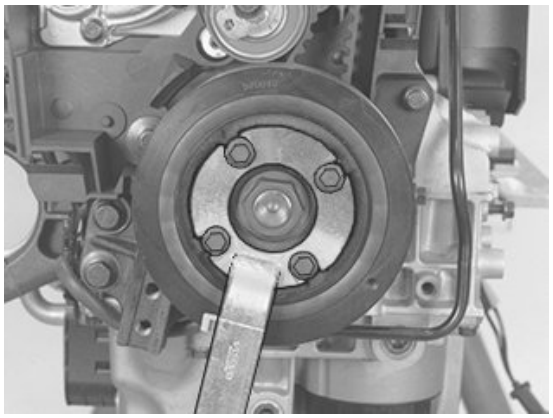
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Aligning the engine according to the marking



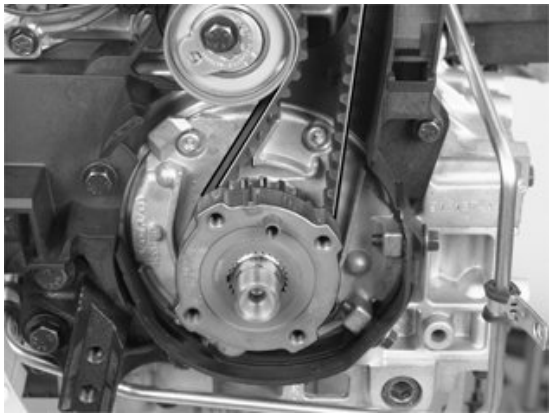
Install the upper timing belt cover.
Turn the crankshaft clockwise until the markings on the crankshaft belt pulley and the timing belt pulley are aligned with the markings on the oil pump and the upper timing belt cover.
Remove the upper timing cover.

Removing the vibration damper



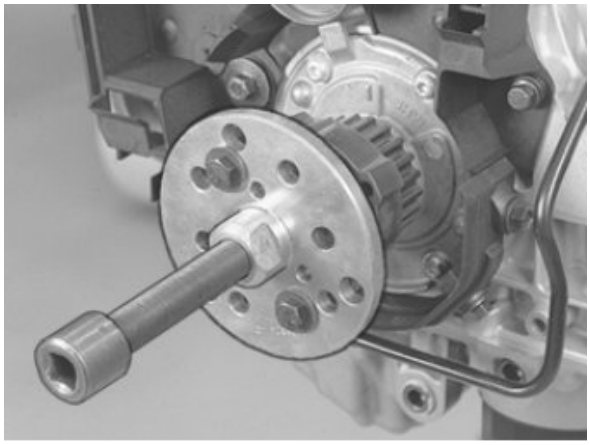
Remove the 4 screws. Use the crankshaft center nut as a counterhold.
Install counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold. Remove the center nut.
Remove counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold.
Work the vibration damper loose.

Removing the timing belt



Slacken off the center screw for the belt tensioner slightly.
Hold the center screw in place. Turn the belt tensioner eccentric clockwise to 10 o'clock using a 6mm Allen key.
Remove the timing belt from the timing gear pulley for the camshafts.
Remove the timing belt.

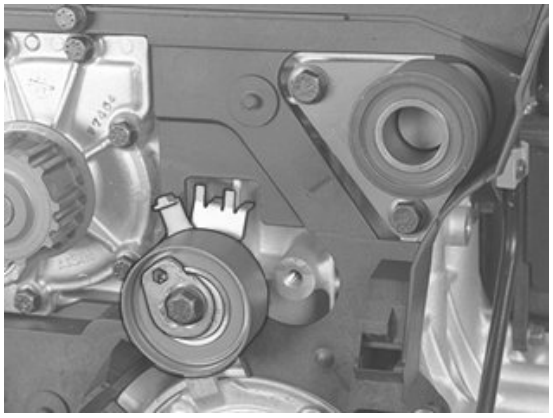
Removing the crankshaft pulley



Caution! The crankshaft must not rotate.

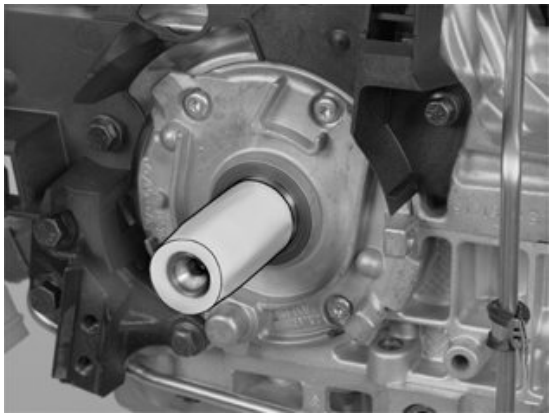
Use puller 999 5304 SEPARATOR See: Tools and Equipment/999 5304 Separator and two 45 mm M8 screws with washers.
Pull off the timing gear pulley.

Removing the belt tensioner and idler pulley



Remove the belt tensioner and idler pulley.
Check the rolling surface and the bearings.
Check for any noise. Check for any play in the bearings.
Check that the rolling surfaces are smooth and clean.

Removing the oil pump



Remove the belt protection from the oil pump.
Remove the 4 screws for the oil pump.
Carefully work the oil pump out. Use a groove-cut chisel with stop lugs.
Carefully draw the oil pump past the end of the crankshaft.
Carefully clean the gasket face and mating surfaces.
Remove tool 999 5747 Socket See: Tools and Equipment/999 5747 Socket.

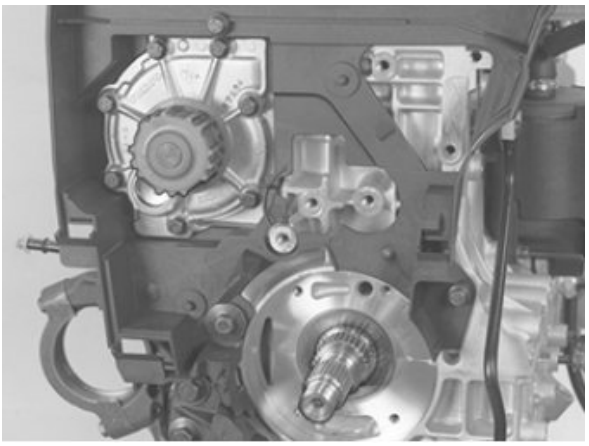
Checking the oil pump

Unscrew the oil pump. Note the position of the outer/inner pump wheel and the piston/spring for the relief valve.
Clean and check all components.
Check for damage and wear. Replace the oil pump in the event of a fault.
When replacing the sealing ring.
Carefully tap the sealing ring out. Use a carefully selected drift and hammer.
A new sealing ring is first installed after the pump has been installed in the cylinder block.

Assembling the oil pump

Place the inner and outer pump wheels in the oil pump housing.
The inner pump wheel has a inset surface around the hole for alignment to the crankshaft. The inset surface should be positioned towards the sealing ring in the oil pump housing.
Install the spring and piston for the relief valve. Screw the pump together. Tighten the screws. See: Tightening torque See: Specifications/Tightening Torque.

Removing the coolant pump/timing belt cover

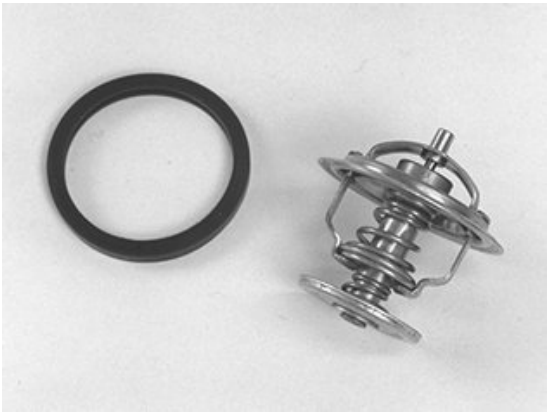


Remove the screws.
Carefully tap the pump pulley with a rubber mallet.
Work the pump loose.
Carefully clean the gasket face and mating surfaces.
Remove the inner timing belt cover.

Removing the thermostat and thermostat housing

Remove the cover over the thermostat (Tx40).
Lift out the thermostat
Remove the hose for the water heated crankcase ventilation.
Remove the thermostat housing from the cylinder head.
Carefully clean the gasket face and mating surfaces.
Remove the fuel pressure line.

Checking the opening function of the thermostat



The thermostat can be tested in warm water.
Maximum opening must occur within 2 minutes in water at opening temperature.
Marking.90° C
Starts to open at.90°C
Fully open at.105°C

Timing Components: Service and Repair
Belt Drive, Assembly

Belt drive, assembly

Special tools:

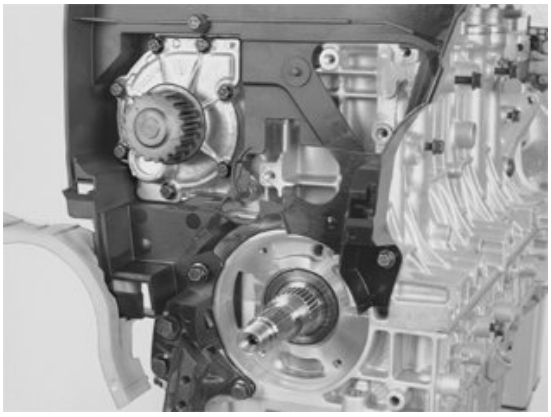
999 5747 Socket See: Tools and Equipment/999 5747 Socket
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool
999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Tightening torque

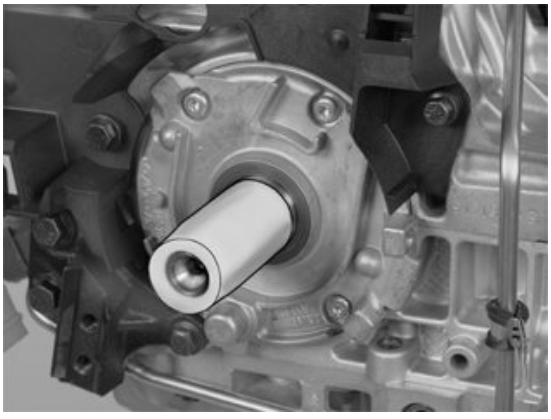
For tightening torques not in the text, see Tightening torque See: Specifications/Tightening Torque.

Installing the water pump



Install the rear timing cover.
Screw into place at the three mounting points.
Install the water pump with a **new gasket**.
Apply thread sealant, P/N 11-61 056, to all the screws for the water pump. Tighten the screws crosswise.

Installing the oil pump

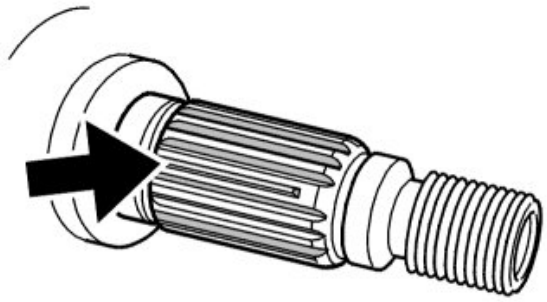


Use a new gasket and a new O-ring around the oil pump housing and new screws. Alternatively, apply thread sealant 11 61 056 to the underside of the old screw heads.
Screw sliding sleeve 999 5747 Socket See: Tools and Equipment/999 5747 Socket into place at the front of the crankshaft journal.
Press in the pump over the sliding sleeve.
Install the screws as a guide.
Carefully tap in the oil pump with a rubber mallet.
Tighten the oil pump crosswise. See Tightening torque See: Specifications/Tightening Torque.
Remove the sliding sleeve 999 5747 Socket See: Tools and Equipment/999 5747 Socket.

Installing front crankshaft seal

See Oil pump / crankshaft seal, front, replacing, B5244T5 See: Seals and Gaskets/Front Crankshaft Seal/Service and Repair.

Installing the crankshaft timing gear pulley



Note! The timing gear pulley can only be installed in one position on the crankshaft journal splines (see the illustration).

Carefully tap in the timing gear pulley with a rubber mallet.

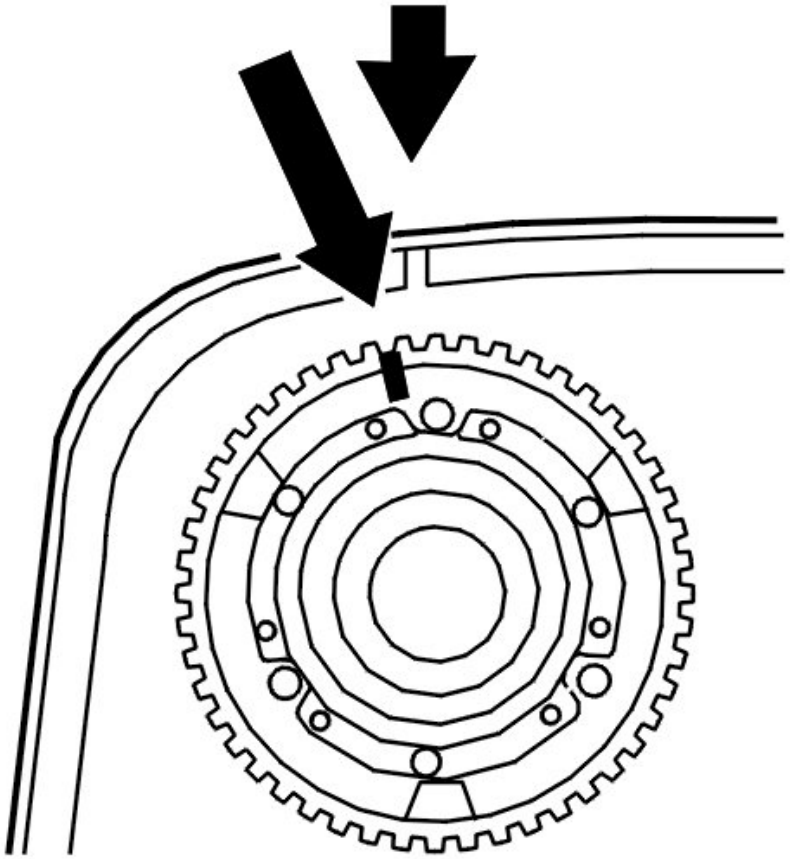
Installing the idler pulley and belt tensioner

Install:

- idler pulley. Tighten
- the belt tensioner and the center screw so that the tensioner fork is centered over the cylinder block rib. Do **not** tighten
- the lower belt guard at the oil pump
- the fuel delivery line.

Installing the timing gear pulley for the camshafts

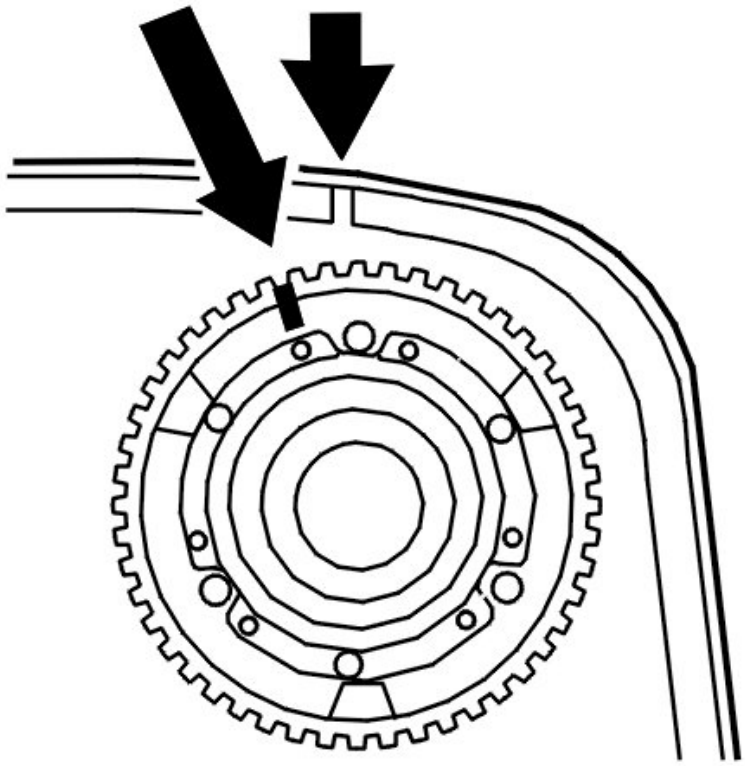
Note! The purpose of the "Installing the timing gear pulley" section described here is to ensure that the VVT unit is correctly positioned and to reset the camshaft timing gear pulley to the correct position using the markings made at the factory. This is to ensure that the conditions are correct for any later fault-tracing.



Note! Do not turn counter clockwise during this procedure.

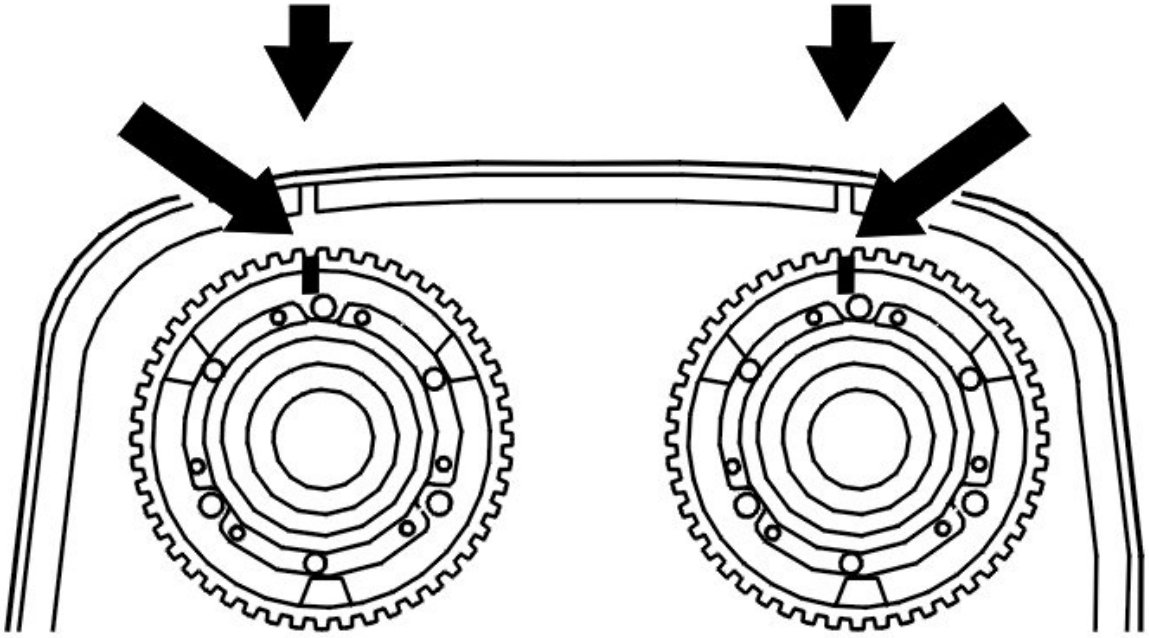
Slacken off, but do not remove, the screws which secure the timing gear pulley to the variable valve timing unit.
Press the variable valve timing unit and timing gear pulley onto the camshaft.
Install the center screw which secures the variable valve timing unit to the camshaft. Tighten slightly. Turn the variable valve timing unit **counter-clockwise** as far as it will go. Remove the center screw.
Position the upper timing cover.
Turn the timing gear pulley **clockwise**until the screws at the oval holes are in the limit position. Continue turning **clockwise** until the timing gear pulley marking is **1 cogs** before the marking on the upper timing cover.
Check that the timing gear pulley is still in the limit position in the oval holes. Tighten the center screw in the variable valve timing unit. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Check that the variable valve timing unit does not rotate when tightening. Install and tighten the center plug. See Tightening torque See: Specifications/Tightening Torque.
Turn the variable valve timing unit **clockwise** to the limit position.
Turn the timing gear pulley so that the markings correspond.

Installing the variable valve timing (VVT) unit on the intake camshaft



Note! Do not turn counter clockwise during this procedure.

Slacken off, but do not remove, the screws which secure the timing gear pulley to the variable valve timing unit. Press the variable valve timing unit and timing gear pulley onto the camshaft.
Install the center screw which secures the variable valve timing unit to the camshaft. Tighten slightly.
Turn the variable valve timing unit **counter-clockwise** as far as it will go. Remove the center screw. Position the upper timing cover.
Turn the timing gear pulley **clockwise**until the screws at the oval holes are in the limit position. Continue turning **clockwise** until the timing gear pulley marking is **1-1/2 cogs** before the marking on the upper timing cover.



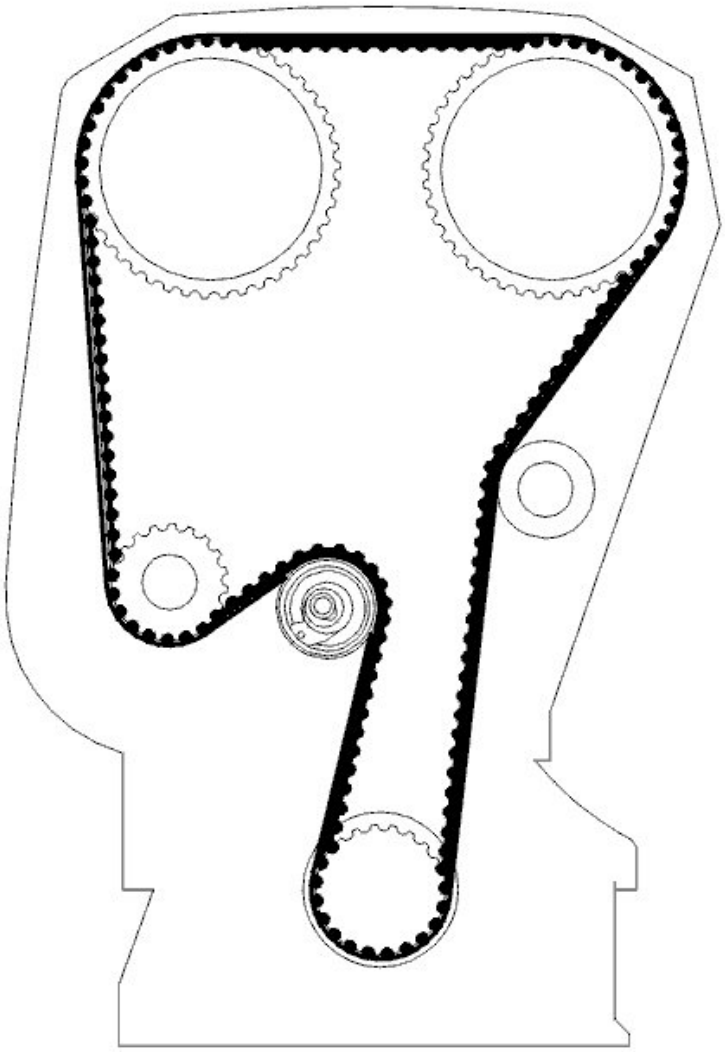
Check that the timing gear pulley is still in the limit position in the oval holes.

Tighten the center screw in the VVT unit. See Tightening torque See: Specifications/Tightening Torque.
Check that the variable valve timing unit does not rotate when tightening. Install the center plug. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Turn the variable valve timing unit clockwise to the limit position. Turn the timing gear pulley so that the markings correspond.

Finishing

Tighten the center screw on the timing belt tensioner. Tighten to **5 Nm**.

Installing the timing belt

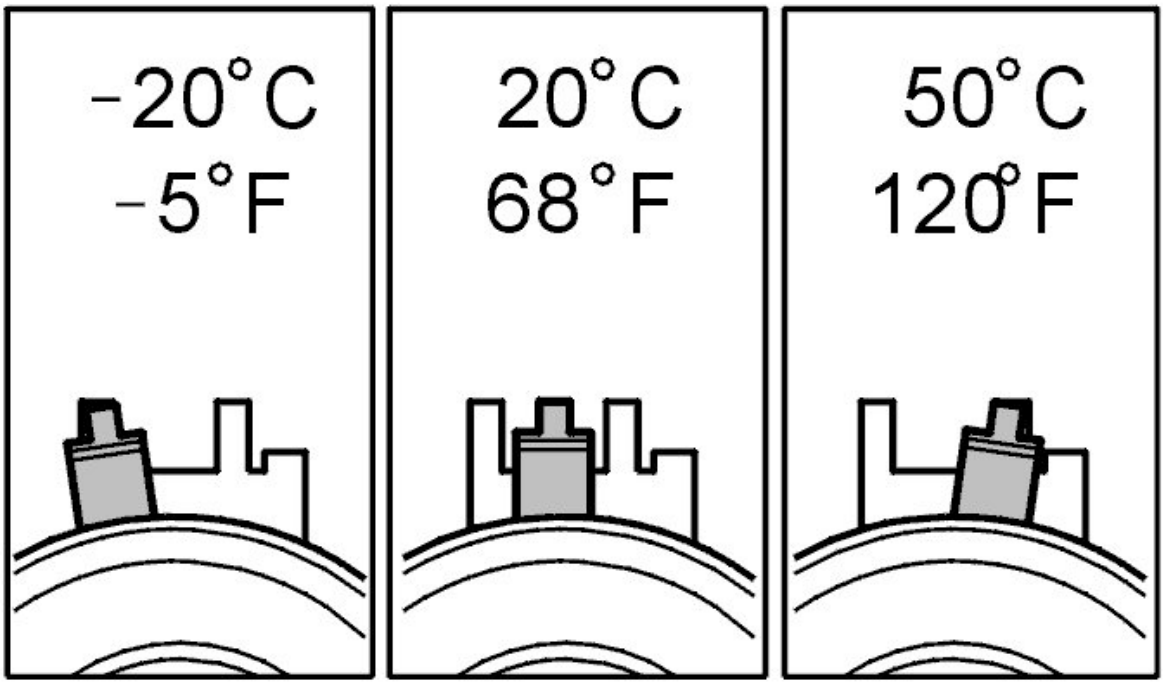


Install the belt in the following order:

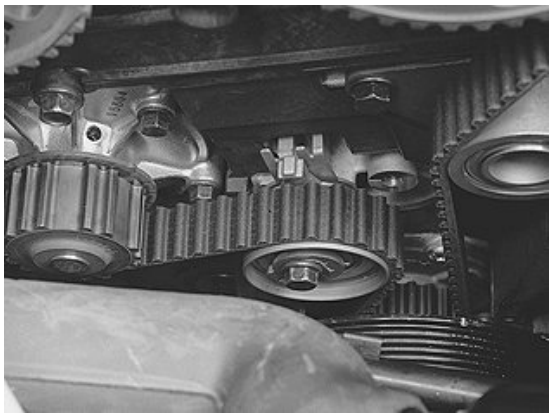
- crankshaft
- the idler pulley
- intake camshaft
- exhaust camshaft
- coolant pump
- belt tensioner.

Note! The variable valve timing units do not have a return spring and are easily dislodged when reinstalling the timing belt. Check that the markings are correct.

Adjusting the timing belt

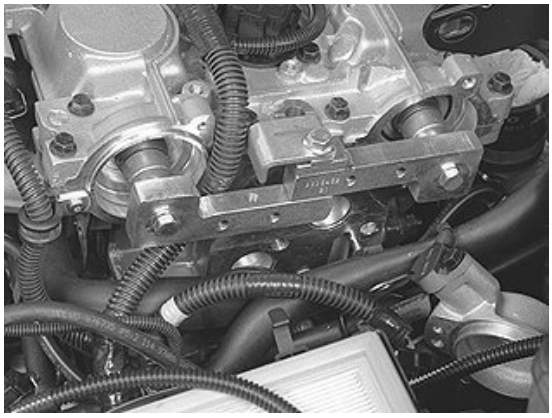


This adjustment is to be made with a cold engine. A suitable temperature is approximately **20°C/68°F**.
At higher temperatures (with the engine at operating temperature or a high outside temperature for example) the indicator is further to the right.
The illustration shows the position of the indicator when aligning the timing belt tensioner at different temperatures.
Hold the center screw secure and turn the belt tensioner eccentric clockwise until the tensioner indicator passes the marked position and reaches the limit position.
Tighten the 3 screws on the exhaust camshaft timing gear pulley. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Tighten the 3 screws on the intake camshaft timing gear pulley. Tighten. See Tightening torque See: Specifications/Tightening Torque.



Note! Check that the variable valve timing units are in the limit position.

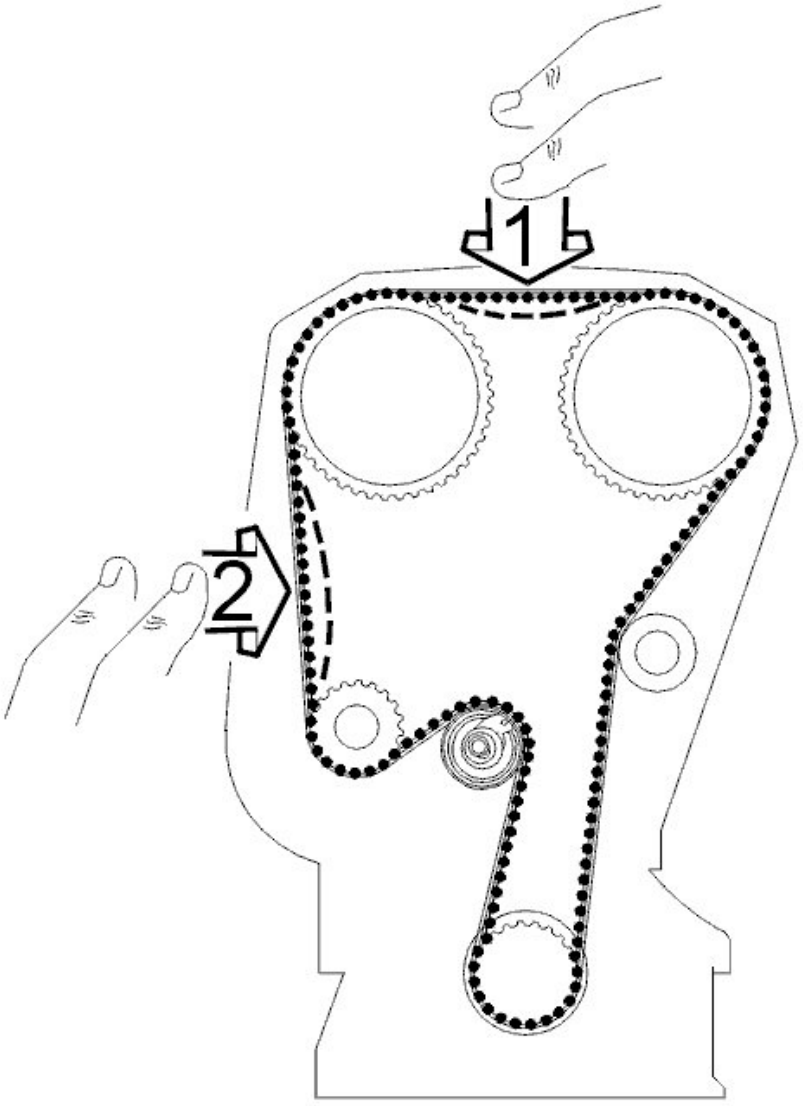
Turn the eccentric back so that the indicator reaches the marked position in the center of the window.
Remember to hold the center screw secure at the same time.
Hold the eccentric secure. Tighten the center screw. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Check that the indicator is in the correct position.



Remove:

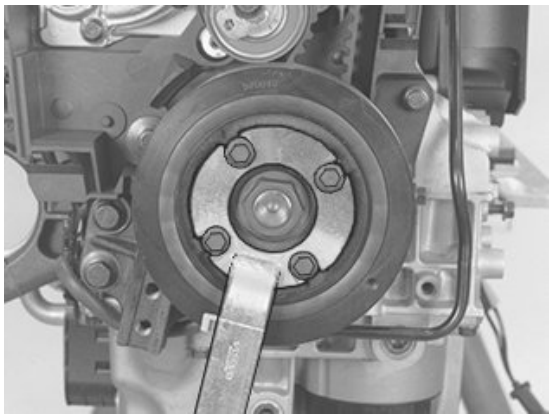
- camshaft adjustment tools 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool from the rear edge of the camshafts
- crankshaft stop 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
- the plug with a new sealing washer. Tighten. See Tightening torque See: Specifications/Tightening Torque.

Checking the markings and belt tension



Press the timing belt to check that the indicator on the belt tensioner moves easily.
Position the upper timing cover.
Turn the crankshaft 2 rotations and check that the markings on the crankshaft and camshaft pulleys correspond.
Check that the indicator on the belt tensioner is within the marked area.
Remove the upper timing cover.

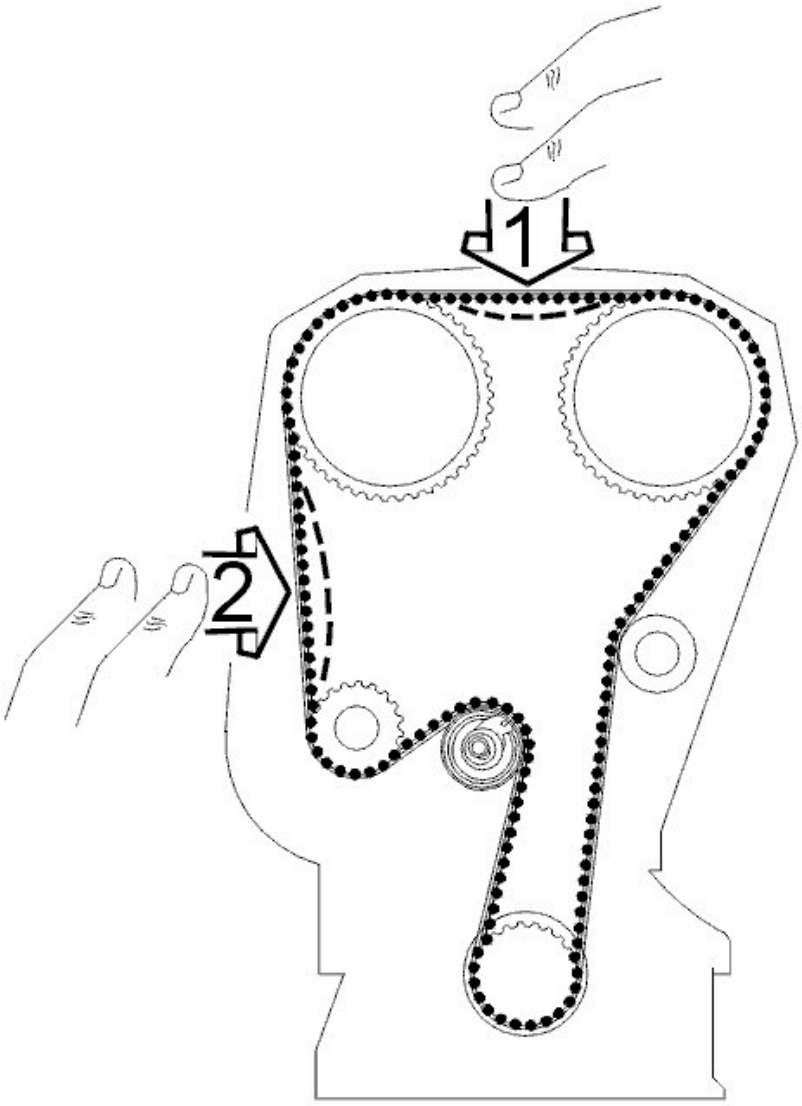
Installing the vibration damper



Install:

- the vibration damper. Use counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
- the crankshaft center nut. Tighten. See Tightening torque See: Specifications/Tightening Torque. Remove counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
- the 4 screws. Tighten. See Tightening torque See: Specifications/Tightening Torque. Use the crankshaft center screw as a counterhold.

Checking the markings and belt tension



Press the timing belt to check that the indicator on the belt tensioner moves easily.
Position the upper timing cover.
Turn the crankshaft two turns. Check that the markings on the crankshaft and timing gear pulley match up with the markings on the oil pump and upper timing cover respectively.
Check that the indicator on the belt tensioner is within the marked area.

Timing Belt: Service and Repair
Timing Belt, Replacing

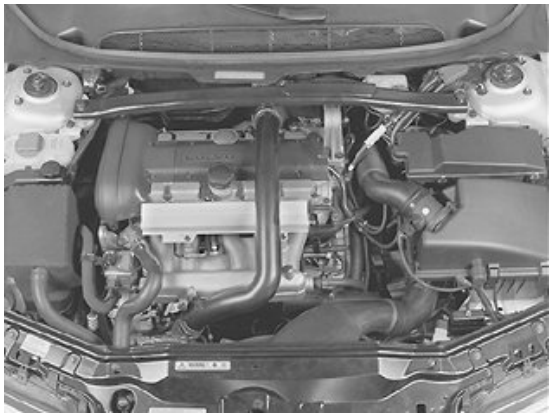
Timing belt, replacing

Special tools:

999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold

Note! Since the illustrations in this service information are used for different model years and/or models, some variation may occur. However, the essential information is always correct.

Remove components



Caution! Remove the ignition key.

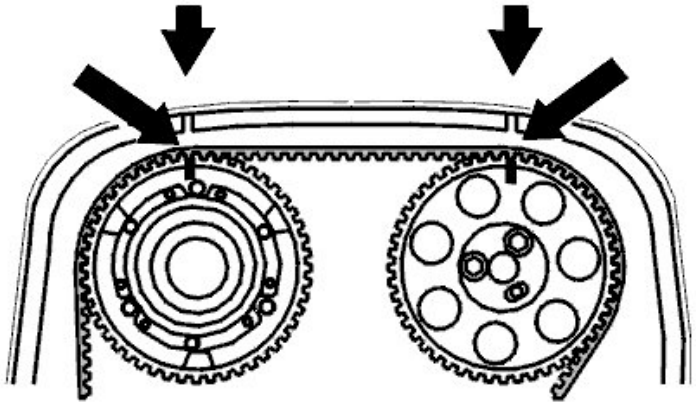
Remove:
- the cross stay between the suspension turrets
- the upper timing belt cover
- the servo reservoir and the expansion tank.

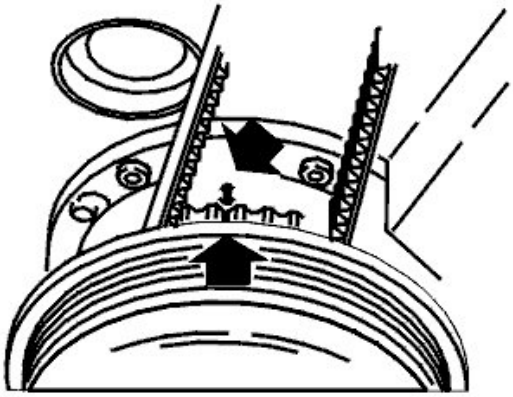
Lift up and place on top of the engine.

Warning! Make sure that no power steering fluid is spilled. Extremely flammable.

- the auxiliaries belt
- the front timing belt cover.

Position the engine according to the marking



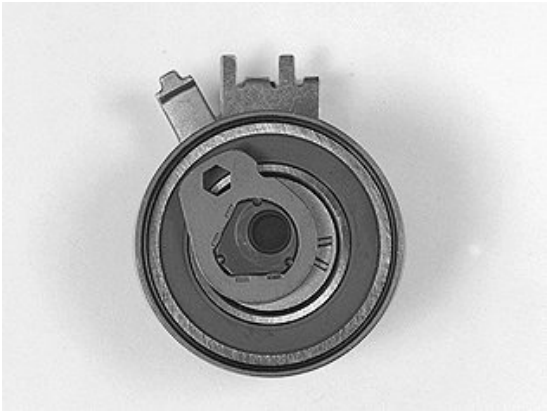


- Remove the right front wheel
- Remove the nut from the cover in the wing liner
- Install the upper timing belt cover
- Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulley correspond
- Turn the crankshaft a further 1/4 turn clockwise and then back again until the markings correspond.

The markings are illustrated

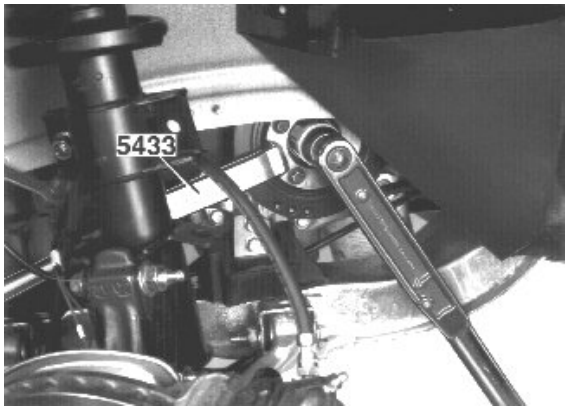
- Remove the upper timing belt cover.

Removing the timing belt



Slacken off the belt tensioner.

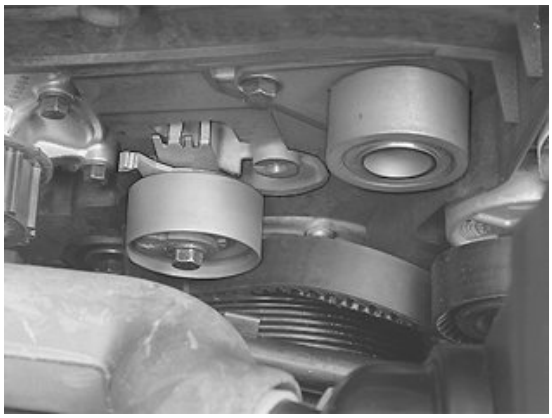
Slacken off the centre screw for the belt tensioner slightly.
Hold the centre screw still. Turn the tensioner eccentric clockwise using a 6 mm Allen key to 10 o'clock.
Remove the timing belt from the tension pulley, camshaft pulley and water pump.



Remove the vibration damper.

Remove the oscillation damper. Use counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold. Work the oscillation damper loose.
Remove the timing belt

Checking the tensioner pulley and idler pulley



Check bearing wear:

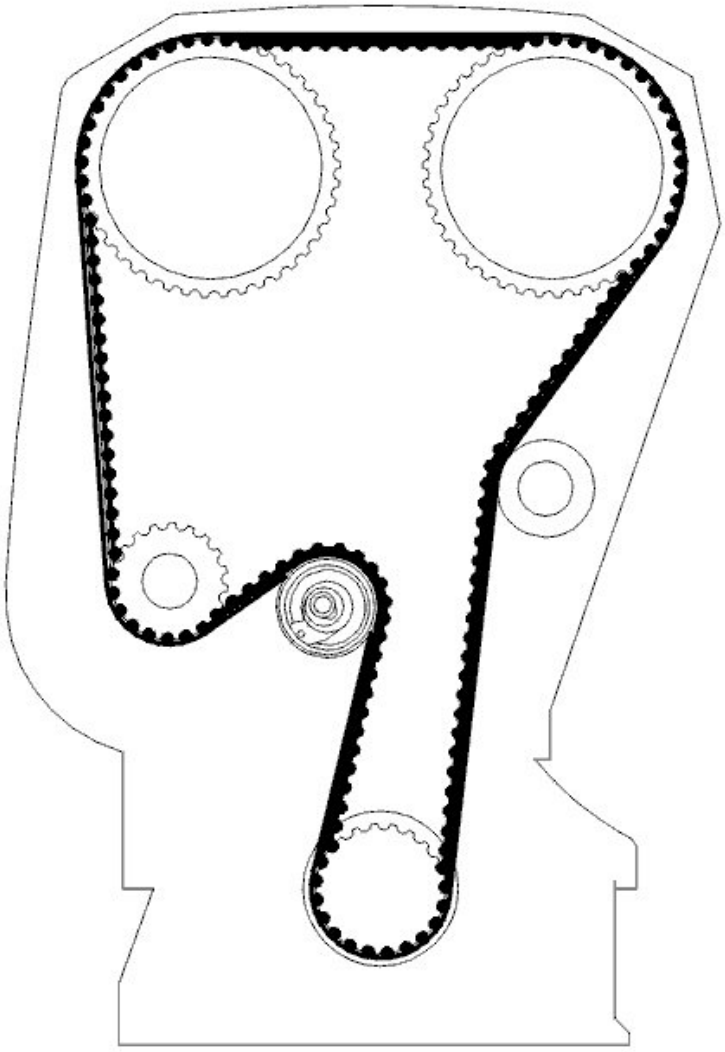
- spin the idler pulley and listen for noise.

If replacing with a new idler pulley, tighten to **24 Nm**.

- spin the tension pulley and listen for noise.

When replacing, screw the tension pulley into place using the centre screw.
Screw in the centre screw by hand.
Ensure that the tensioner fork is centered over the cylinder block rib.
Ensure that the Allen hole on the eccentric is at "10 o'clock".

Installing the timing belt



Note: For information regarding Variable Valve Timing see: Variable Valve Timing Actuator, Adjustments See: Variable Valve Timing/Variable Valve Timing Actuator/Adjustments

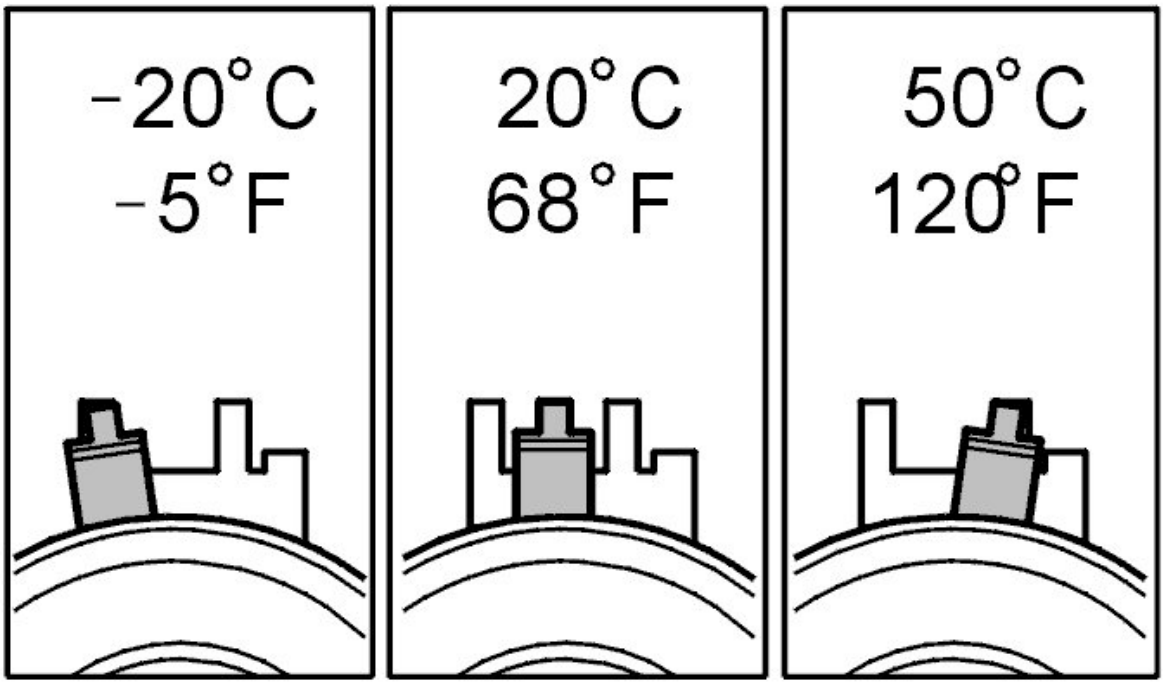
Also see Belt Drive, Assembly See: Belt Drive, Assembly

Install the timing belt over the pulley on the crankshaft.
Install the oscillation damper. Tighten the center nut to **180 Nm**. Use counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold.
Remove the counterhold and install new screws. Tighten the screws to **25 Nm**. Angle-tighten **30°**

Install the new belt in the following order:

- crankshaft
- the idler pulley
- intake camshaft pulley
- exhaust camshaft pulley
- water pump
- belt tensioner.

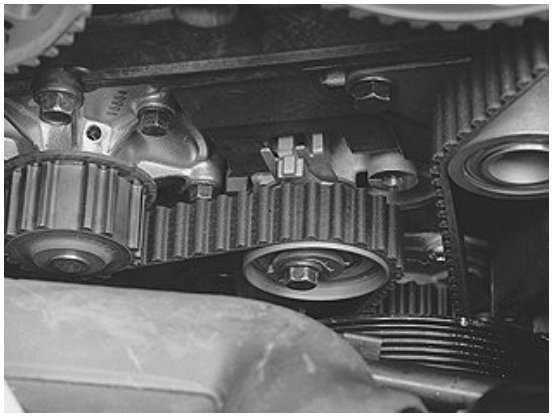
Tighten the timing belt



This adjustment is carried out on a cold engine. A suitable temperature is approximately 20°C/68°F.

At higher temperatures, for example with the engine at operating temperature or at higher ambient temperature, the needle is further to the right. The illustration shows the position of the indicator when aligning the timing belt tensioner at different temperatures.

For engine serial no. up to 3188688



Tension the timing belt as follows:

- turn the crankshaft clockwise carefully until the timing belt is tensioned. The belt must be tensioned between the intake camshaft pulley, the idler pulley and the crankshaft
- hold the centre screw on the belt tensioner fixed. Turn the belt tensioner eccentric **counter-clockwise** until the tensioner indicator passes the marked position.

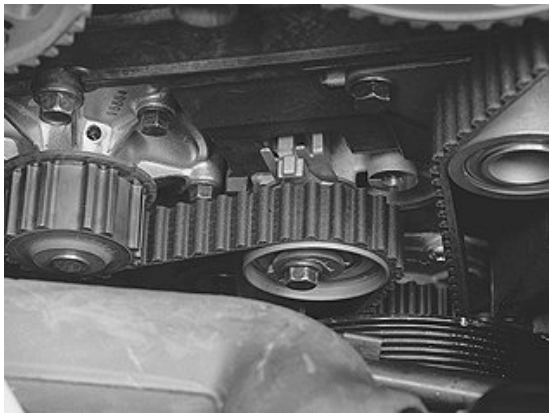
Then turn the eccentric back so that the indicator reaches the marked position in the centre of the window

- Secure the eccentric and tighten the center screw to **20 Nm**.

Check that the indicator is in the correct position.

For engine serial no. from 3188689

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Tension the timing belt as follows:

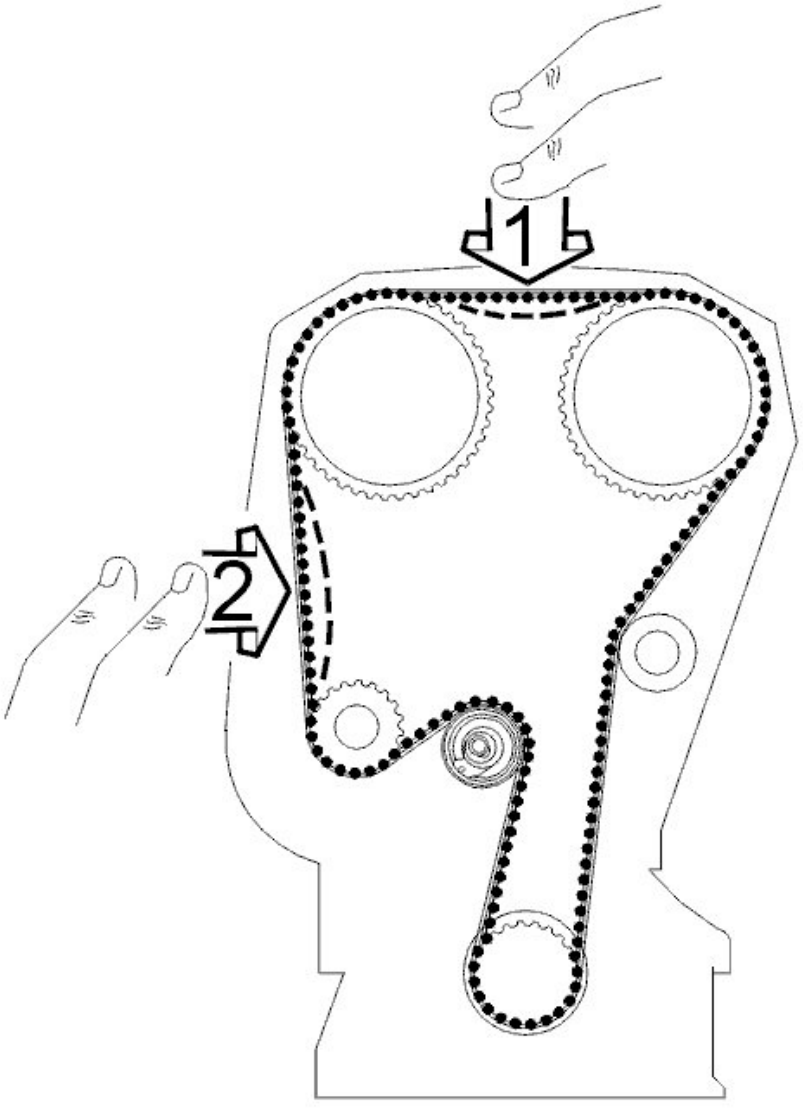
- turn the crankshaft clockwise carefully until the timing belt is tensioned. The belt must be tensioned between the intake camshaft pulley, the idler pulley and the crankshaft
- hold the centre screw on the belt tensioner fixed. Turn the belt tensioner eccentric **clockwise** until the tensioner indicator passes the marked position.

Then turn the eccentric back so that the indicator reaches the marked position in the centre of the window

- Secure the eccentric and tighten the center screw to **20 Nm**.

Check that the indicator is in the correct position.

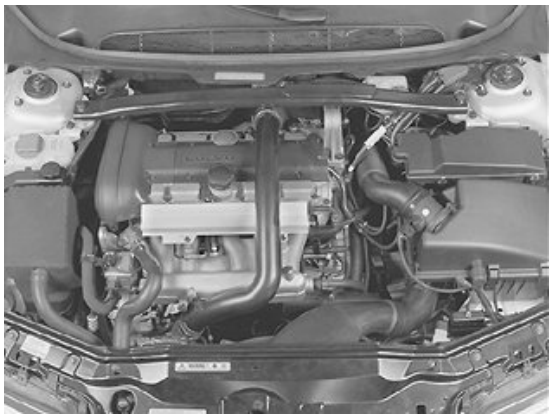
Check



Checking markings:

- press the belt to check that the indicator on the tensioner moves easily
- install the upper timing belt cover
- turn the crankshaft 2 turns. Check that the markings on the crankshaft and camshaft pulley correspond
- check that the indicator on the belt tensioner is within the marked area.

Reinstall



Reinstall the removed components:

- the front timing belt cover.

Tighten to **12 Nm.**.

- the upper timing belt cover
- install the auxiliaries belt
- the servo reservoir
- the expansion tank.

Note! Make sure that the hoses are routed positioned.

- the cross member. Tighten the screws at the suspension turret to **50 Nm** and the screw for the engine bracket to **80 Nm**.

Wipe clean and check the engine compartment

- the cover in the wing liner
- the front wheel according to Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Checking work

Function test:

- Test drive the engine.

Timing Belt: Service and Repair

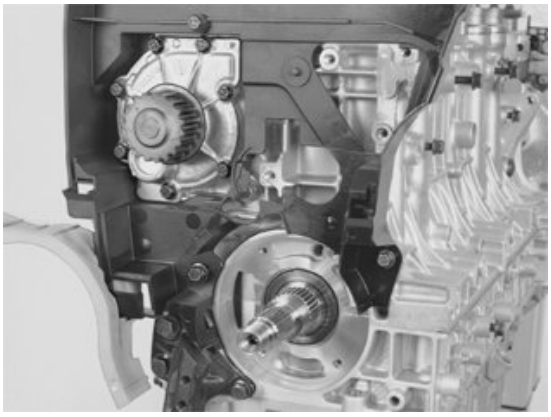
999 5747 Socket See: Tools and Equipment/999 5747 Socket
999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool
999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Tightening torque

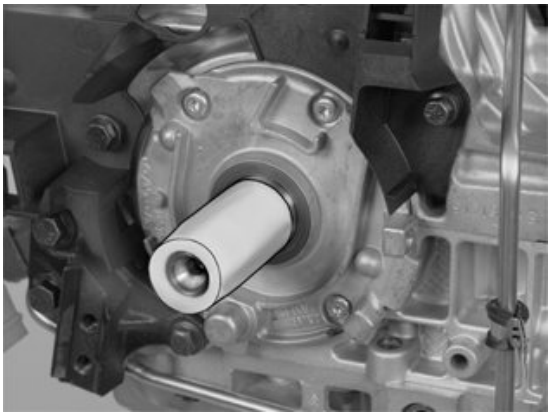
For tightening torques not in the text, see Tightening torque See: Specifications/Tightening Torque.

Installing the water pump



Install the rear timing cover.
Screw into place at the three mounting points.
Install the water pump with a **new gasket**.
Apply thread sealant, P/N 11-61 056, to all the screws for the water pump. Tighten the screws crosswise.

Installing the oil pump

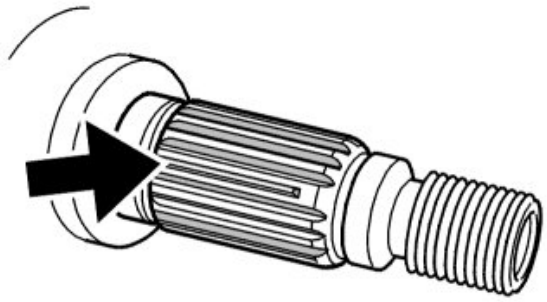


Use a new gasket and a new O-ring around the oil pump housing and new screws. Alternatively, apply thread sealant 11 61 056 to the underside of the old screw heads.
Screw sliding sleeve 999 5747 Socket See: Tools and Equipment/999 5747 Socket into place at the front of the crankshaft journal.
Press in the pump over the sliding sleeve.
Install the screws as a guide.
Carefully tap in the oil pump with a rubber mallet.
Tighten the oil pump crosswise. See Tightening torque See: Specifications/Tightening Torque.
Remove the sliding sleeve 999 5747 Socket See: Tools and Equipment/999 5747 Socket.

Installing front crankshaft seal

See Oil pump / crankshaft seal, front, replacing, B5244T5 See: Seals and Gaskets/Front Crankshaft Seal/Service and Repair.

Installing the crankshaft timing gear pulley



Note! The timing gear pulley can only be installed in one position on the crankshaft journal splines (see the illustration).

Carefully tap in the timing gear pulley with a rubber mallet.

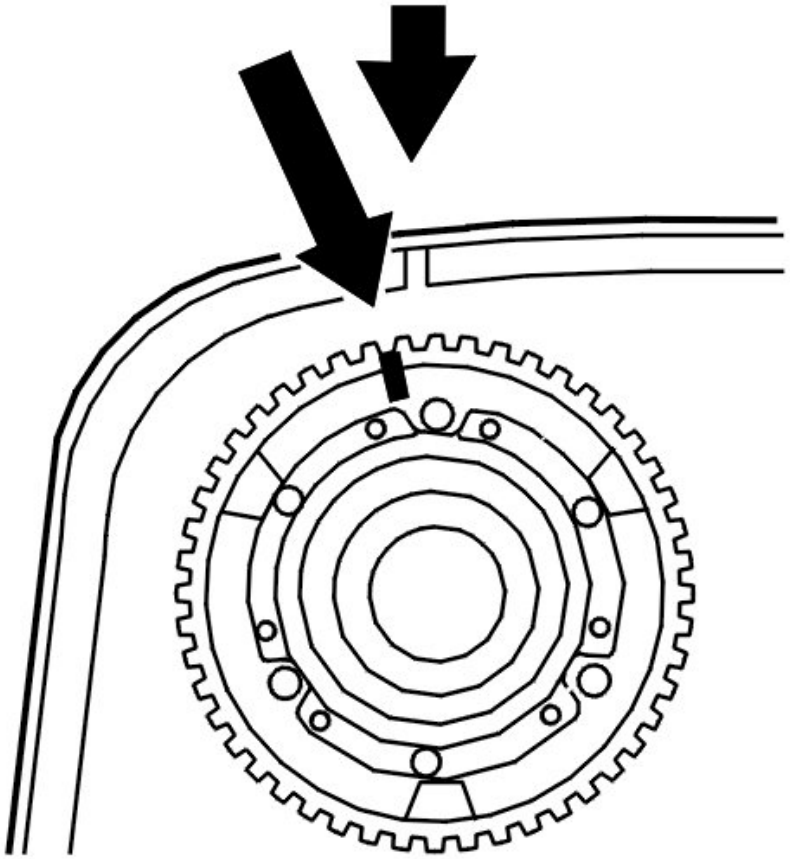
Installing the idler pulley and belt tensioner

Install:

- idler pulley. Tighten
- the belt tensioner and the center screw so that the tensioner fork is centered over the cylinder block rib. Do **not** tighten
- the lower belt guard at the oil pump
- the fuel delivery line.

Installing the timing gear pulley for the camshafts

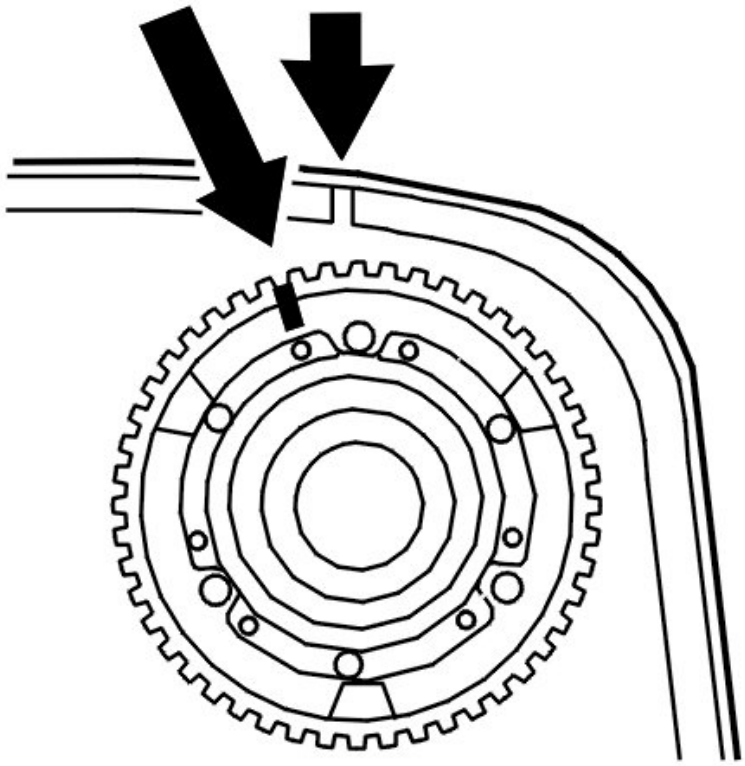
Note! The purpose of the "Installing the timing gear pulley" section described here is to ensure that the VVT unit is correctly positioned and to reset the camshaft timing gear pulley to the correct position using the markings made at the factory. This is to ensure that the conditions are correct for any later fault-tracing.



Note! Do not turn counter clockwise during this procedure.

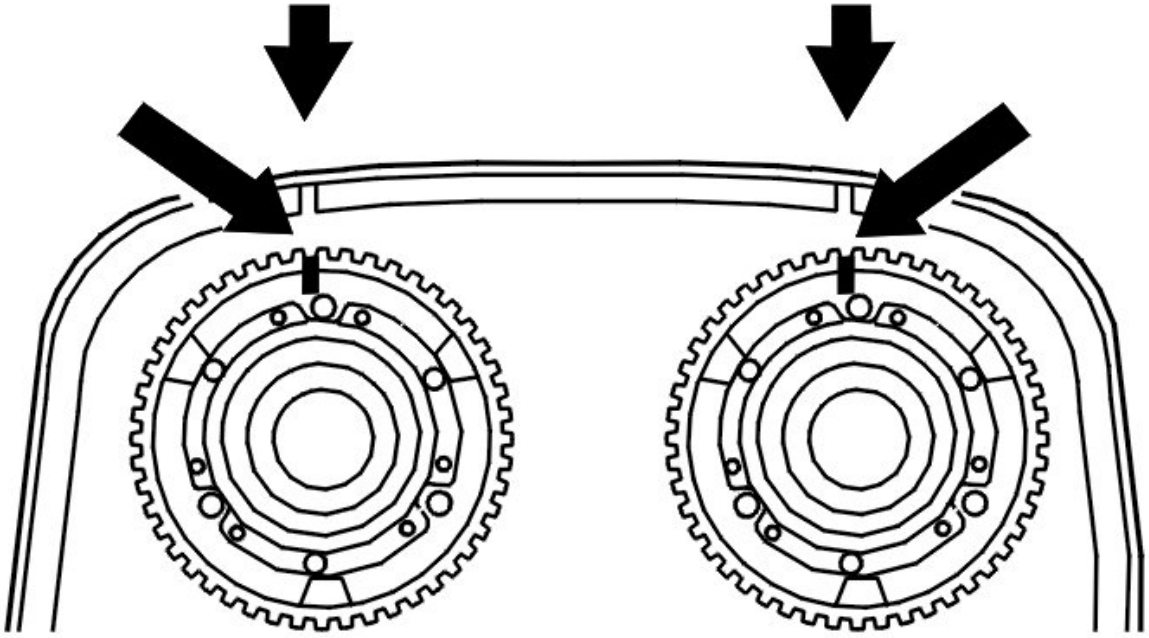
Slacken off, but do not remove, the screws which secure the timing gear pulley to the variable valve timing unit.
Press the variable valve timing unit and timing gear pulley onto the camshaft.
Install the center screw which secures the variable valve timing unit to the camshaft. Tighten slightly. Turn the variable valve timing unit **counter-clockwise** as far as it will go. Remove the center screw.
Position the upper timing cover.
Turn the timing gear pulley **clockwise**until the screws at the oval holes are in the limit position. Continue turning **clockwise** until the timing gear pulley marking is **1 cogs** before the marking on the upper timing cover.
Check that the timing gear pulley is still in the limit position in the oval holes. Tighten the center screw in the variable valve timing unit. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Check that the variable valve timing unit does not rotate when tightening. Install and tighten the center plug. See Tightening torque See: Specifications/Tightening Torque.
Turn the variable valve timing unit **clockwise** to the limit position.
Turn the timing gear pulley so that the markings correspond.

Installing the variable valve timing (VVT) unit on the intake camshaft



Note! Do not turn counter clockwise during this procedure.

Slacken off, but do not remove, the screws which secure the timing gear pulley to the variable valve timing unit. Press the variable valve timing unit and timing gear pulley onto the camshaft.
Install the center screw which secures the variable valve timing unit to the camshaft. Tighten slightly.
Turn the variable valve timing unit **counter-clockwise** as far as it will go. Remove the center screw. Position the upper timing cover.
Turn the timing gear pulley **clockwise**until the screws at the oval holes are in the limit position. Continue turning **clockwise** until the timing gear pulley marking is **1-1/2 cogs** before the marking on the upper timing cover.



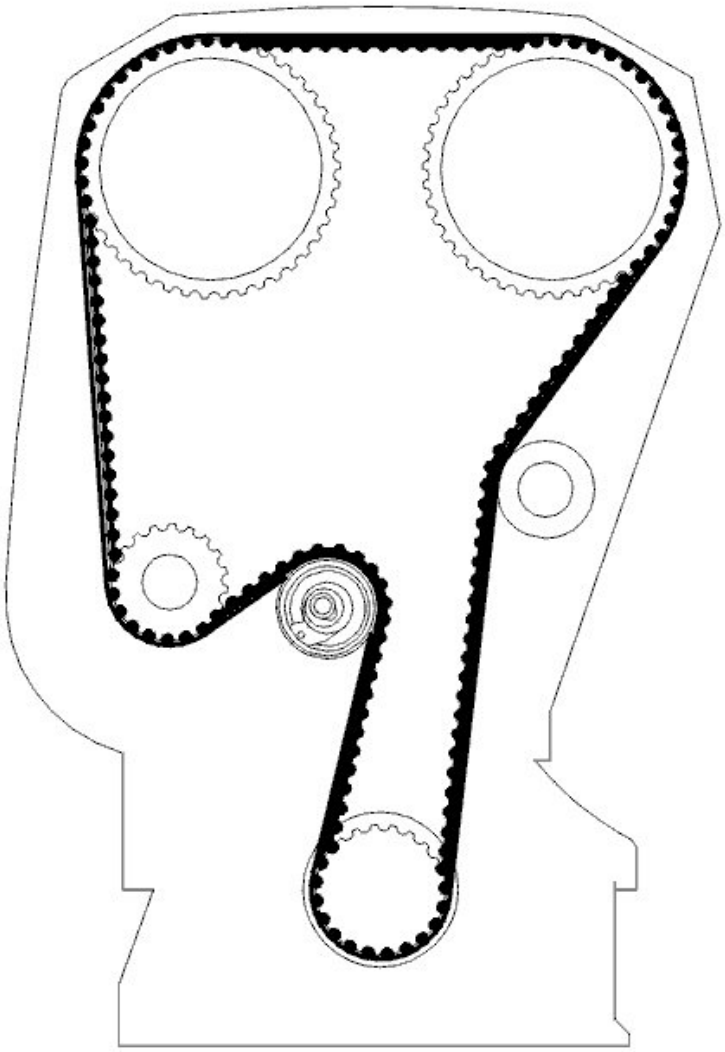
Check that the timing gear pulley is still in the limit position in the oval holes.

Tighten the center screw in the VVT unit. See Tightening torque See: Specifications/Tightening Torque.
Check that the variable valve timing unit does not rotate when tightening. Install the center plug. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Turn the variable valve timing unit clockwise to the limit position. Turn the timing gear pulley so that the markings correspond.

Finishing

Tighten the center screw on the timing belt tensioner. Tighten to **5 Nm**.

Installing the timing belt

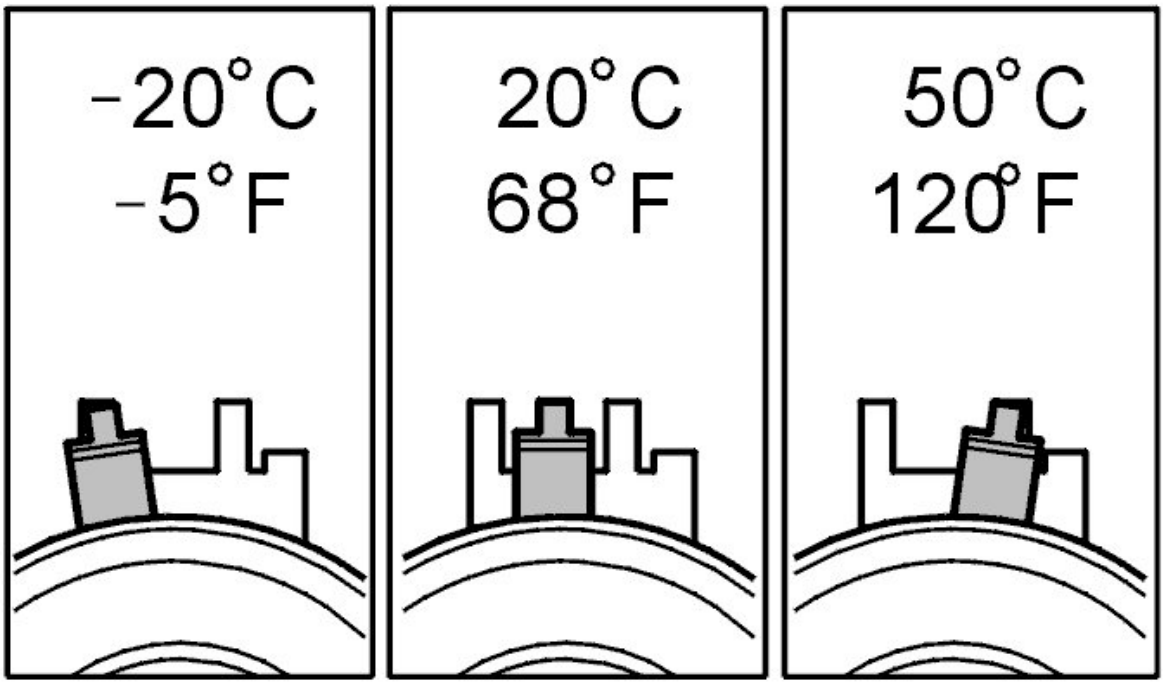


Install the belt in the following order:

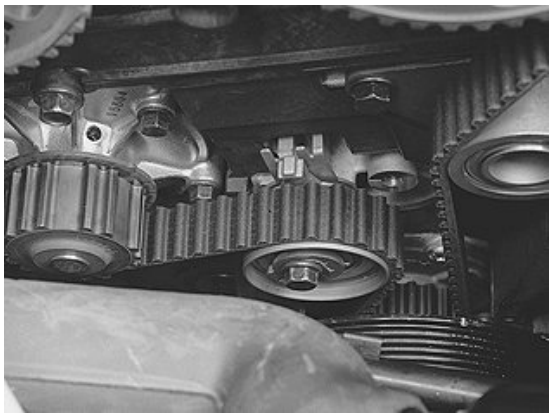
- crankshaft
- the idler pulley
- intake camshaft
- exhaust camshaft
- coolant pump
- belt tensioner.

Note! The variable valve timing units do not have a return spring and are easily dislodged when reinstalling the timing belt. Check that the markings are correct.

Adjusting the timing belt

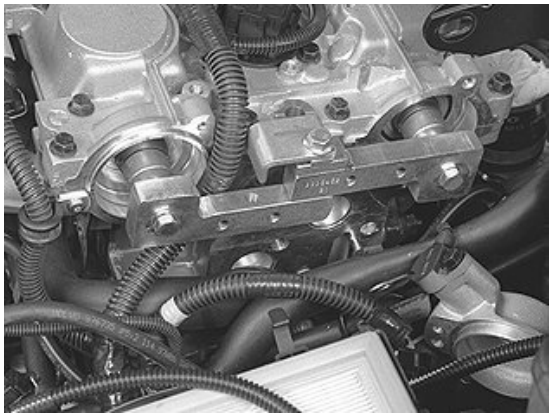


This adjustment is to be made with a cold engine. A suitable temperature is approximately **20°C/68°F**.
At higher temperatures (with the engine at operating temperature or a high outside temperature for example) the indicator is further to the right.
The illustration shows the position of the indicator when aligning the timing belt tensioner at different temperatures.
Hold the center screw secure and turn the belt tensioner eccentric clockwise until the tensioner indicator passes the marked position and reaches the limit position.
Tighten the 3 screws on the exhaust camshaft timing gear pulley. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Tighten the 3 screws on the intake camshaft timing gear pulley. Tighten. See Tightening torque See: Specifications/Tightening Torque.



Note! Check that the variable valve timing units are in the limit position.

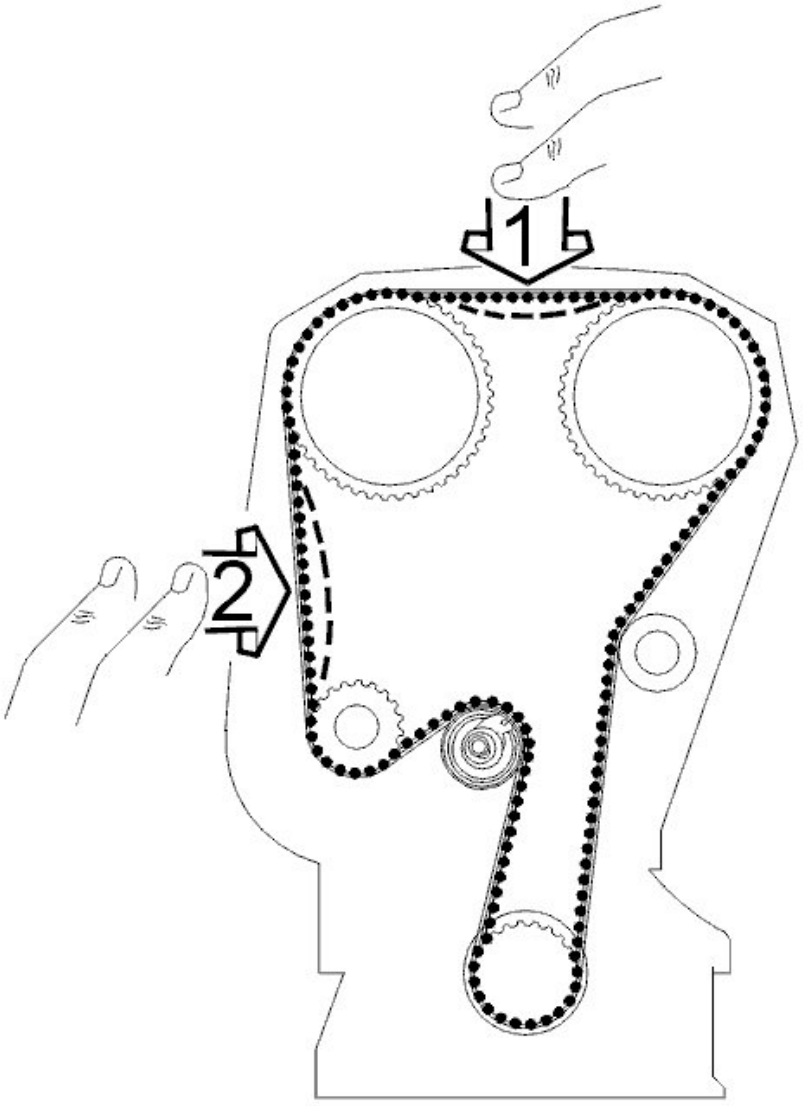
Turn the eccentric back so that the indicator reaches the marked position in the center of the window.
Remember to hold the center screw secure at the same time.
Hold the eccentric secure. Tighten the center screw. Tighten. See Tightening torque See: Specifications/Tightening Torque.
Check that the indicator is in the correct position.



Remove:

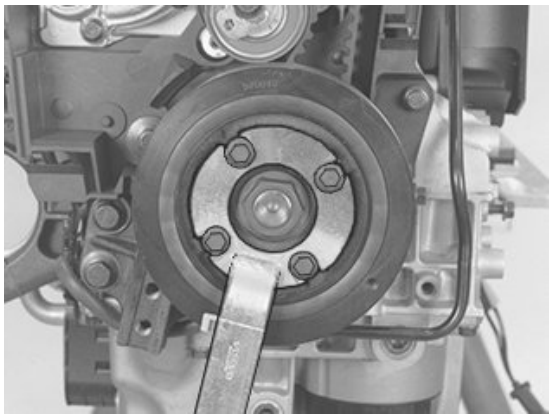
- camshaft adjustment tools 999 5452 CAMSHAFT ADJUSTMENT TOOL See: Tools and Equipment/999 5452 Camshaft Adjustment Tool from the rear edge of the camshafts
- crankshaft stop 999 5451 ADJUSTMENT TOOL See: Tools and Equipment/999 5451 Adjustment Tool
- the plug with a new sealing washer. Tighten. See Tightening torque See: Specifications/Tightening Torque.

Checking the markings and belt tension



Press the timing belt to check that the indicator on the belt tensioner moves easily.
Position the upper timing cover.
Turn the crankshaft 2 rotations and check that the markings on the crankshaft and camshaft pulleys correspond.
Check that the indicator on the belt tensioner is within the marked area.
Remove the upper timing cover.

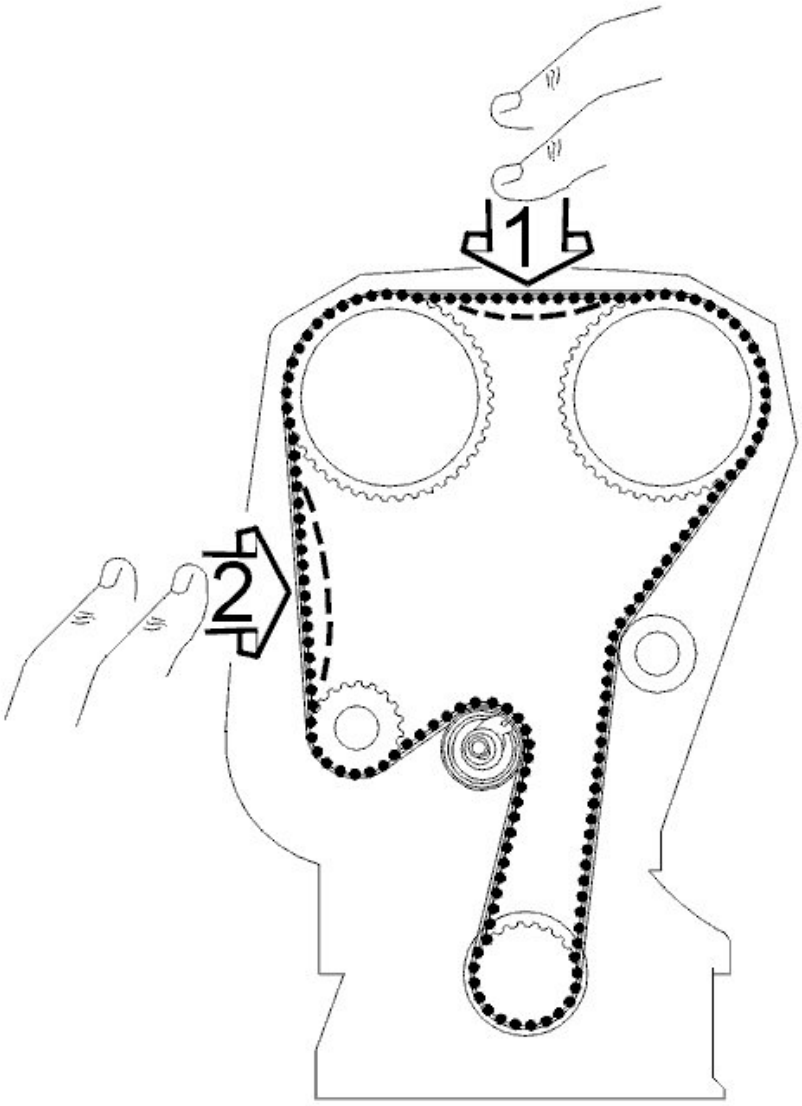
Installing the vibration damper



Install:

- the vibration damper. Use counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
- the crankshaft center nut. Tighten. See Tightening torque See: Specifications/Tightening Torque. Remove counterhold 999 5433 COUNTERHOLD See: Tools and Equipment/999 5433 Counterhold
- the 4 screws. Tighten. See Tightening torque See: Specifications/Tightening Torque. Use the crankshaft center screw as a counterhold.

Checking the markings and belt tension



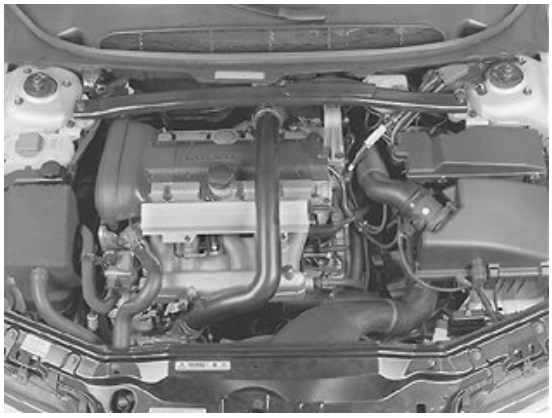
Press the timing belt to check that the indicator on the belt tensioner moves easily.
Position the upper timing cover.
Turn the crankshaft two turns. Check that the markings on the crankshaft and timing gear pulley match up with the markings on the oil pump and upper timing cover respectively.
Check that the indicator on the belt tensioner is within the marked area.

Water Pump: Service and Repair

Coolant pump, replacing

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removing the coolant pump



Caution! Remove the ignition key.

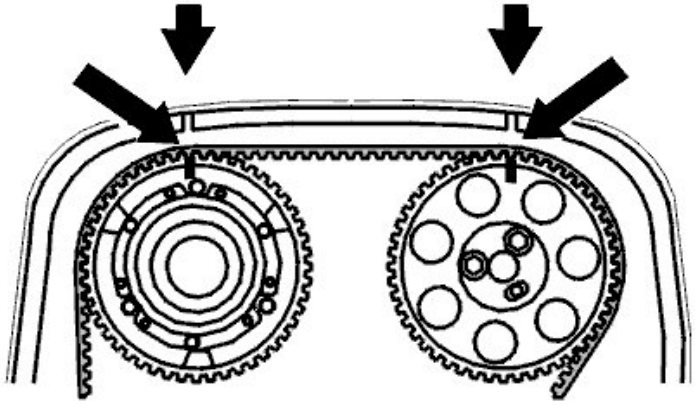
- Remove the expansion tank cap.

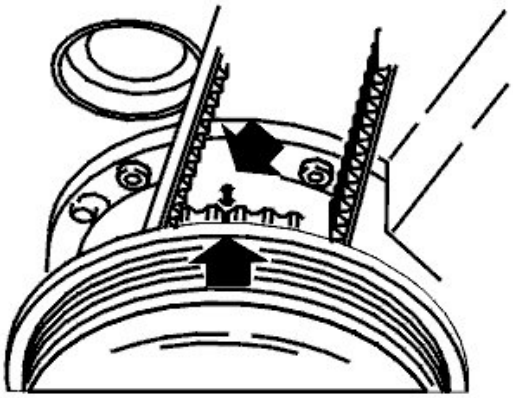
- Remove the splash guard under the engine
- Position a container under the engine drain cock. Drain the engine coolant.

Avoid skin contact with the coolant.

- Transfer the container to the radiator draining tap. Drain off the remaining coolant
- Close the nipples
- Install the splashguard under the engine.

Position the engine according to the marking





Remove

- the cross stay between the suspension turrets
- the servo reservoir and the expansion tank and place them on top of the engine.

Warning! Ensure that no power steering fluid is spilled. Extremely flammable.

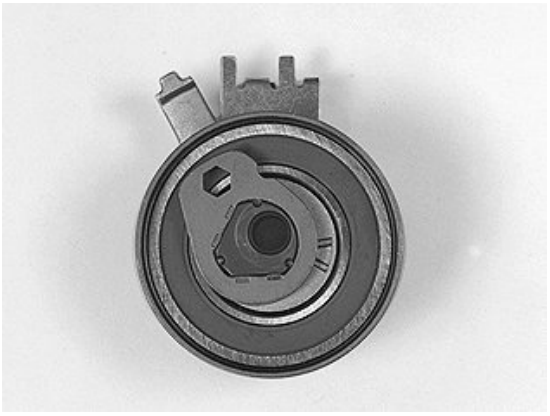
- the auxiliaries belt
- the front timing belt cover.

Raise the car.

- the right front wheel
- the nut for the cover in the right fender liner.

Install the upper timing belt cover.
Turn the crankshaft clockwise until the markings on the crankshaft and camshaft pulley correspond.
Turn the crankshaft a further 1/4 of a turn clockwise, then back counter-clockwise until the markings correspond.
Remove the upper timing belt cover.

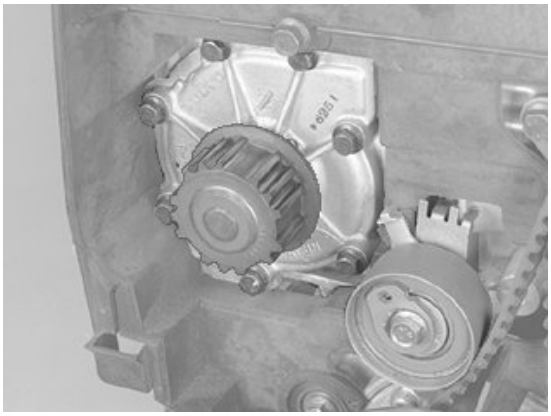
Removing the timing belt



Slacken off the belt tensioner.

Slacken off the center screw for the belt tensioner slightly.
Hold the center screw in place. Turn the tensioner eccentric clockwise to 10 o'clock using a 6 mm Allen key.
Unhook the timing belt.

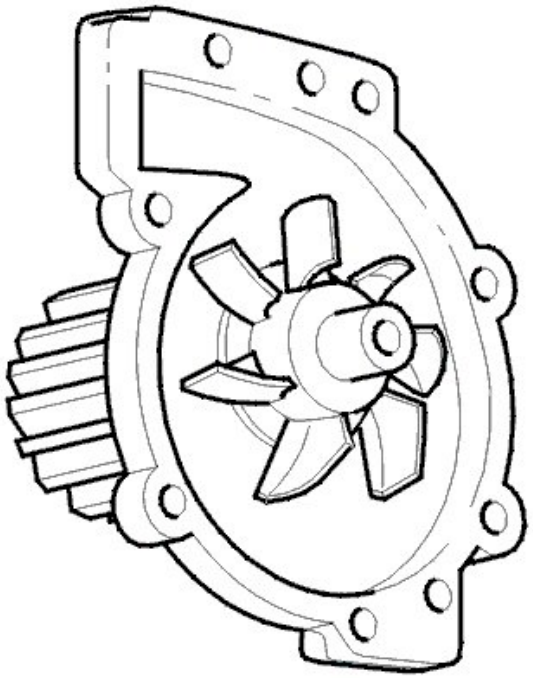
Remove the coolant pump

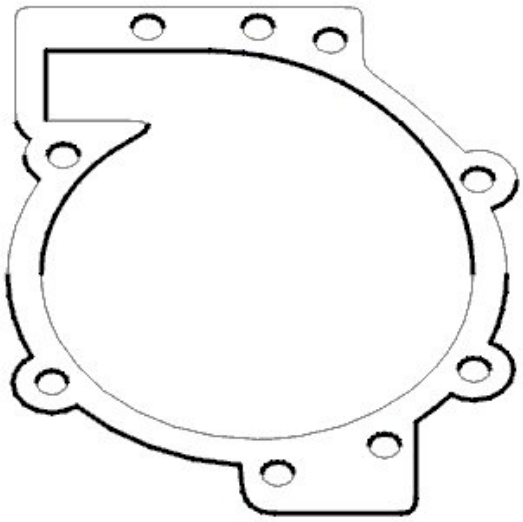


Remove the screws

- Tap the pump wheel with the shaft of a hammer and remove the pump
- Clean the gasket faces thoroughly.

Replace the coolant pump



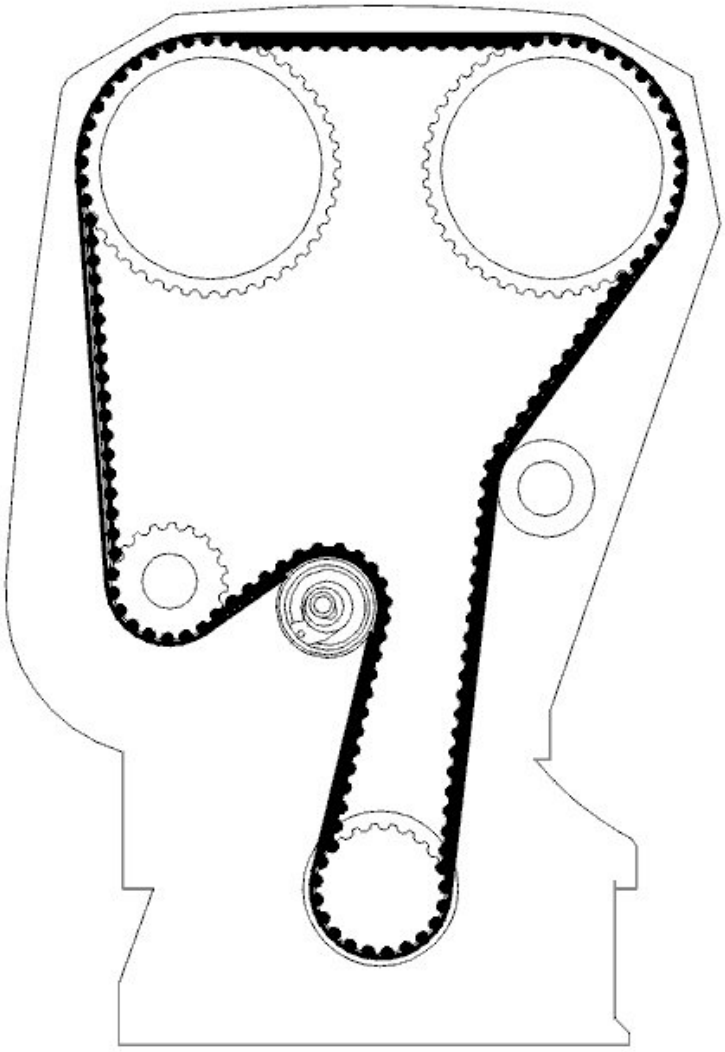


Install:

- a new gasket
- a new pump.

Tighten the screws crosswise. Tighten to **17 Nm**.

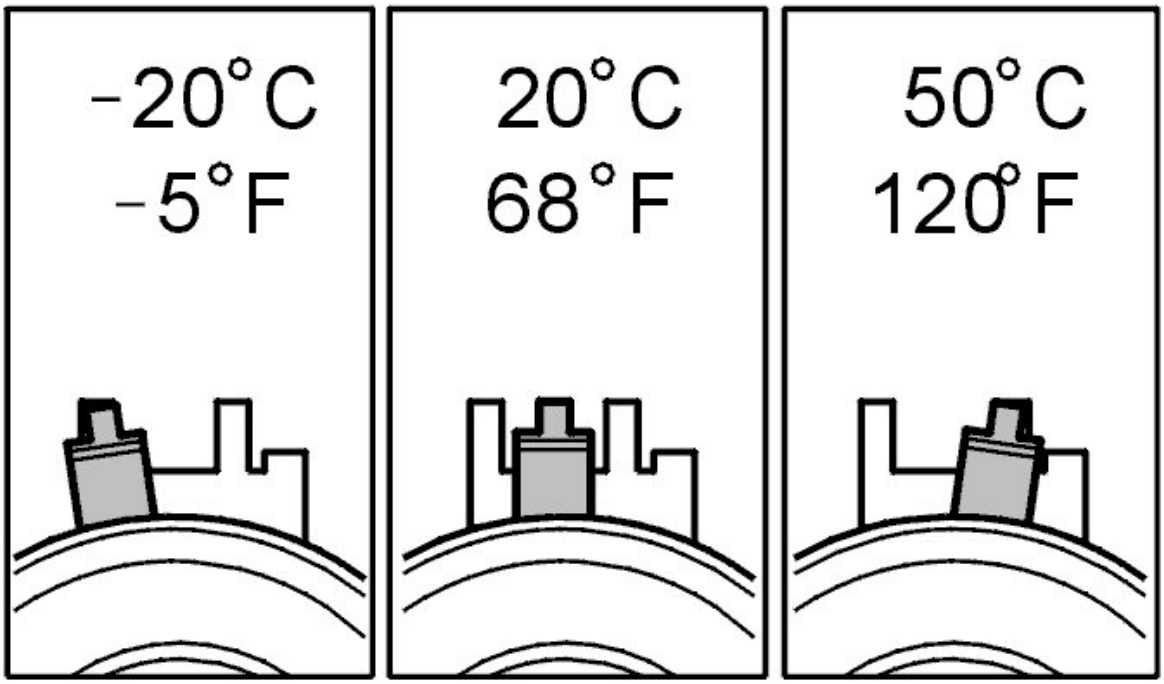
Installing the timing belt



Install the belt in the following order:

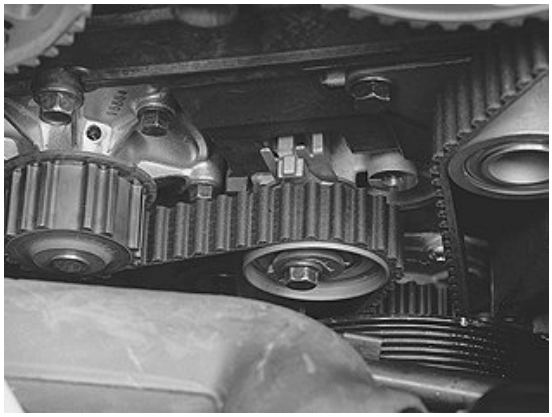
- crankshaft
- the idler pulley
- intake camshaft pulley
- exhaust camshaft pulley
- water pump
- belt tensioner.

Tension the timing belt



This adjustment is carried out on a cold engine. A suitable temperature is approximately 20°C/68°F.

At higher temperatures (with the engine at operating temperature or a high outside temperature for example) the indicator is further to the right. The illustration shows the needle position when adjusting the timing belt tensioner at different engine temperatures.



Tension the timing belt as follows

- Carefully turn the crankshaft clockwise until the timing belt is tensioned.

The belt must be tensioned between the intake camshaft pulley, the idler pulley and the crankshaft

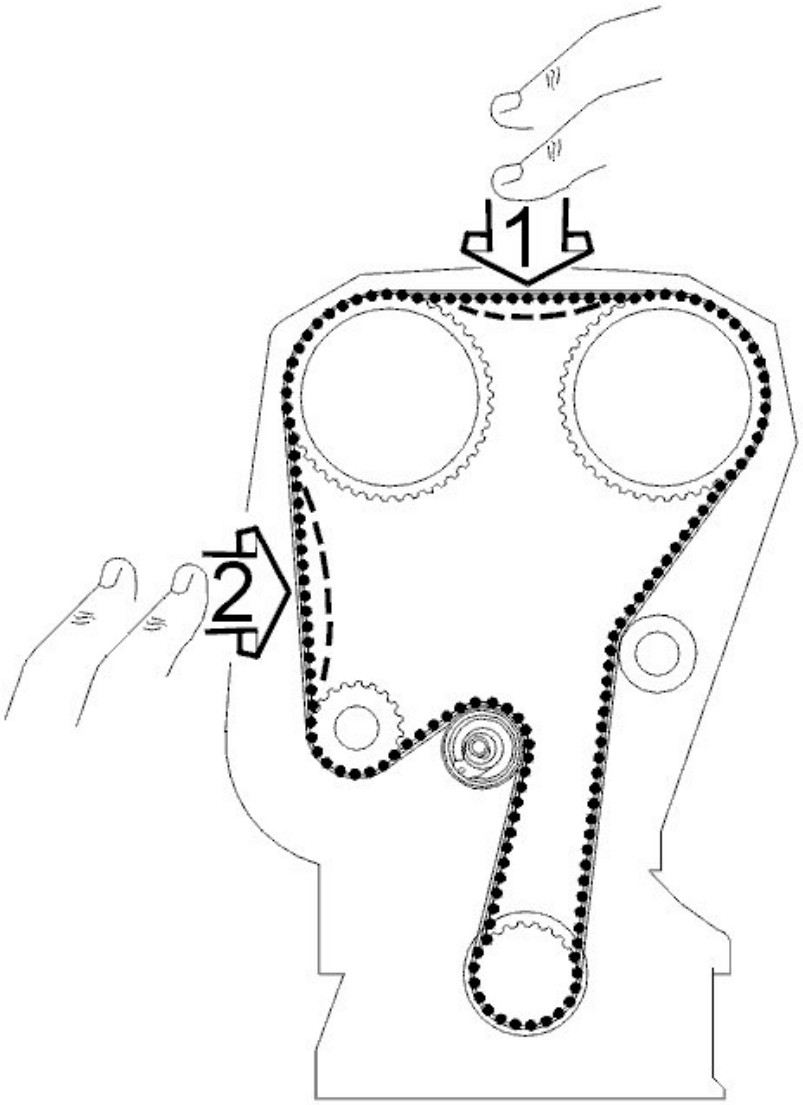
- Hold the belt tensioner center screw secure. Turn the belt tensioner eccentric counter-clockwise until the tensioner indicator passes the marked position.

Then turn the eccentric back so that the indicator reaches the marked position in the center of the window

- Hold the eccentric secure and tighten the center screw. Tighten to **20 Nm**.

Check that the indicator is in the correct position.

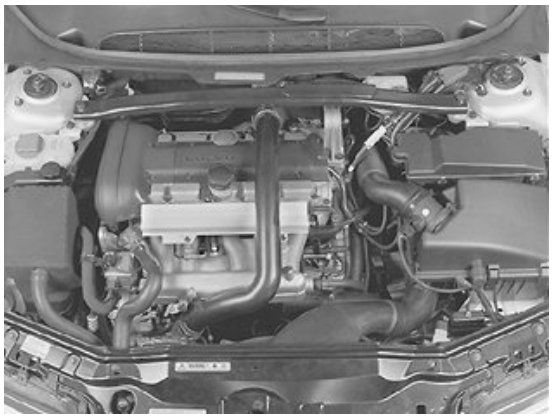
Check



Checking markings:

- press the belt to check that the indicator on the tensioner moves easily
- install the upper timing belt cover
- turn the crankshaft 2 turns. Check that the markings on the crankshaft and camshaft pulley correspond
- also check that the indicator on the belt tensioner is within the marked area.

Reinstall



Reinstall the removed components:

- the upper timing belt cover
- the front timing belt cover.

Tighten to **12 Nm**

- install the auxiliaries belt
- reinstall the servo reservoir and the expansion tank.

Ensure that the hoses are correctly positioned

- the engine stabilizer brace. Tighten the screws at the suspension turrets. Tighten to **50 Nm**.Tighten the screw for the engine bracket. Tighten

to **80 Nm**

- the cover in the fender liner
- the wheel. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Fill the cooling system with Volvo original coolant.
Wipe clean and check the engine compartment.

Checking work

Function test

- Warm up the engine until the thermostat opens
- Top up the cooling system if necessary.

Check for leaks.

Cooling System: Description and Operation

Water quality

The water that may be used in Volvo engine cooling systems together with Volvo original coolant must meet certain requirements. Tap water, for example, contains too much chlorine, minerals and salts. Water that does not meet the requirements according to the specification can cause corrosion and deposits in the cooling system even if the water is mixed with coolant. See specification.

Description	Quantity
Total fixed particles	< 340 ppm
Total hardness	< 9,5µ° dH
Chloride	< 40 ppm
Sulphate	< 100 ppm
pH value	5,5-9
Silicon	< 20 mg SiO2/l
Iron	< 0.10 ppm
Manganese	< 0.05 ppm
Conductivity	< 500 µS/cm
Organic content COD-Mn	< 115 mg/l

If in doubt about whether the water meets the requirements according to the specification, Volvo original coolant must be mixed 50/50 with distilled water (battery water) or ready mixed Volvo original coolant must be used.

When changing coolant or components in the cooling system, the system must be flushed clean with water that meets the specification or with distilled water. Alternatively the cooling system can be flushed with ready mixed Volvo original coolant.

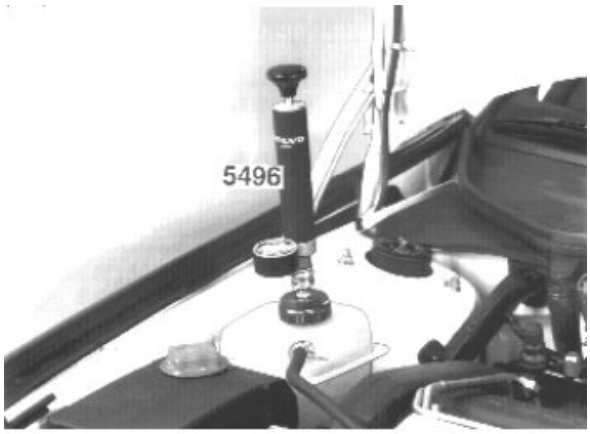
Cooling System: Testing and Inspection

Test pressurization

Special tools:

998 5496 ENGINE COOLANT SYSTEM - PRESSURE TESTER See: Tools and Equipment/998 5496 Engine Coolant System - Pressure Tester

Cooling system test pressurization



Use pressure tester 998 5496 ENGINE COOLANT SYSTEM - PRESSURE TESTER See: Tools and Equipment/998 5496 Engine Coolant System - Pressure Tester.
Connect the tester to the expansion tank cover.
Pump up the pressure and check for leaks.

- the pressure must be **150 kPa**
- the pressure in the system must be stable.

Note! Allow the pressure to stabilize for a few minutes.

Cooling System: Service and Repair

Cooling system - draining, charging and bleeding

Operation number: 26012-2

Note! Some variation in the illustrations may occur, but the essential information is always correct.

Special tools	
	T9512957 COOLANT FILLER **Tool number:**T9512957 **Tool description:**COOLANT FILLER **Tool boards:**
	T9512953 COVER **Tool number:**T9512953 **Tool description:**COVER **Tool boards:**

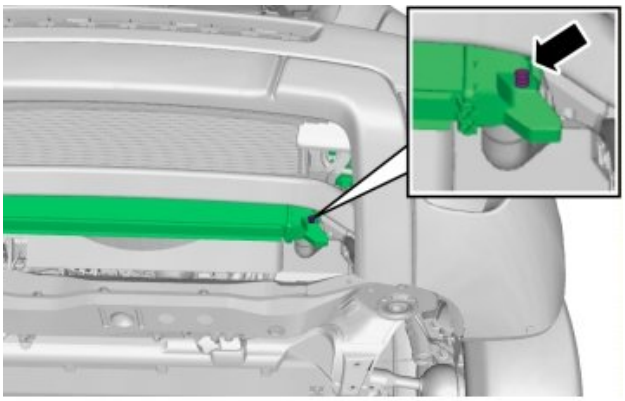
Note! Removal steps in this procedure may contain installation details.

Removal

Warning! Read the health and safety instructions for the cooling system. Refer to: Safety information Cooling system .

Warning! When releasing the cooling system pressure, cover the coolant expansion tank cap with a thick cloth.

Coolant must only be mixed with water of the correct quality. Refer to: Water quality See: Description and Operation



Installation

To install, reverse the removal procedure

Charge the cooling system. 951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir together with 951 2953 Cover See: Tools and Equipment/951 2953 Cover.

Warm up until the thermostat opens. Top off as necessary.

Auxiliary Water Pump: Service and Repair

Replacing the water pump for the engine coolant heater

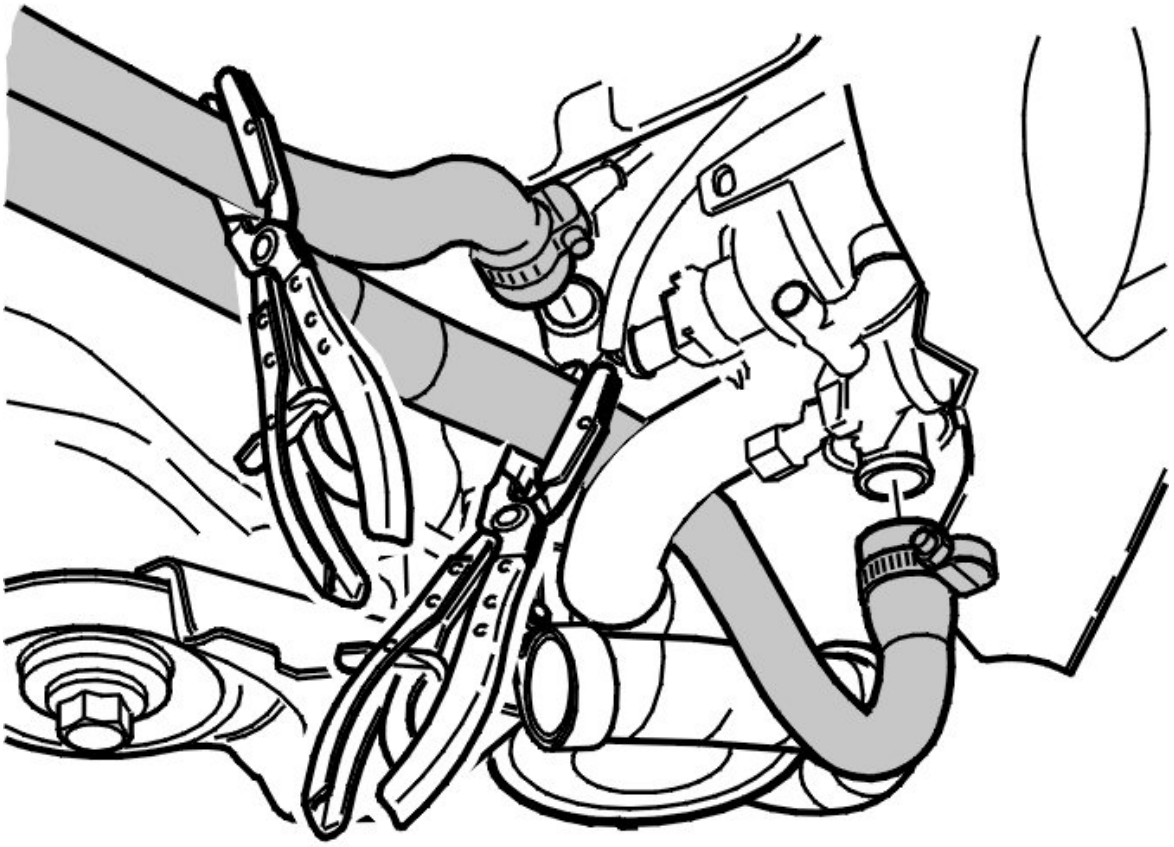
As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparations

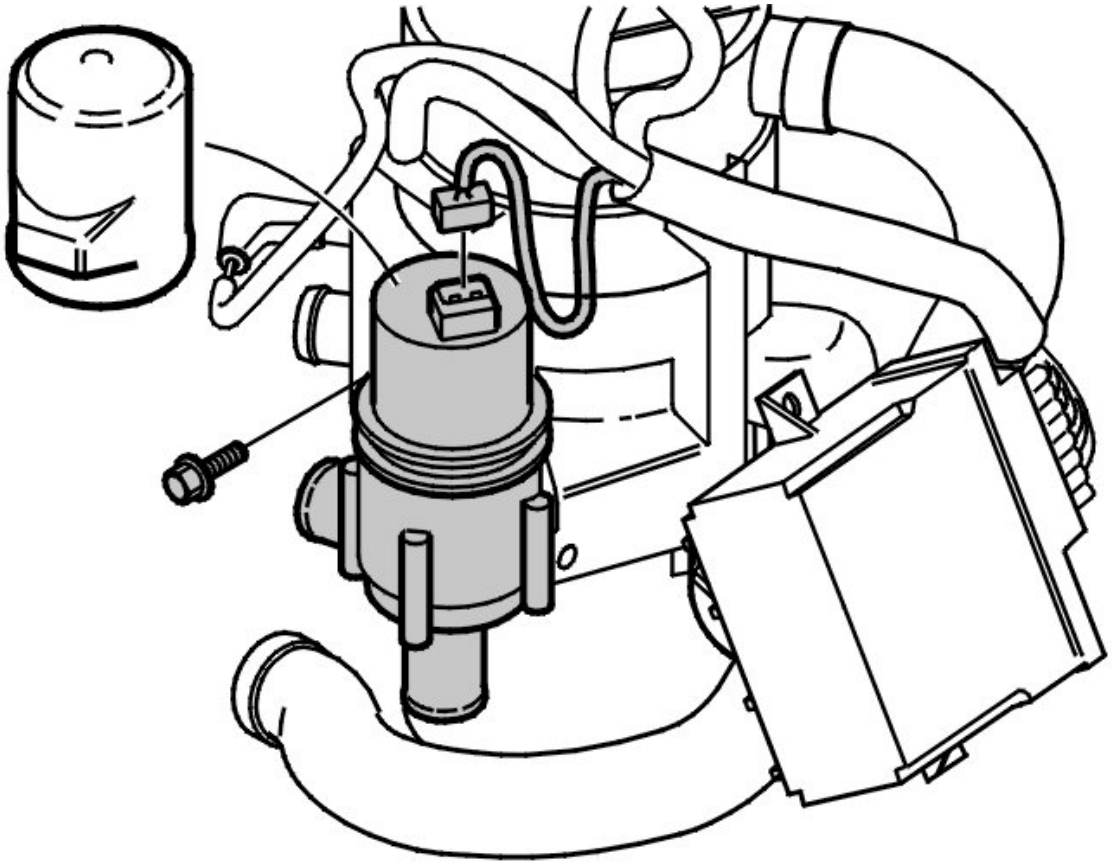
Remove:

- the air baffles
- the bumper cover. See**(S80)**, Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(V70)**, Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(V70XC)**or Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(S60)**
- the control module. See Control module engine coolant heater, replacing See: Heating and Air Conditioning/Auxiliary Cabin Heater/Auxiliary Cabin Heater Control Module/Service and Repair. Allow the cable harness to remain on the control module.

Removing the water pump for the engine coolant heater



Install hose clips on both the engine coolant hoses by the heat exchanger.
Position a container under the heater.
Disconnect the hoses.



Cut off the tie strap holding the protective cap over the control module. Lift off the protective cap.

Remove:

- the connector
- the nut for the water pump mounting. Hold the damper while removing the water pump.

Note! Note the position of the water pump on the holder.

Installing the water pump for the engine coolant heater

Position the water pump (according to the noted position) in the shutter using the shaped hoses.

Install:

- the water pump mounting using a nut (1xM6). Tighten to **3 Nm**
- the connector
- the protective cap
- a new tie strap.

Tighten the hose clamps for both the engine coolant hoses.
Install the control module. See Control module engine coolant heater, replacing See: Heating and Air Conditioning/Auxiliary Cabin Heater/Auxiliary Cabin Heater Control Module/Service and Repair.

Final check

Note! Start the engine and let it idle for a few seconds before starting the heater.

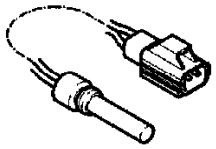
Test run the heater. Check the function of the heater. See Engine coolant heater, test running See: Heating and Air Conditioning/Auxiliary Cabin Heater/Testing and Inspection/Component Tests and General Diagnostics.
Check for leakage in the engine coolant hoses or fuel lines.
Top up the coolant if necessary.
Check that no diagnostic trouble codes (DTC) have been stored during the repair work.

Install:

- the bumper cover. See**(S80)**, Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(V70)**, Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(V70XC)**or Casing, bumper front, replacing See: Body and Frame/Bumper/Front Bumper/Front Bumper Cover / Fascia/Service and Repair **(S60)**
- the air baffle.

Coolant Level Sensor: Description and Operation

Engine Coolant Level Sensor



The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.

The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.

The sensor is supplied with voltage (signal) from the Engine Control Module (ECM) and grounded in chassis. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

NOTE: There are no functions controlled by the engine which are directly connected to the low coolant level warning lamp. The Engine Control Module (ECM) only transfers the signal which is used by the Driver Information Module (DIM).

The following applies from model year 2005-

The engine coolant level sensor signal can be read using VIDA.

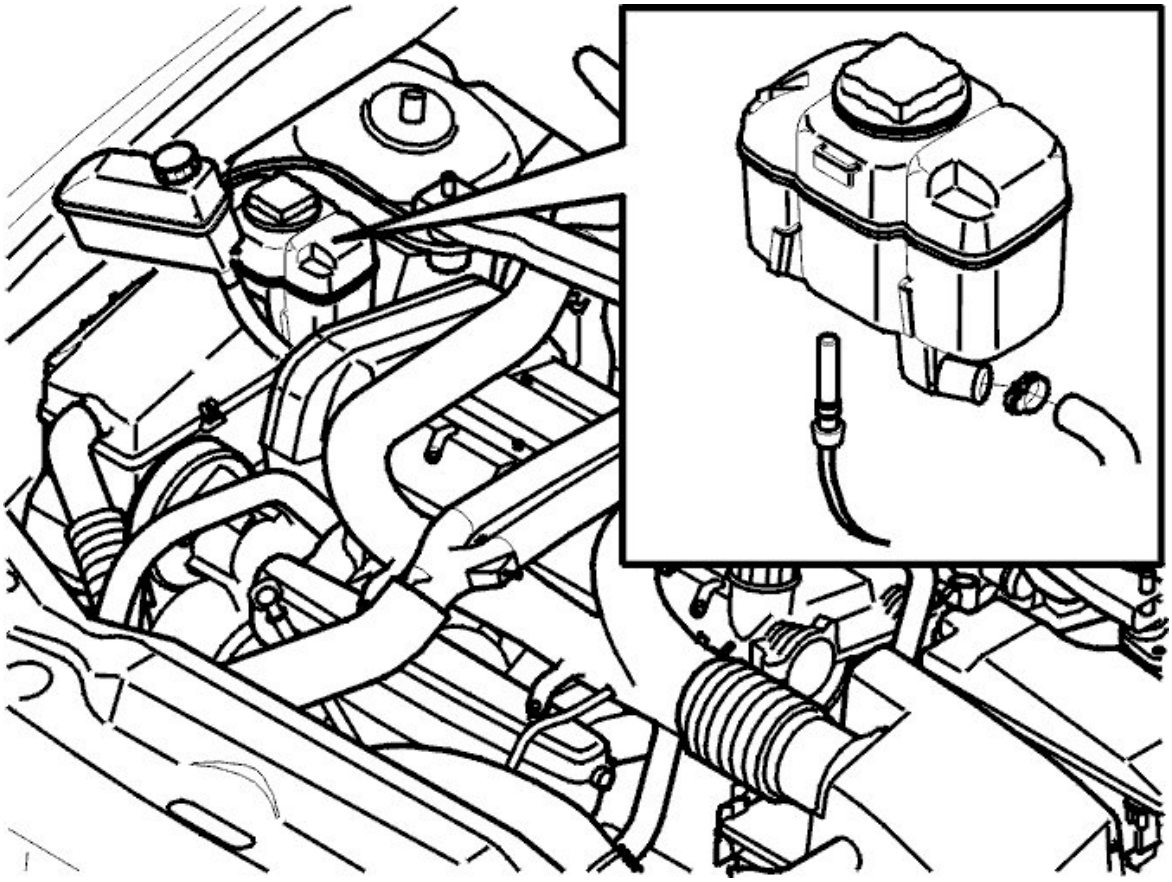
The engine control module (ECM) cannot diagnose the engine coolant level sensor.

Coolant Level Sensor: Service and Repair

Level sensor, engine coolant, replacing

Removal

Engine coolant level sensor



- Remove the fluid reservoir for the power steering pump from the bracket. Place it to one side. To remove the fluid reservoir, see
- Disconnect the expansion tank and place to one side
- Remove the sensor using a screwdriver
- Disconnect the connector.

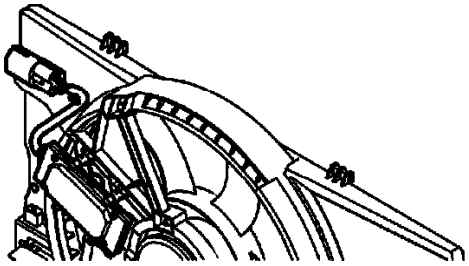
Installation

Engine coolant level sensor

In reverse order.

Radiator Cooling Fan: Description and Operation

Engine Cooling Fan (FC) / Engine Cooling Fan (FC) Control Module



The engine cooling fan (FC) has two functions. One is to cool the engine compartment, the other is to cool the condenser when the air conditioning (A/C) compressor is working.

The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control module. The control module then activates the fan at different speeds.

The speed of the engine cooling fan (FC) is determined by the engine control module (ECM), depending on the coolant temperature (based on the signal from the engine coolant temperature (ECT) sensor) and the vehicle speed.

The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level.

The temperature conditions apply when:
- the A/C is off
- no faults are detected by the Engine Control Module (ECM).

WARNING: The engine cooling fan (FC) may start itself for some time after the engine has been switched off. This is normal.

The engine cooling fan (FC) and its control module are behind the radiator.

The engine control module (ECM) can diagnose the engine cooling fan (FC). The fan can be activated using VIDA.

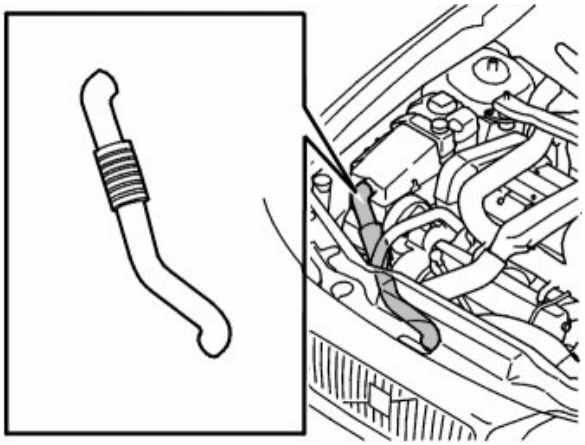
Radiator Cooling Fan: Service and Repair

Engine cooling fan (FC), replacing

Removing the engine cooling fan (FC)

Remove the intake pipe for the air cleaner housing (ACL). Disconnect both the connectors for the engine cooling fan (FC).

Remove:
- The evaporative emission system (EVAP) valve from the engine cooling fan (FC) shroud
- the hose clamps and charge air pipe/hose on the right-hand side (turbo charged engines only).



Remove the four tie straps that hold the cable harness secure at the fan shroud.

Note! Certain vehicles have three tie straps and a clip holding the cable harness at the fan shroud.

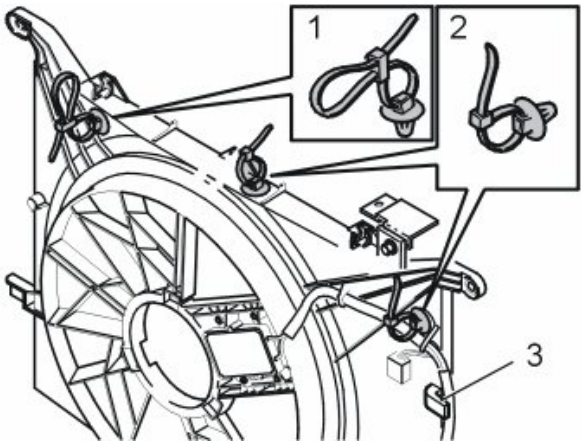
Lift out the hose for the expansion tank from the holders on top of the fan shroud

Remove:
- the cool box plastic hose from the fan shroud.
- both the screws holding the fan shroud.

Release the hose for the coolant reservoir from the fan shroud.

Installation

Installing the engine cooling fan (FC) and fan shroud

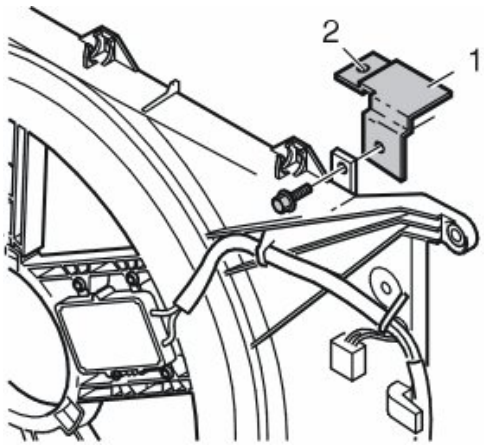


Carefully lower the fan shroud and align with the holders. Route the cable harness behind the holder (3).
Tighten both the mounting screws
Press the hose down from the expansion tank into the holder on the fan shroud
Transfer the clips from two tie-straps to the tie straps that have two catches (1).
Secure the cable harness by the fan shroud using tie straps (1) and (2).

Install:

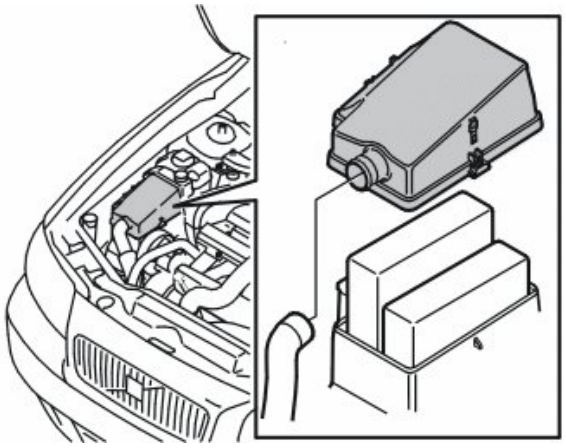
- the canister purge (CP) valve
- the hose clamp and charge air pipe/hose on the right-hand side (turbo charged engines only)
- the intake manifold to the air cleaner (ACL) housing.

Connect the engine cooling fan (FC) connectors.



Transfer the bracket (1) to the new fan shroud.
Install the connectors for the fan on the bracket using the holder from the service kit (2).

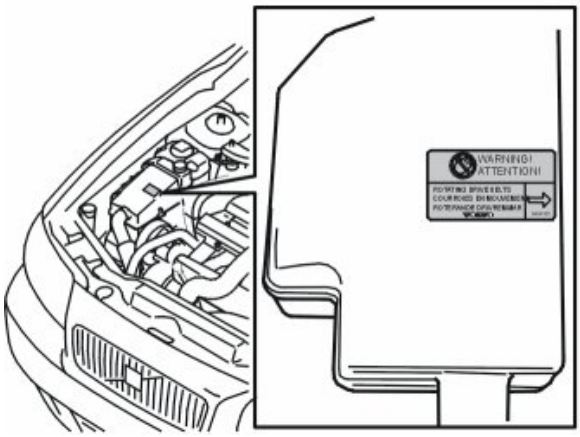
Replacing the cool box, certain versions only



Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Only applies to vehicles with chassis number:	
S60	000148-017811
S80	116812-184211
V70 (00-)	000929-082669
V70XC (01-)	000160-016110

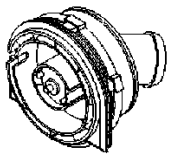
For vehicles with chassis number according to the table: Replace the cover on the cool box (Engine control module (ECM), Transmission control module (TCM)).



Apply the decal to the cover of the cool box.

Engine Compartment Fan: Description and Operation

Cooling Fan For Control Modules, Turbocharger (TC) (Certain Markets Only)



The function of the cooling fan is to cool the control modules in the control module box in the engine compartment. The control modules may be damaged if they overheat.

The engine control module (ECM) activates the fan depending on the signal from the engine coolant temperature (ECT) sensor and the temperature sensor in the control module.

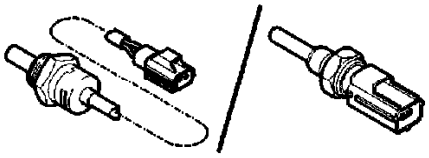
The cooling fan is in the hose between the control module box and the firewall.

The engine control module (ECM) can diagnose the engine cooling fan (FC). The fan can be activated using VIDA.

A diagnostic trouble code (DTC) is stored if the temperature in the engine control module (ECM) gets too high.

Coolant Temperature Sensor/Switch (For Computer): Description and Operation

Engine Coolant Temperature (ECT) Sensor



The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.

The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, a voltage (signal) is transmitted to the Engine Control Module (ECM).

At **0 degrees C**, the voltage is approximately **4.0 V**. At **100 degrees C** the voltage is approximately **0.5 V**. Low temperature results in high voltage (high resistance), high temperature in low voltage (low resistance).

The engine coolant temperature (ECT) sensor is located beside the thermostat.

The engine control module (ECM) can diagnose the engine coolant temperature (ECT) sensor.

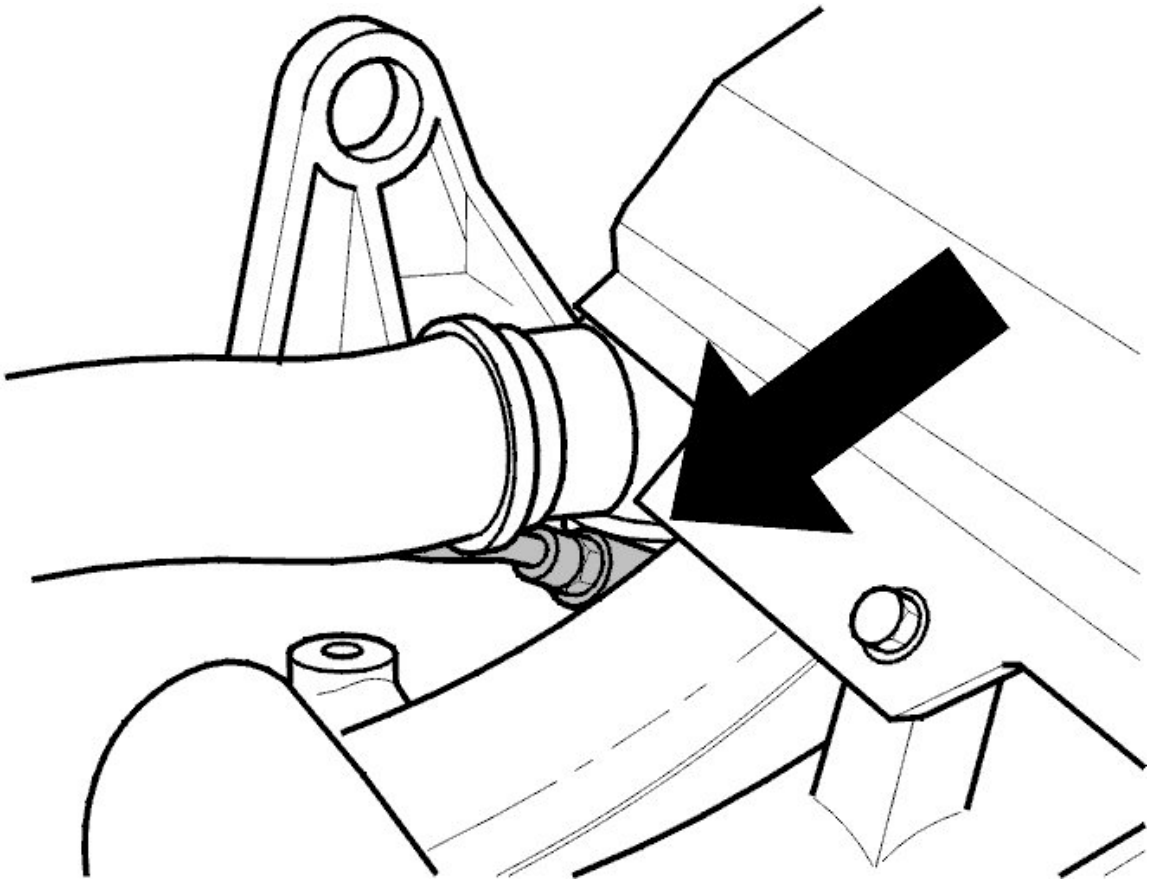
The sensor value can be read off using VIDA.

Coolant Temperature Sensor/Switch (For Computer): Service and Repair
Engine Temperature Sensor

Engine temperature sensor

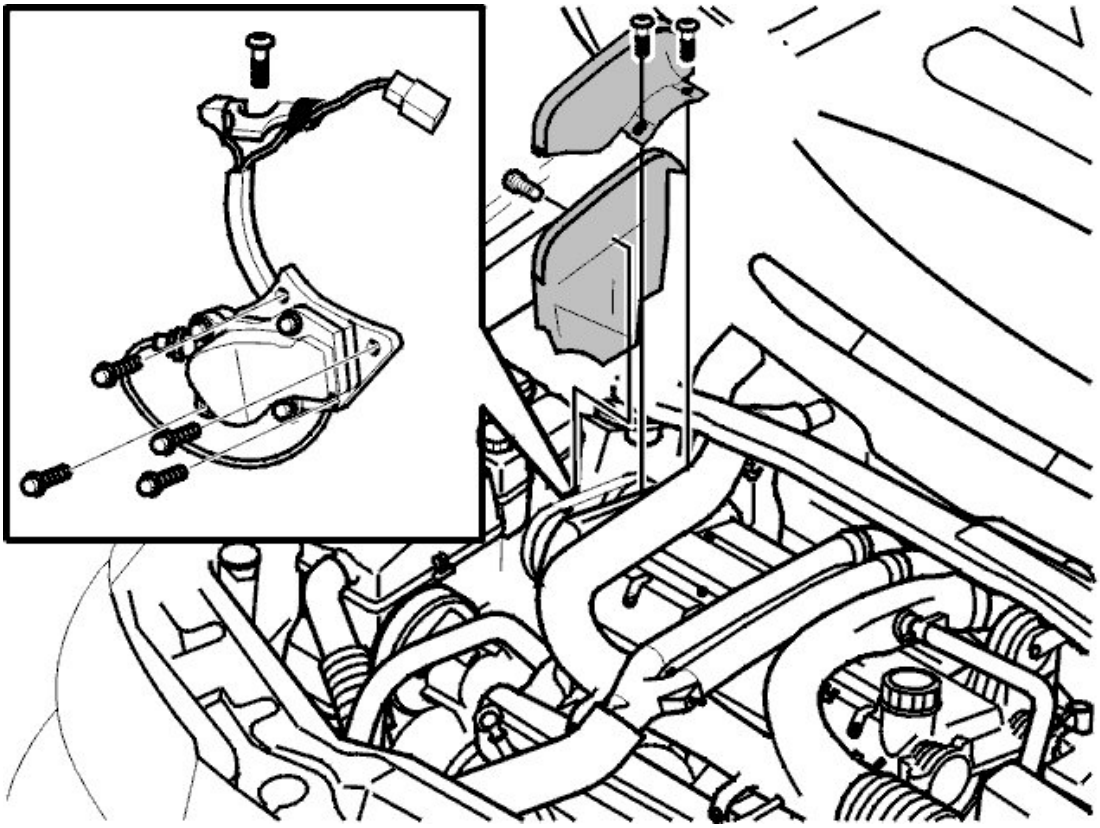
Removal

Engine temperature sensor, 5-cylinder



- Jack up the car.
- Remove protection cover from under engine.
- Drain the coolant as described in Replacing radiator/charge air cooler (CAC) See: Powertrain Management/Fuel Delivery and Air Induction/Turbocharger/Intercooler/Service and Repair.
- Lower the car.
- Release coolant hose from thermostat housing using pliers.
- Remove thermostat housing.
- Remove sensor.

Engine temperature sensor, 6-cylinder



- Jack up the car.
- Remove protection cover from under engine.
- Drain the coolant as described in Radiator / charge air cooler (CAC), replacement See: Powertrain Management/Fuel Delivery and Air Induction/Turbocharger/Intercooler/Service and Repair/Radiator / Charge Air Cooler (CAC), Replacement.
- Lower the car.
- Loosen oil reservoir for servo pump as described in.
- Remove coolant reservoir and put it to one side.
- Remove screws and outer/upper timing-gear casing.
- Remove screws and wire channel.
- Disconnect connector.
- Remove 4 screws and thermostat housing.
- Remove sensor and wires.

Installation

Engine temperature sensor, 6-cylinder

- Install thermostat housing sensor.
- Position wires in slot on thermostat housing.

Note! The white marks should be positioned in lower opening of slot, from underneath.

- Position gasket on thermostat housing correctly and install thermostat housing using two of the screws.
- Position thermostat housing correctly and tighten the four screws.
- Position wire channel correctly and position wire in channel.
- Tighten screw on wire channel.
- Connect the connector.
- Install outer/upper timing-gear casing.
- Install coolant reservoir.
- Install oil reservoir for servo pump as described in.

Follow-on work, 6-cylinder

- Fill up coolant.
- Warm the engine until the thermostat opens.

Switch engine off and check the level. Re-fill if necessary.

- Check for leaks.
- Check in VIDA vehicle communication (read-out of parameter values), for current engine system, that the engine temperature shown appears correct.

Engine temperature sensor, 5-cylinder

Install in reverse order.

Follow-on work, 5-cylinder

- Fill up coolant.
- Warm the engine until the thermostat opens.

Switch engine off and check the level. Re-fill if necessary.

- Check for leaks.
- Check in VIDA vehicle communication (read-out of parameter values), for current engine system, that the engine temperature shown appears correct.

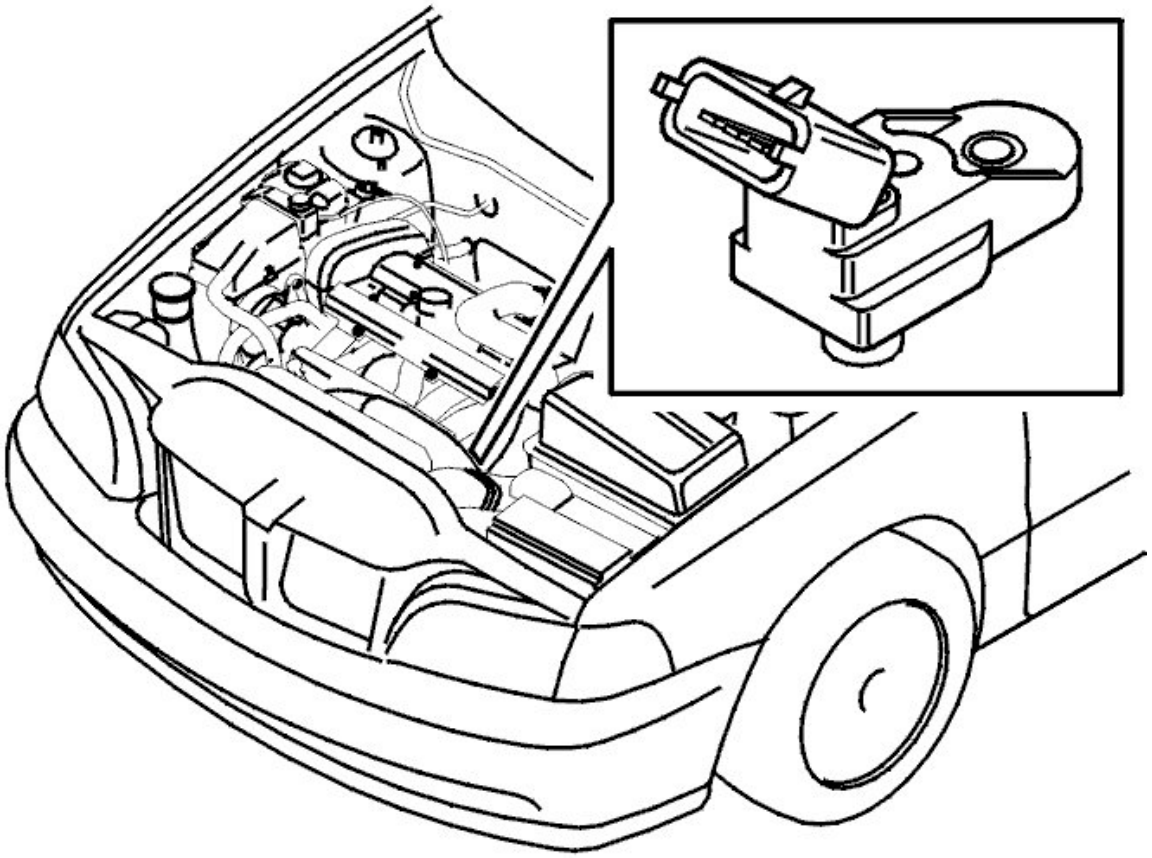
Coolant Temperature Sensor/Switch (For Computer): Service and Repair
Temperature and Pressure Sensors, Replacing

Temperature and pressure sensors, replacing

Removal and Installation

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the temperature and pressure sensors



Remove the boost pressure sensor which is on the pipe coming from the charge air cooler (CAC).

Installing the temperature and pressure sensors

Install a new sensor.

Coolant Temperature Sensor/Switch (For Computer): Service and Repair
Thermostat / Temperature Sensor, Engine Coolant, Replacing

Thermostat / temperature sensor, engine coolant, replacing

Special tools:

951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve
999 5722 Wrench See: Tools and Equipment/999 5722 Wrench
999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
951 2953 Cover See: Tools and Equipment/951 2953 Cover
951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removing / installing

Removing the engine coolant temperature (ECT) sensor

Remove:
- the upper timing belt cover. Disconnect the connector for the temperature sensor
- the temperature sensor from the thermostat housing. Use 951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve.

Note! Put paper underneath the sensor to prevent coolant spillage.

Installing the engine coolant temperature (ECT) sensor

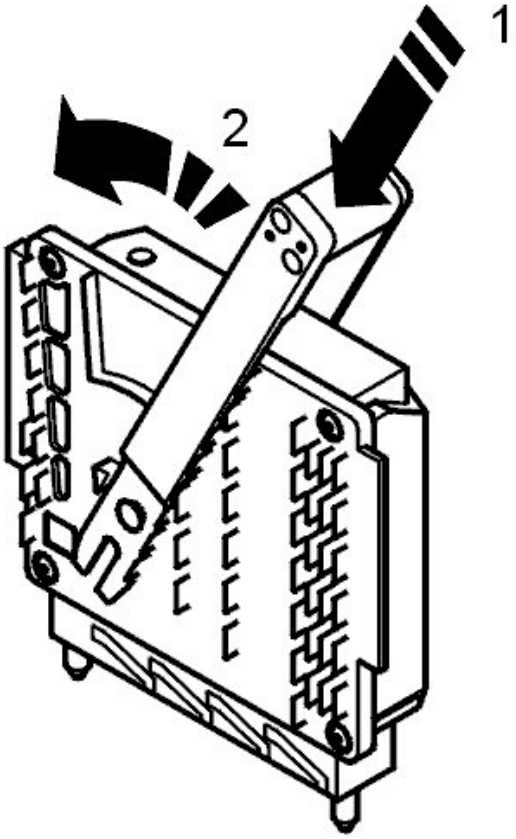
Install:
- the sensor with a new seal. Tighten. See: Tightening torque See: Engine/Specifications/Tightening Torque. Use: 951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve
- the upper timing belt cover.

Removal

Preparation

Remove the cap from the expansion tank. Install a hose clamp on the upper coolant hose.
The vehicle must be raised for this work. See: Jacking points, body See: Maintenance/Vehicle Lifting/Service and Repair. Remove the lower cover plate.
Position a container under the engine drain cock. Drain **2 liters** of engine coolant.
Close the cock. Install the lower protective panel.
Lower the vehicle.

Removing the engine control module (ECM)

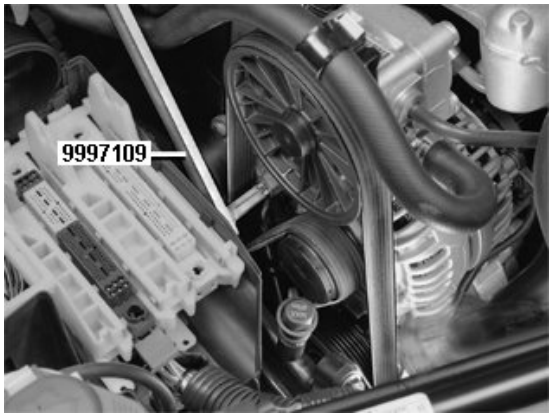


Ignition off. Wait for 2 minutes.

Caution! Do not touch the terminal pins on the control module with fingers. Static electricity may damage components in the engine control module (ECM).

Remove the cover over the control module box. Put the cover to one side.
Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
Move the upper section of the tool backwards as far as it will go. Pull up the tool. Carefully pull up the control module.
For vehicles with automatic transmissions repeat the above work.
Remove the surround from around the control module box.

Removing the auxiliaries belt



Note! Make a note of the routing of the belt.

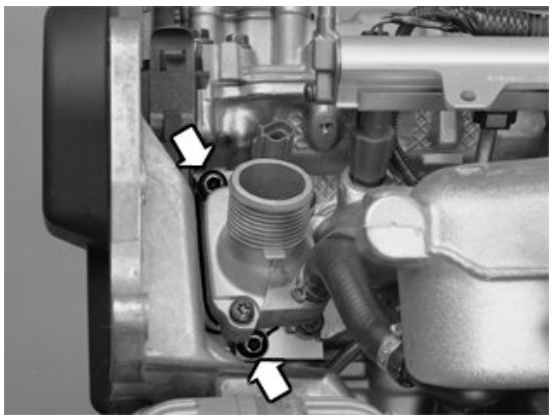
Remove:

- the auxiliaries belt. Use 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
- the upper timing belt cover.

Removing the power steering pump

Remove the 3 x screws for the power steering pump. Place the power steering pump to one side.

Removing the thermostat housing



Remove:

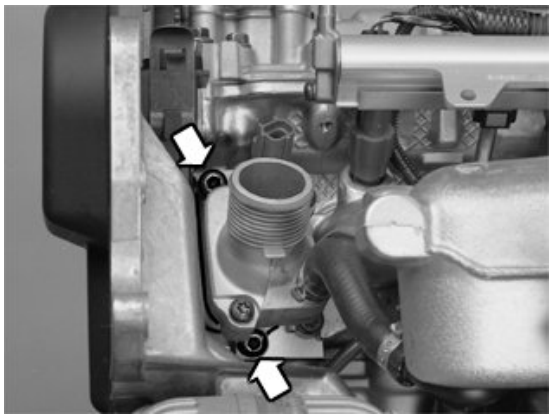
- the hose clamp to the upper radiator hose. Disconnect the hose from the thermostat housing
- the connector from the temperature sensor
- the 2 x screws for the thermostat housing at the section against the cylinder head
- the thermostat housing from the cylinder head
- the hose clamp for the water hose for heating crankcase ventilation.

Transfer the temperature sensor to the new thermostat housing.

Installation

Note! For tightening torques, see: Tightening torque See: Engine/Specifications/Tightening Torque.

Installing the thermostat housing



Install:

- the hose for the water heated crankcase ventilation. Before installing the thermostat housing, use a new hose clamp
- a new gasket
- the thermostat housing assembly. Tighten the screws
- the upper radiator hose. Tighten the hose clamp.

Connect the connector for the temperature sensor.

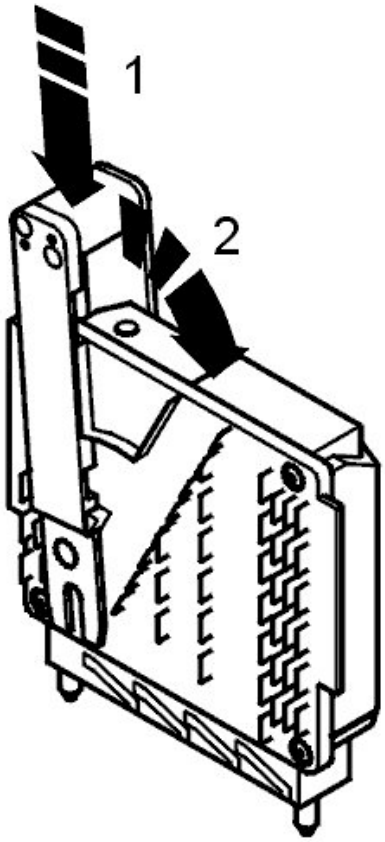
Finishing

Note! Ensure that the auxiliaries belt is correctly positioned on all the pulleys.

Install:

- the power steering pump. Tighten the 3 x screws
- the auxiliaries belt. Use 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
- the upper camshaft cover.

Installing control modules



Caution! Check that no pins or sockets are damaged on the connector.

Install the surround for the control module box.
Carefully press the control module down into the grooves on the inside of the control module box. Press to the limit position
Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
Move the upper section of the tool forwards as far as it will go. Pull up the tool.
Press the cover into place over the control modules. Check that the air ducts are correctly positioned.

Finishing

Remove the hose clip. Refill with coolant. Use filling equipment 951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir and cover 951 2953 Cover See: Tools and Equipment/951 2953 Cover. Install the cap on the expansion tank.
Test drive the engine until the thermostat has opened. Check for leakage. Top-up the coolant.

Heater Core: Service and Repair
L.H.D.

Heat exchanger, replacing

Special tools:

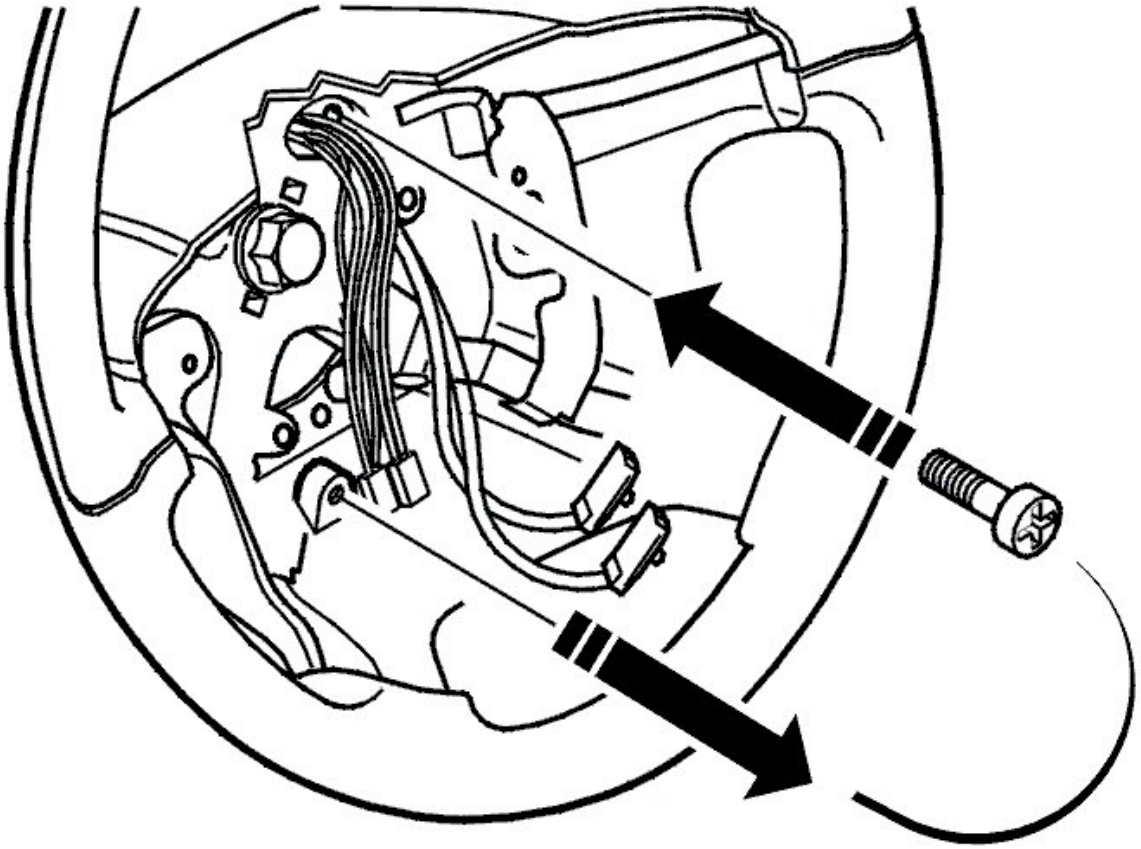
115 8957 HOSE PLIERS See: Tools and Equipment/115 8957 Hose Pliers
951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

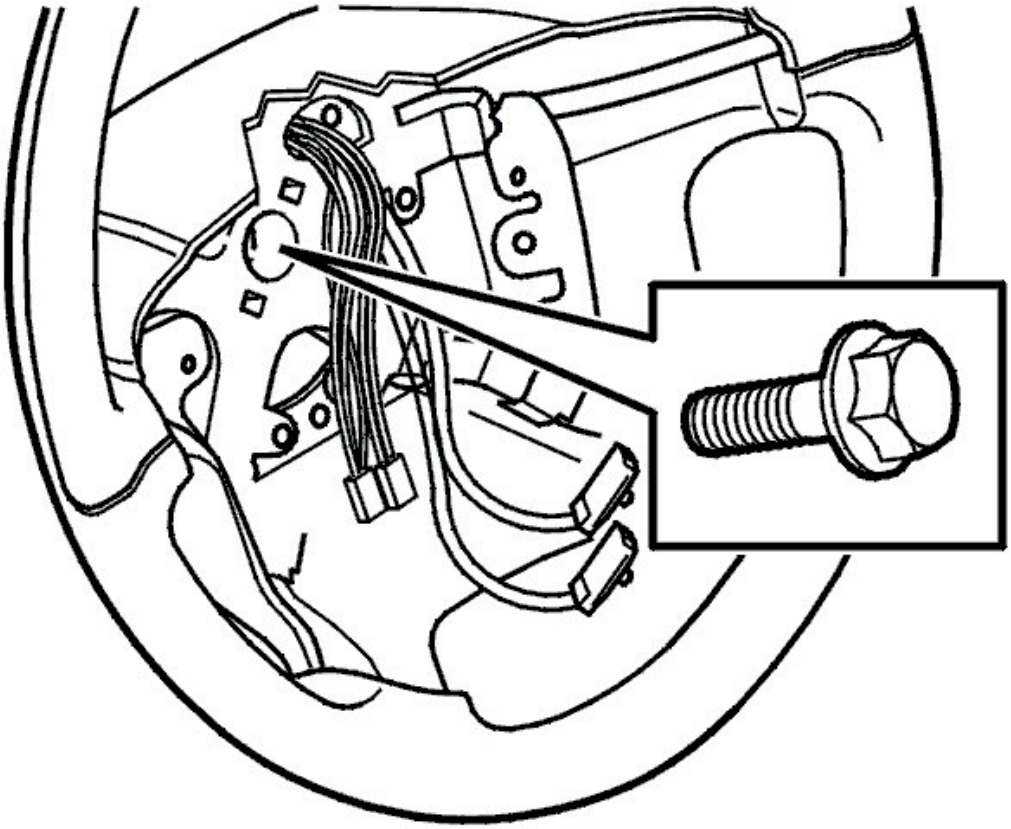
Preparatory work

Caution! Cars with DSTC systems. When working on the steering or wheel alignment, the adaptation of the steering wheel angle must be set to zero using the diagnostic tool. Test drive according to: Test Drive Form (DSTC (dynamic stability and traction control) /brake control module), description See: Brakes and Traction Control/Antilock Brakes / Traction Control Systems/Testing and Inspection/Initial Inspection and Diagnostic Overview/Test Drive Form (DSTC (Dynamic Stability And Traction Control) /Brake Control Module), Description.

Removing the steering wheel



Remove the driver's airbag module according to: Airbag driver and passenger (SRS), replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair.
Remove the lock screw from its "parking hole" in the steering wheel and install it in the contact reel.



Remove the steering wheel screw.
Make sure that the front wheels and steering wheel are pointing straight ahead
Remove the steering wheel.

Note! Take care to ensure that the connector does not catch on the steering wheel during removal.

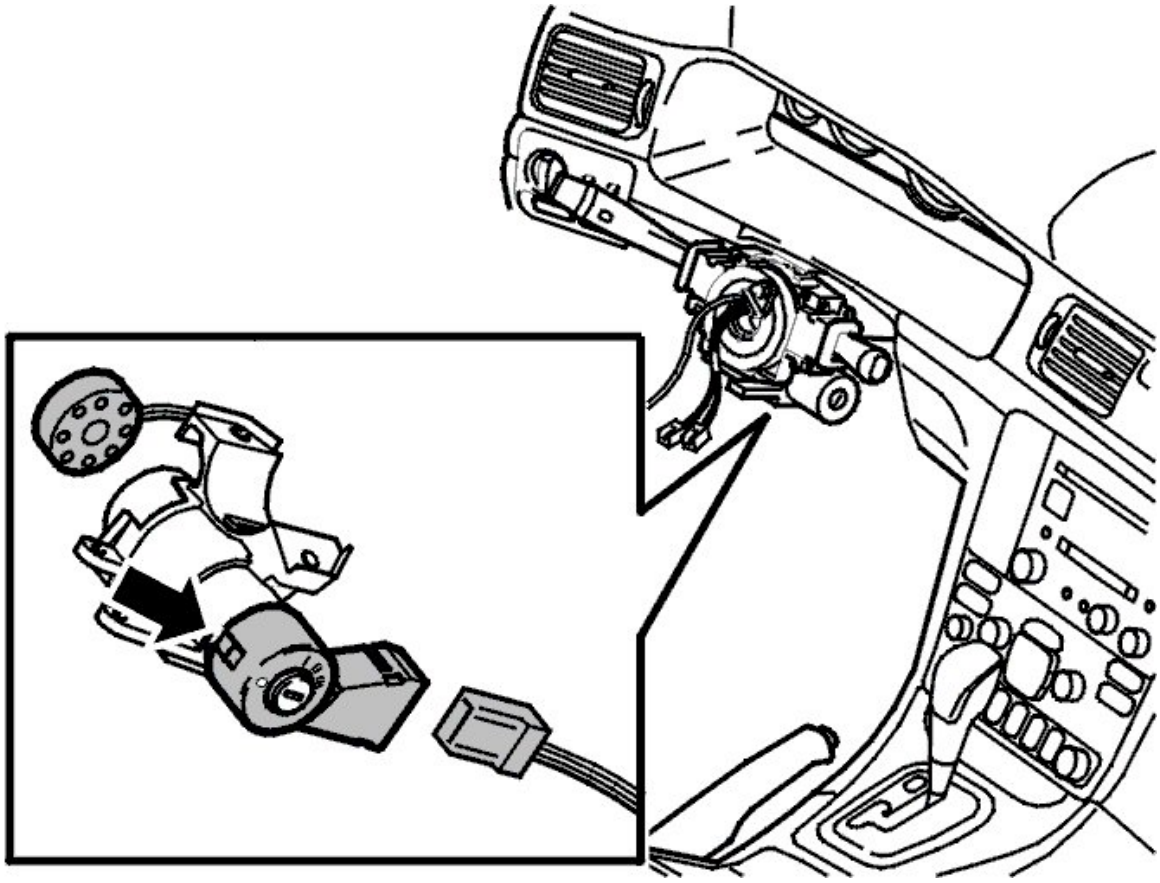
Removing steering column covers

Remove the steering column covers. See: Combined instrument panel surround See: Instrument Panel, Gauges and Warning Indicators/Instrument Cluster / Carrier/Service and Repair/Combined Instrument Panel Surround.

Removing soundproofing panels

Remove the soundproofing panel. See: Soundproofing panel, replacing See: Body and Frame/Interior Moulding / Trim/Dashboard / Instrument Panel/Service and Repair/Soundproofing Panel, Replacing.

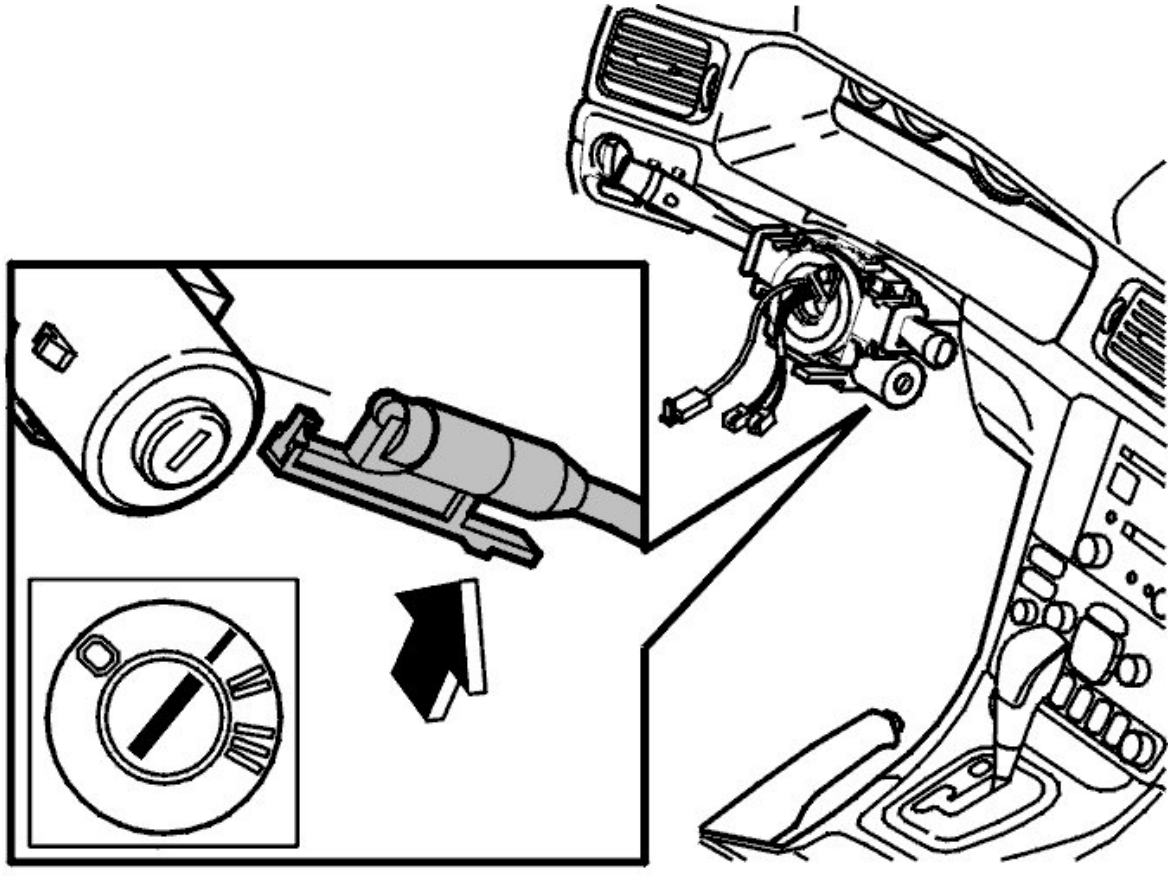
Removing the steering wheel lock module



Disconnect the connectors.
Press in the snap fastener and remove the steering wheel lock unit.

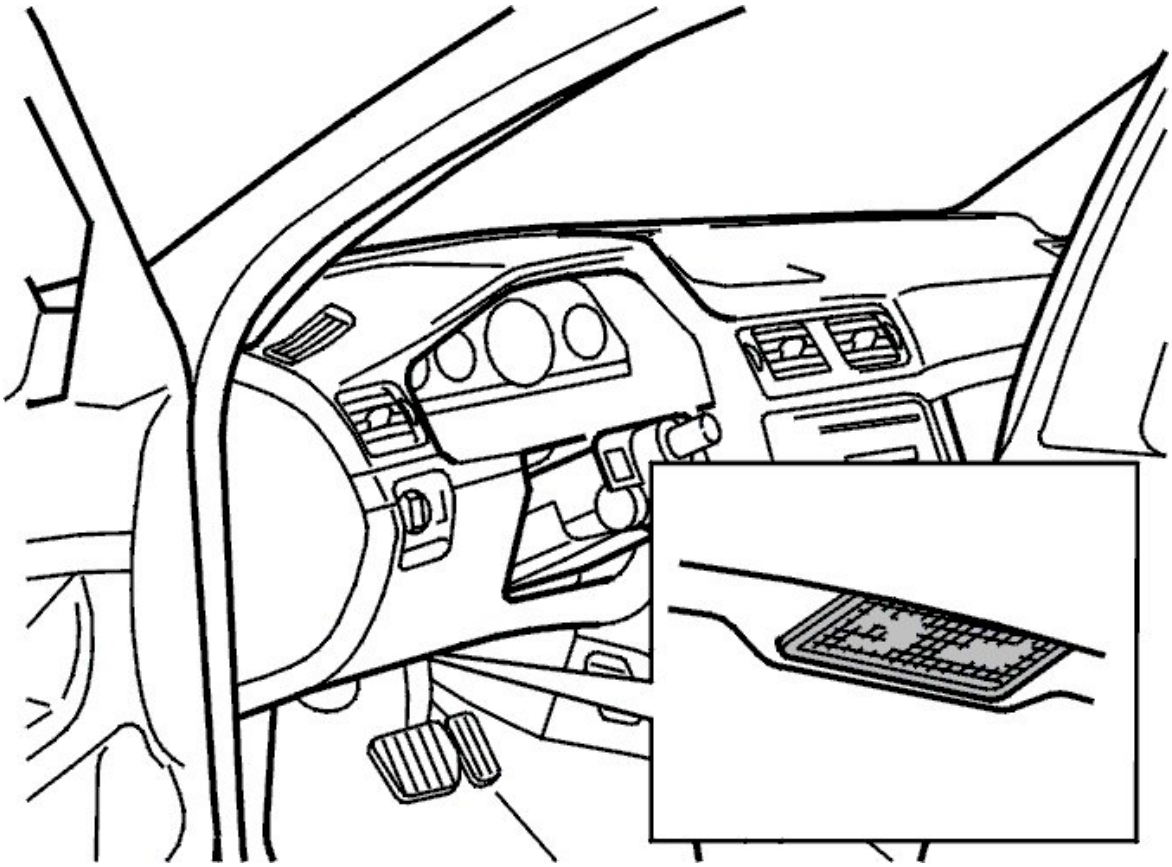
Removing cable for key interlock

Note! Applies to cars with automatic transmission.

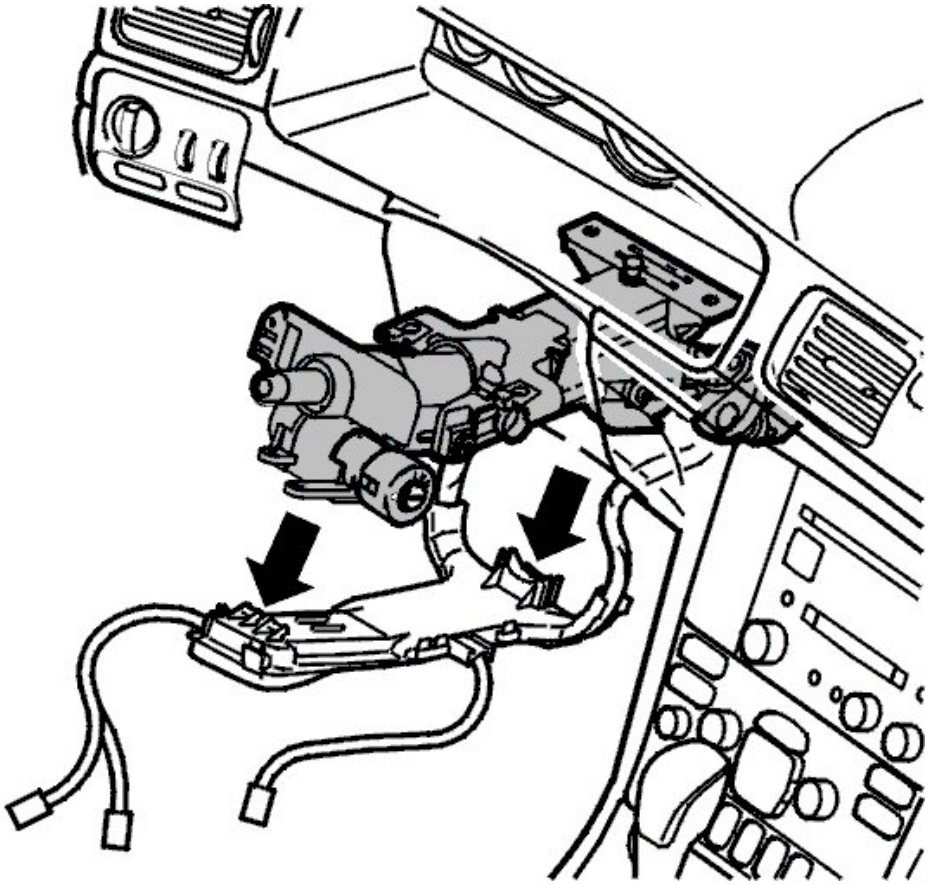


Remove the ignition switch interlock cable.
Move the ignition key to position I.
Press up the lock facing and pull out the cable.

Removing the lever console

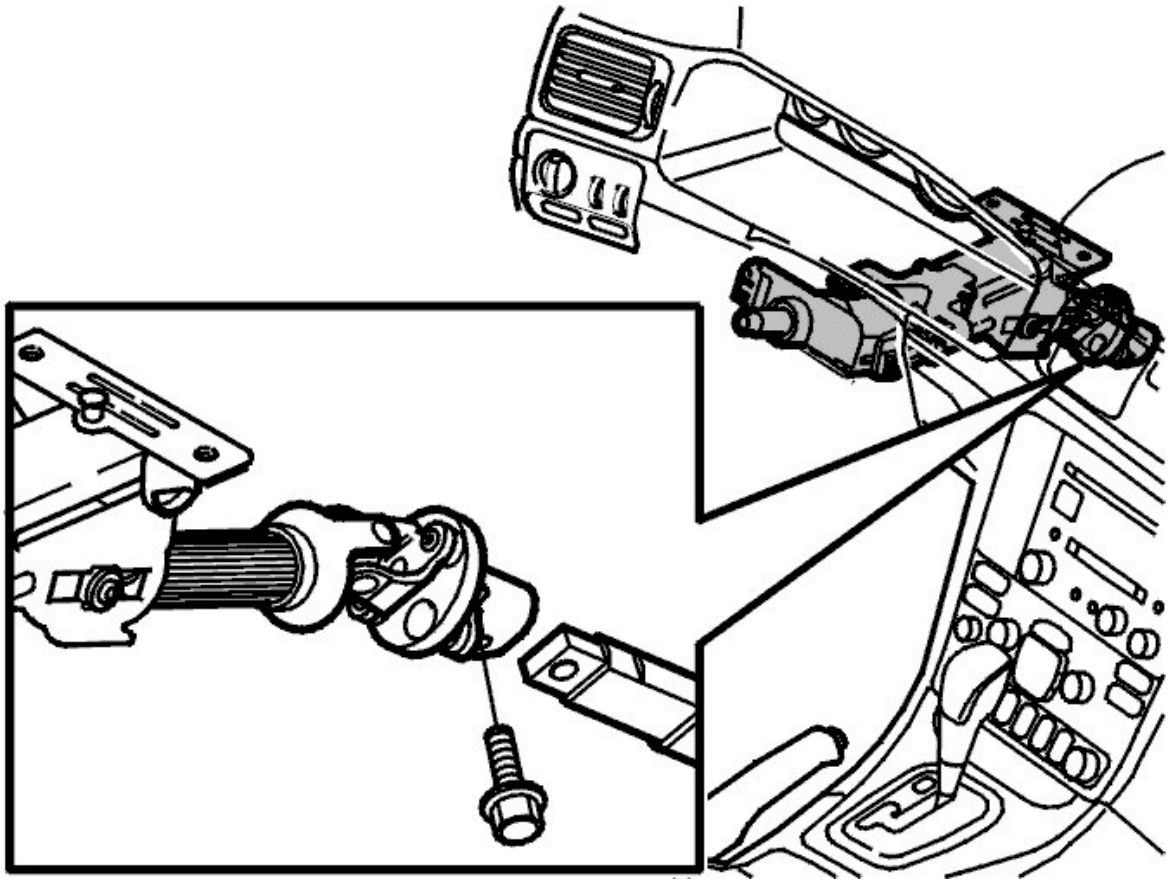


See Gear selector assembly and steering wheel module See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Shifter A/T/Service and Repair/Gear Selector Assembly and Steering Wheel Module.
Remove the floor lighting.



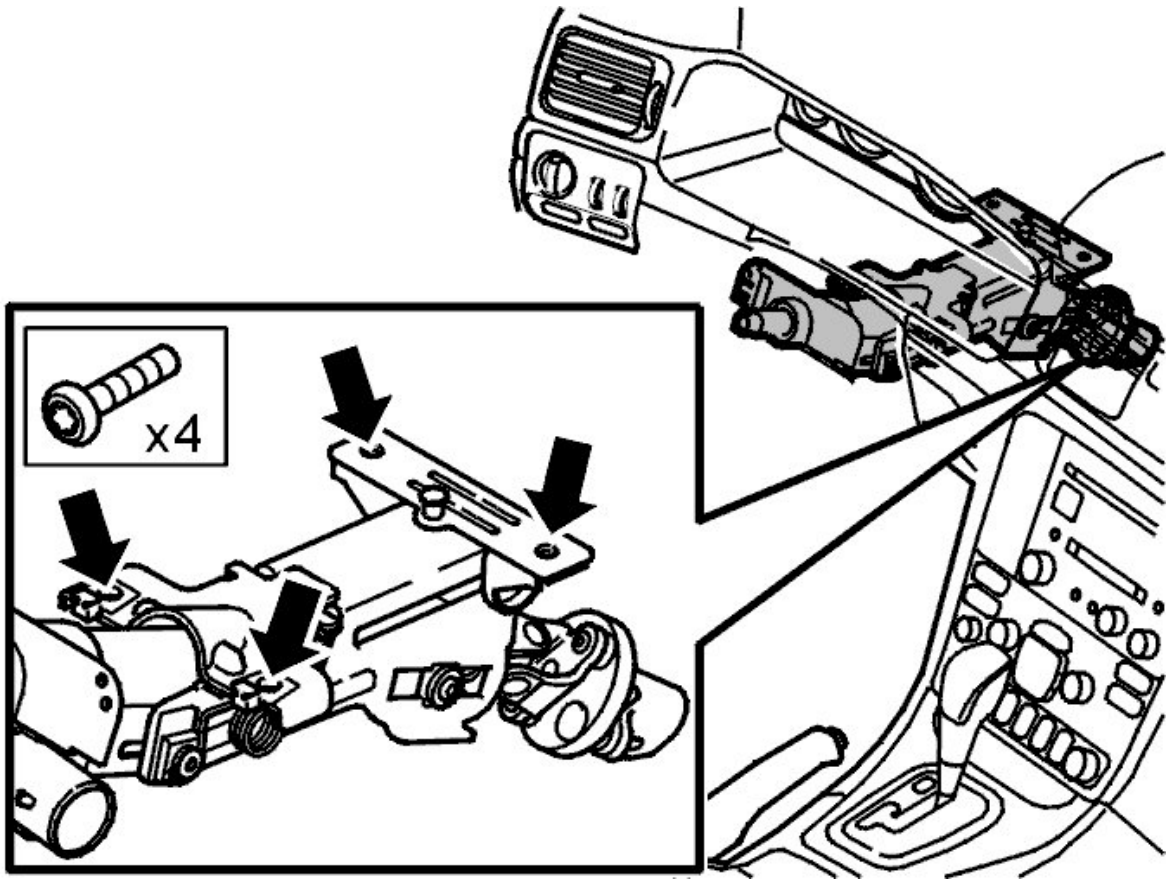
Loosen the cable casing from the steering column and lay it on the floor.

Removing universal joint from lower steering shaft

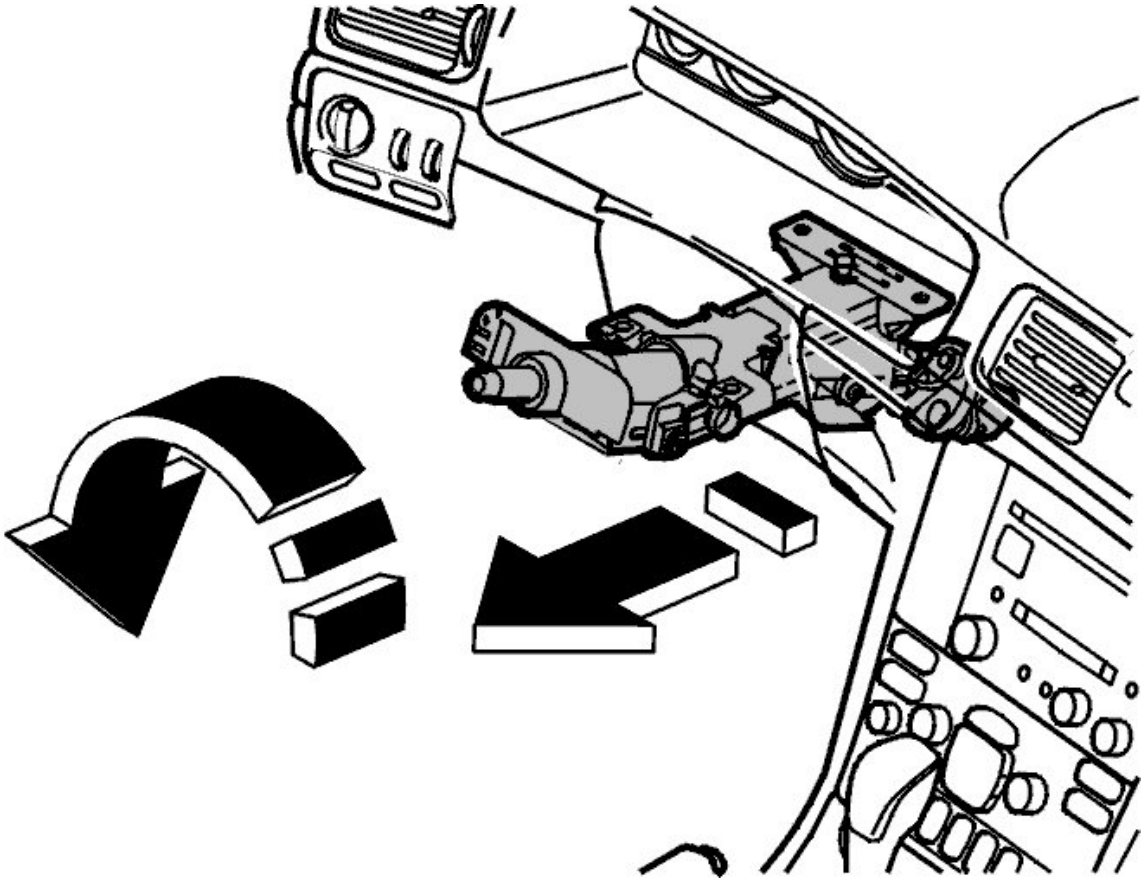


Remove the screw for the lower steering shaft's attachment in the universal joint.
Remove the universal joint from the steering shaft.

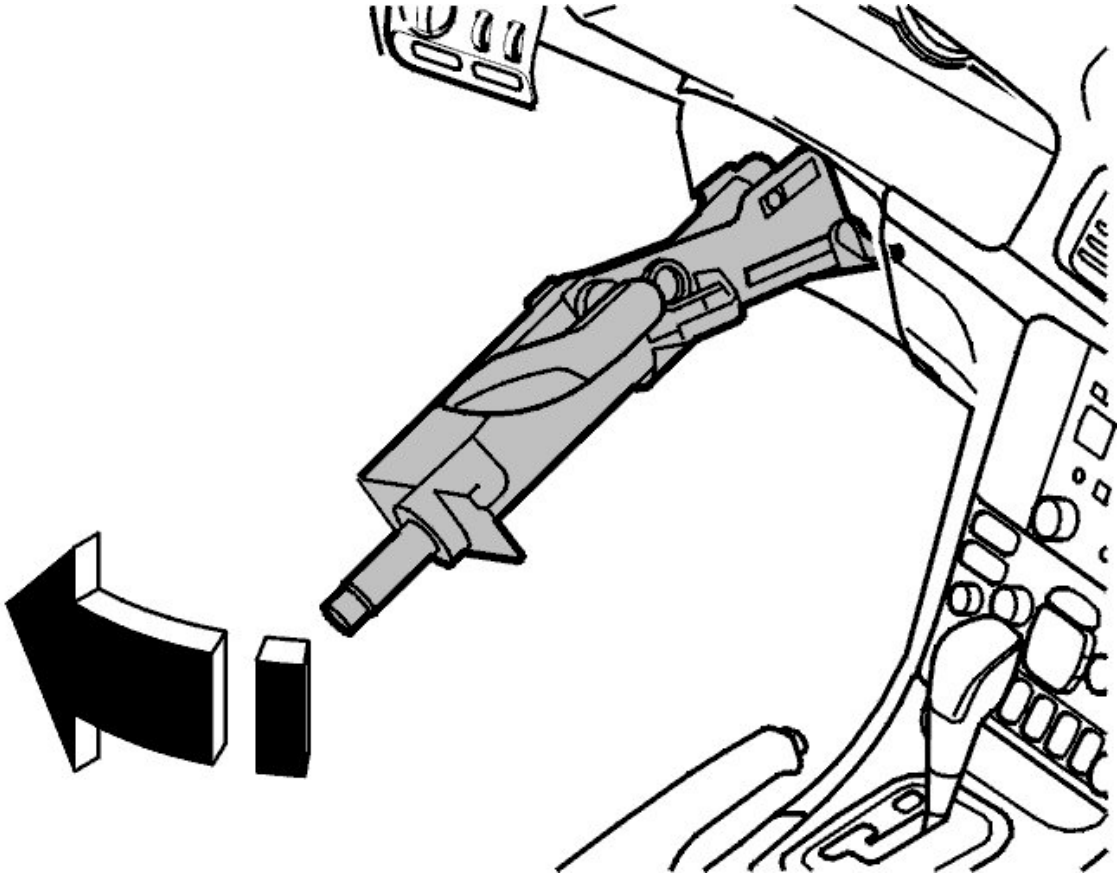
Removing steering column and steering shaft



Remove the four screws that hold the steering column.
Pull the steering column backwards from the three guides.



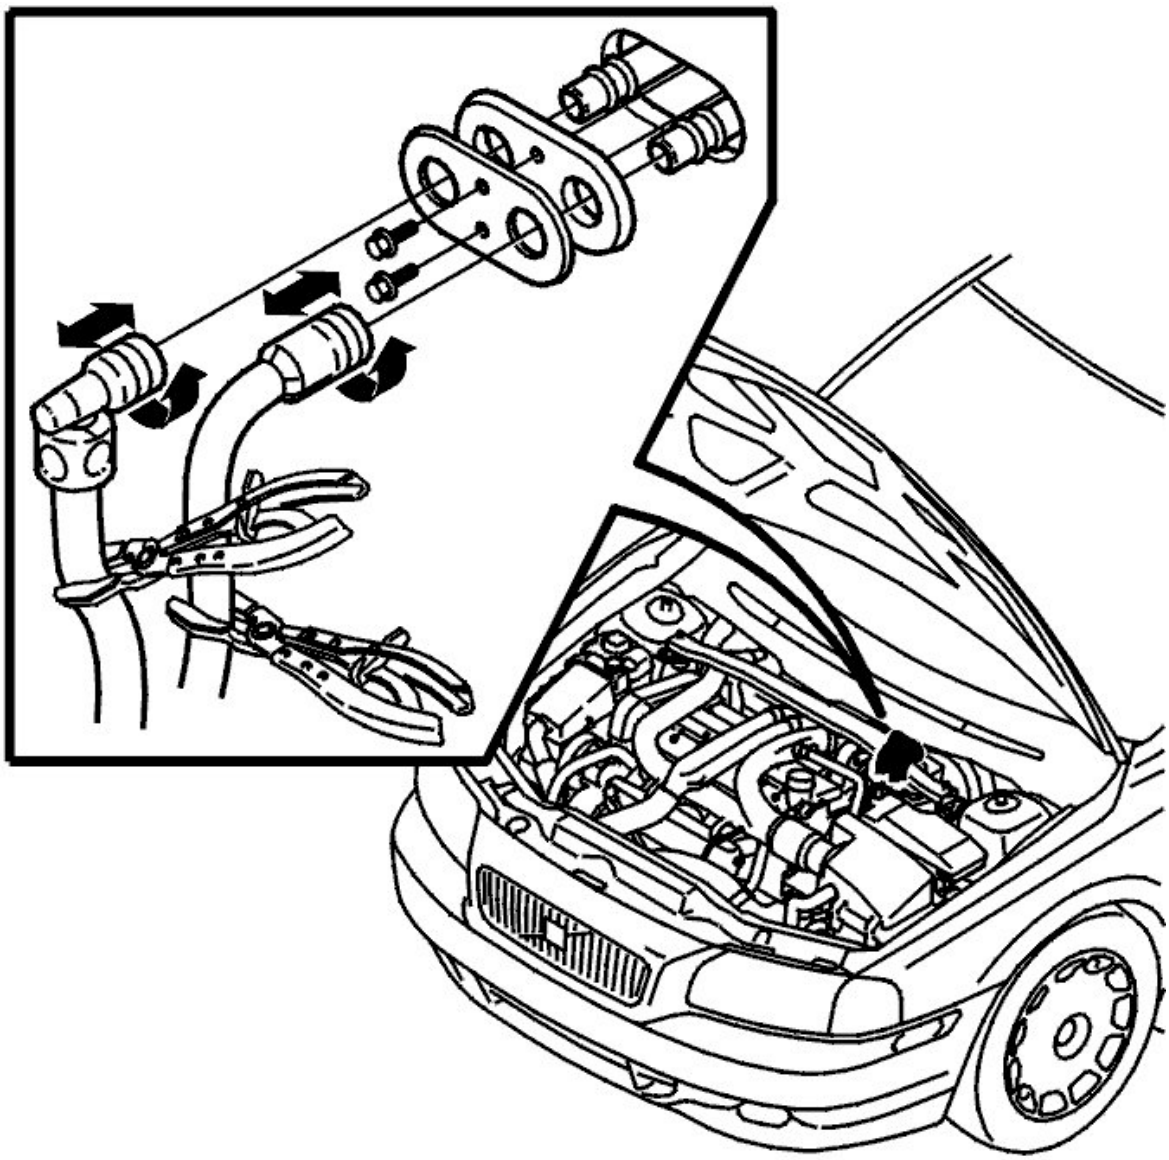
Pull out the steering column slightly and turn it half a turn to the left, to upside-down position.



Pull out the steering column at an angle backward to the left.

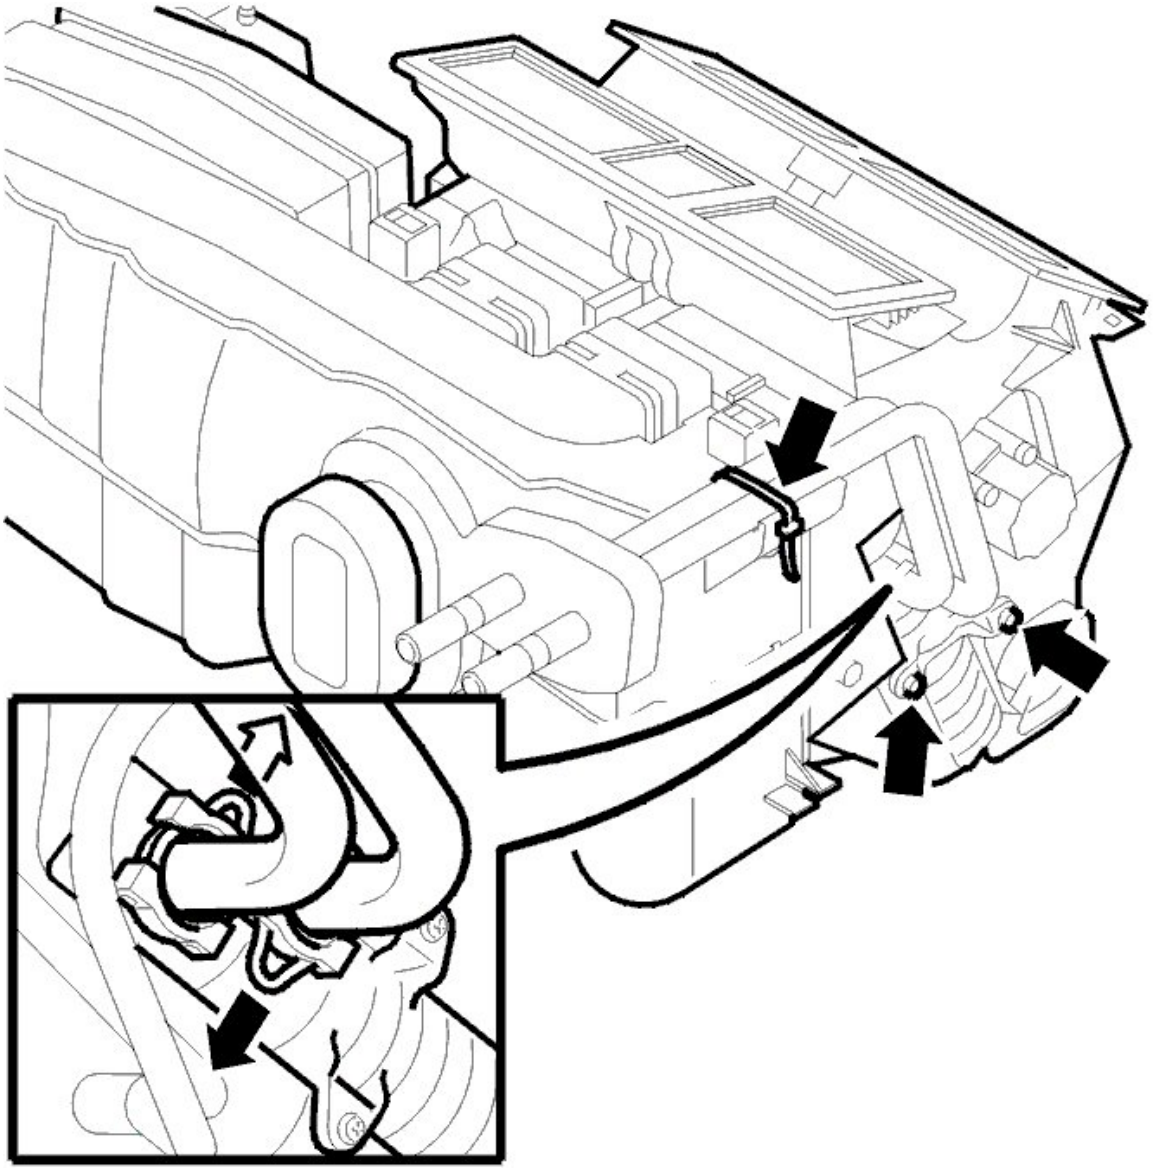
Removal

Removing heat exchanger



Remove:

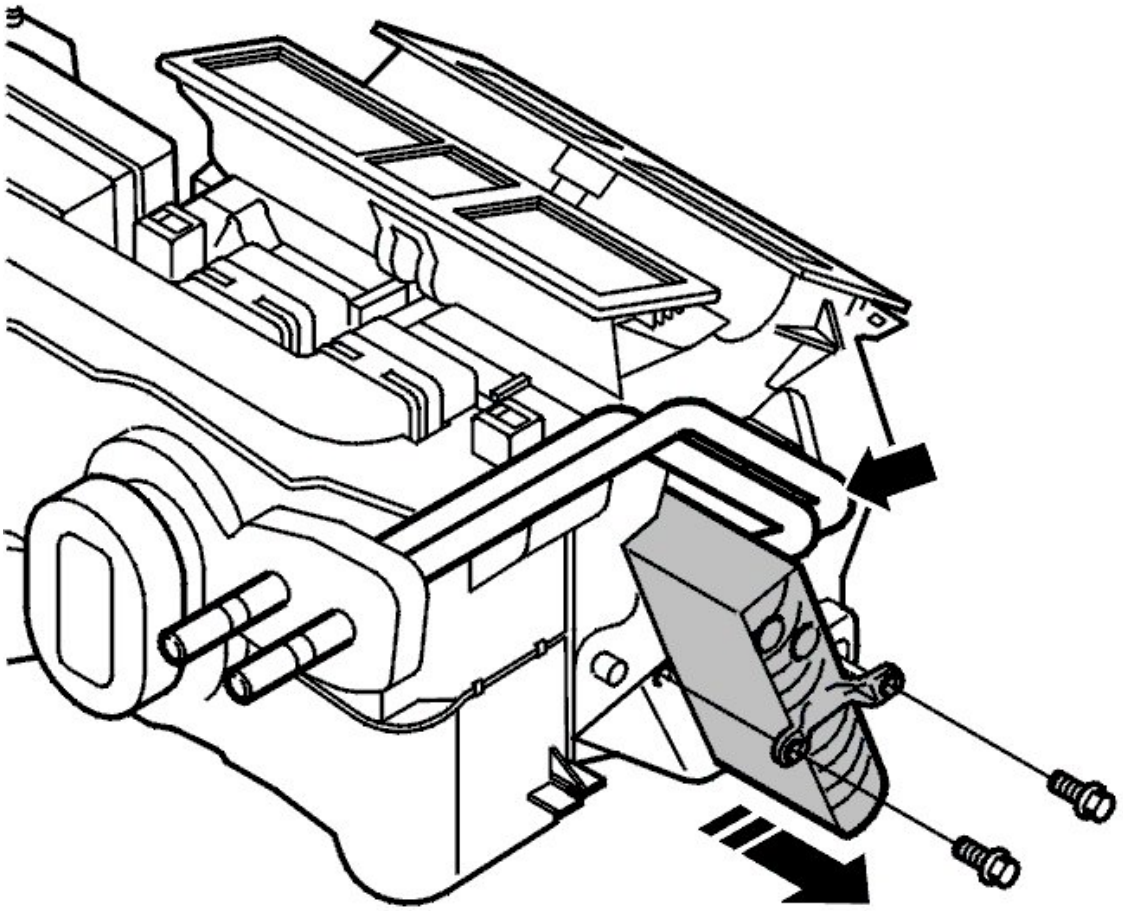
- the heater hoses in the engine compartment, use special pliers: 115 8957 HOSE PLIERS See: Tools and Equipment/115 8957 Hose Pliers
- the seal and the plate.
- the brake light switch according to: Stop lamp switch, replacing See: Lighting and Horns/Brake Light Switch/Service and Repair



Remove:

- the tie strap for the pipes
- the screws for the heat exchanger
- the mounting brackets for the pipes.

Position plenty of paper under the heat exchanger and around the pipes
Drain the coolant in a suitable container.



Loosen the pipes and position them out of the way.
Pull out the heat exchanger.

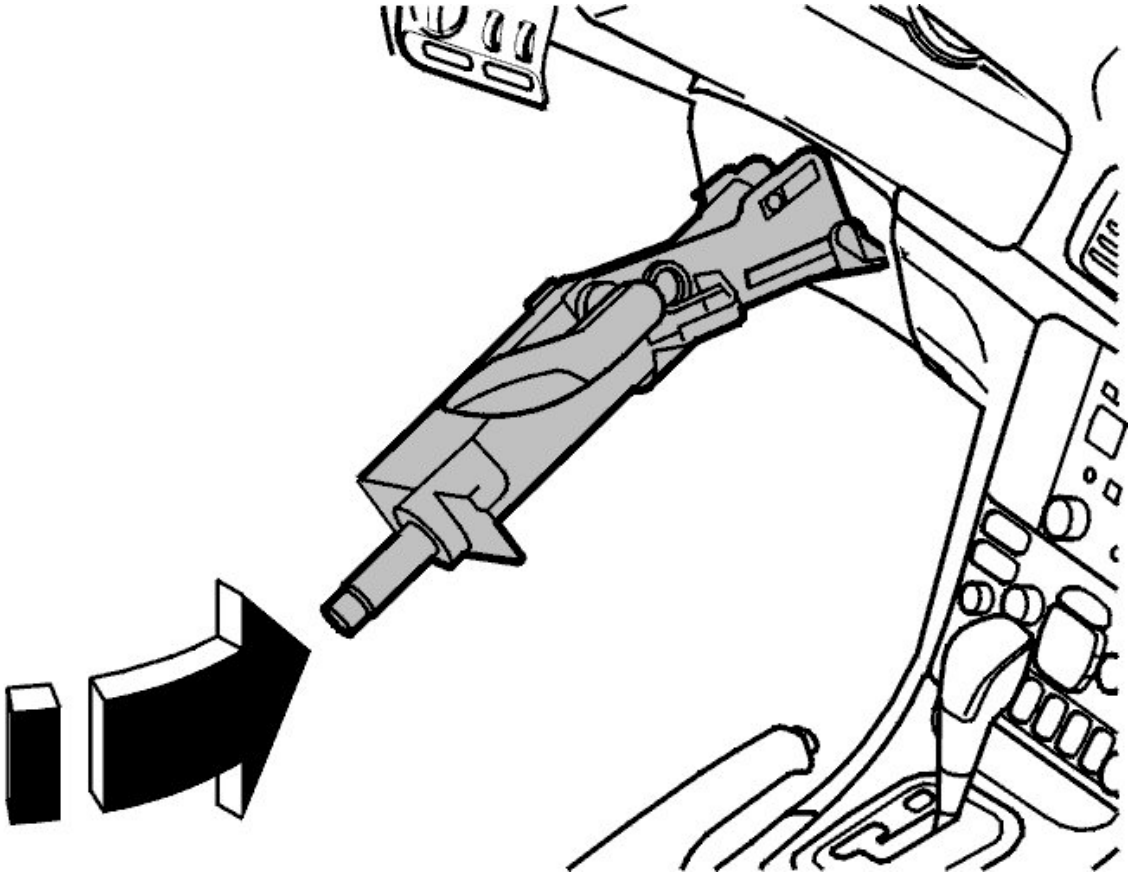
Installation

Installing heat exchanger

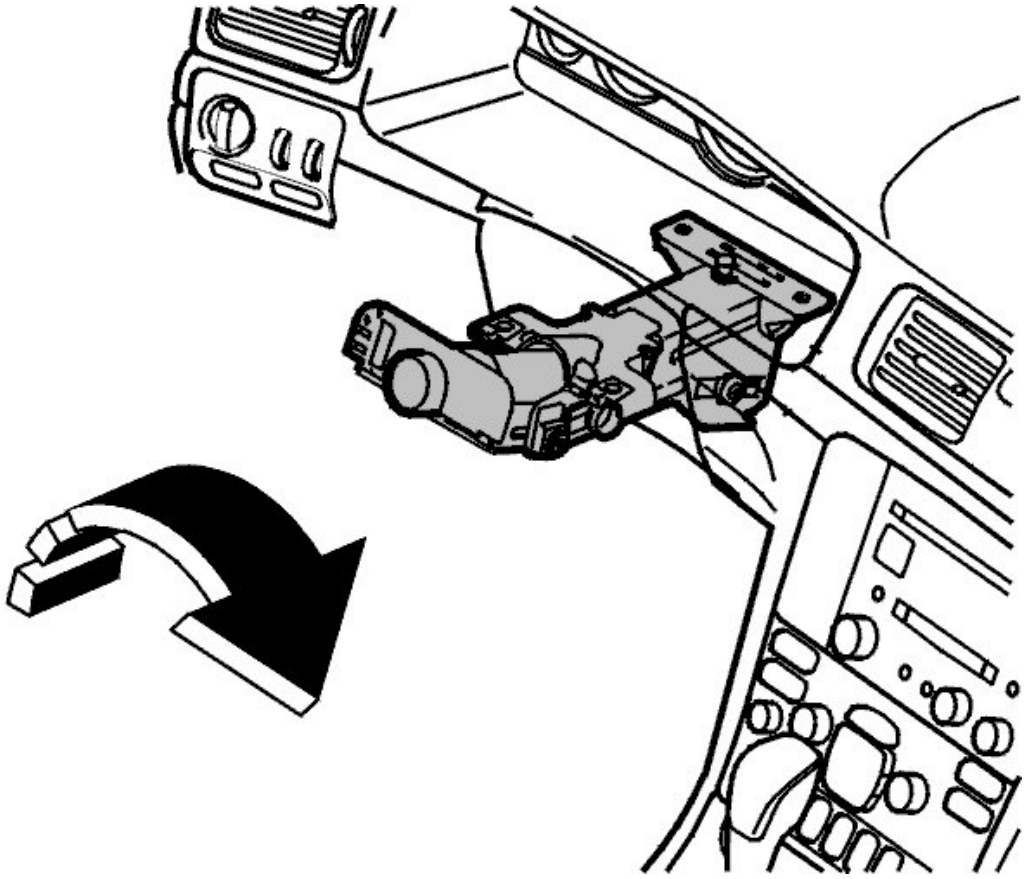
Note! Always use new O rings.

Install the heat exchanger carefully.
Screw the heat exchanger into place.
Install the upper pipes.
Install the lock bracket using round-nosed pliers.
Press in the pipes using a screwdriver and the lock catch using pliers.
Install the lower pipes.
Install the lock bracket using round-nosed pliers.
Press in the pipe using a screwdriver and the lock bracket using round-nosed pliers
Install the strip clamp for the pipes.
Install the seal and the plate.
Install the heater hoses in the engine compartment.

Installing the Steering column / Steering shaft

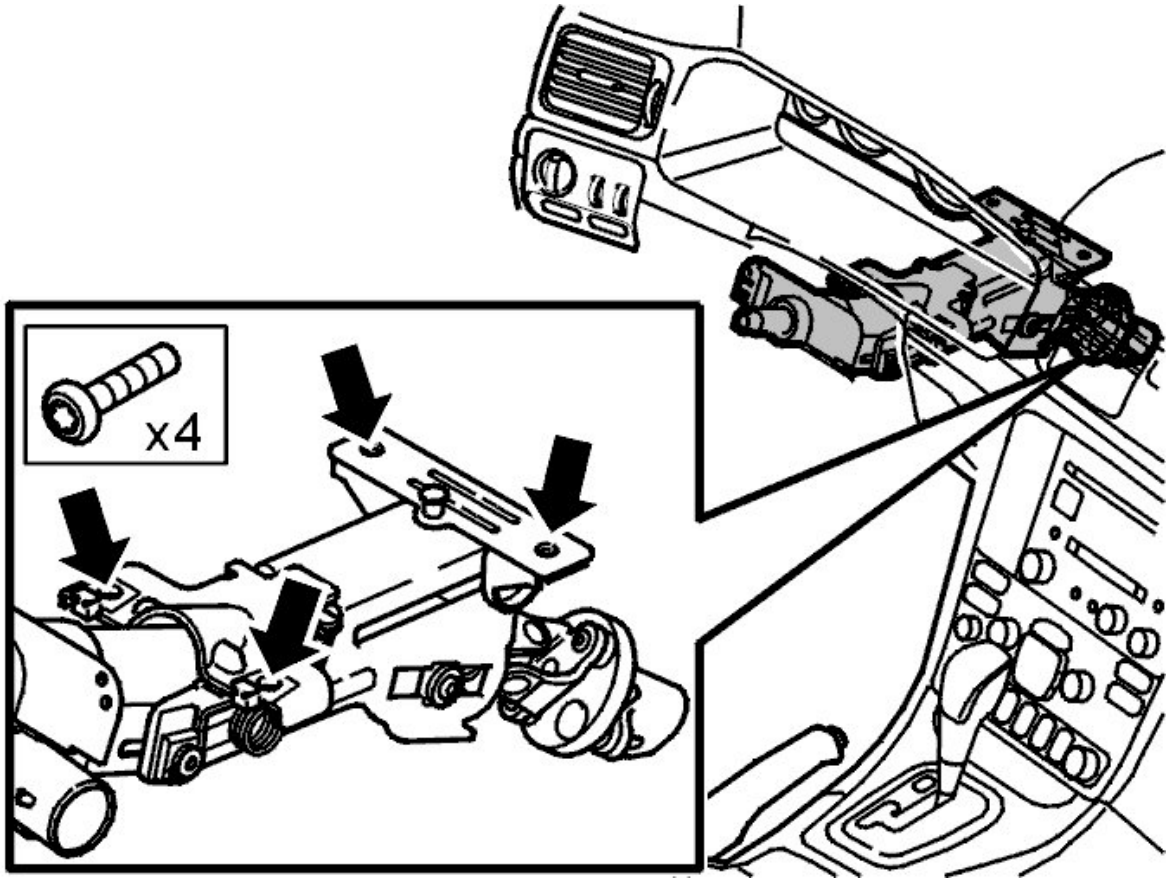


Insert the steering column in upside-down position.



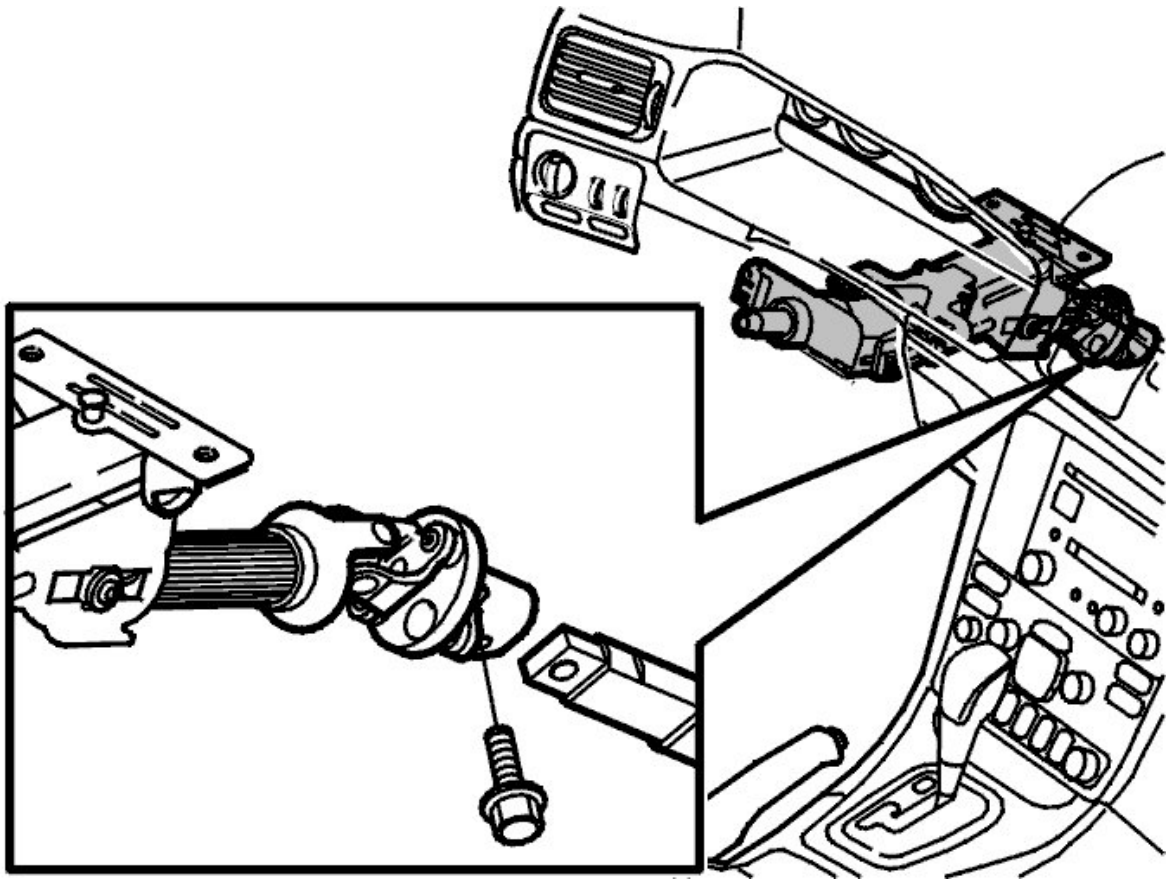
Turn it to the right to correct position.

Note! Check that the rear seat rails are undamaged.

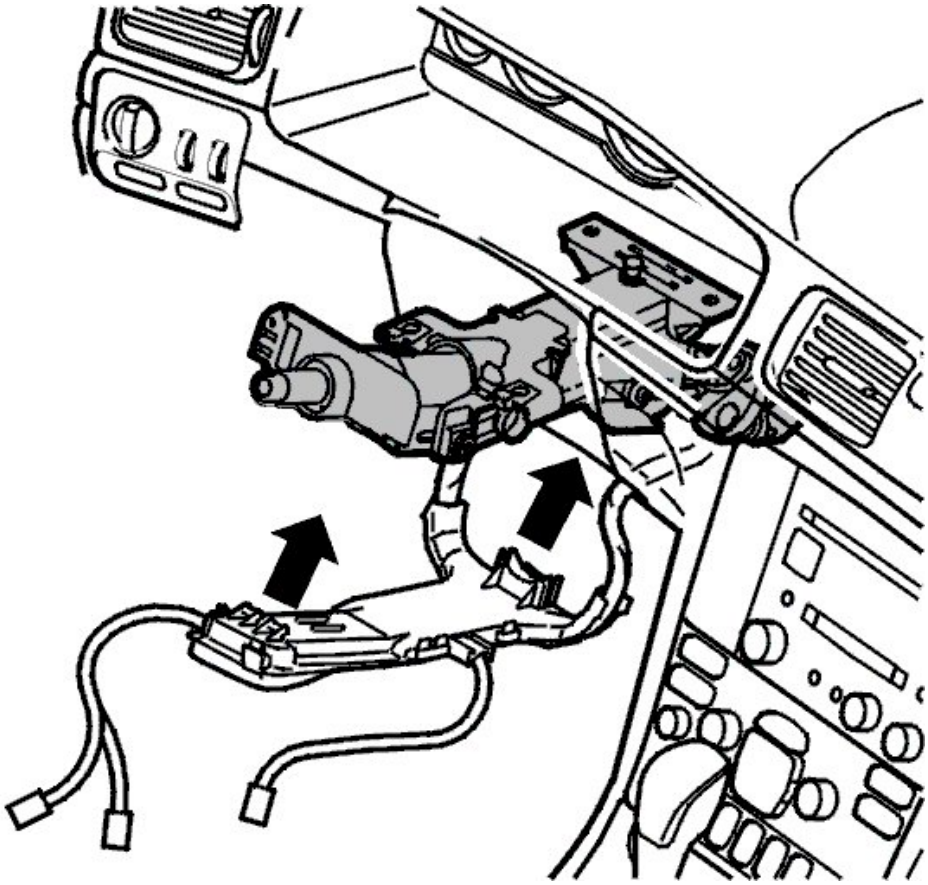


Hook the steering column into the three guides.
Install the screws and tighten with 25 Nm.
Tighten the rear screw first.

Installing steering shaft's universal joint on lower steering shaft

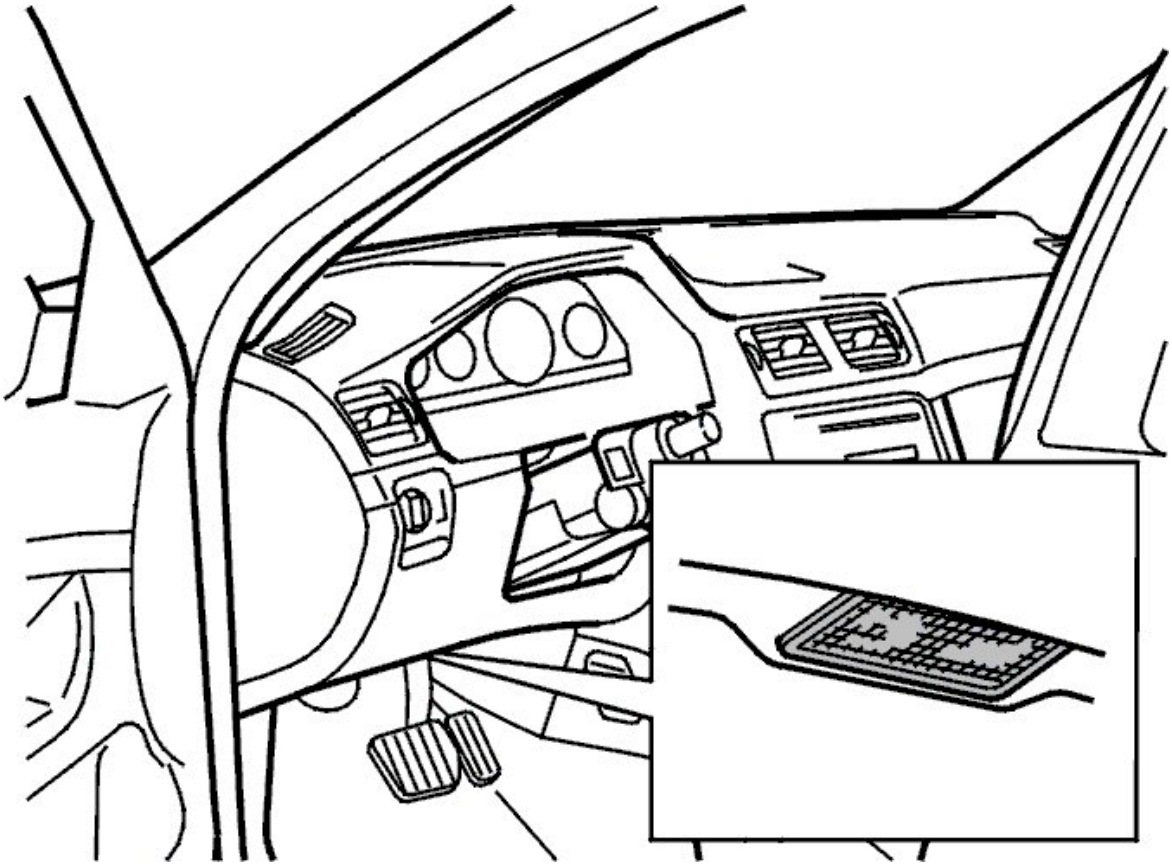


Install the steering shaft on lower steering shaft.
Set the front wheels straight ahead.
Install the upper steering shaft's universal joint on the lower steering shaft.
Install a new screw and tighten with 30 Nm.



Install the cable casing on the steering column.

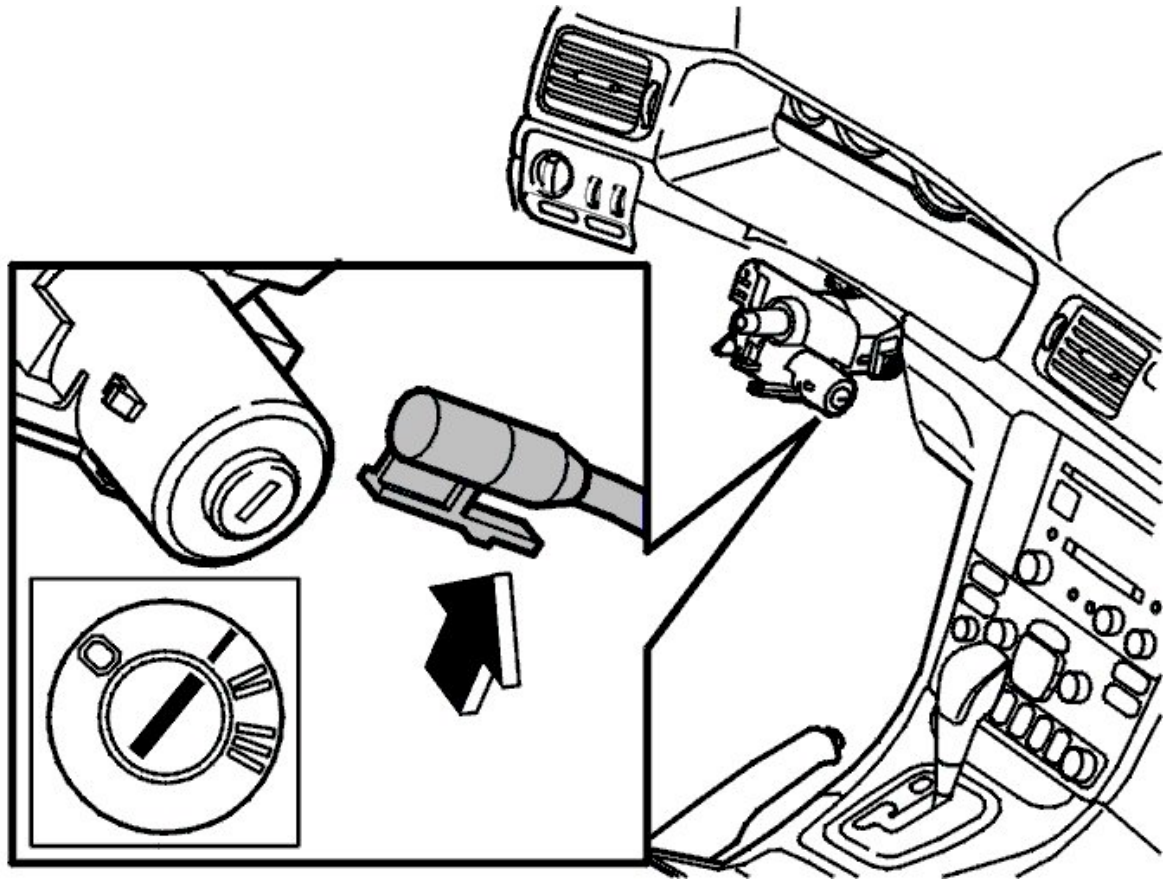
Installing the floor lighting



Install the floor lighting and plug in the connector.

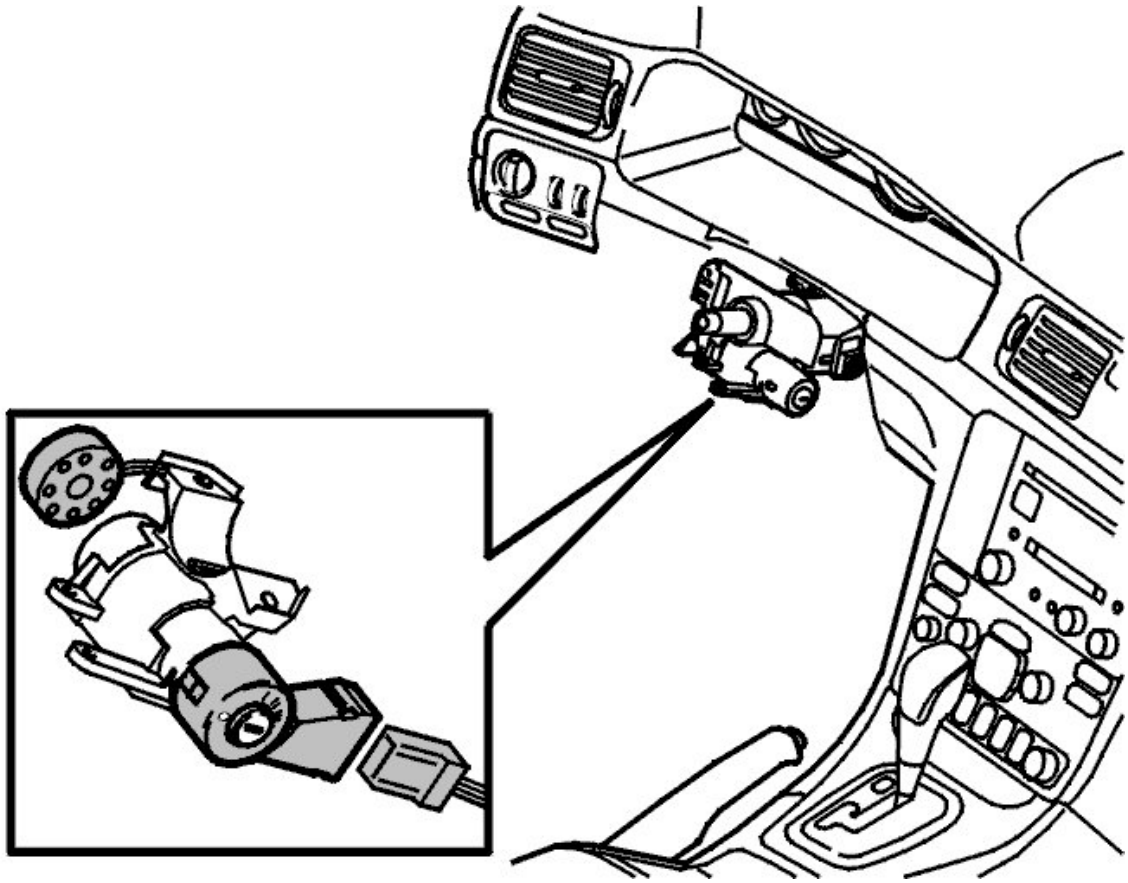
Installing cable for key interlock

Note! Applies to cars with automatic transmission.



Set the gear selector lever to P position.
Move the ignition key to position I.
Press the cable into the ignition switch and feel to see that it sits correctly.
Remove the ignition key and check that the gear selector lever is blocked in P position.

Installing the steering wheel lock module



Remove the ignition key.
Install the connector and the module for steering wheel lock.

Plug in the connectors.

Installing lever module

See Gear selector assembly and steering wheel module See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Shifter A/T/Service and Repair/Gear Selector Assembly and Steering Wheel Module.
Connect the lever module's connectors.

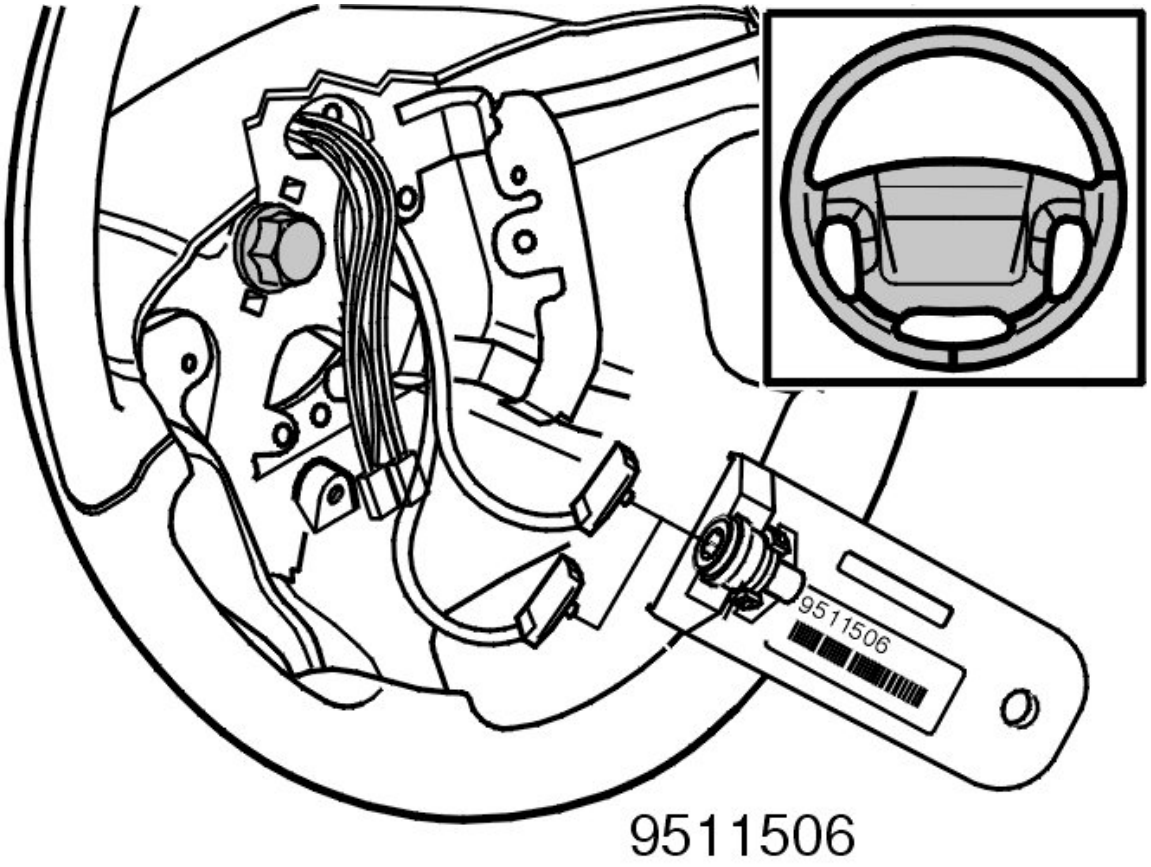
Installing steering column covers

Install the steering wheel casings according to: Combined instrument panel surround See: Instrument Panel, Gauges and Warning Indicators/Instrument Cluster / Carrier/Service and Repair/Combined Instrument Panel Surround.

Resetting contact roller

Reset the contact roller according to: Contact reel driver airbag module, resetting See: Restraint Systems/Air Bag Systems/Clockspring Assembly / Spiral Cable/Service and Repair/Reset Procedure.

Installing steering wheel and checking steering wheel position



Note! Check that the front wheels are pointing straight ahead.

Pull the connectors from the contact roller through the steering wheel.
Install the steering wheel carefully so that the contact roller's two catches fit in the steering wheel hub's both slots.
Install the steering wheel screw. Use a new screw. Tighten with fingers.

Caution! Do not turn the steering wheel when it is on the steering shaft. Since the contact reel is locked, it will be damaged beyond repair if the wheel is turned in this situation.

Loosen the lock screw that holds the contact roller.
Install it in the parking hole on the steering wheel.
Connect tools (2 pcs.): 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the contact roller's SRS-wiring.
Drive the car straight ahead and check that the steering wheel stands in position "straight ahead".
If the steering wheel position is incorrect, repeat the adjustment.
Tighten the screw in the center of the steering wheel.
Remove the tools (2 pcs.): 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy.
Tighten the steering wheel screw with 40 Nm.
Check that the SRS-light goes out, that is, that no diagnostic trouble codes remain.

Installing driver's airbag module

Install the driver's airbag module according to: Airbag driver and passenger (SRS), replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair.

Finishing

Checking function on steering column

Ensure that the steering wheel turns easily and that the steering lock functions.
Check that no diagnostic trouble codes have been stored during the repairs.
Start the engine and the heating system.
Fill coolant in the cooling system.
Check that the pipe connections do not leak.
Install the soundproofing panel according to: Soundproofing panel, replacing See: Body and Frame/Interior Moulding / Trim/Dashboard / Instrument Panel/Service and Repair/Soundproofing Panel, Replacing.

Heater Core: Service and Repair

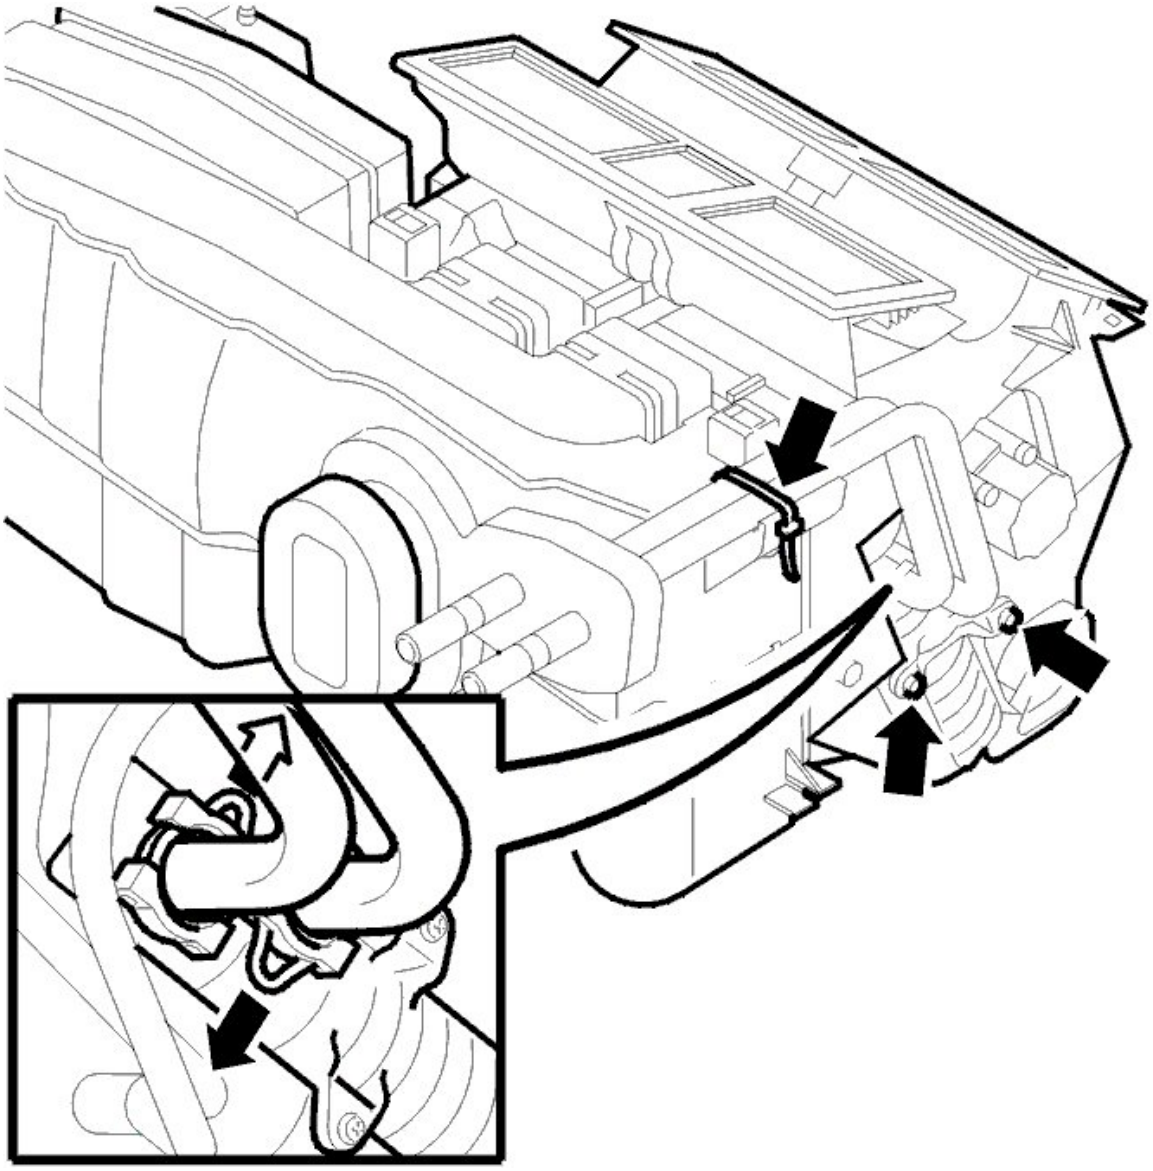
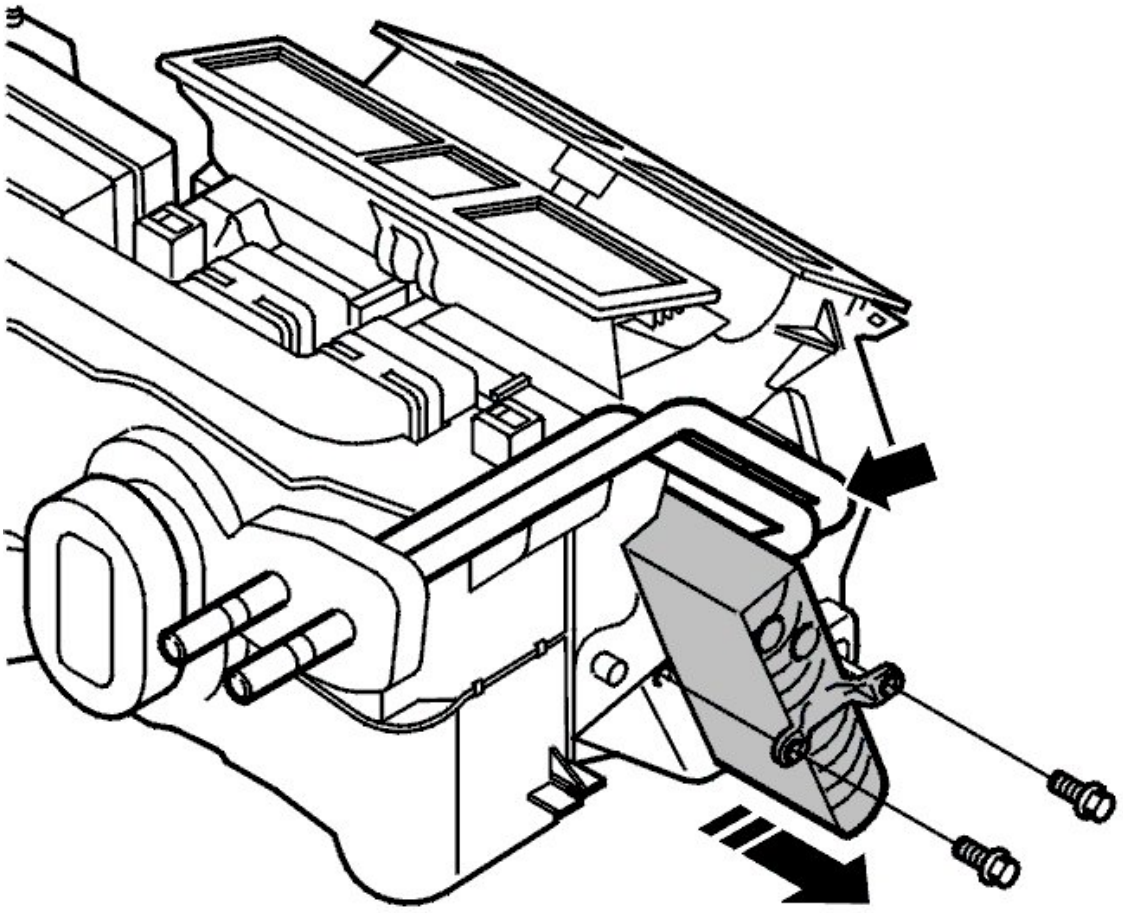
Removing heat exchanger





Remove:

- the climate control system. See Climate control unit, replacing, L.H.D, R.H.D See: Heating and Air Conditioning/Housing Assembly HVAC/Service and Repair
- the tie strap for the pipe
- the mounting brackets for the pipe
- the screw/screws for the heat exchanger

Loosen the pipe for the heat exchanger and drain the coolant.
Remove the screws, 3 pcs., for the fan housing-central unit.
Fold out the central unit and remove it.
Pull out the heat exchanger from the central unit.

Installation

Installing heat exchanger

Carefully place the heat exchanger in the central unit and check that the seals are okay.
Screw the heat exchanger into place.
Install the seals for the central unit on the fan housing and bolt down.
Install the pipe. **NOTE! New O-rings**.
Brace the pipe.
Install the strip clamps for the pipes.
Install remaining components in reverse order.

Radiator: Service and Repair
Radiator/Charge Air Cooler (CAC), Replacing

Radiator / charge air cooler (CAC), replacement

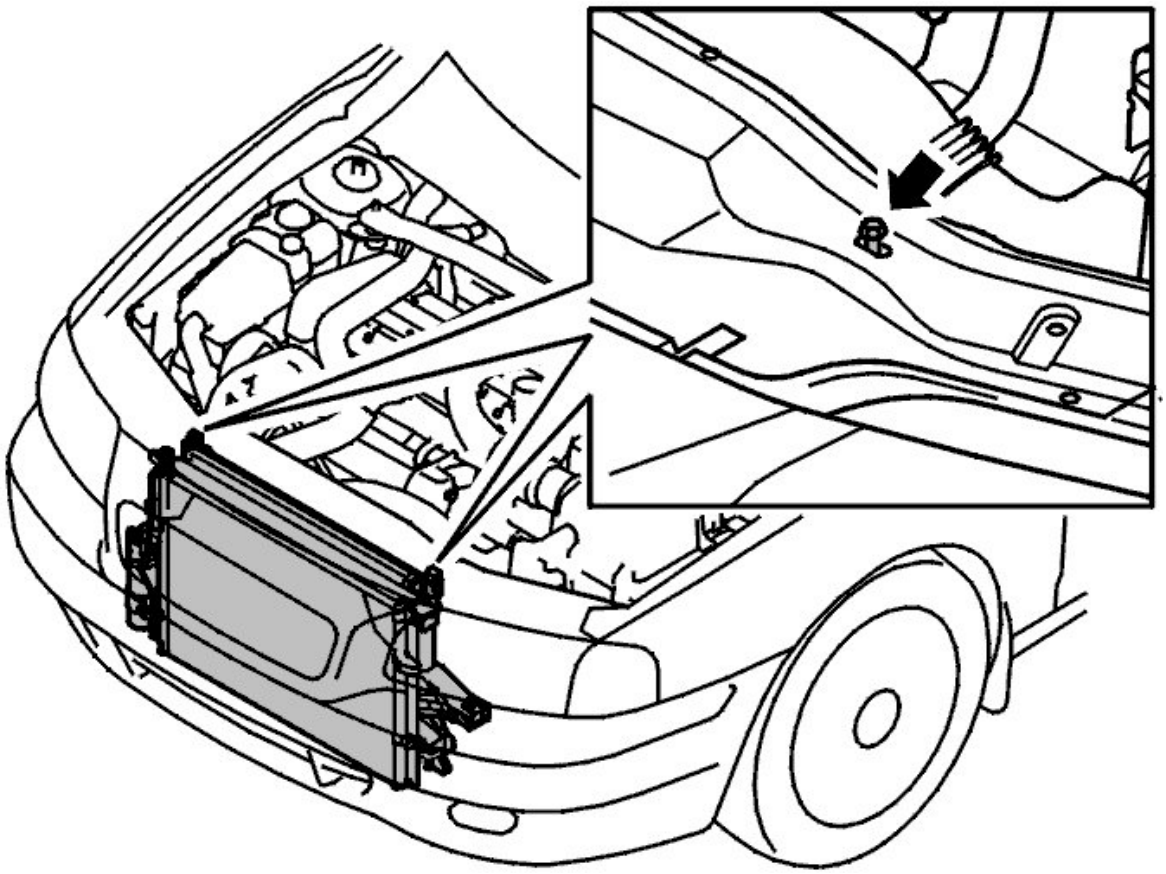
Special tools:

999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

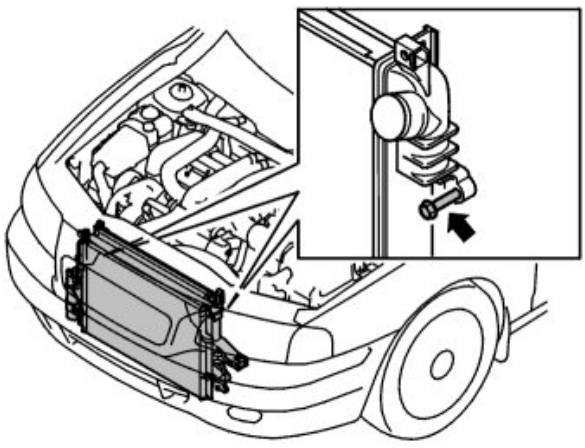
Removal

Removing the radiator unit

- Remove the engine cooling fan (FC) according to Engine cooling fan (FC), replacing See: Radiator Cooling Fan/Service and Repair.

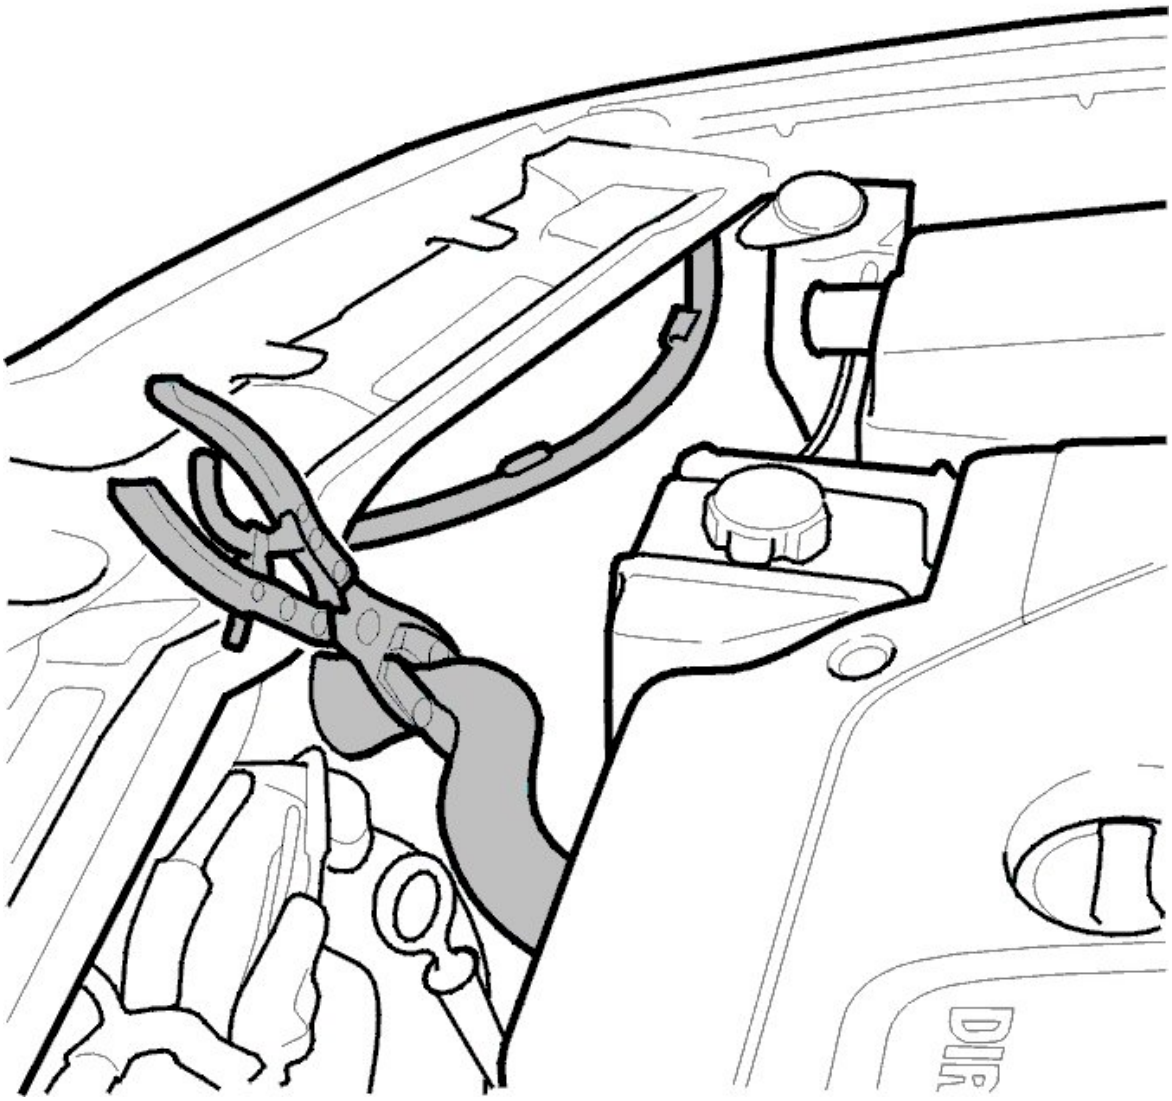


- Disconnect the charge air pipe from the charge air cooler (CAC) on the left-hand side (turbocharged engines only). If necessary, use a hot air gun to make removal easier
- Remove the screws for the radiator unit on the front cover plate.



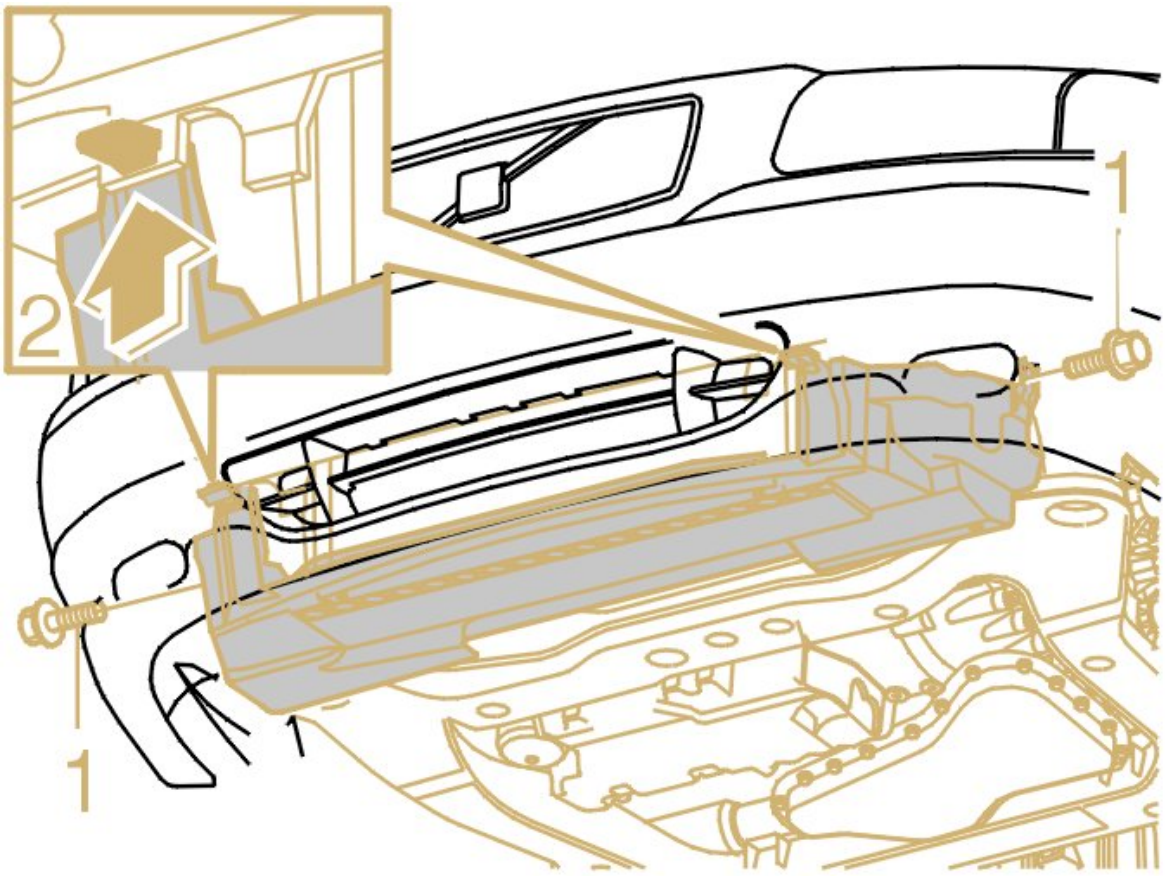
Remove

- the two upper screws holding the radiator unit together
- the expansion tank cap.



Block the upper radiator hose with lock grip pliers

Work under the car



Remove

- the air baffles
- the lower oil cooler hose from the radiator unit (automatics only)
  Note! Collect the oil from the oil cooler in a container.

- the screw for the mounting for the cable duct for engine wiring at the front edge of the sub-frame.

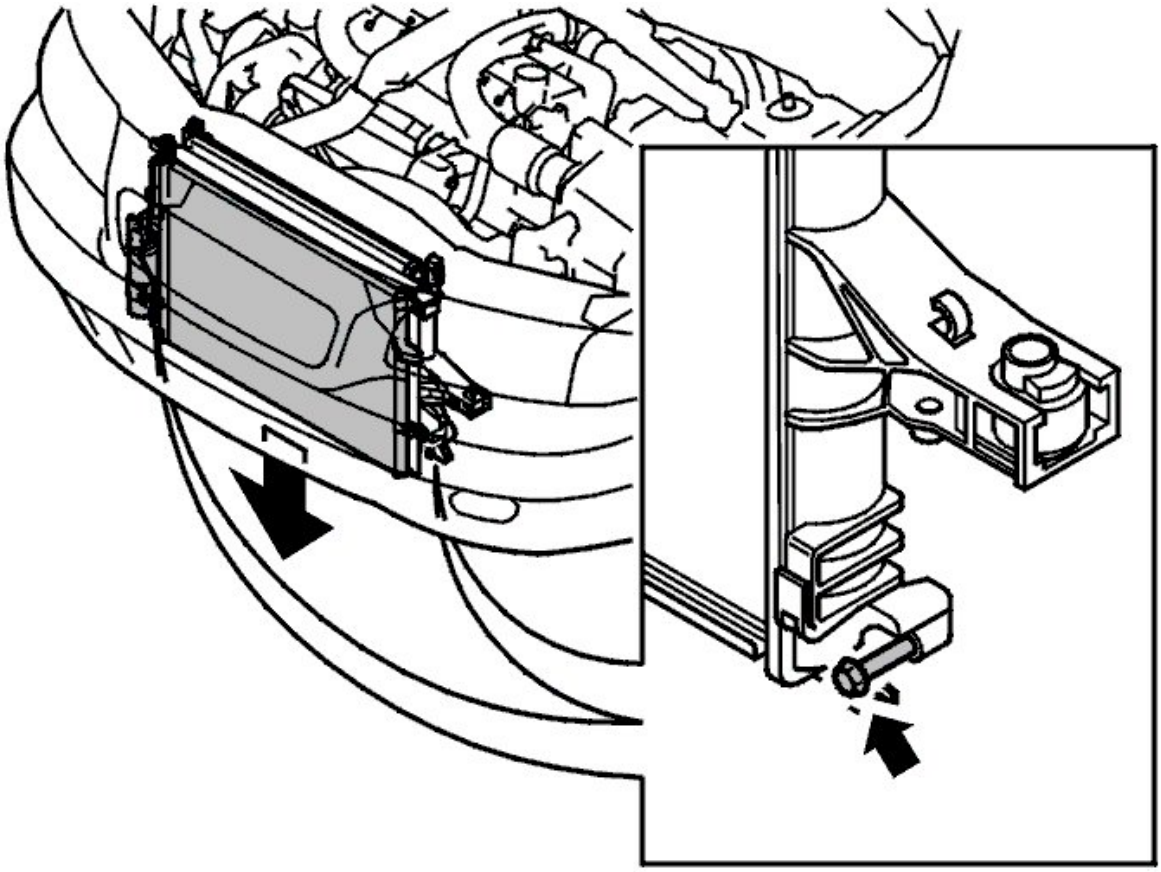
Drain the coolant

- Block the lower hose coolant hose with lock grip pliers
- Apply a hose on the nipple at the radiator
- Feed the hose down to a container
- Open the nipple and drain off the coolant.

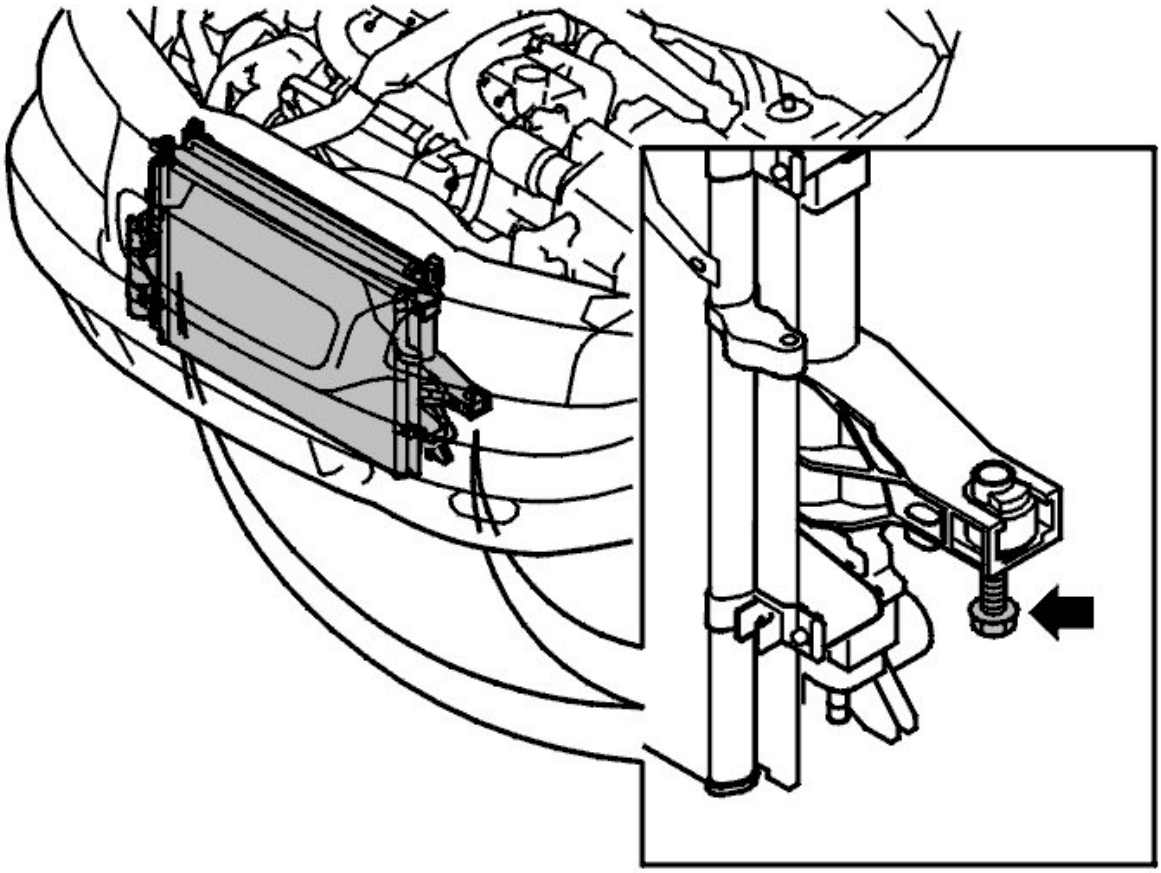
Work from above

- Remove the upper radiator hose. Place it to one side. Seal the openings.

Work under the car



- Disconnect the connector from the receiver drier and the cable from the holder
- Hang up the condenser using tie straps on the right-hand side in the pipe for the receiver drier and on the left-hand side in the pipe for the condenser
- Remove the lower screws holding the radiator unit.



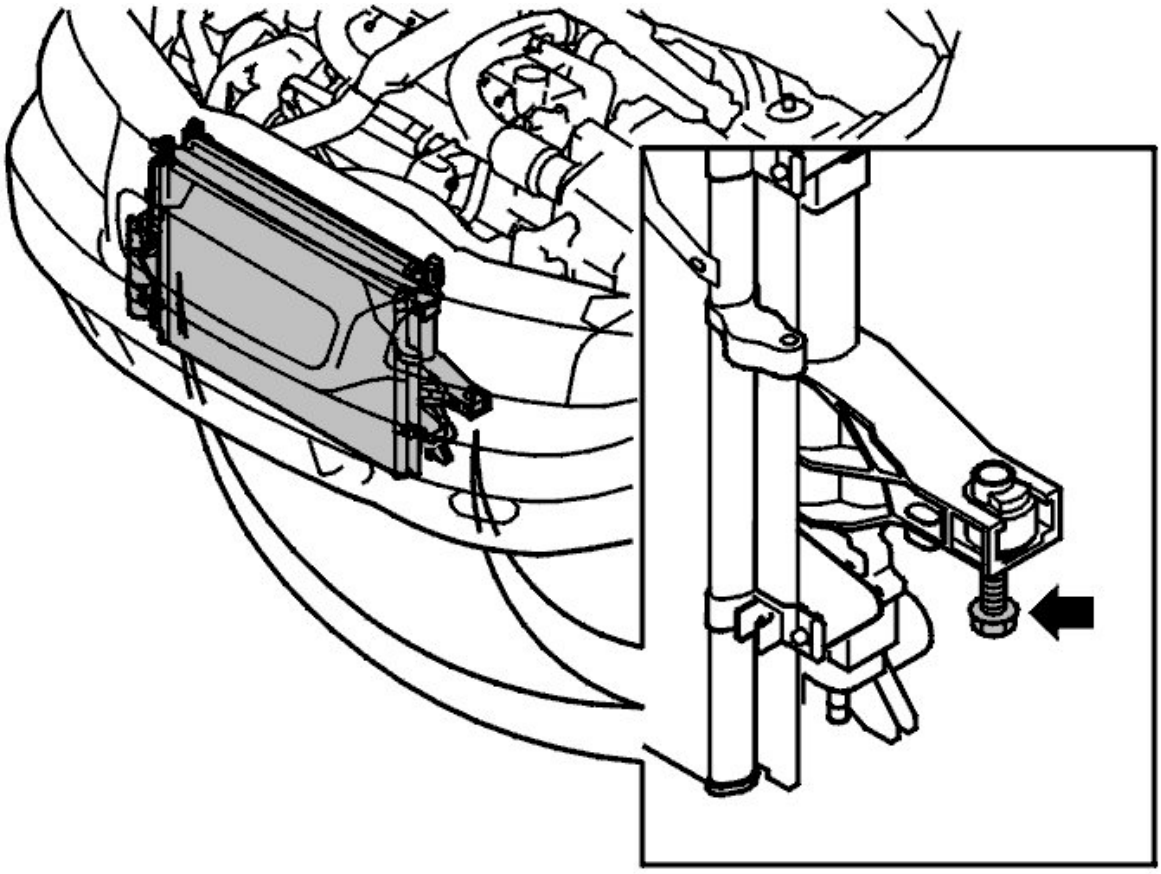
- **The following requires two people:** Disconnect the radiator and the charge air cooler (CAC) firstly from the left and then from the right-hand side by removing the two screws
- On the right-hand side, press the cable duct and the compressor hose towards the engine. At the same time release the radiator and charge air cooler (CAC) downwards on the right-hand side. Then release the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the radiator and charge air cooler (CAC) passes the AC pipe

- Disconnect the hose from the radiator to the expansion tank
- Replace the radiator / charge air cooler (CAC).

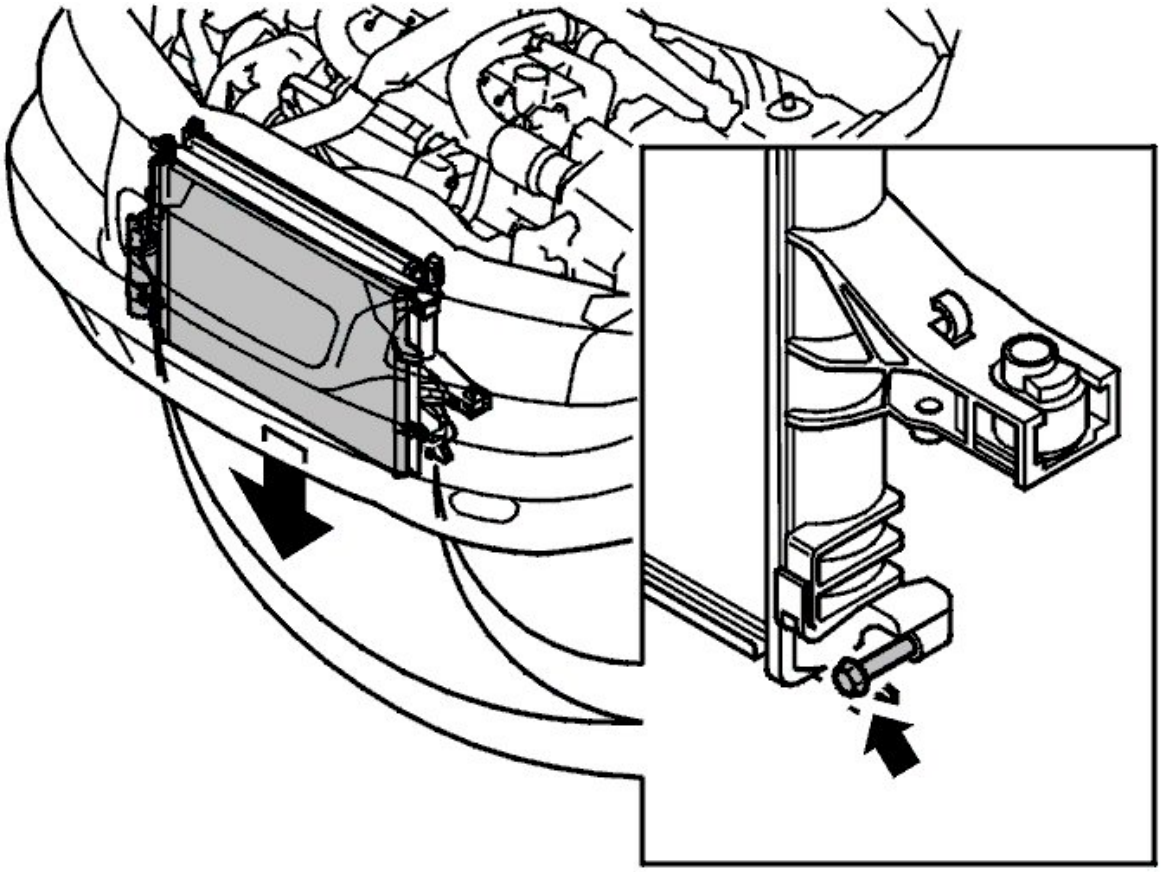
Installation

Installing the radiator and charge air cooler (CAC)

- Hold the radiator unit and secure the hose from the expansion tank to the radiator
- Install the connector from the receiver drier and the cable from the holder.

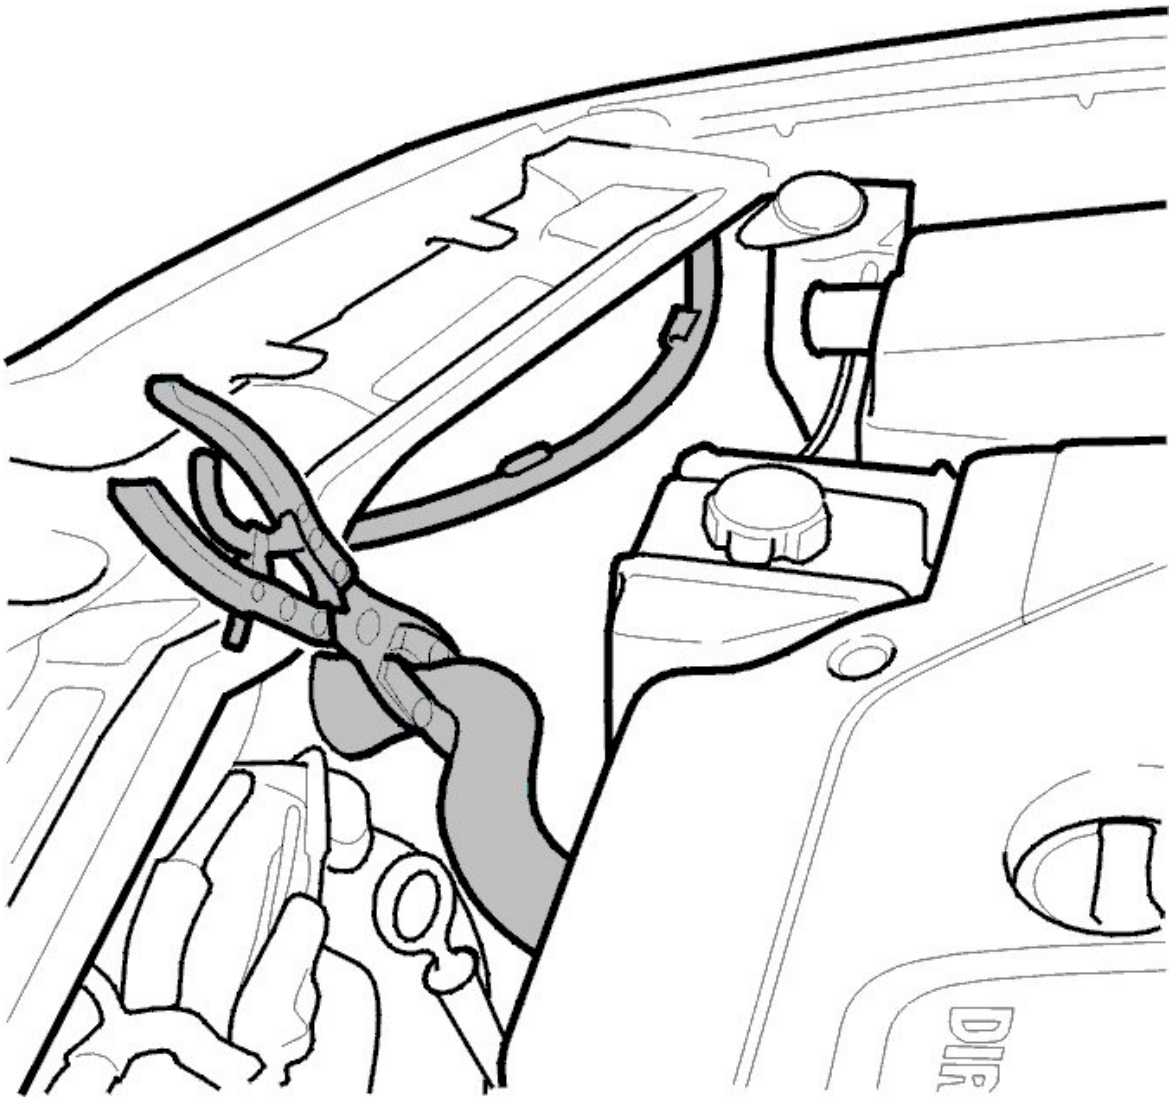


- Lift up the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the charge air cooler (CAC) passes above the AC pipe. Lift the right-hand side while pressing the cable duct and the compressor hose towards the engine
- Thread the screws for the radiator and charge air cooler (CAC) into the member.



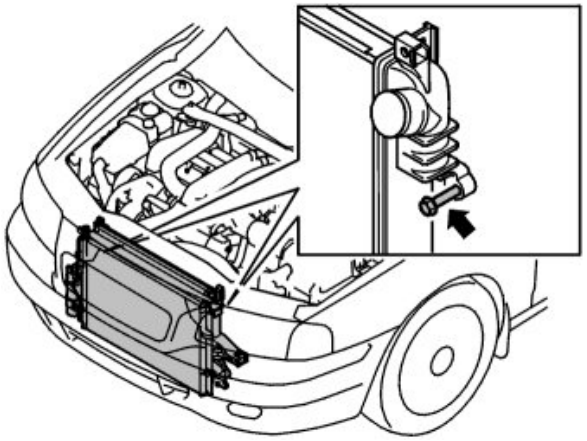
- Install the lower screws to assemble the radiator unit. Tighten the screws. Tighten to **10 Nm**
- Remove the tie straps
- Check that the radiator unit is against the rubber seal
- Tighten the radiator unit to the member. Tighten to **25 Nm**.
- Install the lower radiator hose
- Remove the lock grip pliers
- Install the screw for the mounting for the engine wiring cable duct at the front edge of the sub-frame
- Install the lower oil cooler hose on the radiator unit (automatic gearboxes only).

Work from above

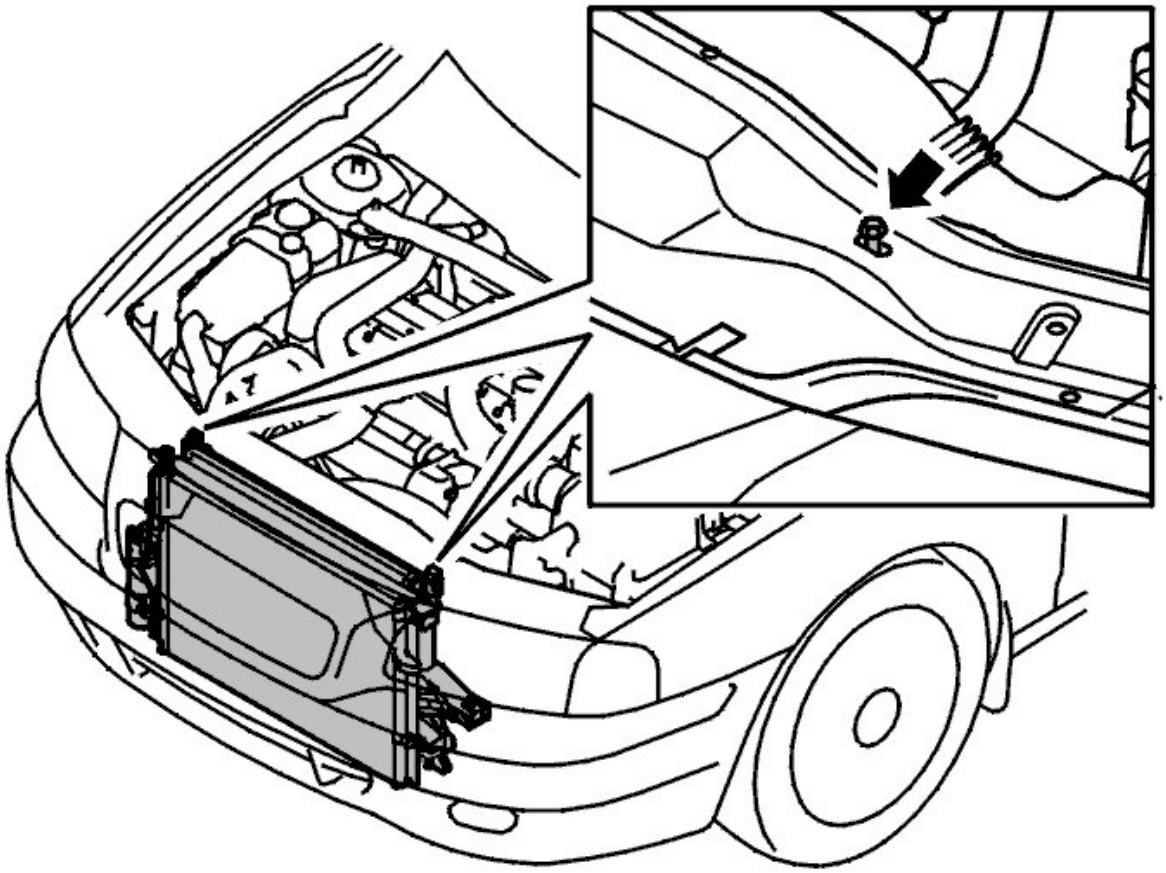


Install

- the upper radiator hose. Remove the lock grip pliers
- the charge air pipe to the charge air cooler (CAC) on the left-hand side (turbocharged engines only).



- Install the upper screws to assemble the radiator unit. Tighten the screws
- Tighten to **10 Nm**.



- Install the screws for the radiator unit on the front cover plate
- Tighten to **10 Nm**

Installing the engine cooling fan (FC)

To install the engine cooling fan (FC), see Engine cooling fan (FC), replacing See: Radiator Cooling Fan/Service and Repair.

Topping up the coolant

- Install the cap on the expansion tank
- Run the engine until the thermostat has opened
- Stop the engine. Top up if necessary.

Radiator: Service and Repair
Replacing Radiator/Charge Air Cooler (CAC)

Replacing the radiator / charge air cooler (CAC)

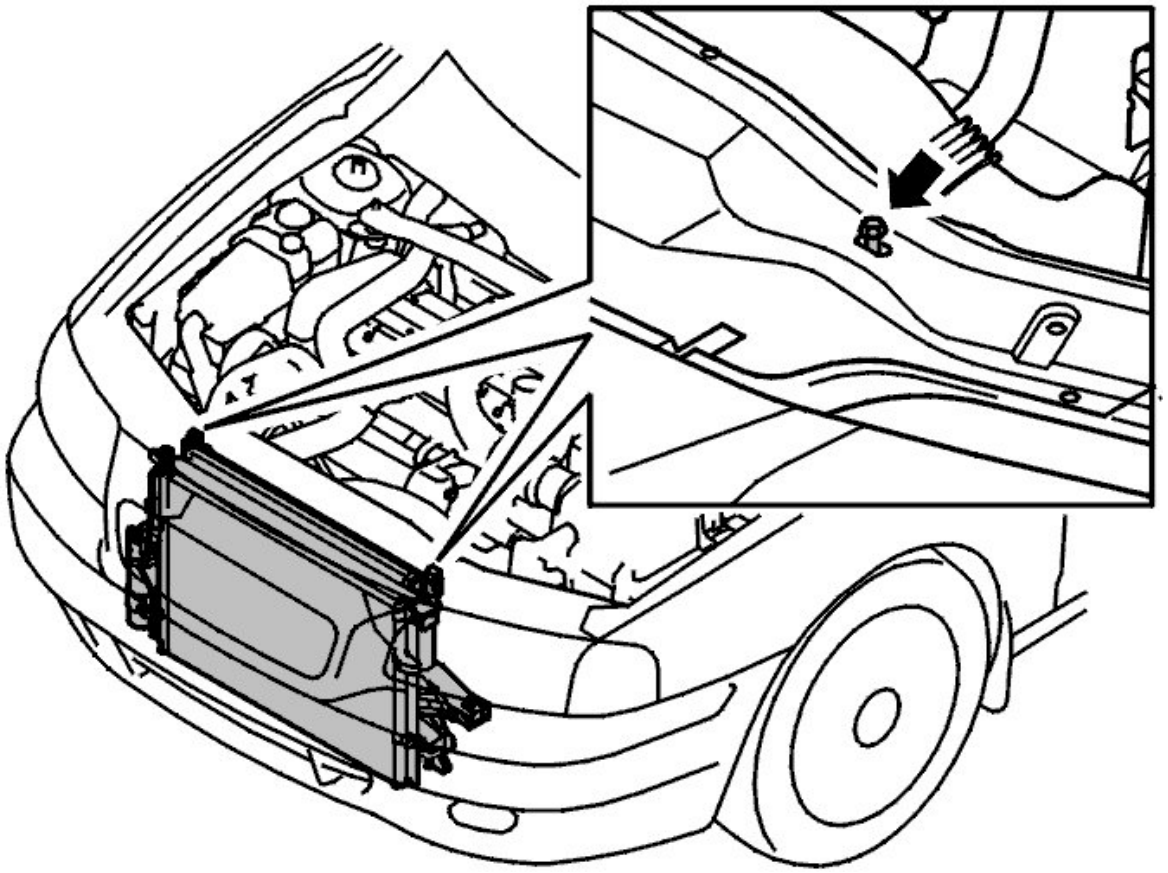
Special tools:

999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

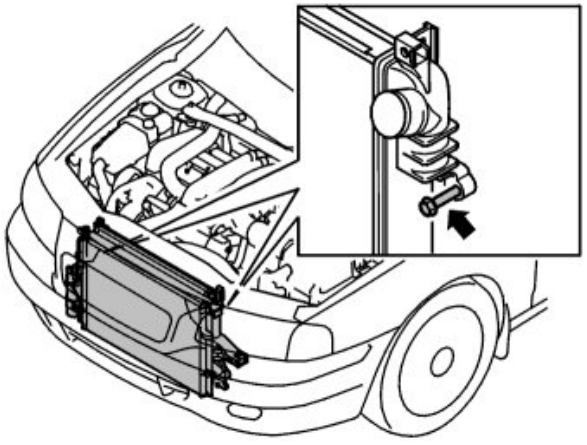
Removal

Removing the radiator unit

Remove the engine cooling fan (FC) according to Engine cooling fan (FC), replacing See: Radiator Cooling Fan/Service and Repair.

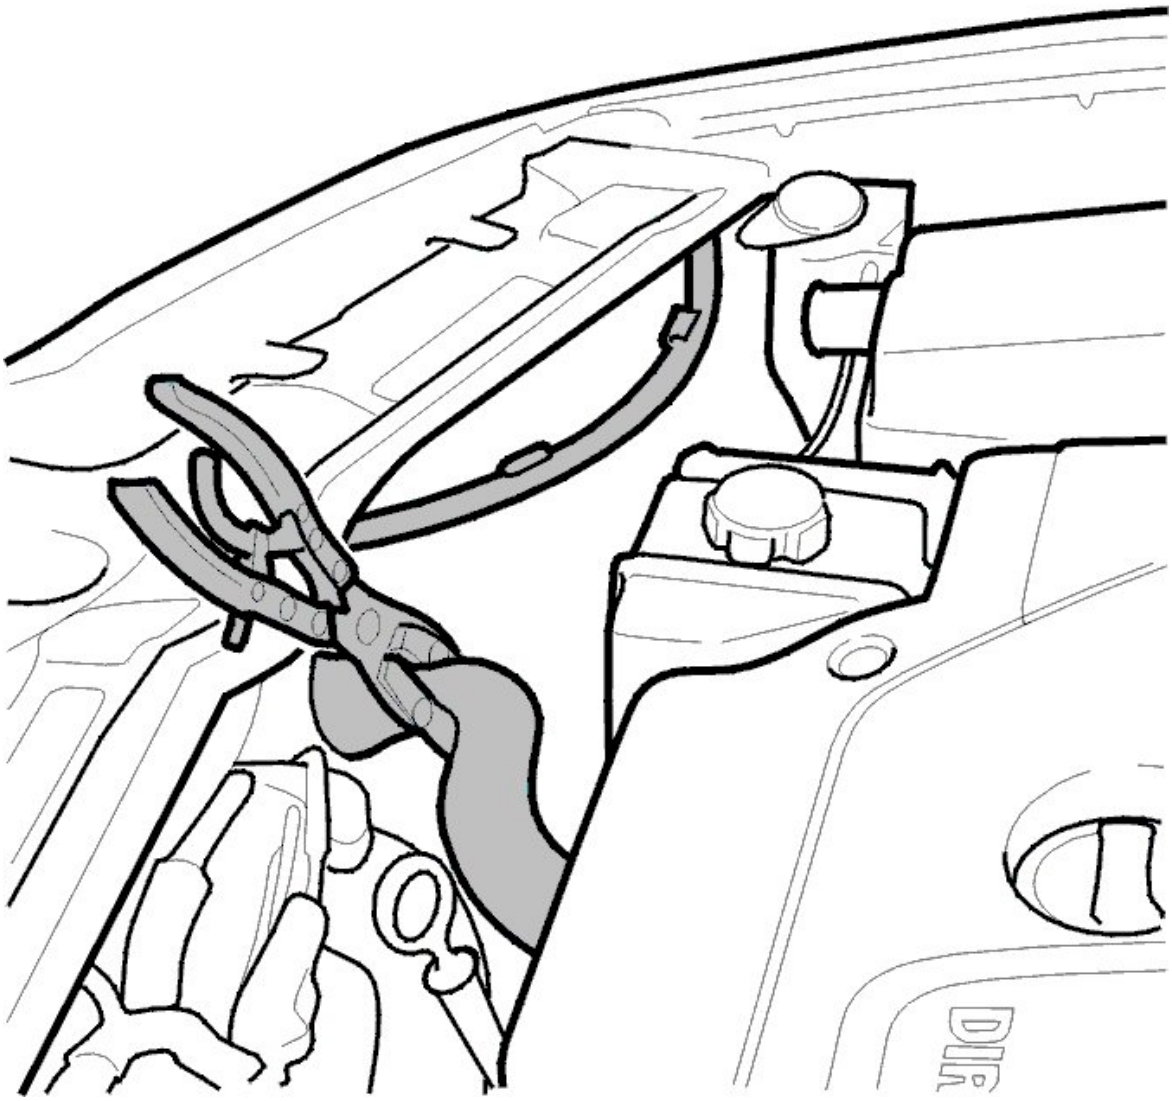


Disconnect the charge air pipe for the charge air cooler (CAC) on the left-hand and right-hand sides. Fold the hoses out of the way.
Remove the screws for the cooler unit on the front cover plate



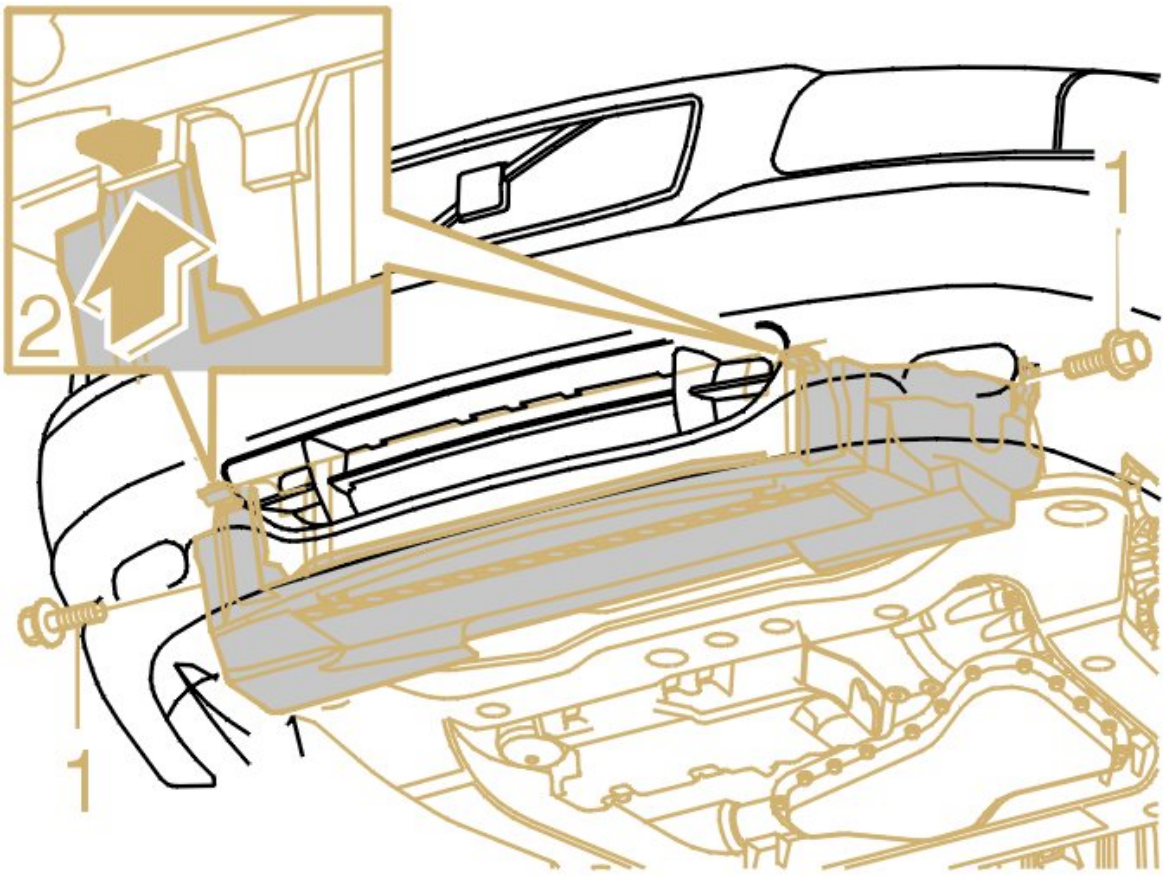
Remove:

- the two upper screws holding the air conditioning aggregate together
- the expansion tank cap.



Block the upper radiator hose with lock grip pliers.
Disconnect the hose from the radiator. Collect the coolant that flows out.

Work under the car



Remove:

- the air baffles
- the lower oil cooler hose from the cooler unit (automatics only). Protect the hose opening
  Note! Collect the oil from the oil cooler in a container.

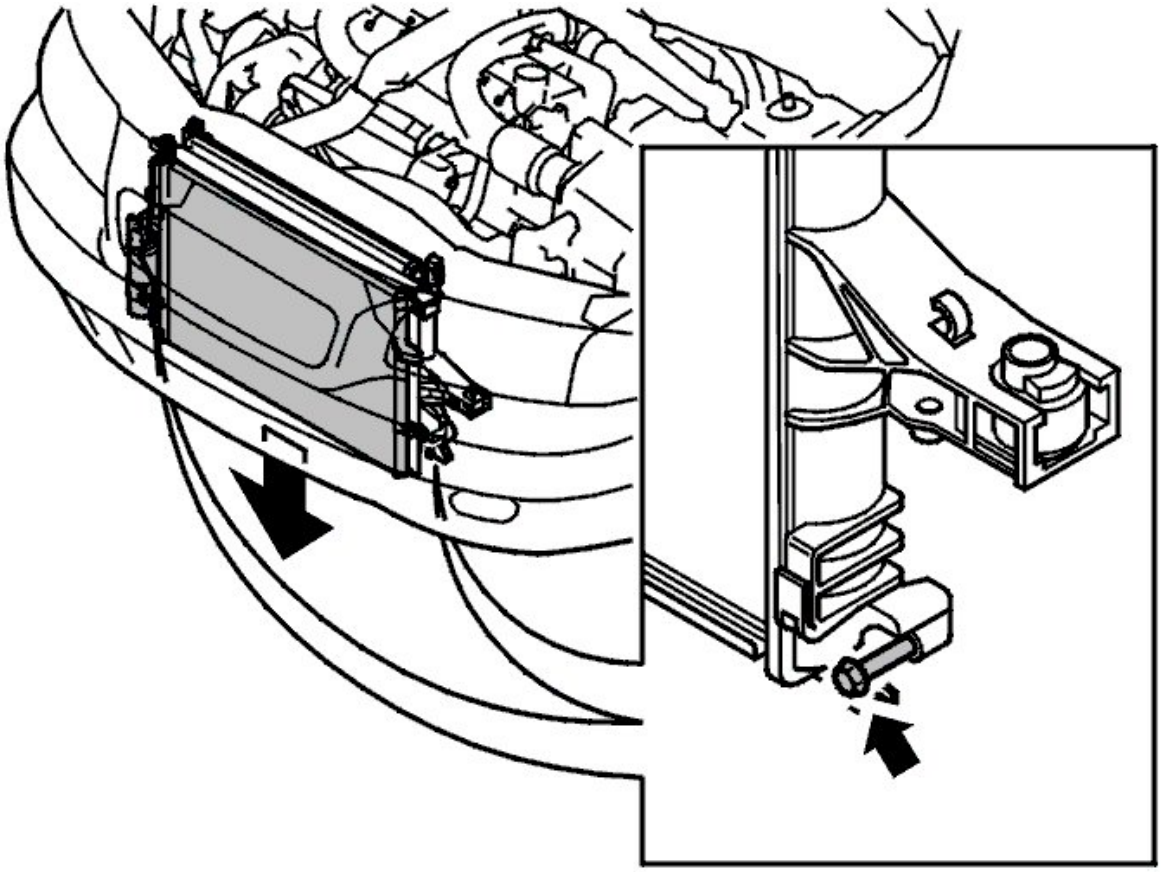
- the screw (1) for the cable harness on the front edge of the sub-frame.

Disconnect the connector from the condenser on the right side. Press the spring to disconnect the connector.

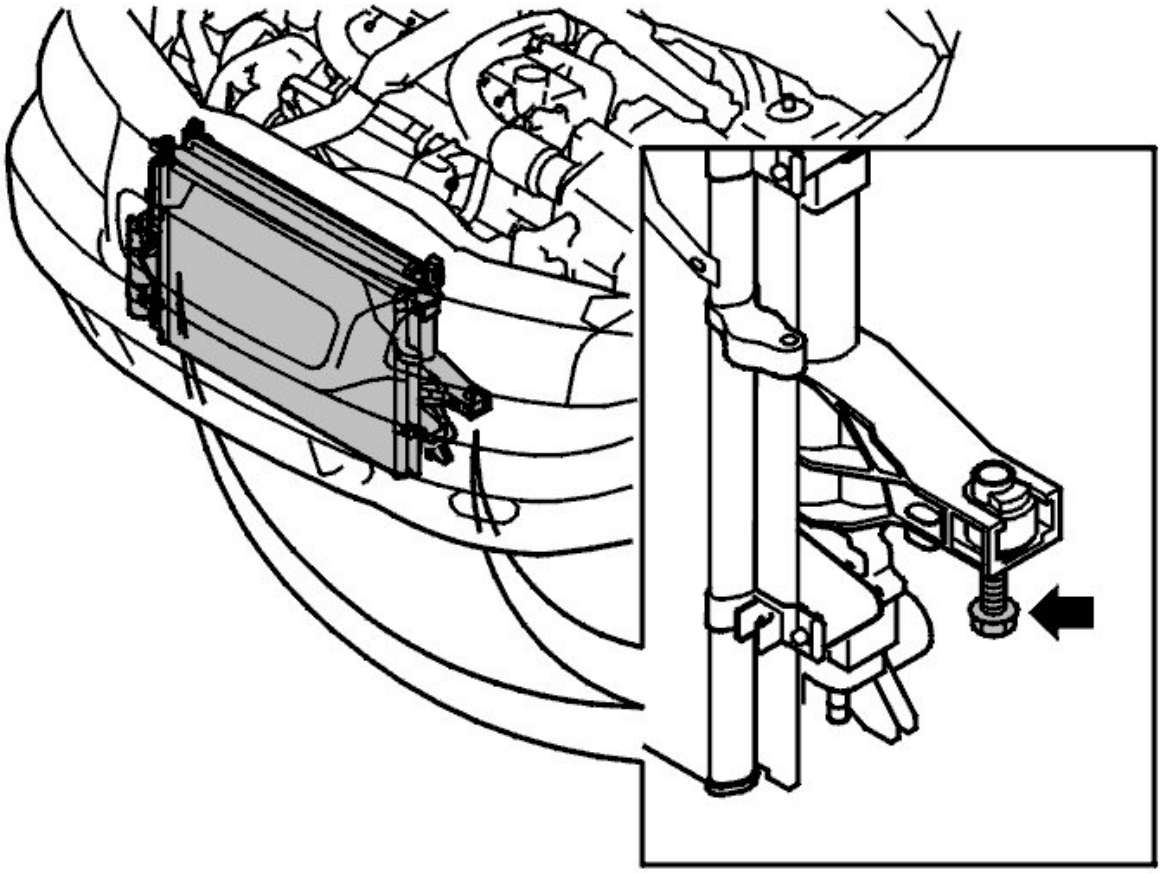
Drain the coolant

- Block the lower hose coolant hose with lock grip pliers
- Apply a hose on the nipple at the radiator
- Feed the hose down to a container
- Open the nipple and drain off the coolant.

Work under the car



Hang up the condenser using tie straps on the right-hand side in the pipe for the receiver drier and on the left-hand side in the pipe for the condenser.
Remove the lower screws holding the air conditioning aggregate.



Hint: The following step requires two people.

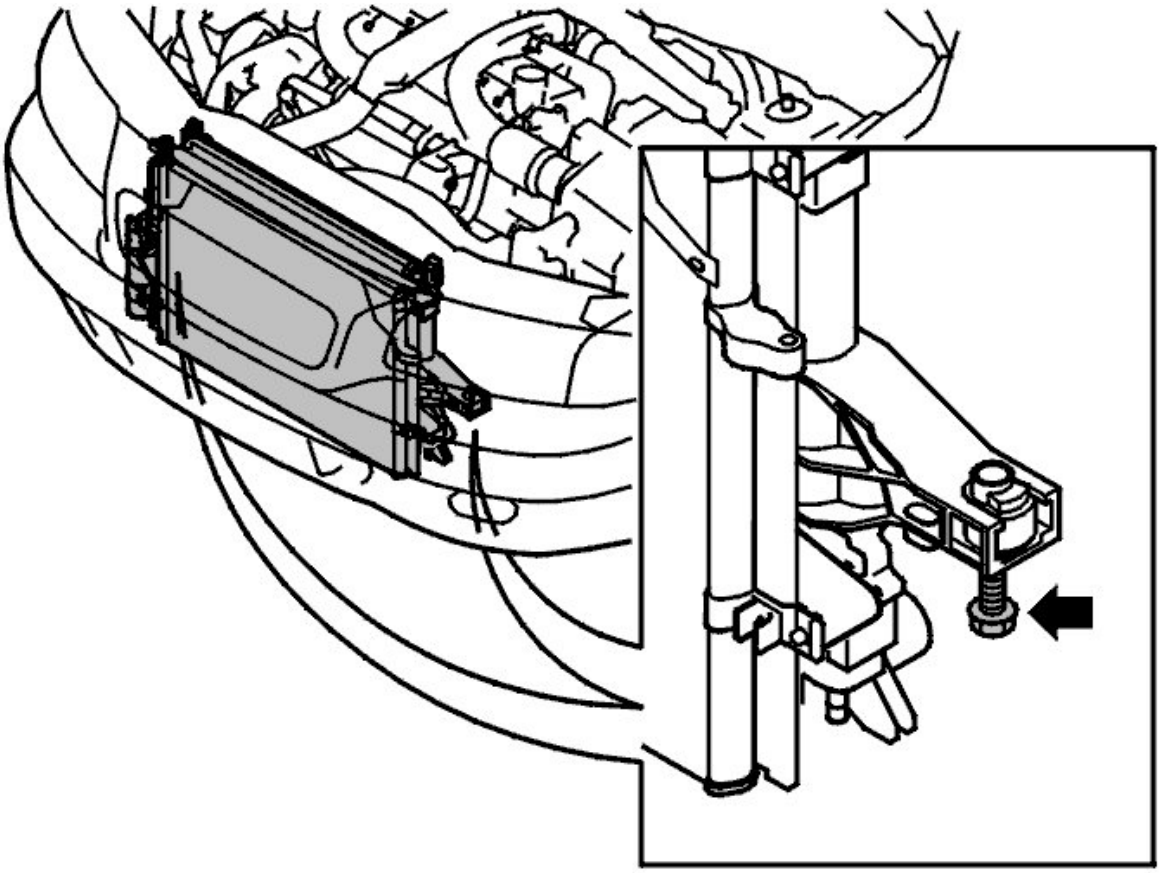
Disconnect the radiator and the charge air cooler (CAC) firstly from the left and then from the right-hand side by removing the two screws.
On the right-hand side, press the cable duct and the compressor hose towards the engine. At the same time release the radiator and charge air cooler (CAC) downwards on the right-hand side. Then release the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the radiator and charge air cooler (CAC) passes the AC pipe.

Disconnect the hose from the radiator to the expansion tank.
Remove the radiator / charge air cooler (CAC).

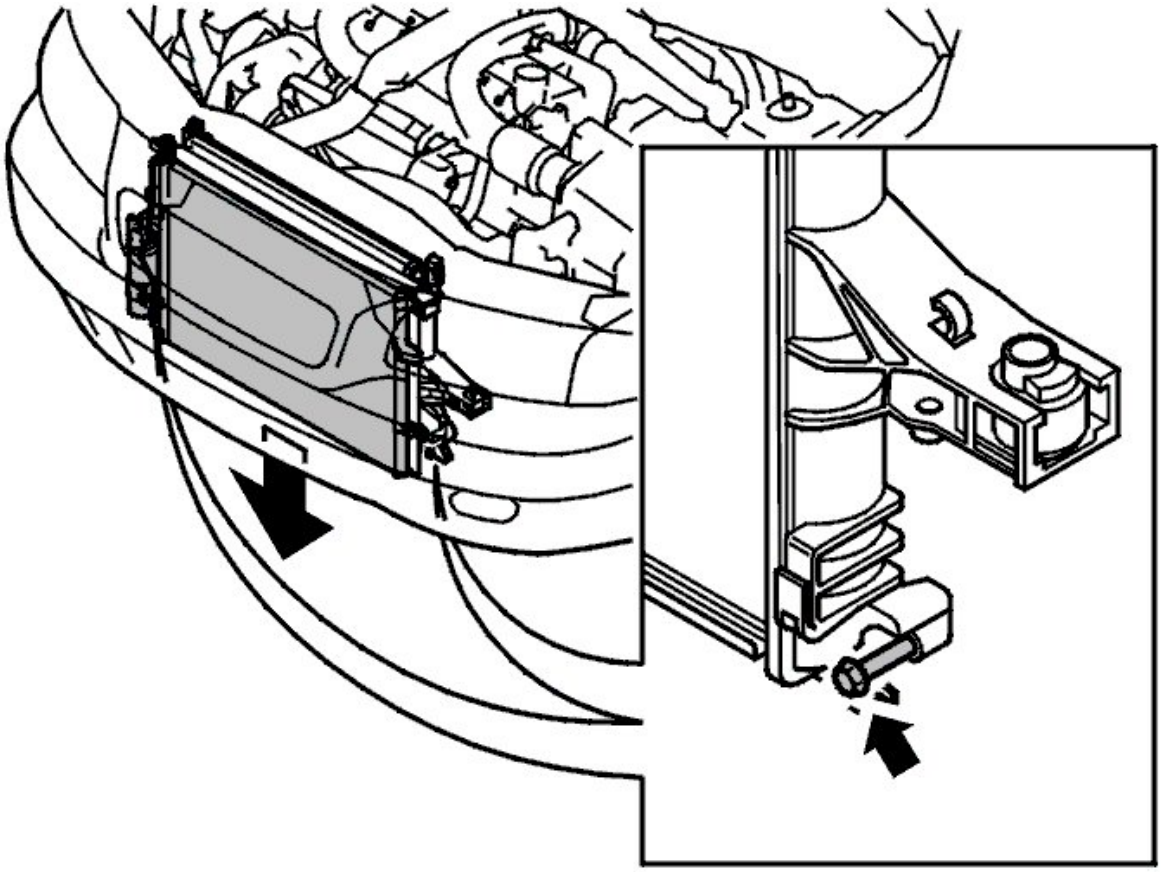
Installation

Installing the radiator and charge air cooler (CAC)

Hold the radiator unit. Secure the hose from the expansion tank to the radiator. Use a new clamp.
Check that the 2 plastic nuts are in position on the radiator.

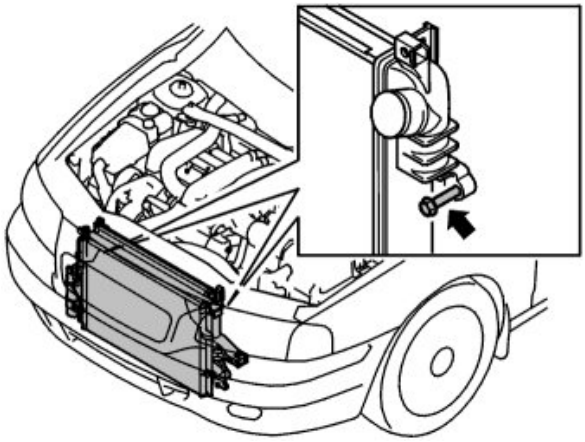


Lift up the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the charge air cooler (CAC) passes above the AC pipe. Lift the right-hand side while pressing the cable duct and the compressor hose towards the engine.
Thread the screws for the radiator and charge air cooler (CAC) into the member.
Connect the connector to the right-hand side of the condenser.

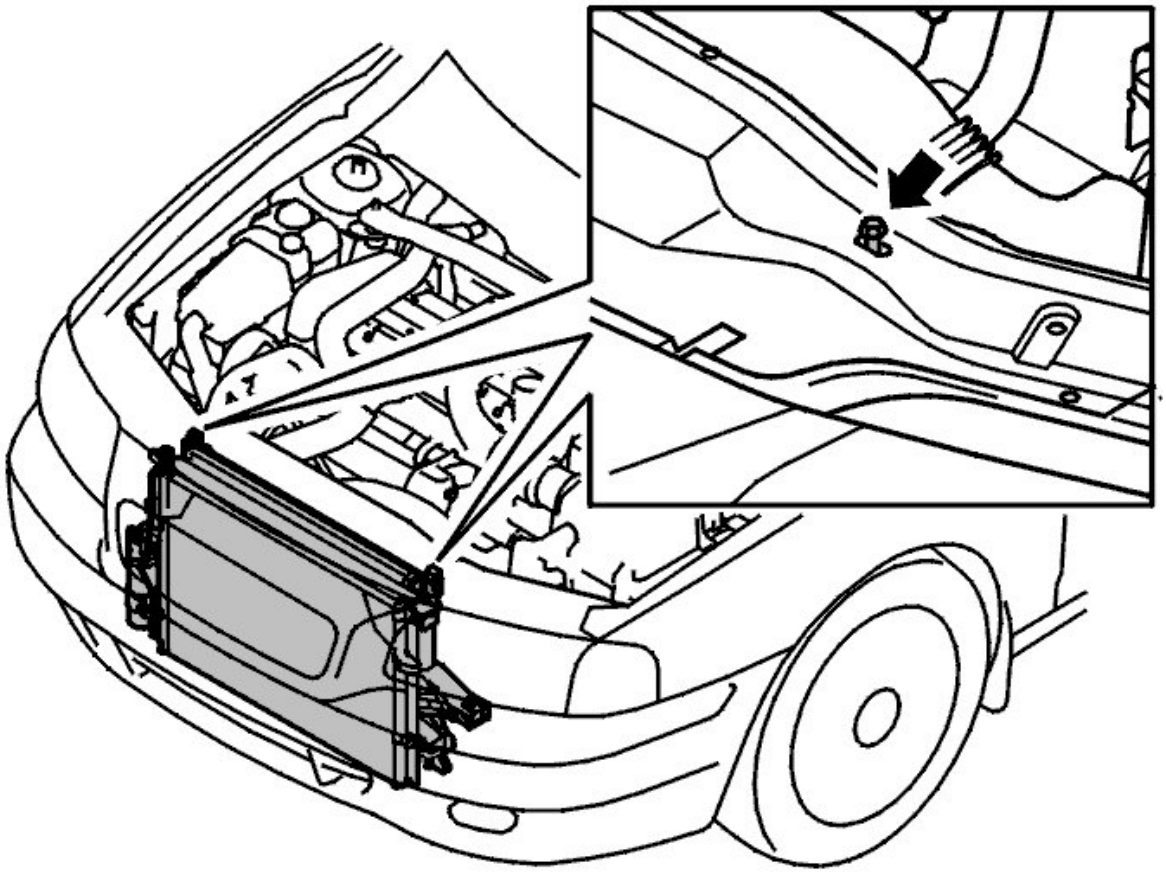


Install the lower screws to assemble the air conditioning aggregate. Tighten the screws. Tighten to **10 Nm**.
Remove the tie straps.
Check that the air conditioning aggregate is against the rubber seal. Secure.
Tighten the air conditioning aggregate to the member. Tighten to **25 Nm**.
Install the lower radiator hose.
Remove the lock grip pliers.
Install the screw for the mounting for the engine wiring cable duct at the front edge of the sub-frame.
Install the lower oil cooler hose on the air conditioning aggregate (automatic transmissions only).
Lower the car.

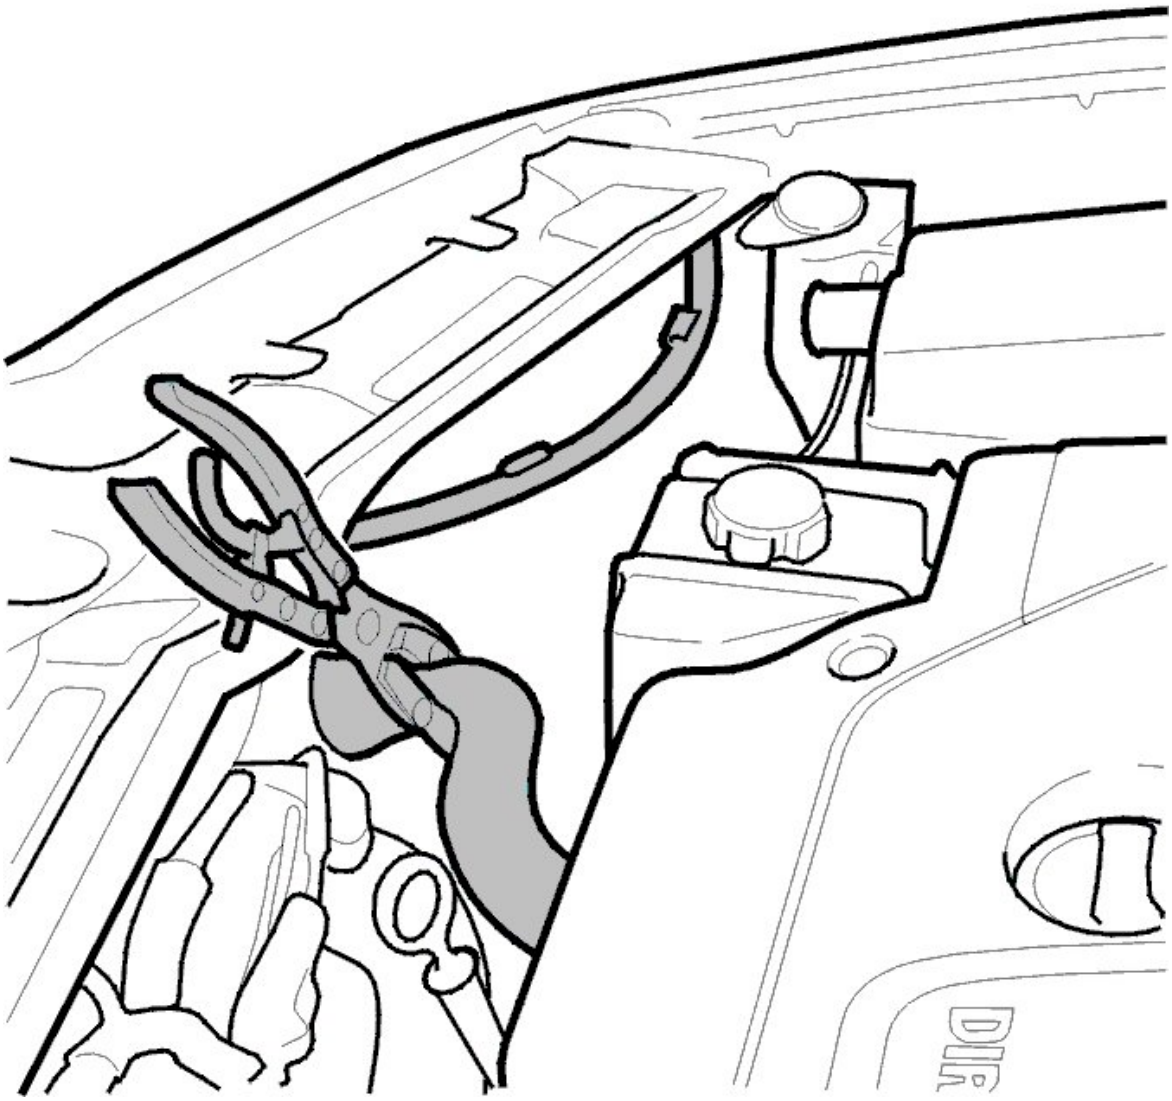
Installing the screws for the air conditioning aggregate



Install the upper screws to assemble the air conditioning aggregate. Tighten the screws. Tighten to **10 Nm**.



Install the screws for the air conditioning aggregate on the front cover plate. Tighten to **10 Nm**.



Install:

- the charge air pipe on the left and right-hand sides of the radiator
- the upper radiator hose.

Installing the engine cooling fan (FC)

To install the engine cooling fan (FC), see Engine cooling fan (FC), replacing See: Radiator Cooling Fan/Service and Repair.

Topping up the coolant

- Install the cap on the expansion tank
- Run the engine until the thermostat has opened
- Stop the engine. Top up if necessary.

Thermostat: Service and Repair
Thermostat

Thermostat / temperature sensor, engine coolant, replacing

Special tools:

951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve
999 5722 Wrench See: Tools and Equipment/999 5722 Wrench
999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
951 2953 Cover See: Tools and Equipment/951 2953 Cover
951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removing / installing

Removing the engine coolant temperature (ECT) sensor

Remove:

- the upper timing belt cover. Disconnect the connector for the temperature sensor
- the temperature sensor from the thermostat housing. Use 951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve.

Note! Put paper underneath the sensor to prevent coolant spillage.

Installing the engine coolant temperature (ECT) sensor

Install:

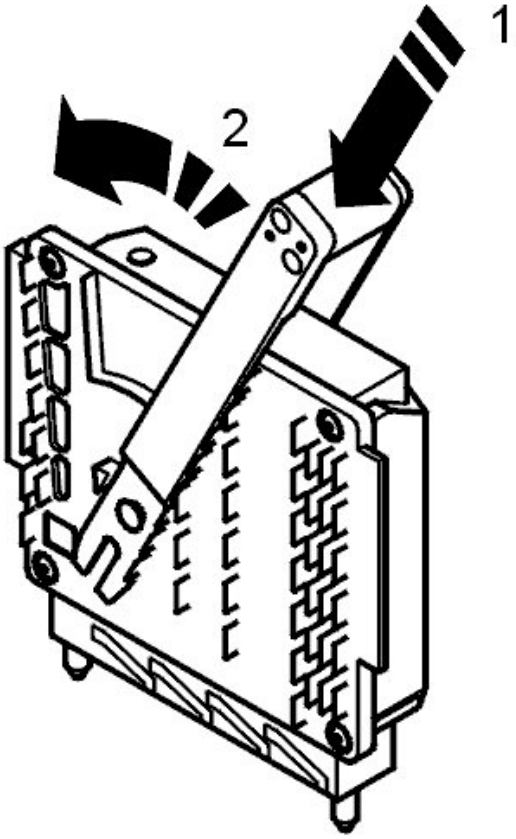
- the sensor with a new seal. Tighten. See: Tightening torque See: Engine/Specifications/Tightening Torque. Use: 951 2885 Sleeve See: Tools and Equipment/951 2885 Sleeve
- the upper timing belt cover.

Removal

Preparation

Remove the cap from the expansion tank. Install a hose clamp on the upper coolant hose.
The vehicle must be raised for this work. See: Jacking points, body See: Maintenance/Vehicle Lifting/Service and Repair. Remove the lower cover plate.
Position a container under the engine drain cock. Drain **2 liters** of engine coolant.
Close the cock. Install the lower protective panel.
Lower the vehicle.

Removing the engine control module (ECM)

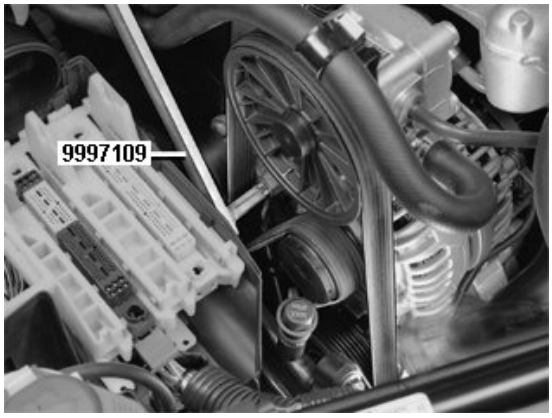


Ignition off. Wait for 2 minutes.

Caution! Do not touch the terminal pins on the control module with fingers. Static electricity may damage components in the engine control module (ECM).

Remove the cover over the control module box. Put the cover to one side.
Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
Move the upper section of the tool backwards as far as it will go. Pull up the tool. Carefully pull up the control module.
For vehicles with automatic transmissions repeat the above work.
Remove the surround from around the control module box.

Removing the auxiliaries belt



Note! Make a note of the routing of the belt.

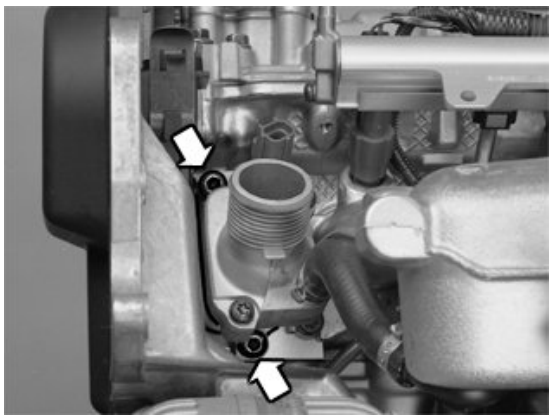
Remove:

- the auxiliaries belt. Use 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
- the upper timing belt cover.

Removing the power steering pump

Remove the 3 x screws for the power steering pump. Place the power steering pump to one side.

Removing the thermostat housing



Remove:

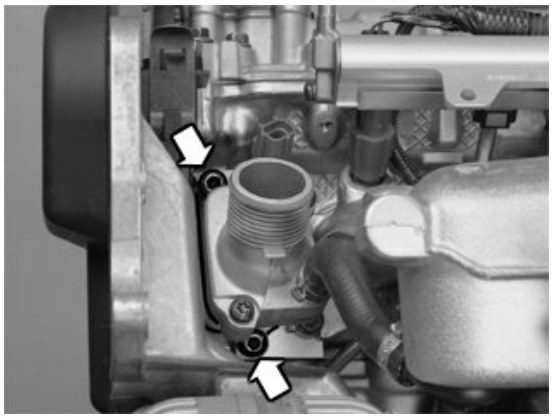
- the hose clamp to the upper radiator hose. Disconnect the hose from the thermostat housing
- the connector from the temperature sensor
- the 2 x screws for the thermostat housing at the section against the cylinder head
- the thermostat housing from the cylinder head
- the hose clamp for the water hose for heating crankcase ventilation.

Transfer the temperature sensor to the new thermostat housing.

Installation

Note! For tightening torques, see: Tightening torque See: Engine/Specifications/Tightening Torque.

Installing the thermostat housing



Install:

- the hose for the water heated crankcase ventilation. Before installing the thermostat housing, use a new hose clamp
- a new gasket
- the thermostat housing assembly. Tighten the screws
- the upper radiator hose. Tighten the hose clamp.

Connect the connector for the temperature sensor.

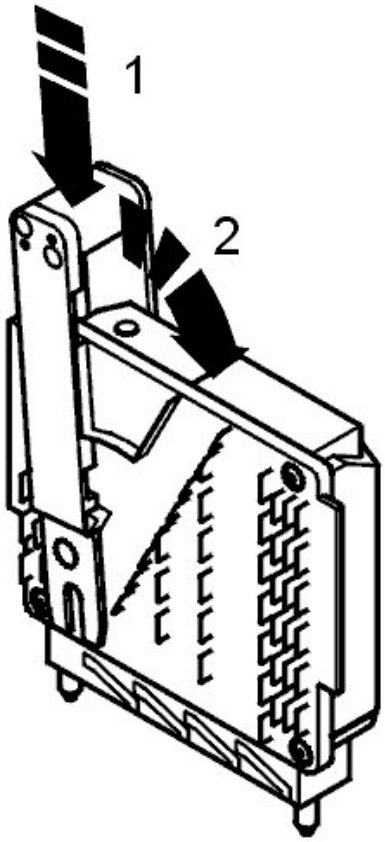
Finishing

Note! Ensure that the auxiliaries belt is correctly positioned on all the pulleys.

Install:

- the power steering pump. Tighten the 3 x screws
- the auxiliaries belt. Use 999 7109 Wrench See: Tools and Equipment/999 7109 Wrench
- the upper camshaft cover.

Installing control modules



Caution! Check that no pins or sockets are damaged on the connector.

Install the surround for the control module box.
Carefully press the control module down into the grooves on the inside of the control module box. Press to the limit position
Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
Move the upper section of the tool forwards as far as it will go. Pull up the tool.
Press the cover into place over the control modules. Check that the air ducts are correctly positioned.

Finishing

Remove the hose clip. Refill with coolant. Use filling equipment 951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir and cover 951 2953 Cover See: Tools and Equipment/951 2953 Cover. Install the cap on the expansion tank.
Test drive the engine until the thermostat has opened. Check for leakage. Top-up the coolant.

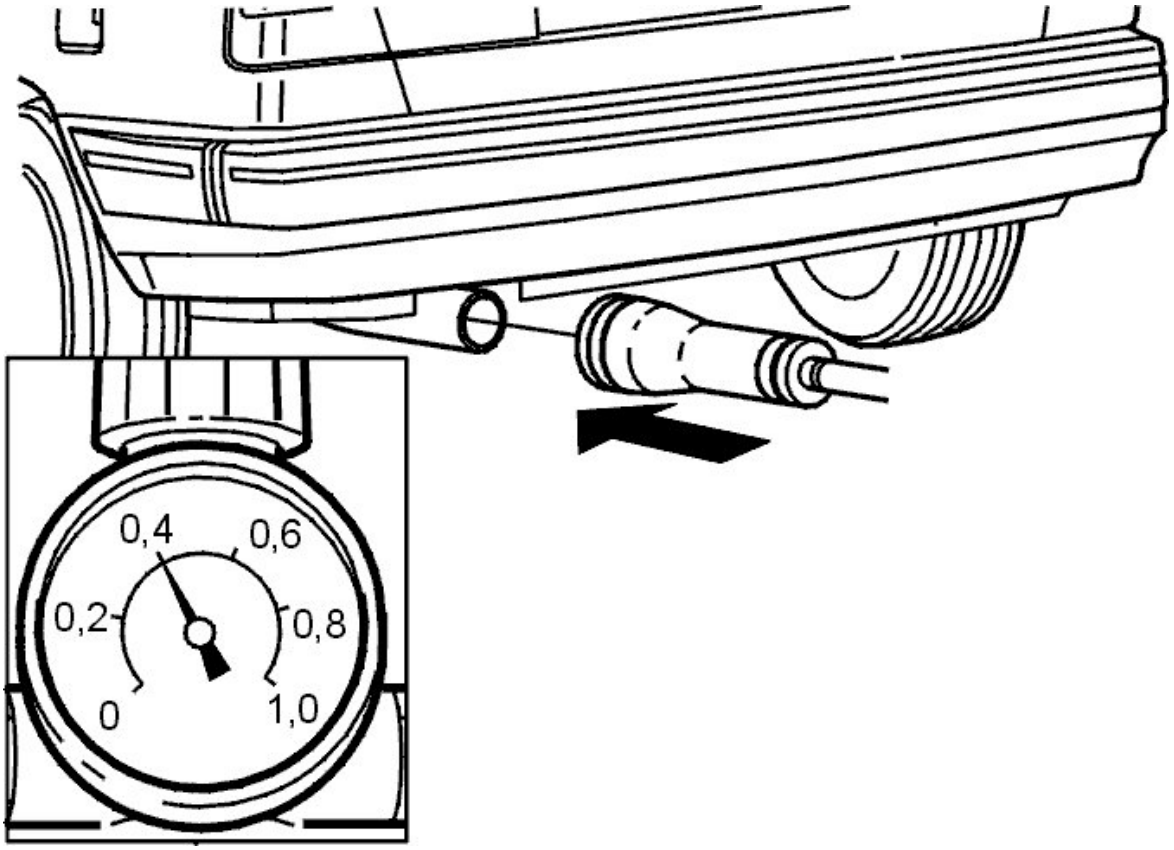
Exhaust System: Testing and Inspection
Checking for Air Leakage in the Exhaust System, B5244T5, B5254T2

Checking for air leakage in the exhaust system

Special tools:

999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator
999 5546 ADAPTOR See: Tools and Equipment/999 5546 Adaptor

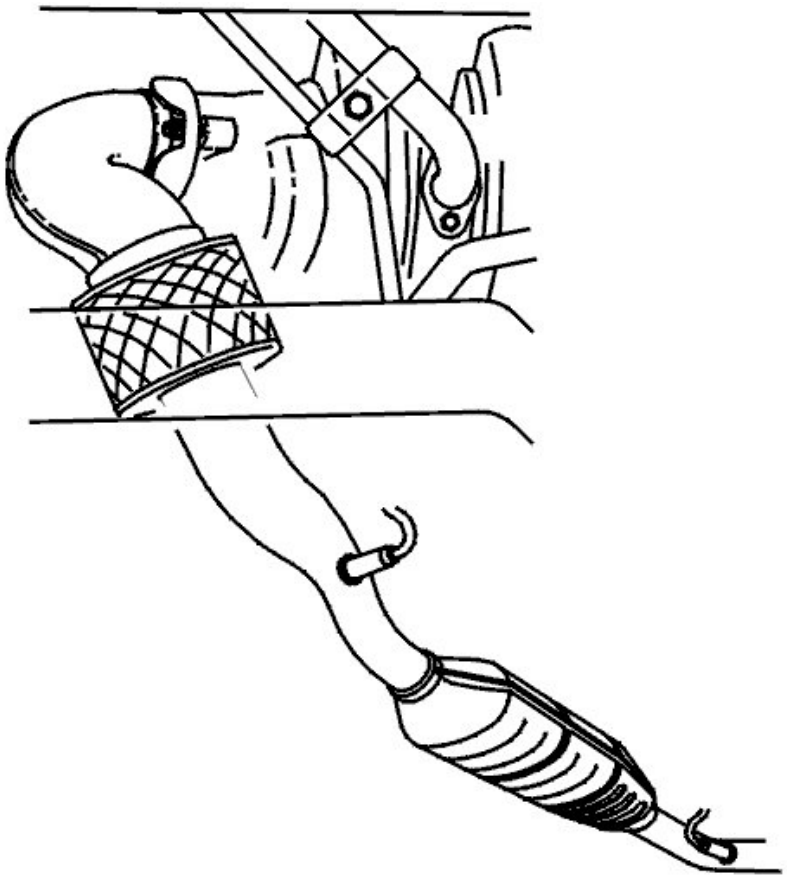
Connecting



Caution! If the car has been driven recently the exhaust system can be very hot, let it cool down a little. Otherwise the special tool may get burnt.

Remove the exhaust tail pipe.
Install tool 999 5546 ADAPTOR See: Tools and Equipment/999 5546 Adaptor with pressure regulator999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator on the exhaust system.
Adjust the pressure to **0.4 bar**. Depending on the condition of the exhaust system a **lower** pressure may be necessary.

Check



Check exhaust system by spraying a soap solution on all joints and connections between cylinder head and rear heated oxygen sensor (HO2S).
Only very small and slow bubbles are permissible.
Install tail pipe on exhaust system after check.

Exhaust System: Testing and Inspection
Air Leakage Exhaust System, Check

Checking for air leakage in the exhaust system

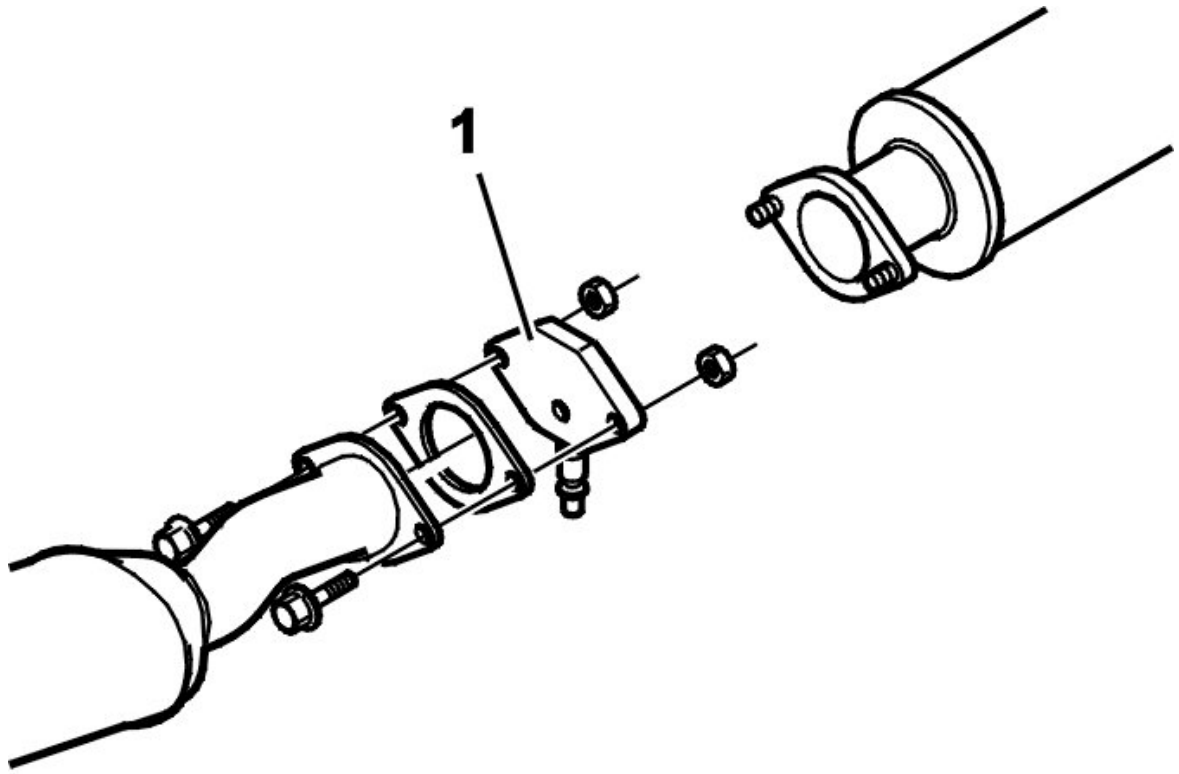
Special tools:

999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator
999 7085 Adapter See: Tools and Equipment/999 7085 Adapter

Note! The illustrations in this service information are used for different model years and / or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Preparatory work

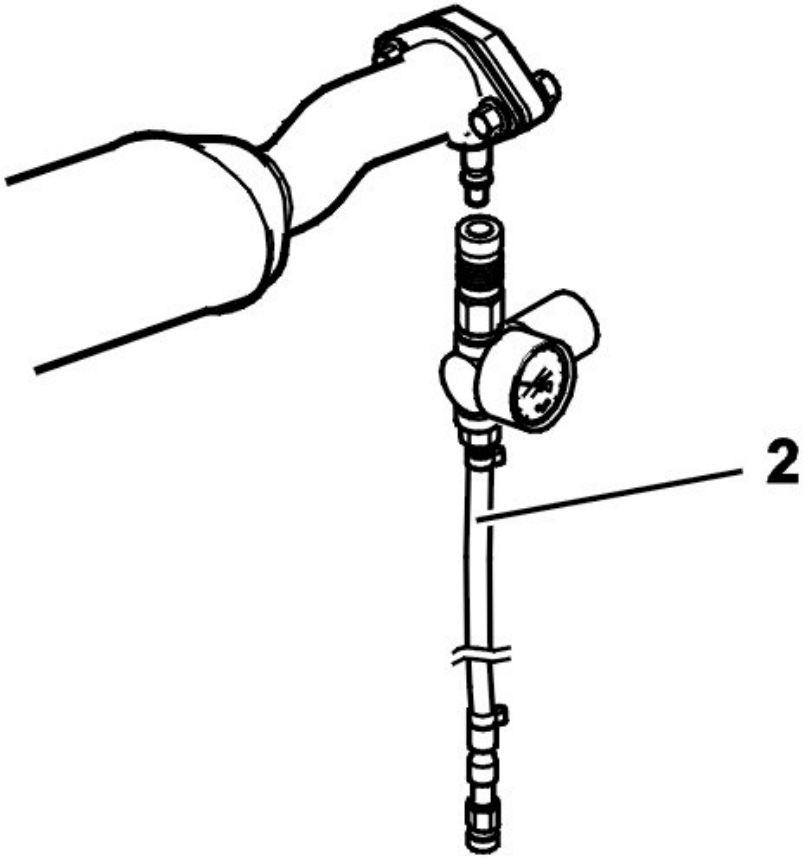
Removing components



Remove:
- the nut where the three-way catalytic converter (TWC) and exhaust system separate
  Note! Use rust solvent or similar on the nuts.

the gasket. Separate the exhaust system from the three-way catalytic converter (TWC).

Installing tool



Install:

- The tool (1) 999 7085 Adapter See: Tools and Equipment/999 7085 Adapter using a new gasket
- pressure regulator 999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator on tool 999 7085 Adapter See: Tools and Equipment/999 7085 Adapter. Adjust the pressure to **0.4 bar**.

Cleaning and checking

Check

Check the exhaust system by spraying a soap solution on all joints and connections between the cylinder head and the rear heated oxygen sensor (HO2S). Only very small and slow bubbles are permissible.

Finishing

Removing tools

Remove:

- pressure regulator 999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator
- tool 999 7085 Adapter See: Tools and Equipment/999 7085 Adapter.

Installing components

Install:

- a **new** gasket where the exhaust system and three-way catalytic converter (TWC) divide
- a **new** nut for the exhaust system. Tighten.

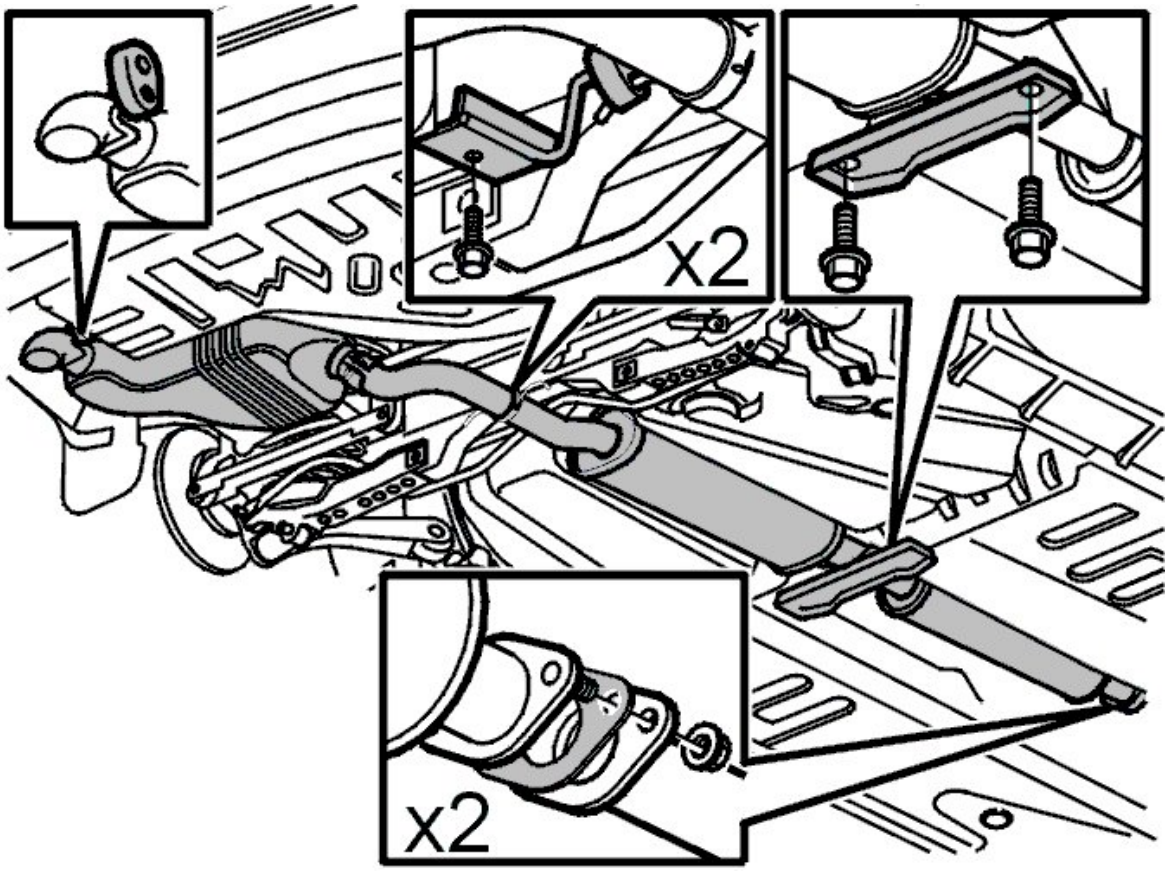
Start the engine. Check for leaks where the three-way catalytic converter (TWC) and the exhaust system divide.

Exhaust System: Service and Repair

Exhaust system, replacing

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the exhaust system

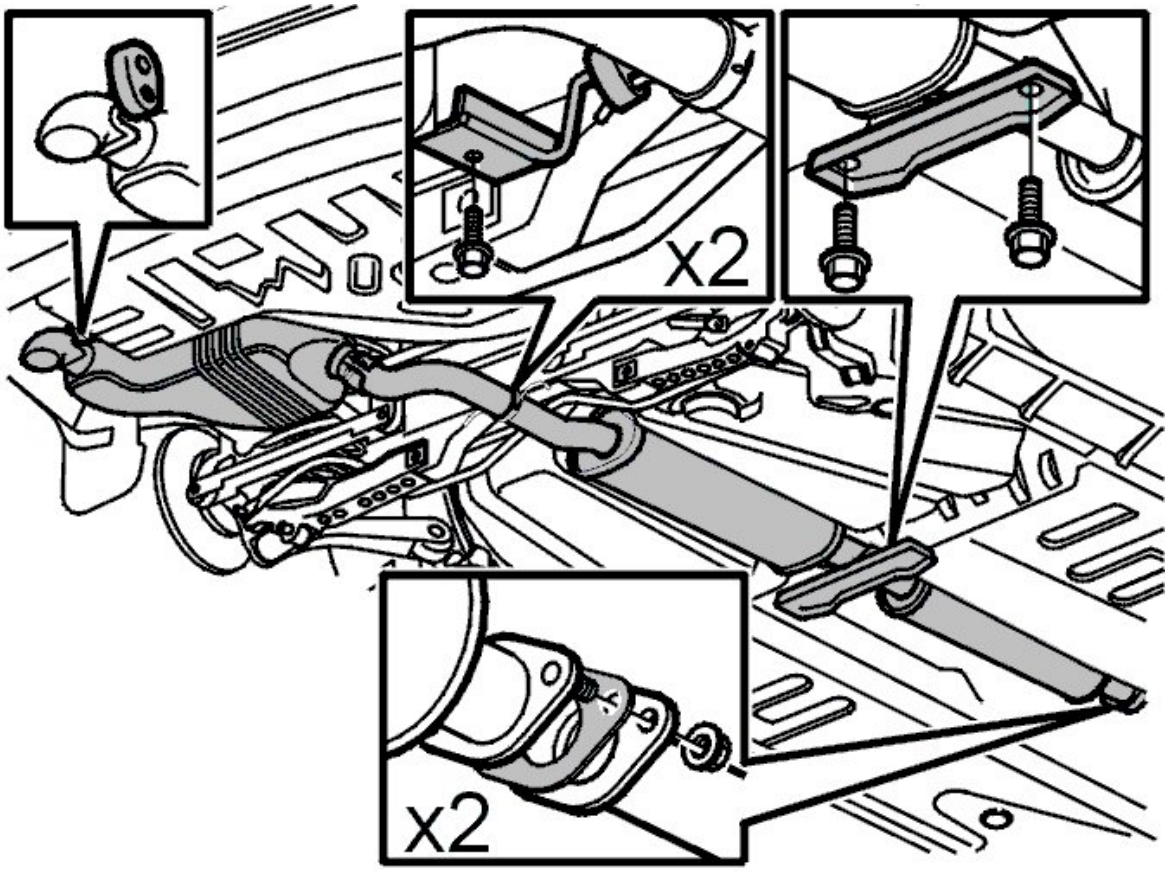


- Raise the car
- Remove the old exhaust pipe. Begin from the front.

Installing the exhaust system

Note! To ensure that there is no exhaust leakage, see: Flanged joint, assembling See: Exhaust Pipe/Service and Repair.

Note! The new exhaust system is supplied in two sections.



Install:

- the front section of the exhaust system. Use a new flange gasket. Do not tighten
- the rear section with the pipe clamp
- the mountings for the exhaust system.

Adjust the position of the exhaust system and tighten:

- the screws and the nuts for the flange gasket
- the pipe clamp.

Catalytic Converter: Application and ID

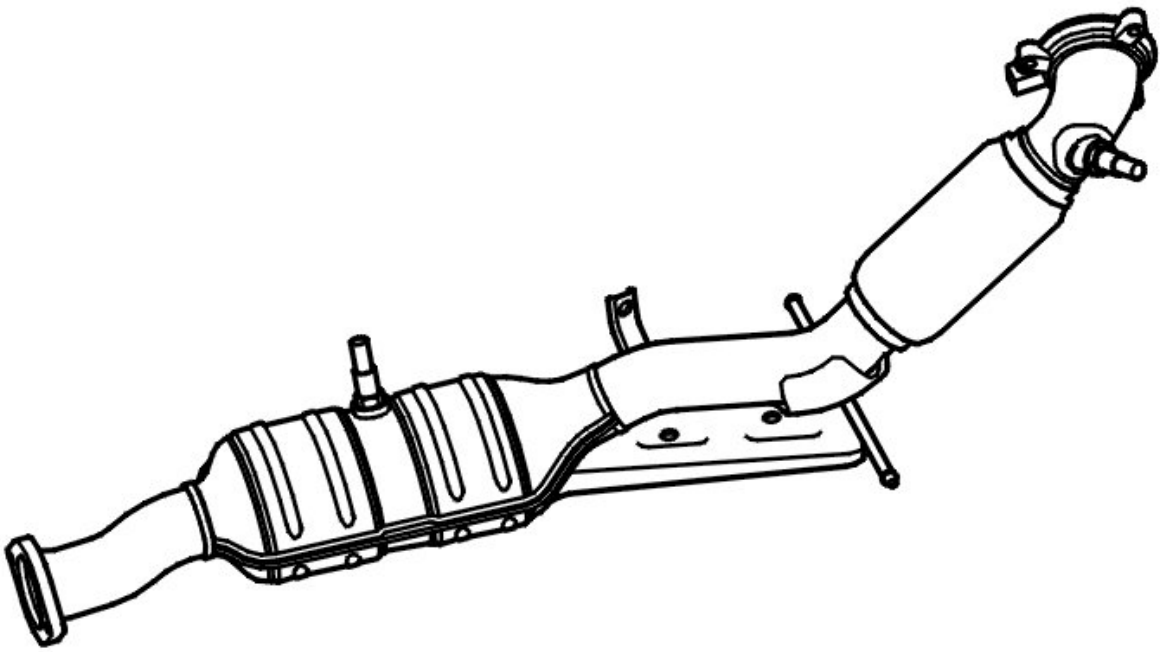
Catalytic Converter: Description and Operation
Catalytic Converter (TWC) Diagnostic

Catalytic converter diagnostic

- For 5 cylinder engines, see Catalytic converter diagnostics 5 cylinder
- For 6 cylinder engines, see Catalytic converter diagnostics 6 cylinder.

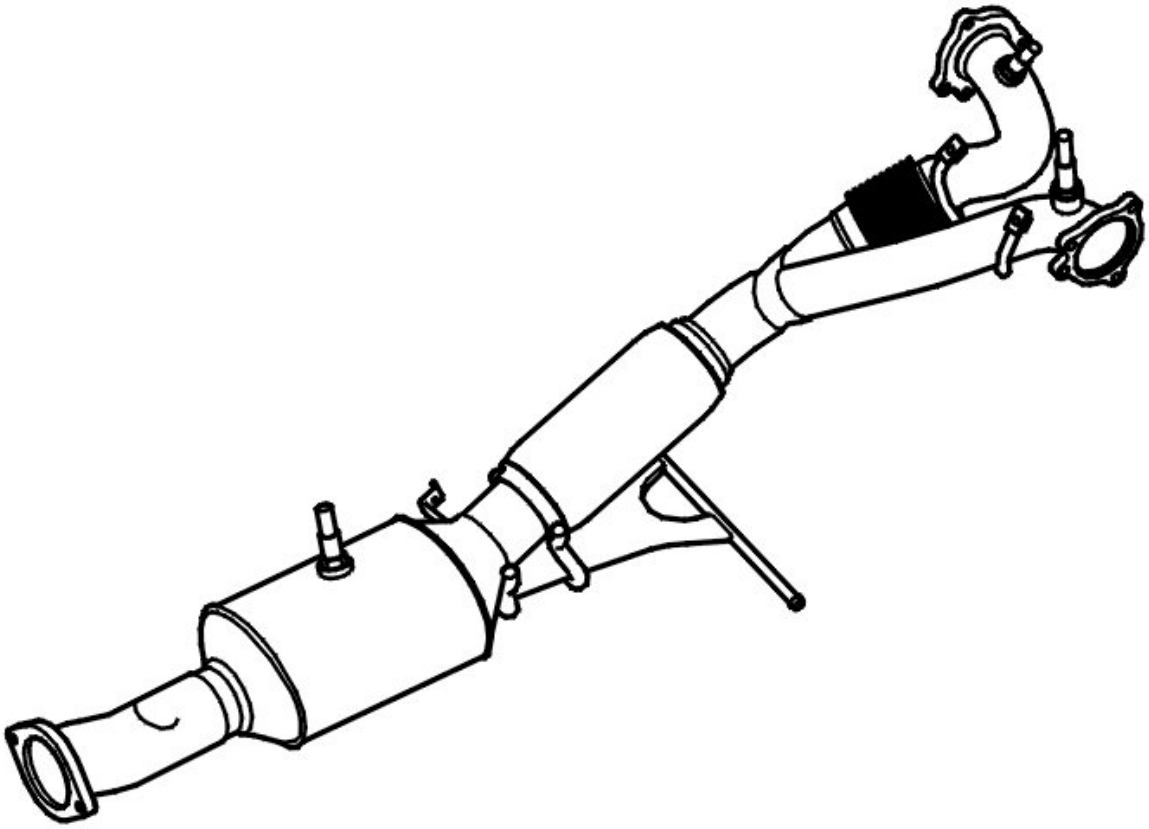
Catalytic converter diagnostics 5 cylinder



The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NOx(nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages its ability to store oxygen drops. This reduces the conversion capacity of the three-way catalytic converter (TWC). To avoid dangerous emissions the engine control module (ECM) checks three-way catalytic converter (TWC) efficiency. In brief, this check is carried out as follows.
Two heated oxygen sensors (HO2S) are used to check the three-way catalytic converter (TWC), one upstream of the converter and one in the center of the converter (the rear heated oxygen sensor (HO2S)). The main function of the heated oxygen sensors (HO2S) is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel / air mixture at around lambda=1. This mixture allows for optimum catalytic conversion. To determine catalytic converter efficiency the amplitude of the heated oxygen sensor (HO2S) signals is compared (amplitude is a measure of signal oscillation).
When efficiency of the catalytic converter is good and the fuel / air mixture is normal, the front probe signal switches between rich and lean while the rear probe signal is steady. If the three-way catalytic converter (TWC) efficiency is poor but the fuel / air mixture is normal, the rear probe signal will also switch between rich and lean. This is because the exhaust gases flow straight through the three-way catalytic converter (TWC) without being acted on. If the amplitude of the rear sensor becomes too great in relation to the amplitude of the front sensor for a number of checks, a diagnostic trouble code (DTC) will be stored for catalytic converter efficiency.

Catalytic converter diagnostics 6 cylinder

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NOx(nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages its ability to store oxygen drops. This reduces the conversion capacity of the three-way catalytic converter (TWC). To avoid dangerous emissions the engine control module (ECM) checks three-way catalytic converter (TWC) efficiency. In brief, this check is carried out as follows.

Three heated oxygen sensors (HO2S) check the common catalytic converter. One heated oxygen sensor (HO2S) is in front of the three-way catalytic converter (TWC) for each bank of cylinders and a common rear heated oxygen sensor (HO2S) in the center of the three-way catalytic converter (TWC). The main function of the heated oxygen sensors (HO2S) is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel / air mixture at around lambda=1. This mixture allows for optimum catalytic conversion. To determine catalytic converter efficiency the amplitude of the heated oxygen sensor (HO2S) signals is compared (amplitude is a measure of signal oscillation). When efficiency of the catalytic converter is good and the fuel / air mixture is normal, the front probe signals for banks 1 and 2 switch between rich and lean while the rear probe signal is steady. If the three-way catalytic converter (TWC) efficiency is poor but the fuel / air mixture is normal, the rear probe signal will also switch between rich and lean. This is because the exhaust gases flow straight through the three-way catalytic converter (TWC) without being acted on. If the amplitude of the rear sensor becomes too great in relation to the amplitude of the front sensor for a number of checks, a diagnostic trouble code (DTC) will be stored for catalytic converter efficiency.

Catalytic Converter: Description and Operation
Three-way Catalytic Converter (TWC) Diagnostics

Three-way catalytic converter (TWC) diagnostics

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NOx(nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages, its ability to store oxygen is reduced. The conversion capacity of the three-way catalytic converter (TWC) is reduced and unburned residue which is harmful to environment is released. To reduce the environmentally damaging emissions, the engine control module (ECM) checks the efficiency of the three-way catalytic converter (TWC). In brief, this check is carried out as follows.
Two heated oxygen sensors are used to check the three-way catalytic converter (TWC). One is upstream of the converter and one is in the center of the converter (the rear heated oxygen sensor).
The main function of the heated oxygen sensors is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel/air mixture at around lambda=1. This mixture allows for optimum catalytic conversion.
To evaluate the efficiency of the three-way catalytic converter (TWC) one uses a deviation added to the lambda signal.
This means that 8 to 15 minutes after the engine is started (depending on the market) catalytic converter diagnostics start.
The process is as follows:
A deviation is added to the lambda signal and the engine control module (ECM) is allowed to correct this.
The deviation switches between positive and negative values so that the fuel/air mixture switches between rich and lean.
A counter registers the number of switches occurring while the diagnostic is taking place.
If the rear heated oxygen sensor registers a large number of switches exceeding a parameter, a diagnostic trouble code (DTC) for three-way catalytic converter (TWC) efficiency will be stored.
If the parameter is not exceeded the three-way catalytic converter (TWC) is deemed to be operating well.

Note! In a poorly operating three-way catalytic converter (TWC) the switches caused by the deviation will quickly exceed the parameter. This is because the exhaust gases in principle pass straight through the three-way catalytic converter (TWC) without being cleaned. If the three-way catalytic converter (TWC) is operating well the switches will be slower as it takes a longer time for the variations to make themselves felt.

Catalytic Converter: Service and Repair

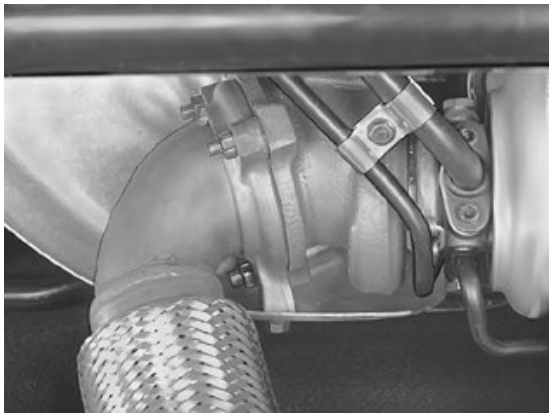
Three-way catalytic converter (TWC), replacing

Special tools:

999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

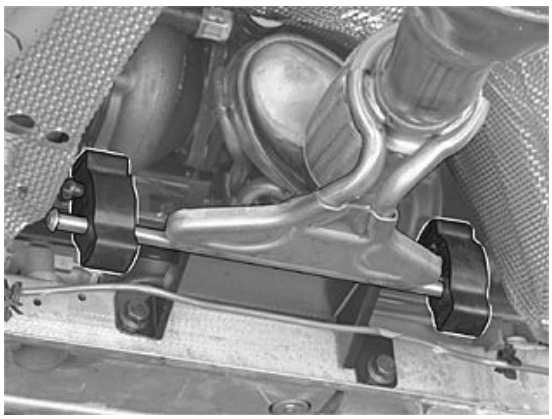
Removing the three-way catalytic converter (TWC)



Remove:

- the wiring for the front heated oxygen sensor (HO2S) from the clips and clamps. Separate the wiring. Raise the car
- the lower engine cover
- the front SIPS member. Unhook the brake pipe from the clips
- the lower screw in the heat deflector plate on the turbocharger (TC)
- the nuts for the flange between the turbocharger (TC) and the three-way catalytic converter (TWC).

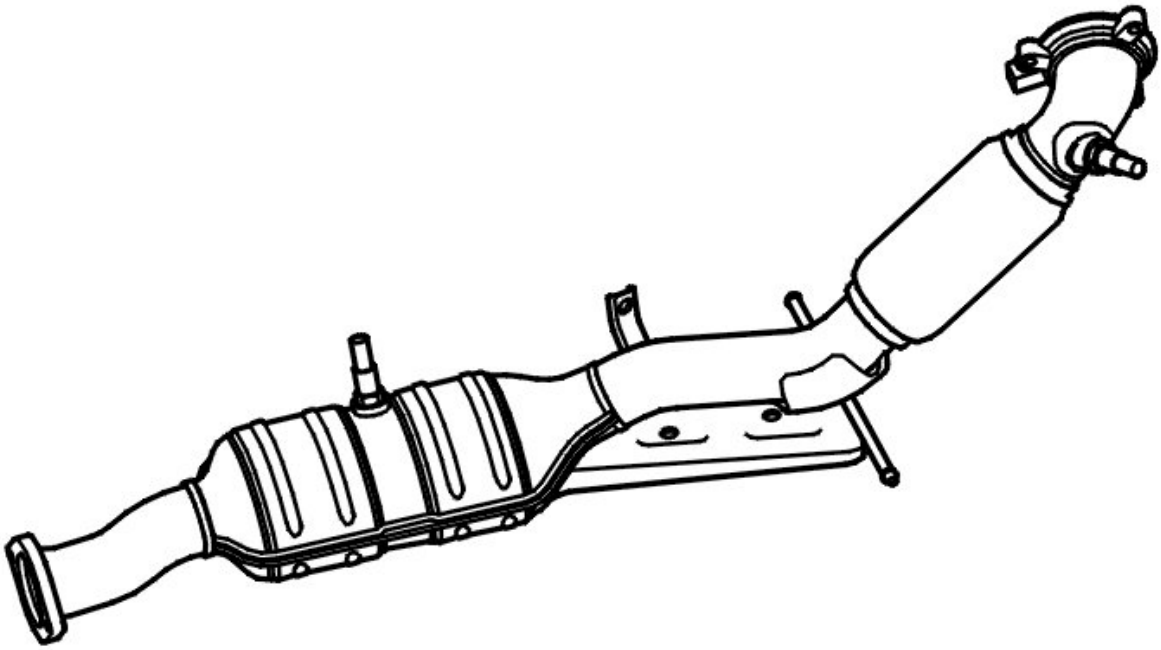
Hint: Use rust solvent or similar.



Remove:

- the rubber mounting for the three-way catalytic converter (TWC)
- the nuts for the flange between the three-way catalytic converter (TWC) and exhaust system
- the wiring for the rear heated oxygen sensor (HO2S) from the clips and clamps. Separate the wiring
- the three-way catalytic converter (TWC).

Transferring components



- Transfer the rear and front heated oxygen sensors (HO2S). Use tool 999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S.

  Caution! Do not mix up the heated oxygen sensors (HO2S).

- Tighten.

Installing the three-way catalytic converter (TWC)

Note! For tightening see Tightening torque See: Engine/Specifications/Tightening Torque.

Note! To ensure that there is no exhaust leakage, see: Flanged joint, assembling See: Exhaust Pipe/Service and Repair.

Lubricate the studs on the turbocharger (TC). Use paste, P/N: 1161408. Avoid skin contact with the paste.

Install:

- the three-way catalytic converter (TWC). Use new nuts and gaskets. Tighten. See Tightening torque See: Engine/Specifications/Tightening Torque
- the wiring for the rear heated oxygen sensors (HO2S) using the clips and the clamps. Connect the wiring
- the rubber mounting for the three-way catalytic converter (TWC)
- the lower screw in the heat deflector plate above the turbocharger (TC)
- the SIPS (side impact protection system) member. Secure the brake pipe to the member
- the lower engine cover.

Lower the car.
Install the wiring for the front heated oxygen sensor (HO2S) using clips and clamps. Connect the wiring.

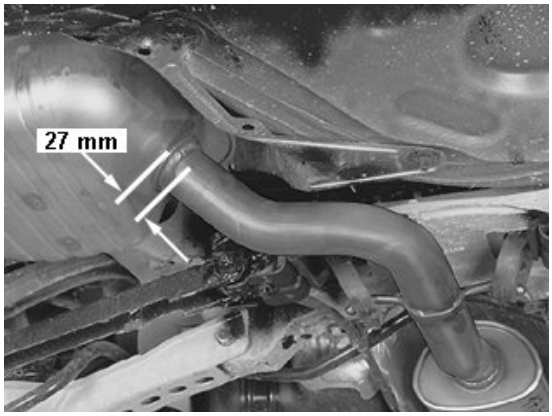
Final check

Start the engine. Check for exhaust leakage.

Muffler: Service and Repair

Muffler, rear, replace

Removing the rear muffler



Measure **27 mm** from the muffler and along the pipe. **See illustration!**

Mark and cut the pipe. Use pipe cutter 115 8590 PIPE CUTTER See: Tools and Equipment/115 8590 Pipe Cutter.
Remove the muffler.

Installing the rear muffler

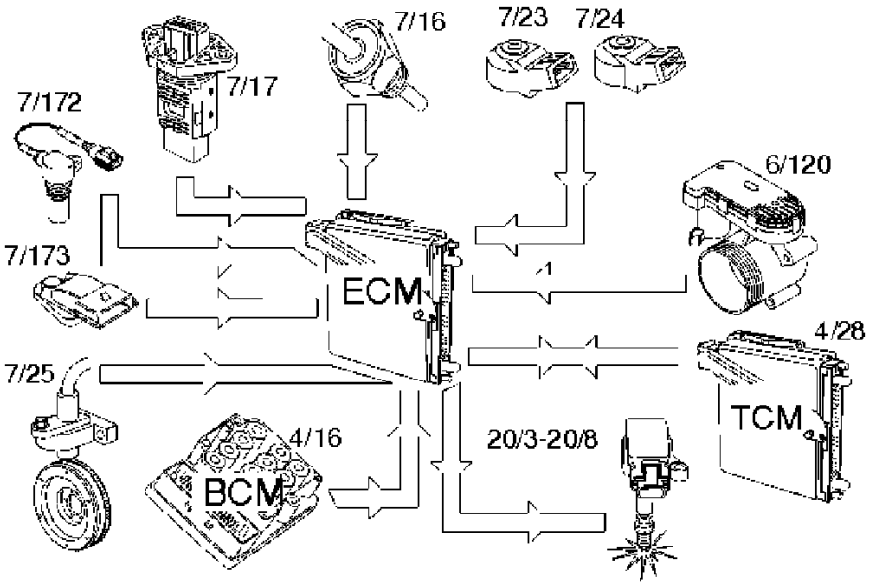
Polish the pipe with emery cloth.
Install a **new muffler**.
Tighten the clamp.

Check

Test run the engine. Check that the joint is properly sealed.

Ignition System: Description and Operation
Ignition Control

Ignition Control



The following components are used for ignition control:
- engine speed (RPM) sensor (7/25)
- camshaft position (CMP) sensor (7/172-7/173)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-7/24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/3-20/8)
- brake control module (BCM) (4/16).

The engine control module (ECM) calculates the optimum ignition advance based on the software and information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.

During the starting phase the engine control module (ECM) produces a fixed ignition setting.

When the engine starts and the car is driven the engine control module (ECM) calculates the optimum ignition setting according to the engine speed (RPM), load, temperature etc.

The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.

The ignition then advanced to the normal position or until the knock recurs.

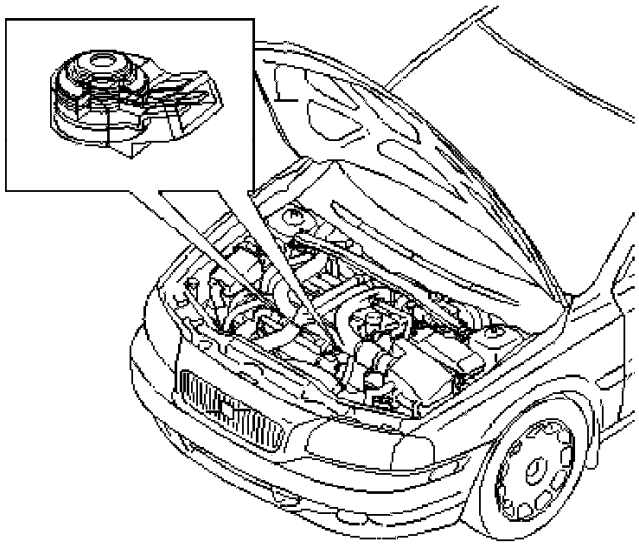
Before the transmission control module (TCM) changes gear, it sometimes transmits a torque limiting request to the engine control module (ECM). The engine control module (ECM) then retards the ignition momentarily to reduce the torque, resulting in smoother gear changes and reducing the load on the transmission. There are different ignition retardation levels depending on the signals from the transmission control module (TCM). The return signal from the engine control module (ECM) to the transmission control module (TCM) confirms that the signal reached the engine control module (ECM). The Brake Control Module (BCM) transmits information to the engine control module (ECM) about deviations in the drive line.

The signal is used to stop the diagnosis. For further information, also see Misfire diagnostics.

The engine misfires if the fuel does not ignite correctly. For further information, also see Misfire diagnostics.

Ignition System: Description and Operation
Knock Control

Knock Control



Knocking occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.

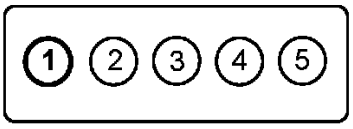
This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.

If any of the cylinders knock there is a specific type of vibration in the cylinder block. These vibrations are transferred to the knock sensors (KS) which are screwed into place in the cylinder block. The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. The engine control module (ECM) can then determine which cylinder is knocking with the help of the camshaft position (CMP) sensor and the engine speed (RPM) sensor.

The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.

If the knock sensors (KS) detect knocking in the engine over a certain threshold value, the ignition timing is first retarded and then the fuel/air mixture is enriched to eliminate knocking.

Firing Order : 1-2-4-5-3



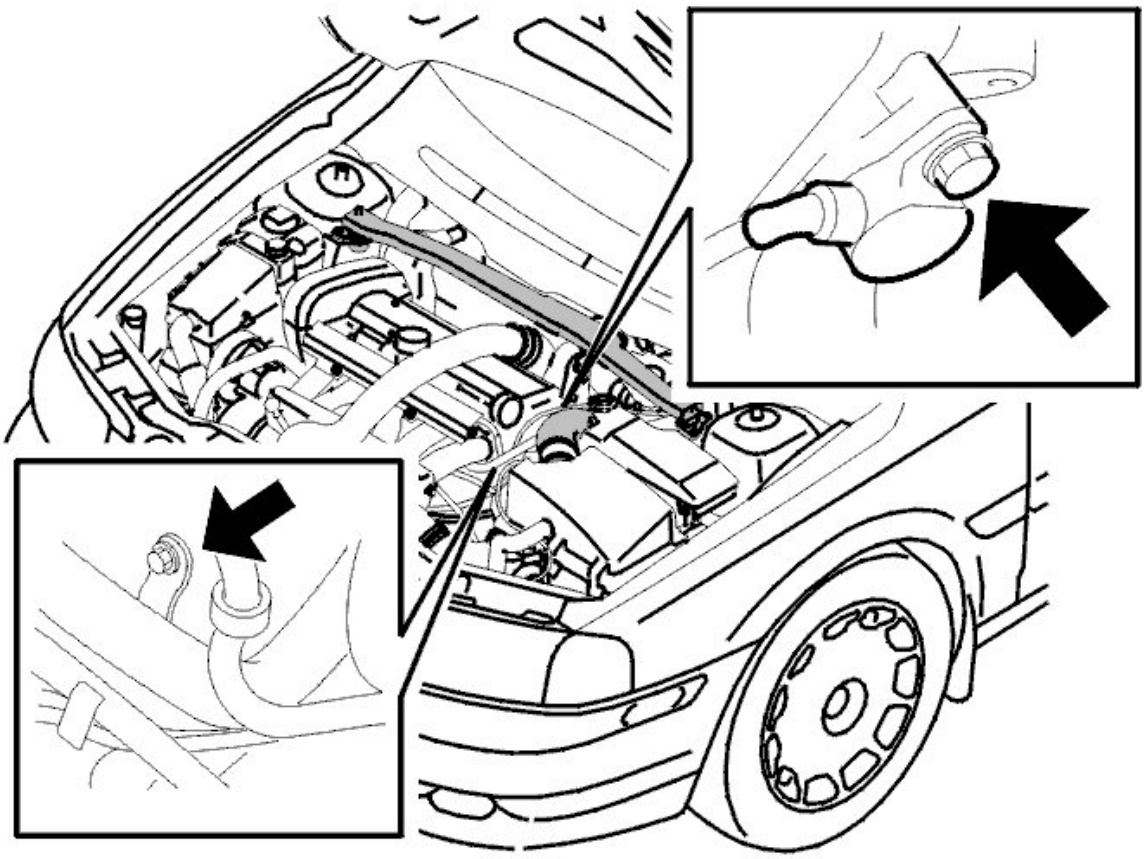
Front of Vehicle

Camshaft Position Sensor: Service and Repair

Position sensor camshaft, replacing

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removing the position sensor

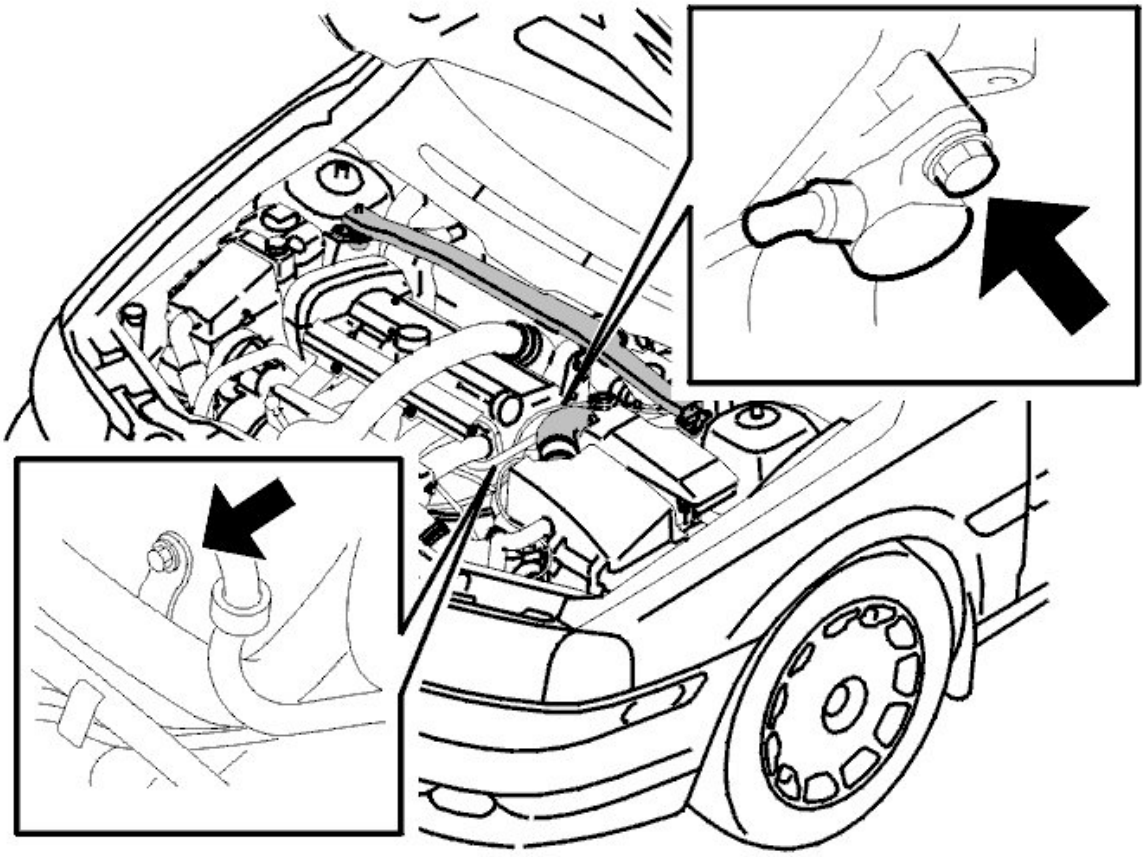


Disconnect the connector from the sensor.

Remove:

- the screw for the sensor
- the sensor.

Installing the position sensor



Install:

- the sensor
- screws. Tighten.

Connect the connector for the sensor.

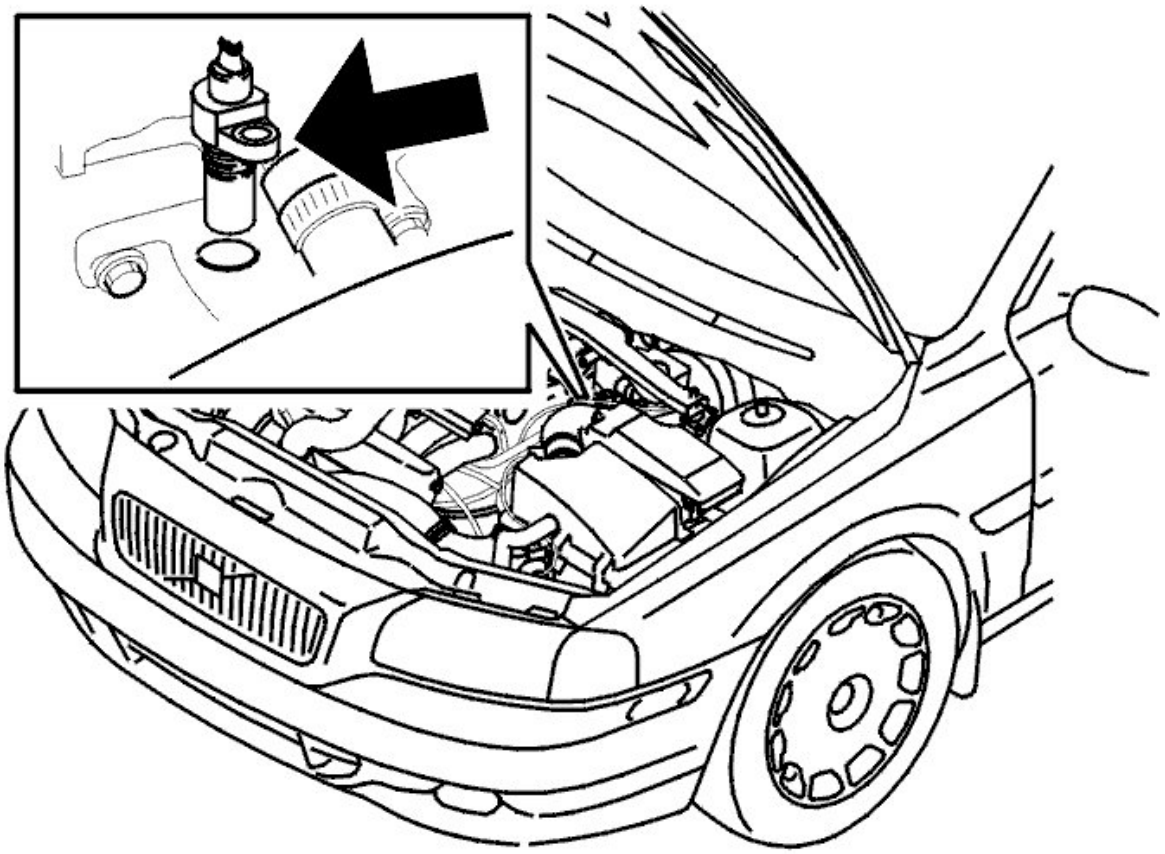
Finishing

Start the engine. Check the function.

Crankshaft Position Sensor: Service and Repair

Replacing the engine speed (RPM) sensor

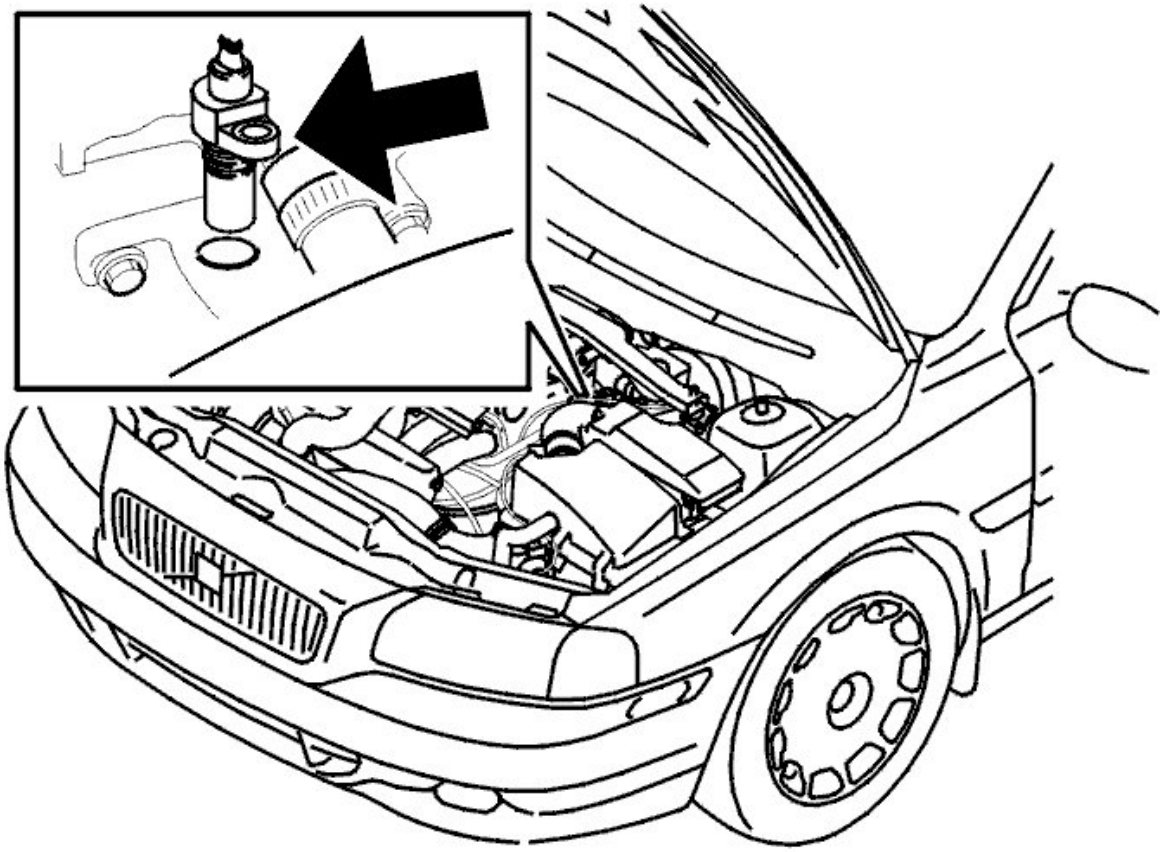
Removing the engine speed (RPM) sensor



Remove the tie strap from the torque rod.
Open the hose clamp.

Remove:
- the hoses
- the connector from the sensor
- the nut for the sensor
- the sensor.

Installing the engine speed (RPM) sensor



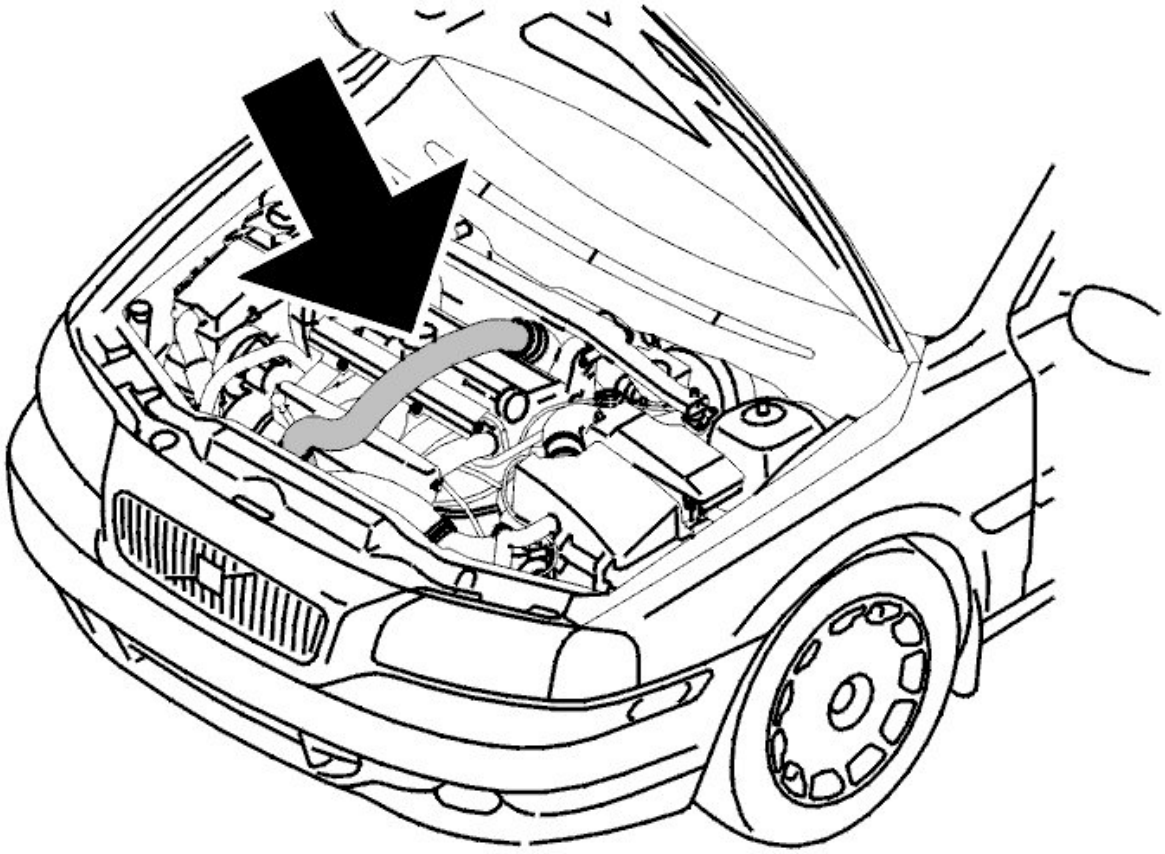
Install

- the sensor. Use a**new**nut. Tighten to **10 Nm**
- the connector
- the hoses and close the clamp
- the tie strap on the torque rod.

Ignition Coil: Service and Repair

Replacing ignition coils

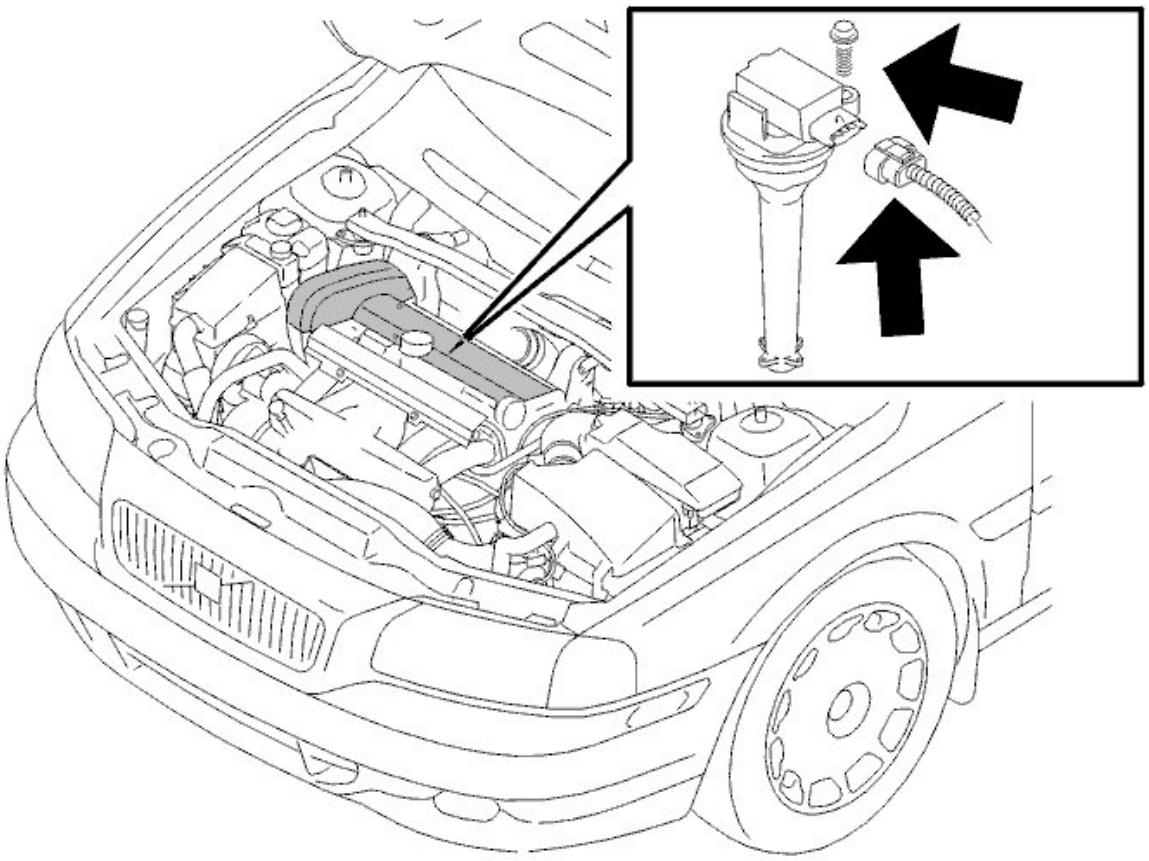
Removing ignition coils



Remove

- the charge air pipe over the engine.

Seal the openings

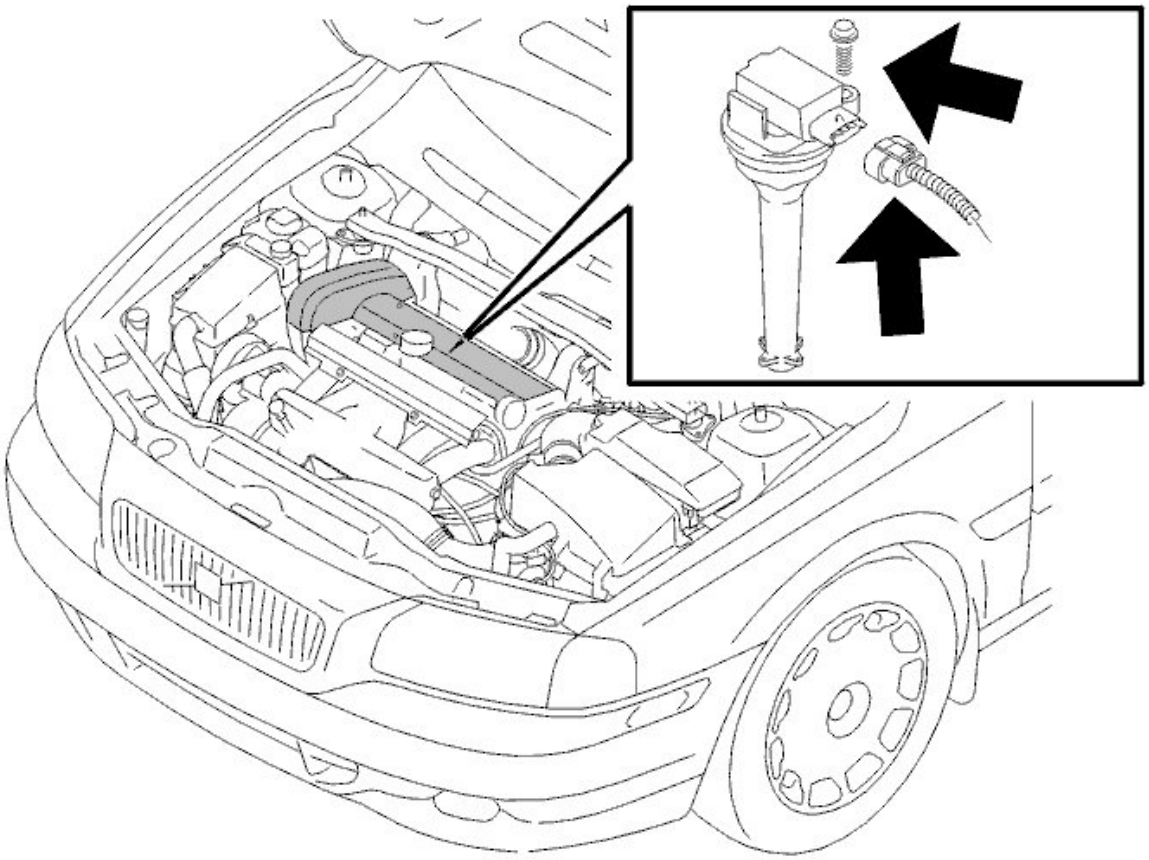


- the upper timing belt cover
- the cover over the ignition coils

Disconnect the ignition coil connector.

- the mounting screw. Pull the coil up.

Installing ignition coils



Install the**new**coil.
Align the coil and press it down. Install the screw. Tighten to **10 Nm**.

Press in the connector until a clicking sound is heard.
Install the cover over the ignition coil.
Install the upper timing belt cover.
Remove the seals from the charge air pipe. Reinstall the charge air pipe over the engine.

Knock Sensor: Service and Repair

Replacing knock sensors (KS)

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removing the knock sensor (KS)

Remove

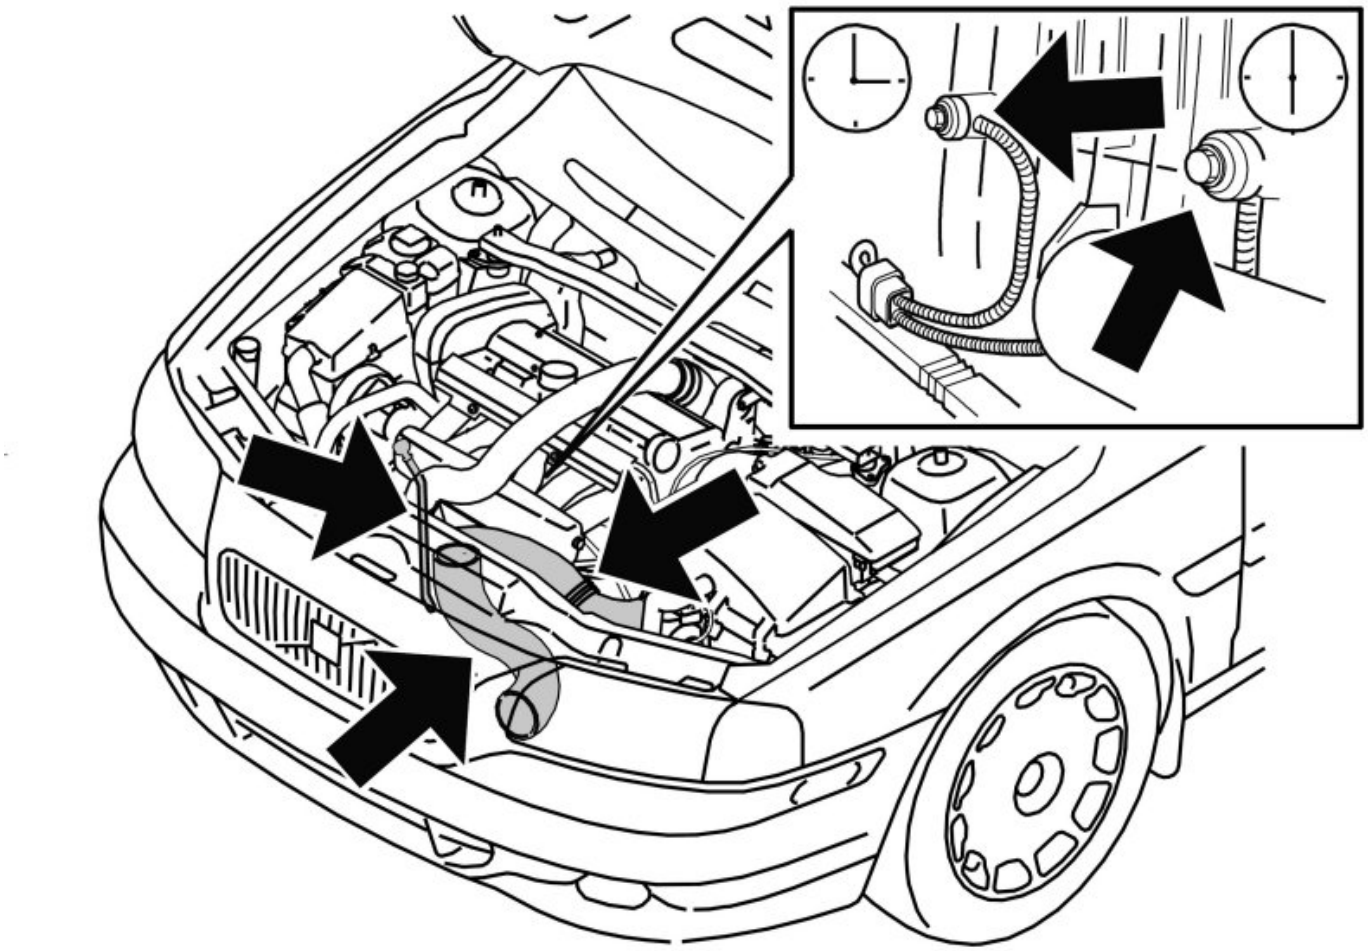
- the cable from the battery negative terminal. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- the intake pipe between the front cover plate and the air cleaner (ACL)

Detach the pipe from the charge air cooler at the throttle housing. Push the pipe to one side

- the dip stick and its holder
- the screws for the knock sensors (KS)
- the tie strap at the connector.

Disconnect the connector. Pull the sensors downwards and past the rear edge of the starter motor bracket.

Installing knock sensors (KS)



Install the new sensor. Tighten by hand.
Route the cables on the outside of the starter motor bracket.
Align the sensors. The cable from the sensor for cylinder 2 = 3 o'clock and from the sensor for cylinder 4 = 6 o'clock.
Tighten the knock sensors (KS) to **20 Nm**.
Connect the knock sensor (KS) connectors. Check that the wiring is in the correct position. Secure with a tie strap at the starter motor bracket.

Install

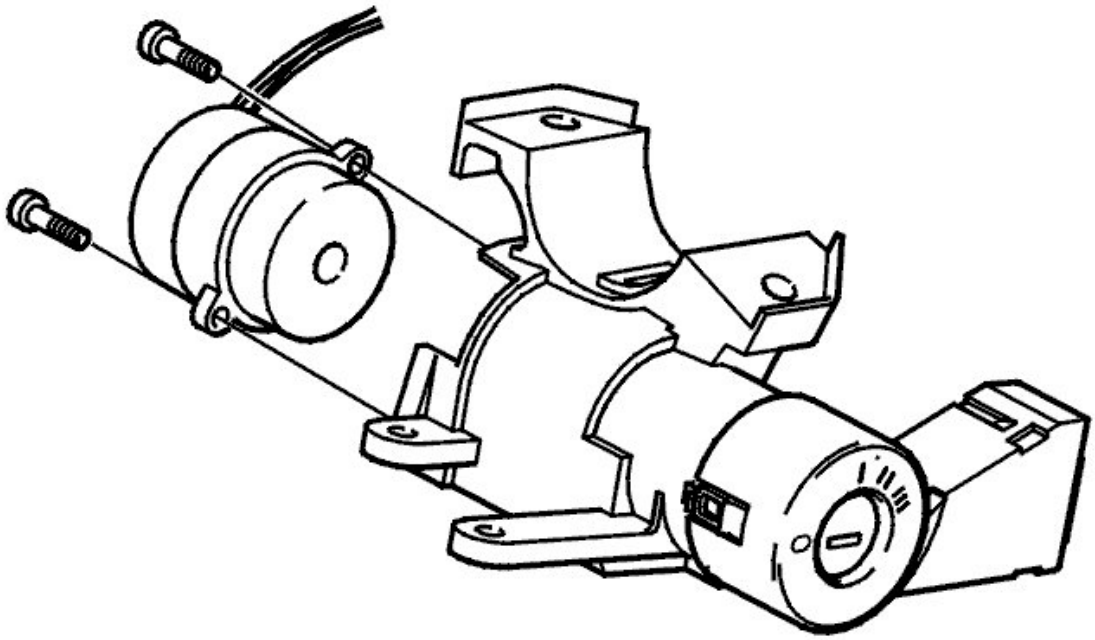
- the dip stick
- the pipe between the throttle body (TB) and the charge air cooler (CAC)
- the intake pipe between the front cover plate and the air cleaner (ACL)
- the negative battery cable. First read Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Ignition Switch: Service and Repair

Starter switch, replacing

Removal

Start switch



- Remove the steering column covers. See Soundproofing panel, replacing See: Body and Frame/Interior Moulding / Trim/Dashboard / Instrument Panel/Service and Repair/Soundproofing Panel, Replacing
- Disconnect the connector
- Remove the 2 screws
- Remove the starter switch.

Installation

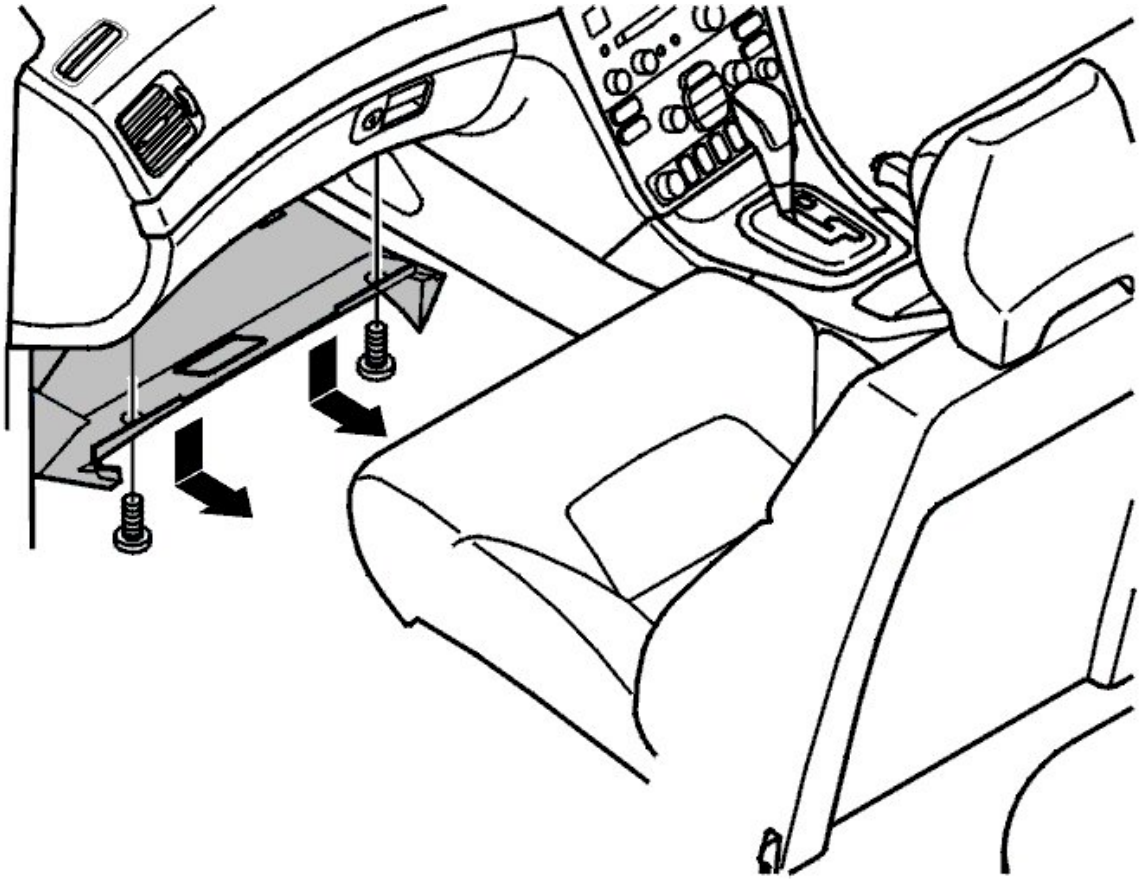
Start switch

- In reverse order
- Install the steering column covers. See Soundproofing panel, replacing See: Body and Frame/Interior Moulding / Trim/Dashboard / Instrument Panel/Service and Repair/Soundproofing Panel, Replacing.

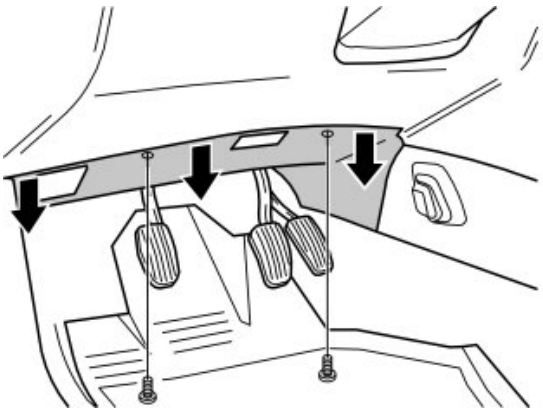
Dashboard / Instrument Panel: Service and Repair
Soundproofing Panel, Replacing

Soundproofing panel, replacing

Removing soundproofing panels



Remove two screws.
Remove the panel by pulling it straight down.



Remove two screws.
Remove the panel by pulling it straight down.

Installing soundproofing panel

Install:

In reverse order.

Spark Plug: Application and ID

Spark Plugs

Spark Plug	**Champion RC8PYP 8 (or equivalent)**
Gap	**0.028-0.032" (0.7-0.8 mm)**
Torque	**18.4 ft lb (25 Nm)**

Fuel Delivery and Air Induction: Testing and Inspection
Air Leaks in the Intake System, Checking

Air leakage in the intake system, checking

Special tools:

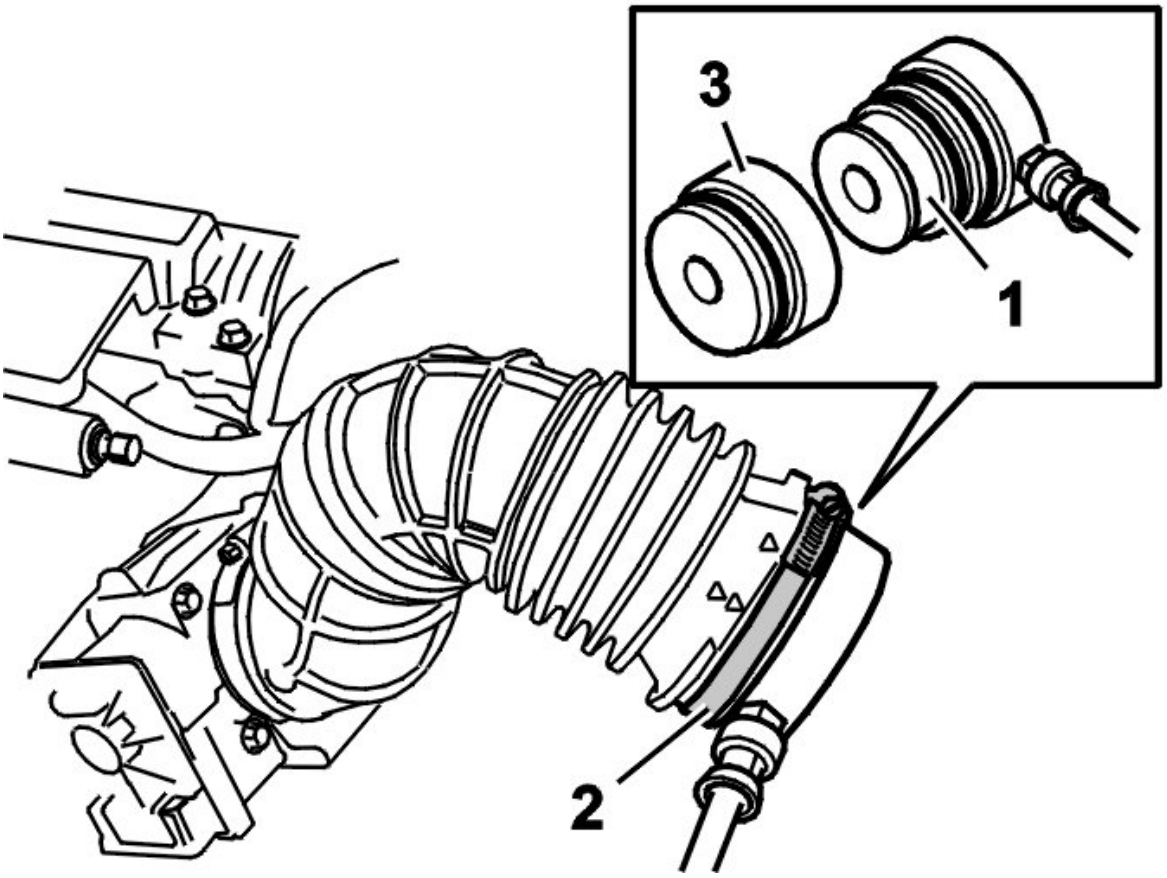
999 5545 ADAPTOR See: Tools and Equipment/999 5545 Adaptor
999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator
999 7080 Adapter See: Tools and Equipment/999 7080 Adapter

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Preparations

Check that all hoses are undamaged and are in place with their hose clamps tightened.

Engagement



Note! S80 T6 and S60/V70 R use: 999 5545 ADAPTOR See: Tools and Equipment/999 5545 Adaptor (1) with 999 7080 Adapter See: Tools and Equipment/999 7080 Adapter (3). Lock 999 7080 Adapter See: Tools and Equipment/999 7080 Adapter on 999 5545 ADAPTOR See: Tools and Equipment/999 5545 Adaptor.

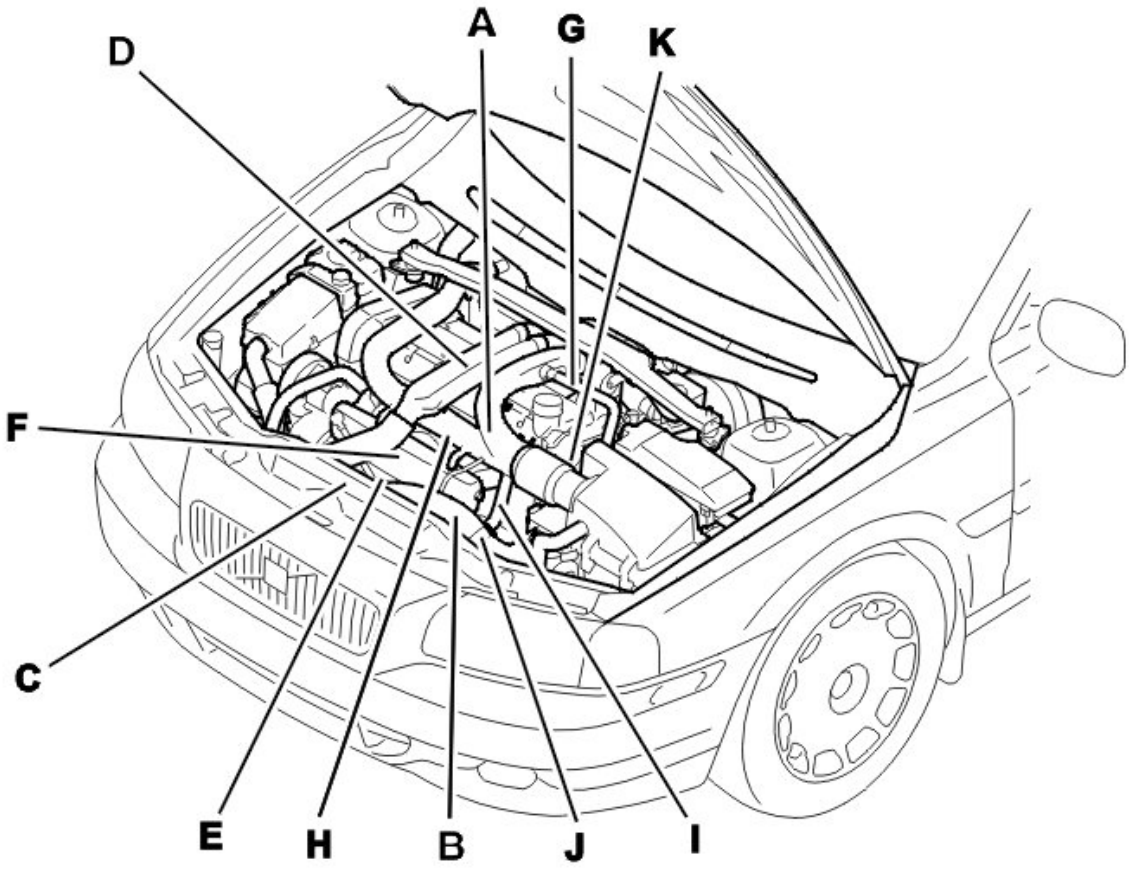
Remove the fresh air hose from the mass air flow (MAF) sensor.
Install tool 999 5545 ADAPTOR See: Tools and Equipment/999 5545 Adaptor (1) and pressure regulator 999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator on the fresh air intake. Tighten the hose clamp (2).
Remove the oil filler cap.

Check

Adjust the regulator to obtain a maximum pressure of **0.3 bar** (0.15 psi). There may be a gentle hissing sound from the oil filler opening. This is due to the opening of an intake valve and the leakage of cylinder pressure past the piston rings.
Check components and connections. See: Checking components.
If a leak is suspected, spray a soap solution onto the area. Check for air leakage from the canister purge (CP) valve. No leakage is permissible.

Checking components

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



- A fresh air intake
- B lower charge air pipe
- C charge air cooler (CAC)
- D upper charge air pipe
- E throttle body (TB)
- F intake manifold with vacuum hoses and gaskets
- G crankcase ventilation
- H injectors
- I brake servo hose
- J evaporative emission system (EVAP) valve
- K Turbocharger (TC) control valve.

Fuel Delivery and Air Induction: Testing and Inspection
Fuel System Pressure, Checking

Fuel system pressure, checking

Note! Some variation in the illustrations may occur, but the essential information is always correct.

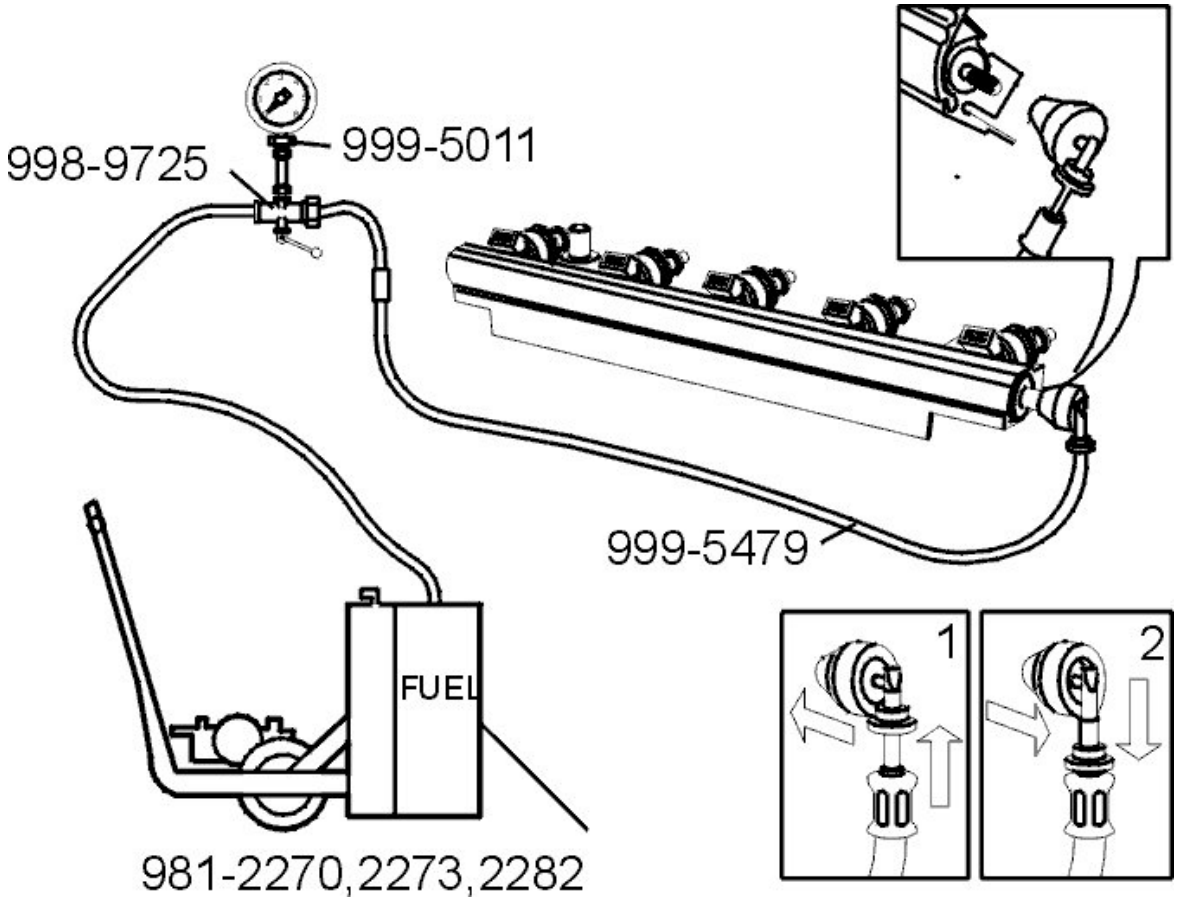
Check the fuel pressure see: Diagnostics, Vehicle communication, ECM, Parameters, Fuel pressure.

Absolute pressure: Fuel pressure in fuel system + air pressure.
Relative pressure: Fuel pressure in fuel system.
The air pressure is approx. 100 kPa at sea level. VIDA measures the fuel pressure in absolute pressure. External pressure gauge (pressure gauge) measures the fuel pressure in relative pressure.

Fuel line pressure. Refer to: Specifications, mechanical, B5244T5, B5254T2 See: Engine, Cooling and Exhaust/Engine/Specifications/Specifications, Mechanical

The following method must be used when reading the fuel line pressure on the fuel rail:



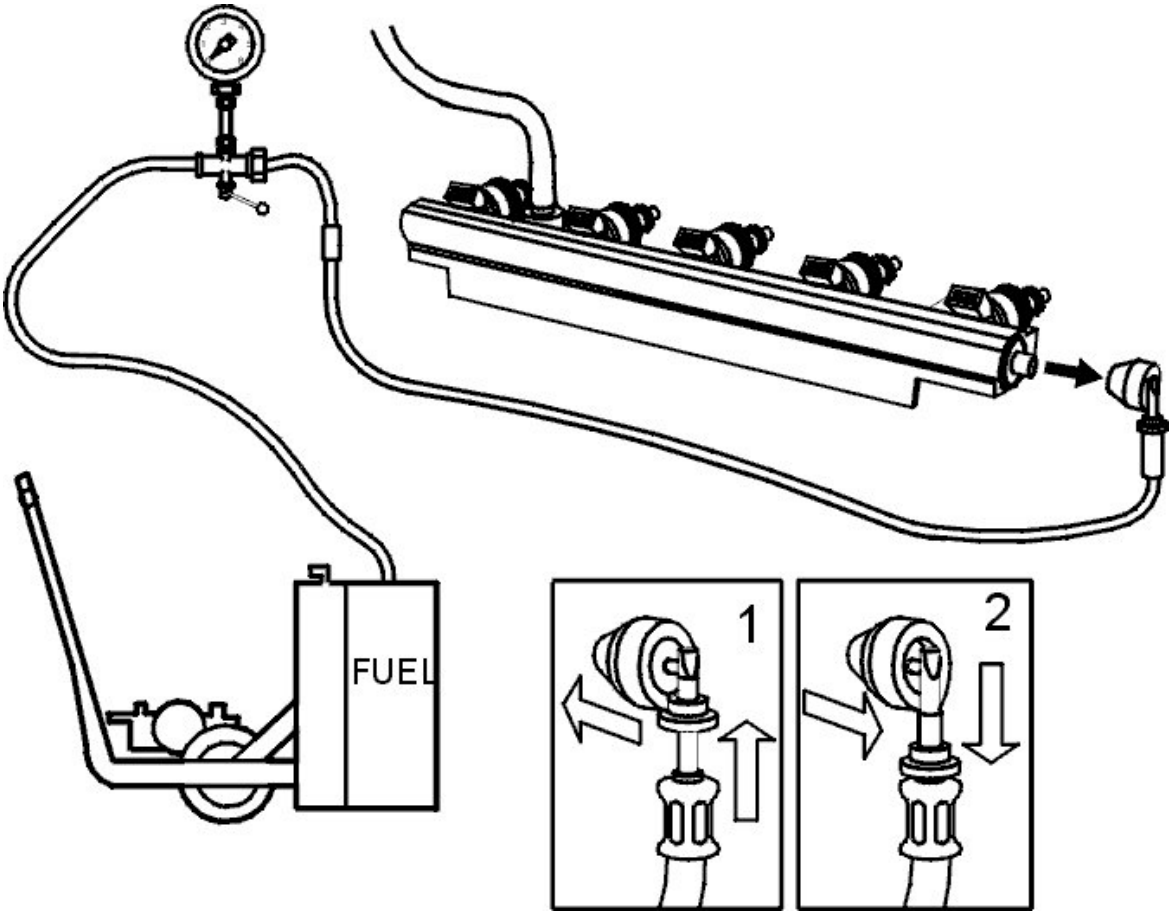
Engagement of fuel pressure gauge.
Supplement the pressure gauge with adapter and nipple before use.

- 999 5011 MANOMETER See: Tools and Equipment/999 5011 Manometer
- 998 9725 Adapter See: Tools and Equipment/998 9725 Adapter
- 999 5479 ADAPTER See: Tools and Equipment/999 5479 Adapter

Connect the adapter to the valve on the fuel rail in the locked position (image 1, valve closed).
Set the cock on the pressure gauge in the direction of the nipple.
999 5479 ADAPTER See: Tools and Equipment/999 5479 Adapter
Connect the pressure gauge's other connection to the fuel drain equipment.

- 981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley
- 981 2273 PUMP See: Tools and Equipment/981 2273 Pump
- 981 2282 Tank See: Tools and Equipment/981 2282 Tank

Unlock the adapter (illustration 2, valve open).
Start the engine.
Read off the relative pressure.



Disengagement of fuel pressure gauge.
Ignition off.
Start the draining unit.
Set the cock on the pressure gauge to the central position.
Secure the adapter (image 1, valve closed).
Remove the adapter from the valve.
Stop the draining unit.
Reset the equipment.

Fuel Delivery and Air Induction: Service and Repair

Draining the fuel system

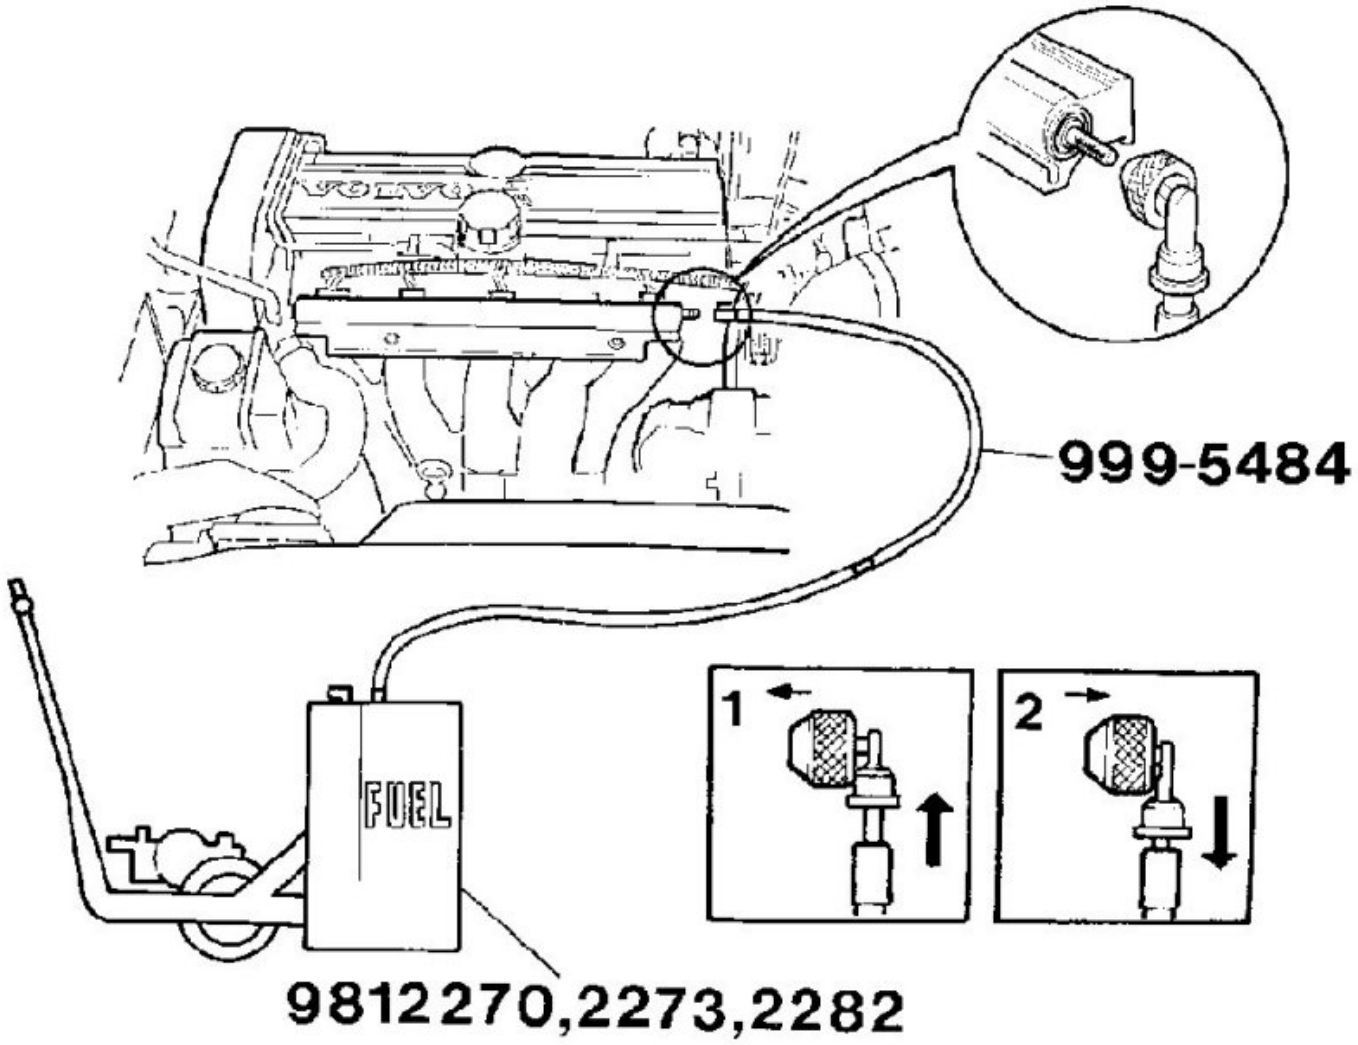
Special tools:

981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley
981 2273 PUMP See: Tools and Equipment/981 2273 Pump
981 2282 Tank See: Tools and Equipment/981 2282 Tank
999 5480 Adapter See: Tools and Equipment/999 5480 Adapter
999 5484 Adapter See: Tools and Equipment/999 5484 Adapter

Safety

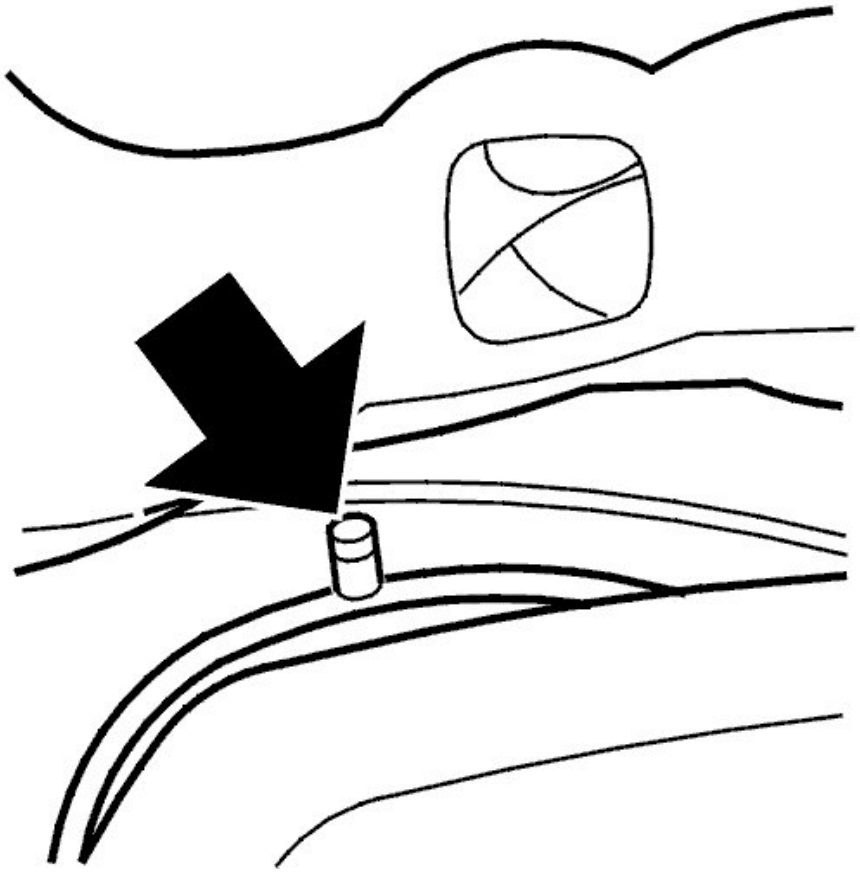
See Safety regulations for handling fuel See: Service Precautions/Safety Regulations for Handling Fuel.

Engagement



Remove the cover on the valve which is positioned on the fuel rail.
Connect adapter 999 5484 Adapter See: Tools and Equipment/999 5484 Adapter to fuel draining unit 981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley , 981 2273 PUMP See: Tools and Equipment/981 2273 Pump and 981 2282 Tank See: Tools and Equipment/981 2282 Tank.
Connect the adapter to the valve on the fuel rail in the **locked** position (figure 1, valve closed).
Start the fuel drainage unit.
Unlock the adapter (illustration 2 valve open).
Raise the car.

Draining the fuel system



Remove the cover on the valve cap positioned at the fuel filter.
Connect venting hose 999 5480 Adapter See: Tools and Equipment/999 5480 Adapter to the valve prior to the fuel filter.
It takes approximately **2 minutes** to evacuate the system.

Installation

Reinstall the components in reverse order.

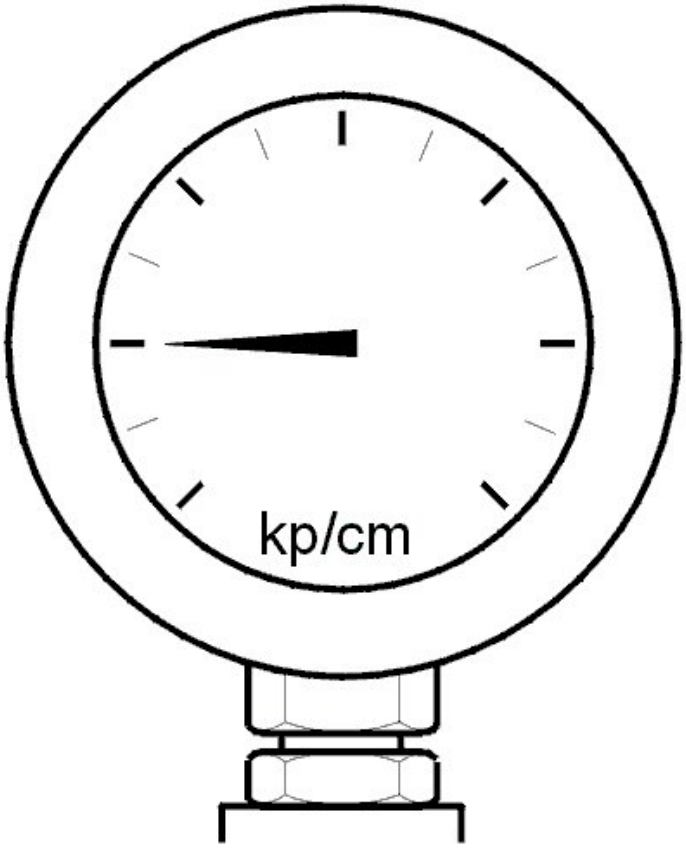
Caution! Do not forget to reinstall the valve caps.

Fuel Pressure: Testing and Inspection
Checking Fuel and Residual Pressures

Checking fuel and residual pressures

Note! For vehicles with demand activated fuel pumps (FP), see VIDA vehicle communication Quick test of fuel pump (FP).

Measuring the line pressure



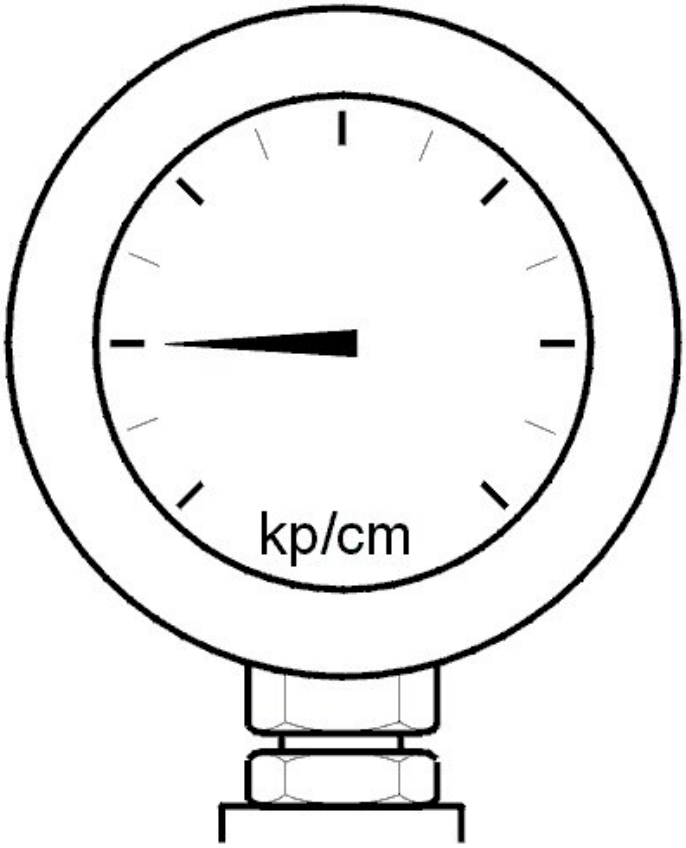
- Connect the pressure gauge according to Fuel pressure gauge See: Fuel Pressure Gauge
- Remove the soundproofing panel
- Remove the fuel pump (FP) relay (CMI 12 in the passenger compartment)
- Connect a cable to the relay base as illustrated.

Read off the line pressure from the pressure gauge. The line pressure must be 375-395 kPa.
Check the residual pressure if the fuel pressure is OK.
Remedy as necessary.

Other information:

- For the location of and to replace the fuel pump (FP) relay, see Central electronic module (CEM), replacing See: Computers and Control Systems/Body Control Module/Service and Repair/Central Electronic Module (CEM), Replacing
- For the location of and to replace the fuel pump (FP), see
- For the location of and to replace the fuel filter, see Replacing the fuel filter See: Fuel Filter/Service and Repair
- To disconnect the pressure gauge, see Fuel pressure gauge See: Fuel Pressure Gauge

Checking the residual pressure



- Switch off the ignition
- Disconnect the cable between the terminals on the relay base
- Reinstall the fuel pump (FP) relay.

The line pressure must not fall below 200 kPa within 20 minutes of the fuel pump (FP) being shut-off.
Remedy as necessary.

Other information:

- For the location of and to replace the injector on 5-cylinder engines, see Injector/pulse damper, replacement See: Fuel Pressure Pulsation Damper/Service and Repair. For 6-cylinder engines, see
- For the location of and to replace the fuel pump (FP) relay, see Central electronic module (CEM), replacing See: Computers and Control Systems/Body Control Module/Service and Repair/Central Electronic Module (CEM), Replacing
- For the location of and to replace the fuel pump (FP), see Right side fuel pump with level sensor See: Fuel Tank/Fuel Gauge Sender/Service and Repair/Right Side Fuel Pump With Level Sensor
- To disconnect the pressure gauge, see, Fuel pressure gauge See: Fuel Pressure Gauge.

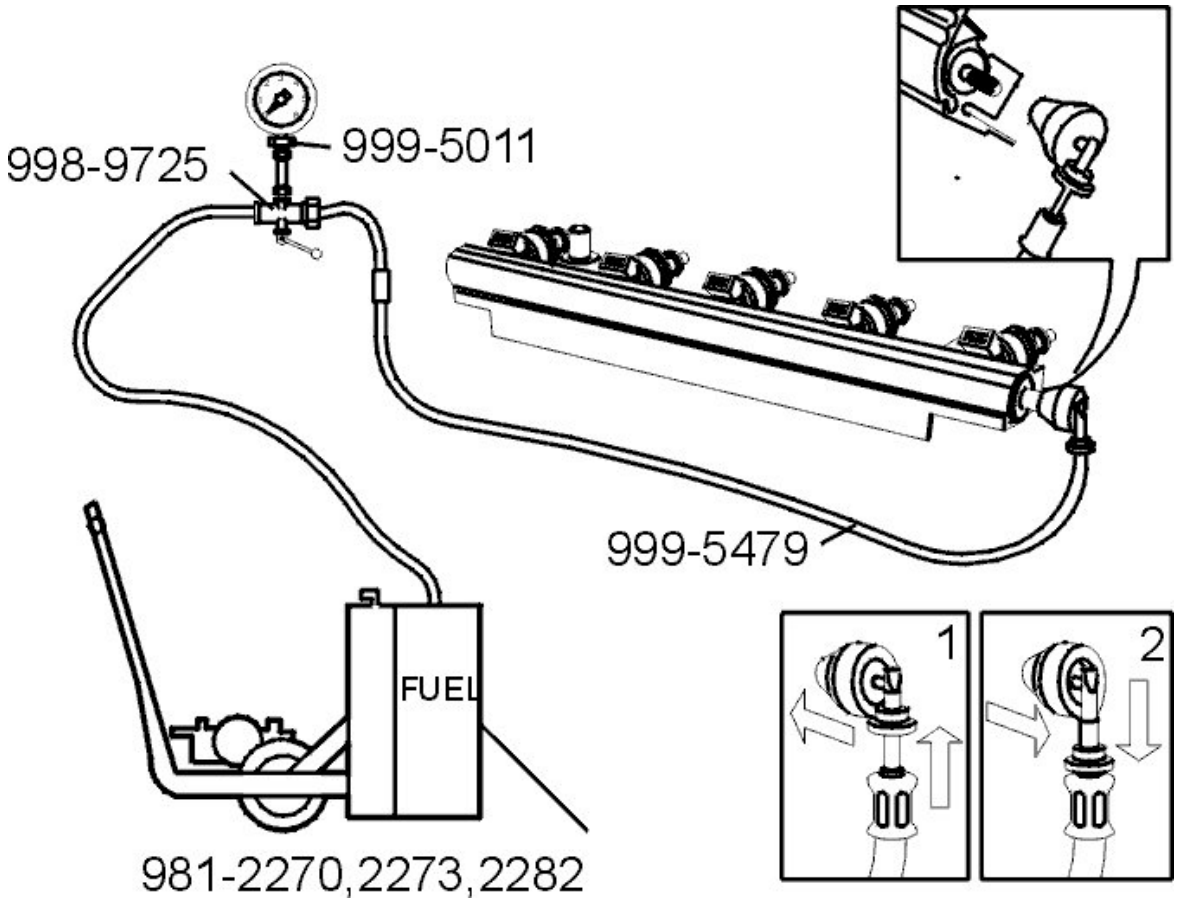
Fuel Pressure: Testing and Inspection
Fuel Pressure Gauge

Fuel pressure gauge

Special tools:

981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley
981 2273 PUMP See: Tools and Equipment/981 2273 Pump
981 2282 Tank See: Tools and Equipment/981 2282 Tank
998 9725 Adapter See: Tools and Equipment/998 9725 Adapter
999 5011 MANOMETER See: Tools and Equipment/999 5011 Manometer
999 5479 ADAPTER See: Tools and Equipment/999 5479 Adapter

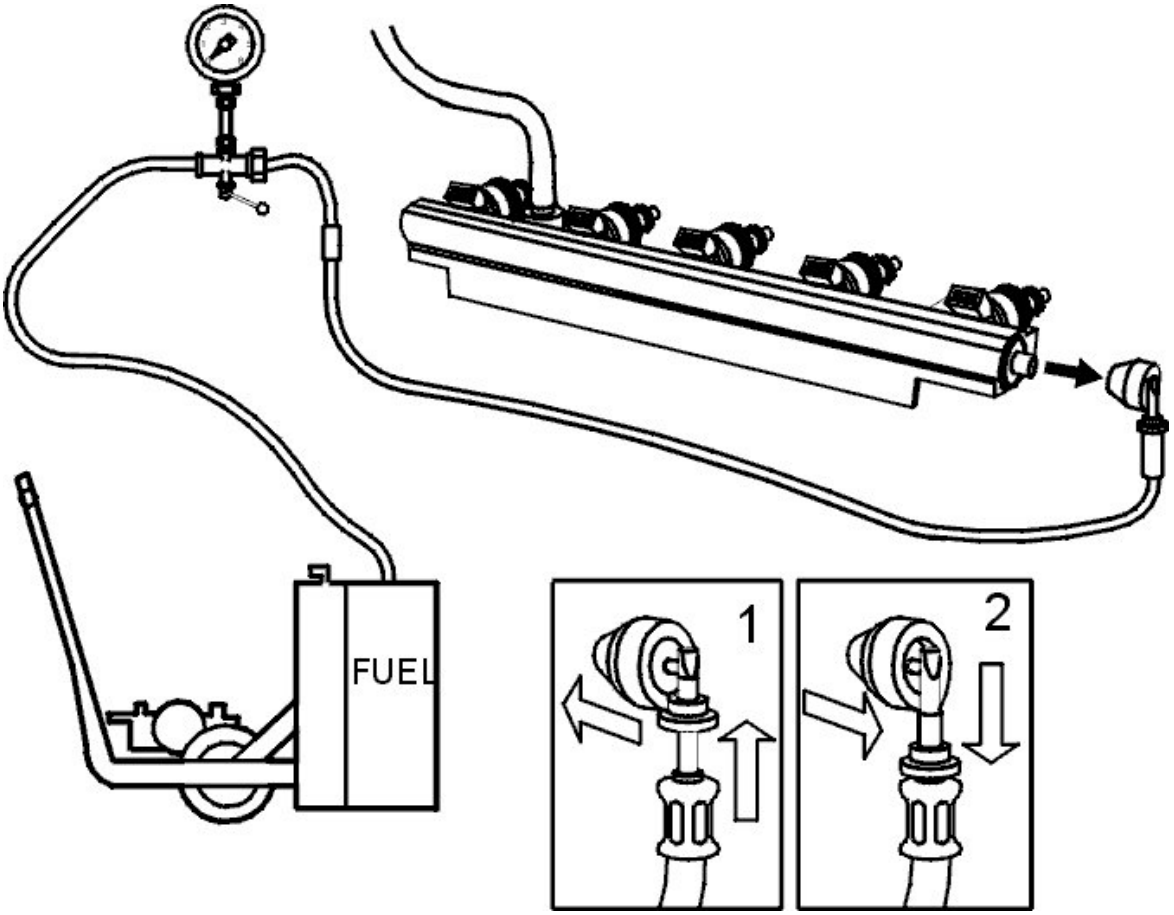
Connecting fuel pressure gauge



- Supplement pressure gauge999 5011 MANOMETER See: Tools and Equipment/999 5011 Manometer with adapter998 9725 Adapter See: Tools and Equipment/998 9725 Adapter and nipple999 5479 ADAPTER See: Tools and Equipment/999 5479 Adapter before use.
- Connect adapter to valve on fuel rail, with adapter in locked position (valve closed as in picture 1).
- Turn pressure gauge cock towards nipple999 5479 ADAPTER See: Tools and Equipment/999 5479 Adapter.
- Connect pressure gauge second connector to fuel draining unit981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley ,981 2273 PUMP See: Tools and Equipment/981 2273 Pump and981 2282 Tank See: Tools and Equipment/981 2282 Tank.
- Unlock adapter (illustration 2 valve open).

Disconnecting fuel pressure gauge

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



- Ignition off.
- Start draining unit.
- Turn pressure gauge cock to mid-position.
- Lock adapter (valve closed as in illustration 1).
- Disconnect adapter from valve.
- Stop draining unit.
- Reinstall equipment.

Caution! Remember to reinstall valve safety cap.

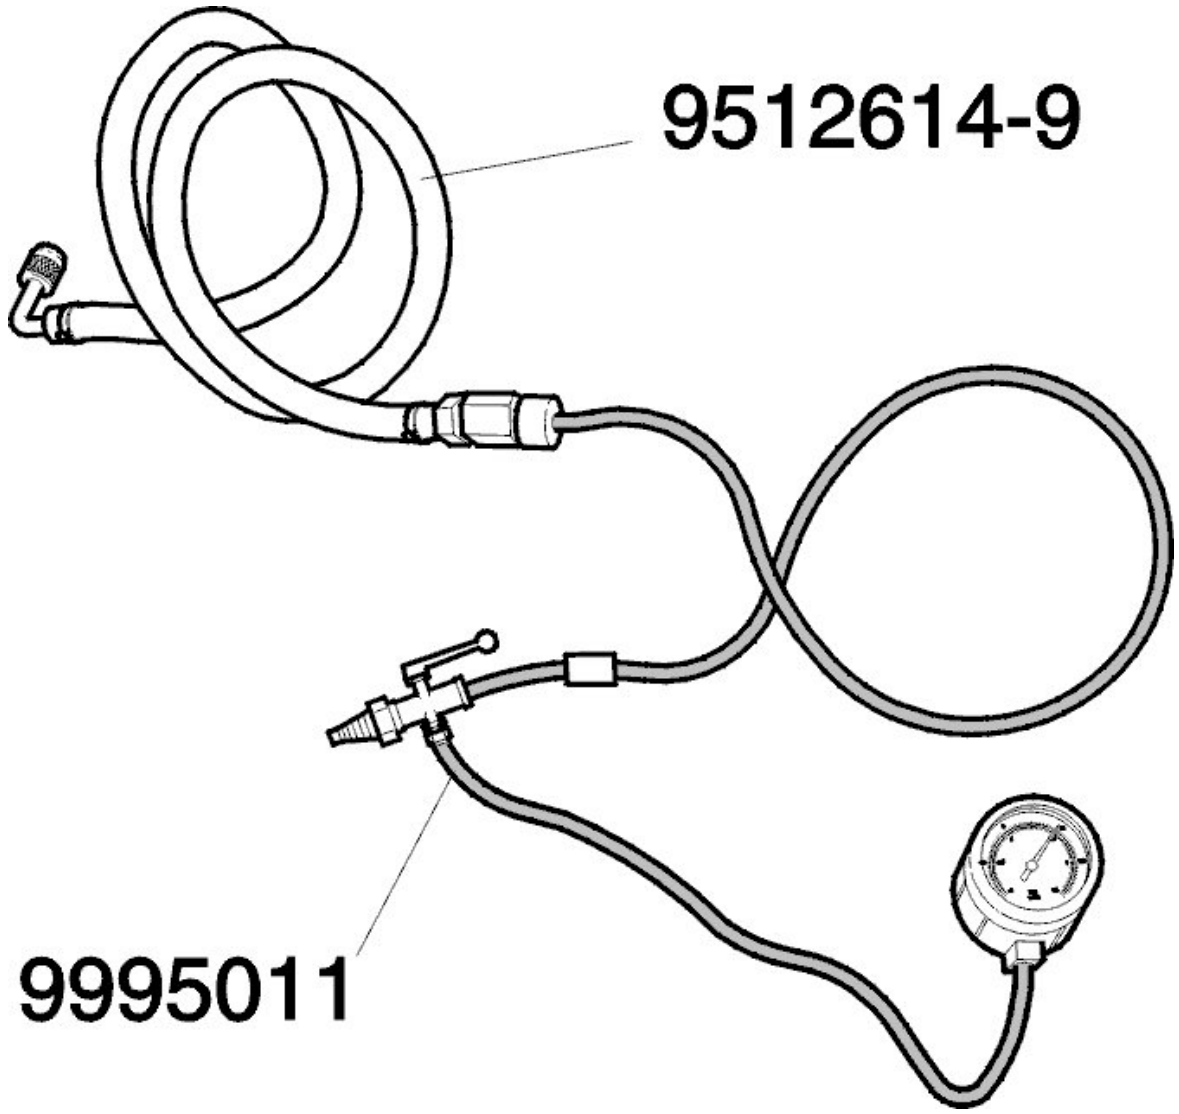
Fuel Pressure: Testing and Inspection
Taking Fuel Pressure Readings While Driving the Car

Taking fuel pressure readings while driving the car

Special tools:

999 5011 MANOMETER See: Tools and Equipment/999 5011 Manometer
951 2614 hose See: Tools and Equipment/951 2614 Hose
981 2270 PUMP TROLLEY See: Tools and Equipment/981 2270 Pump Trolley
981 2273 PUMP See: Tools and Equipment/981 2273 Pump
981 2282 Tank See: Tools and Equipment/981 2282 Tank

Installing test equipment

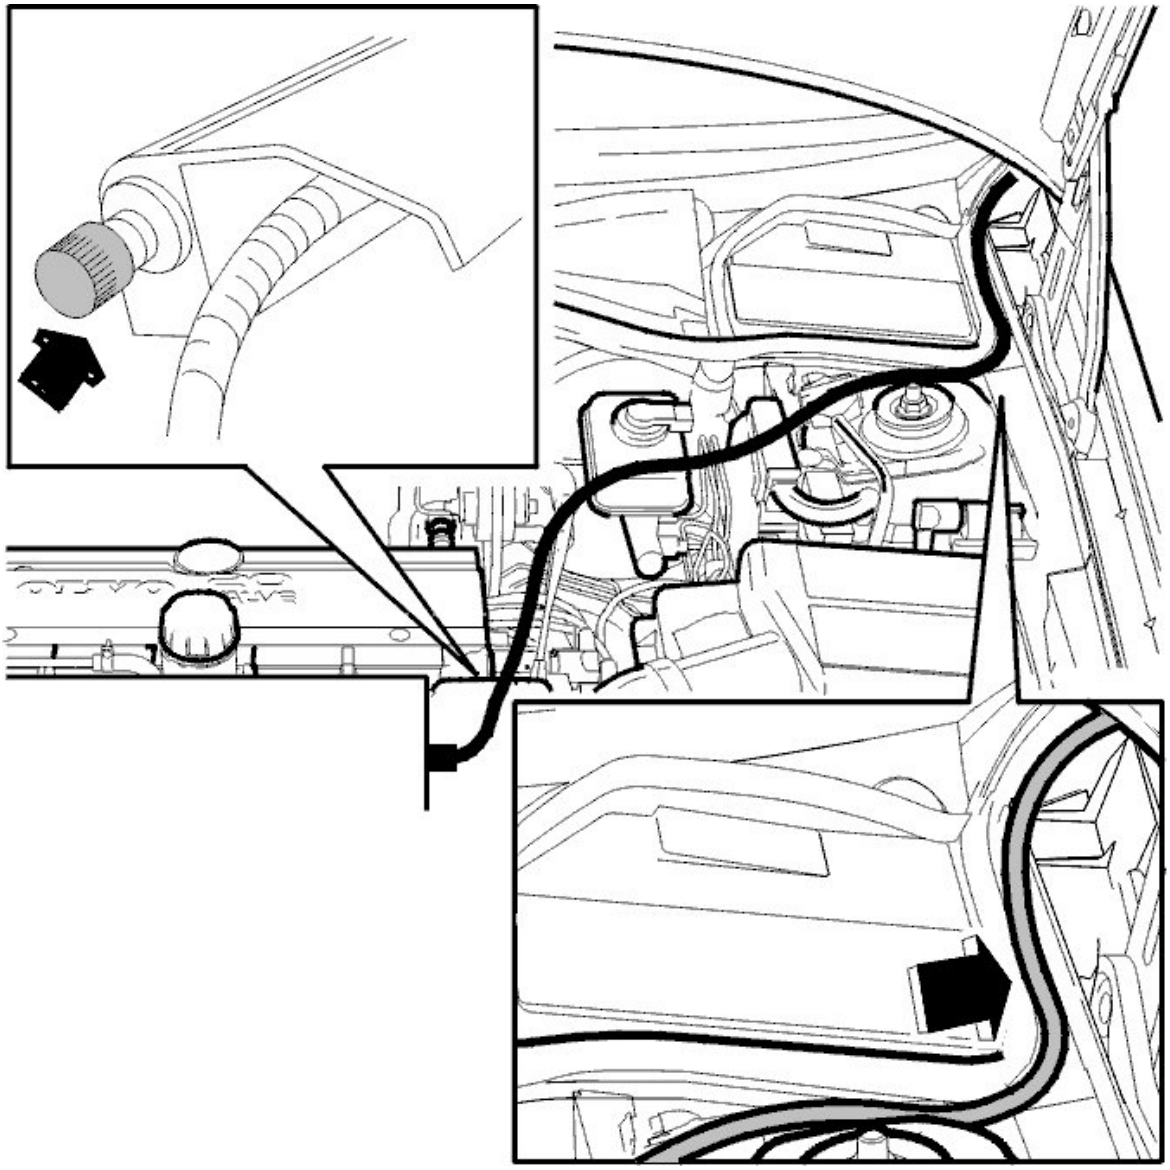


Corrective actions:

- Assemble fuel pressure gauge999 5011 MANOMETER See: Tools and Equipment/999 5011 Manometer and new adapter hose**951 2614**.
- Use foam wrapping around the fuel pressure gauge and all metal joints to avoid scratching the interior of the car or damaging the exterior paintwork.

Connecting fuel pressure gauge

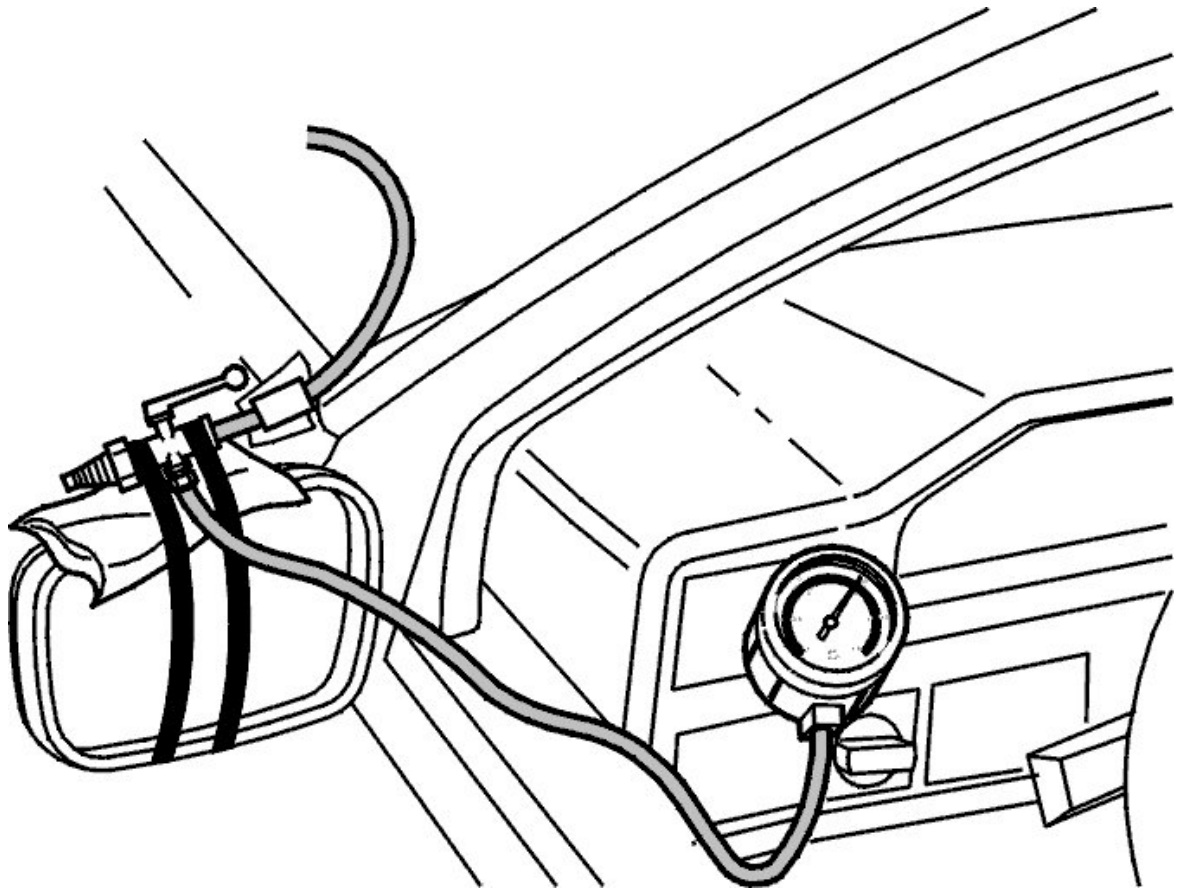
Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Corrective actions:

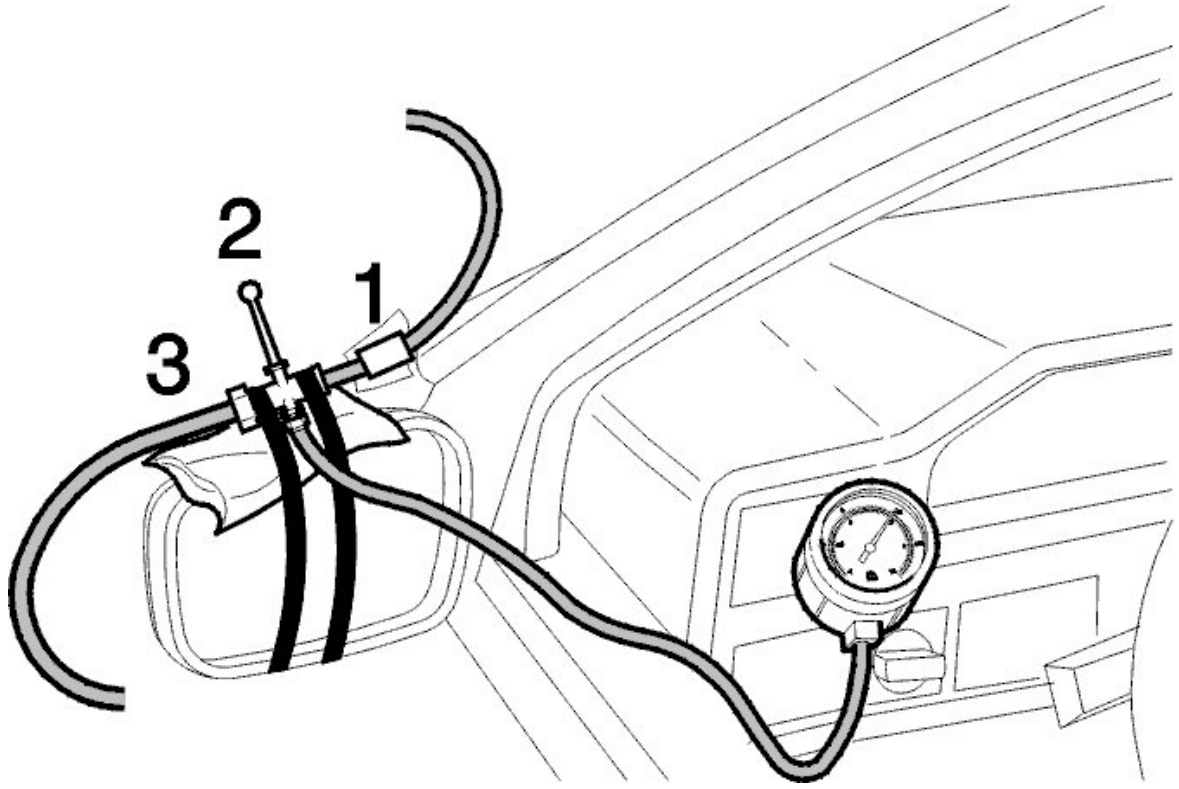
- Remove protective cap from the fuel pressure line nipple.
- Install the adapter hose nipple loosely on the nipple on the fuel pressure line. The nipple will be tightened later.
- Arrange hose as illustrated.

Caution! Ensure that the hose follows the rubber trim on the plenum chamber and then out of the engine compartment at the rear corner of the hood, with the adapter hose joint at the T-valve outside the engine room, so that neither the bonnet or the hose are damaged when the hood is closed. In addition check that hose cannot contact the throttle control reel.



- Install the T-valve to the left door mirror using tape. NOTE! Protect the door mirror and wing edge with foam protection as shown in the illustration.

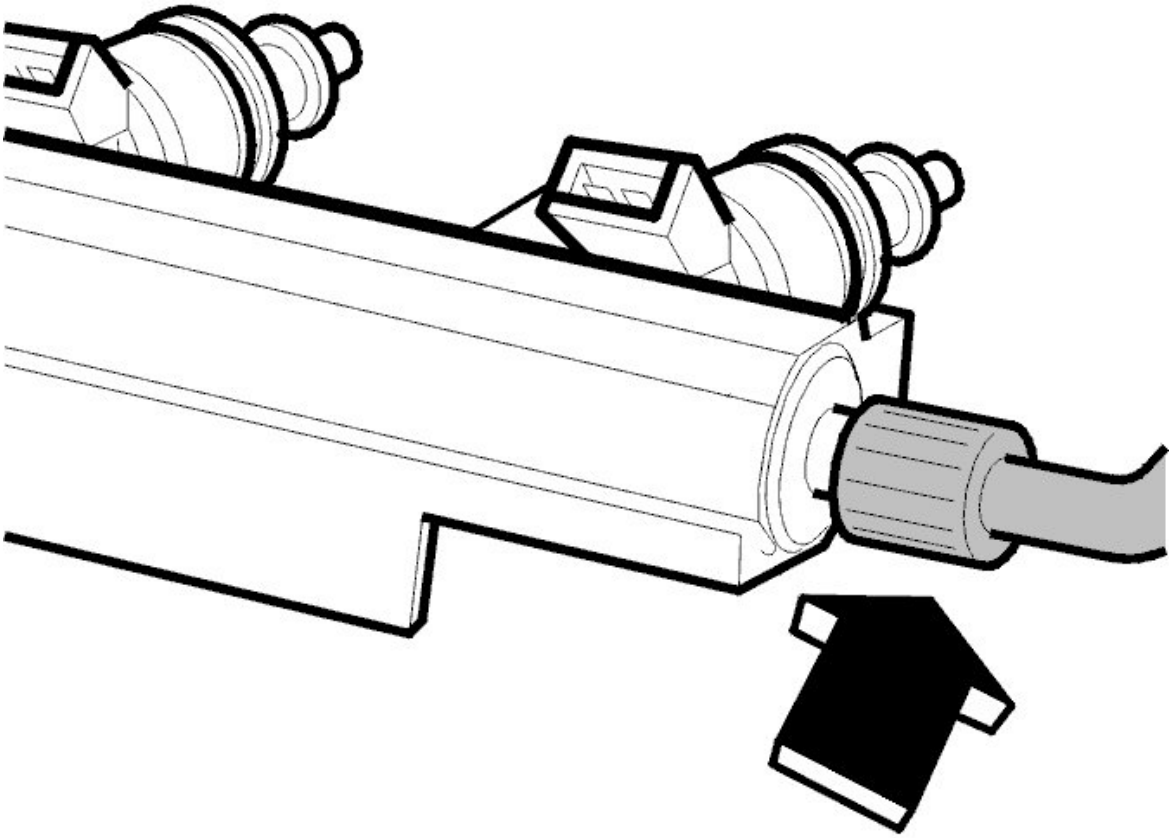
Connecting fuel draining unit



The unit must be operating when the measuring equipment's hose is connected to the engine in order to reduce the risk of fuel spillage.

Corrective actions:

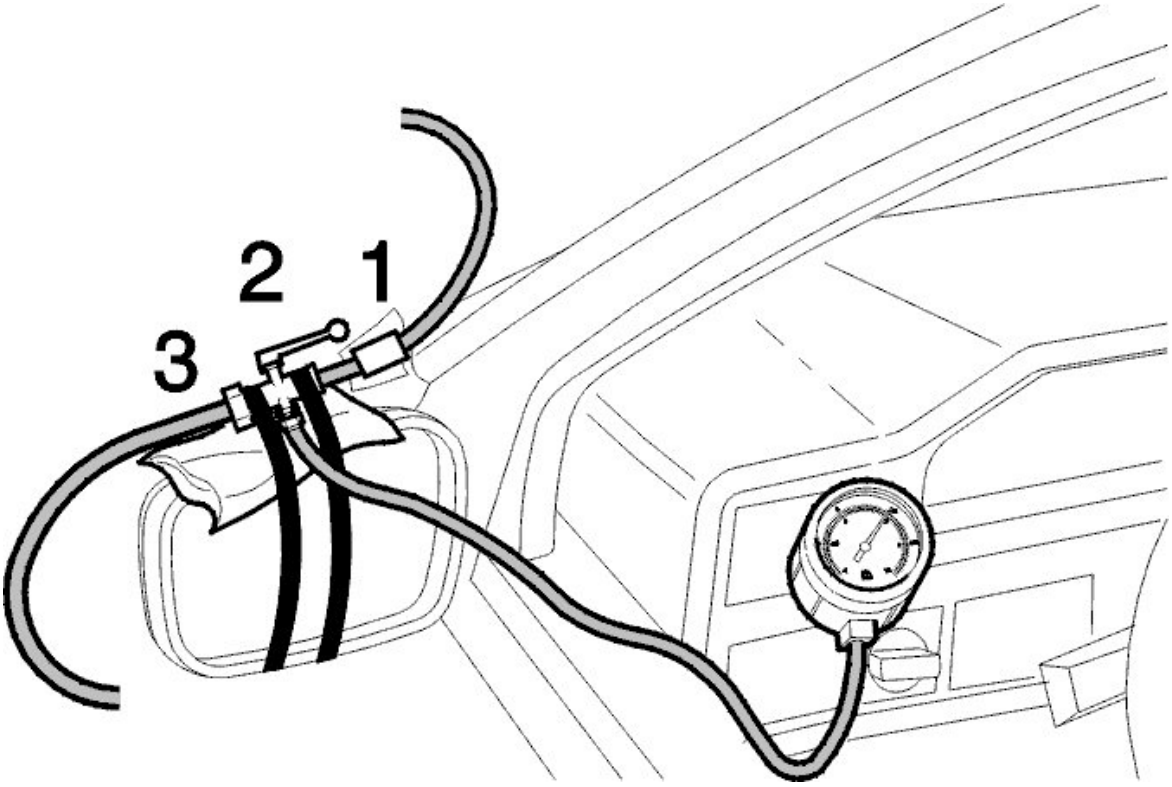
- Connect the fuel drainage unit hose to the T-valve on the door mirror (pos. 3 in illustration).
- Turn the T-valve cock to the middle position (position 2 in the illustration).
- Start the evacuation unit to get suction in the measurement unit hose to the engine.



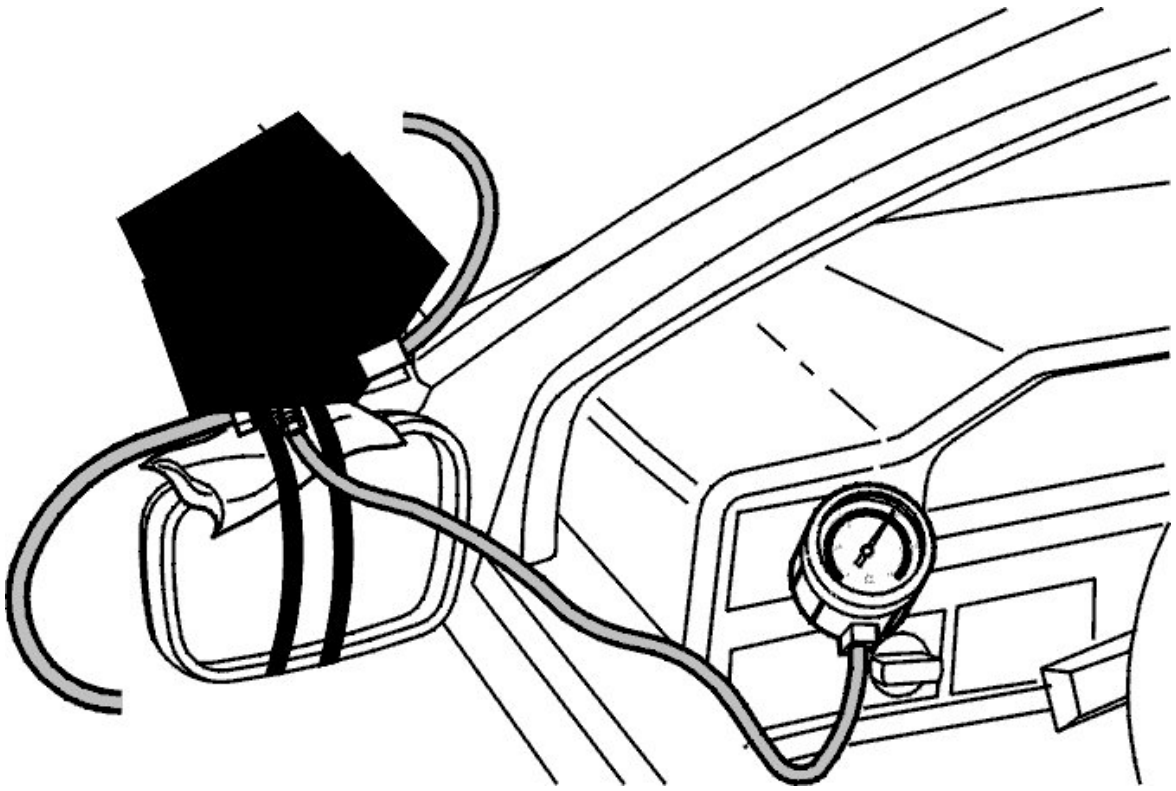
Corrective actions:

- Tighten nipple on fuel rail.

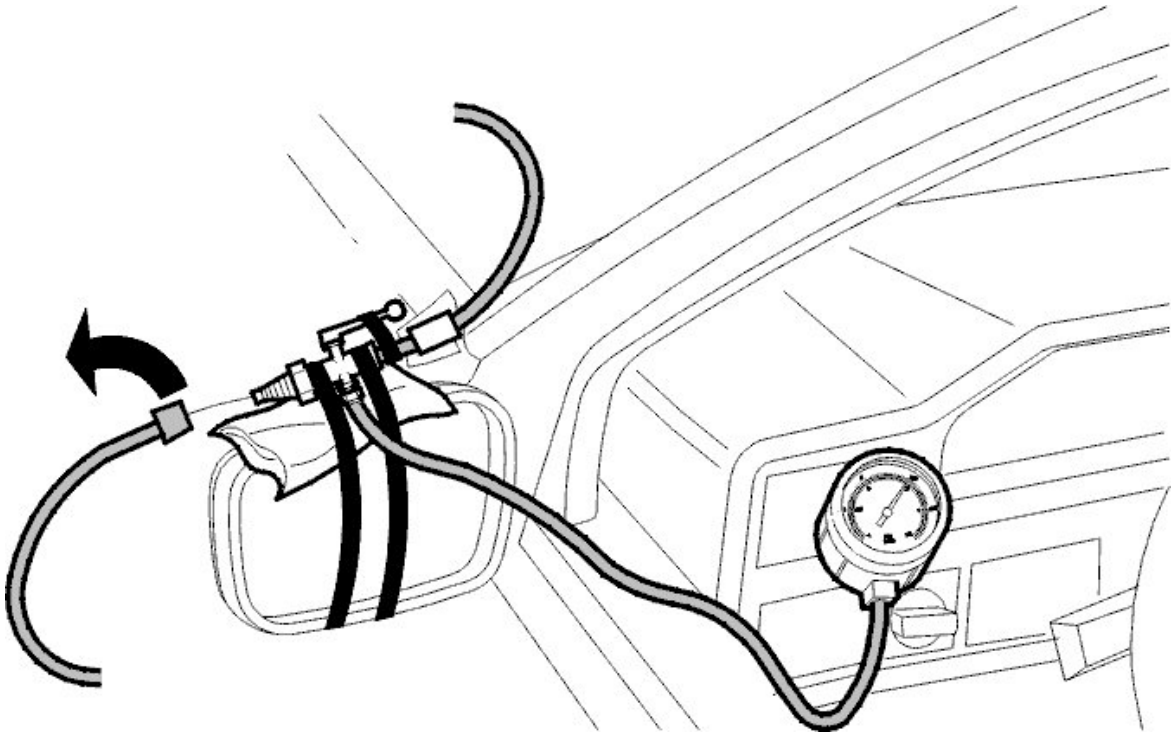
Caution! Note! Check that there is no fuel leakage and that the evacuation unit is operating while the nipple is connected to the engine.



- Turn the T-valve cock so that it is pointing toward the engine (position 1 in the illustration) to shut off the suction from the evacuation equipment.

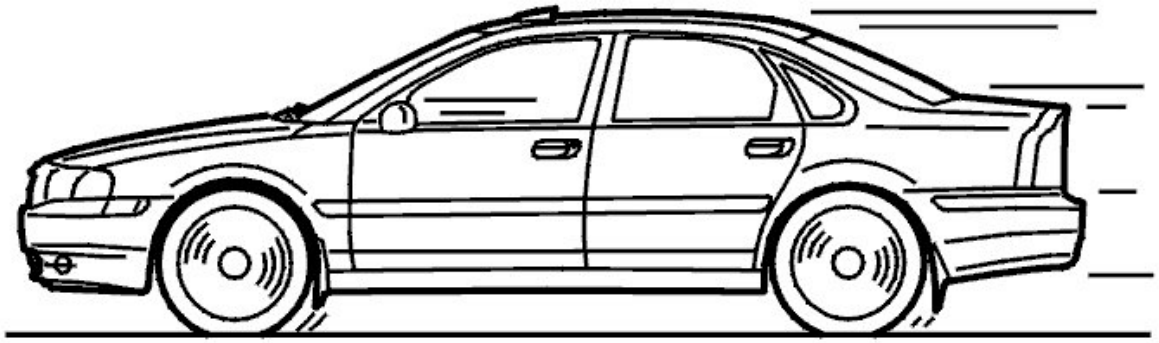


- Use a tie strap to lock the cock in the position toward the engine.



- Remove the draining unit hose from the T-valve hose connector.
- Turn off the evacuation unit when the hose is empty.
- Arrange the measuring equipment hose along the rubber list on plenum chamber cover at the left bonnet hinge in such a position that the hose and bonnet are not damaged (as in illustration on page 2).
- Carefully close the hood.

Measuring fuel pressure

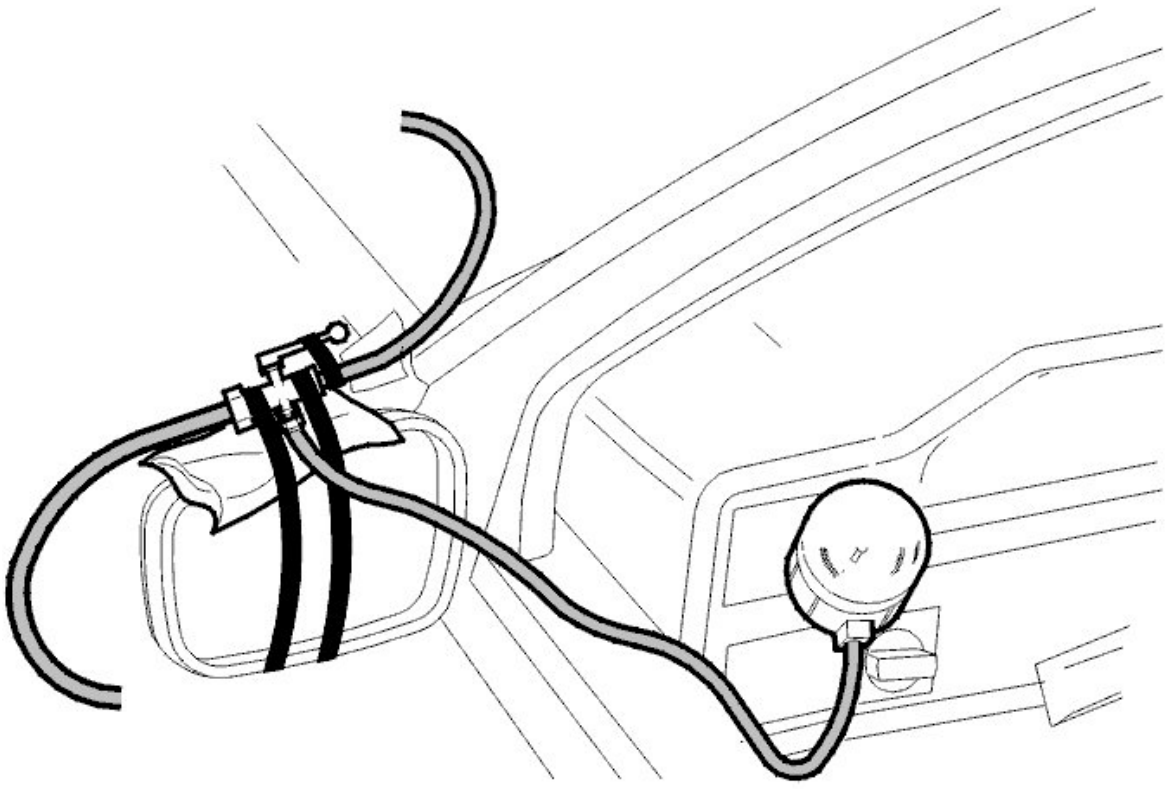


Corrective actions:

- Start the engine.
- Drive the car and read off fuel pressure while the car is being driven. The fuel pressure should be:**375-395 kPa (54.4 - 57.3 psi)**.

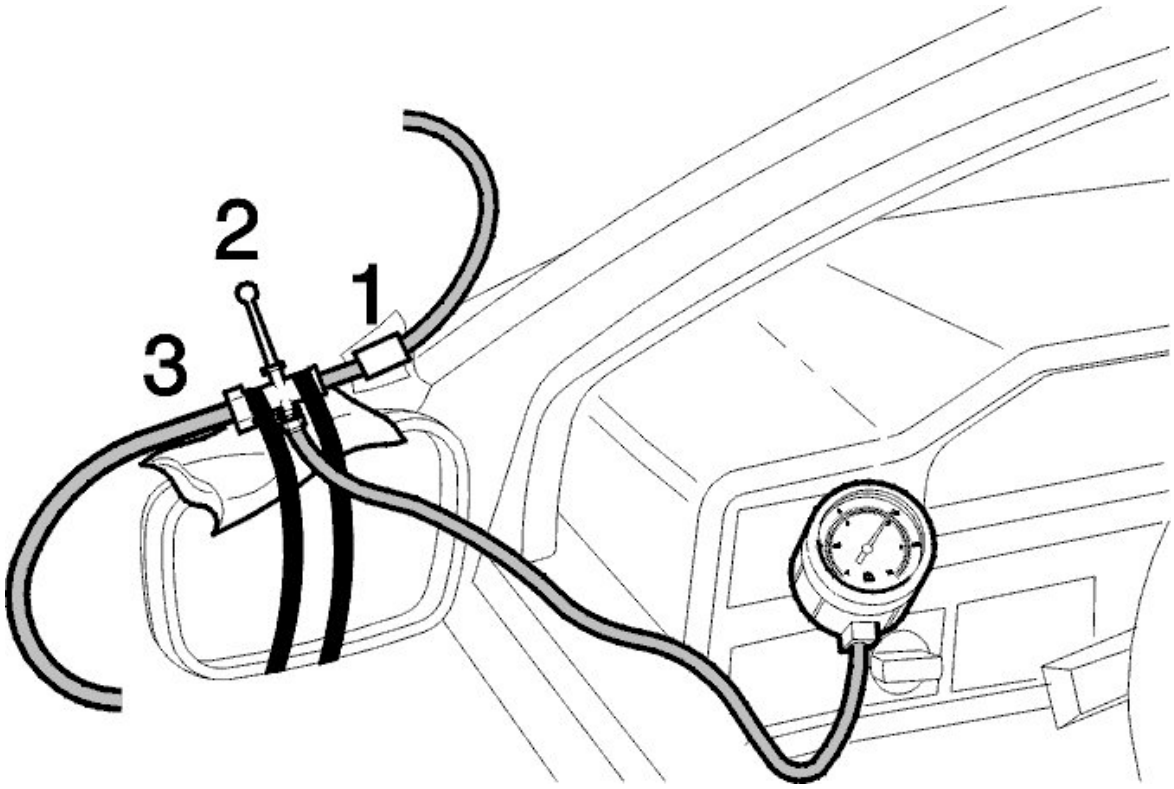
Caution! Note! At constant engine loads the fuel pressure should be stable. At acceleration or during engine braking the fuel pressure may vary between the maximum and minimum readings.

Removing fuel pressure gauge



Corrective actions:

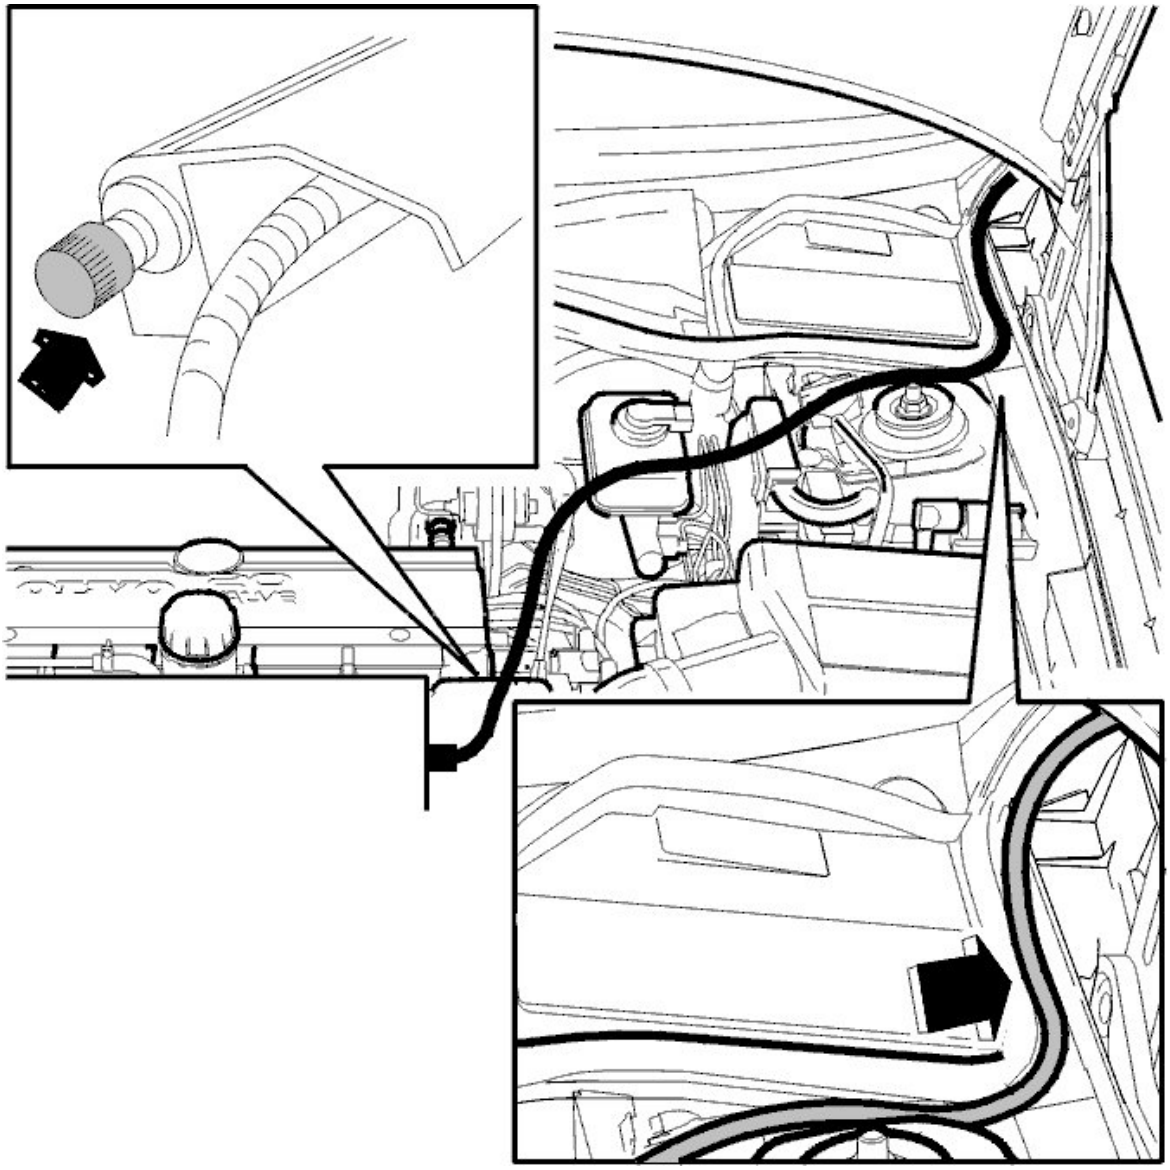
- Connect the evacuation unit hose to the hose nipple on the door mirror (see black arrow in illustration).
- Start the evacuation unit so there is suction in the hose.



Corrective actions:

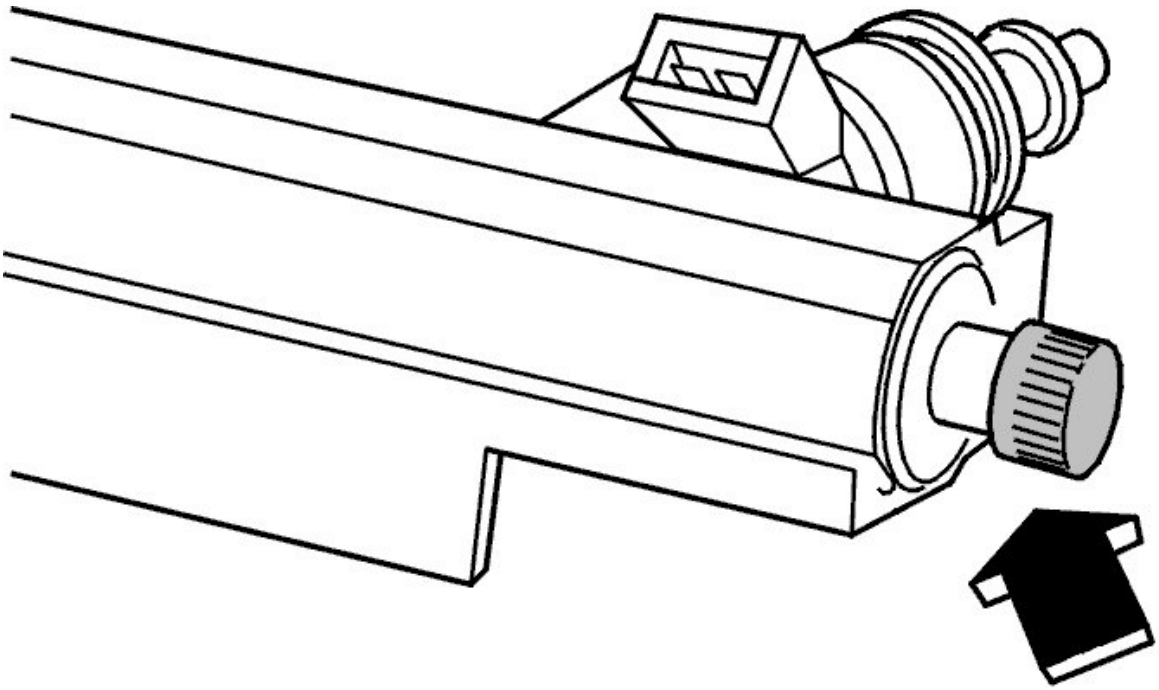
- Remove the tie strap locking the cock on the T-nipple.
- Turn the cock to the middle position (position 2) to obtain suction in the hose to the nipple in the fuel manifold on the engine.

Removing fuel draining unit



Corrective actions:

- Remove adapter hose from the engine.
- Wait a minute or so for the hose to empty.
- Turn off the draining unit.
- Remove the measurement equipment and hoses from the car.



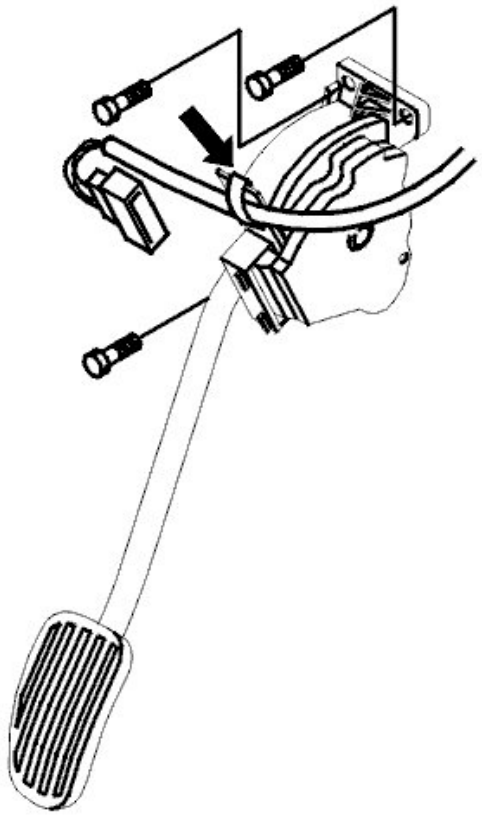
- Reinstall the protective cap on the fuel rail.

Accelerator Pedal: Service and Repair

Accelerator pedal (AP), replacing

Removal

Accelerator pedal (AP)



- Remove the soundproofing panel. See Soundproofing panel, replacing See: Body and Frame/Interior Moulding / Trim/Dashboard / Instrument Panel/Service and Repair/Soundproofing Panel, Replacing
- Remove the screws
- Cut off the clamp
- Disconnect the connector
- Remove the accelerator pedal (AP).

Installation

Accelerator pedal (AP)

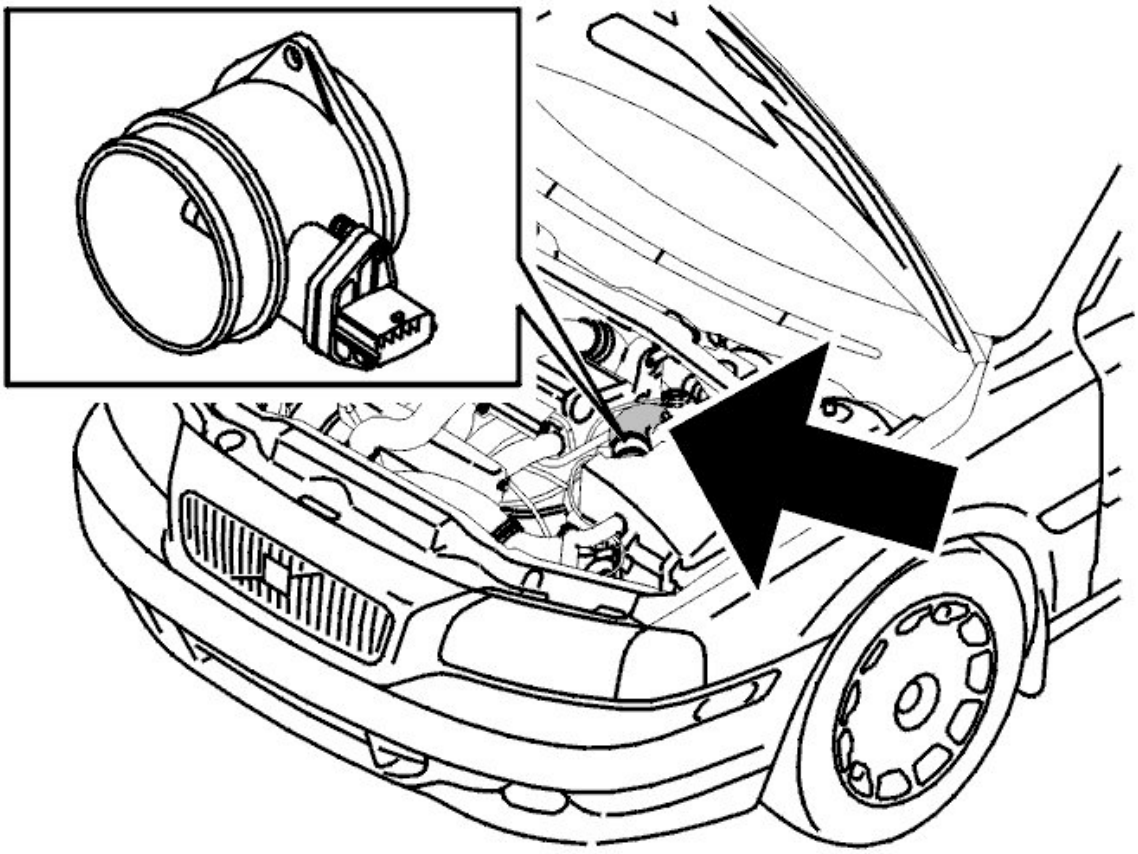
In reverse order.

Air Flow Meter/Sensor: Service and Repair

Mass air flow (MAF) sensor, replacing

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the mass air flow (MAF) sensor

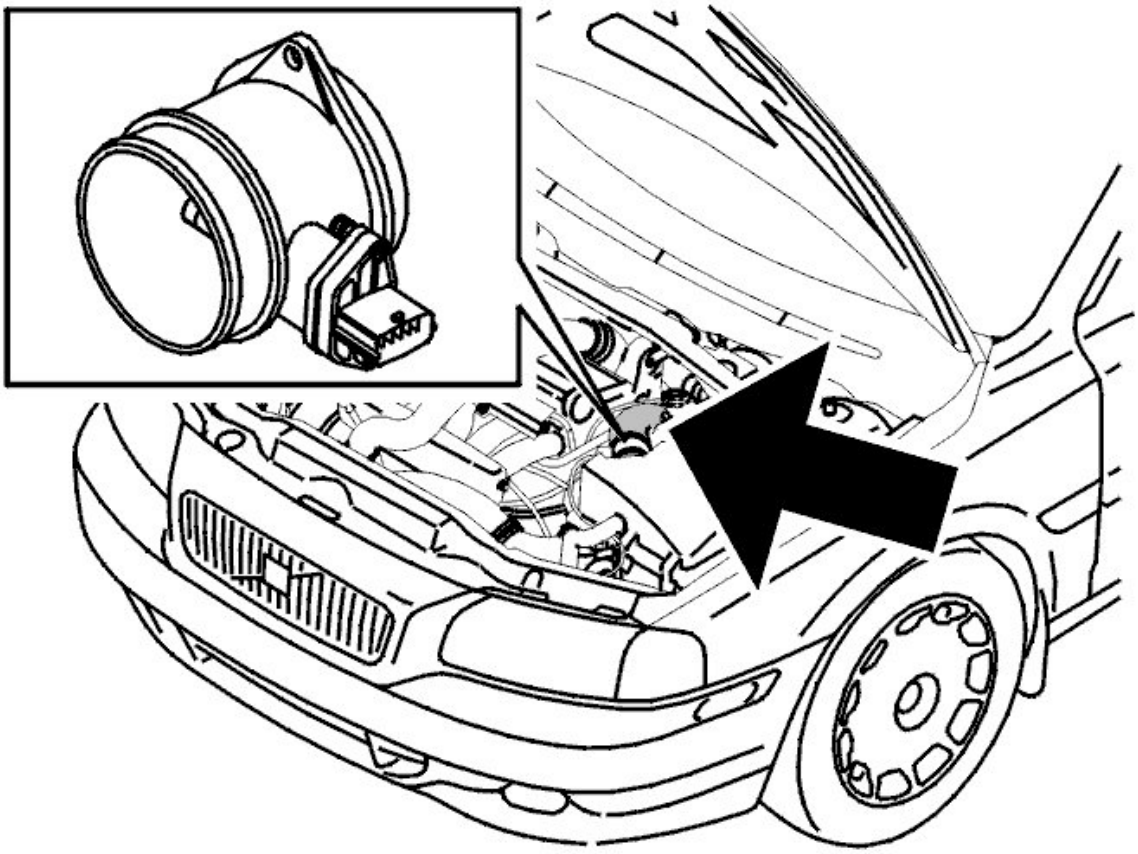


Remove:

- the inlet hose from the mass air flow (MAF) sensor
- the connector from the mass air flow (MAF) sensor
- the screws securing the mass air flow (MAF) sensor to the air cleaner (ACL) cover.

Pull and work the mass air flow (MAF) sensor loose from the air cleaner (ACL) cover.

Installing the mass air flow (MAF) sensor



Note! Apply water to the O-ring in the air cleaner (ACL) cover to facilitate installation of the mass air flow (MAF) sensor.

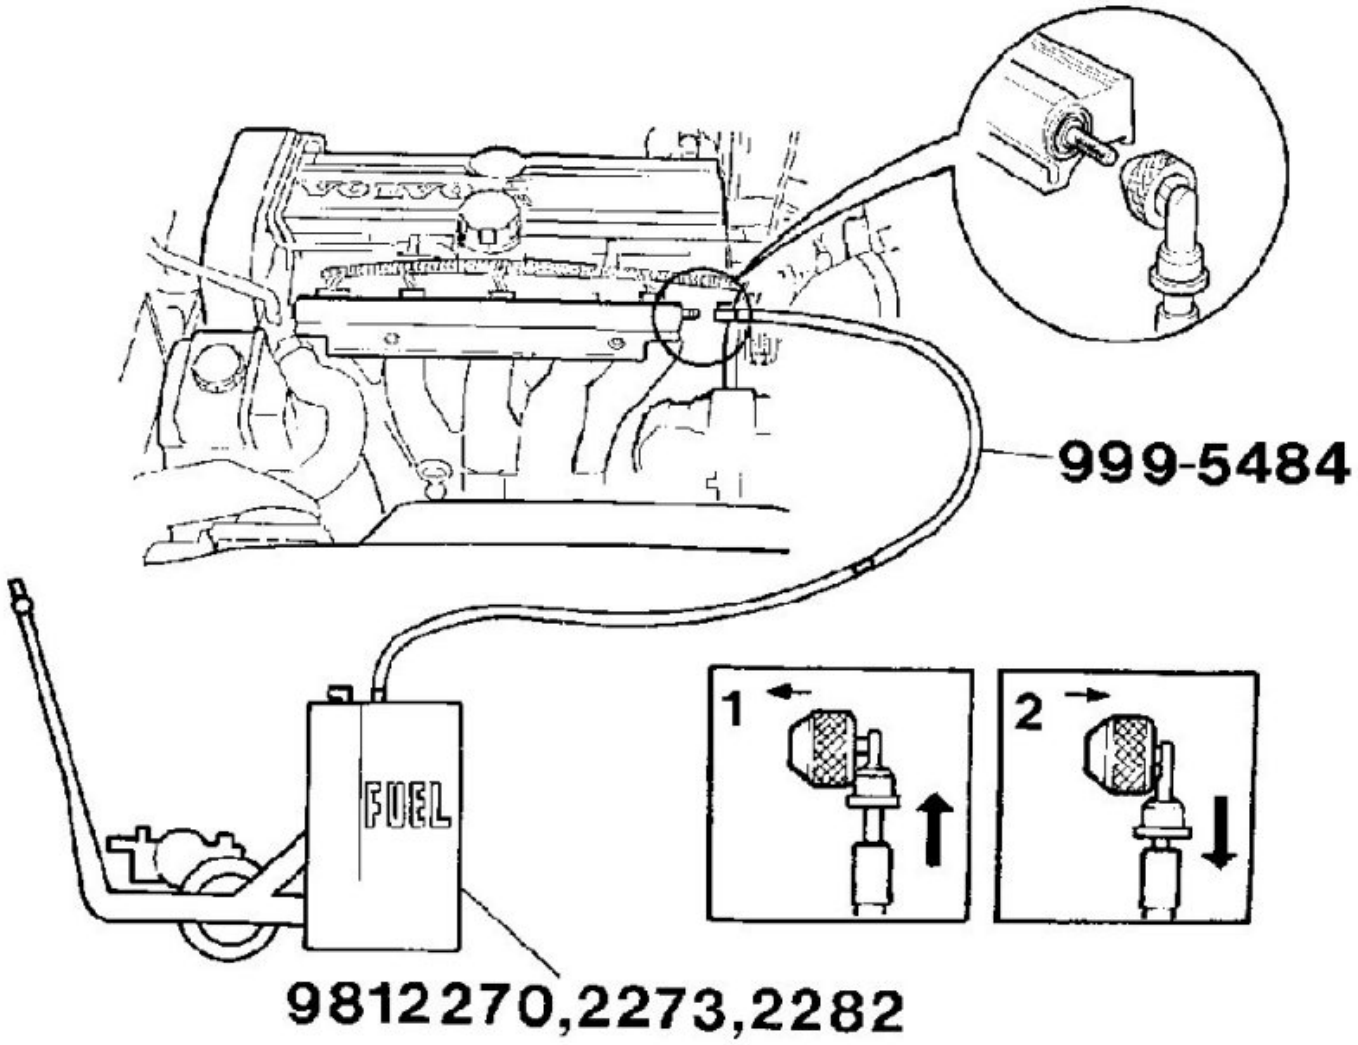
Install the new mass air flow (MAF) sensor.
Press the mass air flow (MAF) sensor into place.
Install the screws. Tighten.
Install the inlet hose on the mass air flow (MAF) sensor. Tighten the hose clamp.
Press the connector for the mass air flow (MAF) sensor into place.

Fuel Filter: Service and Repair

Replacing the fuel filter

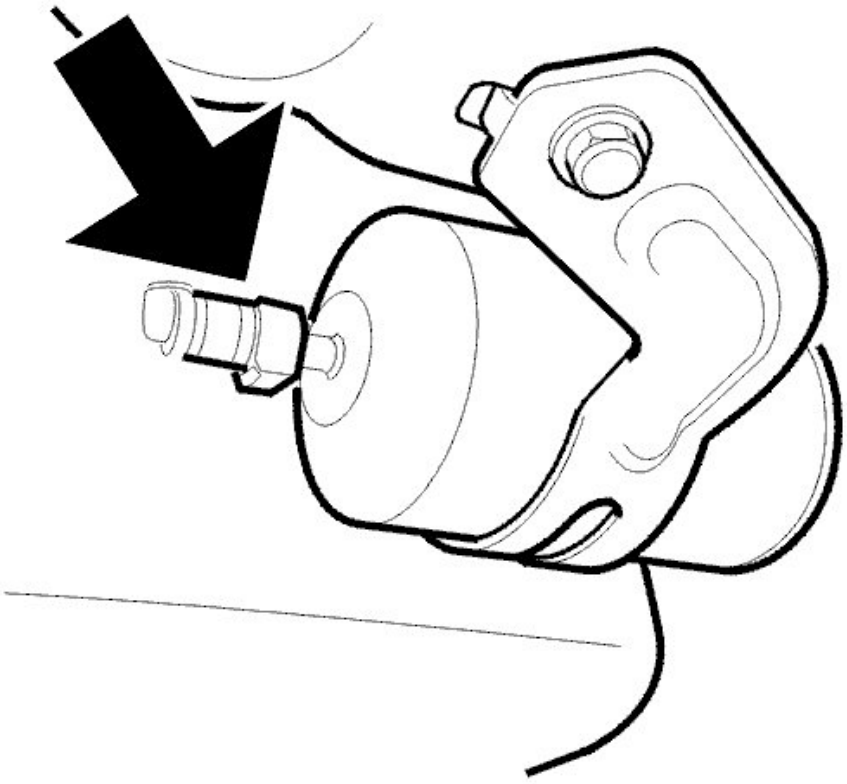
Removal

Draining the fuel system



- Depressurize the fuel system according to Fuel system pressure release See: Fuel Pressure Release/Service and Repair.

Removing the fuel filter



- Remove the screw securing the clamp around the filter
- Disconnect the quick-release connectors from the fuel filter
- Replace the filter.

Installation

Installing the fuel filter

In reverse order.
Tighten the screw. Tighten to **25 Nm**.

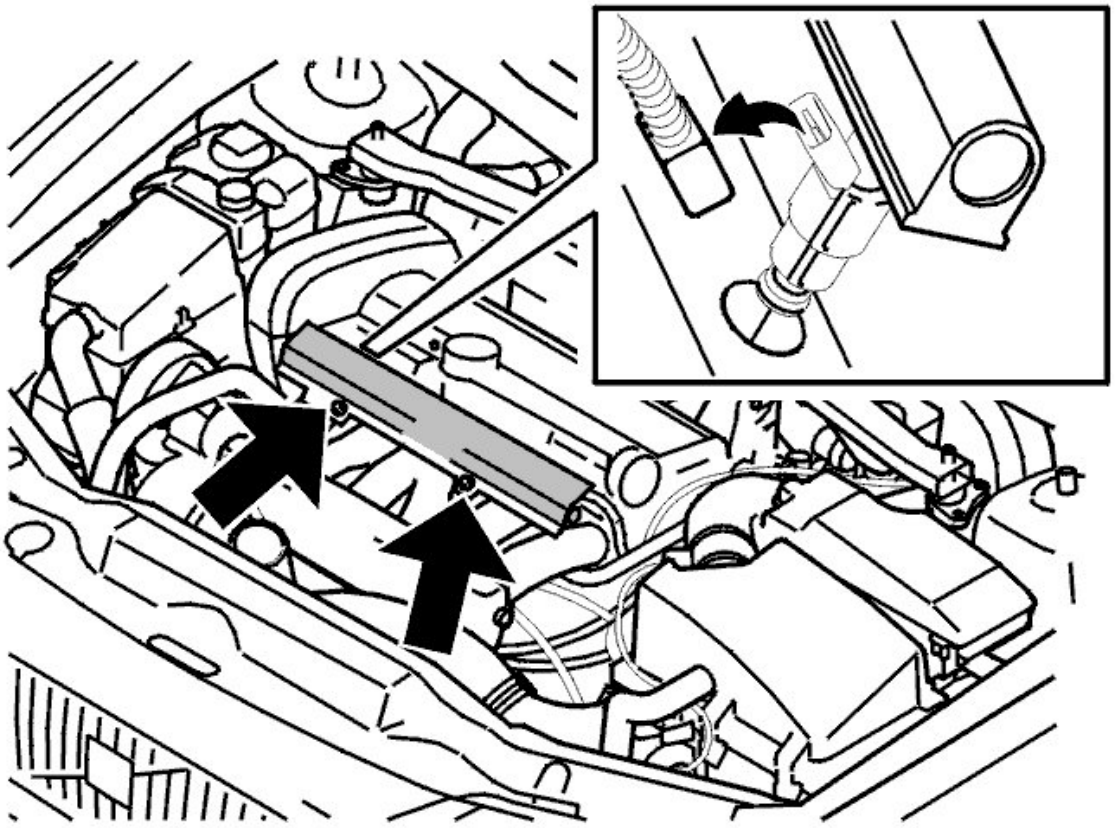
Fuel Injector: Service and Repair

Injector/pulse damper, replacement

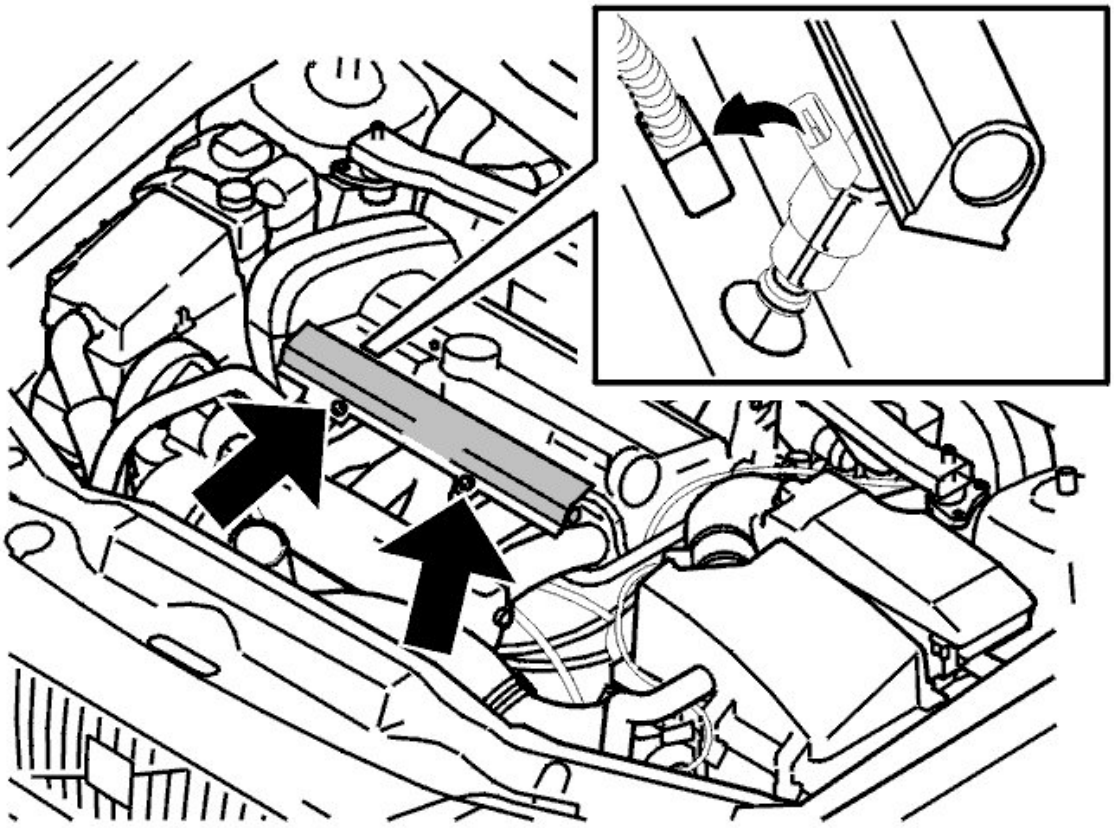
Removal and Installation

Note! Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation



Depressurize the fuel system according to: Fuel system pressure release See: Fuel Filter/Fuel Pressure Release/Service and Repair.
Remove the charge air pipe over the engine. Seal the openings.



Note! Handle the injectors carefully to avoid damage to the fuel nozzles and fuel needles.

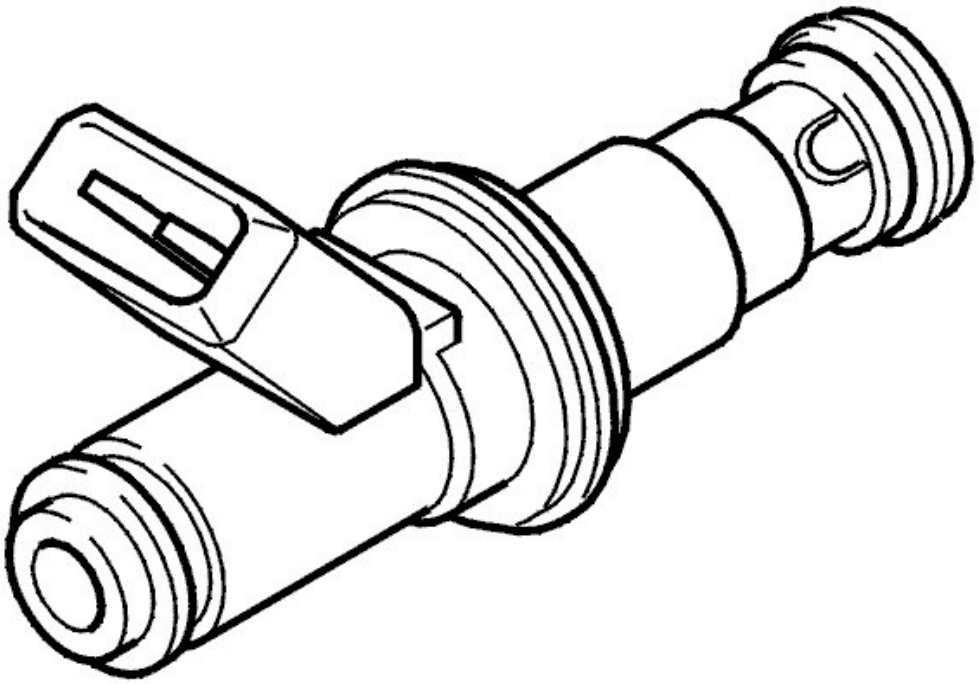
Remove the cover over the fuel rail.
Disconnect the injector connectors. Blow clean around the injectors.
Remove the mounting screws from the fuel rail.
Separate the fuel line quick-release connector. See: Fuel line, lock See: Fuel Rail/Service and Repair. Spray universal oil or similar around the injector terminals on the intake manifold.
Disconnect the connector for the fuel pressure sensor in the end of the fuel line. Gently work the fuel rail and injectors loose. Seal the openings.
Remove the tie strap for the fuel pressure sensor wiring.
Gently work the fuel rail and injectors loose. Seal the openings.

Removing injectors

Remove:
- the screws holding the mounting rail to the fuel rail
- the mounting rail
- the injector.

Installing injectors

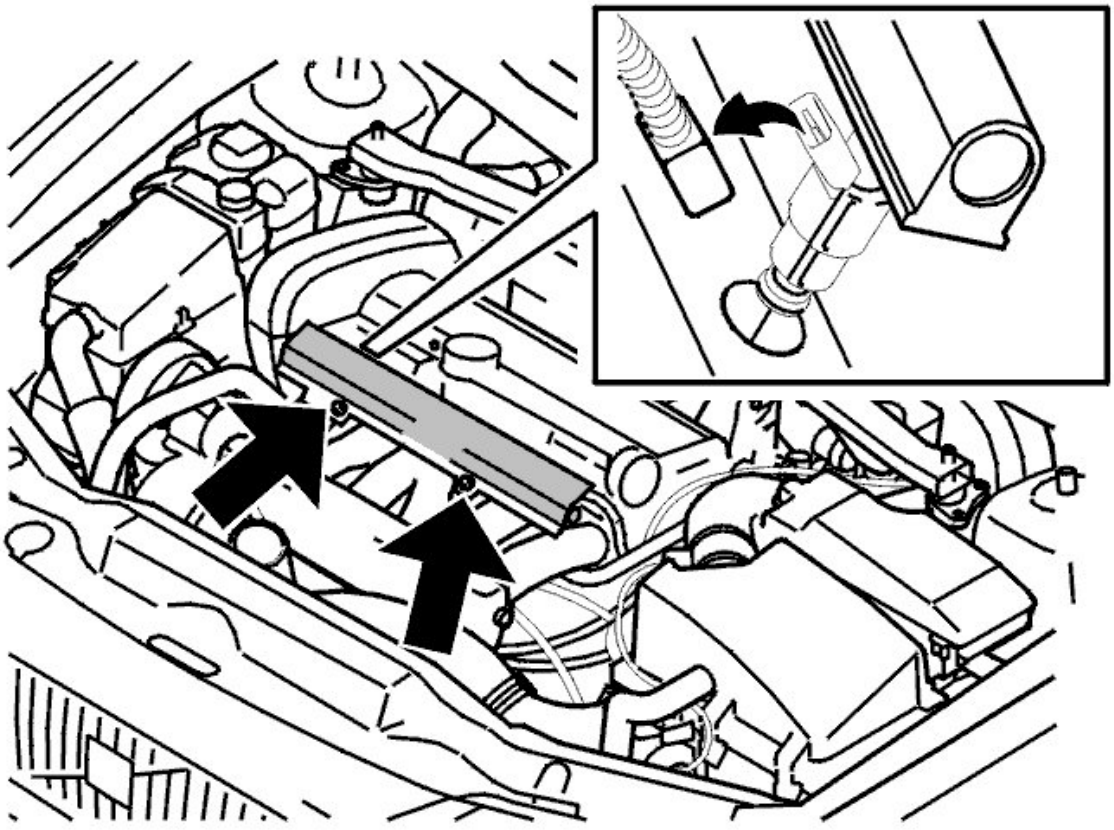
Note! For tightening torques, see: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque



Lubricate the injector O-ring using a thin layer of petroleum jelly.
Install the new injector.

Finishing

Position the mounting rail. The injectors may need to be pulled away from the fuel rail a few millimeters to install the rail.
Tighten the mounting rail to the fuel rail. See Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.
Lubricate the injector O-rings with petroleum jelly.

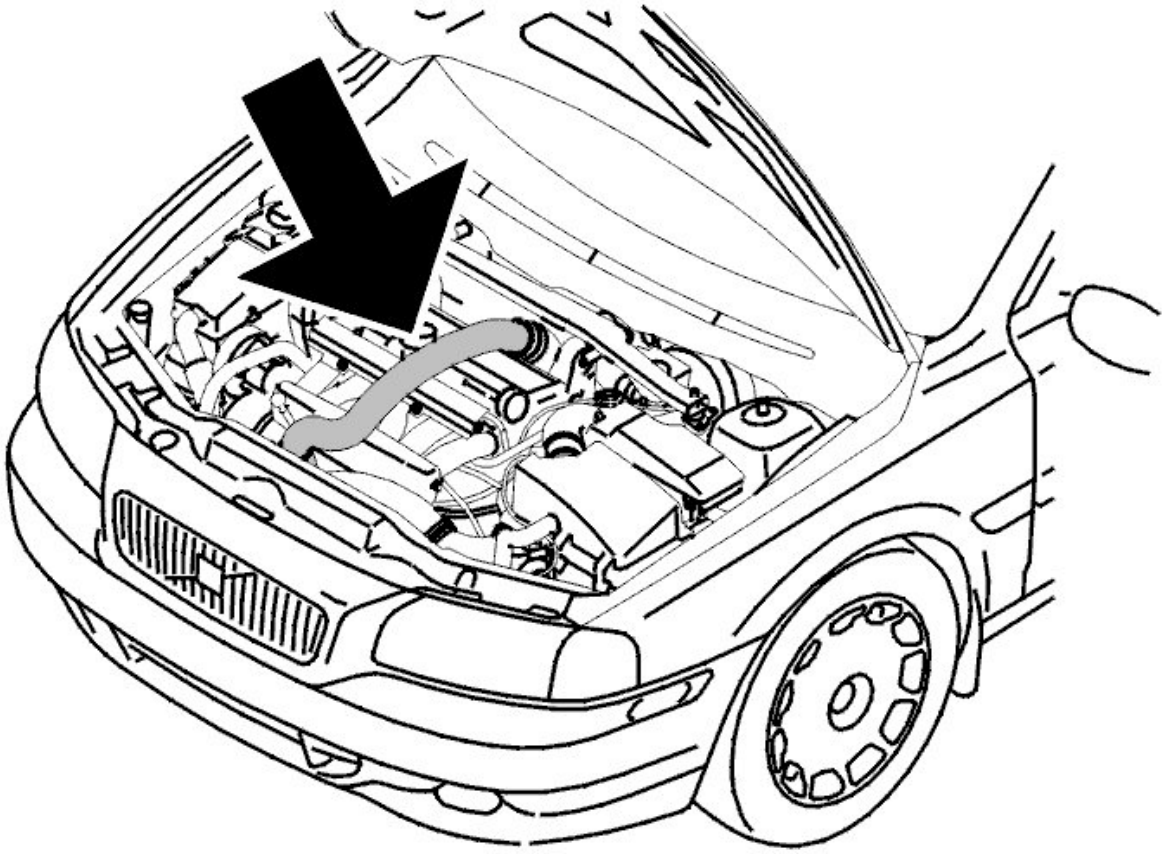


Depress the fuel rail. Ensure that all injectors sit correctly.

Screw the fuel rail into place. Use new screws and tighten. See Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.
Connect the connectors for the injectors and the fuel pressure sensor.
Install a tie strap for the cable for the fuel pressure sensor.
Press the quick-release connector together until a clicking sound is heard. See Fuel line, lock See: Fuel Rail/Service and Repair.

Caution! The fuel pressure pipe must be in place.

Reinstall the cover over the fuel rail.



Remove the seals from the charge air pipe. Reinstall the charge air pipe over the engine.
Start the engine. Check for fuel leakage.

Fuel Line Coupler: Description and Operation

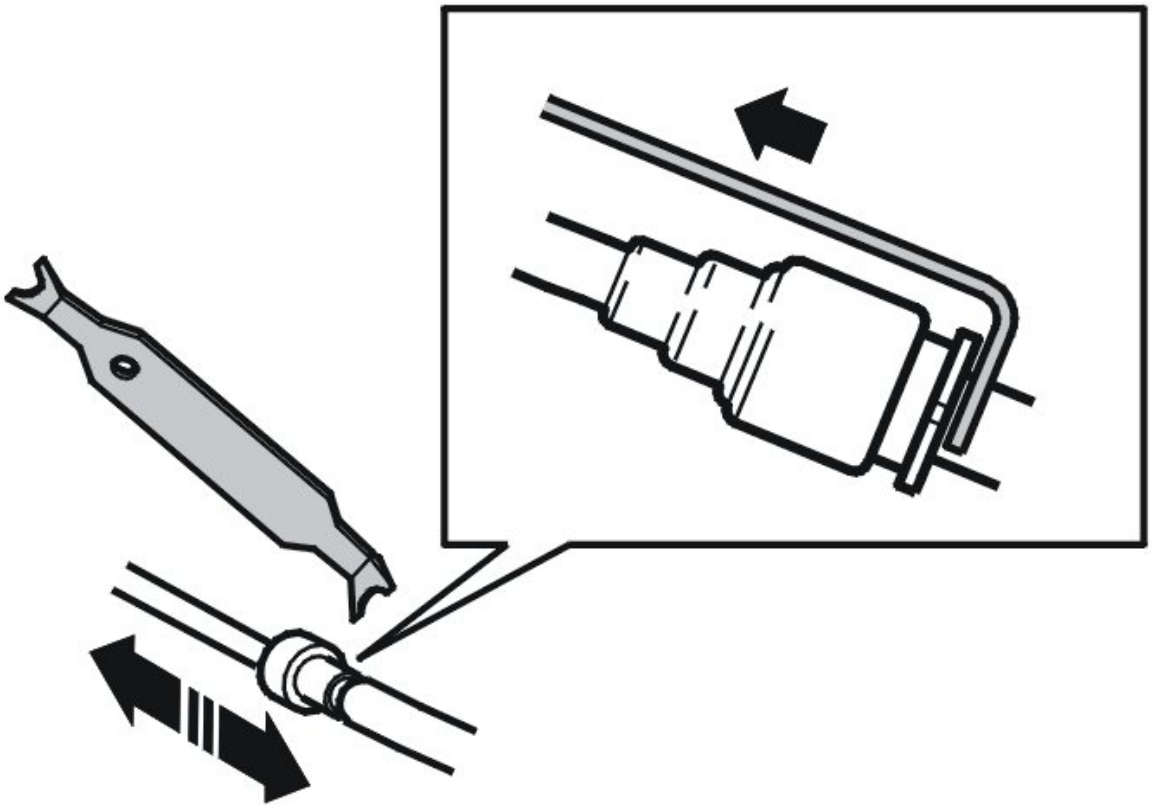
Fuel system, quick-release connectors

Special tools:

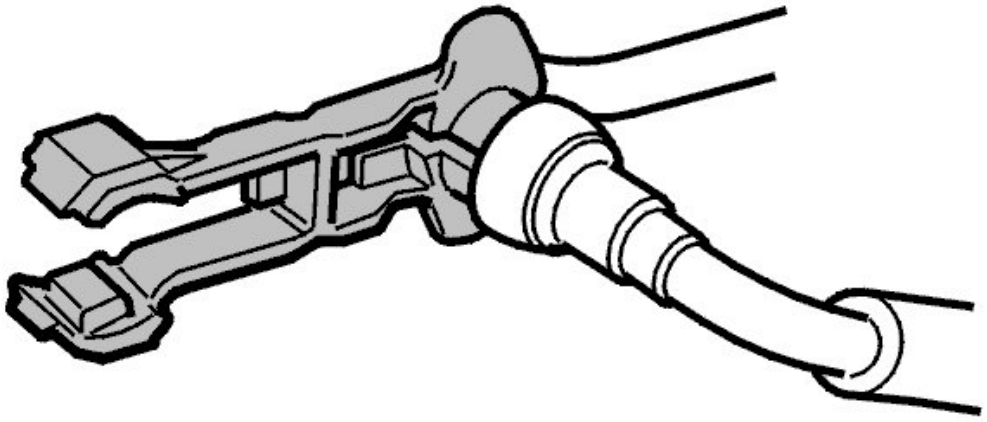
999 5666 Wrench See: Tools and Equipment/999 5666 Wrench
951 2666 Replaced by 9997298 See: Tools and Equipment/951 2666 Replaced By 9997298

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

There are different types of quick-release connector in the fuel system. Special tools are required for some connectors (see below).



If the catch appears as illustrated, special tool999 5666 Wrench See: Tools and Equipment/999 5666 Wrench must be used to press in the catch.



If the connector has an internal catch, special tool951 2666 Replaced by 9997298 See: Tools and Equipment/951 2666 Replaced By 9997298 must be used.

Fuel Pump: Service and Repair
Draining the Fuel Tank

Special Tools: 999 5720, 999 5721

NOTE: As the illustrations in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation
Disconnect the battery negative lead. See Note when disconnecting/connecting the battery lead

WARNING: RISK OF EXPLOSION! THE USE OF A FRESH AIR MASK IS RECOMMENDED.

Insert the heavy duty hose **1.3 meters** into the fuel filler pipe, measured from the edge of the opening of the filler pipe.

Pump until air comes out.

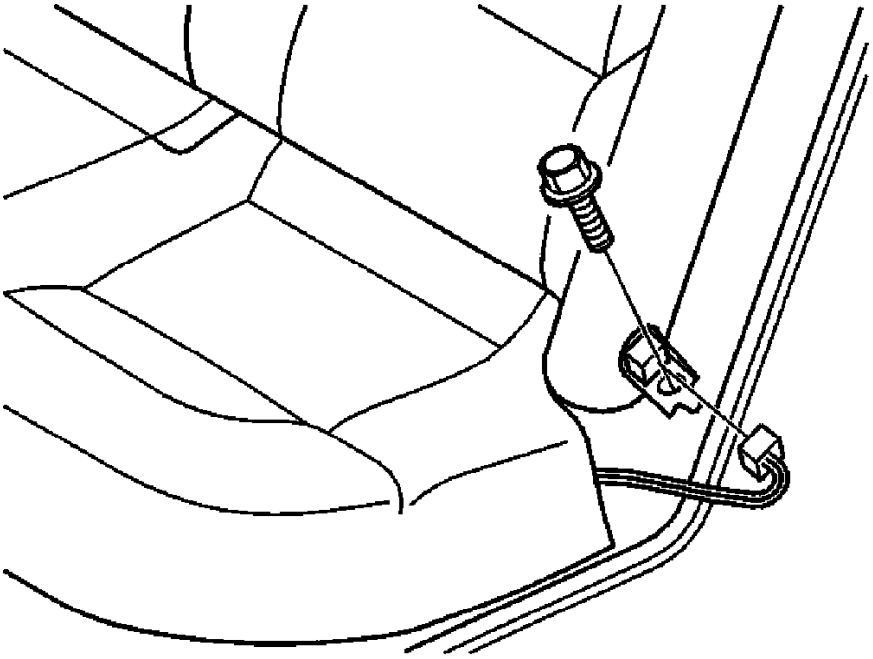
(V70) Fold up both sides of the rear seat.

(S80, S60) Remove the seat cushion for the rear seat.

Remove the right side cushion. See Side cushion

Disconnect the connector at the hinge.

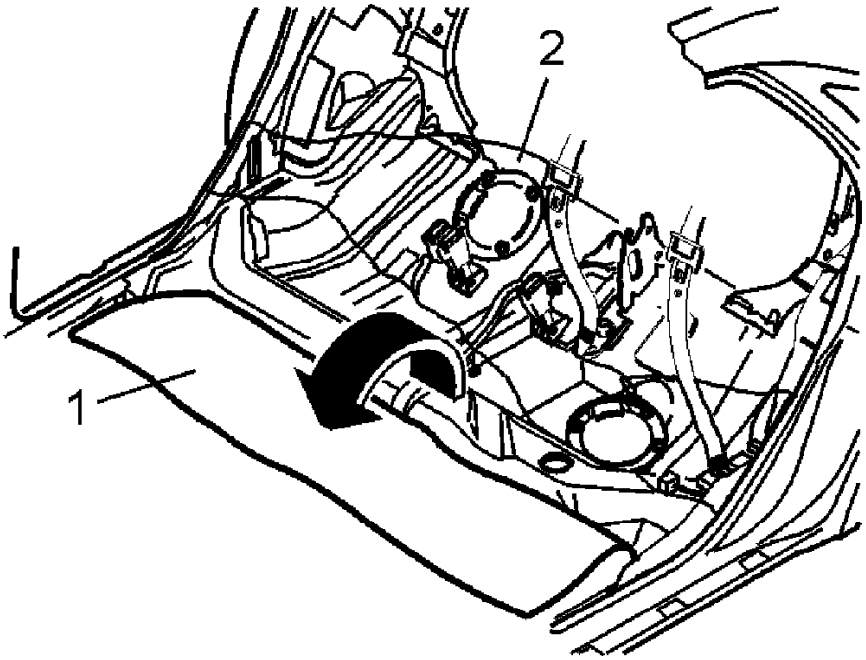
Remove:



- the mounting screw for the hinge
- the screw for the seatbelt end mounting.

Release the strap/straps of the folding mechanism for the seat belt buckle. (Hooked into place on the lower edge of the backrest).

Lift out the backrest.



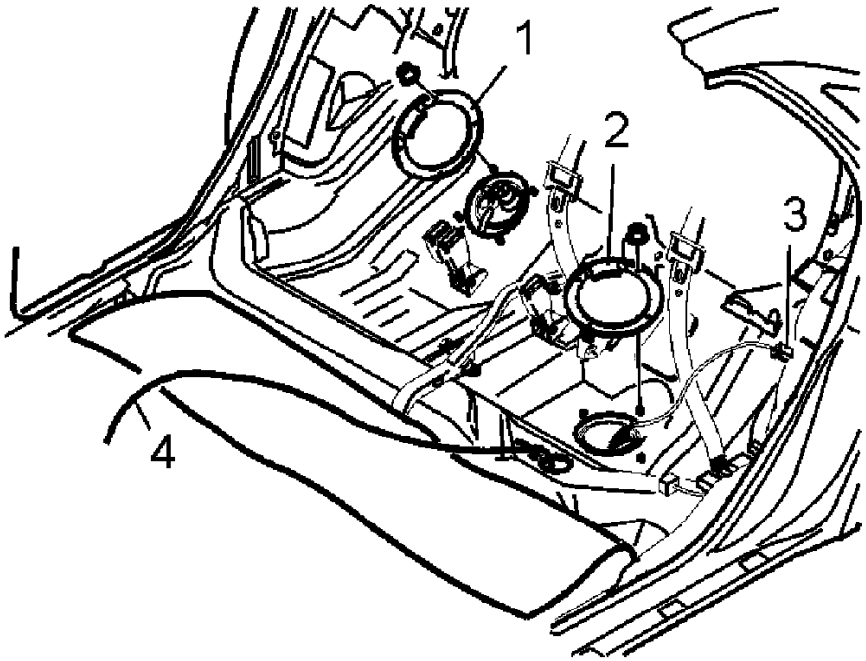
Fold the carpet (1) out of the way.

Remove the insulation panel.

Cover the area (2) around the cover and between the doors with absorbent material.

CAUTION: Ensure that there is no risk of dirt getting into the tank.

Removing the fuel tank filler cap over the fuel tank units

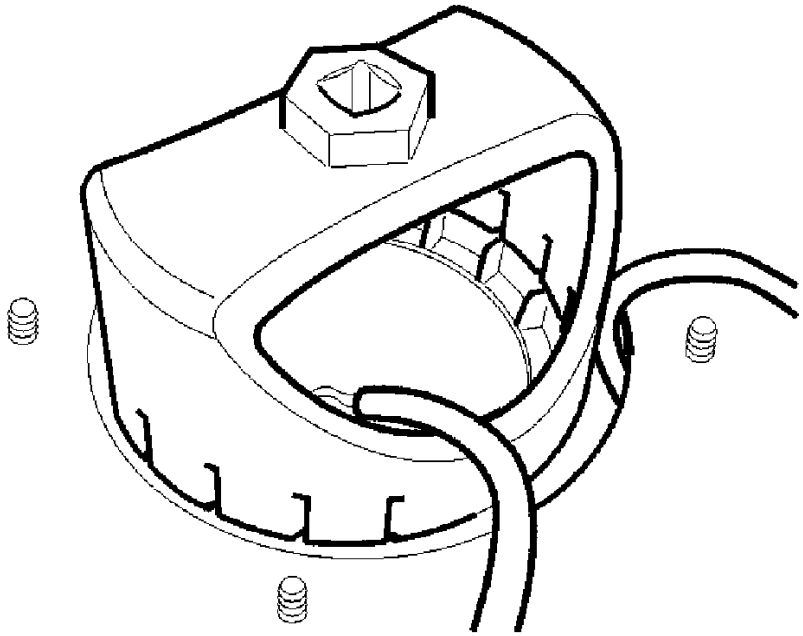


Remove the covers (1.2) over the fuel tank units.

Disconnect the fuel tank unit connectors (3).

Remove the hoses from the fuel tank unit.

Draining the fuel tank

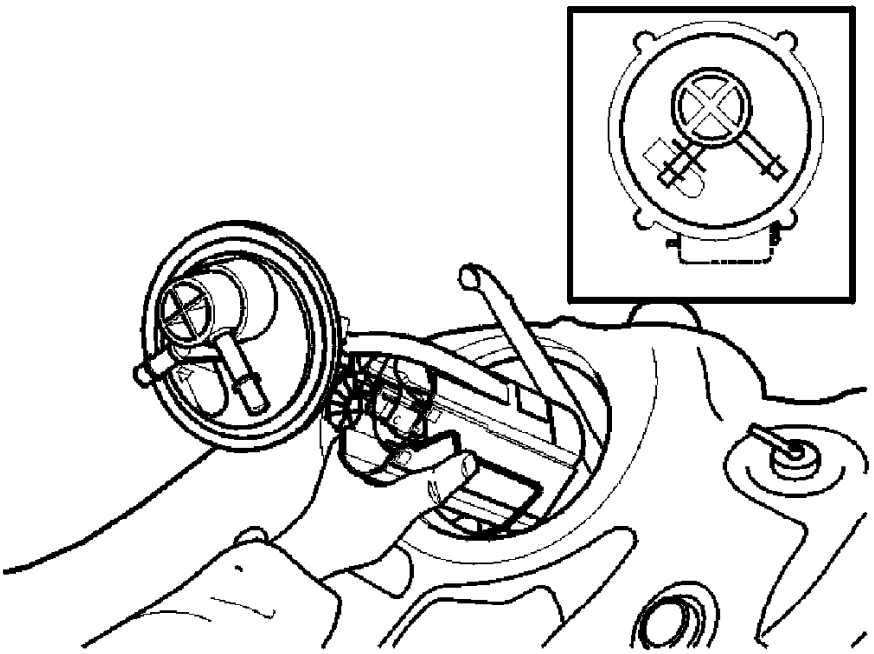


Special Tools: 999 5720

Clean the area around the fuel tank unit thoroughly.

Open the right fuel tank unit. Insert the heavy duty hose and suck out the remains from the bottom of the right-hand side of the fuel tank.

Connect hose 999 5721 to the heavy duty hose. Suck out the remains from the bottom of the fuel tank unit reservoir.



Carefully remove the overflow pipe from the reservoir.

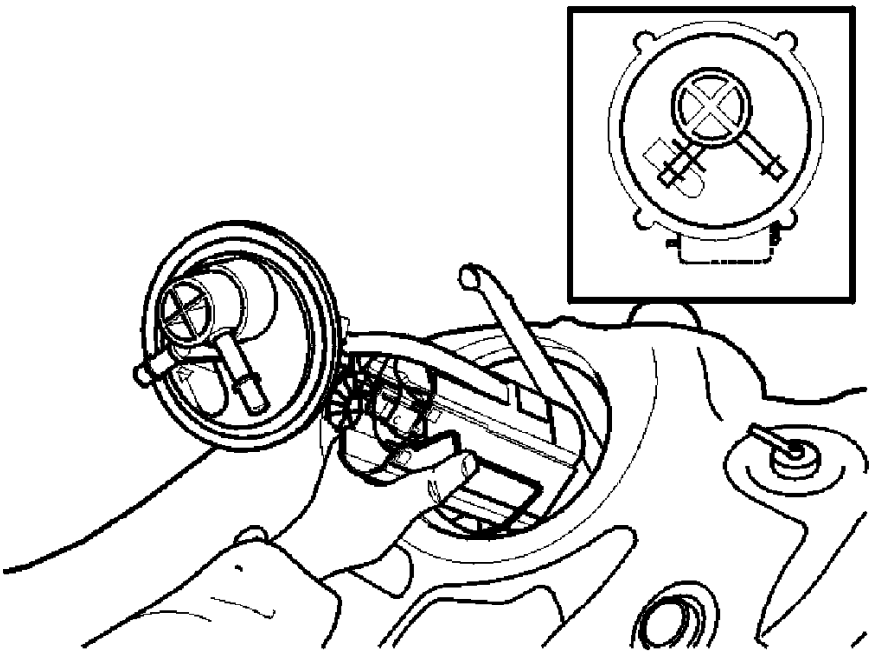
Remove the thin hose (999 5721) from the heavy duty hose. Connect the thin hose to the overflow pipe. Use a hose clamp.

Pump until a lot of air comes out.

Open the left fuel tank unit. Insert the heavy duty hose and suck out the remains from the bottom of the left-hand side of the fuel tank.

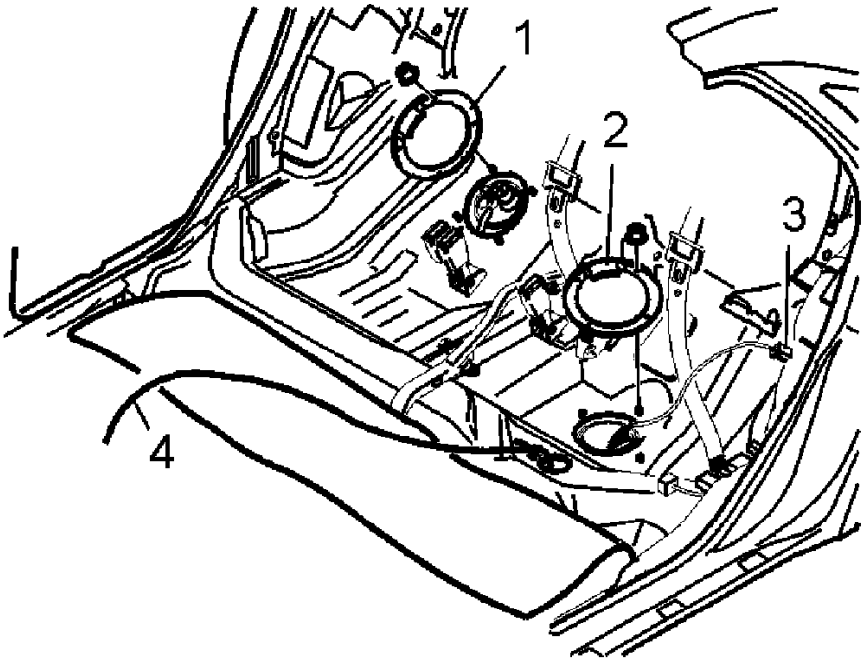
Installation

Right fuel tank unit:



- Place the overflow pipe **approximately half a centimeter** to the lefthand side
- Grip the right fuel tank unit reservoir. Pinch the fuel tank unit reservoir so that the float is held in its lowest position
- Lower the reservoir carefully while rotating it backwards around the front-rear shaft on the float
- Install the overflow pipe on the reservoir.

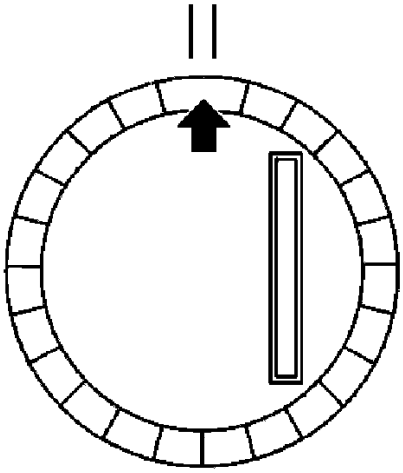
Left fuel tank unit:



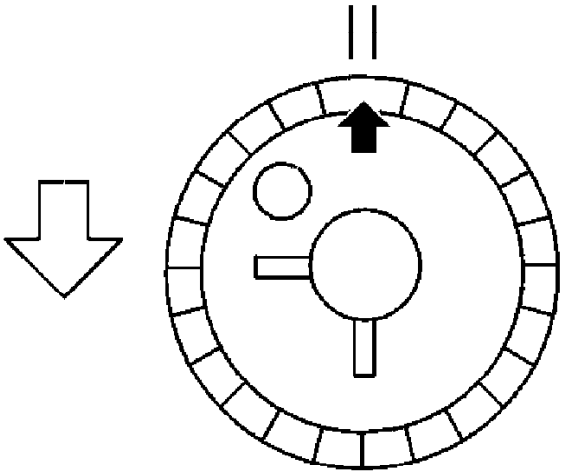
- Install a new O-ring. Lubricate the new O-ring using petroleum jelly
- Press the left fuel tank unit down so that the row of protruding cables runs along the car
- Check that the O-ring is not trapped
- Tighten the screw. Tighten to **60 Nm**
- Wipe up any fuel spillage
- Position the wiring in the cut-out in the rubber ring.

NOTE: Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.

Right fuel tank unit, continued:



- Install a new O-ring. Lubricate the new O-ring using petroleum jelly
- Press the right fuel tank unit down so that the fuel line connectors are pointing forwards and to the right
- Check that the O-ring is not trapped
- Tighten the screw. Tighten to **60 Nm**
- Install the hoses on the fuel tank unit
- Wipe up any fuel spillage
- Position the wiring in the cut-out in the rubber ring.

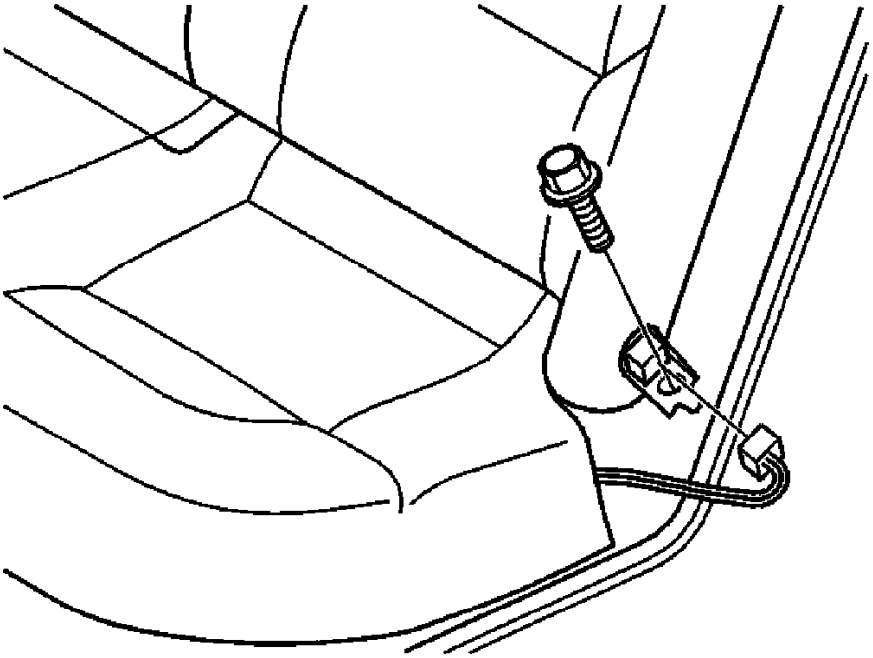


NOTE: Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.

Install the cover over the fuel tank unit. Tighten the nuts.

Connect the wiring and the connectors.

Install:



- the backrest
- the mounting screw for the hinge. Tighten to **50 Nm**
- the connector for the hinge
- the seat belt end mounting. Tighten to **48 Nm**
- the side cushion.

(V70) Fold the seat cushion forward.

(S80, S60) Install the seat cushion.

Fuel Pump: Service and Repair
Level Sensor, Fuel Tank/Fuel Pump, Replacement

Level sensor, fuel tank/fuel pump, replacement

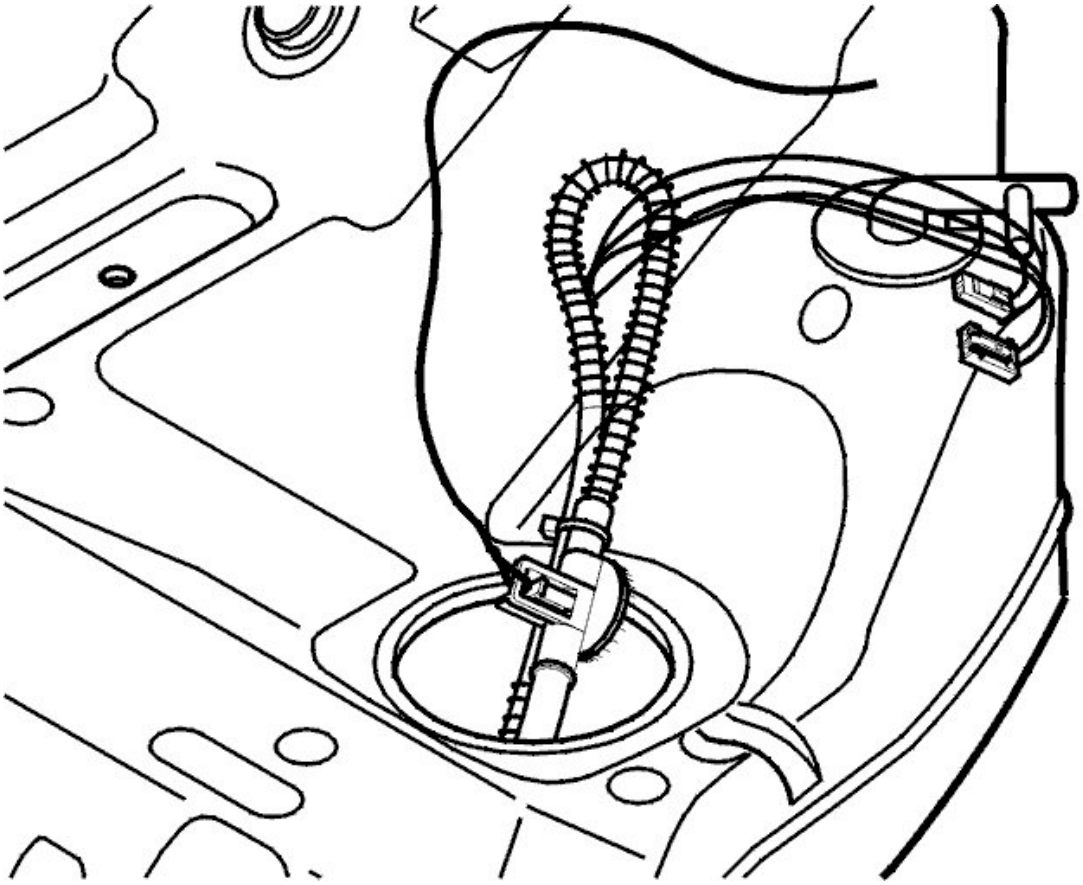
Removal

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Draining the fuel system and fuel tank

Drain:
- the fuel system. See Draining the fuel system See: Service and Repair.
- the fuel tank. See Draining the fuel tank See: Service and Repair.

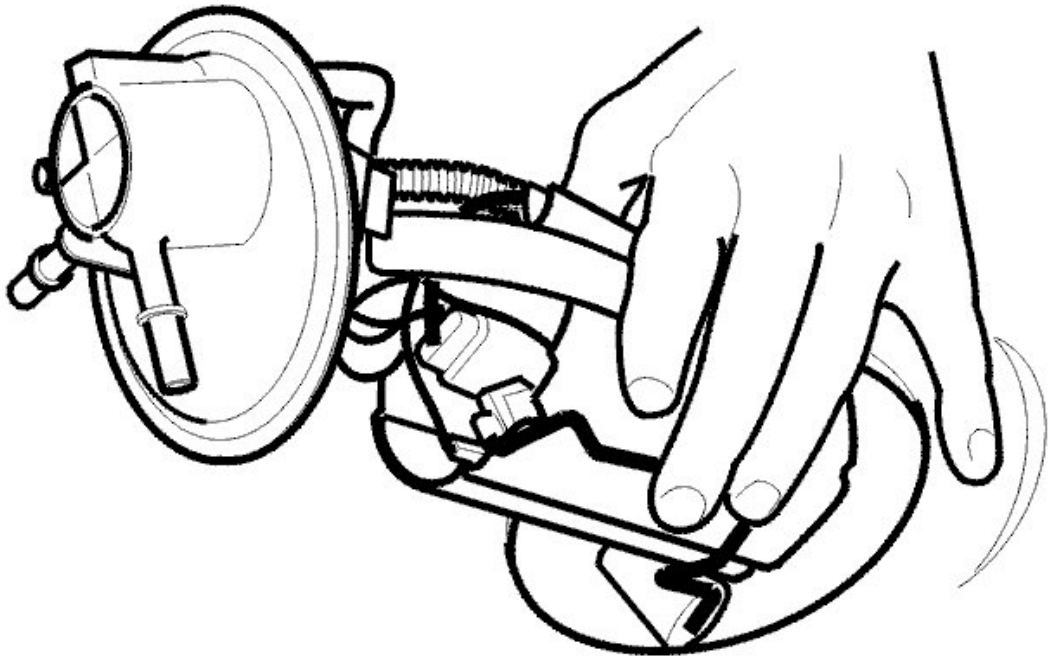
Removing the left-hand level sensor



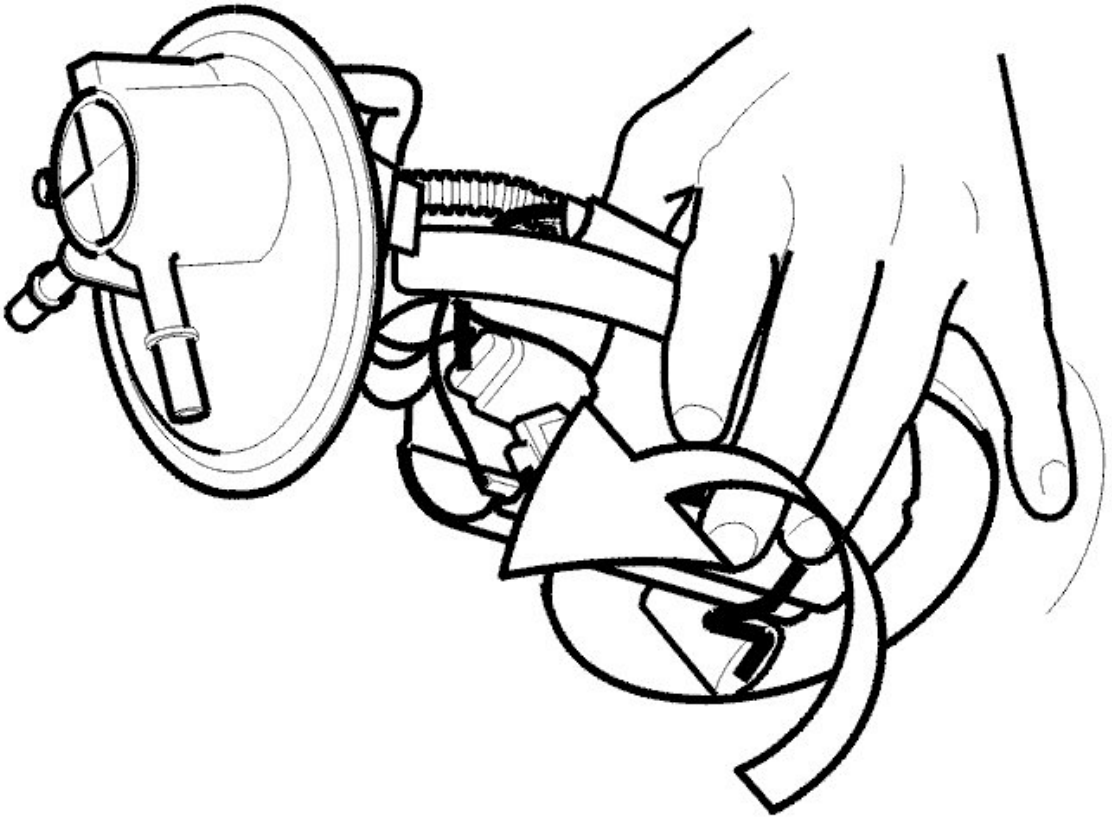
Remove:
- the two connectors from the underneath of the left-hand level sensor
- the left-hand level sensor from the ejector on which it is positioned.

Note! Secure a wire in the area of the ejector.The wire must be sufficiently long that it reaches over to the opposite side of the tank with some excess remaining to ensure that it does not slide into the tank. The wire is needed to pull the hoses and wiring back to the left-hand side of the tank after the fuel tank unit has been replaced.

Removing the right-hand level sensor / pump



- Grip the right-hand level sensor and pump holder and pinch the float so that it is held in its lowest position.



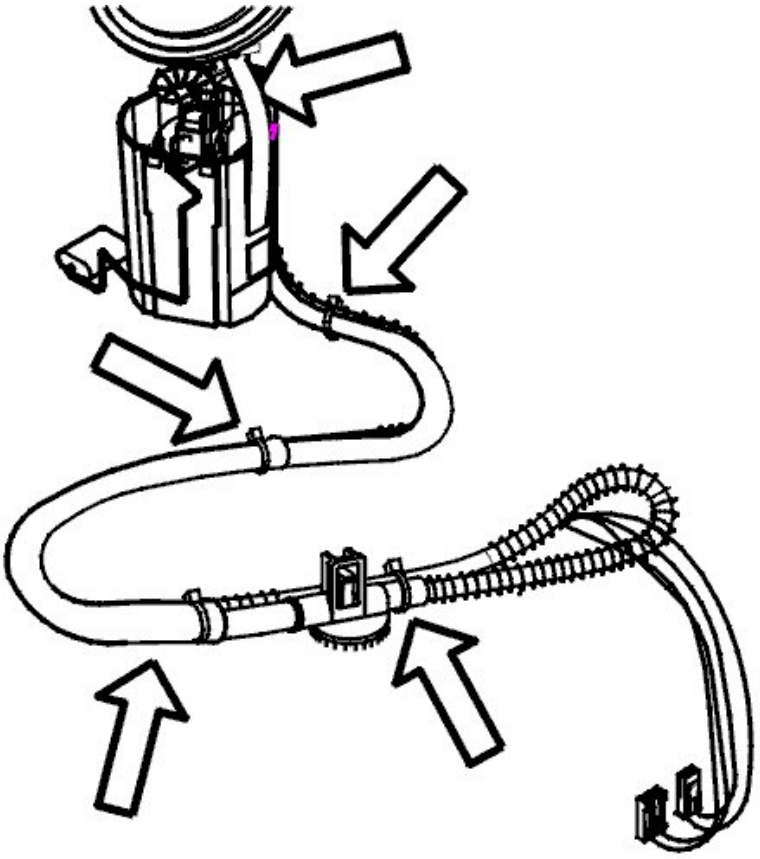
Note! Take care with the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.
Pull the hoses out from the tank without pulling up the entire wire from the right-hand hole in the tank.

Note! It is extremely important that the float arm is not broken or bent.

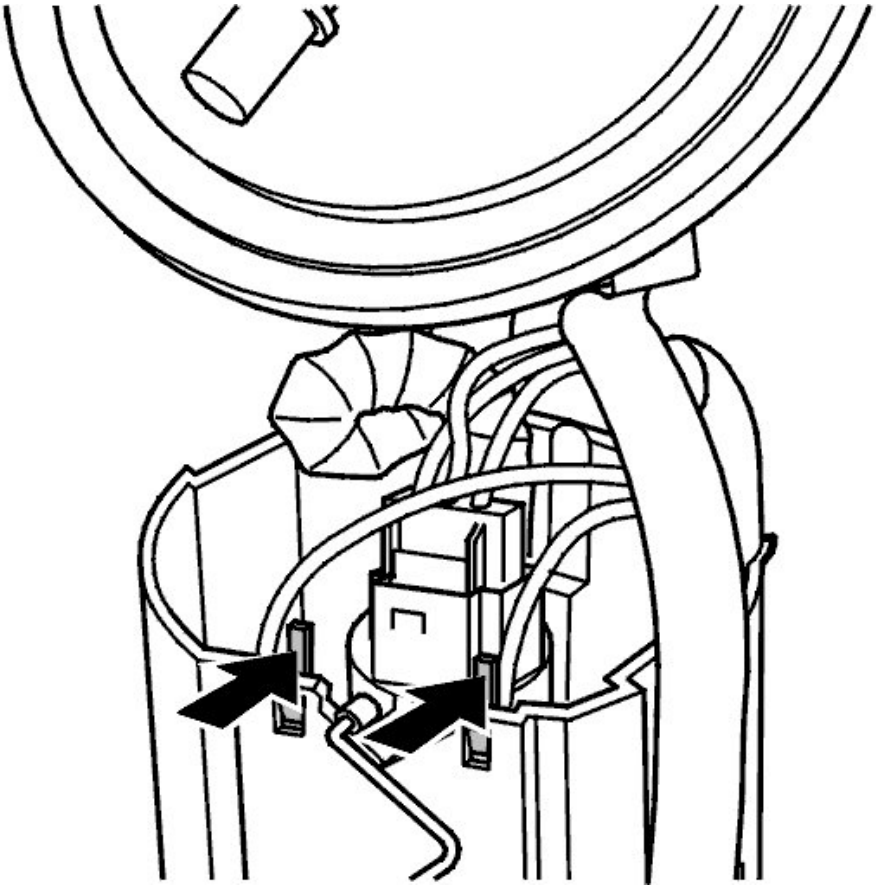
Remove the wire from the old level sensor and pump ejector.

Removing the right-hand level sensor



Remove:

- the tie straps around the protective sheath, hoses and wiring
- the net protective sheath by carefully threading it off the hoses and wiring
- the tie strap under the protective sheath.



Remove:

- the tie strap around the wiring above the pump

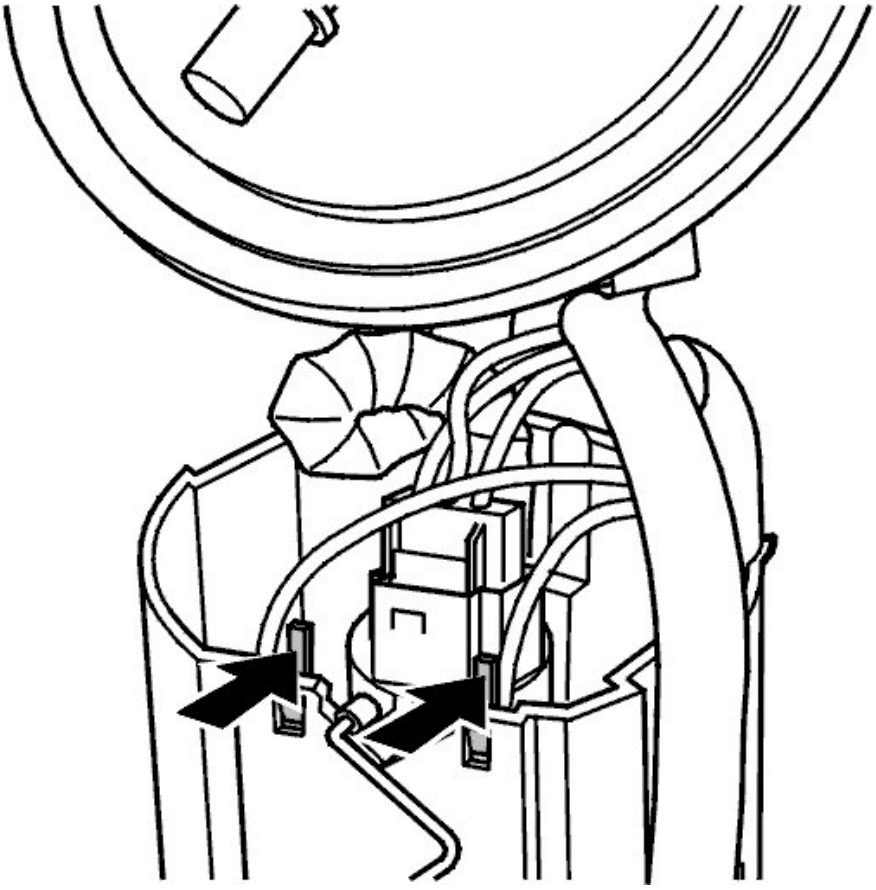
- the level sensor by pressing in the two clips and pulling upwards
- the thin pipe from the holder on the outside of the fuel tank unit
- the wiring from the holder in the fuel tank unit.

Installation

Only applies to vehicles with parking heaters

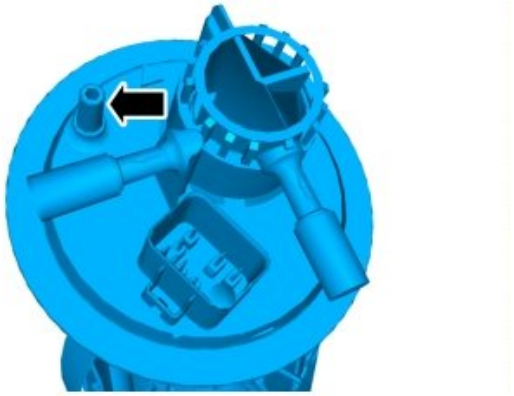
If the vehicle has an engine block heater, drill out the hole connection in the fuel tank unit. Use a -4 mm drill bit. Transfer the dip pipe.

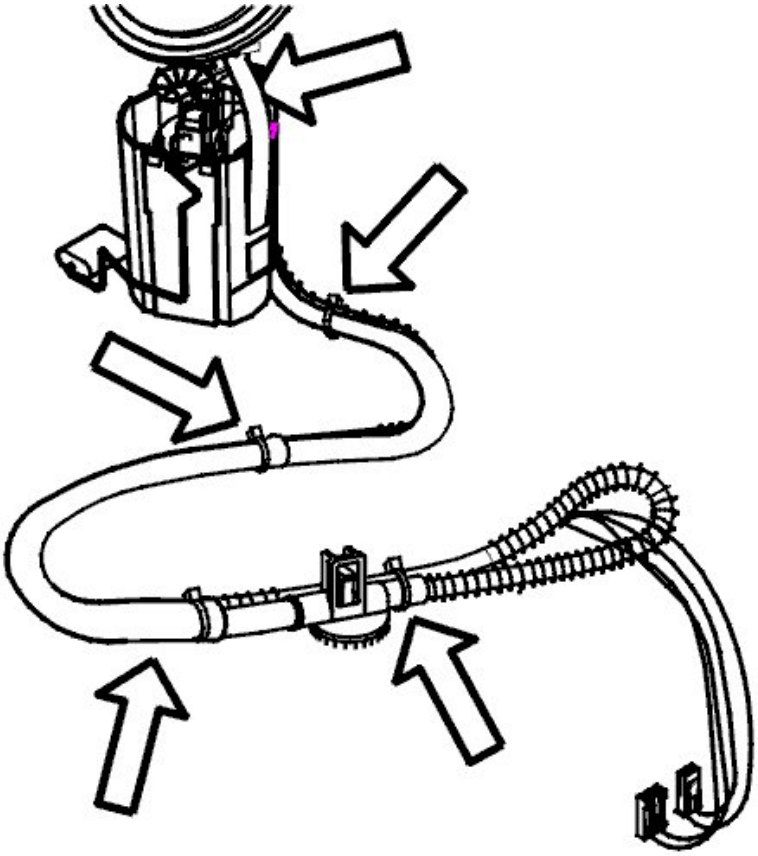
Installing the right-hand level sensor



Install:

- the new level sensor
- the wiring in the holder
- the thin pipe in the holder on the outside of the fuel tank unit
- the tie strap around the wiring above the pump.





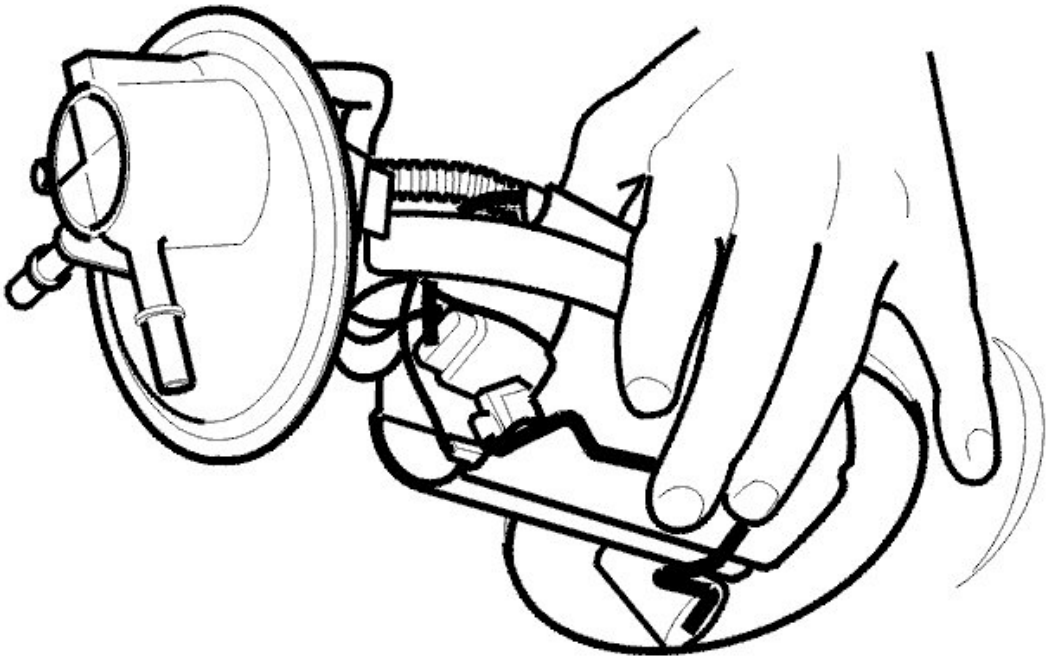
Install:

- the tie strap under the protective sheath

Note! Secure the tie strap on the smooth central section of the corrugated hose.

- the protective sheath
- four tie straps around the protective sheath, hoses and wiring. Secure the tie straps on the four smooth central sections of the corrugated hose.

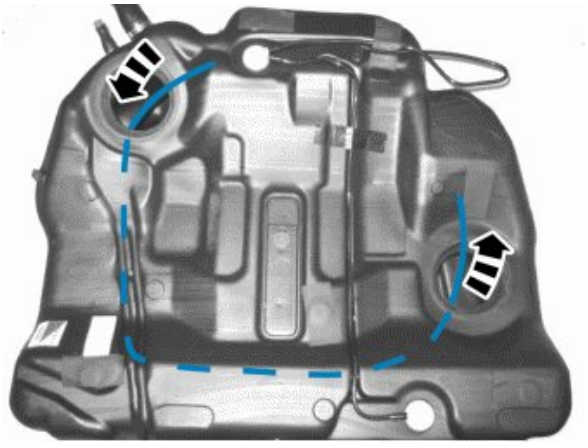
Installing the right-hand level sensor and pump and the left-hand level sensor in the fuel tank



If the fuel tank is replaced, see next step.

- Install the wire on the new ejector for the level sensor and pump
- Insert the hoses and wiring into the tank via the right-hand tank hole
- Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position
- Carefully and slowly lower the holder. Carefully work the holder into place
- Pull the wire so that the hoses and wiring end up on the left side of the tank
- Install the left-hand level sensor on the ejector
- Install the switches on the underneath of the left-hand level sensor
- Remove the wire from the ejector.

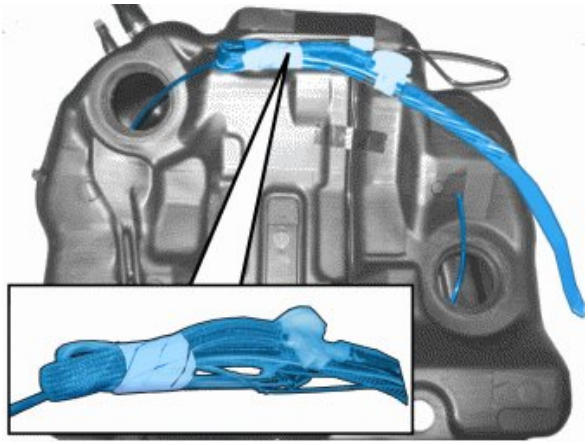
Cable routing when replacing the fuel tank



If replacing the fuel tank, wire cannot be used.
The image shows how to route the fuel lines and electrical wiring in the tank. Use a plastic pipe at least 1.7 m long.

Hint: Use spare part plastic pipe between the carbon filter and EVAP valve.

Insert the hose through the hole for the level sensor on the left-hand side of the vehicle and press it through the tank and take the end of the hose through the hole for the fuel pump.



Tape the fuel pump's fuel lines/electrical wiring to the plastic pipe.
Pull the wiring out of the hole for the level sensor. Remove the plastic pipe and the tape. Check that there is no tape/adhesive residue on the wiring.
Pull the wiring forwards and backwards to check that it has not bent or got trapped.

Finishing

- Install the sensor, backrest, side cushion and seat cushion. See Draining the fuel tank See: Service and Repair.

Fuel Pump: Service and Repair
Replacing the Fuel Pump / Level Sensor for the Right-Hand Fuel Tank

Replacing the fuel pump / level sensor for the right-hand fuel tank

Special tools:

999 5720 Wrench See: Tools and Equipment/999 5720 Wrench

Removal

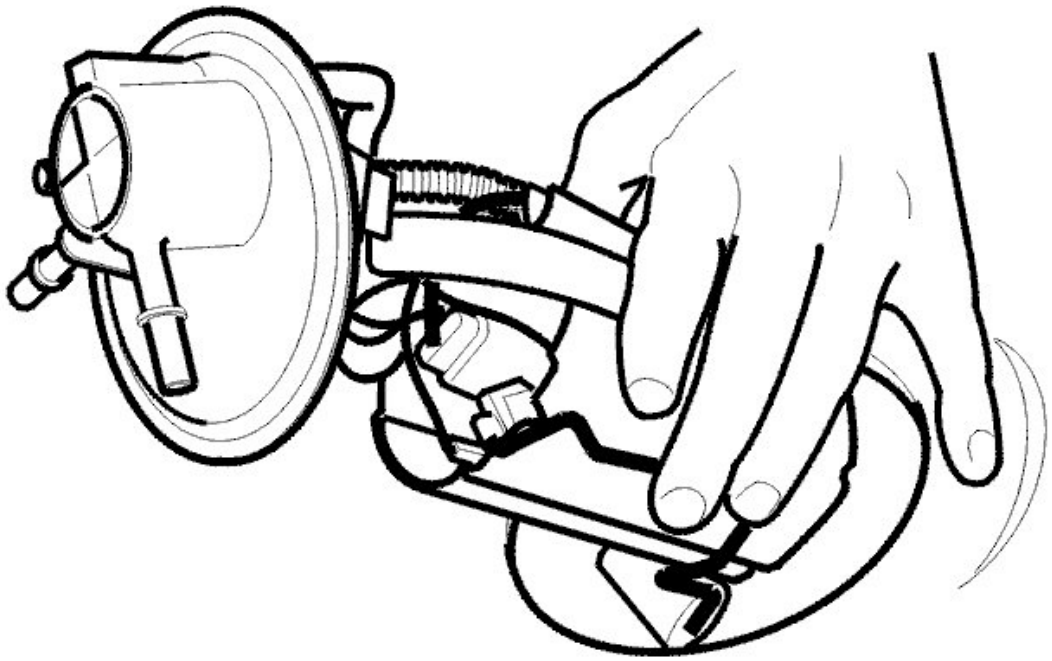
Removing the rear seat

Remove:
- the backrest. See Backrest See: Body and Frame/Seats/Seat Back/Service and Repair/Backrest.

Draining the fuel system and fuel tank

Drain:
- the fuel system. See the relevant service procedure.

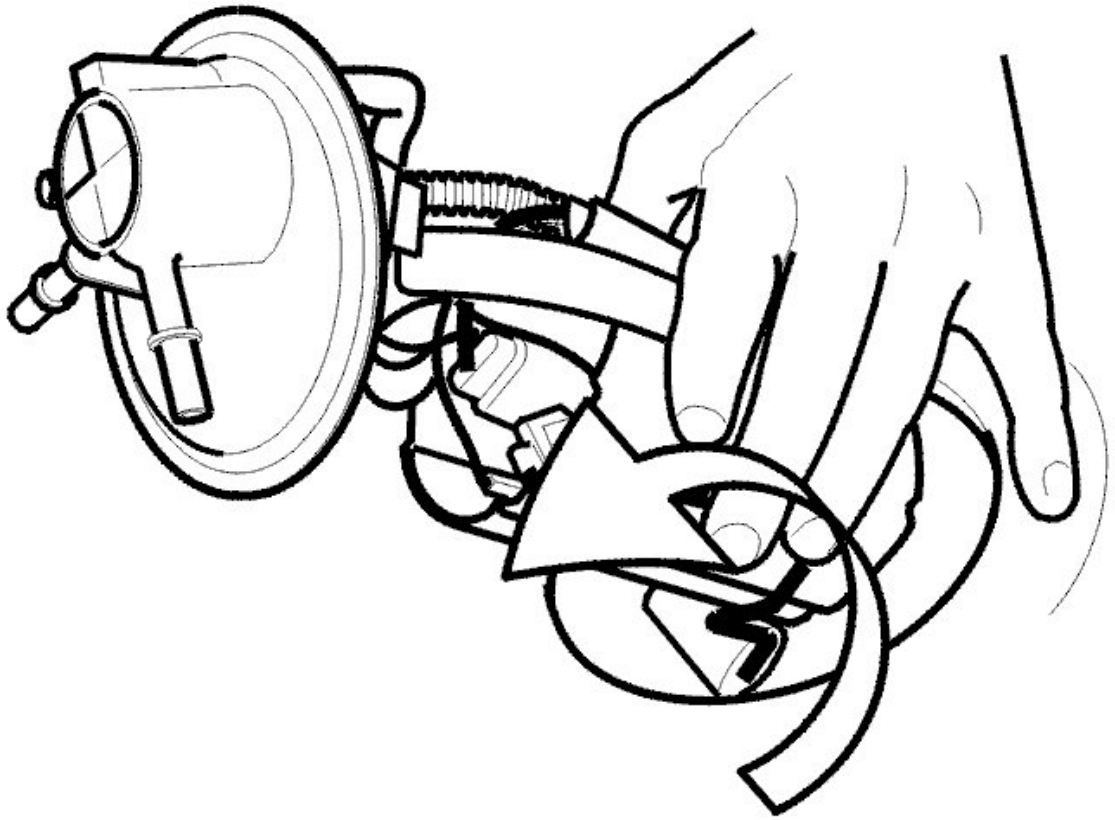
Removing the level sensor / pump



Note! Use special tool999 5720 Wrench See: Tools and Equipment/999 5720 Wrench to remove the snap ring for the level sensor / pump.

Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position.

Removing the level sensor / pump, continued



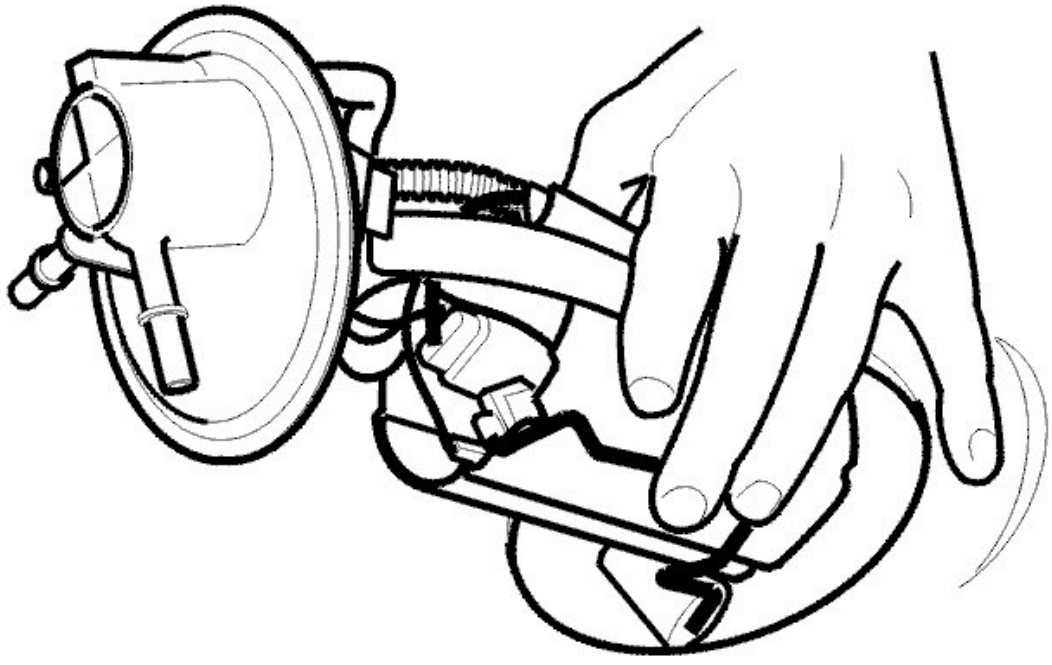
Caution! Take care with the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.

Caution! It is extremely important that the float arm is not broken or bent.

Installation

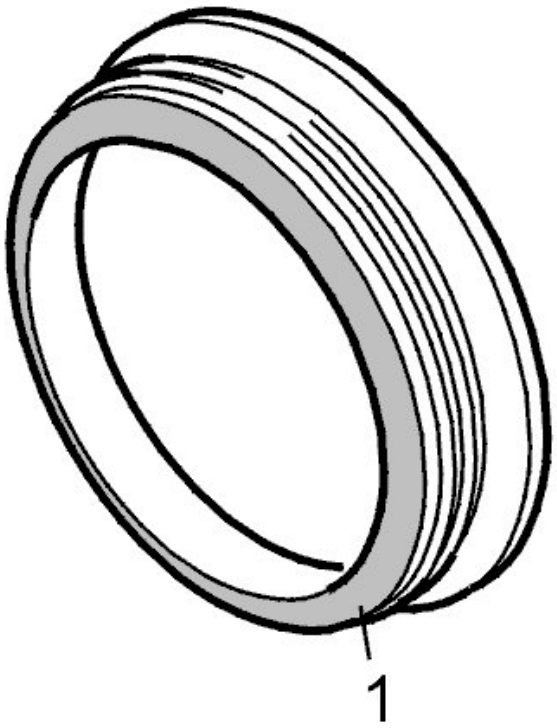
Installing the level sensor / pump



Note! Use special tool999 5720 Wrench See: Tools and Equipment/999 5720 Wrench to tighten the snap ring for the level sensors.

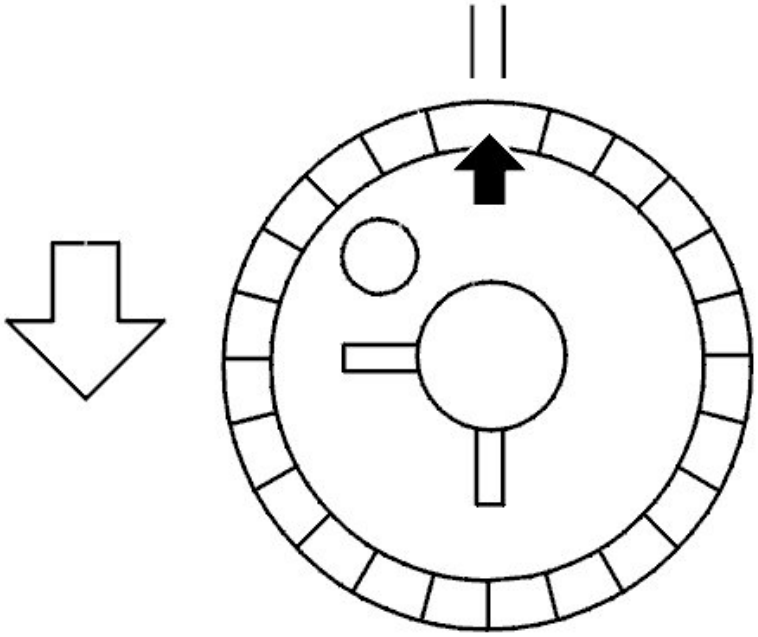
Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position.
Carefully and slowly lower the holder. Carefully work the holder into place.

Lubricating the screw, level sensor and pump



Thoroughly clean and dry the O-ring mating surfaces.
Install a**new**O-ring.
Use petroleum jelly to lubricate the screw mating surface with the fuel tank unit. This is so that the screw does not turn the fuel tank unit when it is tightened.
Press down the right fuel sensor and pump so that the fuel line is pointing forward and to the right.**Ensure that the arrow on the cover is between the markings on the tank**.
Check that the O-ring does not deform.
Tighten the screw. Tighten to **60 Nm**.

Note! Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.



Finishing

Wipe up any fuel spillage.
Position the wiring in the cut-out in the rubber ring.
Connect the connectors.
Install the cover over the left-hand level sensor and right-hand level sensor and pump. Tighten the nuts.
Install the rear seat backrest. See Backrest See: Body and Frame/Seats/Seat Back/Service and Repair/Backrest.

Fuel Pump: Service and Repair
Replacing the Right-Hand Level Sensor and Pump

Replacing the right-hand level sensor and pump

Removal

Note! Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

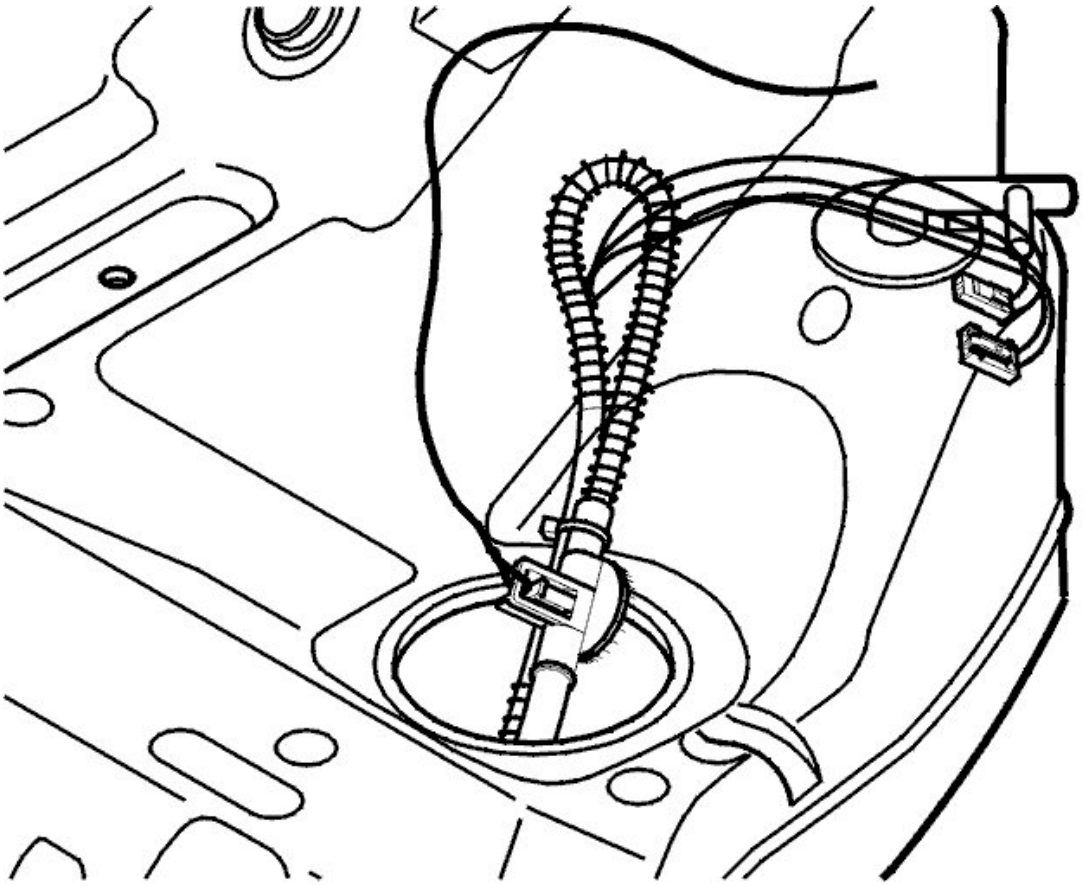
Depressurizing the fuel system

Depressurize the fuel system according to, Fuel system pressure release See: Fuel Filter/Fuel Pressure Release/Service and Repair

Draining fuel tank

Drain the fuel tank according to, Draining the fuel tank See: Service and Repair

Removing the left-hand level sensor

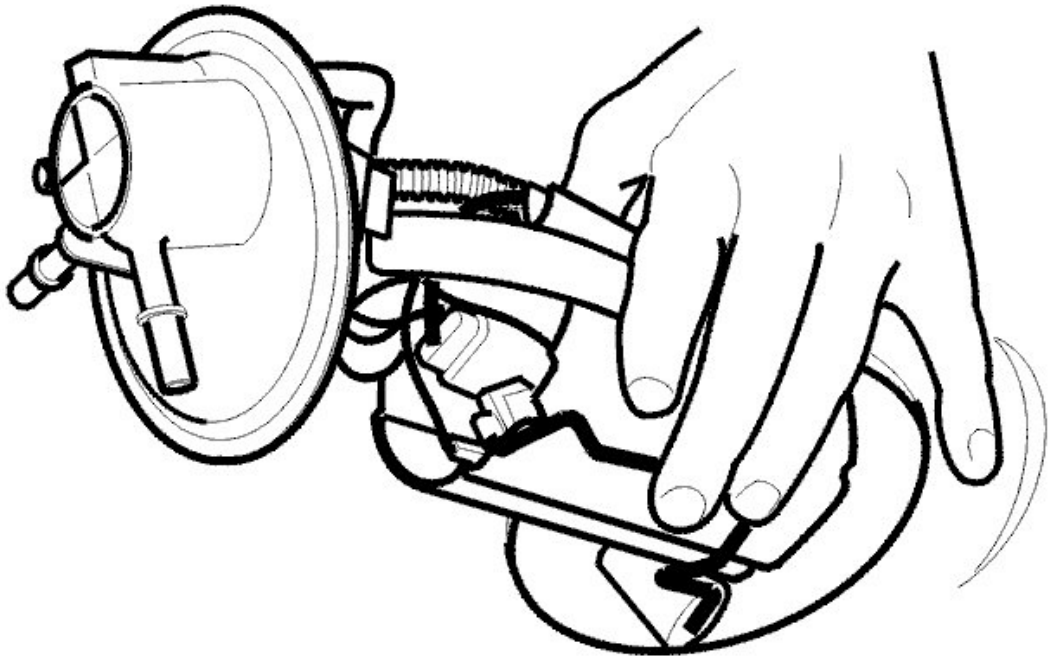


Disconnect:

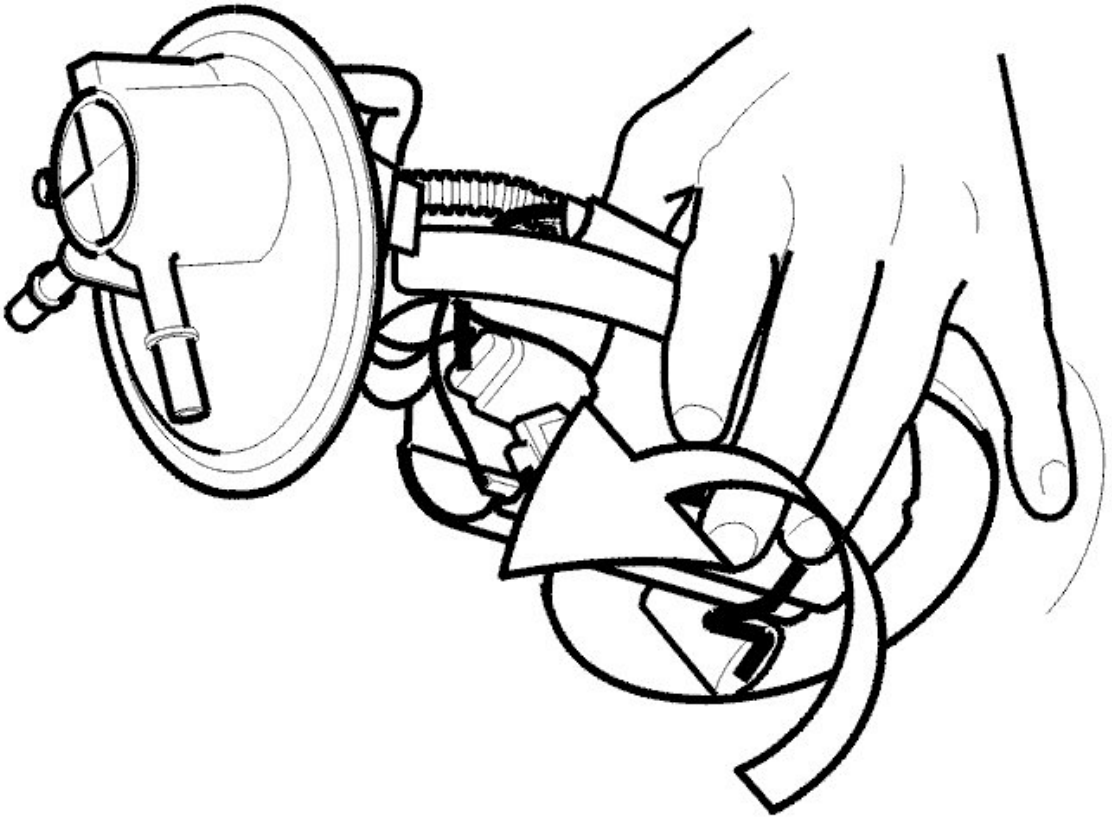
- the two connectors from the underneath of the left-hand level sensor
- the left-hand level sensor from the ejector on which it is positioned.

Note! Fasten a wire in the area of the ejector.The wire must be long enough that it reaches over to the opposite side of the tank with some excess remaining to ensure that it does not slide into the tank. The wire is needed to pull the hoses and wiring back to the left side of the tank after the fuel tank unit has been replaced.

Removing the right-hand level sensor / pump



- Grip the right-hand level sensor and pump holder and pinch the float so that it is held in its lowest position.



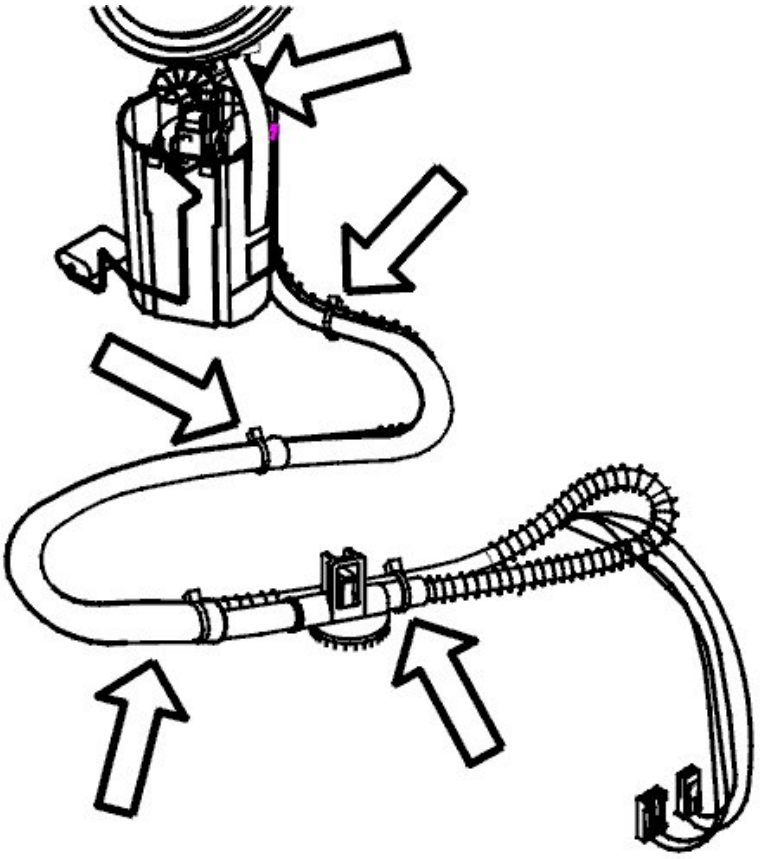
Note! Watch out for the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.
Pull the hoses out from the tank without pulling up the entire wire from the right-hand hole in the tank.

Note! It is extremely important that the float arm is not broken or bent.

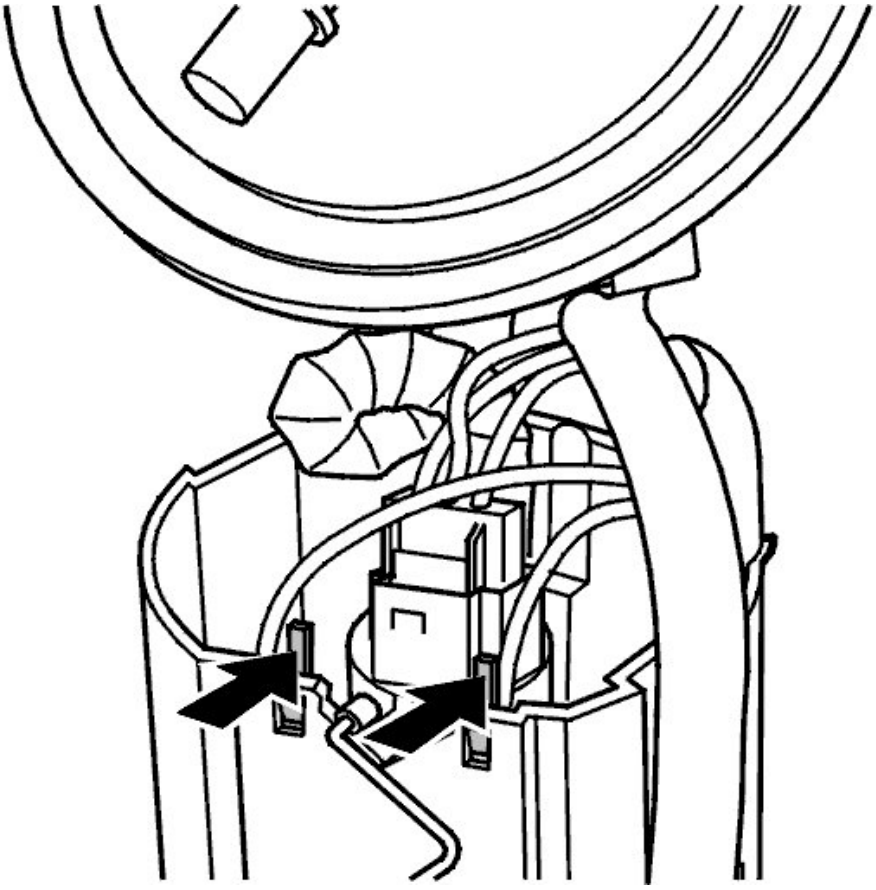
Remove the wire from the old level sensor and pump ejector.

Removing the right-hand level sensor



Remove:

- the tie straps around the protective sheath, hoses and wiring
- the net protective sheath by carefully threading it off the hoses and wiring
- the tie strap under the protective sheath.



Remove:

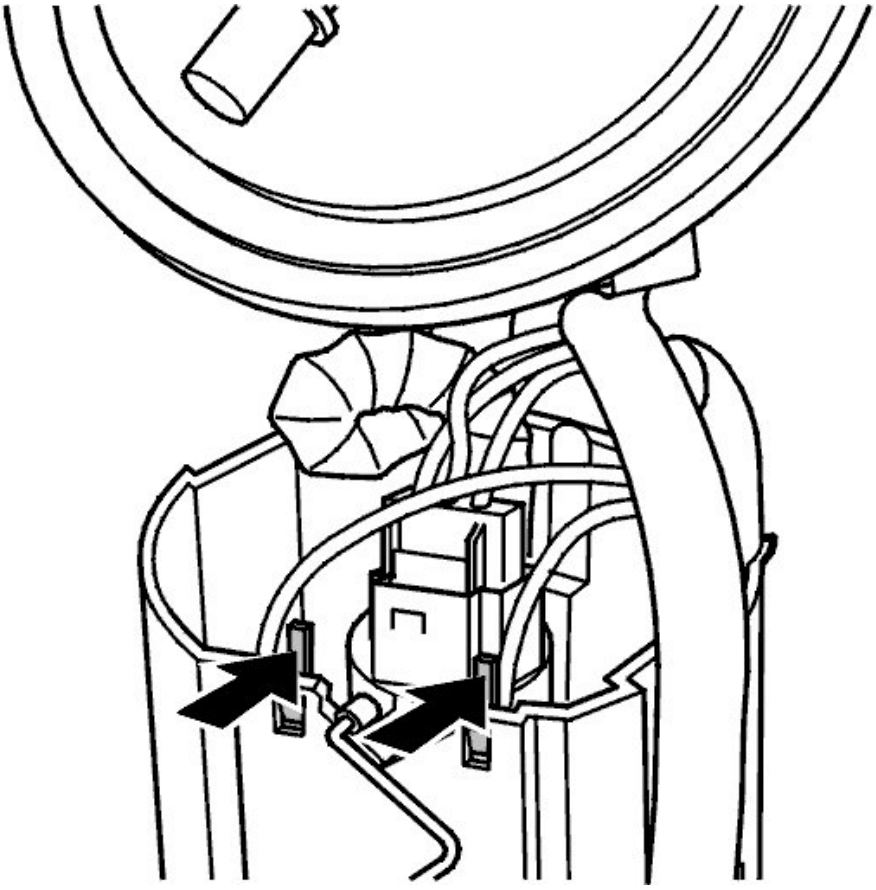
- the tie strap around the wiring above the pump

- the level sensor by pressing in the two clips and pulling upwards
- the thin pipe from the holder on the outside of the fuel tank unit
- the wiring from the holder in the fuel tank unit.

Installation

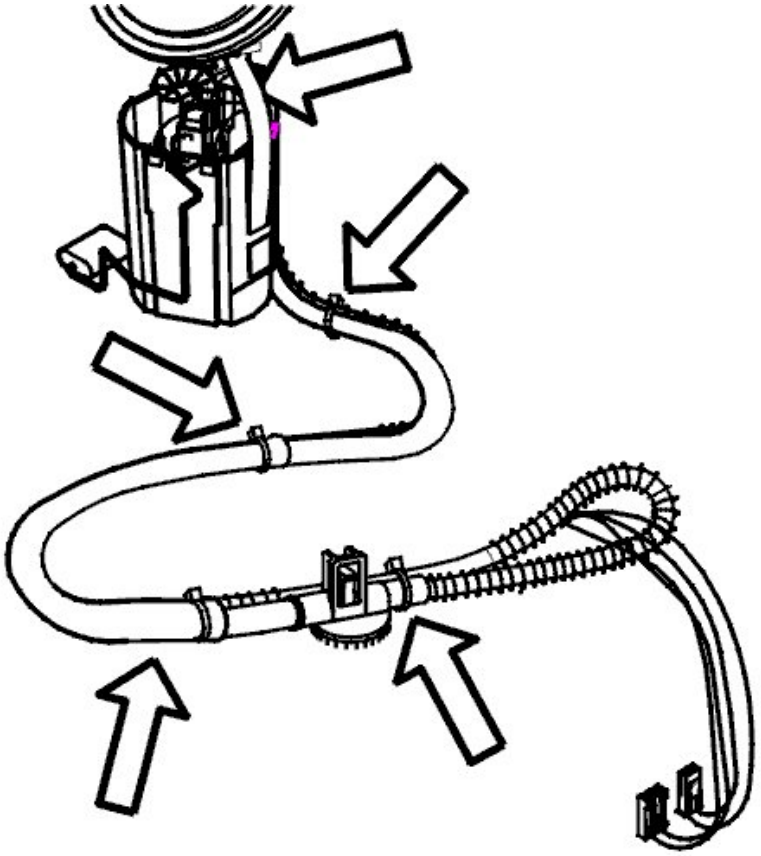
Installing the right-hand level sensor

If the vehicle has an engine block heater, drill out the hole connection in the fuel tank unit. Use a -4 mm drill bit. Transfer the dip pipe.



Install:

- the new level sensor
- the wiring in the holder
- the thin pipe in the holder on the outside of the fuel tank unit
- the tie strap around the wiring above the pump.



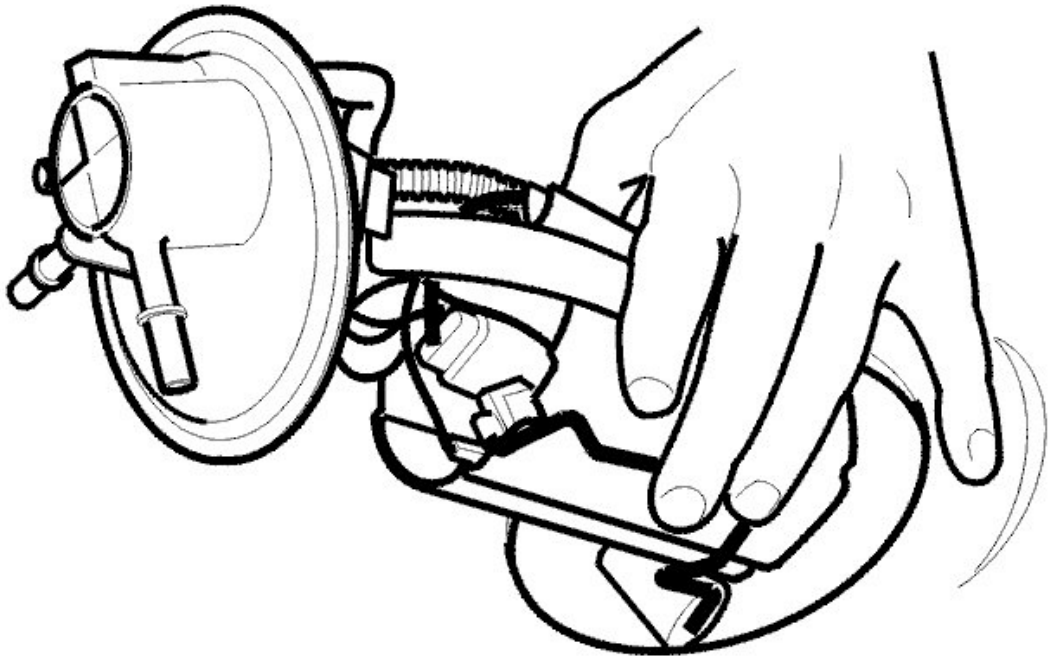
Install:

- the tie strap under the protective sheath

Note! Fasten the cable tie on the smooth central section of the corrugated hose.

- the protective sheath
- four tie straps around the protective sheath, hoses and wiring. Secure the tie straps on the four smooth central sections of the corrugated hose.

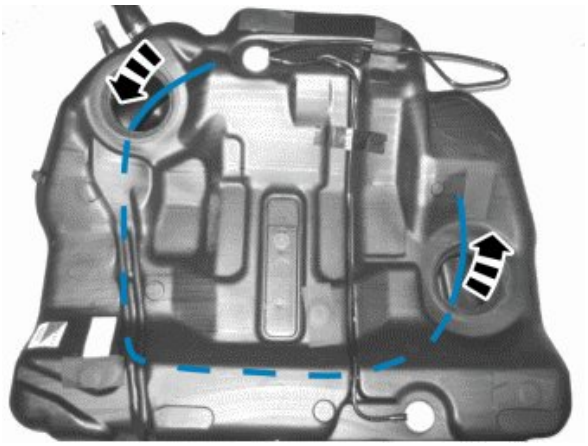
Installing the right-hand level sensor and pump and the left-hand level sensor in the fuel tank



If the fuel tank is replaced, see next step.

- Install the wire on the new ejector for the level sensor and pump
- Insert the hoses and wiring into the tank via the right-hand tank hole
- Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position
- Carefully and slowly lower the holder. Carefully work the holder into place
- Pull the wire so that the hoses and wiring end up on the left side of the tank
- Install the left-hand level sensor on the ejector
- Install the switches on the underneath of the left-hand level sensor
- Remove the wire from the ejector.

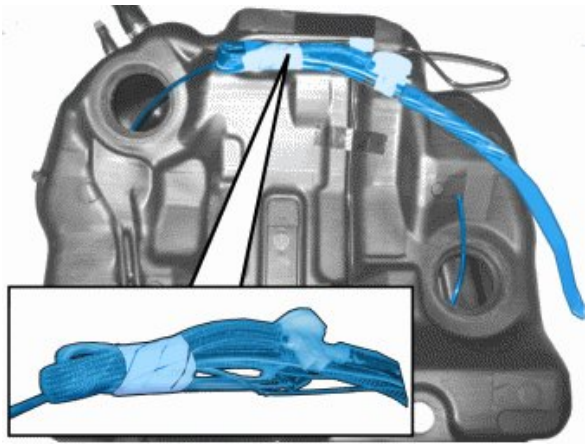
Cable routing when replacing the fuel tank



If replacing the fuel tank, wire cannot be used.
The image shows how to route the fuel lines and electrical wiring in the tank. Use a plastic pipe at least 1.7 m long.

Hint: Use spare part plastic pipe between the carbon filter and EVAP valve.

Insert the hose through the hole for the level sensor on the left-hand side of the vehicle and press it through the tank and take the end of the hose through the hole for the fuel pump.



Tape the fuel pump's fuel lines/electrical wiring to the plastic pipe.
Pull the wiring out of the hole for the level sensor. Remove the plastic pipe and the tape. Check that there is no tape/adhesive residue on the wiring.
Pull the wiring forwards and backwards to check that it has not bent or got trapped.

Finishing

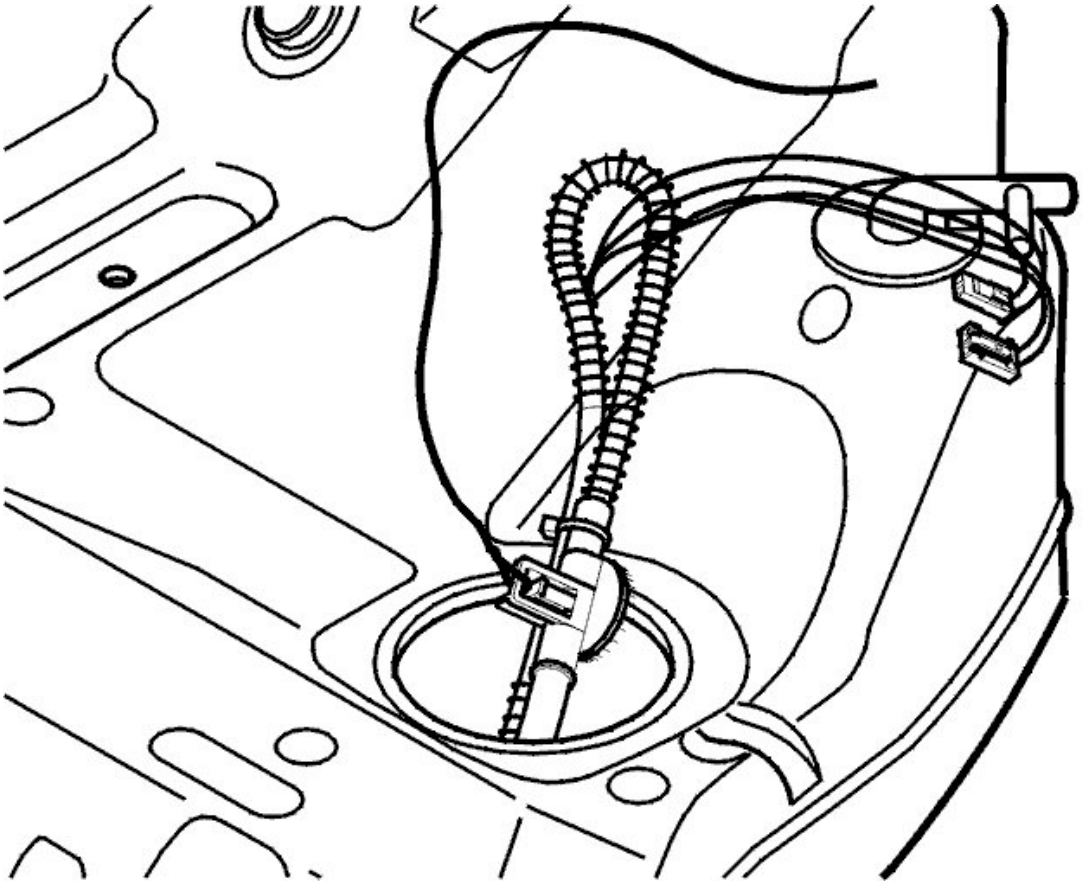
- Install the sensor, backrest, side cushion and seat cushion. See Draining the fuel tank See: Service and Repair.

Fuel Pump: Service and Repair
Right Side Fuel Pump with Level Sensor

Right side fuel pump with level sensor

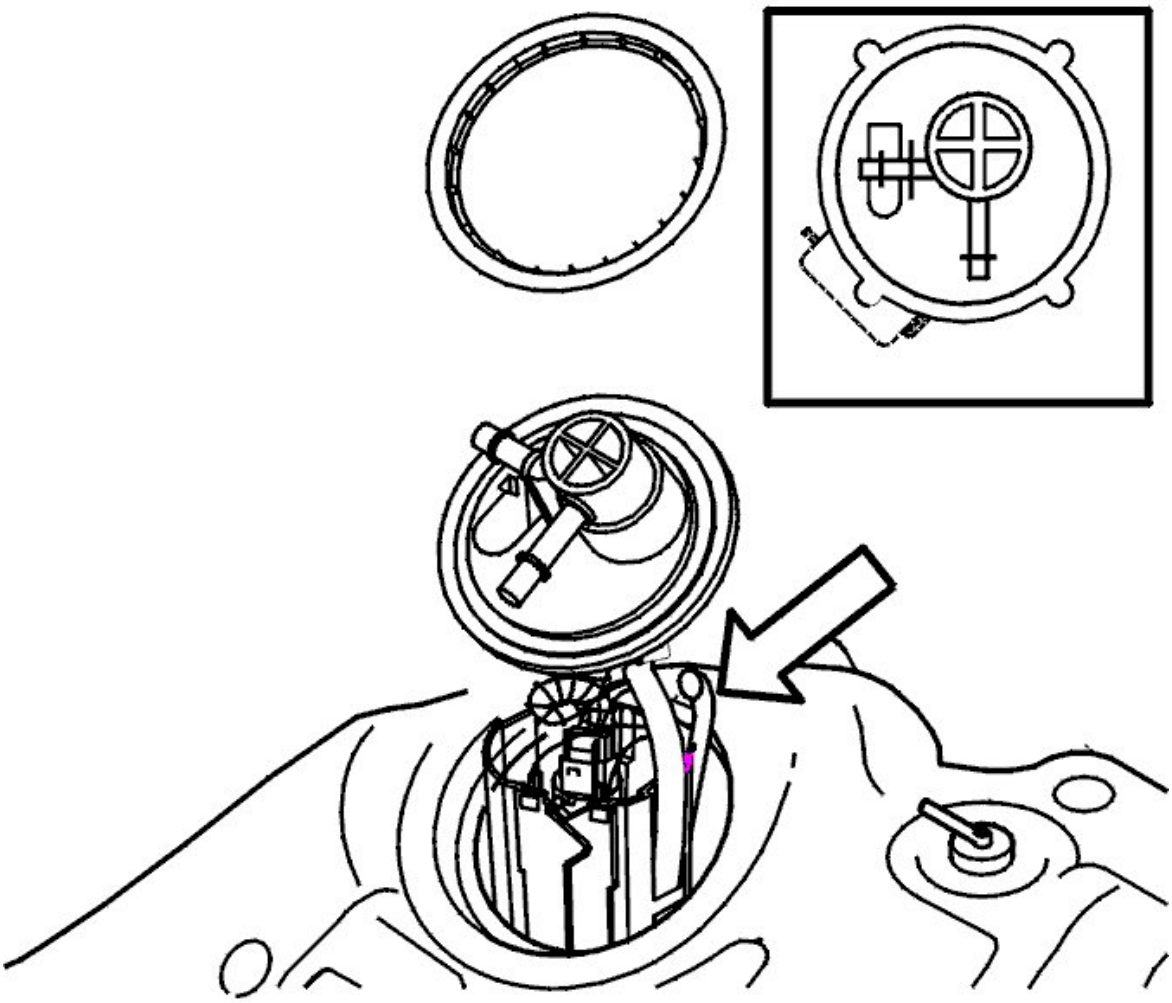
Removal

Preparation

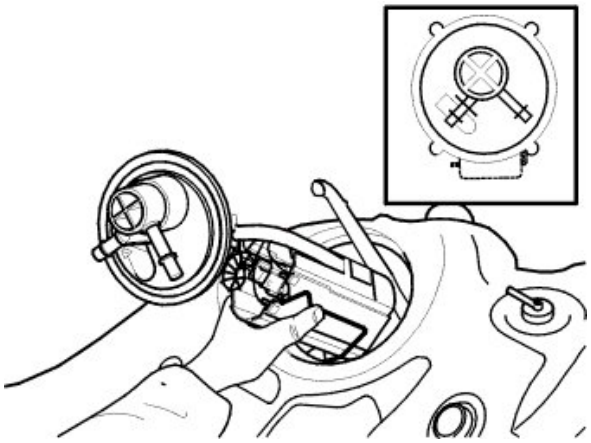


- Remove left side fuel gauge sensor as described in Left fuel gauge sensor See: Fuel Tank/Fuel Gauge Sender/Service and Repair/Left Fuel Gauge Sensor
- Attach a piece of string or steel wire onto attachments for wire and tube system on left side fuel gauge sensor.

Right side fuel pump with level sensor

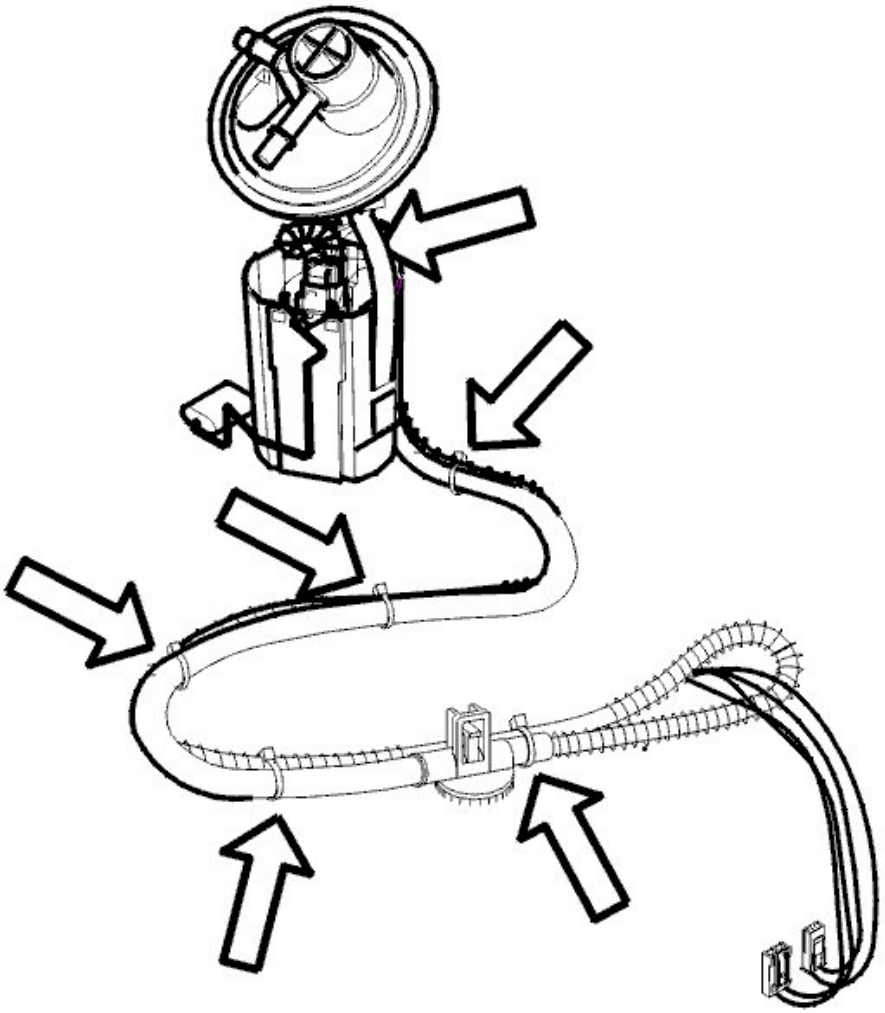


- Remove hatch and seal from fuel pump
- Loosen fuel pipe
- Loosen fuel pump lock ring using special tool999 5720 Wrench See: Tools and Equipment/999 5720 Wrench
- Pull up fuel pump to position 1 (see figure) and release plastic tube.



- Turn fuel pump to position 2 (see figure)
- Hold float against pump housing, then turn fuel pump forwards and lift it up
- Pull wire and tube system out using string or steel wire.

Level sensor with cable and pipe system

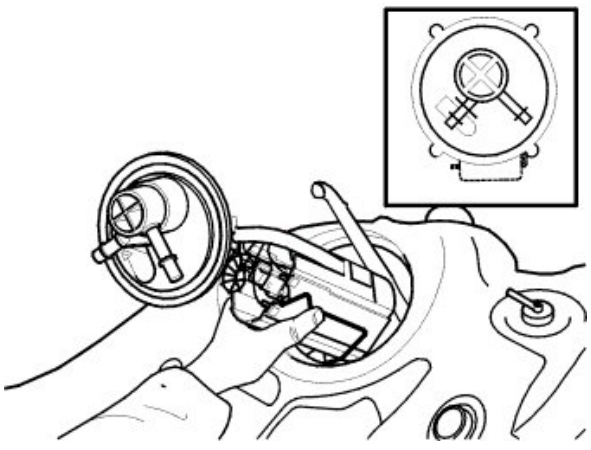


- Remove fuel pump with wire and tube system
- Release six clamps. Note clamp positions
- Position fuel pump correctly, loosen fixings and push level sensor up.

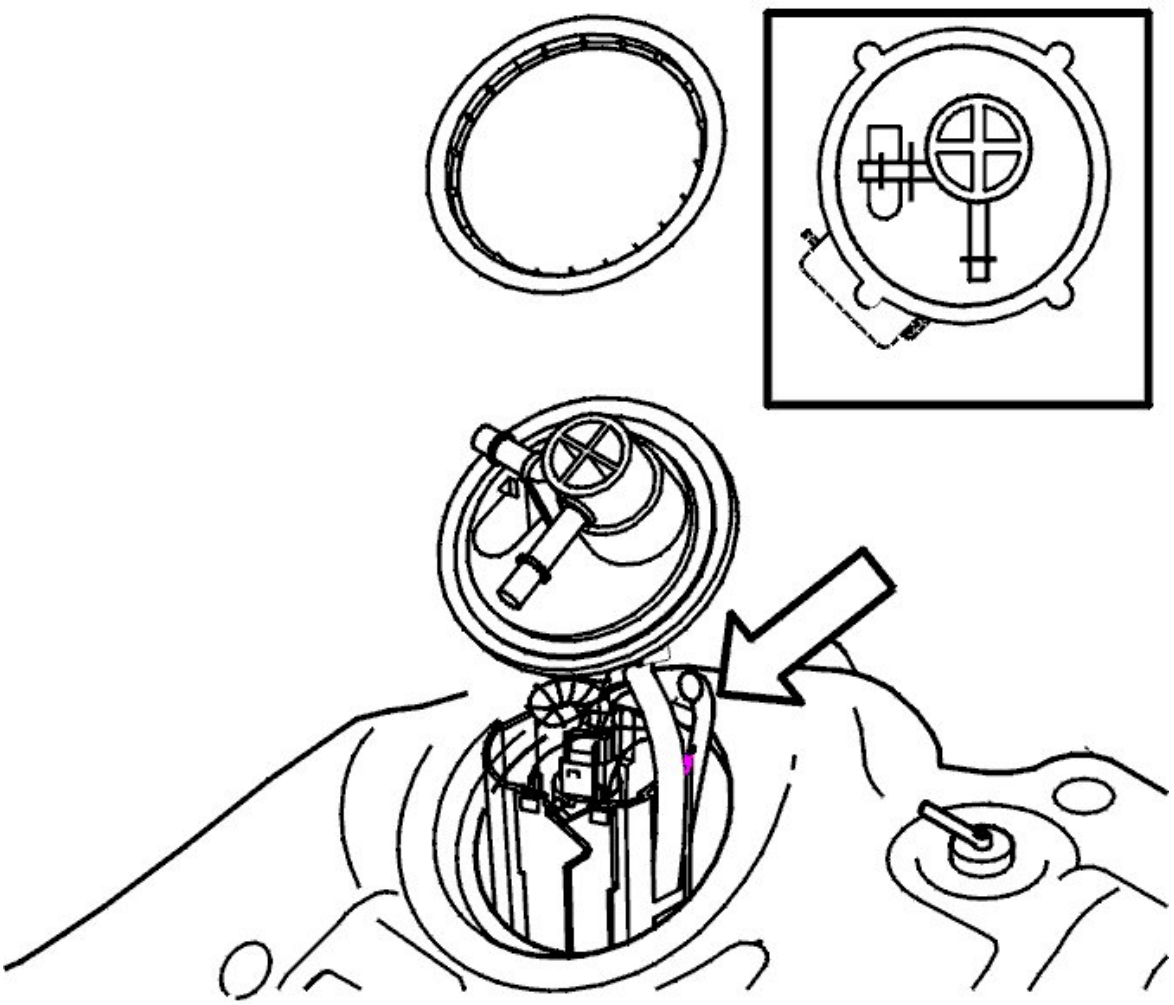
Installation

Level sensor with cable and pipe system
- Position level sensor and press firmly
- Pull out wire next to wire and tube system and install clamps. Note clamp positions.

Right side fuel pump with level sensor
- Attach a piece of string or steel wire onto attachments for wire and tube system on left side fuel gauge sensor
- Install wire and tube system into fuel tank
- Pull wire and tube system towards opening for left side level sensor, and feed through.



- Loosen plastic tube from slot in pump housing
- Hold float against pump housing and install fuel pump in position 2 (see figure).



- Turn fuel pump to position 1 (see figure)
- Press plastic tube firmly into slot in pump housing
- Press fuel pump down in hole
- Install lock ring and tighten by hand.

Note! Markings on cover and fuel tank.

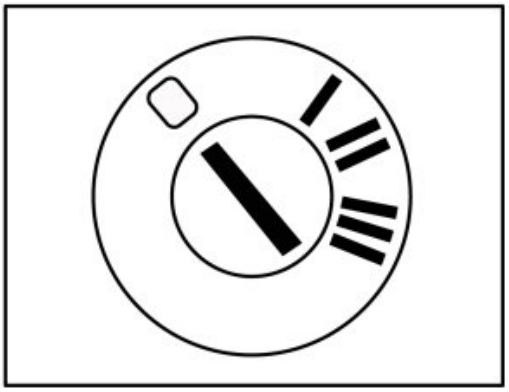
- Tighten lock ring using special tool999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.
- Install seal and hatch onto fuel pump.

Fuel Pump Control Unit: Service and Repair

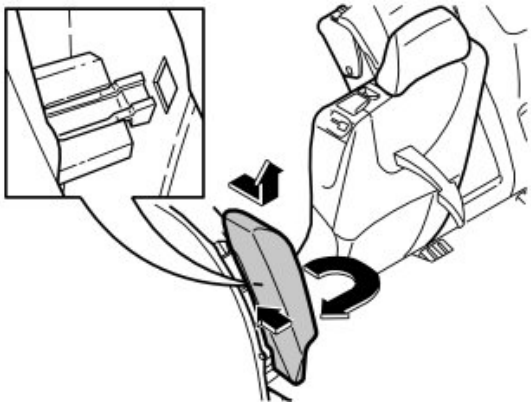
Control module fuel pump (FP), replacing

Note! Some variation may occur. However, the essential information in the illustrations is always correct.

Removal



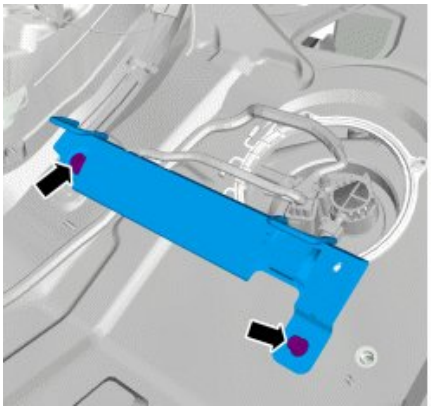
Vehicles with fuel pump module located on fuel tank



Open Luggage Compartment Lid/tailgate

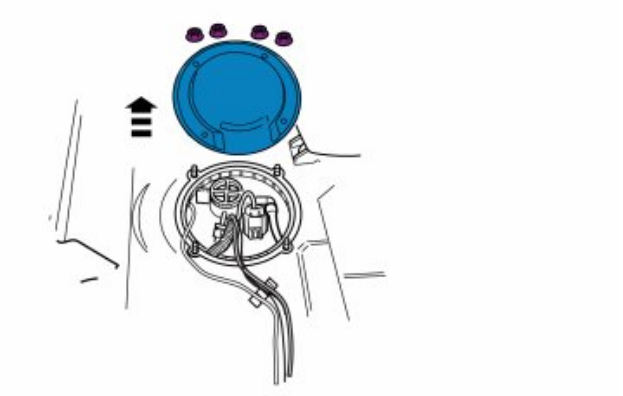
Remove:
- luggage compartment mat/floor hatches and side panels on the right side
- backseat's seat cushion

Fold the rear seat backrest forward.
Remove the right side upholstery Refer to: Upholstery, side cushion, replacing See: Body and Frame/Seats/Seat Cover/Service and Repair/Rear Seat, Passenger Seat/Upholstery, Side Cushion, Replacing
Remove the right part of the backrest
Use new bolt, 1 pc. M10.
Tighten with 50 Nm.



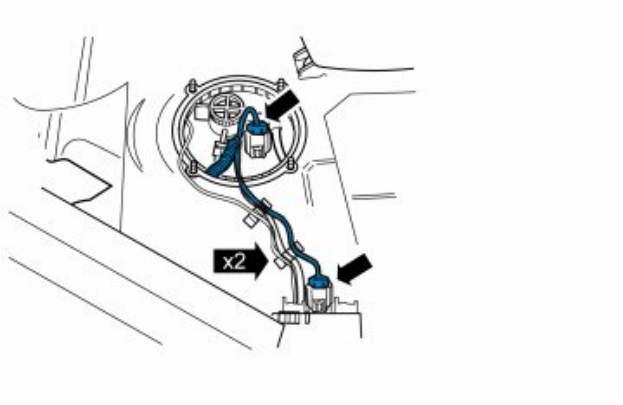
Remove bracket for child seat from the floor.
Use new bolt and nut.
1 pc. M10, tighten with 50 Nm.
1 pc. M12, tighten with 80 Nm.

Move aside the insulating mat.



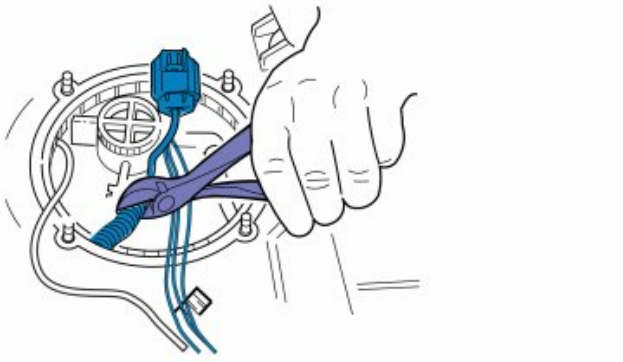
Remove:

- right floor hatch over fuel tank
- the cable harness

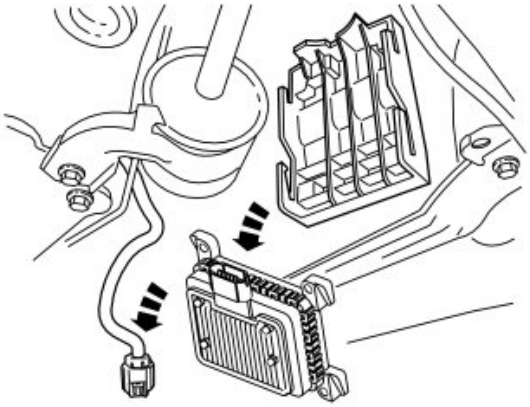


Disconnect:

- cable harness' connectors by wheel housing/sill and fuel pump
- cable from brackets



Cut off the cable harness as shown. This is done to make it easier to remove the cable harness.
Remove the remaining part of the cable harness with connector.



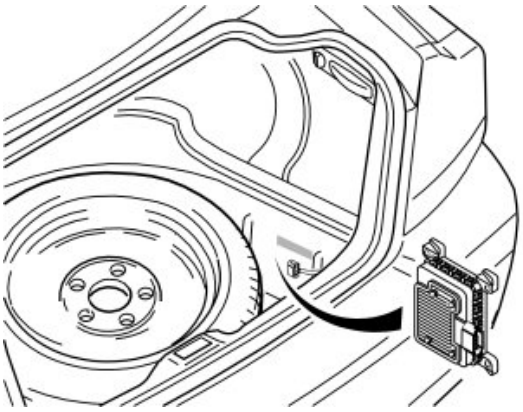
Raise the car

Remove:

- the connector from the control unit
- control module from the vehicle
- cable harness from its brackets
- cable harness from the vehicle

Check that the fuel line is located in its clamps.

Vehicles with fuel pump module located in spare wheel well's right trailing edge.

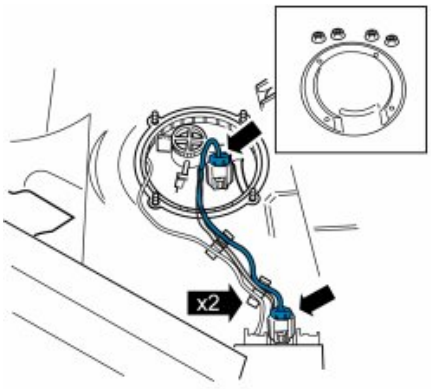


Remove:

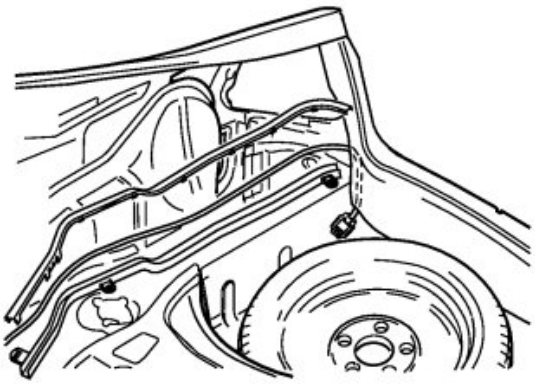
- luggage compartment mat/floor hatches so that spare wheel well can be released
- the connector from the control unit
- the control module from Velcro fastener

Installation

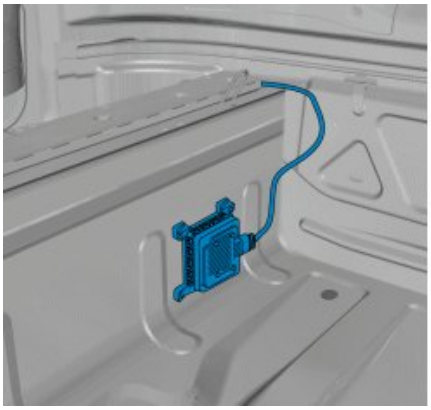
Vehicles with fuel pump module originally located on fuel tank.



Connect a new cable harness to the connector by the sill and the fuel tank.
Place the cable harness in the seal ring's slot and in the bracket on the body.
Install the floor hatch and tighten with 6 Nm.
Check carefully that the seal is in place when the hatch is installed.



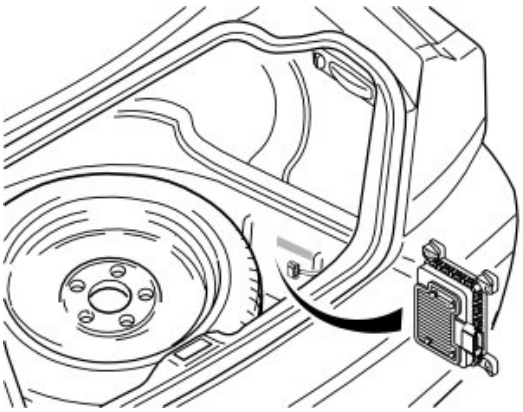
Open the vehicle's cable channel and lay down the cable harness.
Close the cable channel.



The control module shall be placed in the spare wheel well's rear part on the right side, between the two markings and below the bead of sealing compound.
Remove the protective tape from the self-adhesive Velcro fastener and install the control module.
Plug in the connector from the cable harness to the control module.

To install, reverse the removal procedure.

Vehicles with fuel pump module originally located in spare wheel well's right trailing edge.



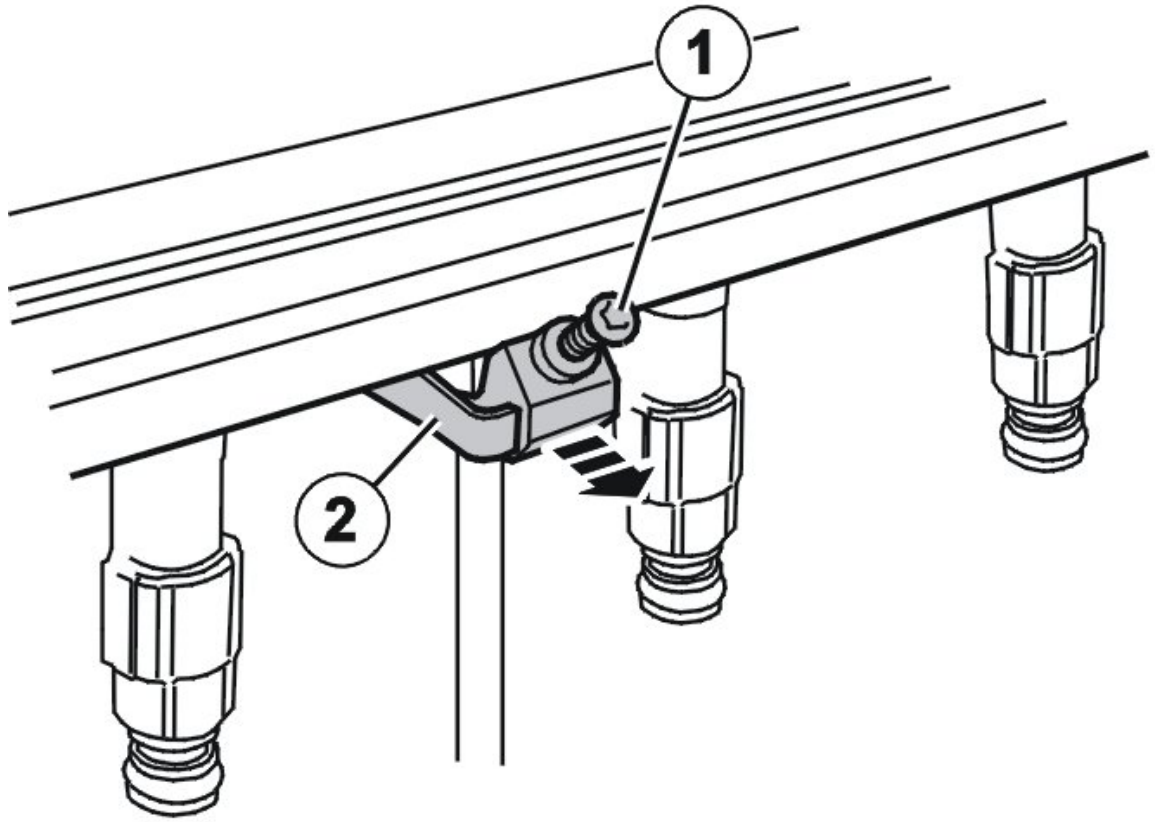
Install:

- new control module
- the connector to the control module
- the luggage compartment mat/floor hatches

Fuel Rail: Service and Repair

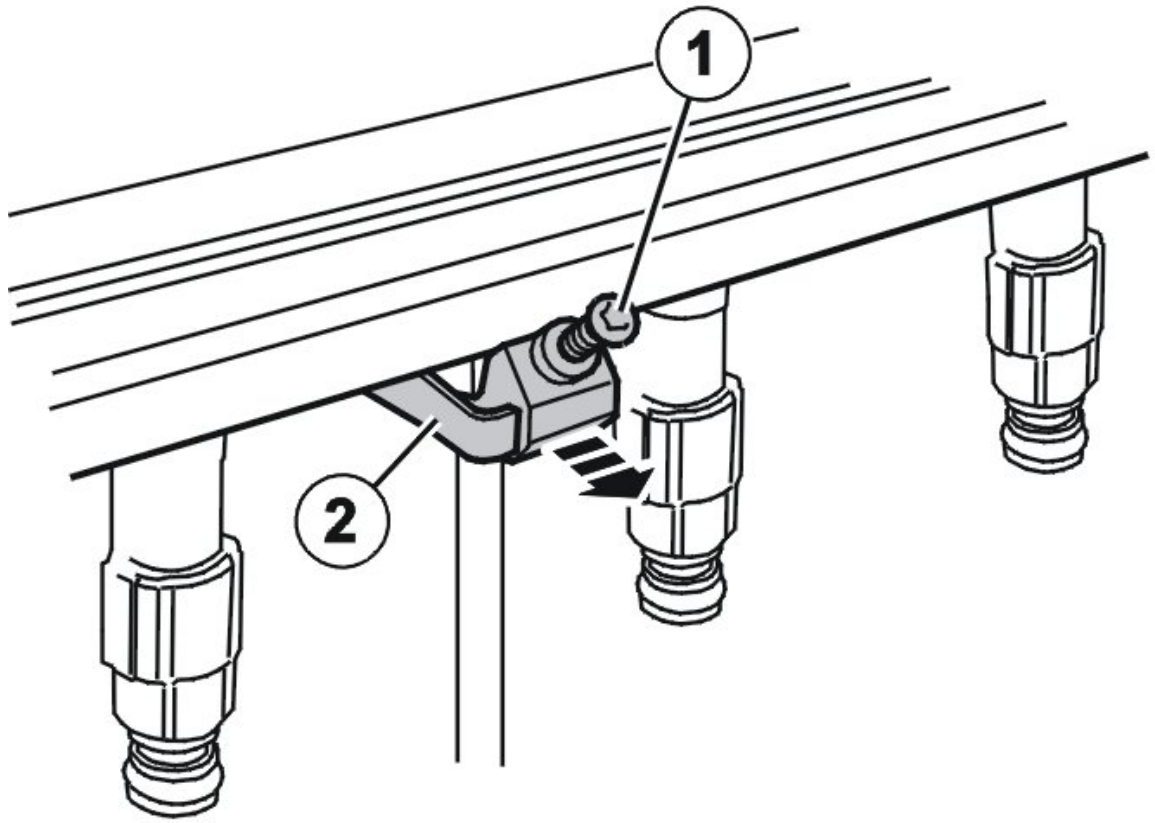
Fuel line, lock

Removing lock



Unscrew the screw (1).
Bend out the secondary lock (2). Pull out the catch.
Remove the fuel rail.

Installing the lock



Note! Screw in the screw until it takes.

Install the fuel rail.
Press in the secondary lock (2).
Screw the screw (1) right in.

Fuel Tank: Testing and Inspection
Test Pressurizing the Tank System

Test pressurizing the tank system

Special tools:

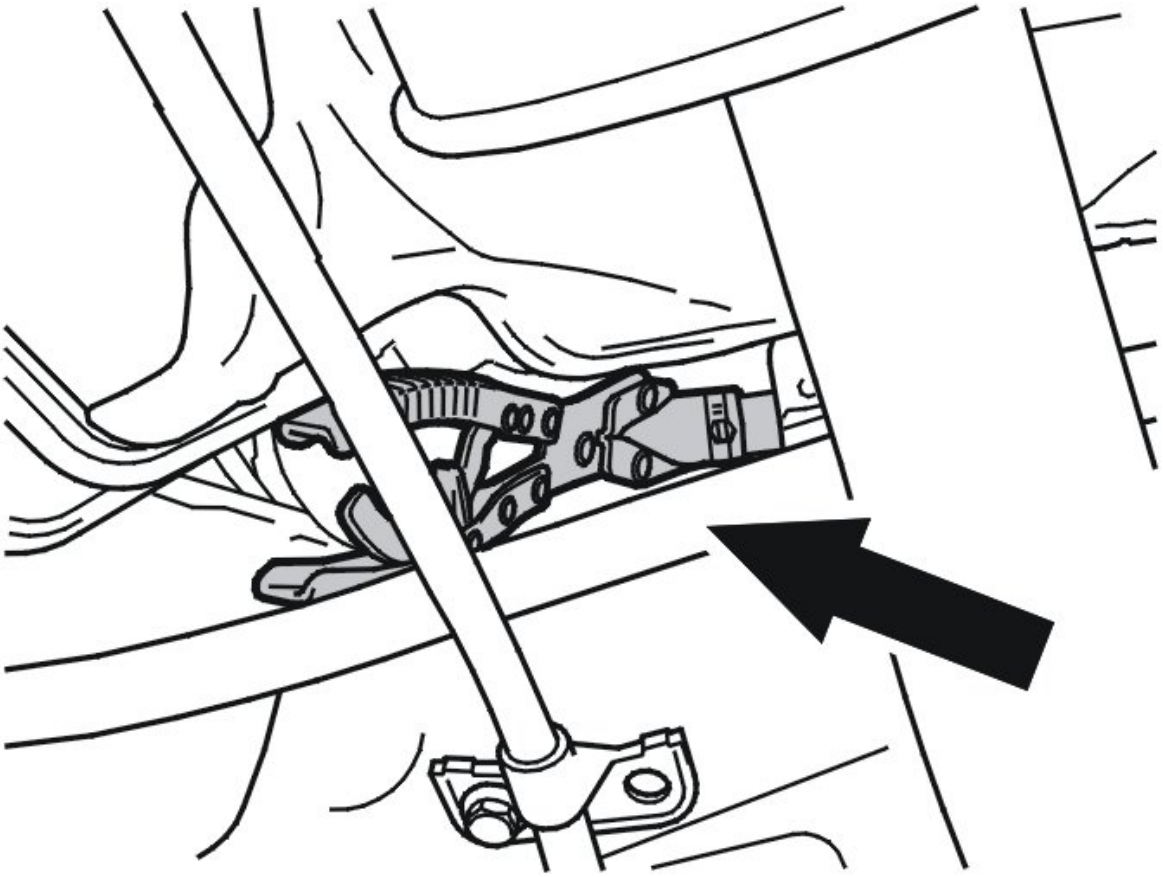
999 5646 Pressure gauge See: Tools and Equipment/999 5646 Pressure Gauge
999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator

Safety

First read Safety regulations for handling fuel See: Service Precautions/Safety Regulations for Handling Fuel.

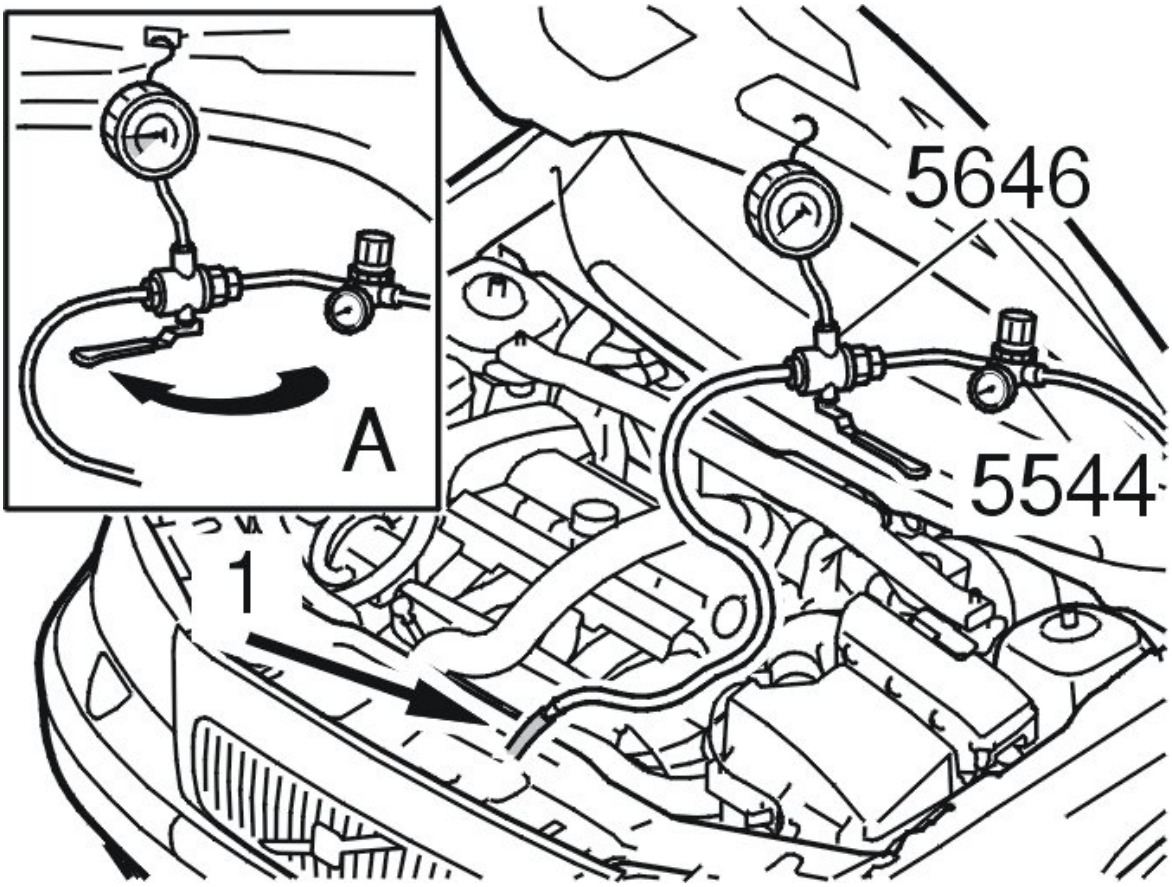
Note! The tank must not be more than 85% full when test pressurizing.

Preparation



Ignition off.
Block the hose between the leak diagnostic module and the leak diagnostic module filter by clamping the hose using hose clips.

Connecting the manometer



Expose the canister purge (CP) valve.
Disconnect the hose (1) between the EVAP canister and the EVAP canister purge valve.
Connect manometer 999 5646 Pressure gauge See: Tools and Equipment/999 5646 Pressure Gauge to the hose (1) and the pressure regulator 999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator to the manometer.

Caution! The cock should face the pressure regulator.

Connect compressed air to the pressure regulator
Set the pressure to a **maximum of 7 kPa** (read off from manometer 999 5646).
Pressurize the fuel tank system by turning the cock at right angles to the hoses.
Allow pressure to build up in the tank system.
Check that the system does not leak.
Stop the pressurization by turning the cock towards the hose (1) as illustrated in A.

Note! A certain amount of leakage may occur from the leak diagnostic unit. The pressure may therefore drop when the pressurization is stopped. This is normal. The leakage is caused because the pressurization is not carried out using the leak diagnostic unit.

Caution! Never leave the car unattended with the tank system pressurized

Resetting

Remove the manometer. Reconnect the hose to the EVAP canister purge valve.
Remove the hose clip from the hose to the filter.

Fuel Tank: Procedures

Draining The Fuel Tank

Special Tools: 999 5720, 999 5721

NOTE: As the illustrations in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation
Disconnect the battery negative lead. See Battery Disconnecting.

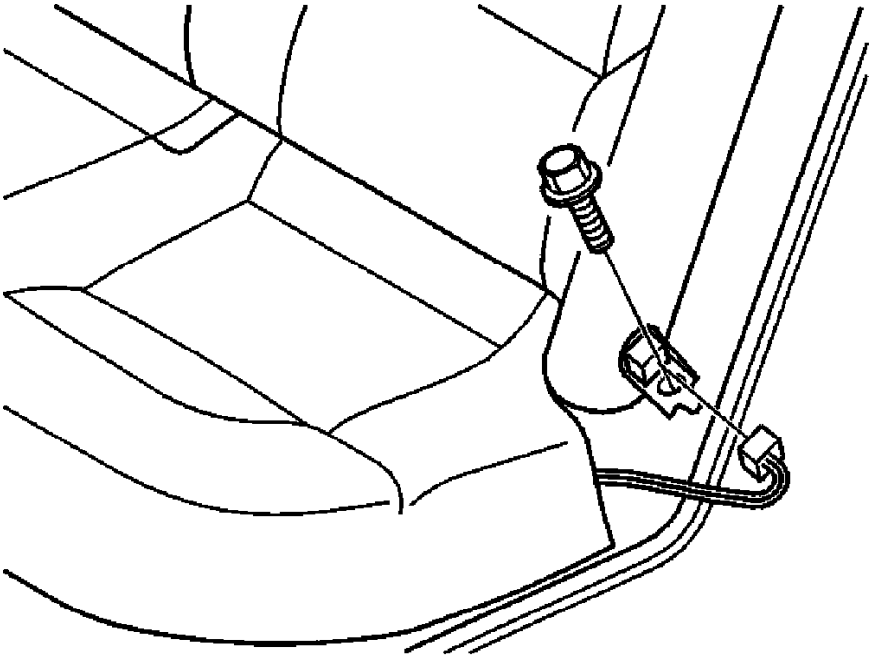
WARNING: RISK OF EXPLOSION! THE USE OF A FRESH AIR MASK IS RECOMMENDED.

Insert the heavy duty hose **1.3 meters** into the fuel filler pipe, measured from the edge of the opening of the filler pipe.
Pump until air comes out.

NOTE: Always ensure that there is a ground connection between the fuel intake and the fuel filler pipe.

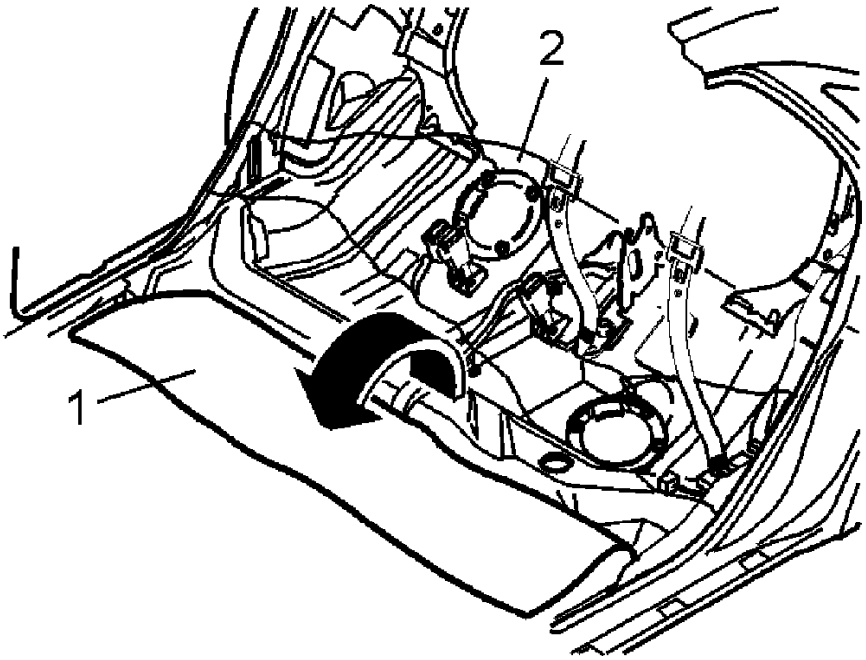
(V70) Fold up both sides of the rear seat.
(S80, S60) Remove the seat cushion for the rear seat.
Remove the right side cushion.
Disconnect the connector at the hinge.

Remove:



- the mounting screw for the hinge
- the screw for the seatbelt end mounting.

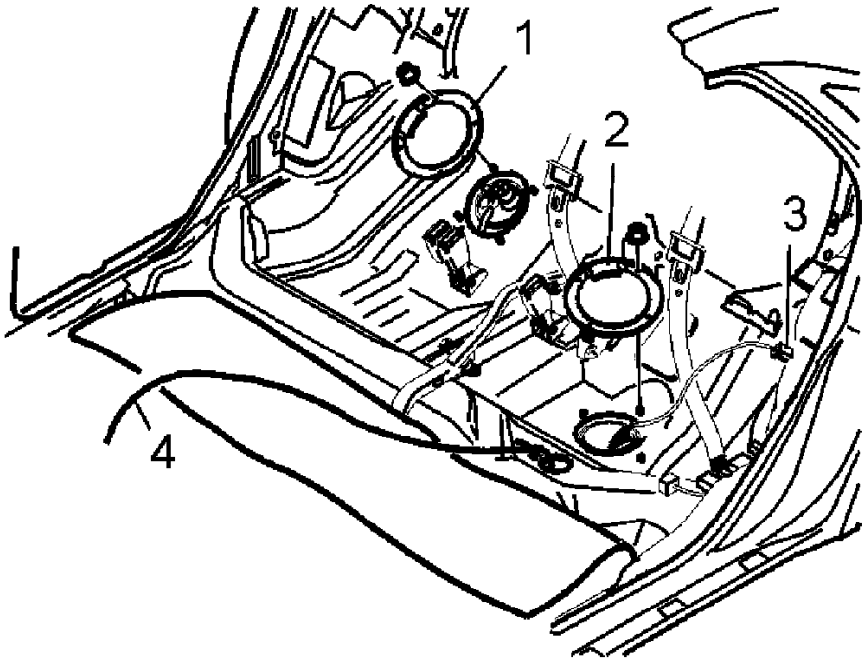
Release the strap/straps of the folding mechanism for the seat belt buckle. (Hooked into place on the lower edge of the backrest).
Lift out the backrest.



Fold the carpet (1) out of the way.
Remove the insulation panel.
Cover the area (2) around the cover and between the doors with absorbent material.

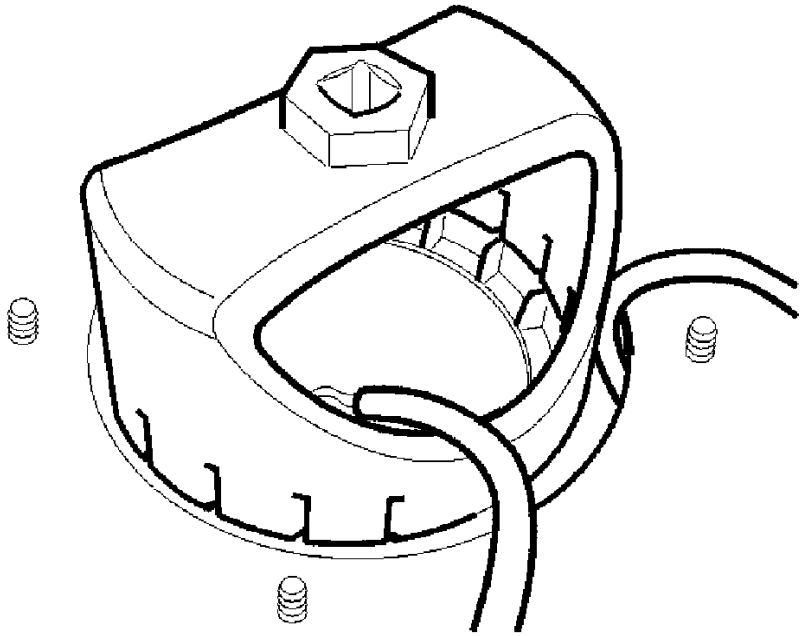
CAUTION: Ensure that there is no risk of dirt getting into the tank.

Removing the fuel tank filler cap over the fuel tank units



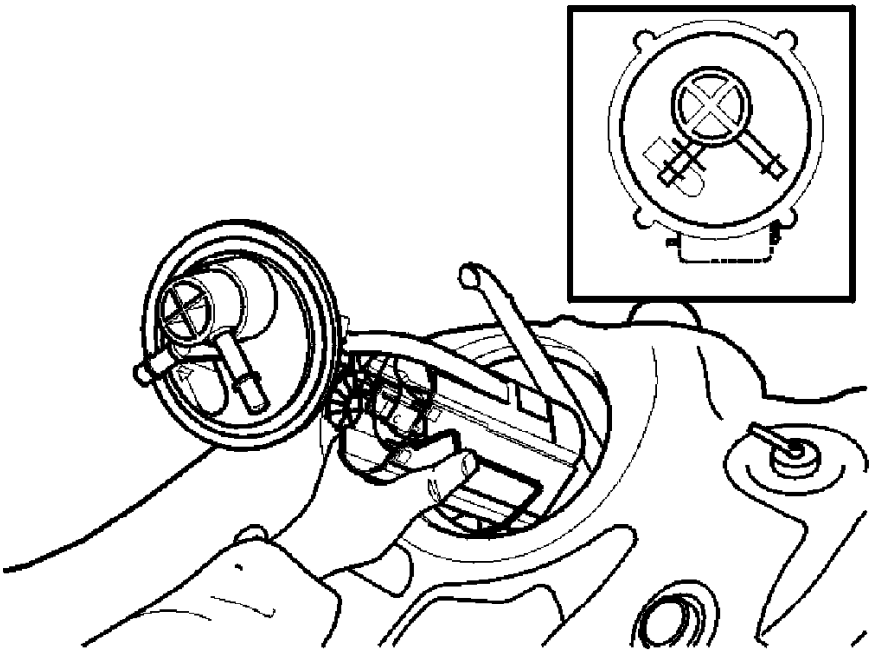
Remove the covers (1.2) over the fuel tank units.
Disconnect the fuel tank unit connectors (3).
Remove the hoses from the fuel tank unit.

Draining the fuel tank



Special Tools: 999 5720

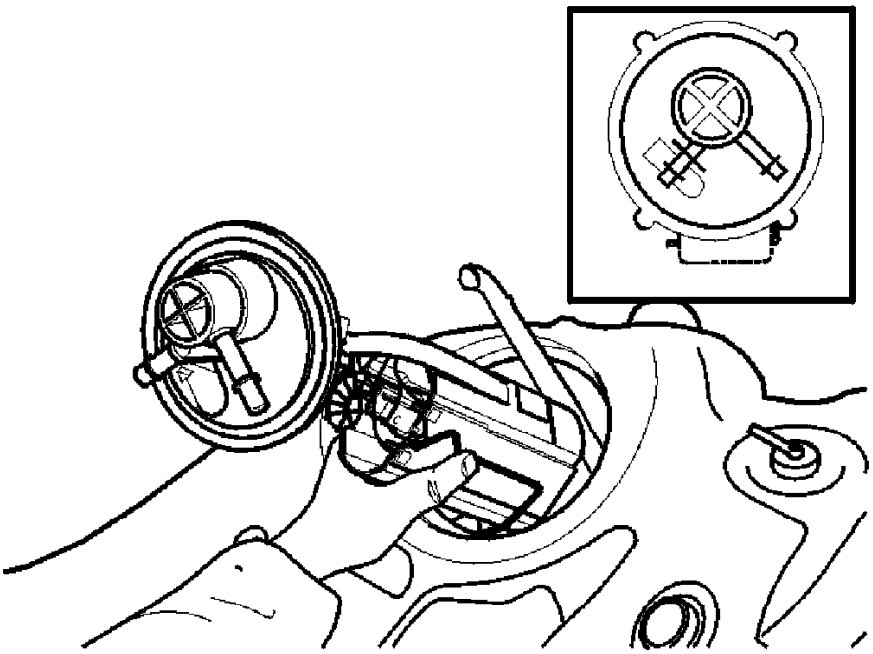
Clean the area around the fuel tank unit thoroughly.
Open the right fuel tank unit. Insert the heavy duty hose and suck out the remains from the bottom of the right-hand side of the fuel tank.
Connect hose 999 5721 to the heavy duty hose. Suck out the remains from the bottom of the fuel tank unit reservoir.



Carefully remove the overflow pipe from the reservoir.
Remove the thin hose (999 5721) from the heavy duty hose. Connect the thin hose to the overflow pipe. Use a hose clamp.
Pump until a lot of air comes out.
Open the left fuel tank unit. Insert the heavy duty hose and suck out the remains from the bottom of the left-hand side of the fuel tank.

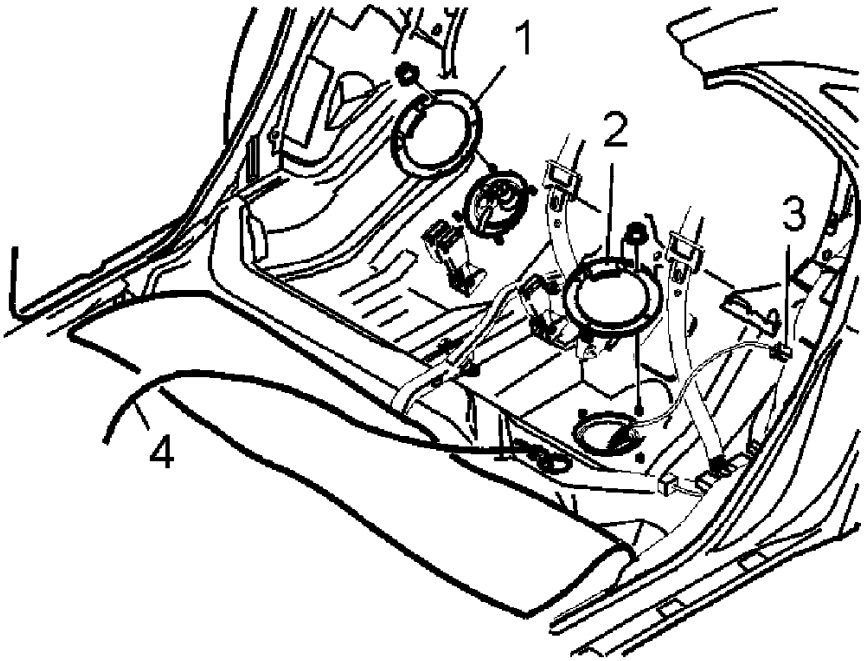
Installation

Right fuel tank unit:

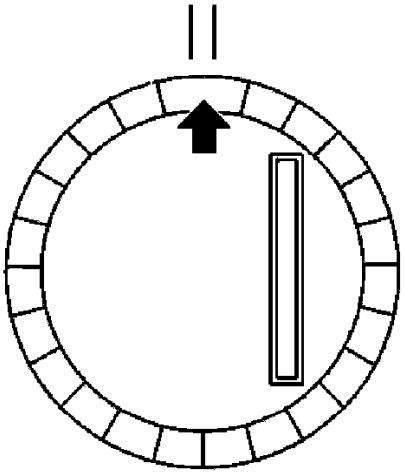


- Place the overflow pipe approximately half a centimeter to the lefthand side
- Grip the right fuel tank unit reservoir. Pinch the fuel tank unit reservoir so that the float is held in its lowest position
- Lower the reservoir carefully while rotating it backwards around the front-rear shaft on the float
- Install the overflow pipe on the reservoir.

Left fuel tank unit:

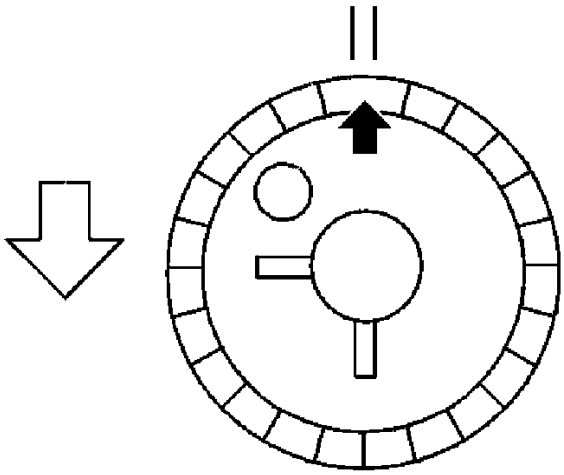


- Install a new O-ring. Lubricate the new O-ring using petroleum jelly
- Press the left fuel tank unit down so that the row of protruding cables runs along the car
- Check that the O-ring is not trapped
- Tighten the screw. Tighten to **60 Nm**
- Wipe up any fuel spillage
- Position the wiring in the cut-out in the rubber ring.



NOTE: Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.

Right fuel tank unit, continued:

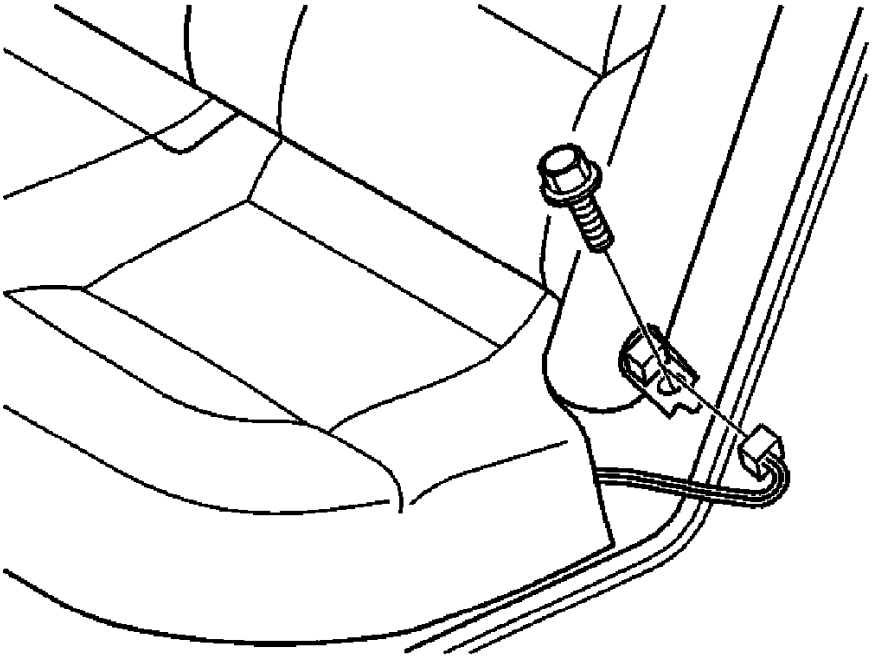


- Install a new O-ring. Lubricate the new O-ring using petroleum jelly
- Press the right fuel tank unit down so that the fuel line connectors are pointing forwards and to the right
- Check that the O-ring is not trapped
- Tighten the screw. Tighten to **60 Nm**
- Install the hoses on the fuel tank unit
- Wipe up any fuel spillage
- Position the wiring in the cut-out in the rubber ring.

NOTE: Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.

Install the cover over the fuel tank unit.
Tighten the nuts. Connect the wiring and the connectors.

Install:



- the backrest
- the mounting screw for the hinge. Tighten to **50 Nm**
- the connector for the hinge
- the seat belt end mounting. Tighten to **48 Nm**
- the side cushion.

(V70) Fold the seat cushion forward.
(S80, S60) Install the seat cushion.

Fuel Tank: Removal and Replacement

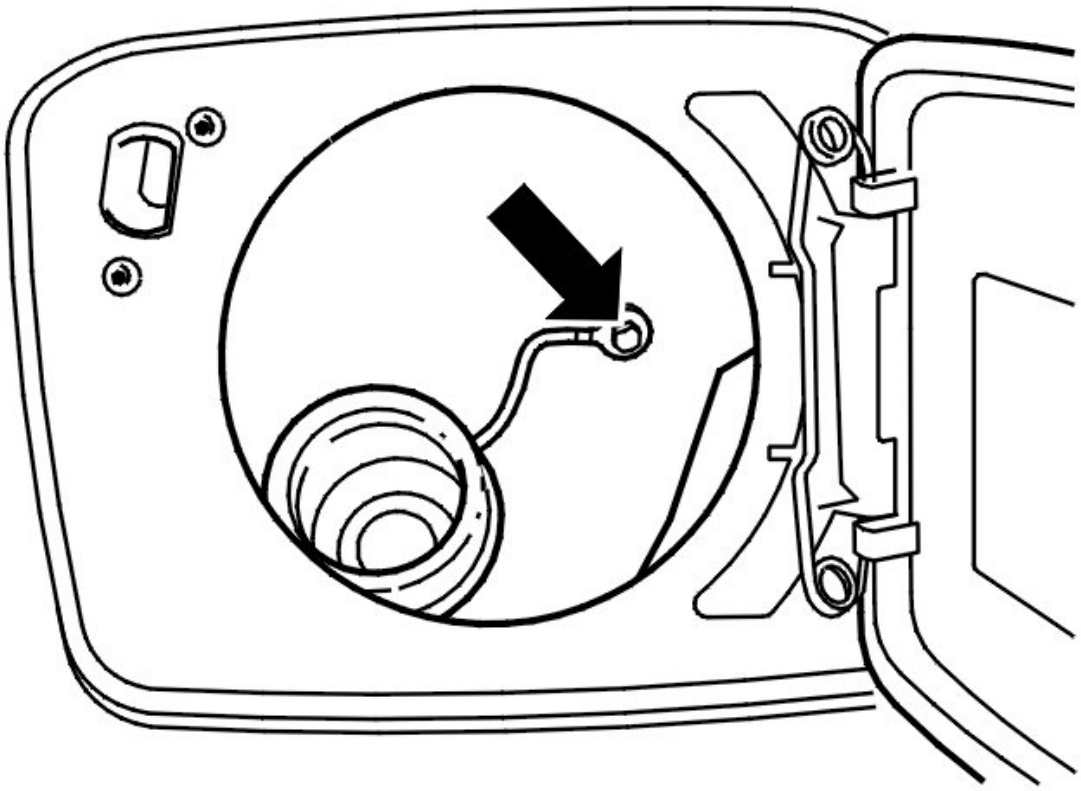
Fuel tank, replacing

Special tools:

998 5972 JACK See: Tools and Equipment/998 5972 Jack
999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture
999 5720 Wrench See: Tools and Equipment/999 5720 Wrench
999 7017 Socket set rear axle See: Tools and Equipment/999 7017 Socket Set Rear Axle

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

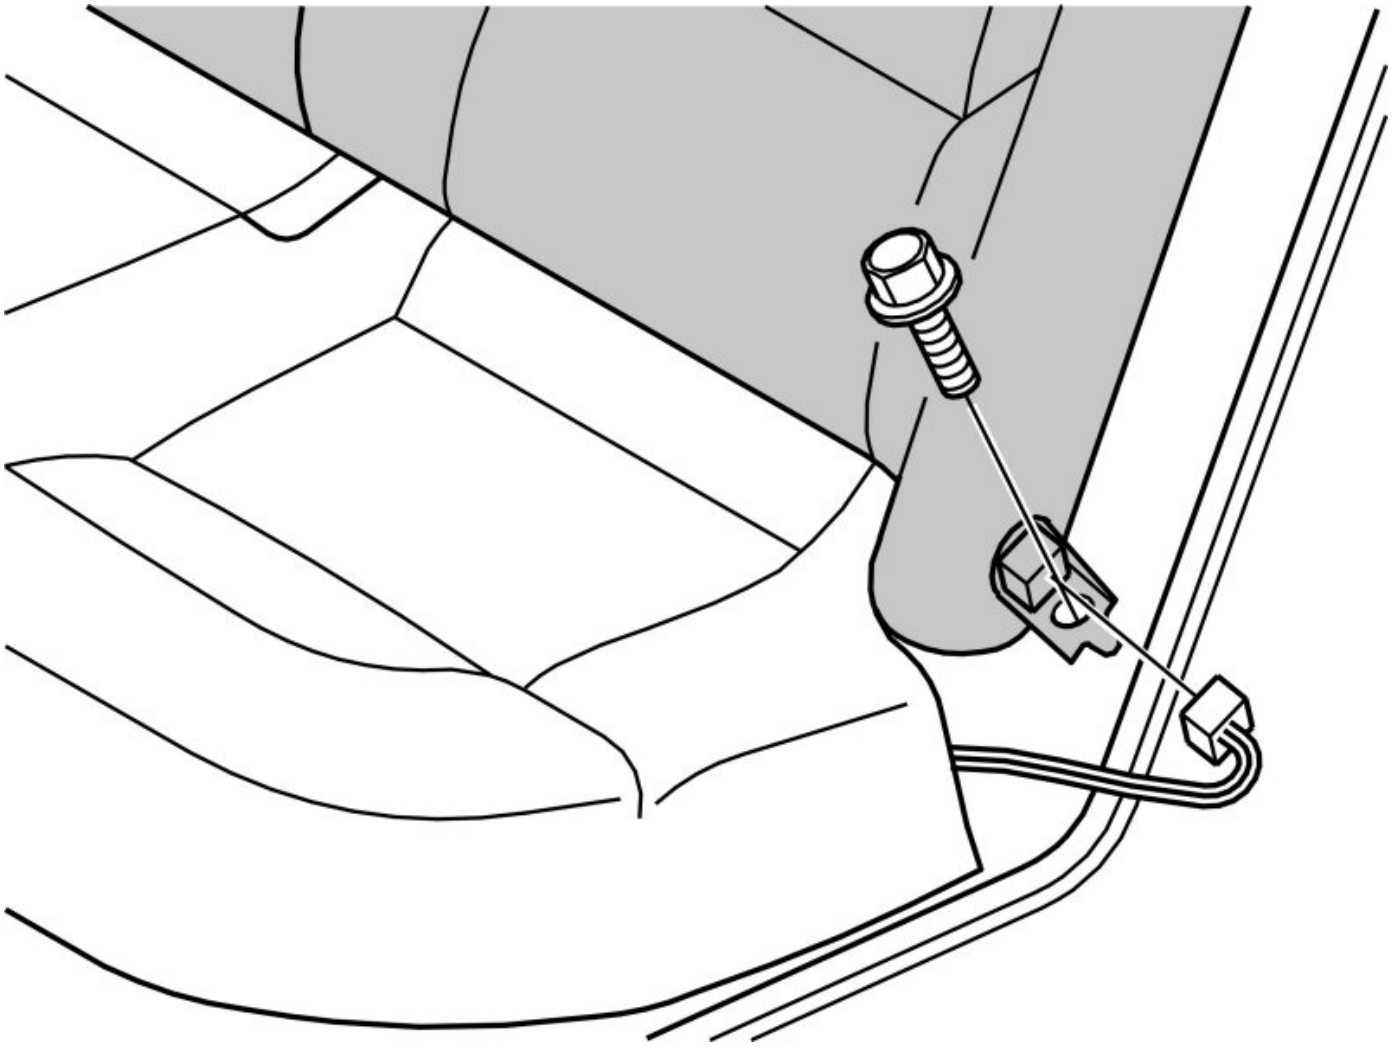
Preparation



Drain the fuel tank. See Fuel tank, draining See: Service and Repair.

Remove:

- the rubber seal around the fuel filler pipe
- the screw for the ground strip.



Applies to V70:

Lift up the right-hand seat cushion.
Remove the right side cushion. See Side cushion See: Body and Frame/Seats/Service and Repair/Removal and Replacement/Rear Seat/Side Cushion.

Applies to the S60:

Remove:

- the seat cushion. See Upholstery, seat cushion, replacing See: Body and Frame/Seats/Seat Cover/Service and Repair/Rear Seat, Passenger Seat/Upholstery, Seat Cushion, Replacing
- the right-hand side cushion. See Side cushion See: Body and Frame/Seats/Service and Repair/Removal and Replacement/Rear Seat/Side Cushion.

Applies to all models:

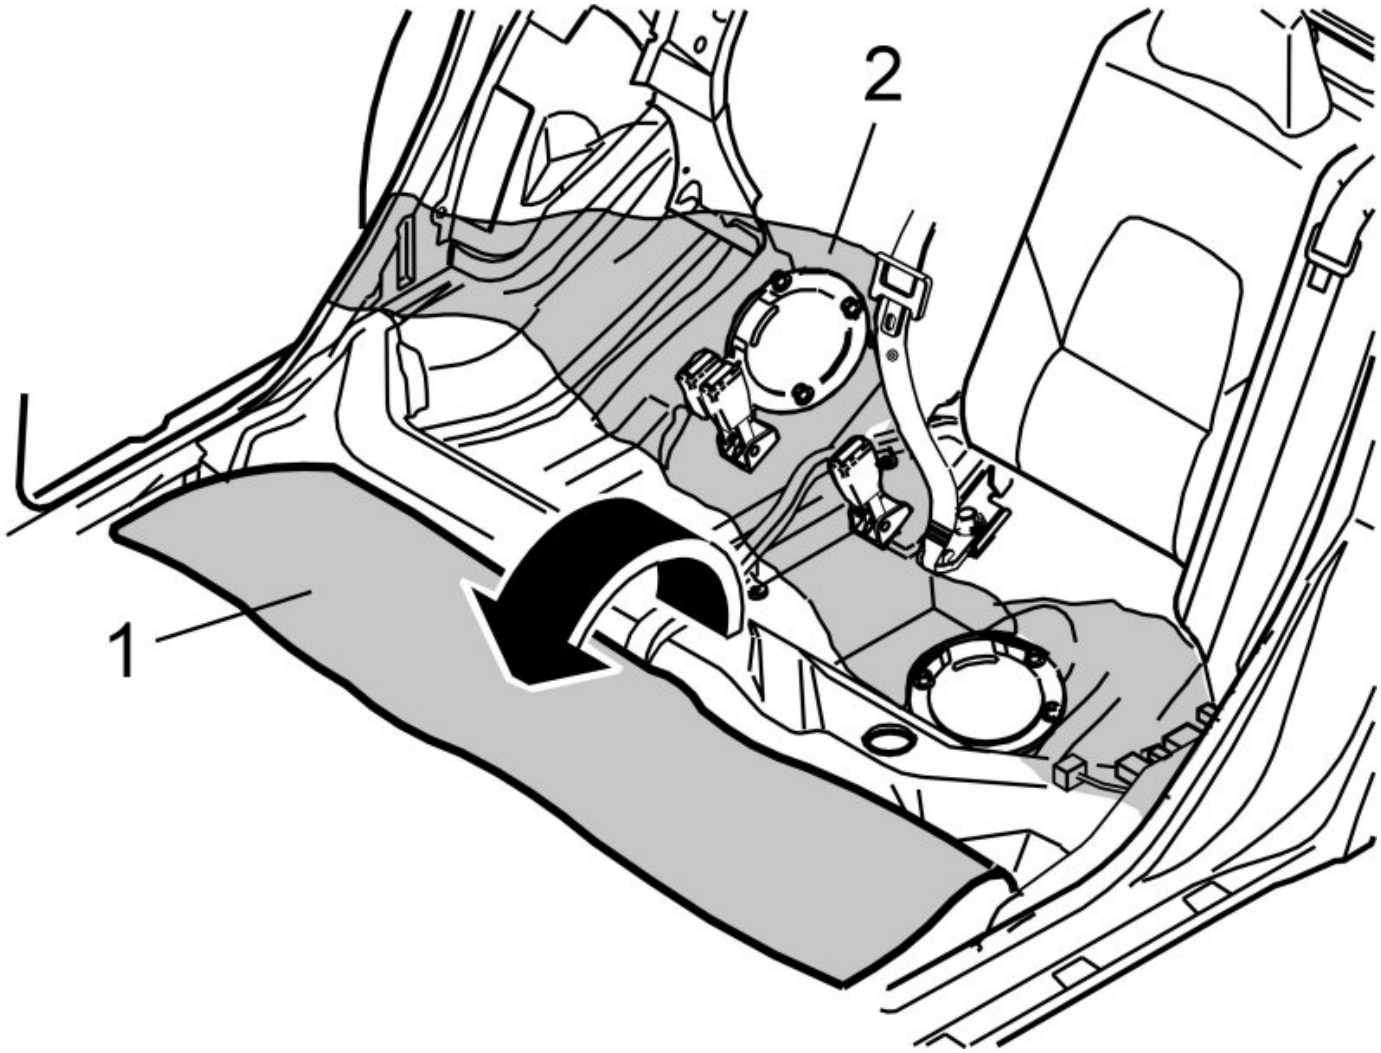
Disconnect the connector at the hinge.

Remove:

- the mounting screw for the hinge
- the screw for the hinge end mounting.

Release the strap/straps of the folding mechanism for the seat belt buckle. (Hooked into place on the lower edge of the backrest).
Lift out the backrest.

Removing the cover for the level sensor/fuel pump (FP)



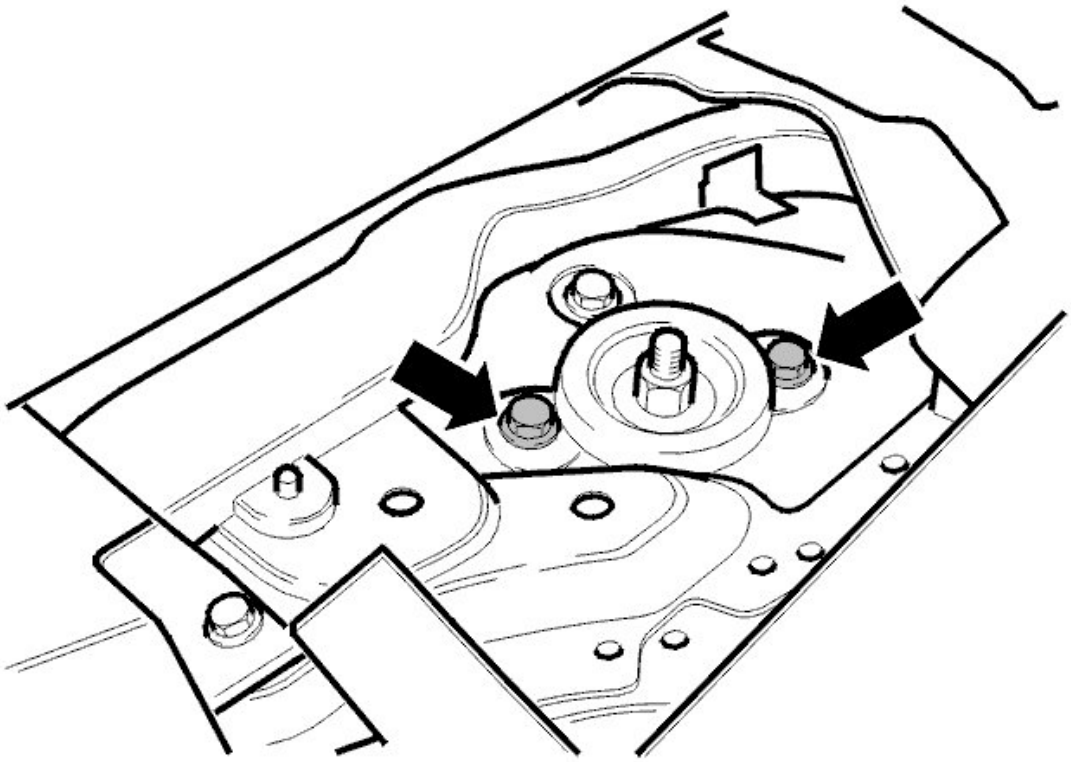
Push the carpet to one side.

Remove:

- the insulation panel
- the cover (2).

Disconnect the connectors for the leak diagnostic pump and level sensor/fuel pump (FP).
Place the cable harnesses on the tank.

Removing the screws for the upper spring seat



Remove the cargo compartment carpet.
Disconnect and fold out the side panels in the cargo compartment.
Remove the seal above the shock absorber mounting on both sides.
Remove the two screws for the spring seat mounting on both sides.
Raise the car.

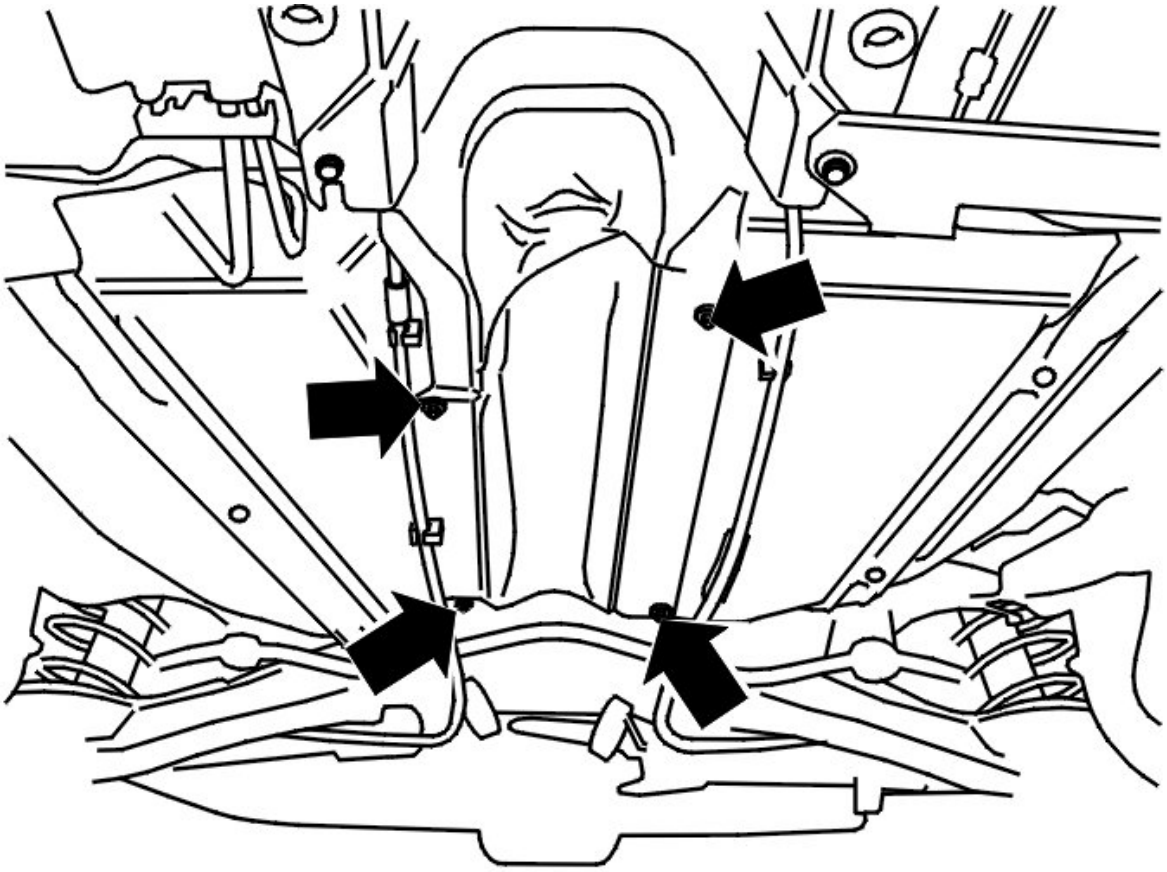
Note! Lift the sill edges so that the rear axle is free.

Removing the exhaust system

Remove:

- the exhaust system from the three-way catalytic converter (TWC) and backward. See Exhaust system, replacing See: Engine, Cooling and Exhaust/Exhaust System/Service and Repair.

Removing the heat deflector plate

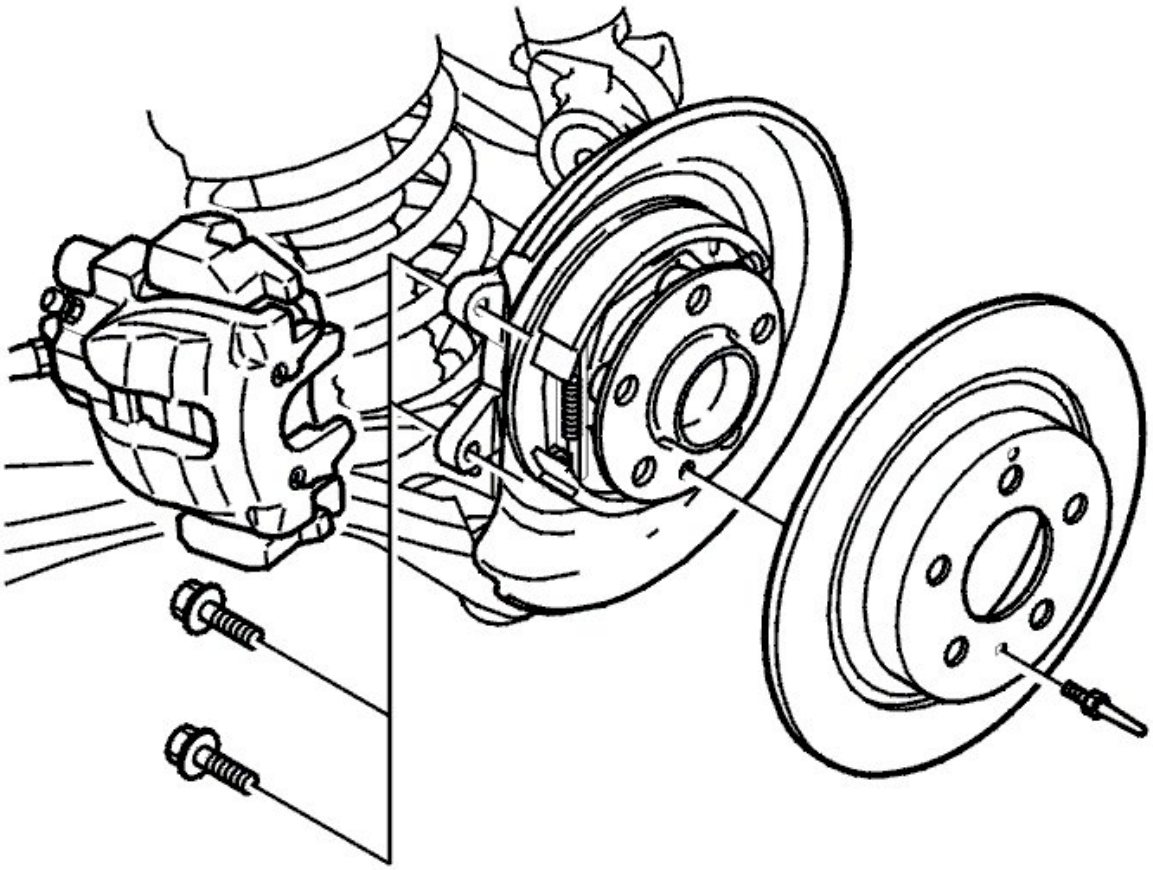


Remove:

- the four plastic nuts
- the heat deflector plate.

Pull the handbrake cables from the clips on the tank.

Removing the brake calliper



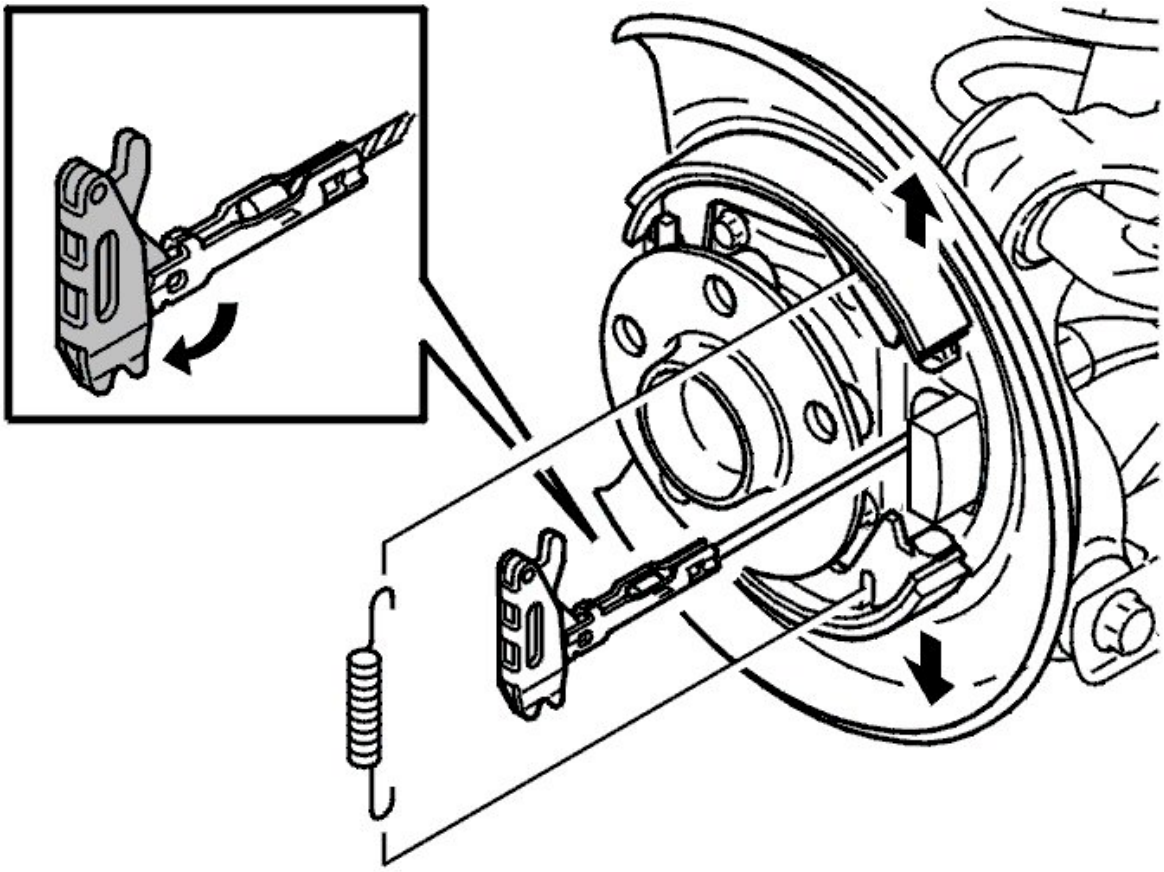
Release the handbrake adjuster. See Handbrake, brake shoes, replacing See: Brakes and Traction Control/Parking Brake System/Parking Brake Shoe/Service and Repair.

Remove (on both sides):

- the wheel
- the ABS sensor and the ABS line from the bracket on the stub axle
- the brake calliper mounting screws.

Hang up the ABS line and the brake calliper. Use a piece of wire.

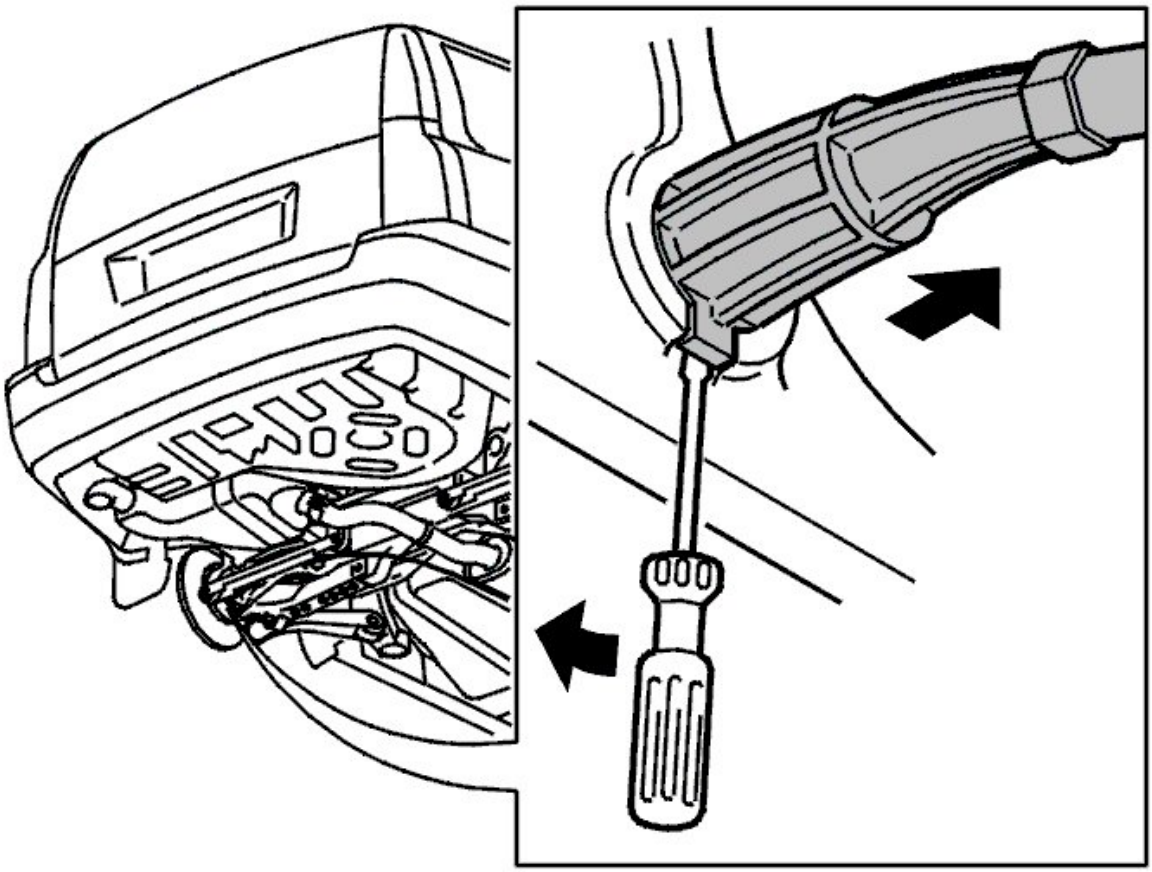
Removing the brake cable for the handbrake



Remove:

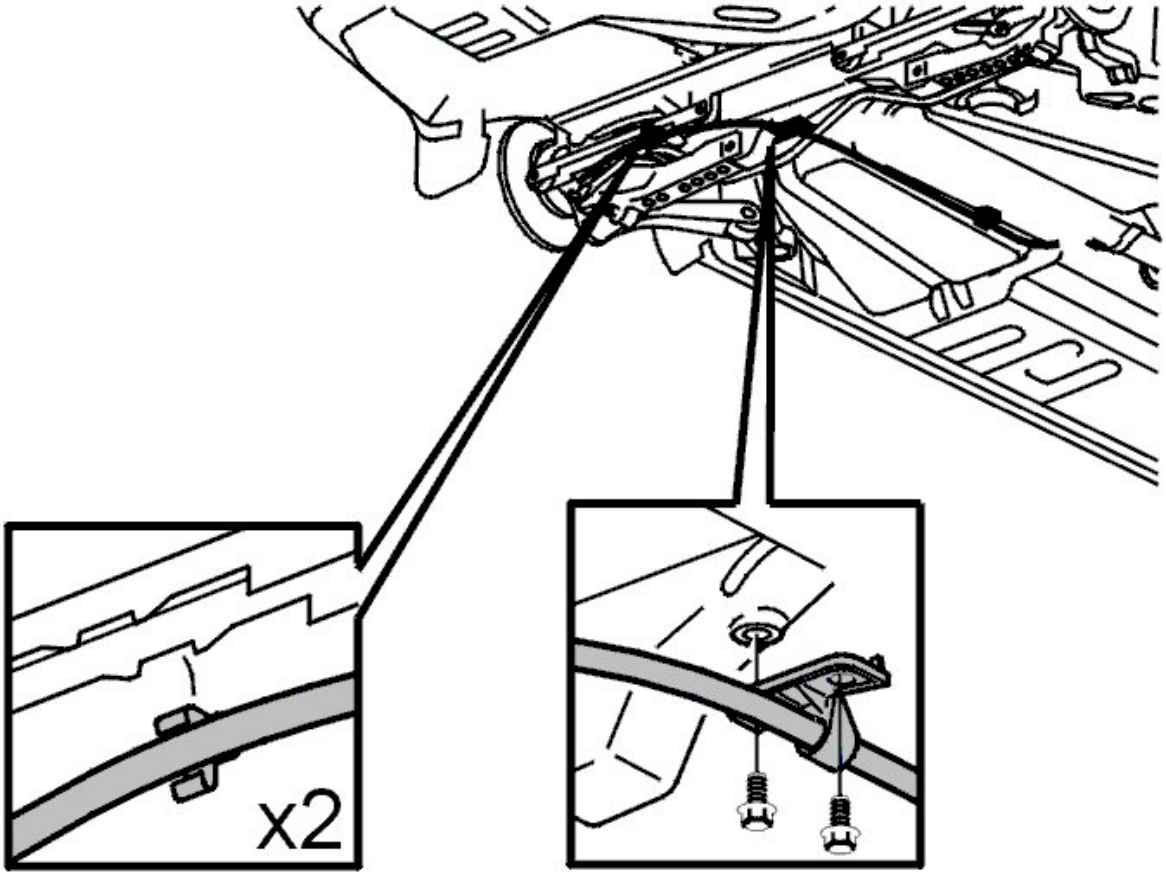
- the locating pin for the brake disc
- the brake disc
- the return spring at the expander
- the expander. Lift the brake shoe slightly. Grip the expander. Pull the expander outwards.

Unhook the expander from the metal bracket.



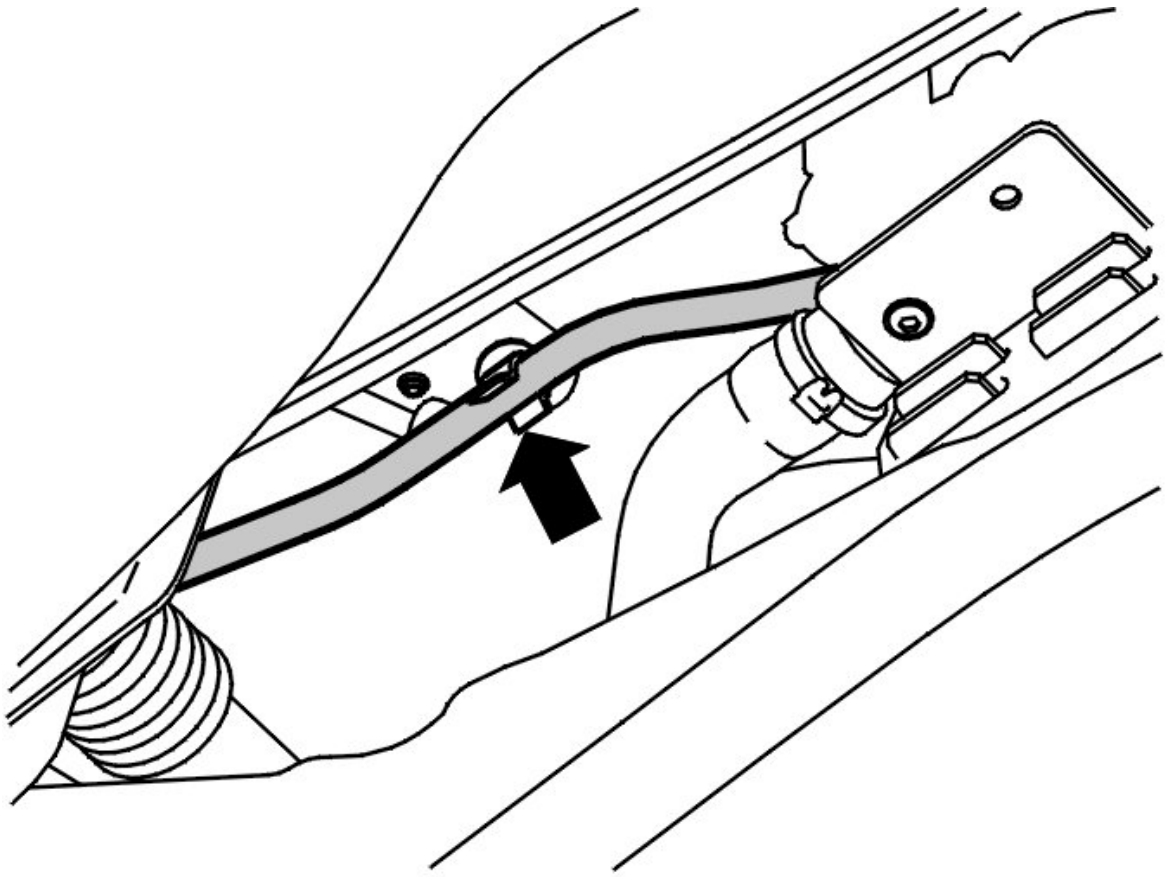
Remove (on both sides):

- the guide sleeve for the cable sleeve. Apply a screwdriver between the guide sleeve lug and wheel arch. Pry apart slightly to remove the sleeve.

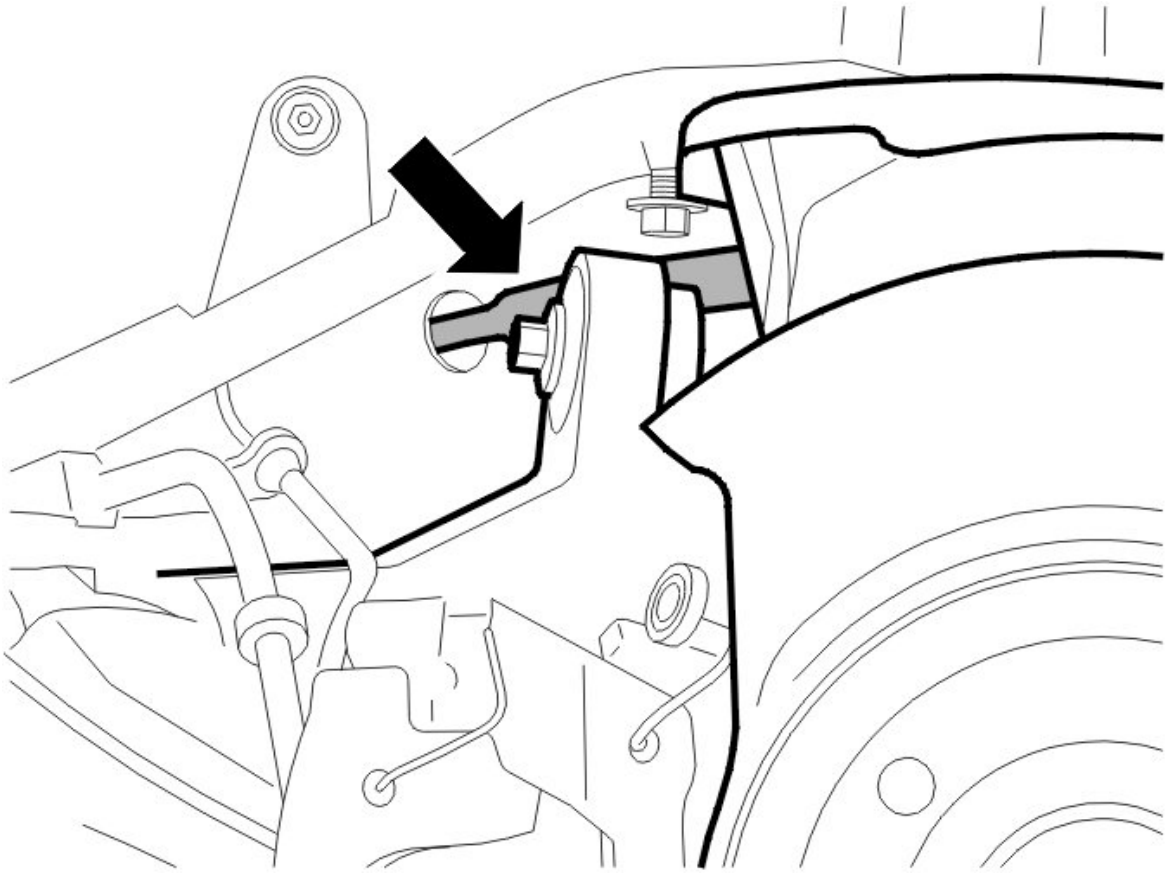


Remove the handbrake cable from the track rod and the sub-frame on both sides.

Preparations for lowering the rear axle

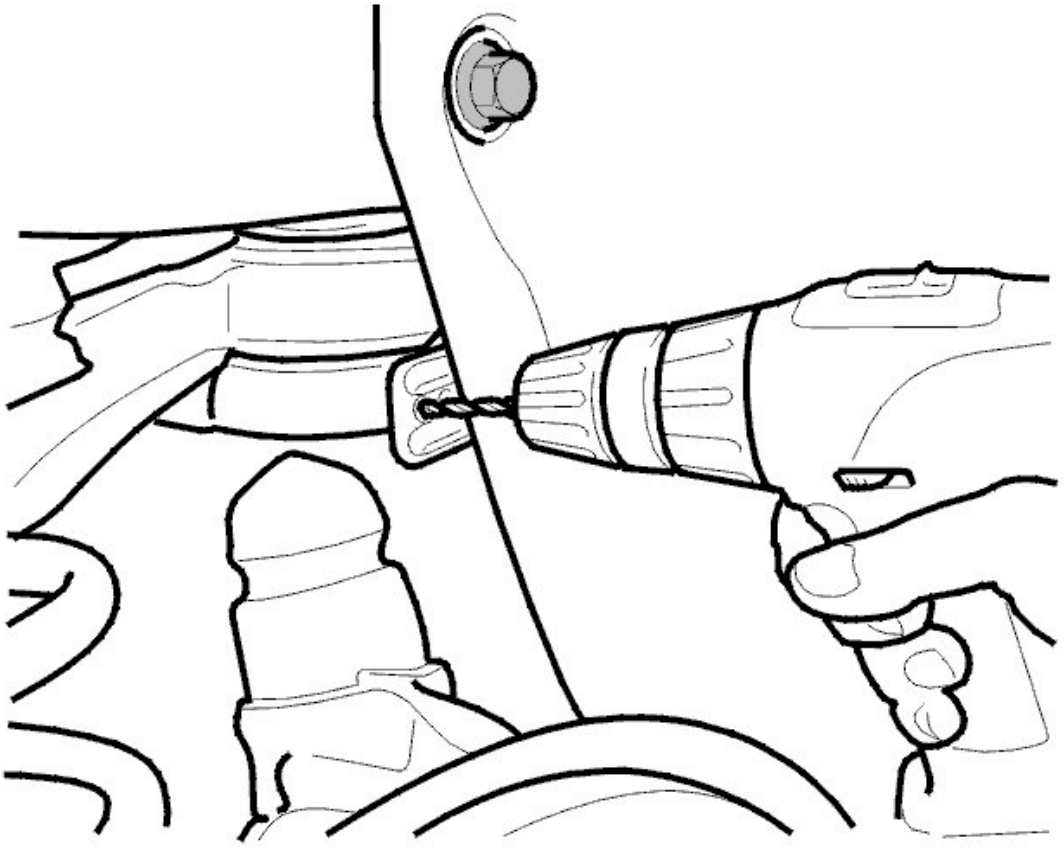


Remove the evaporative emission system (EVAP) pipe from the clip between the tank and rear axle.

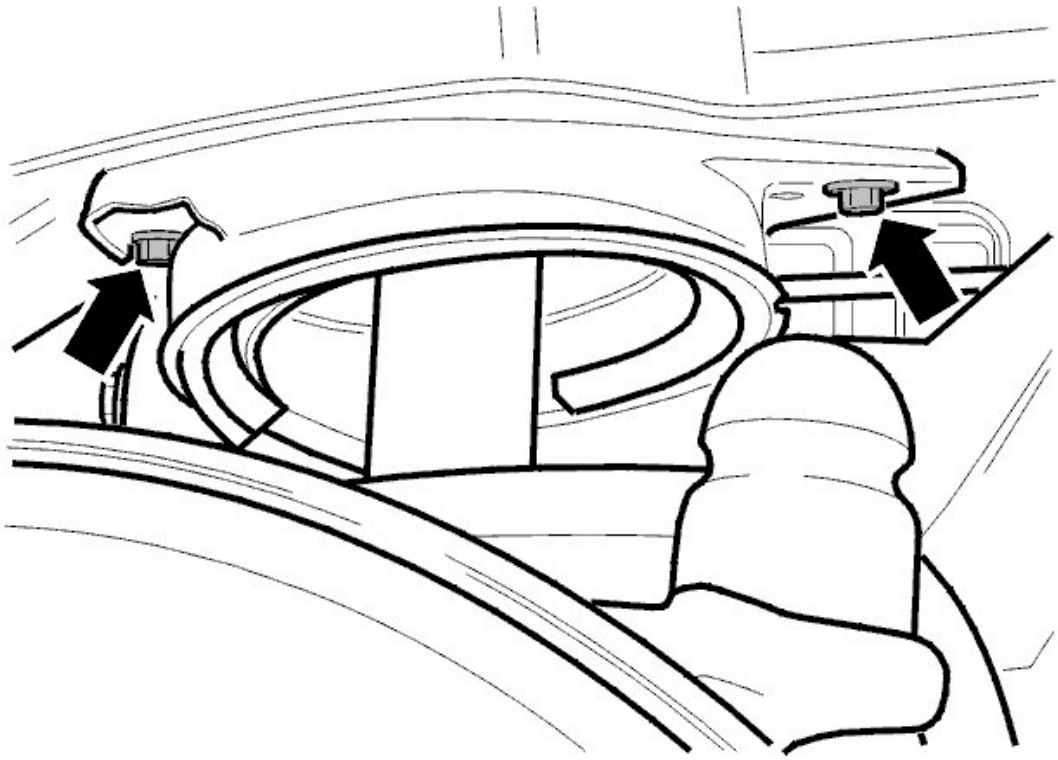


Remove the hose for the carbon filter from the tank.

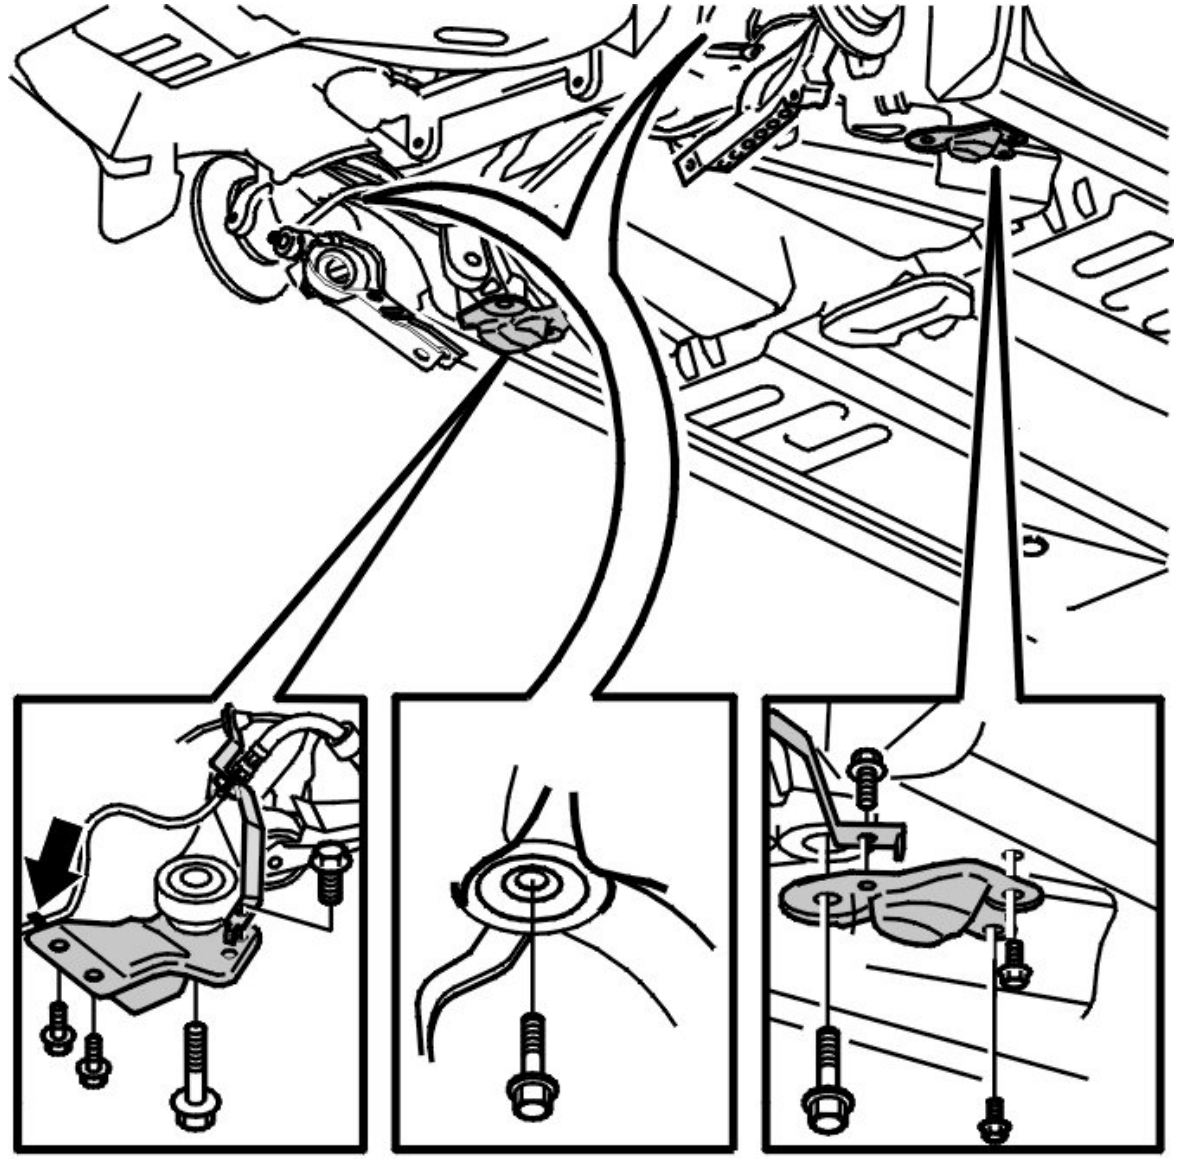
Removing the rear axle



Remove the plastic nut for the wing liner. Bend the wing liner out of the way.
Drill out the heat deflector plate rivet on the sub-frame left rear bushing.



Remove the two screws for the spring seat mounting on both sides.



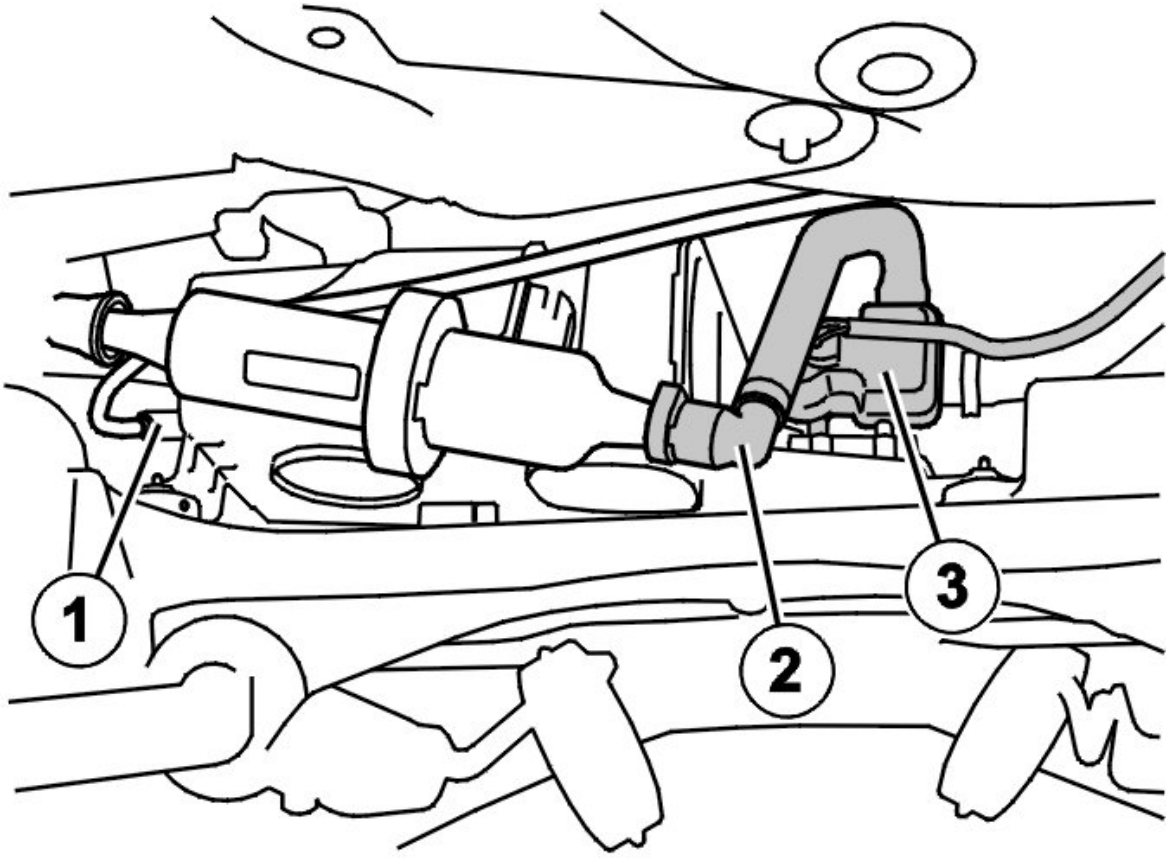
Position a lifting table under the rear suspension.

Warning! Always check that the car does not lift from the lifting arms of the car lift when working with the lifting table.

Remove:

- the four sub-frame mountings
- the sub-frame brackets screws
- the brake hose mounting stays from mountings on the brackets
- the brake pipes from the plastic clips.

Carefully lower the rear suspension approximately 50 mm.

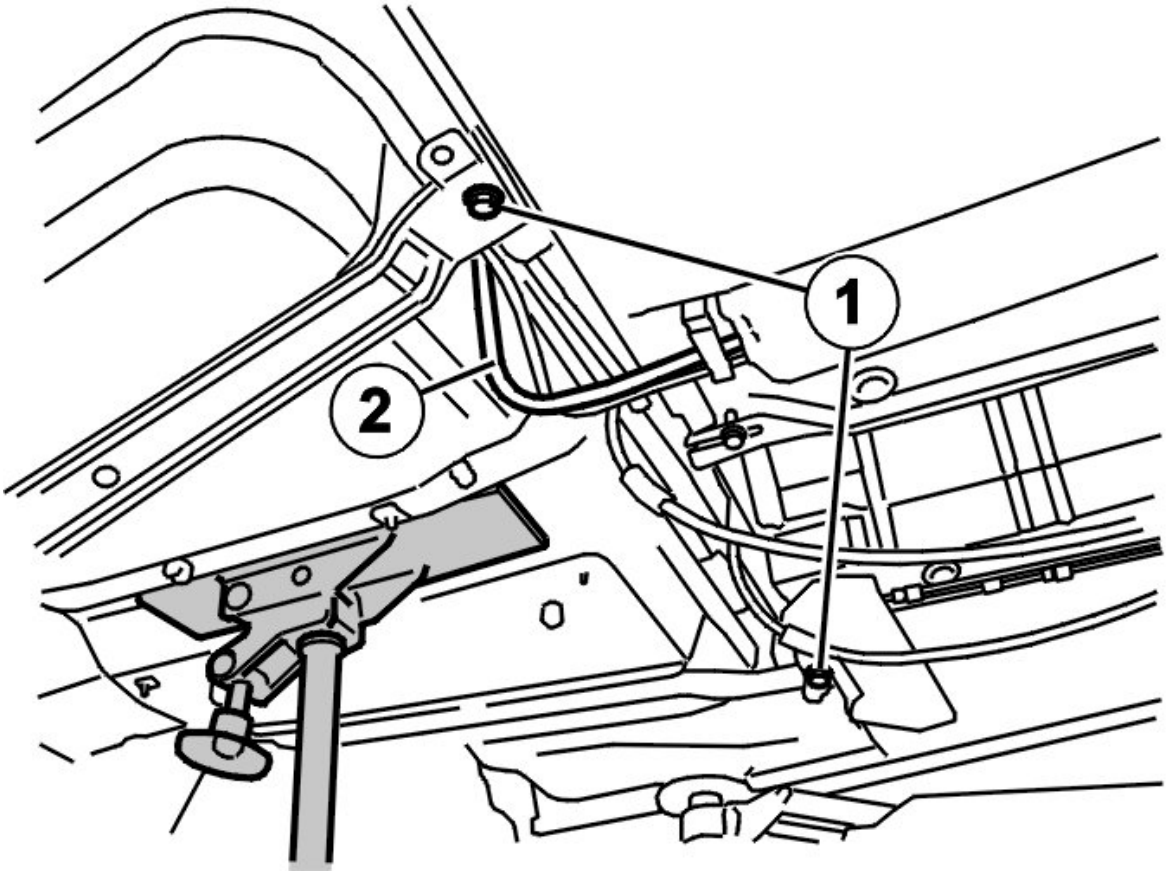


Remove:

- the evaporative emission system (EVAP) hose (1)
- the leak diagnostic hose (2).

Pull the leak diagnostic pump (3) from the mounting.
Lower and remove the rear suspension.

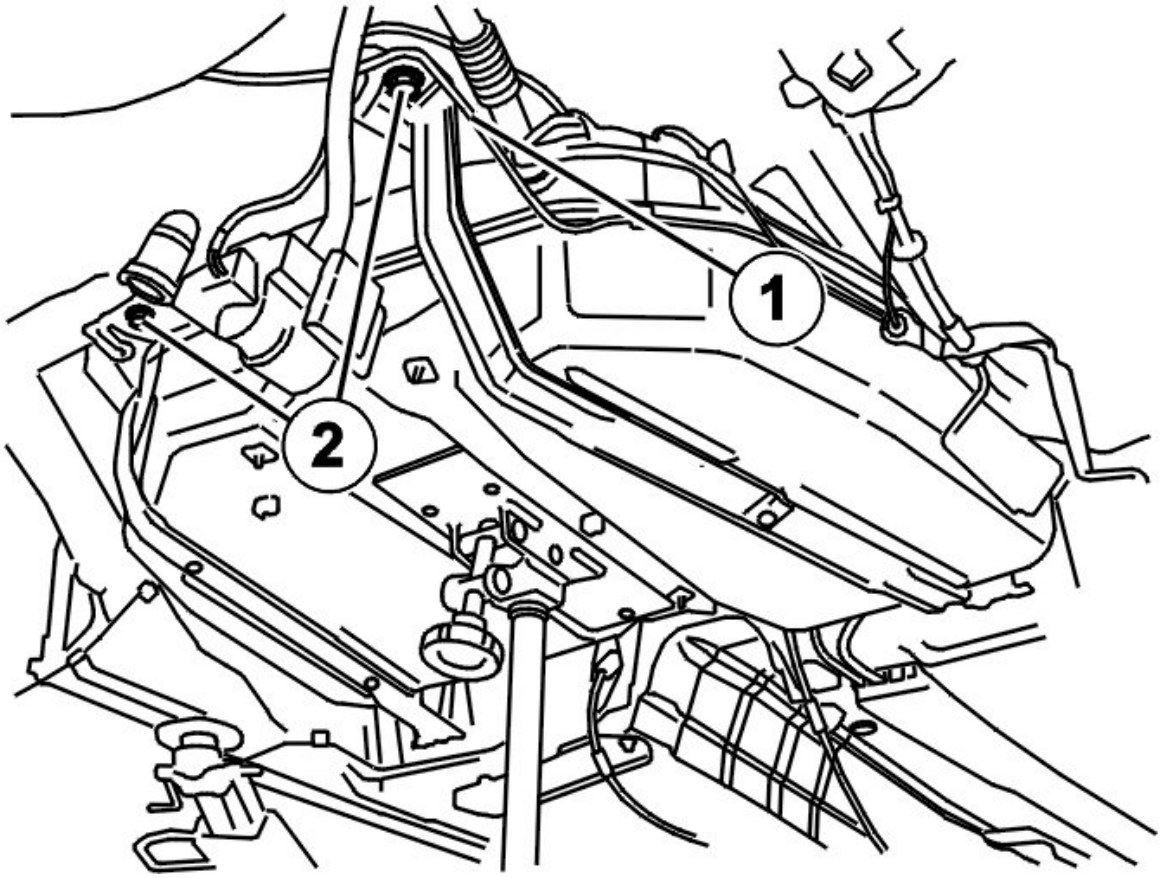
Removing the tank



Position gearbox jack 998 5972 JACK See: Tools and Equipment/998 5972 Jack with plate 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture under the tank.

Remove:

- the fuel line (1)
- the two screws for the front mounting (2) for the fuel tank.

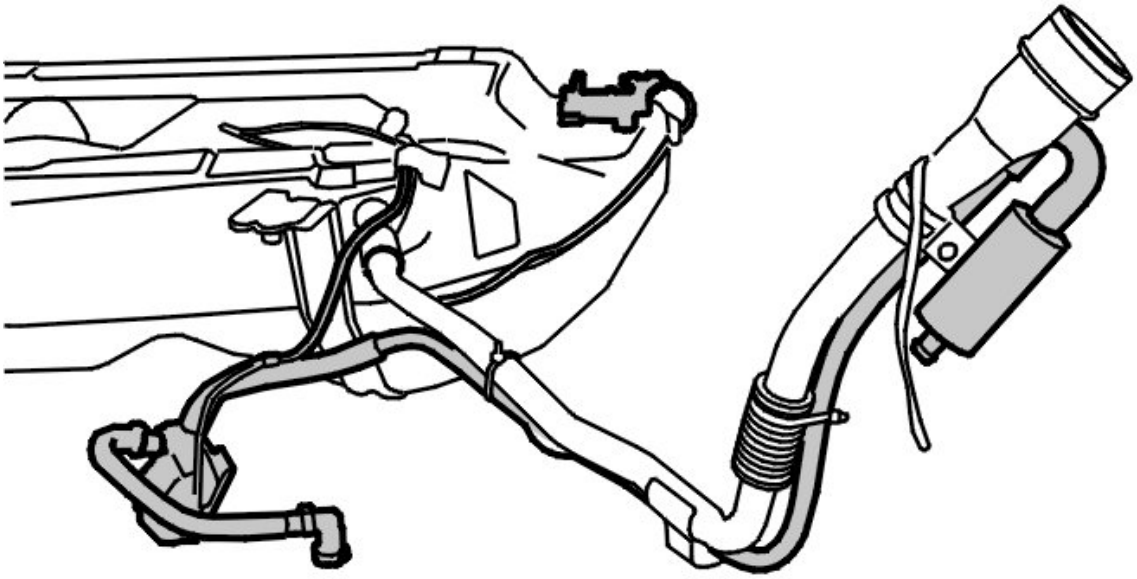


Remove the evaporative emission system (EVAP) hose (1) from the clip mountings.
Remove the two screws (2) for the rear mounting for the fuel tank.
Lower and remove the fuel tank.

Tightening torque

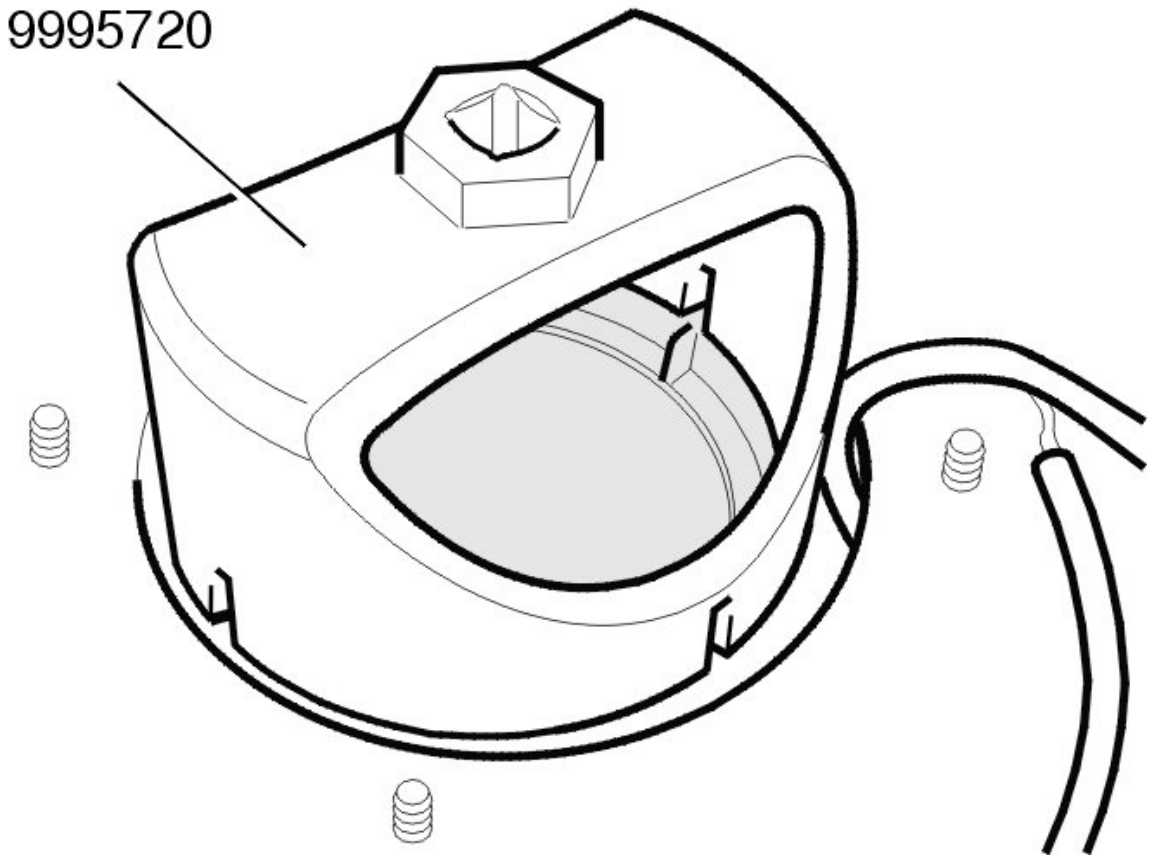
For tightening torques, see Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Transferring components



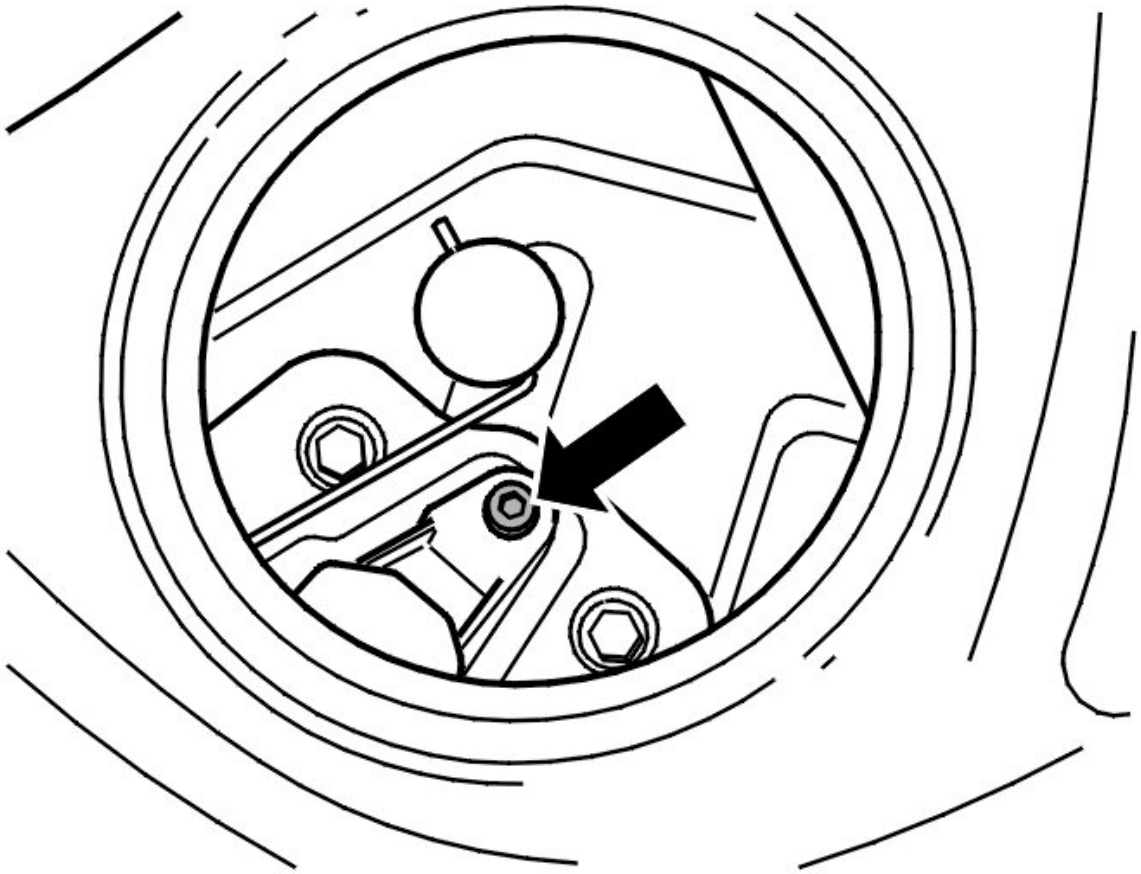
Transfer the venting pipe, leak diagnostic pump, pump control module and cable harnesses.

Transferring the fuel pump (FP)

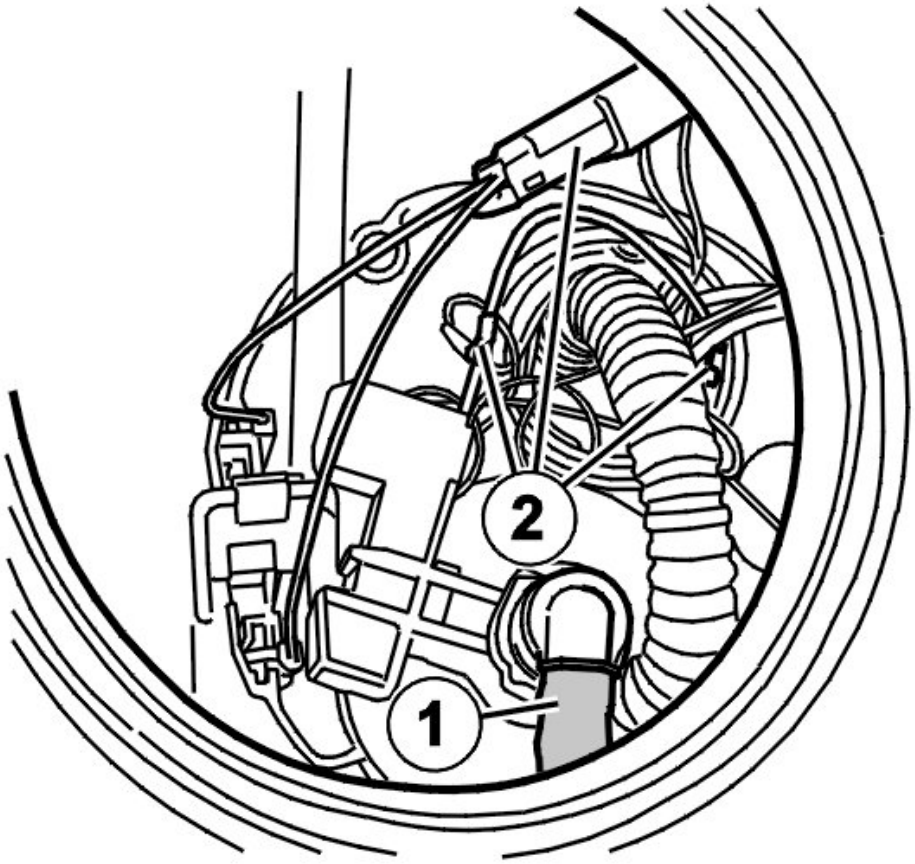


Removal

Remove the cover.
Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.



Remove the screw (1).



Carefully turn the pump to access the fuel hose (1).

Remove:

- the hose (1)
- the three connectors (2).

Carefully lift up the pump.

Note! Ensure that the level sensor arm is not obstructed. Do not bend the arm when removing the pump.

Installation

Lower the pump into the tank.

Install:
- the fuel hose
- the three connectors.

Turn the pump to the installation position. Install the mounting bracket and screw. (M6)
Install the cover.
Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.
For tightening torques, see Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Installing the tank

Use 998 5972 JACK See: Tools and Equipment/998 5972 Jack together with plate 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture.
Carefully raise the tank.

Install:
- the two screws for the rear mounting for the fuel tank. (M8)
- the evaporative emission system (EVAP) hose in the mounting clips
- the two screws for the front mounting for the fuel tank. (M8)
- the fuel line.

Remove 998 5972 JACK See: Tools and Equipment/998 5972 Jack and 999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture.

Installing the rear suspension

Raise the rear suspension until the spring seats enter the holes in the chassis.

Note! Do not trap the hoses, lines or brake components when raising the rear suspension.

Install:
- the leak diagnostic pump in its mounting
- the leak diagnostic hose
- the evaporative emission system (EVAP) hose.

Raise the rear suspension further so that there is a 20mm gap between the chassis and the sub frame bushing.

Warning! Always check that the car does not lift from the lifting arms of the car lift when working with the lifting table.

Install the screws for the upper spring seat. (M10)
Slide up the centring sleeves 999 7017 Socket set rear axle See: Tools and Equipment/999 7017 Socket Set Rear Axle in the two rear mountings on the sub-frame.

Install:
- the screws. Tighten lightly
- the screws for the front mountings on the sub-frame (install the screws through the brackets).

Tighten all front mountings. (M12)
Remove the screws for the rear mountings on the sub-frame. Remove the centering sleeves.
Install the screws for the rear mountings on the sub-frame again. Tighten. (M12)
Remove the lifting table.

Install:
- the brake pipes in the plastic clips on the brackets
- the screw for the brake line mounting stay. (M8)
- rivets to the heat shield on the sub-frame left rear bushing
- the plastic nut for the wing liner
- the hose for the carbon filter on the tank
- the evaporative emission system (EVAP) pipe between the tank and rear suspension.

Installing the brake cable for the handbrake
Applies to both sides:

Install the mounting for the cables on the sub-frame and the clips on the tie rods.
Thread the mechanical cables into the brake covers.

Hint: Lubricate the O-rings on the guide sleeves of the mechanical cables. Use silicone grease.

Note! Ensure that the guide sleeve lug is correctly positioned in the cover.

Hook the expander in the plate bracket.

Install:
- the expander
- the return spring
- the brake disc
- the locating pin for the brake disc. (M6).

Installing the brake calliper
Applies to both sides:

Install:
- the brake calliper
- the brake calliper mounting screw. Use new screws.

For tightening torques, see Tightening torque See: Brakes and Traction Control/Specifications/Tightening Torque.

Install:
- the ABS sensor
- the screw. (M6)
- the ABS sensor cable in the bracket
- the wheels. See Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

Installing the heat deflector plate

Install:
- the heat deflector plate.
- the four plastic nuts
- the handbrake cables from the clips on the tank.

Installing the exhaust system

Install the exhaust system starting from the three-way catalytic converter (TWC) and working backward. See Exhaust system, replacing See: Engine, Cooling and Exhaust/Exhaust System/Service and Repair.

Installing the screws for the upper spring seat

Install on both sides:
- the two screws for the spring seat mounting
- the seal above the shock absorber mounting
- the side panels in the cargo compartment.

Install the cargo compartment carpet.

Installing the cover for the level sensor/fuel pump (FP)

Connect the connectors for the leak diagnostic pump and level sensor/fuel pump (FP).

Install:
- the cover
- the insulation panel.

Reinstall the carpet.

Finishing

Install:
- the backrest
- the screw for the hinge mounting (M10)
- the connector for the hinge
- the end mounting for the seat belt.

For tightening torques, see the relevant service procedure.
Install the side cushion.
(V70) Fold the seat cushion forward.
(S80, S60) Install the seat cushion.

Install:
- the screw for the ground strip.
- the rubber seal around the fuel filler pipe

Top up the fuel.

Fuel Gauge Sender: Service and Repair

Left Fuel Gauge Sensor

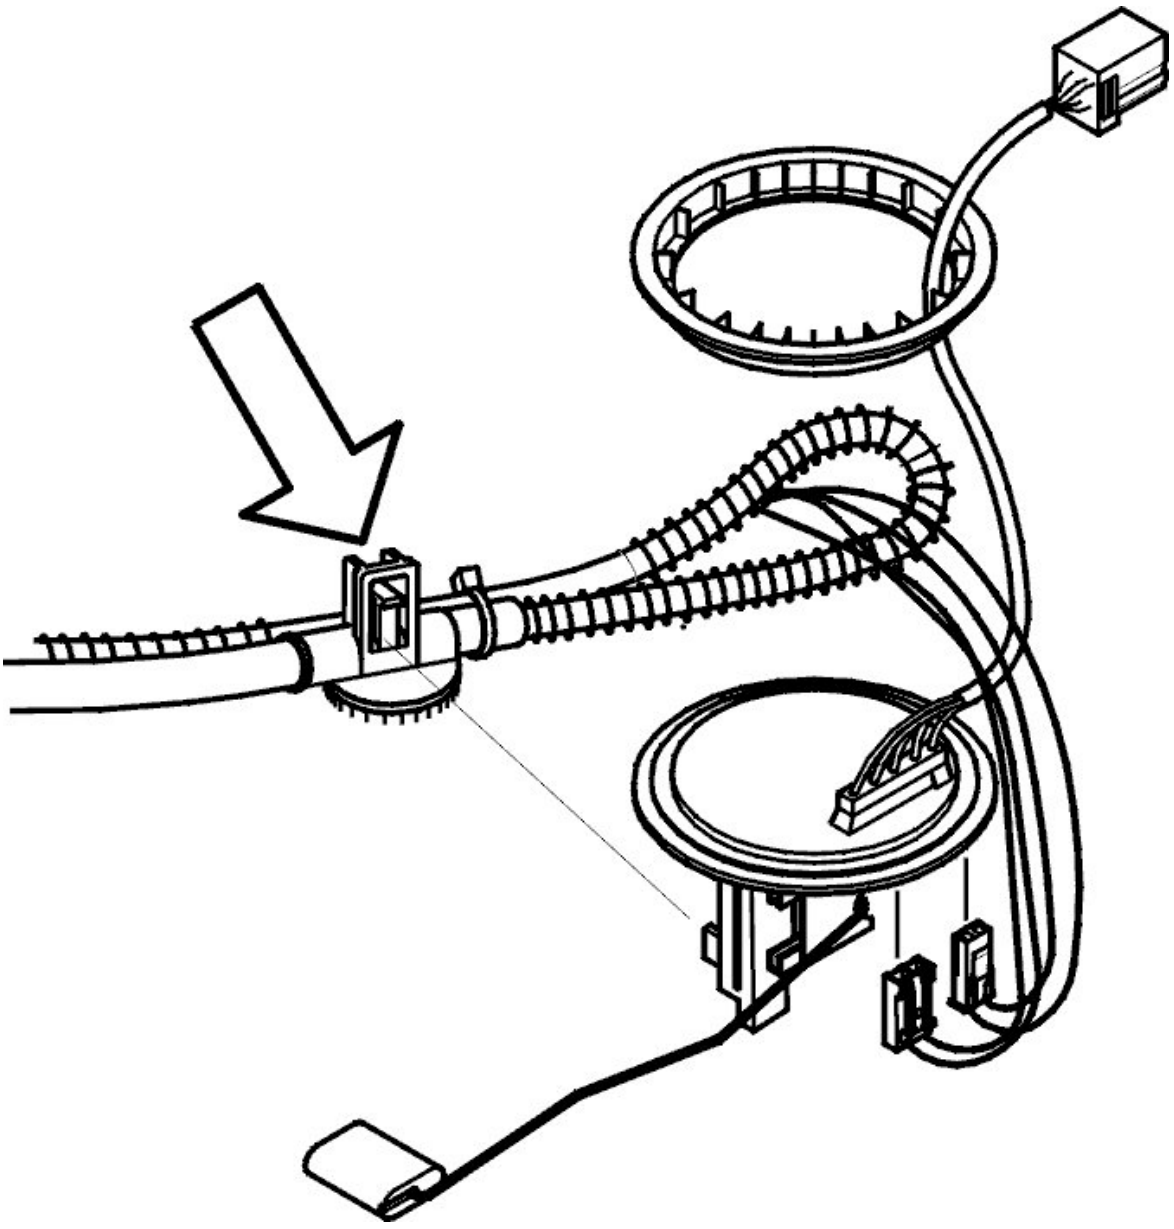
Left fuel gauge sensor

Removal

Preparation

- Remove rear seat as described in Rear seat assembly See: Body and Frame/Seats/Service and Repair/Removal and Replacement/Rear Seat/Rear Seat Assembly
- Remove insulation
- Fold floor mat in boot under.

Fuel gauge sensor



- Remove level sensor cover
- Disconnect connector
- Loosen level sensor lock ring using special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench
- Remove level sensor. It is easier if the fuel pipe bends upwards through the hole
- Disconnect the 2 connectors from the level sensor
- Loosen tube system by pressing release button down
- Remove level sensor.

Installation

Fuel gauge sensor

- Position level sensor correctly
- Install a new rubber seal
- Connect the 2 connectors to the level sensor
- Press tube system onto level sensor
- Carefully position level sensor down with tube system and wires
- Install level sensor attaching ring but do not tighten it
- Press level sensor into position. Note position marks on cover and tank
- Tighten lock ring, first by hand and then using special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench
- Install wire in rubber seal slots
- Connect the connector
- Install level sensor cover
- The rest of the section is done in reverse order.

Additional information

To replace fuel gauge sensor on right side, see Right side fuel pump with level sensor See: Right Side Fuel Pump With Level Sensor.

Level Sensor, Fuel Tank Left, Replacing

Level sensor fuel tank left, replacing

Special tools:

999 5720 Wrench See: Tools and Equipment/999 5720 Wrench

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Preparatory work

Disconnecting the battery lead

Disconnect the battery negative lead. See: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Warning! Explosion risk.Use a fresh air mask.

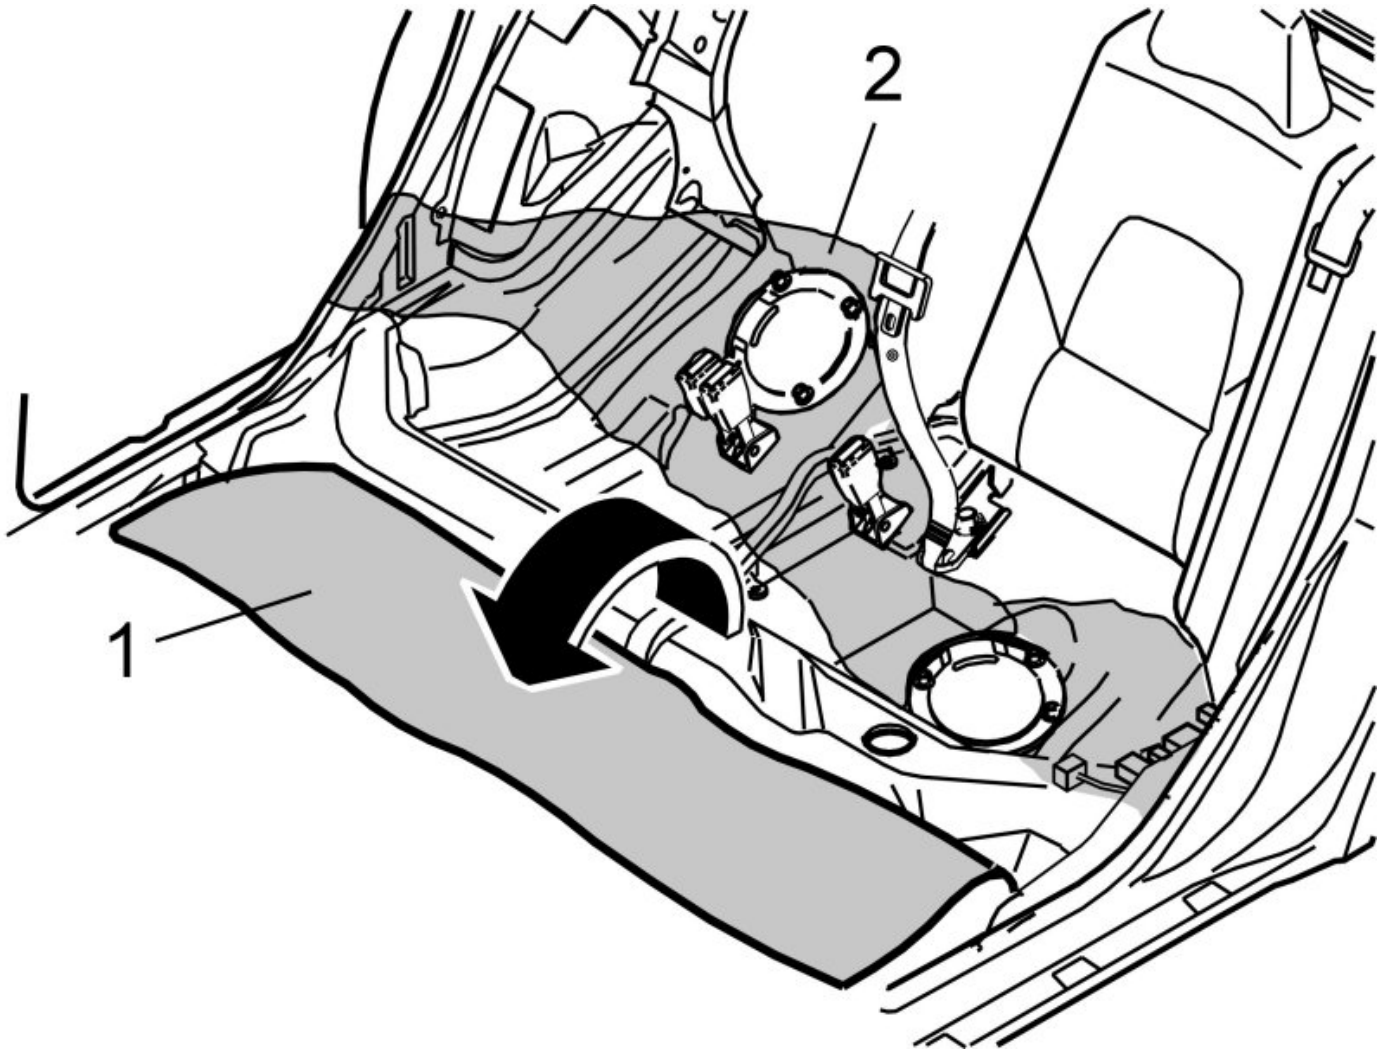
Draining fuel tank

Note! Before draining the fuel, see: Safety regulations for handling fuel See: Service Precautions/Safety Regulations for Handling Fuel.

Insert the heavy duty hose 1.3 meters into the fuel filler pipe, measured from the edge of the opening of the filler pipe.
Pump until air comes out.
V70: Fold up both sides of the rear seat. Remove the rear seat.
S80, S60: Remove the seat cushion for the rear seat.

Removal

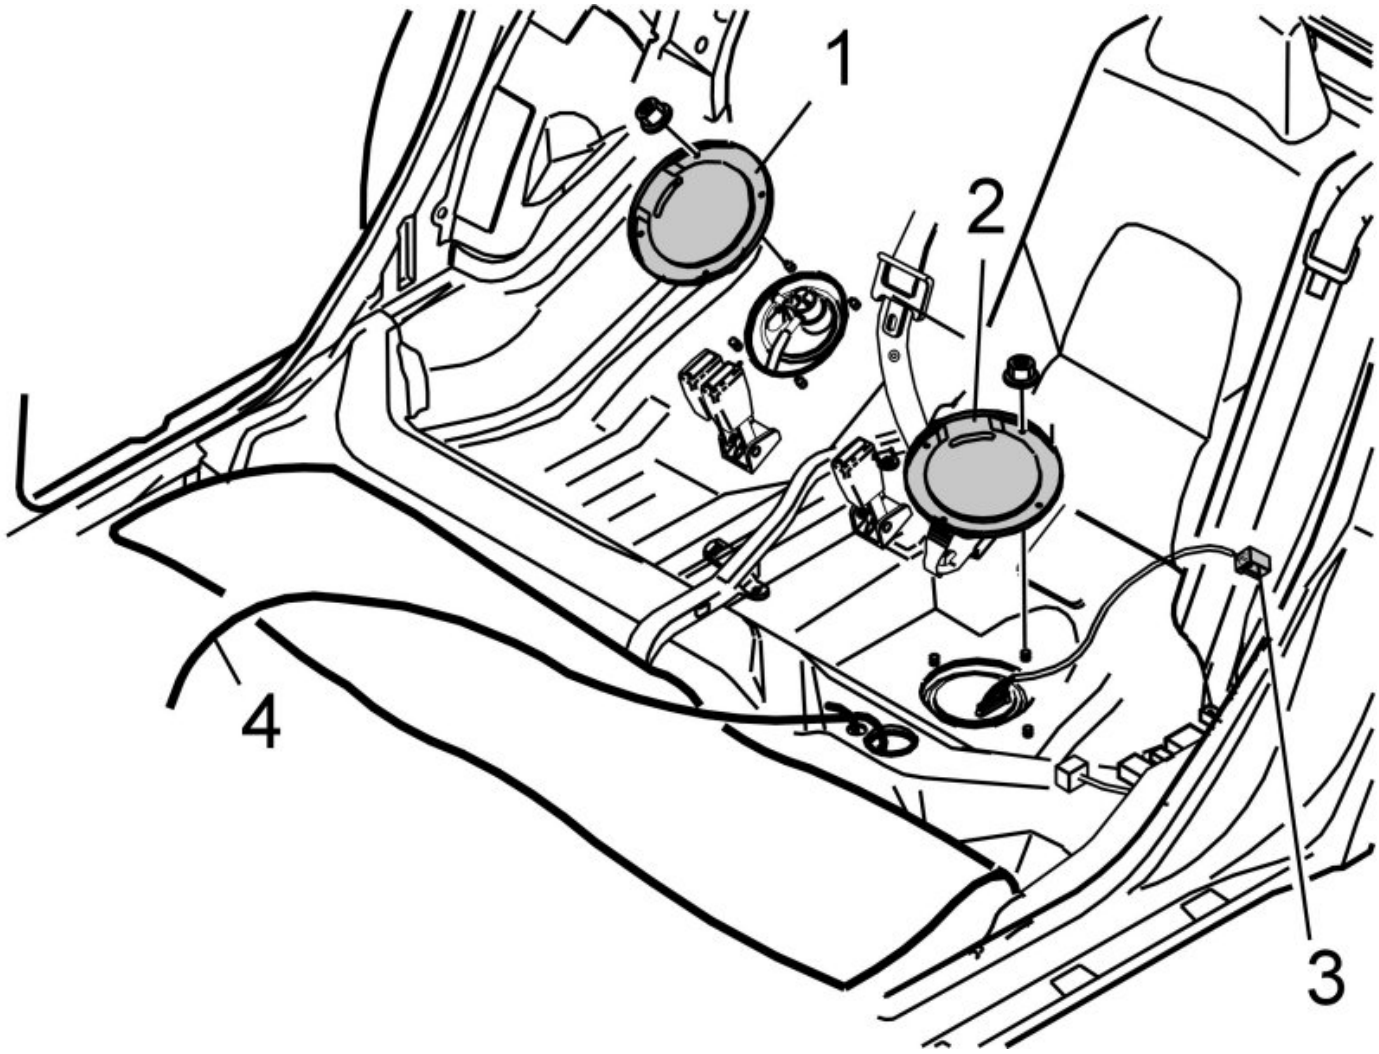
Removing the insulation panel



Fold the carpet (1) out of the way.
Remove the insulation panel.
Cover the area (2) around the cover and between the doors with absorbent material.

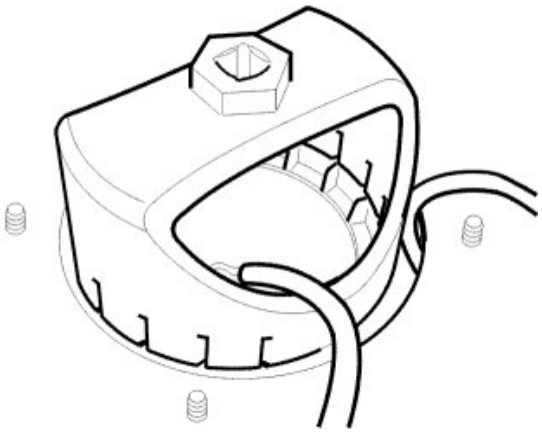
Caution! Ensure that there is no risk of dirt getting into the tank.

Removing the cap over the left-hand level sensor

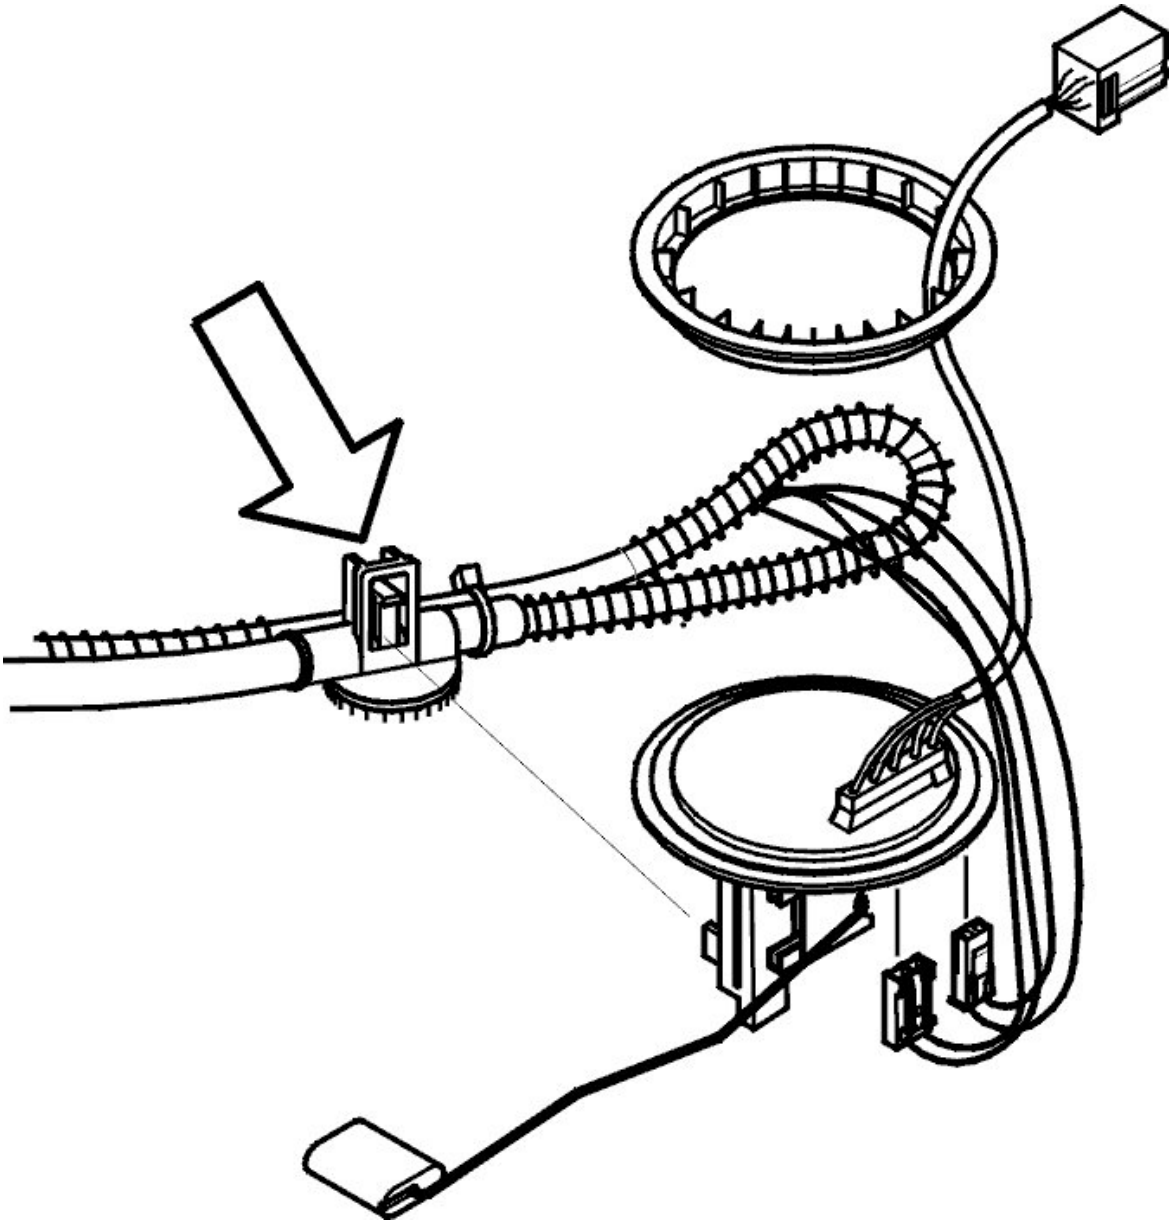


Remove the cover (2) over the level sensor.
Disconnect the level sensor connector (3).

Removing the left-hand level sensor



Clean the area around the level sensor thoroughly.
Open the left-hand level sensor. Use: 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.

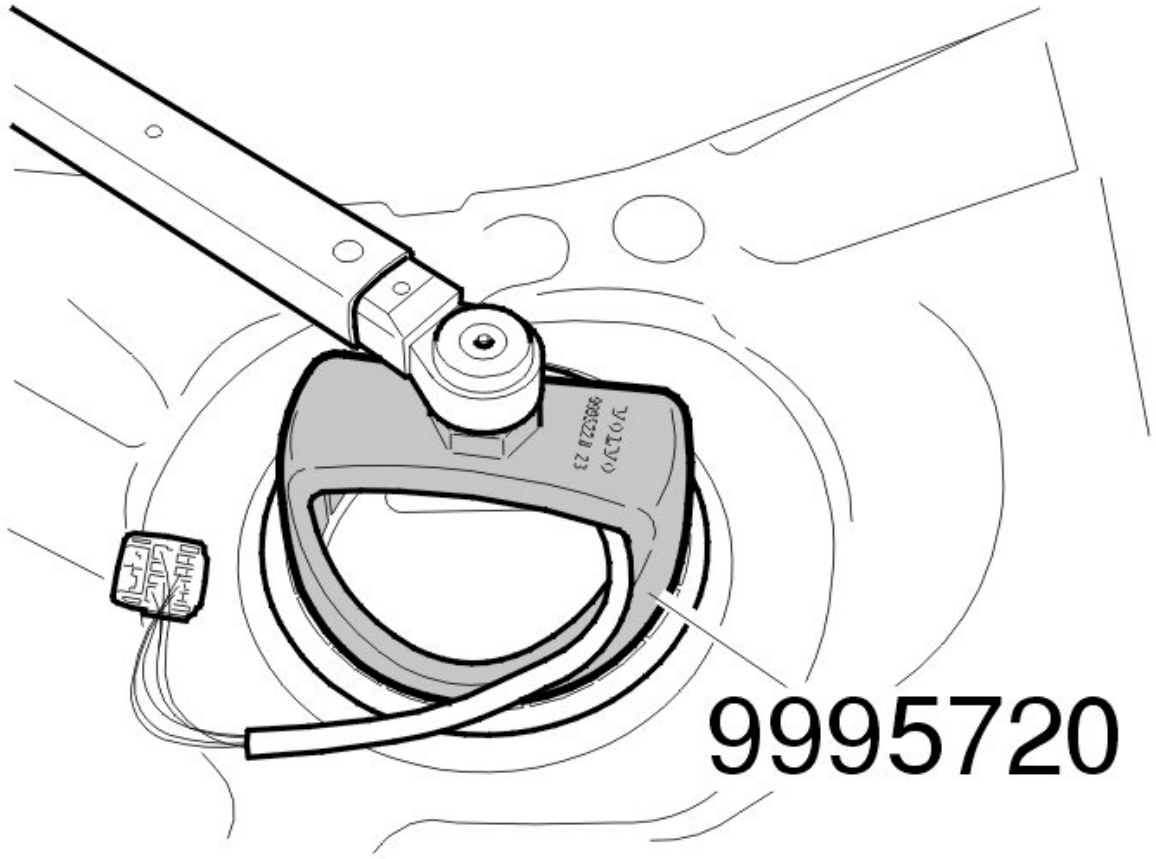


Remove:

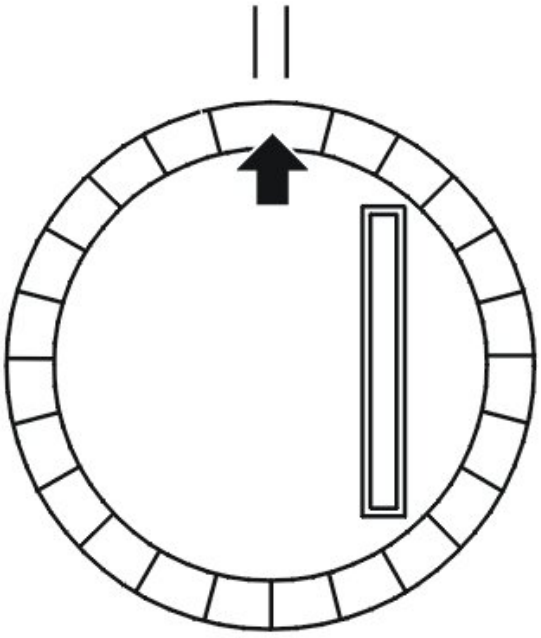
- the ejector
- the connectors.

Installation

Installing the left-hand level sensor



Install the left-hand level sensor on the ejector.
Install the connectors on the underside of the left-hand level sensor.
Install a new O-ring. Lubricate the new O-ring. Use petroleum jelly.
Press the left level sensor down so that the row of protruding cables runs along the vehicle.
Check that the O-ring is not trapped.
Install the screw. Use 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench. Tighten. See: Tightening torque See: Specifications/Mechanical Specifications/Starting and Charging.
Position the wiring in the cut-out in the rubber ring.
Wipe up any fuel spillage.



Note! Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the sensor. Tighten as above.

Install the cover over the fuel tank unit. Tighten the nuts.
Connect the cables and the connectors.
Reinstall the insulation panel and fold down the seat cushion.

Level Sensor, Fuel Tank/Fuel Pump, Replacement

Level sensor, fuel tank/fuel pump, replacement

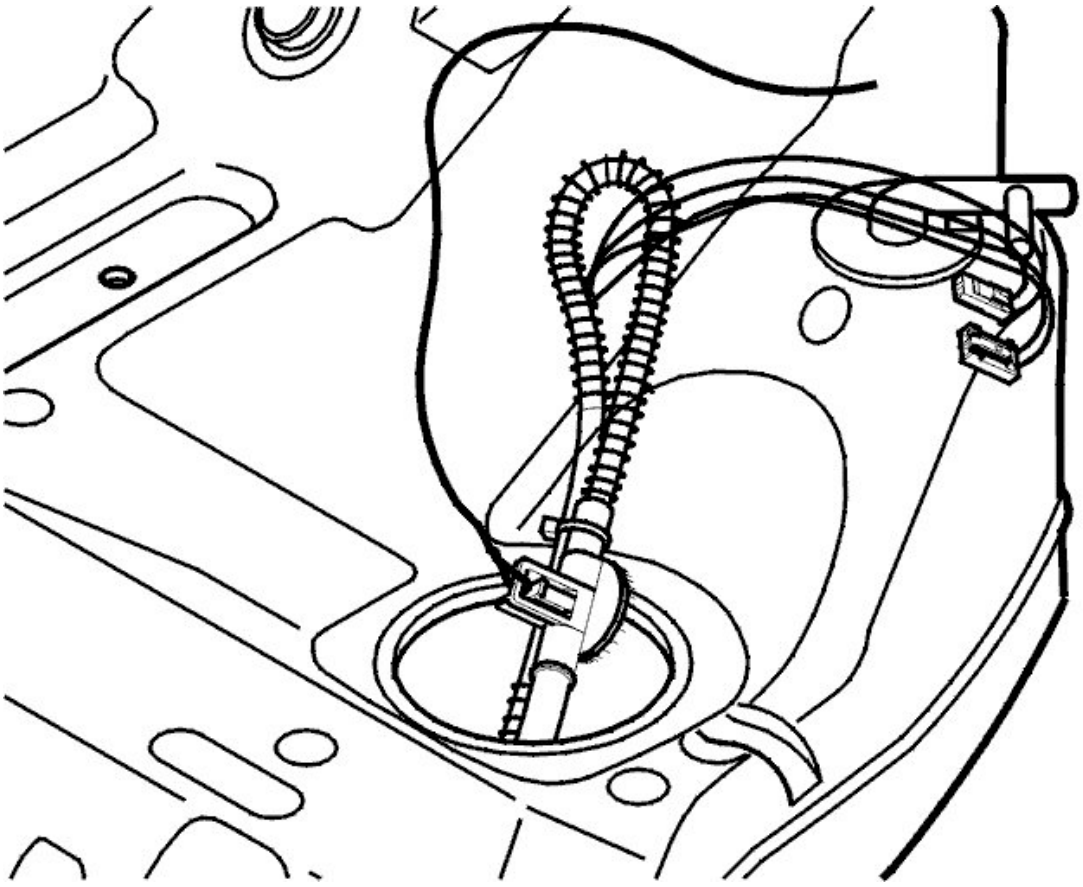
Removal

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Draining the fuel system and fuel tank

Drain:
- the fuel system. See Draining the fuel system See: Service and Repair.
- the fuel tank. See Draining the fuel tank See: Service and Repair.

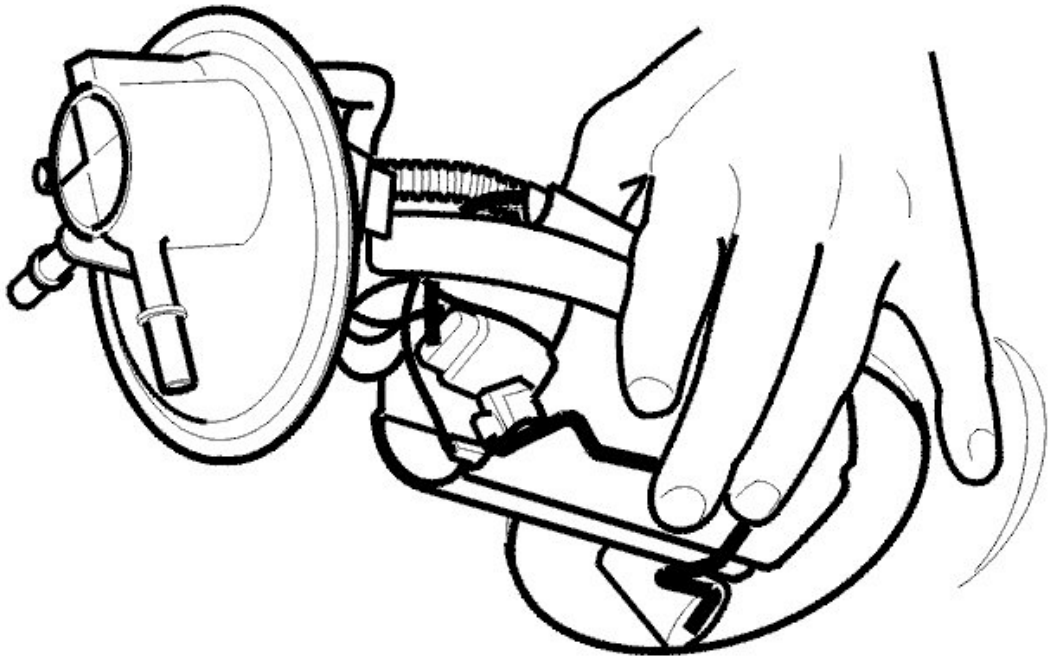
Removing the left-hand level sensor



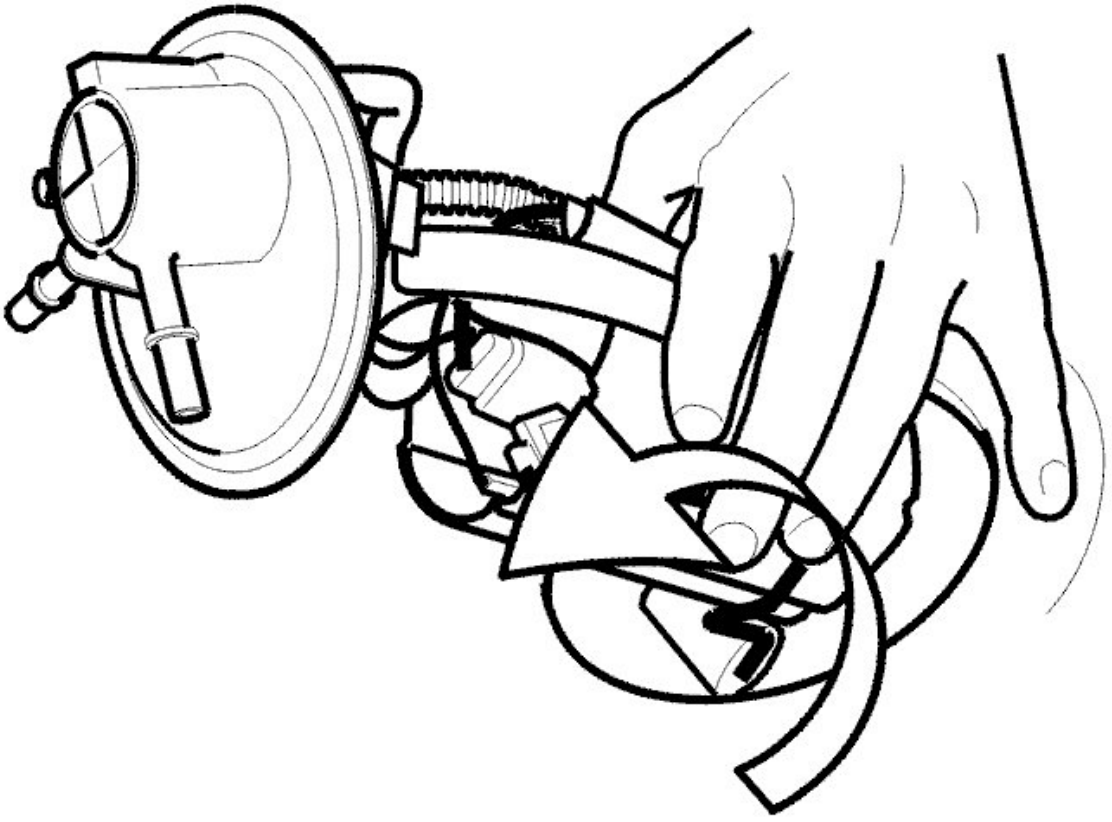
Remove:
- the two connectors from the underneath of the left-hand level sensor
- the left-hand level sensor from the ejector on which it is positioned.

Note! Secure a wire in the area of the ejector.The wire must be sufficiently long that it reaches over to the opposite side of the tank with some excess remaining to ensure that it does not slide into the tank. The wire is needed to pull the hoses and wiring back to the left-hand side of the tank after the fuel tank unit has been replaced.

Removing the right-hand level sensor / pump



- Grip the right-hand level sensor and pump holder and pinch the float so that it is held in its lowest position.



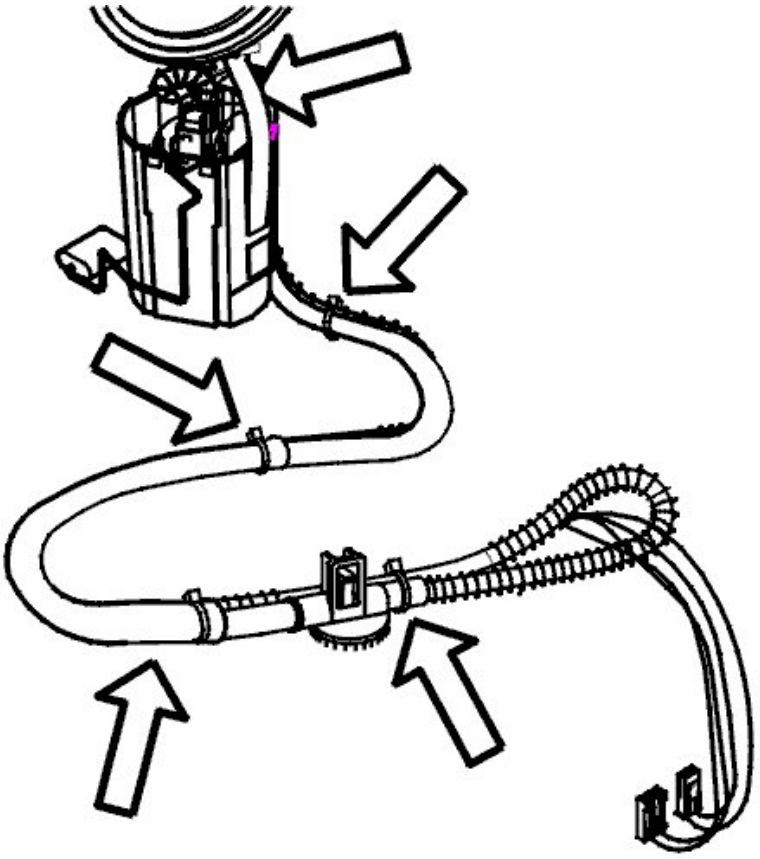
Note! Take care with the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.
Pull the hoses out from the tank without pulling up the entire wire from the right-hand hole in the tank.

Note! It is extremely important that the float arm is not broken or bent.

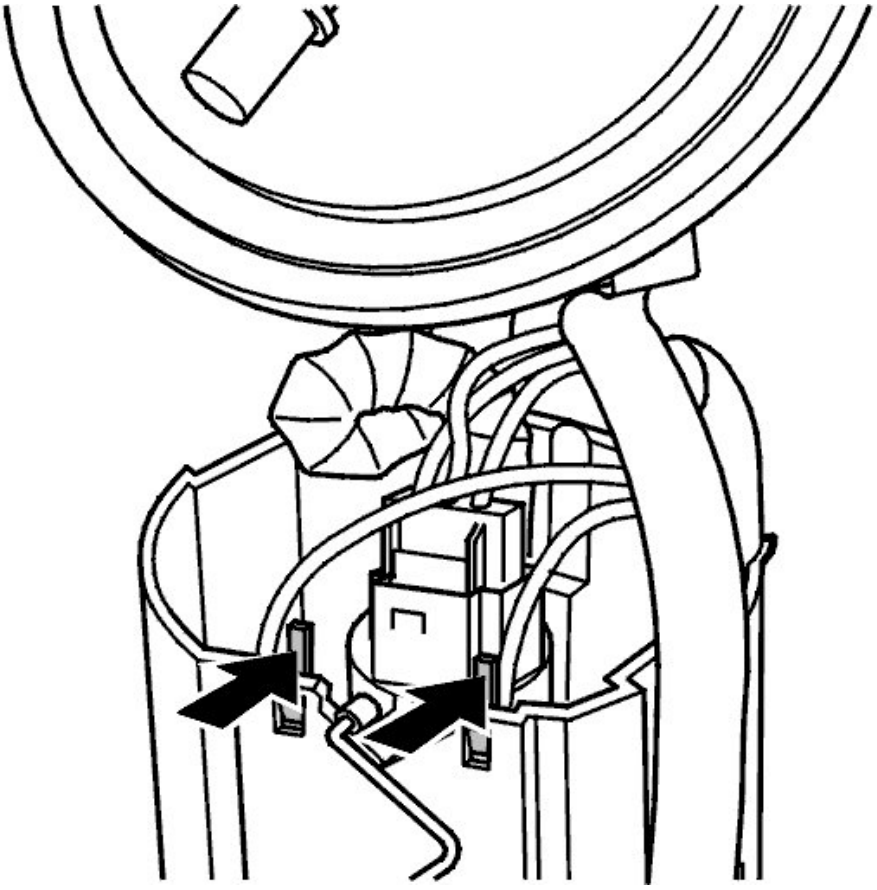
Remove the wire from the old level sensor and pump ejector.

Removing the right-hand level sensor



Remove:

- the tie straps around the protective sheath, hoses and wiring
- the net protective sheath by carefully threading it off the hoses and wiring
- the tie strap under the protective sheath.



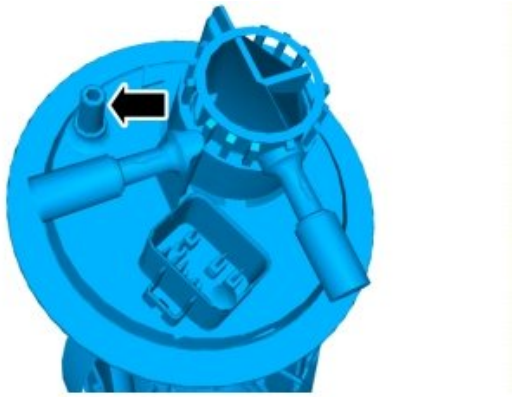
Remove:

- the tie strap around the wiring above the pump

- the level sensor by pressing in the two clips and pulling upwards
- the thin pipe from the holder on the outside of the fuel tank unit
- the wiring from the holder in the fuel tank unit.

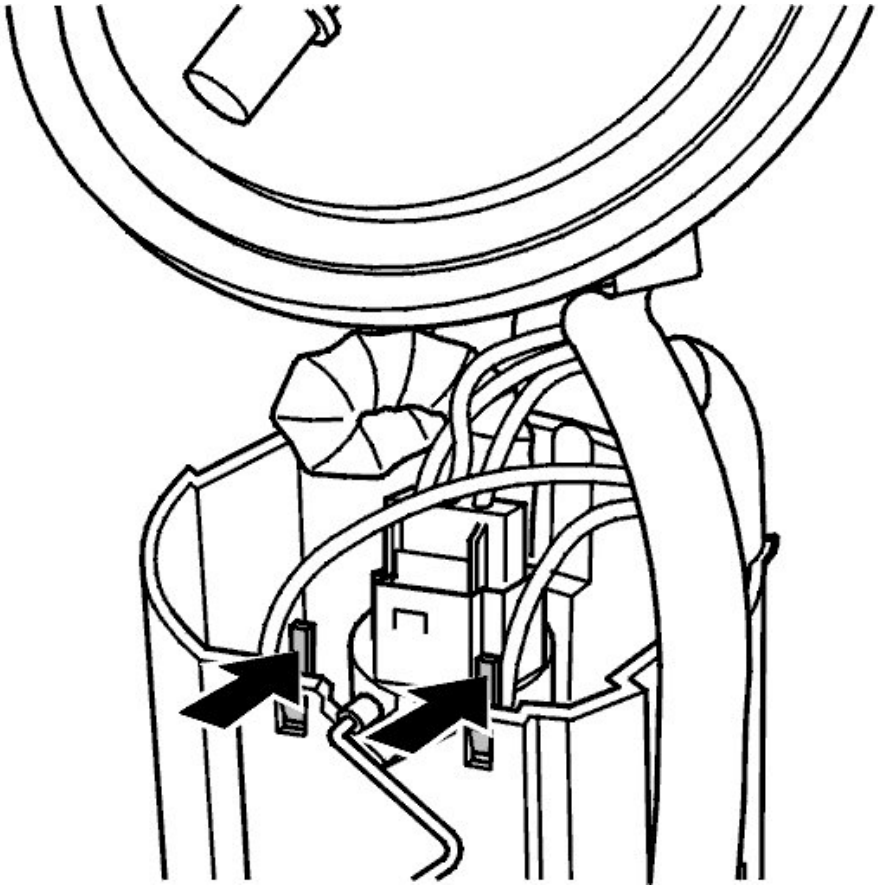
Installation

Only applies to vehicles with parking heaters



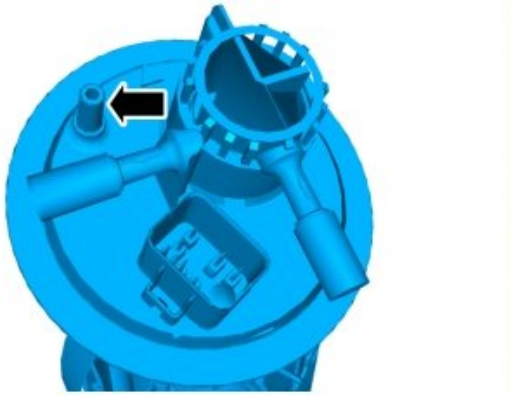
If the vehicle has an engine block heater, drill out the hole connection in the fuel tank unit. Use a -4 mm drill bit. Transfer the dip pipe.

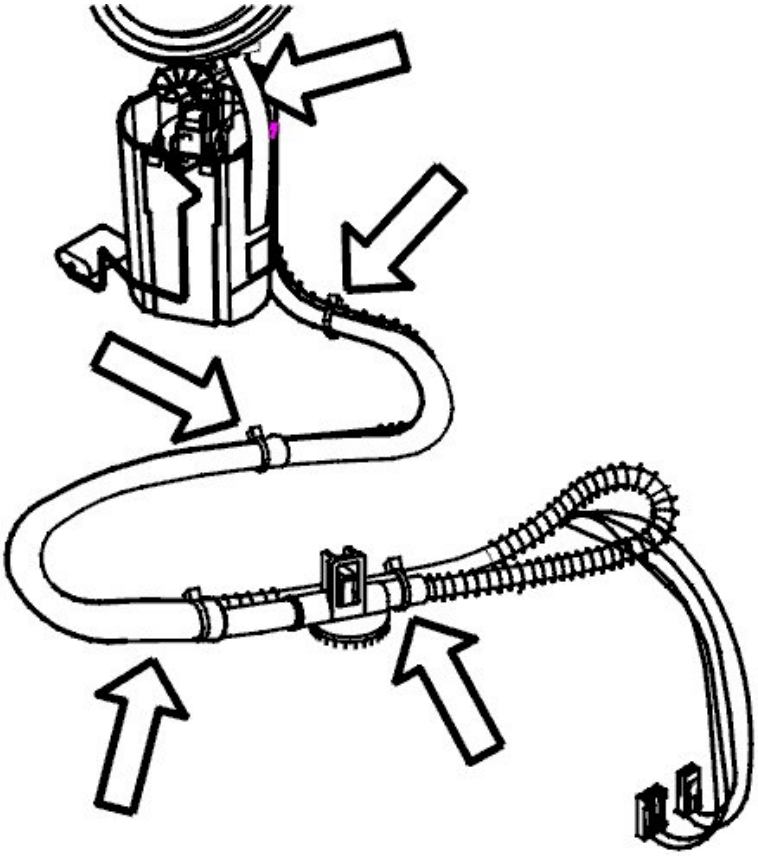
Installing the right-hand level sensor



Install:

- the new level sensor
- the wiring in the holder
- the thin pipe in the holder on the outside of the fuel tank unit
- the tie strap around the wiring above the pump.





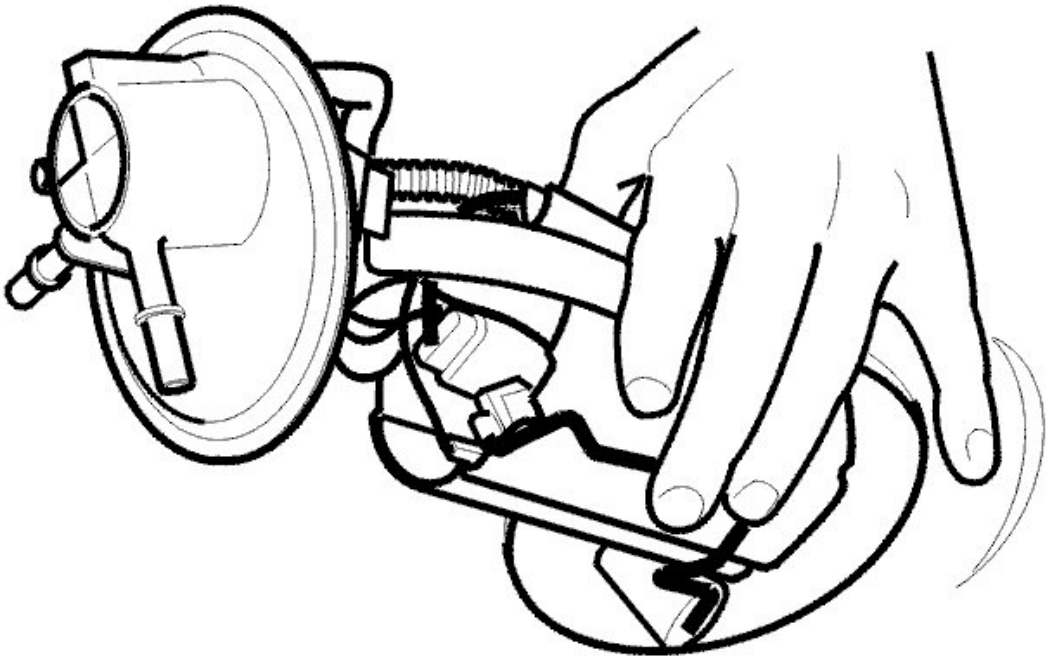
Install:

- the tie strap under the protective sheath

Note! Secure the tie strap on the smooth central section of the corrugated hose.

- the protective sheath
- four tie straps around the protective sheath, hoses and wiring. Secure the tie straps on the four smooth central sections of the corrugated hose.

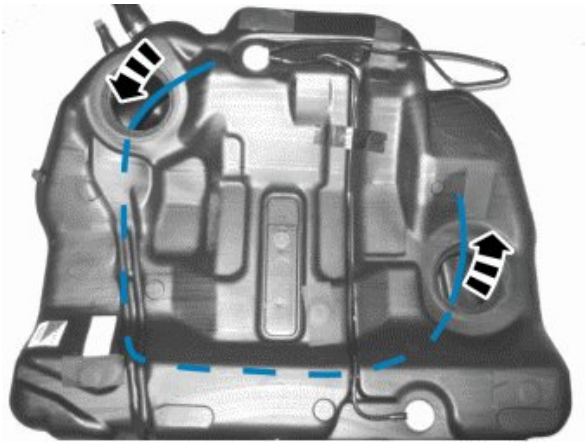
Installing the right-hand level sensor and pump and the left-hand level sensor in the fuel tank



If the fuel tank is replaced, see next step.

- Install the wire on the new ejector for the level sensor and pump
- Insert the hoses and wiring into the tank via the right-hand tank hole
- Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position
- Carefully and slowly lower the holder. Carefully work the holder into place
- Pull the wire so that the hoses and wiring end up on the left side of the tank
- Install the left-hand level sensor on the ejector
- Install the switches on the underneath of the left-hand level sensor
- Remove the wire from the ejector.

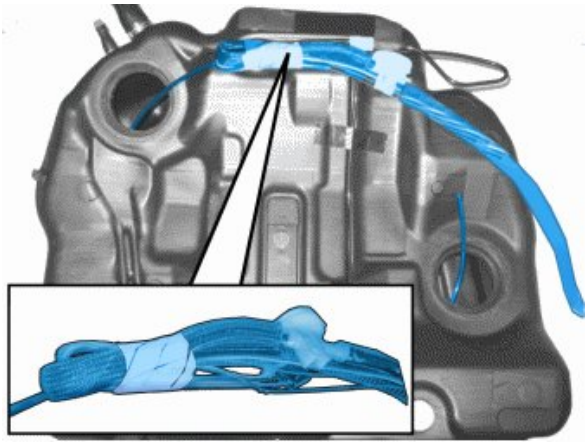
Cable routing when replacing the fuel tank



If replacing the fuel tank, wire cannot be used.
The image shows how to route the fuel lines and electrical wiring in the tank. Use a plastic pipe at least 1.7 m long.

Hint: Use spare part plastic pipe between the carbon filter and EVAP valve.

Insert the hose through the hole for the level sensor on the left-hand side of the vehicle and press it through the tank and take the end of the hose through the hole for the fuel pump.



Tape the fuel pump's fuel lines/electrical wiring to the plastic pipe.
Pull the wiring out of the hole for the level sensor. Remove the plastic pipe and the tape. Check that there is no tape/adhesive residue on the wiring.
Pull the wiring forwards and backwards to check that it has not bent or got trapped.

Finishing

- Install the sensor, backrest, side cushion and seat cushion. See Draining the fuel tank See: Service and Repair.

Level Sensor, Replacing

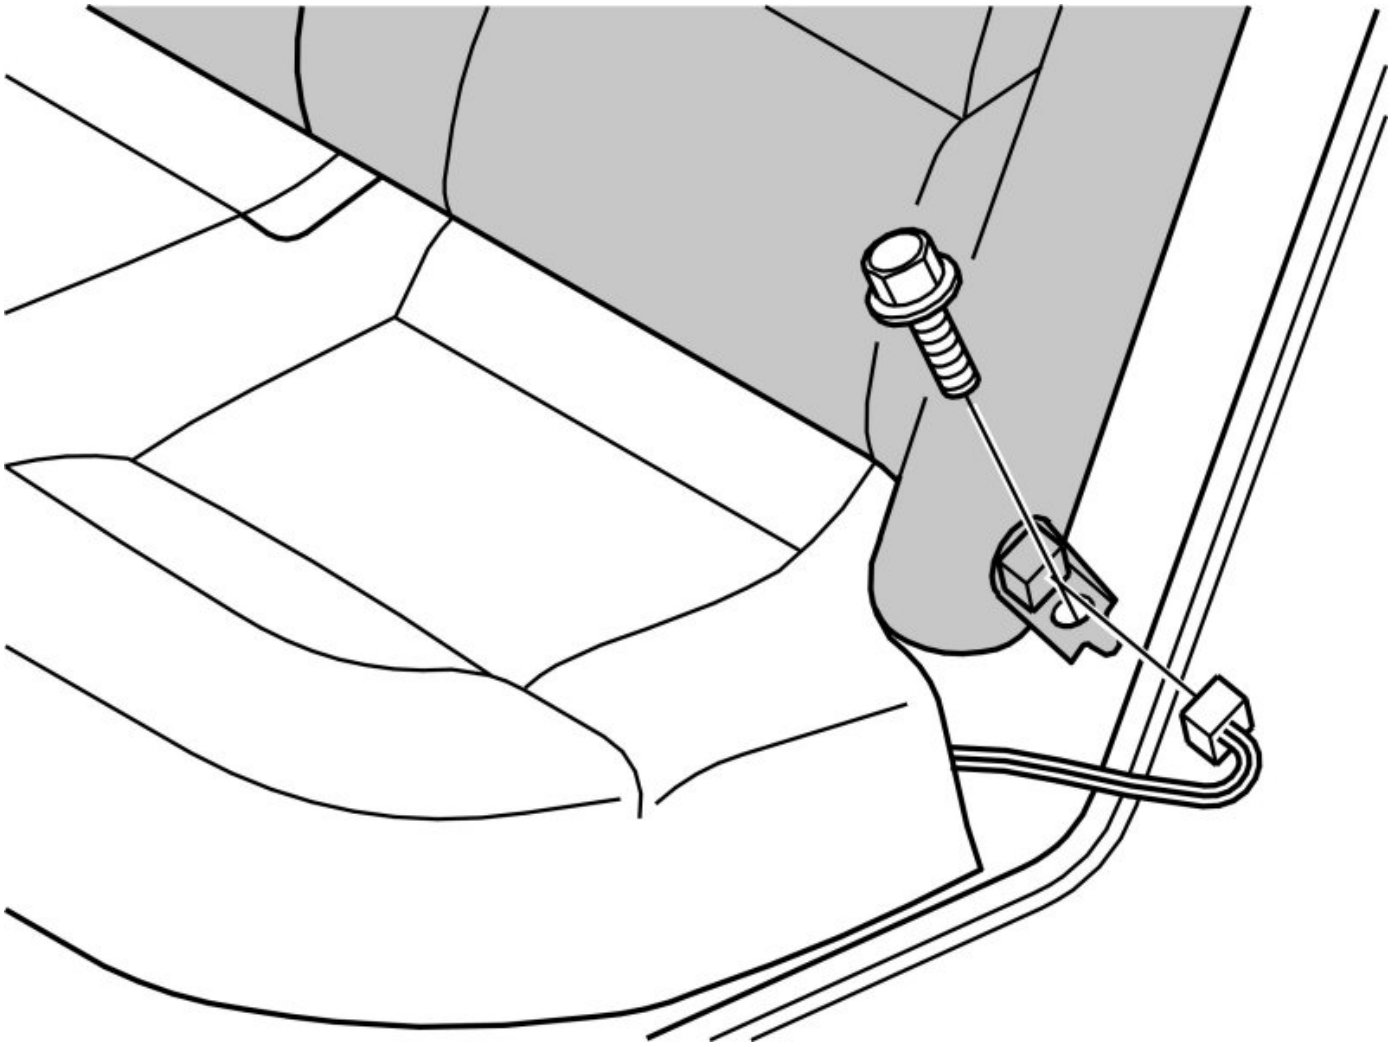
Level sensor, replacing

Special tools:

999 5720 Wrench See: Tools and Equipment/999 5720 Wrench

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Preparation



Drain the tank. See Fuel tank, draining See: Service and Repair.
Applies to V70:

Lift up the right-hand seat cushion.
Remove the right side cushion. See Side cushion See: Body and Frame/Seats/Service and Repair/Removal and Replacement/Rear Seat/Side Cushion.
Applies to the S60:

Remove:
- the seat cushion. See Upholstery, seat cushion, replacing See: Body and Frame/Seats/Seat Cover/Service and Repair/Rear Seat, Passenger Seat/Upholstery, Seat Cushion, Replacing
- the right-hand side cushion. See Side cushion See: Body and Frame/Seats/Service and Repair/Removal and Replacement/Rear Seat/Side Cushion.

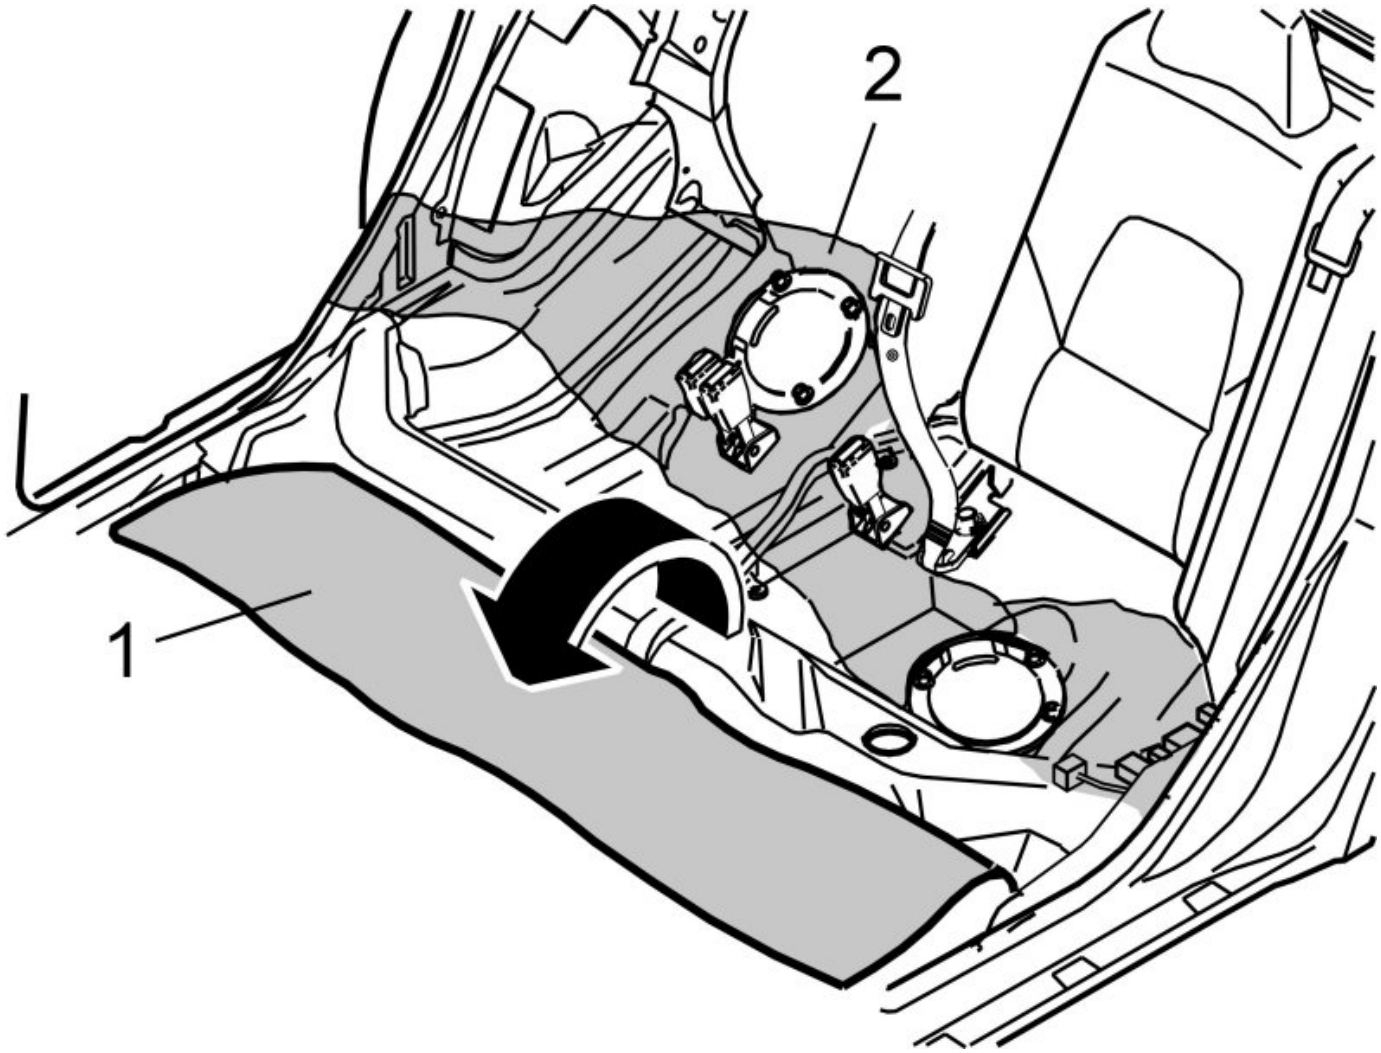
Applies to all models:

Disconnect the connector at the hinge.

Remove:
- the mounting screw for the hinge
- the screw for the hinge end mounting.

Release the strap/straps of the folding mechanism for the seat belt buckle. (Hooked into place on the lower edge of the backrest).
Lift out the backrest.

Removing the cover for the level sensor/fuel pump (FP)

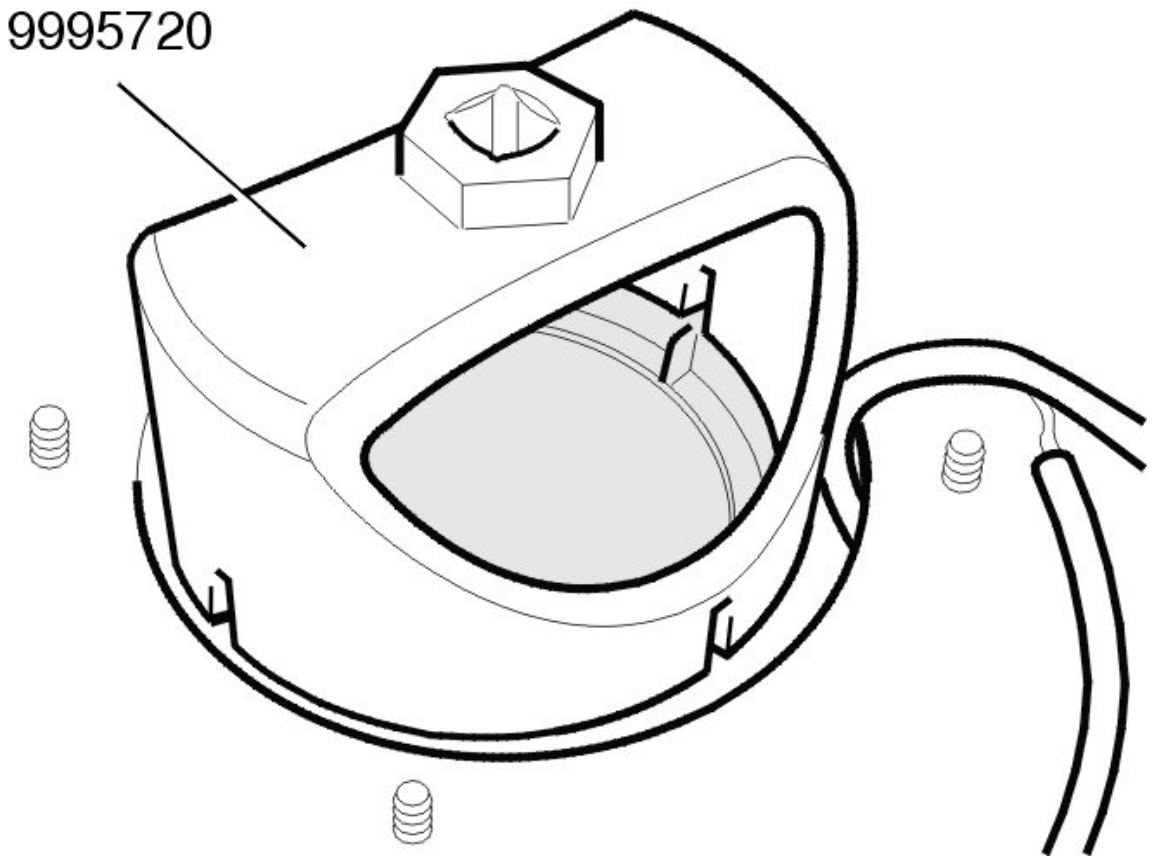


Push the carpet to one side.

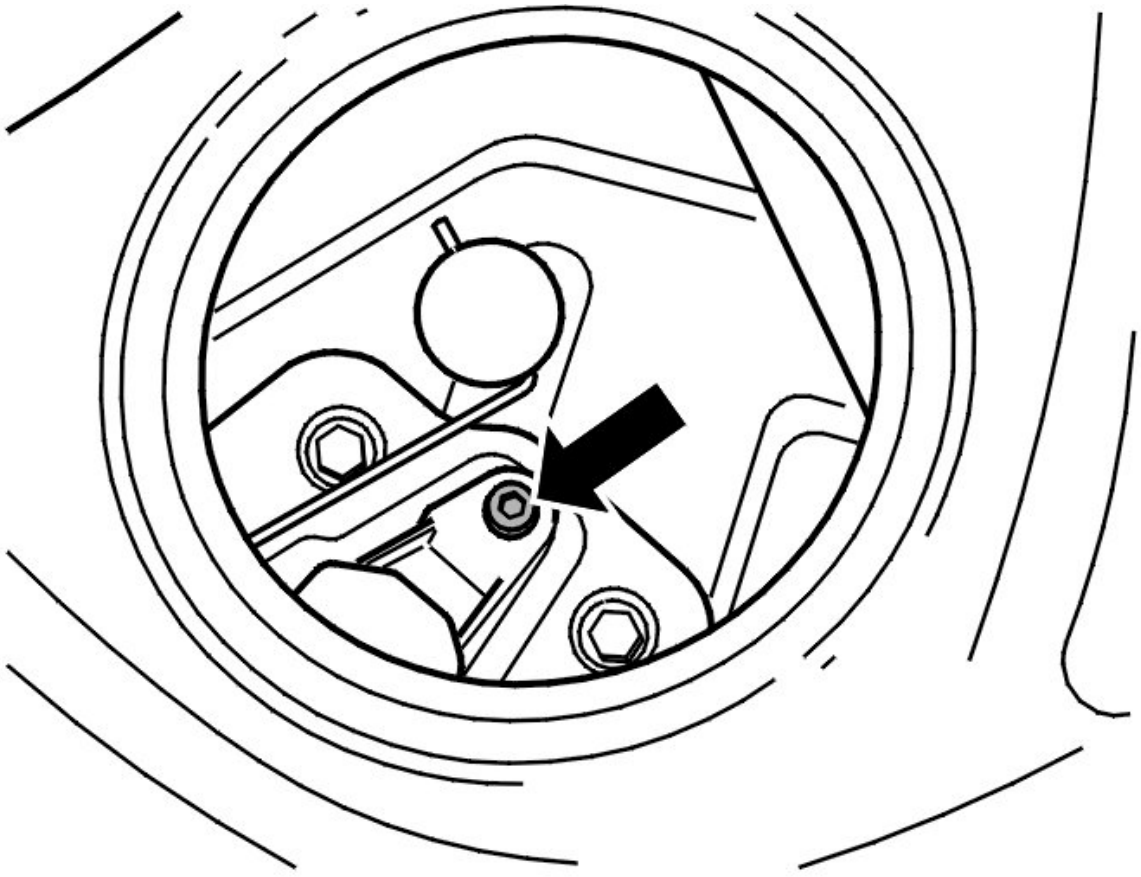
Remove:

- the insulation panel
- the cover (2).

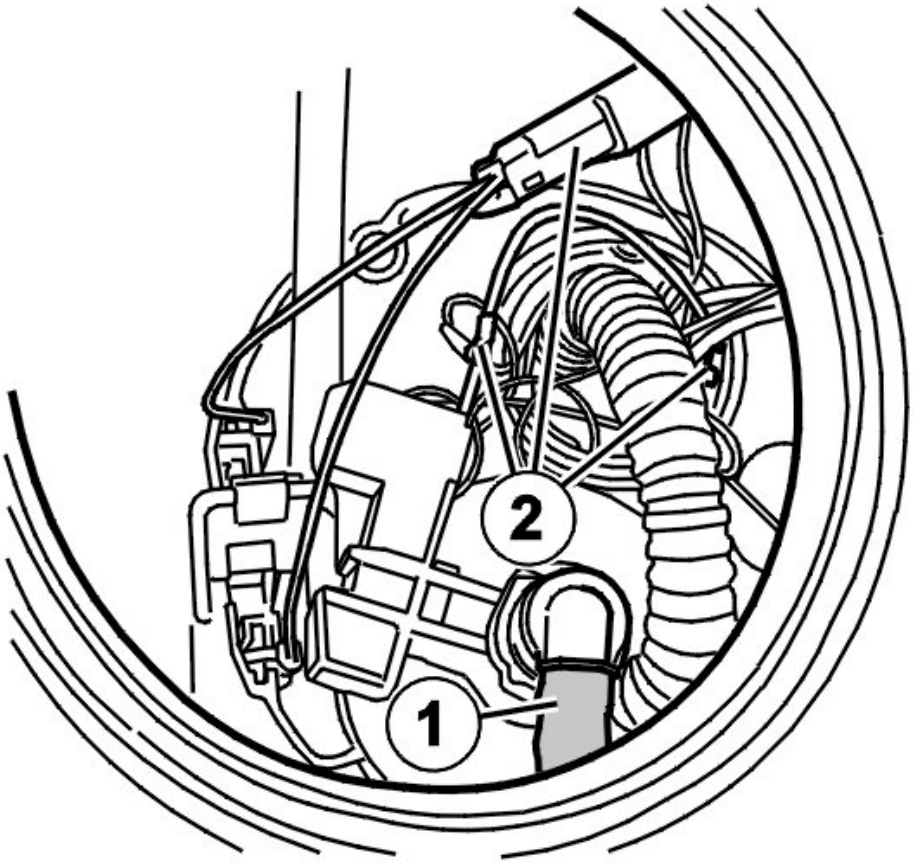
Removing the fuel pump (FP)



Remove the cover. Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.



Remove the screw (1).



Carefully turn the pump in order to access the fuel hose (1).

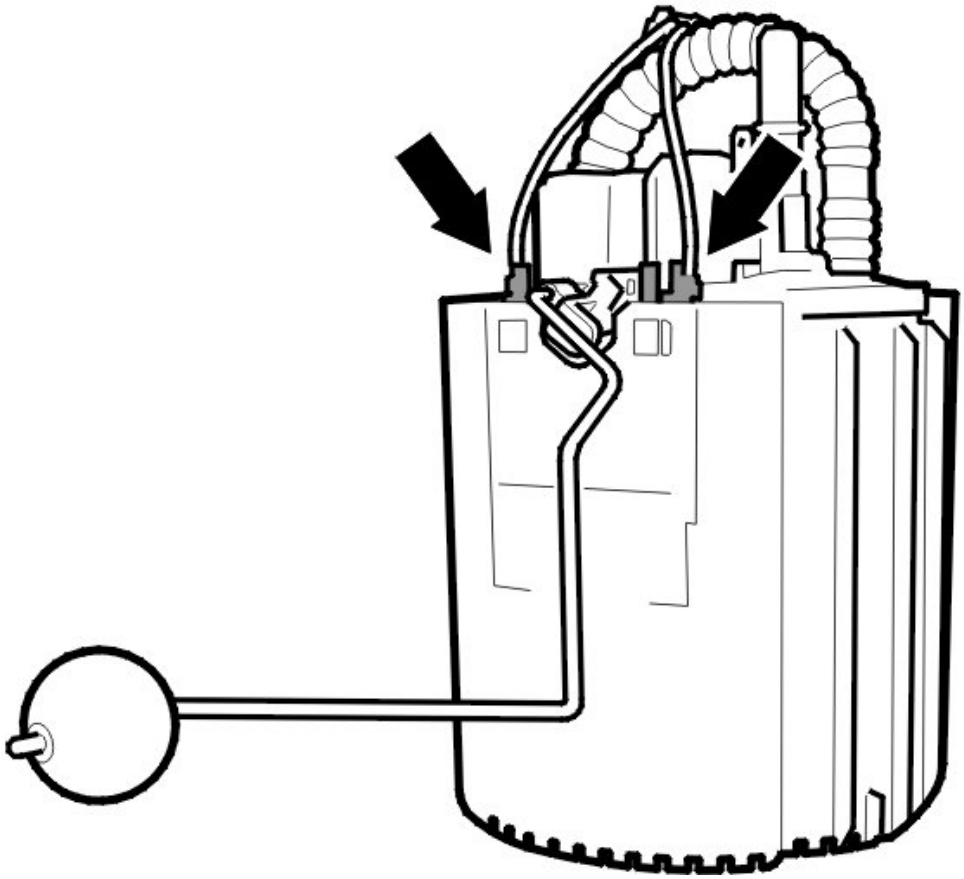
Remove:

- the hose (1)
- the three connectors (2).

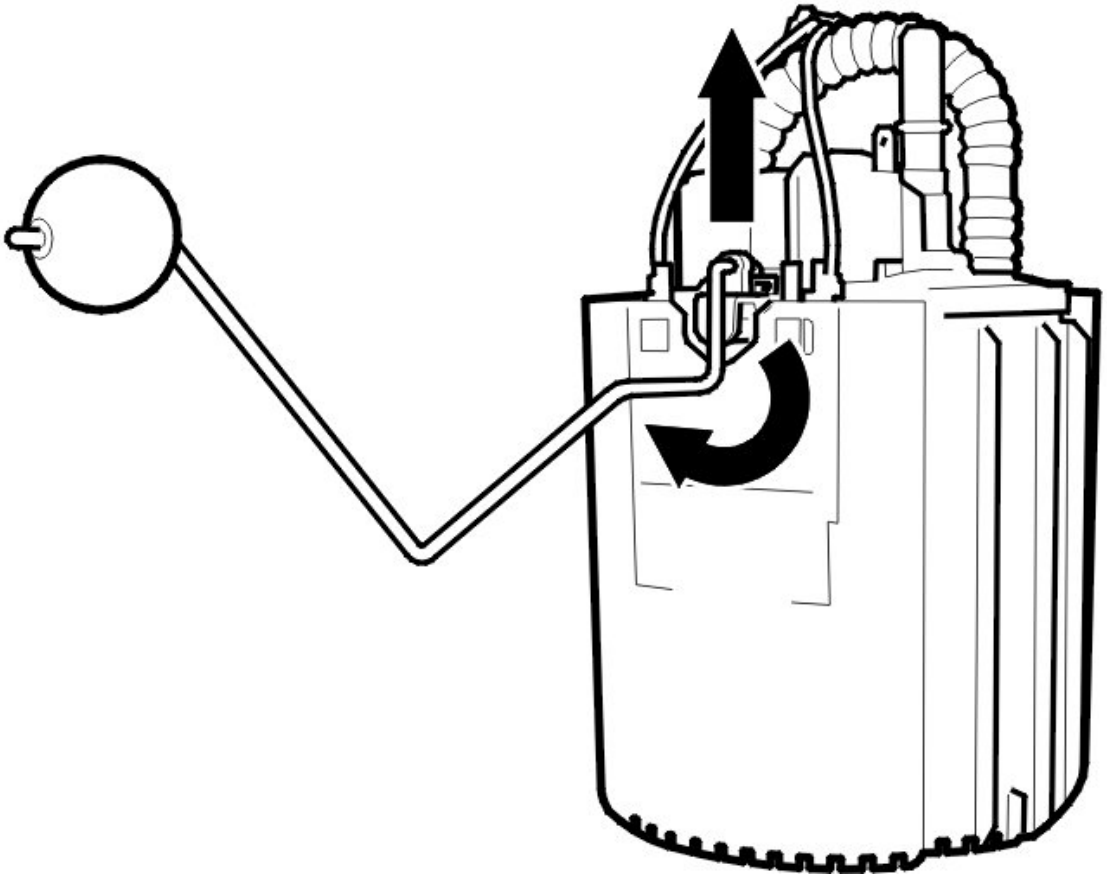
Carefully lift up the pump.

Note! Ensure that the level sensor arm is not obstructed. Do not bend the arm when removing the pump.

Removing the level sensor



Carefully press in both retaining clips and lift the level sensor approx. 5 mm. Lift up the float to the centre position and remove the level sensor.



Lift up the float arm to the centre position and remove the level sensor.

Installing the level sensor

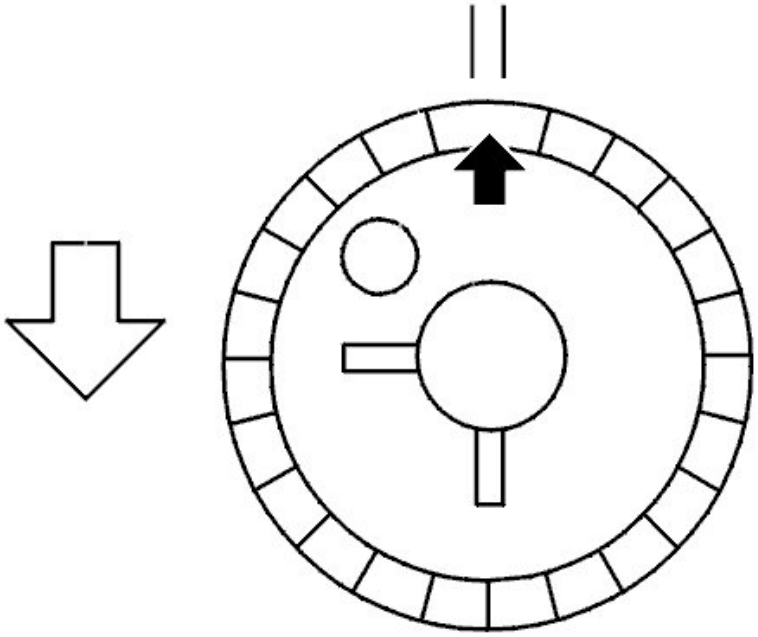
Hold the float arm in the centre position and press the level sensor into position.

Installing the fuel pump (FP)

Lower the pump into the tank.

Install:
- the fuel hose
- the three connectors.

Turn the pump to the installation position. Install the mounting bracket and screw. (M6)
Install the cover.
Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.
For tightening torques, see Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.



Note! Check that the arrow on the cap ends up between the markings on the tank. If the arrow ends up outside the markings it will result in the tank gauge indicating the wrong value and the float may jam against the tank's inner wall.

Installing the cover for the level sensor/fuel pump (FP)

Install:
- the cover
- the insulation panel.

Reinstall the carpet.

Finishing

Install:
- the backrest
- the screw for the hinge mounting (M10)
- the connector for the hinge
- the end mounting for the seat belt.

For tightening torques, see Tightening torque See: Body and Frame/Specifications.
Install the side cushion.
(V70) Fold the seat cushion forward.
(S80, S60) Install the seat cushion.

Replacing the Fuel Pump / Level Sensor For the Right-Hand Fuel Tank

Replacing the fuel pump / level sensor for the right-hand fuel tank

Special tools:

999 5720 Wrench See: Tools and Equipment/999 5720 Wrench

Removal

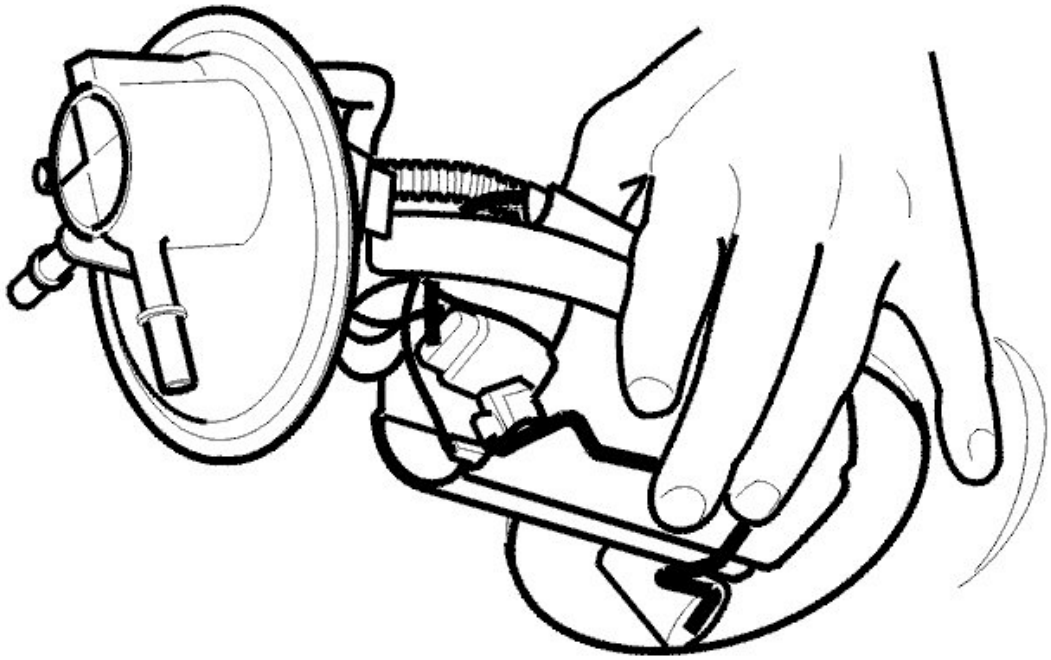
Removing the rear seat

Remove:
- the backrest. See Backrest See: Body and Frame/Seats/Seat Back/Service and Repair/Backrest.

Draining the fuel system and fuel tank

Drain:
- the fuel system. See the relevant service procedure.

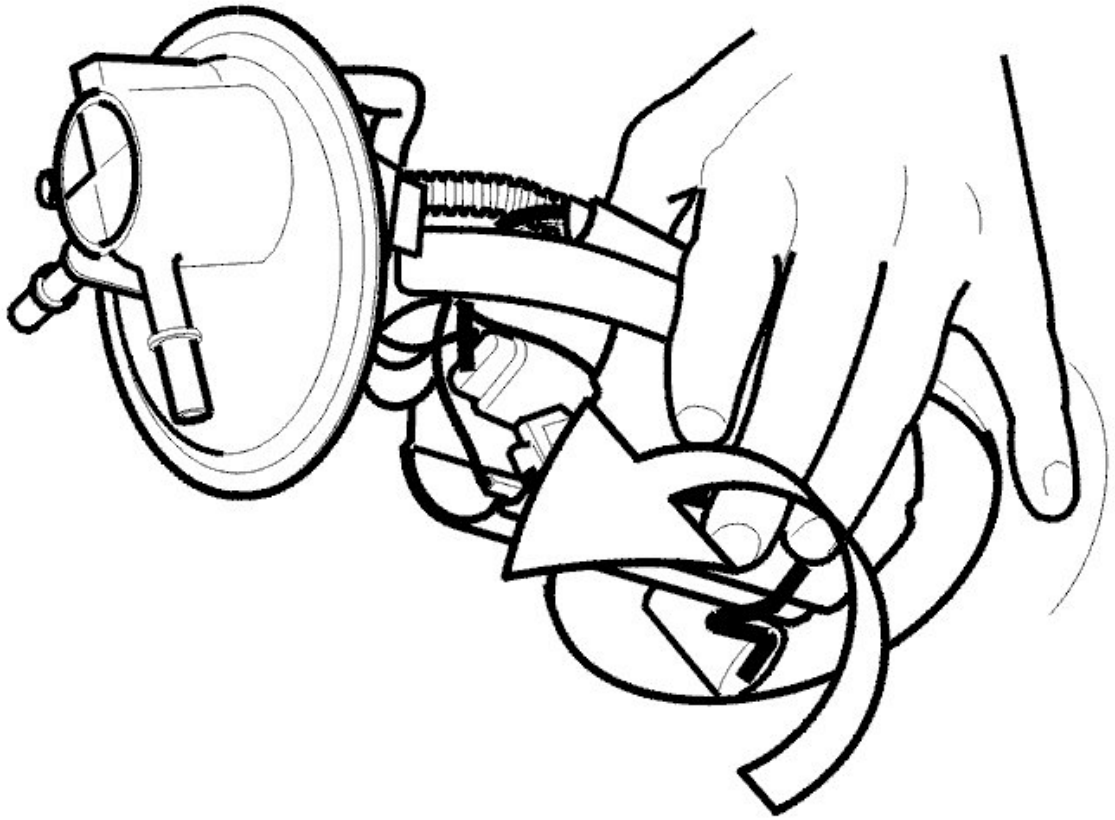
Removing the level sensor / pump



Note! Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench to remove the snap ring for the level sensor / pump.

Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position.

Removing the level sensor / pump, continued



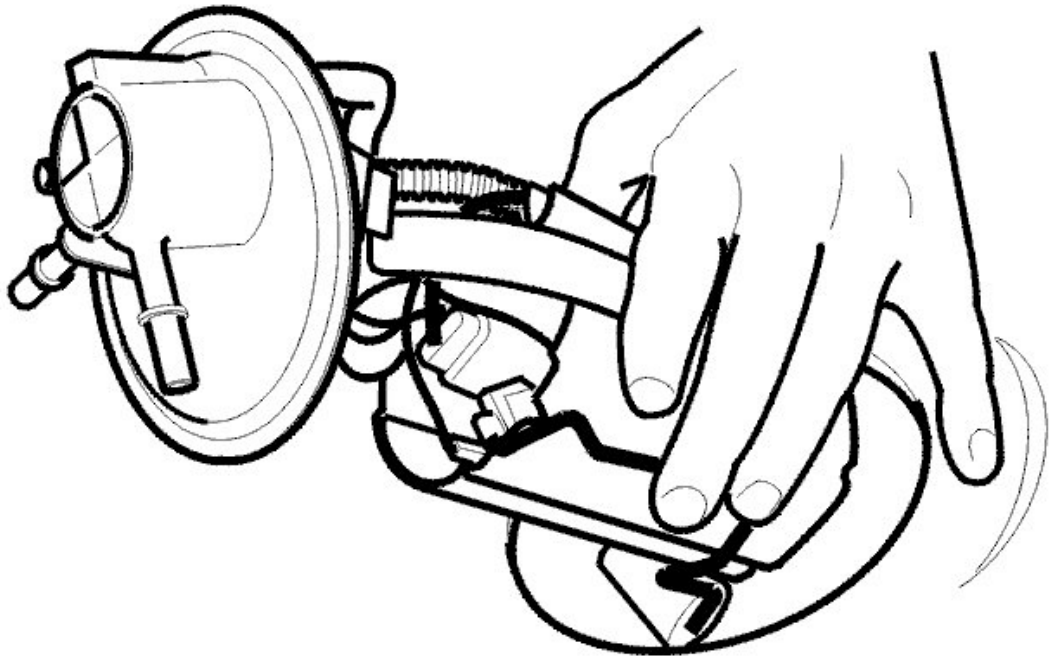
Caution! Take care with the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.

Caution! It is extremely important that the float arm is not broken or bent.

Installation

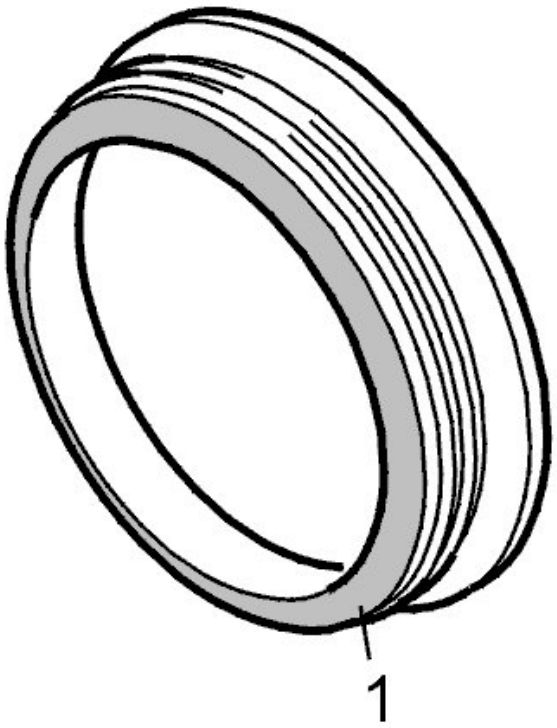
Installing the level sensor / pump



Note! Use special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench to tighten the snap ring for the level sensors.

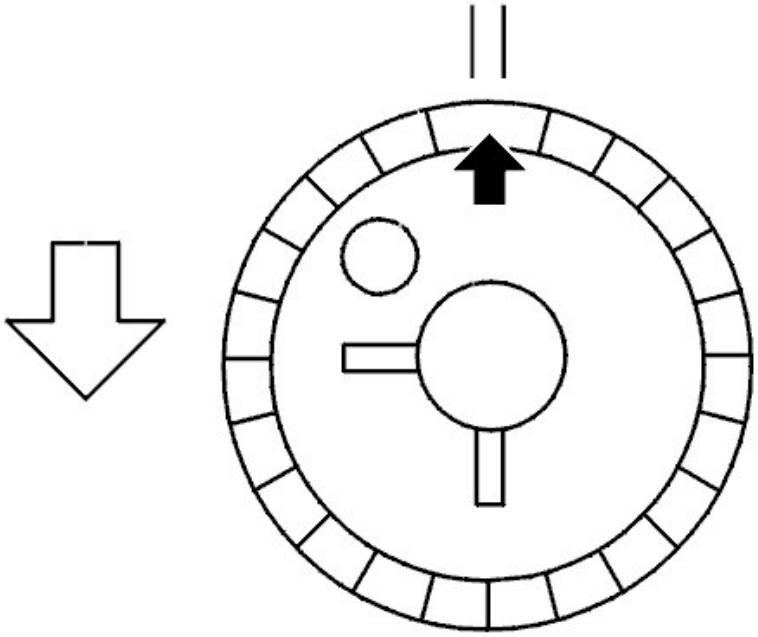
Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position.
Carefully and slowly lower the holder. Carefully work the holder into place.

Lubricating the screw, level sensor and pump



Thoroughly clean and dry the O-ring mating surfaces.
Install a **new** O-ring.
Use petroleum jelly to lubricate the screw mating surface with the fuel tank unit. This is so that the screw does not turn the fuel tank unit when it is tightened.
Press down the right fuel sensor and pump so that the fuel line is pointing forward and to the right. **Ensure that the arrow on the cover is between the markings on the tank**.
Check that the O-ring does not deform.
Tighten the screw. Tighten to **60 Nm**.

Note! Check that the arrow on the cover is between the markings on the tank. If the arrow is outside the markings the fuel gauge sensor will give an incorrect value and the float may catch against the inner wall of the tank. If not: Slacken off the screw and adjust the position of the fuel tank unit. Tighten as above.



Finishing

Wipe up any fuel spillage.
Position the wiring in the cut-out in the rubber ring.
Connect the connectors.
Install the cover over the left-hand level sensor and right-hand level sensor and pump. Tighten the nuts.
Install the rear seat backrest. See Backrest See: Body and Frame/Seats/Seat Back/Service and Repair/Backrest.

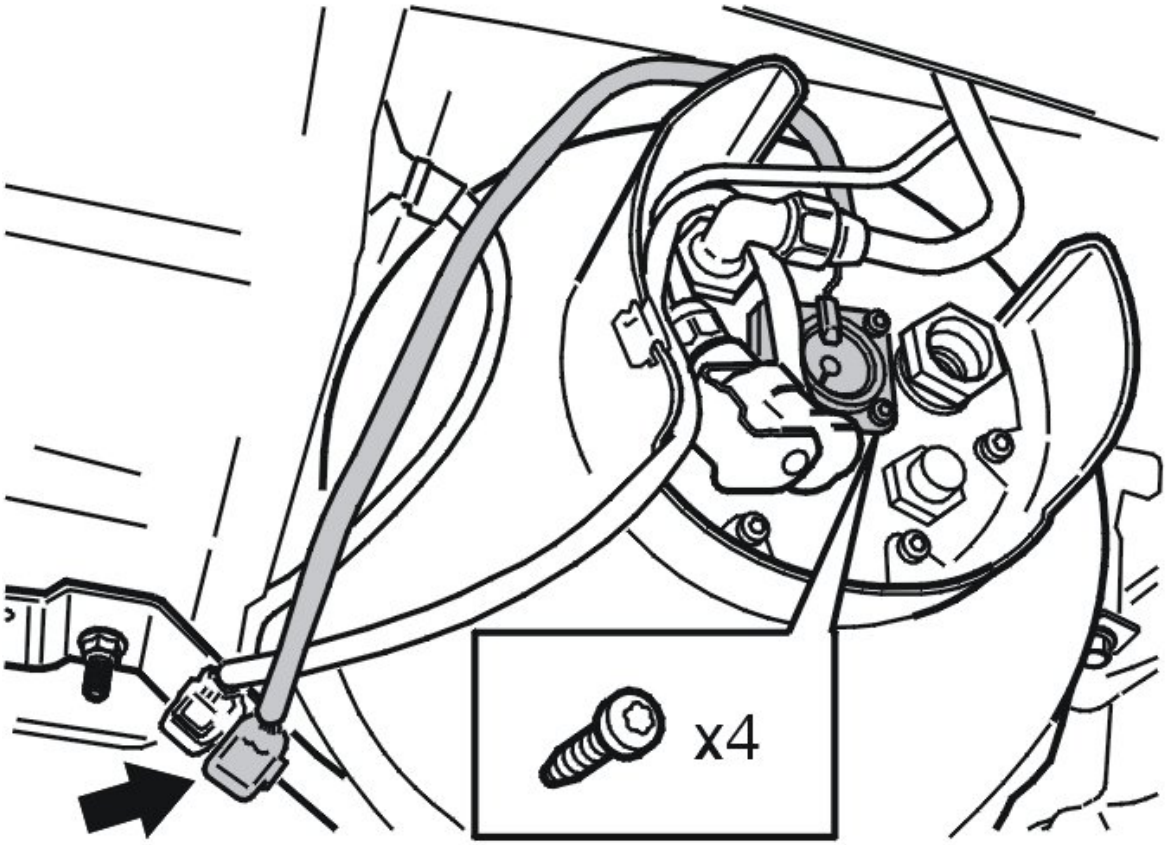
Replacing the Level Sensor For the Gas Tank

Replacing the level sensor for the gas tank

Caution! When replacing the level sensor the tank must be removed from the car. The tank must be placed upright so that the float is not damaged.

Caution! When replacing components on the tank, the gas pipes and the tank must be drained. The battery negative terminal must be disconnected during all work carried out on gas installations. See Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.Do not damage the seals.

Removing level sensor assembly



Note! Always clean around any connections that will be disconnected. This is to prevent contaminants from entering the system.

Remove:

- the guard for the gas tank
- the connector
- the four screws

Note! There may be residual pressure in the tank. Slacken off the screws one revolution and release using a screwdriver and allow the gas to hiss out.

Warning! Take care when working with highly pressurized gas. There is a risk of explosion and cold damage. Carry out any work outdoors or in a workshop with extraction fans.

the level sensor assembly.

Installing the level sensor assembly

Caution! Before installation, check that the pipe ends and connections are undamaged.

Install:

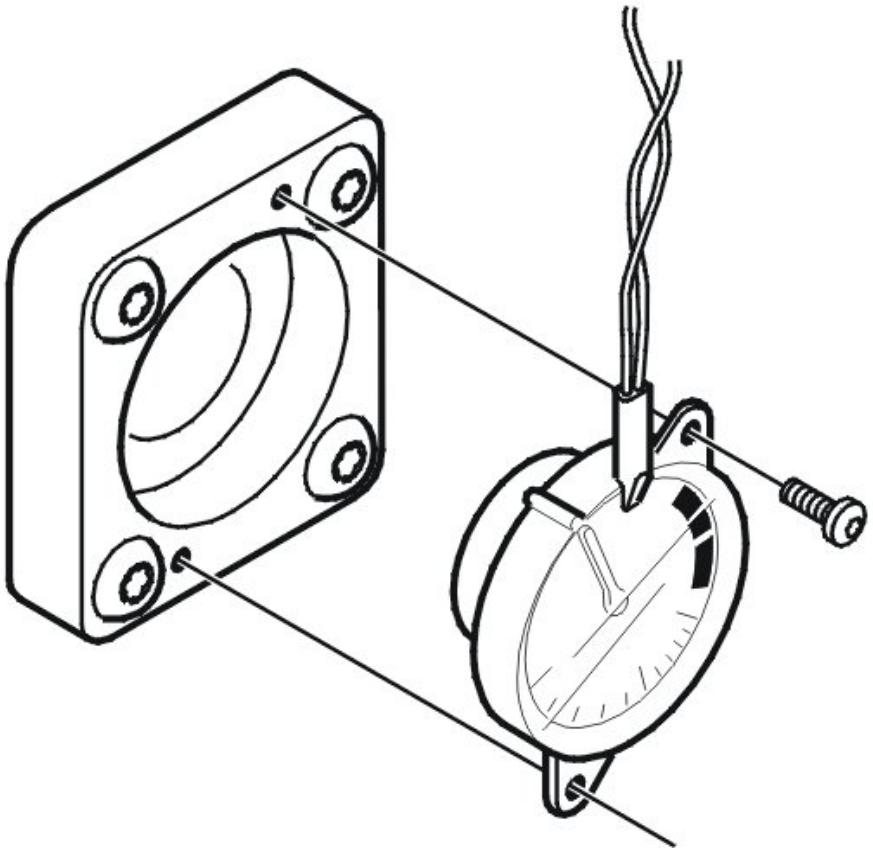
- level sensor, assembly with new gasket
- four screws. Tighten to **6 Nm**
- the connector. Check for leakage.
- the guard for the gas tank.

Connect the connector in the cargo compartment.

Replacing the electronic level sensor

Hint: The gas tank does not need to be emptied when replacing the analog level sensor.

Removing analog level sensors



Remove:

- the guard for the gas tank
- the connector
- the two screws
- slacken off the level sensor and turn the pipe first **180°** clockwise and then **180°** counter-clockwise. Rotate the level sensor to the correct position with a magnet
- the cable.

Installing analog level sensors

Install:

- the cable
- the level sensor. Rotate the level sensor to the correct position with a magnet
- the two screws
- the connector
- the guard for the gas tank.

Replacing the Right-Hand Level Sensor and Pump

Replacing the right-hand level sensor and pump

Removal

Note! Since the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

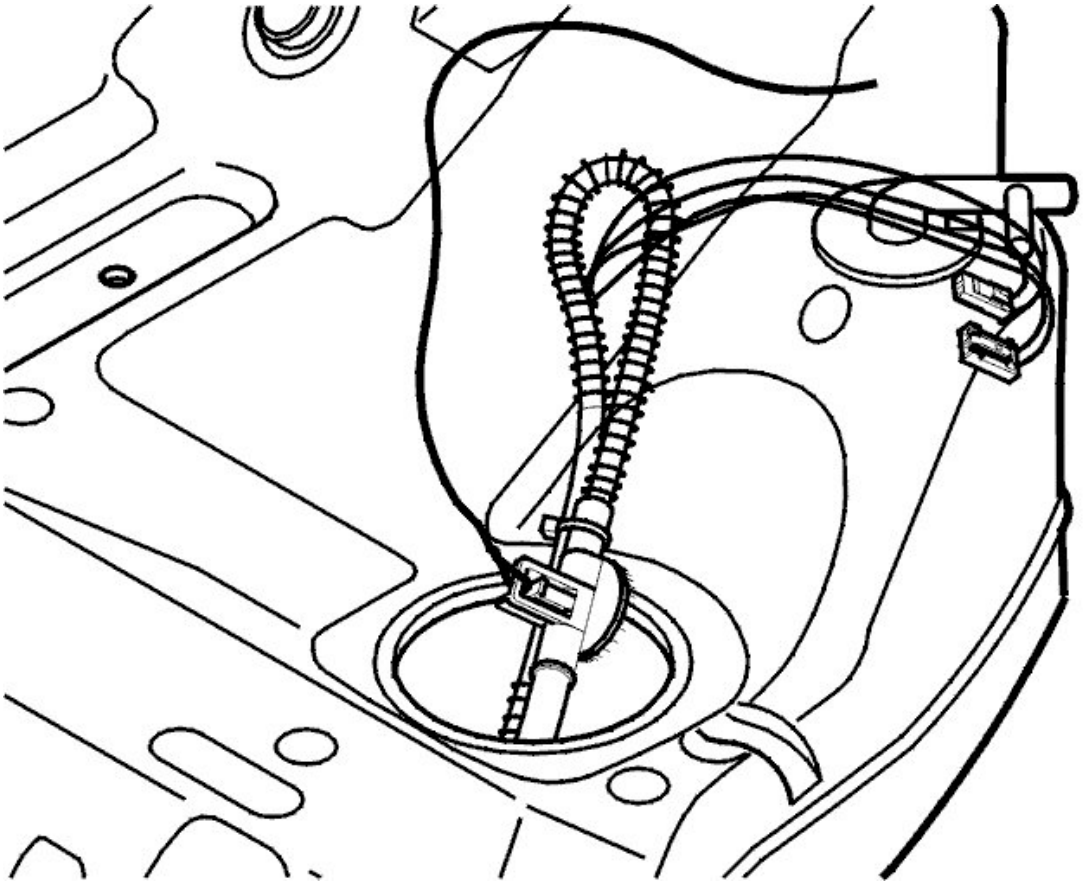
Depressurizing the fuel system

Depressurize the fuel system according to, Fuel system pressure release See: Fuel Filter/Fuel Pressure Release/Service and Repair

Draining fuel tank

Drain the fuel tank according to, Draining the fuel tank See: Service and Repair

Removing the left-hand level sensor

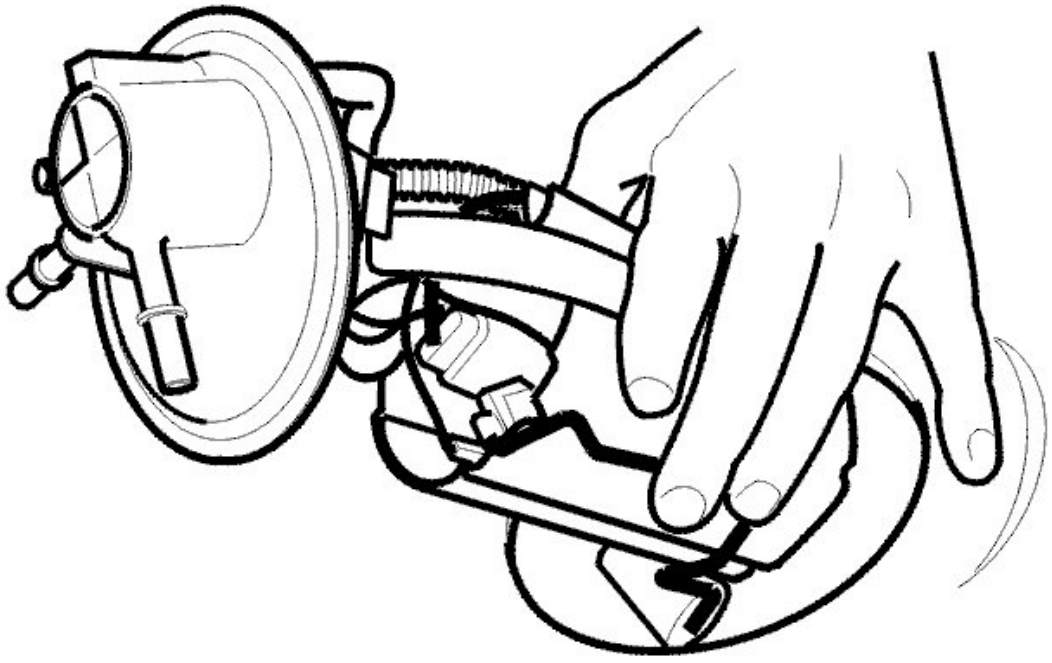


Disconnect:

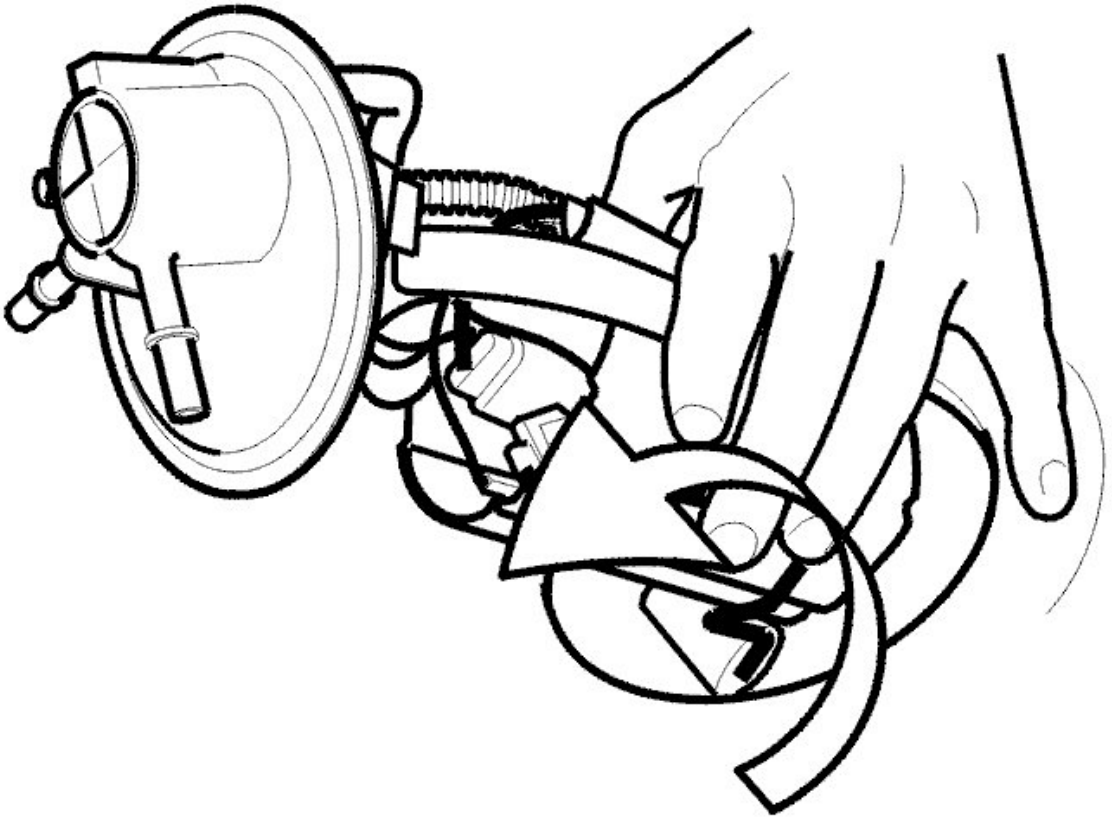
- the two connectors from the underneath of the left-hand level sensor
- the left-hand level sensor from the ejector on which it is positioned.

Note! Fasten a wire in the area of the ejector.The wire must be long enough that it reaches over to the opposite side of the tank with some excess remaining to ensure that it does not slide into the tank. The wire is needed to pull the hoses and wiring back to the left side of the tank after the fuel tank unit has been replaced.

Removing the right-hand level sensor / pump



- Grip the right-hand level sensor and pump holder and pinch the float so that it is held in its lowest position.



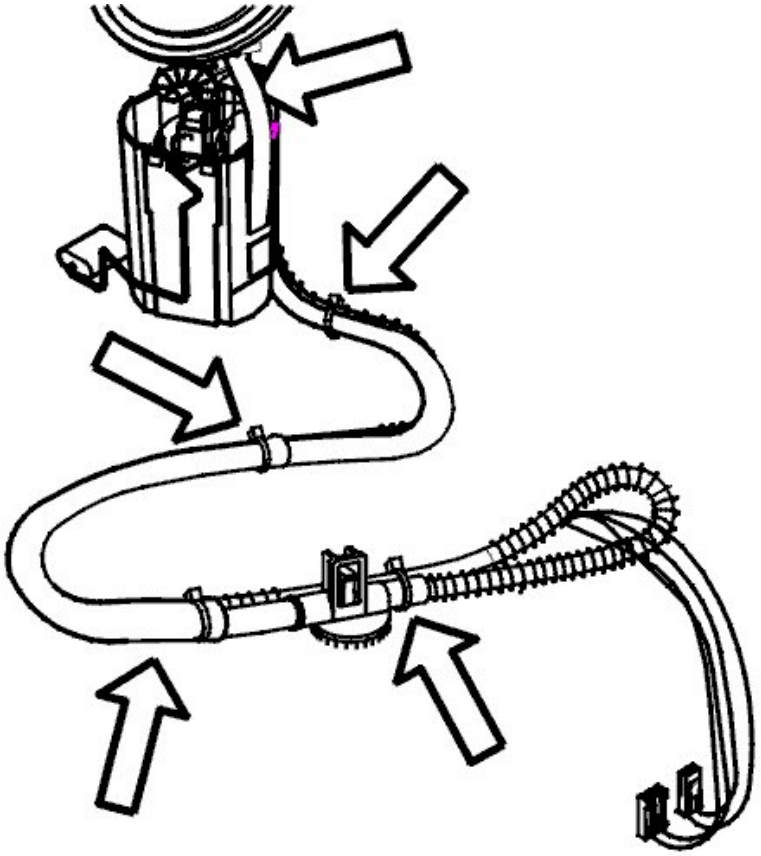
Note! Watch out for the fuel tank.

Carefully and slowly pull up the holder. Carefully work the holder out.
Pull the hoses out from the tank without pulling up the entire wire from the right-hand hole in the tank.

Note! It is extremely important that the float arm is not broken or bent.

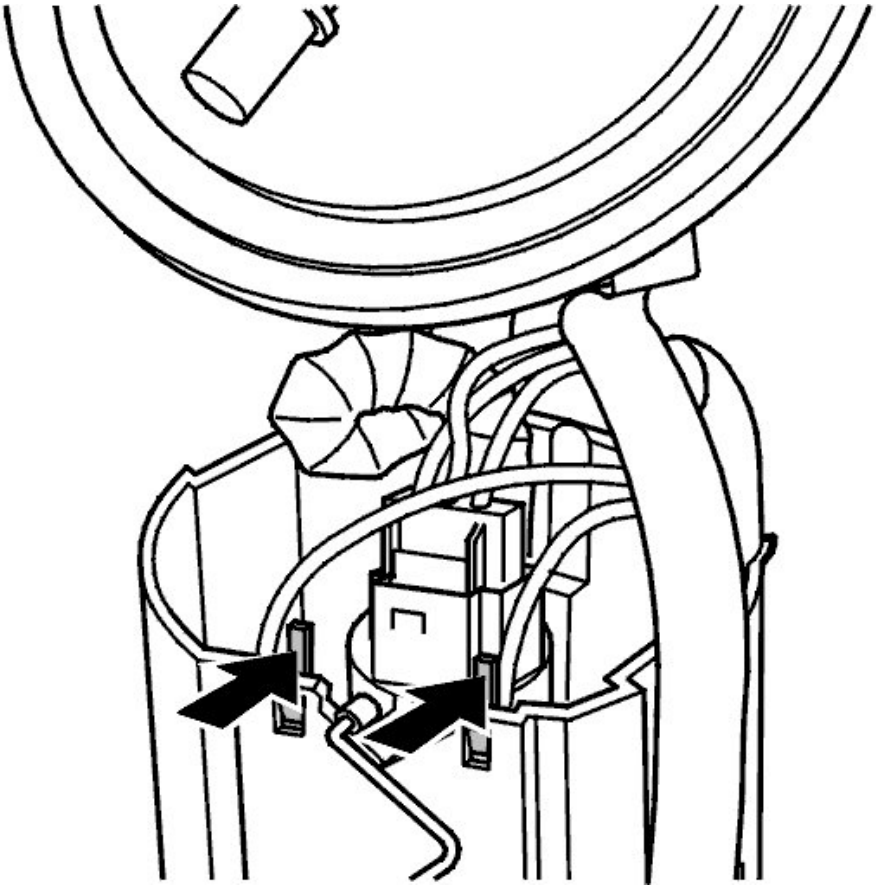
Remove the wire from the old level sensor and pump ejector.

Removing the right-hand level sensor



Remove:

- the tie straps around the protective sheath, hoses and wiring
- the net protective sheath by carefully threading it off the hoses and wiring
- the tie strap under the protective sheath.



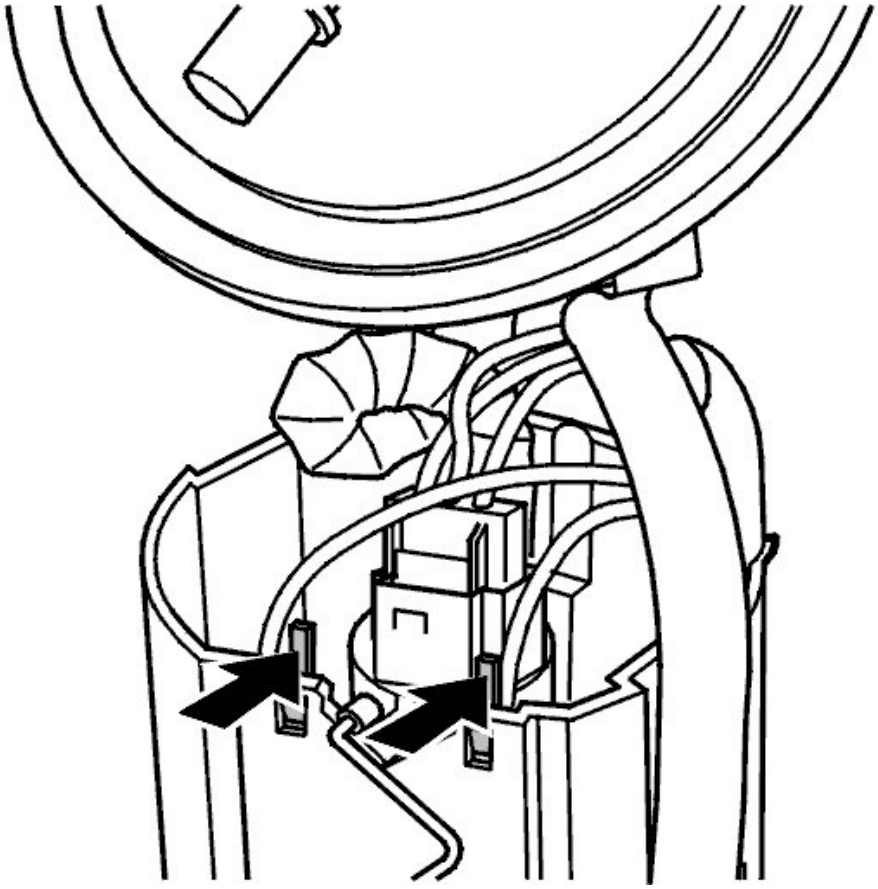
Remove:

- the tie strap around the wiring above the pump
- the level sensor by pressing in the two clips and pulling upwards
- the thin pipe from the holder on the outside of the fuel tank unit
- the wiring from the holder in the fuel tank unit.

Installation

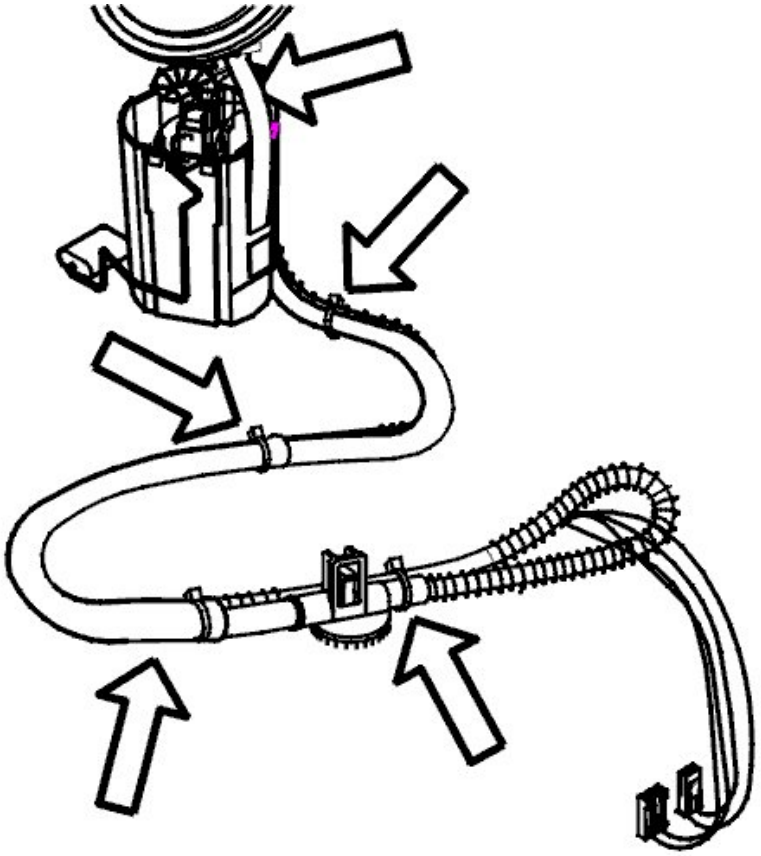
Installing the right-hand level sensor

If the vehicle has an engine block heater, drill out the hole connection in the fuel tank unit. Use a -4 mm drill bit. Transfer the dip pipe.



Install:

- the new level sensor
- the wiring in the holder
- the thin pipe in the holder on the outside of the fuel tank unit
- the tie strap around the wiring above the pump.



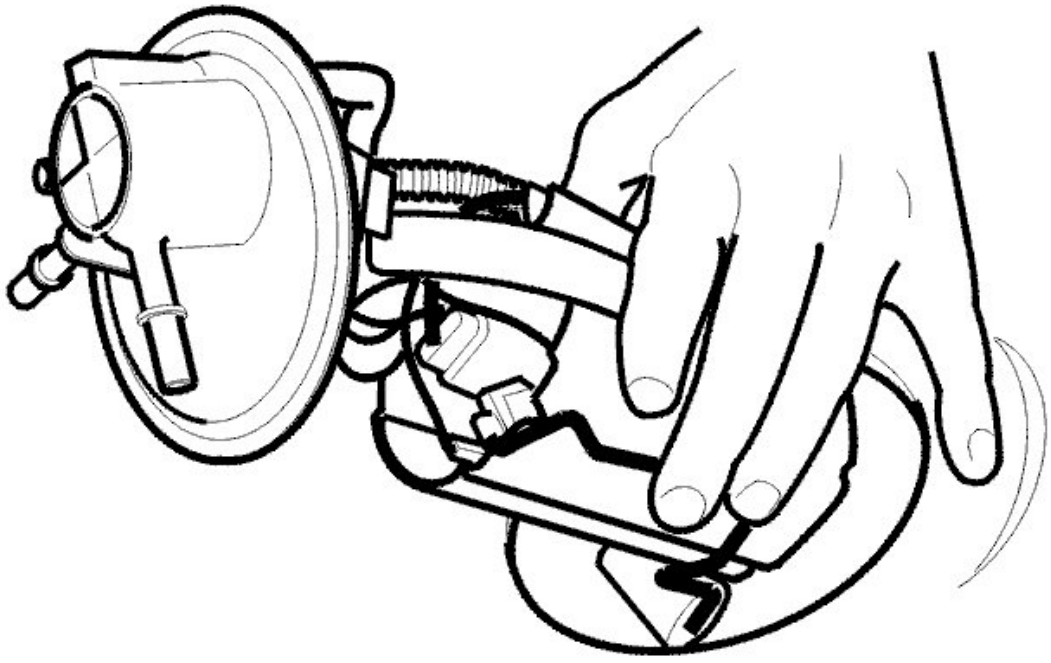
Install:

- the tie strap under the protective sheath

Note! Fasten the cable tie on the smooth central section of the corrugated hose.

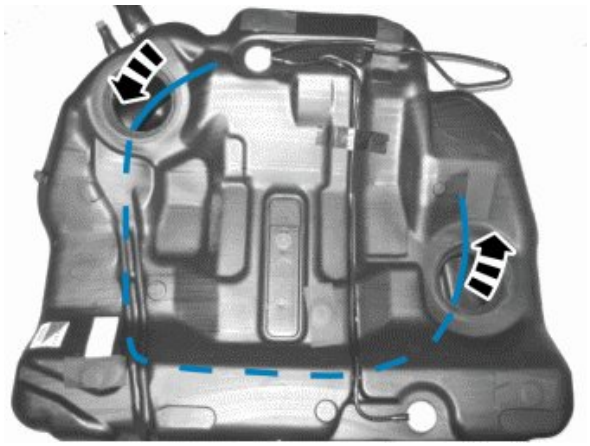
- the protective sheath
- four tie straps around the protective sheath, hoses and wiring. Secure the tie straps on the four smooth central sections of the corrugated hose.

Installing the right-hand level sensor and pump and the left-hand level sensor in the fuel tank



If the fuel tank is replaced, see next step.
- Install the wire on the new ejector for the level sensor and pump
- Insert the hoses and wiring into the tank via the right-hand tank hole
- Grip the right-hand level sensor and pump holder and pinch it so that the float is held in its lowest position
- Carefully and slowly lower the holder. Carefully work the holder into place
- Pull the wire so that the hoses and wiring end up on the left side of the tank
- Install the left-hand level sensor on the ejector
- Install the switches on the underneath of the left-hand level sensor
- Remove the wire from the ejector.

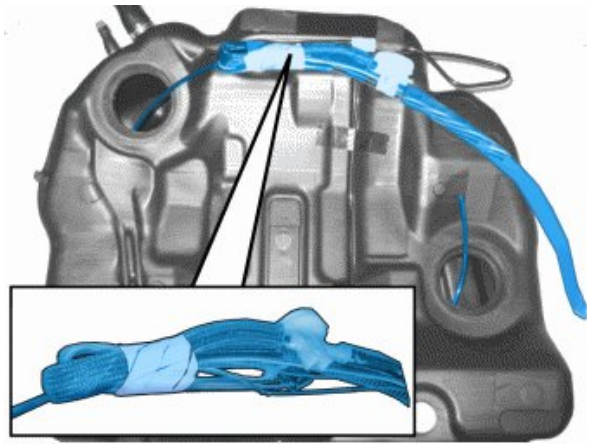
Cable routing when replacing the fuel tank



If replacing the fuel tank, wire cannot be used.
The image shows how to route the fuel lines and electrical wiring in the tank. Use a plastic pipe at least 1.7 m long.

Hint: Use spare part plastic pipe between the carbon filter and EVAP valve.

Insert the hose through the hole for the level sensor on the left-hand side of the vehicle and press it through the tank and take the end of the hose through the hole for the fuel pump.



Tape the fuel pump's fuel lines/electrical wiring to the plastic pipe.
Pull the wiring out of the hole for the level sensor. Remove the plastic pipe and the tape. Check that there is no tape/adhesive residue on the wiring.
Pull the wiring forwards and backwards to check that it has not bent or got trapped.

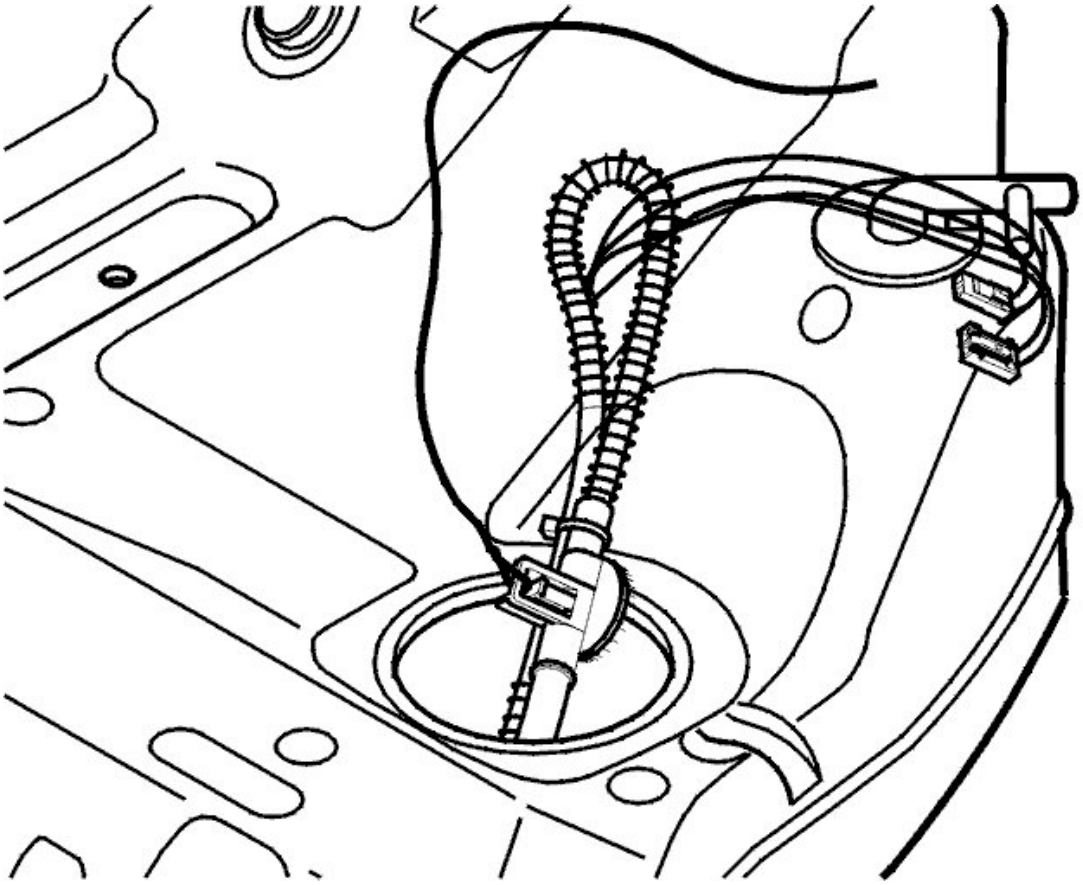
Finishing
- Install the sensor, backrest, side cushion and seat cushion. See Draining the fuel tank See: Service and Repair.

Right Side Fuel Pump With Level Sensor

Right side fuel pump with level sensor

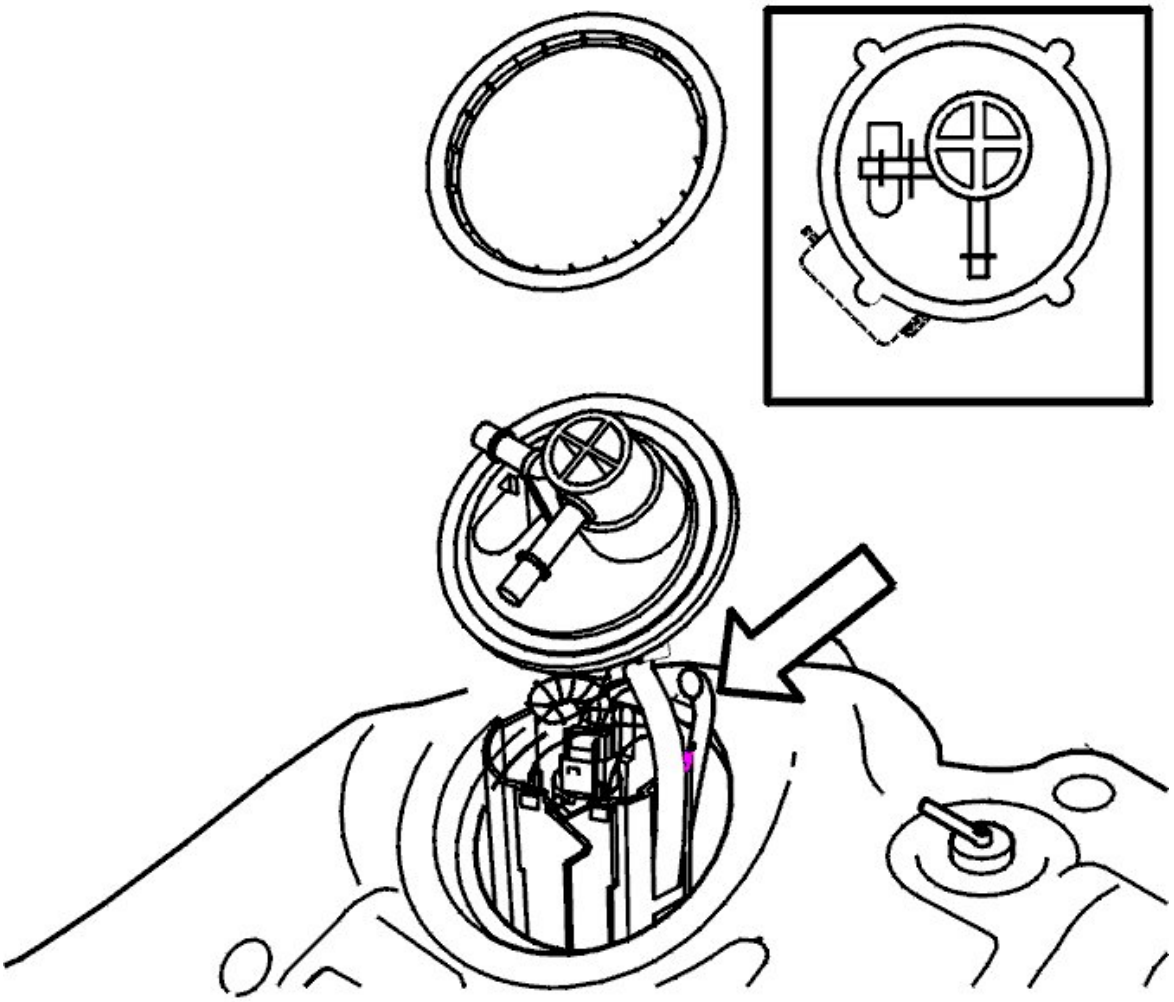
Removal

Preparation

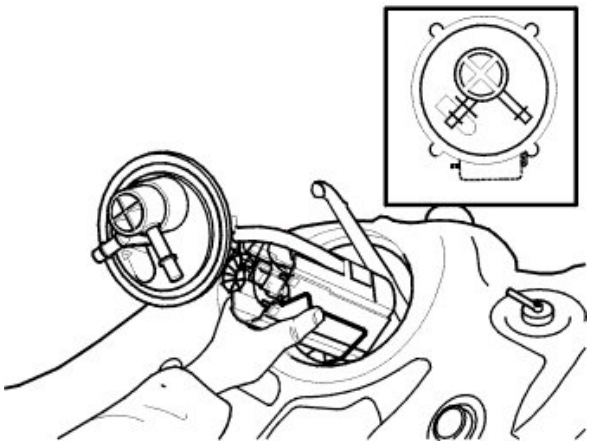


- Remove left side fuel gauge sensor as described in Left fuel gauge sensor See: Left Fuel Gauge Sensor
- Attach a piece of string or steel wire onto attachments for wire and tube system on left side fuel gauge sensor.

Right side fuel pump with level sensor

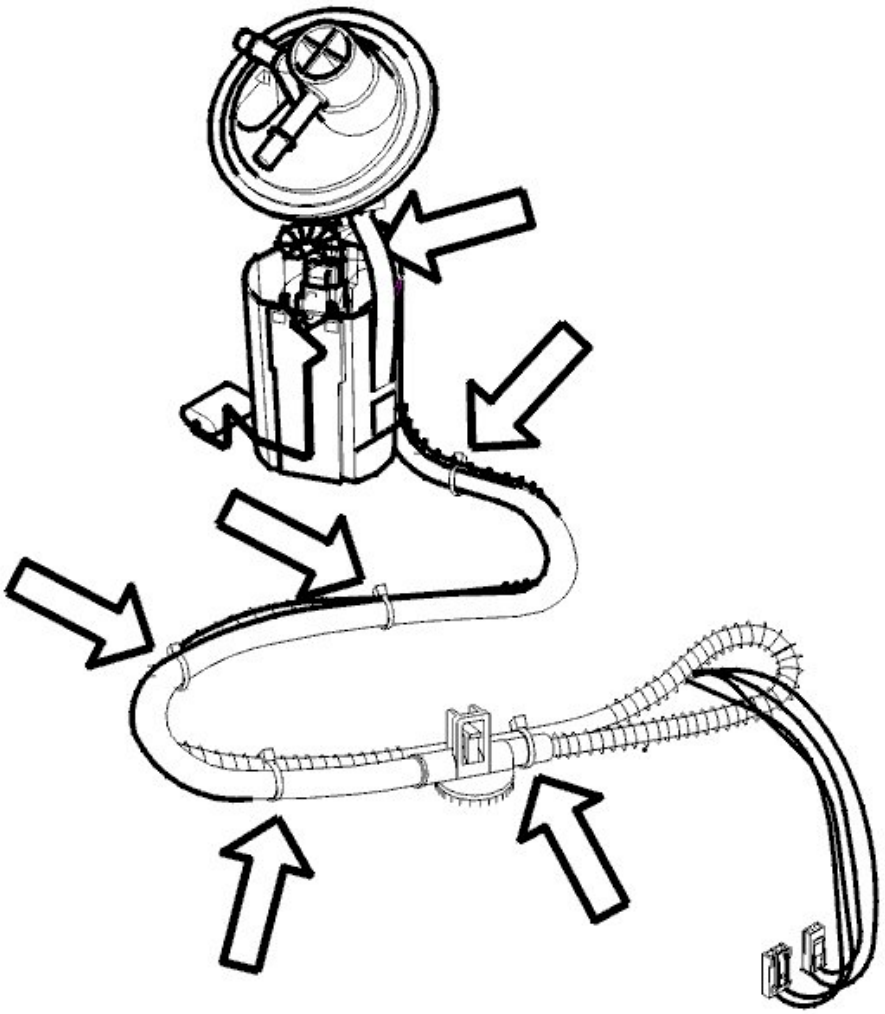


- Remove hatch and seal from fuel pump
- Loosen fuel pipe
- Loosen fuel pump lock ring using special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench
- Pull up fuel pump to position 1 (see figure) and release plastic tube.



- Turn fuel pump to position 2 (see figure)
- Hold float against pump housing, then turn fuel pump forwards and lift it up
- Pull wire and tube system out using string or steel wire.

Level sensor with cable and pipe system



- Remove fuel pump with wire and tube system
- Release six clamps. Note clamp positions
- Position fuel pump correctly, loosen fixings and push level sensor up.

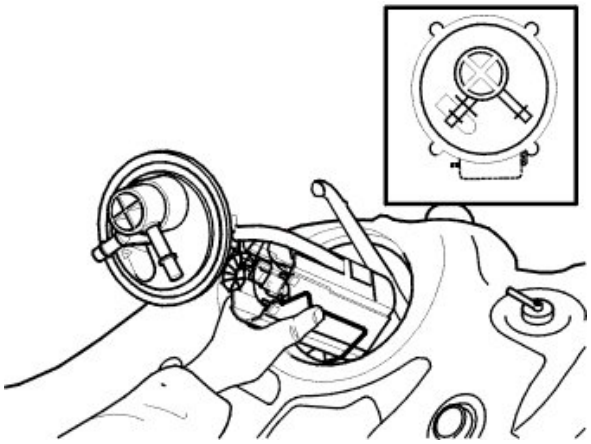
Installation

Level sensor with cable and pipe system

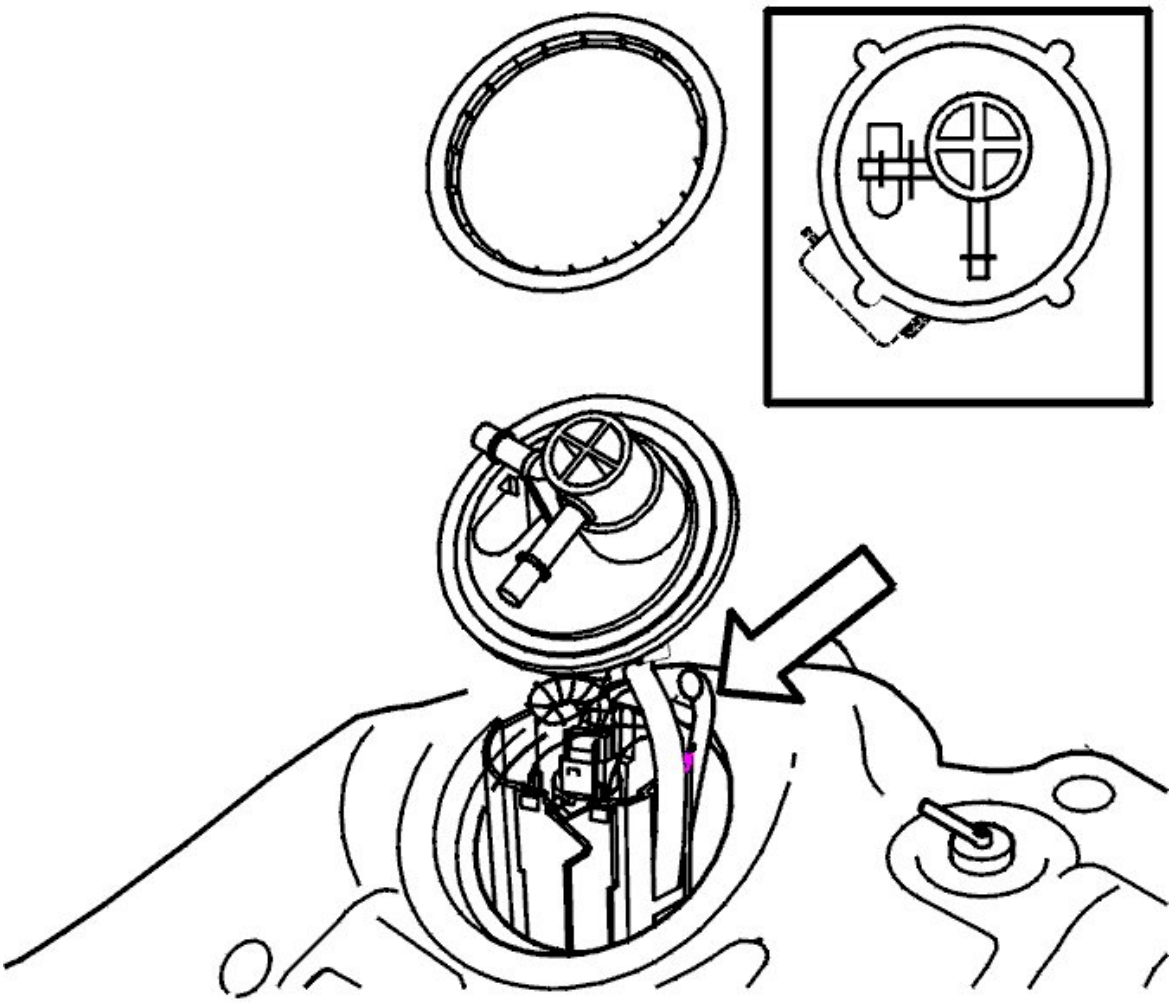
- Position level sensor and press firmly
- Pull out wire next to wire and tube system and install clamps. Note clamp positions.

Right side fuel pump with level sensor

- Attach a piece of string or steel wire onto attachments for wire and tube system on left side fuel gauge sensor
- Install wire and tube system into fuel tank
- Pull wire and tube system towards opening for left side level sensor, and feed through.



- Loosen plastic tube from slot in pump housing
- Hold float against pump housing and install fuel pump in position 2 (see figure).



- Turn fuel pump to position 1 (see figure)
- Press plastic tube firmly into slot in pump housing
- Press fuel pump down in hole
- Install lock ring and tighten by hand.

Note! Markings on cover and fuel tank.

- Tighten lock ring using special tool 999 5720 Wrench See: Tools and Equipment/999 5720 Wrench.
- Install seal and hatch onto fuel pump.

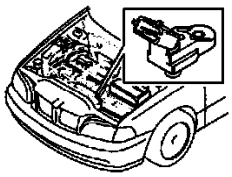
Turbo Boost Sensor: Service and Repair

Temperature And Pressure Sensors, Replacing

Removal and Installation

NOTE: As the illustrations in this service information are used for different model years and/or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the temperature and pressure sensors



Remove the boost pressure sensor which is on the pipe coming from the charge air cooler (CAC).

Installing the temperature and pressure sensors
Install a new sensor.

Throttle Body: Procedures

Throttle body (TB), cleaning

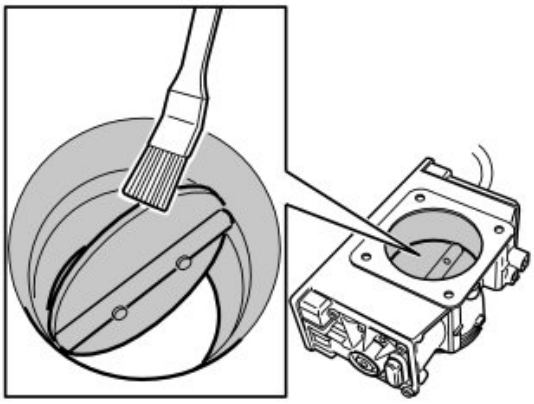
Operation number: 25121

Note! Some variation in the illustrations may occur, but the essential information is always correct.

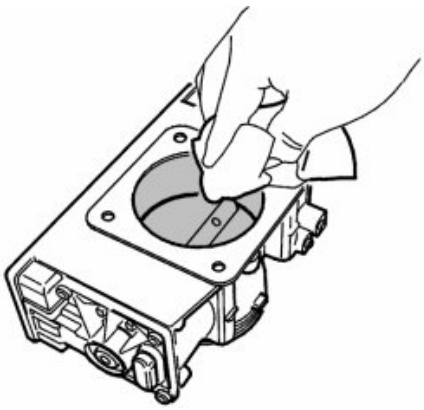
Removal and Installation

Note! Removal steps in this procedure may contain installation details.

Remove the throttle body Refer to: Throttle body (electronic throttle module (ETM)), replacing See: Removal and Replacement



Clean the throttle body with a brush.
Use: Cleaner, 1161826
Ensure that all deposits are removed from the marked surfaces.



Carefully wipe clean the air duct on both sides of the throttle disc. Also wipe clean the edge of the throttle disc.

Install the throttle body Refer to: Throttle body (electronic throttle module (ETM)), replacing See: Removal and Replacement

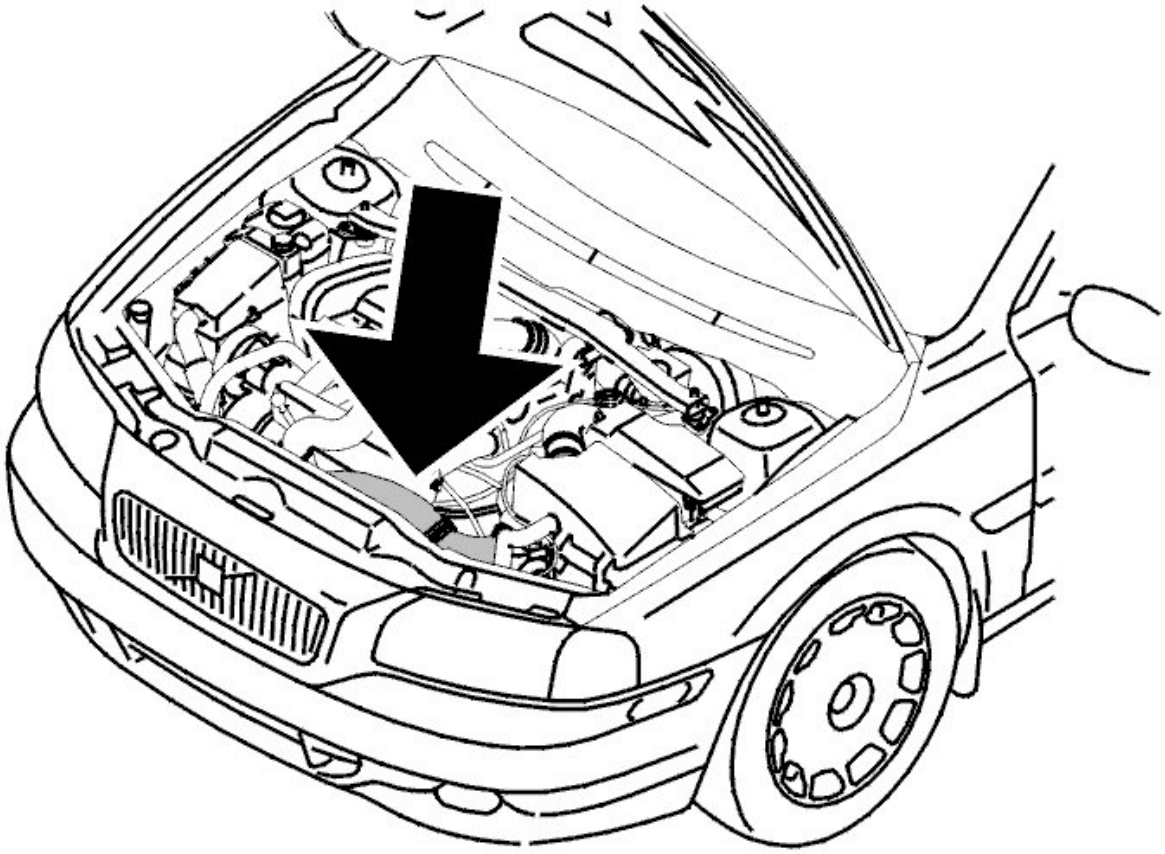
Throttle Body: Removal and Replacement

Throttle body (electronic throttle module (ETM)), replacing

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removal

Preparation



Remove:
- the air intake between the front cover plate and the air cleaner (ACL) housing
- the charge air pipe between the charge air cooler (CAC) and the electronic throttle module (ETM).

Removing the electronic throttle module (ETM)

Disconnect the connector for the electronic throttle module.
Remove the 4 x screws for the electronic throttle module (ETM). Lift out the electronic throttle module (ETM). Discard the gasket.

Installation

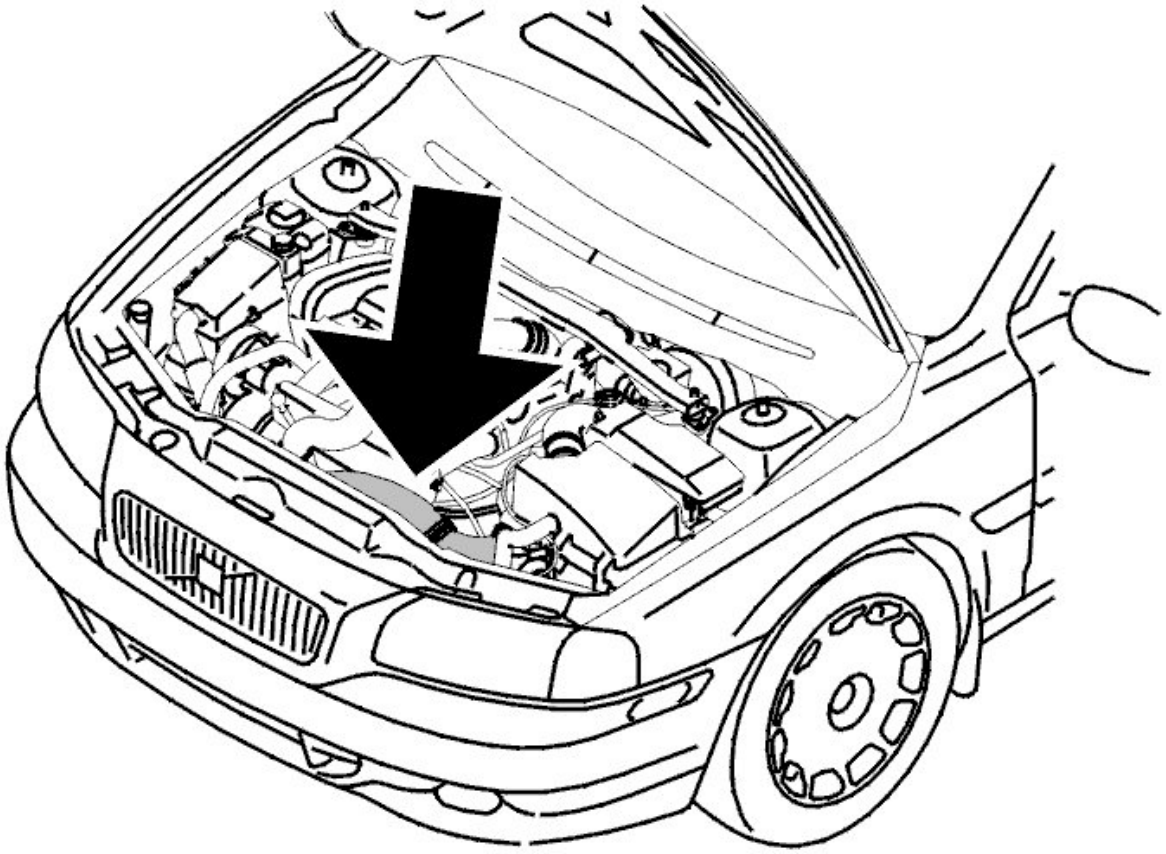
Note! For tightening torques, see: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Replacing the electronic throttle module (ETM)

Caution! Ensure that the surfaces between the throttle body (TB) and the intake manifold are clean.

Install a new electronic throttle module (ETM). Use a new gasket. Tighten the 4 screws.

Installing components



Install the charge air pipe between the electronic throttle module (ETM) and the charge air cooler (CAC).

Note! Heat the pipe at the connections to facilitate installation.

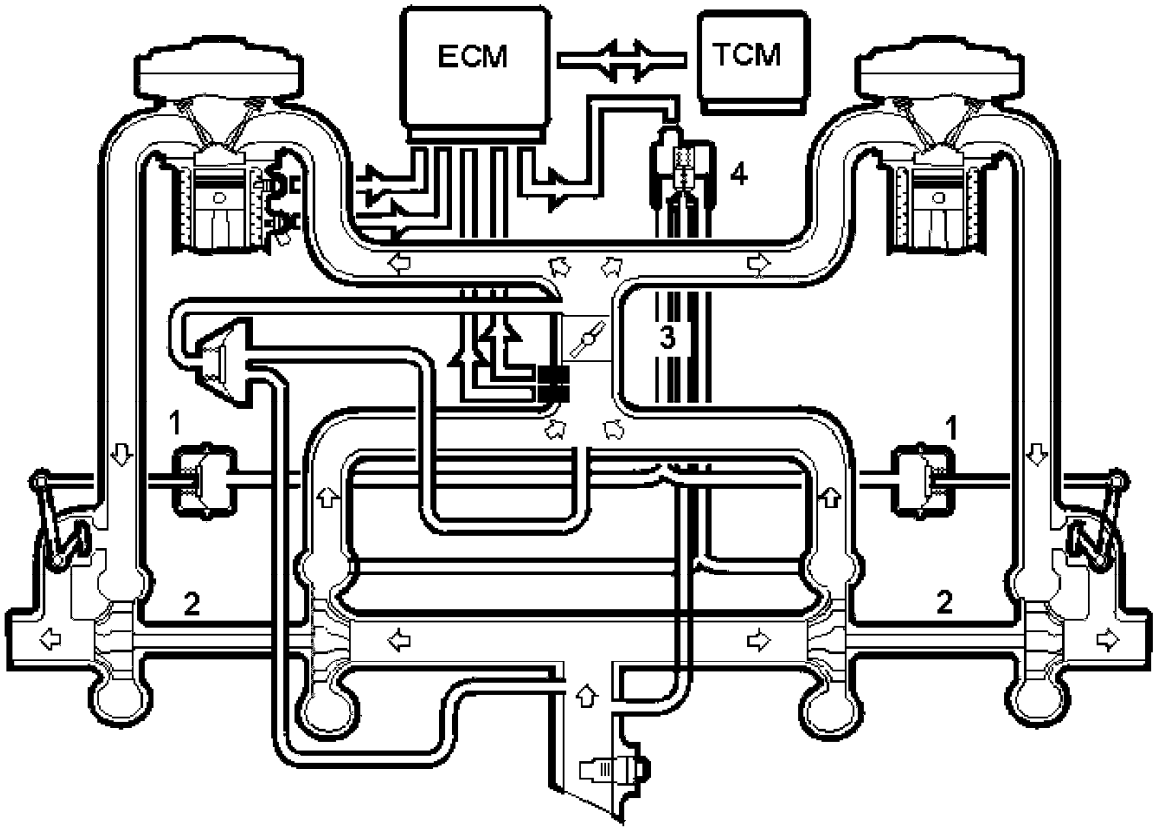
Install the intake pipe between the front cover plate and the air cleaner (ACL) housing.

Finishing

After replacing the electronic throttle module (ETM), the electronic throttle module (ETM) must be adapted using the vehicle communication input: "Adaptation of the electronic throttle unit"
Start the engine and check the function.

Turbocharger: Description and Operation

Turbocharger (TC) Control System



HINT: The above illustration is for a 6 cylinder engine. However the principle is the same for 5 cylinder engines.

The boost pressure in the intake manifold is controlled by the boost pressure control (BPC) valves, whose pressure regulators (1) are affected by the pressure from the turbocharger (TC) (2).

The Engine Control Module (ECM) receives information about the actual throttle position via the throttle position sensor (TP) for the throttle unit (3), engine load, knocking etc. This affects the boost pressure that is permitted. The boost pressure is measured by the boost pressure sensor.

The control module controls the control pressure using the turbocharger (TC) control valve (4) (also see Design), which controls the pressure to the boost pressure control (BPC) valves so that the control is adapted to the required pressure.

The pressure regulators in the boost pressure control (BPC) valves are affected when the pressure rises. When the boost pressure has increased to the maximum permissible value, the boost pressure control (BPC) valves open. Some of the exhaust gases pass the turbine in the turbocharger (TC), limiting the boost pressure.

Turbocharger (TC) control is governed continually by the engine control module (ECM).

When a higher boost pressure is permitted, the control module opens the turbocharger (TC) control valve further. Some of the boost pressure which affects the pressure regulators for the boost pressure control (BPC) valves is released back into the turbocharger (TC) intake. This lowers the control pressure, the boost pressure control (BPC) valves open later and the boost pressure increases.

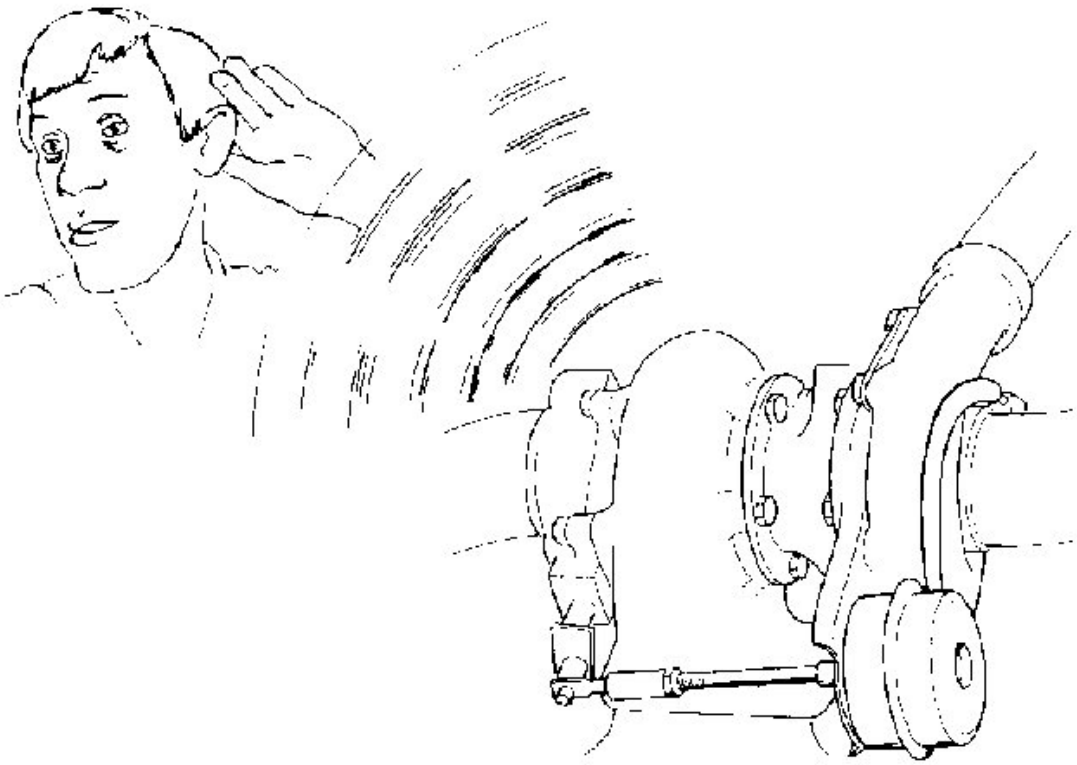
Because the control module calculates the boost pressure using the signal from the boost pressure sensor and the intake temperature sensor, there is automatic compensation of boost pressure control when driving at altitude and at different temperatures. As a result engine power will not be noticeably affected by the air density or temperature.

The engine control module (ECM) can diagnose the turbocharger (TC) control function.

Turbocharger: Testing and Inspection

Quick check, turbocharger (TC)

Stop engine and listen to turbocharger (TC) at the moment of stopping



Normally the rotating turbocharger (TC) components stop moving after the engine.

If this is not the case:

Remove the inlet hose from the compressor housing.

Check afterwards that:
- the compressor wheel spins easily when rotated.
- axial- and radial play feels normal.
- the compressor wheel does not rub in the compressor housing.

Replacing turbocharger (TC)

In a number of cases the turbocharger (TC) has been changed unnecessarily. This happened because some play has been felt when checking (the shaft floats on an oil film).
Play should always be checked before replacing, to determine if the bearings are worn.

The turbocharger (TC) should always be replaced complete:
- plug all terminals on the old turbocharger before it is sent away.

Turbocharger: Service and Repair

Turbocharger (TC), replacing

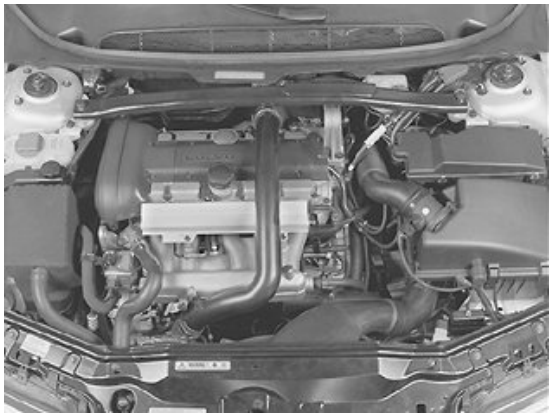
Special tools:

999 5562 PROTECTIVE SOCKET See: Tools and Equipment/999 5562 Protective Socket
999 7076 Lever See: Tools and Equipment/999 7076 Lever
999 7057 Counterhold See: Tools and Equipment/999 7057 Counterhold
951 2953 Cover See: Tools and Equipment/951 2953 Cover
951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Preparatory work

Removing components



Remove:
- the cross stay between the suspension turrets
- the charge air hose and the charge air pipe above the engine. Remove the hose clamps for the turbocharger (TC) intake pipe at the turbocharger (TC). Pull off the pipe from the connector. Place the pipe to one side.

Raise the vehicle. See: Jacking points, body See: Maintenance/Vehicle Lifting/Service and Repair.

Draining coolant

Remove the splash guard under the engine. Open the engine nipple. Drain the coolant into a container. Close the nipple. Lower the vehicle.

Removal

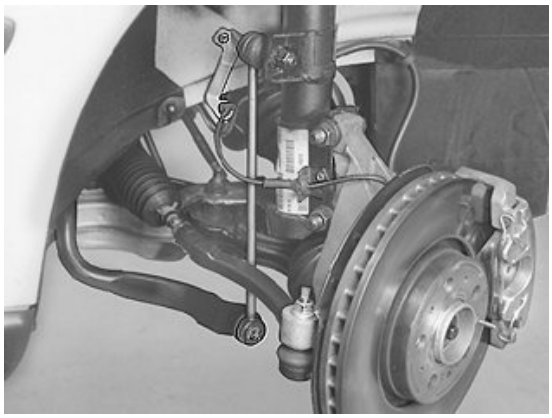
Removing components from the turbocharger (TC)

Mark up the vacuum hose for the pressure regulator on the turbocharger (TC).

Remove:
- the vacuum hose from the pressure regulator on the turbocharger (TC)
- the cable for the heated oxygen sensors (HO2S) from the clips and clamps
- the upper heat deflector plate from the turbocharger (TC)
- the pipe screw for the oil pressure pipe in the turbocharger (TC). Discard the gaskets

- the pipe screws for the upper coolant pipe from the turbocharger (TC). Discard the gaskets.

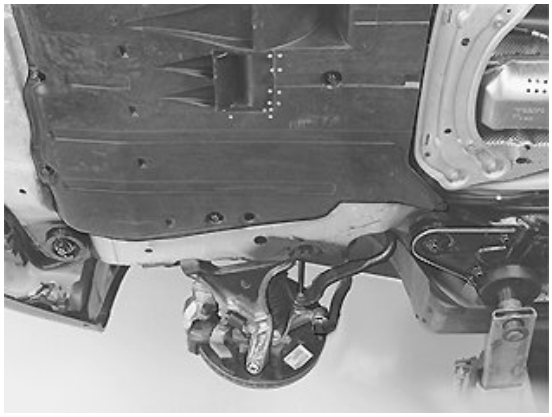
Disconnecting the front suspension components



Remove:

- the right-hand front wheel
- the screw for the drive shaft / wheel hub.

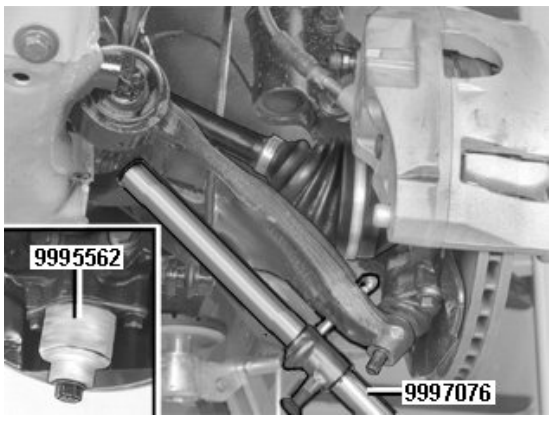
Disconnecting the front suspension components, continued



Note! Clean the exposed threads outside the nut. Spray using rust solvent before removing the nut.

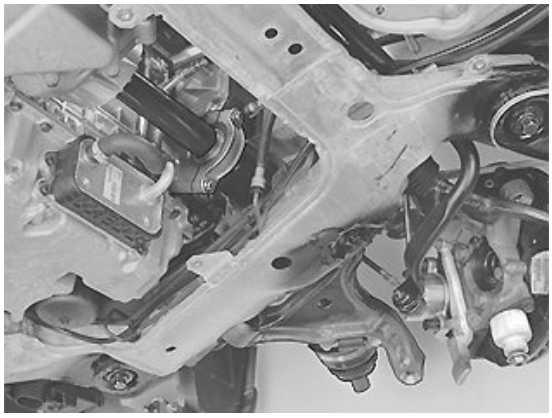
Remove the nut for the ball joint and control arm. Counterhold the ball joint pinion so that the boot does not twist. Use a Torx wrench.

Removing the drive shaft from the wheel hub



Fold down the control arm. Use lever 999 7076 Lever See: Tools and Equipment/999 7076 Lever to move the wheel spindle to the side. At the same time, install protective sleeve 999 5562 PROTECTIVE SOCKET See: Tools and Equipment/999 5562 Protective Socket on the ball joint pinion. Hold the sleeve in place using the nut for the ball joint.

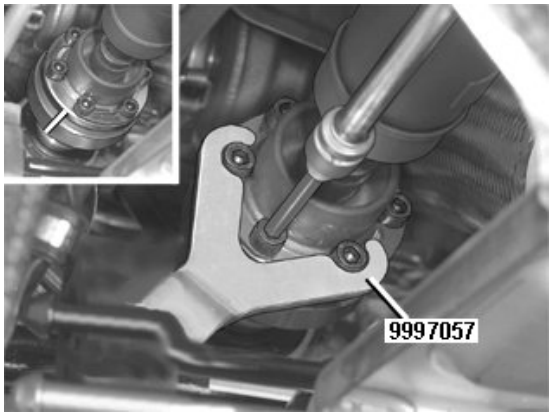
Removing the drive shaft



Caution! Do not pull the outer part of the shaft. Doing so could damage the axial stops in the joints.

Press out the wheel spindle. Detach the drive shaft from the hub. Do not damage the drive shaft boot. Use a tensioner band to pull the spring strut backwards. Remove the screws from the bearing cap for the drive shaft. Pull the drive shaft straight out.

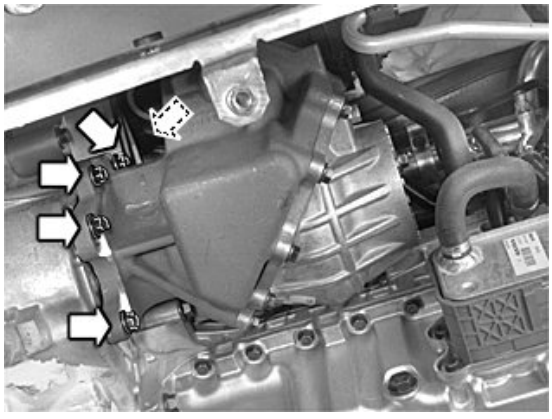
Removing the propeller shaft



For AWD vehicles carry out the following work:

Remove the front member from the car body.
Remove the brake pipe from the mountings in the member. Mark the propeller shaft CV joint in relation to the bevel gear flange.
Remove the screws from the propeller shaft. Use: 999 7057 Counterhold See: Tools and Equipment/999 7057 Counterhold. Press the drive shaft joints together as much as possible. Remove the shaft from the bevel gear. Leave the end of the shaft resting against the anti-roll bar.

Removing bevel gear



Remove the 5 x screws for the bevel gear. Pull the bevel gear straight out. Then turn it during removal.

Removing the three-way catalytic converter (TWC)

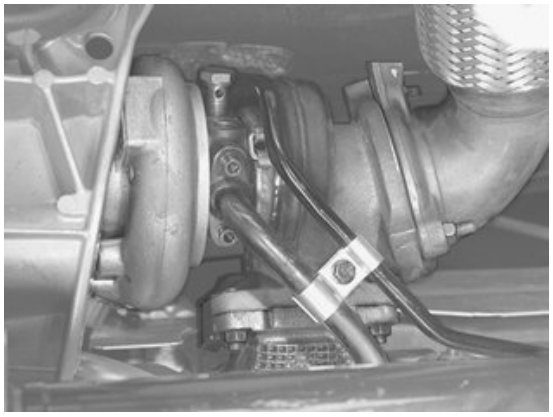
Remove the three-way catalytic converter (TWC). See: Three-way catalytic converter (TWC), replacing, B5244T5, B5254T2 See: Emission Control Systems/Catalytic Converter/Service and Repair.

Removing the support bracket

Remove:

- the 3 x screws
- the bracket.

Removing components from the turbocharger (TC)



Remove:

- the clamp between the turbocharger (TC) oil pressure line and the oil return line
- the screws where the oil return line connects to the turbocharger (TC). Pull the pipe from the cylinder block.

Note! Check that the rubber sealing ring comes away with the pipe. Seal the opening in the cylinder block.

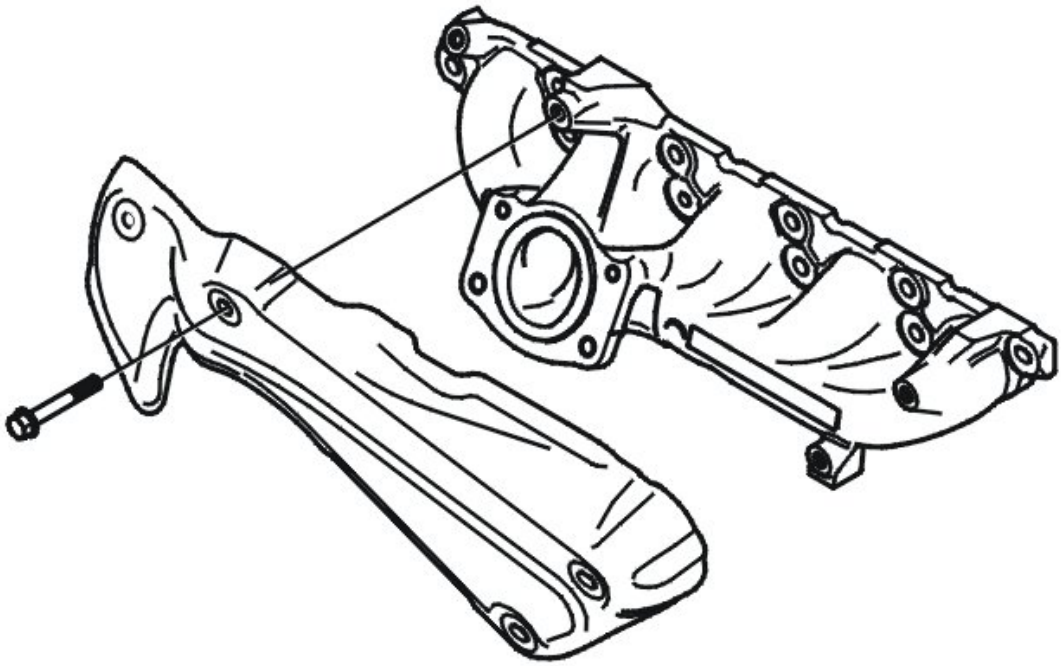
Remove:

- the pipe screws for the lower coolant pipe from the turbocharger (TC). Discard the gaskets
- the pipe screw for the oil pressure pipe in the engine block. Discard the gaskets.

Note! Collect any oil spilled under the pipe screws in the cylinder block.

Remove the oil pressure pipe.

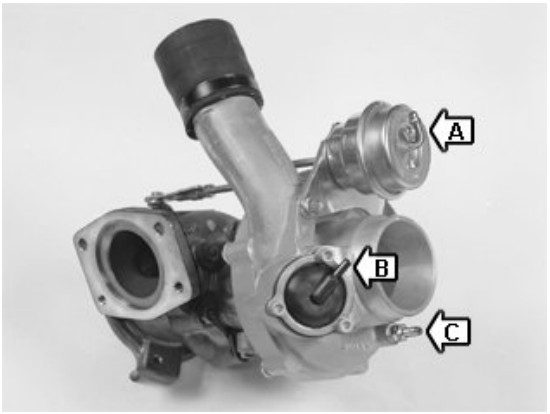
Removing the turbocharger (TC) and exhaust manifold



Hint: Use rust solvent or similar on the studs.

Remove:

- the inner heat deflector plate from the manifold
- the nuts and washers holding the manifold to the cylinder head
- the manifold
- the old gasket residue. Clean the gasket faces. Check that all the studs are tightened.



Lower the turbocharger (TC) and exhaust manifold as one complete unit.

Note! Mark up the hoses on the turbocharger (TC) in a suitable way.

Installation

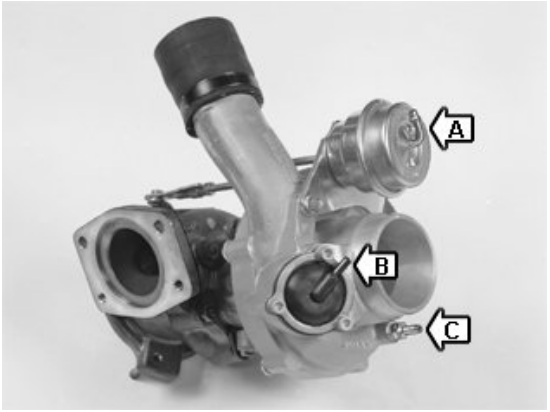
Note! For tightening torques, see: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Note! To ensure that there is no exhaust leakage, see: Flanged joint, assembling See: Engine, Cooling and Exhaust/Exhaust System/Exhaust Pipe/Service and Repair.

Assembling the turbocharger (TC)

Install:

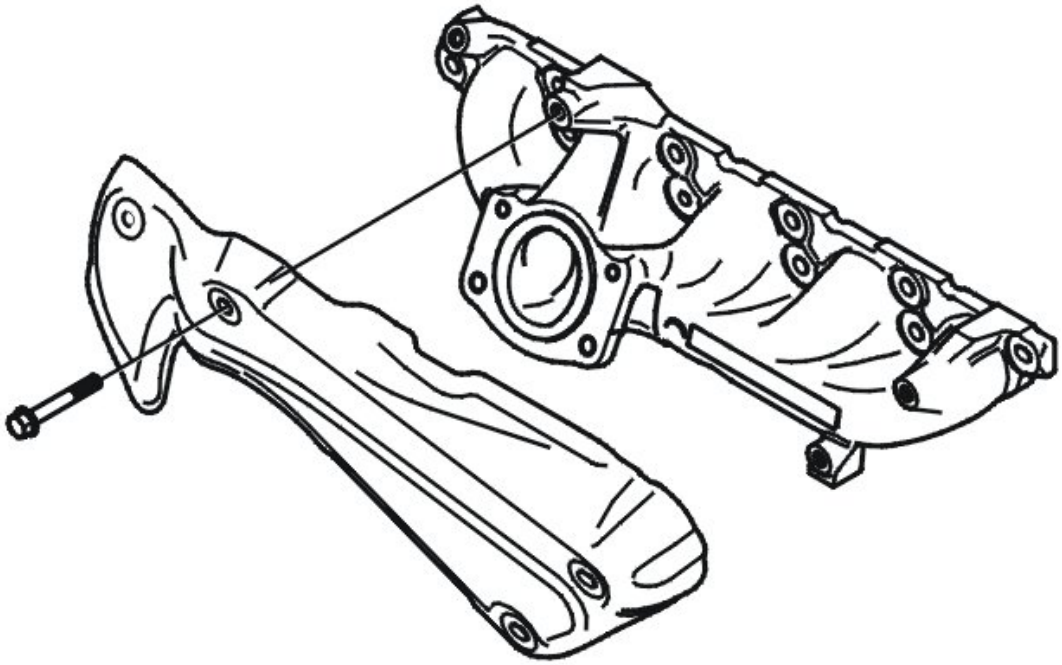
- a new gasket between the turbocharger (TC) and exhaust manifold
- the turbocharger (TC) to the exhaust manifold
- new screws and tighten.



Note! Install the hoses on the turbocharger (TC) according to the marking.

Raise the turbocharger (TC) and exhaust manifold as one complete unit.

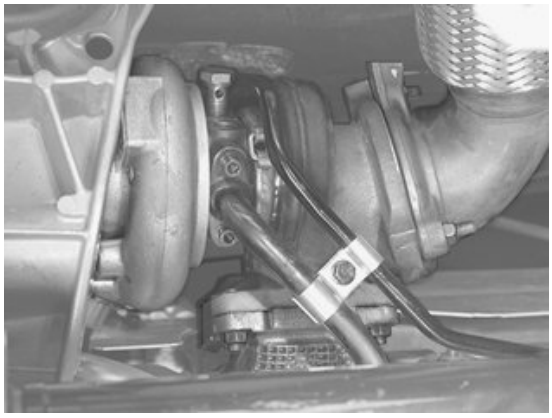
Installing the turbocharger and exhaust manifold



Install:

- new gaskets
- the turbocharger (TC) and the exhaust manifold. Use new nuts at the manifold. Tighten
- the inner heat deflector plate.

Installing components on the turbocharger (TC)



Install:

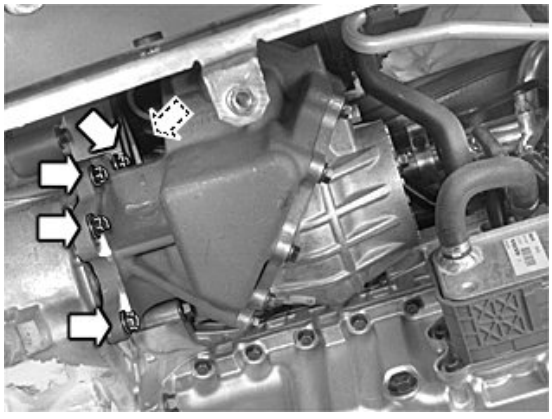
- the oil pressure pipe in the cylinder block with the pipe screw. Use new gaskets. Do not tighten
- the oil return line in the cylinder block with a new sealing ring
- the 2 x screws for the oil return line in the turbocharger (TC). Use a new gasket. Tighten
- the lower and upper coolant pipe and pipe screws. Tighten. See: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque
- the clamp between the oil pressure pipe and the return pipe. Tighten.

Installing the bracket

Install:

- the bracket
- the 3 screws. Tighten. See: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

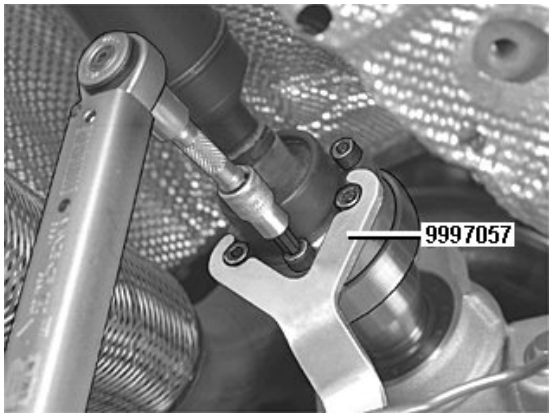
Installing the bevel gear



For AWD vehicles carry out the following work:

Before installing the bevel gear, lubricate the spline joint between the transmission and the bevel gear. Use appropriate grease.
Ensure that the mating surfaces on the transmission and bevel gear are clean. Install the bevel gear. Lightly tighten the M10 screws alternately. Tighten.

Installing the propeller shaft



Check that the mating surfaces of the propeller shaft and flange are clean. Install the propeller shaft using the marking made earlier. Use new screws. Tighten the screws. See: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

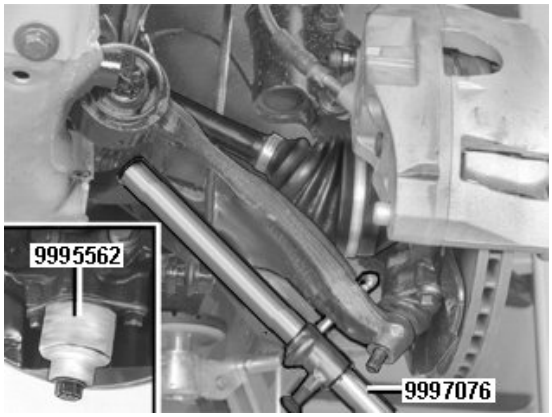
Installing the three-way catalytic converter (TWC)

Install the three-way catalytic converter (TWC). See: Three-way catalytic converter (TWC), replacing, B5244T5, B5254T2 See: Emission Control Systems/Catalytic Converter/Service and Repair.

Installing the drive shaft and bearing cap on the pilot bearing for the shaft

Lubricate the mating surface at the end of the drive shaft. Use wheel bearing grease P/N 1161 241-3 (80 g). Install the drive shaft on the transmission and the mounting for the pilot bearing with the bearing cap and the 2 M8 screws. Tighten.

Installing the drive shaft



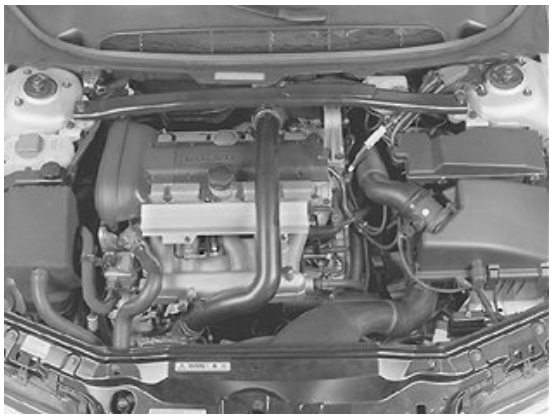
Caution! Check that the seal on the end of the drive shaft is correctly positioned. See: Seal CV joint housing, replacing See: Transmission and Drivetrain/Drive Axles, Bearings and Joints/Seals and Gaskets/Service and Repair/Seal CV Joint Housing, Replacing.

Press out the spring strut. Align the drive shaft in the hub. Remove protective sleeve. Use: 999 5562 PROTECTIVE SOCKET See: Tools and Equipment/999 5562 Protective Socket. Locate the control arm on the ball joint pinion. Use: 999 7076 Lever See: Tools and Equipment/999 7076 Lever.

Install:

- the nut for the ball joint and control arm. Tighten to applicable specifications. Counterhold so that the ball joint boot does not rotate. Use a Torx wrench
- the drive shaft center screw. Use a new screw. Tighten to applicable specifications. Use a screwdriver as a counterhold on the brake disc.

Installing the components engine compartment



Install:

- the pipe screw together with new gaskets on the oil pressure pipe in the turbocharger (TC). Tighten
- the upper heat deflector plate. Tighten the screws
- the charge air pipe over the engine
- the cross stay between the suspension turrets
- the tie strap for the servo cable in the cross stay. Raise the vehicle. See: Jacking points, body See: Maintenance/Vehicle Lifting/Service and Repair.

Finishing

Routing the joint

Tighten the pipe screws for the oil pressure pipe in the cylinder block. See: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Installing components

Install:

- the lower engine cover
- the right-hand front wheel. See: Installing wheels See: Maintenance/Wheels and Tires/Wheels/Service and Repair.

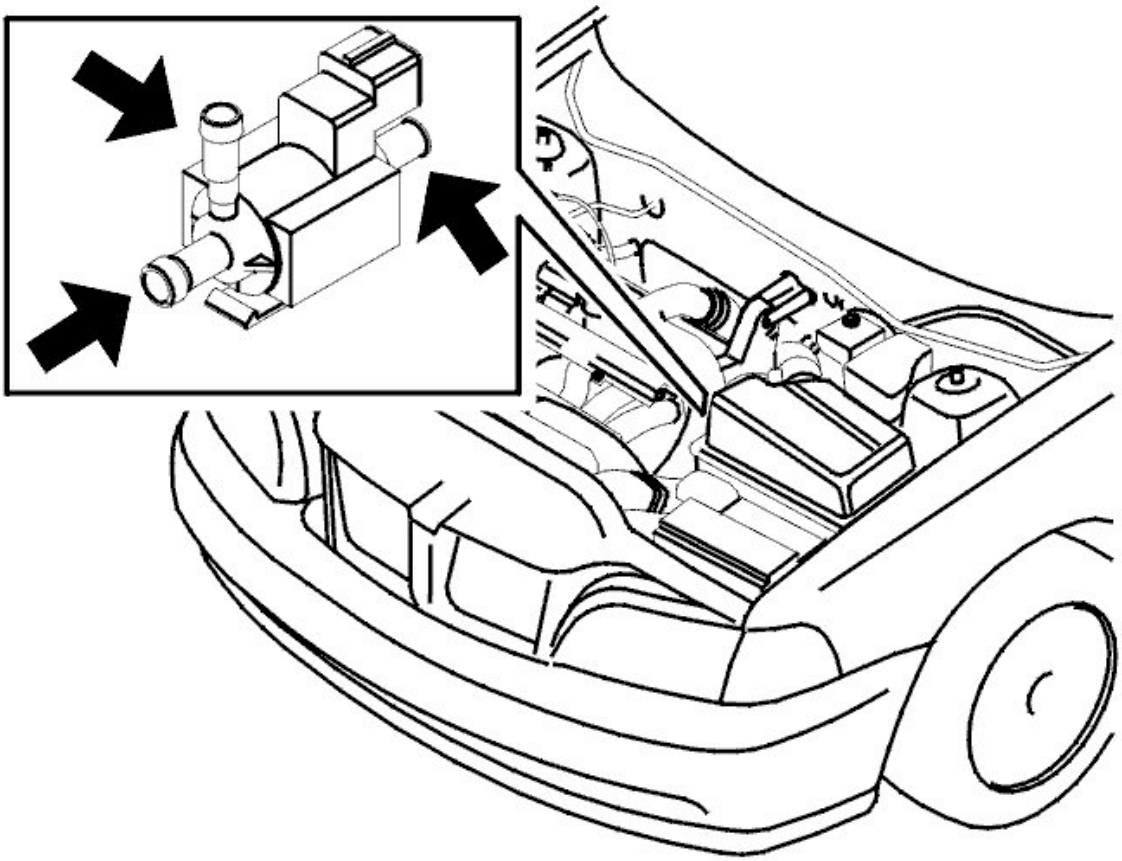
Check

Fill with coolant. Use the filling equipment: 951 2957 Coolant Reservoir See: Tools and Equipment/951 2957 Coolant Reservoir and cover 951 2953 Cover See: Tools and Equipment/951 2953 Cover.
Start the engine and run the engine to normal operating temperature.
Check the function. Check for leaks. To up the coolant to max if necessary.

Boost Solenoid: Service and Repair

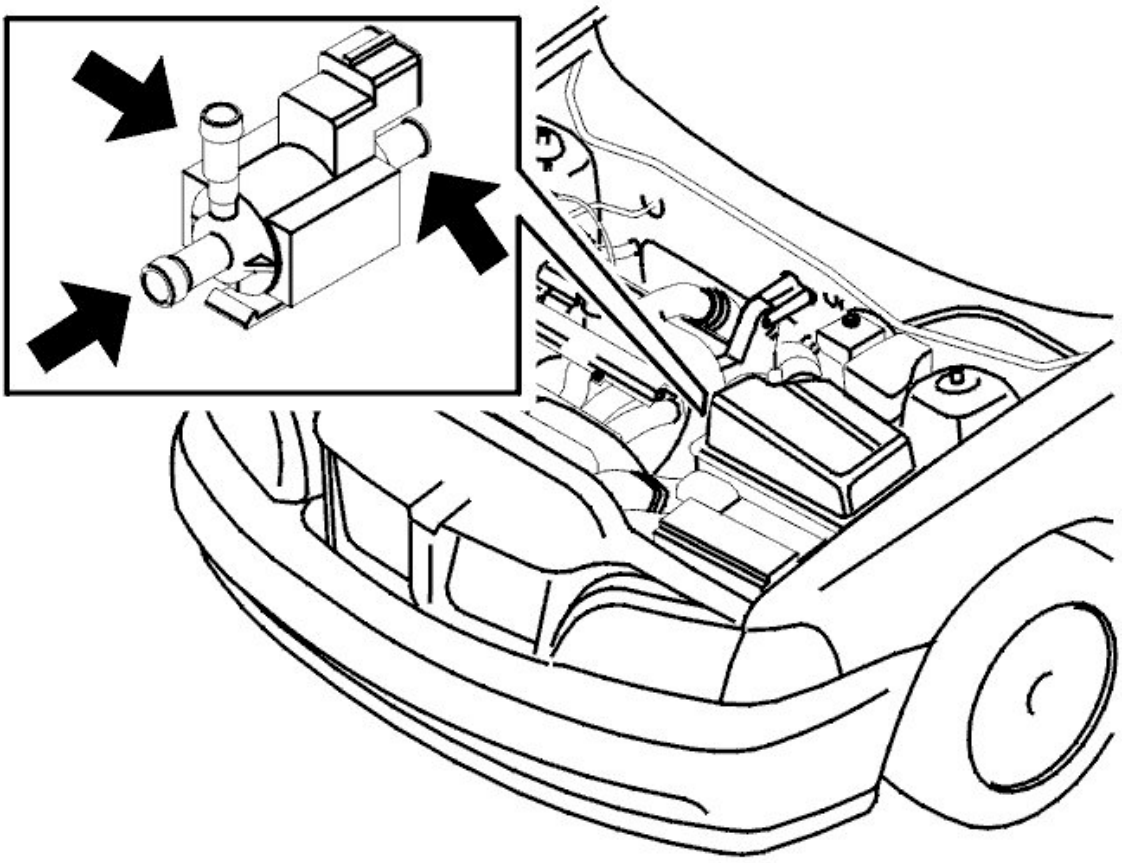
Replacing the turbocharger (TC) control valve

Removing the turbocharger (TC) control valve



Lift the valve away from the air cleaner (ACL) cover.
Remove the connector from the valve.
Mark up and pull off the hoses.

Installing the turbocharger (TC) control valve



Install

- the hoses according to the marking on the control valve
- the connector on the valve
- the valve on the air cleaner (ACL) cover.

Intercooler: Service and Repair
Radiator / Charge Air Cooler (CAC), Replacement

Radiator / charge air cooler (CAC), replacement

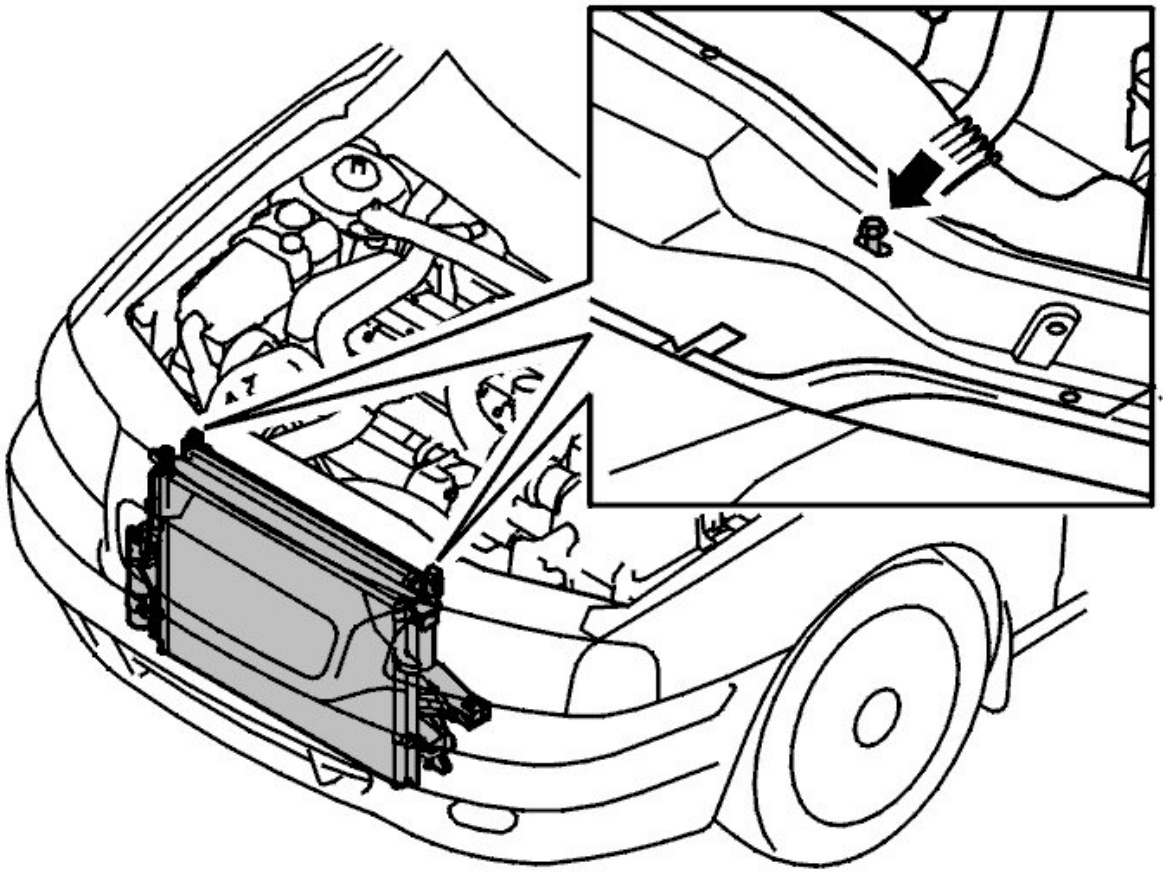
Special tools:

999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

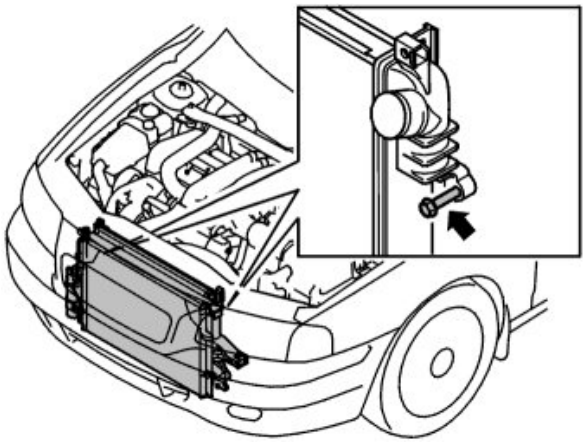
Removal

Removing the radiator unit

- Remove the engine cooling fan (FC) according to Engine cooling fan (FC), replacing See: Engine, Cooling and Exhaust/Cooling System/Radiator Cooling Fan/Service and Repair.

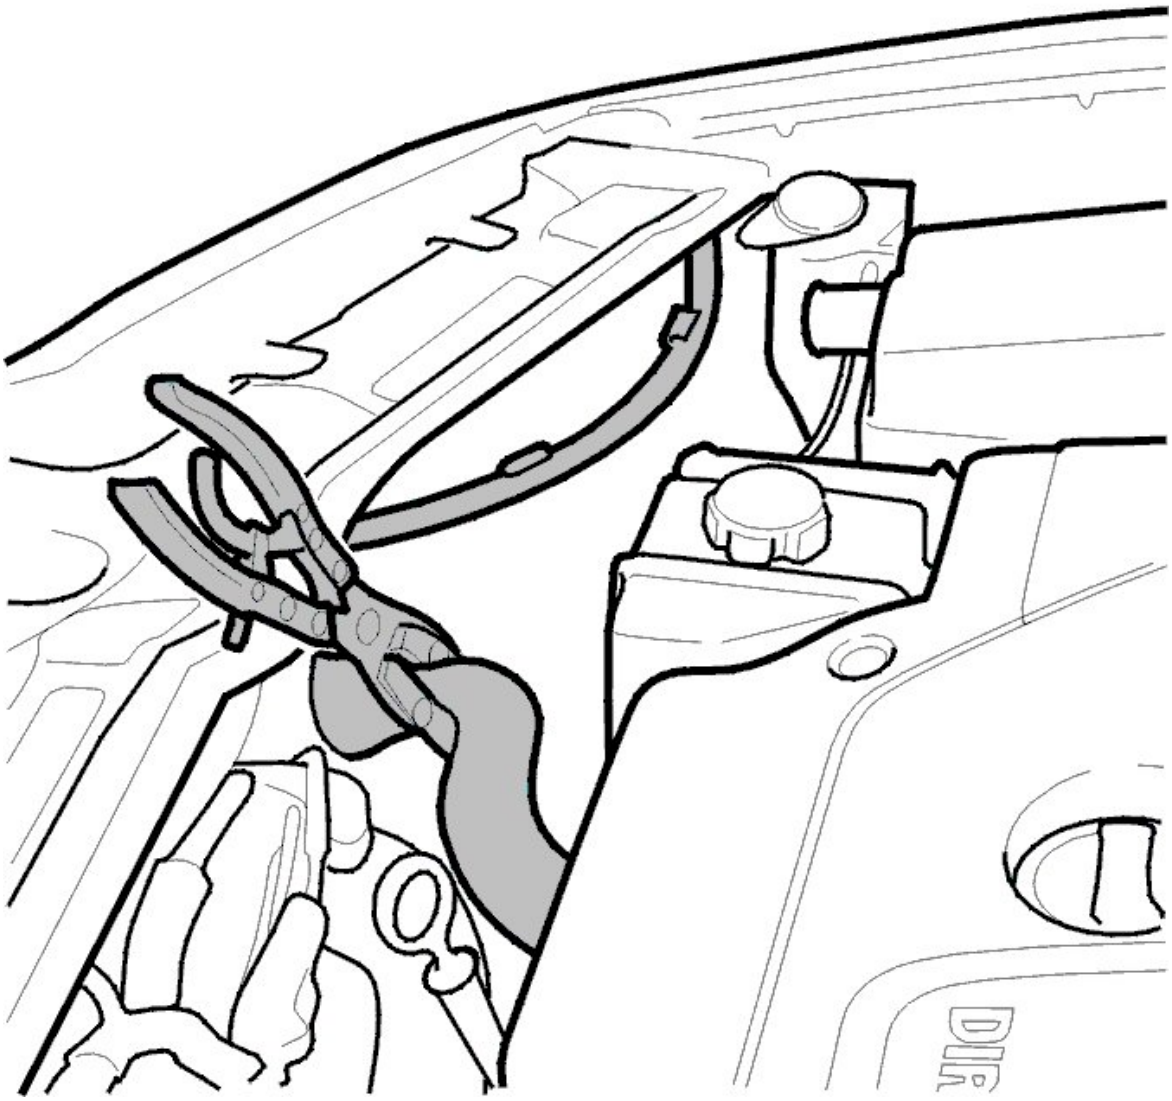


- Disconnect the charge air pipe from the charge air cooler (CAC) on the left-hand side (turbocharged engines only). If necessary, use a hot air gun to make removal easier
- Remove the screws for the radiator unit on the front cover plate.



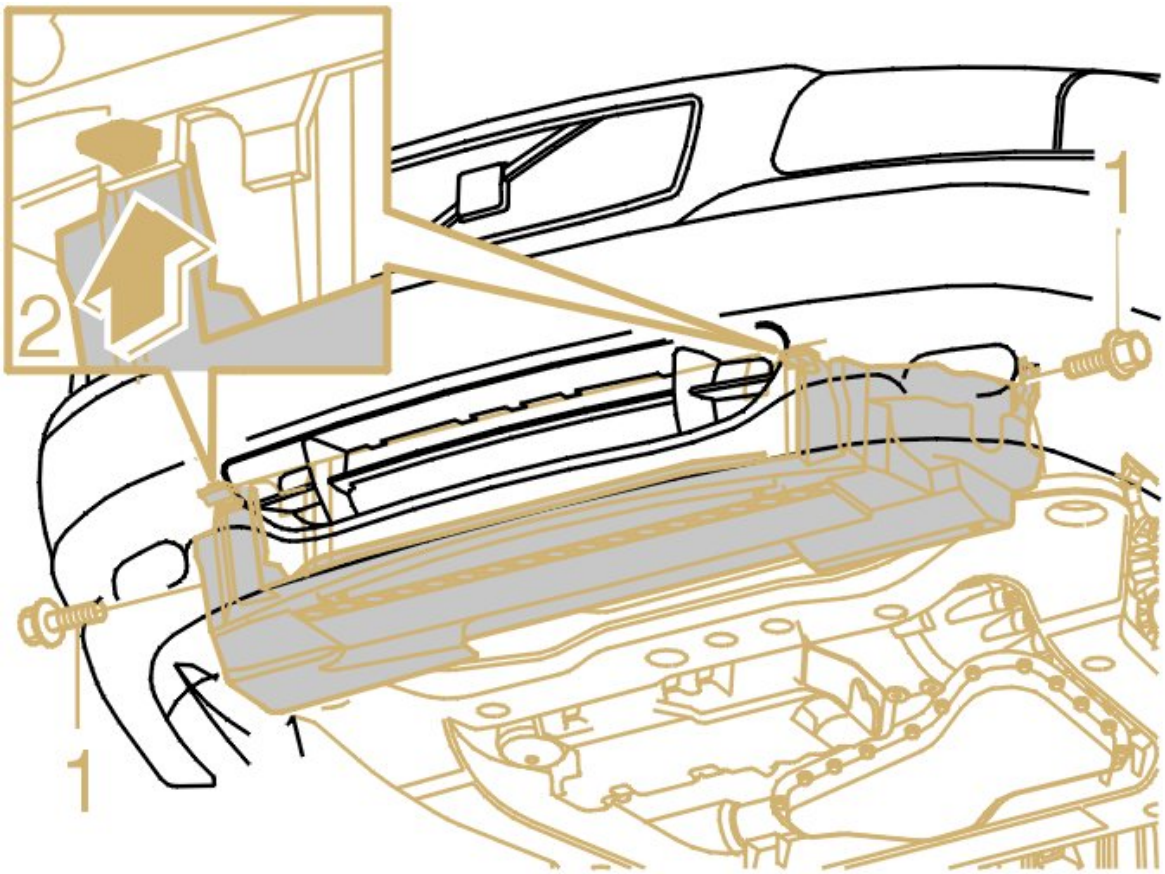
Remove

- the two upper screws holding the radiator unit together
- the expansion tank cap.



Block the upper radiator hose with lock grip pliers

Work under the car



Remove

- the air baffles
- the lower oil cooler hose from the radiator unit (automatics only)
  Note! Collect the oil from the oil cooler in a container.

- the screw for the mounting for the cable duct for engine wiring at the front edge of the sub-frame.

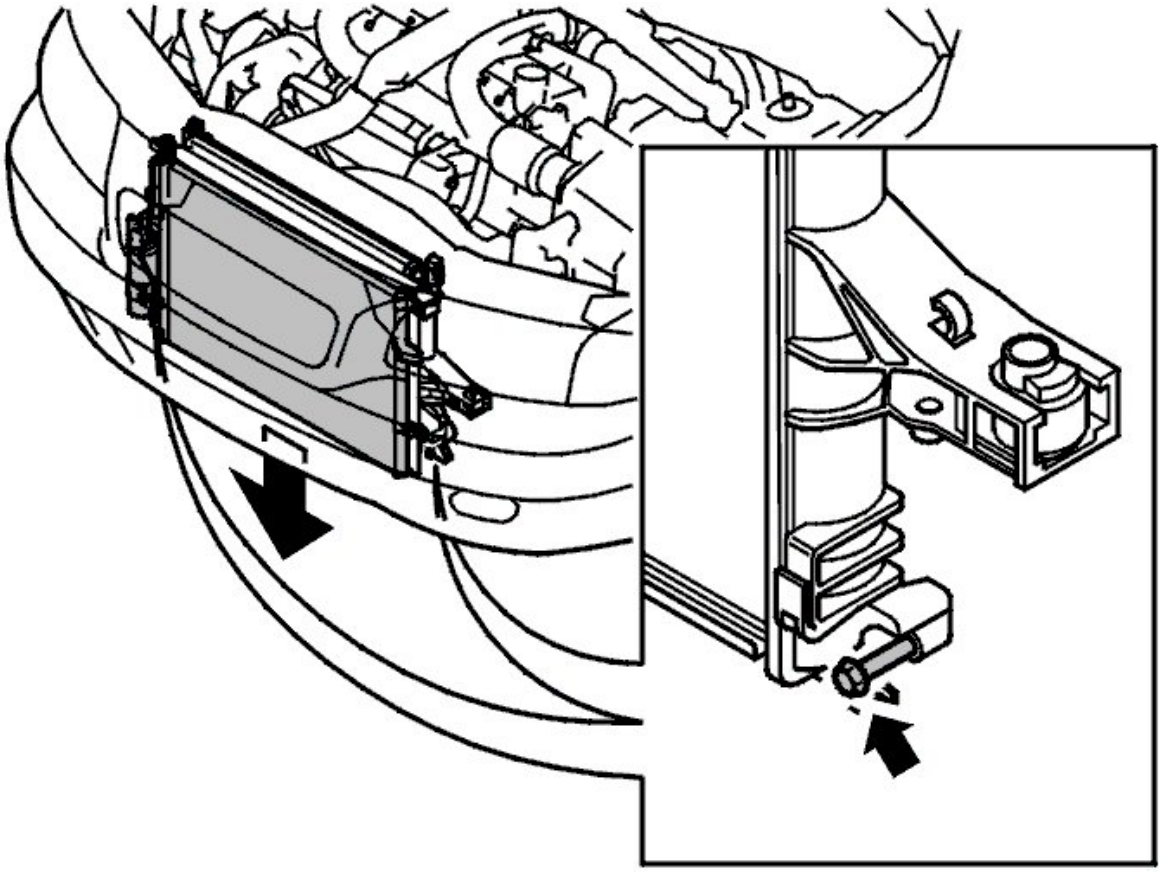
Drain the coolant

- Block the lower hose coolant hose with lock grip pliers
- Apply a hose on the nipple at the radiator
- Feed the hose down to a container
- Open the nipple and drain off the coolant.

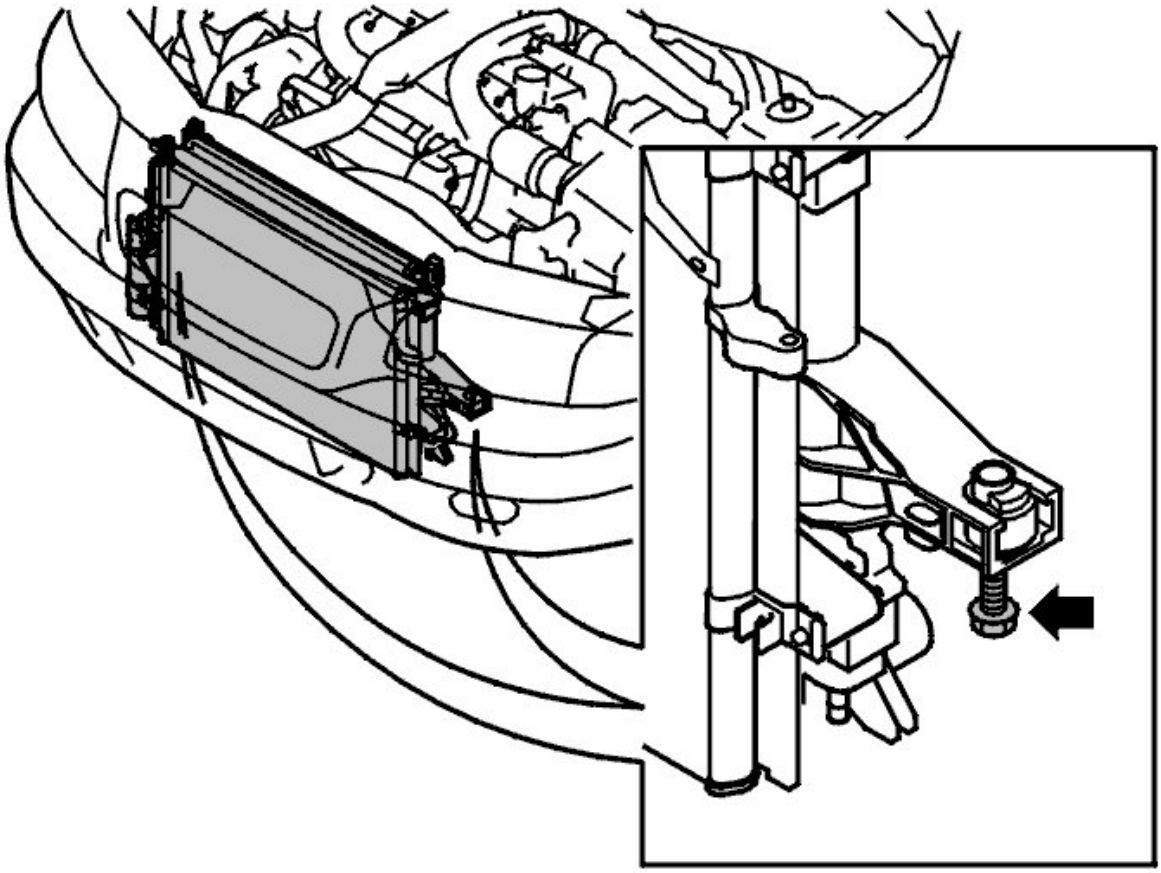
Work from above

- Remove the upper radiator hose. Place it to one side. Seal the openings.

Work under the car



- Disconnect the connector from the receiver drier and the cable from the holder
- Hang up the condenser using tie straps on the right-hand side in the pipe for the receiver drier and on the left-hand side in the pipe for the condenser
- Remove the lower screws holding the radiator unit.



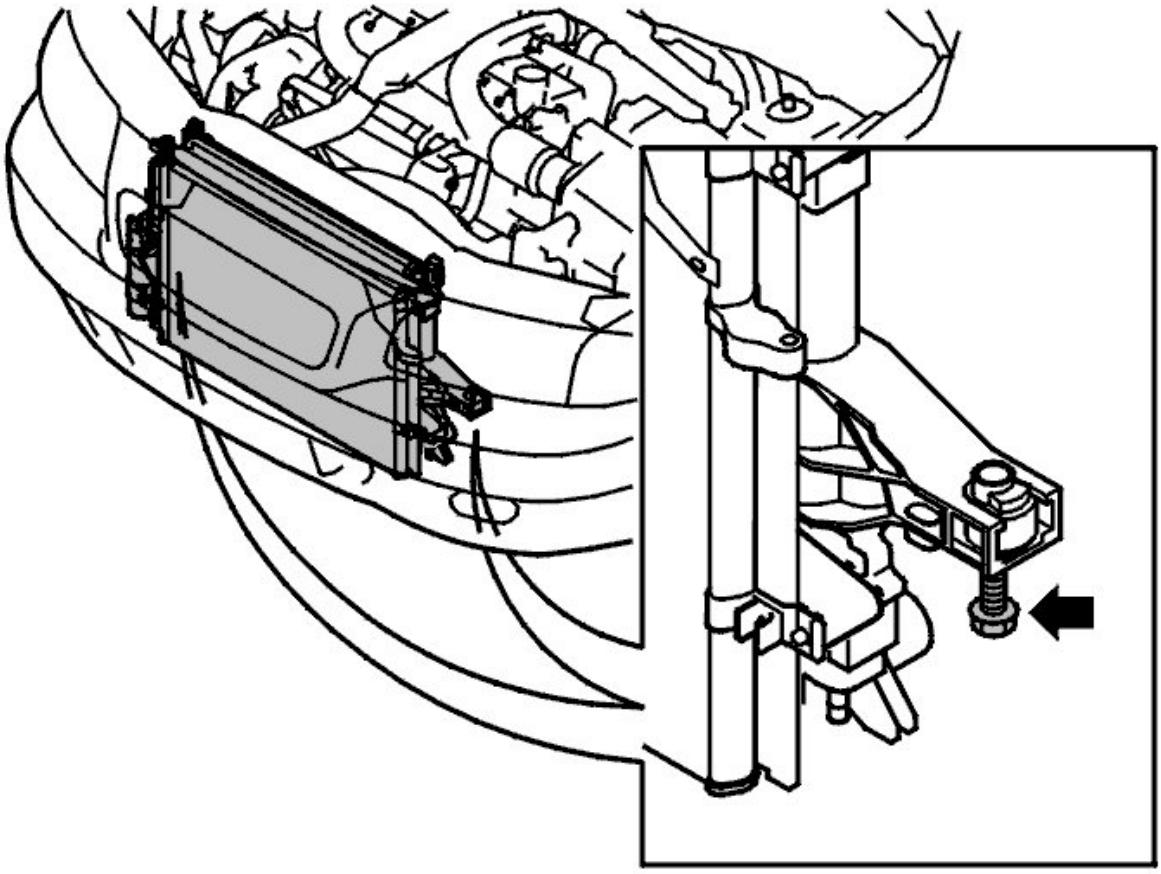
- **The following requires two people:** Disconnect the radiator and the charge air cooler (CAC) firstly from the left and then from the right-hand side by removing the two screws
- On the right-hand side, press the cable duct and the compressor hose towards the engine. At the same time release the radiator and charge air cooler (CAC) downwards on the right-hand side. Then release the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the radiator and charge air cooler (CAC) passes the AC pipe

- Disconnect the hose from the radiator to the expansion tank
- Replace the radiator / charge air cooler (CAC).

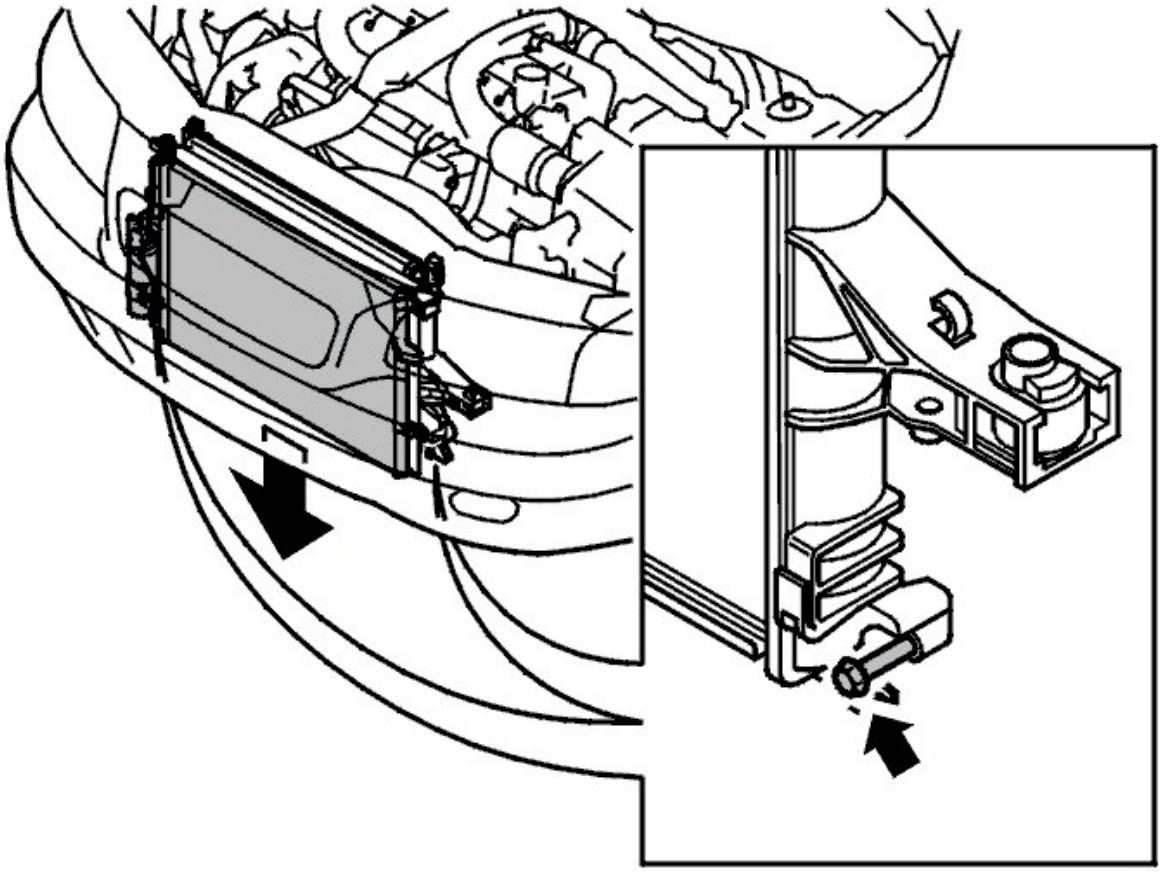
Installation

Installing the radiator and charge air cooler (CAC)

- Hold the radiator unit and secure the hose from the expansion tank to the radiator
- Install the connector from the receiver drier and the cable from the holder.

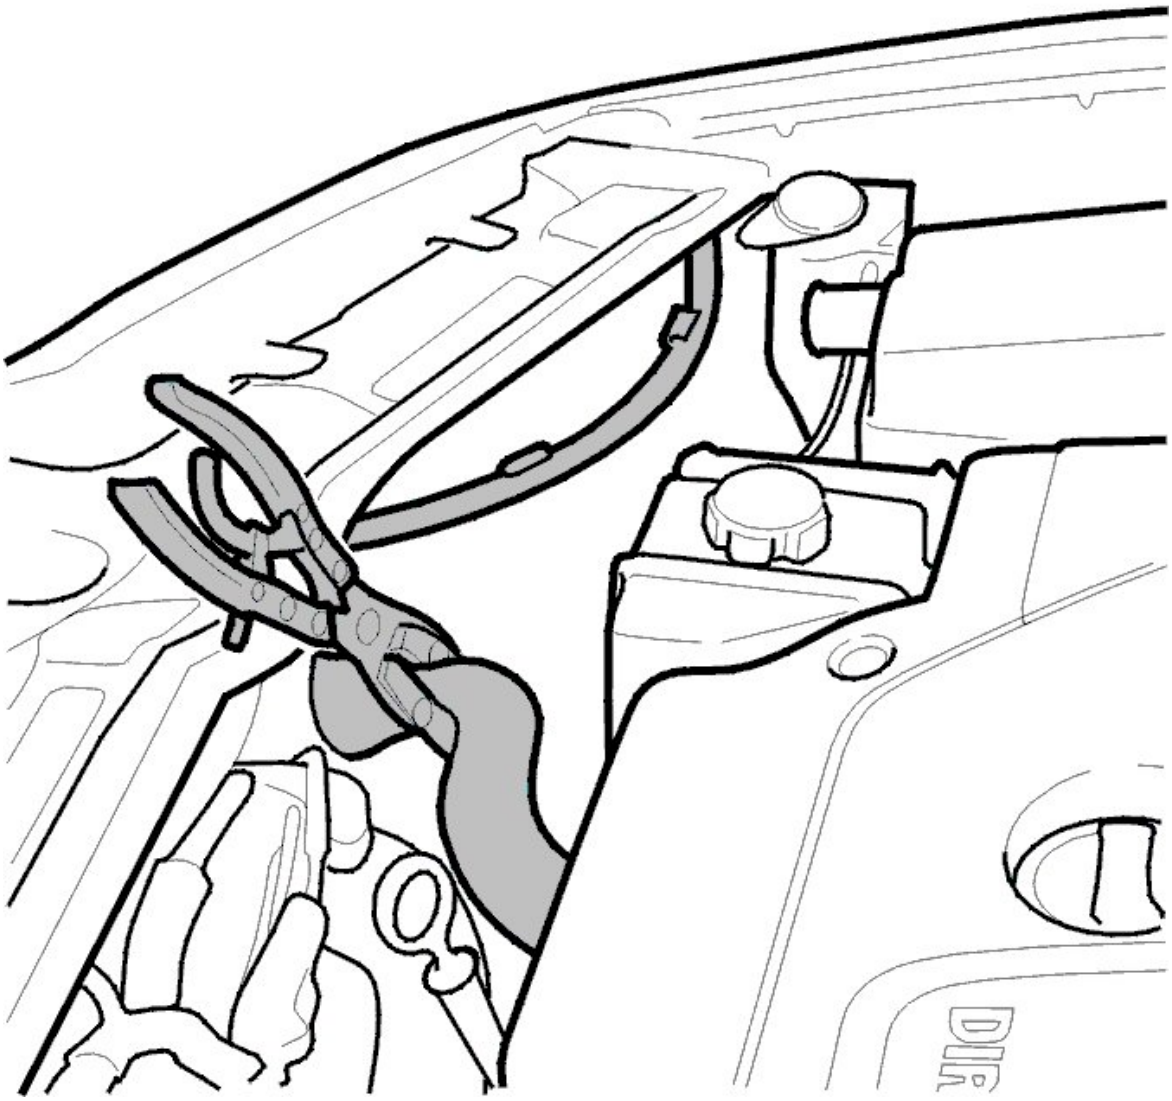


- Lift up the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the charge air cooler (CAC) passes above the AC pipe. Lift the right-hand side while pressing the cable duct and the compressor hose towards the engine
- Thread the screws for the radiator and charge air cooler (CAC) into the member.



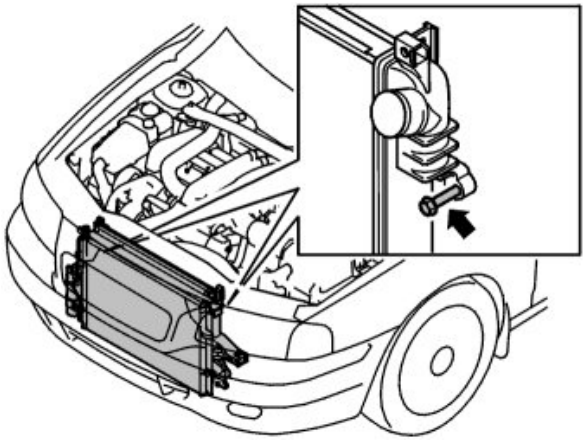
- Install the lower screws to assemble the radiator unit. Tighten the screws. Tighten to **10 Nm**
- Remove the tie straps
- Check that the radiator unit is against the rubber seal
- Tighten the radiator unit to the member. Tighten to **25 Nm**.
- Install the lower radiator hose
- Remove the lock grip pliers
- Install the screw for the mounting for the engine wiring cable duct at the front edge of the sub-frame
- Install the lower oil cooler hose on the radiator unit (automatic gearboxs only).

Work from above

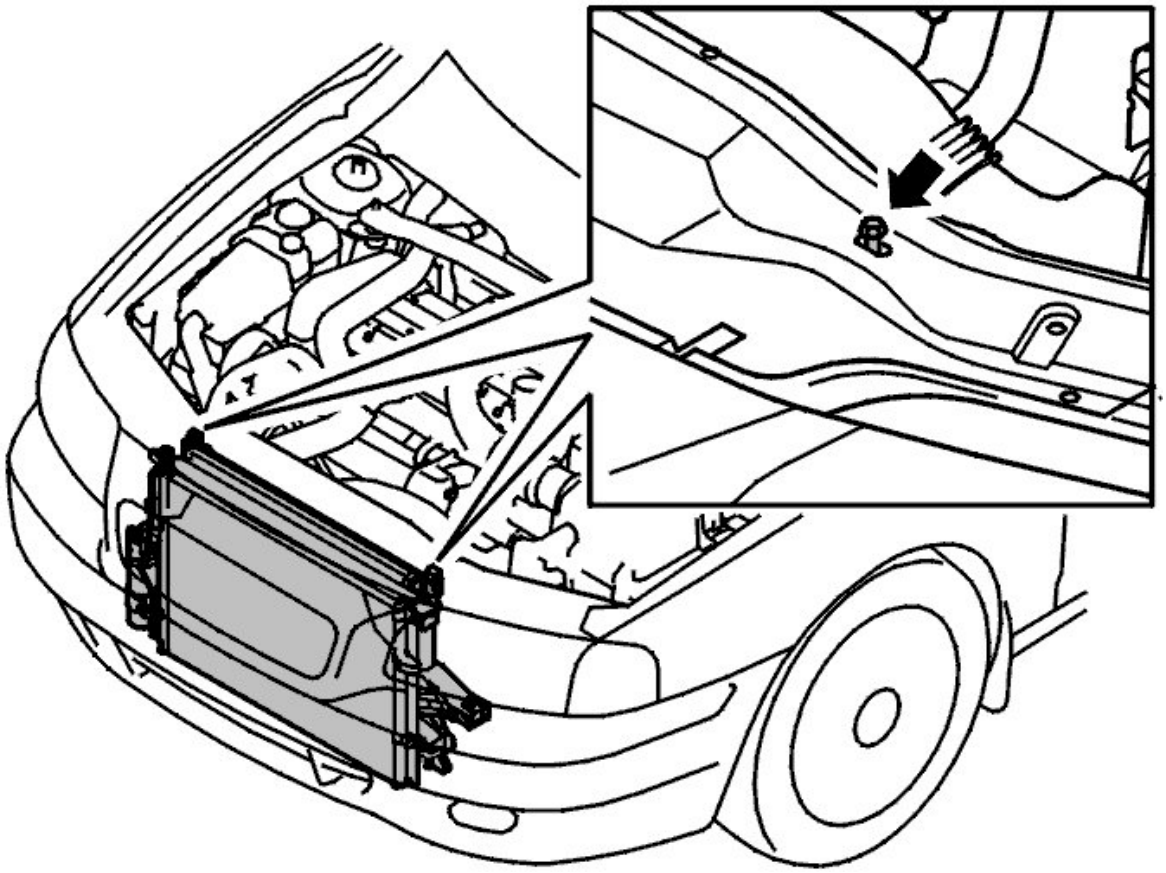


Install

- the upper radiator hose. Remove the lock grip pliers
- the charge air pipe to the charge air cooler (CAC) on the left-hand side (turbocharged engines only).



- Install the upper screws to assemble the radiator unit. Tighten the screws
- Tighten to **10 Nm**.



- Install the screws for the radiator unit on the front cover plate
- Tighten to **10 Nm**

Installing the engine cooling fan (FC)

To install the engine cooling fan (FC), see Engine cooling fan (FC), replacing See: Engine, Cooling and Exhaust/Cooling System/Radiator Cooling Fan/Service and Repair.

Topping up the coolant

- Install the cap on the expansion tank
- Run the engine until the thermostat has opened
- Stop the engine. Top up if necessary.

Intercooler: Service and Repair
Replacing the Radiator / Charge Air Cooler (CAC)

Replacing the radiator / charge air cooler (CAC)

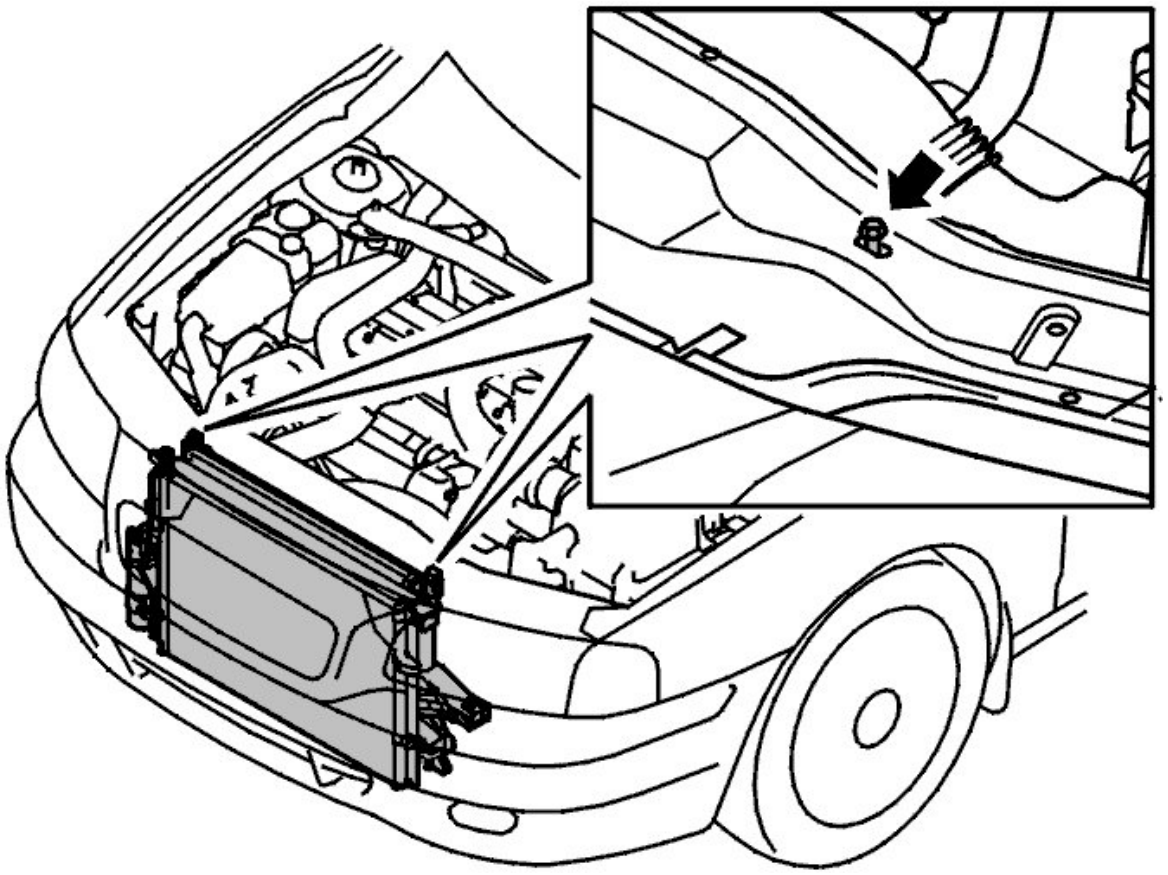
Special tools:

999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

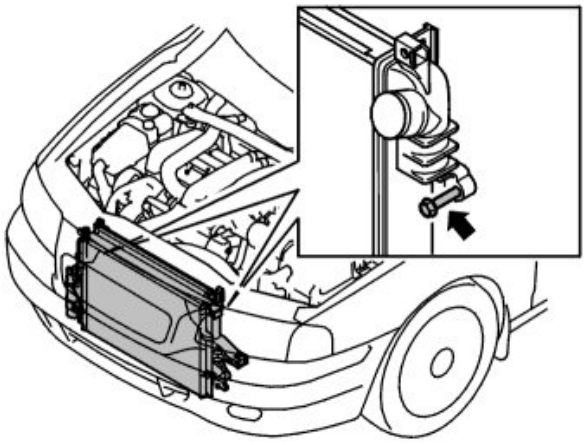
Removal

Removing the radiator unit

Remove the engine cooling fan (FC) according to Engine cooling fan (FC), replacing See: Engine, Cooling and Exhaust/Cooling System/Radiator Cooling Fan/Service and Repair.

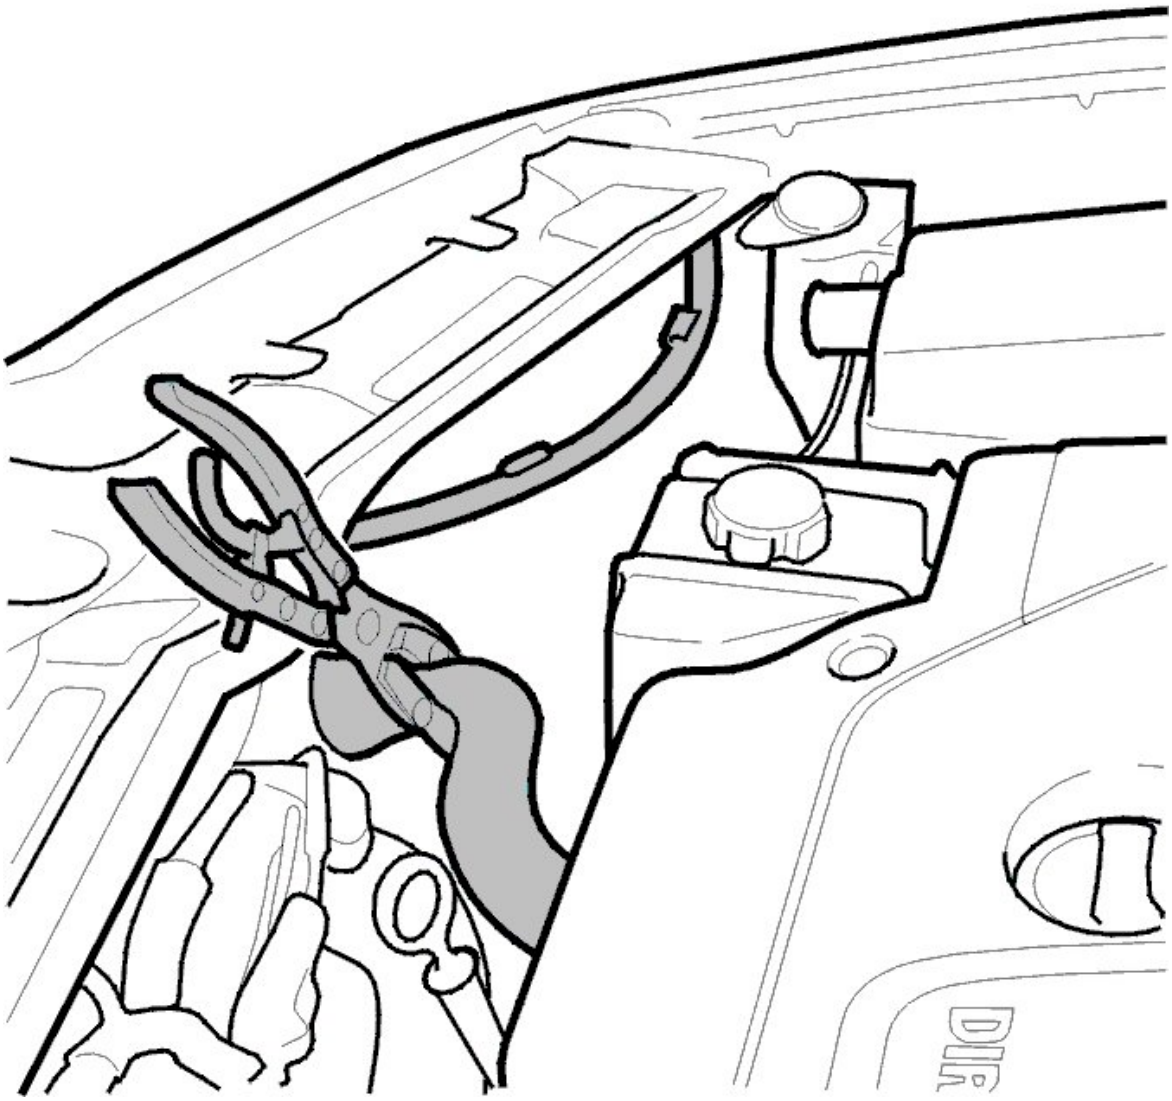


Disconnect the charge air pipe for the charge air cooler (CAC) on the left-hand and right-hand sides. Fold the hoses out of the way.
Remove the screws for the cooler unit on the front cover plate



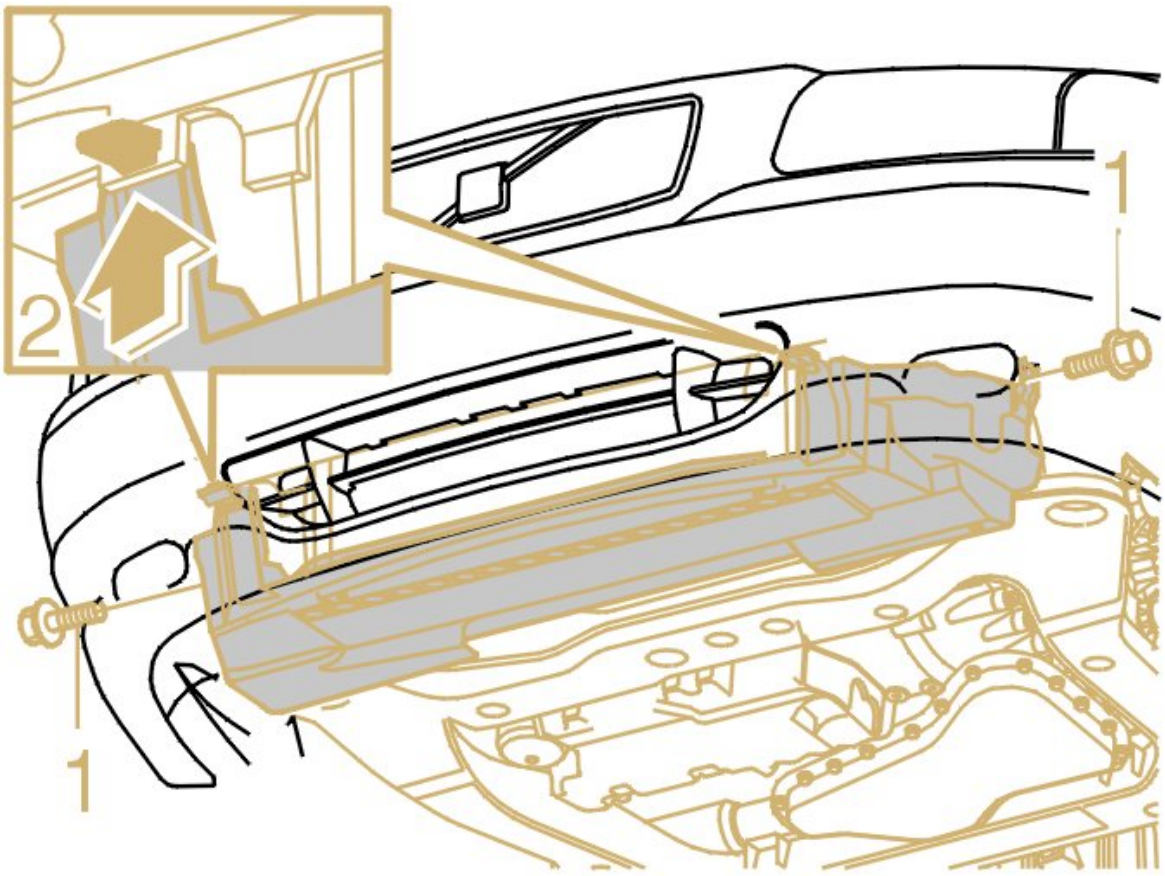
Remove:

- the two upper screws holding the air conditioning aggregate together
- the expansion tank cap.



Block the upper radiator hose with lock grip pliers.
Disconnect the hose from the radiator. Collect the coolant that flows out.

Work under the car



Remove:

- the air baffles
- the lower oil cooler hose from the cooler unit (automatics only). Protect the hose opening
  Note! Collect the oil from the oil cooler in a container.

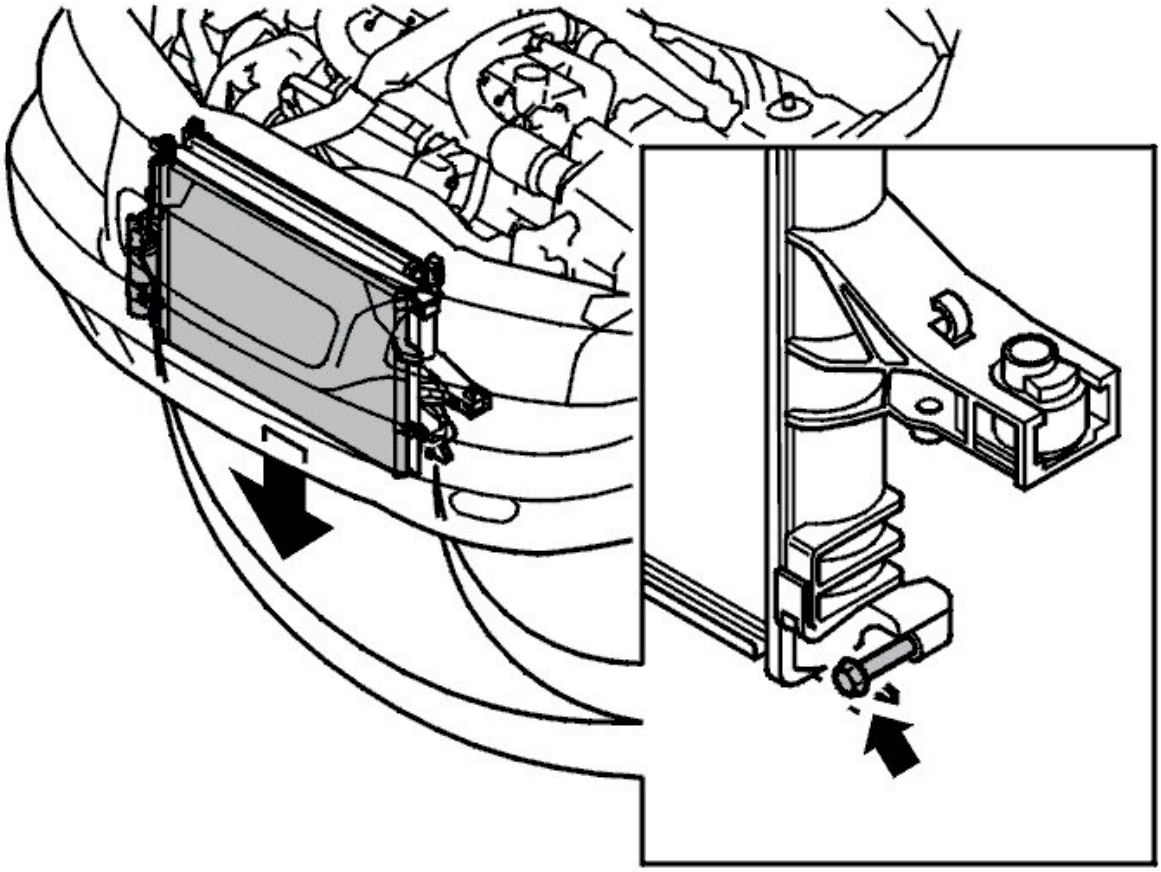
- the screw (1) for the cable harness on the front edge of the sub-frame.

Disconnect the connector from the condenser on the right side. Press the spring to disconnect the connector.

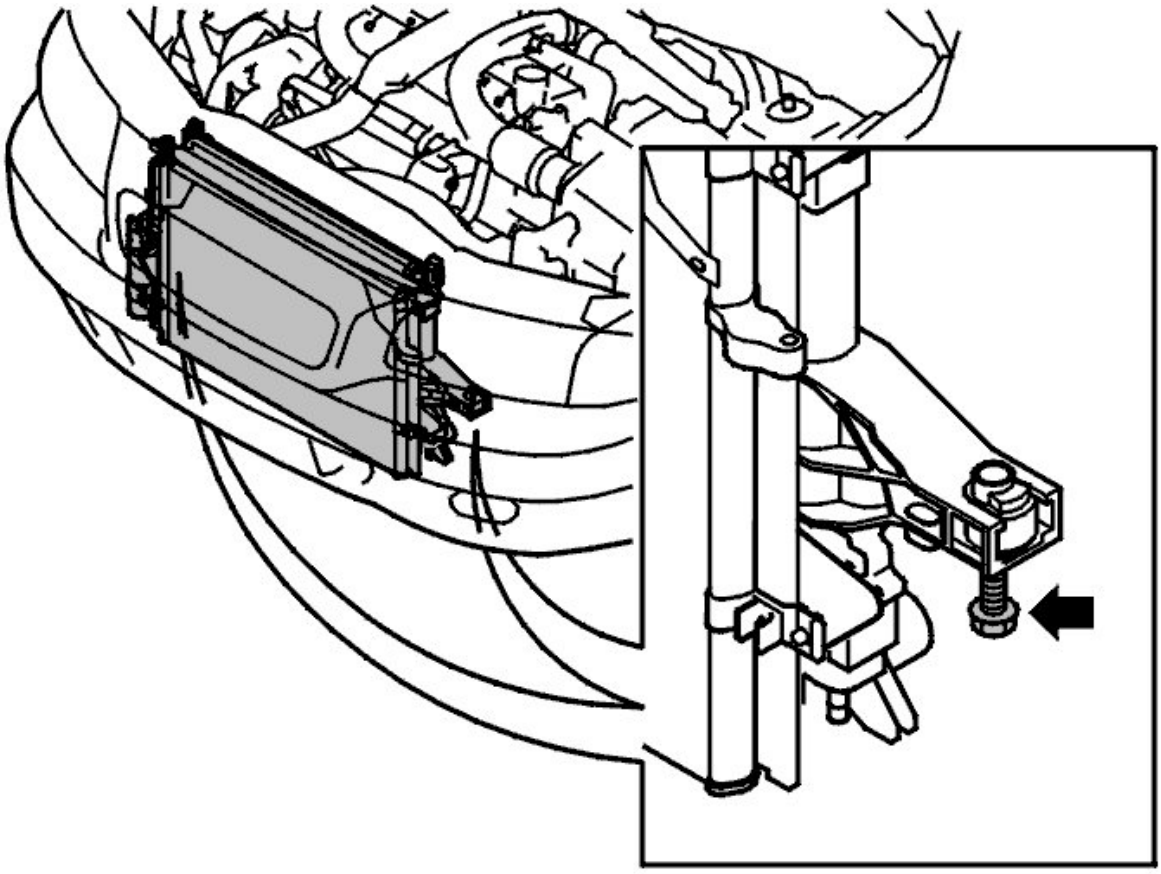
Drain the coolant

- Block the lower hose coolant hose with lock grip pliers
- Apply a hose on the nipple at the radiator
- Feed the hose down to a container
- Open the nipple and drain off the coolant.

Work under the car



Hang up the condenser using tie straps on the right-hand side in the pipe for the receiver drier and on the left-hand side in the pipe for the condenser.
Remove the lower screws holding the air conditioning aggregate.



Hint: The following step requires two people.

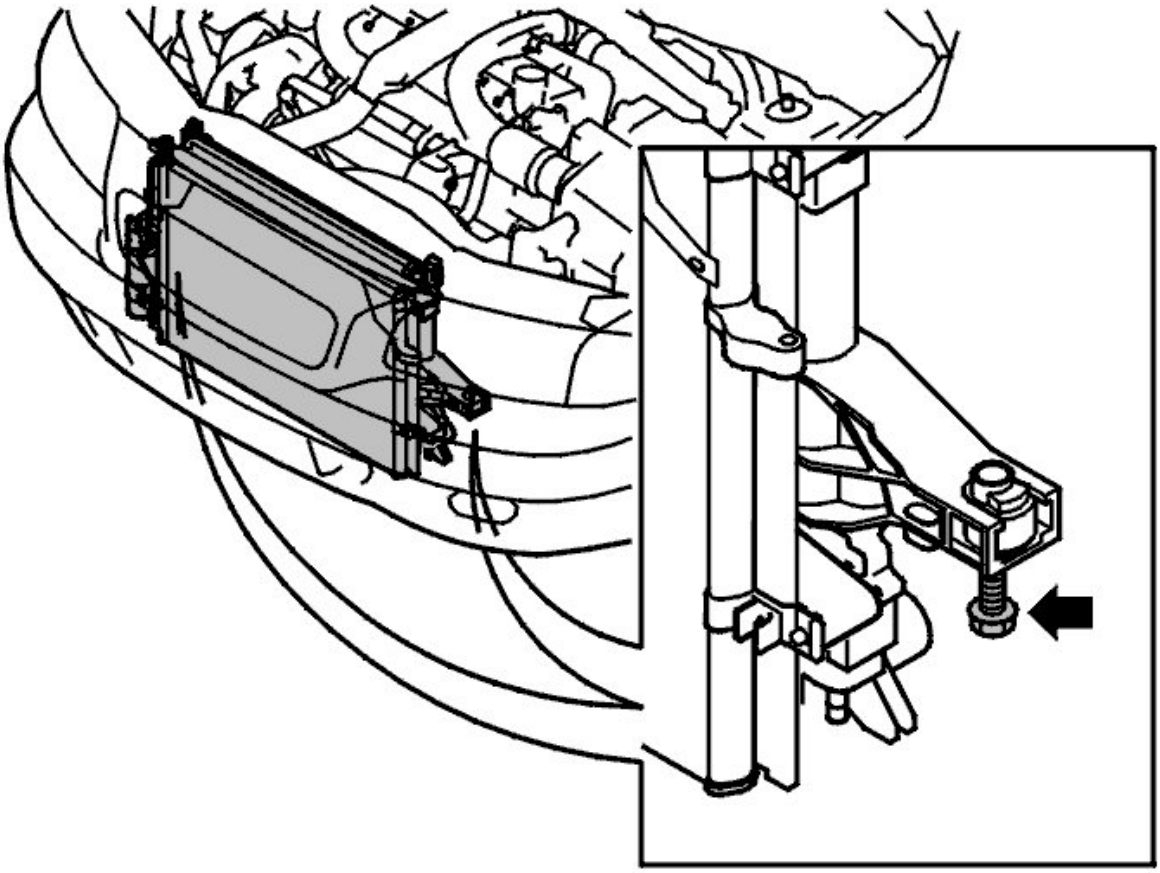
Disconnect the radiator and the charge air cooler (CAC) firstly from the left and then from the right-hand side by removing the two screws.
On the right-hand side, press the cable duct and the compressor hose towards the engine. At the same time release the radiator and charge air cooler (CAC) downwards on the right-hand side. Then release the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the radiator and charge air cooler (CAC) passes the AC pipe.

Disconnect the hose from the radiator to the expansion tank.
Remove the radiator / charge air cooler (CAC).

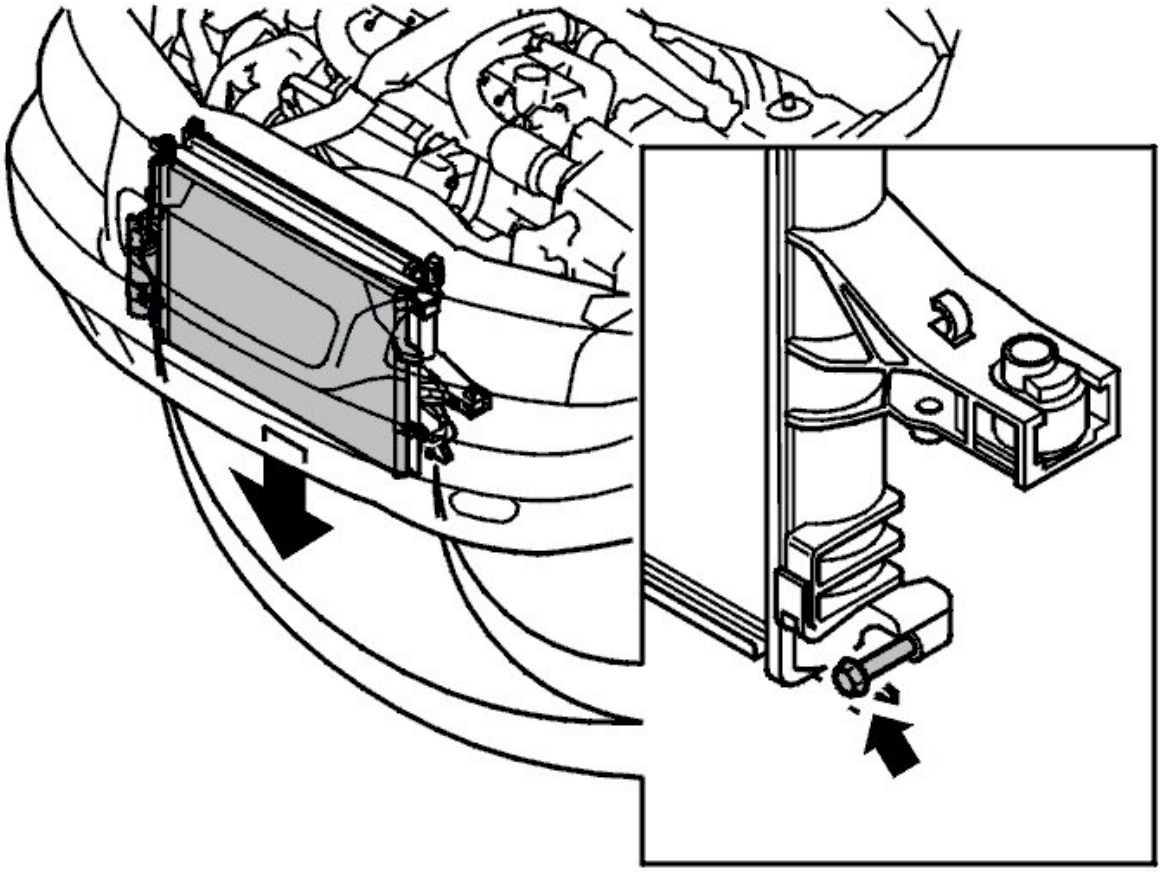
Installation

Installing the radiator and charge air cooler (CAC)

Hold the radiator unit. Secure the hose from the expansion tank to the radiator. Use a new clamp.
Check that the 2 plastic nuts are in position on the radiator.

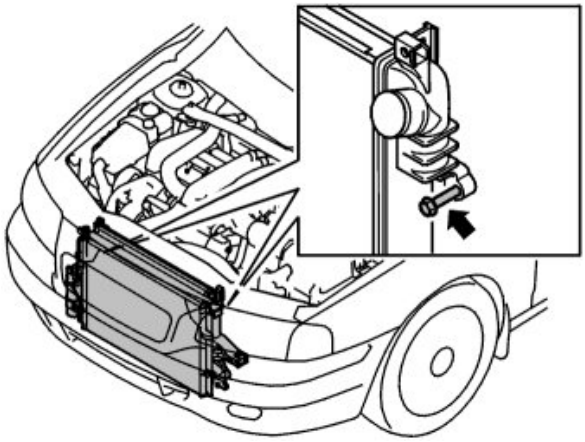


Lift up the radiator and charge air cooler (CAC) on the left-hand side. Ensure that the mounting for the charge air cooler (CAC) passes above the AC pipe. Lift the right-hand side while pressing the cable duct and the compressor hose towards the engine.
Thread the screws for the radiator and charge air cooler (CAC) into the member.
Connect the connector to the right-hand side of the condenser.

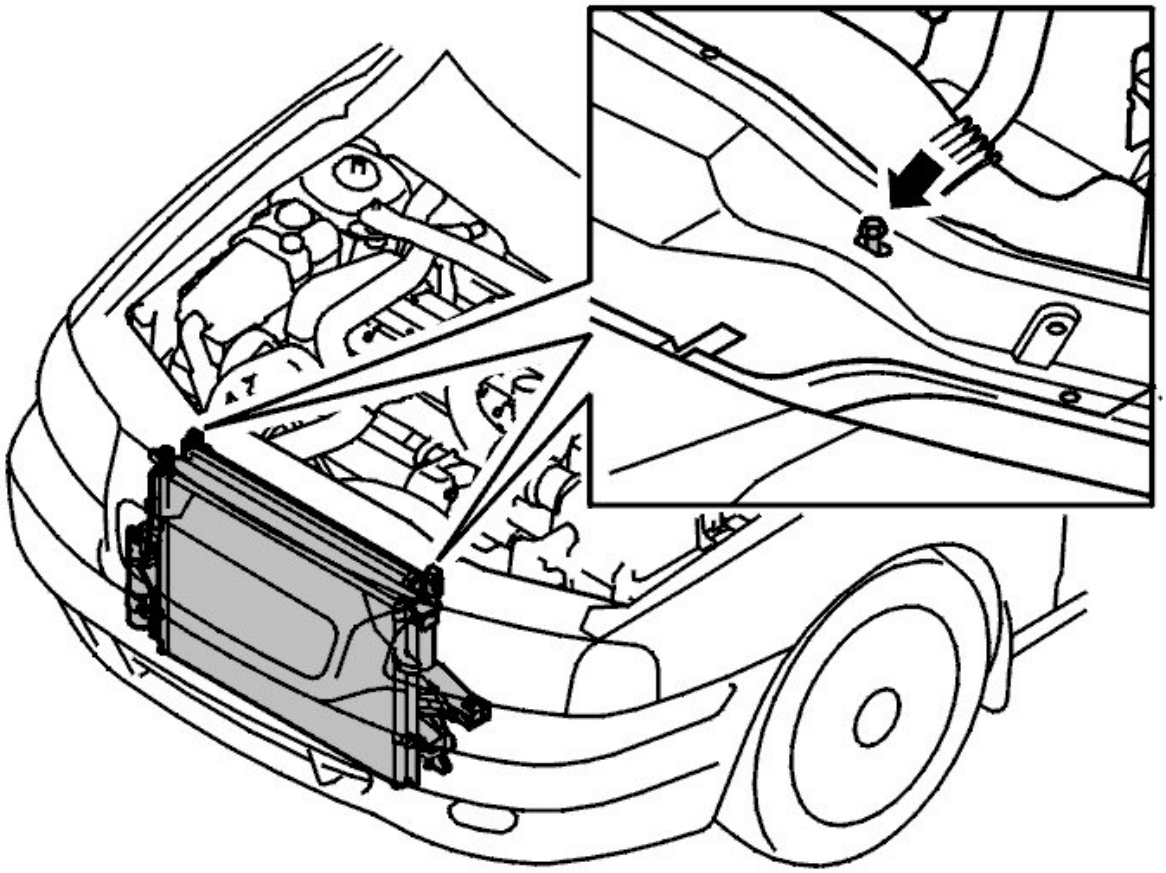


Install the lower screws to assemble the air conditioning aggregate. Tighten the screws. Tighten to **10 Nm**.
Remove the tie straps.
Check that the air conditioning aggregate is against the rubber seal. Secure.
Tighten the air conditioning aggregate to the member. Tighten to **25 Nm**.
Install the lower radiator hose.
Remove the lock grip pliers.
Install the screw for the mounting for the engine wiring cable duct at the front edge of the sub-frame.
Install the lower oil cooler hose on the air conditioning aggregate (automatic transmissions only).
Lower the car.

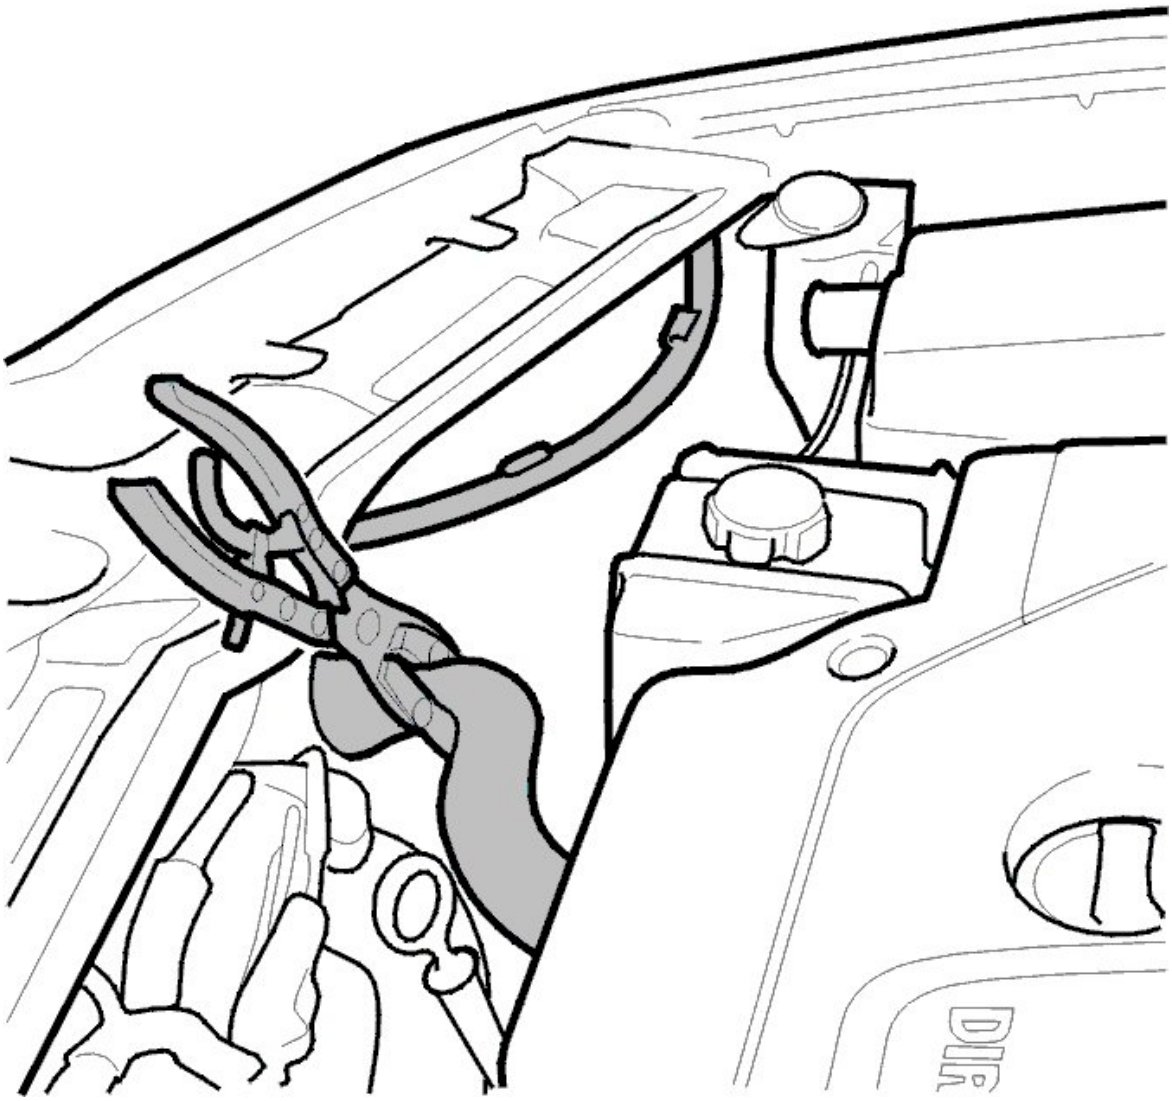
Installing the screws for the air conditioning aggregate



Install the upper screws to assemble the air conditioning aggregate. Tighten the screws. Tighten to **10 Nm**.



Install the screws for the air conditioning aggregate on the front cover plate. Tighten to **10 Nm**.



Install:

- the charge air pipe on the left and right-hand sides of the radiator
- the upper radiator hose.

Installing the engine cooling fan (FC)

To install the engine cooling fan (FC), see Engine cooling fan (FC), replacing See: Engine, Cooling and Exhaust/Cooling System/Radiator Cooling Fan/Service and Repair.

Topping up the coolant

- Install the cap on the expansion tank
- Run the engine until the thermostat has opened
- Stop the engine. Top up if necessary.

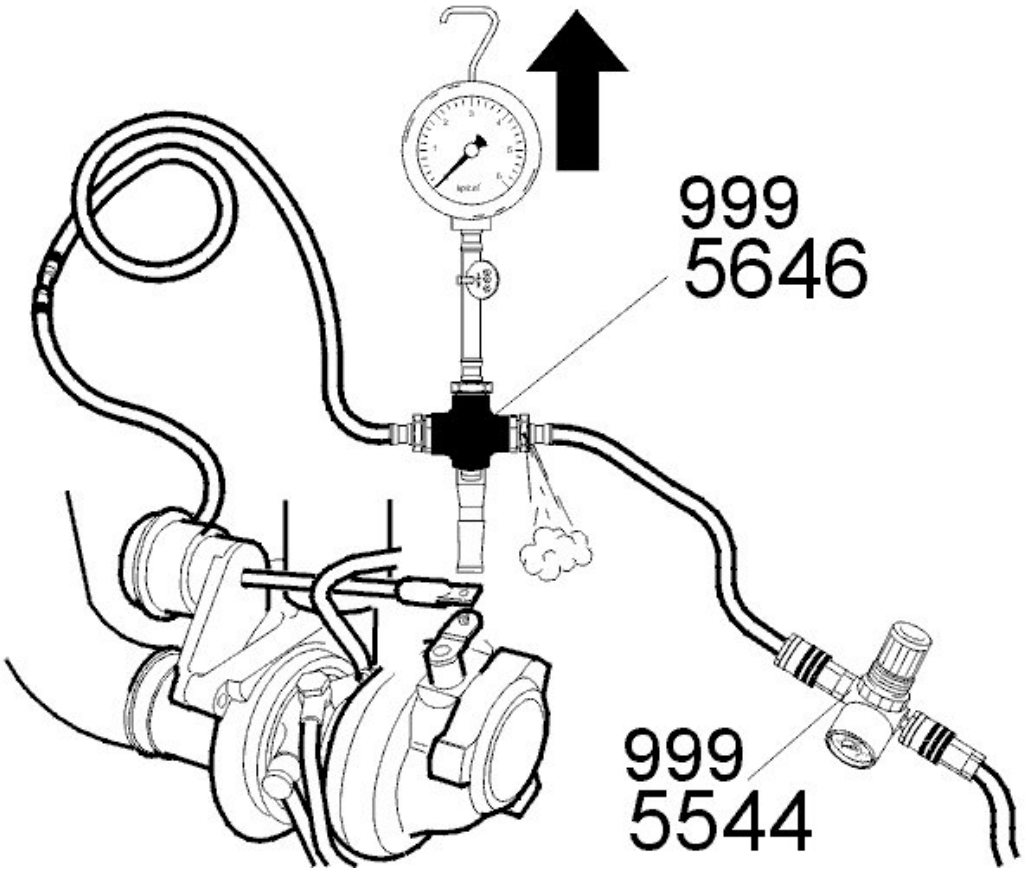
Wastegate Actuator: Adjustments

Wastegate valve, adjusting

Special tools:

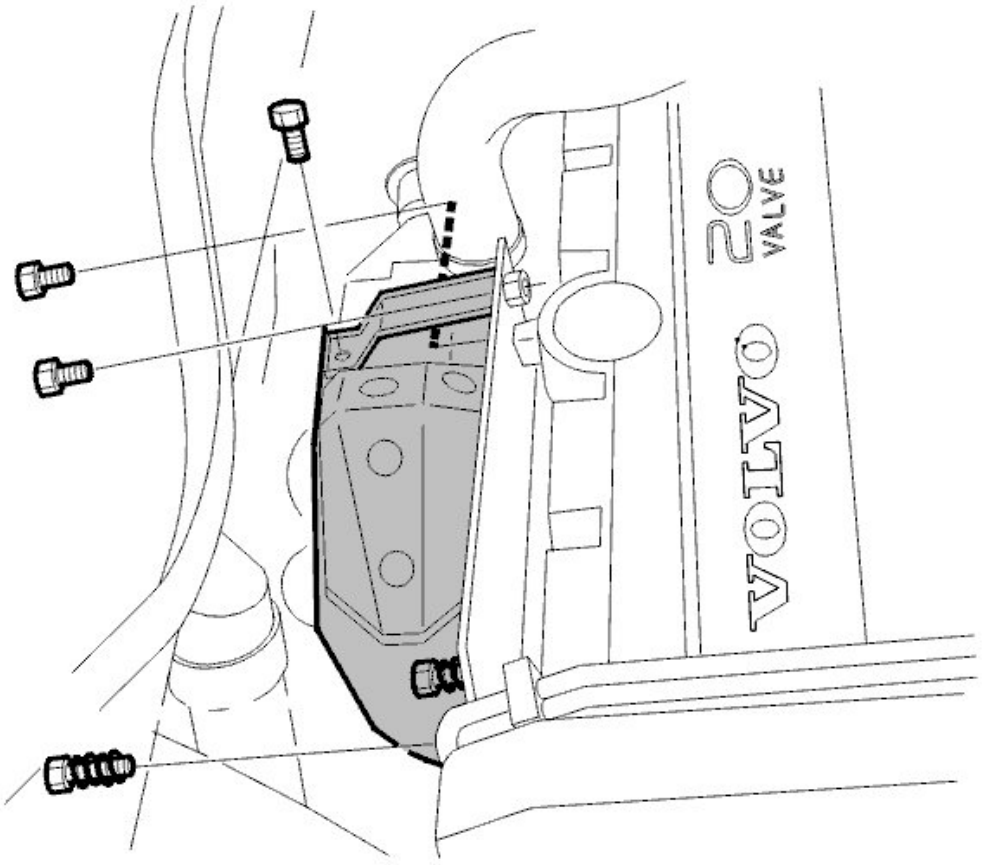
999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator
999 5646 Pressure gauge See: Tools and Equipment/999 5646 Pressure Gauge

Manometer



Use test equipment 999 5646 Pressure gauge See: Tools and Equipment/999 5646 Pressure Gauge to measure the adjustment pressure. The manometer must always hang vertically when taking readings. This is to ensure that the values obtained are correct.

Removing the heat deflector plate



Remove the heat deflector plate over the turbocharger (TC). 4 screws.

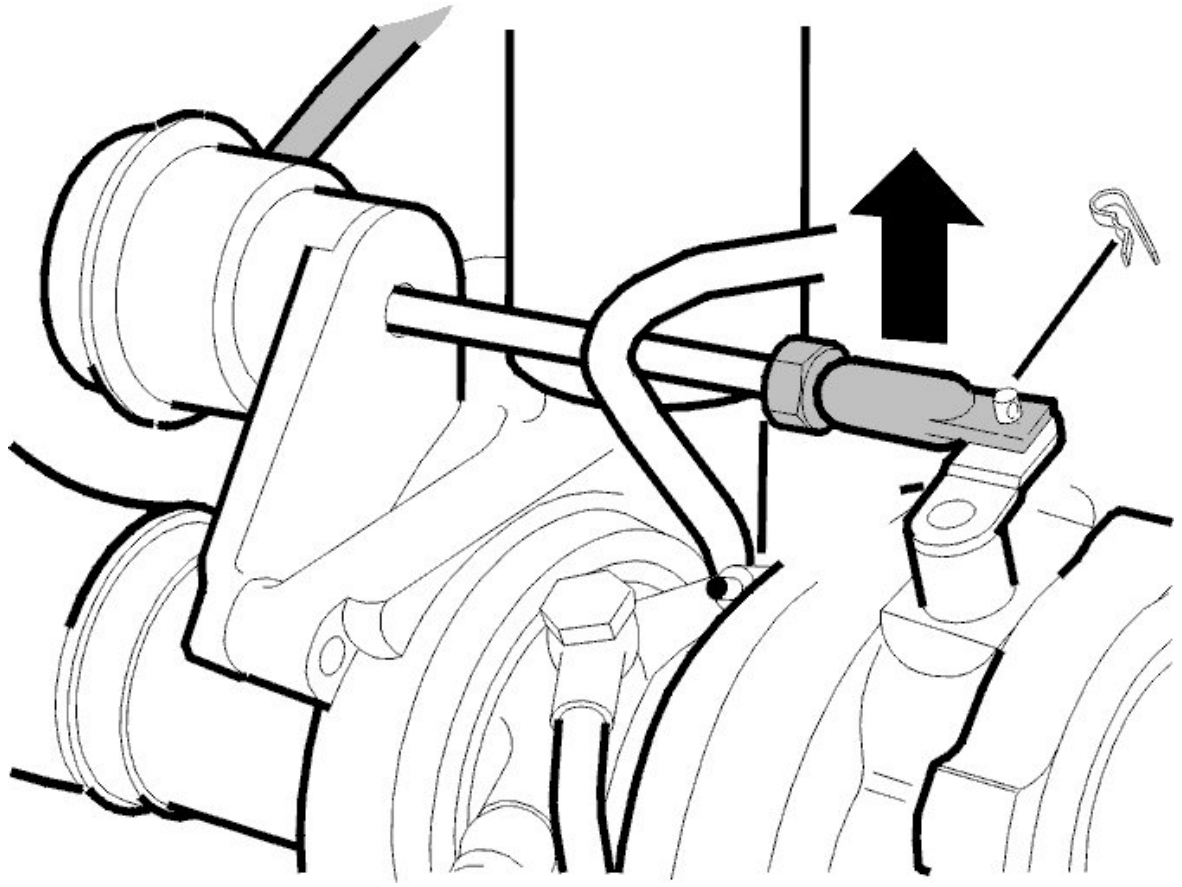
Removing the hose for the pressure regulator

Remove the hose for the pressure regulator (marked yellow). Disconnect the hose at the turbocharger (TC) control valve.
Remove the fresh air intake hose from the air cleaner (ACL) to access the hose clamp.

Only S70/V70/C70:

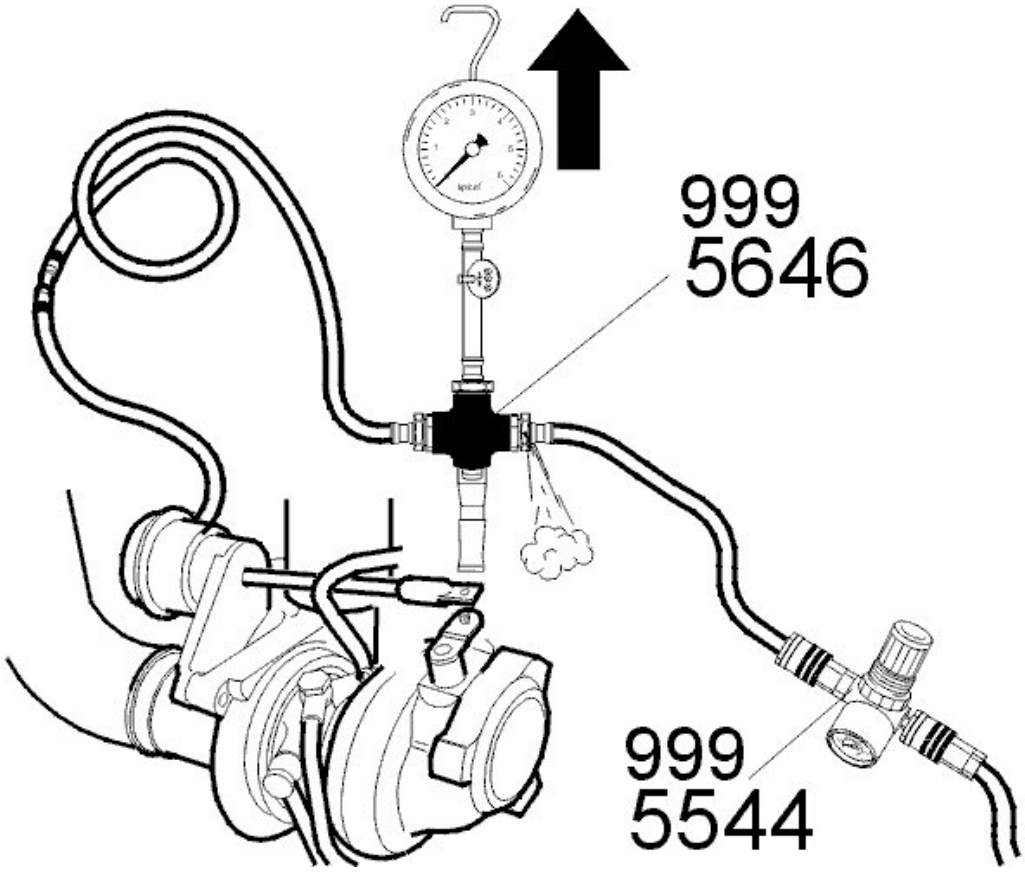
The position and version of the turbocharger (TC) control valve have been changed on the S70/V70/C70.
Disconnect the hose running backward on the turbocharger (TC) control valve (marked yellow).

Release the push rod



Remove the split pin from the lever.
Release the push rod. Lift the push rod straight up.

Connecting test equipment



Connect:

- manometer 999 5646 Pressure gauge See: Tools and Equipment/999 5646 Pressure Gauge to the pressure regulator hose
- pressure regulator 999 5544 REGULATOR See: Tools and Equipment/999 5544 Regulator to the manometer.

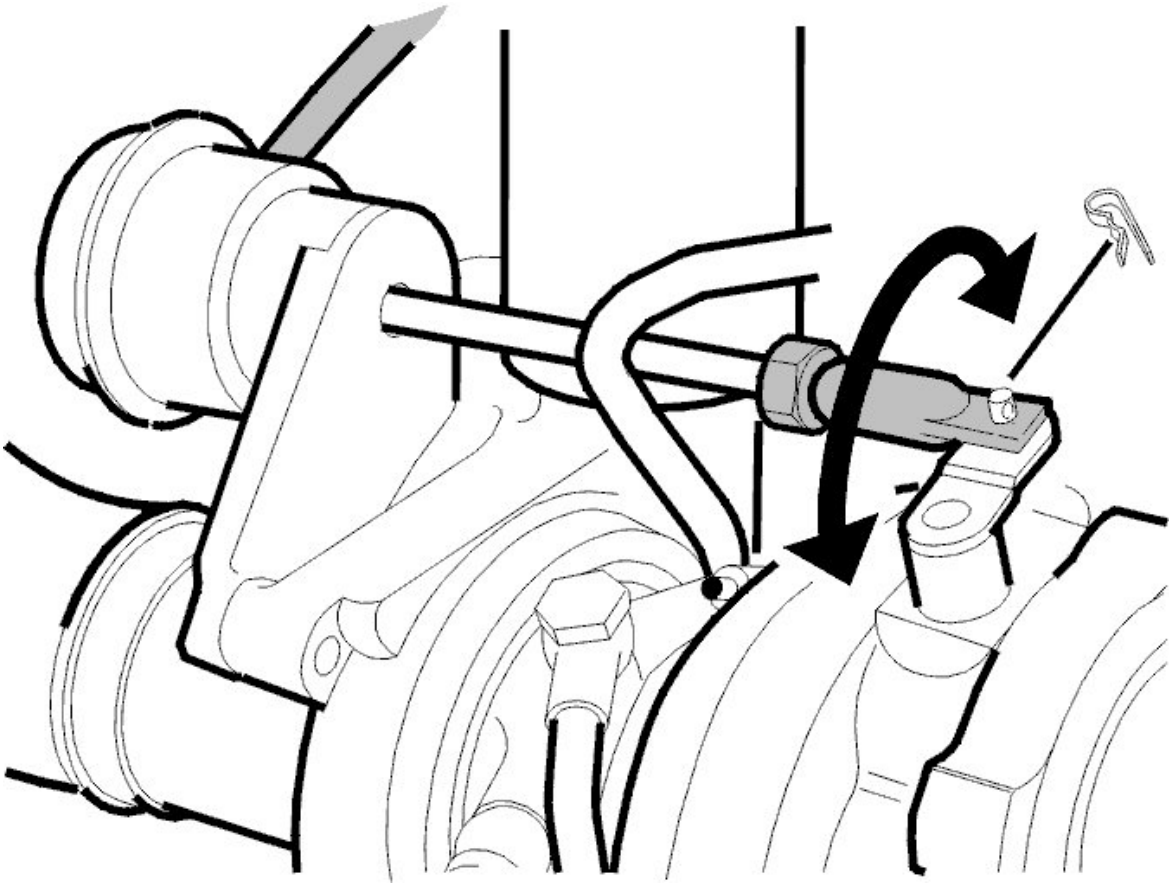
Note! When taking readings the manometer must always hang vertically from its hook. This is to ensure that the correct values are

obtained. Set the 3-way junction connector handle in its middle position.

Screw out the adjustment screw for the pressure regulator completely.
Connect compressed air to the pressure regulator.
Screw in the adjustment screw for the pressure regulator so that the manometer displays the value applicable to the relevant engine. See the table.
3-way junction connector has a vent (drilled hole) where it connects to the pressure regulator. This is to facilitate setting the correct pressure.

Engine	Adjustment pressure
B5204T	12.5 kPa
B5204T2	12.5 kPa
B5204T3	15 kPa
B5204T3, from model year 1999	18 kPa
B5204T4	12.5 kPa
B5204T5	12.5 kPa
B5234T	12.5 kPa
B5234T2	30 kPa
B5234T3	30 kPa
B5234T4	12.5 kPa
B5234T4 R-line, from model year 1998	28 kPa
B5234T5	12.5 kPa
B5234T6	30 kPa
B5234T7	12.5 kPa
B5234T8	30 kPa
B5244T	12.5 kPa
B5244T2	30 kPa
B5244T3	12.5 kPa
B5244T7	12.5 kPa
B5254T	12.5 kPa

Checking and adjusting



Push the lever for the boost pressure control (BPC) valve towards the turbocharger (TC) housing.
The boost pressure control (BPC) valve must be closed.
Check that the push rod locates on the lever lug.
If necessary, adjust the push rod until it locates.

Note! The push rod must be mounted on the lever when the lock-nut is adjusted.The diaphragm in the pressure regulator will be damaged if the push rod is twisted.

Reinstall

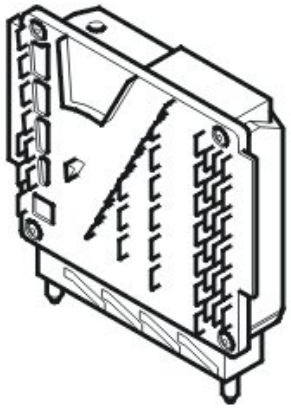
Install the split pin on the lever.
Tighten the lock-nut on the push rod.
Remove the test equipment.
Connect the hose.
Install the heat shield.
Erase any diagnostic trouble codes (DTCs).
Test drive the car. Accelerate to wide open throttle (WOT) a couple of times.
Then check that no diagnostic trouble codes (DTCs) have been stored.

Computers and Control Systems: Description and Operation
Engine Management System

System Overview

System overview

Control module



The Engine Control Module (ECM) controls the following functions:
- injectors
- ignition
- camshafts (CVVT)
- evaporative emission system (EVAP) valve
- turbocharger (TC) control
- throttle angle
- engine cooling fan (FC)
- Air conditioning (A/C) compressor
- fuel pump (only vehicles with demand controlled fuel pumps).

There is a micro-processor in the control module which receives signals from the different sensors in the car. The micro-processor uses a program which interprets the signals from the different sensors and how the components / functions should be controlled.
The control module has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (wear, air leaks, differences between different fuels etc.).
Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve and camshafts etc. Faults which affect emissions can be detected by running diagnostics for functions and components.
The control module is in a box in the engine compartment.
The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication.
The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is replaced with a substitute value or certain functions are limited.
Substitute values can be set for e.g.:
- engine coolant temperature (ECT)
- mass air flow
- throttle position
- atmospheric pressure
- etc.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the control module.
The substitute value allows the car to be driven and for the emissions to be kept at a reasonable level even though vital functions / components are faults.
Functions which are limited may be for example:
- turbocharger (TC) control
- Camshaft control (CVVT)
- fuel trim
- throttle angle
- etc.

A function is limited so that the system still functions, to protect components or for safety reasons (for example the throttle angle).
Any diagnostic trouble codes (DTCs) are stored in the control module memory. The data can be read off using VIDA.

Signals

The table below summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, serial communication and controller area network (CAN) communication. The illustration below displays the same

information with the Volvo component designations.

Input signals	**Output signals**
Directly connected:	**Directly connected:**
• Ignition switch (3/1) • Stop lamp switch (3/9) • Clutch pedal sensor (7/123) • Air conditioning (A/C) pressure sensor (7/8) • Front heated oxygen sensor (HO2S) (7/15) • Rear heated oxygen sensor (HO2S) (7/82) • Engine coolant temperature (ECT) sensor (7/16) • Mass air flow (MAF) sensor (7/17) • Manifold absolute pressure (MAP) sensor, intake (7/81) (certain turbocharged engines only) • Manifold absolute pressure (MAP) sensor, with integrated intake air temperature (IAT) sensor, intake (7/81) (certain turbocharged engines only) • Leak diagnostic unit (6/67), (certain markets only) • Electronic throttle unit (6/120) • Outside temperature sensor (7/105) • Camshaft position (CMP) sensor (7/172) • Camshaft position (CMP) sensor (7/173) • Engine speed (RPM) sensor (7/25) • Accelerator pedal (AP) position sensor (7/51) • Engine coolant level sensor (7/73) • Knock sensor (KS) (7/23-7/24) • Manifold absolute pressure (MAP) sensor, intake (7/77) (not turbocharged engines 2003-2004) • Oil level sensor (7/35) (certain markets and models only) • Fuel pressure sensor with integrated fuel temperature sensor (7/156) (vehicles with demand controlled fuel pumps only).	• Main relay (system relay) (2/32) • Fuel pump (FP) relay (2/23) • Air conditioning (A/C) relay (2/22) • Electronic throttle unit (6/120) • Engine cooling fan (FC) control module (4/71) • Engine cooling fan (FC) control module box (6/44) (turbocharger (TC) only and certain markets) • Front heated oxygen sensor (HO2S), preheating (7/103) • Rear heated oxygen sensor (HO2S), preheating (7/104) • Injectors (8/6-8/11) • Leak diagnostic unit (6/67), (certain markets only) • Evaporative emission system (EVAP) valve (8/18) • Camshaft reset valve (CVVT) (8/19) (certain engines only) • Camshaft reset valve (CVVT) (8/81) (certain engines only) • Turbocharger (TC) control valve (8/28) • Ignition coils (20/3-20/8) • Driver information module (DIM) (5/1), emissions warning lamp • Fuel pump control module (6/33) (only vehicles with demand controlled fuel pumps) • Central electronic module (CEM) (4/56).
Via Controller Area Network (CAN) communication:	**Via Controller Area Network (CAN) communication:**
• Transmission Control Module (TCM) (4/28) (only cars with automatic transmissions) • Brake control module (BCM) (4/16) • Central electronic module (CEM) (4/56) • Suspension module (SUM) (4/84) (vehicle with Four-C (Continuously Controlled Chassis Concept) only). Via central electronic module (CEM) (4/56): • Climate Control Module (CCM) (3/112) • Data link connector (DLC) (17/13) • Driver information module (DIM) (5/1) • Steering wheel module (SWM) (3/130).	• Transmission Control Module (TCM) (4/28) (only cars with automatic transmissions) • Brake control module (BCM) (4/16) • Central electronic module (CEM) (4/56) • Differential electronic module (DEM) (4/82) (AWD only) • Suspension module (SUM) (4/84) (vehicle with Four-C (Continuously Controlled Chassis Concept) only). Via central electronic module (CEM) (4/56): • Climate Control Module (CCM) (3/112) • Data link connector (DLC) (17/13) • Driver information module (DIM) (5/1) • Steering wheel module (SWM) (3/130).

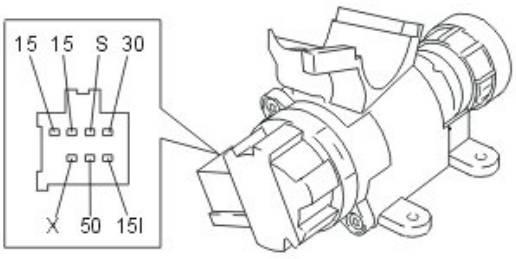
Part 1

Design

Ignition switch

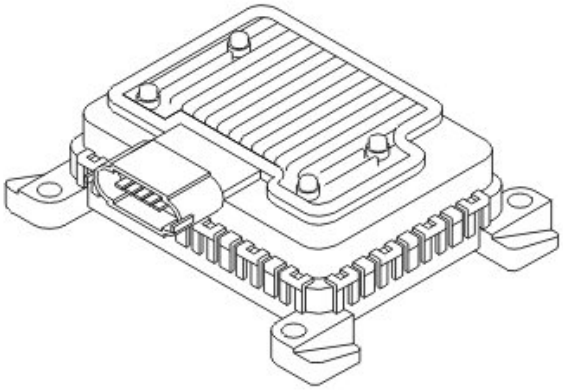


The Engine Control Module (ECM) uses the signal from the ignition switch to detect when the ignition key has been turned to position II or III. When the key is in the ignition position (position II) or starting position (position III) a high signal (Ubat) is transmitted from the ignition switch to the engine control module (ECM). The engine management system prepares for start-up (for example, temporarily activates the fuel pump (FP) relay). When the flywheel in the engine rotates, the engine speed (RPM) sensor signal is used to keep the fuel pump (FP) relay activated.
The fuse in the fusebox in the passenger compartment supplies current to the ignition switch.
The central electronic module (CEM) can diagnose the ignition switch.

Immobilizer

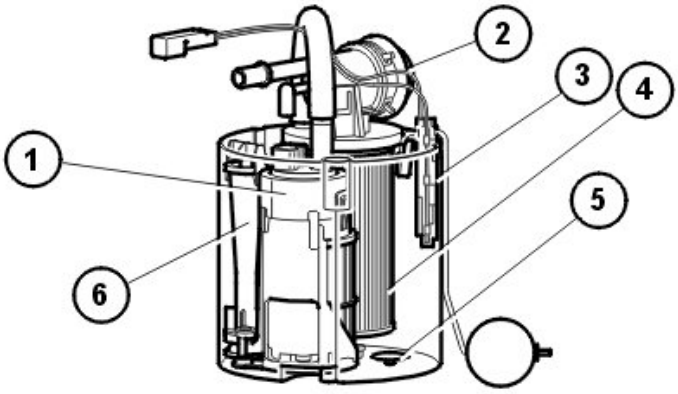
See Design and Function, Immobilizer.

Fuel pump control module (only vehicles with demand controlled fuel pumps)



The fuel pump control module powers the fuel pump and regulates the output of the pump. The fuel pressure changes with the output of the pump.
The fuel pump control module is supplied with battery voltage by the fuel pump (FP) relay and is grounded in the car body. The fuel pump (FP) relay is controlled by the central electronic module (CEM) when requested by the engine control module (ECM).
The engine cannot be started if the power supply to the fuel pump control module is faulty because the fuel pump will not then be powered.
The fuel pump control module is controlled by the engine control module (ECM) via serial communication. The fuel pump control module then controls the fuel pump by transmitting a PWM voltage on the ground lead for the fuel pump. This means that the voltage drop across the pump changes, and with it the output of the fuel pump. Also see Function, B5244T5, B5254T2 See: Function.
There are no diagnostics for the fuel pump control module. The engine control module (ECM) has diagnostics for fuel pressure regulation and the associated components. Also see Fuel pressure regulation, diagnostics See: Diagnostic Functions/Fuel Pressure Regulation, Diagnostics.
The pulse-width modulated (PWM) signal from the engine control module (ECM) to the fuel pump control module can be read using VIDA.
The fuel pump control module is on the outside on the right-hand side of the fuel tank.

Fuel pump (only vehicles with demand controlled fuel pumps)

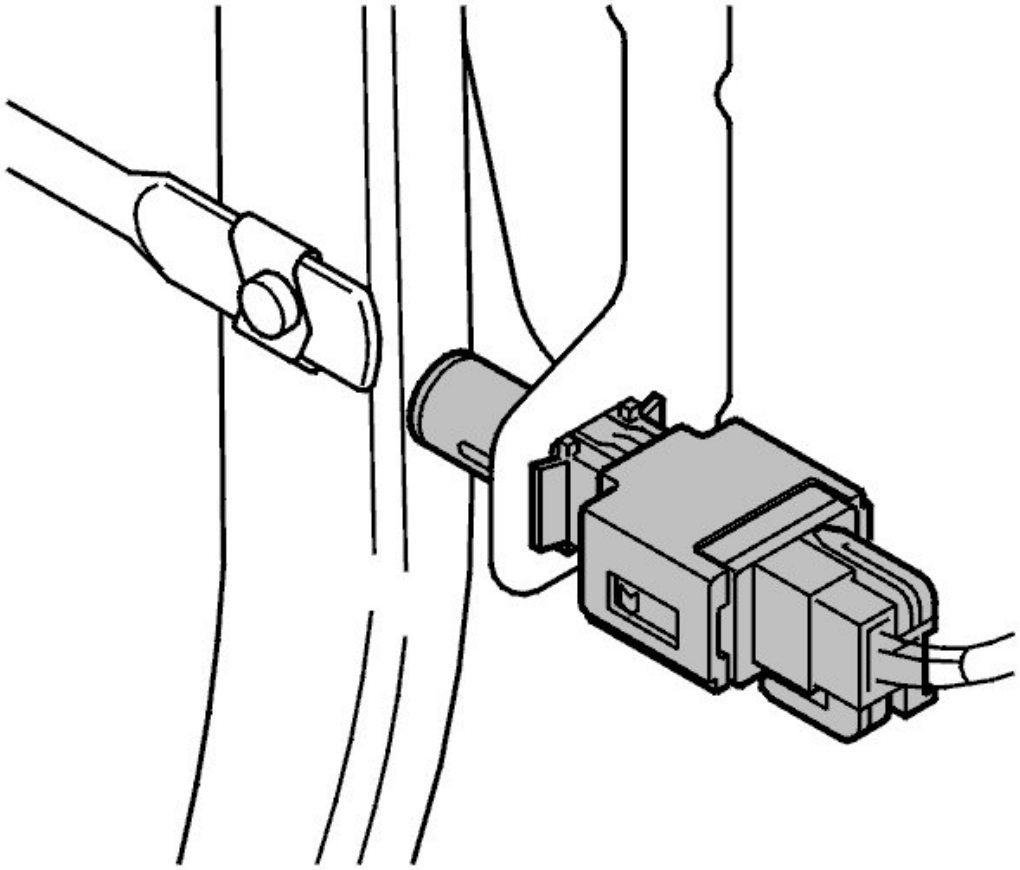


The function of the fuel pump is to ensure that the pressure is correct at the delivery lines for the injectors when requested by the fuel pump control module.
The fuel pump consists of:

1. An electrical pump with an integrated safety valve
2. A pressure equalization valve. This valve equalizes rapid pressure peaks which occur, for example, when the injectors close during engine braking. It also contains a non-return valve which ensures that the pressure in the system does not drop when the engine is switched off
3. Fuel level sensor
4. Fuel filter, cannot be replaced separately
5. Relief valve, releases fuel into the pump housing
6. Ejector pump, continuously fills the pump housing with fuel. The fuel always flows from the fuel pump through the ejector and back to the pump housing.

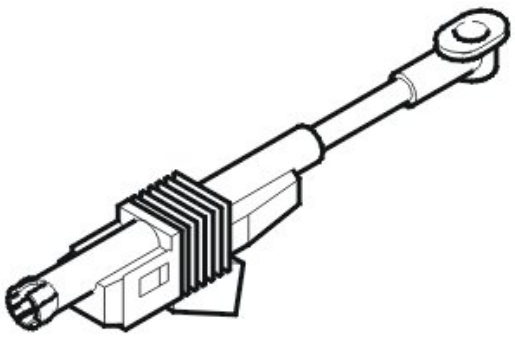
The fuel pump is supplied with battery voltage by the fuel pump control module and is grounded in the car body.
The engine control module (ECM) has diagnostics for the fuel pump function to ensure that the pressure is correct. Also see Fuel pressure regulation, diagnostics See: Diagnostic Functions/Fuel Pressure Regulation, Diagnostics.
The fuel pump can be activated and its status read off using VIDA.
The pressure in the fuel rail can be measured by connecting a manometer to a nipple. This nipple is on the right-hand end of the fuel rail.

Brake light switch



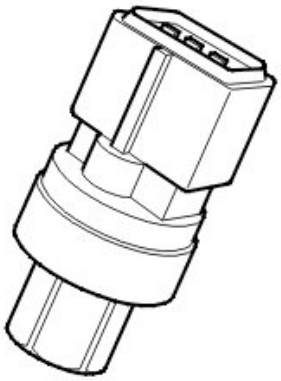
The task of the brake light switch is to provide the engine control module (ECM) with information about the position of the brake pedal.
A signal is transmitted to the engine control module (ECM) when the brake pedal is pressed. The engine control module (ECM) disengages the cruise control (if activated). The brake pedal sensor also disengages cruise control. For further information, see Design and Function, Brake system, design.
The brake light switch is supplied with power from the ignition switch (terminal 30). When the brake pedal is depressed the switch closes and a high signal (12 V) is transmitted to the engine control module (ECM).
The engine control module (ECM) can diagnose the brake light switch. The status of the switch can be read using VIDA.
The brake light switch is on the pedal box by the brake pedal.

Clutch pedal sensor (manual transmissions only)



The clutch pedal sensor provides the Engine Control Module (ECM) with information about the position of the clutch pedal.
This information is used by the control module to switch off the cruise control.
The sensor signal is also used by the control module to prevent engine start if the clutch pedal is not pressed (certain markets).
The sensor consists of a sliding potentiometer which is supplied with power by the control module (signal) and which is grounded in the control module.
The resistance in the sensor drops when the clutch pedal is pressed.
The engine control module (ECM) can diagnose the clutch pedal sensor. The status (position) of the sensor can be read using VIDA.
The sensor is on the pedal box by the clutch pedal.

Air conditioning (A/C) pressure sensor



The air conditioning (A/C) pressure sensor detects the pressure in the high-pressure side of the air conditioning (A/C) system. This is so the engine control module (ECM) can control:

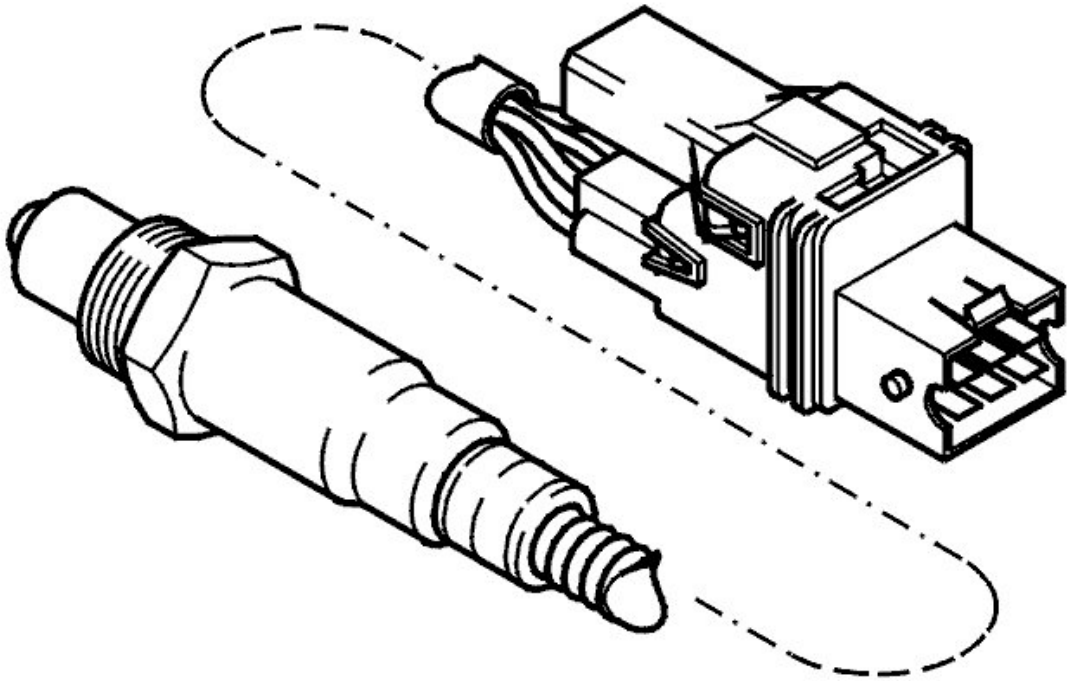
- engine cooling fan (FC) start
- stopping the compressor if the pressure in the air conditioning (A/C) is too high
- constant idle speed compensation for the air conditioning (A/C) compressor load.

The sensor is linear. It is grounded in the control module and supplied with a 5 Volt current from the control module. A linear signal (between 0-5 V depending on the pressure in the air conditioning (A/C)) is transmitted to the control module. At 0.25 kPa or lower, the voltage is 0 V, at 3100 kPa the voltage is approximately 4.75 V. Low pressure results in low voltage, high pressure in high voltage.
The engine control module (ECM) can diagnose the air conditioning (A/C) pressure sensor. The sensor value can be read off using VIDA.
The air conditioning (A/C) pressure sensor is positioned on the high pressure delivery line for the air conditioning (A/C) system.

Heated oxygen sensors (HO2S)

- 5 cylinder engines have two heated oxygen sensors (HO2S), front and rear
- 6 cylinder engines have four heated oxygen sensors (HO2S), front and rear for bank 1 (cylinders 1-3) and front and rear for bank 2 (cylinders 4-6)
- XC90s with 6 cylinder engines utilize the Y-concept, where the engine has two heated oxygen sensors (HO2S) bank 1 (cyl. 1 -3), bank 2 (cyl. 4 -6) and a rear heated oxygen sensor (HO2S) (bank 1).

Front heated oxygen sensor (HO2S)



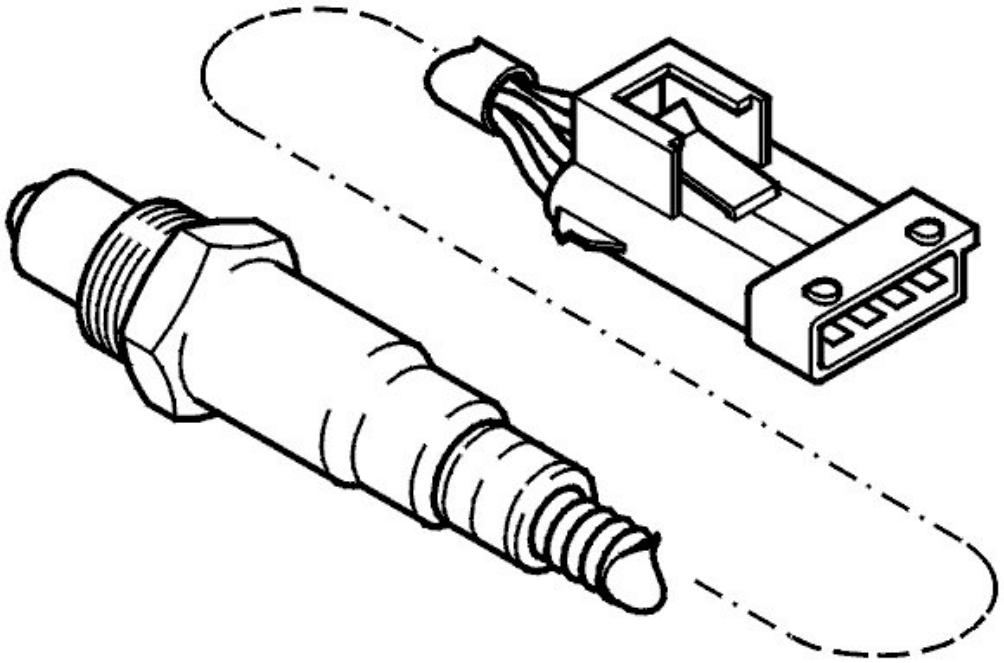
The front heated oxygen sensor (HO2S) is used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases in front of the three-way catalytic converter (TWC). This is so that the Engine Control Module (ECM) can continually check the combustion so that lambda=1. lambda=1 is the ideal fuel-air ratio, with 14.7 kg air/1 kg fuel.
The heated oxygen sensor uses current regulation and its signal characteristic is linear. With a linear signal characteristic, the amplitude of the

signal curve is low when changing the oxygen content in the exhaust gases. The probe consists of a preheating element (see "Pre-heating heated oxygen sensors (HO2S)") and the actual lambda sensor. The lambda sensor is an oxygen sensitive ceramic body consisting of zirconium oxide. The control module supplies power to the ceramic body, which reacts to the oxygen content of the exhaust gases. This in turn affects the signal to the engine control module (ECM). In order to determine the oxygen content in the exhaust pipe, the heated oxygen sensor needs reference air from the surrounding air. This reference air reaches the heated oxygen sensor via the wiring.

Caution! The wiring for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

The engine control module (ECM) can diagnose the heated oxygen sensor. For further information, see Heated oxygen sensor (HO2S) diagnostic See: Diagnostic Functions/Heated Oxygen Sensor (HO2S) Diagnostic. VIDA can be used to read off the calculated lambda value from the heated oxygen sensor.

Rear heated oxygen sensor (HO2S)



The rear heated oxygen sensor (HO2S) is used to provide the Engine Control Module (ECM) with information about the remaining oxygen content of the exhaust gases beyond the three-way catalytic converter (TWC). This information is used by the Engine Control Module (ECM) to check the function of the three-way catalytic converter (TWC). This check is carried out when the conditions for the catalytic converter diagnostics have been met. The rear heated oxygen sensor (HO2S) has no direct effect on regulation of the fuel/air mixture. However the Engine Control Module (ECM) uses the signal to optimize the signal from the front heated oxygen sensor (HO2S). For further information, see:
For S60/ S80/ V70/ V70XC/ XC70: Three-way catalytic converter (TWC) diagnostics See: Diagnostic Functions/Three-Way Catalytic Converter (TWC) Diagnostics.
For XC90: Catalytic converter diagnostic See: Diagnostic Functions/Three-Way Catalytic Converter (TWC) Diagnostics.
The heated oxygen sensor (HO2S) uses voltage control. The signal characteristic is binary. With a binary signal characteristic, the amplitude of the signal curve changes considerably when changing the oxygen content in the exhaust gases. Otherwise its components and function are the same as the front heated oxygen sensor (HO2S).

Caution! The wiring for the heated oxygen sensors (HO2S) must not be trapped or damaged in any way. The connectors for the heated oxygen sensors (HO2S) must not be greased under any circumstances. The oil in the grease would disrupt the reference air and the function of the heated oxygen sensors (HO2S).

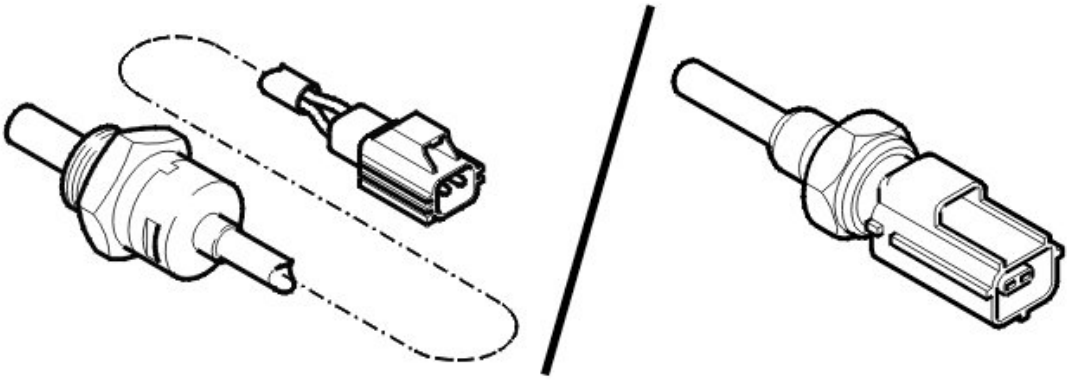
The engine control module (ECM) can diagnose the rear heated oxygen sensor. The signal can be read using VIDA.

Preheating of the heated oxygen sensors (HO2S)

The heated oxygen sensor (HO2S) only functions above a certain temperature, approximately 300 °C. The normal operating temperature is between 300-900 °C. The heated oxygen sensors (HO2S) are electrically pre-heated so that operating temperature is rapidly reached. This also ensures that the heated oxygen sensors (HO2S) maintain a normal operating temperature and to prevent condensation which could damage the heated oxygen sensor (HO2S).

The heater element in the probe consists of a positive temperature coefficient (PTC) resistor. The system relay supplies the heater element with voltage. The element is grounded in the engine control module (ECM). When the control module grounds the connection a current flows through the PTC resistor. When the heated oxygen sensor (HO2S) is cold, the resistance in the PTC resistor is low and a large current will flow through the circuit. The current from the Engine Control Module (ECM) is pulsed at first to prevent condensation damage to the heated oxygen sensor (HO2S). Depending on the temperature, allowances are made for factors such as the dew point. As the temperature in the PTC resistor rises, the resistance rises, the current falls and switches in stages to a constant current. The pre-heating time for the front heated oxygen sensor (HO2S) is short, approximately 20 seconds.
Probe preheating begins as soon as the engine is started. The heater element heats the heated oxygen sensors (HO2S) to approximately 350 °C. The probes maintain this as a minimum temperature.
The engine control module (ECM) can diagnose the heater element.

Engine coolant temperature (ECT) sensor

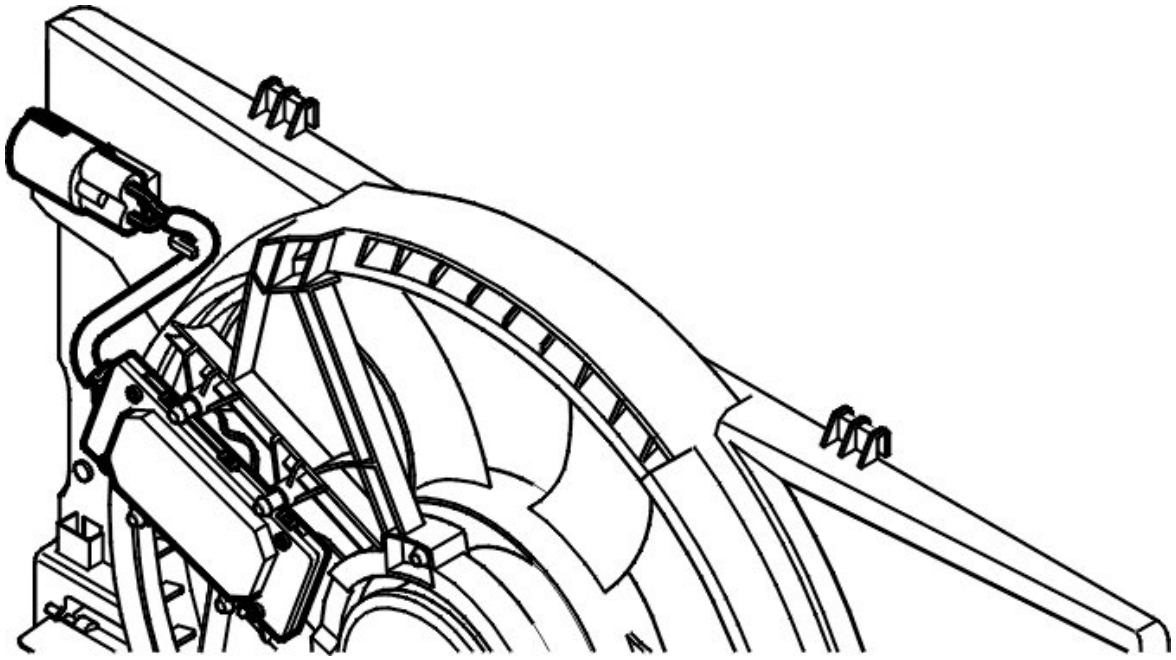


The engine coolant temperature (ECT) sensor checks the temperature of the engine coolant. The temperature of the engine coolant is required so that the engine control module (ECM) can regulate:

- the injection period
- the idle speed
- the engine cooling fan (FC)
- the ignition advance
- engagement and disengagement of the A/C compressor
- diagnostic functions.

The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.
The resistance in the sensor changes depending on the temperature of the coolant. Depending on the resistance in the sensor, a voltage (signal) is transmitted to the Engine Control Module (ECM). At 0 °C, the voltage is approximately 4.0 V. At 100 °C the voltage is approximately 0.5 V. Low temperature results in high voltage (high resistance), high temperature in low voltage (low resistance).
The engine coolant temperature (ECT) sensor is located beside the thermostat.
The engine control module (ECM) can diagnose the engine coolant temperature sensor. The sensor value can be read off using VIDA.

Engine cooling fan (FC) / engine cooling fan (FC) control module



The engine cooling fan (FC) has two functions. One is to cool the engine compartment, the other is to cool the condenser when the air conditioning

(A/C) compressor is working.
The engine control module (ECM) transmits a pulse width modulated (PWM) signal to the engine cooling fan (FC) control module. The control module then activates the fan at different speeds. The speed of the engine cooling fan (FC) is determined by the engine control module (ECM), depending on the coolant temperature (based on the signal from the engine coolant temperature (ECT) sensor) and the vehicle speed.
The temperature conditions for engagement of the different engine cooling fan (FC) stages may vary slightly, depending on the engine variant and the equipment level.
The temperature conditions apply when:

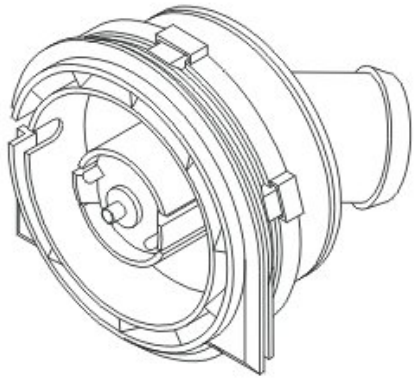
- the A/C is off
- no faults are detected by the Engine Control Module (ECM).

Note! The engine cooling fan may have a post-run of up to approx. 6 minutes after the engine has been turned off. The time for the fan's post-run depends on engine temperature, temperature in the engine compartment and pressure level in the AC-system.

Warning! Be careful since the engine cooling fan may have a post-run after the engine has been turned off.

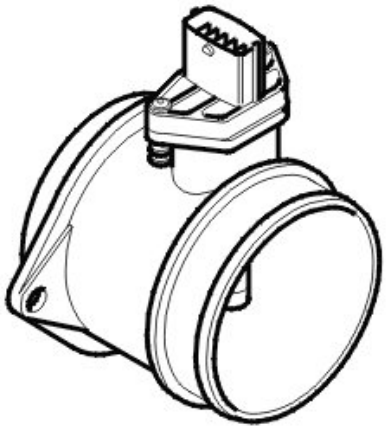
The engine cooling fan (FC) and its control module are behind the radiator.
The engine control module (ECM) can diagnose the engine cooling fan. The fan can be activated using VIDA.

Cooling fan for control modules, turbocharger (TC) (certain markets only)



The function of the cooling fan is to cool the control modules in the control module box in the engine compartment. The control modules may be damaged if they overheat.
The engine control module (ECM) activates the fan depending on the signal from the engine coolant temperature (ECT) sensor and the temperature sensor in the control module.
The cooling fan is in the hose between the control module box and the firewall.
The engine control module (ECM) can diagnose the cooling fan. The fan can be activated using VIDA.
A diagnostic trouble code (DTC) is stored if the temperature in the engine control module (ECM) gets too high.

Mass air flow (MAF) sensor (2002-2004)



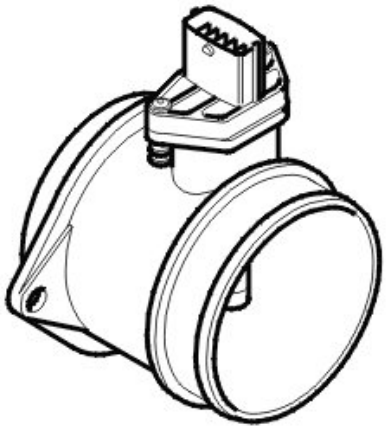
The mass air flow (MAF) sensor gauges the air mass sucked into the engine. It continuously transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

- the injection period
- the ignition timing
- turbocharger (TC) boost pressure (turbocharged engines only)
- the engine load.

The transmission control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the transmission control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).
The mass air flow (MAF) sensor consists of a plastic housing with connectors, test electronics and an aluminum heat sink. The test electronics in

the mass air flow (MAF) sensor consist of a hot film comprised of four resistors. The hot film is cooled by the air flow to the engine.
The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analogue and varies between approximately 1-5 V depending on the air mass. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage. No air flow gives a reading of approximately 1 V.
The mass air flow (MAF) sensor is positioned between the air cleaner (ACL) housing and the intake manifold.
The shape of the mass air flow (MAF) sensor is slightly different on naturally aspirated engines and also contains an air temperature sensor.
The engine control module (ECM) can diagnose the mass air flow (MAF) sensor. The signal can be read using VIDA.

Mass air flow (MAF) sensor (2005-)



The mass air flow (MAF) sensor measures the air mass sucked into the engine. On naturally aspirated engines and 5 cylinder turbocharged engines (except B5254T2/-T4), it also measures the temperature of the intake air.

Air mass

The mass air flow (MAF) sensor transmits signals to the engine control module (ECM) about the mass of the intake air. This data is used by the engine control module (ECM) to calculate:

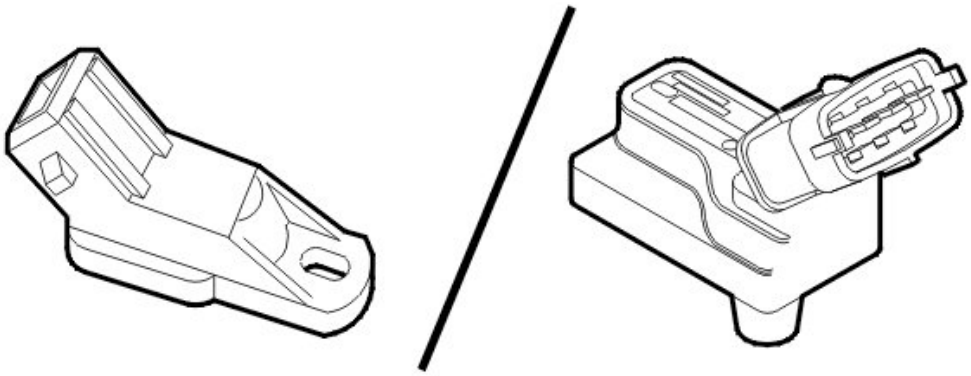
- the injection period
- the ignition timing
- turbocharger (TC) boost pressure (turbocharged engines only)
- the engine load.

The transmission control module (TCM) also uses this data for its gear shift calculations. This data is transmitted to the transmission control module (TCM) from the engine control module (ECM) via the high speed side of the Controller area network (CAN).
The mass air flow (MAF) sensor consists of a plastic housing with connectors, test electronics and an aluminum heat sink. The test electronics in the mass air flow (MAF) sensor consist of a hot film comprised of four resistors. The hot film is cooled by the air flow to the engine.
The mass air flow (MAF) sensor is supplied with battery voltage by the system relay and is grounded in the engine control module (ECM). The signal from the sensor is analogue and varies between approximately 1-5 V depending on the air mass. Low air flow (low mass) results in low voltage, high air flow (high mass) gives high voltage. No air flow gives a reading of approximately 1 V.

Intake temperature

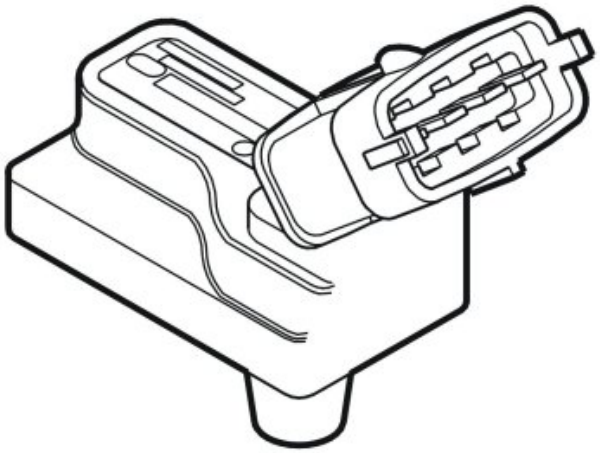
The temperature sensor detects the temperature of the intake air after the charge air cooler (CAC). This data is used by the engine control module (ECM) to calculate the boost pressure control (turbocharger (TC) and to calculate the injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.
The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module. The resistance in the sensor changes according to the temperature of the intake air. This provides the control module with a signal of between 0-5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).
The mass air flow (MAF) sensor is positioned between the air cleaner (ACL) housing and the intake manifold.
The engine control module (ECM) can diagnose the air mass and intake temperature of the mass air flow sensor. The signals can be read using VIDA.

Manifold absolute pressure (MAP) sensor, intake (turbocharged engines only, 2002-2004)



The manifold absolute pressure (MAP) sensor detects the pressure in the intake manifold downstream of the charge air cooler (CAC). The signal from the sensor is primarily used by the engine control module (ECM) to check that the correct boost pressure is reached. The boost pressure is governed by the turbocharger (TC) control valve.
The sensor, which is a piezo resistor, is grounded in the control module and supplied with 5 V from the control module.
The resistance in the sensor changes depending on the pressure in the intake manifold, giving a signal of 0 -5 V. Low pressure results in low voltage, high pressure in high voltage.
The engine control module (ECM) can diagnose the manifold absolute pressure sensor. The sensor signal can be read using VIDA.
The manifold absolute pressure (MAP) sensor is in the intake hose for the throttle body (TB).

Manifold absolute pressure (MAP) sensor, intake (turbocharged engines only, 2005-)



The manifold absolute pressure (MAP) sensor detects the pressure in the intake manifold downstream of the charge air cooler (CAC). On 6 cylinder turbocharged engines and B5254T2/-T4, the temperature of the intake air is also detected.

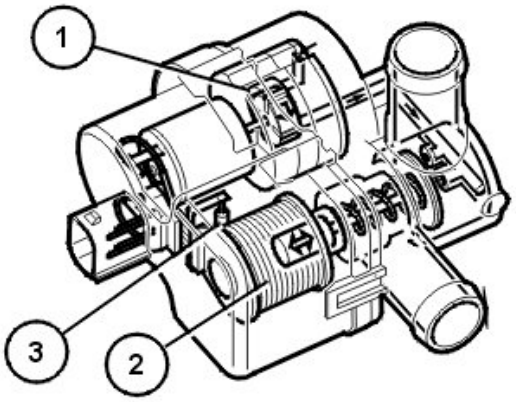
Pressure sensor

The signal from the sensor is primarily used by the engine control module (ECM) to check that the correct boost pressure is reached. The boost pressure is governed by the turbocharger (TC) control valve.
The sensor, which is a piezo resistor, is grounded in the control module and supplied with 5 V from the control module.
The resistance in the sensor changes depending on the pressure in the intake manifold, giving a signal of 0 -5 V. Low pressure results in low voltage, high pressure in high voltage.

Intake temperature

The temperature sensor detects the temperature of the intake air after the charge air cooler (CAC). This data is used by the engine control module (ECM) to calculate the boost pressure control (turbocharger (TC) and to calculate the injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.
The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.
The resistance in the sensor changes according to the temperature of the intake air. This provides the control module with a signal of between 0-5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).
The engine control module (ECM) can diagnose the manifold absolute pressure sensor. The sensor signal can be read using VIDA.
The manifold absolute pressure (MAP) sensor is in the intake hose for the throttle body (TB).

Leak diagnostic unit (certain markets only)



The function of the leak diagnostic unit is to pressurize the fuel tank system during leak diagnostics.
The leak diagnostic unit consists of a plastic housing with:

1. electrical air pump
2. a valve / solenoid which governs the air flow in the unit
3. a heater element (PTC resistor) which warms up the pump.

The electrical pump, valve and heater element in the unit are supplied with voltage by the system relay. The pump, valve and heater element are grounded (control) in the engine control module (ECM).

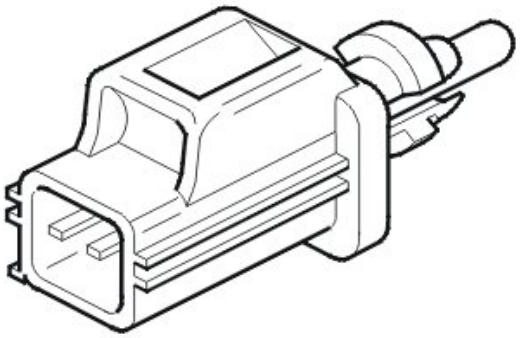
Note! On model years, 2002-2004 the heating element was controlled by the Central electronic module (CEM), but on request from the Engine control module (ECM).

During leak diagnostics the pump in the leak diagnostic unit starts. The valve in the unit is operated by the engine control module (ECM) by grounding the different circuits internally in the engine control module (ECM).
The Engine control module (ECM) checks the fuel tanks system for leaks by pressurizing the system and at the same time monitoring a number of relevant parameters. Also see: Leak diagnostics (certain markets only) See: Diagnostic Functions/Leak Diagnostics (Certain Markets Only)
The engine control module (ECM) can diagnose the leak diagnostic unit.
The valve in the leak diagnostic unit can be activated.
The leak diagnostic unit is at the upper front edge of the fuel tank.

Part 2

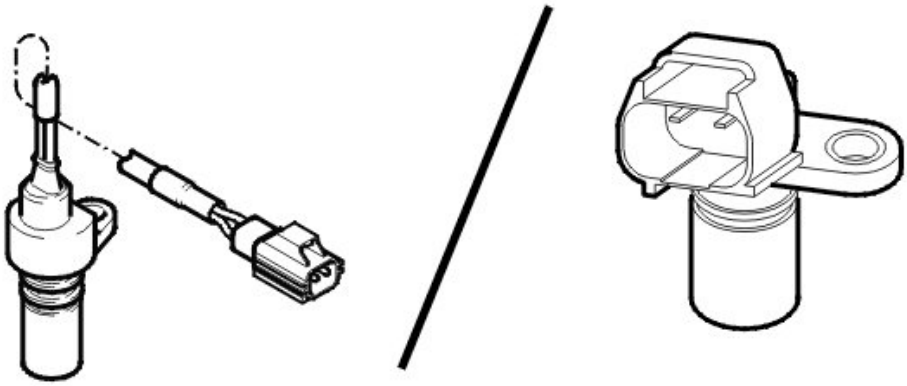
Design (Continued)

Outside temperature sensor



The outside temperature sensor detects the temperature in the surrounding air. The signal is used by the engine control module (ECM) as a substitute value in the event of a fault in certain components or functions and to control certain diagnostic functions.
The sensor is a negative temperature coefficient (NTC) type which is supplied with power from the control module (signal) and is grounded in the control module.
The resistance in the sensor, which provides a signal between 0-5 V, changes depending on the outside temperature. Low temperatures produce high voltage (high resistance), high temperatures produce low voltage (low resistance).
The outside temperature sensor is positioned in the left door mirror.
The engine control module (ECM) can diagnose the outside temperature sensor. The sensor value can be read off using VIDA.

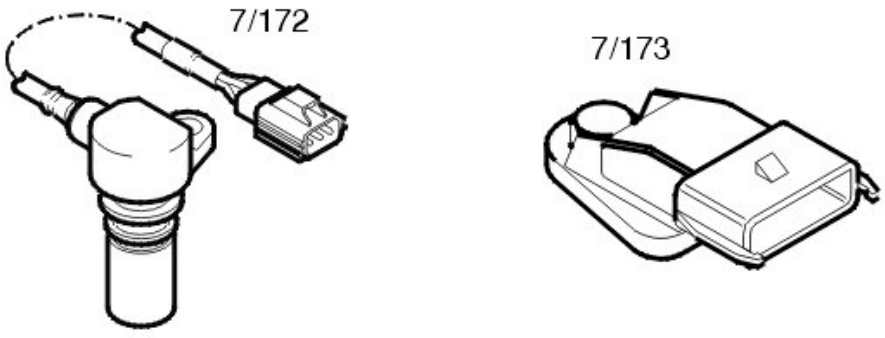
Engine speed (RPM) sensor



The engine speed (RPM) sensor provides the Engine Control Module (ECM) with information about the speed and position of the crankshaft. The Engine Control Module (ECM) is able to use the signal from the engine speed (RPM) sensor to determine when a piston is approaching top dead center (TDC). However it is unable to use the signal from the engine speed (RPM) sensor to determine whether the piston is in the combustion stroke or whether the exhaust valve is open (exhaust stroke). The signal from the camshaft position (CMP) sensor is also required to determine the operating cycle of the engine.
The signal from the engine speed (RPM) sensor is also used to check the engine for misfires. For further information, see Misfire diagnostics See: Diagnostic Functions/Misfire Diagnostics.
Cars with manual transmissions have a series of holes drilled in the periphery of the flywheel. Cars with automatic transmissions have a steel ring with punched holes. This steel ring is welded to the edge of the carrier plate. In both cases, there is 6° between each hole. This arrangement creates a hole for each tooth. There are 360° in one revolution. 6° between each hole means that there are 60 holes. However one hole is not drilled/punched, to create a reference position (tooth) for the crankshaft. This reference position is 72° before the top dead center (TDC) of cylinder 1 on a 5 cylinder engine.
The engine speed (RPM) sensor is at the rear of the engine above the flywheel.
The sensor is inductive with a permanent magnet. An alternating current is induced in the sensor when the flywheel/carrier plate passes the engine speed (RPM) sensor. The generated voltage and frequency increases with the engine speed (rpm). The signal varies between 0.1-100 V depending on the engine speed (RPM).
The Engine Control Module (ECM) is able to determine the engine speed (RPM) by counting the number of holes per time unit. When the reference tooth passes the engine speed (RPM) sensor, the voltage and frequency drop momentarily to zero, even though the engine is still running. This allows the engine control module (ECM) to determine the position of the crankshaft.
The following applies to model year 2002 onwards:

If the signal from the engine speed (RPM) sensor is incorrect or missing, the control module will use the signals from the camshaft position (CMP) sensor, on the condition that the position of the camshaft has been adapted and the car can be driven if there is no signal.
The engine control module (ECM) can diagnose the engine speed (RPM) sensor. The sensor value (engine speed (rpm)) can be read off using VIDA.

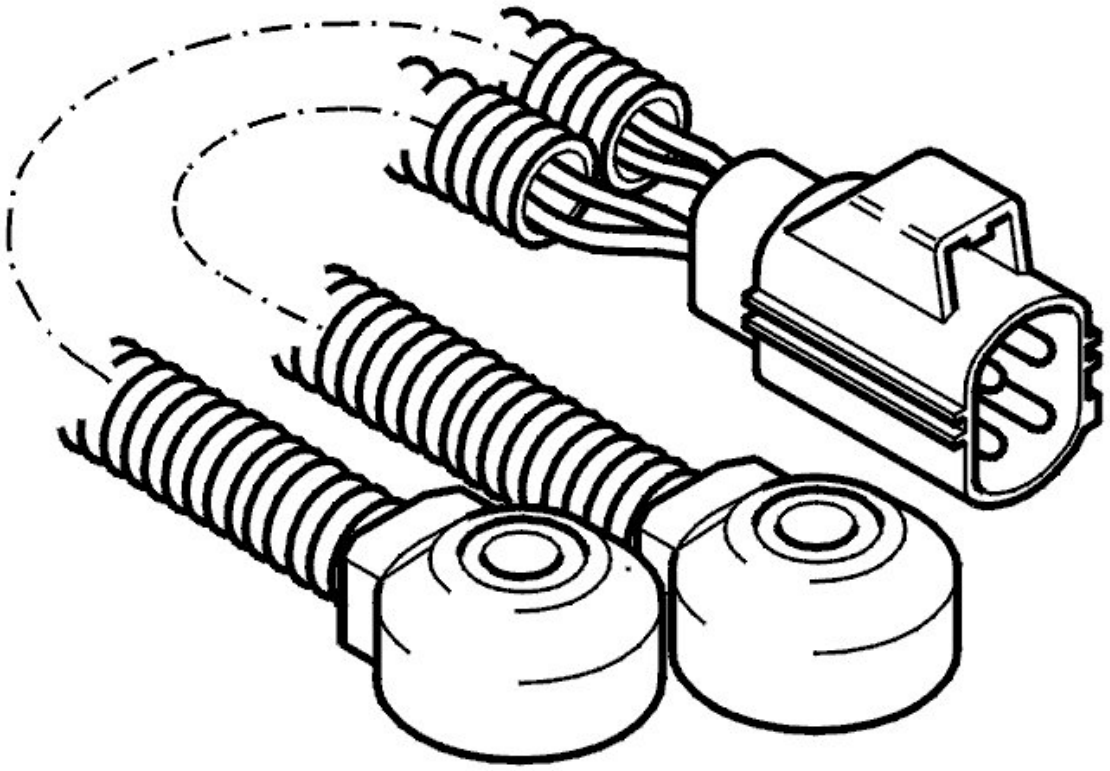
Camshaft sensor



The function of the camshaft position (CMP) sensor is to detect the camshaft flanks. The signal from the sensor is used by the engine control module (ECM) to determine the radial position of the camshaft.
Each camshaft has four flanks per camshaft revolution. A pulse wheel on the camshaft consisting of four teeth (the teeth are positioned by each flank) is used by the camshaft position sensor (CMP) to detect the flanks.
The flanks are not symmetric on the camshaft. This allows the control module to determine which flank has been detected and therefore which operating cycle the camshaft is in.
When the operating cycle of the camshaft is established, the control module is able to determine which cylinder should be ignited. In the event of misfire or engine knock, the control module is also able to determine which cylinder is misfiring or knocking. Also see Knock sensor (KS) and Engine speed (RPM) sensor.
Data about the position of the camshaft is used during camshaft control (CVVT). See Function, B5244T5, B5254T2 See: Function.
The sensor, which is a magnetic resistor with a permanent magnet, is grounded in the control module and supplied with 5 V from the control

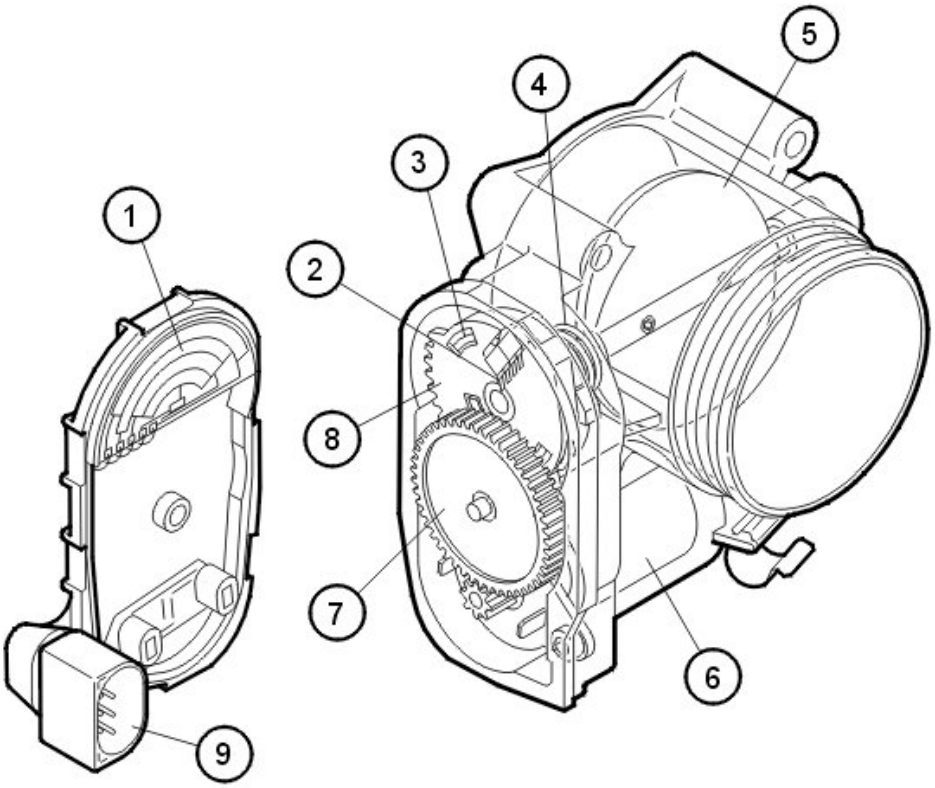
module. When one of the teeth on the camshaft pulse wheel passes the camshaft position (CMP) sensor, a signal is transmitted to the control module from the camshaft position (CMP) sensor. The signal varies between 0-1 V and is low when a flank passes the camshaft position (CMP) sensor.
The camshaft position (CMP) sensor is positioned at the rear of the engine by the controllable camshaft (CVVT).
The engine control module (ECM) can diagnose the camshaft position (CMP) sensor.

Knock sensor (KS)



The function of the knock sensor (KS) is to monitor combustion knocking from the engine. Knocking may damage the engine and reduces the efficiency of engine combustion.
If the engine control module (ECM) registers knocking from any of the cylinders, the ignition will be retarded for that cylinder at the next combustion stage. If repeated ignition retardation does not prevent knocking, the injection period will be increased. This has a cooling effect. On turbocharged engines the boost pressure will also be lowered, reducing the engine load.
The sensor is made up of a Piezo electrical crystal. If there is engine knock, vibrations (sound waves) spread through the cylinder block to the knock sensor (KS). The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. This signal is transmitted to the engine control module (ECM). The signal corresponds to the frequency and amplitude of the sound waves. This allows the Engine Control Module (ECM) to determine if the engine is knocking. The camshaft position (CMP) sensor and engine speed (RPM) sensor are used to determine the operating cycle of the engine (which cylinder is igniting) and thereby which cylinder is knocking.
The knock sensors (KS) are positioned on the cylinder block below the intake manifold.
The engine control module (ECM) can diagnose the knock sensors (KS).

Electronic throttle unit



250 1298

The electronic throttle unit, using the control signal from the engine control module (ECM), regulates the amount of air for engine combustion. This is done using an electronic shutter.
The electronic throttle unit consists of a round throttle disc on a shaft. This is turned using a DC motor (damper motor), gear wheel and two springs, an opening spring and a return spring. The damper motor is controlled by the engine control module (ECM) and is supplied with power by an integrated power stage in the control module. At one of the limit positions the throttle disc is closed so that no air can pass the throttle unit. At the other limit position the throttle disc is parallel to the air flow so that the air is able to freely pass through the throttle unit. The throttle disc shaft is mechanically connected to two built-in potentiometers (position sensors) which are supplied with power by the control module. The signals from the potentiometers provide the control module with data about the position of the throttle disc. The electronic throttle unit has a connector with six gold plated pins.

Note! A damaged terminal pin surface can interfere with the function

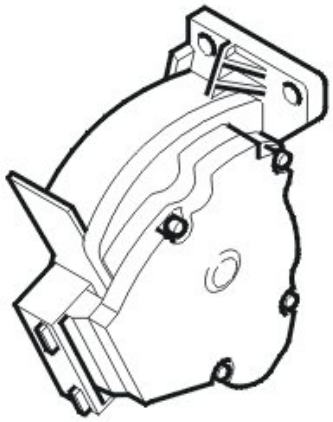
1. Current channels, potentiometers
2. Contact strips, potentiometers
3. Spring
4. Spring
5. Throttle disc
6. Damper motor
7. Gear wheel
8. Gear sector
9. Connector.

The electronic throttle unit is located on the engine intake manifold.
In the event of a fault, the throttle unit must be replaced as a single unit.
The engine control module (ECM) can diagnose the electronic throttle unit.

Throttle position (TP) sensor

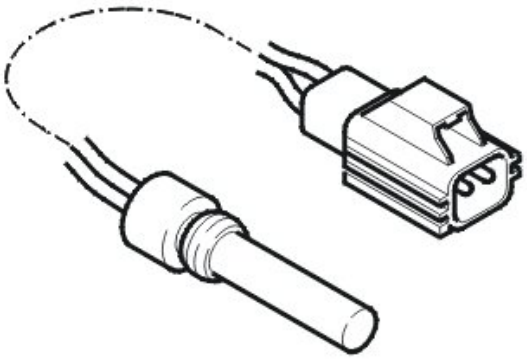
See Electronic throttle unit.

Accelerator pedal (AP) position sensor



The function of the accelerator pedal (AP) position sensor is to provide the engine control module (ECM) with information about the position of the accelerator pedal. This data is used by the control module to deploy the shutter in the throttle unit to the correct angle.
The sensor consists of a plastic housing with two potentiometers, an Analog/Digital converter and circuits. The potentiometers are connected to a shaft which is affected by the position of the accelerator pedal (AP). The resistance in the potentiometers changes with the position of the accelerator pedal (AP).
The accelerator pedal (AP) position sensor transmits an analogue and a digital signal (pulse width modulated (PWM) signal) to the control module. These signals indicate the position of the accelerator pedal (AP). The digital signal is generated by the sensors Analog/Digital converter.
The analog and digital signals are used at the same time by the control module to regulate the throttle shutter angle.
The sensor is supplied with 12 V by the system relay via a fuse and is grounded to the body.
The digital signal is also used in conjunction with the analog signal for accelerator pedal position sensor diagnostics. The accelerator pedal (AP) position sensor signals can be read off using VIDA. A diagnostic trouble code (DTC) is stored if the engine control module (ECM) detects a difference between the analog and digital signals. The engine control module (ECM) then uses a minimal value to ensure the function (limp home).
The accelerator pedal (AP) position sensor is located on the accelerator pedal bracket.

Engine coolant level sensor

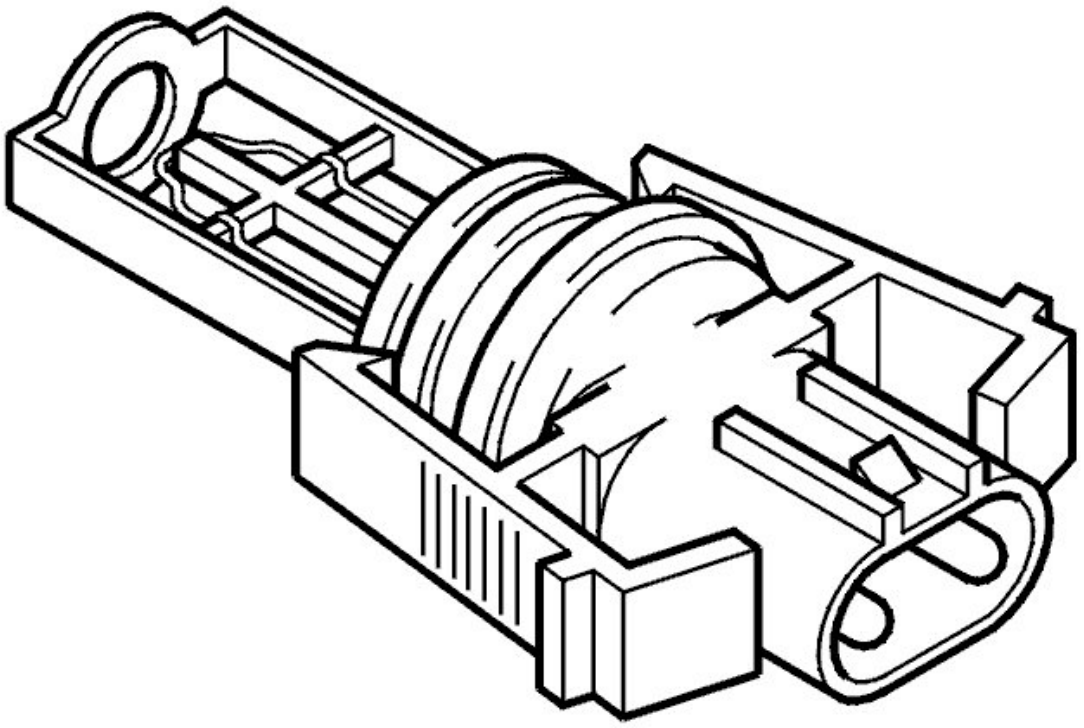


The function of the engine coolant level sensor is to alert the driver if the engine coolant level in the expansion tank is too low.
The sensor is a magnetic reed switch, which is enclosed in a pipe on the bottom of the expansion tank. Around the pipe, on the inside of the expansion tank is a float. This float contains a magnet. When the engine coolant level is above minimum, the float is too high in the tank to affect the switch. However if the engine coolant level falls below the minimum level, the magnetic field acts on the switch.
The sensor is supplied with voltage (signal) from the Engine Control Module (ECM) and grounded in chassis. When the engine coolant level in the expansion tank is over a certain level the circuit closes, which produces a low signal. When the engine coolant level is below a certain level the circuit is opened by the engine coolant level sensor, which produces a high signal. When the engine control module (ECM) detects a high signal the information about low engine coolant level is transmitted via the Controller area network (CAN) to the driver information module (DIM), which warns the driver.

Note! There are no functions controlled by the engine which are directly connected to the low coolant level warning lamp. The Engine Control Module (ECM) only transfers the signal which is used by the Driver Information Module (DIM).

The following applies from model year 2005-
The signal of the engine coolant level sensor can be read using VIDA.
The engine control module (ECM) cannot diagnose the engine coolant level sensor.

Temperature sensor, intake (turbocharged engines only, 2002-2004)

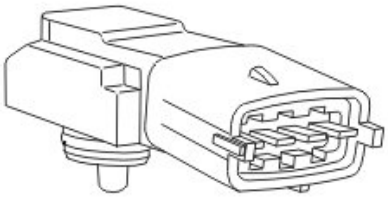


On naturally aspirated engines, the intake air temperature sensor is integrated in the mass air flow (MAF) sensor. On model year 2002 turbocharged engines, the temperature sensor is a stand-alone component. On turbocharged engines from model year 2003, the temperature sensor is integrated in the intake air pressure sensor.
The temperature sensor detects the temperature of the intake air after the charge air cooler (CAC). This data is used by the engine control module (ECM) to calculate the boost pressure control (turbocharger (TC) and to calculate the injection period. The control module also controls certain diagnostic functions using the signal from the temperature sensor.
The sensor, which is an NTC resistor, is grounded in the control module and supplied with power (signal) from the control module.
The resistance in the sensor changes according to the temperature of the intake air. This provides the control module with a signal of between 0-5 V. The lower the temperature the higher the voltage (high resistance). A high temperature results in low voltage (low resistance).
The temperature sensor is between the air cleaner (ACL) housing and the intake manifold (does not apply to turbocharged engines 2003-). The temperature sensor on turbocharged engines 2003- is integrated in the intake air pressure sensor.
The engine control module (ECM) can diagnose the temperature sensor. The sensor signal can be read using VIDA.

Part 3

Design (Continued)

Fuel pressure sensor / fuel temperature sensor (only vehicles with demand controlled fuel pumps)



The fuel pressure sensor is combined and consisted of both the fuel pressure sensor and the fuel temperature sensor. The sensor detects the fuel pressure (the absolute pressure) and the temperature of the fuel in the fuel rail.

Fuel pressure sensor

The pressure sensor is a Piezo resistive type resistor, the resistance of which changes with the pressure. Depending on the pressure in the fuel rail, an analog signal of 0-5 V is transmitted. Low pressure results in low voltage, high pressure in high voltage.
The engine control module (ECM) then uses this signal to adjust the pressure in the fuel rail using the fuel pump control module. Also see Function, B5244T5, B5254T2 See: Function.
The pressure sensor is supplied with 5 V and grounded in the engine control module (ECM). The pressure sensor transmits a signal indicating the fuel pressure to the engine control module (ECM) on a separate cable.
The engine control module (ECM) can diagnose the fuel pressure sensor. Its signals (pressure and temperature) can be read using VIDA.

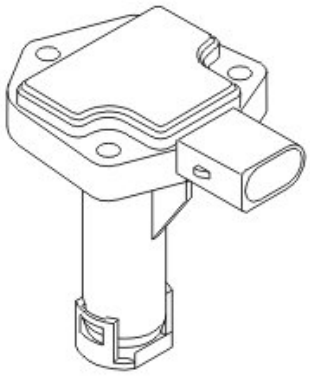
Note! The absolute pressure is displayed when using VIDA parameter readout to read off the fuel pressure. If there is no pressure at the fuel rail, the atmospheric pressure will be displayed.

Hint: The relative pressure (absolute pressure minus atmospheric pressure) is displayed when reading off the fuel pressure via a manometer connected to the fuel rail.

Fuel temperature sensor

The temperature sensor is an NTC sensor. The sensor is supplied with voltage (signal) from and grounded in the engine control module (ECM). The resistance in the sensor changes according to the temperature of the fuel. This provides the engine control module (ECM) with a signal of between 0-5 V. Low temperature results in high voltage (high resistance). High temperature results in low voltage (low resistance).
The engine control module (ECM) uses the signal to calculate the volume of the fuel.
The fuel pressure sensor is on the left-hand end of the fuel rail.

Oil level sensor (2004-, certain markets and models only)

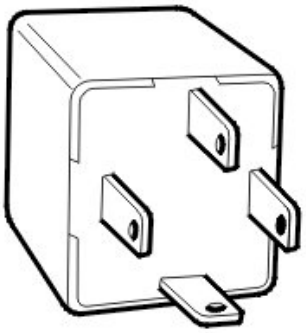


The oil level sensor provides the engine control module (ECM) with information about the quality and temperature of the engine oil and the oil level in the oil trough. Which of these functions is used by the sensor varies between different car models.
All three functions are combined in one unit with a sensor section and an electronics section. There are no moving parts in the sensor.
The sensor consists of:

- a terminal with three pins
- integrated electronics
- 2 capacitive gauge elements
- a PTC resistor.

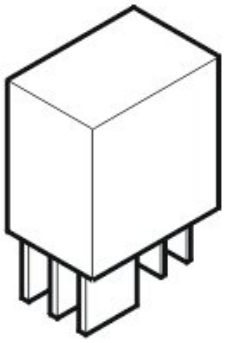
The oil level sensor is supplied with 5 V by the engine control module (ECM). The oil level sensor generates a PWM signal for the engine control module (ECM). Also see Function, B5244T5, B5254T2 See: Function.
The engine control module (ECM) can diagnose the functions of the oil level sensor. Also see Oil level sensor, diagnostics See: Engine, Cooling and Exhaust/Engine/Engine Lubrication/Oil Level Sensor/Testing and Inspection.
The pulse-width modulated (PWM) signal from the oil level sensor can be read using parameter readout.

Main relay (system relay)



The function of the main relay (system relay) is to supply certain components with voltage.
The relay is mechanical and has a closing function. In the rest position the circuit in the relay is open.
The main relay terminals (#30 and #86) are supplied with voltage by the battery. When the ignition key has been turned and the Engine Control Module (ECM) is powered, the terminal (#85) on the main relay is grounded by the Engine Control Module (ECM).
When the terminal (#85) is grounded, the relay is activated and a number of components are powered via the relay terminal (#87).
The engine control module (ECM) can diagnose the main relay.
The main relay is in the relay/fusebox in the engine compartment.

Air conditioning (A/C) relay

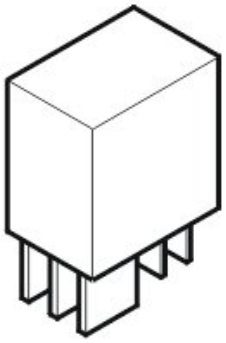


The air conditioning (A/C) relay supplies the A/C compressor with voltage. The relay is controlled by the engine control module (ECM) based on information from different signals:

- the climate control module (CCM) (via the control area network (CAN))
- the engine coolant temperature
- the position of the accelerator pedal (AP)
- the pressure in the system.

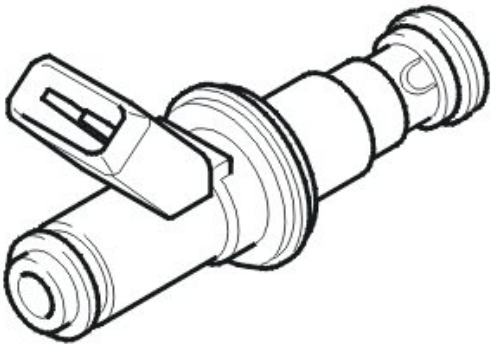
The Engine Control Module (ECM) can temporarily disengage the A/C compressor during wide open throttle (WOT) acceleration.
The relay is mechanical. It has a closing / breaking function and is supplied with power from the system relay.
In the rest position the circuit in the relay is open.
The system relay supplies the coil and the relay with power. The relay activates when the coil is grounded in the engine control module (ECM), the circuit closes and the A/C compressor is supplied with power via the relay voltage output.
The relay coil is grounded (signal) when the engine control module (ECM) receives a signal via the Controller area network (CAN) from the climate control module (CCM) to activate the relay and start the compressor.

Fuel pump (FP) relay, (2002-2004)



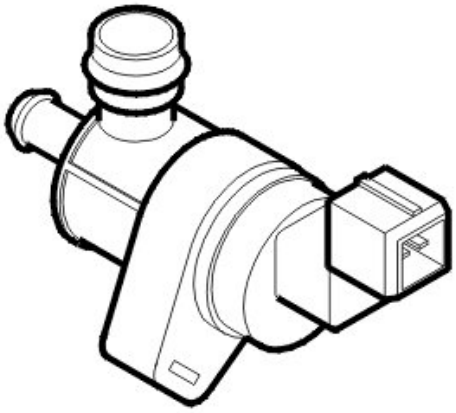
For information about the fuel pump (FP) relay for model year 2005-, see Design and Function, central electronic module (CEM).
The following applies for model year 2002-2004
The fuel pump (FP) relay supplies the fuel pump with power. The relay also cuts the power to the pump when the ignition is switched off or if the engine stops. In cars with demand controlled fuel pumps, the above function applies to the fuel pump control module. The central electronic module (CEM) also cuts the power to the relay if the supplemental restraint module (SRS) transmits a message indicating that an airbag has deployed.
The central electronic module (CEM) activates and deactivates the relay when requested by the engine control module (ECM) (via the Controller area network (CAN)).
See Design and Function, central electronic module (CEM).
When the ignition is switched on, the engine control module (ECM) sends a signal to the central electronic module (CEM) via the controller area network (CAN) to run the fuel pump (FP) for one seconds. This is so that the pressure increases in the fuel system, shortening the start time.
When the flywheel in the engine rotates (generating a signal from the engine speed (rpm) sensor), the engine control module (ECM) will transmit a request to the central electronic module (ECM) via the controller area network (CAN) to start the fuel pump. In the event of the engine stopping, the Engine Control Module (ECM) cancels the "activated fuel pump" signal. The central electronic module (CEM) then switches off the fuel pump.
There is a directly connected cable between the engine control module (ECM) and the central electronic module (CEM). In the event of a fault in the controller area network (CAN), this cable is used for the "activated fuel pump" signal.

Injectors



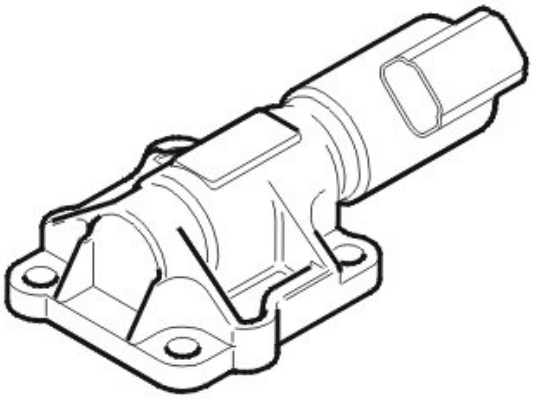
The function of the injectors is to spray fuel into the cylinders in the correct spray patterns. This happens sequentially.
The injectors are in the intake manifold.
It is essential that the injectors are correctly installed with no air leakage around them. Fuel leakage from the top of an injector when it is not activated may lead to starting and driving problems.
The engine control module (ECM) controls the injectors using a pulse width modulation (PWM) signal.
The injectors for each cylinder have different terminals in the engine control module (ECM), depending on whether the engine has 5 or 6 cylinders.
The engine control module (ECM) can diagnose the injectors. The injectors can be activated using VIDA.

evaporative emission system (EVAP) valve



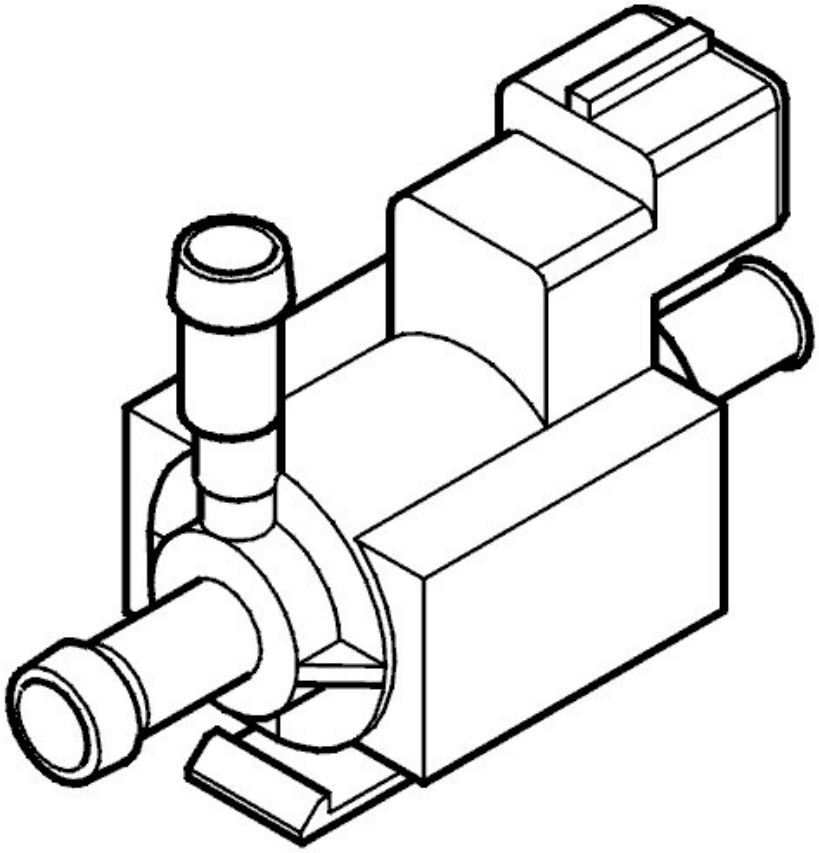
The evaporative emission system (EVAP) valve is used to open/close the connection between the EVAP canister and the intake manifold. The valve controls the flow of hydro-carbons (fuel vapor) from the EVAP canister to the engine intake manifold using the vacuum in the intake manifold. This ensures that hydro-carbons stored in the EVAP canister are used in the engine combustion process.
The valve is an electro-magnetic valve which is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The evaporative emission system (EVAP) valve is closed when in the standby position (open-circuit).
When the control module requests that the EVAP canister should be emptied (the hydrocarbons stored in the canister should be released into the engine), the control module deploys the evaporative emission system (EVAP) valve by grounding it. The valve is grounded using a pulse width modulation (PWM) signal, allowing the control module to govern the extent to which the valve opens and adapting the emptying of the canister according to how full it is, engine speed (rpm) and load etc.
The engine control module (ECM) can diagnose the evaporative emission system (EVAP) valve. The valve can be activated using VIDA.
The evaporative emission system (EVAP) valve is close to the intake manifold.

Camshaft reset valve (Continuous variable valve timing (CVVT))



The camshaft reset valve controls the oil flow to the CVVT unit (camshaft pulley).
The valve consists of an electro-magnetic valve with a spring-loaded piston. There are slits in the piston which channel the engine lubricating oil to the CVVT unit by moving the piston in the reset valve. The continuous variable valve timing (CVVT) unit turns the camshaft (the cam timing changes). The direction in which the camshaft turns depends on the chamber in the CVVT unit which is supplied with oil (pressure). Also see Function, B5244T5, B5254T2 See: Function.
The system relay supplies the reset valve with voltage. The valve is grounded (control stage) in the engine control module (ECM). When the valve is grounded using a pulse width modulation (PWM) signal, the oil flow in the valve can be controlled to the different chambers in the continuous variable valve timing (CVVT) unit at variable rates. This allows the cam timing to be changed precisely and steplessly.
The engine control module (ECM) can diagnose the camshaft reset valve.
The valve is on the cylinder head above the camshaft with camshaft control.

Turbocharger (TC) control valve

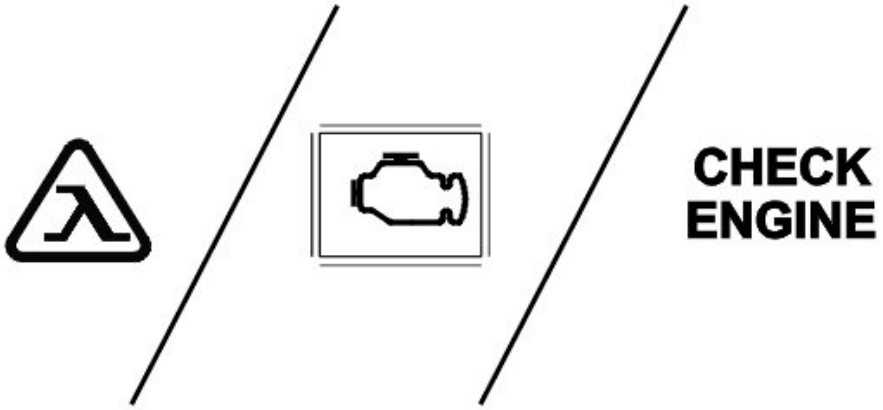


The turbocharger (TC) control valve is used to open/close the connection between the intake manifold and the pressure servo for the turbocharger (TC). The valve controls the pressure servo which affects the boost pressure control (BPC) valve and therefore the boost pressure. Also see Function, B5244T5, B5254T2 See: Function.
The valve is an electro-magnetic valve which is powered from the system relay. When the valve needs to be opened, it is grounded internally in the engine control module (ECM). The valve can be controlled steplessly by grounding the valve using a pulse width modulation (PWM) signal.
The valve is closed when in the standby position (open-circuit).
The turbocharger control valve can be diagnosed and can be activated using VIDA.
The turbocharger (TC) control valve is on a hose between the intake manifold and the pressure servo for the turbocharger.

Ignition coils

The ignition coils supply the spark plugs with high voltage to produce sparks. The engine control module (ECM) controls the ignition coils so that sparks are generated at the correct time.
Each ignition coil has its own integrated power stage.
The ignition coils are in the sparkplug wells above each spark plug.
The ignition coils for each cylinder have different terminals in the engine control module (ECM), depending on whether the engine has 5 or 6 cylinders.
The engine control module (ECM) can diagnose the ignition coils.

Emissions warning lamp



The emissions warning lamp in the Driver Information Module (DIM) has a warning symbol. This warning symbol varies depending on the market and model year. The warning symbols are:

- "Engine symbol" (not USA, model year 2001-)
- "CHECK ENGINE" (MIL - Malfunction Indicator Lamp, USA only).
- "Lambda symbol" (not USA, model year 1999-2000).

The warning symbol lights when the ignition key is turned to position II and goes out when the engine is started if the engine management system does not detect any faults.
The warning lamp is directly connected to the engine control module (ECM).
The warning lamp will light if there is a fault in one of the parameters in the engine management system. The warning lamp will also light in response to a request transmitted via the Control area network (CAN) if there is a fault in one of the following systems which affects emissions:

- transmission control module (TCM)
- brake control module (BCM).

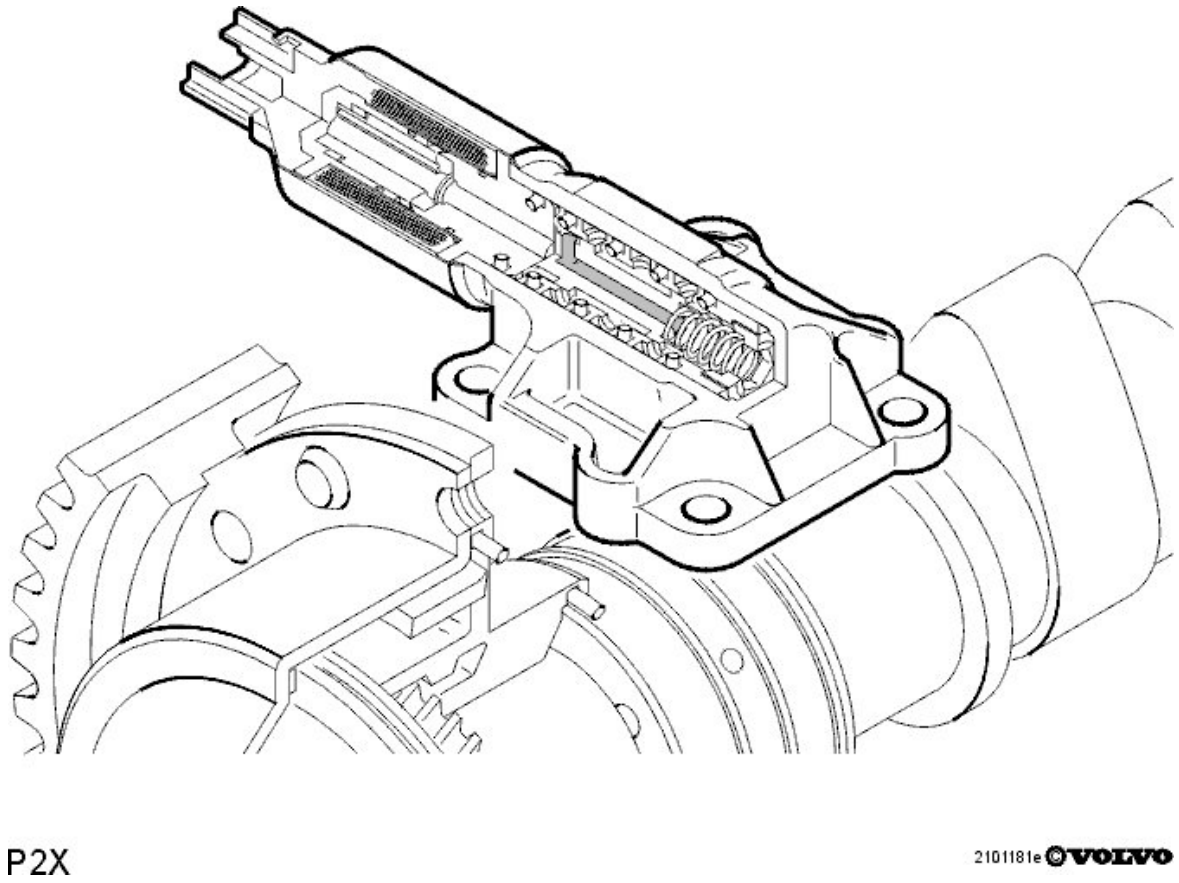
Part 1

Function

Immobilizer

See Design and Function, Immobilizer.

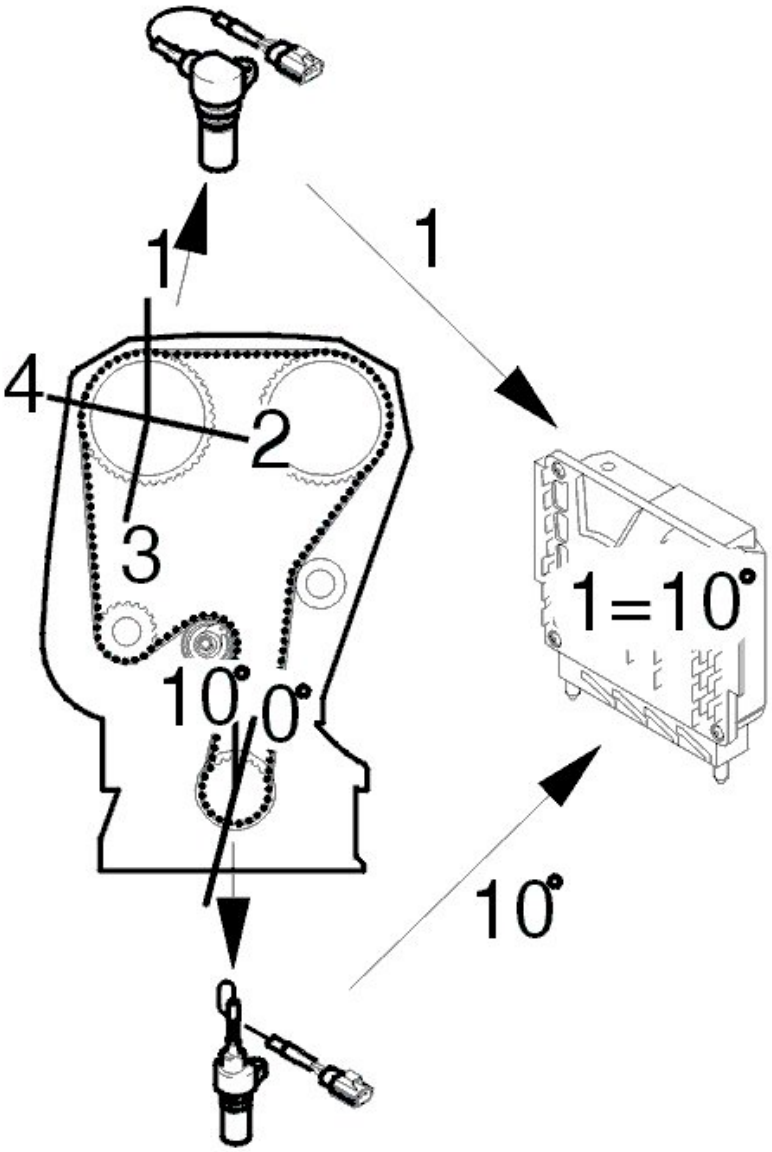
Camshaft control (CVVT)



When the camshaft is set at the factory, it is aligned with the position of the crankshaft. The position of the camshaft in relation to the crankshaft is

designated the camshaft 0 position. During camshaft control (CVVT) the camshaft 0 position is offset. The value of the 0 position offset is called the cam timing. The cam timing is 0° if the camshaft is not being controlled.
By controlling the cam timing (the camshaft is deployed from its 0 position) the performance of the engine is increased, the idle speed quality is improved and the emissions are reduced.
In order to detect the cam timing, the engine control module (ECM) uses the signals from the engine speed (RPM) sensor (the position of the crankshaft) and from the camshaft position (CMP) sensor (the position of the camshaft). By comparing these two signals, the control module is able to determine the cam timing (the number of degrees the camshaft is from its 0 position).
There are diagnostic for this function. See also Camshaft diagnostics (CVVT) See: Diagnostic Functions/Camshaft Diagnostics (CVVT).

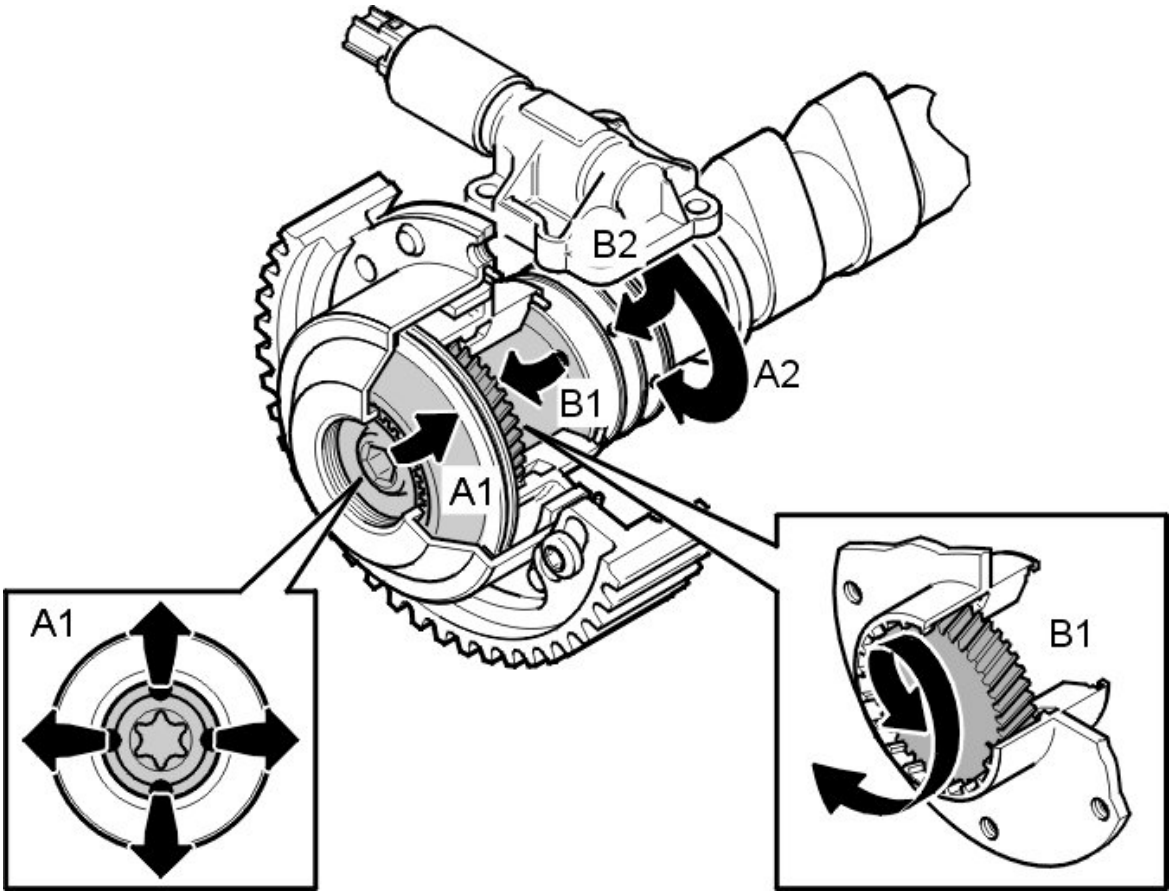
Camshaft cam timing



The camshaft (A) is divided into four flanks per revolution of the camshaft (flanks 1-4). The angle between flanks 1-2 = 103°, flanks 2-3 = 90°, flanks 3-4 = 90° and flanks 4-1 = 77°. The angle between the flanks is different, allowing the control module to determine which flank it is detecting and therefore determine which combustion cycle the cylinders are in,
The crankshaft has four reference positions, one for each camshaft flank. The camshaft turns at half the speed of the crankshaft. This means that two reference positions are detected for each turn of the crankshaft. Therefore two engine revolutions are required to detect all flanks on the camshaft. For example (may vary between different engine variants): flank 1 at 0°, flank 2 at 206°, flank 3 at 386° and flank 4 at 576° (flanks 3 and 4 are detected during the second engine revolution).
The reference positions of the crankshaft coincide exactly with each camshaft flank if the camshaft cam timing is 0°. If the cam timing deviates from 0°, i.e. the flanks deviate from the reference positions of the crankshaft, the control module calculates the number of crankshaft degrees by which the flank is deviating.
The control module detects the reference positions for the camshaft flanks using the signal from the engine speed (RPM) sensor.
Example:

If camshaft flank 1 is detected at 10° from the crankshaft reference position for flank 1 (0° +10°), the cam timing is 10°. If the cam timing is the same (10°), flank 2 is detected at 216° (206° + 10°), flank 3 at 396° (386° + 10°), and flank 4 at 586° (576° + 10°). The cam timing can be positive (+) or negative (-) depending on whether the flank is detected before or after the different reference positions for the crankshaft.
The engine control module (ECM) controls the camshaft reset valve smoothly in order to regulate the camshaft cam timing. The valve controls the flow of engine oil to the continuous variable valve timing (CVVT) unit which is affected by the oil pressure that builds up.
Also see Design, B5244T5, B5254T2 See: Design.

Control



Control takes place as follows when deploying the camshaft:

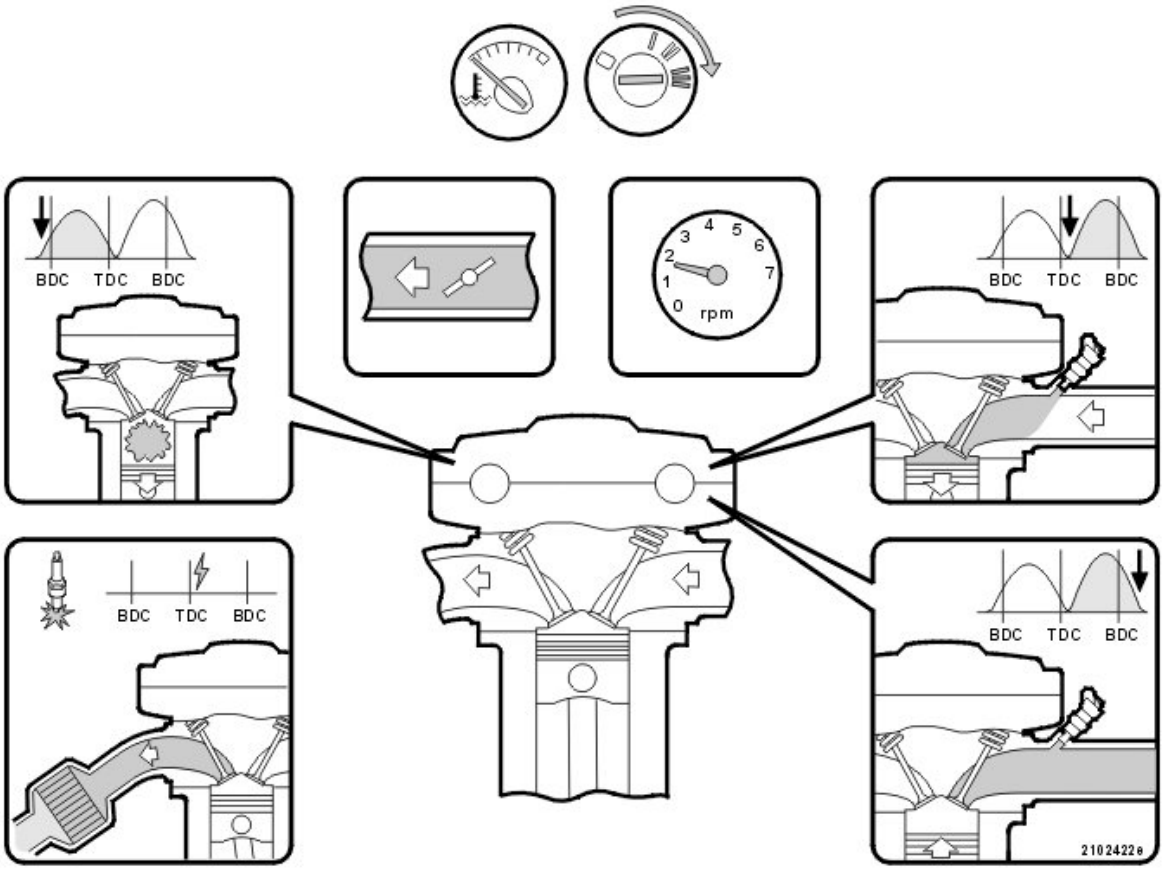
1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) grounds the valve, the position of the piston in the valve changes and the oil is guided to the continuous variable valve timing (CVVT) unit chamber (A1) via the duct (A2) in the camshaft
3. The continuous variable valve timing (CVVT) unit hub is pressed backwards by the oil pressure. The continuous variable valve timing (CVVT) unit then rotates the hub and the carriers are joined by twisted splines
4. The oil flows to the engine oil pan via the outer ducts on the hub and the reset valve's return hose.

Control takes place as follows when returning the camshaft:

1. Oil is forced from the engine lubricating system to the intake port on the reset valve
2. The engine control module (ECM) breaks the ground connection for the valve. The piston in the valve is then pressed back by a spring. The oil flows to the continuous variable valve timing (CVVT) unit chamber (B1) via a duct (B2) in the camshaft
3. The hub of the continuous variable valve timing (CVVT) unit is forced forward by the oil pressure that is created. The continuous variable valve timing (CVVT) unit will rotate back to the non-deployed position
4. The oil flows to the engine oil pan via the center duct on the hub and the reset valve's return duct.

The above takes place very quickly. The engine control module (ECM) controls the deployment and return of the reset valve continually at high frequency. This results in rapid and exact control. The extent of camshaft control (the change of cam timing) varies depending on the engine variant and the model year.

"Wide Range" concept



Ignition timing

The combustion of the fuel film on the cylinder walls is improved by retarding the ignition.
Retarded ignition reduces the efficiency of the engine and the heat energy which is generated is released with the exhaust gases. This is used to heat the three-way catalytic converters (TWC).

Exhaust camshaft (turbocharged engines)

By opening the exhaust valve late, combustion takes place over a relatively long period. The film of fuel on the cylinder walls combusts, reducing the exhaust emissions.

Intake camshaft

By opening/closing the intake valve late:

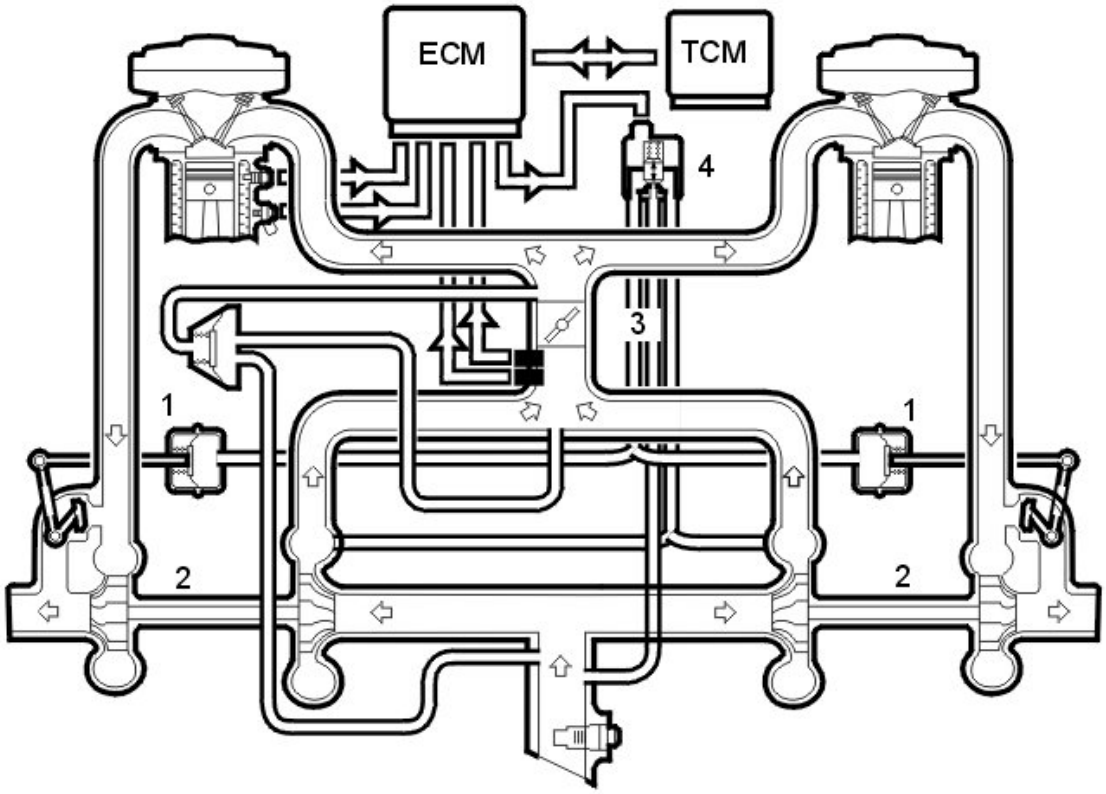
- so that there is little or no overlap, a predetermined pressure difference is maintained between the intake manifold and the combustion chamber/cylinder. The lower pressure in the cylinder ensures that all the injected fuel reaches the cylinder. This allows the Engine Control Module (ECM) to calculate and control the fuel quantity required in the combustion phase in advance
- maintains a high and stable pressure in the intake manifold (due to the upwards movement of the piston). Stable high pressure means that the vaporization of the fuel which has condensed on the walls of the intake manifold can be predicted.

Double continuous variable valve timing (CVVT)

CVVT on both the intake camshaft and the exhaust camshaft means that the valve overlap can be changed to a greater degree than on engines where only one of the camshafts is controlled. Valve overlap is the extent to which the intake and exhaust valves (on the same cylinder) are open at the same time.
The advantages of continuous variable valve timing (CVVT) are used in different operating conditions:

- **during cold starting and during the warm-up phases**when the intake camshaft and exhaust camshaft are set late. This reduces the emissions
- **during idle and when the engine is at operating temperature**when the exhaust camshaft is set to early and the intake camshaft is set to late. This results in small valve overlap, reducing exhaust gas recirculation (EGR) and ensuring stable idling
- **at part load**when both the exhaust and intake camshaft are set to relatively late, with greater valve overlap. Greater valve overlap results in internal exhaust gas recirculation (EGR) which reduces the release of nitrous oxide. This also limits the incoming fuel/air mixture to the cylinder. As a result, the throttle does not need to reduce the supply of air, thereby reducing "pump losses" and lowering the fuel consumption. At higher engine speeds (RPM), the camshafts are set for a smaller valve overlap. The exhaust camshaft is set earlier, the intake camshaft later. This provides an optimum fuel/air mixture to the cylinder. Reduces internal exhaust gas recirculation (EGR).

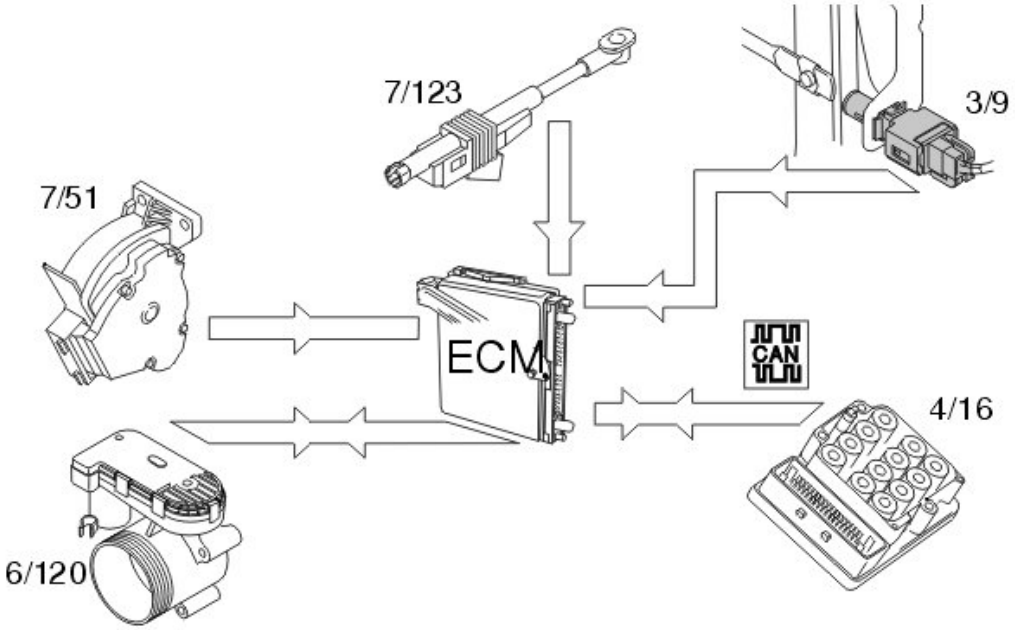
Turbocharger (TC) control system



Hint: The above illustration is for a 6 cylinder engine. However the principle is the same for 5 cylinder engines.

The boost pressure in the intake manifold is controlled by the boost pressure control (BPC) valves, whose pressure regulators (1) are affected by the pressure from the turbocharger (TC) (2).
The Engine Control Module (ECM) receives information about the actual throttle position via the throttle position sensor (TP) for the throttle unit (3), engine load, knocking etc. This affects the boost pressure that is permitted. The boost pressure is measured by the boost pressure sensor.
The control module controls the control pressure using the turbocharger (TC) control valve (4) (also see Design, B5244T5, B5254T2 See: Design), which controls the pressure to the boost pressure control (BPC) valves so that the control is adapted to the required pressure.
The pressure regulators in the boost pressure control (BPC) valves are affected when the pressure rises. When the boost pressure has increased to the maximum permissible value, the boost pressure control (BPC) valves open. Some of the exhaust gases pass the turbine in the turbocharger (TC), limiting the boost pressure.
Turbocharger (TC) control is governed continually by the engine control module (ECM).
When a higher boost pressure is permitted, the control module opens the turbocharger (TC) control valve further. Some of the boost pressure which affects the pressure regulators for the boost pressure control (BPC) valves is released back into the turbocharger (TC) intake. This lowers the control pressure, the boost pressure control (BPC) valves open later and the boost pressure increases.
Because the control module calculates the boost pressure using the signal from the boost pressure sensor and the intake temperature sensor, there is automatic compensation of boost pressure control when driving at altitude and at different temperatures. As a result engine power will not be noticeably affected by the air density or temperature.
The engine control module (ECM) can diagnose the turbocharger (TC) control function.

Throttle control



To ensure that the correct throttle angle is reached, the engine control module (ECM) controls the throttle shutter in the throttle unit (6/120), mainly using the signal from:

- accelerator pedal (AP) position sensor (7/51)
- clutch pedal sensor (7/123)
- stop lamp switch (3/9)
- the throttle position (TP) sensor on the electronic throttle unit (6/120)
- brake control module (BCM) (4/16), signal for the brake pedal sensor.

Additional signals and parameters are used to ensure optimum throttle control. For example there is compensation for the load from the air conditioning (A/C) compressor, load from the transmission depending on the gear selected (automatic), engine temperature etc. In cars with Four-C (Continuously Controlled Chassis Concept), the throttle characteristic changes depending on the driving mode selected.
The position of the throttle is measured by two potentiometers, in the throttle position (TP) sensor, which are on the throttle unit. These are connected, so that potentiometer 1 produces a higher voltage as the throttle angle increases, while potentiometer 2 does the opposite.
In a combustion engine, the difference between the minimum and maximum airflow is considerable. The smaller air flows need more thorough regulation, so the potentiometer signal from potentiometer 1 is amplified approximately 4 times in the engine control module (ECM) before it reaches the Analog/Digital converter in the engine control module (ECM). This means that there are three, two real and one fictitious, input signals available to the engine control module (ECM). These signals are used to determine the position of the throttle and to deploy the damper motor to the correct position. In general the amplified signal is primarily used for small throttle angles (small air flows), which are desirable when a high degree of accuracy is required, for idle air trim for example.
Because the signal is amplified, it reaches its maximum value as early as approximately a quarter of maximum deployment.
The engine control module (ECM) first uses the signal from potentiometer 1 to measure the throttle opening. The signal from potentiometer 2 is mainly used to check that potentiometer 1 is functioning correctly. The engine control module (ECM) then uses the signal to calculate a throttle angle (actual value). This is the actual throttle angle. The value for the actual throttle angle is used by those functions in the engine control module (ECM) which depend on this information so that the throttle can be correctly regulated.
There is an adaptation (learning) in the engine control module (ECM) so that the control module can calculate how the damper motor needs to be controlled. See "Adaptation of the throttle unit" below. This adaptation is carried out during manufacture of the car, when the engine control module (ECM) deploys the throttle disc to the different positions and reads off and registers the actual values from the potentiometers.
The throttle angle is regulated so that the actual angle (actual value) is the same as the angle calculated by the engine control module (ECM) (desired value). The engine control module (ECM) also uses the values that were stored during adaptation of the throttle angle, and the actual signals from the potentiometers.
The damper motor is controlled by a power stage integrated in the engine control module (ECM) using a pulse width modulation (PWM) signal.
The torsion from the opening and return springs in the throttle unit is also used. If there is a fault in the engine control module (ECM) so that the throttle unit cannot be operated or supplied with power, the springs in the throttle unit will turn the throttle disc to the limp home position (return position). This return position gives a throttle angle large enough to allow the car to be driven to a workshop, although with considerably reduced drivability.

Throttle angle

The throttle angle is usually gauged by potentiometer 1. For small angles the amplified signal is used to obtain a clearer signal. The engine control module (ECM) also monitors the throttle unit signals from the potentiometers to check that they are plausible, that they are within the minimum and maximum limits and that the signals correspond to the same throttle angle. If there is a difference in the signals, a fictitious throttle signal is calculated from the load signal, the engine speed (rpm) and the prevailing conditions, particularly pressure and temperature.
The potentiometer whose signal is closest to the calculated throttle angle will then be assumed to be correct. The other potentiometer is then classified as not functioning and a diagnostic trouble code (DTC) is stored. The system then constantly monitors the throttle angle of the remaining potentiometer in comparison to the calculated throttle angle. If there is a difference between these values, the engine control module (ECM) will not rely on any of the throttle unit potentiometers. The power stage in the throttle unit is then disengaged, and the throttle switches to limp home mode

(return position).

Adaptation of the throttle unit

Normally the engine control module (ECM) adapts the throttle unit during manufacture of the car. There are a number of other occasions when the throttle unit must be adapted. A new adaptation is obviously required if the throttle unit or the engine control module (ECM) is replaced, but also if the software in the engine control module (ECM) is replaced. This is because the adaptation values are stored in the EEPROM memory in the control module, at a predetermined location in the memory for each software. These storage locations may vary between different software, in which case a new adaptation will be required. The final reason for adaptation is that the values for the throttle unit may have changed during its service life. Therefore there is a routine which begins adaptation of the throttle unit if the car is left with the engine off and the throttle on for 30 seconds (and other basic conditions for adaptation of the throttle unit are met). A new adaptation is then carried out. If the "new" values are different from the "old" values, the new values are used. Adaptation usually takes place automatically when the engine control module (ECM) detects that the adaptation has not been run or that the values from a previous adaptation are outside certain tolerances. However a number of basic conditions must be met to ensure that the adaptation is carried out correctly:

Basic conditions for adaptation of the throttle unit:

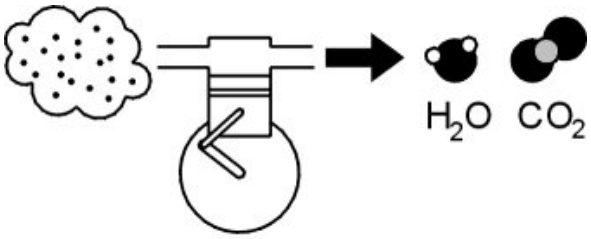
- ignition on / engine off
- battery voltage above 10 V
- accelerator pedal (AP) released (unaffected)
- the car must be stationary (no speed signal)
- engine coolant temperature (ECT) between 5 and 100 °C
- intake air temperature (IAT) above 5 °C.

During adaptation, the engine control module (ECM) checks that the values obtained are within reasonable limits. This helps to determine whether the throttle unit is functioning correctly or not. When the adaptation has been carried out, all relevant values are stored in the EEPROM memory in the control module so that they can be retrieved if the power supply is broken. This means that if the battery is replaced for example, a new adaptation is not necessary.

Part 2

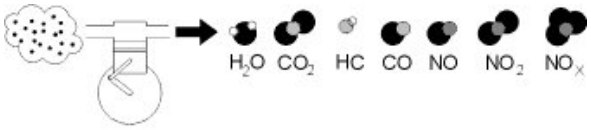
Function (Continued)

Fuel trim

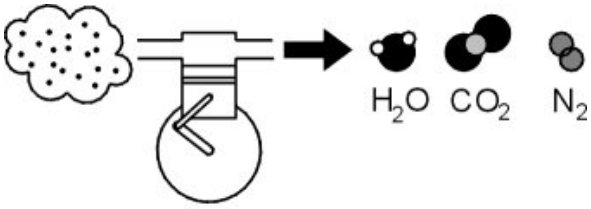


Overview

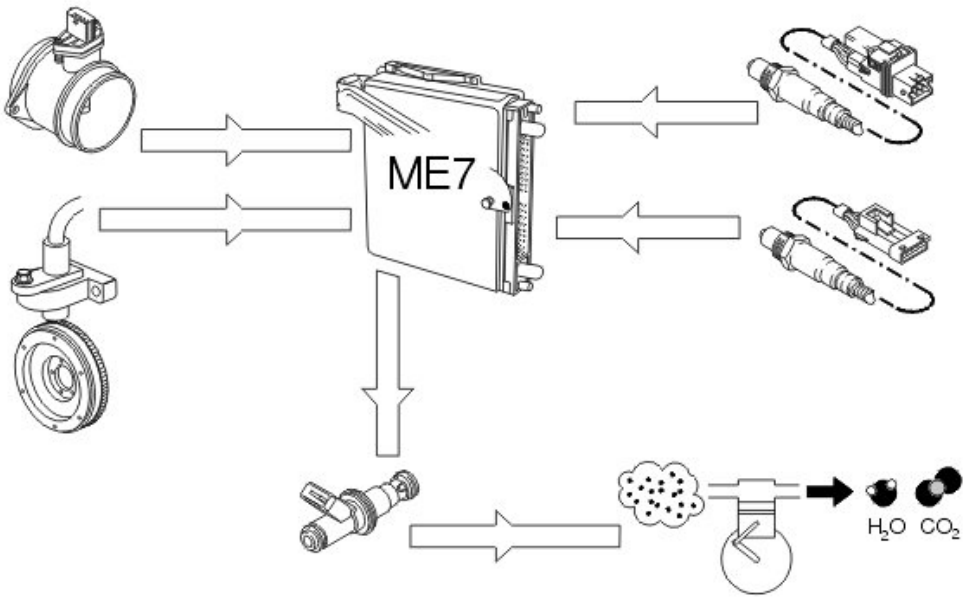
Fuel trim reduces exhaust emissions. Fuel trim reduces nitrous oxide (NOx), carbon monoxide (CO) and hydrocarbon (HC) emissions.
Theoretically, if the correct amount of oxygen is added during combustion, fuel can be converted to water (H2O) and carbon dioxide (CO2). Emissions would then be completely safe.
In practice considerable amounts of hydro-carbons (HC) and varying amounts of carbon monoxide (CO) and carbon dioxide (CO2) remain.



Due to the high temperature and pressure, nitrous oxides such as NO and NO2are also formed. The common designation for these gases is nitrous oxides NOx.



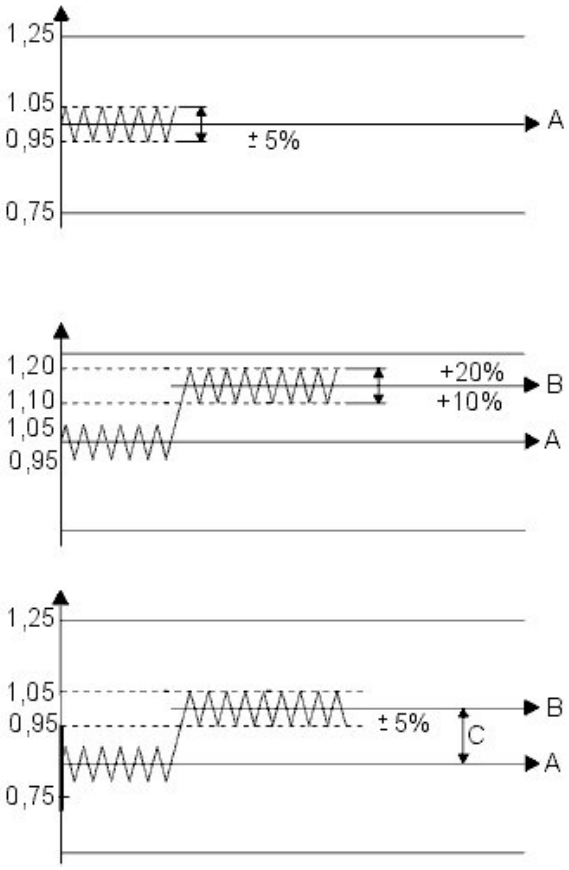
By speeding up the reaction between the remaining reactive components using a catalytic converter, these can be converted to water (H2O), carbon dioxide (CO2) and nitrogen (N2).
However this can only happen if the balance of hydro-carbons (HC), carbon monoxide (CO), oxygen (O2) and nitrous oxides (NOx) is exactly right in the exhaust. This happens when the fuel air mixture before combustion is 14.7 kg of air per kg of fuel. The Lambda value is then said to be one, (lambda=1).



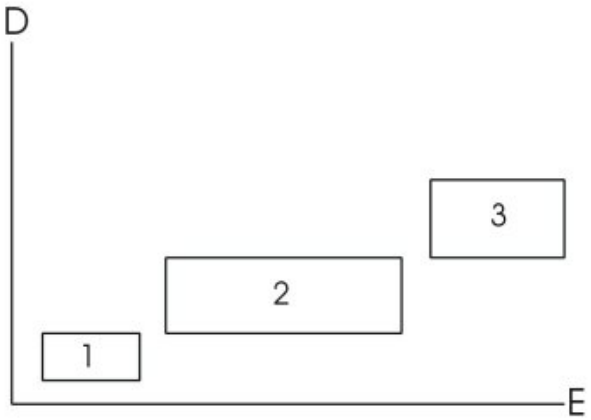
A base program in the engine control module (ECM) calculates the injection period based on data about load, i.e. the measured air mass and engine speed (rpm). The calculated injection time (from the base program) is then modified by a circuit (short-term fuel trim). The signal from the heated oxygen sensor (HO2S) is used to finely adjust the injection period so that lambda=1 is reached. The short-term fuel trim is also a circuit that finely adjusts the injection period so that the fuel air mixture is optimized (lambda=1). The control module also used the signals from the front and rear heated oxygen sensors (HO2S) to correct the front heated oxygen sensor (HO2S) (offset adjustment) and thereby the injection period. This gives a

higher degree of accuracy during fuel trim. Fuel trim is a rapid process which may take place several times a second. Adjustment of the calculated injection period calculated in the base program is limited.
The fuel trim can be read off using VIDA.

Adaptive functions



Certain factors, such as deviations in tolerance for certain components such as the mass air flow (MAF) sensor and injectors, intake air leakage, fuel pressure etc, will affect the composition of the fuel air mixture. To compensate for this, the engine control module (ECM) has adaptive (self learning) functions. When the engine is new, the short-term fuel trim is assumed to vary cyclically around a nominal center line (A) 1.00 with, for example, a ± 5% change in the injection period when fuel trim is active.
If there is air leakage for example, the short-term fuel trim will quickly be offset to a new position (B) and will then work for example between 1.10 (+10%) and 1.20 (+20%), although still at an amplitude of 5%, but with an offset in relation to the original center line (A). The injection period has then been increased to compensate the increase in the amount of air.
The adaptive functions will correct the change, so that the short-term fuel trim will work around the new center line (B) where it will again have its full range of control available.
Put simply, fuel trim is a measurement of the difference (C) between the original short-term fuel trim center line (A) and the new center line (B).



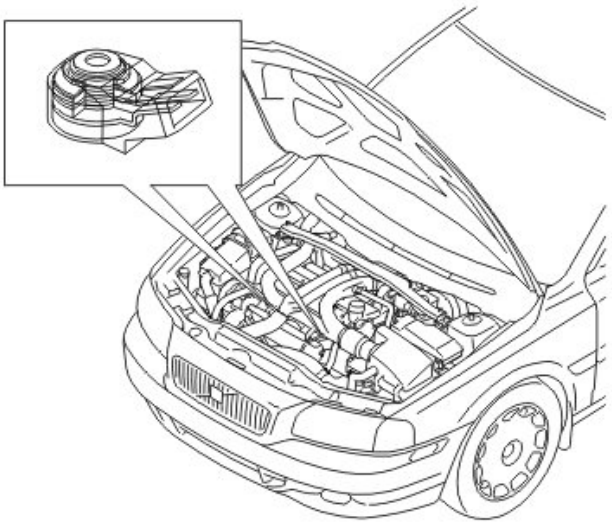
The adaptive functions consist of three sections and correspond to the different operating ranges of the engine; load (D) and engine speed (E):

- Additive adaptation (1) is when the engine is idling. This is how the control module adjusts the CO content at idle speed. Long-term fuel trim, idling can be read off using VIDA
- Multiplicative adaptation, lower part load (2), carried out in the lower part load range. Lower part load range is reached when driving at low load. Long-term fuel trim, lower part load can be read off using VIDA

- Multiplicative adaptation, upper part load (3). Carried out in the upper part load range. The upper part load range is reached when driving under high load and at high engine speed (rpm). Long-term fuel trim, upper part load can be read off using VIDA.

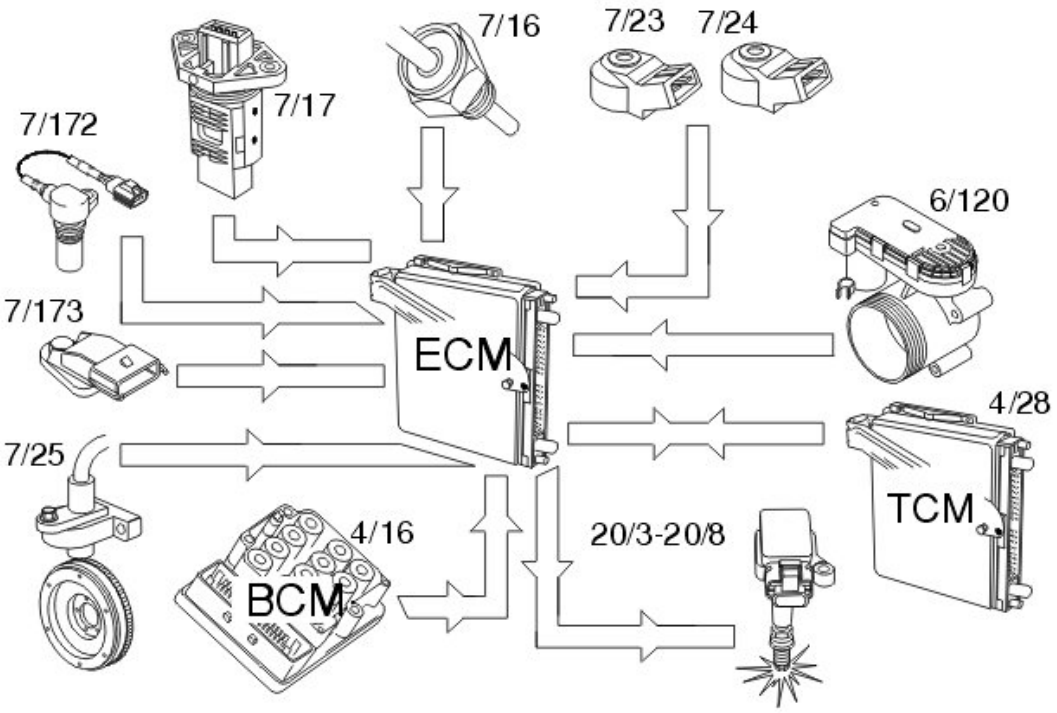
The adaptive adjustments of the injection period are stored continuously in the control module. This means that under different operating conditions the fuel air mixture is obtained before the heated oxygen sensor (HO2S) is warm enough to function.
A diagnostic trouble code (DTC) will be stored in the control module if any adaptation value is too high or too low. For further information, also see Heated oxygen sensor (HO2S) diagnostic See: Diagnostic Functions/Heated Oxygen Sensor (HO2S) Diagnostic.

Knock control



Knocking occurs in the combustion chamber when the fuel and air mixture self ignites. This can occur either before or after the spark plug has produced an ignition spark. In both cases the gas in two or more places ignites in the combustion chamber.
This results in an extremely fast combustion process with flames from several directions. When these flames collide, the pressure in the cylinder increases rapidly and there is a mechanical knocking sound.
If any of the cylinders knock there is a specific type of vibration in the cylinder block. These vibrations are transferred to the knock sensors (KS) which are screwed into place in the cylinder block. The resultant mechanical stress in the piezo electrical material in the knock sensors generates a voltage. The engine control module (ECM) can then determine which cylinder is knocking with the help of the camshaft position (CMP) sensor and the engine speed (RPM) sensor.
The knock sensors (KS) also interpret a proportion of normal engine sound. The control module is able to recognize the vibrations which correspond to knocking by filtering, amplifying and using software to evaluate the signal.
If the knock sensors (KS) detect knocking in the engine over a certain threshold value, the ignition timing is first retarded and then the fuel / air mixture is enriched to eliminate knocking.

Ignition control



The following components are used for ignition control:
- engine speed (RPM) sensor (7/25)
- camshaft position (CMP) sensor (7/172-7/173)
- mass air flow (MAF) sensor (7/17)
- engine coolant temperature (ECT) sensor (7/16)
- throttle position (TP) sensor on the electronic throttle unit (6/120)
- knock sensor (KS) (7/23-7/24)
- transmission control module (TCM) (4/28)
- spark plugs with ignition coils (20/3-20/8)
- brake control module (BCM) (4/16).

The engine control module (ECM) calculates the optimum ignition advance based on the software and information from the sensors. The engine control module (ECM) cuts the current to the ignition coil mounted on the cylinder to be ignited and produces a spark.
During the starting phase the engine control module (ECM) produces a fixed ignition setting. When the engine starts and the car is driven the engine control module (ECM) calculates the optimum ignition setting according to the engine speed (RPM), load, temperature etc.
The engine control module (ECM) analyses the signal from the knock sensors (KS) when the engine reaches operating temperature. If any of the cylinders knock, the ignition is retarded for that specific cylinder until the knocking ceases.
The ignition then advanced to the normal position or until the knock recurs.
Before the transmission control module (TCM) changes gear, it sometimes transmits a torque limiting request to the engine control module (ECM). The engine control module (ECM) then retards the ignition momentarily to reduce the torque, resulting in smoother gear changes and reducing the load on the transmission. There are different ignition retardation levels depending on the signals from the transmission control module (TCM). The return signal from the engine control module (ECM) to the transmission control module (TCM) confirms that the signal reached the engine control module (ECM). The Brake Control Module (BCM) transmits information to the engine control module (ECM) about deviations in the drive line.
The signal is used to stop the diagnosis. For further information, also see Misfire diagnostics See: Diagnostic Functions/Misfire Diagnostics.
The engine misfires if the fuel does not ignite correctly. For further information, also see Misfire diagnostics See: Diagnostic Functions/Misfire Diagnostics.

Cruise control

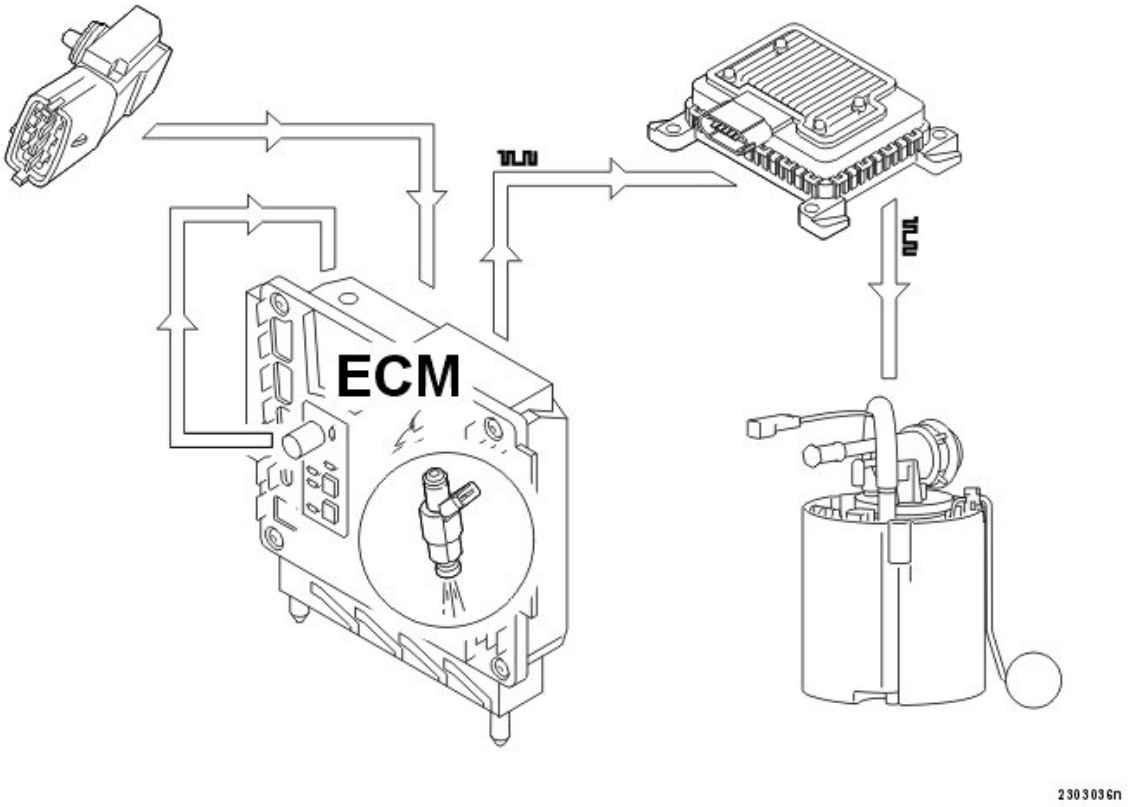
The cruise control function is an example of distributed functionality.
The following components are used when driving using cruise control:
- engine control module (ECM)
- electronic throttle unit
- brake control module (BCM)
- accelerator pedal (AP) position sensor
- clutch pedal sensor
- brake pedal sensor
- control unit cruise control
- steering wheel module (SWM)
- central electronic module (CEM)
- transmission control module (TCM)
- driver information module (DIM).

To activate cruise control the function must be switched on using the "CRUISE" button. A lamp lights up in the driver information module (DIM).
The driver activates the function by pressing the SET+ or SET- button. A message is then transmitted via the low speed side of the Controller area network (CAN) to the central electronic module (CEM) which then transmits the message on via the high speed side of the Controller area network (CAN) to the engine control module (ECM).
The engine control module (ECM) controls the throttle angle so that a constant speed is maintained using the vehicle speed signal from the Brake Control Module (BCM). The transmission control module (TCM) also receives a message indicating that cruise control is active via the Controller area network (CAN), so that the transmission follows certain shifting patterns when the cruise control is active.
If the accelerator pedal (AP) is depressed the speed increases as normal and then resumes to the stored value when the driver releases the accelerator pedal (AP) again.
The engine control module (ECM) continually stores the speed. If the cruise control is disengaged, if for example the driver presses the brake pedal, the previous stored speed can be used by pressing the "RESUME" button.
Cruise control cannot be activated at speeds below 35 km/h.

Cruise control is disengaged:

- when the driver presses the clutch pedal or brake pedal
- when the driver presses the "CRUISE" button on the steering wheel
- when the driver depresses the "0" button on the steering wheel
- if the "P" or "N" positions are transmitted on the controller area network (CAN) (applies to automatic transmissions)
- if the speed deviates too much from the set value
- when certain diagnostic trouble codes (DTCs) are stored which do not allow continued activation (For further information see diagnostic trouble code (DTC) information).

Fuel pressure regulation (only vehicles with demand controlled fuel pumps)



General

Fuel pressure regulation for demand controlled fuel pumps (DECOS - DEmand COntrolled fuel Supply) means that the fuel pressure is controlled steplessly by varying the output of the fuel pump. The design of the system allows a greater maximum pressure (approximately 6.5 bar) in the fuel pump. This pressure is used in extreme situations, such as heavy engine load for example.

The following components are used for fuel pressure regulation:

- engine control module (ECM)
- the fuel pump control module
- a fuel pressure sensor with a fuel temperature sensor
- a fuel pump (FP) with a by-pass valve.

The time taken for the engine start procedure can be reduced by rapidly increasing the pressure in the fuel rail when the engine control module (ECM) receives a signal about the position of the ignition switch from the central electronic module (CEM).

The engine control module (ECM) is better able to calculate the injection period because the signal from the fuel pressure sensor gives information about the fuel pressure. This particular improves the cold starting characteristics of the engine.

The advantages of varying the output of the fuel pump so that it is not always at full power are:

- the total power consumption of the fuel pump (FP) is reduced, reducing the load on the power supply system
- the service life of the fuel pump (FP) is increased
- fuel pump noise is reduced.

Control

The engine control module (ECM) calculates the desired fuel pressure. A signal is then transmitted to the fuel pump control module indicating the desired fuel pressure. Serial communication between the engine control module (ECM) and the fuel pump control module is used to carry the signal. The fuel pump control module then operates the fuel pump unit to obtain the desired pressure using a pulse width modulation voltage on the ground lead. The fuel pump (FP) can be controlled steplessly by changing the pulse width modulation (PWM) signal. Only that pressure which is required at that specific time will then be released to the fuel rail/injectors. The value of the pulse width modulation (PWM) signal is a measurement of the operational load of the fuel pump (FP) (% duty, 100% = maximum pressure).

The engine control module (ECM) continuously monitors the fuel pressure using the signal from the fuel pressure sensor. This allows the desired fuel pressure to be reached, and if necessary a signal is transmitted to the fuel pump control module requesting that the fuel pressure is adjusted.

By-pass valve

When the injectors are closed because of too high pressure (during engine braking for example) there is a pressure peak. The by-pass valve in the fuel pump (FP) is used to even out the pressure peak. The opening pressure of the valve is approximately 6.5 bar.
The by-pass valve also functions as a non-return valve, ensuring that the fuel pressure in the system is maintained when the engine is switched off. There is high pressure before the engine is started. This high pressure means that the valve in the by-pass valve opens and the system is "flushed".

Passive safety

For safety reasons, the engine control module (ECM) shuts off the fuel pump (FP) if the supplemental restraint system module (SRS) detects a collision.

Oil level monitoring (2004-, certain markets and models only)

General

The following components are used for oil monitoring:
- the oil level sensor
- engine control module (ECM)
- driver information module (DIM).

One of the advantage of always monitoring the oil level is that the driver can then be informed, via the driver information module (DIM), if the oil needs topping up.

Oil quality detection

To calculate the quality of the oil, the capacitance of the oil is gauged and then compared with the capacitance of the air. (Capacitance is the ability to store an electrical charge).
The capacitance of the oil and air is measured using both the capacitive gauge elements. The volume of contaminants in the oil increases the capacitance. This provides the electronics integrated in the oil level sensor with an oil quality dependent input signal.

Oil temperature detection

The PTC resistor integrated in the oil level sensor is used to calculate the oil temperature. The resistance of the PTC resistor changes, depending on the oil temperature. The resistance increases as the oil temperature rises. This provides the electronics integrated in the oil level sensor with a temperature dependent input signal.

Oil level detection

The electronics integrated in the sensor calculate the oil level using the obtained values for oil temperature and quality.
Temporary changes in the oil level in the oil trough must be taken into account to correctly calculate the oil level. This happens when cornering and taking hills for example. The engine control module (ECM) makes these calculations using the oil level sensor signal and a number of other parameters. These other parameters include the vehicle speed signal and the load signal.

Oil level sensor signal

The oil level sensor internally calculates the parameters for oil level, quality and temperature. A PWM signal is then generated and transmitted on a cable to the engine control module (ECM).
The PWM signal consists of a pulse train. The first pulse in the pulse train represents the oil temperature. The second pulse represents the oil level. The third pulse represents the oil quality. A change in oil level, quality or oil temperature affects the pulse ratio of the relevant pulse.

Camshaft diagnostics (CVVT)

See Camshaft diagnostics (CVVT) See: Diagnostic Functions/Camshaft Diagnostics (CVVT).

Leak diagnostics (certain markets only)

To minimize false detection of leakage, new software has been released for the Engine control module (ECM). The software has been released afterwards, in order of priority, started at the end of 2006.
To check the current software version, see Vehicle communication in VIDA.
The improved software version makes diagnostics more robust and durable against aging and wear of the leak diagnostic unit. It affects strategies, behavior and to a degree also read off parameters.

Camshaft Diagnostics (CVVT)

Camshaft diagnostics (CVVT)

In addition to electrical checks of the camshaft reset valve, the engine control module (ECM) checks that the position of the camshaft is correct and that the control (deployment and return of the camshaft) is working satisfactorily. The control module uses the signals from the camshaft position sensor and engine speed (RPM) sensor (crankshaft position) for the diagnostics.

Checking the camshaft position

The control module checks that the 0 position of the camshaft (mechanical rest position) is correct. At idle speed camshaft control is not active. The control module checks the camshaft deviation from the 0 position, that is, how much the camshaft flanks deviate from the predetermined positions on the crankshaft.
The position of the camshaft is stored in the control module. If the position is incorrect the diagnostic trouble code (DTC) is stored in the engine control module (ECM). The camshaft position value can be read off using VIDA.

Checking the camshaft control

Active camshaft control checks that the camshaft assumes the position the control module intends the camshaft to move to, that is that the correct camshaft angle is obtained. This is done by measuring the time the system takes to deploy to the correct camshaft position (the transition time from the actual to the desired camshaft angle). A diagnostic trouble code (DTC) is stored in the engine control module (ECM) If the camshaft angle does not reach the desired value within a certain time frame.
The actual value and the desired value for the camshaft's angle can be read using VIDA.

Fuel Pressure Control, Diagnostics

Fuel pressure control, diagnostics

General

The fuel pump control module has no functions for diagnostics. Fuel pressure control components and functions are diagnosed by the engine control module (ECM).
The following components and functions are diagnosed by the engine control module (ECM). Diagnostic trouble codes (DTCs) can be stored for each component and function:

- **Fuel pump control module**, a diagnostic checks the power supply. A diagnostic trouble code (DTC) will be stored and the fuel pump will not work if there is no power supply to the fuel pump control module
- **Fuel pressure sensor**with temperature sensor, a diagnostic checks the pressure and temperature signals to see if they are outside the normal

operating range of the sensor. If a fault in the fuel pressure sensor is detected, the fuel pump (FP) will run at a predefined power and the pressure is governed by the by-pass valve in the fuel tank
- **Fuel pressure**, the engine control module (ECM) compares the requested pressure with the measured pressure(signal from the fuel pressure sensor). If the measured pressure deviates excessively from the requested pressure, or if the pressure pulses, a diagnostic trouble code (DTC) will be stored for incorrect fuel pressure. The diagnostic is not active if a diagnostic trouble code (DTC) for the fuel pressure sensor is stored. A diagnostic trouble code (DTC) for fuel pressure will be stored if there is a fault in the**fuel pump**
- **Communication cable.**The engine cannot be started if there is a fault in the communication cable between the engine control module (ECM) and the fuel pump control module. A diagnostic trouble code (DTC) will be stored for the fault.

For further information about diagnostic trouble codes (DTCs), see Information, diagnostic trouble codes (DTCs) in VIDA.

Components and functions which cannot be diagnosed:

If there is a fault in the**by-pass valve**in the tank unit, the starting process of the engine will take longer if the valve is leaking fuel when the fuel pump is off. If the valve does not open when there are pressure peaks in the fuel system, engine operation will be affected negatively, especially after engine braking. The fault can also cause rough idling.

Fuel Pressure Regulation, Diagnostics

Fuel pressure regulation, diagnostics

General

The fuel pump control module has no functions for diagnostics. Fuel pressure regulation components and functions are diagnosed by the engine control module (ECM).
The following components/functions are diagnosed by the engine control module (ECM). Diagnostic trouble codes (DTCs) can be stored for each component/function:
- **Fuel pump control module**, the power supply is checked. A diagnostic trouble code (DTC) will be stored and the fuel pump will not work if there is no power supply to the fuel pump control module
- **Fuel pressure sensor with temperature sensor**, the pressure and temperature signals are checked to see if they are outside the normal operating range of the sensor. If a fault in the fuel pressure sensor is detected, the fuel pump (FP) will run at full power and the pressure is governed by the by-pass valve in the fuel tank
- **Fuel pressure**, the engine control module (ECM) compares the requested pressure with the measured pressure(the signal from the fuel pressure sensor). If the measured pressure deviates excessively from the requested pressure, or if the pressure pulses, a diagnostic trouble code (DTC) will be stored for incorrect fuel pressure. The diagnostic is not active if a diagnostic trouble code (DTC) for the fuel pressure sensor is stored. A diagnostic trouble code (DTC) for fuel pressure will be stored if there is a fault in the**fuel pump**
- **Communication cable.**The engine cannot be started if there is a fault in the communication cable between the engine control module (ECM) and the fuel pump control module. A diagnostic trouble code (DTC) will be stored for the fault.

For further information about diagnostic trouble codes (DTCs), see Information, diagnostic trouble codes (DTCs) in VIDA.

Components/functions which cannot be diagnosed:

If there is a fault in the**by-pass valve**in the tank unit, the starting process of the engine will take longer if the valve is leaking fuel when the fuel pump is off. If the valve does note open when there are pressure peaks in the fuel system, engine operation will be negatively effected, especially after engine braking.

Heated Oxygen Sensor (HO2S) Diagnostic

Heated oxygen sensor (HO2S) diagnostic

Heated oxygen sensor (HO2S) diagnostic

Two heated oxygen sensors (HO2S) are used in the Denso engine control module (ECM). The heated oxygen sensors (HO2S) are checked as usual for short-circuits and open-circuits. Diagnostic trouble code (DTC) ECM-2120 (front heated oxygen sensor (HO2S)) or ECM-2200 (rear heated oxygen sensor (HO2S)) will be stored if any of these faults occur. The probe heat elements are also checked. In the event of a fault, diagnostic trouble code (DTC) ECM-2110 (front heated oxygen sensor (HO2S), heating), ECM-2120 (front heated oxygen sensor (HO2S), probe control) or ECM-2210 (rear heated oxygen sensor (HO2S), heating) will be stored. In addition, probe control is also checked. In brief, these checks are carried out as follows.

The front heated oxygen sensor (HO2S)

The front heated oxygen sensor (HO2S), which is a linear type: Two checks where the switch over time between rich-lean and lean rich fuel / air mixture is checked. The diagnostic checks the response time of the front heated oxygen sensor (HO2S) when fuel shut-off is activated and deactivated.
The rich-lean check takes place when the fuel shut-off system is activated, on condition that the sensor current is below a lower limit (indicates rich fuel / air mixture). When the fuel shut-off system is activated, the sensor current usually rises (this indicates a lean fuel / air mixture). The lean-rich check measures the time taken for the sensor current to rise from a lower to an upper limit value. If the time counter exceeds a fault level without the sensor current having reached the upper limit value, the response is considered to be too slow; a fault marker is stored.
The lean-rich check is carried out in a similar way when the fuel shut-off system is deactivated. The difference is that the time taken for the sensor current to fall is measured. Diagnostic trouble code (DTC) ECM-210A (front heated oxygen sensor (HO2S)) is stored in the event of a fault in both

of these checks.
In addition, the lambda value is also checked. This value must not deviate significantly from its control value. Diagnostic trouble code (DTC) ECM-210F (front heated oxygen sensor (HO2S)) is stored if the difference is too great.

Rear heated oxygen sensor (HO2S)

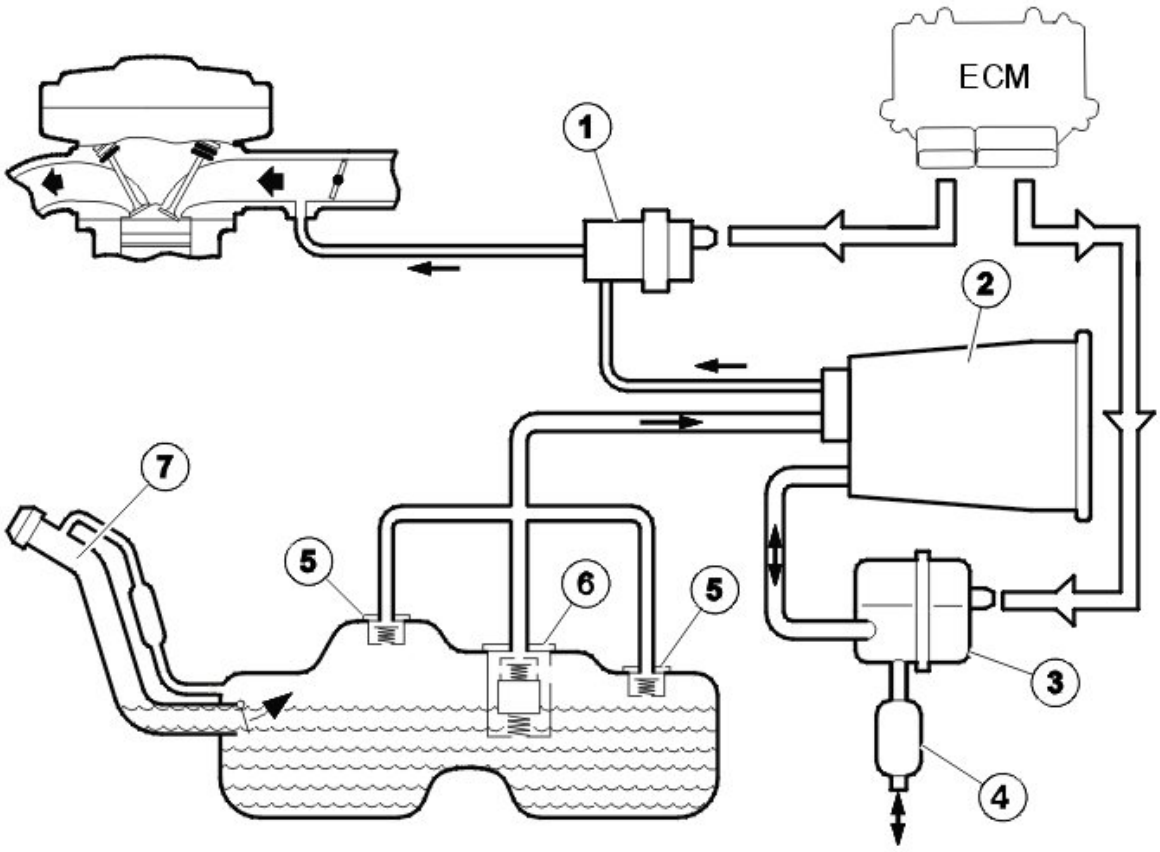
The rear heated oxygen sensor (HO2S), which is a binary type, is checked in the following way.
The control module checks the difference between the rear probe voltage maximum and minimum values. This voltage must not exceed 0.5 V. If the difference is greater, the control module takes an initialization value as its starting point. This is a maximum of 0 V and a minimum of 5 V. After this, the rear heated oxygen sensor (HO2S) maximum value must exceed the initialization value (0 V) for the probe voltage by at least 0.6 V and fall below the initialization value (5 V) probe voltage to the minimum value 0.1 V. If these limit values are not reached within approximately 5 minutes and the accumulated and actual probe warming has not reached certain limit values, the control module interprets it as a fault.

Twin probe control starts and is active when
- the front probe has started control
- the rear probe has reached operating temperature

Twin probe control is interrupted during fuel shut-off, during misfiring or in the event of a fault in
- the catalytic converter
- heated oxygen sensor (HO2S) heating

Leak Diagnostic

Leak diagnostic



All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:
- fuel tank
- Canister purge (CP) valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that

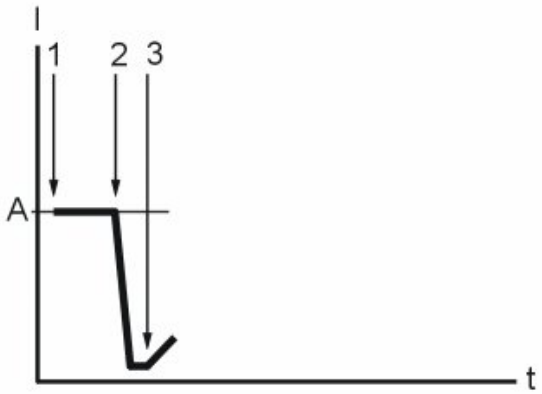
is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak (fuel tank filler cap missing for example) leakage greater than 1.0 mm.
The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:
- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
- Engine off for at least 5 hours (continuous), engine running for at least 20 minutes (continuous)
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) +4 °C or higher
- Maximum altitude of 2500 meters above sea level
- Outside temperature between +4 and +35 °C
- Stable signal from the fuel level sensor
- Fuel volume in the tank between 15-85 %
- Battery voltage between 11.0-14.5 V. The voltage must be stable
- EVAP canister purge valve closed
- Low volume in the canister.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.
- reference phase 1
- function test
- leak diagnostic
- reference phase 2 (only during minor leak diagnostics, if the previous phase detected leaks).

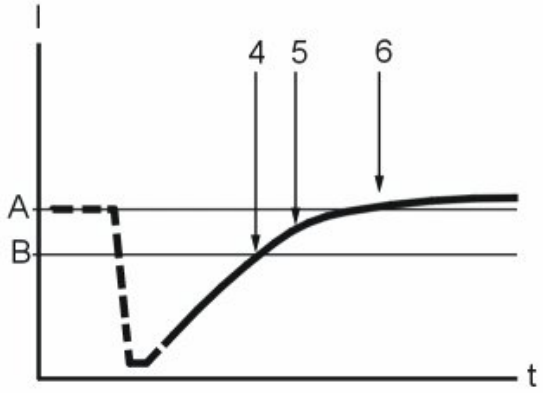


Reference phase 1 (1-2)

The illustration is a diagram of a fault free fuel tank system.
Before the leak diagnostic begins, the control module runs reference phase 1 for leakage. During reference phase 1 (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then used by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during reference phase 1 (1-2), or if the value for pump power consumption varies too much during reference phase 1 (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled because the power consumption of the pump is varying excessively.
After reference phase 1, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

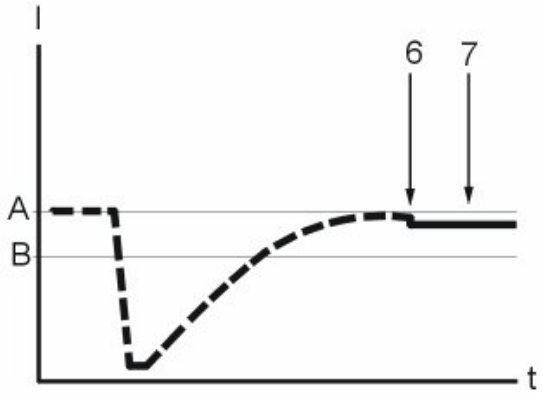


Leak diagnostic, major leak (leakage greater than 1.0mm)

The diagnostic for "major leaks" is carried out every other time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). If the measured value reaches the calculated desired value within a certain time frame (determined by the fuel level in the tank), the engine control module (ECM) assumes that the fuel tank system is free of major leaks.
If a diagnostic trouble code (DTC) for major leaks is stored by the engine control module (ECM), a diagnostic trouble code (DTC) for fuel tank filler cap missing will also be stored and the driver will be notified by a text message in the driver information module (DIM).

Leak diagnostic, minor leak (leakage greater than 0.5mm but less than 1.0mm)

The diagnostic for minor leaks is run every 14th time the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5). If the measured value (6) is the same or less than the value stored in reference phase 1 (A) (minor leak) after a certain amount of time (the time is determined by the fuel level in the tank), reference phase 2 is run (see reference phase 2 below).
A diagnostic trouble code (DTC) for minor leakage is stored, depending on the power consumption of the pump during reference phase 2.



Reference phase 2

The illustration shows the reference phase after the diagnostic for minor leaks, sealed fuel tank system.
Reference phase 2 is run when the power consumption of the pump is too low during the diagnostic for leakage. This is to ensure that lower power consumption during the minor leak diagnostic (6) is not caused by changes in components. If the measured power consumption during reference phase 2 (7) is lower than that measured during pressurization (6), the control module interprets this as meaning that the fuel tank system is sealed. A diagnostic trouble code (DTC) for minor leakage is stored if the measured power consumption from reference phase 2 (7) is the same or higher than that measured during pressurization (6).

Leak Diagnostics

Leak diagnostics

Overview

Vapor which evaporates from the fuel in the fuel tank is routed to and stored in the EVAP canister from where it is guided into the combustion process via the canister purge (CP) valve and negative pressure in the intake manifold. The diagnosis is designed to detect leaks between 0.5-1 mm, depending on the model year.
The tank system consists of the fuel tank, fuel tank filler cap, fuel filler pipe, roll-over valve, EVAP canister, EVAP components, fuel tank pressure sensor, and EVAP canister shut-off valve.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

The diagnostic is divided into different phases under which the various components are tested and faulty components are isolated with a diagnostic trouble code (DTC).

Conditions for diagnosis

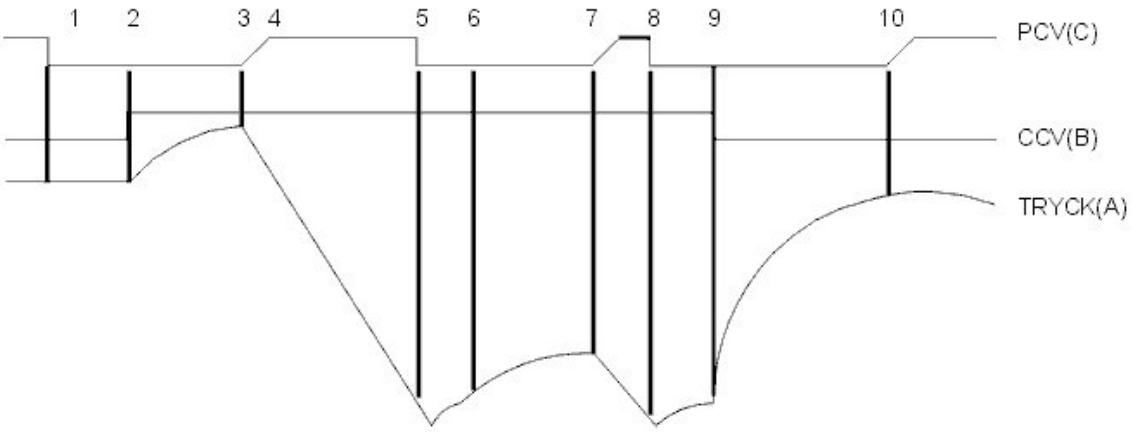
The diagnosis begins when all the following conditions are met.
There must be no diagnostic trouble code (DTC) stored for the following components or functions:

- EVAP canister shut-off valve
- the fuel tank pressure sensor
- the canister purge (CP) valve
- Vehicle speed is between 30-160km/h, must be steady driving
- Engine speed below 3500 rpm
- Engine coolant temperature (ECT)> 60°C
- Maximum altitude of 2500 meters above sea level
- Outside temperature above +3.5°C
- Stable fuel tank pressure
- Low volume in the canister.

The diagnostic test works as follows:

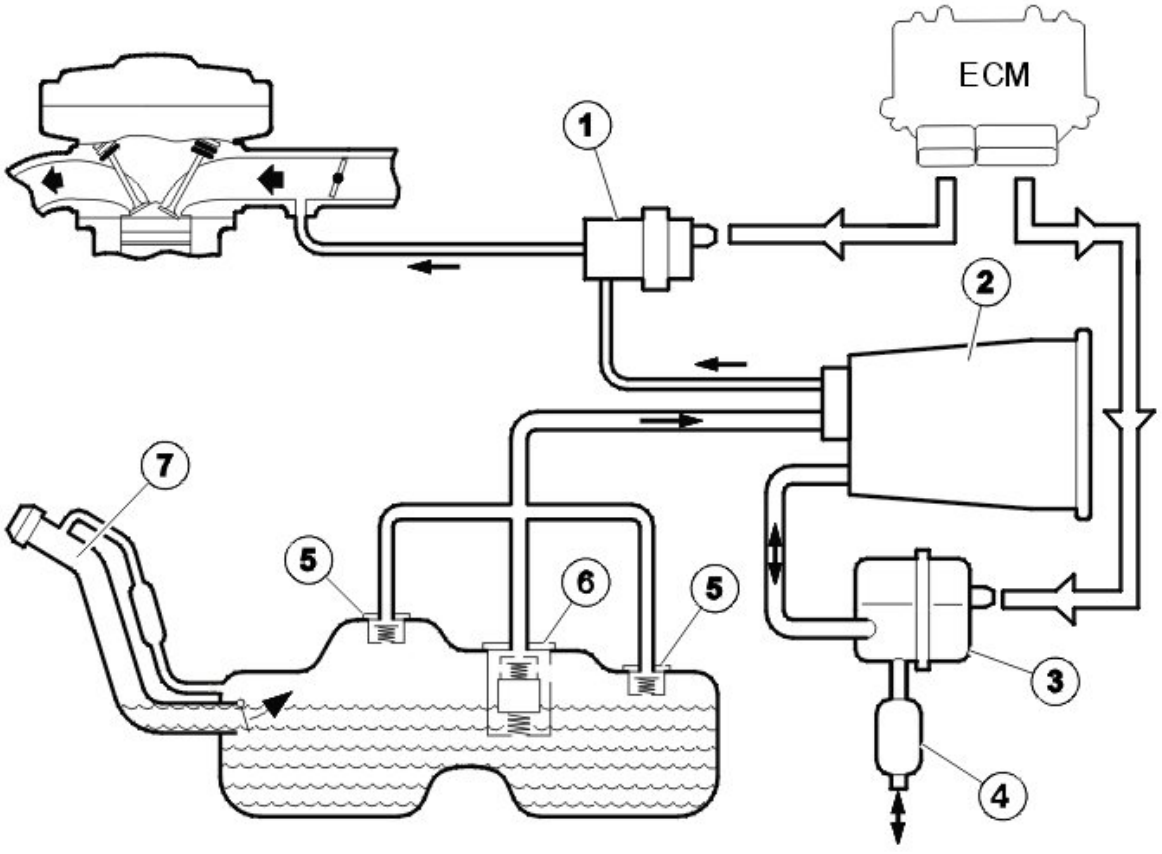
- 1. The canister purge (CP) valve (C) closes the fuel tank ventilation. The EVAP canister shut-off valve is still open. The pressure in the tank must now return to atmospheric pressure. If the pressure in the fuel tank does not return to atmospheric pressure, the canister purge (CP) valve (C) is leaking or that the EVAP canister shut-off valve (B) is blocked. Diagnostic trouble code (DTC) ECM-4047 canister purge (CP) valve leaking or EVAP canister shut-off valve blocked is stored
- 2. The evaporative emission system (EVAP) valve (C) is closed and the EVAP canister shut-off valve (B) closes the opening for fresh air ventilation. The pressure in the fuel tank must be unchanged or rise. If the fuel tank pressure drops the canister purge (CP) valve is leaking. Diagnostic Trouble Code (DTC) ECM-4047, canister purge (CP) valve leaking is stored. If the pressure in the fuel tank rises, there is considerable fuel evaporation and the diagnostic is cancelled
- 3-4. The EVAP canister shut-off valve (B) remains closed, the evaporative emission system (EVAP) valve (C) starts to pulse. The pressure (A) in the fuel tank now starts to drop quite quickly. If the pressure does not drop quickly there is a major leak in the system. Diagnostic trouble code (DTC) ECM-4308 leak diagnostic major leak is then stored. If the pressure drops too quickly instead, the fuel tank level is too high and the diagnostic is cancelled
- 5-6-7 The canister purge (CP) valve (C) closes. The EVAP canister shut-off valve (B) remains closed. When the fuel tank pressure has stabilized, a check is carried out as to whether pressure is rising too quickly in the fuel tank. This would indicate a minor leak in the fuel tank system and ECM-4308 Minor leak would be stored
- 8-9-10. The evaporative emission system (EVAP) valve (C) pulses, so that the fuel tank pressure (A) drops again. The EVAP canister shut-off valve (B) then opens so that the fuel tank pressure can return to atmospheric pressure. Diagnostic trouble code (DTC) ECM-4047 EVAP canister shut-off valve blocked is stored if the recovery time is too long. The time taken to return to atmospheric pressure is also a measurement of the amount of fuel in the tank. The fuel level is used as a compensation value when calculating the size of the leak during stages 5-6-7 above.

The diagnostic test starts at the earliest 13 minutes after the engine has started when all conditions have been fulfilled, and takes approximately 60-80 seconds. If the diagnostic is interrupted it will try again when all the conditions have been fulfilled again. The control module makes a maximum of 20 attempts in one trip. No more attempts are made until the engine is started again.



Leak Diagnostics, Improved Version (2002-)

Leak diagnostics, improved version (2002-)



All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- the EVAP canister purge valve (1)

- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the conditions for leak diagnostics are met.
The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.
The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The Engine control module (ECM) checks for leakage in the fuel tank system by measuring the relationship between reached pressure and flow from the leak diagnostic pump during pressurization.
If a certain pressure is not reached with a predetermined supplied flow (with known mass), the Engine control module (ECM) interprets this as a leak from the fuel tank system.
Leak diagnostics starts in normal operation when specific conditions are met, see below. The diagnostics can also be started on command using VIDA when some of these conditions are ignored.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met.
Note: When diagnostics are started on command using VIDA, certain different conditions apply. See relevant information about these, available with starting Quick test fuel tank system.

- No diagnostic trouble codes (DTCs) for EVAP valve or atmospheric pressure sensor may be stored.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes
- Ignition off
- Vehicle speed 0 km/h.
- Engine coolant temperature (ECT) 4-35°C.
- Maximum altitude of 2500 meters above sea level
- Outside temperature 4-35 °C.
- Fuel volume in the tank between 0-85 %. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined.
- Battery voltage between 11-15 V. The voltage must be stable.
- EVAP canister purge valve closed
- Low volume in the canister.
- Fuel tank filler cap locked. Tip. Locking occurs when the vehicle speed exceeds approximately 20 km/h.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- reference phase
- function test
- checking the fuel tank system

Reference phase

Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phases for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the pump in the leak diagnostic unit is monitored and the reference values stored for later use to determine whether the tank system is leaking or not.
If a reference value for the pump is outside its unexpectedly high or low, or deviates too much, diagnostics is cancelled and a DTC is stored.

Function test

After the reference phase, the valve in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the load the pump to fall briefly before the pressure builds up in the fuel tank system. If the load does not change within permitted parameters within a permitted time, diagnostics is cancelled and a DTC is stored.

Checking the tank system, major leak (leak greater than 1.0 mm)

Diagnostics are carried out every time conditions for diagnostics are met.
The leak diagnostic unit pressurizes the fuel tank system and checks for leaks by monitoring the pressure the fuel tank system. The pressure is a calculated pressure, calculated using the measured pump power consumption. If the pressure stabilizes and/or does not exceed 1500 Pa within 450 seconds, this is interpreted as a leak from the fuel tank system. Diagnostics are cancelled and a DTC for major leak is stored.

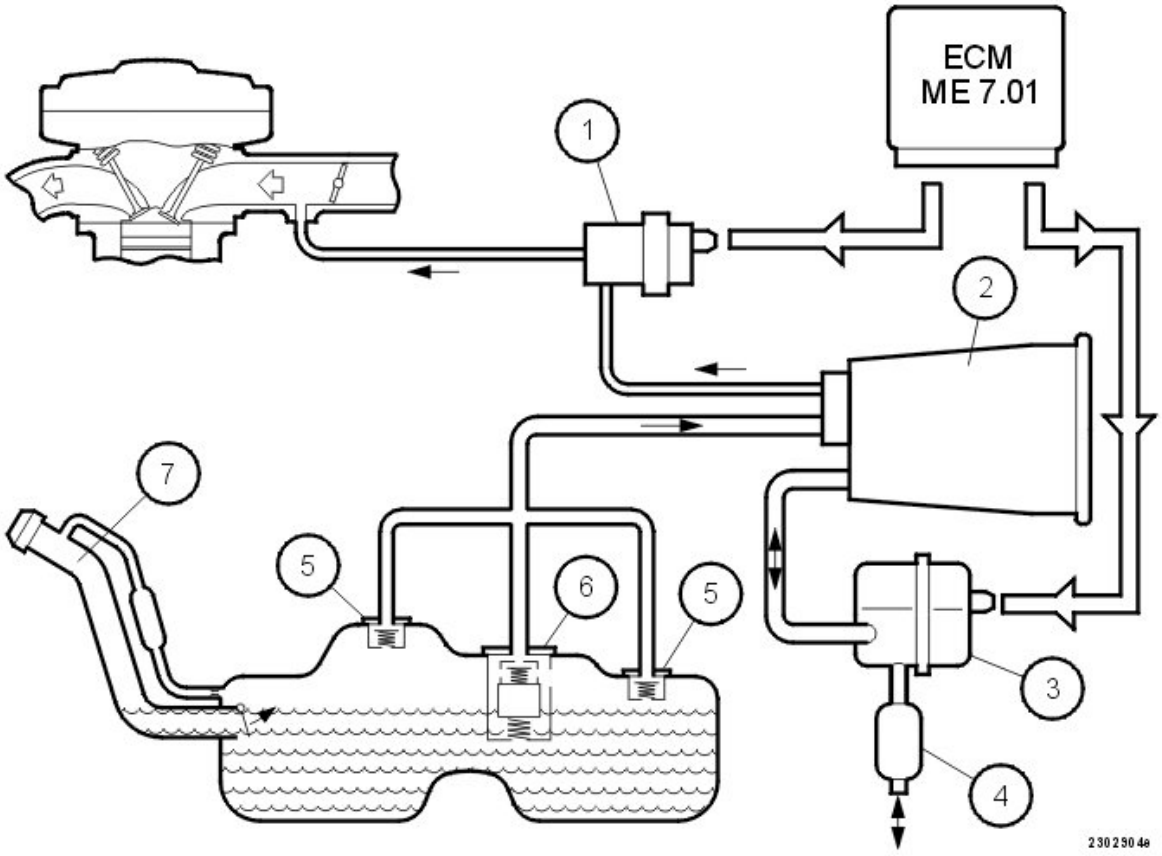
Checking the fuel tank system, minor leak (leakage greater than 0.5 mm but less than 1.0 mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. Otherwise diagnostics stop after checking for major leaks.
The leak diagnostic unit continues to pressurize the fuel tank system. The Engine control module (ECM) checks for leakage in the fuel tank system

by measuring the relationship between reached pressure and flow from the leak diagnostic pump during pressurization. In a sealed system the relationship between these must be linear. Any deviations from the linear relationship are calculated and used to determine how well sealed the tank system is.
A diagnostic trouble code (DTC) is stored if a minor leak is detected within 15 minutes.

Leak Diagnostics, Original Version (-2004)

Leak diagnostics, original version (-2004)



All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages that cause gas to evaporate into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of fuel tank, roll-over valve (5), Float Limit Vent Valve (6), fuel filler pipe (7), EVAP canister (2), EVAP valve (1), air cleaner (4), leak diagnostic unit (3) and all cables between these components. The fuel tank system has a leak diagnostic unit that makes it possible to diagnose any leaks. The unit pressurizes the fuel tank system when the ignition is switched off if the conditions for leak diagnostics are met. The control module can detect faults in the function of the diagnostic unit and leakage that is 0.5 mm (minor leak) or greater (major leak, fuel filler cap missing).
The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

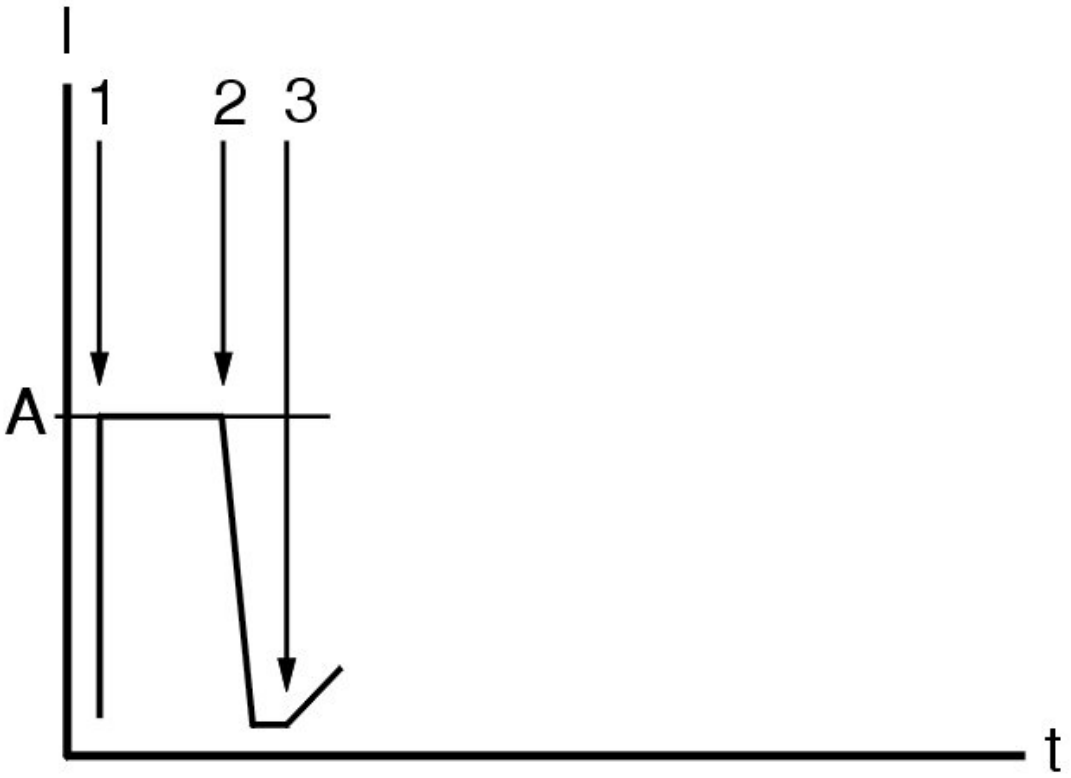
The diagnosis begins when all the following conditions are met:
- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the EVAP canister purge valve.
- Engine off for at least 5 hours (context), engine running for at least 20 minutes (context)
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) +4 °C or higher
- Maximum altitude of 2500 meters above sea level
- Outside temperature between +4 and +35 °C
- Stable signal from the fuel level sensor
- Fuel volume in the tank between 15-85 %
- Battery voltage between 11.0-14.5 V. The voltage must be stable
- EVAP canister purge valve closed
- Low volume in the canister.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.

- Reference phase 1
- Function test
- Leak diagnostic.

Reference phase and function test



(the illustration is a diagram of a fault free fuel tank system) Before the actual leak diagnostic begins, the control module enters a reference phase for leakage and checks the components in the system.

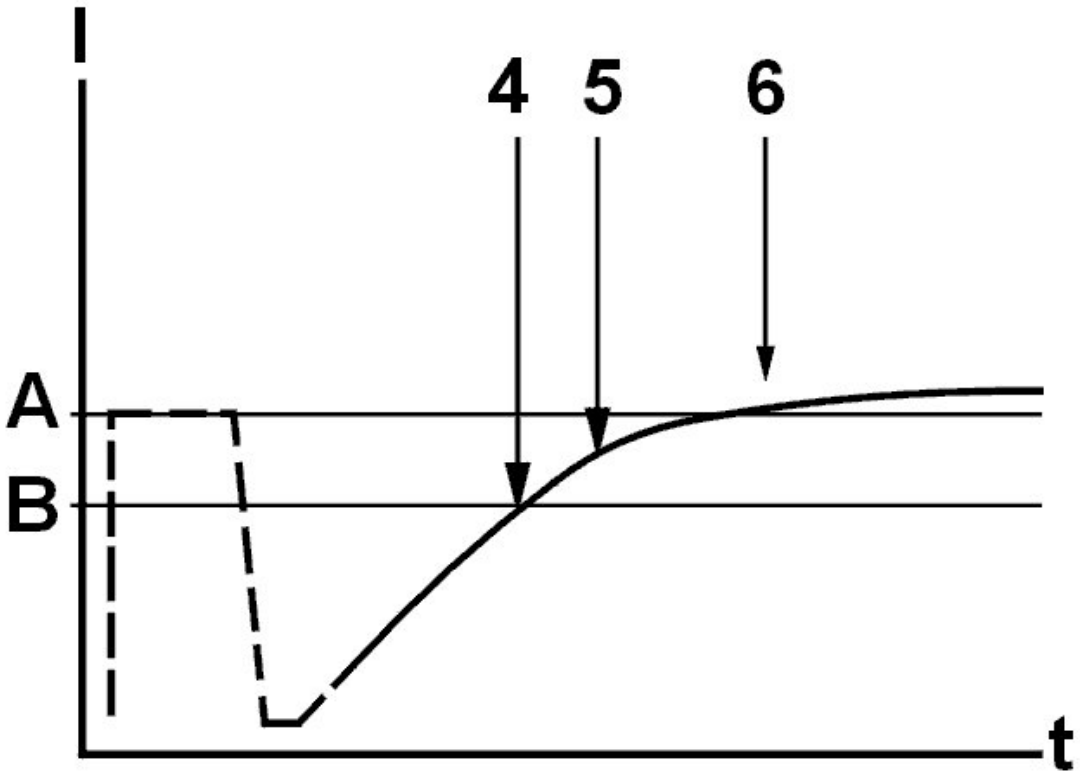
Reference phase 1 and reference phase 2

During the reference phases (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption of the pump is measured and stored in the control module (A). The stored value for the power consumption of the pump corresponds to a leakage of 0.5 mm.

Function test

If the value for the power consumption of the pump is too high or low during reference phase1 (1-2), or if the value varies too much during reference phase 1 (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. Diagnostic trouble code (DTC) ECM-431D, faulty signal, is stored if the diagnostic is cancelled 10 times due to excessive variation in the power consumption of the pump. After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). Diagnostic trouble code (DTC) ECM-431D, signal missing, is stored if the value for the power consumption of the pump drops too quickly, too slowly or not at all.

Leak diagnostic

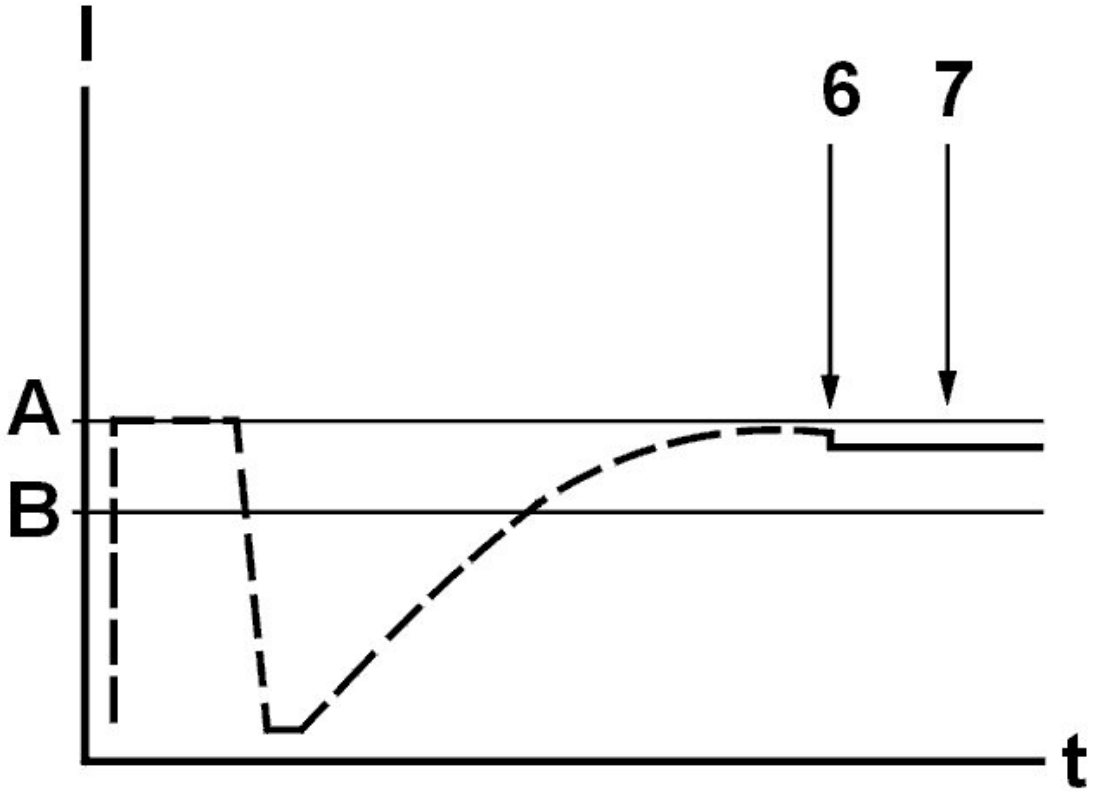


(the illustration is a diagram of a fault free fuel tank system). As long as diagnostic trouble code (DTC) ECM-431D is not stored, the leak diagnostic will be carried out after the reference phase and the function test.

Major leak

(leaks >1.0 mm) The diagnostic for "major leaks" is carried out every other time when the diagnostic conditions are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). If the measured value does not reach the calculated desired value within a certain amount of time (this time is determined by the fuel level in the tank), the function of the leak diagnostic unit is rechecked by running reference phase 2 again to check that low power consumption has not led to changes in the components. Diagnostic trouble code ECM-400C, major leak, is generated if the power consumption of the pump is OK during reference phase 2.
Diagnostic trouble code (DTC) ECM-4338 (fuel tank filler cap missing) will also be stored and the driver will receive a text message in the Driver Information Module (DIM) when a major leak is detected by the Engine Control Module (ECM).

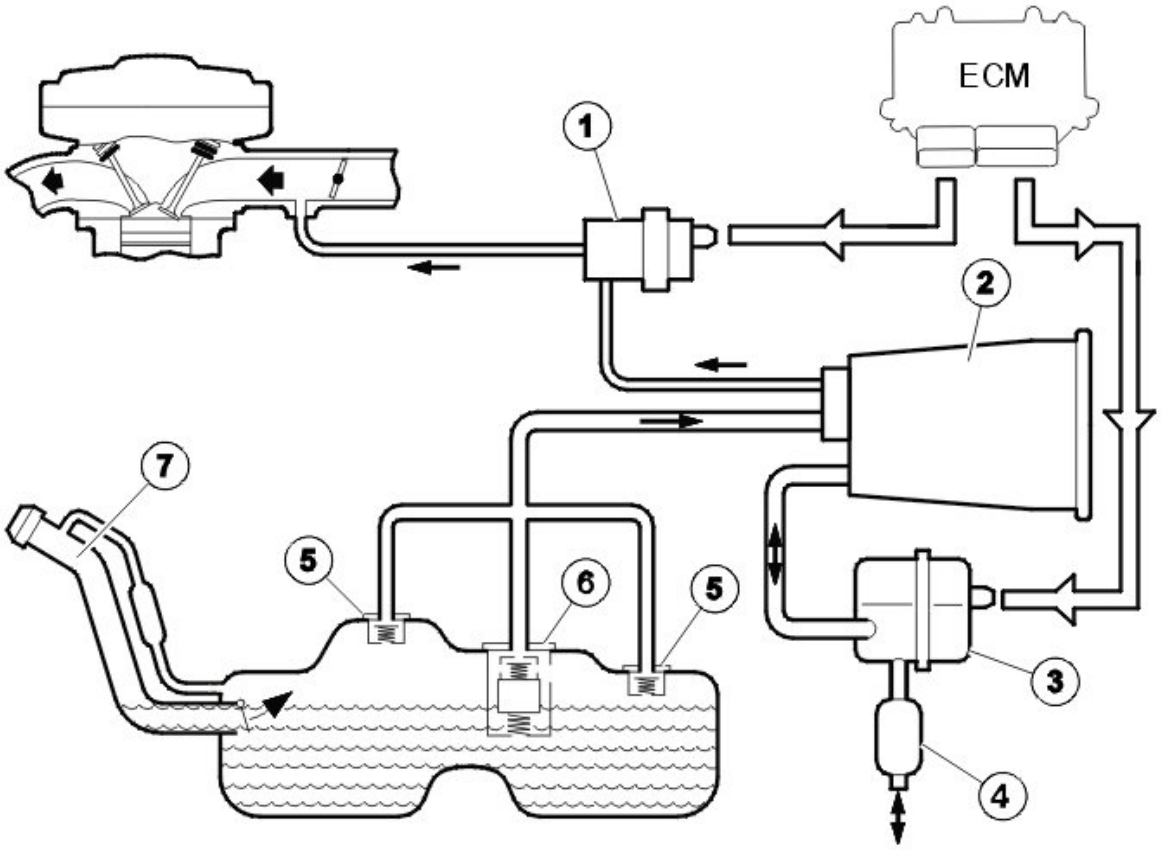
Minor leak



(leaks >0.5 mm <1.0 mm). The diagnostic for "minor leaks" is carried out every 14th time when the diagnostic conditions are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5). If the measured value (6) is the same or less than the value stored in the reference phase (A) after a certain amount of time (determined by the fuel level in the tank), reference phase 2 (7) is run to ensure that the lower power consumption (6) is not the result of changes in components. If the measured power consumption during the second reference phase (7) is lower than that measured during pressurization (6), the control module interprets this as meaning that the fuel tank system is sealed. Diagnostic trouble code ECM-400C, minor leak, is generated if the measured power consumption from the second reference phase (7) is the same or higher than that measured during pressurization (6).

Leak Diagnostics, Original Version (2005-)

Leak diagnostics, original version (2005-)



All gases that evaporate from fuel in the fuel tank must be led to and stored in the evaporative emission system (EVAP) canister so that they can be directed into the engine for combustion. In order to detect leakages which cause evaporation of gases into the air, the fuel tank system is diagnosed for leakage. The fuel tank system consists of:

- fuel tank
- the EVAP canister purge valve (1)
- EVAP canister (2)
- leak diagnostic unit (3)
- air cleaner (ACL) (4)
- Roll-over valve (5)
- Float Limit Vent Valve (6)
- fuel filler pipe (7)
- all lines between the above components.

The fuel tank system has a leak diagnostic unit to diagnose any leakage. The leak diagnostic unit pressurizes the fuel tank system when the ignition is off, if the conditions for diagnosis have been met. The control module can detect faults in the function of the leak diagnostic unit and leakage that is 0.5 mm or greater. Minor leak; leakage greater than 0.5 mm but less than 1.0 mm. Major leak; leakage greater than 1.0 mm.
The leak diagnostic unit consists of a pump and a valve that controls the air flow in the unit. The fuel tank system tests for leaks by measuring the power consumption of the pump. The power consumption of the pump corresponds to a certain pressure in the fuel tank system. During diagnosis, the rate at which the pressure can build up is checked, taking into account the quantity of fuel in the tank. The quicker the pressurization the better the fuel tank system is sealed.

Conditions for diagnosis

The diagnosis begins when all the following conditions are met:

- There must be no diagnostic trouble code (DTC) stored for the following components or functions:
  - the power stage for the pump in the leak diagnostic unit
  - the power stage for the valve in the leak diagnostic unit
  - the power stage for the EVAP canister purge valve
  - the evaporative emission system (EVAP) valve
  - the engine coolant temperature (ECT) sensor
  - speed signal.
- The engine is switched off until the engine coolant temperature (ECT) has fallen to a few degrees above the outside temperature, then engine running for at least 10 minutes
- Ignition off
- Vehicle speed 0 km/h
- Engine coolant temperature (ECT) -5 °C or higher
- Maximum altitude of 2500 meters above sea level.
- Outside temperature between -5 and +35 °C
- Fuel volume in the tank less than 85 %. The engine control module (ECM) ignores these parameters if a diagnostic trouble code (DTC) is stored for the fuel level sensor and the fuel volume cannot be determined
- Battery voltage between 11.0-14.5 V. The voltage must be stable

- EVAP canister purge valve closed
- Low volume in the canister.

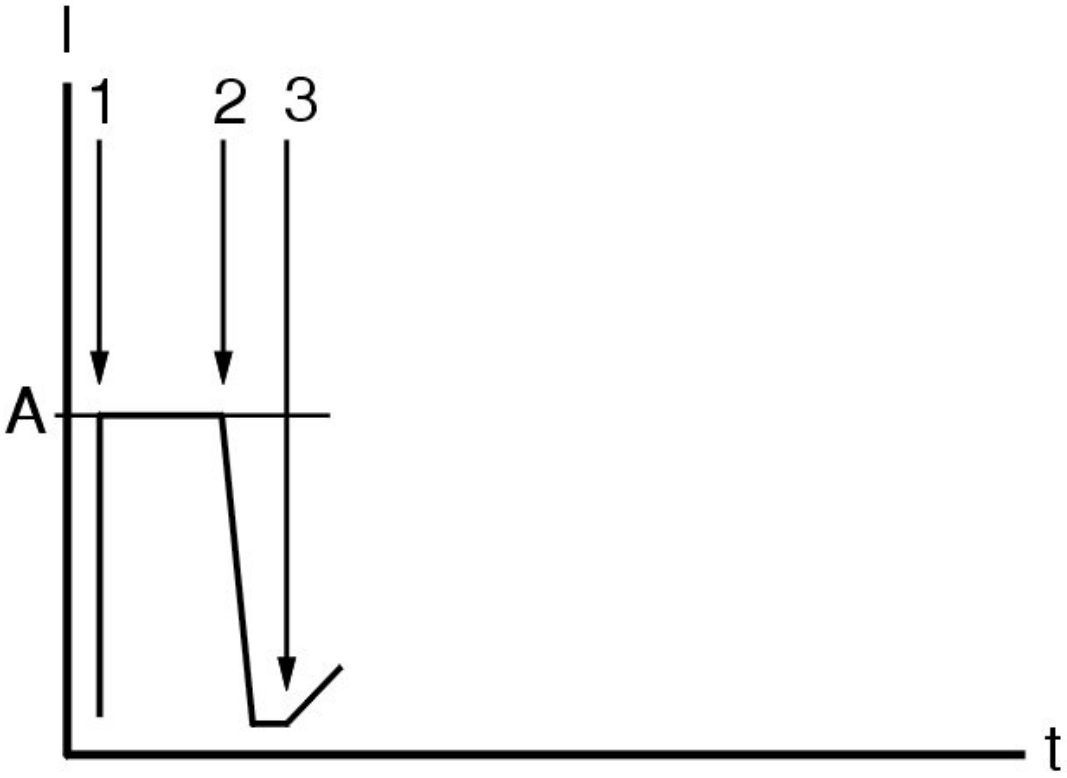
Fuel tank filler cap check

The exception from the above conditions is when the car has been refuelled. The engine control module (ECM) starts a check of the fuel tank filler cap after refuelling. This check is a simplified version of the leak diagnostic unit for major leaks. The fuel tank filler cap control is run whilst the vehicle is being driven. This allows the control module to check that the cap has been reinstalled. A diagnostic trouble code (DTC) is stored in the engine control module (ECM) and a text message is displayed in the driver information module (DIM) if the cap is missing.

Diagnostic phases

The diagnostic is divided into the following phases and is carried out in sequence when all conditions for the diagnostic have been met.
- Reference phase
- Function test
- Leak diagnostics

Reference phase (1-2)

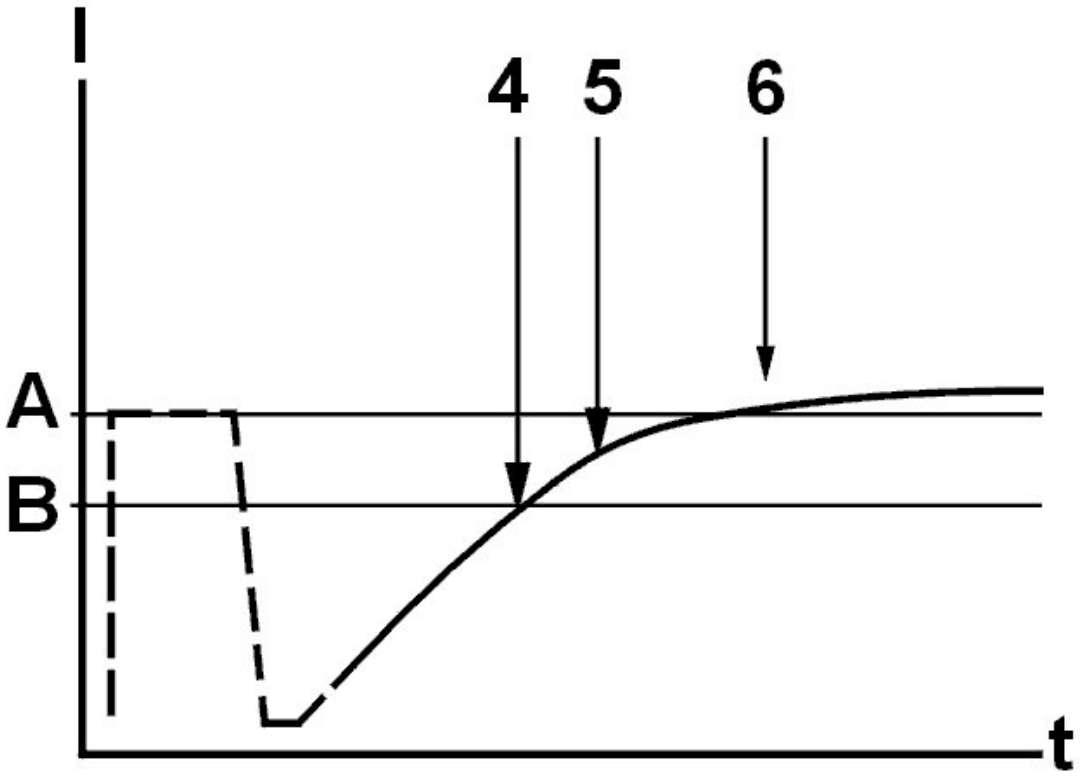


The illustration is a diagram of a fault free fuel tank system.
Before the leak diagnostic begins, the control module runs a reference phase for leakage. During the reference phase (1-2) for leakage that is 0.5 mm, the pump in the leak diagnostic unit pumps ambient air through a 0.5 mm hole and back out to the ambient air. At the same time, the power consumption (A) of the pump is measured and stored in the control module. The stored value (A) for the power consumption of the pump corresponds to a leakage of 0.5 mm. This value is then used by the engine control module (ECM) to determine the leak status of the fuel tank system.

Function test (1-3)

If the value for the power consumption of the pump is too high or low during the reference phase (1-2), or if the value varies too much during the reference phase (1-2), the diagnostic is cancelled and starts again the next time the conditions for the diagnostic are met. A diagnostic trouble code (DTC) is stored if the diagnostic is cancelled several time in a row because the power consumption of the pump is varying excessively.
After the reference phase, the valve (2) in the leak diagnostic unit is activated and controls the air flow to the fuel tank to pressurize the fuel tank system. This change of air flow will cause the power consumption of the pump to fall briefly before the pressure builds up in the fuel tank system (3). A diagnostic trouble code is stored if the value for the power consumption of the pump drops too quickly, slowly or not at all.

Leak diagnostic, major leak (leakage greater than 1.0mm)



The diagnostic for "major leaks" is carried out each time when the conditions for the diagnostic are met. The leak diagnostic unit pressurizes the fuel tank system, measures the power consumption of the pump (4) and compares this with a calculated desired value (B). A diagnostic trouble code (DTC) for a major leak is stored if the measured value does not reach the calculated desired value within a certain time (the time is determined by atmospheric pressure and the fuel level in the tank).

Leak diagnostic, minor leak (leakage greater than 0.5mm but less than 1.0mm)

The diagnostic for minor leaks is run every other time that the conditions for the diagnostic are met. The diagnostic for major leaks is always run before the diagnostic for minor leaks. The leak diagnostic unit continues to pressurize the fuel tank system (5-6). After a certain amount of time (the time varies depending on the fuel level in the tank), the engine control module (ECM) checks that the fuel tank system for leaks. This is determined based on:

- time
- the measured reference current consumption of the pump (A)
- the measured power consumption of the pump when the assessment is made
- the shape and character of the current curve during pressurization.

A diagnostic trouble code (DTC) is stored if a minor leak is detected.

Misfire Diagnostics

Misfire diagnostics

Misfiring

If the fuel / air mixture does not ignite completely in the ignition stroke the engine is misfiring. The engine control module (ECM) detects the misfire by registering deviations in the rotation of the flywheel.
Deviation in flywheel rotation is due to:

- driveline oscillations
- normal variations caused by uneven combustion
- flywheel mechanical tolerances
- misfiring, which is caused by:
  - incorrect fuel / air mixture
  - poor ignition sparking
  - insufficient compression.

Diagnostics

The mechanical tolerances and oscillations in the drive line disrupt the signal. This makes it difficult to determine if a misfire has occurred or if the detection is incorrect.
The signal from the flywheel is adapted to filter out the irregular rotation. This eliminates the mechanical variations in the flywheel.
Misfires can be detected by registering the time difference between the intervals and comparing this with the filtered time difference in the

flywheel. If the flywheel signal has not been adapted, the diagnostic is active. However this cannot identify misfires as accurately as an adapted flywheel signal. The adaptation is carried out at different loads and engine speed ranges. For the values to be set in the different ranges, the deviation in rotation must be within certain fixed limits.
Drive line oscillations, caused by extremely uneven road surfaces for example, may lead to uneven engine operation. Drive line oscillations are registered by the accelerator in the brake control module (BCM) which sends this information to the engine control module (ECM).
The misfire diagnostic is shut off when:

- The brake control module (BCM) transmits information to the engine control module (ECM) about driveline oscillations
- A fault has been detected by the engine control module (ECM) in the engine speed (RPM) sensor or mass air flow (MAF) sensor
- When DSTC, traction control and/or ABS is active.

Diagnostic trouble code (DTC) management

Diagnostic trouble codes (DTC) for misfiring will light the malfunction indicator lamp (MIL).
The engine control module (ECM) determines how much the engine is misfiring by counting the number of misfires during a certain number of engine revolutions.

Misfire affecting emission levels

If the engine control module (ECM) detects a certain number of misfires during 1000 engine revolutions, this is interpreted as misfiring which affects emissions. If misfiring is detected in the first 1000 engine revolutions a diagnostic trouble code (DTC) is stored and the malfunction indicator lamp (MIL) lights. However, if misfiring is detected after the first 1000 engine revolutions, four misfires need to be detected before a diagnostic trouble code (DTC) is stored.

Catalytic converter damage

If the engine control module (ECM) detects a certain number of misfires during 200 engine revolutions, this is interpreted as misfiring which damages the three-way catalytic converter (TWC). The number of misfires that the engine control module (ECM) allows before interpreting it as misfiring depends on the load and engine speed range.
The engine control module (ECM) registers and stores the engine speed and load range and whether the engine is warm or cold when misfiring is detected.
If the misfire stops, the requirements for the engine speed and load parameters must be met without misfiring before the engine control module (ECM) will begin counting down to extinguish the warning lamp and erase stored diagnostic trouble codes (DTCs) for misfiring.

Three-Way Catalytic Converter (TWC) Diagnostics

Three-way catalytic converter (TWC) diagnostics

The three-way catalytic converter (TWC) stores oxygen from the exhaust gases and uses it to make toxic gases more environmentally friendly. The catalytic converter is a 3 way catalytic converter in which HC (hydrocarbons) and CO (carbon monoxide) are oxidized and NOx(nitrous oxide) is reduced. As the three-way catalytic converter (TWC) ages, its ability to store oxygen is reduced. The conversion capacity of the three-way catalytic converter (TWC) is reduced and unburned residue which is harmful to environment is released. To reduce the environmentally damaging emissions, the engine control module (ECM) checks the efficiency of the three-way catalytic converter (TWC). In brief, this check is carried out as follows.
Two heated oxygen sensors are used to check the three-way catalytic converter (TWC). One is upstream of the converter and one is in the center of the converter (the rear heated oxygen sensor).
The main function of the heated oxygen sensors is to measure the oxygen content in the exhaust gases so that the engine control module (ECM) can maintain the fuel/air mixture at around lambda=1. This mixture allows for optimum catalytic conversion.
To evaluate the efficiency of the three-way catalytic converter (TWC) one uses a deviation added to the lambda signal.
This means that 8 to 15 minutes after the engine is started (depending on the market) catalytic converter diagnostics start.
The process is as follows:
A deviation is added to the lambda signal and the engine control module (ECM) is allowed to correct this.
The deviation switches between positive and negative values so that the fuel/air mixture switches between rich and lean.
A counter registers the number of switches occurring while the diagnostic is taking place.
If the rear heated oxygen sensor registers a large number of switches exceeding a parameter, a diagnostic trouble code (DTC) for three-way catalytic converter (TWC) efficiency will be stored.
If the parameter is not exceeded the three-way catalytic converter (TWC) is deemed to be operating well.

Note! In a poorly operating three-way catalytic converter (TWC) the switches caused by the deviation will quickly exceed the parameter. This is because the exhaust gases in principle pass straight through the three-way catalytic converter (TWC) without being cleaned. If the three-way catalytic converter (TWC) is operating well the switches will be slower as it takes a longer time for the variations to make themselves felt.

Readiness Monitor (Certain Markets Only)

Readiness Monitor (certain markets only)

This is a function in Engine control module (ECM) that controls the control module's emission-related sub-system. With the function you can read out if the control module has run all diagnostics for the following sub-systems:

- Misfiring

- Fuel system
- Catalytic converter
- Evaporative emission (EVAP) system
- Heated oxygen sensors (HO2S)
- Other related components

Thus, Readiness refers only to if the diagnostics (tests) have been run or not, not if a malfunction was found or not. If a malfunction is found during the test, a diagnostic trouble code is stored and the malfunction light (MIL-light) is lit.
If the tests are run in the driving cycle without detecting a malfunction, then "Readiness" is immediately generated to OK.
However, if a malfunction is found in the driving cycle, then Readiness is generated to Not OK, and another driving cycle is required where the test is run to generate Readiness to OK.

The following alternatives are possible:

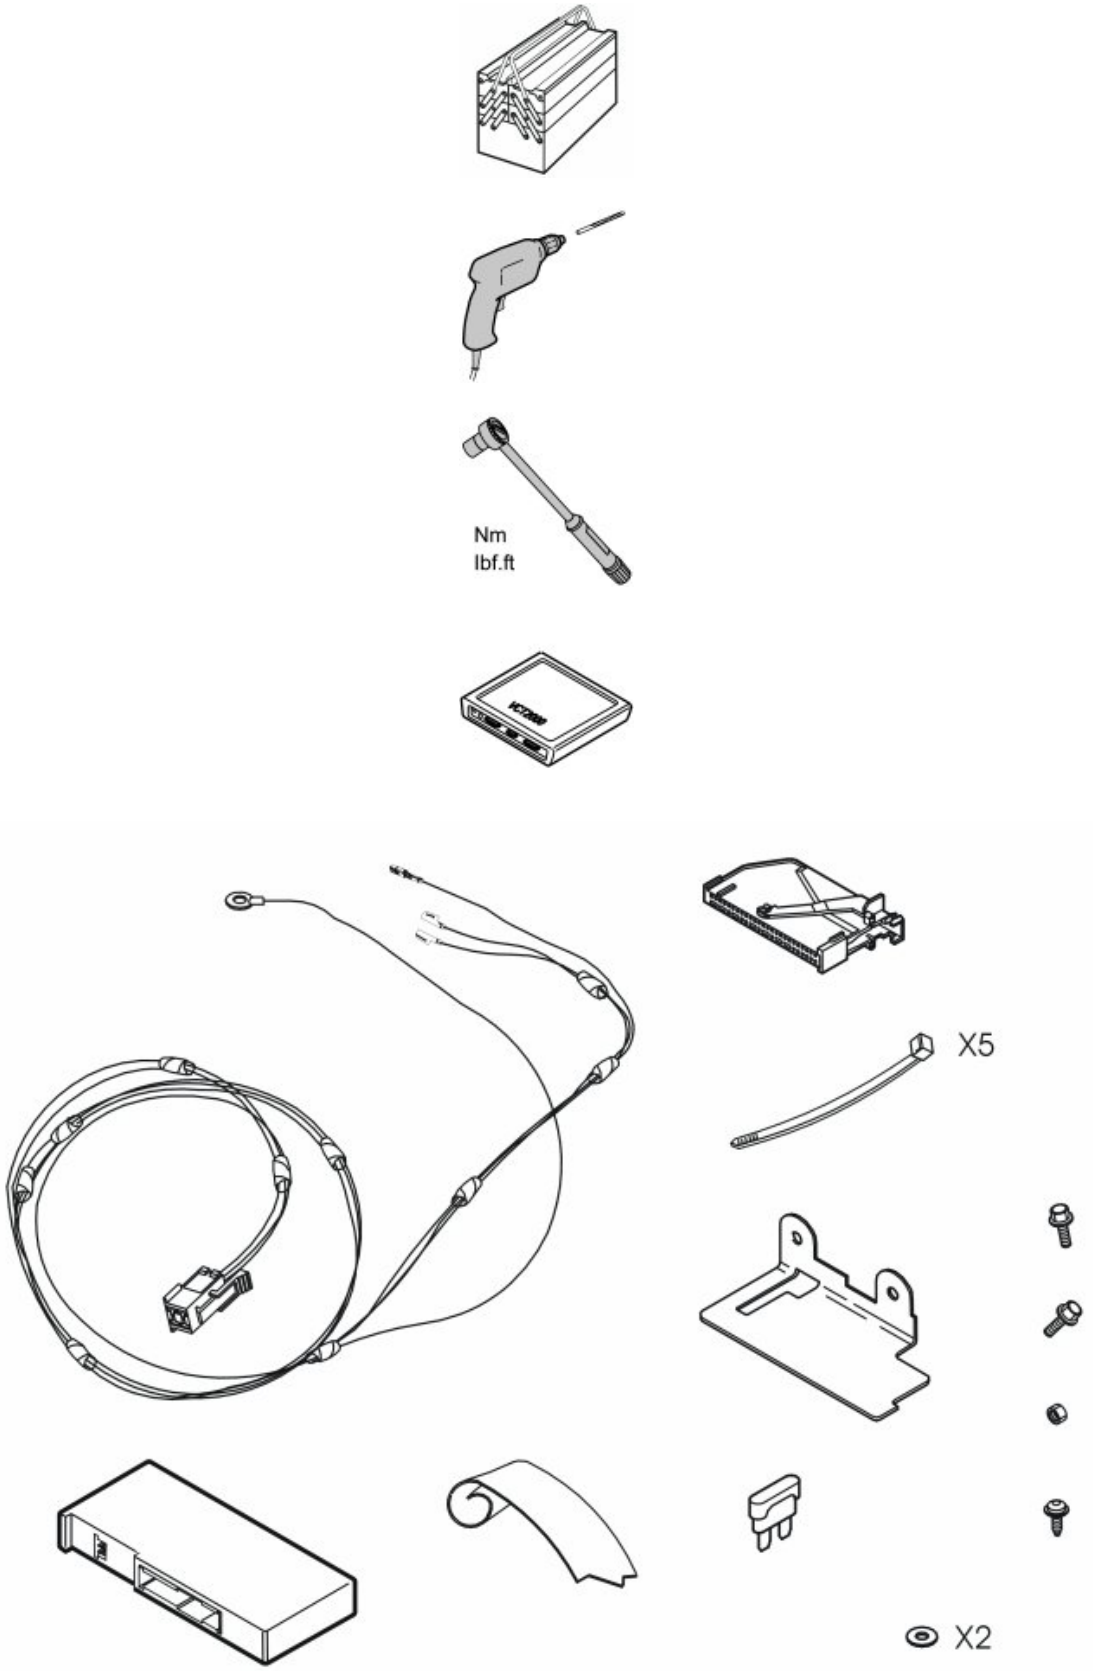
- Readiness is run (OK), no malfunction detected, which means that the vehicle can be approved in a check.
- Readiness is run (OK), with malfunction detected, which means that the vehicle cannot be approved in a check.
- Readiness is not run (Not OK), which means that the vehicle cannot be approved in a check.

Readiness was originally a requirement from the American authority, United States Environmental Protection Agency (EPA), and is used there for Inspection and maintenance test (IM-test) (corresponds to annual inspection). Depending on legal requirements, the function may also be found on other markets.

Body Control Module: Service and Repair

Accessory Electronic Module (AEM)

Accessory Electronic Module (AEM)

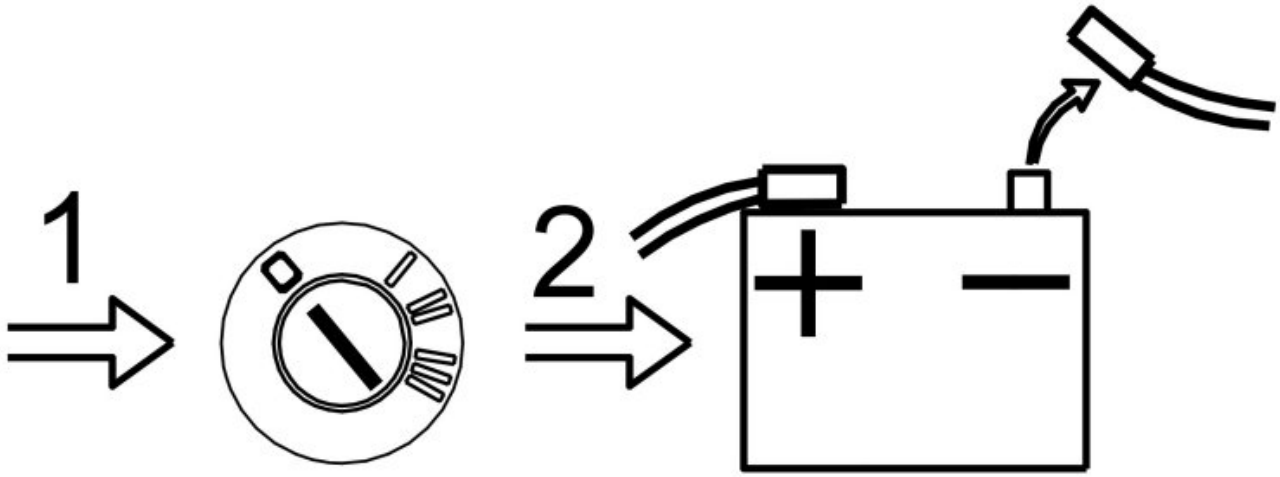


Accessory Electronic Module (AEM)

Note!

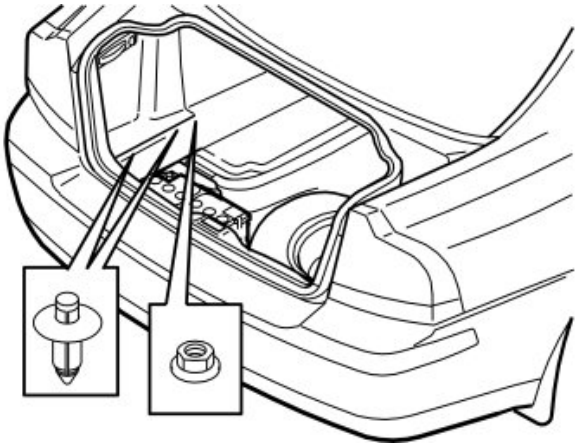
- Steps 1 - 16 apply to S60 and S80.
- Steps 17 - 39 apply to V70.

Applies to S60 and S80

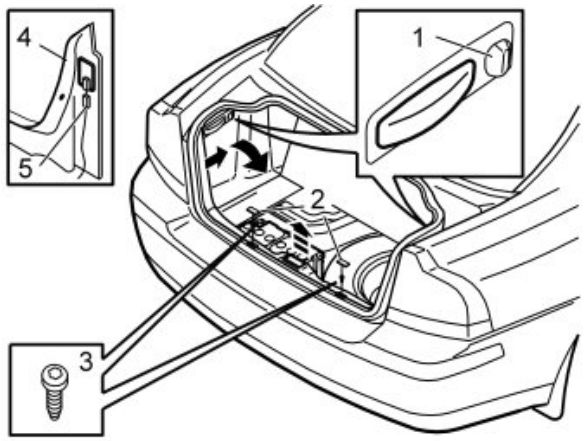


- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

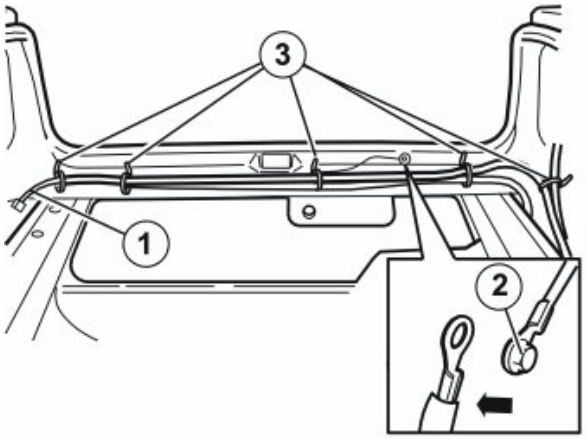
Note! Wait at least five minutes before disassembling the connectors or removing other electrical equipment.



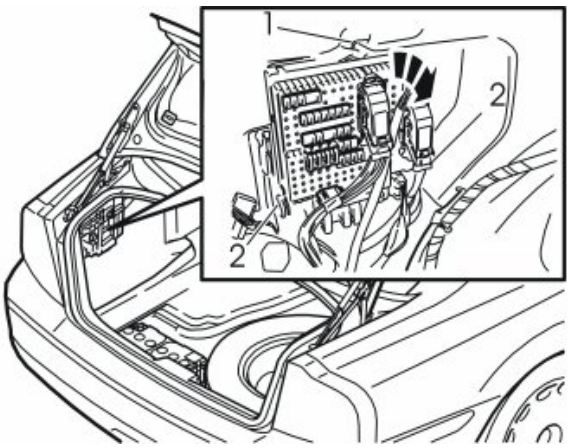
- Remove the cargo compartment carpet.
- Remove the clips from the lower edge of the folding panel by pressing in the clip centre until there is an audible click.
- Remove the clips.
- Unscrew the front clip.
- Repeat the operation on the other side.



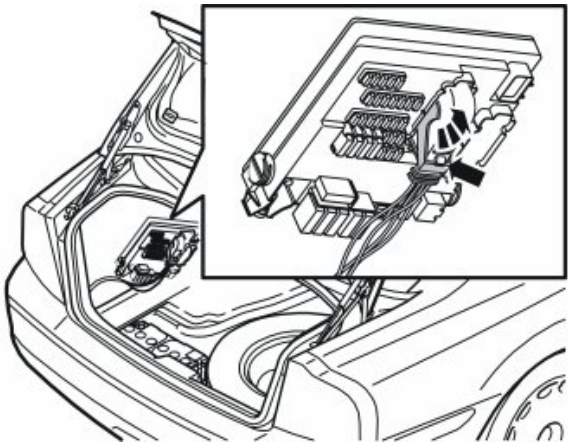
- Turn the knob (1) on the right/left side 90°.
- Fold the panels inwards. Lift the panels out
- Remove the two covers (2) and the screws (3) underneath (applies to S80 only).
- First pull the boot lid sill panel (4) forward until the two clips on the right/left side release. Pull hard but carefully as the panel is securely fastened. Then pull the panel straight up until the four clips in the bottom edge release.
- Remove the wiring (5) for the cargo compartment lighting.
- Lift out the sill trim panel.



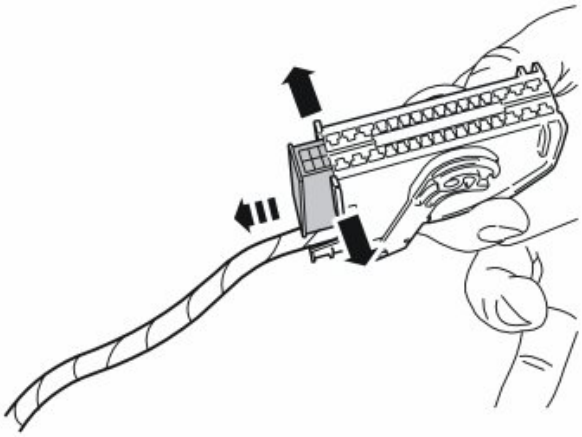
- Take the wiring harness (1) from the kit. Position it along the boot lid sill with the black connector to the right, in the rear edge on the right wheel housing.
- Remove the ground screw (2) and connect the ground cable of the new wiring harness to the existing grounding point. Tighten the ground screw securely.
- Take five cable ties (3) from the kit and secure the wiring harness to the existing wiring harness as illustrated.



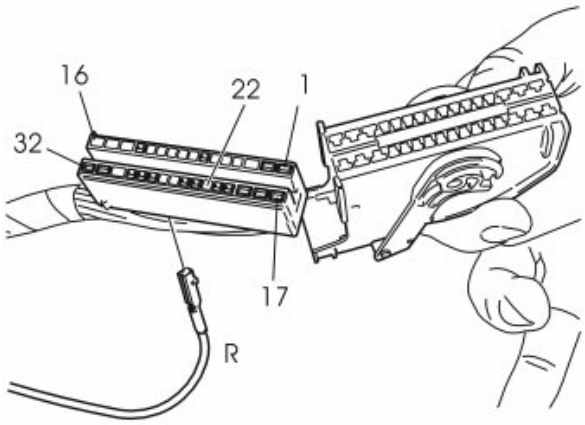
- Remove the Rear Electronic Module (REM) by opening the lock (1) on the top of the unit. Tip the unit forward and lift it out of the mountings (2).



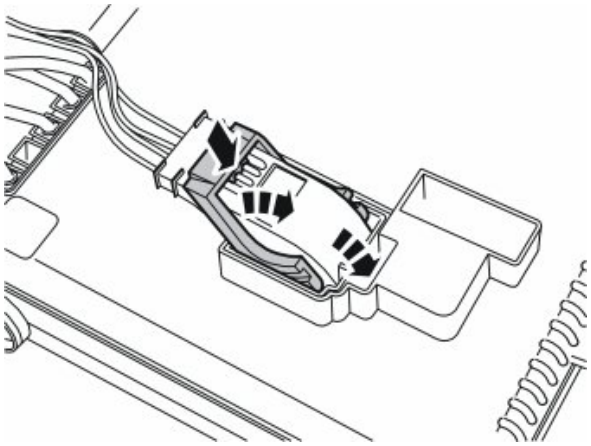
- Press in the catch on the rear brown connector in the fuse holder in the cargo compartment, turn the lock arm up as far as it will go and pull out the connector.



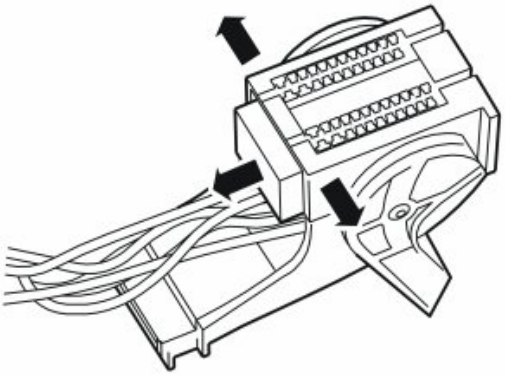
- Carefully prise apart the sides of the connector holder in the ends so that the connector can pass by the retaining hooks.
- Pull out the connector.



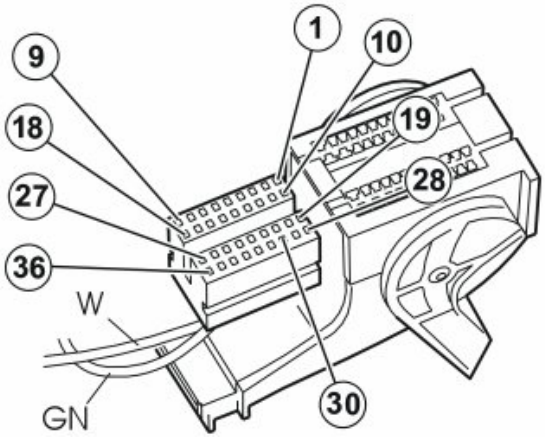
- Connect the red (R) cable to position 22.
- Reinstall the connector in the holder
- Reinstall the connector in the fuse holder.



- Press in the catch on the grey connector on the rear of the fuse holder in the cargo compartment, turn the lock arm up as far as it will go and pull out the connector.

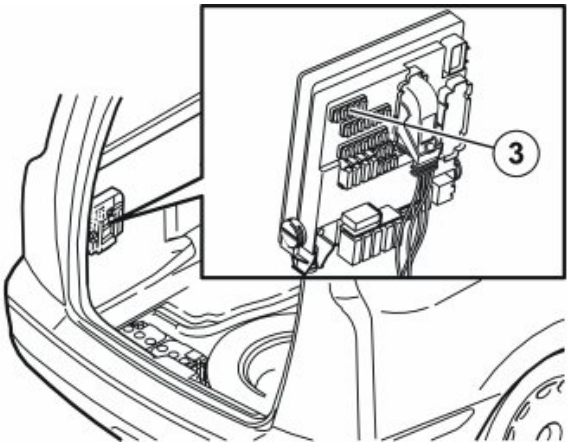


- Carefully prise apart the sides of the connector holder in the ends so that the connector can pass by the retaining hooks.
- Pull out the connector.

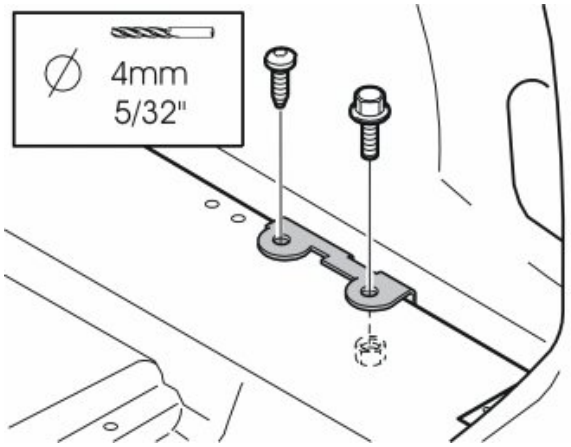


Note! Make a note of the position number of the connector. These are located on the ends of the connector and in the bottom of the fuse holder.

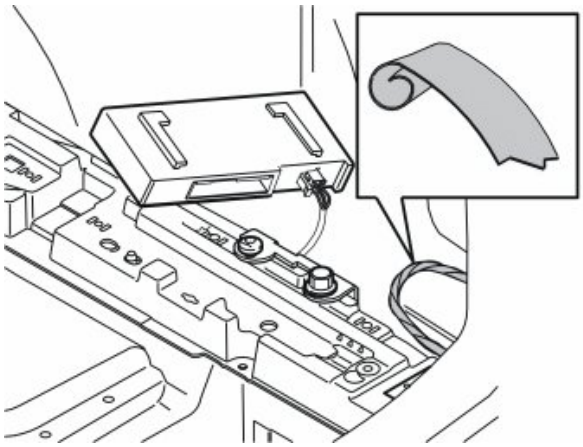
- Connect the green (GN) cable to position 19 in the connector. Connect the white (W) cable to position 30.
- Reinstall the connector in the holder
- Reinstall the connector in the fuse holder.
- Refit the Rear Electronic Module (REM).



- Fit fuse 15A from the kit in position 3 on the fuse holder.



- Install the new bracket on the right-hand rear side member as illustrated
- Install and tighten the bracket parallel with the side member. Use the screw and the nut from the kit
- Drill a **-4 mm (5/32")** hole in the side member, through the front hole in the bracket.
- Remove any swarf.
- Detach the bracket and treat the edges of the holes using a rust-proofing agent.
- Tighten the bracket to the side member.
- Tighten the rear bolt/nut to **10 Nm (8 lbf.ft.)**.

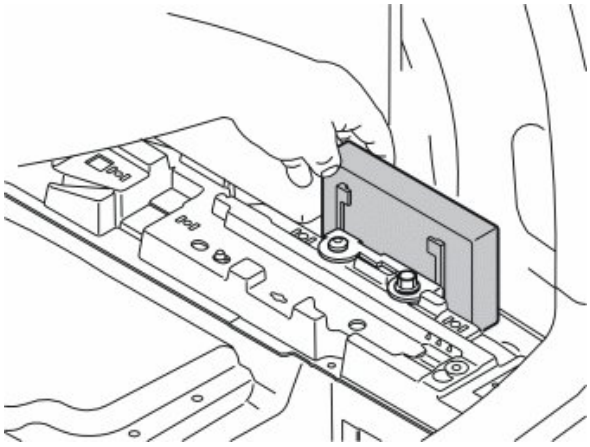


Applies to cars equipped with a Diversity aerial amplifier

- Wrap foam tape around the cable / wiring for the aerial amplifier.

Applies to all models

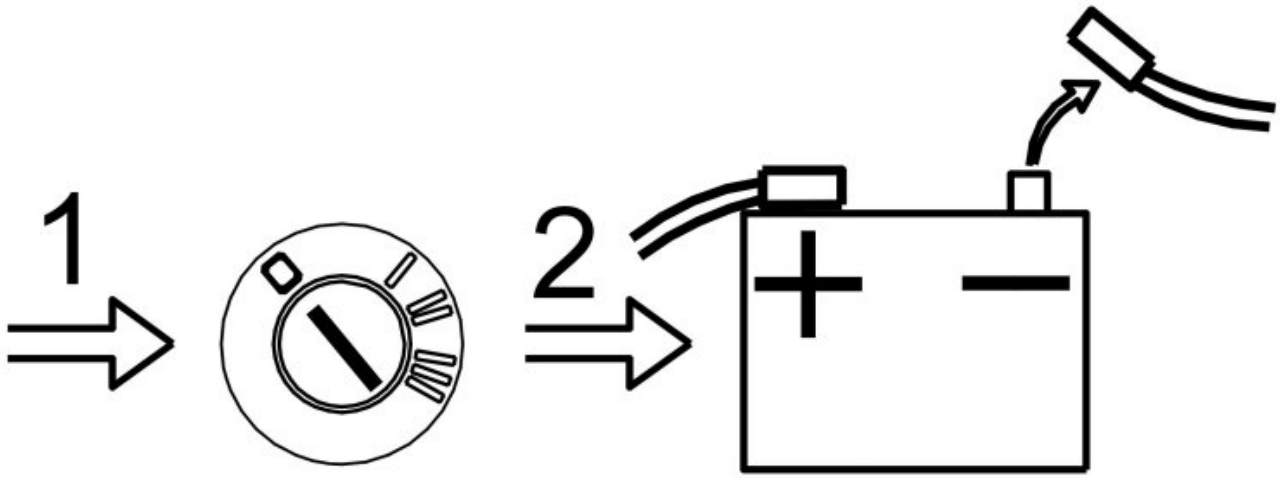
- Take the accessory electronic module from the kit. Connect the routed cable to the cable illustrated.



- Press the control module onto the bracket by the side member

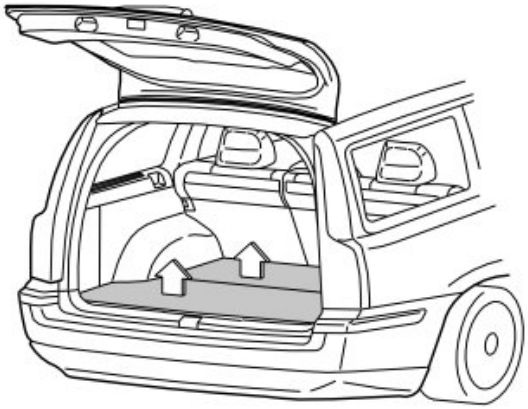
- Plug in the connectors of the cargo compartment lighting and refit the sill panel.
- Turn the ignition key to position II.
- Reconnect the battery negative lead
- Reposition the folding panels and refit the cargo compartment carpet.
- Program the software according to the service information in VIDA.

Applies to the V70

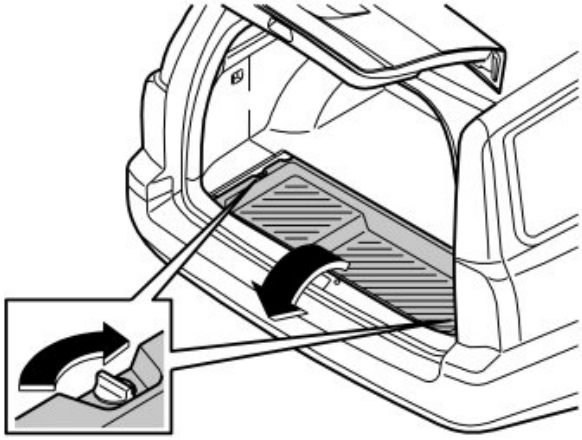


- Turn the ignition switch to position 0.
- Disconnect the battery negative lead.

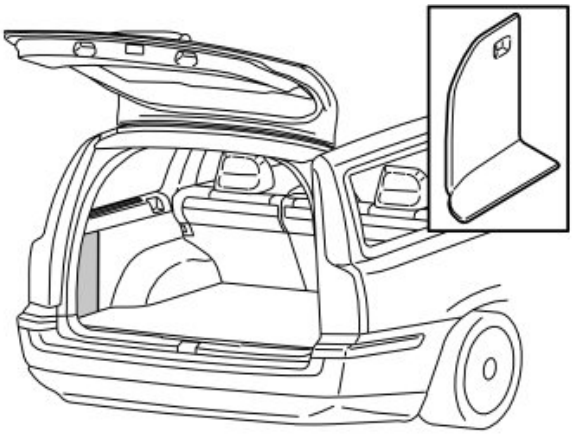
Note! Wait at least five minutes before disassembling the connectors or removing other electrical equipment.



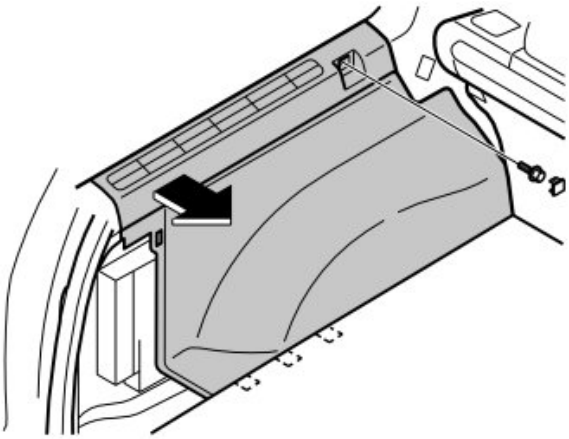
- Remove both the floor hatches. First lift the rear edges of the floor hatches slightly. Then pull the hatches backwards from their mountings.



- Remove the storage box under the rear floor hatch by turning the clip on the right and left-hand side 90°. Lift out the box.

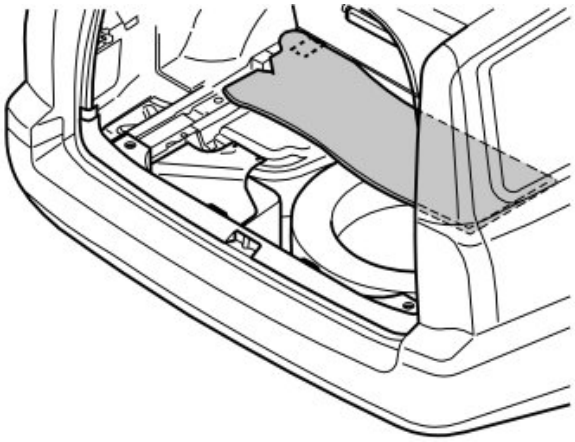


- Remove the left folding panel from the cargo compartment.
- Repeat the operation on the other side.

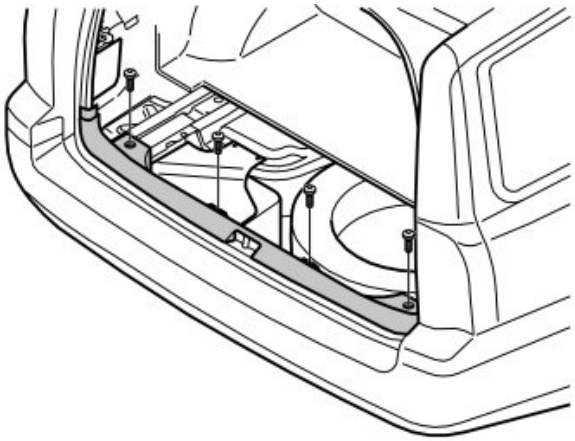


- Remove the left side panel by first removing the cover and the screw from the front edge.

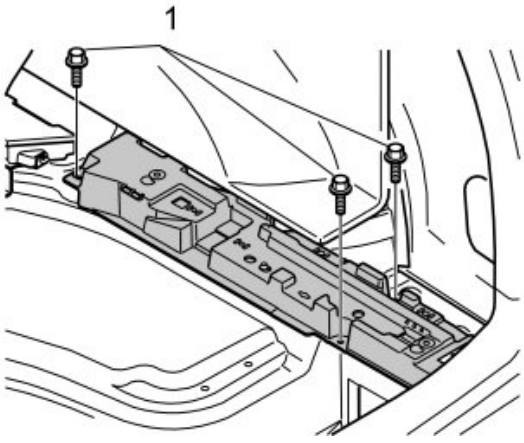
- Pull the top edge of the panel out until the clips release
- Fold the panel inwards. Lift the panel out.
- Repeat the operation on the other side.



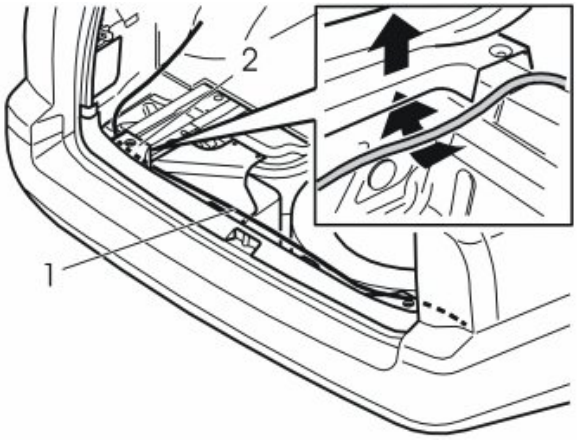
- Remove the insulation panel from the cargo compartment.



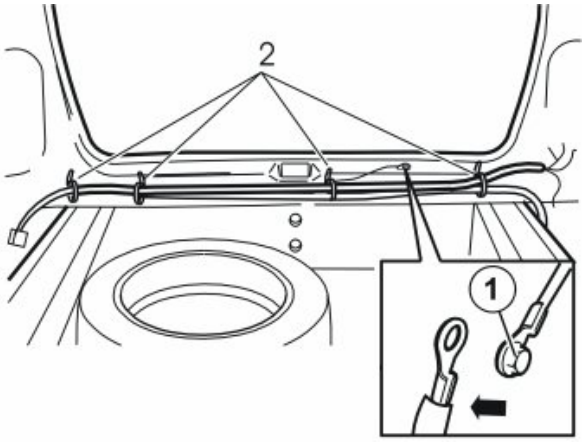
- Remove the 4 x screws in the tailgate sill panel.



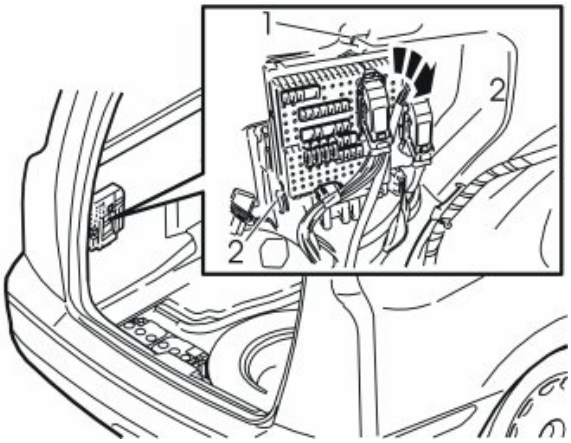
- Remove the three screws (1) from the right-hand floor support
- Remove the floor support.



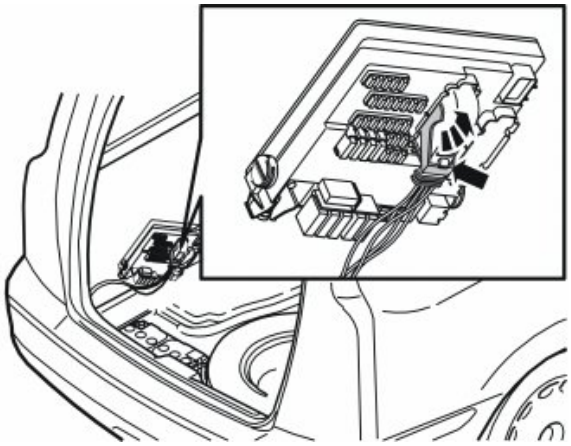
- Take the wiring harness (1) from the kit and position it along the tailgate sill panel with the black connector to the right.
- Carefully pull the tailgate sill panel upward at the left-hand corner until there is an audible click and the clips release.
- Lift the panel and insert the wiring harness into the gap between the floor support (2) and the panel.
- Insert the cable as far under the panel as possible. Ensure that the cable is not trapped
- Also insert the cable under the sill panel on the right side and then out to the rear edge of the wheel housing.



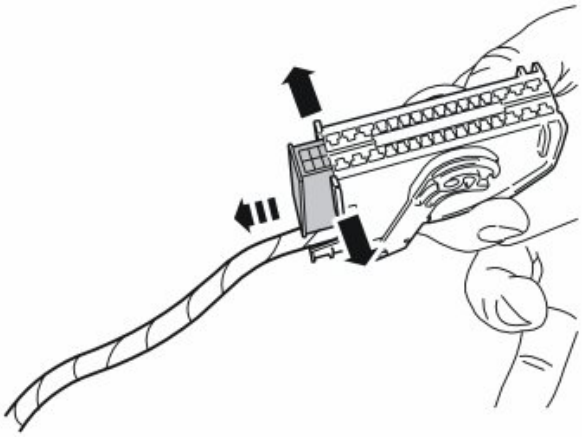
- Remove the ground screw (1) and connect the ground cable of the new wiring harness to the existing grounding point. Tighten the ground screw securely.
- Take four cable ties (2) from the kit and secure the wiring harness to the existing wiring harness as illustrated.
- Press the sill panel into place.
- Reinstall the screws in the panel. Tighten.



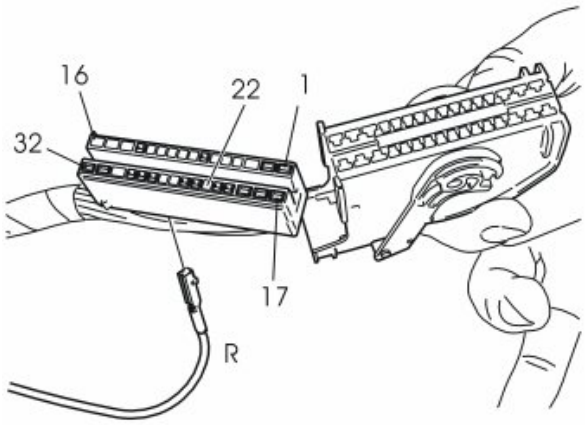
- Remove the Rear Electronic Module (REM) by opening the lock (1) on the top of the unit. Tip the unit forward and lift it out of the mountings (2).



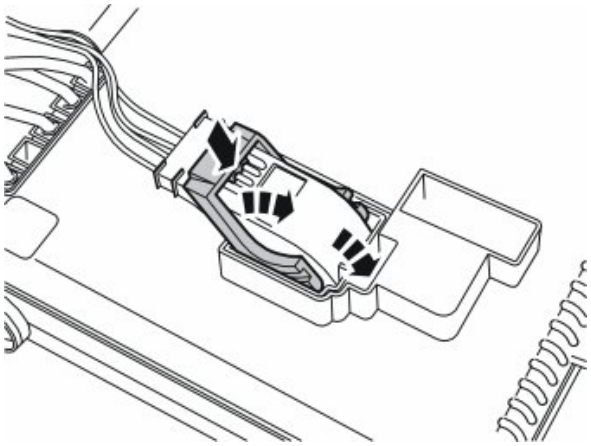
- Press in the catch on the rear brown connector in the fuse holder in the cargo compartment, turn the lock arm up as far as it will go and pull out the connector.



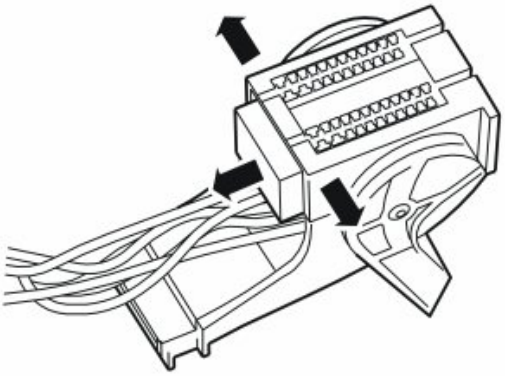
- Carefully prise apart the sides of the connector holder in the ends so that the connector can pass by the retaining hooks.
- Pull out the connector.



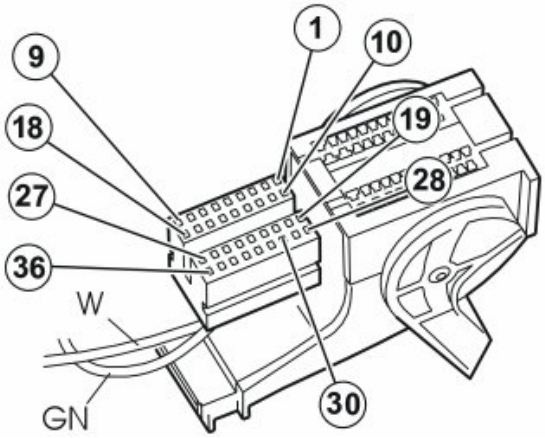
- Connect the red (R) cable to position 22.
- Reinstall the connector in the holder
- Reinstall the connector in the fuse holder.



- Press in the catch on the grey connector on the rear of the fuse holder in the cargo compartment, turn the lock arm up as far as it will go and pull out the connector.

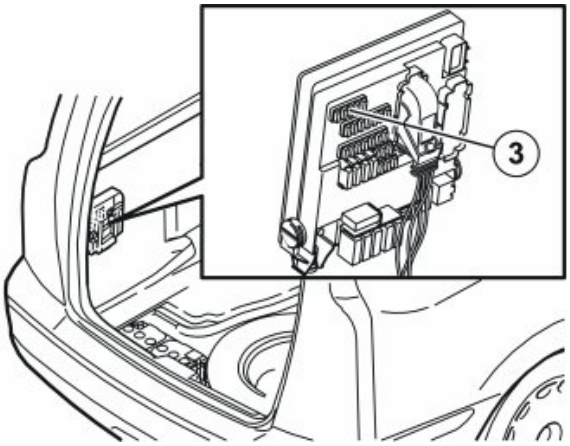


- Carefully prise apart the sides of the connector holder in the ends so that the connector can pass by the retaining hooks.
- Pull out the connector.

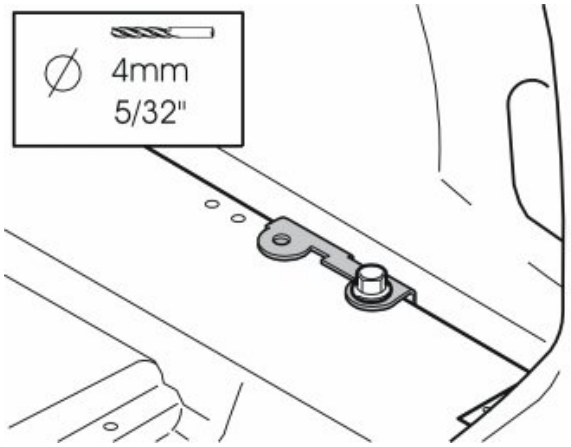


Note! Make a note of the position number of the connector. These are located on the ends of the connector and in the bottom of the fuse holder.

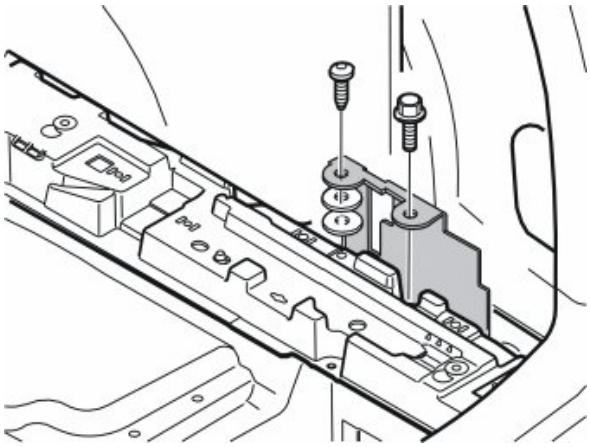
- Connect the green (GN) cable to position 19 in the connector. Connect the white (W) cable to position 30.
- Reinstall the connector in the holder
- Reinstall the connector in the fuse holder.
- Refit the Rear Electronic Module (REM).



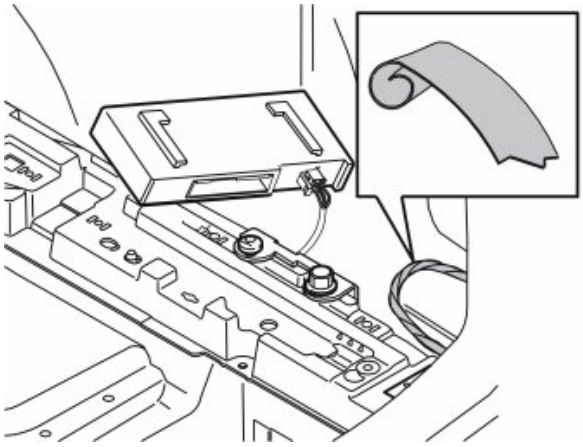
- Fit fuse 15A from the kit in position 3 on the fuse holder.



- Tighten the bracket of the accessory electronic module in the rear right hole for the floor support parallel to the side member as illustrated. On newer cars, there is a foam rubber block on the right-hand side member. This is to be kept in place and is compressed when the bracket is fitted in place.
- Drill a **-4 mm (5/32")** hole in the side member, through the front hole in the bracket.
- Remove the screw and the bracket
- Remove any swarf.
- Treat the edges of the holes using a rust-proofing agent.



- Reinstall the floor support. Tighten the floor support together with the bracket for the accessory electronic module. Use the three M6-screws, tightening them to **10 Nm (8 lbf.ft.)**.
- Position two new spacer washers between the front hole in the bracket and the floor support. Tighten using a new self tapping screw.

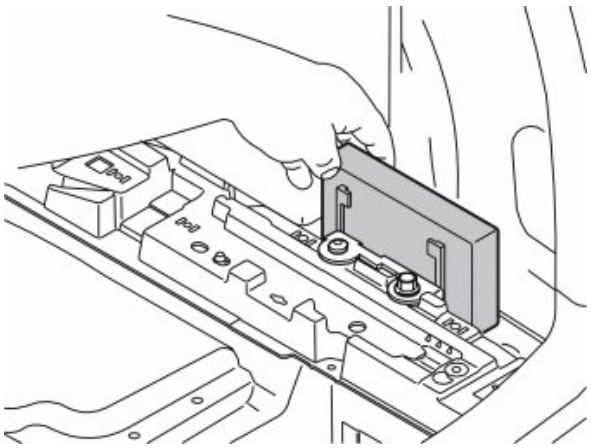


Applies to cars equipped with a Diversity aerial amplifier

- Wrap foam tape around the cable / wiring for the aerial amplifier.

Applies to all models

- Take the accessory electronic module from the kit. Connect the routed cable to the cable illustrated.



- Press the control module onto the bracket by the side member

- Turn the ignition key to position II.
- Reconnect the battery negative lead
- Reinstall the panels.
- Refit the insulation panel.
- Reinstall the storage box.
- Reinstall both floor hatches
- Program the software according to the service information in VIDA.

Central Electronic Module (CEM), Replacing

Central electronic module (CEM), replacing

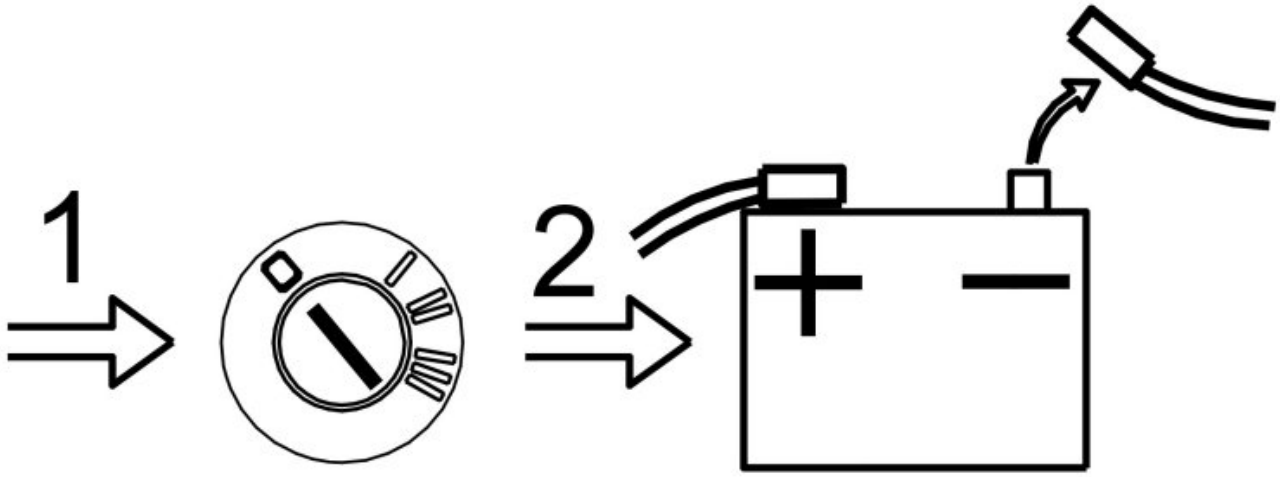
Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

For further information, see Downloading software and replacing the control module See: Body and Frame/Body Control Systems/Testing and Inspection/Programming and Relearning/Downloading Software and Replacing the Control Module/Central Electronic Module (CEM)

Preparatory work

Disconnecting the battery lead

Caution! The customer-programmed data must be read off before the control module is replaced. The relevant data must then be programmed into the new control module, via VIDA vehicle communication, after it has been installed.



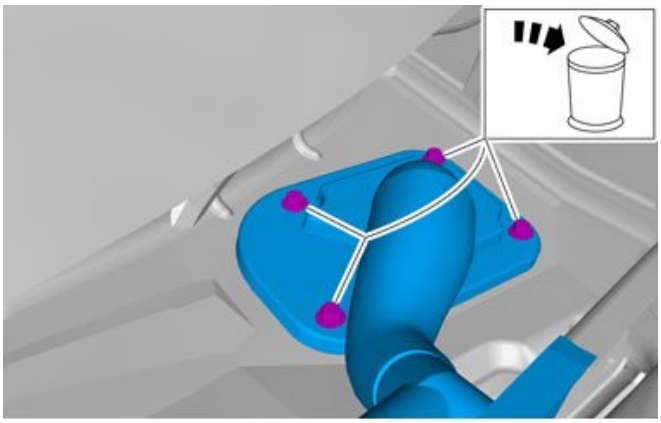
Ignition off
Disconnect the battery negative cable. See: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Note! For vehicles equipped with Volvo On Call Plus, the automatic alarm for the emergency services may deploy.

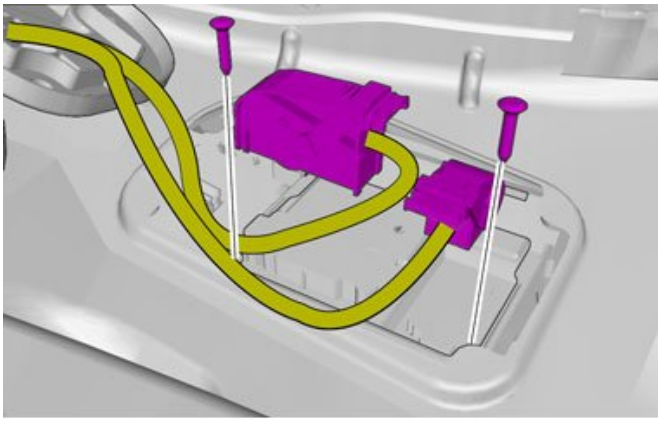
Note! The driver information module (DIM) must not be replaced at the same time. This would erase the mileage.

Removal

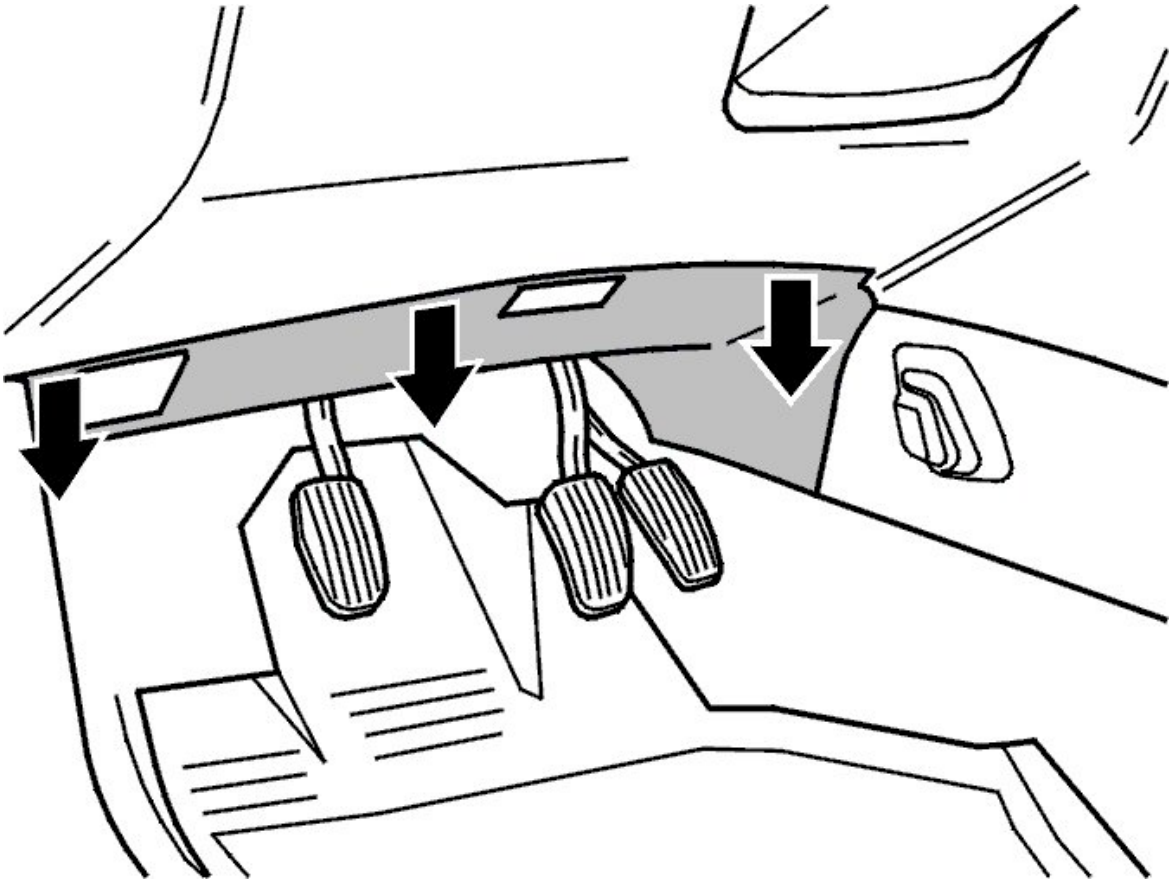
Removing the wiper mechanism and cover



Remove the wiper mechanism according to: Wiper mechanism, windshield, replacing See: Wiper and Washer Systems/Wiper Motor Linkage/Service and Repair/Wiper Mechanism, Windshield, Replacing



Removing the soundproofing panel on the driver's side

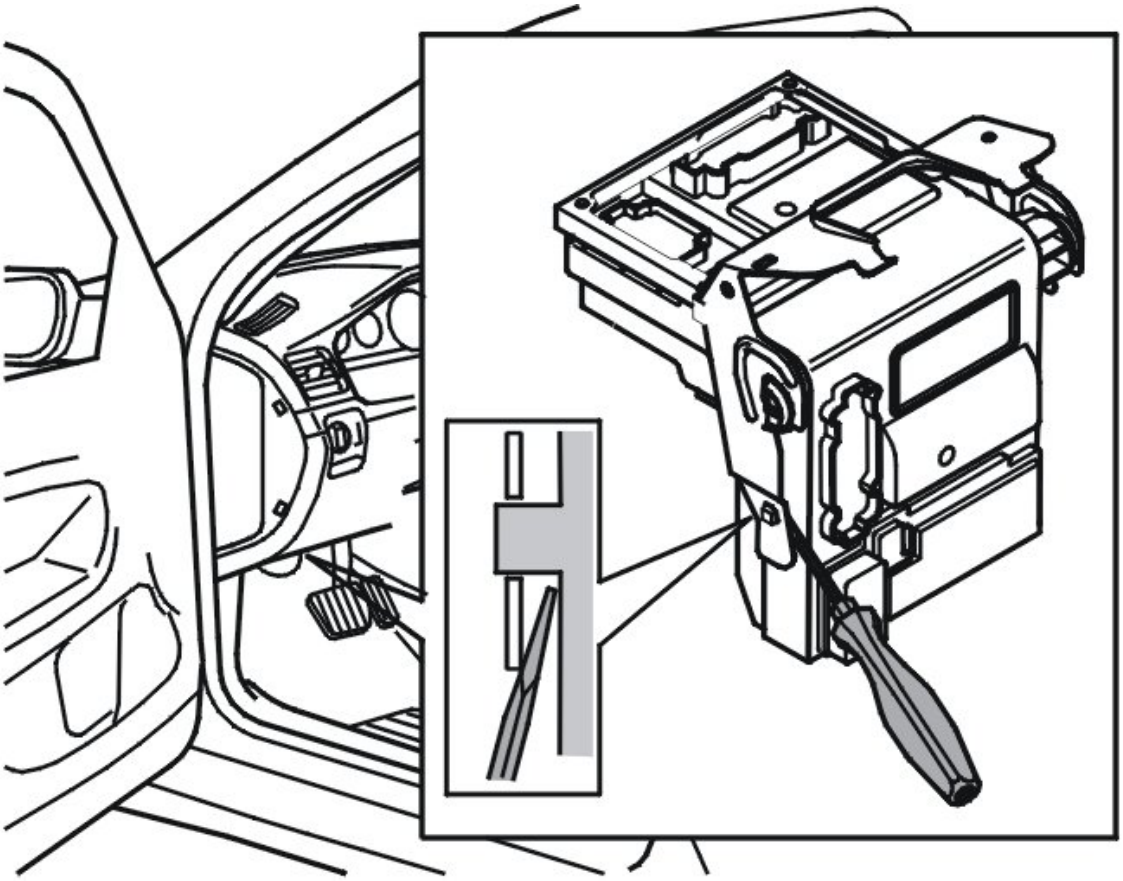


Remove the 2 screws.

Hint: The soundproofing panel sits in a groove at the pedal box.

Remove the soundproofing panel by pulling it straight down and back.

Removing the central electronic module (CEM)



Remove:

- the connectors
- the control module by inserting a screwdriver up between the bracket and the relay box. Turn the screwdriver so that the bracket opens out. At the same time, pull the relay box out of the bracket towards the underside of the dashboard
- the control module from the bracket and pull downwards under the dashboard.

Remove the fuses from the central electronic module (CEM).

Hint: For the location of the fuses, see:

- The wiring diagram for the relevant model year
- The decals by the relevant fuse box in the vehicle
- The Pocket Data booklet
- The Owner's manual.

Installation

Installing the central electronic module (CEM)

Caution! The pins are fragile. Check that the connectors go straight down into the control module.

Install:

- the control module on the bracket. Press the control module forward so that the catches enter the bracket
- the connectors
- the soundproofing panel on the driver's side
- the 2 screws on top of the control module
- the 2 connectors on top of the control module.

Note! Make sure that the rubber seal is correctly positioned in the groove.

Install:

- the cover
- the wiper arm mechanism. See: Wiper mechanism, windshield, replacing See: Wiper and Washer Systems/Wiper Motor Linkage/Service and Repair/Wiper Mechanism, Windshield, Replacing
- the battery negative lead. See: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Finishing

Ordering software

Order applicable software.

Programming data

Program in the data read off from the old control module (customer-programmed data for example). This is performed via VIDA vehicle communication.
Reset the service reminder indicator (SRI). Otherwise the lamp will receive incorrect reference data. (Global time is reset when the central electronic module (CEM) is replaced.) Reset the service reminder indicator (SRI). See: Resetting the service reminder indicator (SRI) See: Instrument Panel, Gauges and Warning Indicators/Maintenance Required Lamp/Indicator/Service and Repair/Resetting The Service Reminder Indicator (SRI).
Check that the CAN-communication is functioning. This is done by reading off the control module ID for the central electronic module (CEM), rear electronic module (REM) and engine control module (ECM) via VIDA vehicle communication.

Other information

For the location of other relay and fuse boxes, see: Relays, fuse boxes and wiring See: Power and Ground Distribution/Locations.

Door Module (Power Windows, Power Mirrors, Child Locks, Central Locking), Front Doors

Door module (power windows, power mirrors, child locks, central locking), front doors

Replacing the driver door module (DDM) and passenger door module (PDM)

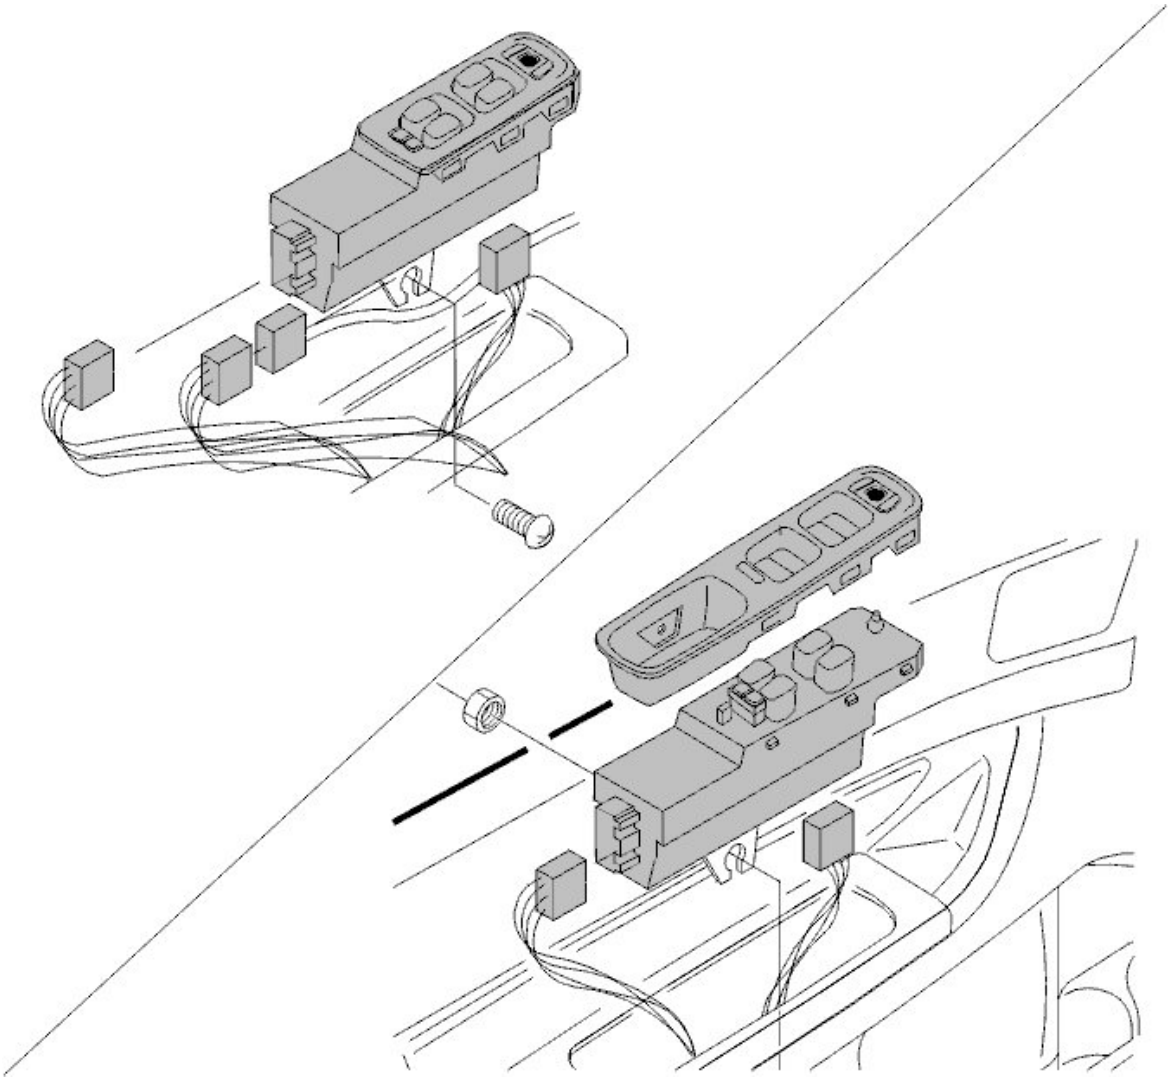
Preparations

Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Always check that the control module and control module box connectors do not have bent or damaged terminals or socket / sleeves. This may have been the cause of the fault.

Removing the control module

This method of removal applies to both the driver door module (DDM) and the passenger door module (PDM).



The illustration shows the driver door module (DDM).

- Ignition off
- Remove the door panel
- Remove the nut and screw holding the door module
- Disconnect the connectors
- Pry up the rear edge of the door module. Pull the door module backwards and upwards. Remove the door module from its mounting on the door panel
- Press up the door module.

To remove the upper panel, see Removing the upper panel.

Check

Check that the control module's connectors are intact.

Installing the control module

This method of installation applies to both the driver door module (DDM) and the passenger door module (PDM).

- Position the door module in the hole on the door panel.

Check that the lower mounting for the door module is correctly located in the support on the door panel

- Press the door module into place
- Connect the connectors
- Install the nut and screw
- Install the door panel.

Ordering software

Order software for the driver door module (DDM) according to the table below.

V70 2000-	9494718
S80	9438272

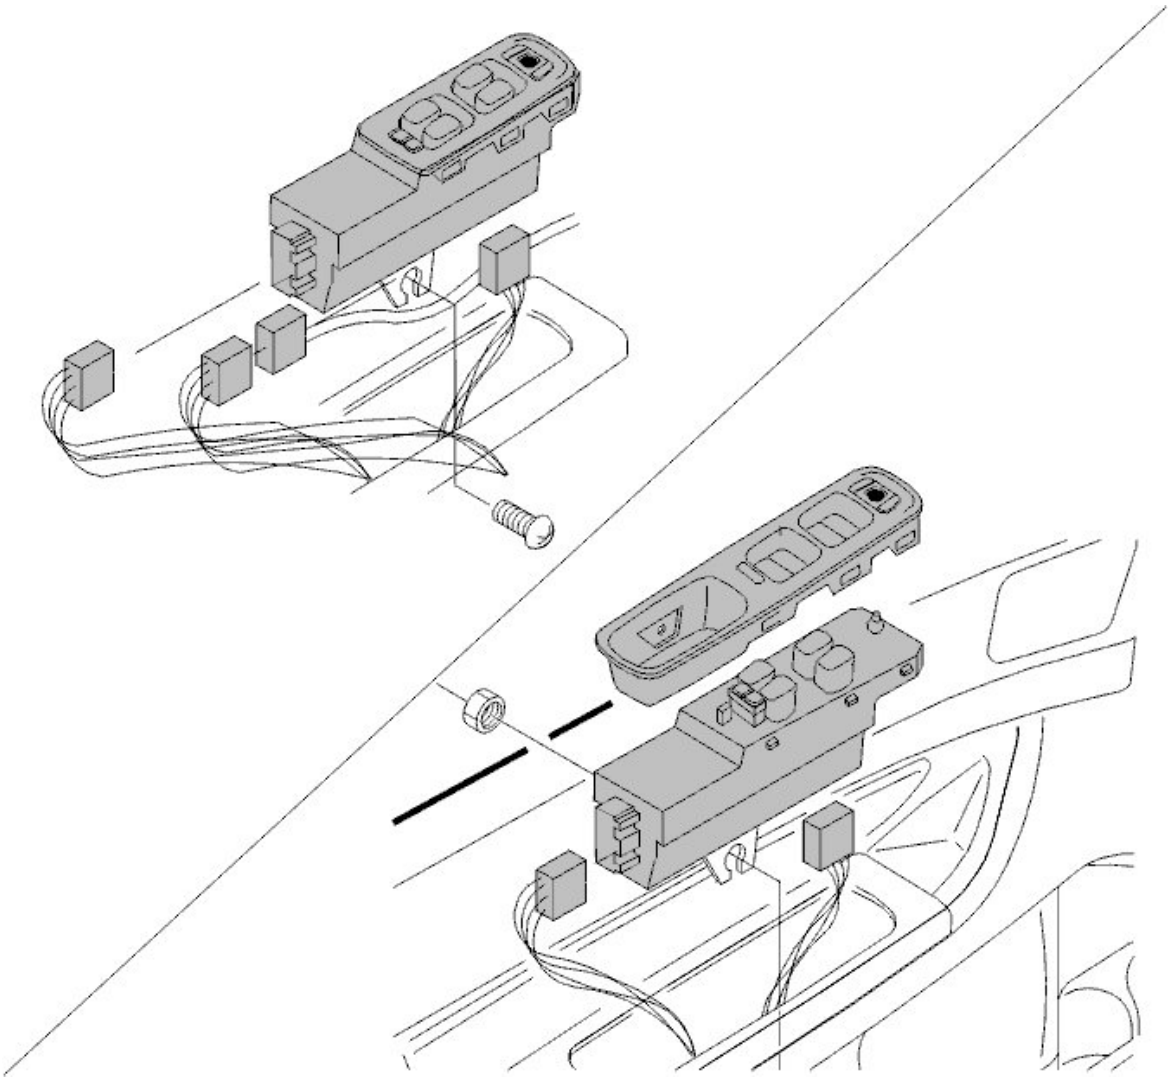
Order software for the passenger door module (PDM) according to the table below.

V70 2000-	9494719
S80	9438296

Finishing

Initialise the window position in the communication input

Removing the upper panel



The illustration shows the driver door module (DDM).

- Remove the control module, see instruction Removing the control module.
- Disconnect the catches. Lift the upper panel from the control module.

Installing the upper panel

In reverse order.

Driver Door Module (DDM)

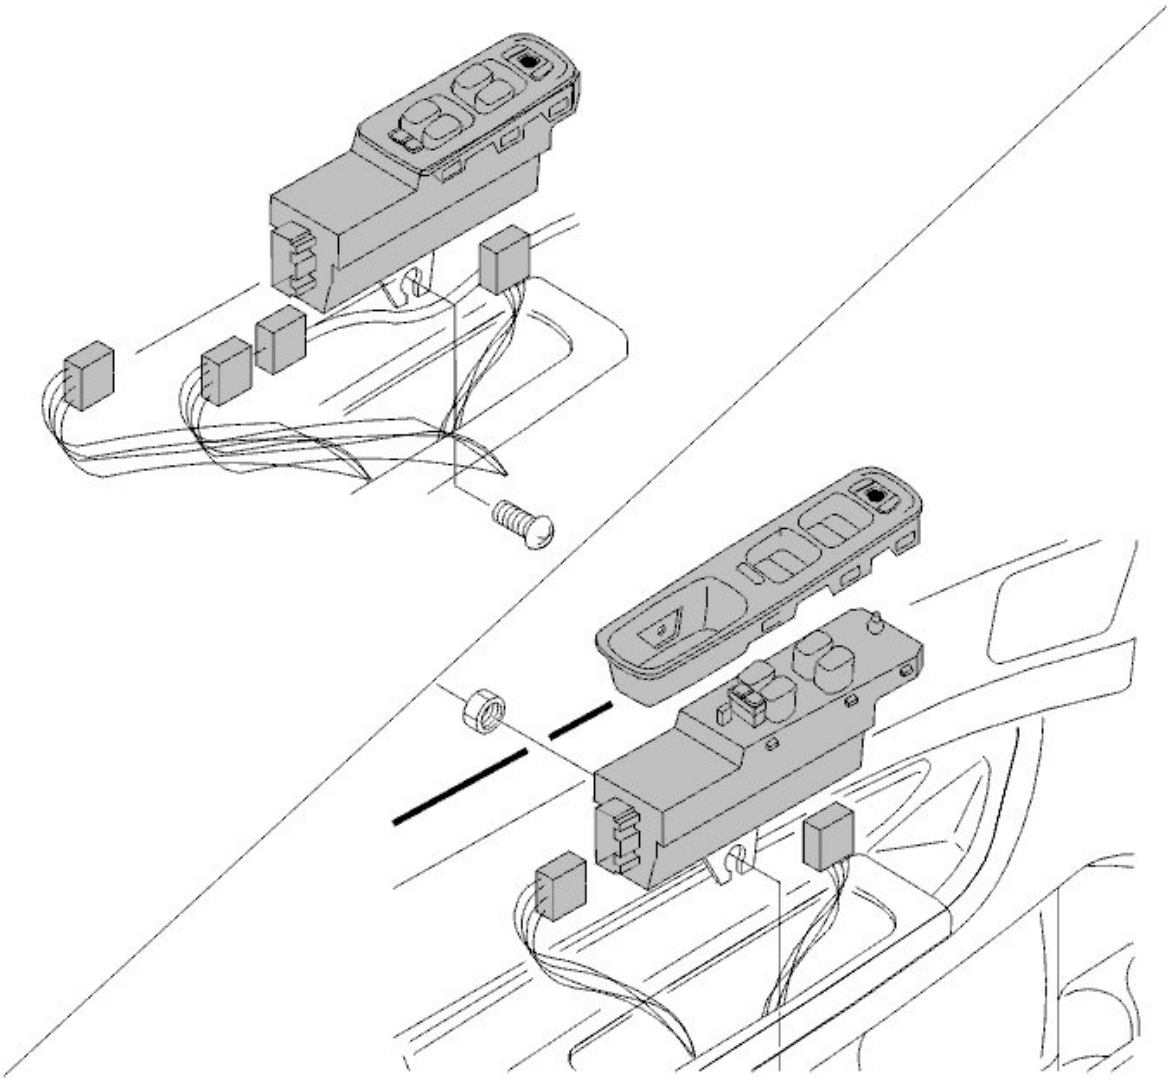
Driver door module (DDM), replacing

Preparations

Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Always check that the control module and control module box connectors do not have bent or damaged terminals or sockets. This may have been the cause of the fault.

Removing the driver door module (DDM)



Ignition off.

Remove:

- the door panel, see Replacing the front door side panel See: Body and Frame/Doors, Hood and Trunk/Doors/Front Door/Front Door Panel/Service and Repair/Front Door Side Panel.
- the nut and screw holding the control module in place
- the connectors.

Pull up the rear edge of the door module.
Pull the control module backwards and upwards.
Detach the control module from the mounting on the door panel.
Press up the control module.
Disconnect the catches. Lift the upper panel from the control module.

Note! Check that the control module's connectors are intact.

Installing the driver door module (DDM)

Install the upper panel.
Position the control module in the hole on the door panel.
Check that the lower mounting for the control module is correctly located in the support on the door panel.
Press the control module into place.

Install:

- the connectors
- the nut and screw
- the door panel, see Replacing the front door side panel See: Body and Frame/Doors, Hood and Trunk/Doors/Front Door/Front Door Panel/Service and Repair/Front Door Side Panel.

Ordering software

Order software for the driver door module (DDM) according to the table below.

S60	8645429
V70 XC 2001-/XC70	9494718
XC90	8691286

Finishing

Initialise the window position in the communication input.

Driver's Door Module / Passenger Door Module (DDM/PDM), Replacing

Driver's door module / passenger door module (DDM/PDM), replacing

S60 2001-, V70 2001-, V70XC 2001-, XC90
- Replacing the driver's side door module. See Driver door module (DDM), replacing See: Driver Door Module (DDM)
- Replacing the passenger side door module. See Passenger door module (PDM), replacing See: Passenger Door Module (PDM).

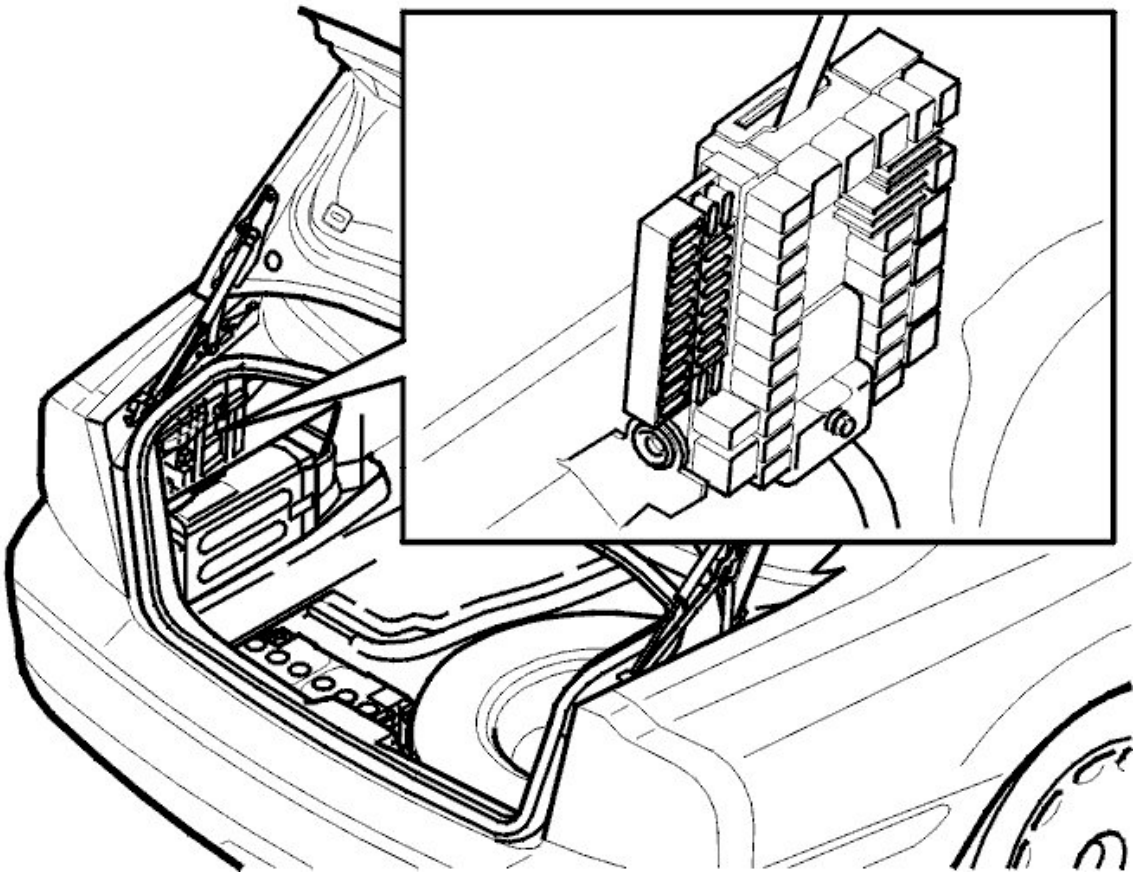
S80, V70 2000:
- Replacing the driver and passenger side door modules. See Door module (power windows, power mirrors, child locks, central locking), front doors See: Door Module (Power Windows, Power Mirrors, Child Locks, Central Locking), Front Doors.

Integrated Relay/Fusebox Cargo Compartment/Rear Electronic Module (REM), Replacing

Integrated relay/fusebox cargo compartment/Rear electronic module (REM), replacing

Integrated relay/fusebox in the cargo compartment

Exposing the integrated relay/fusebox in the cargo compartment



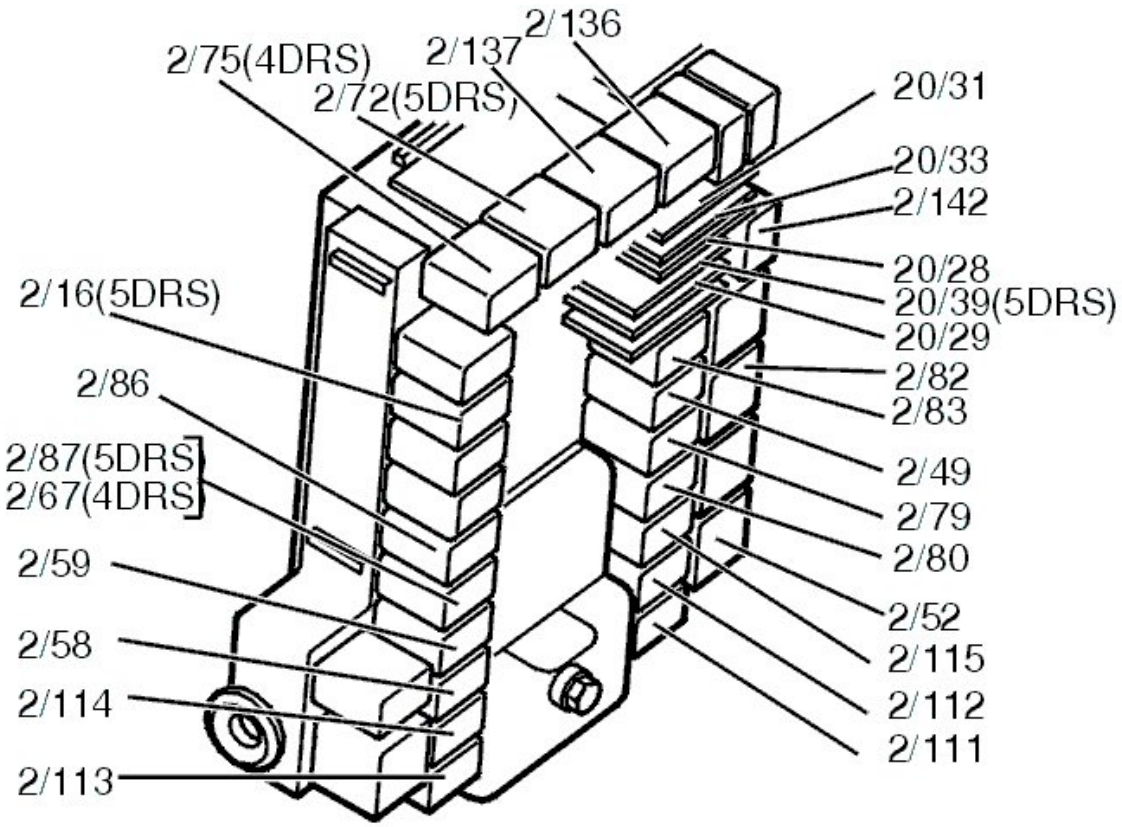
- Open the catch for the left-hand side panel in the cargo compartment. Fold down the upholstery

If necessary:
- Remove the floor hatch in the cargo compartment
- remove the clips on the floor. Remove the upholstery
- remove the road traffic information module (RTI), see Road traffic information module (RTI), replacing.
- remove the CD changer. See CD reader, RTI (road traffic information), replacing.

Replacing relays, shunts and fuses

- Expose the relay and fuse box, see instruction Exposing the integrated relay/fusebox in the cargo compartment.
- Replace the relay, shunt and/or fuse.

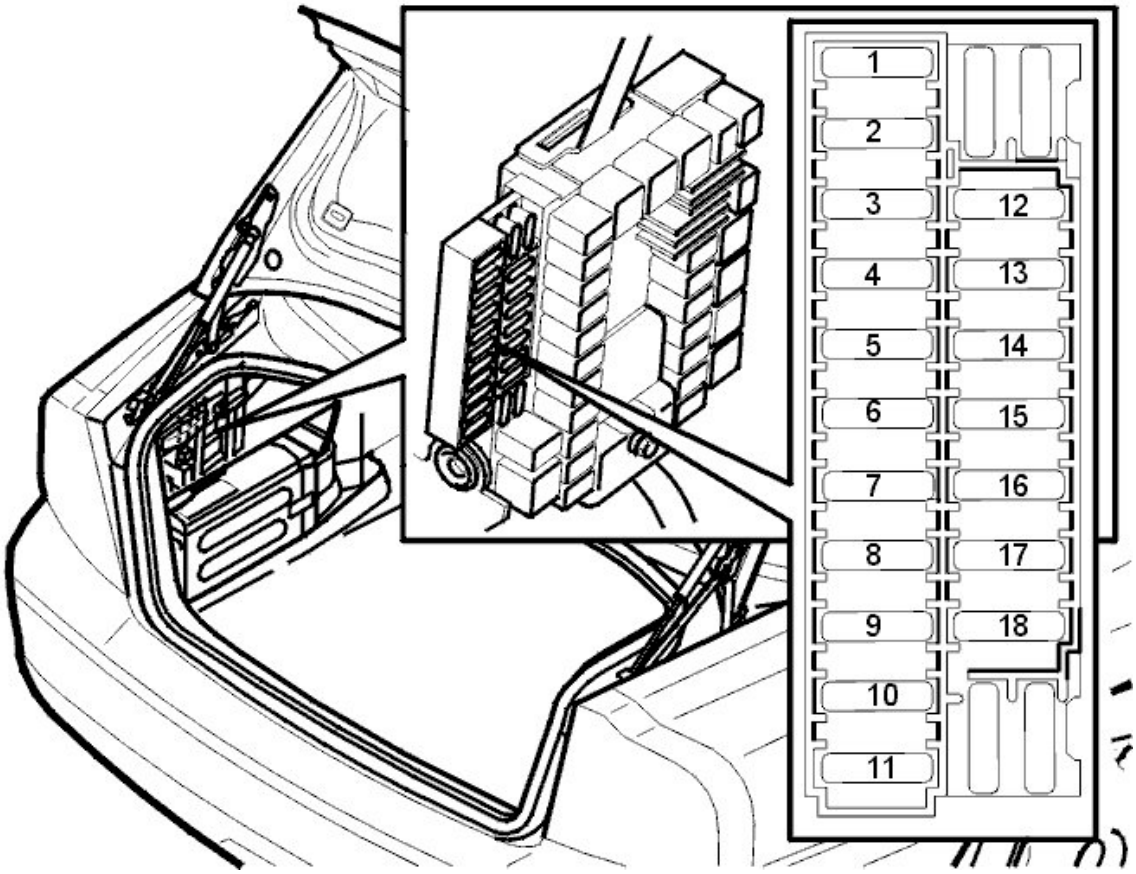
Relay location



For the location of the relays, see:

1. Wiring diagram for relevant model year
2. Decals at both the integrated relay box and fusebox in the car
3. Pocket data book
4. Owner's Manual.

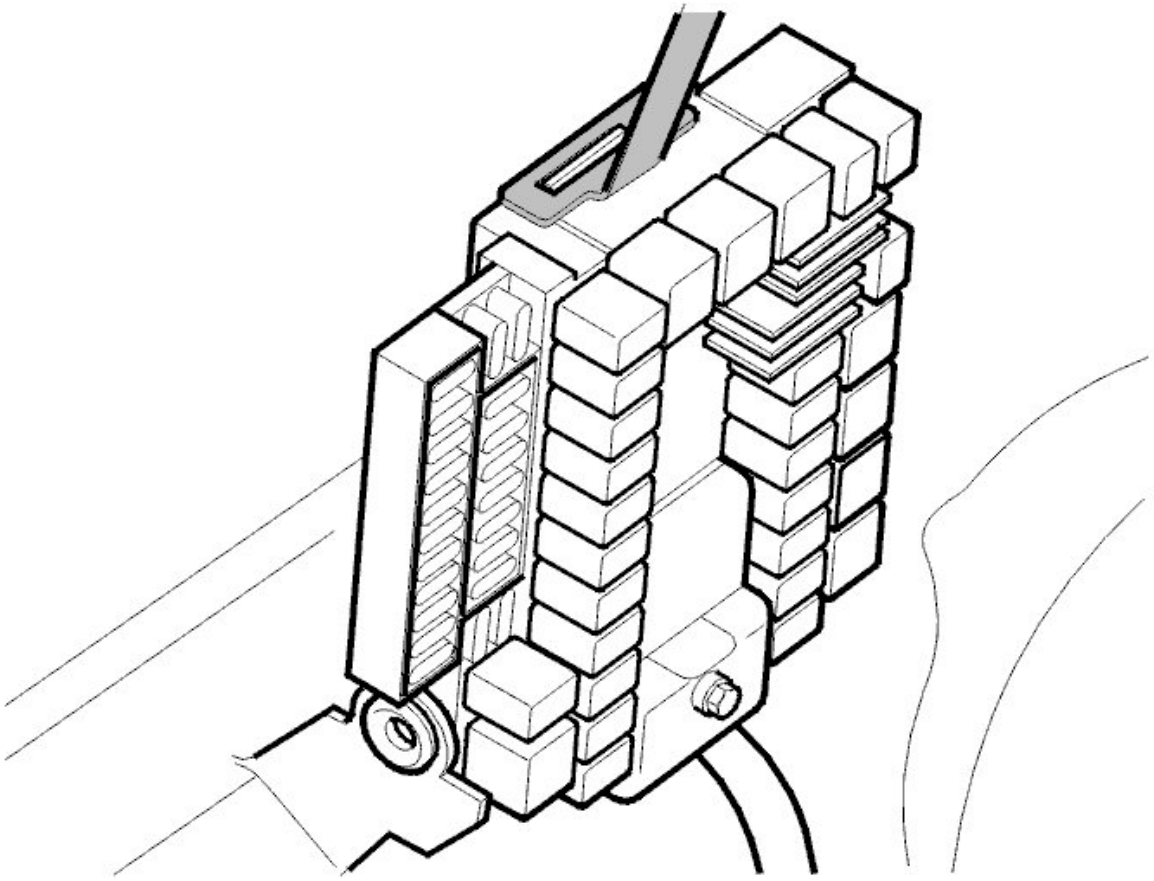
Location of fuse 11D



For the location of the fuses, see:

1. Wiring diagram for relevant model year
2. Decals at both the integrated relay box and fusebox in the car
3. Pocket data book
4. Owner's Manual.

Removing the integrated relay/fusebox in the cargo compartment



- Expose the integrated relay / fusebox. See Exposing the integrated relay/fusebox in the cargo compartment
- Release the catch on the top as illustrated. Fold down the integrated relay / fusebox and lift up to release it.

Installing the integrated relay / fusebox in the cargo compartment

- Install the integrated relay / fusebox. Ensure that the catches on the top engage correctly
- Install the upholstery
- Reinstall the floor hatch.

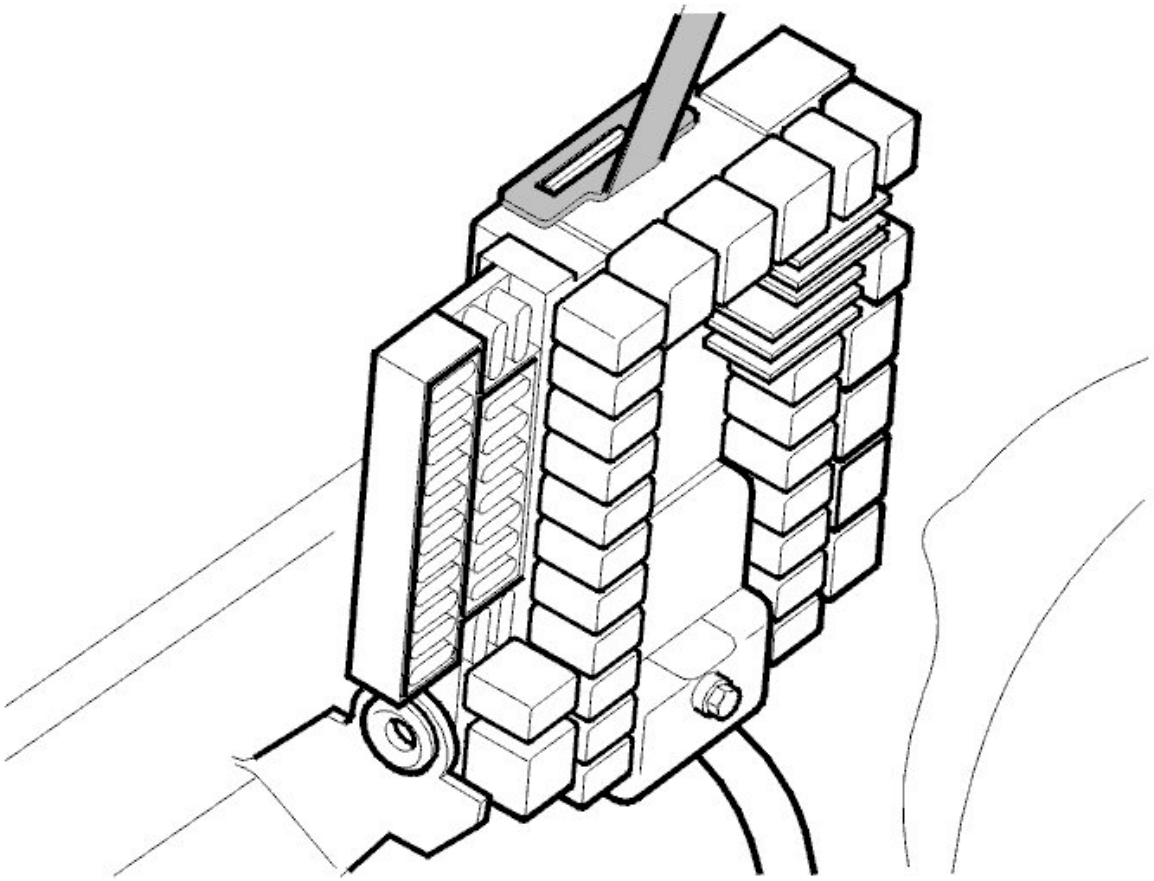
Rear electronic module (REM)

Preparations

Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

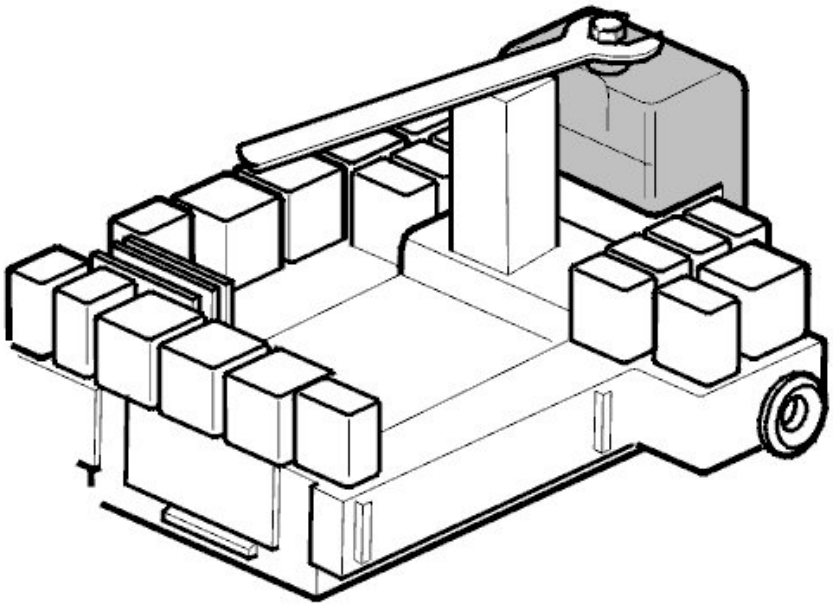
Always check that the control module and control module box connectors do not have bent or damaged terminals or socket / sleeves. This may have been the cause of the fault.

Removing the control module



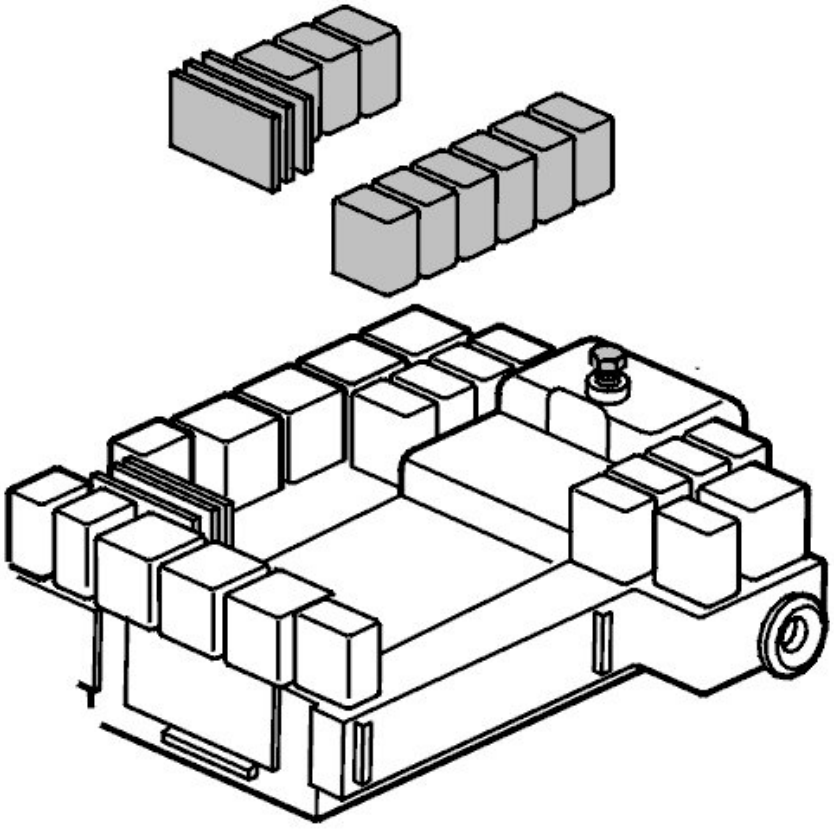
The rear electronic module (REM) is a separate unit in the relay box in the cargo compartment.

- Remove the integrated relay / fusebox. See Removing the integrated relay/fusebox in the cargo compartment.



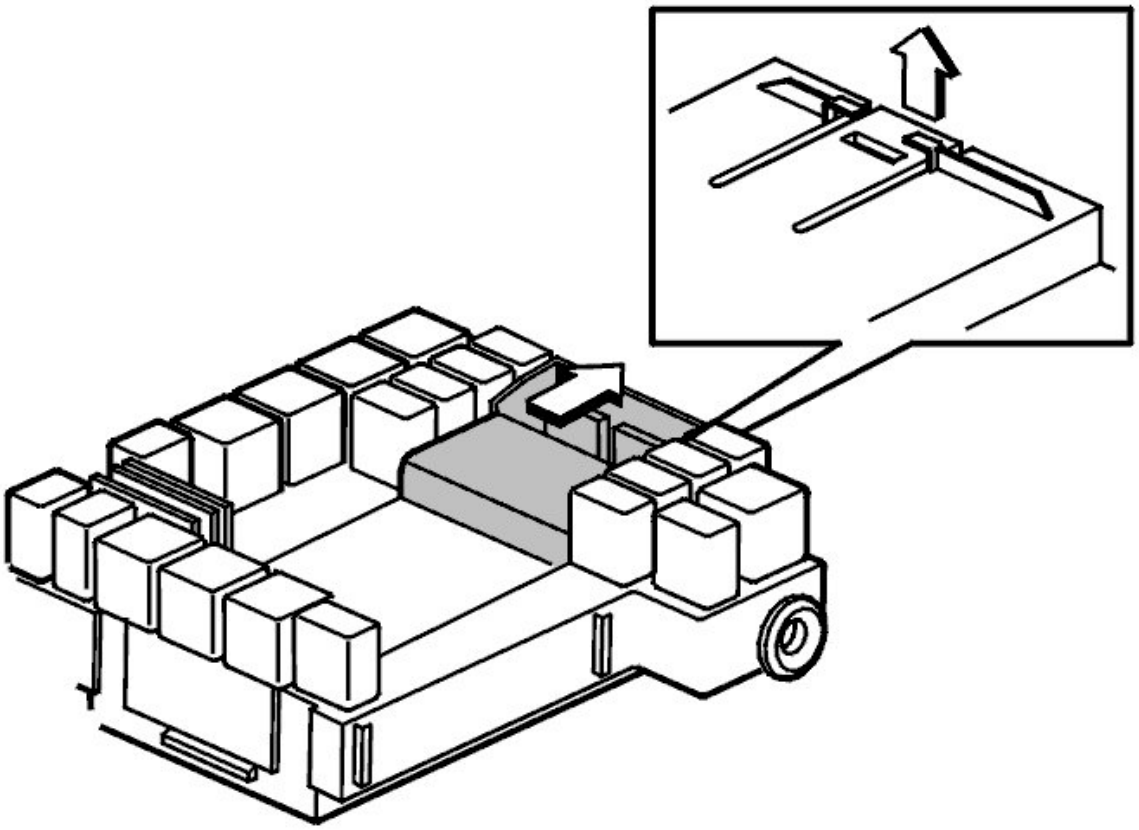
- Unscrew the screw holding the connector so that it is free of its threads. Check that the screw is free using your fingers
- Disconnect the connector. Use an open spanner and a support. See the illustration.

Note! Do not damage the terminal pins.



- Remove all relays and shunts bridged to the control module.

Note the locations.



- Release the catch on the rear. Use a screwdriver
- Lift and pull out the control module.

Check

Check that the control module connectors are intact.

Installing the control module

- Press the control module into place so that the catch on the rear engages
- Position the connector. **Carefully** press the connector down.

Note! The pins are fragile. Check that the connector goes straight down into the control module.

- Tighten the screw for the connector
- Check that the connector cover is correctly positioned. Remedy if necessary
- Install the relays and shunts. For relay locations, see instruction Relay location.
- Install the integrated relay / fusebox, see Installing the integrated relay / fusebox in the cargo compartment.

Ordering software

Order the software. See 9438285.

Other information

For the location of other relay and fuse boxes, see Relays, fuse boxes and wiring See: Power and Ground Distribution/Locations.

Passenger Door Module (PDM)

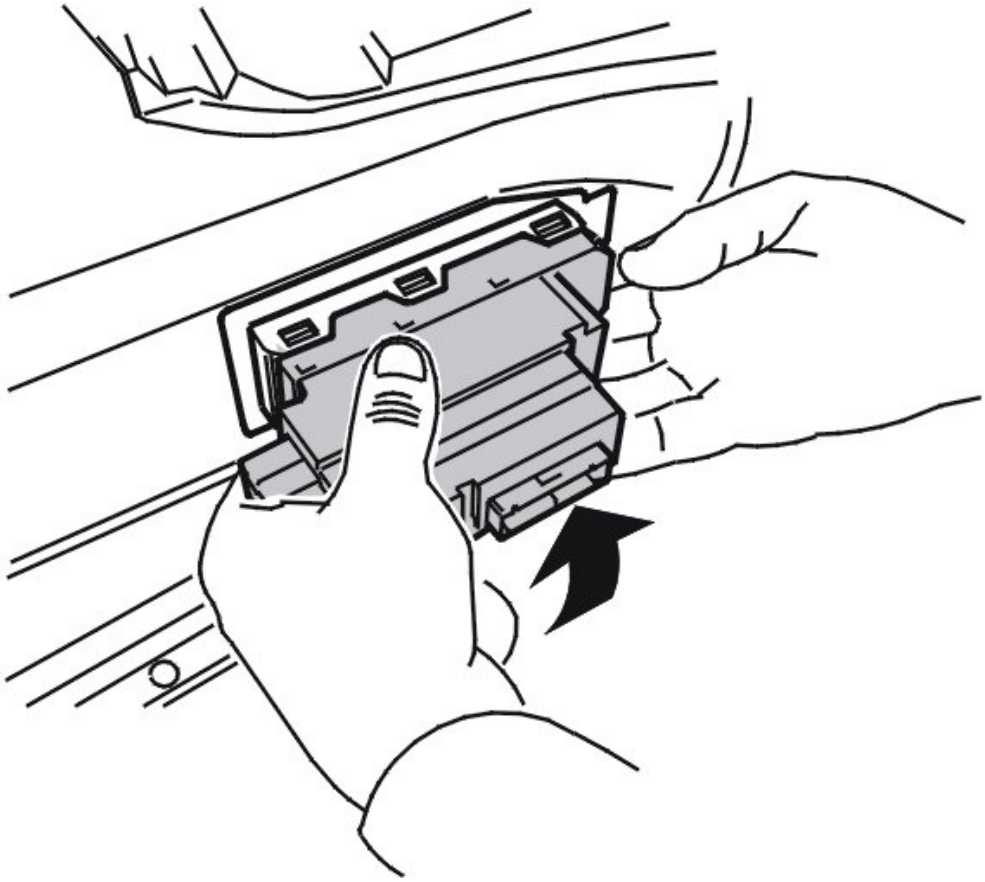
Passenger door module (PDM), replacing

Preparations

Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Always check that the control module and control module box connectors do not have bent or damaged terminals or sockets. This may have been the cause of the fault.

Removing the passenger door module (PDM)

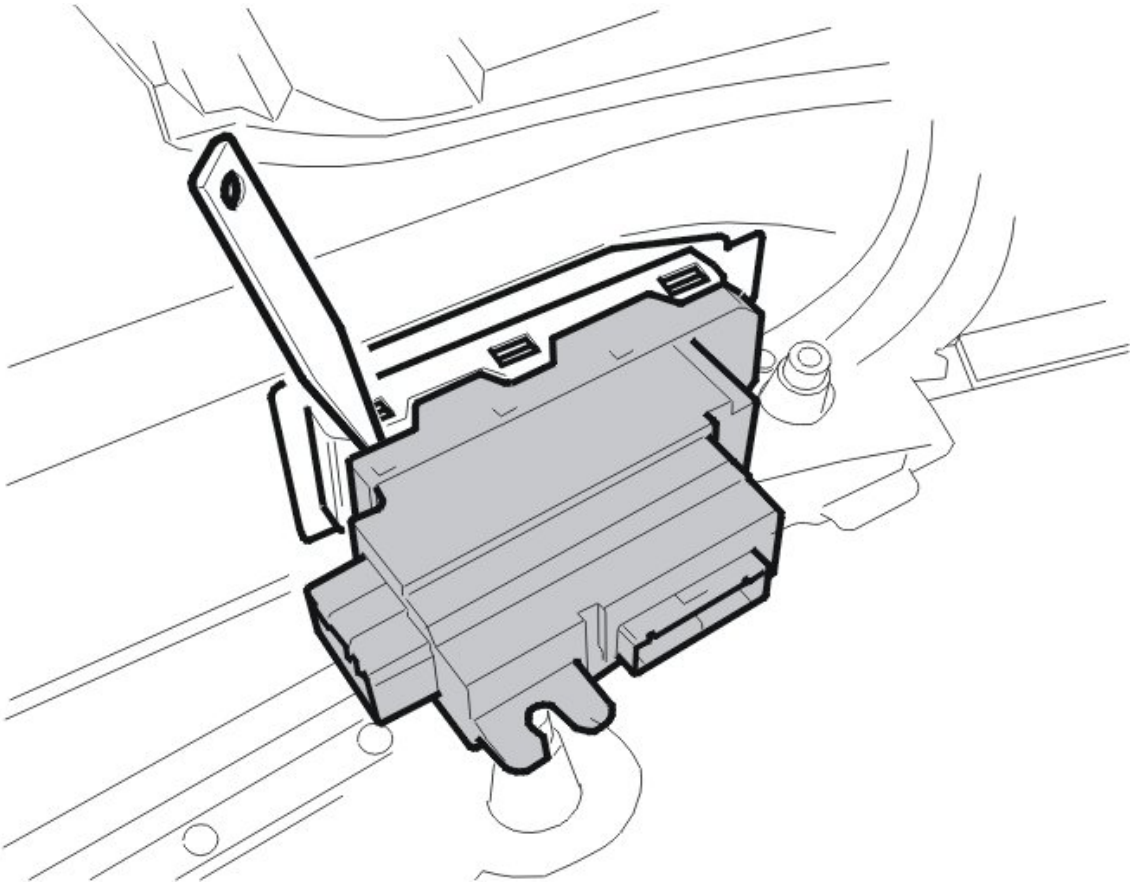


Ignition off.

Remove:

- the door panel, see Replacing the front door side panel See: Body and Frame/Doors, Hood and Trunk/Doors/Front Door/Front Door Panel/Service and Repair/Front Door Side Panel.
- the nut and screw holding the control module in place
- the connectors.

Grasp the underneath of the control module. Press upwards. Carefully pull the module from the lower catches.



Release the upper catches using a weatherstrip tool. Lift out the control module.

Note! Check that the control module's connectors are intact.

Installing the passenger door module (PDM)

Press the control module into place.

Install:
- the connectors
- the nut and screw
- the door panel, see Replacing the front door side panel See: Body and Frame/Doors, Hood and Trunk/Doors/Front Door/Front Door Panel/Service and Repair/Front Door Side Panel.

Ordering software

Order software for the passenger door module (PDM) according to the table below.

S60	8645430
V70 XC 2001-/XC70	9494719
XC90	8691287

Finishing

Initialise the window position in the communication input.

Rear Electronic Module (REM), Replacing

Rear electronic module (REM), replacing

Note! Since the illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Preparatory work

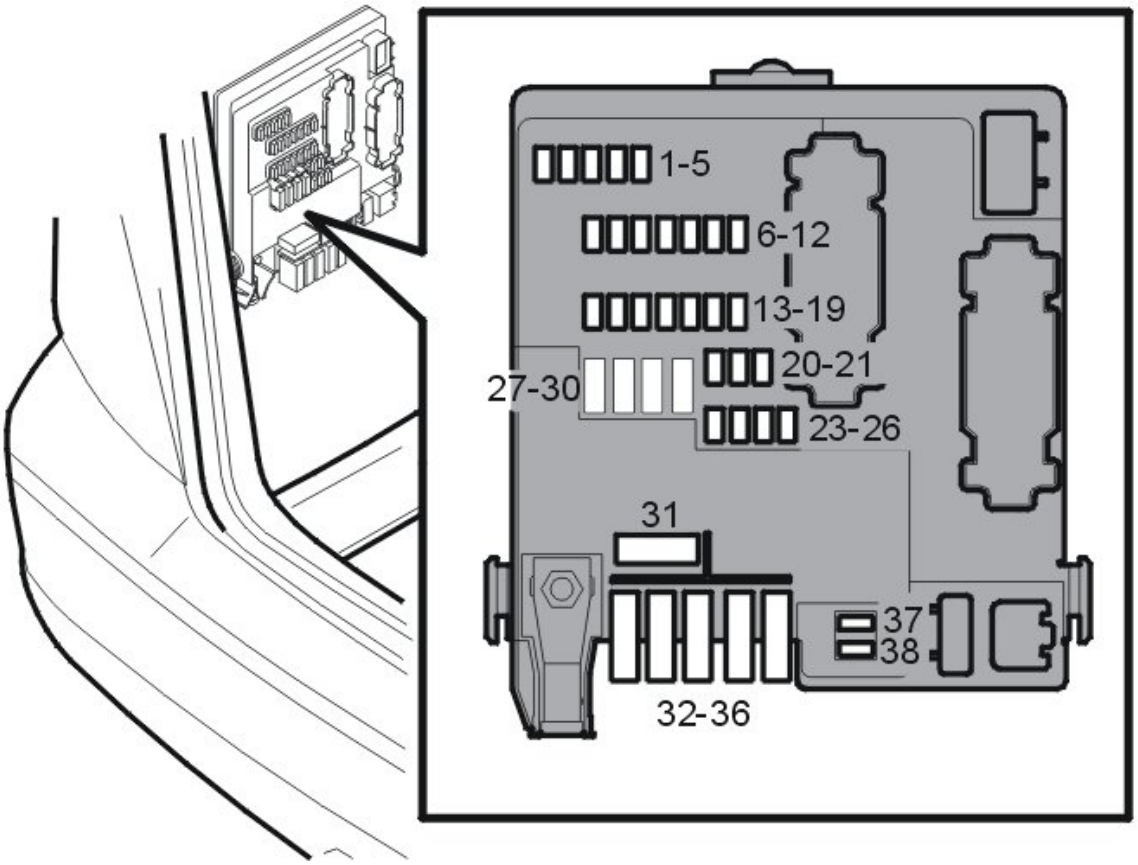
Ignition off

Ignition off.

Removal

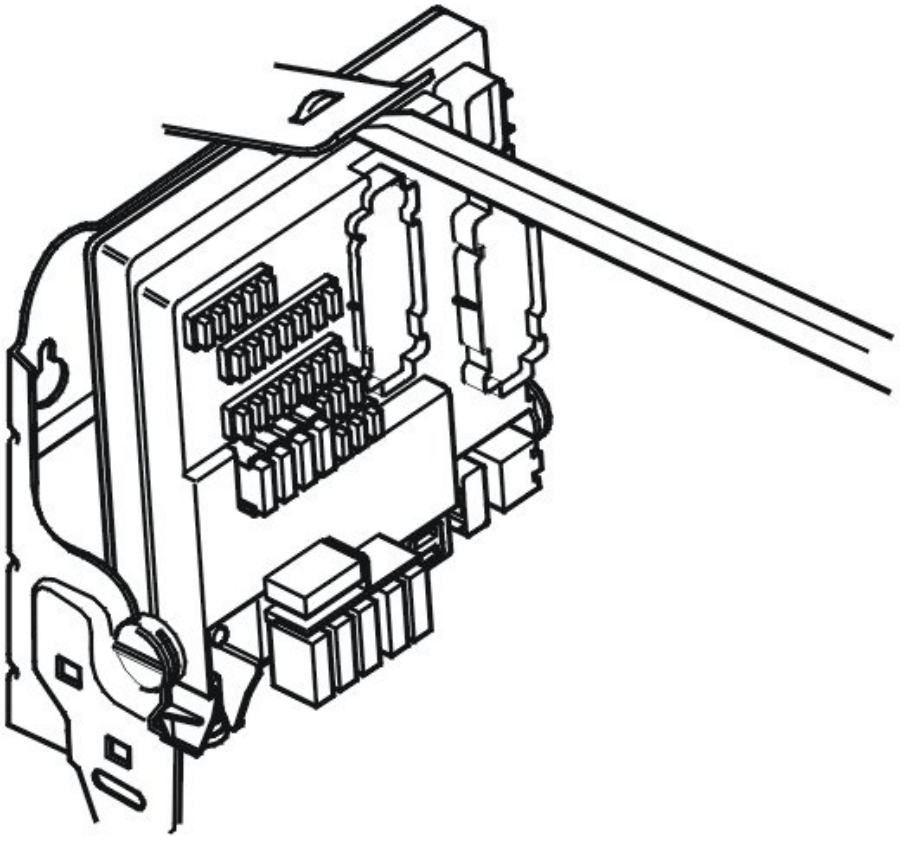
Removing the left cargo compartment side panel

Hint: The rear panel in the side panel of the cargo compartment can be removed to change fuses.



Remove the left-hand side panel in the cargo compartment. See: Side panel, cargo compartment, replacing See: Body and Frame/Interior Moulding / Trim/Trim Panel/Service and Repair/Side Panel, Cargo Compartment, Replacing.

Removing the rear electronic module (REM)



Remove:

- the control module by lifting the catches at the upper edge and angle out
- the connectors.

Note! Always check that the terminals or pins/sockets of the control module and control module box connectors are not bent or damaged.

This may be the cause of the problem.

Hint: For the location of relays, see:

- The wiring diagram for the relevant model year
- Decals at both the integrated relay box and fusebox in the car
- The Pocket Data book
- The Owner's manual.

Installation

Installing the rear electronic module (REM)

Caution! The pins are fragile. Check that the connector enters straight down into the control module.

Install:
- the connectors
- the control module in the bracket groove. Press the control module into place.

Installing the left cargo compartment side panel

Install the left-hand side panel in the cargo compartment. See: Side panel, cargo compartment, replacing See: Body and Frame/Interior Moulding / Trim/Trim Panel/Service and Repair/Side Panel, Cargo Compartment, Replacing.

Finishing

Ordering software

Caution! New software can only be ordered when the new control module is installed in the vehicle. The new control module identity is read off by VIDA with ordering, which is required for ordering the correct software.

Order applicable software.

Vehicles with Xenon headlights, without four_C

Perform calibration.

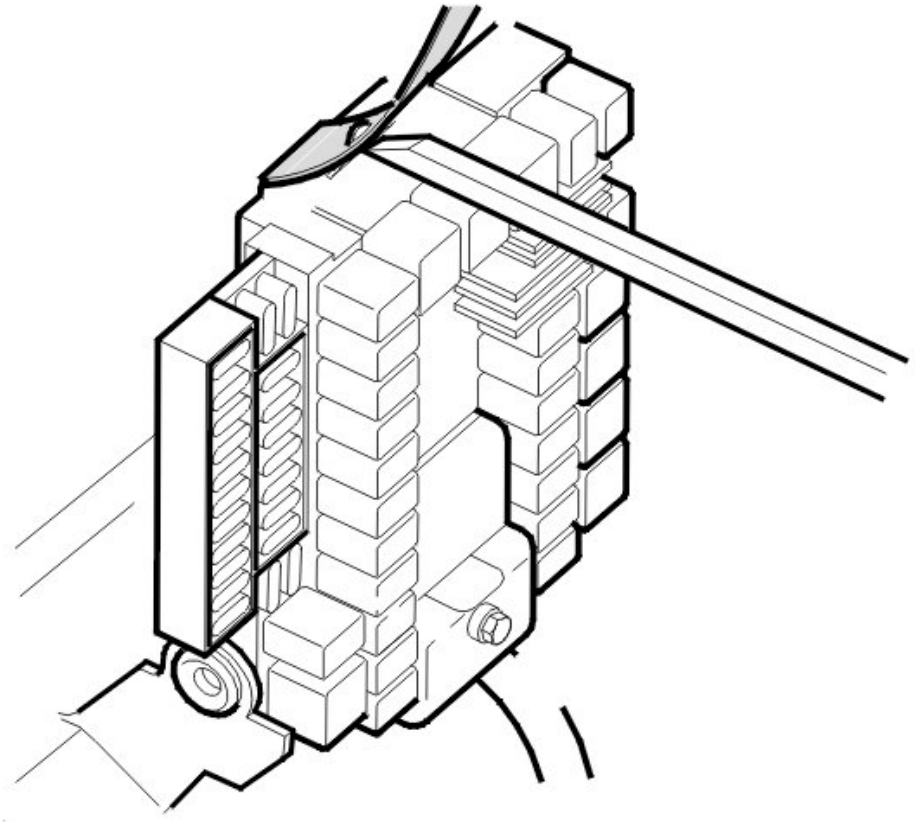
Relay/Fuse Box Cargo Compartment/Rear Electronic Module (REM), Replacing

Relay/fuse box cargo compartment/Rear electronic module (REM), replacing

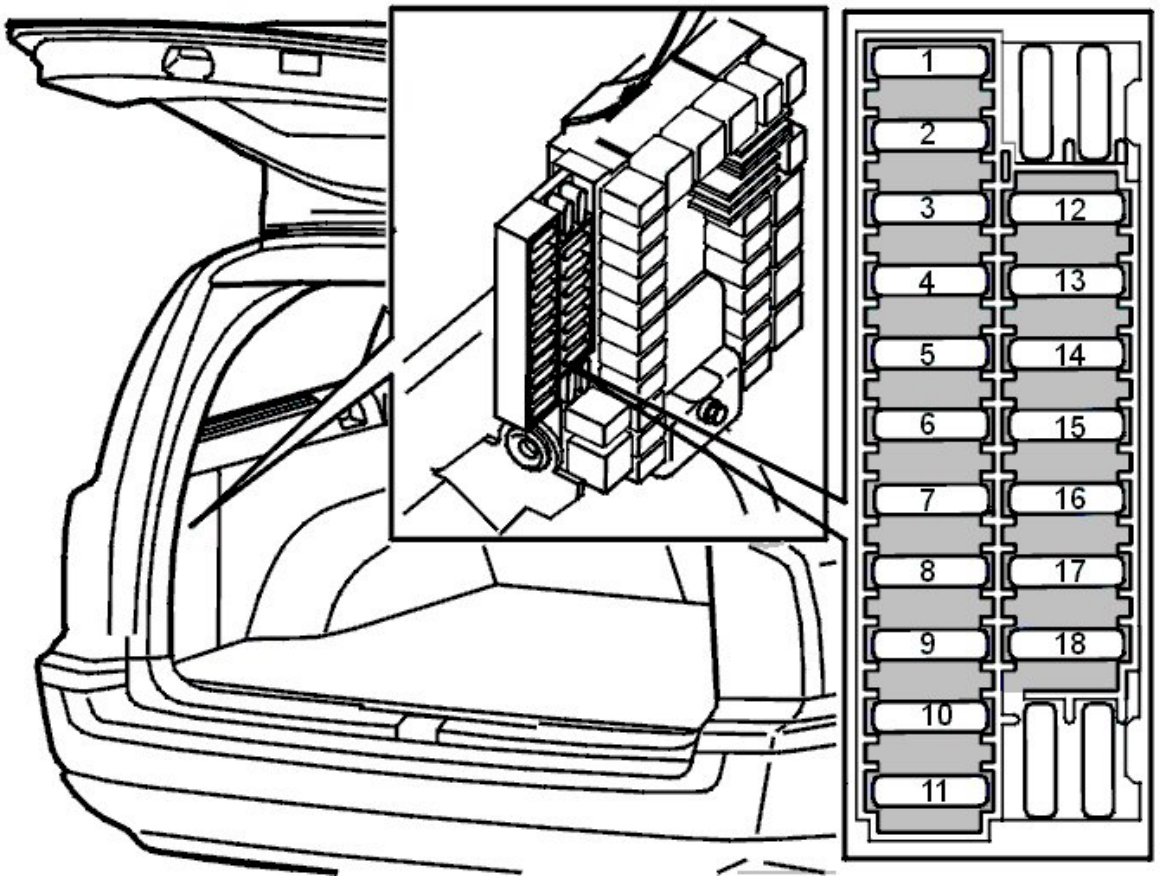
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Exposing the integrated relay/fusebox in the cargo compartment

Switch off the ignition.



Remove the left side panel in the cargo compartment.
Release the integrated relay/fusebox. Lift the catch by the upper edge and angle out the integrated relay/fusebox.



Hint: The rear panel in the side panel of the cargo compartment can be removed to change fuses.

Relay and fuse location, 11D

For the location of the relays and fuses, see:

1. Wiring diagram for relevant model year
2. Decals at both the integrated relay box and fusebox in the car

3. Pocket data book
4. Owner's Manual.

Installing the integrated relay / fusebox in the cargo compartment

Align the integrated relay/fusebox in the grooves in the bracket and press into place.
Install the left side panel in the cargo compartment.

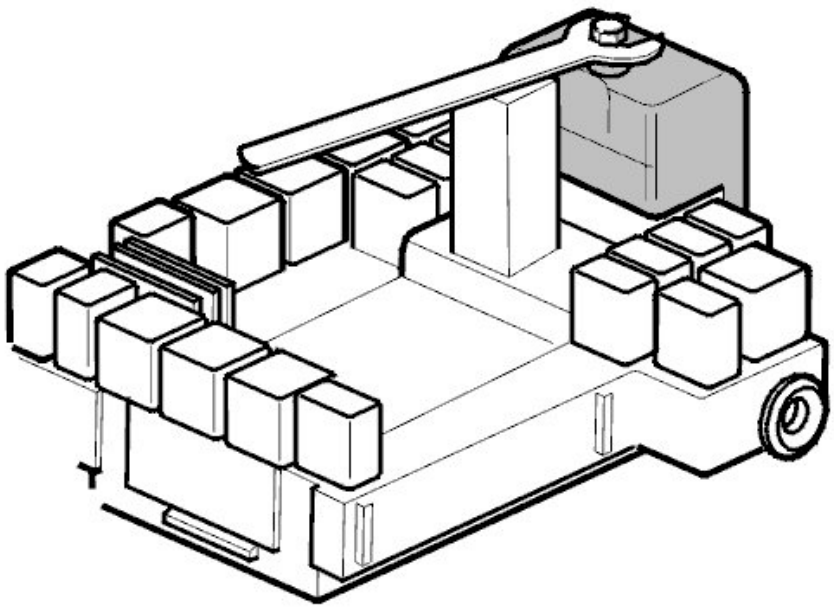
Replacing the rear electronic module (REM)

The rear electronic module (REM) is a separate unit in the relay box in the cargo compartment.

Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

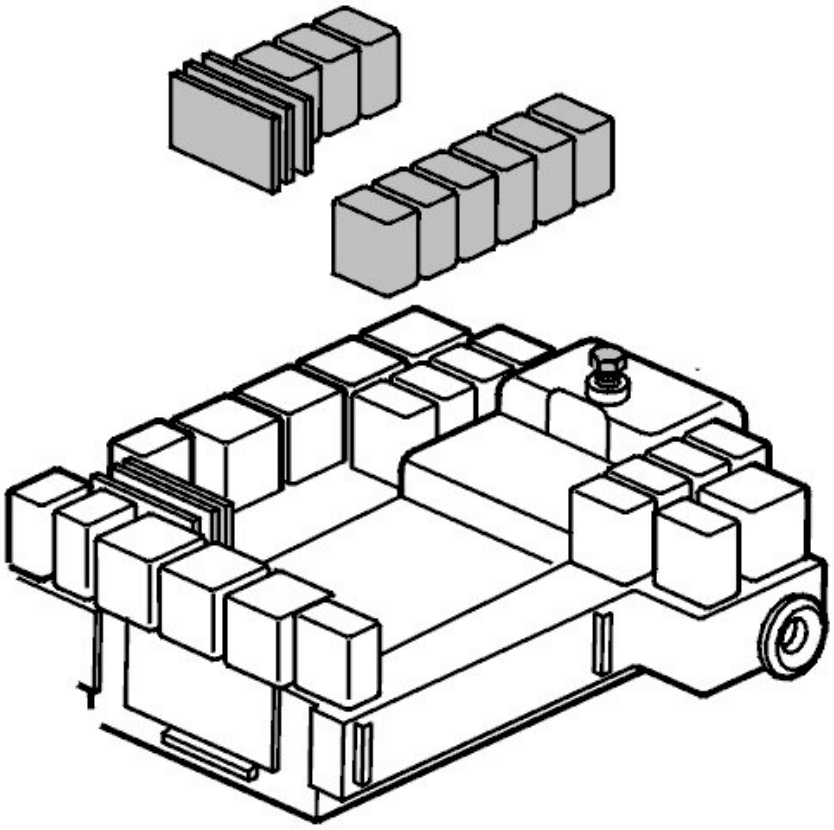
Release the relay and fuse box. See Exposing the integrated relay/fusebox in the cargo compartment.

Removing the control module

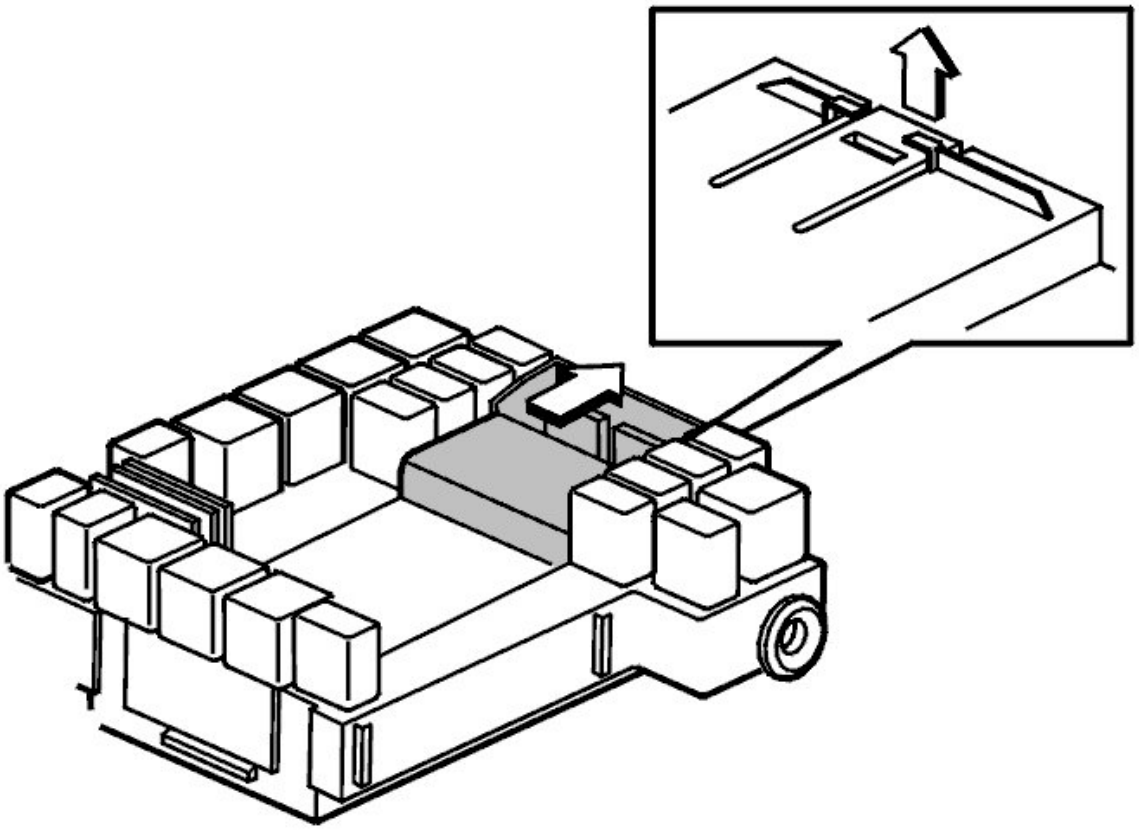


Unscrew the screw holding the connector so that it is free of its threads. Check that the screw is free with your fingers.
Disconnect the connector. Use an open spanner and a support. See the illustration.

Note! Do not damage the pins. Always check that the control module's and control module box's connectors do not have bent or damaged pins or sleeves. This may have be the cause of the problem.



Remove all relays and shunts bridged to the control module. Note the locations.



Release the catch on the rear. Use a screwdriver.
Lift and pull out the control module.

Check

Check that the control module's connectors are intact.

Installing the control module

- Press the control module into place so that the catch on the rear engages
- Position the connector. **Carefully** press the connector down.

Note! The pins are fragile. Check that the connector goes straight down into the control module.

- Tighten the screw for the connector
- Check that the connector cover is correctly positioned. Remedy if necessary
- Install the relays and shunts. Note their locations
- Install the integrated relay / fusebox. See Installing the integrated relay / fusebox in the cargo compartment.

Ordering software

Order the software. See 9494723.

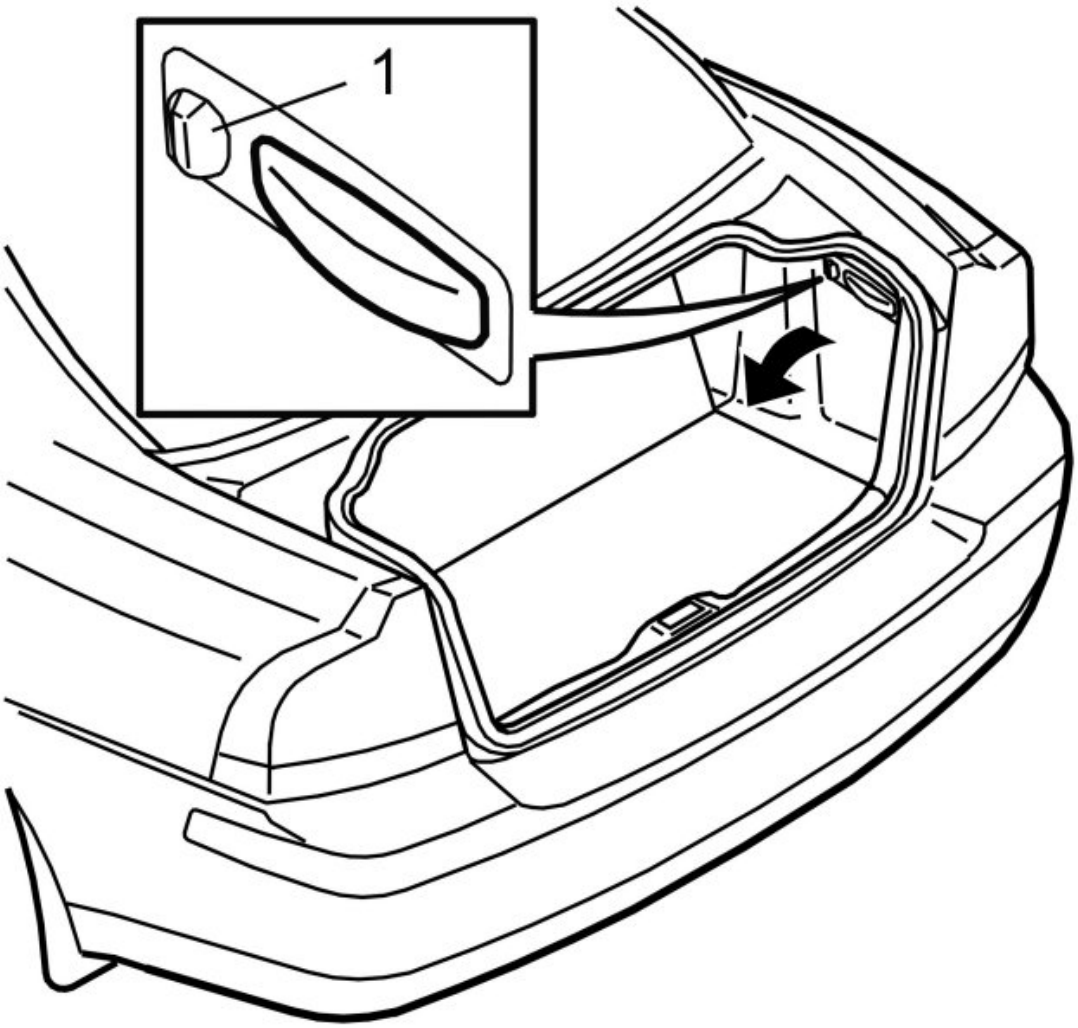
Replacing the Accessory Electronic Module

Replacing the accessory electronic module

Removal

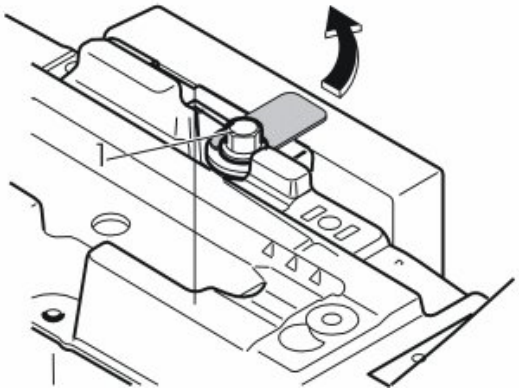
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Preparation



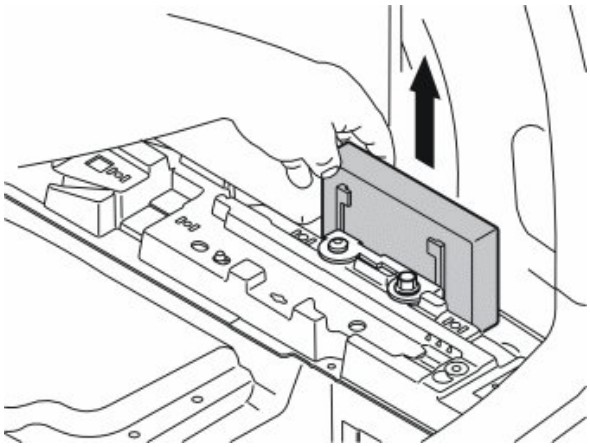
Remove the side panel on right-hand side.

Removing the lock plate



Slacken off the screw slightly and twist out the lock plate.
Remove the lock plate.

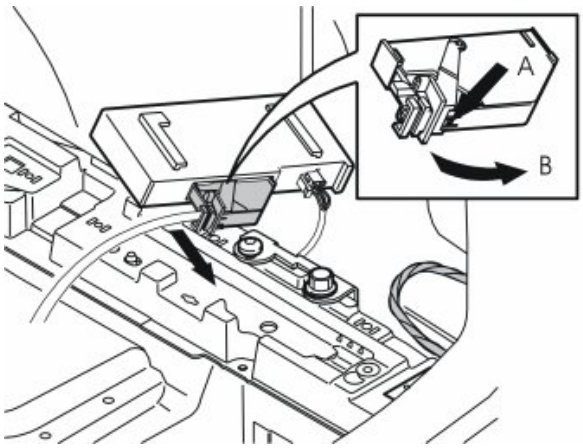
Exposing the control module



Lift the control module out of the bracket to access the connectors.

Hint: On **V70** and **V70XC**, it may be necessary to angle the control module downwards and forwards to access the connectors.

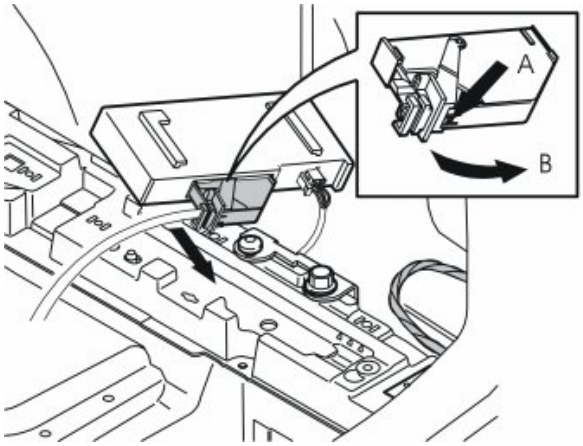
Disconnecting the connectors



Press the catch (A) and pull the lock handle backwards. Pull the connector out of the control module.
Disconnect the small connector from the control module.
Replace the control module.

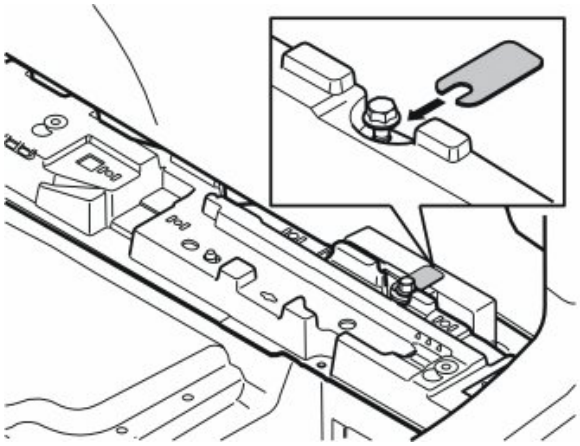
Installation

Installing the connectors



Install the large connector on the control module.
Lock the connector using the lock handle above the catch (A).
Install the other connector.

Installing the control module



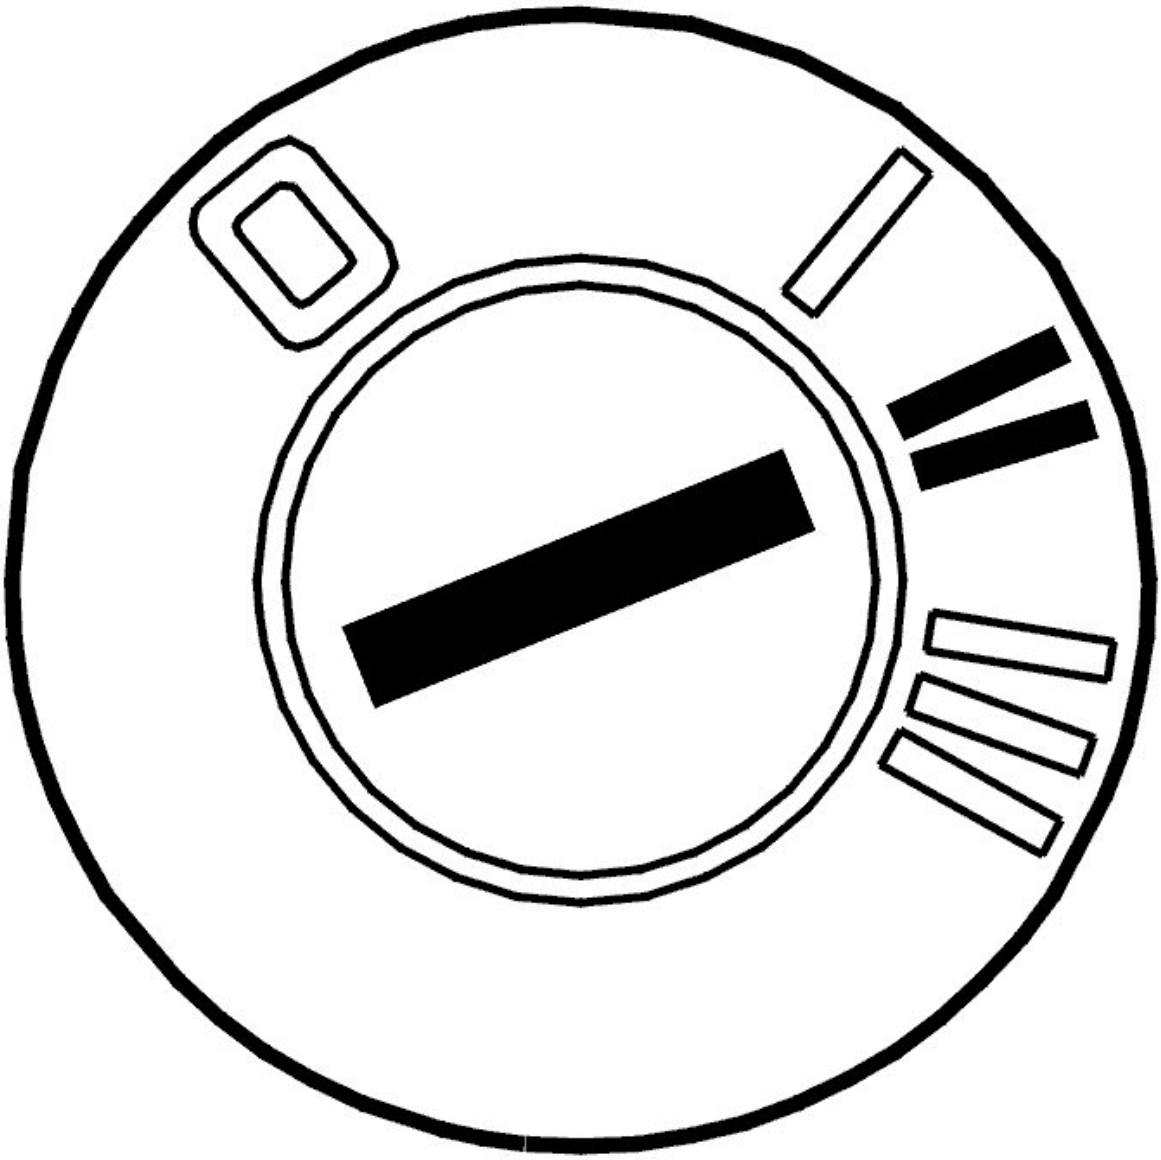
Move the wiring to the outside of the control module.
Place the control module in the bracket and press it down.
Install the lock plate. Tighten the screw. Tighten to **10 Nm**.
Reinstall the side panel.
After consultation with the customer, new software that corresponds to the car can be downloaded. Software for the accessory electronic module must be downloaded first. Software for the connected accessories must then be downloaded.
Check that no diagnostic trouble codes (DTCs) have been stored during the repair.

Replacing the Control Module (UEM)

Replacing the control module

Reading off the programmed values

Note! Read off the programmed values from the upper electronic module (UEM) before replacing the control module.



- Ignition on
- Click on the symbol for VCT2000 to read off the programmed values.

The retained values are programmed customer parameters in the upper electronic module (UEM). The retained values should be noted for later use.

Other information

- For information about programming the customer parameters, see Diagnostic functions See: Body and Frame/Body Control Systems/Description and Operation/Upper Electronic Module (UEM)/Diagnostic Functions.

Continue - Replacing control modules and downloading software

---

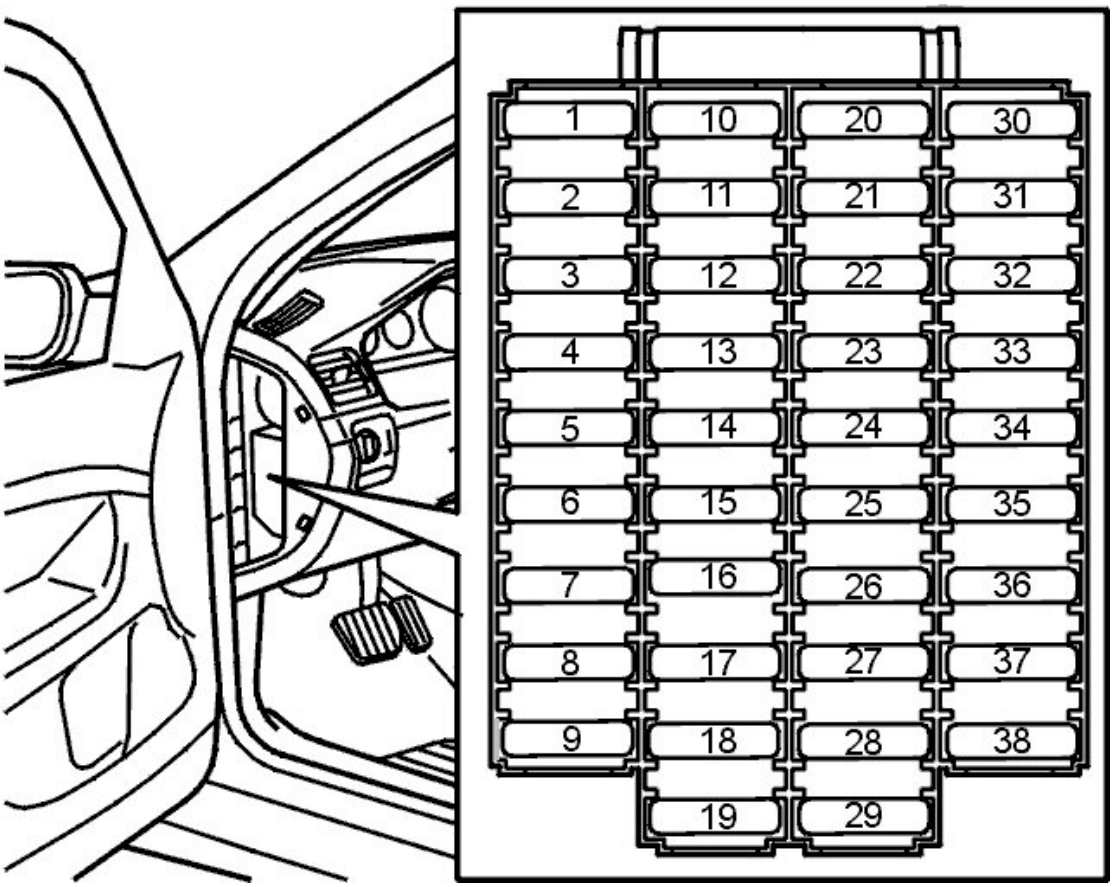
Replacing control modules and downloading software

Caution! A new control module is delivered without software. In order for the control module to function new software must be programmed into the control module after it has been replaced.

Replace the control module and download the new software. See Upper electronic module (UEM) rear view / door mirror, replacing See: .

Hint: When diagnostic trouble code (DTC) E001 is stored, communication with the control module cannot be established. This can be remedied in two ways.

1. Press the remote control button for local lighting
2. Remove fuse 11C/28 from the fusebox in the passenger compartment. Reinstall the fuse again.



Continue - Checking the interior lighting

Checking the interior lighting

Checking the interior lighting (2)

Checking the interior lighting

Two times can be programmed for the interior lighting:

1. Short
- The period from when the door is unlocked, or the engine stops, to when the interior lighting goes out can be changed if it is too long or too short.

2. Long
- The period from when the door is opened, or a lamp is lit with a switch, to when the lamp goes out can be changed if it is too long or too short.

To program a long interior lighting period you must step ("click") through the short interior lighting period programming.

Continue - Programming a short interior lighting period

Programming a short interior lighting period

The general lighting and rear reading lamps light and remain lit for 30 seconds when:
- The door has been unlocked from outside with a key or the remote control.
- The engine has been stopped and the ignition key turned to 0.

The default period is 30 seconds. This can be changed to between 5 and 255 seconds.
Read off the programmed values.
To change the time, mark the desired value in the scrolling list and start programming.

Do you want to program any more parameters?

Yes - Programming a long interior lighting period

No - Fault Found

Programming a long interior lighting period

The general lighting and rear reading lamps light and remain lit for 10 minutes when:
- A door is opened after being unlocked.
- The lamp is lit with a switch.

The default period is 10 minutes. This can be changed to between 0 and 255 minutes at 10 minute intervals.
Read off the programmed values.
To change the time, mark the desired value in the scrolling list and start programming.

Continue - Fault Found

FAULT FOUND - Checking the anti-dazzle function in the rear view mirror

---

Checking the anti-dazzle function in the rear view mirror

Checking the anti-dazzle function in the rear view mirror

Checking the anti-dazzle function

Note! If the upper electronic module (UEM) has been replaced software, specially developed for downloading after replacing the control module, must be downloaded to the control module before the anti-dazzle function is changed. See Upper electronic module (UEM) rear view / door mirror, replacing See: .

The rear view mirror anti-dazzle function can be adjusted:
- If the rear view mirror anti-dazzle function is too powerful or too weak, it can be adjusted.

Specific software for setting the anti-dazzle function must be installed in the car to do this.
Order the software. See9499432.
Install the software. See9499432.

Continue - DONE

DONE - DONE

Upper Electronic Module (UEM)/Rearview Mirror, Replacing

Upper electronic module (UEM)/rearview mirror, replacing

Removal

Preparatory information

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Note! A rear view mirror with manual function cannot be replaced with automatic anti-dazzle or vice versa. The system will store diagnostic trouble codes (DTCs). The upper electronic module (UEM) is integrated in the rear view mirror.

Note! Read off data from the control module before replacing the control module. Program this data back into the new control module. Programmed data is read off via VIDA vehicle communication.

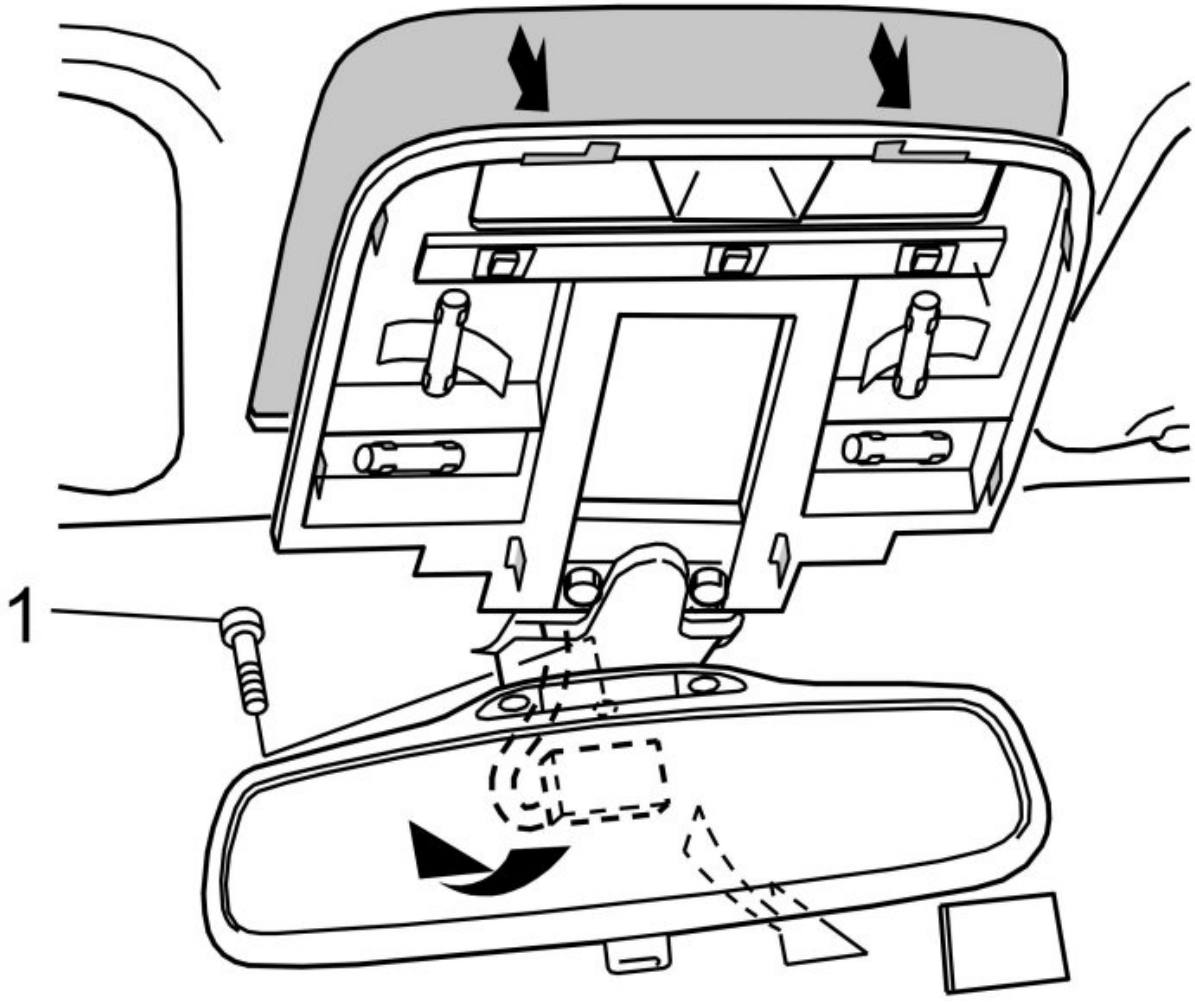
Caution! New software can only be ordered when the control module is installed in the car. VIDA reads off the new control module identity which is required to order the correct software.

Note! Always check that the control module and control module box connectors do not have bent or damaged terminals or socket / sleeves. This may have been the cause of a fault.

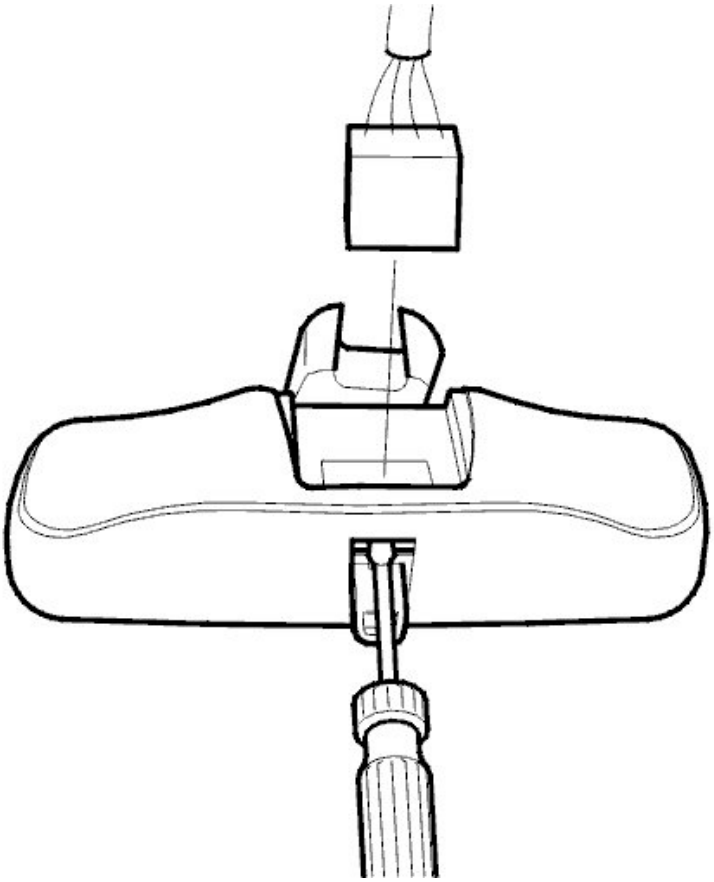
Preparatory work

Remove the interior lighting. See Interior lighting, replacing See: Lighting and Horns/Dome Lamp/Service and Repair/Interior Lighting, Replacing.

Removing the rear view mirror/control module



- Remove the cover over the connector for the rear view mirror and control module
- Remove the cable spring using a screwdriver
- For rear view mirrors with manual anti-dazzle: Flip the anti-dazzle button toward the lens.



Disconnect the connector by pressing the catch using a small screwdriver.

Installation

Installing the rear view mirror and control module

Connect the connector.
- The cable spring
- The connector cover
- The interior lighting. See Interior lighting, replacing See: Lighting and Horns/Dome Lamp/Service and Repair/Interior Lighting, Replacing.

Ordering software

Order applicable software.

S60	8645443

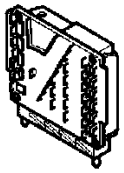
S80	8637414
XC90	8691298

Engine Control Module: Description and Operation

Control Module



The Engine Control Module (ECM) controls the following functions:
- injectors
- ignition
- camshafts (CVVT)
- evaporative emission system (EVAP) valve
- turbocharger (TC) control
- throttle angle
- engine cooling fan (FC)
- Air conditioning (A/C) compressor
- fuel pump (only vehicles with demand controlled fuel pumps).

There is a micro-processor in the control module which receives signals from the different sensors in the car. The micro-processor uses a program which interprets the signals from the different sensors and how the components / functions should be controlled.

The control module has several self-learning (adaptive) functions. It continually adapts ongoing calculations to changing circumstances (wear, air leaks, differences between different fuels etc.).

Emissions are kept low through efficient management of the injection period, ignition, evaporative emission system (EVAP) valve and camshafts etc. Faults which affect emissions can be detected by running diagnostics for functions and components.

The control module is in a box in the engine compartment.

The engine control module (ECM) communicates with other control modules using controller area network (CAN) communication.

The engine control module (ECM) checks activations, input and output signals and functions using an integrated diagnostic system. A diagnostic trouble code (DTC) is stored if, after validation, the control module detects a fault. In certain cases the faulty signal is replaced with a substitute value or certain functions are limited.

Substitute values can be set for e.g.:
- engine coolant temperature (ECT)
- mass air flow
- throttle position
- atmospheric pressure
- etc.

Mathematical calculations and signals from certain components are used to calculate the substitute values. Other substitute values are fixed, predefined values in the control module. The substitute value allows the car to be driven and for the emissions to be kept at a reasonable level even though vital functions / components are faults.

Functions which are limited may be for example:
- turbocharger (TC) control
- Camshaft control (CVVT)
- fuel trim
- throttle angle
- etc.

A function is limited so that the system still functions, to protect components or for safety reasons (for example the throttle angle). Any diagnostic trouble codes (DTCs) are stored in the control module memory. The data can be read off using VIDA.

Signals

The table summarizes the input signals to and output signals from the Engine Control Module (ECM). The signal types are divided into directly connected signals, serial communication and controller area network (CAN) communication. The illustration displays the same information with the Volvo component designations.

Input signals	Output signals
Directly connected: * Ignition switch (3/1) * Stop lamp switch (3/9) * Clutch pedal sensor (7/123) * Air conditioning (A/C) pressure sensor (7/8) * Front heated oxygen sensor (HO2S) (7/15) * Rear heated oxygen sensor (HO2S) (7/82) * Engine coolant temperature (ECT) sensor (7/16) * Mass air flow (MAF) sensor (7/17) * Manifold absolute pressure (MAP) sensor, intake (7/81) (certain turbocharged engines only) * Manifold absolute pressure (MAP) sensor, with integrated intake air temperature (IAT) sensor, intake (7/81) (certain turbocharged engines only) * Leak diagnostic unit (6/67), (certain markets only) * Electronic throttle unit (6/120) * Outside temperature sensor (7/105) * Camshaft position (CMP) sensor (7/172) * Camshaft position (CMP) sensor (7/173) * Engine speed (RPM) sensor (7/25) * Accelerator pedal (AP) position sensor (7/51) * Engine coolant level sensor (7/73) * Knock sensor (KS) (7/23-7/24) * Manifold absolute pressure (MAP) sensor, intake (7/77) (not turbocharged engines 2003-2004) * Oil level sensor (7/35) (certain markets and models only) * Fuel pressure sensor with integrated fuel temperature sensor (7/156) (vehicles with demand controlled fuel pumps only).	**Directly connected:** * Main relay (system relay) (2/32) * Fuel pump (FP) relay (2/23) * Air conditioning (A/C) relay (2/22) * Electronic throttle unit (6/120) * Engine cooling fan (FC) control module (4/71) * Engine cooling fan (FC) control module box (6/44) (turbocharger (TC) only and certain markets) * Front heated oxygen sensor (HO2S), preheating (7/103) * Rear heated oxygen sensor (HO2S), preheating (7/104) * Injectors (8/6-8/11) * Leak diagnostic unit (6/67), (certain markets only) * Evaporative emission system (EVAP) valve (8/18) * Camshaft reset valve (CVVT) (8/19) (certain engines only) * Camshaft reset valve (CVVT) (8/81) (certain engines only) * Turbocharger (TC) control valve (8/28) * Ignition coils (20/3-20/8) * Driver information module (DIM) (5/1), emissions warning lamp * Fuel pump control module (6/33) (only vehicles with demand controlled fuel pumps) * Central electronic module (CEM) (4/56).
Via Controller Area Network (CAN) communication: * Transmission Control Module (TCM) (4/28) (only cars with automatic transmissions) * Brake control module (BCM) (4/16) * Central electronic module (CEM) (4/56) * Suspension module (SUM) (4/84) (vehicle with Four-C (Continuously Controlled Chassis Concept) only). Via central electronic module (CEM) (4/56): * Climate Control Module (CCM) (3/112) * Data link connector (DLC) (17/13) * Driver information module (DIM) (5/1) * Steering wheel module (SWM) (3/130).	**Via Controller Area Network (CAN) communication:** * Transmission Control Module (TCM) (4/28) (only cars with automatic transmissions) * Brake control module (BCM) (4/16) * Central electronic module (CEM) (4/56) * Differential electronic module (DEM) (4/82) (AWD only) * Suspension module (SUM) (4/84) (vehicle with Four-C (Continuously Controlled Chassis Concept) only). Engine Control Module: Service and Repair

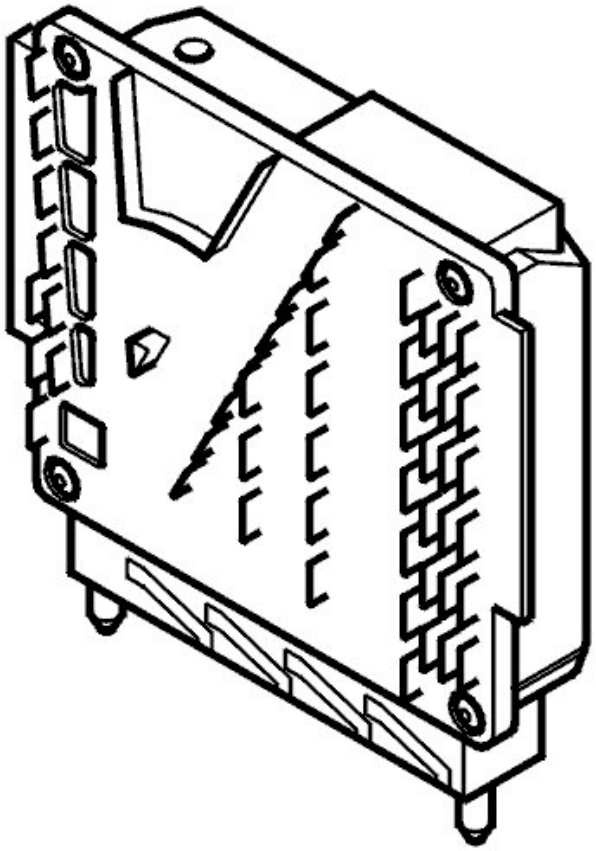
Engine control module (ECM), replacing

Special tools:

999 5722 Wrench See: Tools and Equipment/999 5722 Wrench

Points to observe when replacing the control module

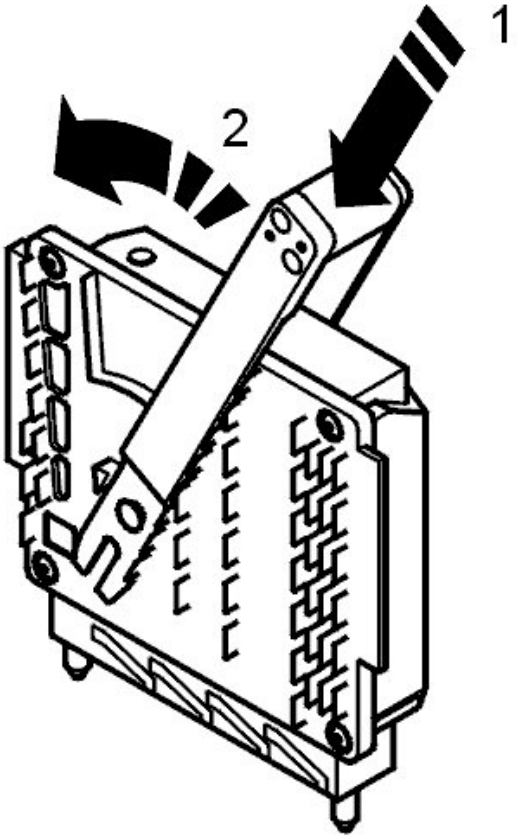


Caution! New software can only be ordered when the control module is installed in the vehicle. VIDA reads off the new control module identity which is required to order the correct software.The software can only be ordered when the new control module is installed in the car.

Caution! Wait 2 minutes after the ignition has been switched off. The main relay must be voltage-free before the control module can be removed from the car. If the engine cooling fan runs on after the ignition has been switched off, wait until it stops and then wait for another 2 minutes.

Caution! Always check that the control module and control module box connector pins and sleeves are not bent or damaged. This may have caused the fault.

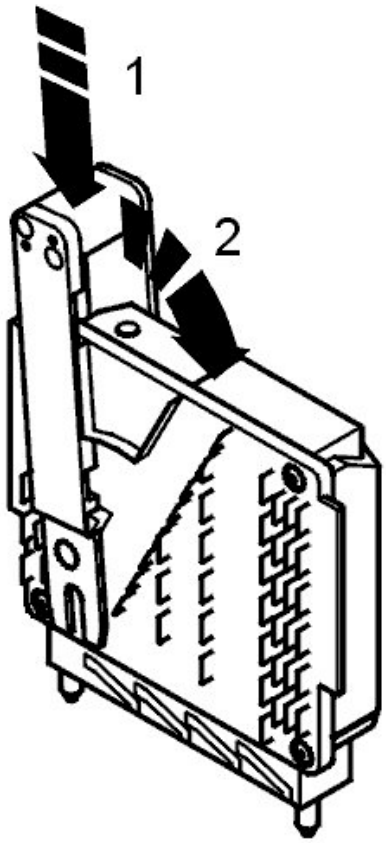
Removing the engine control module (ECM)



- Ignition off. Wait for 2 minutes
- Remove the cover over the control module box. Put the cover to one side
  Note! Do not touch the control module terminal pins with your fingers. Static electricity may damage components in the control module.

- Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
- Move the upper section of the tool backwards as far as it will go. Pull up the tool
- Carefully pull up the control module.

Installing the engine control module (ECM)



- Check that no pins or sockets are damaged on the connector.
- Carefully press the control module down into the grooves on the inside of the control module box. Press to the limit position
- Insert tool 999 5722 Wrench See: Tools and Equipment/999 5722 Wrench around the control module.
- Move the upper section of the tool forwards as far as it will go. Pull up the tool
- Press the cover into place over the control modules
- Check that the air ducts are correctly positioned.

Ordering software

Order applicable software.

S60	8645426
V70 2000-, V70 XC 2001-/XC70	9494715
S80	9438288
XC90	8691283

Note! After downloading the software or replacing the engine control module (ECM), the throttle unit must be adapted according to vehicle communication input: "Adapting the throttle unit".

Finishing

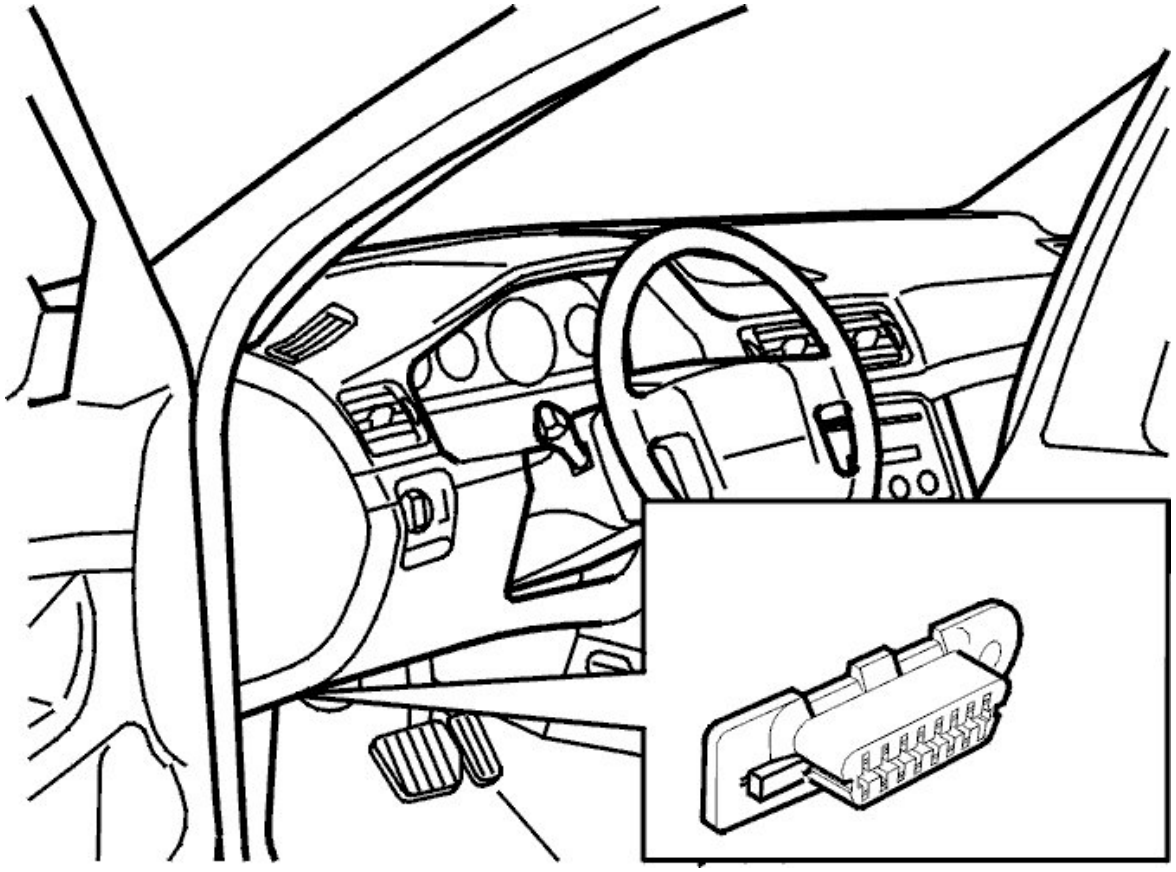
Check that no diagnostic trouble codes have been stored during the repair.
Test drive the car. Check the function of the engine.

Data Link Connector: Service and Repair

Data link connector (DLC), replacing

Removal

Data link connector (DLC) without bracket



- Disconnect the catch using a screwdriver
- Pull out the data link connector (DLC).

Data link connector (DLC) with bracket

- Remove the screws (2) for the bracket
- Disconnect the catch using a screwdriver
- Pull out the data link connector (DLC).

Installation

Data link connector (DLC) with bracket

In reverse order.

Data link connector (DLC) without bracket

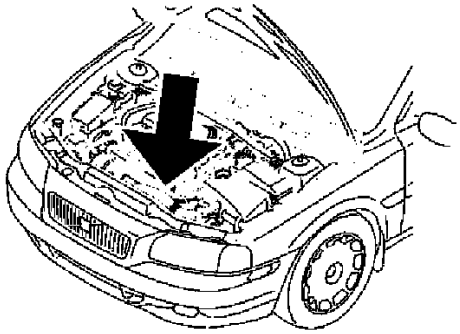
In reverse order.

Electronic Throttle Control Module: Service and Repair

Throttle body (electronic throttle module (ETM)), replacing

Note: The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Removal
Preparation
Remove:



- the air intake between the front cover plate and the air cleaner (ACL) housing
- the charge air pipe between the charge air cooler (CAC) and the electronic throttle module (ETM).

Removing the electronic throttle module (ETM)

Disconnect the connector for the electronic throttle module.

Remove the 4 x screws for the electronic throttle module (ETM). Lift out the electronic throttle module (ETM). Discard the gasket.

Installation

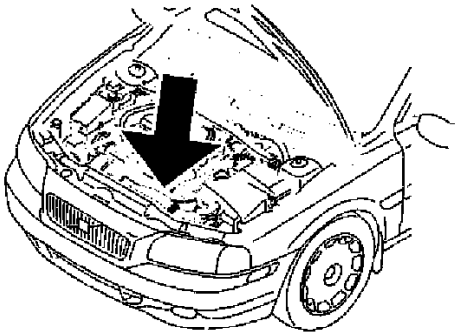
Note: For tightening torques, see Specifications.

Replacing the electronic throttle module (ETM)

Caution: Ensure that the surfaces between the throttle body (TB) and the intake manifold are clean. Install a new electronic throttle module (ETM).

Use a new gasket. Tighten the 4 screws.

Installing components



Install the charge air pipe between the electronic throttle module (ETM) and the charge air cooler (CAC).

Note: Heat the pipe at the connections to facilitate installation.

Install the intake pipe between the front cover plate and the air cleaner (ACL) housing.

Finishing

After replacing the electronic throttle module (ETM), the electronic throttle module (ETM) must be adapted using the vehicle communication input: "Adaptation of the electronic throttle unit"

Start the engine and check the function.

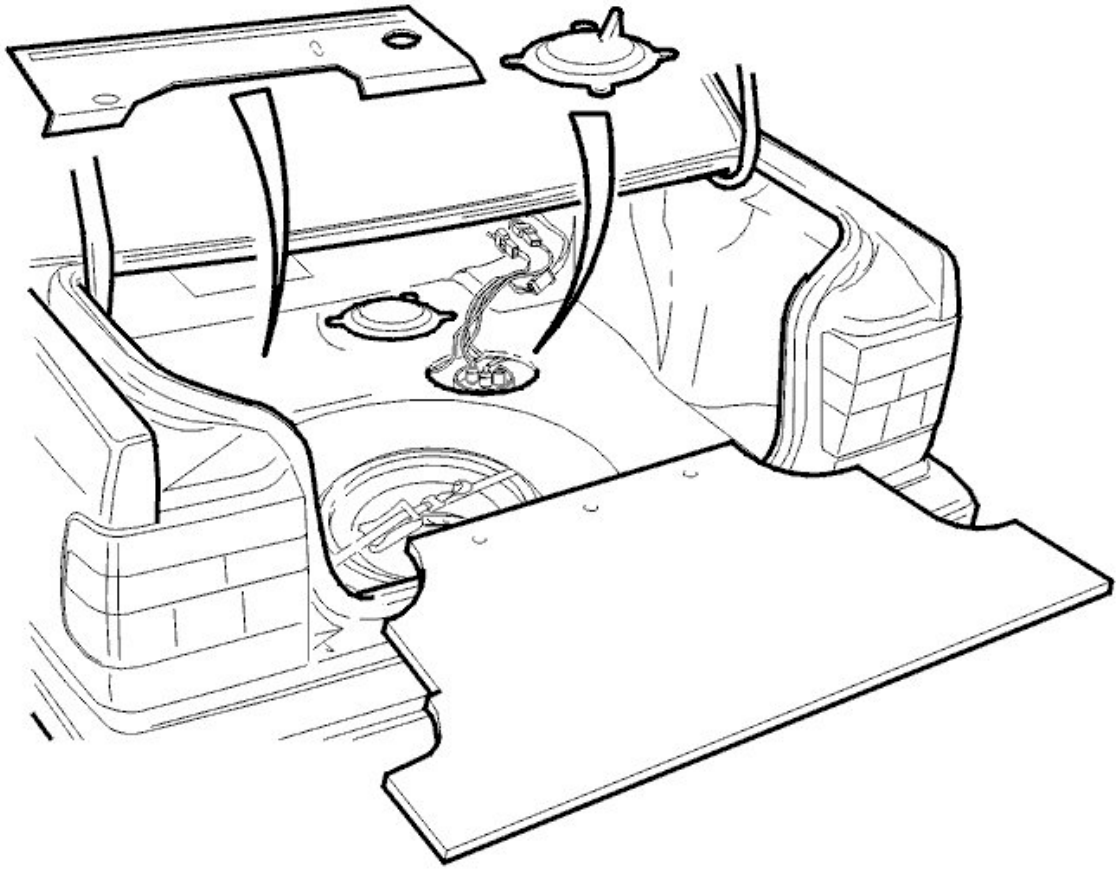
Fuel Tank Pressure Sensor: Service and Repair

Replacing fuel tank pressure sensor

Special tools:

999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture

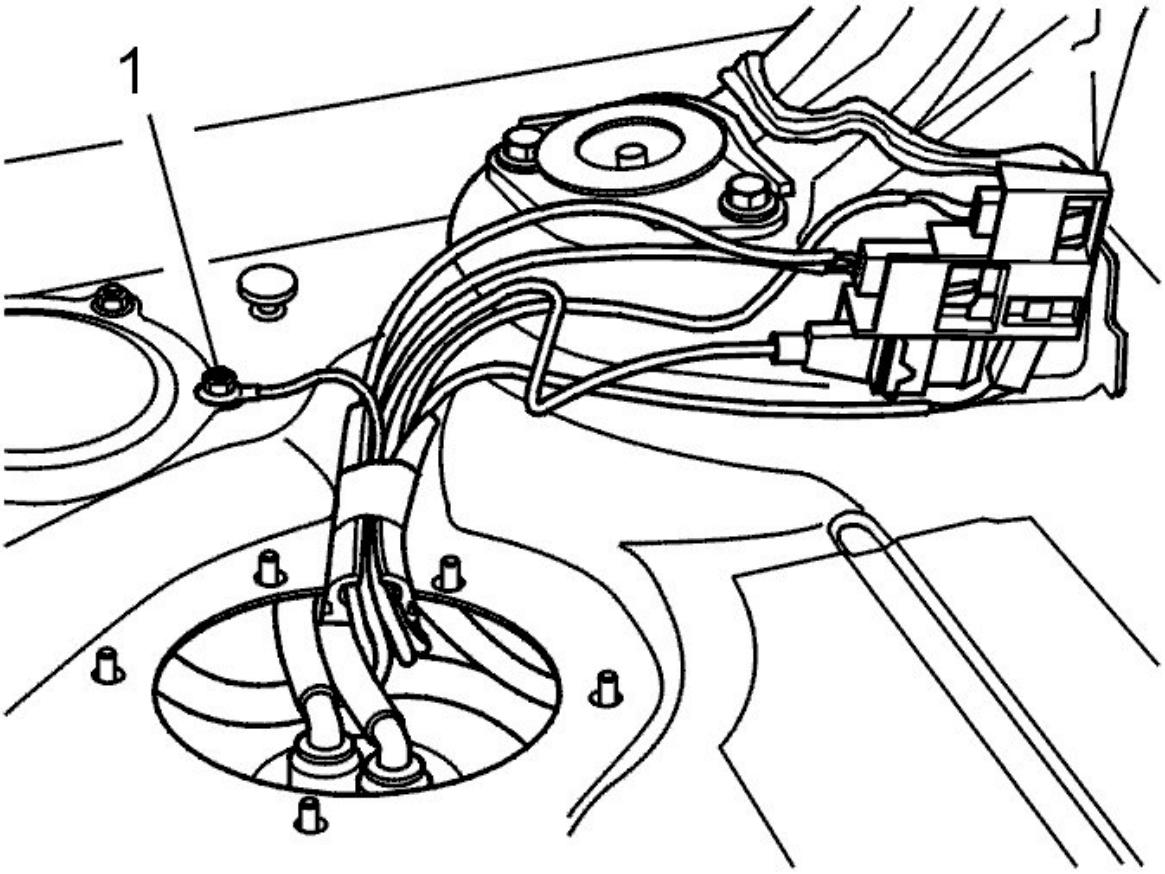
Preparations



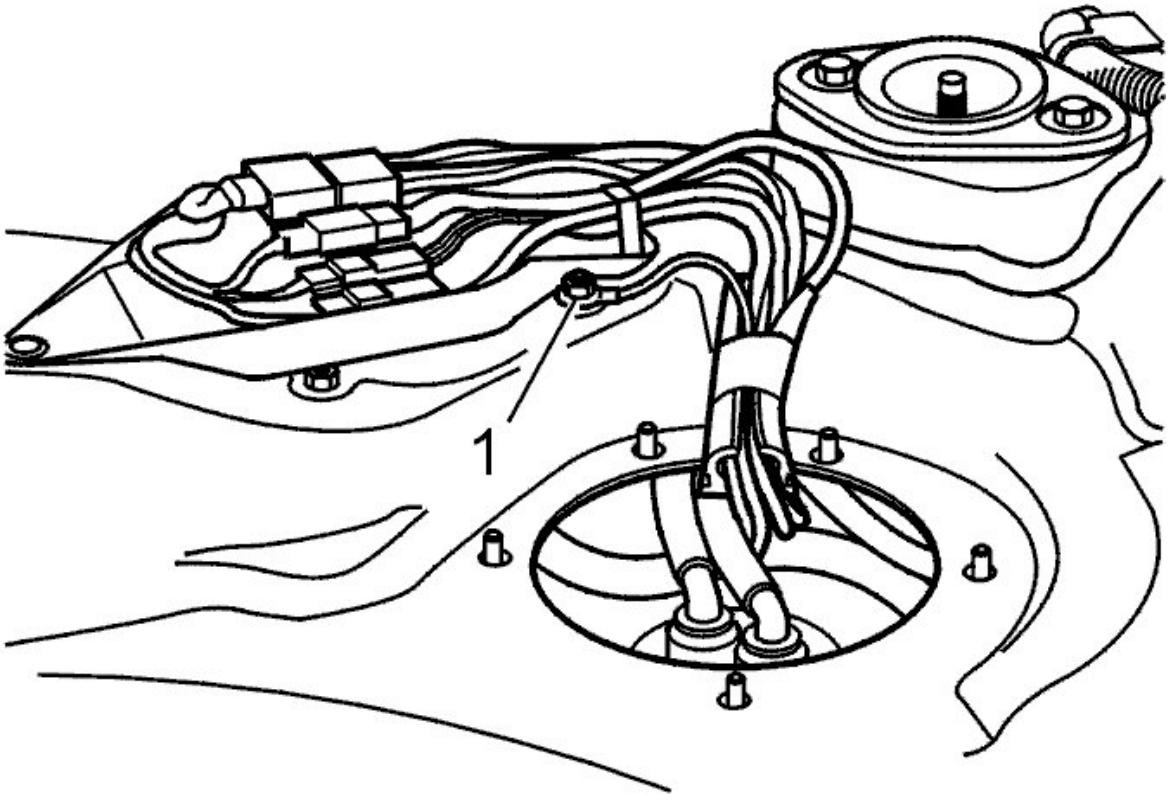
5-door cars:
- Remove all floor hatches and fold back carpet.
- Remove cover over fuel pump (FP) unit.

4-door cars:
- Fold forward right rear seat
- Remove cargo compartment carpet.
- Fold back corner of wheel housing panel at shock absorber mounting.
- Remove cover over fuel pump (FP) unit.

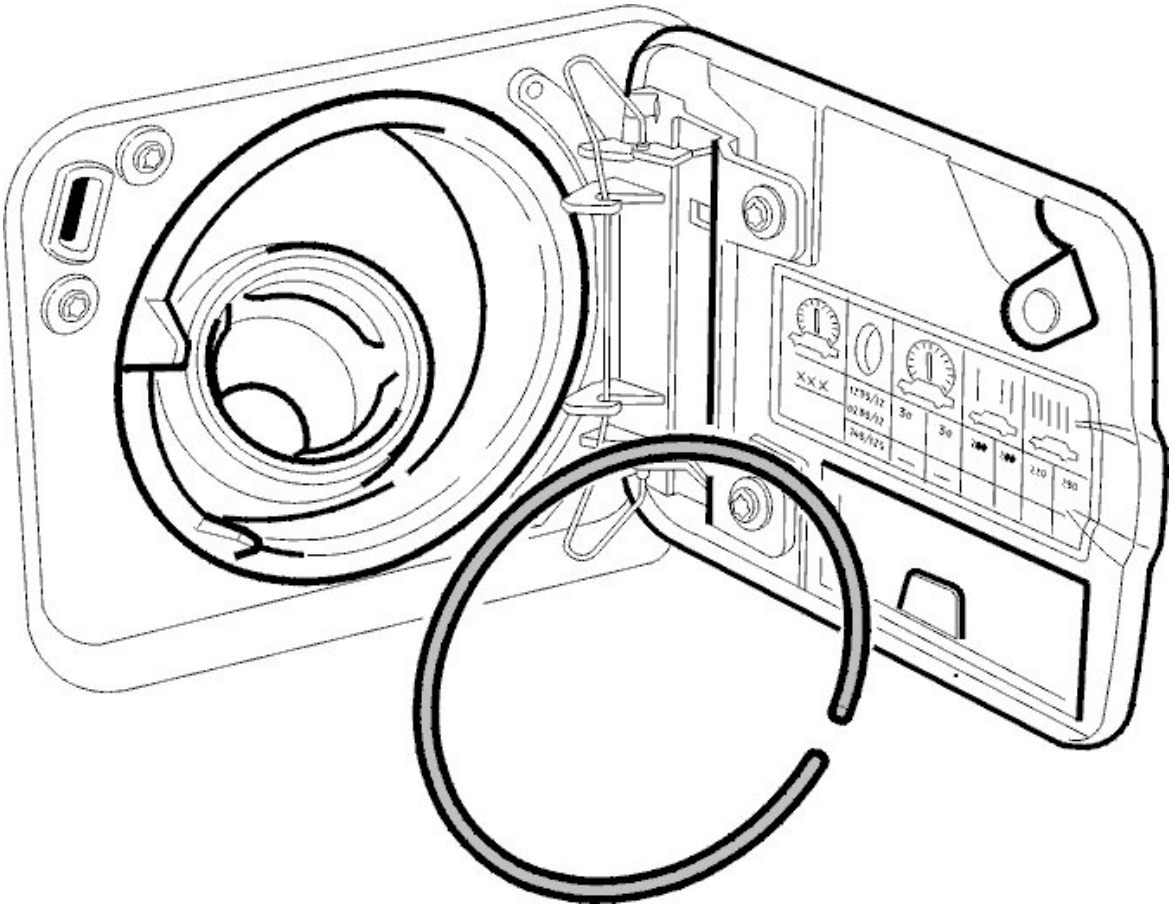
Disconnect connectors



- Disconnect all connectors on the bracket.
- Remove rubber bracket around wiring.
- Remove fuel filler pipe ground lead from nut on fuel tank level sensor cover.
- Ensure that all cables routed through the fuel pump (FP) unit hole are free to follow the fuel tank when it is lowered.

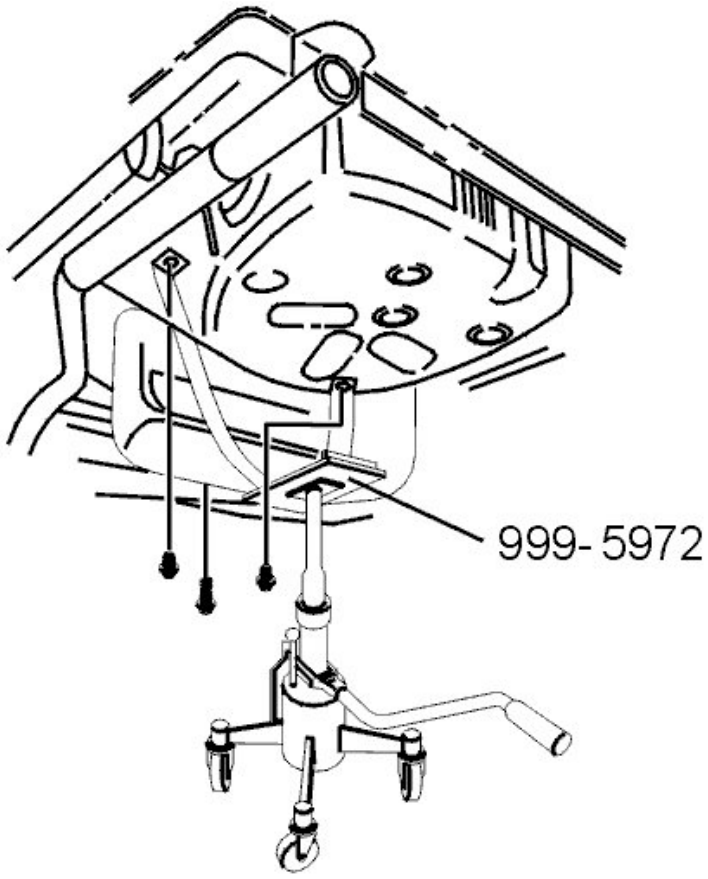


Remove fuel filler pipe



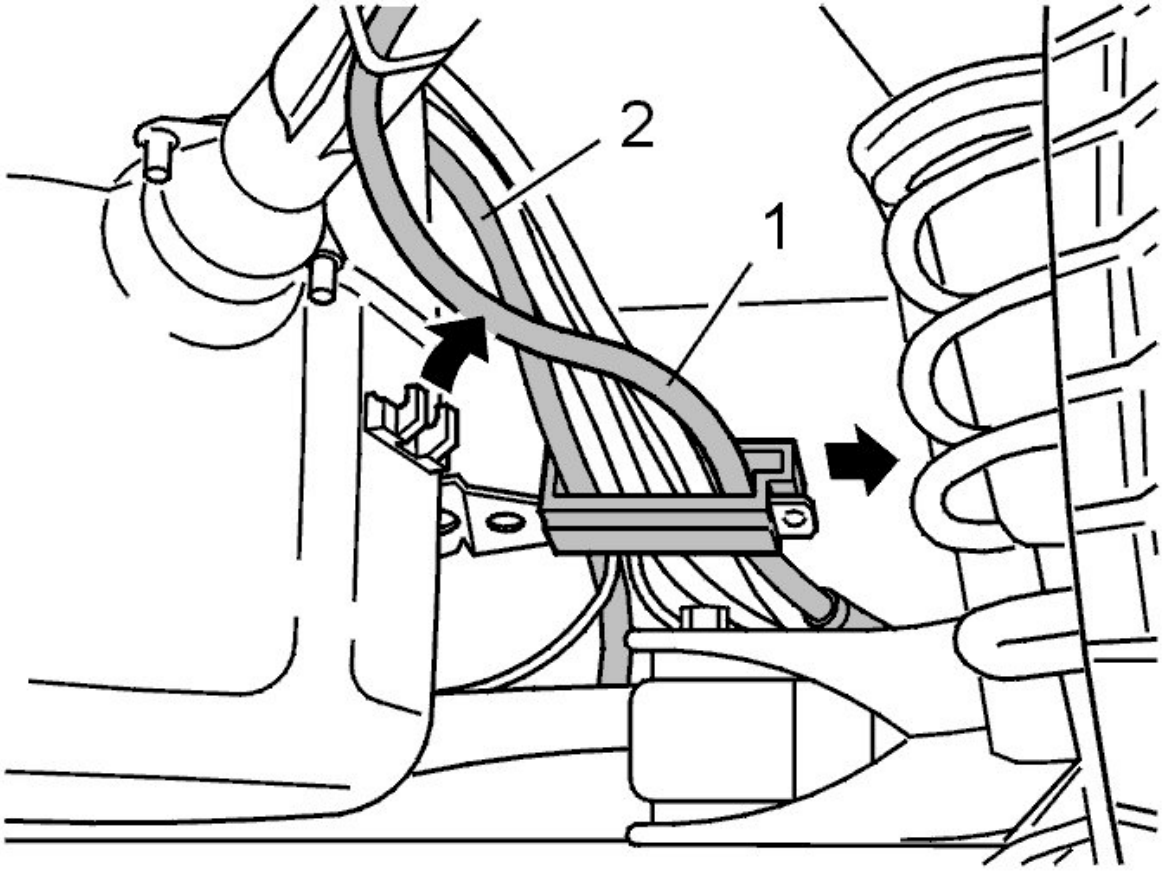
- Remove circlip securing rubber seal.
- Release rubber seal from bodywork.

Remove fuel tank



- Position mobile jack with fixture999 5972 FIXTURE See: Tools and Equipment/999 5972 Fixture under fuel tank, check that the lifting platform is flat so as not to damage the fuel tank.
- Undo tank retaining straps and lower tank slightly.

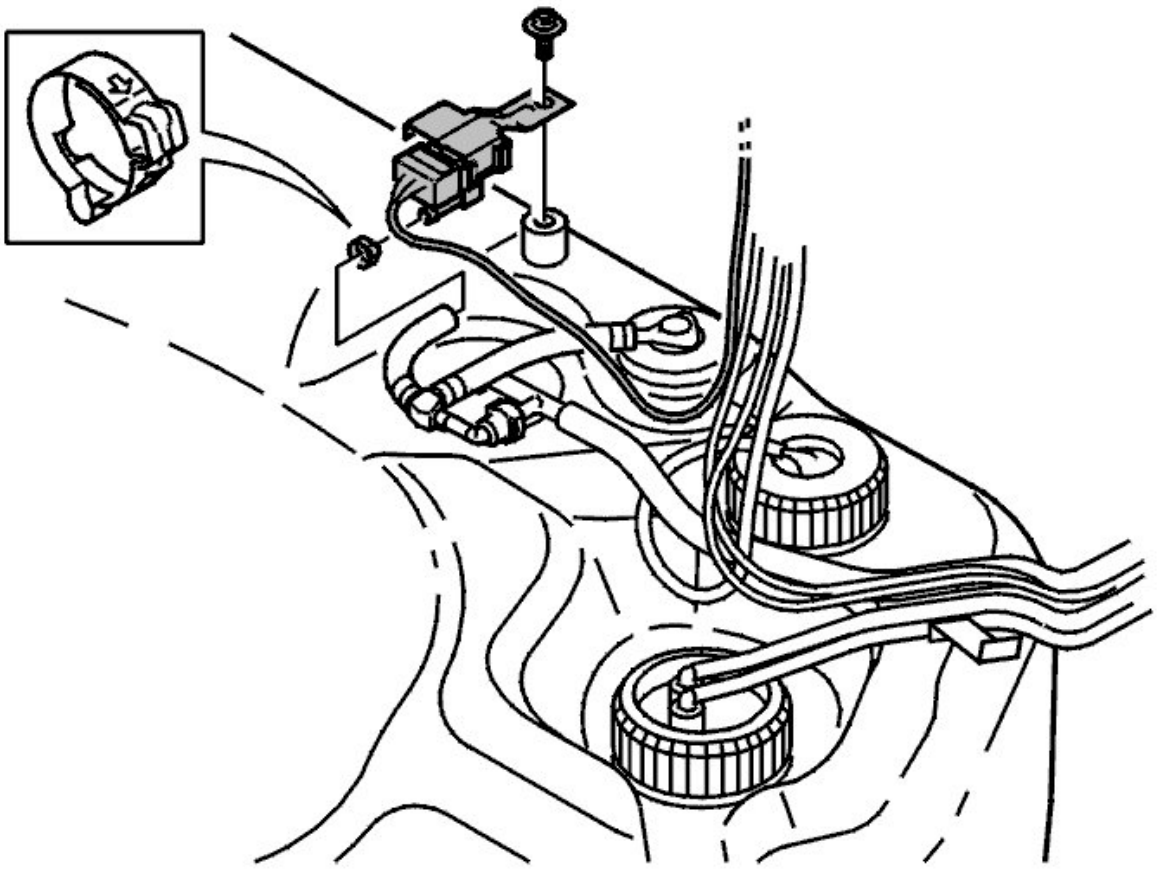
Remove front holder

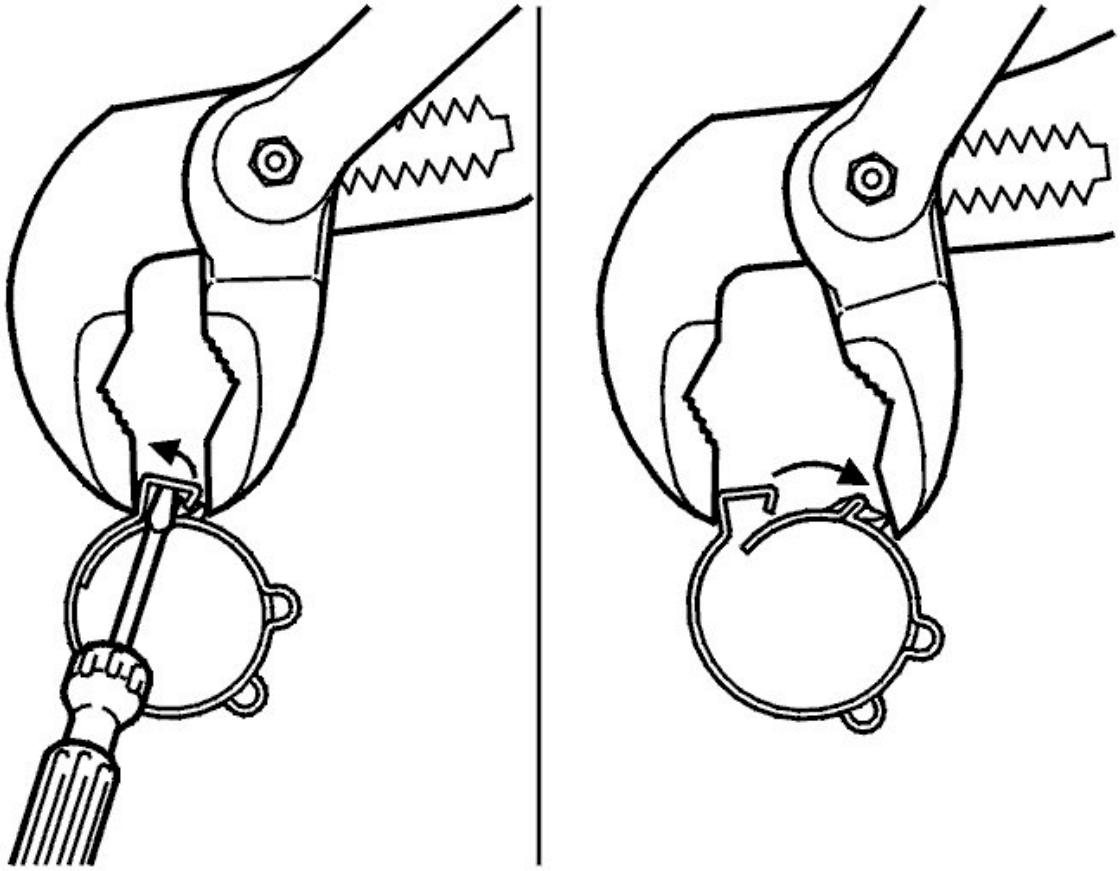


- Remove the entire mounting from the bracket by pulling it towards the right of the car.
- Disconnect the hose between the EVAP canister shut-off valve and air cleaner (ACL) from the clamp on the fuel tank.

Hint: Note position of hose in the clamp in case it opens. The hoses must be reinstalled in their original positions.

Replacing fuel tank pressure sensor





- Remove the screw
- Remove clamp

Note! The clamp will be reused

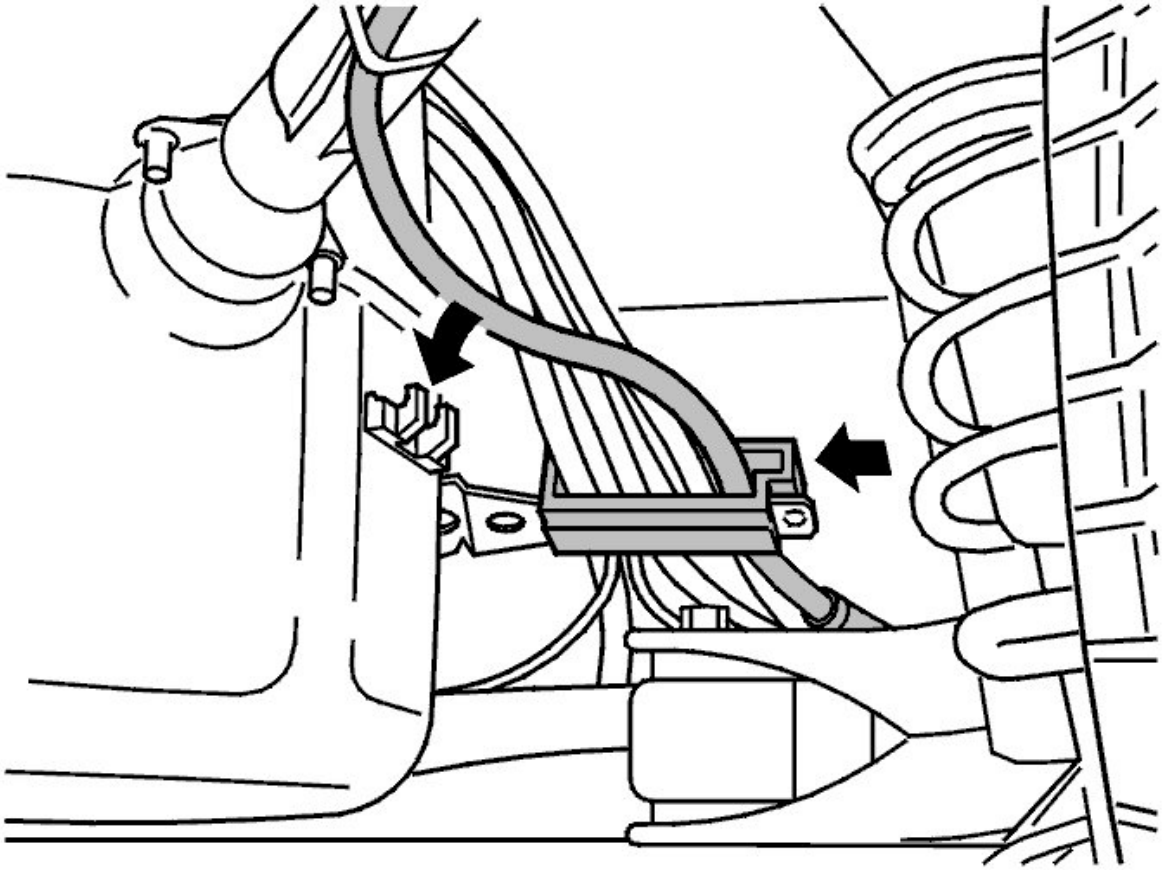
Removing clamp:
- squeeze clamp with a pipe wrench. Hold in place
- pry apart with a small screwdriver.

Note! It is reusable.

- Disconnect hose.
- Remove cable harness.
- Install the new pressure sensor, route cabling as before.

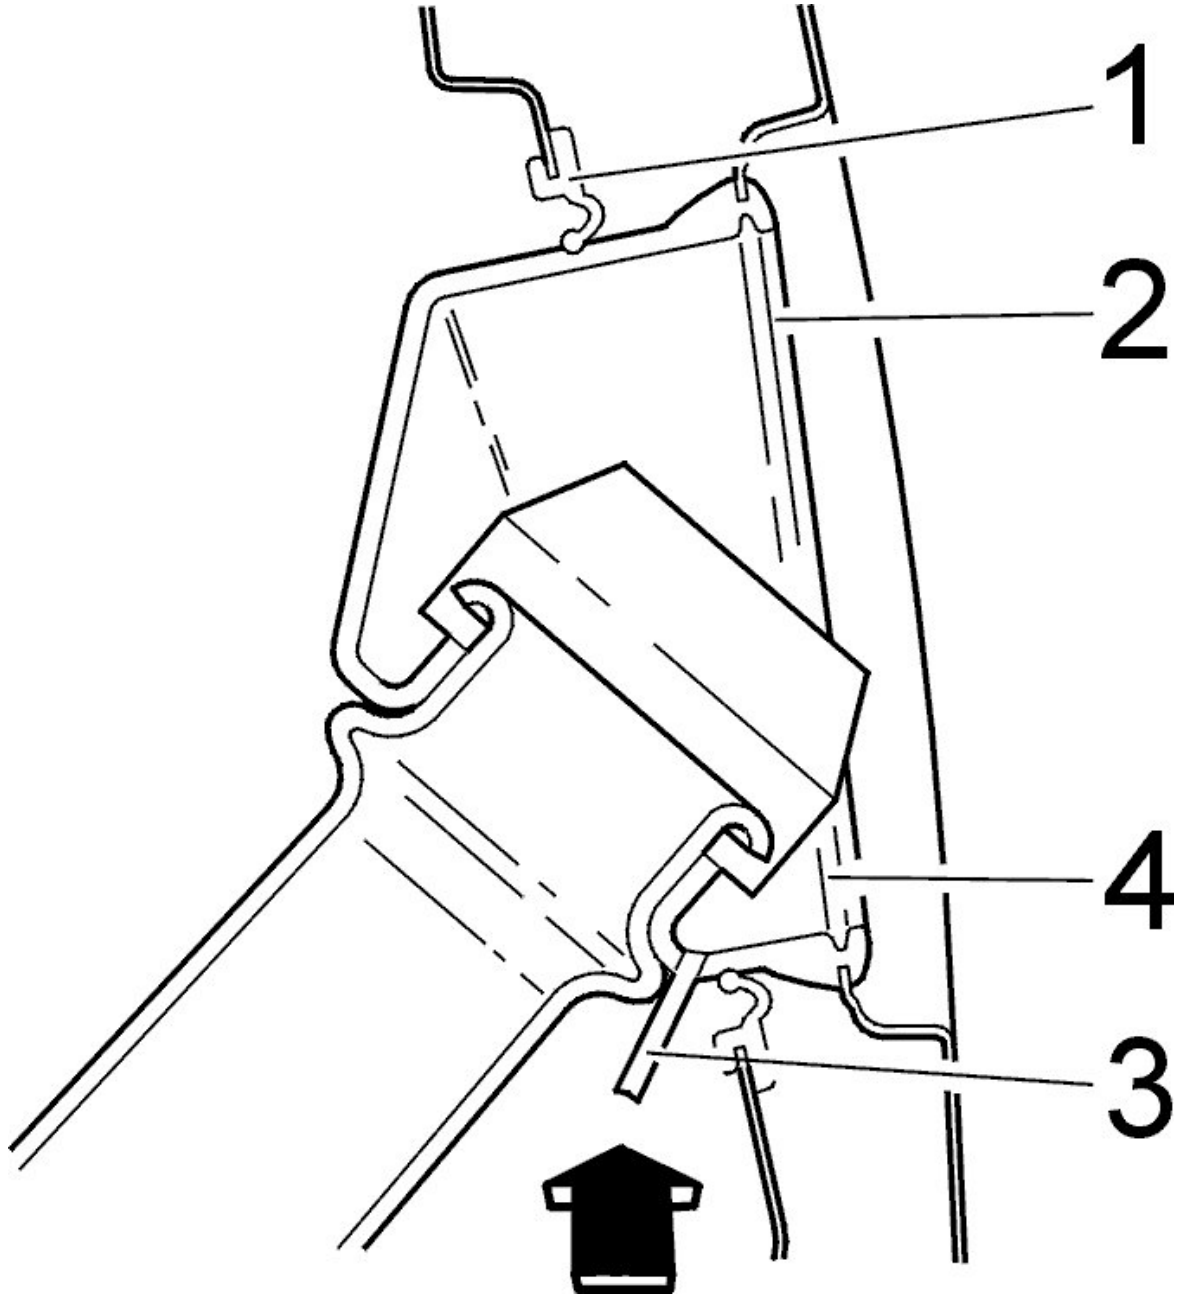
Installing clamp:
- Press in the clamp with a pipe wrench until it locks.

Installing fuel tank



- Raise the fuel tank so that the front holder can be installed to the bracket by pressing it until it locks into place.
- Ensure that cabling routed through the fuel pump (FP) unit hole will not be trapped when the fuel tank is installed.
- Raise the fuel tank and fix it to the bodywork.
- Install EVAP canister shut-off valve hose in the clamp on the fuel tank.

Installing rubber cover on fuel filler pipe



- Check that the inner rubber seal is correctly seated and that the drain pipe is inside the inner seal.
- Check that circlip (1) is in position.
- Lubricate rubber cover sealing surfaces (2) with petroleum jelly.
- Install rubber cover (ensure that it is correctly positioned in relation to bodywork).
- Install circlip (4) and drain pipe (3).
- Connect all connectors and install fuel filler pipe ground lead.
- Install rubber bracket around wiring.
- Install panels, covers and carpets.

Fuel Pressure Sensor: Service and Repair

Fuel pressure sensor

Operation number: 28406-3

Note! Some variation in the illustrations may occur, but the essential information is always correct.

Materials:	
Designation	**Part number**
Lubricant	1161580

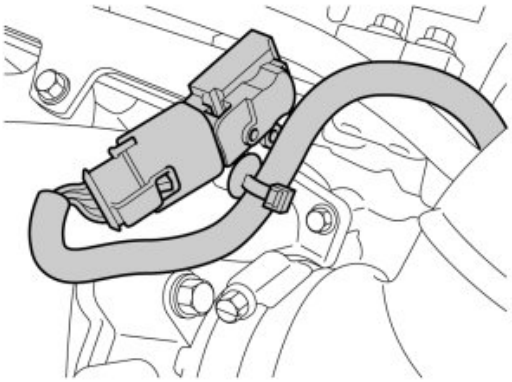
Removal

Note! Removal steps in this procedure may contain installation details.

Work on the fuel system. Refer to: Safety regulations for handling fuel See: Fuel Delivery and Air Induction/Service Precautions/Safety Regulations for Handling Fuel

Depressurize the fuel system. Refer to: Fuel system pressure release See: Fuel Delivery and Air Induction/Fuel Filter/Fuel Pressure Release/Service and Repair

Warning! Wear protective goggles.

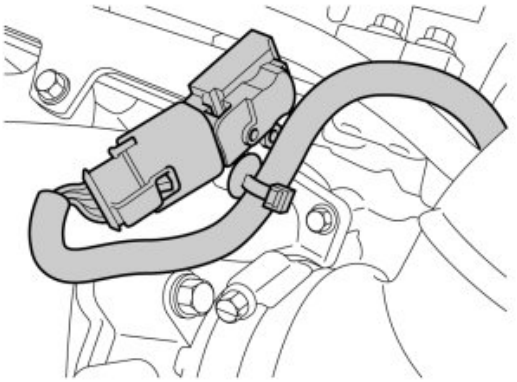


Blow clean with compressed air around the fuel pressure sensor.

Remove the following items:
- cable tie
- Connector
- screw.

Place paper under the fuel pressure sensor to take care of any petrol that may remain in the fuel distribution pipe.
Cut out the bottom of a plastic bottle and place on the paper.
Remove the fuel pressure sensor.

Installation



Lubricate the O-ring on the new fuel pressure sensor.
Use: Lubricant, 1161580

Install the following items:
- the fuel pressure sensor
- screw**Torque:** M5, 5 Nm

- cable tie
- the connector
- cable in the cable tie.

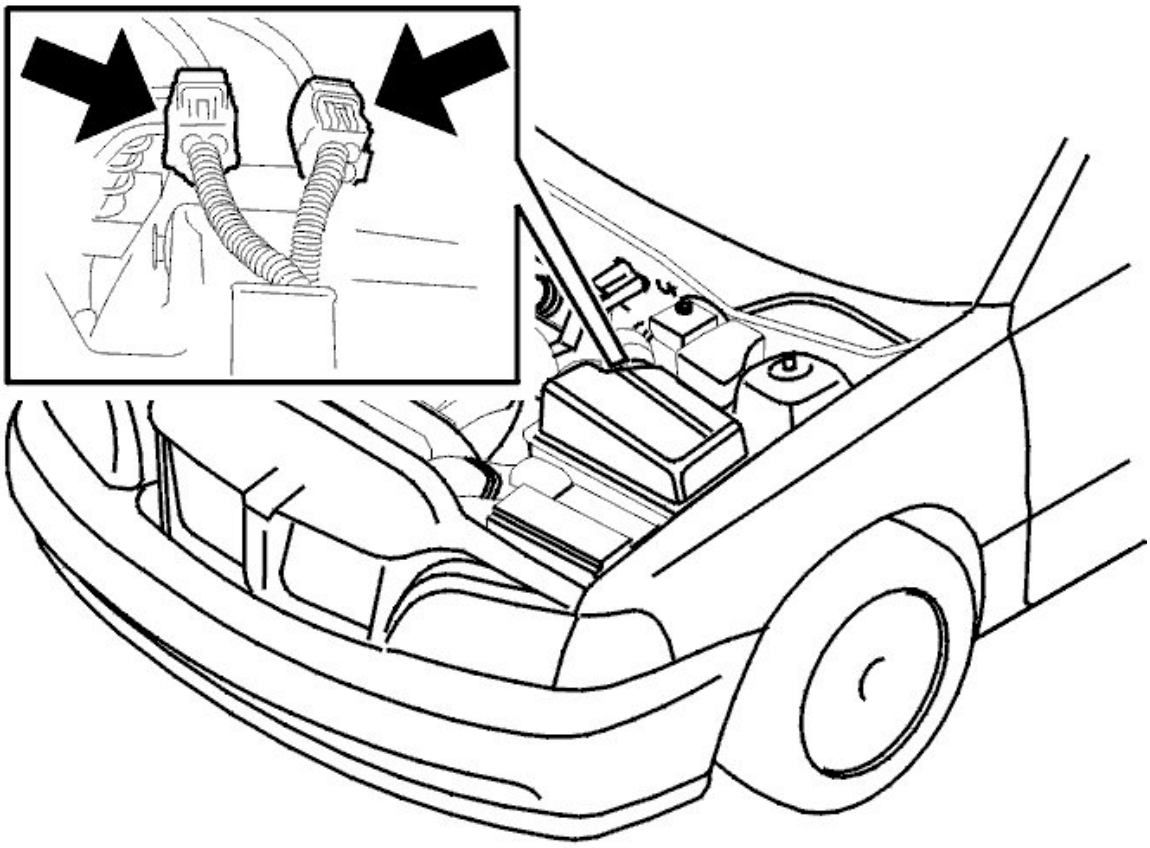
Start the engine and check that there are no leaks.

Oxygen Sensor: Service and Repair
Adapter Wiring Switch, Replacing

Adapter wiring switch, replacing

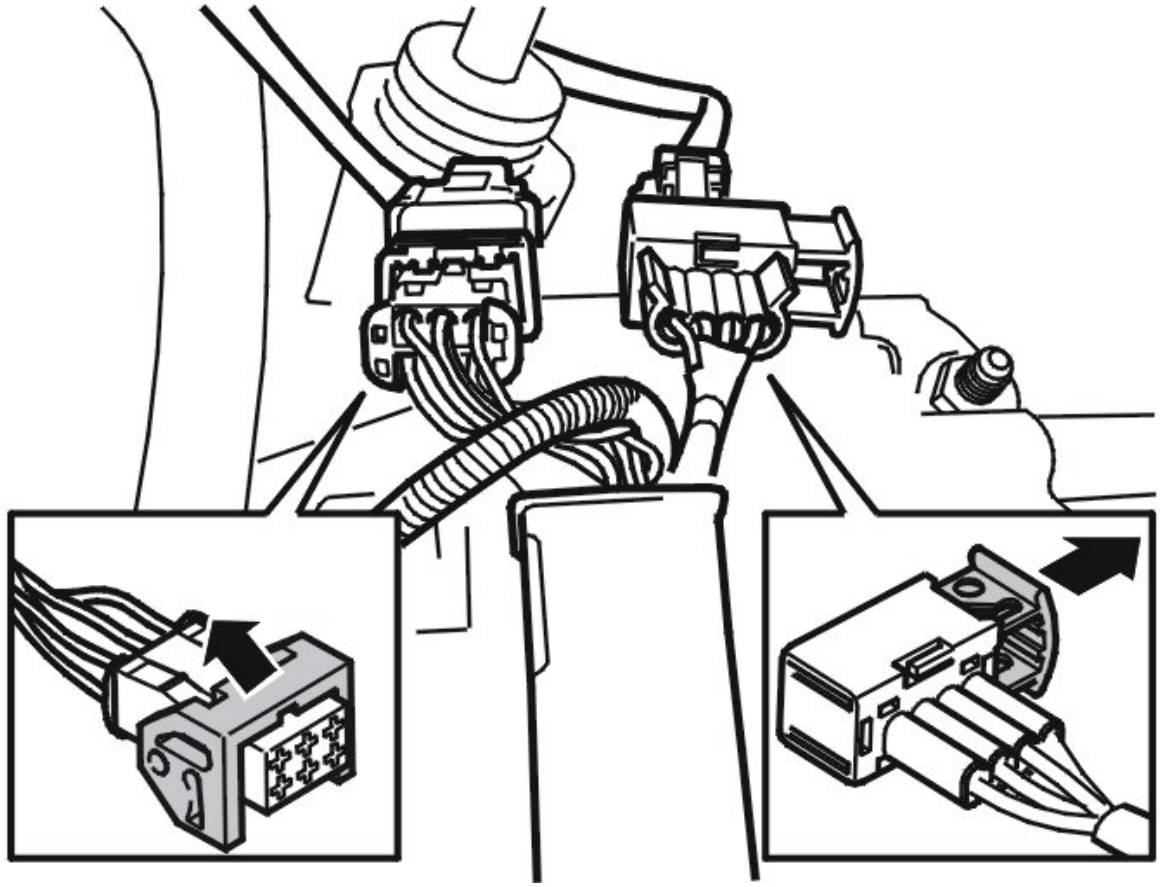
Removal and Installation

Removing heated oxygen sensors (HO2S)



The connectors for the heated oxygen sensors (HO2S) are on the transmission.

Preparations

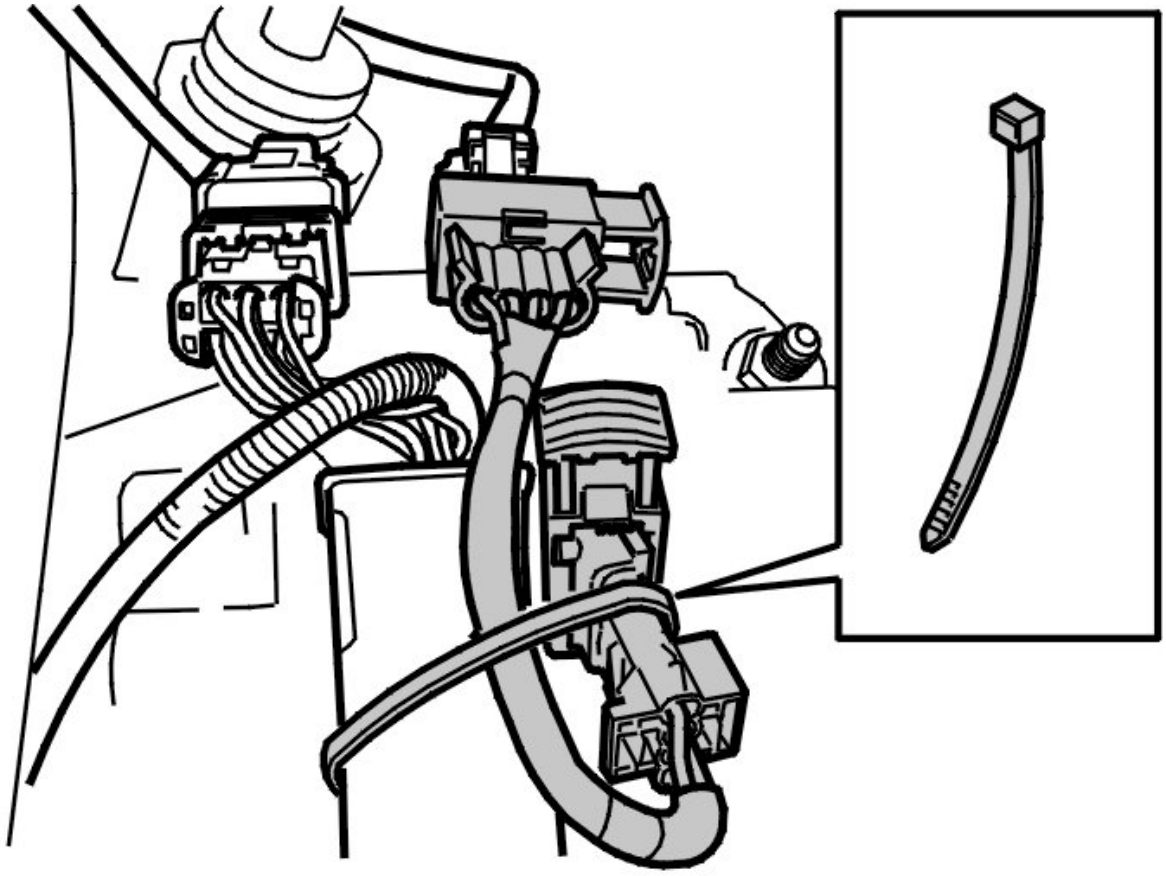


Switch off the ignition.
Remove the air cleaner (ACL) housing.
Detach the inlet hose between the air cleaner (ACL) and the turbocharger (TC) from the turbocharger (TC).
Open the catches and disconnect both the connectors for the heated oxygen sensors (HO2S).

Heated oxygen sensors (HO2S), removing

See Heated oxygen sensor (HO2S), replacing See: Heated Oxygen Sensor (HO2S), Replacing.

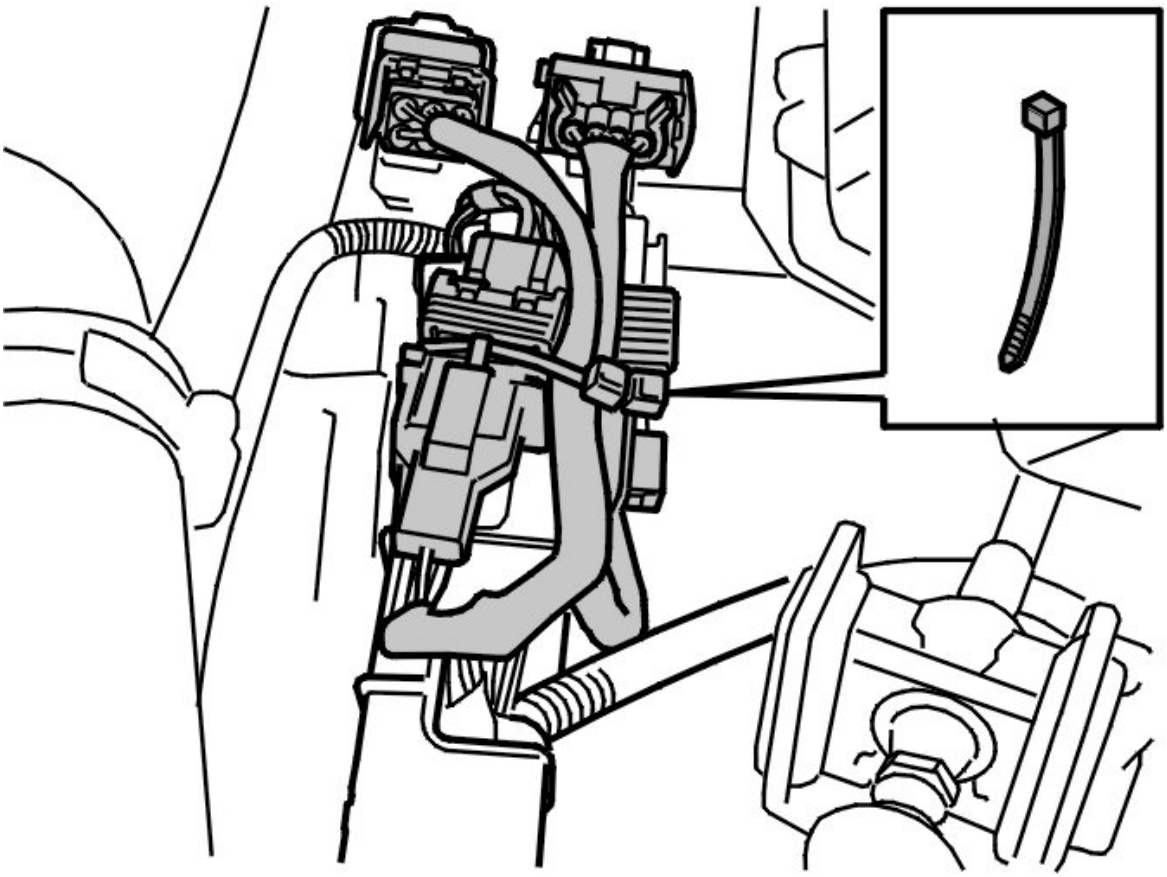
Installing the adapter cable



Note! Ensure that the ends of the protective sheath on the adapter cable point downwards so that water does not gather in the protective sheath.

Install:

- the adapter cable between the existing 4-pin connectors
- a tie strap as illustrated.



Install the adapter wiring between the existing 6-pin connectors.

Note! Ensure that the ends of the protective sheath on the adapter cable point downwards so that water does not gather in the protective

sheath.

Install:

- the inlet hose between the air cleaner (ACL) and turbocharger (TC) on the turbocharger (TC)
- the air cleaner (ACL) housing.

Oxygen Sensor: Service and Repair
Heated Oxygen Sensor (HO2S), Replacing

Heated oxygen sensor (HO2S), replacing

Special tools:

999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S

Removal and Installation

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Removing the front heated oxygen sensor (HO2S)

Remove the heated oxygen sensor (HO2S) wiring from the clips and clamps.
Separate the wiring.
Raise the car

Remove:
- the lower engine cover
- the heated oxygen sensor (HO2S). Use tool 999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S.

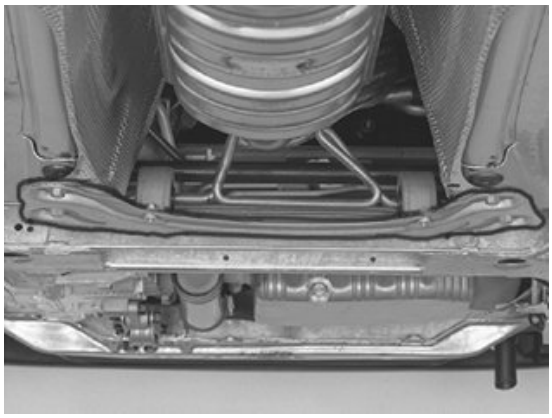
Installing the front heated oxygen sensor (HO2S)

For tightening torques, see: Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque

Install:
- the front heated oxygen sensor (HO2S). Tighten to **45 Nm**. Use tool 999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S
- the lower engine cover. Lower the car
- the wiring for the heated oxygen sensor (HO2S) using clips and clamps. Connect the wiring.

Removal and Installation

Removing the rear heated oxygen sensor (HO2S)



Raise the car.

Remove:
- the lower engine cover
- the front SIPS member. Unhook the brake pipe from the clips
- unhook the three-way catalytic converter (TWC) from the rubber mountings
- the nuts between the three-way catalytic converter (TWC) and exhaust system. Unhooks the three-way catalytic converter (TWC)
- the wiring for the heated oxygen sensor (HO2S) from the clips and clamps. Disconnect the wiring
- the rear probe. Use tool 999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543 Socket NV-22 HO2S.

Installing the rear probe

Note! For tightening torques, see Tightening torque See: Engine, Cooling and Exhaust/Engine/Specifications/Tightening Torque.

Install:
- the rear heated oxygen sensor (HO2S). Tighten to **45 Nm**. Use tool 999 5543 SOCKET NV-22 HO2S See: Tools and Equipment/999 5543

Socket NV-22 HO2S

- the wiring for the heated oxygen sensor (HO2S) in clips and clamps. Connect the wiring
- a new gasket and new nuts at the join between the three-way catalytic converter (TWC) and the exhaust system. Tighten to **24 Nm**
- the rubber mounting for the three-way catalytic converter (TWC)
- the front SIPS member. Press the brake pipe into place in the member
- the lower engine cover.

Erase Diagnostic Trouble Codes (DTCs).

Reset trim.

Transmission Position Switch/Sensor: Adjustments

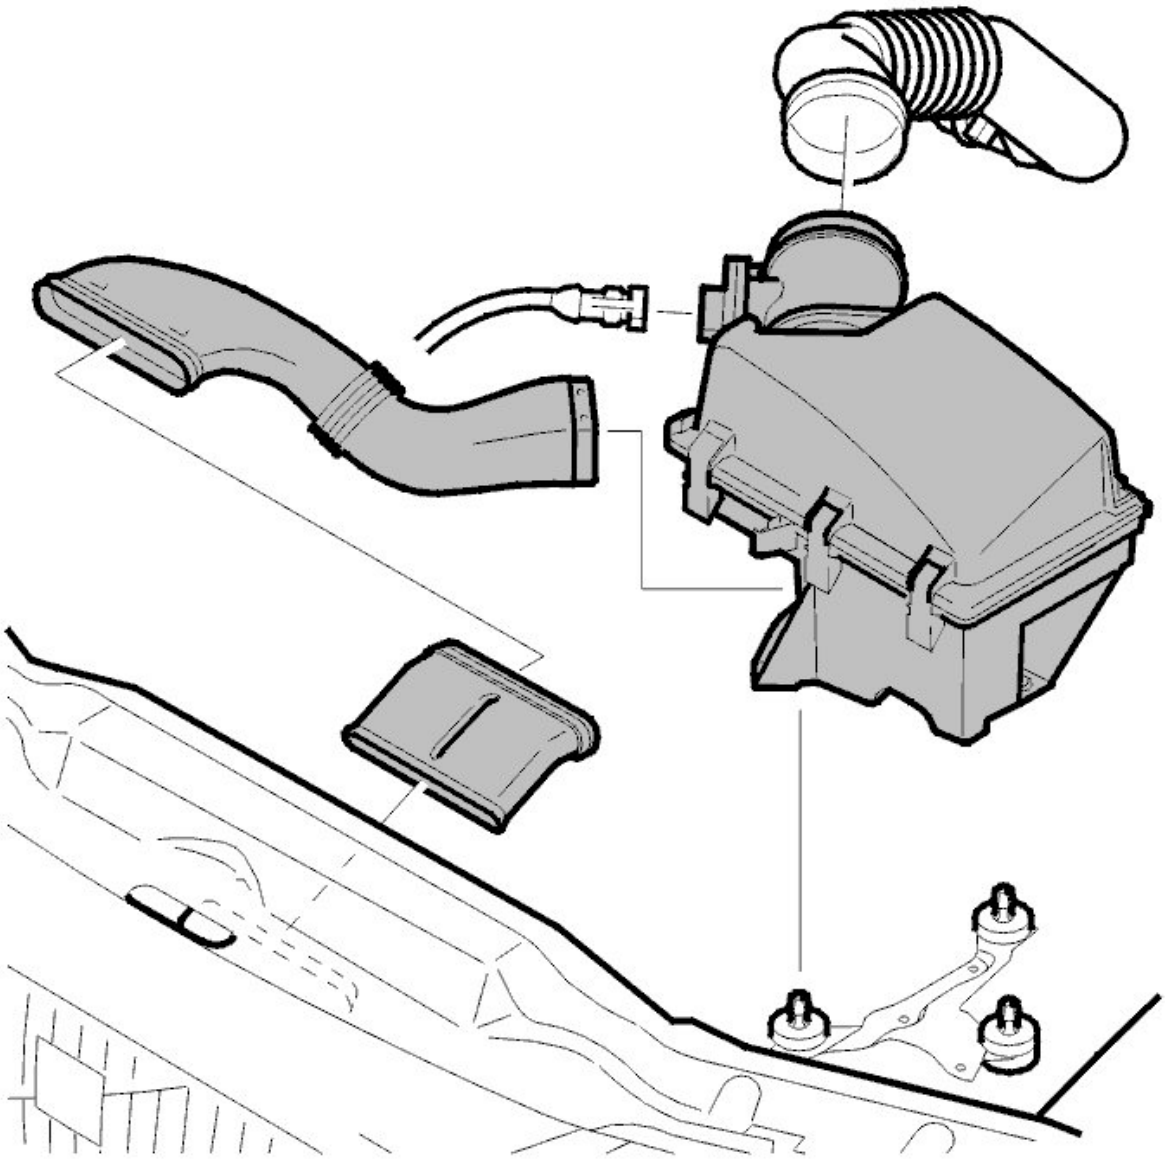
Gear-shift position sensor, checking/adjusting

Special tools:

999 5475 GAUGE See: Tools and Equipment/999 5475 Gauge
999 7077 Jimmy bar See: Tools and Equipment/999 7077 Jimmy Bar

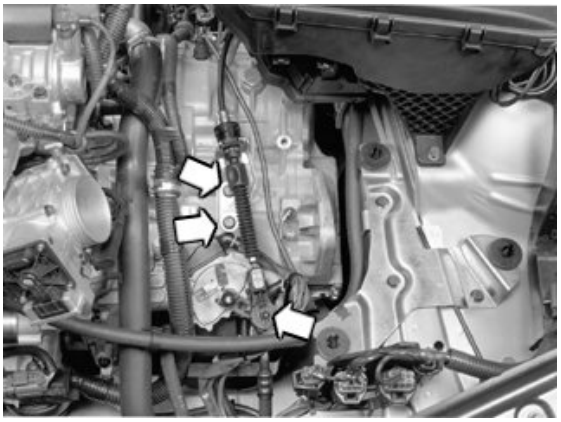
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removing the air cleaner (ACL) housing

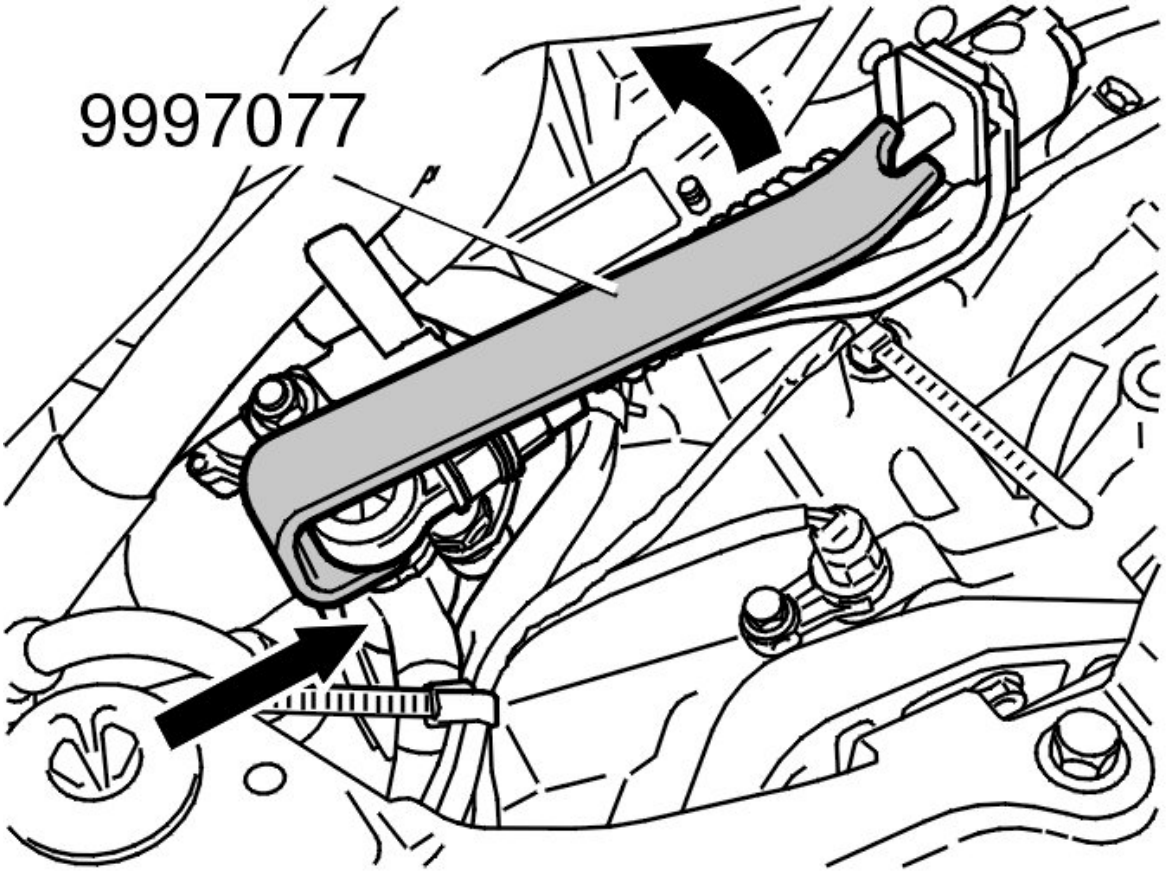


Remove the air cleaner housing ACL assembly with the intake pipe.

Removing the gear selector cable

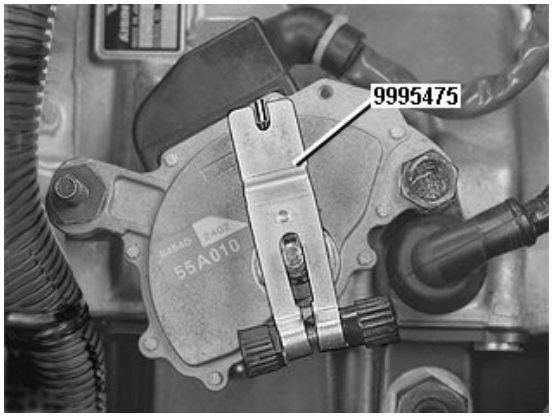


Remove the screws from the bracket for the gear selector cables.



Detach the cable from the lever. Use special tool 999 7077 Jimmy bar See: Tools and Equipment/999 7077 Jimmy Bar.
Remove the cable from the bracket.
Move the cable to one side.

Checking the setting

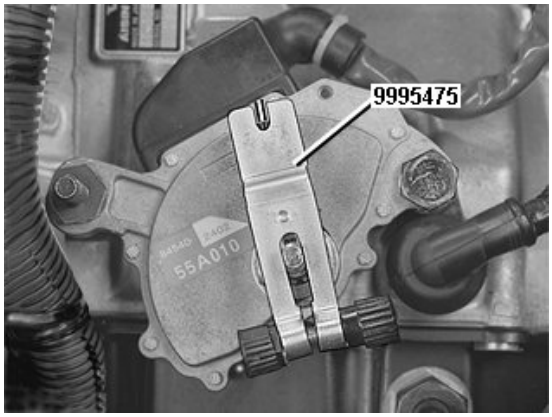


Note! When adjusting the gear-shift position sensor, press the tool down to the flat surfaces below the thread on the shaft.

Remove the lever. Install adjustment tool 999 5475 GAUGE See: Tools and Equipment/999 5475 Gauge on the gear shift linkage rod. Check that

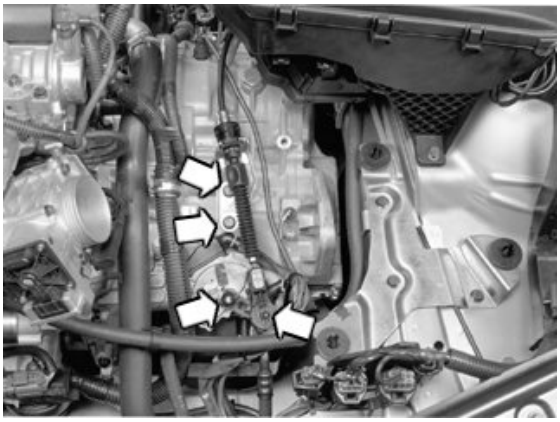
the shaft is in the N position. The groove on the tool must align with the marking on the gear position sensor.
If adjustment is required, see the following procedure in this section.

Adjusting the gear-shift position sensor



Remove the nut for the cable duct. Lift the cable duct away from the screw.
Slacken off the screws for the gear-shift position sensor.
Rotate the gear position sensor so that the mark on the switch aligns with the groove on the tool. Tighten the screws for the sensor. Tighten to **25 Nm**.
Remove the adjustment tool.

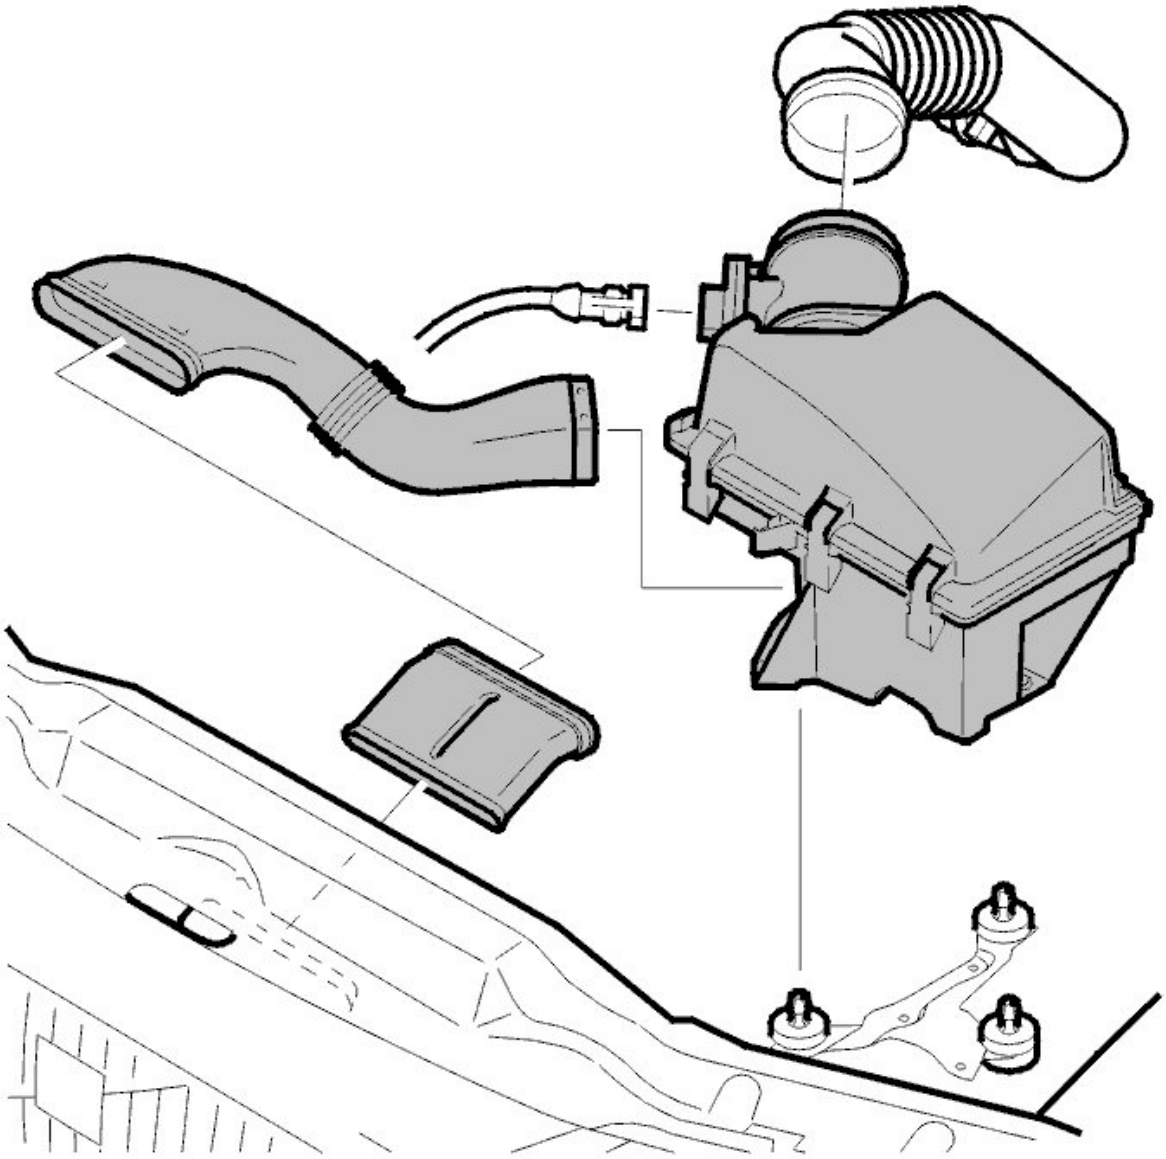
Installing the lever and gear selector cable



Install:

- the lever on the gear shift linkage rod. Tighten to **16 Nm**
- the cable on the lever
- the screws for the bracket. Tighten to **25 Nm**.

Installing the air cleaner (ACL) housing



Install the air cleaner housing (ACL) assembly with the intake pipe and connector.

Checking diagnostic trouble codes (DTCs)

Check and erase any diagnostic trouble codes (DTCs).
Check the gear-shift position sensor positions: Use the on-board diagnostic (OBD) system.

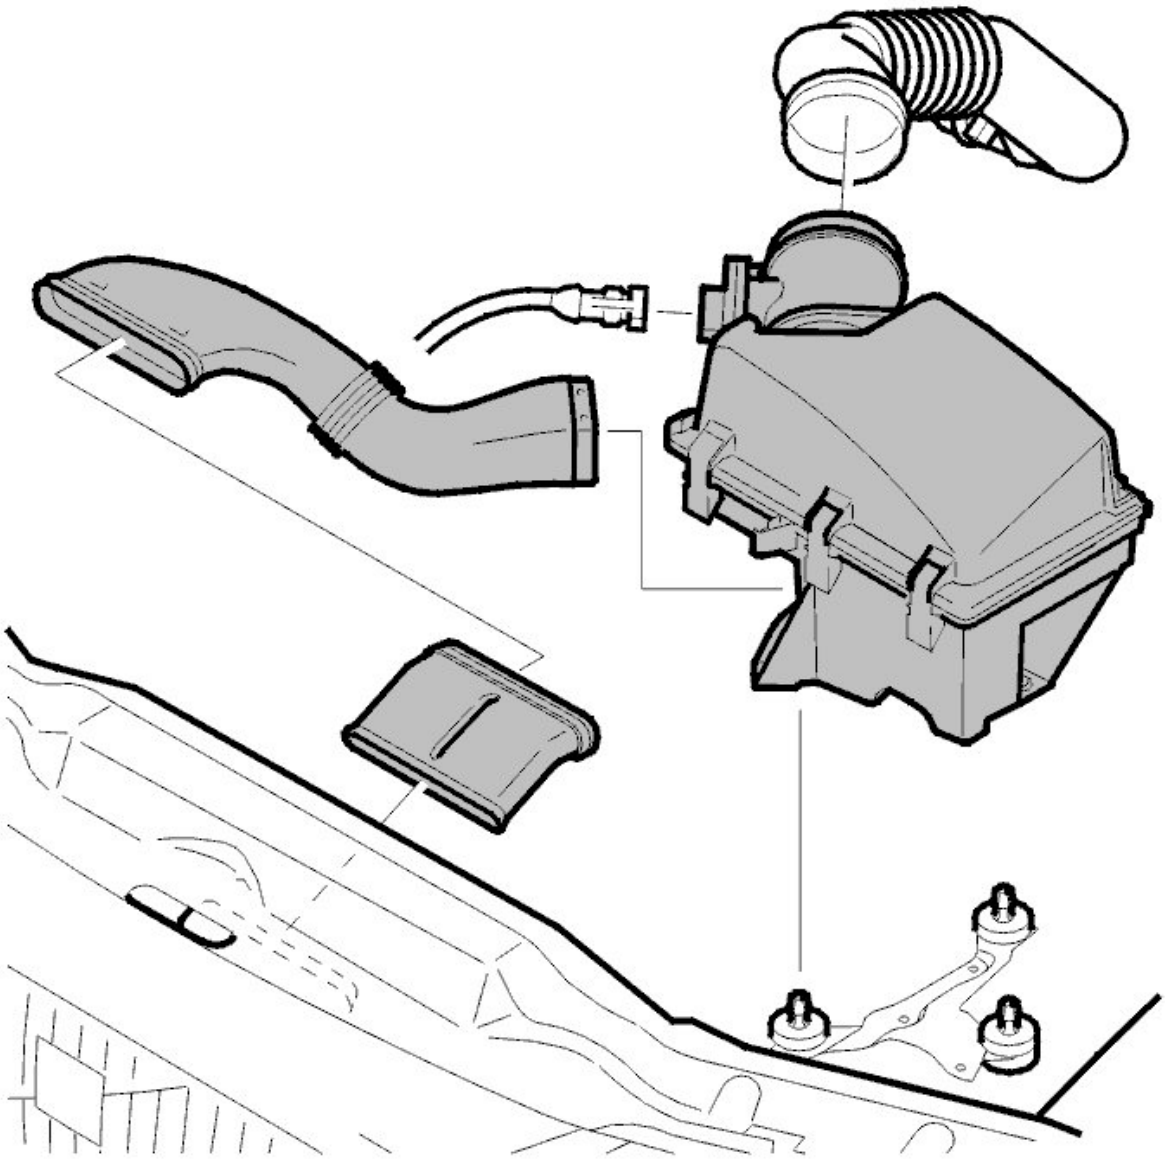
Transmission Position Switch/Sensor: Service and Repair

Replacing the gear-shift position sensor

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information is always correct.

Removal

Removing the air cleaner (ACL) housing



Ignition off.
Remove the air cleaner housing ACL assembly with the intake pipe.

Removing the gear selector cable and connector

Remove the gear selector from the lever and the cable mounting from the transmission.
Unhook the mounting with the connector for the transmission from the bracket for the air cleaner (ACL) housing.
Remove the tie straps for the cable harness and the mounting in the cover for the control system.
Separate the connector for the gear-shift position sensor. Remove the gear-shift position sensor from the mounting.

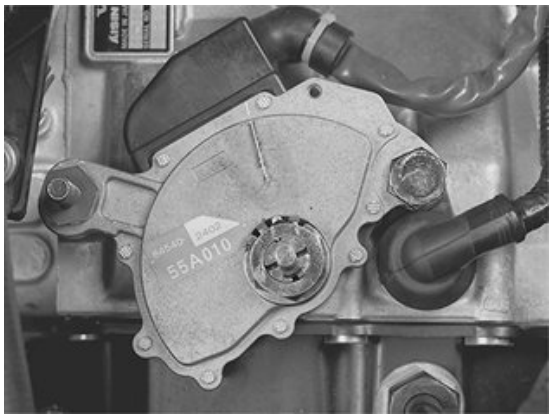
Removing the gear-shift position sensor

Remove:

- the lever for the gear shift linkage rod
- the nut, locking washer and rubber seal securing the gear-shift position sensor to the gear shift linkage rod
- the 2 screws
- the gear-shift position sensor.

Installation

Installing the gear-shift position sensor



Install:

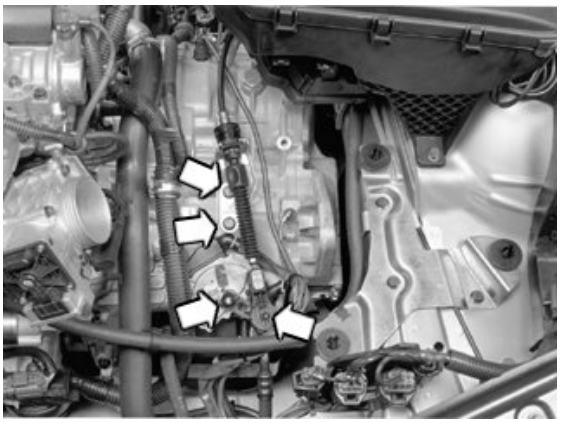
- the sensor. Lightly tighten the 2 screws
- the rubber washer, the lock washer and the nut on the sensor.

Tighten the nut. Lock the nut with the locking washer.

Adjusting the gear-shift position sensor

Adjust the gear-shift position sensor according to adjustments.

Installing the lever and the gear-shift position sensor

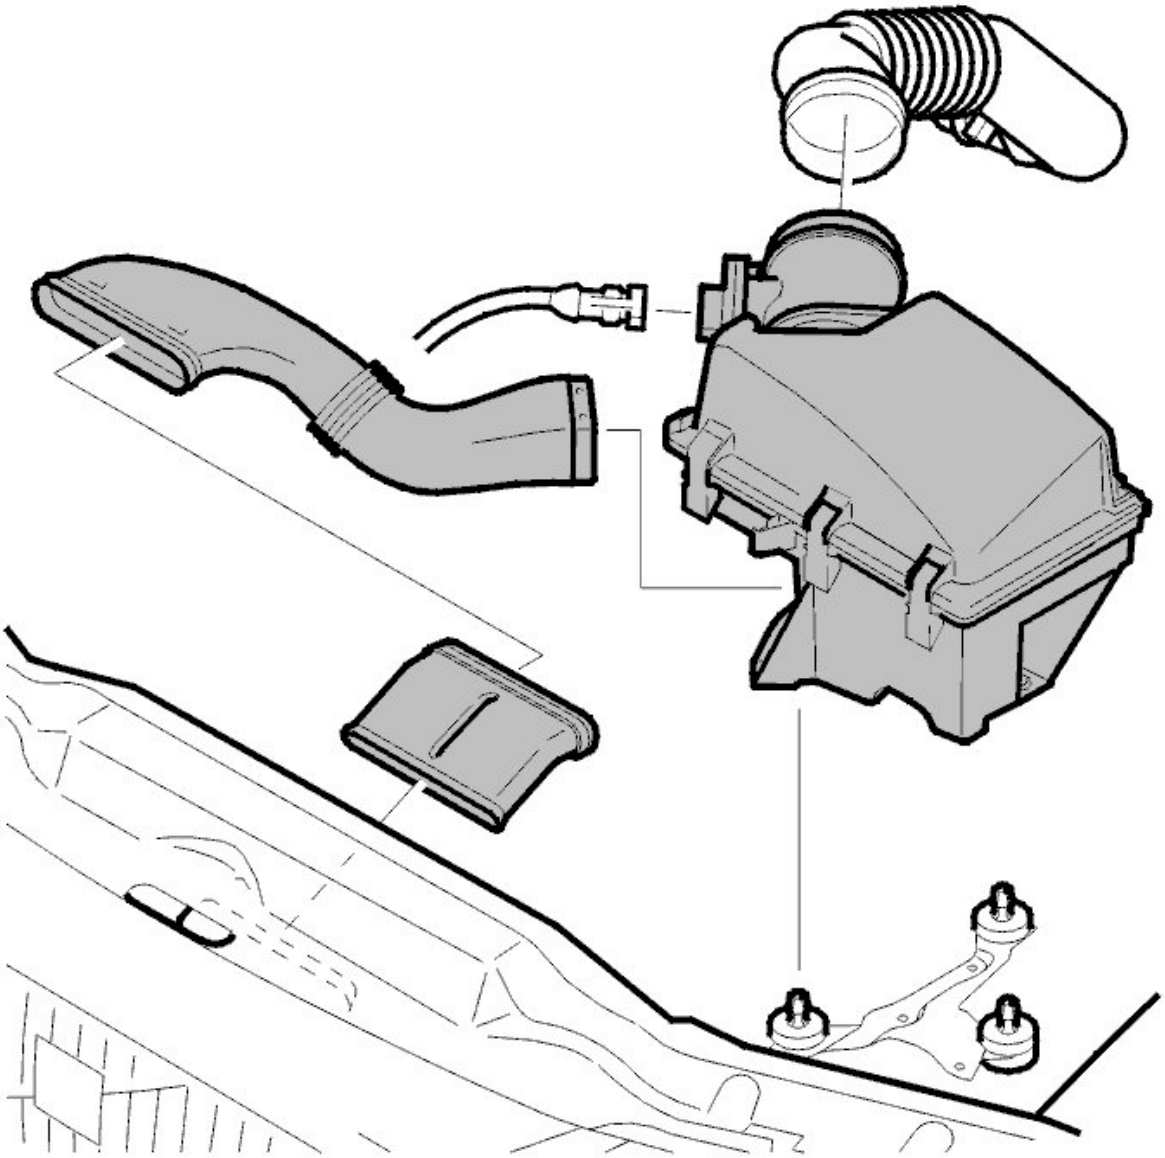


Install:

- the lever for the gear shift linkage rod. Tighten the nut. Tighten to **16 Nm**
- the gear selector cable on the lever and transmission. Tighten to **25 Nm**
- the connector for the gear-shift position sensor on the mounting. Connect the connector.

Assemble the cable harness with tie straps.
Press the mounting for the cable harness into place in the cover for the control system. Install the mounting for the connectors on the bracket.

Installing the air cleaner (ACL) housing



Install the air cleaner (ACL) housing with connections.

Checking diagnostic trouble codes (DTCs)

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Check and erase any diagnostic trouble codes (DTCs).

Vehicle: Specifications

System Specifications

Component specifications

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.
The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Other
Active yaw control sensor	CAN node with integrated yaw rate sensor, lateral accelerometer and accelerometer (AWD only)	12 V (#3-#5)	Yaw rate sensor: °/s Lateral accelerometer: m/s^2 Accelerometer: m/s^2	The active yaw control sensor either contains two (2WD) or three (AWD) sensors and is connected to the brake control module with its own CAN lead.
Brake pressure sensor 1 & 2	Pressure switch (Pressostat)	5 V (#1-#3)	Operating range 0-170 bar 21 bar when brake pedal is not depressed	-
Pressure build-up valve	Electro magnetically controlled valve	12 V	Pulse width modulated (PWM) signal	-
Wheel sensor	Hall sensor	12 V	Tooth against sensor: I≈ 14mA U≈9V Cover against sensor: I≈7 mA U≈1V below Ubat	-
Pedal pressure sensor	Two position switch	12 V (#2-#5) NO (#1-#5) NC	NO=Normally open NC=Normally closed	-
Pedal position sensor	Slide potentiometer	12 V	0 mm: ≈ 0 V 38.5 mm: ≈ 95 % of Ubat	-

Braking Sensor/Switch

Component specifications

- Mass air flow (MAF) sensor
- Air pressure sensor intake manifold (MAP)
- Engine coolant temperature (ECT) sensor
- Intake air temperature (IAT) sensor inlet
- A/C pressure sensor
- Air conditioning (A/C) pressostat
- Sensor for fuel pressure and fuel temperature (only for vehicles with demand-controlled fuel pump)
- Clutch pedal sensor
- Brake pedal sensor
- Impulse sensor
- Knock sensor

System Specifications

Component specifications

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.

The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Other
Air conditioning (A/C) relay	Mechanical relay	12V (#1)	Approximately 96 Ω (coil)	
A/C pressure sensor	Absolute manifold absolute pressure (MAP) sensor	5 V (#3)	-	
Stop lamp switch	Position switch	12 V (#1)	The switch is closed when the pedal is depressed (terminals #1-#5)	
Fuel pump (FP) relay	Mechanical relay	-	Approximately 96 Ω (coil)	The relay is controlled by the central electronic module (CEM)
Fuel temperature sensor	NTC resistor	5V (#3)	5896 Ω at 0°C 3792 Ω at 10°C 2500Ω at 20°C 1707Ω at 30°C 1175 Ω at 40°C (#1-#2)	Integrated in the fuel pressure sensor
Fuel pressure sensor	Piezo resistive pressure sensor	5V (#3)	-	
Engine cooling fan (FC) control module	-	12 V (#2)	-	
Canister purge (CP) valve	Electromagnetic valve	12 V (#1)	17-24 Ω at 20°C (terminals #1-#2)	
Accelerator pedal (AP) position sensor	Electronic pedal sensor with two output signals, PWM and a linear analog signal	12 V (terminal #1) 5 V (terminal #6) Power supply analog position sensors	-	
Throttle unit	Electronic throttle control module with two integrated potentiometers and a damper motor	5 V (#3)	1.2-3.5 Ω (terminals #1-#4 motor winding). 1000-1500 Ω (terminals #2-#3 Parallel connection of potentiometers 1 and 2).	-

Designation	Type	Supply voltage	Value	Other
			Approximately 820 Ω when the throttle is closed. Approximately 1580 Ω at wide open throttle (terminals #2-#6 potentiometer 1). Approximately 1480 Ω when the throttle is closed. Approximately 500 Ω at wide open throttle (terminals #2-#5 potentiometer 2)	
Injector	Electromagnetic injector valve	12 V (#1)	Approximately 12 Ω at 20°C (terminal #1-#2)	
Camshaft sensor	Magneto-resistive sensor	5 V (#1)	-	
Knock sensor (KS)	Piezo electric component	-	Greater than 1 MΩ (terminal #1-#2 front knock sensor (KS)). Greater than 1 MΩ (terminals #3-#4 rear knock sensor (KS))	Separate signal ground for the knock sensors (KS)
Clutch pedal sensor	Slide potentiometer	5 V (#2)	Unaffected pedal: 1400-2400 Ω Fully depressed pedal: 200-800 Ω (#2-#4)	
Cooling fan for control modules	Fan motor	12 V (#1)	-	The engine cooling fan (FC) is controlled by the engine control module (ECM)
Coolant level sensor	Position switch	Connected to ground (terminal #2)	Closed when the engine coolant level is normal	
Boost pressure sensor	Absolute manifold absolute pressure (MAP) sensor	5 V (#3)	-	
Preheating, front heated oxygen sensor (HO2S)	PTC resistor	12 V (#3)	2.6-3.4 Ω at 20°C (terminals #3-#4)	
Preheating, rear heated oxygen sensor (HO2S)	PTC resistor	12 V (#1)	Approximately 9 Ω at 20°C (terminal #1-#2)	

Designation	Type	Supply voltage	Value	Other
Mass air flow (MAF) sensor	-	12 V (#2) 5 V (#4)	-	
Air temperature sensor, intake	NTC resistor	5 V (#3)	5886 Ω at 0°C 3791 Ω at 10°C 2510 Ω at 20°C 1715 Ω 30°C (#1-#2)	Integrated in the boost pressure sensor
Leak diagnostic unit	Consists of an air pump, an electromagnetic valve and an internal heating element (PTC resistor)	12 V (#4)	Approximately 118 Ω (terminals #1-#4 pump motor winding) 27.9 -34.1 Ω (terminals #3-#4 Valve coil)	The heating element for heating up the pulsed secondary air injection system (PAIR) pump is controlled by the central electronic module (CEM)
Engine coolant temperature (ECT) sensor	NTC resistor	5 V (#1)	15040 Ω at -20°C 2450 Ω at 20°C 318 Ω at 80°C (#1- #2)	
PTC resistor air preheating	PTC resistor	12 V (#1)	Approximately 10 Ω at 20°C	
Oil level sensor	Electronic sensor with PTC resistor and capacitive measurement element	5 V (#3)	-	
Oil pressure sensor	Pressure switch (Pressostat)	Grounded in the cylinder block	Closed switch when the oil pressure is low	
Camshaft reset valve	Electromagnetic valve	12 V (#1)	3.7-11.1 Ω (#1-#2)	
Flywheel sensor	Engine speed sensor	-	108.5-142.5 Ω at 20°C (terminals #1-#2)	
System relay	Mechanical relay	12V (#1)	Approximately 80 Ω (coil)	
Turbocharger (TC) control valve	Electromagnetic valve (3 way)	12 V (#1)	21.8-24.2 Ω at 20° C (terminals #1-#2)	
Outer temperature sensor	NTC resistor	5 V (#1)	18702 Ω at -20 °C 6318 Ω at 0°C 2424 Ω at 20°C 1034 Ω at 40°C (#1- #3)	

Engine Control Module

Component specifications

The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.
The figure within the brackets indicates the terminal pin on the component to which the value refers.

Suspension Control (Automatic - Electronic Level)

Component specifications

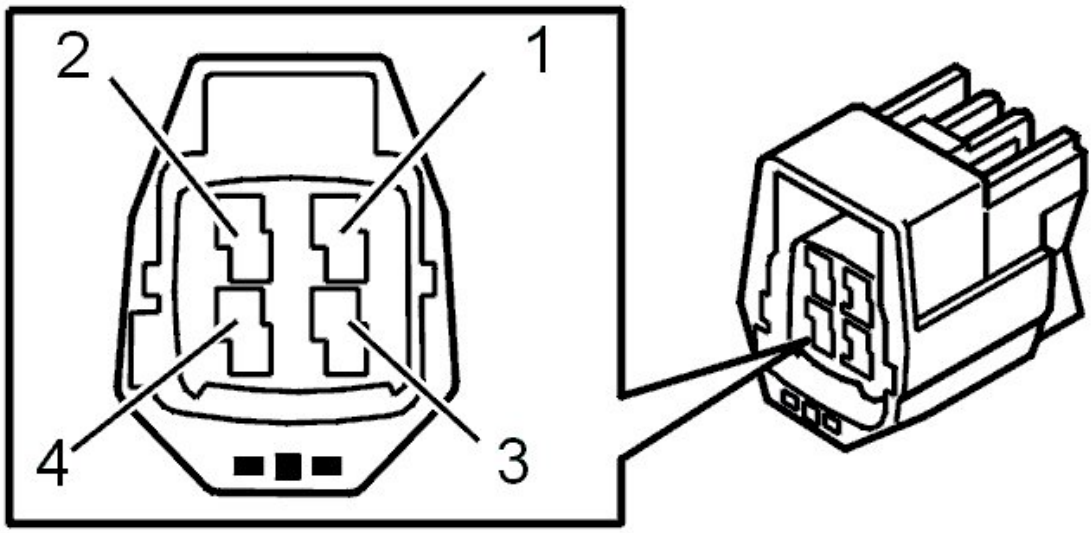
The component specification gives the value of the component when the connector is disconnected. Where no value is given, it is not possible to measure a relevant value at the component.
The figure within the brackets indicates the terminal pin on the component to which the value refers.

Designation	Type	Supply voltage	Value	Other
Acceleration sensor suspension, left and right-side front		5V (#5)	Output signal (terminal #1) 0.5V - 4.5V	Resistance readings cannot be taken
Position sensor suspension, left and right sides rear		5V (#5)	Output signal (terminal #1) 0.5V - 4.5V	Resistance readings cannot be taken
Acceleration sensor body		5V (#5)	Output signal (terminal #1) 0.5V - 4.5V	Resistance readings cannot be taken
Keypad		5V		-
Shock absorber solenoids		U_{bat} (#1)	Pulse width modulated (PWM) signal	Approximately 5 Ω(terminals #1-#2)

Connector A, Transmission

Connector A, transmission

4-pin connector



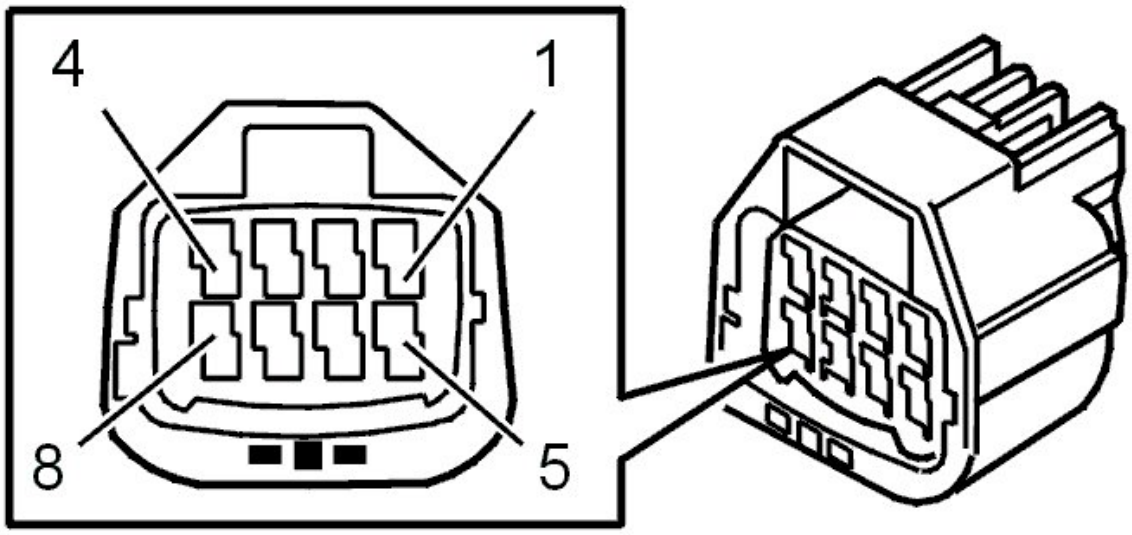
Control module terminals #A1-#A60 correspond to terminals #A1-#A60 on the breakout box, terminals #A61-#A70 correspond to terminals #B1-#B10 on the breakout box.

Terminal	Signal	Connected to control module terminal #
A1	Signal ground, transmission input speed sensor (SP2)	A41
A2	Power supply, engine speed (RPM) sensor (SP2)	A59
A3	Signal ground, transmission output speed sensor (SP1)	A39
A4	Power supply, speed sensor (SP1)	A57

Connector B, Transmission

Connector B, transmission

6-pin connector



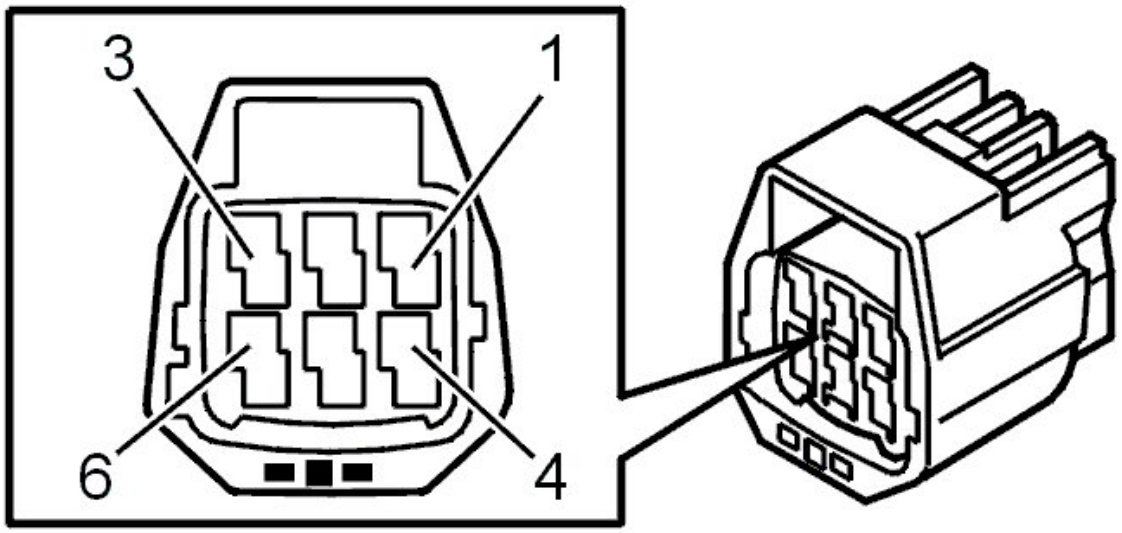
Control module terminals #A1-#A60 correspond to terminals #A1-#A60 on the breakout box, terminals #A61-#A70 correspond to terminals #B1-#B10 on the breakout box.

Terminal	Signal	Connected to control module terminal #
B1	Shift lock solenoid, replacement	
B2	Shift lock solenoid, replacement	
B4	Ground terminal, gear-shift position sensor	
B5	Gear-shift position sensor, signal A	A46
B6	Gear-shift position sensor, signal B	A64
B7	Gear-shift position sensor, signal C	A45
B8	Gear-shift position sensor, signal PA	A63

Connector C, Transmission

Connector C, transmission

6-pin connector



Control module terminals #A1-#A60 correspond to terminals #A1-#A60 on the breakout box, terminals #A61-#A70 correspond to terminals #B1-#B10 on the breakout box.

Terminal	Signal	Connected to control module terminal #
C1	S1	A50
C2	S2	A68
C3	S3	A48
C4	S4	A47

Toe measurement across both wheels

Model	Front	Rear
S60 (except S60R, see below)	0.10° ± 0.10°	0.20° ± 0.20°
V70 (01-)	0.10° ± 0.10°	0.20° ± 0.20°
V70 (01-) AWD (except V70 (01-)R, see below)	0.10° ± 0.10°	0.20° ± 0.20°
S60R/V70 (01-)R	0.10° ± 0.10°	0.16° ± 0.10°
V70 XC (01-)/XC70	0.20° ± 0.10°	0.20° ± 0.20°
S80	0.10° ± 0.10°	0.20° ± 0.20°
XC90	-0.20° ± 0.10°	0.3° ± 0.2°

Toe Measurement Across Both Wheels

System Specifications

Tightening torque

General tightening torque

Caution! Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.
Nuts and screws which are not self locking can be reused provided that they are in good condition.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

Summary of tightening torques for specific components

Caution! Screws coated with locking fluid or sealant must be replaced with new ones when reinstalling.

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.
Angle-tightening in tight spaces. See Screwed joint, torque/angle tightening See: Description and Operation/Screwed Joint, Torque/Angle Tightening.

All drive shafts

Bolt drive shaft - wheel hub, front	Stage 1: 35 Nm Stage 2: 90°
Bolt drive shaft - wheel hub, version with rubber cone	50 Nm
Bolt drive shaft - wheel hub, rear	50 Nm

All gearboxes, angle gears, chain angle gears and rear axle gears

Sensors	6 Nm
Filler plug, Level plug and Drain plug	35 Nm

AW, 4T65

Cover, control system (AW)	Diagonally 14 Nm
The nut for the lever and gear shift linkage rod	16 Nm
Side cover, gearbox (4T65)	Stage 1: Crosswise 10 Nm Stage 2: Crosswise 25 Nm
Bolt driver plate - torque converter 6 x bolts	35 Nm
Screws for the lower torque rod in the transmission **Note!** Applies to 5-cylinder engines only	Stage 1: 35 Nm Stage 2: 40°
Connection, oil cooler pipe to gearbox	30 Nm
Screw, oil pipe - transmission	6 Nm
Screw, oil pipe - dipstick pipe - transmission	15 Nm
Dipstick pipe for the transmission	24 Nm

TF-80SC

Integrated level plug/Torx	8 Nm
Cover, control system	Diagonally 14 Nm
Torque converter to carrier plate 6 screws	60 Nm
Gear selector mechanism (nut)	16 Nm

M56, M58, M66

Back-up (reversing) lamps switch	24 Nm

AWD

Bevel gear to transmission	75 Nm
Universal joint (spider) fastened with 4 bolts	Stage 1: Crosswise 16 Nm Stage 2: Crosswise 120°
Universal joint CV fastened with 6 bolts	Stage 1: Crosswise 10 Nm Crosswise 25 Nm
Pinion nut (Active on Demand Coupling)	150 Nm
Pinion nut, angle gear	180 Nm
Oil pump (AOC)	5 Nm
Control module (AOC)	5 Nm
Driveshaft (center bearing)	30 Nm
Oil plug, final drive	35 Nm
Oil plug, Active On-Demand Coupling	35 Nm
Bevel gear bracket	Stage 1: alternately to light contact Stage 2: 50 Nm
Manifold support bracket bevel gear	Stage 1: 35 Nm Stage 2: 90°

Fluid Pan, A/T

Tightening torque

General tightening torque

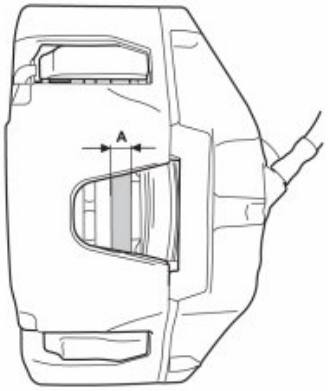
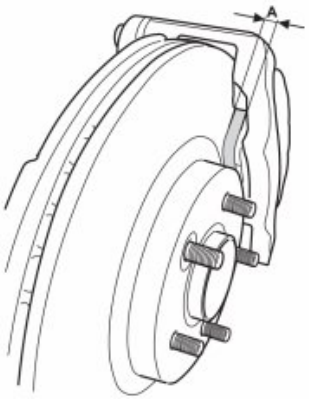
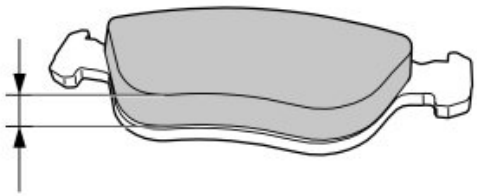
Front

Brake pads, front







Note! The brake pads are measured in place in the brake caliper.

The illustrations show where to measure the thickness of the pad.

Note! The brake pad's backing plate is not included in the dimensions.

Example at 20, 000 km service interval

The wear is given in mm on the brake pad for the next service interval. **Note!** 2 mm (replacement limit) must be added to all dimensions.		
S60/V70/XC70	=	4 mm + 2 mm
S60 R/V70 R	=	3 mm + 2 mm
S80 (-06)	=	4 mm + 2 mm
XC90	=	6 mm + 2 mm

Example at 30, 000 km service interval

The wear is given in mm on the brake pad for the next service interval. **Note!** 2 mm (replacement limit) must be added to all dimensions.		
S60/V70/XC70	=	6 mm + 2 mm
S60 R/V70 R	=	5 mm + 2 mm
S80 (-06)	=	6 mm + 2 mm
XC90	=	9 mm + 2 mm

Rear

Brake Pads, Rear

Minimum thickness for replacing the brake pads ..... 2 mm

Tightening Torque

Tightening torque

S80 (-06)	=	6 mm + 2 mm
XC90	=	9 mm + 2 mm

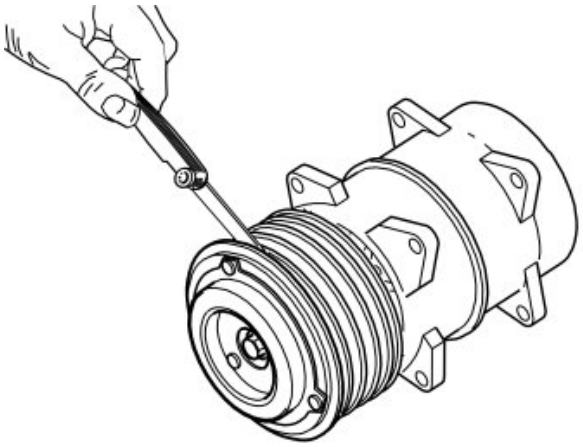
Rear

Brake Pads, Rear

Minimum thickness for replacing the brake pads ..... 2 mm

Compressor Clutch

Checking the clearance



Check the clearance between the turning plate and the belt pulley with a feeler gauge.

The clearance should be 0.3 - 0.5 mm.

0.3 mm clearance all the way round.

It must not be possible to insert 0.6 mm at any point.

If clearance is not within given values, replace the shims.
The following dimensions are available:
- 0.2 mm
- 0.3 mm
- 1.0 mm.

System Specifications

Tightening torque

General tightening torque

Note! Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.

Summary of specific components and tightening torques

Note! Screws coated with locking fluid or sealant must always be replaced with new screws during reinstallation.

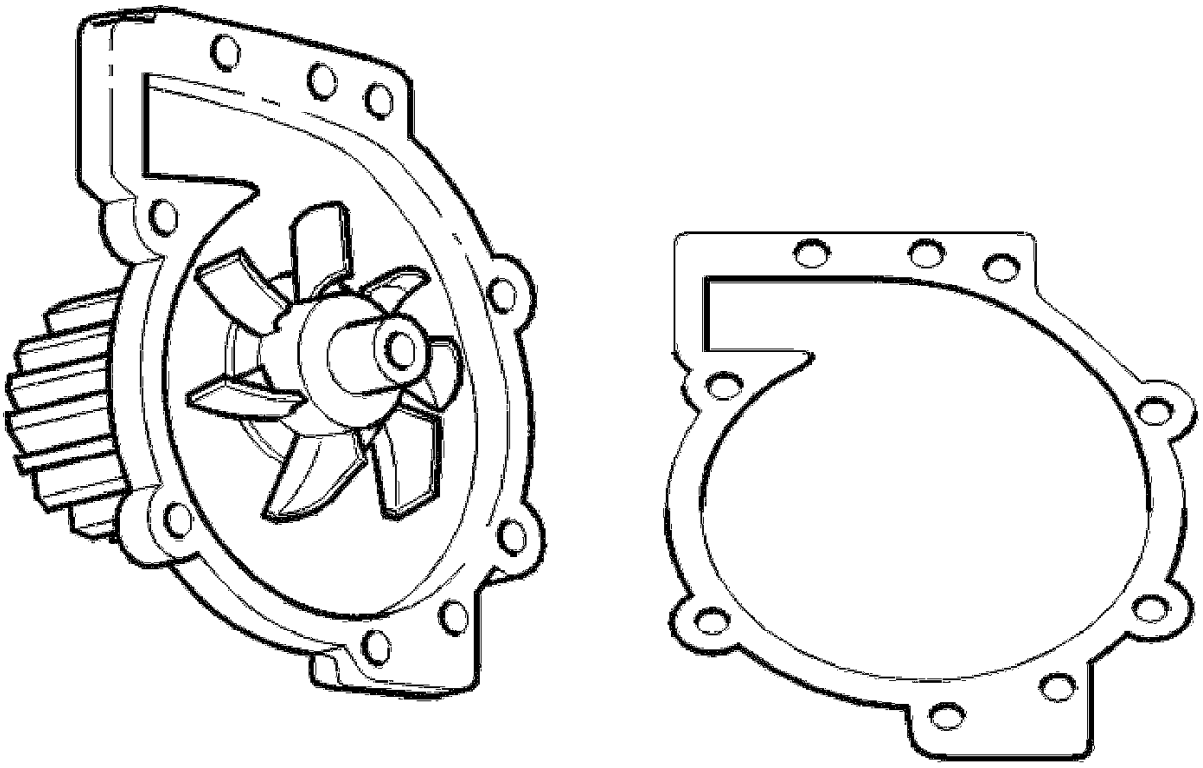
Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.
Angle-tightening in tight spaces. See Screwed joint, torque/angle tightening See: Description and Operation/Screwed Joint, Torque/Angle Tightening.

Exhaust system (to the turbocharger (TC))	24 Nm
Cylinder head Tighten the screws in sequence from the center and outwards.	Stage 1.....20 Nm Stage 2.....60 Nm Stage 3.....130°
Manifold (cylinder head side)	25 Nm
Pipe screw (coolant pipe / turbocharger (TC))	26 Nm
Pipe screw (water heated crankcase ventilation.)	26 Nm
Pipe screw (oil pressure line / turbocharger (TC))	26 Nm
Pipe screw (oil pressure line / engine block)	38 Nm
Sub-frame nut (lower torque rod)	Stage 1.....65 Nm Stage 2.....60°
Subframe screws (start on the left-hand side, then the right-hand side)	Stage 1.....105 Nm Stage 2.....120°
Subframe bracket	50 Nm
Intake manifold	19 Nm
Catalytic converter (to the turbocharger (TC)) (to the exhaust system)	25 Nm 24 Nm
Knock sensor (KS)	20 Nm
Piston cooling valve (piston cooling oil duct, in cylinder block)	36 Nm
Timing gear pulley (camshafts without variable valve timing)	20 Nm
Timing gear pulley (camshafts with variable valve timing)	10 Nm
Heated oxygen sensor (HO2S)	45 Nm
Carrier plate	Stage 1.....45 Nm Stage 2.....50°
Intermediate section Tighten the screws in sequence from the center and outwards.	Stage 1 M10.....20 Nm Stage 2 M10.....45 Nm Stage 3 M8.....24 Nm Stage 4 M7.....17 Nm Stage 5 M10.....90°
Torque converter	50 Nm
Engine mounting Right side (M10x35 to cylinder block)	Stage 1.....35 Nm Stage 2.....60°
Engine mounting Right side (M8x23 to cylinder block)	Stage 1.....20 Nm Stage 2.....60°
Right-hand engine pad for the subframe (Only applies to XC90)	Stage 1.....120 Nm Stage 2.....40°
Lower torque rod, transmission screw	Stage 1.....35 Nm Stage 2.....40°
Lower torque rod, sub-frame nut	Stage 1.....65 Nm Stage 2.....60°
Oil filter (environmental filter)	25 Nm

Oil trap	15 Nm
Oil pan plug	38 Nm
Oil pump (countersunk Allen, M6x20, holds the pump housing together)	6 Nm
Oil return line (turbocharger (TC))	12 Nm
Oil pan (Applies to B5254T4)	the screws (1, 2, 3 and 4). Tighten to .....3 Nm the screws (5). Tighten to .....25 Nm. Then tighten to 48 Nm
Oil pressure switch	27 Nm
Stud (at exhaust port, manifold, turbocharger (TC))	20 Nm
Plug (check hole for gauging valve clearance)	20 Nm
Plug (gauge hole / crankshaft seal)	38 Nm
Belt tensioner (mechanical)	20 Nm
Flywheel	Stage 1.....45 Nm Stage 2.....65°
Vibration damper -2002 (flanged screws x4)	Stage 1.....25 Nm Stage 2.....30°
Vibration damper 2002- /flanged screws x4	Stage 1.....25 Nm Stage 2 .....60°
(center nut)	180 Nm
Temperature sensor (coolant)	22 Nm
Timing cover,(front/rear)	12 Nm
Timing cover,(upper)	8 Nm
Turbocharger (TC) (to manifold, without gasket)	25 Nm
Turbocharger (TC) (to manifold, with gasket)	37 Nm
Spark plugs	30 Nm
Connecting rod cap (connecting rod with treated toothed surface between the connecting rod and cap, screw with waist)	Stage 1.....20 Nm Stage 2.....90°
Connecting rod cap (connecting rod with fracture surface between the connecting rod and cap, fully threaded screw)	Stage 1.....30 Nm Stage 2.....90°
Transmission screw (lower torque rod)	Stage 1.....35 Nm Stage 2.....40°
Variable valve timing center screw	120 Nm
Variable valve timing center plug	35 Nm

Water Pump

Install:



- a new gasket
- a new pump.

Tighten the screws crosswise..... 17 Nm

Hold the eccentric secure and tighten the center screw. Tighten..... 20 Nm

Upper and Front timing belt cover. Tighten..... 12 Nm

Engine stabilizer brace. Tighten the screws at the suspension turrets..... 50 Nm
Tighten the screw for the engine bracket..... 80 Nm

Differential Assembly

Tightening torque

General tightening torque

Nuts and screws which are not self locking can be reused provided that they are in good condition.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

Summary of specific components and tightening torques

Note! Screws coated with locking fluid or sealant must always be replaced with new screws during reinstallation.

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.
Angle-tightening in tight spaces. See Screwed joint, torque/angle tightening See: Description and Operation/Screwed Joint, Torque/Angle Tightening.

Exhaust system (to the turbocharger (TC))	24 Nm
Cylinder head Tighten the screws in sequence from the center and outwards.	Stage 1.....20 Nm Stage 2.....60 Nm Stage 3.....130°
Manifold (cylinder head side)	25 Nm
Pipe screw (coolant pipe / turbocharger (TC))	26 Nm
Pipe screw (water heated crankcase ventilation.)	26 Nm
Pipe screw (oil pressure line / turbocharger (TC))	26 Nm
Pipe screw (oil pressure line / engine block)	38 Nm
Sub-frame nut (lower torque rod)	Stage 1.....65 Nm Stage 2.....60°
Subframe screws (start on the left-hand side, then the right-hand side)	Stage 1.....105 Nm Stage 2.....120°
Subframe bracket	50 Nm
Intake manifold	19 Nm
Catalytic converter (to the turbocharger (TC)) (to the exhaust system)	25 Nm 24 Nm
Knock sensor (KS)	20 Nm
Piston cooling valve (piston cooling oil duct, in cylinder block)	36 Nm
Timing gear pulley (camshafts without variable valve timing)	20 Nm
Timing gear pulley (camshafts with variable valve timing)	10 Nm
Heated oxygen sensor (HO2S)	45 Nm
Carrier plate	Stage 1.....45 Nm Stage 2.....50°
Intermediate section Tighten the screws in sequence from the center and outwards.	Stage 1 M10.....20 Nm Stage 2 M10.....45 Nm Stage 3 M8.....24 Nm Stage 4 M7.....17 Nm Stage 5 M10.....90°
Torque converter	50 Nm
Engine mounting Right side (M10x35 to cylinder block)	Stage 1.....35 Nm Stage 2.....60°
Engine mounting Right side (M8x23 to cylinder block)	Stage 1.....20 Nm Stage 2.....60°
Right-hand engine pad for the subframe (Only applies to XC90)	Stage 1.....120 Nm Stage 2.....40°
Lower torque rod, transmission screw	Stage 1.....35 Nm Stage 2.....40°
Lower torque rod, sub-frame nut	Stage 1.....65 Nm Stage 2.....60°
Oil filter (environmental filter)	25 Nm

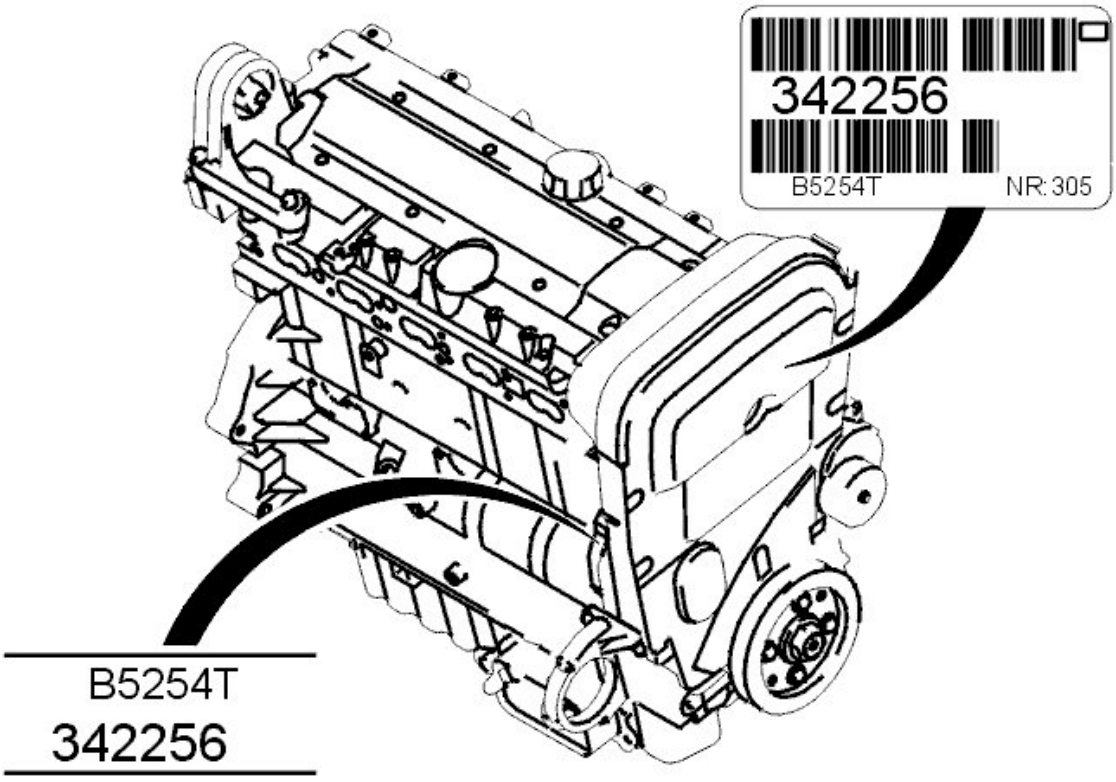
Oil trap	15 Nm
Oil pan plug	38 Nm
Oil pump (countersunk Allen, M6x20, holds the pump housing together)	6 Nm
Oil return line (turbocharger (TC))	12 Nm
Oil pan (Applies to B5254T4)	the screws (1, 2, 3 and 4). Tighten to .....3 Nm the screws (5). Tighten to .....25 Nm. Then tighten to 48 Nm
Oil pressure switch	27 Nm
Stud (at exhaust port, manifold, turbocharger (TC))	20 Nm
Plug (check hole for gauging valve clearance)	20 Nm
Plug (gauge hole / crankshaft seal)	38 Nm
Belt tensioner (mechanical)	20 Nm
Flywheel	Stage 1.....45 Nm Stage 2.....65°
Vibration damper -2002 (flanged screws x4)	Stage 1.....25 Nm Stage 2.....30°
Vibration damper 2002- /flanged screws x4	Stage 1.....25 Nm Stage 2 .....60°
(center nut)	180 Nm
Temperature sensor (coolant)	22 Nm
Timing cover,(front/rear)	12 Nm
Timing cover,(upper)	8 Nm
Turbocharger (TC) (to manifold, without gasket)	25 Nm
Turbocharger (TC) (to manifold, with gasket)	37 Nm
Spark plugs	30 Nm
Connecting rod cap (connecting rod with treated toothed surface between the connecting rod and cap, screw with waist)	Stage 1.....20 Nm Stage 2.....90°
Connecting rod cap (connecting rod with fracture surface between the connecting rod and cap, fully threaded screw)	Stage 1.....30 Nm Stage 2.....90°
Transmission screw (lower torque rod)	Stage 1.....35 Nm Stage 2.....40°
Variable valve timing center screw	120 Nm
Variable valve timing center plug	35 Nm

Specifications, Mechanical

Specifications, mechanical

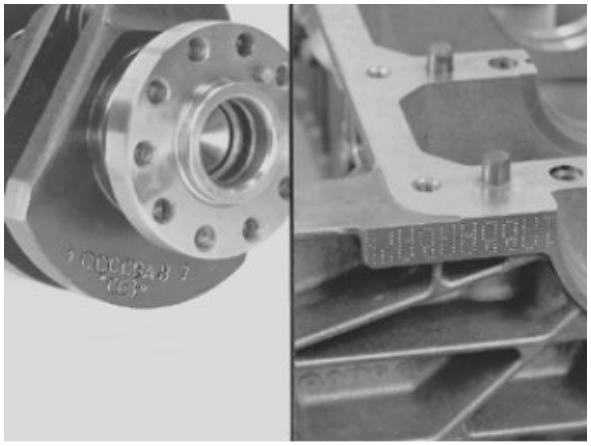
Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Engine manufacture number, engine serial number and type



The engine serial number and type are stamped on the left side of the cylinder block at the top of the mounting for the water pump. There is also a decal on the timing casing with the engine type, manufacturing number, and serial number.

Classification of main bearings



The marking is stamped on the cylinder block and crankshaft.

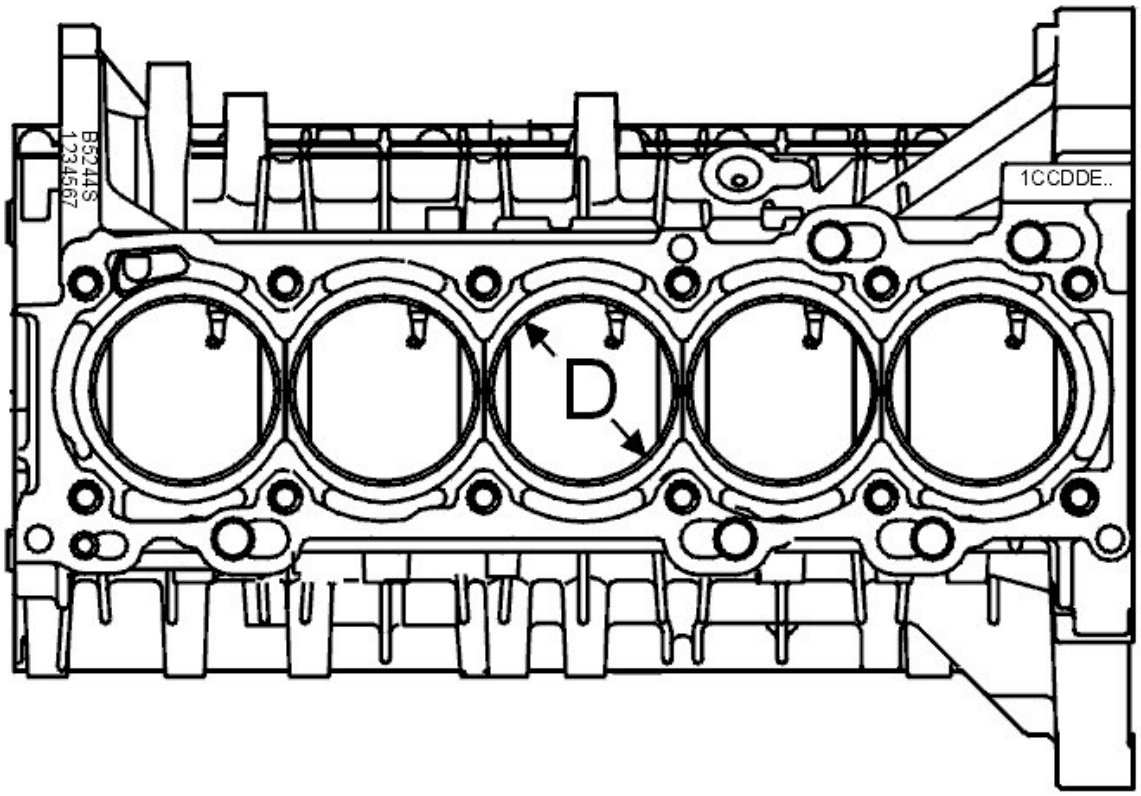
General data (engine capacities)

	B5204T5	B5234T3	B5244T2	B5244T3	B5254T2
Output (kw at rpm)	132/5280	184/5220	195/5700	147/6000	154/5000
Maximum torque (Nm at rpm)	240/2220-5280	330/2520-5220	350/2400-5100	285/1800-4980	320/1500-4500
Max rpm	6200	6200	6200	6200	6500
Idling (rpm)	670	670	850	670	670
No. of cylinders	5	5	5	5	5
Cylinder bore (mm)	81	81	83	83	83
Stroke (mm)	77	90	90	90	93.2
Cylinder displacement (dmÂ³ =litres)	1984	2319	2435	2435	2521
Firing sequence	1-2-4-5-3	1-2-4-5-3	1-2-4-5-3	1-2-4-5-3	1-2-4-5-3
Compression ratio	9.5:1	8.5:1	8.5:1	9.0:1	9.0:1
Weight, complete, including oil (kg)	approximately 177	approximately 177	approximately 177	approximately 177	approximately 177

Cylinder block

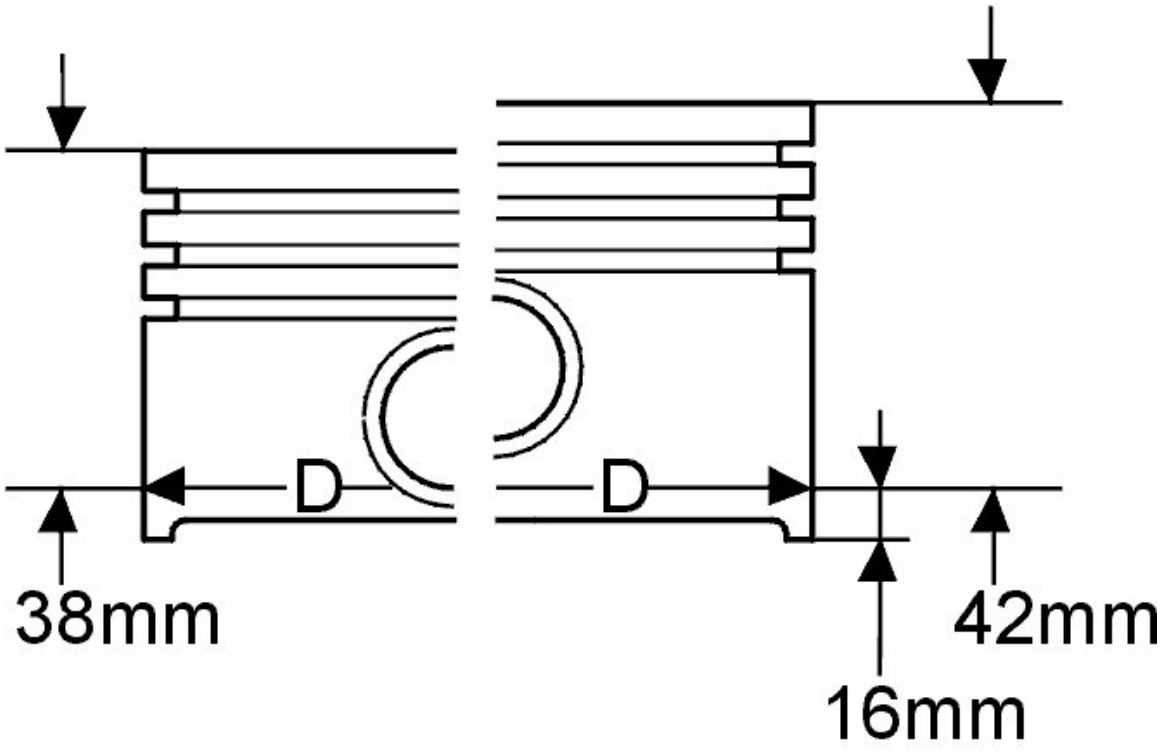


Bore (D) in mm

Standard	B5204Tx	B5234Tx	B5244Tx
C-markedÂ¹	81.000-81.010	81.000-81.010	83.000-83.010
D-markedÂ¹	81.010-81.020	81.010-81.020	83.010-83.020
E-markedÂ¹	81.020-81.030	81.020-81.030	83.020-83.030

The bore classification is stamped on top of the engine block. For example: 1CCDDE is read as cyl 1=C, cyl 2=C, cyl 3=D, cyl 4=D, cyl 5=E.

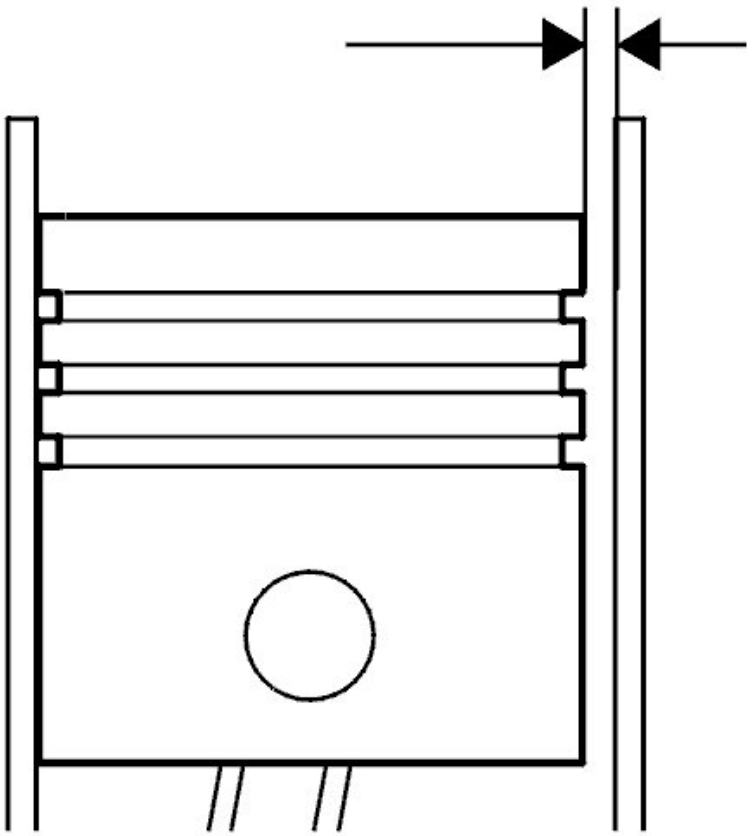
Pistons (engine capacities)



Bore (D) in mm

Standard	**B5204T5** Measured 16 mm from the bottom of the piston	**B5234T3** Measured 42 mm from the top of the piston	**B5244T2** Measured 42 mm from the top of the piston	**B5244T3** Measured 38 mm from the top of the piston
C-markedÂ¹	80.980-80.990	80.980-80.990	82.980-82.990	82.980-82.990
D-markedÂ¹	80.990-81.000	80.990-81.000	82.990-83.000	82.990-83.000
E-markedÂ¹	81.000-81.010	81.000-81.010	83.000-83.010	83.000-83.010

Classification is marked on the top of the piston.



Piston running clearance (example)

Measured cylinder diameter.....	83.015 mm
Measured piston diameter.....	82.995 mm
The piston running clearance is.....	0.020 mm
The piston running clearance must be 0.010-0.030 mm.	

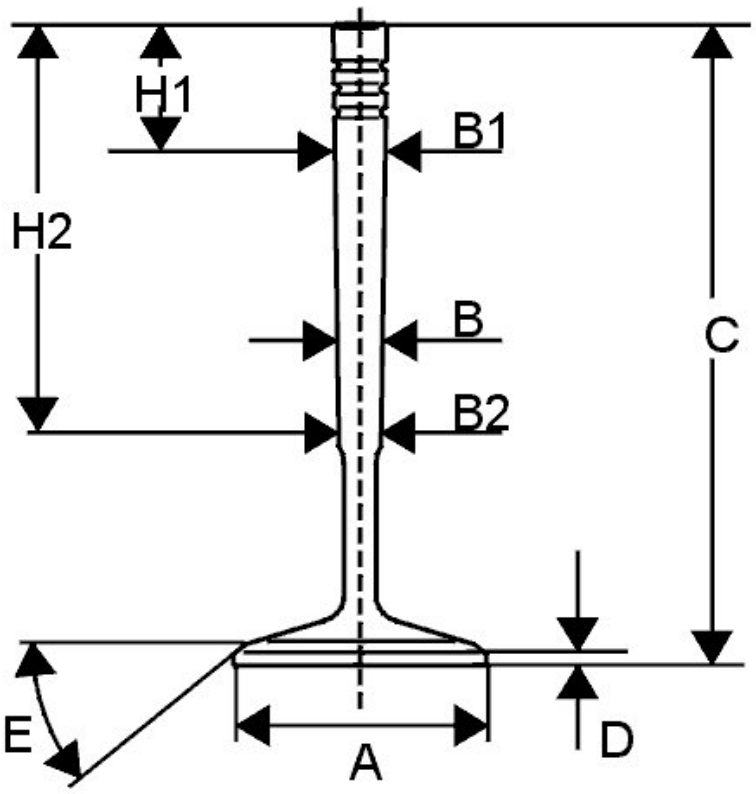
Piston rings

Upper compression ring.0.030-0.070 mm
Lower compression ring.0.030-0.070 mm
Oil control ring assembly.0.038-0.142 mm
Upper.1,200 -0.010/-0.030 mm
Lower.1,500 -0.010/-0.030 mm
Spring.1.510 ± 0.020 mm
Rail.0.460 ± 0.011 mm

Piston pin

	B52x4Tx (excluding B5244T3)	**B5244T3**
Diameter (mm)	23.000 +0/-0.004	21.000 +0/-0.004
Length (mm)	61.000 +0/-0.200	60.000 +0/-0.200

Valves

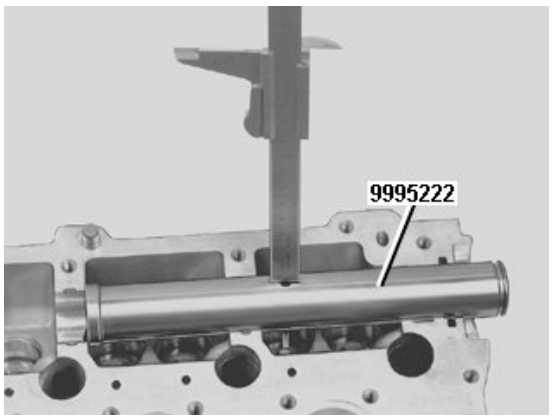


Inlet.31.00 ± 0.15 mm
Exhaust.27.00± 0.15 mm
Inlet (early versions).6.970 +0/-0.015mm
Inlet (late versions).5.970 +0/-0.015mm

Valve stem diameter (B1/B2)

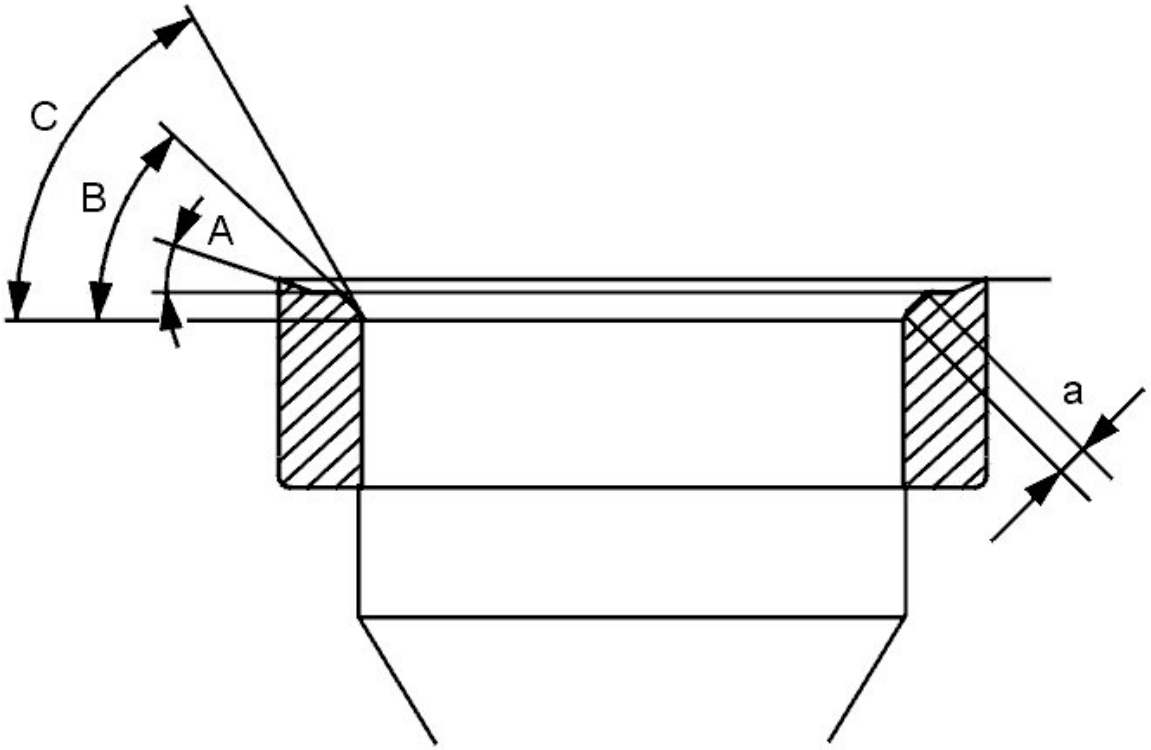
Exhaust (early versions)	
H1 = 22.7 mm	B1 = 6,962 ± 0.007 mm
H2 = 65.1	B2 = 6,954 ± 0.007 mm
Exhaust (late versions)	
H1 = 22.7 mm	B1 = 5.962 ± 0.007 mm
H2 = 65.1	B2 = 5954 ± 0.007 mm

Inlet.102.00 ± 0.07 mm
Exhaust.101.05± 0.07 mm
Inlet and exhaust.1.50 mm
Minimum height after grinding.1.20 mm
Inlet and exhaust.44.5°



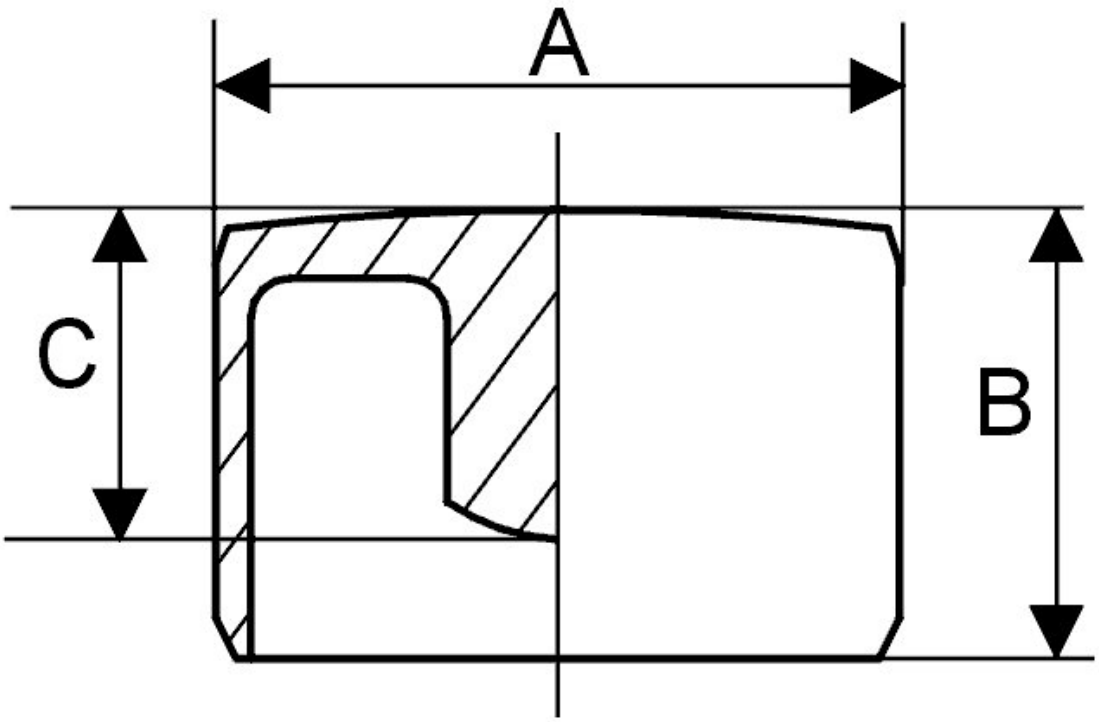
Valve stem height.48.4± 0.5 mm
Maximum machining of the valve stem.0.5 mm

Valve seats



Upper reduction angle (A)
Inlet.....20°
Exhaust.....15°
Matching surface angle (B)
Inlet/Exhaust.....45°
Lower reduction angle (C)
Inlet/Exhaust.....60°
Valve seat, width (a)
Inlet.....1.4-1.8 mm
Exhaust.....1.8-2.2 mm

Tappets



Tappets, dimensions

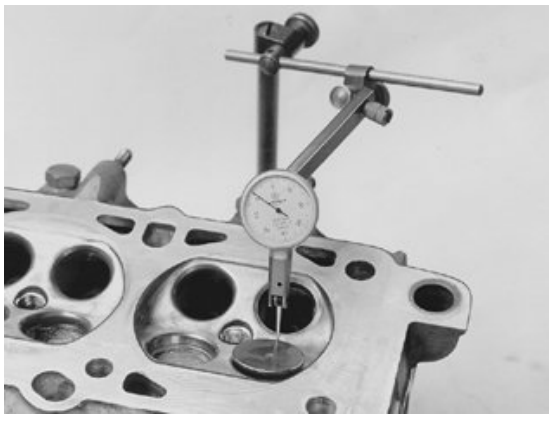
External diameter (A).32.000 +0.025/-0.041 mm
External height (B).26.0± 0.5 mm
Solid valve lifter shaft length (C)

15.96 mm at 0.02 mm intervals up to 16.16 mm. The dimensions are listed on the inside of each valve lifter.

Valve springs

Length.45.1 + 1.5/-0.5 mm
Type.Conical

Valve guides

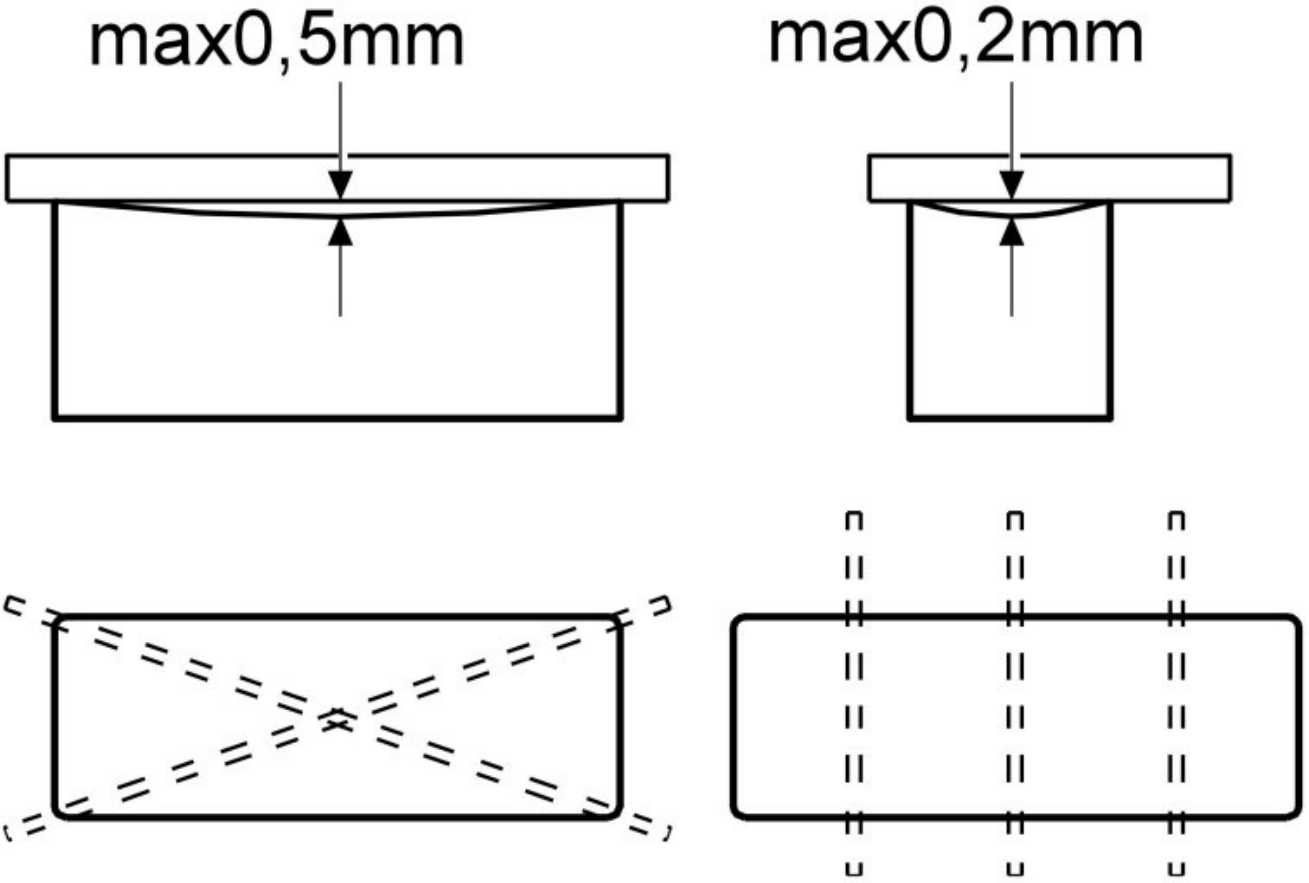


Inlet/Exhaust.0.03-0.06 mm
Inlet/Exhaust.0.15 mm

Camshafts

Inlet camshaft	Part number	Maximum lift height (mm)	Exhaust camshaft	Part number	Maximum lift height (mm)
B5204Tx excluding T4	9207943	8.40	**B5204Tx**	9207944	9.05
B5204T4	9207941	8.15			
B5234Tx	9207943	8.40	**B5234Tx**	9207944	9.05
B5244Tx excluding T2, T3	9207942	8.40	**B5244Tx** excluding T3	9207944	9.05
B5244T2	9497231	8.40	**B5244T3**	9497822	9.05
B5244T3	9497823	8.45	**B5254Tx**	9207944	9.05
B5254Tx	9207942	8.40			

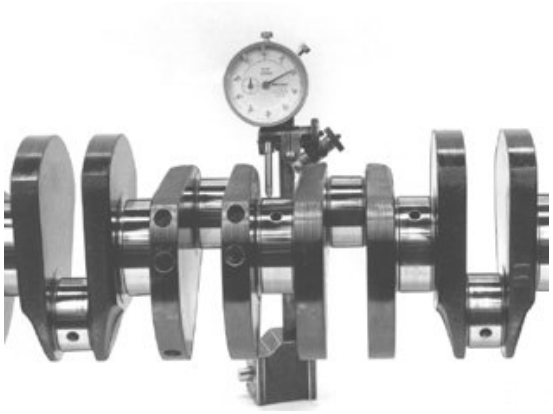
Cylinder head



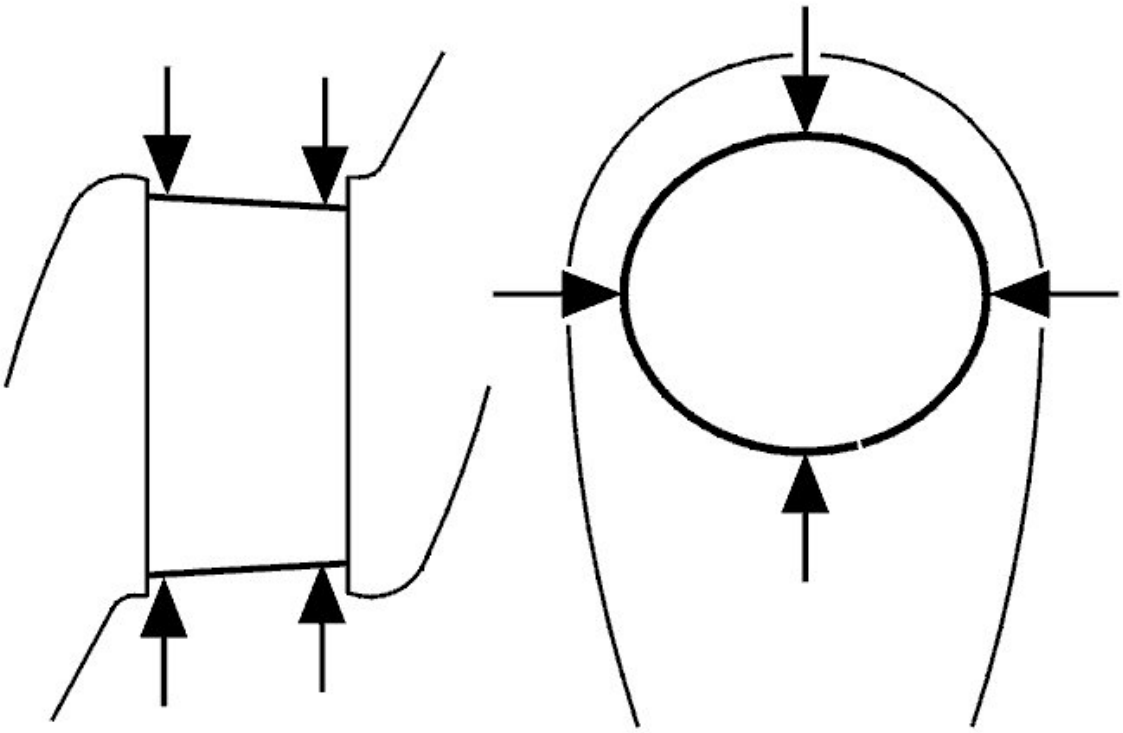
Front-rear.0.50 mm
Lateral.0.20 mm
Cylinder head height.129.00± 0.05 mm
Maximum machining.0.30 mm

Caution! Scratches and corrosion to the cylinder head gasket face should only be machined on a flat cylinder head.

Crank mechanism



Main bearing journal radial runout. maximum 0.040 mm
Axial play (Measured in the engine with the intermediate section tightened). 0.08-0.19 mm
Main bearing journal radial runout. 0.020-0.043 mm

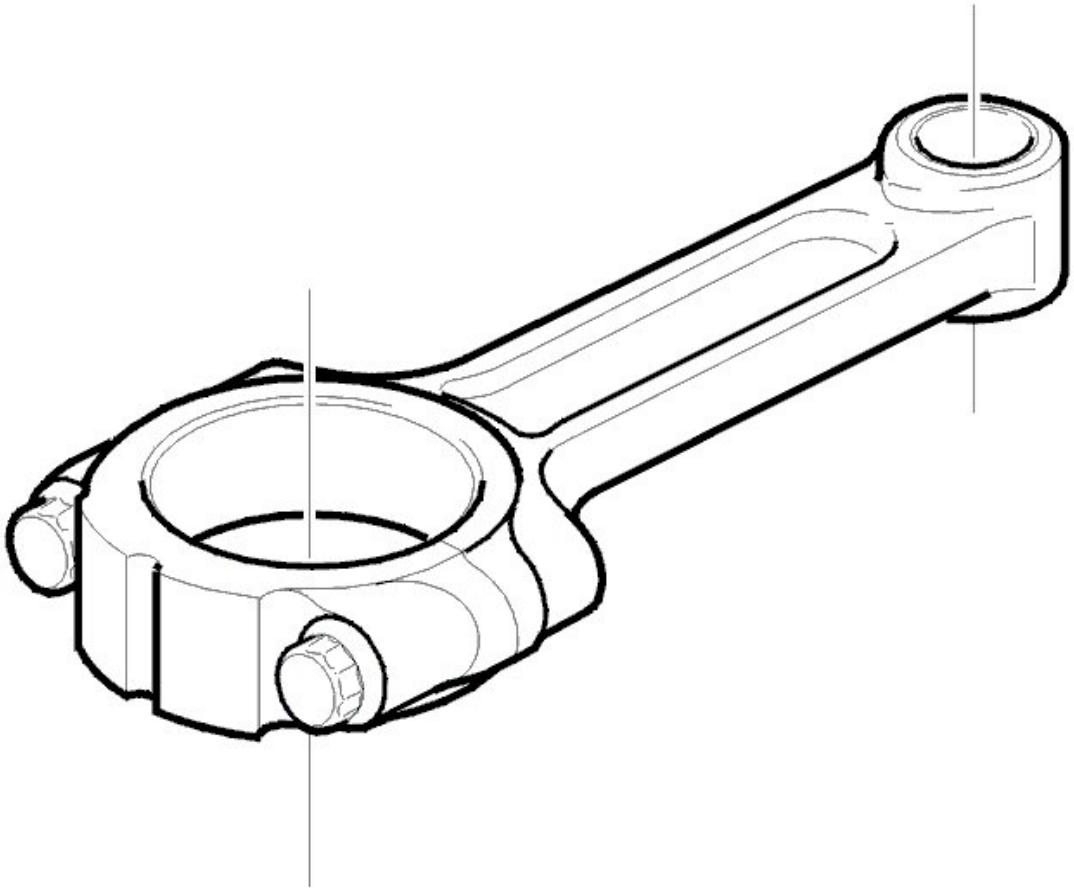


Diameter, standard. 50.000 +0/-0.016
Bearing recess width. 26.0 ± 0.1 mm
Maximum out-of-round. 0.004 mm
Maximum taper. 0.004 mm

The variation in diameter for each bearing journal must not exceed 0.008 mm.

Diameter, standard. 65.000 +0.003/-0.016 mm
Axial bearing width. 26.00 +0/-0.04mm
Maximum out-of-round. 0.004 mm
Maximum taper. 0.004 mm

The variation in diameter for each bearing journal must not exceed 0.008 mm.



Diameter, bearing recesses

Designation	B52x4Tx excluding B5244T3	B5244T3
Big end (mm)	53.000 -0/+0.013	53.000 -0/+0.013
Small end (mm)	21.000 +0.011/+0.005	23.000 +0.011/+0.005
Max. ovality in the bearing recesses	0.006	0.006
Length big end-small end (mm)	147	139.5

Engine oil

Oil volume including filter.6.6 liters
According to API Service.lowest SH or SJ.
According to ACEA.Grade A2, A2/B2, A3 or A3/B3.
13.3 r/s (800 rpm).0.10 Mpa
14.2 r/s (850 rpm).0.10 Mpa
66.7 r/s (4000 rpm).0.35 Mpa
Maximum oil pressure (the relief valve opens).0.48 Mpa

The oil pressure given is for an oil temperature of 100 °C, which is reached after 10-15 minutes driving.

Fuel line pressure

Desired value	
Relative pressure	380 kPa
absolute pressure	480 kPa

Cooling system

Marking. 90
Starts to open at. 90°C
Fully open at. 105°C

Camshaft Bearing

Tightening torque

General tightening torque

Note! Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.
Nuts and screws which are not self locking can be reused provided that they are in good condition.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

Summary of specific components and tightening torques

Note! Screws coated with locking fluid or sealant must always be replaced with new screws during reinstallation.

Always use **new screws and nuts** when angle tightening. Any exceptions to this rule will be indicated in the method.
Angle-tightening in tight spaces. See Screwed joint, torque/angle tightening See: Description and Operation/Screwed Joint, Torque/Angle Tightening.

Exhaust system (to the turbocharger (TC))	24 Nm
Cylinder head Tighten the screws in sequence from the center and outwards.	Stage 1.....20 Nm Stage 2.....60 Nm Stage 3.....130°
Manifold (cylinder head side)	25 Nm
Pipe screw (coolant pipe / turbocharger (TC))	26 Nm
Pipe screw (water heated crankcase ventilation.)	26 Nm
Pipe screw (oil pressure line / turbocharger (TC))	26 Nm
Pipe screw (oil pressure line / engine block)	38 Nm
Sub-frame nut (lower torque rod)	Stage 1.....65 Nm Stage 2.....60°
Subframe screws (start on the left-hand side, then the right-hand side)	Stage 1.....105 Nm Stage 2.....120°
Subframe bracket	50 Nm
Intake manifold	19 Nm
Catalytic converter (to the turbocharger (TC)) (to the exhaust system)	25 Nm 24 Nm
Knock sensor (KS)	20 Nm
Piston cooling valve (piston cooling oil duct, in cylinder block)	36 Nm
Timing gear pulley (camshafts without variable valve timing)	20 Nm
Timing gear pulley (camshafts with variable valve timing)	10 Nm
Heated oxygen sensor (HO2S)	45 Nm
Carrier plate	Stage 1.....45 Nm Stage 2.....50°
Intermediate section Tighten the screws in sequence from the center and outwards.	Stage 1 M10.....20 Nm Stage 2 M10.....45 Nm Stage 3 M8.....24 Nm Stage 4 M7.....17 Nm Stage 5 M10.....90°
Torque converter	50 Nm
Engine mounting Right side (M10x35 to cylinder block)	Stage 1.....35 Nm Stage 2.....60°
Engine mounting Right side (M8x23 to cylinder block)	Stage 1.....20 Nm Stage 2.....60°
Right-hand engine pad for the subframe (Only applies to XC90)	Stage 1.....120 Nm Stage 2.....40°
Lower torque rod, transmission screw	Stage 1.....35 Nm Stage 2.....40°
Lower torque rod, sub-frame nut	Stage 1.....65 Nm Stage 2.....60°
Oil filter (environmental filter)	25 Nm

Oil trap	15 Nm
Oil pan plug	38 Nm
Oil pump (countersunk Allen, M6x20, holds the pump housing together)	6 Nm
Oil return line (turbocharger (TC))	12 Nm
Oil pan (Applies to B5254T4)	the screws (1, 2, 3 and 4). Tighten to .....3 Nm the screws (5). Tighten to .....25 Nm. Then tighten to 48 Nm
Oil pressure switch	27 Nm
Stud (at exhaust port, manifold, turbocharger (TC))	20 Nm
Plug (check hole for gauging valve clearance)	20 Nm
Plug (gauge hole / crankshaft seal)	38 Nm
Belt tensioner (mechanical)	20 Nm
Flywheel	Stage 1.....45 Nm Stage 2.....65°
Vibration damper -2002 (flanged screws x4)	Stage 1.....25 Nm Stage 2.....30°
Vibration damper 2002- /flanged screws x4	Stage 1.....25 Nm Stage 2 .....60°
(center nut)	180 Nm
Temperature sensor (coolant)	22 Nm
Timing cover,(front/rear)	12 Nm
Timing cover,(upper)	8 Nm
Turbocharger (TC) (to manifold, without gasket)	25 Nm
Turbocharger (TC) (to manifold, with gasket)	37 Nm
Spark plugs	30 Nm
Connecting rod cap (connecting rod with treated toothed surface between the connecting rod and cap, screw with waist)	Stage 1.....20 Nm Stage 2.....90°
Connecting rod cap (connecting rod with fracture surface between the connecting rod and cap, fully threaded screw)	Stage 1.....30 Nm Stage 2.....90°
Transmission screw (lower torque rod)	Stage 1.....35 Nm Stage 2.....40°
Variable valve timing center screw	120 Nm
Variable valve timing center plug	35 Nm

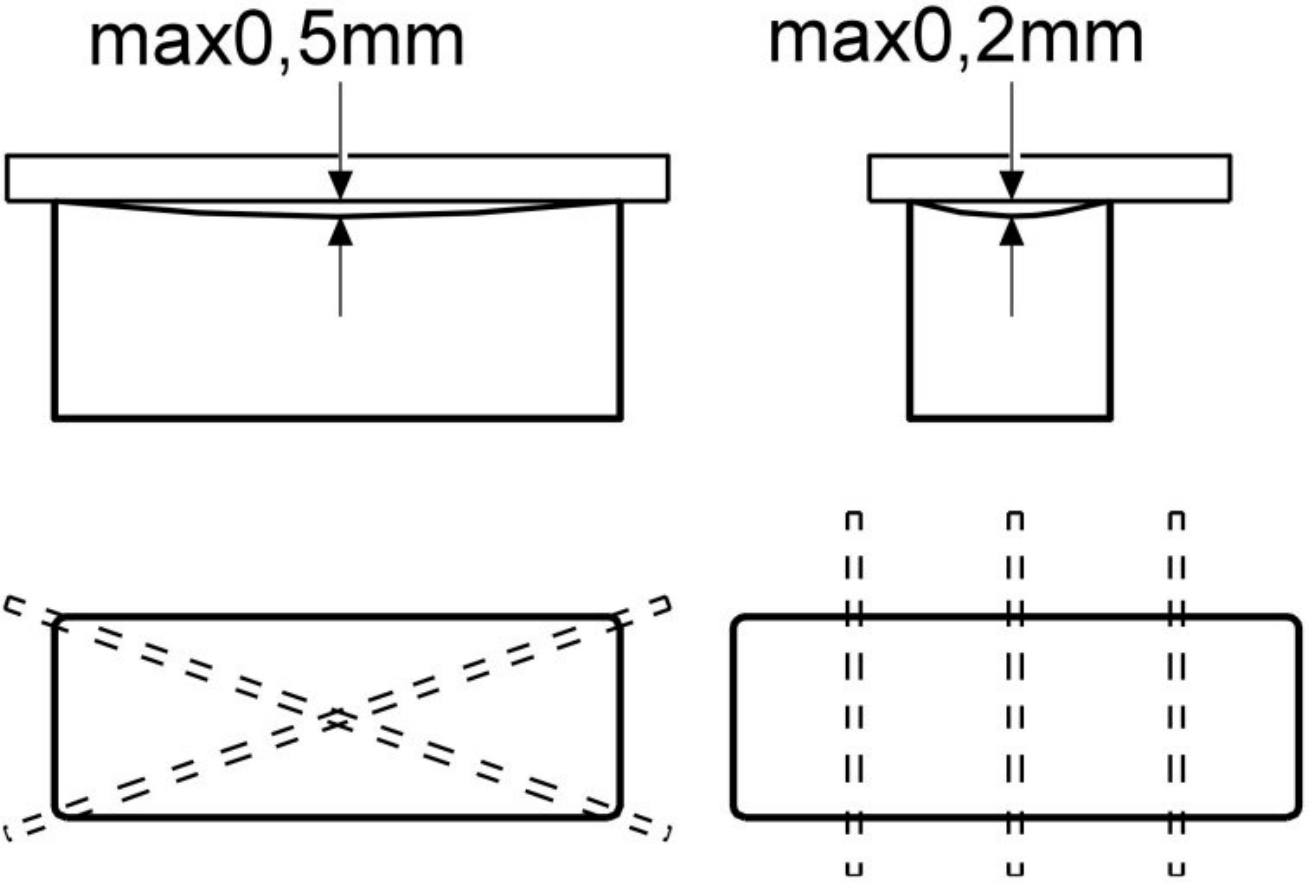
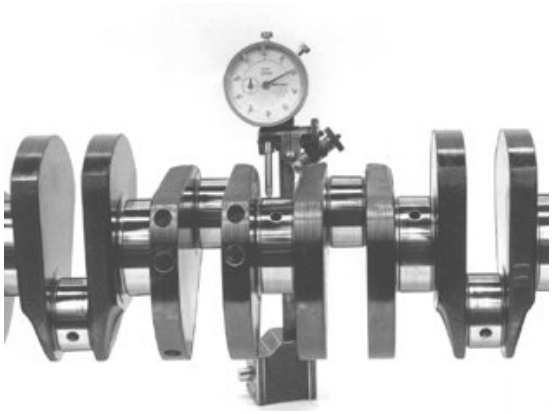
Cylinder head



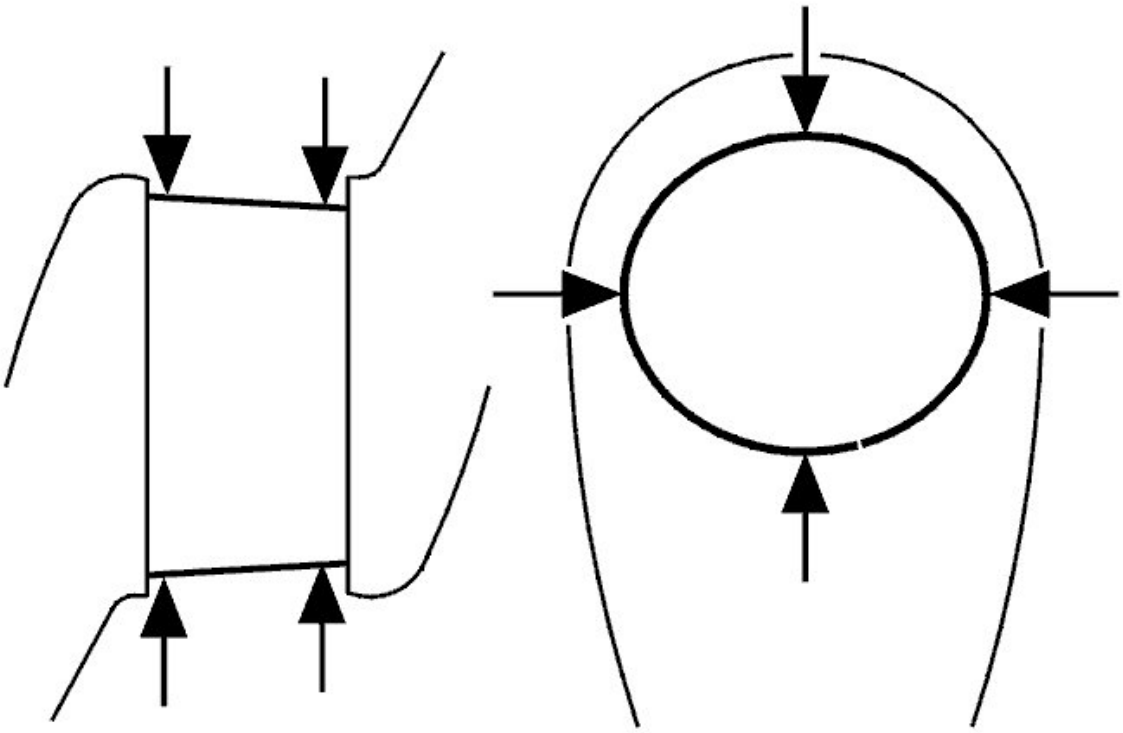
Front-rear.0.50 mm
Lateral.0.20 mm
Cylinder head height.129.00± 0.05 mm
Maximum machining.0.30 mm

Caution! Scratches and corrosion to the cylinder head gasket face should only be machined on a flat cylinder head.

Crank mechanism



Main bearing journal radial runout. maximum 0.040 mm
Axial play (Measured in the engine with the intermediate section tightened). 0.08-0.19 mm
Main bearing journal radial runout. 0.020-0.043 mm

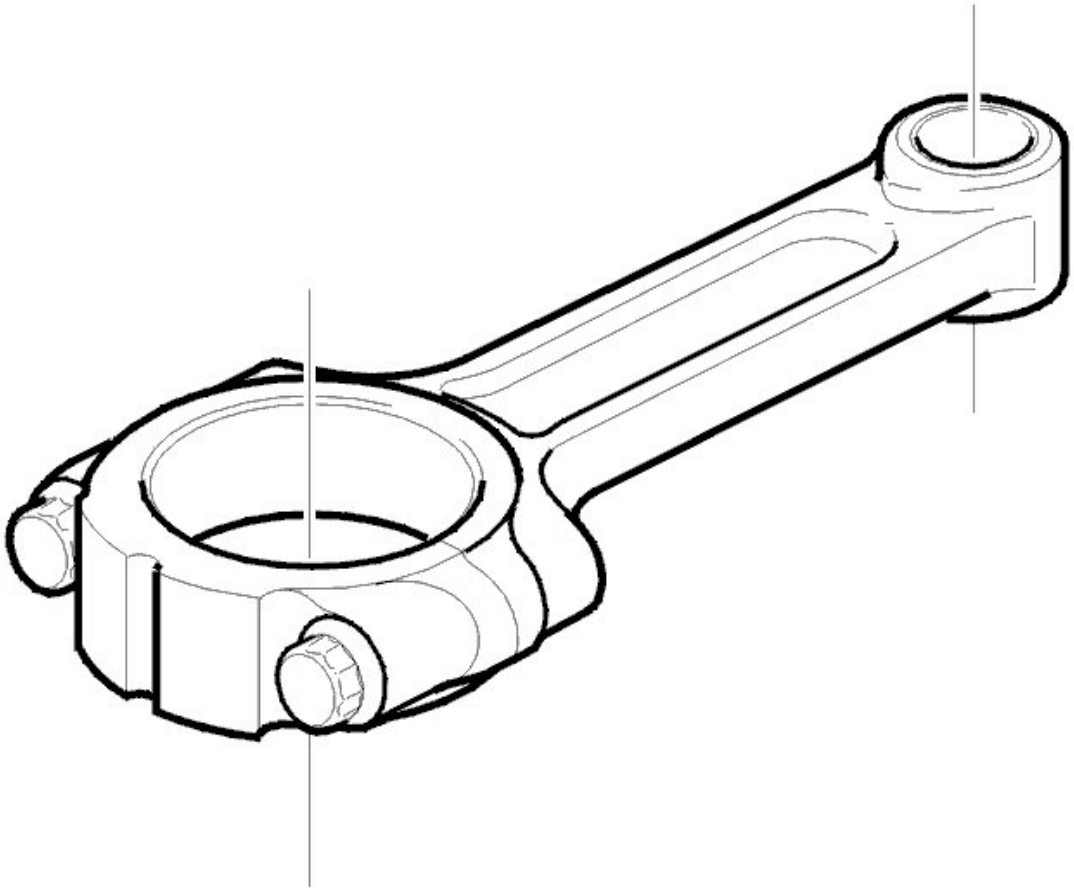


Diameter, standard. 50.000 +0/-0.016
Bearing recess width. 26.0 ± 0.1 mm
Maximum out-of-round. 0.004 mm
Maximum taper. 0.004 mm

The variation in diameter for each bearing journal must not exceed 0.008 mm.

Diameter, standard. 65.000 +0.003/-0.016 mm
Axial bearing width. 26.00 +0/-0.04mm
Maximum out-of-round. 0.004 mm
Maximum taper. 0.004 mm

The variation in diameter for each bearing journal must not exceed 0.008 mm.



Diameter, bearing recesses

Designation	B52x4Tx excluding B5244T3	B5244T3
Big end (mm)	53.000 -0/+0.013	53.000 -0/+0.013
Small end (mm)	21.000 +0.011/+0.005	23.000 +0.011/+0.005
Max. ovality in the bearing recesses	0.006	0.006
Length big end-small end (mm)	147	139.5

Engine oil

Oil volume including filter.6.6 liters
According to API Service.lowest SH or SJ.
According to ACEA.Grade A2, A2/B2, A3 or A3/B3.
13.3 r/s (800 rpm).0.10 Mpa
14.2 r/s (850 rpm).0.10 Mpa
66.7 r/s (4000 rpm).0.35 Mpa
Maximum oil pressure (the relief valve opens).0.48 Mpa

The oil pressure given is for an oil temperature of 100 °C, which is reached after 10-15 minutes driving.

Fuel line pressure

Desired value	
Relative pressure	380 kPa
absolute pressure	480 kPa

Cooling system

Marking. 90
Starts to open at. 90°C
Fully open at. 105°C

Tightening Torque

TIGHTENING TORQUE

General Tightening Torque

NOTE: Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)
M5	5
M6	10
M7	17
M8	24
M10	50
M12	80
M14	130

Nuts and screws which are not self locking can be reused provided that they are in good condition.

Summary Of Specific Components And Tightening Torques

NOTE: Screws coated with locking fluid or sealant must be replaced with new when reinstalled.

Always use new screws and nuts when angle tightening. Any exceptions to this rule will be indicated in the method.

Angle-tightening in tight spaces.

Exhaust system (to the turbocharger (TC))	30 Nm
Cylinder head Tighten the screws in sequence from the center and outwards.	Stage 1.....20 Nm Stage 2.....60 Nm Stage 3.....angle-tighten 130°
Manifold (cylinder head side)	25 Nm
Pipe screw (coolant pipe / turbocharger (TC))	26 Nm
Pipe screw (water heated crankcase ventilation.)	26 Nm
Pipe screw (oil pressure line / turbocharger (TC))	26 Nm
Pipe screw (oil pressure line / engine block)	38 Nm
Sub-frame nut (lower torque rod)	65 Nm. Angle-tighten 60º
Sub-frame screw	105 Nm. Angle-tighten 120°
Intake manifold	19 Nm
Catalytic converter (to the turbocharger (TC)) (to the exhaust system)	25 Nm 24 Nm
Knock sensor (KS)	20 Nm
Piston cooling valve (piston cooling oil duct, in cylinder block)	36 Nm
Timing gear pulley (camshafts without variable valve timing)	20 Nm
Timing gear pulley (camshafts with variable valve timing)	10 Nm
Heated oxygen sensor (HO2S)	45 Nm
Carrier plate	Stage 1.....45 Nm Stage 2.....angle-tighten 50°
Intermediate section Tighten the screws in sequence from the center and outwards.	Stage 1 M10.....20 Nm Stage 2 M10.....45 Nm Stage 3 M8.....24 Nm Stage 4 M7.....17 Nm Stage 5 M10.....angle-tighten 90°
Torque converter	50 Nm
Engine mounting Right side (M10x35 to cylinder block) **Engine mounting Right side** (M8x23 to cylinder block)	Stage 1.....35 Nm Stage 2.....angle-tighten 60° Stage 1.....20 Nm Stage 2.....angle-tighten 60°
Lower torque rod, transmission screw	35 Nm. Angle-tighten 40º
Lower torque rod, sub-frame nut	65 Nm. Angle-tighten 60º
Oil filter (environmental filter)	25 Nm
Oil trap	15 Nm
Oil pan plug	38 Nm
Oil pump (countersunk Allen, M6x20, holds the pump housing together)	6 Nm

Oil return line (turbocharger (TC))	12 Nm
Oil pan (Applies to B5254T4)	the screws (1, 2, 3 and 4). Tighten to.....3 Nm the screws (5). Tighten to.....25 Nm. Then tighten to 48 Nm
Oil pressure switch	27 Nm
Stud (at exhaust port, manifold, turbocharger (TC))	20 Nm
Plug (check hole for gauging valve clearance)	20 Nm
Plug (gauge hole / crankshaft seal)	38 Nm
Belt tensioner (mechanical)	20 Nm
Flywheel	Stage 1.....45 Nm Stage 2.....angle-tighten 65°
Vibration damper -2002 (flanged screws x4)	Stage 1.....25 Nm Stage 2.....angle-tighten 30°
Vibration damper 2002- /flanged screws x4	Stage 1.....25 Nm Stage 2.....angle-tighten 60°
(center nut)	180 Nm
Temperature sensor (coolant)	22 Nm
Timing cover, (front/rear)	12 Nm
Timing cover, (upper)	8 Nm
Turbocharger (TC) (to manifold, without gasket)	25 Nm
Turbocharger (TC) (to manifold, with gasket)	37 Nm
Spark plugs	30 Nm
Connecting rod cap (connecting rod with treated toothed surface between the connecting rod and cap, screw with waist)	Stage 1.....20 Nm Stage 2.....angle-tighten 90°
Connecting rod cap (connecting rod with fracture surface between the connecting rod and cap, fully threaded screw)	Stage 1.....30 Nm Stage 2.....angle-tighten 90°
Transmission screw (lower torque rod)	35 Nm. Angle-tighten 40º
Variable valve timing center screw	120 Nm
Variable valve timing center plug	35 Nm

Screwed Joint, Torque/Angle Tightening

Special tools: 951 2050

There are a great number of torque wrench Systems available on the market where the wrench grip can be replaced with other types. These wench grips are normally ideally suited to torque tightening screwed joints in poorly accessible places.

There may be occasions when torque tightening of a screwed joint must be followed by angle tightening and space does not allow the use of protractor 951 2050. In these cases, use either a nut, a screw head or a tool. These are usually hexagonal and each corner is 60°. If there are twelve edges, each corner is 30°.

To angle tighten, mark the material and nut for example as illustrated and then tighten so that the markings are opposite each other.

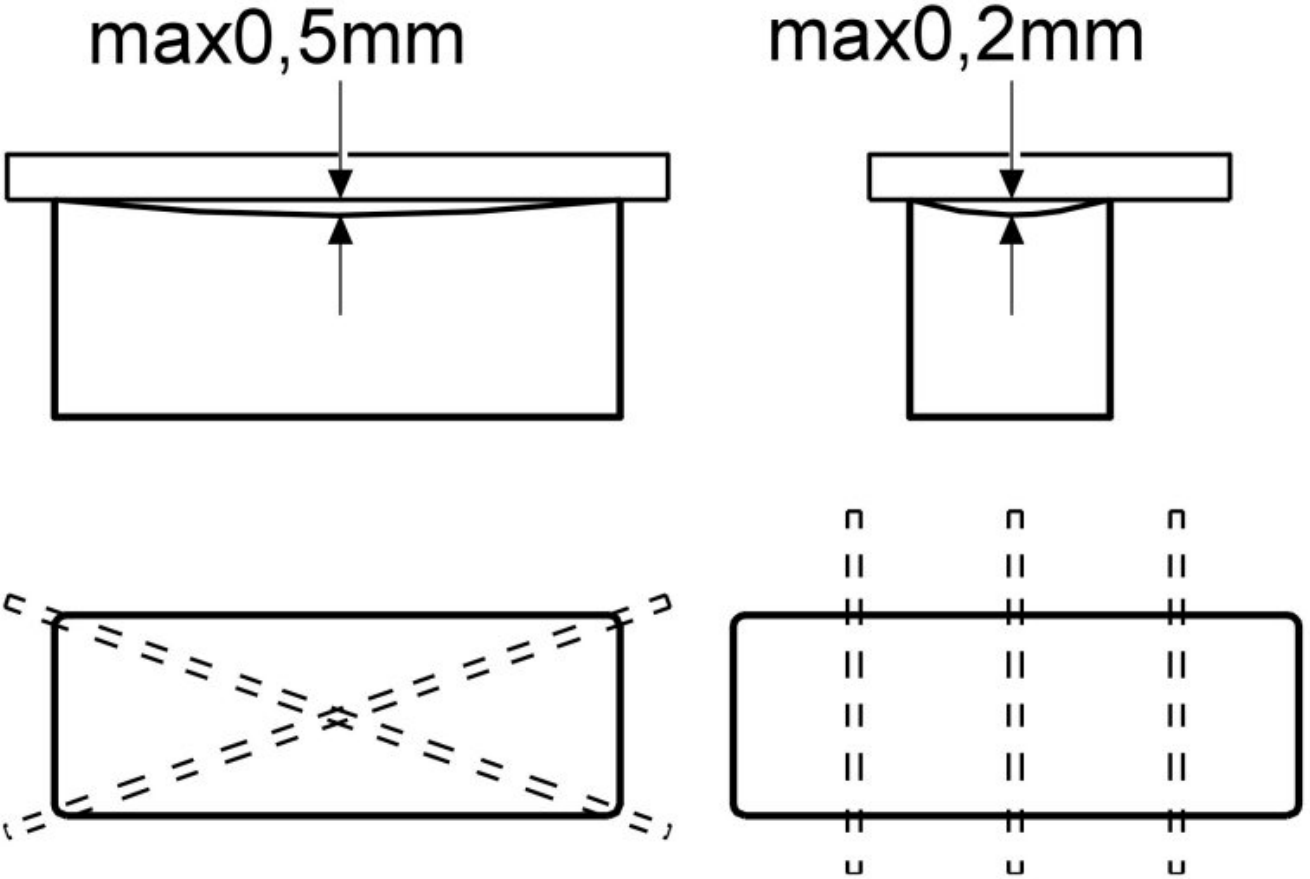
B5254Tx	9207942	8.40			

Cylinder head



Front-rear.0.50 mm
Lateral.0.20 mm
Cylinder head height.129.00± 0.05 mm
Maximum machining.0.30 mm

Caution! Scratches and corrosion to the cylinder head gasket face should only be machined on a flat cylinder head.

Valve Clearance

The valve clearance measured on cold engines (approximately 20°C) should be:

Inlet valve ..... 0.20 ± 0.03 mm
Exhaust valve ..... 0.40 ± 0.03 mm

Note: The tolerances are less at setting! When checking the valve clearance through the plug hole the tolerances are larger.

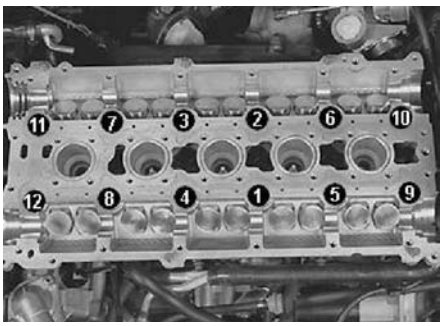
Differences in valve clearance for different engines / ambient temperatures:

- 0.01 mm at 15° C
+ 0.01 mm at 25° C
+ 0.02 mm at 30° C
+ 0.03 mm at 35° C
+ 0.04 mm at 45° C

Cylinder Head Gasket

Tightening Specifications

Cylinder Head



Use new screws.
Lubricate all the screws.
Tighten the screws in the order shown.
Tighten the screws alternately from the center and outwards.

1st Step ..... 20 Nm
2nd Step ..... 60 Nm
3rd Step ..... Angle-tighten 130°

Intake Manifold

Torque ..... 25 Nm

Exhaust Manifold

Torque ..... 25 Nm

Camshaft Bearing Caps/Camshaft Cover

Refer to General Tightening Torque, see Engine, Specifications.
Refer to procedure for sequence. See: Engine, Cooling and Exhaust/Engine/Cylinder Head Assembly/Service and Repair

Camshaft Timing Gear Pulley

Camshafts Without Variable Valve Timing ..... 20 Nm
Camshafts With Variable Valve Timing ..... 10 Nm

Drive Belt Tensioner

Tightening Specifications

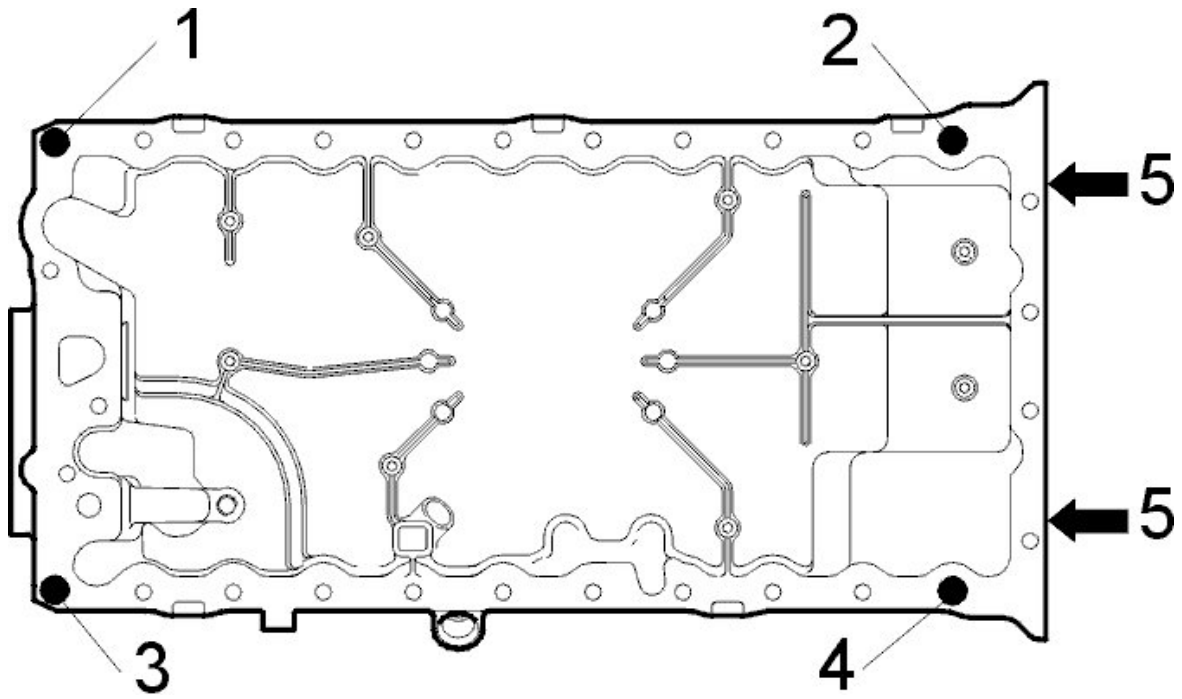
Belt Tensioner (Mechanical) ..... 20 Nm

Intake Manifold

Intake Manifold ..... 19 Nm

Torque tighten all the screws starting from the center.

Oil Pan, Engine



Press the sump against the transmission.

Tighten the screws (1), (2), (3) and (4) to 3 Nm.

First tighten the screws (5) to 25 Nm. Then tighten to 48 Nm.

Tighten all screws in the sump joint to 17 Nm.

Start at the transmission and continue forwards in pairs.

Oil Pump, Engine

Tighten the oil pump screws crosswise..... 10 Nm

Vibration damper
Tighten the center nut..... 180 Nm
Remove the counterhold. Tighten the screws..... 25 Nm
Angle-tighten..... 30 degrees

Hold the eccentric secure and tighten the center screw..... 20 Nm
Ensure that the indicator is in the correct position.

Front timing belt cover. Tighten..... 12 Nm

The engine stabilizer brace.
Tighten the screws at the suspension turrets..... 50 Nm
Tighten the engine bracket screw..... 80 Nm

Oil pump..... 6 Nm
(countersunk Allen, M6x20, holds the pump housing together)

System Specifications

Tightening torque

General tightening torque

Note! Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.
Nuts and screws which are not self locking can be reused provided that they are in good condition.

Applies to screwed joint with strength class 8.8.	
Thread	Tightening torque (Nm)

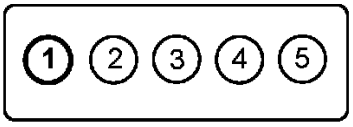
Exhaust Manifold

Manifold (cylinder head side) ..... 25 Nm

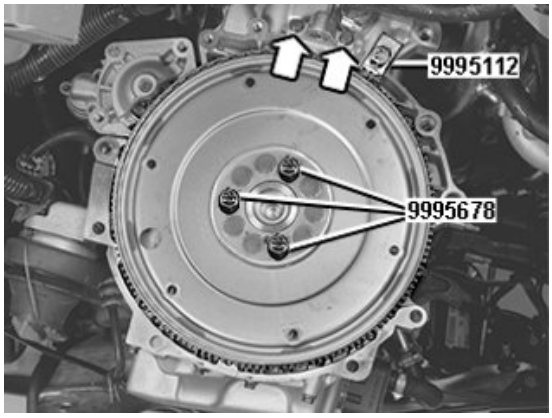
Firing Order : 1-2-4-5-3



Front of Vehicle

Flex Plate

Installing the carrier plate



Note! Ensure that the mating surfaces on the crankshaft and carrier plate are completely clean.

Use tool 999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw , which consists of 3 studs with nuts.

Install:

- The 3 studs belonging to tool 999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw , distributed as illustrated
- the carrier plate.

Note! Check that the locating pin on the crankshaft is positioned opposite the hole in the carrier plate.

Locate gear sector 999 5112 GEAR SECTOR See: Tools and Equipment/999 5112 Gear Sector against the carrier plate.
Pull the flywheel towards the crankshaft using the three nuts on special tool 999 5678 Special screw See: Tools and Equipment/999 5678 Special Screw.

Caution! The carrier plate must lie against the crankshaft flange before the screws are installed. There is a risk that excess locking fluid on the screws will come between the mating surfaces.

Install 7 new screws. Tighten crosswise.

Tighten to 45 Nm.

Remove the 3 nuts and studs.

Install the remaining 3 new screws. Tighten the screws.

Tighten to 45 Nm.

Then angle-tighten all 10 screws crosswise.

Tighten to 50°.

Manual Transmission/Transaxle

Tightening torque

General tightening torque

Caution! Screws coated with a locking fluid or self locking nuts must be replaced with new when reinstalled.

See the table below to find the tightening torques for components not included in the summary.

All drive shafts

Bolt drive shaft - wheel hub, front	Stage 1: 35 Nm Stage 2: 90°
Bolt drive shaft - wheel hub, version with rubber cone	50 Nm
Bolt drive shaft - wheel hub, rear	50 Nm

All gearboxes, angle gears, chain angle gears and rear axle gears

Sensors	6 Nm
Filler plug, Level plug and Drain plug	35 Nm

AW, 4T65

Cover, control system (AW)	Diagonally 14 Nm
The nut for the lever and gear shift linkage rod	16 Nm
Side cover, gearbox (4T65)	Stage 1: Crosswise 10 Nm Stage 2: Crosswise 25 Nm
Bolt driver plate - torque converter 6 x bolts	35 Nm
Screws for the lower torque rod in the transmission **Note!** Applies to 5-cylinder engines only	Stage 1: 35 Nm Stage 2: 40°
Connection, oil cooler pipe to gearbox	30 Nm
Screw, oil pipe - transmission	6 Nm
Screw, oil pipe - dipstick pipe - transmission	15 Nm
Dipstick pipe for the transmission	24 Nm

TF-80SC

Integrated level plug/Torx	8 Nm
Cover, control system	Diagonally 14 Nm
Torque converter to carrier plate 6 screws	60 Nm
Gear selector mechanism (nut)	16 Nm

M56, M58, M66

Back-up (reversing) lamps switch	24 Nm

AWD

Bevel gear to transmission	75 Nm
Universal joint (spider) fastened with 4 bolts	Stage 1: Crosswise 16 Nm Stage 2: Crosswise 120°
Universal joint CV fastened with 6 bolts	Stage 1: Crosswise 10 Nm Crosswise 25 Nm
Pinion nut (Active on Demand Coupling)	150 Nm
Pinion nut, angle gear	180 Nm
Oil pump (AOC)	5 Nm
Control module (AOC)	5 Nm
Driveshaft (center bearing)	30 Nm
Oil plug, final drive	35 Nm
Oil plug, Active On-Demand Coupling	35 Nm
Bevel gear bracket	Stage 1: alternately to light contact Stage 2: 50 Nm
Manifold support bracket bevel gear	Stage 1: 35 Nm Stage 2: 90°

Pressure Plate

Install the clutch and locate the guide pins. Check that the clutch is in contact with the flywheel all around its circumference. Carefully tighten the six screws, crosswise, so that the clutch is guided up onto the guide pins and lies in contact all around with the flywheel. Tighten the screws crosswise. Tighten to **25 Nm**.

Spark Plug

Side cover, gearbox (4T65)	Stage 1: Crosswise 10 Nm Stage 2: Crosswise 25 Nm
Bolt driver plate - torque converter 6 x bolts	35 Nm
Screws for the lower torque rod in the transmission **Note!** Applies to 5-cylinder engines only	Stage 1: 35 Nm Stage 2: 40°
Connection, oil cooler pipe to gearbox	30 Nm
Screw, oil pipe - transmission	6 Nm
Screw, oil pipe - dipstick pipe - transmission	15 Nm
Dipstick pipe for the transmission	24 Nm

TF-80SC

Integrated level plug/Torx	8 Nm
Cover, control system	Diagonally 14 Nm
Torque converter to carrier plate 6 screws	60 Nm
Gear selector mechanism (nut)	16 Nm

M56, M58, M66

Back-up (reversing) lamps switch	24 Nm

AWD

Bevel gear to transmission	75 Nm
Universal joint (spider) fastened with 4 bolts	Stage 1: Crosswise 16 Nm Stage 2: Crosswise 120°
Universal joint CV fastened with 6 bolts	Stage 1: Crosswise 10 Nm Crosswise 25 Nm
Pinion nut (Active on Demand Coupling)	150 Nm
Pinion nut, angle gear	180 Nm
Oil pump (AOC)	5 Nm
Control module (AOC)	5 Nm
Driveshaft (center bearing)	30 Nm
Oil plug, final drive	35 Nm
Oil plug, Active On-Demand Coupling	35 Nm
Bevel gear bracket	Stage 1: alternately to light contact Stage 2: 50 Nm
Manifold support bracket bevel gear	Stage 1: 35 Nm Stage 2: 90°

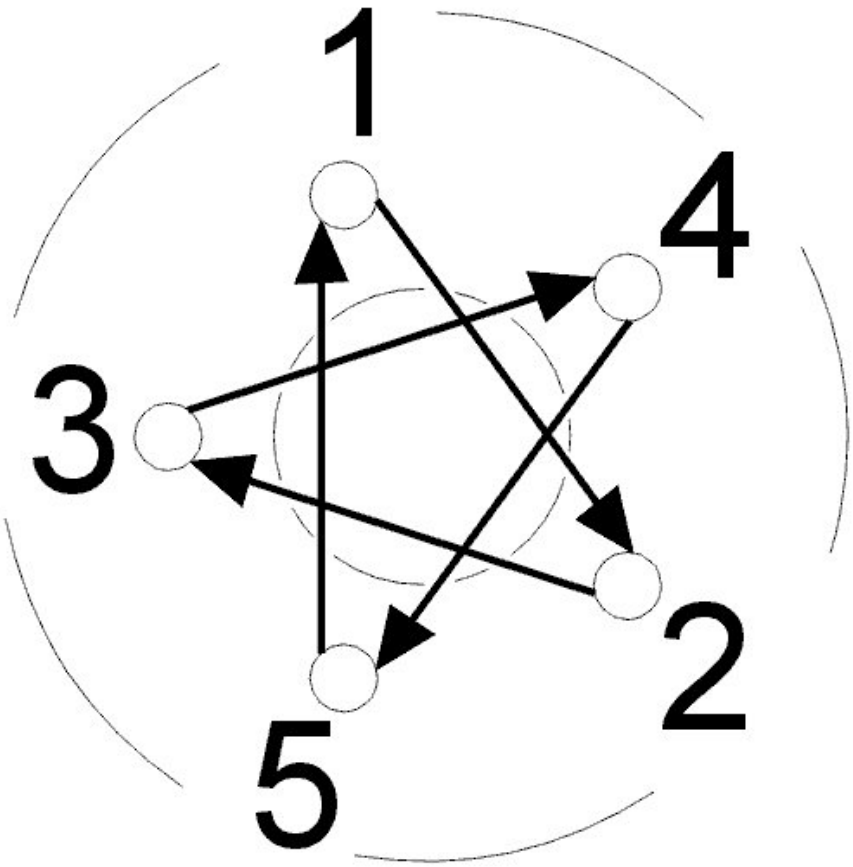
Wheel Fastener

Installing wheels

Special tools:

951 2835 Torque socket 19mm S80 See: Tools and Equipment/951 2835 Torque Socket 19mm S80

Installing wheels



Ensure that the brake disc and wheel rim mating surfaces are clean. Grease the hub center location dowel for the rim. Use installation paste **1161397-3**.
Install the wheel studs lightly. Then tighten crosswise. Tighten to **140 Nm**. Use torque socket 951 2835 Torque socket 19mm S80 See: Tools and Equipment/951 2835 Torque Socket 19mm S80 if an impact wrench is being used.
Crosswise tightening and torque tightening is important to prevent stresses in the brake disc.

Note! The torque socket is designed for use with a standard, pneumatic impact nut runner providing a torque of250-350 Nm.

Compression Check

Engine type: ..... **Normal value MPa:**
Turbo ..... 1.1 - 1.3
Turbo type LT ..... 1.2 - 1.4
Normally aspirated engine ..... 1.3 - 1.5

System Specifications

Thermostat
Marking 90
Starts to open at ..... 90 degree C
Fully open at ..... 105 degree C

Thermostat, Engine Cooling

Thermostat
Marking 90
Starts to open at ..... 90 degree C
Fully open at ..... 105 degree C

System Specifications

Oil Pressure (Minimum)
13.3 r/s (800 r/min) ..... 0.10 Mpa (1)
14.2 r/s (850 r/min) ..... 0.10 Mpa (1)
66.7 r/s (4,000 r/min) ..... 0.35 Mpa (1)
Maximum oil pressure (the relief valve opens) ..... 0.48 Mpa

(1) The oil pressure listed is for an oil temperature of 100 degree C, which is reached after 10 - 15 minutes driving.

Engine Oil Pressure

Oil Pressure (Minimum)
13.3 r/s (800 r/min) ..... 0.10 Mpa (1)
14.2 r/s (850 r/min) ..... 0.10 Mpa (1)
66.7 r/s (4,000 r/min) ..... 0.35 Mpa (1)
Maximum oil pressure (the relief valve opens) ..... 0.48 Mpa

(1) The oil pressure listed is for an oil temperature of 100 degree C, which is reached after 10 - 15 minutes driving.

Heating and Air Conditioning

Pressure values, A/C

Component	Pressure
High pressure shut-off for the compressor	30 bar
Safety valve	38 bar

Capacity ..... 6.1 US qts. (5.8 liters)

Fuel Tank

Fuel Tank

Capacity ..... **18 US Gallons (68 liters)**

Refrigerant

Refrigerant

Capacity ..... 2.2 lb (1,000 g)

Hint: A specification decal in the engine compartment lists the refrigerant capacity of the air conditioning (A/C) system.

Refrigerant Oil

Refrigerant Oil

When replacing components, the following oil volumes shall be found in the new components or shall be filled in the system through the service valve, except for the compressor (see the "Compressor" below):

Receiver Drier ..... 30 cu.cm
Evaporator ..... 50 cu.cm
Condenser ..... 30 cu.cm
Tube ..... 10 cu.cm
Hose ..... 10 cu.cm

Compressor

Oil return when reusing compressor:
- measure the volume of the oil drained from the compressor
- replace the volume of drained oil according to the table below:

Drained Oil:
Greater than 70 cu.cm = Replace the volume of drained oil with the corresponding quantitiy.
Less than 70 cu.cm = Fill with 70 cu.cm of oil.

Oil return when replacing compressor:
- Drain the old compressor of oil, and measure the amount.
- Drain the new compressor of oil (the amount may be below specified value since it is not possible to drain all oil from the compressor).
- Use the table below to fill the new compressor with the right amount of oil:

Drained Oil:
Greater than 70 cu.cm = Replace the volume of drained oil with the corresponding quantitiy.
Less than 70 cu.cm = Fill with 70 cu.cm of oil.

Caution! When installing completely new system: Check that there is oil in the compressor. The other components should contain no oil.

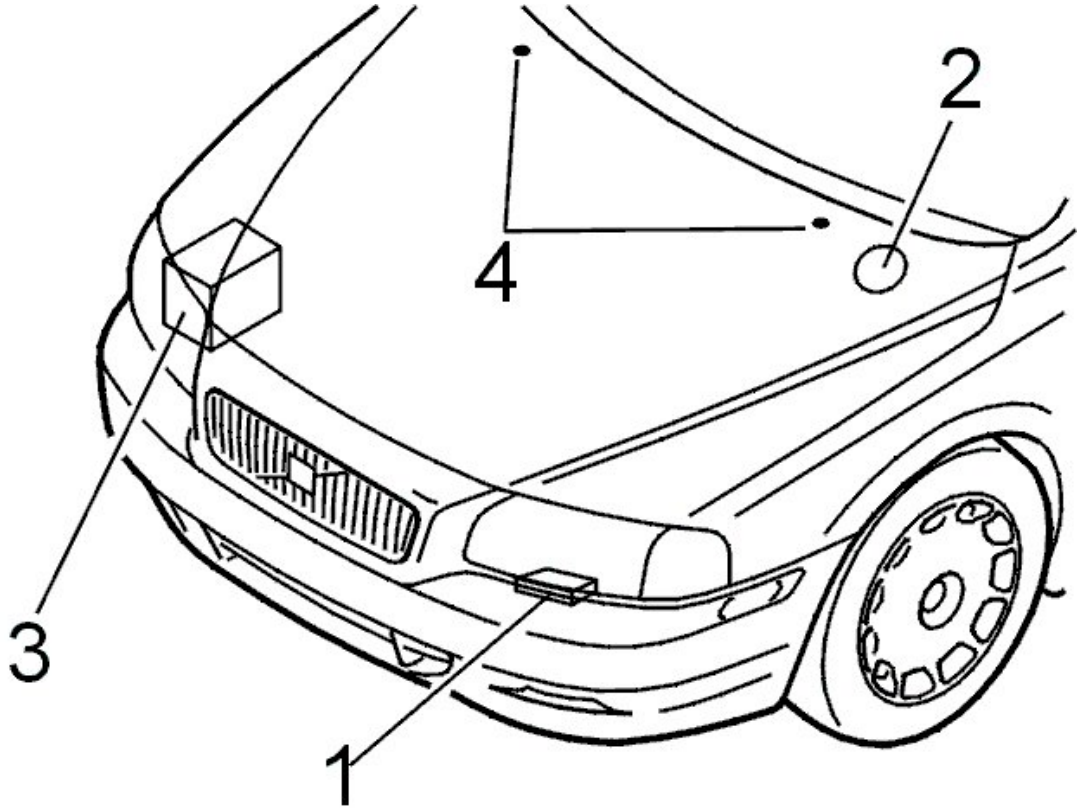
General, Other Electrical Components

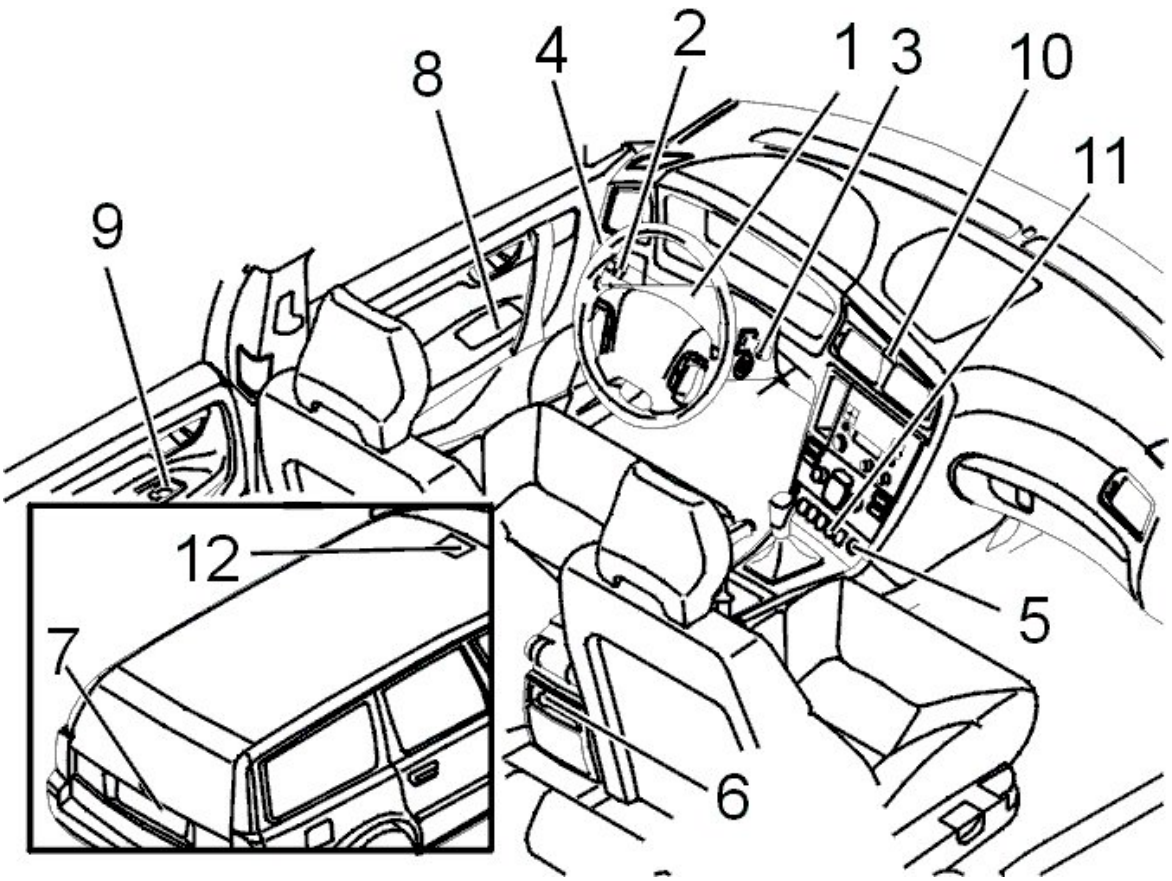
Other electrical components

Wiper and washer components



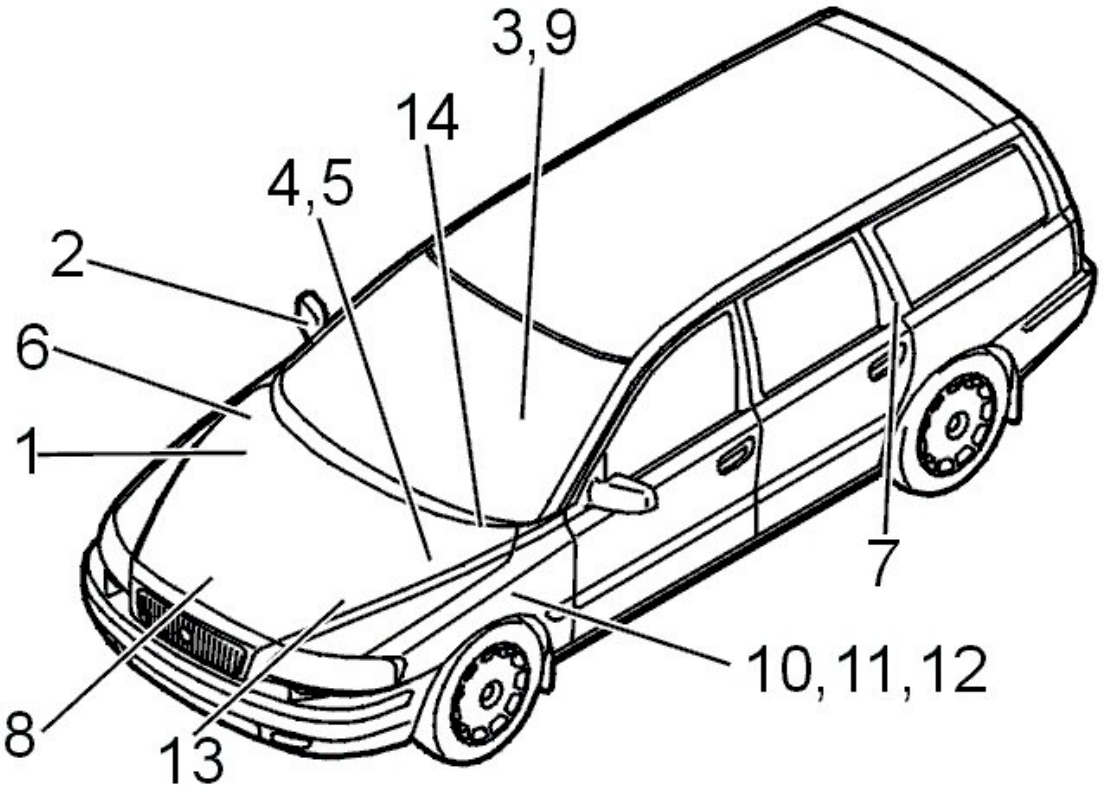
1. Headlamp wiper motor
2. Windshield wiper mechanism and wiper motor
3. Washer fluid reservoir
4. Washer nozzle.

Switches



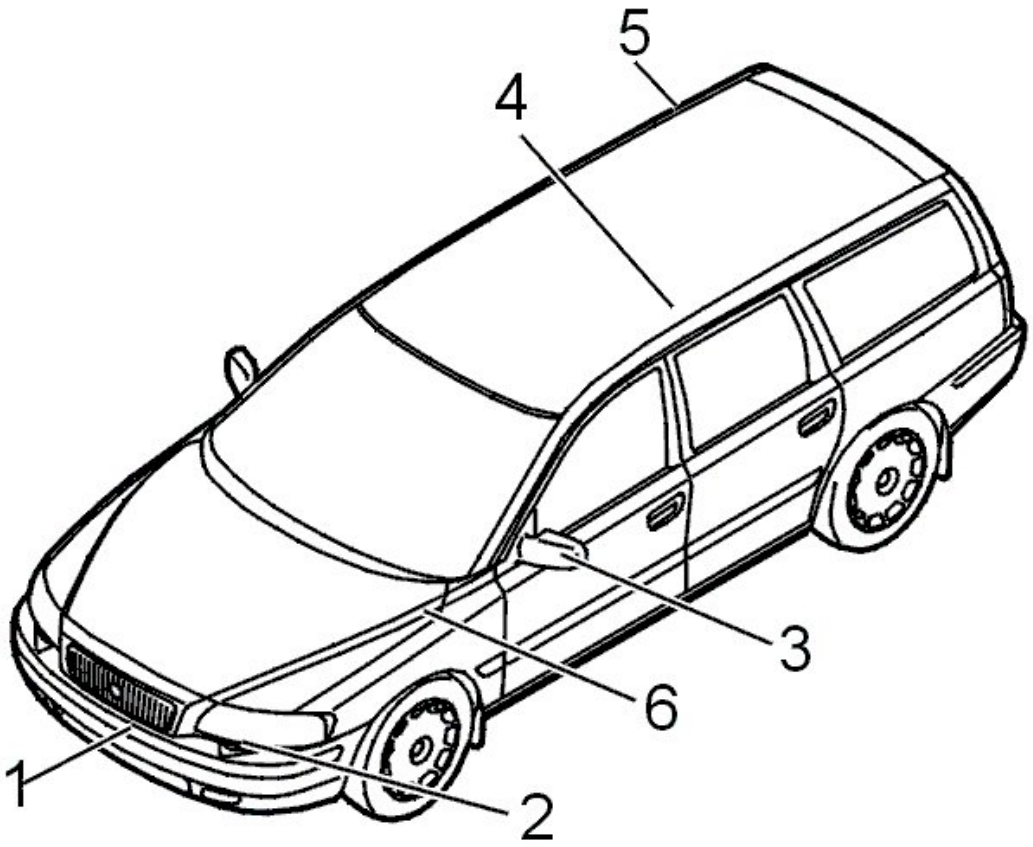
1. Switch gear lever module
2. Turn signal lamp and dip switch
3. Windshield wiper and washer switch
4. Light switch
5. Front cigarette lighter and electrical socket
6. Rear cigarette lighter and electrical socket
7. Trunk lid handle and switch
8. Door module, driver's door module and passenger door module
9. Rear door switch
10. Switch for the hazard warning signal flasher
11. Dashboard environment panel switches
12. Sun roof switch.

Sensors



1. Engine coolant temperature (ECT) sensor
2. Outer temperature sensor
3. Parking brake switch
4. Pedal sensor for the power brake booster
5. Brake fluid level sensor
6. Engine coolant level sensor
7. Left fuel level sensor
8. Oil pressure sensor
9. Yaw rate and lateral acceleration sensors
10. Accelerator pedal (AP)
11. Clutch pedal position sensor
12. Stop lamp switch
13. Back-up (reversing) lamps switch
14. Start switch.

Miscellaneous, electrical components



1. Horn
2. Motor for headlamp beam height control
3. Door mirror
4. Fuel pump (FP) with sensor, right-hand side
5. Motor for the fuel tank filler cover
6. Data Link Connector (DLC).

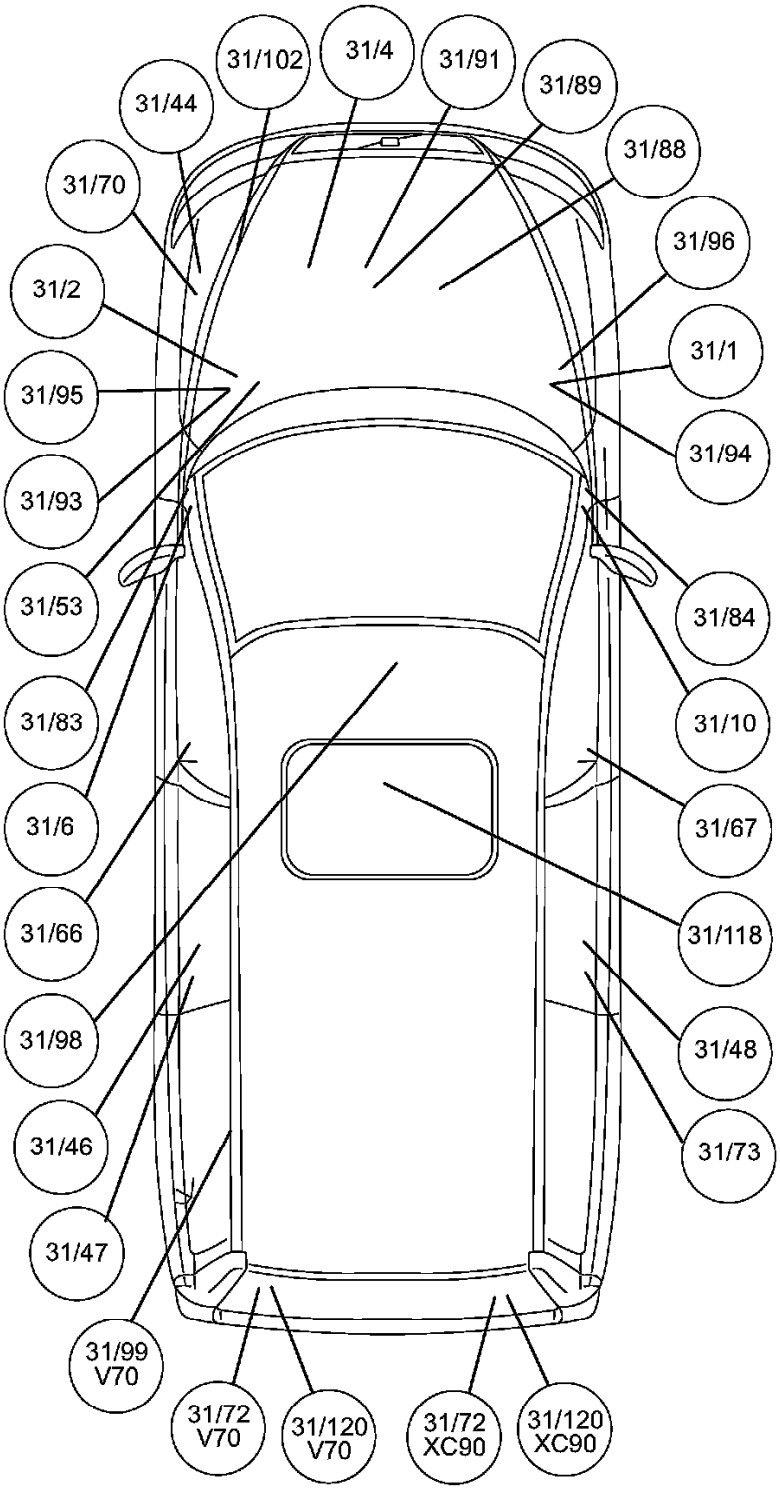
Overview



Overview

31/1	Right MacPherson strut tower
6/3	Right-hand headlight wiper motor, V70
6/104	High pressure headlight washer motor
7/5	Washer fluid level sensor

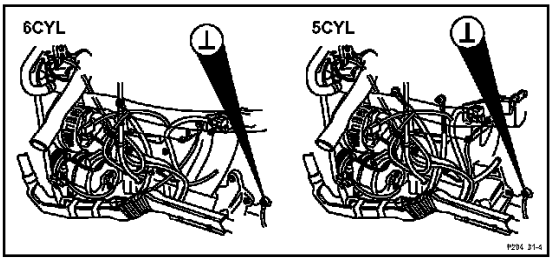
31/2	Left MacPherson strut tower
4/71	Cooling fan control module

31/2

31/4	Engine
31/44	Ground connection

31/4

31/4 Ground connection, Engine



31/4 Ground Connection, Engine

31/6	A-post, left-hand side
3/6	Hazard warning flasher switch
4/31	Fan control module, RHD
4/33	Sunroof Control Module (SRM)
4/56	Central Electronic Module (CEM), LHD
10/29	Glove compartment lighting
10/125	Left-hand front courtesy lighting
10/126	Right-hand front courtesy lighting
16/65	Antenna ring/ignition switch illumination

31/6

31/10	A-post, right-hand side
4/31	Fan control module, LHD
4/56	Central Electronic Module (CEM), RHD
4/84	Suspension Module (SUM), V70
9/1	Outlet 12V front
9/25	Outlet 12V rear

31/10

31/44	Left-hand side member, lower engine compartment
31/4	Ground connection

31/44

31/46	Rear seat riser, left-hand side
3/27	Switch unit, power passenger seat, RHD
3/76	Left-hand rear door lock unit
3/85	Rear left door power window switch
4/52	Power Seat Module (PSM), LHD
4/82	Differential Electronic Module (DEM)
8/51	Front left side airbag igniter
9/12	Seat Heater Module (SHM), left-hand

31/46

31/47	Rear seat riser, left-hand side
4/58	Rear Electronic Module (REM)
8/66	Left-hand inflatable curtain igniter, V70

31/47

31/48	Rear seat riser, right-hand side
4/83	Fuel pump control module
6/31	Feed pump, ejectors
6/33	Fuel pump

31/48

31/53	Firewall
1/1	Battery

31/53

31/66	Front seat riser, left-hand side
3/126	Driver/Passenger Door Module (DDM)/(PDM)
10/15	Direction indicator, left front door, XC90

31/66

31/67	Front seat riser, right-hand side
2/139	Deadlock relay, right-hand rear door, PCL
3/27	Switch unit, power passenger seat, LHD
3/77	Right-hand rear door lock unit, PCL
3/86	Rear right door power window switch
3/127	Passenger/Driver Door Module (PDM)/(DDM)
4/52	Power Seat Module (PSM), RHD
6/35	Fuel pump, auxiliary heater
7/93	Occupant Weight Sensor (OWS)
8/52	Front right side airbag igniter
9/13	Seat Heater Module (SHM), right-hand
10/16	Direction indicator, right front door, XC90

31/67

31/70	Left-hand side member, lower engine compartment
10/65	Front right auxiliary light, accessory
10/69	Front left auxiliary light, accessory

31/70

31/72	Cargo compartment
4/58	Rear Electronic Module (REM)
4/86	Parking Assistance Module (PAM)
6/32	Rear window wiper motor
6/76	Climate control system, rear XC90
7/100	Inclination Sensor Module (ISM)
7/137	Glass breakage sensor, tailgate, V70
8/66	Left-hand inflatable curtain igniter, XC90
9/2	Heated rear window
10/18	Rear left lamp housing
16/15	CD-changer, accessory, V70
16/45	Road Traffic Information module, (RTI), V70

31/72

31/73	Rear seat riser, right-hand side
8/76	Gas tank valve, Bi-Fuel
8/85	Thermal switch and electric fuel filter heating, Diesel
8/88	Solenoid, fuel tank CNG rear, Bi-Fuel
8/89	Solenoid, fuel tank CNG front left, Bi-Fuel
8/90	Solenoid, fuel tank CNG front right, Bi-Fuel
10/17	Rear right lamp housing
16/79	Bass speaker, V70
16/79	Subwoofer Module (SUB), XC90
16/81	LCD-screen accessory, XC90
16/82	DVD-player accessory, XC90
17/19	12V outlet, cargo compartment
54/98	Connector cable harness accessory, XC90

31/73

31/83	A-post, left-hand side
3/117	Dome light control module
4/33	Sunroof Control Module (SRM)
4/70	Upper Electronic Module (UEM)
4/76	Remote control unit for garage door opener
5/1	Driver Information Module (DIM)
7/122	Mass Movement Sensor (MMS), front
7/149	Rain Sensor Module (RSM)
7/158	Mass movement sensor MMS, rear, XC90
10/25	Ceiling light, cargo compartment, V70
10/114	Left-hand vanity mirror lighting
10/150	Rear reading light
10/172	Reading light, third row of seats, XC90
16/65	Antenna ring/ignition switch illumination
16/108	Multimedia module (MMM), XC90
31/98	Ground connection

31/83

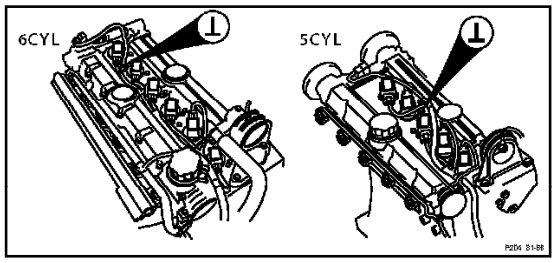
31/84	A-post, right-hand side
3/111	Light Switch Module (LSM)
3/112	Climate Control Module (CCM)
3/254	Steering Wheel Module (SWM)
4/68	Steering Angle Sensor module (SAS)
6/48	Damper Motor Module (DMM), recirculation
6/69	Damper Motor Module (DMM), ventilation/floor/defroster
6/95	Damper Motor Module (DMM), temperature, left-hand side
6/96	Damper Motor Module (DMM), temperature, right-hand side
6/102	Damper Motor Module (DMM), defroster
6/103	Damper Motor Module (DMM), floor/ventilation
7/159	Air Quality Sensor (AQS)
16/1	Audio Module (AUM), V70
16/2	Amplifier, V70
16/46	RTI display, V70
16/46	Multimedia display, XC90
16/60	Phone Module (PHM)
16/93	Control module, cellular phone handsfree, accessory
16/94	Infotainment Control Module (ICM), XC90
16/105	Audio control module (AUD), XC90
16/106	Control module, CD player (MP2), XC90
16/107	Control module, MD player (MP1), XC90
16/108	Multimedia module (MMM), accessory, XC90
17/13	Data link connector
54/112	Connector cable harness Infotainment, XC90

31/84

31/88	Engine, ignition coils, group 1
20/3	Spark plug and ignition coil
20/4	Spark plug and ignition coil

31/88

31/88 Ground connection, Engine ignition coil group 1



31/88 Ground Connection, Engine Ignition Coil Group 1

31/89	Engine, ignition coils, group 2

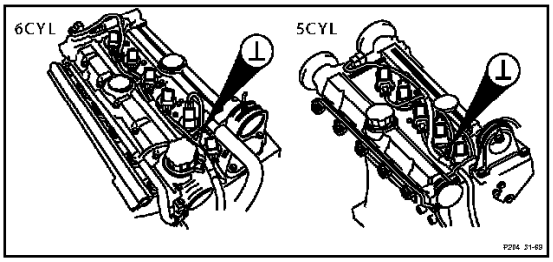
31/89 Ground connection, Engine ignition coil group 2

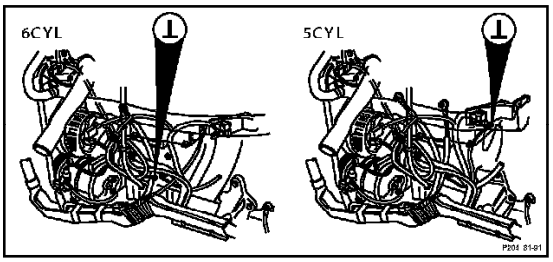


31/89 Ground Connection, Engine Ignition Coil Group 2

31/91	Engine
4/50	Electronic Throttle Module (ETM), Bi-Fuel
9/32	PTC resistor, air preheating, Bi-Fuel

31/91

31/91 Ground connection, Engine



31/91 Ground Connection, Engine

31/93	Left MacPherson strut tower
3/10	Reversing light contact, MAN
3/62	Hood alarm contact
4/7	Combustion Preheater Module (CPM)
4/56	Central Electronic Module (CEM)
4/99	Electronic power steering control module
6/1	Windshield wiper motor
6/38	Left-hand headlight level adjustment motor
6/114	Vacuum pump
6/4	Left-hand headlight wiper motor, V70
7/4	Brake fluid level sensor
7/73	Coolant level sensor
7/51	Accelerator pedal sensor
8/37	Automatic transmission
8/79	Valve LPG, Bi-Fuel
8/134	Solenoid, reverse interlock, manual
9/30	Auxiliary heater
10/1	Left-hand front lamp housing
10/5	Front left fog light
10/11	Front left parking light, XC90
10/13	Front left direction indicator
10/15	Direction indicator front fender left, EU/OS, V70
10/71	Side running light, front left
16/10	Horn 1
16/11	Horn 2, V70
20/16	Capacitor, Bi-Fuel

31/93

31/94	Right MacPherson strut tower
4/28	Transmission Control Module (TCM), AUTO
6/39	Right-hand headlight adjustment motor
10/2	Right-hand front lamp housing
10/6	Front right fog light
10/12	Front right parking light, XC90
10/14	Front right direction indicator
10/16	Direction indicator front fender right, EU/OS, V70
10/73	Side running light, front right
16/35	Siren Control Module (SCM)

31/94

31/95	Left MacPherson strut tower
4/16	Brake Control Module (BCM)

31/95

31/96	Right MacPherson strut tower
4/46	Engine Control Module (ECM)
6/105	Fuel distributor gas, Bi-Fuel
9/32	PTC resistor - air preheating

31/96

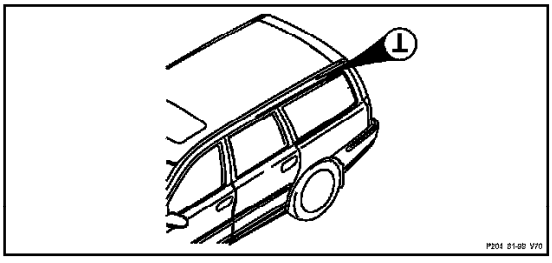
31/98	Windshield member, upper
3/117	Dome light control module
4/33	Sunroof Control Module (SRM)
4/70	Upper Electronic Module (UEM)
4/76	Remote control unit for garage door opener
5/1	Driver Information Module (DIM)
7/122	Mass Movement Sensor (MMS), front
7/149	Rain Sensor Module (RSM)
7/158	Mass Movement Sensor (MMS), rear, XC90
10/25	Ceiling light, cargo compartment, V70
10/114	Left-hand vanity mirror lighting
10/115	Right-hand vanity mirror lighting
10/150	Rear reading light
10/172	Reading light, third row of seats, XC90
16/65	Antenna ring/ignition switch illumination
16/108	Multimedia module (MMM), XC90
31/83	Ground connection

31/98

31/99	Left-hand side window
7/135	Glass breakage sensor, left-hand, V70

31/99

31/99 Ground connection, Side window left



31/99 Ground Connection, Side Window Left

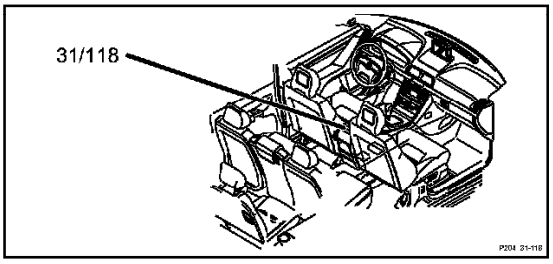
31/102	Front member
2/192	Relay (230V), engine heater, accessory

31/102

31/118	Between front seats under the armrest
2/237	Disconnect relay, rear speaker
16/122	Rear Audio Separation module (RAS)
16/124	Rear Seat Entertainment module (RSE)

31/118

31/118 Ground connection, Between front seats under the armrest



31/118 Ground Connection, Between Front Seats Under The Armrest

31/120	Cargo compartment, accessory
2/191	Relay, remote parking heater start, radio signal, V70
4/78	Accessory Electronic Module (AEM)
4/106	Control module, remote parking heater start, V70
4/110	Trailer Module
10/218	Indicator light remote start, V70
16/15	CD changer, V70
16/45	Road Traffic Information module (RTI), V70
16/46	RTI display, V70
16/79	Bass speaker, V70)
16/79	Subwoofer Module (SUB), XC90
17/37	4-pin outlet, cable harness tow hitch
17/38	7-pin outlet, tow hitch cable harness

53/### Junction Points

Junction Points

All references in the diagrams that begin with the numbers 53 (i.e 53/###) are references to the vehicle's Junction Points.

Diagrams for the Junctions Points can be found at Branching Points Diagrams. See: Power and Ground Distribution/Branching Point/Diagrams/Electrical Diagrams

Locations for the Junctions Points can be found within the Harness Locations images at the vehicle level. See: Locations/Harness Locations

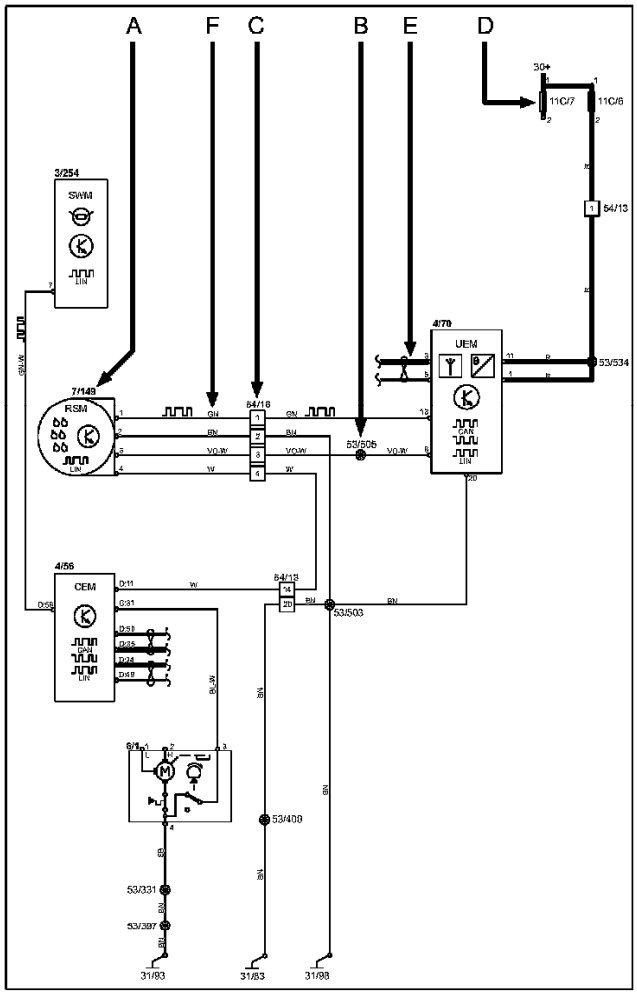
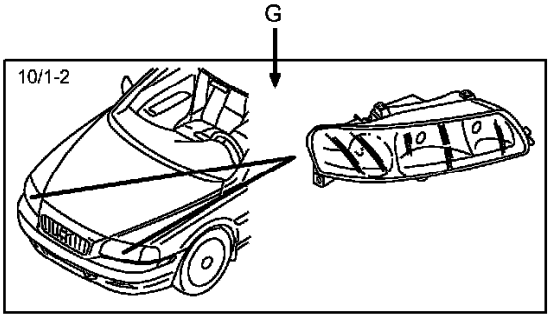
How to Use the Wiring Diagrams

How To Use The Wiring Diagrams



List of symbols

- = System voltage
- = Ground connection via wiring
- = Ground connection in component/chassis
- = Screened wire
- = Junction point
- = Twisted cable
- = Electrical connection
- = Variant
- = CAN communication
- = CAN high data signal (CAN H)
- = CAN low data signal (CAN L)
- = LIN communication
- = LIN communication
- = DIN cable, coaxial cable, etc.
- = Data communication
- = CAN communication
- = MOST communication
- = MOST communication
- = Connection with distribution box
- = Further connection to...
- = Connector between cable harnesses
- = Connector connected in component



The descriptions below apply in general to all wiring diagrams, although not all sections are necessarily contained here.

A. Component designation

Every component has a component designation that consists of two parts.

The first part is a type number that describes the type of component in question, for example 3/xx.

The second part of the designation is a serial number, for example. x/2.

Combined these give a component designation, for example 3/2.

There is a list of components at Component I.D List, where, with the help of the component designation, you can read off the name of the component, for example, 3/2 = light switch. See: Diagram Information and Instructions/Diagram Legend

List of type numbers

The list shows which type of component that respective type numbers refer to, for example, 3/x = switch, 6/x = electric motor, etc.

1 Battery
2 Relay
3 Switch
4 Control module
5 Driver information module
6 Electric motor
7 Sensor
8 Actuator
9 Heating element
10 Light
11 Fuse
15 Electrical distribution rail/box
16 Audio
17 Service/diagnostics
18 Contact reel
19 Meter
20 Ignition component/shunt
26 Converter
27 Optics
31 Ground connection
53 Junction point
54 Connector

B. Junction points

The wiring diagrams contain numbered Junction points, for example 53/352.

This information contains a section (Junction Points Diagrams) with a list of junction points. This list shows all the components that are connected to each junction point. See: Power and Ground Distribution/Branching Point/Diagrams/Electrical Diagrams

The location of the junction points is shown in the Vehicle Level Harness Locations images. See: Locations/Harness Locations

C. Connectors

Connectors provide a bridge between two cable harnesses and are described in the Vehicle Level Connector Views. See: Connector Views

D. Electrical distribution

Operation of the fuses and relays is shown in the "Power and Ground Distribution Diagrams". See: Power and Ground Distribution/Diagrams/Electrical Diagrams

E. Data communication

Today's cars are equipped with CAN, LIN & MOST networks that transmit information. Connections to these networks are shown in their entirety on the respective wiring diagram. Complete information on Data communication can be found in the "Information Bus". See: Powertrain Management/Computers and Control Systems/Information Bus/Diagrams/Electrical Diagrams

F. Abbreviations

A number of different abbreviations are used in the diagrams. These are explained in the "Wire Color Code And Other Abbreviations". See: Diagram Information and Instructions/Wire Color Code and Other Abbreviations

G. Component location

The appearance and location of components is described in alphabetical order at the Vehicle Level component locations A - Z Component List. See: Locations/Component Locations/A - Z Component List

List of Components By Component Number

6/1	Windshield wiper motor XC90
6/3	Right-hand headlight wiper motor
6/4	Left-hand headlight wiper motor
6/15	Sunroof motor V70
6/15	Sunroof motor XC90
6/16	Driver seat motor, backrest angle
6/17	Driver seat motor, up/down front edge
6/18	Driver seat motor, up/down rear edge
6/19	Driver seat motor, forward/backward
6/20	Passenger seat motor, forward/backward
6/25	Starter motor V70
6/25	Starter motor XC90
6/26	Alternator V70
6/26	Alternator XC90
6/28	Motor, passenger compartment fan
6/29	Motor cooling fan V70
6/29	Motor cooling fan XC90
6/31	Feed pump, ejectors
6/32	Rear window wiper motor V70
6/32	Rear window wiper motor XC90
6/33	Fuel pump V70
6/33	Fuel pump XC90
6/35	Fuel pump auxiliary heater V70
6/35	Fuel pump auxiliary heater XC90
6/37	Lock motor fuel filler cover V70
6/37	Lock motor fuel filler cover XC90
6/38	Left-hand headlight level adjustment motor
6/39	Right-hand headlight adjustment motor
6/44	Cooling fan electronics box engine compartment V70
6/44	Cooling fan electronics box engine compartment XC90
6/48	Damper Motor Module (DMM), recirculation
6/58	Front left power window motor V70
6/58	Front left power window motor XC90
6/60	Front right power window motor V70I
6/60	Front right power window motor XC90
6/62	Left power door mirror V70
6/62	Left power door mirror XC90
6/63	Right power door mirror V70
6/63	Right power door mirror XC90
6/64	Passenger seat motor, backrest angle
6/65	Passenger seat motor, up/down front edge
6/66	Passenger seat motor, up/down rear edge
6/67	Pump fuel leakage control, V70I
6/67	Pump fuel leakage control, XC90
6/69	Damper Motor Module (DMM), ventilation/floor/defroster
6/71	Valve speed-dependent power steering, XC90
6/73	Coolant pump auxiliary heater V70
6/73	Coolant pump auxiliary heater XC90
6/76	Climate control system, rear
6/92	Left rear power window motor V70
6/92	Left rear power window motor XC90
6/93	Right rear power window motor V70
6/93	Right rear power window motor XC90
6/95	Damper Motor Module (DMM), temperature, left-hand side
6/96	Damper Motor Module (DMM), temperature, right-hand side
6/102	Damper Motor Module (DMM), defroster
6/103	Damper Motor Module (DMM), floor/ventilation
6/104	Washer motor headlight high pressure V70
6/104	Washer motor headlight high pressure XC90
6/105	Fuel distributor, gas
6/114	Vacuum pump
6/120	Engine throttle body V70
6/120	Engine throttle body XC90
6/127	Washer motor V70
6/127	Washer motor XC90
7/4	Brake fluid level sensor
7/5	Sensor washer fluid level V70
7/5	Sensor washer fluid level XC90
7/6	Oil pressure monitor V70
7/6	Oil pressure monitor XC90
7/8	Pressure sensor climate control system V70
7/8	Pressure sensor climate control system XC90
7/10	Interior temperature sensor
7/11	Sensor ambient temperature V70
7/11	Sensor ambient temperature XC90
7/12	Solar sensor, dusk sensor and indication alarm V70
7/12	Solar sensor, dusk sensor and indication alarm XC90
7/15	Heated oxygen sensor
7/16	Sensor coolant temperature V70
7/16	Sensor coolant temperature XC90
7/17	Mass airflow sensor (MAF) V70
7/17	Mass airflow sensor (MAF) XC90
7/23	Knock sensor rear
7/24	Front knock sensor
7/25	Pulse sensor V70 Diesel
7/25	Pulse sensor XC90 Diesel
7/25	Pulse sensor V70 Gasoline
7/25	Pulse sensor XC90 Gasoline
7/31	Left-hand front ABS sensor
7/32	Right-hand front ABS sensor
7/35	Oil level sensor
7/41	Temperature sensor, evaporator
7/51	Sensor accelerator V70
7/51	Sensor accelerator XC90
7/56	Left-hand rear ABS sensor
7/57	Right rear ABS sensor
7/61	Sensor input rpm AW50
7/61	Sensor input rpm 4T65AWD
7/62	Sensor output rpm AW50
7/62	Sensor output rpm 4T65AWD
7/73	Sensor coolant level V70
7/73	Sensor coolant level XC90
7/74	Sensor oil temperature automatic transmission AW50
7/74	Sensor oil temperature automatic transmission 4T65AWD
7/81	Pressure sensor, intake manifold
7/82	Heated oxygen sensor, diagnosis 1
7/87	Acceleration sensor, Four-C, front left
7/88	Acceleration sensor, Four-C, front right
7/89	Acceleration sensor, Four-C, rear left

7/91	Sensor steering wheel angle V70
7/91	Sensor steering wheel angle XC90
7/93	Occupant Weight Sensor (OWS)
7/100	Inclination Sensor Module (ISM) V70
7/100	Inclination Sensor Module (ISM) XC90
7/103	Heated oxygen sensor 3
7/105	Sensor ambient temperature engine control module V70
7/105	Sensor ambient temperature engine control module XC90
7/108	Side impact sensor rear left V70
7/108	Side impact sensor rear left XC90
7/109	Side impact sensor rear right V70
7/109	Side impact sensor rear right XC90
7/110	Left-hand seat temperature sensor
7/111	Right-hand seat temperature sensor
7/115	Side impact sensor front left V70
7/115	Side impact sensor front left XC90
7/116	Side impact sensor front right V70
7/116	Side impact sensor front right XC90
7/118	Acceleration sensor, shock absorber, Four-C, front left
7/119	Acceleration sensor, shock absorber, Four-C, front right
7/120	Angle sensor Four-C/Bi-Xenon rear left V70
7/120	Angle sensor Four-C/Bi-Xenon rear left XC90
7/121	Angle sensor Four-C/Bi-Xenon rear right
7/122	Mass Movement Sensor (MMS), front V70
7/122	Mass Movement Sensor (MMS), front XC90
7/123	Sensor clutch pedal V70
7/123	Sensor clutch pedal XC90
7/124	Sensor brake pedal V70
7/124	Sensor brake pedal XC90
7/129	Brake pressure sensor 2 V70
7/129	Brake pressure sensor 2 XC90
7/130	Sensor fuel level ejector side V70
7/130	Sensor fuel level ejector side XC90
7/131	Parking assistance sensor, rear 1
7/132	Parking assistance sensor, rear 2
7/133	Parking assistance sensor, rear 3
7/134	Parking assistance sensor, rear 4
7/135	Glass breakage sensor, left-hand
7/136	Glass breakage sensor, right-hand
7/137	Glass breakage sensor, tailgate
7/139	Brake pressure sensor 1 V70
7/139	Brake pressure sensor 1 XC90
7/143	Sensor fuel level pump side V70
7/143	Sensor fuel level pump side XC90
7/149	Rain Sensor Module (RSM) V70
7/149	Rain Sensor Module (RSM) XC90
7/153	Sensor, fuel level LPG
7/156	Pressure and temperature sensor CNG
7/156	Pressure and temperature sensor fuel
7/158	Mass Movement Sensor (MMS), rear
7/159	Air Quality Sensor (AQS)
7/162	Pressure sensor fuel lines V70
7/162	Pressure sensor fuel lines XC90
7/164	Body Sensor Cluster (BSC)
7/165	Pressure and temperature sensor, intake manifold
7/172	Position sensor, camshaft, intake side
7/173	Position sensor camshaft exhaust side Diesel
7/173	Position sensor camshaft exhaust side Gasoline
7/175	Weight sensor passenger seat, seat belt reminder
7/178	RH front impact sensor
7/179	LH front impact sensor
7/201	Pressure and temperature sensor, gas
7/204	Parking assistance sensor, front 5 LHD
7/205	Parking assistance sensor, front 6 LHD
7/206	Parking assistance sensor, front 7 LHD
7/207	Parking assistance sensor, front 8 LHD
8/3	Electromagnetic clutch climate control system V70
8/3	Electromagnetic clutch climate control system XC90
8/6-10	Injectors Diesel
8/6-11	Injectors Gasoline
8/17	EGR valve, Diesel V70
8/17	EGR valve, Diesel XC90
8/18	EVAP valve V70
8/18	EVAP valve XC90
8/19	Solenoid, variable valve time, inlet
8/20	Shock absorber, Four-C, front left
8/21	Shock absorber, Four-C, front right
8/22	Shock absorber, Four-C, rear left
8/23	Shock absorber, Four-C, rear right
8/28	Turbo control valve V70
8/28	Turbo control valve XC90
8/30	Driver side airbag igniter
8/31	Igniter airbag passenger side V70
8/31	Igniter airbag passenger side XC90
8/32	Igniter airbag passenger side stage 2 V70
8/32	Igniter airbag passenger side stage 2, XC90
8/33	Igniter belt tensioner front left V70
8/33	Igniter belt tensioner front left XC90
8/34	Igniter belt tensioner front right V70
8/34	Igniter belt tensioner front right XC90
8/36	Shift lock solenoid
8/37	Automatic transmission AW50
8/37	Automatic transmission 4T65AWD
8/38	Gearshifting solenoid 1 AW50
8/38	Gearshifting solenoid 1 4T65AWD
8/39	Gearshifting solenoid 2 AW50
8/39	Gearshifting solenoid 2 4T65AWD
8/40	Lock-up solenoid AW50
8/40	Lock-up solenoid 4T65AWD
8/41	Pressure solenoid AW50
8/41	Pressure solenoid 4T65AWD
8/46	Activation unit DSTC V70
8/46	Activation unit DSTC XC90
8/51	Igniter side airbag front left V70
8/51	Igniter side airbag front left XC90
8/52	Igniter airbag front right V70
8/52	Igniter airbag front right XC90
8/55	Rear left belt tensioner igniter
8/56	Rear right belt tensioner igniter
8/61	Driver side airbag igniter step 2
8/62	Igniter belt tensioner center rear V70
8/62	Igniter belt tensioner center rear XC90
8/64	Solenoid valve engine mounting, Diesel V70
8/64	Solenoid valve engine mounting, Diesel XC90
8/66	Igniter inflatable curtain left V70
8/66	Igniter inflatable curtain left XC90
8/67	Igniter inflatable curtain right V70
8/67	Igniter inflatable curtain right XC90
8/71	Throttle solenoid
8/72	Shift solenoid 3
8/73	Shift solenoid 4
8/74	Shift solenoid 5
8/75	Valve, fuel cut-off DFCO
8/76	Gas tank valve
8/78	Oil pressure sensor
8/79	Valve LPG
8/81	Solenoid variable valve timing exhaust V70

7/91 Through 8/81

8/81	Solenoid variable valve timing exhaust XC90
8/82	Solenoid variable turbo geometry, Diesel V70
8/82	Solenoid variable turbo geometry, Diesel XC90
8/84	Switch, vacuum pump
8/85	Thermal switch and fuel filter heating V70
8/85	Thermal switch and fuel filter heating XC90
8/88	Solenoid, gas tank CNG rear
8/89	Solenoid, fuel tank CNG front left
8/90	Solenoid, fuel tank CNG front right
8/94	Left-hand belt tensioner igniter, third row of seats
8/95	Right-hand belt tensioner igniter, third row of seats
8/96	Left-hand inflatable curtain igniter, third row of seats
8/97	Right-hand inflatable curtain igniter, third row of seats
8/99	Igniter, steering column
8/111	Solenoid valve, high-pressure diesel
8/123	Igniter airbag driver side stage 3, XC90
8/124	Igniter passenger side airbag stage 3, XC90
8/134	Solenoid, reverse interlock, manual
9/1	Outlet 12V front V70
9/1	Outlet 12V front XC90
9/2	Heated rear window V70
9/2	Heated rear window XC90
9/12	Seat Heater Module (SHM), left-hand
9/13	Seat Heater Module (SHM), right-hand
9/16	Left-hand backrest heating element
9/17	Right-hand backrest heating element
9/18	Left-hand seat heating element
9/19	Right-hand seat heating element
9/25	Outlet 12V rear V70
9/25	Outlet 12V rear XC90
9/30	Auxiliary heater V70
9/30	Auxiliary heater XC90
9/32	PTC resistor - air preheating
9/33	Left-hand heated door mirror
9/34	Right-hand heated door mirror
10/1	Front left lamp housing V70
10/1	Front left lamp housing XC90
10/2	Front right lamp housing V70
10/2	Front right lamp housing XC90
10/3	License plate lighting V70
10/3	License plate lighting, XC90
10/5	Front left fog light V70
10/5	Front left fog light XC90
10/6	Front right fog light V70
10/6	Front right fog light XC90
10/11	Front left running/parking light V70
10/11	Front left running/parking light XC90
10/12	Front right running/parking light V70
10/12	Front right running/parking light XC90
10/13	Front left direction indicator V70
10/13	Front left direction indictor XC90
10/14	Front right direction indicator V70
10/14	Front right direction indicator XC90
10/15	Direction indicator left front fender V70
10/15	Direction indicator, left front door, XC90
10/16	Direction indicator right front fender V70
10/16	Direction indicator, right front door, XC90
10/17	Lamp housing rear right V70
10/17	Rear right lamp housing XC90
10/18	Rear left lamp housing V70
10/18	Rear left lamp housing XC90
10/19	Extra brake light V70
10/19	Extra brake light XC90
10/25	Ceiling light, cargo compartment
10/29	Lighting glove compartment V70
10/29	Lighting glove compartment XC90
10/43	Brake light right V70
10/43	Brake light right XC90
10/44	Tail light 1 right V70
10/44	Tail light 1 right XC90
10/45	Tail light 2 right V70
10/46	Fog light rear right V70
10/46	Fog light rear right XC90
10/47	Right rear direction indicator V70
10/47	Right rear direction indicator XC90
10/48	Back-up light right V70
10/48	Back-up light right XC90
10/50	Brake light left V70
10/50	Brake light left XC90
10/51	Tail light 1 left V70
10/51	Tail light 1 left XC90
10/52	Tail light 2 left V70
10/53	Fog light rear left V70
10/53	Fog light rear left XC90
10/54	Left rear direction indicator V70
10/54	Left rear direction indicator XC90
10/55	Back-up light left V70
10/55	Back-up light left XC90
10/64	High beam right V70
10/64	High beam right XC90
10/65	Extra light front right V70
10/65	Extra light front right XC90
10/66	Low beam right V70
10/66	Low beam right XC90
10/68	High beam left V70
10/68	High beam left XC90
10/69	Extra light front left V70
10/69	Extra light front left XC90
10/70	Low beam left V70
10/70	Low beam left XC90
10/71	Side running light front left V70
10/71	Side running light front left XC90
10/72	Front ashtray lighting
10/73	Side running light front right V70
10/73	Side running light front right XC90
10/114	Lighting vanity mirror left V70
10/114	Lighting vanity mirror left XC90
10/115	Lighting vanity mirror right V70
10/115	Lighting vanity mirror right XC90
10/125	Courtesy lighting front left V70
10/125	Courtesy lighting front left XC90
10/126	Courtesy lighting front right V70
10/126	Courtesy lighting front right XC90
10/148	Lighting door mirror left V70
10/148	Lighting door mirror left XC90
10/149	Lighting door mirror right V70
10/149	Lighting door mirror right XC90
10/150	Reading light rear V70
10/150	Reading light rear XC90
10/151	Left-hand rear door switch lighting
10/152	Right-hand rear door switch lighting
10/172	Reading light, third row of seats
10/173	Cargo compartment lighting, tailgate
10/218	Remote start indicator light
11A	Main fuses in engine compartment fuse box
11B	Main fuses in fuse box engine compartment V70
11B	Main fuses in fuse box engine compartment XC90
11C	Fuses in fuse box passenger compartment V70

8/81 Through 11C

11C	Fuses in fuse box passenger compartment XC90
11E	Main fuses at battery V70
11E	Main fuses at battery XC90
11F	Fuses in cargo compartment auxiliary fuse box
15/30	Connecting rail to 15/31
15/31_A1	Engine compartment distribution box
15/31_C1	Engine compartment distribution box
15/31_C2	Engine compartment distribution box
15/31_C3	Engine compartment distribution box
15/31_C4	Engine compartment distribution box
15/31_C5	Engine compartment distribution box
15/31_C6	Engine compartment distribution box
16/1	Audio Module (AUM)
16/2	Amplifier
16/3	Speaker front door right V70
16/3	Speaker front door right XC90
16/4	Speaker front door left V70
16/4	Speaker front door left XC90
16/5	Speaker rear door right V70
16/5	Speaker rear door right XC90
16/6	Speaker rear door left V70
16/6	Speaker rear door left XC90
16/10	Horn 1 V70
16/10	Horn 1 XC90
16/11	Horn 2 V70
16/15	CD changer
16/16	LH window antenna amplifier 1
16/26	Speaker dashboard center V70
16/26	Speaker dashboard center XC90
16/35	Siren Control Module (SCM) V70
16/35	Siren Control Module (SCM) XC90
16/36	TV receiver V70
16/45	Road Traffic Information (RTI)
16/46	RTI display V70
16/46	Multimedia display, XC90
16/47	GPS antenna RTI
16/50	Left-hand rear window antenna
16/54	Right-hand rear window antenna
16/55	Treble speaker front door left V70
16/55	Treble speaker front door left XC90
16/56	Treble speaker front door right V70
16/56	Treble speaker front door right XC90
16/57	Speaker D-pillar left V70
16/57	Speaker D-pillar left XC90
16/58	Speaker D-pillar right V70
16/58	Speaker D-pillar right XC90
16/59	Antenna, remote control
16/60	Phone Module (PHM) V70
16/60	Phone Module (PHM) XC90
16/62	Hand unit cellular telephone V70
16/62	Hand unit cellular telephone XC90
16/63	GPS antenna, cellular telephone
16/64	Antenna cellular telephone V70
16/64	Antenna cellular telephone XC90
16/65	Antenna ring/lighting ignition V70
16/65	Antenna ring/lighting ignition XC90
16/67	Amplifier antenna, bumper
16/68	Antenna, bumper
16/71	Window antenna amplifier 1 right
16/73	Window antenna amplifier 2 left
16/74	Window antenna amplifier 2 right
16/77	Microphone cellular telephone V70
16/77	Microphone cellular telephone XC90
16/78	Speaker, cellular telephone
16/79	Bass speaker, V70
16/79	Subwoofer Module (SUB) XC90
16/81A	TV display, LH head restraint
16/81B	TV display, RH head restraint
16/81	TV display, accessory
16/82	DVD-player
16/82	DVD-player accessory
16/93	Control module, cellular telephone handsfree, V70
16/93	Control module handsfree cellular telephone XC90
16/94	Infotainment Control Module (ICM)
16/105	Audio Module (AUD)
16/106	Control module, CD player (MP2)
16/107	Control module, MD player (MP1)
16/108	Multimedia module (MMM)
16/110	Antenna control module (ATM)
16/111	Socket, rear left headphones
16/112	Socket, rear right headphones
16/122	Rear Audio Separation module (RAS)
16/123	External equipment socket (AUX)
16/124	Rear Seat Entertainment module (RSE)
16/125	IR transmitter
16/126	Holder handsfree cellular telephone V70
16/126	Holder handsfree cellular telephone XC90
16/127	Microphone handsfree cellular telephone V70
16/127	Microphone handsfree cellular telephone XC90
17/13	Data link connector V70
17/13	Data link connector XC90
17/17	Auxiliary start connection V70
17/17	Auxiliary start connection XC90
17/19	Outlet 12 V cargo compartment V70
17/19	Outlet 12 V cargo compartment XC90
17/37	4-pin outlet, tow hitch cable harness V70
17/37	4-pin outlet, tow hitch cable harness XC90
17/38	7-pin outlet, tow hitch cable harness V70
17/38	7-pin outlet, cable harness tow hitch XC90 EU/OS
17/38	7-pin outlet, cable harness tow hitch XC90 USA
17/39	13-pin outlet, tow hitch cable harness V70
17/39	13-pin outlet, tow hitch cable harness XC90
18/4	Contact reel V70
18/4	Contact reel XC90
20/3-8	Spark plug and ignition coil
20/16	Capacitor
20/22-26	Glow plug
26/4	Converter cable harness tow hitch V70
26/4	Converter cable harness tow hitch XC90
31/1	Ground connection, Right MacPherson strut tower, V70
31/1	Ground connection, Right MacPherson strut tower, XC90
31/2	Ground connection, Left MacPherson strut tower, V70
31/2	Ground connection, Left MacPherson strut tower, XC90
31/4	Ground connection, Engine
31/6	Ground connection, A-pillar left side, V70
31/6	Ground connection, A-pillar left side, XC90
31/10	Ground connection, A-pillar right side, V70
31/10	Ground connection, A-pillar right side, XC90
31/44	Ground connection, Left side member lower engine compartment V70
31/44	Ground connection, Left side member lower engine compartment XC90
31/46	Ground connection, Rear seat riser left side, V70

31/46	Ground connection, Rear seat riser left side, XC90
31/47	Ground connection, Rear seat riser right side, V70
31/47	Ground connection, Rear seat riser right side, XC90
31/48	Ground connection, Rear seat riser right side, V70
31/48	Ground connection, Rear seat riser right side, XC90
31/53	Ground connection, Firewall, V70
31/53	Ground connection, Firewall, XC90
31/66	Ground connection, Front seat riser left side, V70
31/66	Ground connection, Front seat riser left side, XC90
31/67	Ground connection, Front seat riser right side, V70
31/67	Ground connection, Front seat riser right side, XC90
31/70	Ground connection, Left side member lower engine compartment, V70
31/70	Ground connection, Left side member lower engine compartment, XC90
31/72	Ground connection, Cargo compartment, V70
31/72	Ground connection, Cargo compartment, XC90
31/73	Ground connection, Rear seat riser right side, V70
31/73	Ground connection, Rear seat riser right side, XC90
31/83	Ground connection, A-pillar left side, V70

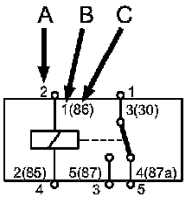
Relays, General

Relays, General

The diagram indicates two or three different designations for the relay's position. This is described below.



A = Corresponds to the position on the back of the relay box (wiring side)
B = Corresponds to the position on the relay.
C = An old designation that may be found on the relay.

VIDA (Vehicle Information & Diagnostics For Aftersales)

VIDA (Vehicle Information & Diagnostics for Aftersales)

During the second half of 2004, VADIS (Volvo Aftersales Diagnostic and Information System) was phased out and replaced by VIDA (Vehicle Information & Diagnostics for Aftersales). The purpose of VIDA is to support service providers in repairing and servicing Volvo vehicles. VIDA provides Service and Parts information, as well as diagnostic fault tracing, and software downloads. As in VADIS, these areas are integrated into one single application. All functionality that could be found in VADIS will be found in VIDA. However, in some particular areas, e.g., the diagnostic work flow, search functionality, and the Parts catalogue, VIDA contains considerable enhancements when compared to VADIS.

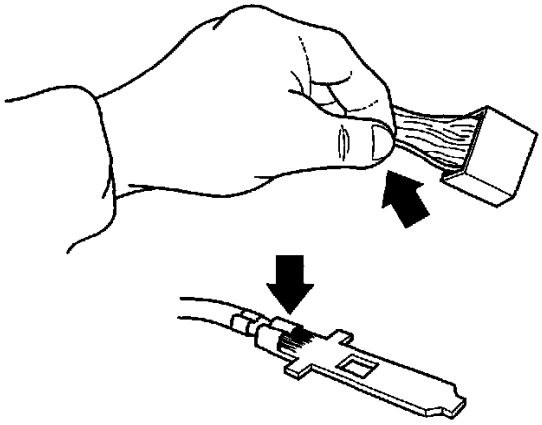
Volvo's VIDA (Vehicle Information & Diagnostics for Aftersales) system ties together service and repair data, parts data, service bulletins, software (firmware) downloads, fault tracing and on-board diagnostic as well as other related information to decrease service time.

Much of the diagnostic information provided here is presented in a manner that assumes the technician is using the web-based Volvo diagnostic system (VIDA) to diagnose the vehicle. Volvo does not provide any information based on performing diagnosis with a third party diagnostic tool aside from a conversion from P Codes to Volvo ECM Codes. See: Powertrain Management/Computers and Control Systems/Testing and Inspection/Diagnostic Trouble Code Descriptions/Conversion Table Standardized Diagnostic Trouble Codes (DTCs)/Volvo Diagnostic Trouble Codes

Check Terminals Visually

Cleaning female socket terminals and male pin terminals
Greasing female terminals

Check terminals visually



NOTE: When checking the engine control module (ECM), do not remove the control module from the car before the main relay has interrupted the power supply. This may take up to **4 minutes** after the ignition has been switched off and the engine cooling fan (FC) has stopped running.

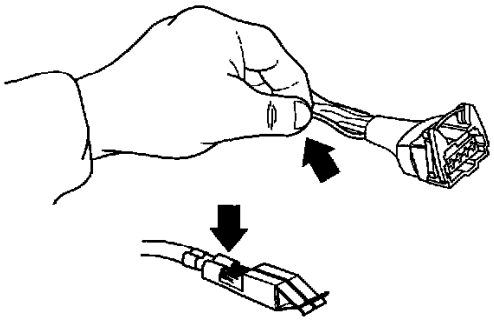
Inspect the terminals visually when checking, or taking readings from, opened connectors.

Repair wiring and cable terminals, using appropriate procedures.

Checks:
- Check for oxidation. This can cause poor connections in the terminals
- Check for damage to pins and terminals. Check that they are properly inserted into the connector. Check that the cable is properly connected to the pin or terminal. Check pins and terminals particularly carefully
- Use a separate male terminal to check the female terminal. Check that they are secure. Pull on the pin.

Contact Resistance and Oxidation

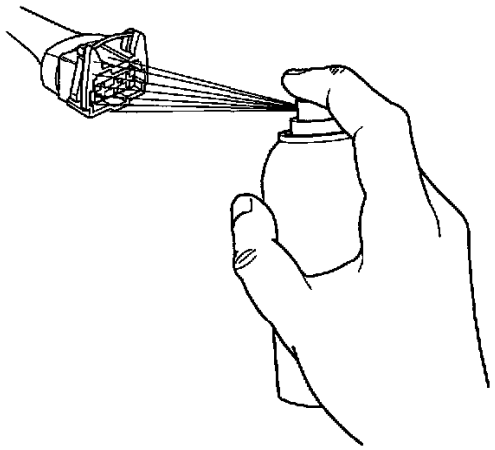
Contact resistance and oxidation



Repair wiring and cable terminals, using appropriate procedures.
In theory, the resistance across contacts, leads and terminals should be **0 [ohm]**. However, there is always some resistance due to terminal oxidation.
If this resistance becomes too great the result will be a malfunction. The magnitude of the resistance before it causes a malfunction depends on the circuit load.

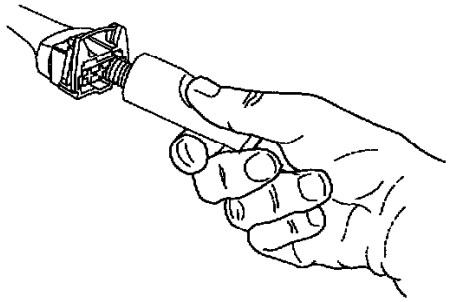
Checks:

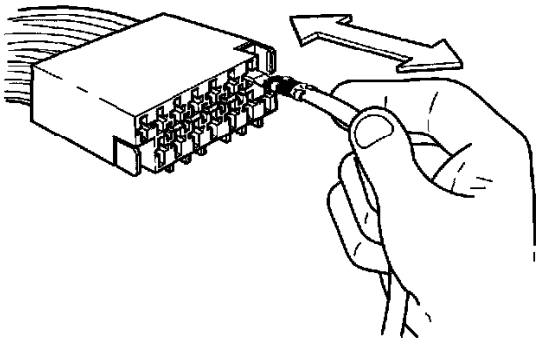
- Check the cables visually according to "Check Terminals Visually."



NOTE: Do not apply rust solvent spray or grease to the Heated Oxygen Sensor (HO2S) or combined instrument panel connectors.

- Ignition off
- Disconnect the battery negative terminal
- Use compressed air to clean the disconnected connector
- Apply rust solvent spray 1161422 to the disconnected connectors
- Blow clean using compressed air.



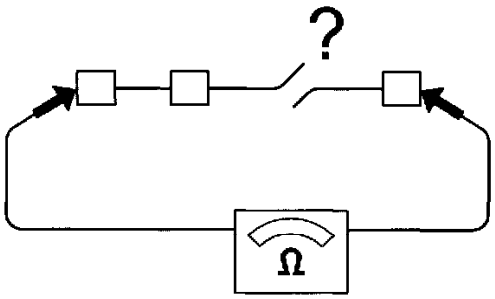


NOTE: Do not fill the protective cover with grease.

- Press grease, P/N 1161417-9, into the female sockets directly from tube
- Check that all the terminal cavities are filled
- Use a loose male pin to ensure that the connection in the sockets is good. The pin should remain in position when pulled gently.

Open-Circuit, Permanent Faults

Open-circuit, permanent faults

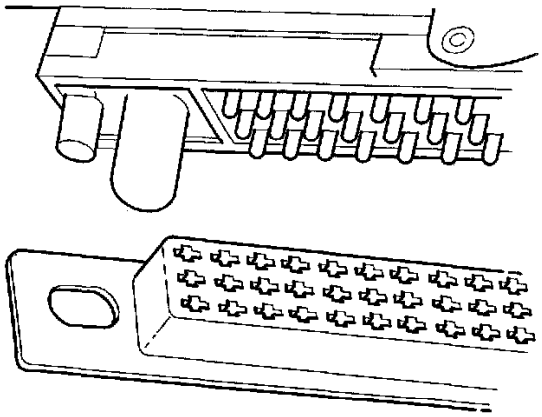


An open-circuit in a cable is indicated by a loss of one or more functions.
Chafed and broken cables or terminals that have come loose are common causes of faults in electrical systems.

Repair wiring and cable terminals, using appropriate procedures.

Checks:
- Disconnect the connectors at both ends of the cable.

Connect an ohmmeter between the ends of the cable.
The ohmmeter should read approximately **0 [ohm]** if there is no open-circuit in the cable



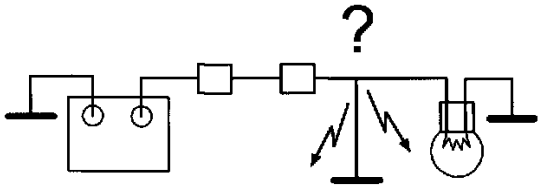
If the reading is not correct. Replace the cable and/or continue, according to "Contact Resistance and Oxidation"

Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, as this can cause faults.

Check pins and terminals particularly for this fault. See "Check Terminals Visually."

Short-Circuit to Ground, Permanent Faults

Short-circuit to ground, permanent faults



A short-circuit between a live cable and ground is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

Repair wiring and cable terminals, using appropriate procedures.

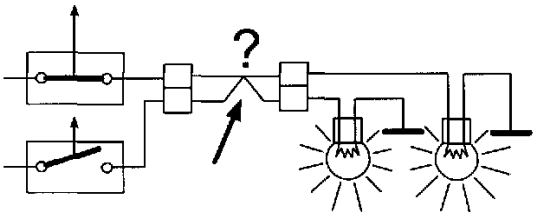
Checks:
- Check terminals visually.
- Activate all switches and sensors in the circuit. Check whether the fuse blows
- Disconnect the connectors in the circuit to ensure that they do not affect readings.

Use an ohmmeter to take a resistance reading between the cable and ground.
The ohmmeter should read infinite resistance if no components are connected.

Check pins and terminals particularly for this fault. See "Check Terminals Visually."

Short-Circuit to Supply Voltage. Permanent Faults

Short-circuit to supply voltage. Permanent faults



A short-circuit between a cable and supply voltage is often indicated by the loss of a function or a fuse blowing when voltage is passed through the cable.

Repair wiring and cable terminals, using appropriate procedures.

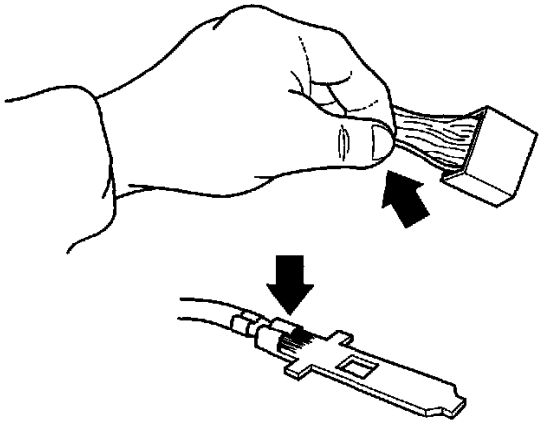
Checks:
- Use a voltmeter to take readings at various points in the circuit while operating switches and sensors.

Voltmeter readings will depend on which circuit is tested and the status of switches and sensors, Use the wiring diagram to determine the correct voltage in the circuit.
Use an ohmmeter between the suspect cables to detect short-circuits between them.
The ohmmeter should read infinite resistance between cables not connected to each other in the circuit.
Check pins and terminals particularly for this fault. See "Check Terminals Visually."

Inspect Terminals Visually

Checking female socket terminals and male pin terminals
Greasing female terminals

Inspect terminals visually



NOTE: When checking the engine control module (ECM), do not remove the control module from the car before the main relay has interrupted the power supply. This may take up to **4 minutes** after the ignition has been switched off and the engine cooling fan (FC) has stopped running.

Inspect the terminals visually when checking, or taking readings from, opened connectors.

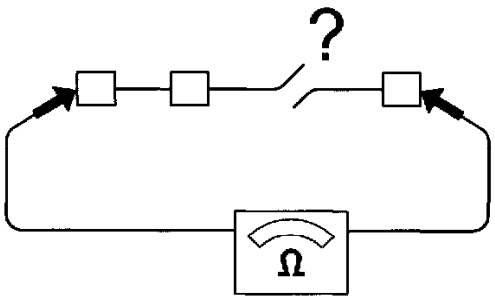
Repair wiring and cable terminals as required, using appropriate procedures.

Checks:
- Check for oxidation. This can cause poor connections in the terminals
- Check for damage to pins and terminals. Check that they are properly inserted into the connector. Check that the cable is properly connected to the pin or terminal. Check pins and terminals particularly carefully

- Using a loose male connector, test to see if the female connector provides a good contact and that the pin remains in place when the male connector is pulled lightly
- Shake the cable lightly and pull on connectors during measurement to locate damage.

Open-Circuit, Intermittent Faults

Open-circuit, Intermittent faults



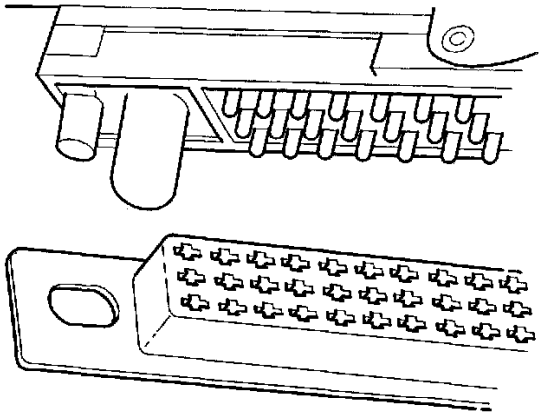
An open-circuit in a cable will be indicated by the loss of a function (or functions).
Chafed and broken leads are common causes of faults.
Repair wiring and cable terminals as required, using appropriate procedures.

Checks:

- Disconnect the connectors at both ends of the cable.

Check the cables visually according to "Inspect Terminals Visually".

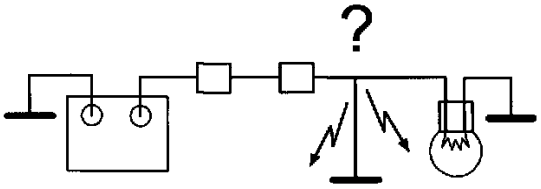
Connect an ohmmeter between the ends of the cable. The ohmmeter should read approximately **0 [ohm]** if there is no open-circuit in the cable.
Shake the cable lightly and pull on connectors during measurement to locate the damage.



If the reading is not correct. Replace the cable and/or continue according to "Contact Resistance and Oxidation".
Always check the control module and control module box connectors to ensure that their pins and sockets are not bent or damaged, this may cause faults.
Check pins and terminals particularly carefully.

Short-Circuit to Ground, Intermittent Faults

Short-circuit to ground, intermittent faults



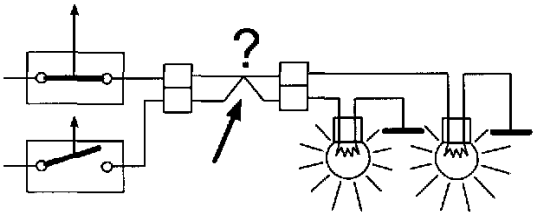
A short-circuit between a live cable and ground is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.
Repair wiring and cable terminals as required, using appropriate procedures.

Checks:
- Check the cables visually according to "Inspect Terminals Visually". Activate all switches and sensors in the circuit. Check whether the fuse blows.
- Disconnect the connectors in the circuit to ensure that they do not affect readings.

Connect an ohmmeter between cable and ground. The ohmmeter should read infinite resistance if no components are connected.
Shake the cable lightly and pull on connectors during measurement to locate the damage.
If the value is not correct, try a new cable and/or continue according to "Contact Resistance and Oxidation".

Short-Circuit to Supply Voltage. Intermittent Faults

Short-circuit to supply voltage, intermittent faults



A short-circuit between a cable and supply voltage is often indicated by the loss of a function or a fuse blowing when a current is passed through the cable.

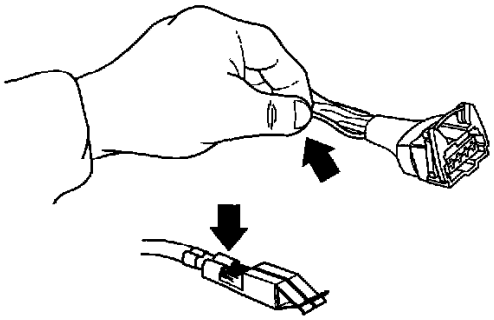
Repair wiring and cable terminals, using appropriate procedures.

Checks:
- Check the cables visually according to "Inspect Terminals Visually". Use a voltmeter to take readings at various points in the circuit while operating switches and sensors.

The voltmeter reading depends on the circuit being tested and the positions of switches and sensors. Use the wiring diagram to determine the correct voltage in the circuit.
Use an ohmmeter between the suspect cables to detect short-circuits between them.
The ohmmeter should read infinite resistance between cables not connected to each other in the circuit. Shake the cable lightly and pull on connectors during measurement to locate the damage.
If the reading is not correct. Replace the cable and/or continue according to "Loose Connections (Terminals)".

Loose Connections (Terminals)

Loose connections (terminals)



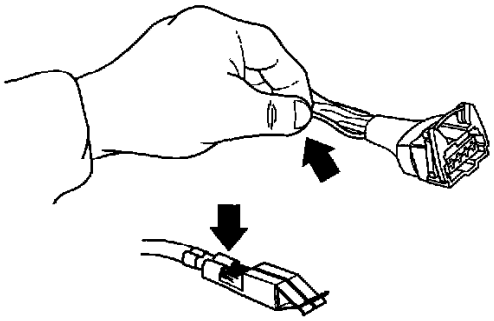
Repair wiring and cable terminals, using appropriate procedures.

Loose connections in terminals may be caused by oxidation of the pins and sockets, or by a faulty connection of a cable to its cable terminal.
Loose connections produce the same faults as an intermittent open-circuit in a cable.

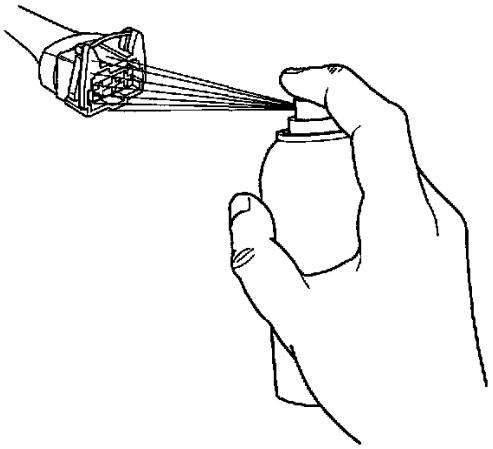
Checks:
- Inspect terminals visually according to "Inspect Terminals Visually". Continue according to "Contact Resistance and Oxidation".

Contact Resistance and Oxidation

Contact resistance and oxidation

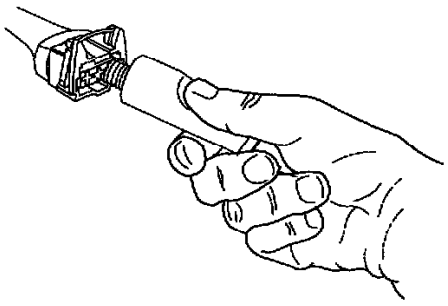


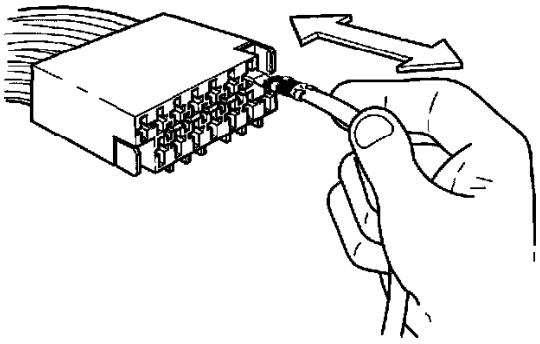
In theory, the resistance across contacts, leads and terminals should be **0 [ohm]**. However, there is always some resistance due to terminal oxidation.
If resistance is too great there will be function problems.
The magnitude of the resistance before it causes a malfunction depends on the circuit load. A guideline would be a few ohms.



NOTE: Do not apply rust solvent spray or grease to the Heated Oxygen Sensor (HO2S) or combined instrument panel connectors.

- Ignition off
- Disconnect the battery negative terminal
- Use compressed air to clean the disconnected connector
- Apply rust solvent spray 1161422 to the disconnected connectors
- Blow clean using compressed air.





NOTE: Do not fill the protective cover with grease.

- Press grease, P/N 1161417-9, into the terminals directly from the tube
- Check that all the cavities in the connectors are filled
- Use a loose male pin to ensure that contact in sockets is good. The pin should remain in position when pulled gently.

Connector

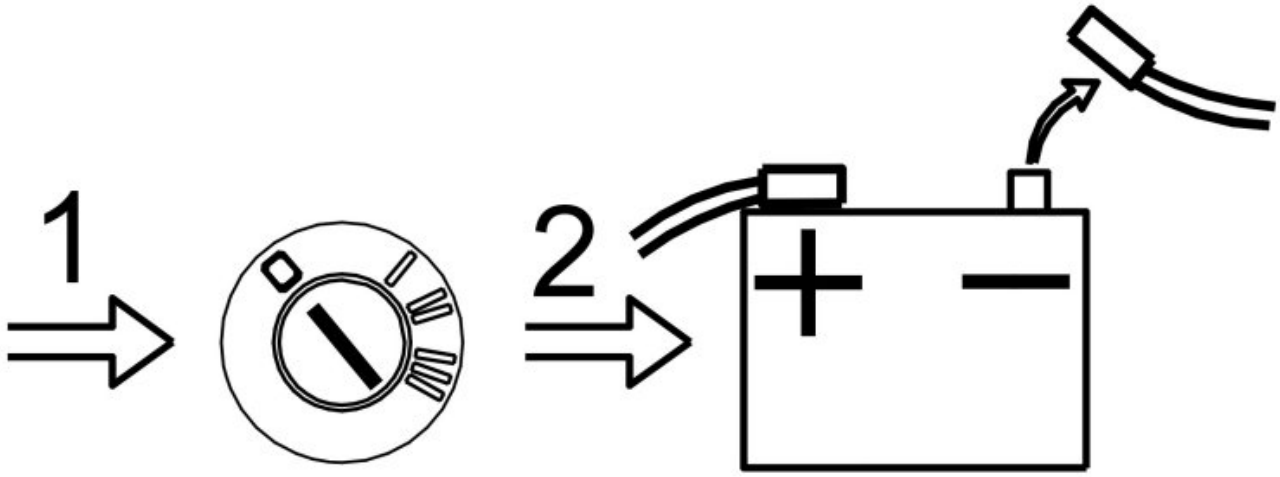
Connectors, repair

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

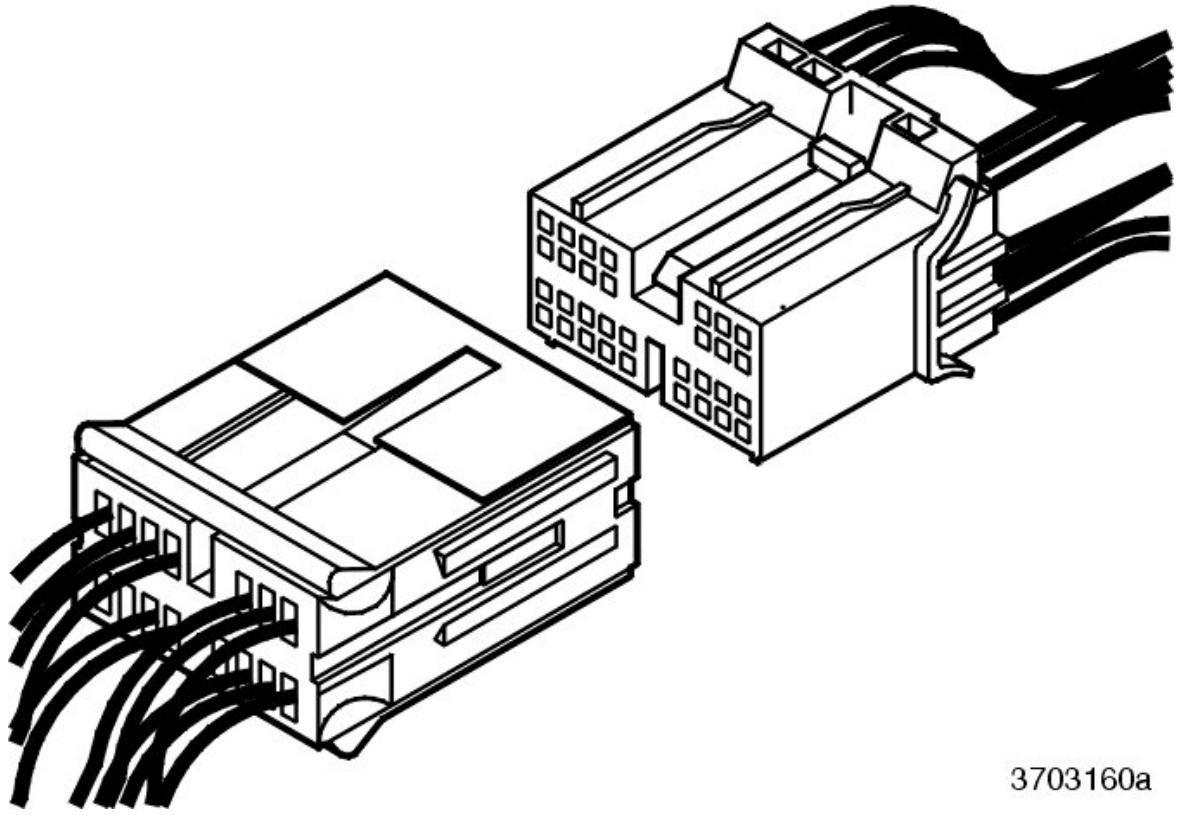
Connector

The commonest types of connector and central electrical unit in the vehicle are listed here.
For more information about secondary locking, primary locking, terminal removal tools, etc., see the link by each type of connector.

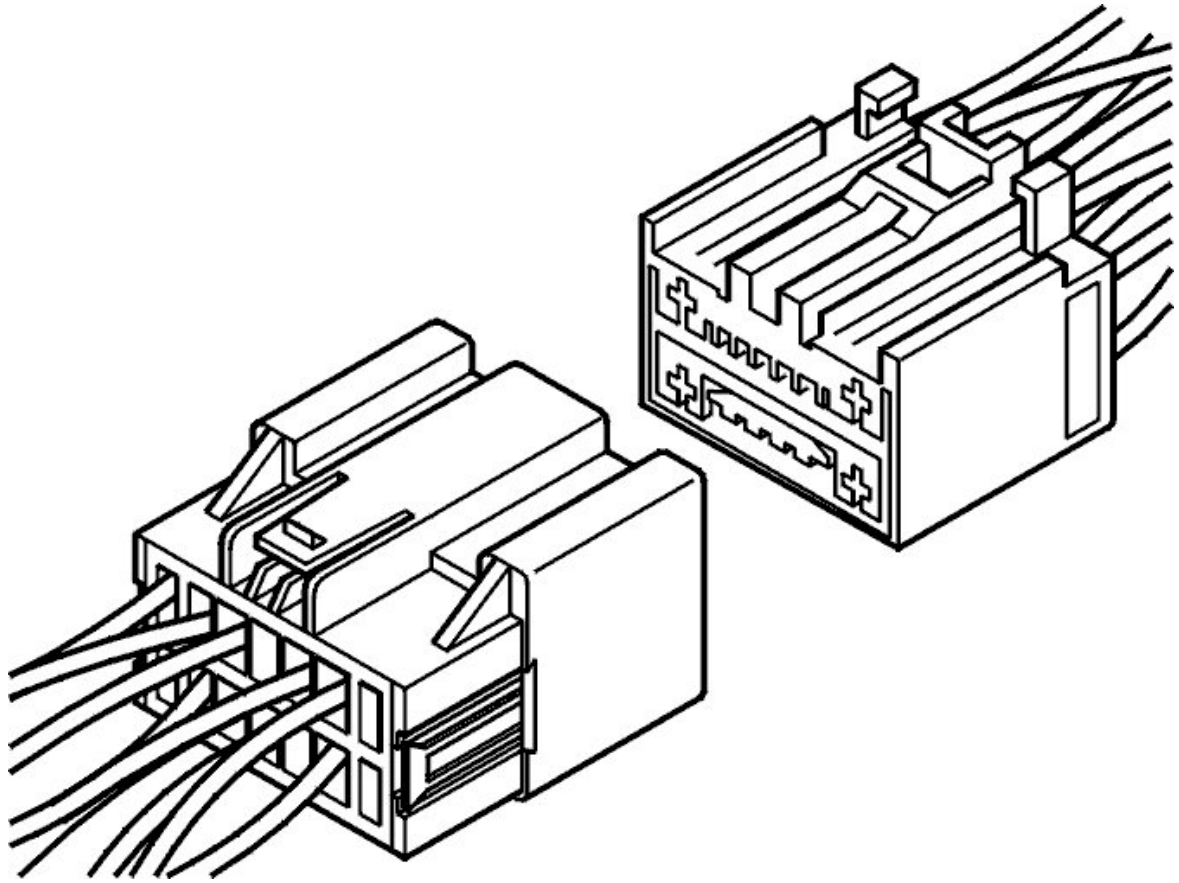
Note! Before working in the connector, disconnect the battery negative terminal, Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.



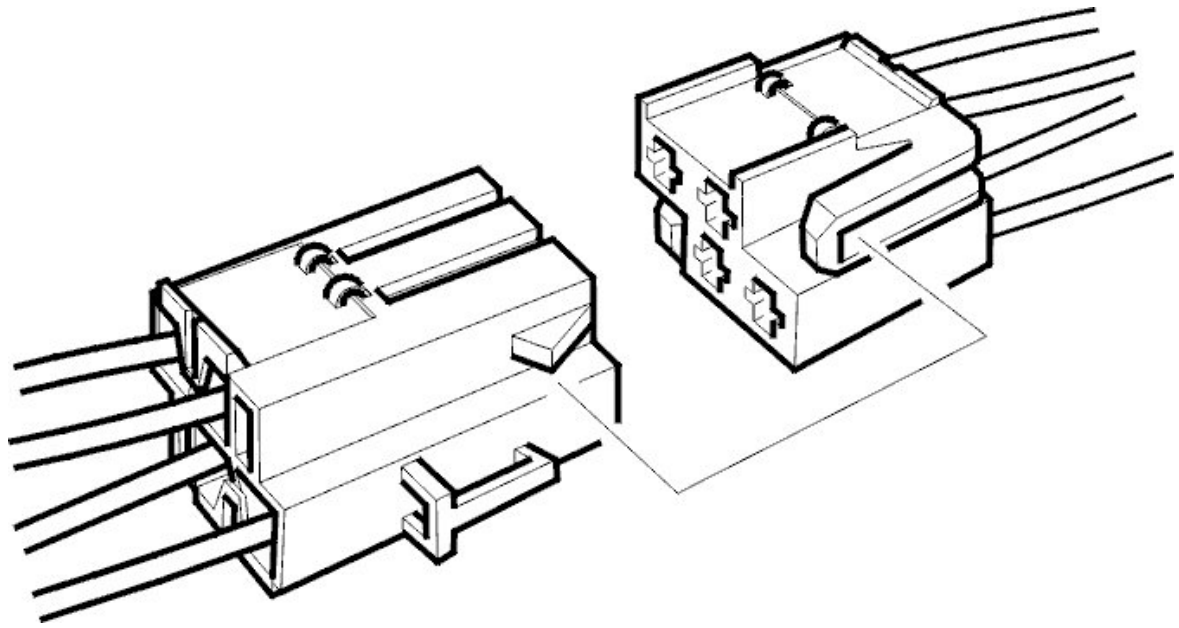
Note! When several tools are recommended for the same type of connector, choose the correct tool according to the size of the lock.



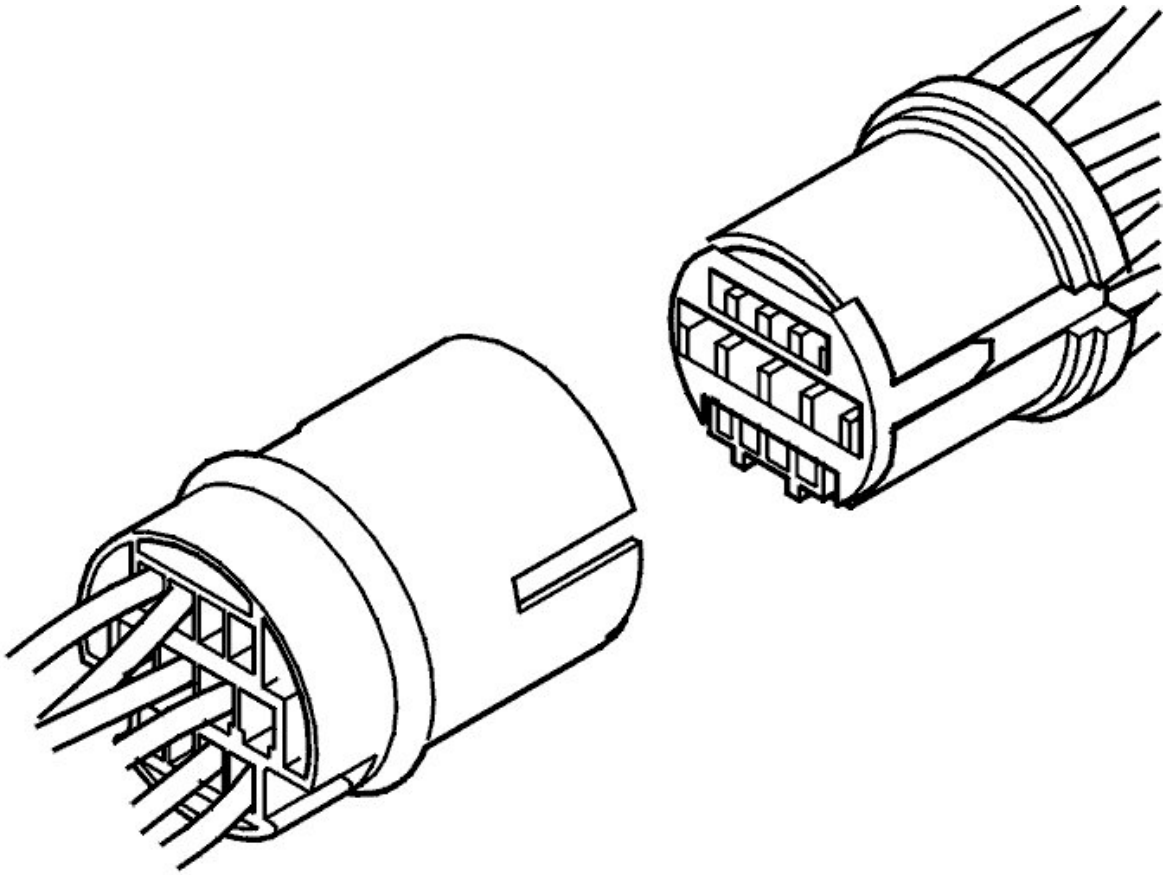
Connectors occur in a number of variants with different numbers of conductors. See Connectors, repair. See: Diagnostic Aids/Connectors, Repair/Connector Type 1



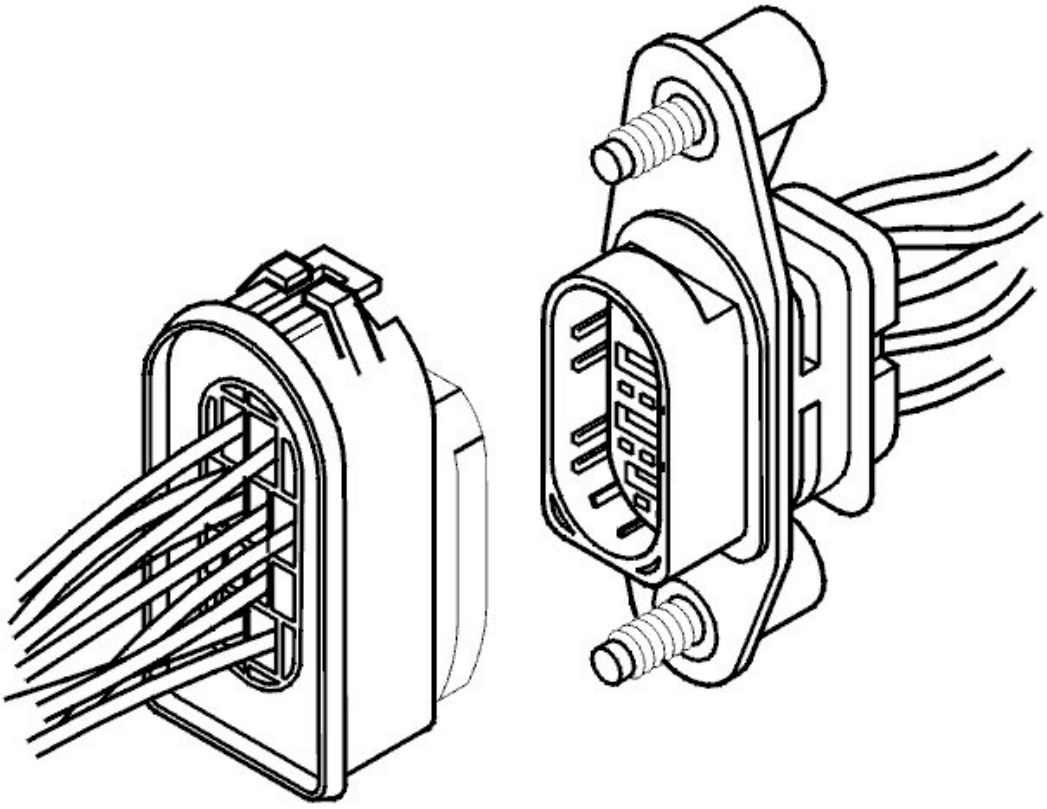
Connectors occur in a number of variants with different numbers of conductors. See Connectors, repair. See: Diagnostic Aids/Connectors, Repair/Connector Type 2



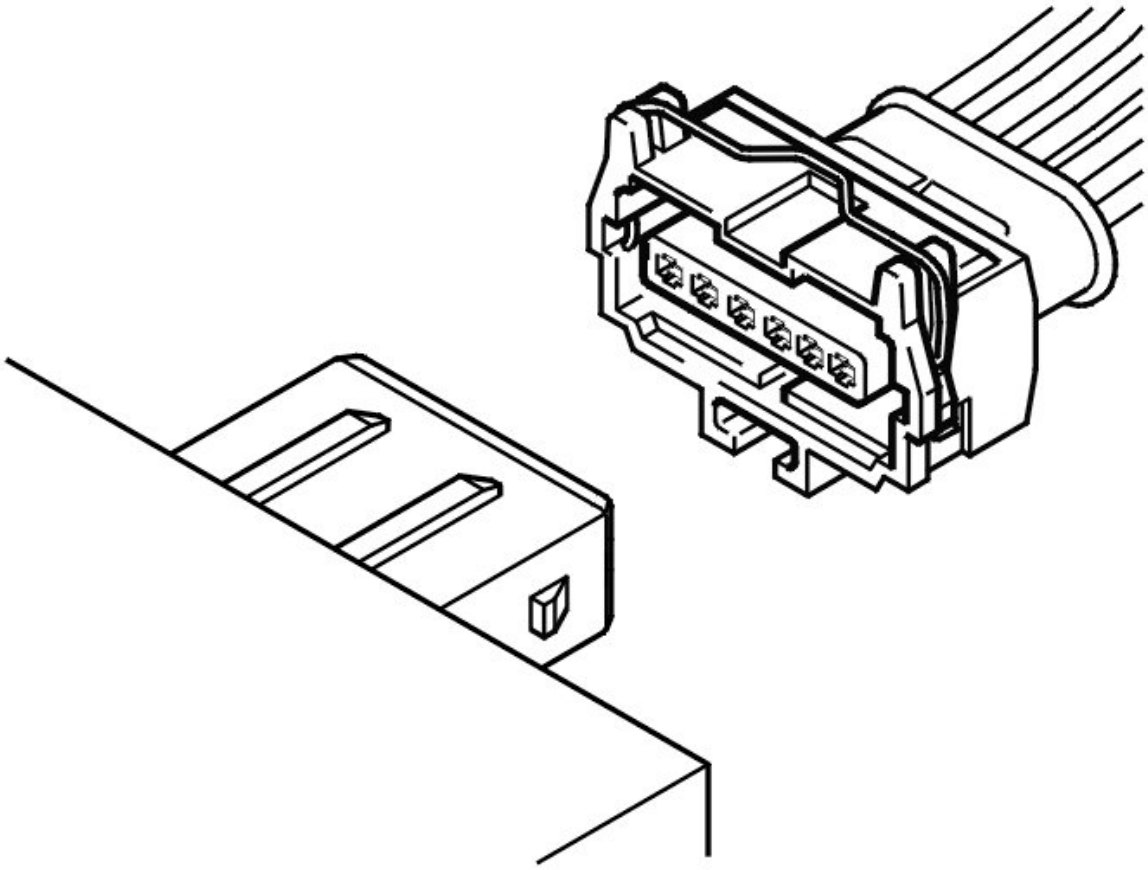
Connectors occur in a number of variants with different numbers of conductors. See Connectors, repair. See: Diagnostic Aids/Connectors, Repair/Connector Type 3



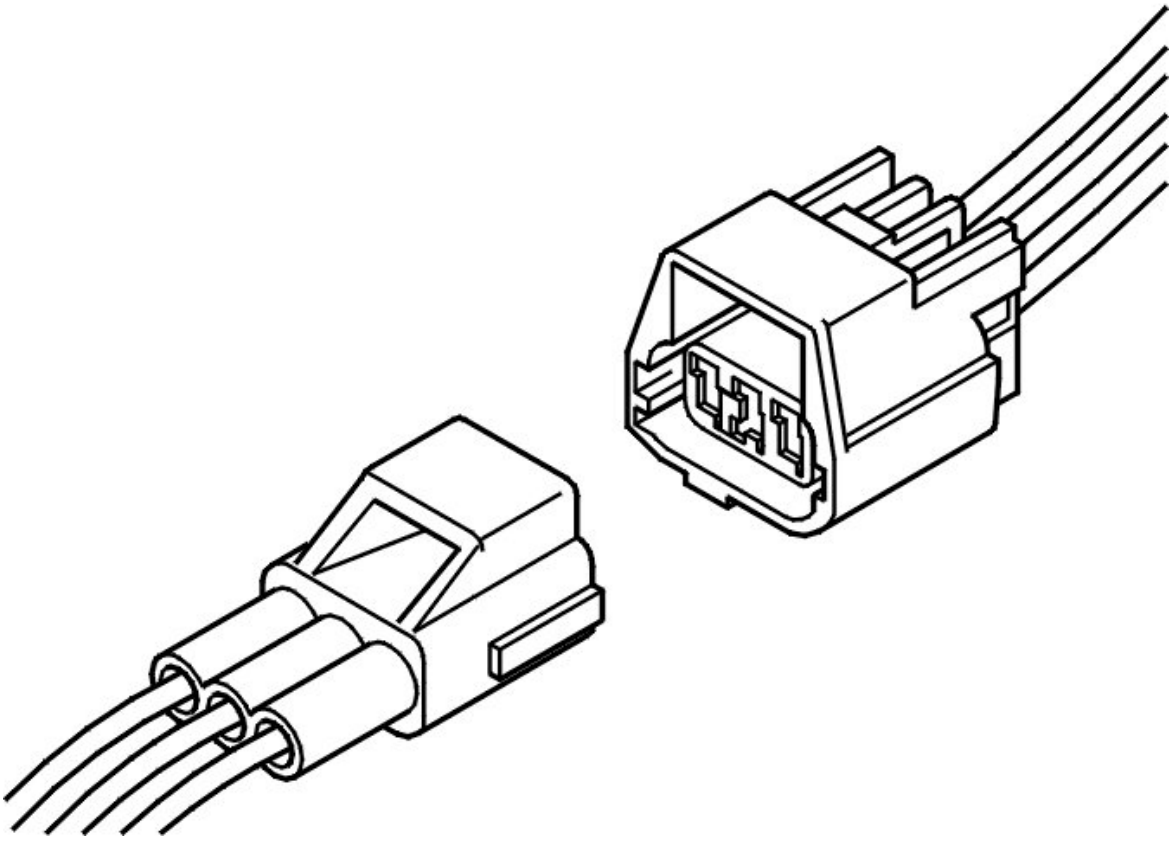
Connector, see Connectors, repair. See: Diagnostic Aids/Connectors, Repair/Connector Type 4



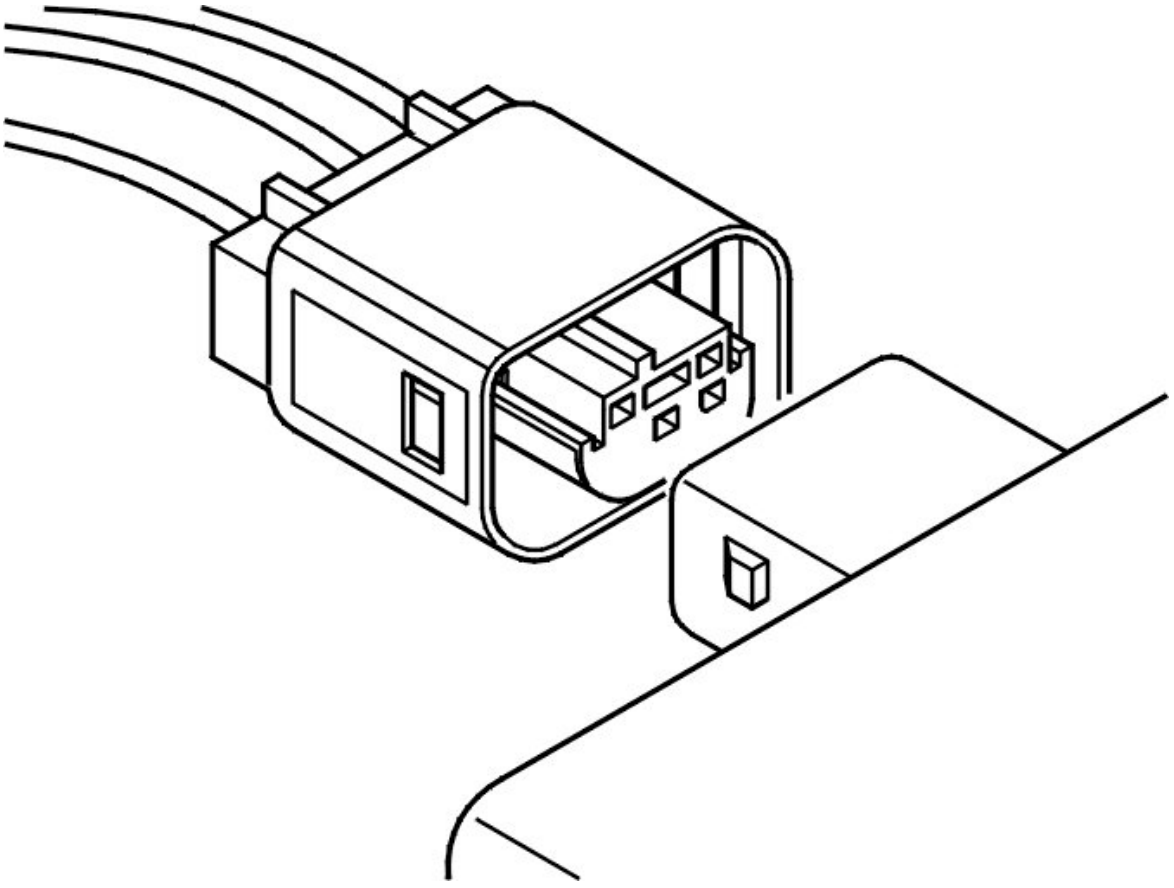
Connector door, see Connector door, repair. See: Diagnostic Aids/Connectors, Repair/Connector Type 5



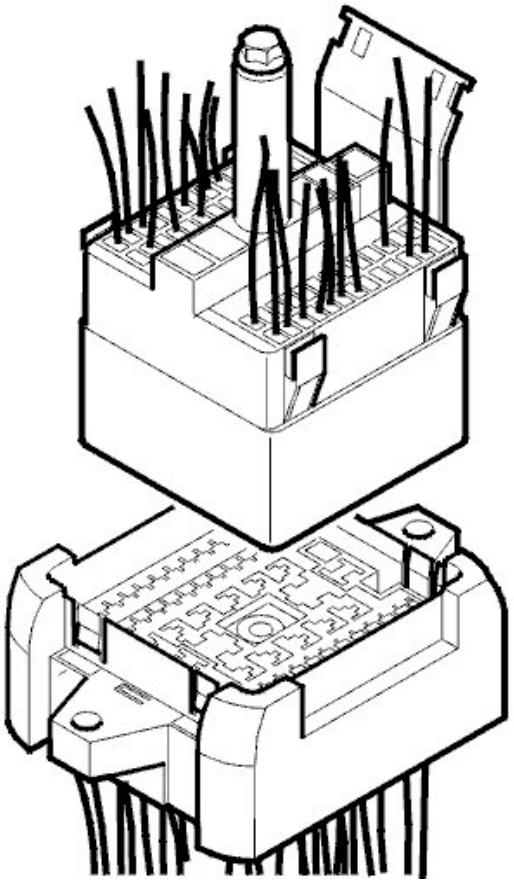
Sealed connectors occur in a number of variants with different numbers of conductors. See Connector sealed, repair. See: Diagnostic Aids/Connectors, Repair/Sealed Connector Type 1



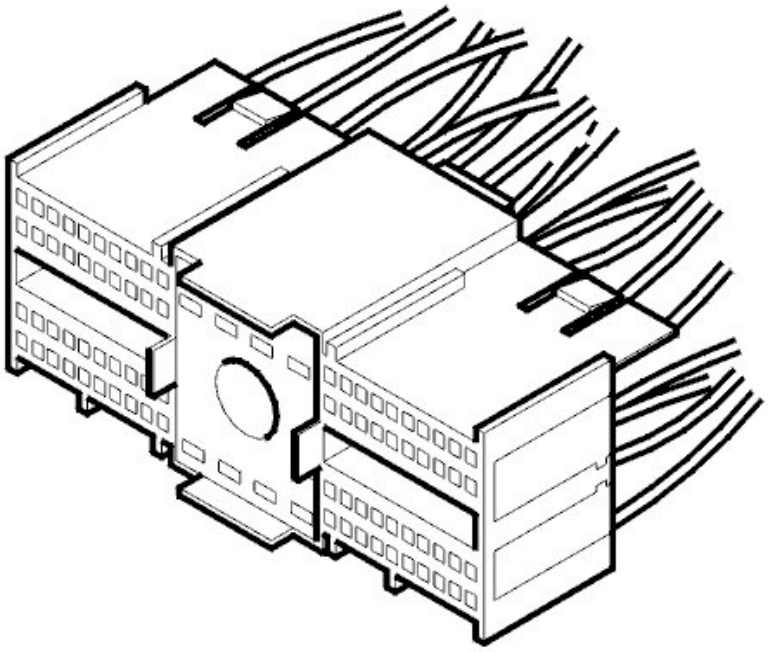
Sealed connectors occur in a number of variants with different numbers of conductors. See Connector sealed, repair. See: Diagnostic Aids/Connectors, Repair/Sealed Connector Type 2



Sealed connectors occur in a number of variants with different numbers of conductors. See Connectors, repair. See: Diagnostic Aids/Connectors, Repair/Sealed Connector Type 3



Connector, see Connectors, repair See: Diagnostic Aids/Connectors, Repair.



Connector, see Connectors, repair See: Diagnostic Aids/Connectors, Repair.

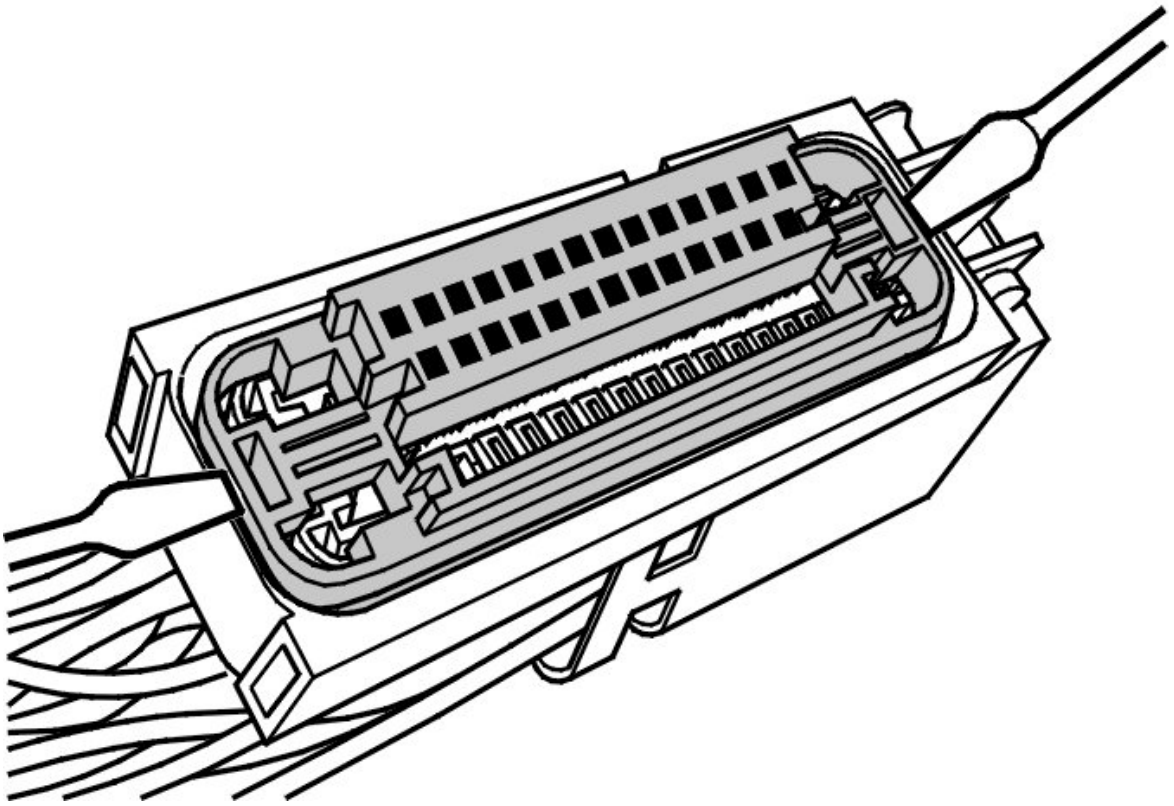
Special tools:
951 2636 Terminal removal tool See: Tools and Equipment/951 2636 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

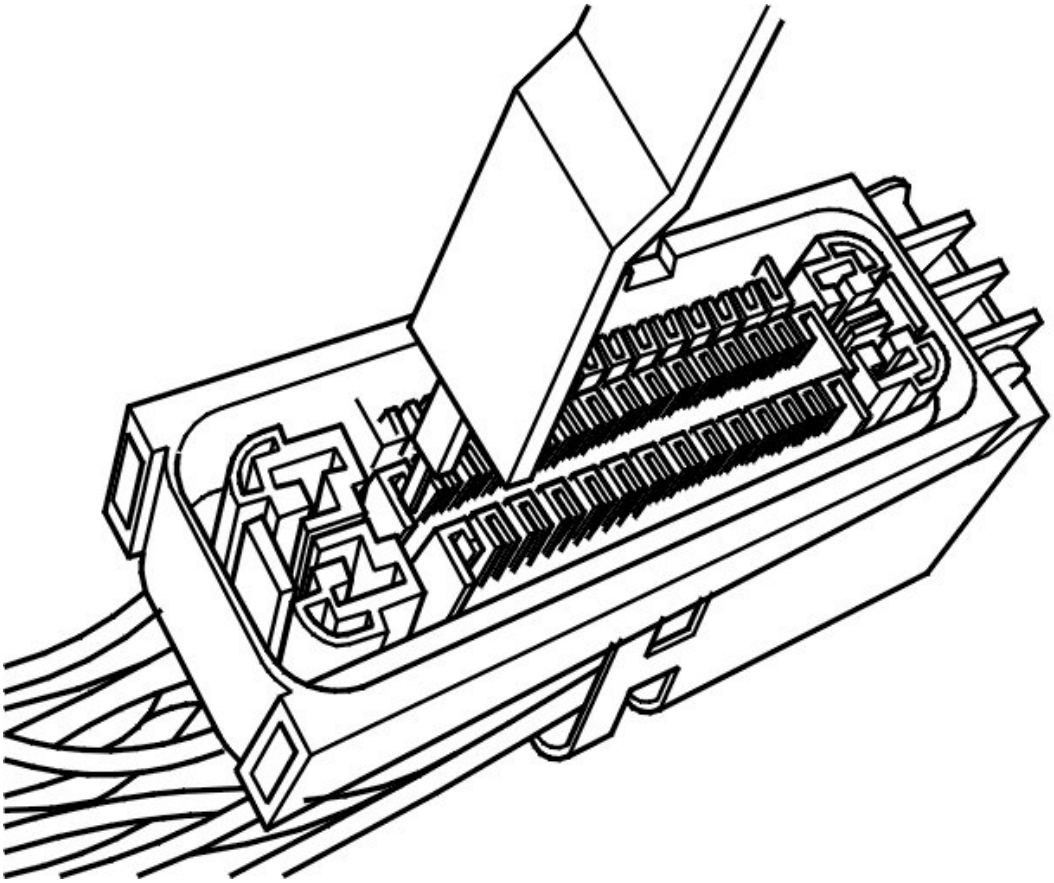
Secondary lock



Release the secondary lock. Use electrician's screwdriver as illustrated.

Caution! Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

Primary lock



Use tools 951 2636 Terminal removal tool See: Tools and Equipment/951 2636 Terminal Removal Tool or951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated.
At the same time pull the cable carefully backwards.

Connector, assembling

Note! Wheel sensor cables are twisted pair (positive and negative signal) cables for each wheel. It is important that paired cables are twinned in the same way when they are reinstalled in the connector. The cables must be twisted approximately 3 times per 100 mm.

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Control Module for Anti-lock Brake System Module (ABS), Repair

Connector control module for Anti-lock Brake System Module (ABS), repair

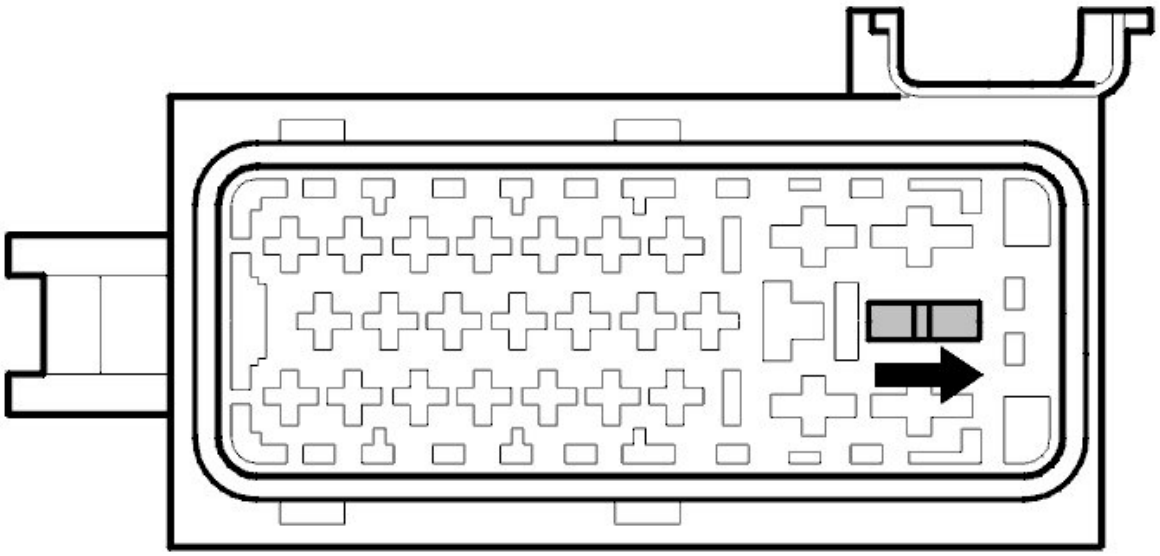
Special tools:
951 2630 Terminal removal tool See: Tools and Equipment/951 2630 Terminal Removal Tool

951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

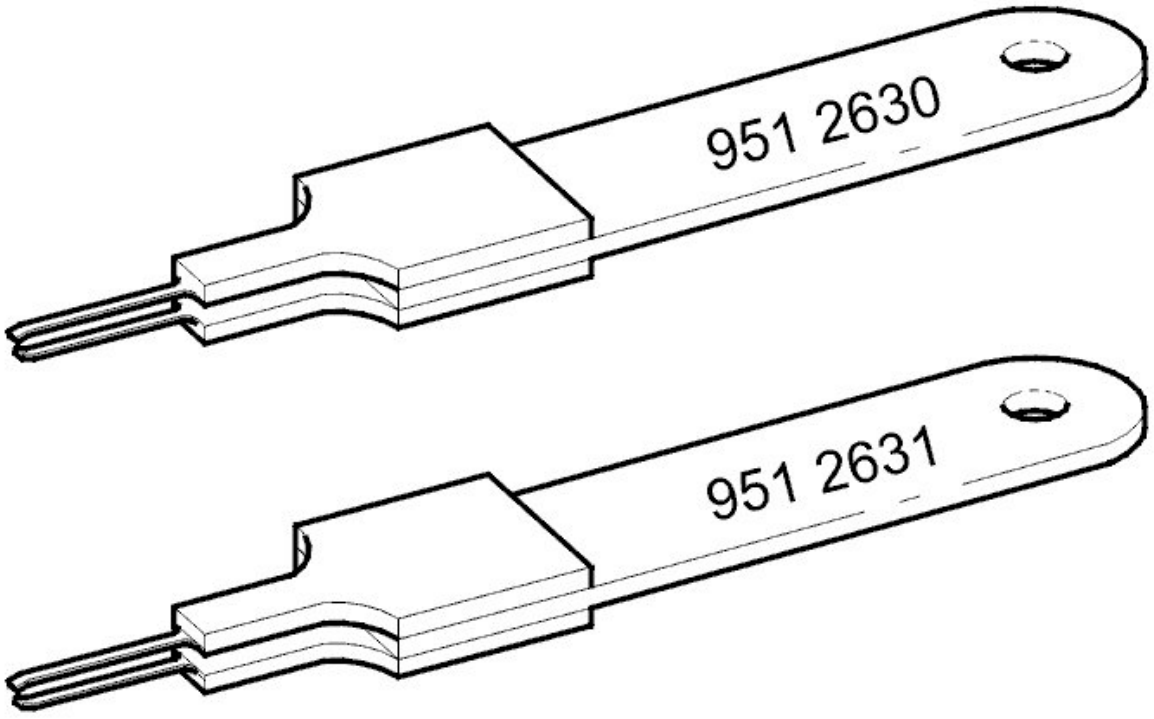
Secondary lock



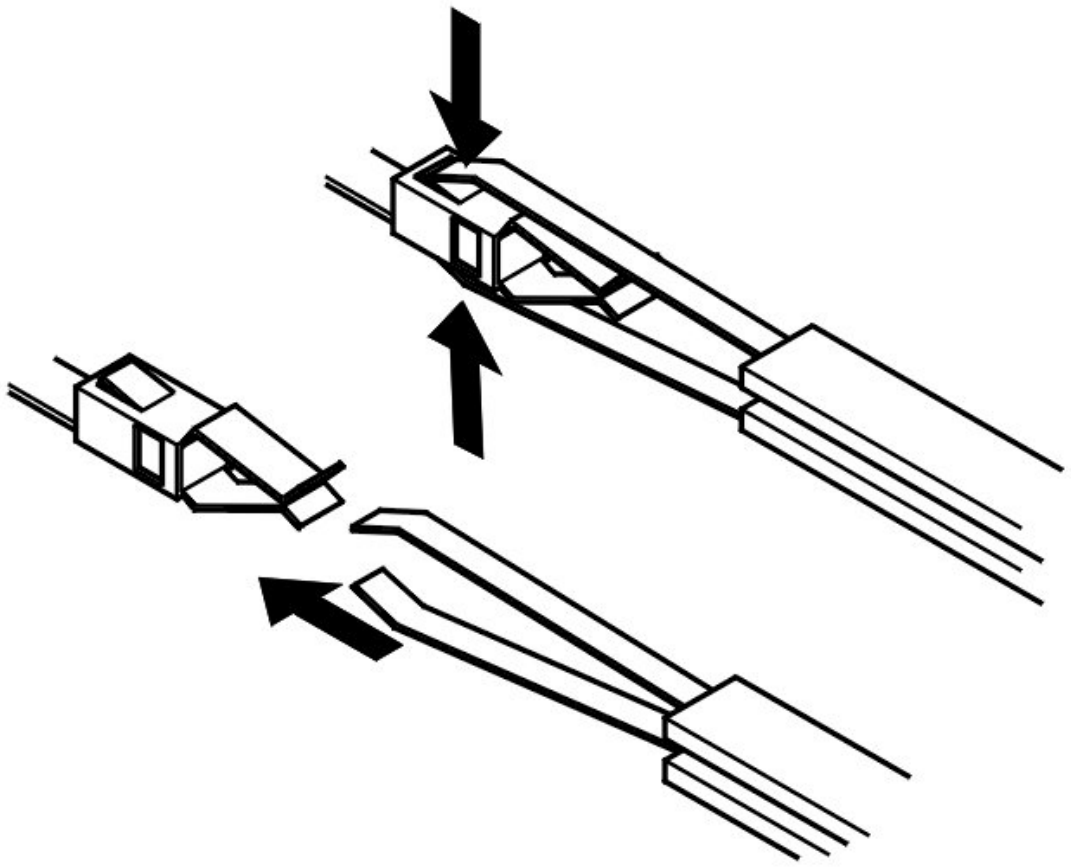
Slide the catch in the direction of the arrow, as illustrated.

Caution! Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

Primary lock



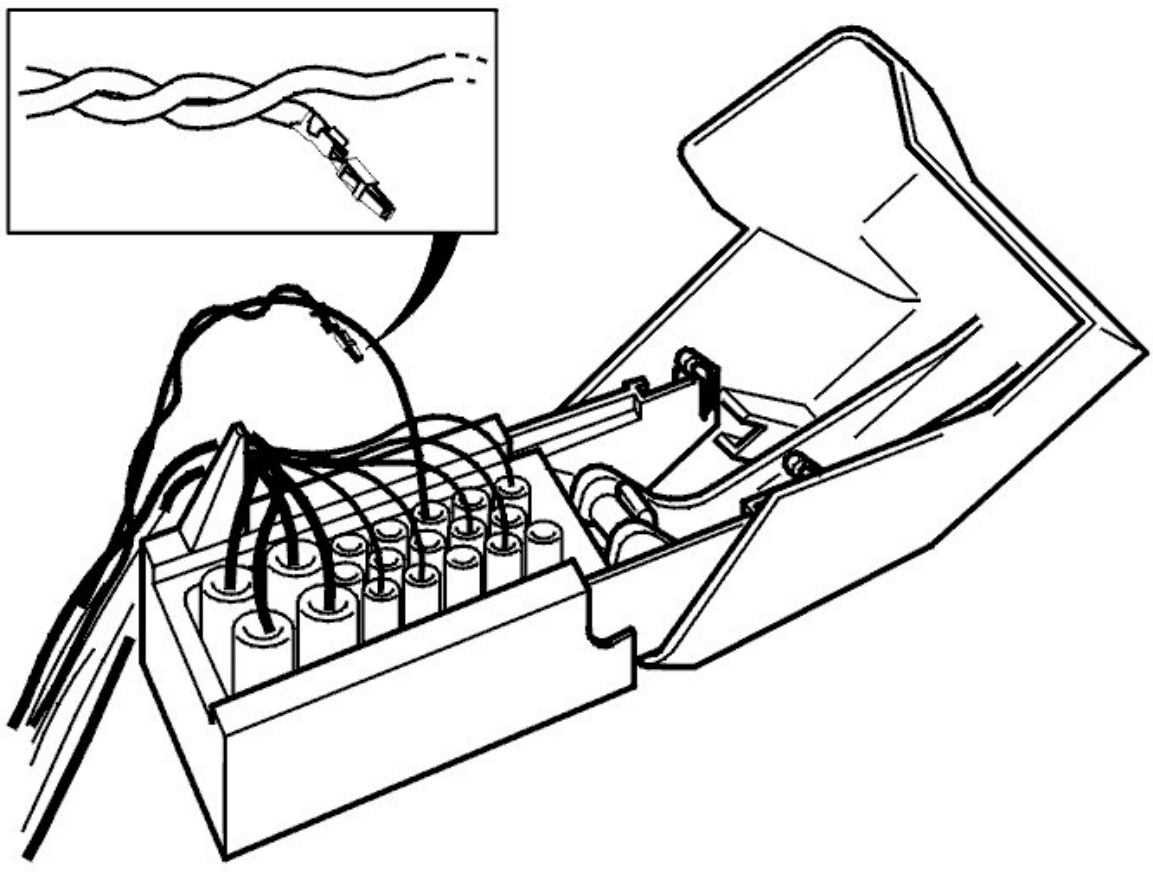
Use tools 951 2630 Terminal removal tool See: Tools and Equipment/951 2630 Terminal Removal Tool and951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool to remove the primary lock, as illustrated.
At the same time pull the cable carefully backwards.



Connector, assembling

Note! Wheel sensor cables are twisted pair (positive and negative signal) cables for each wheel. It is important that paired cables are twinned in the same way when they are reinstalled in the connector. The cables must be twisted approximately 3 times per 100 mm.

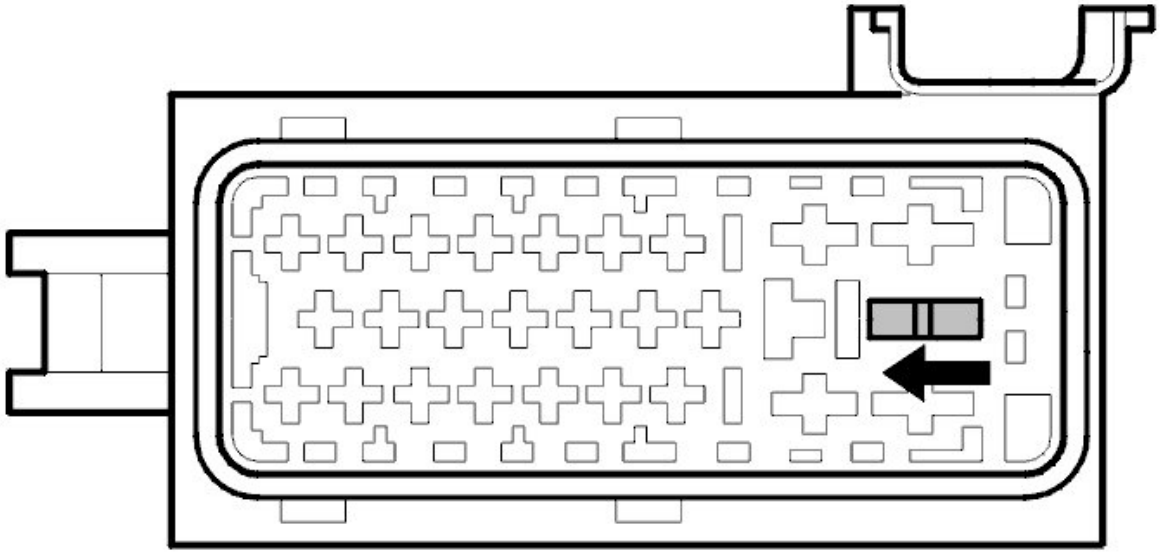
Primary lock



Check that the cable terminal is undamaged.
Press the cable terminal into the housing.

Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock



Slide the catch in the direction of the arrow, as illustrated.

Connector Data Link Connector (DLC), Repair

Connector data link connector (DLC), repair

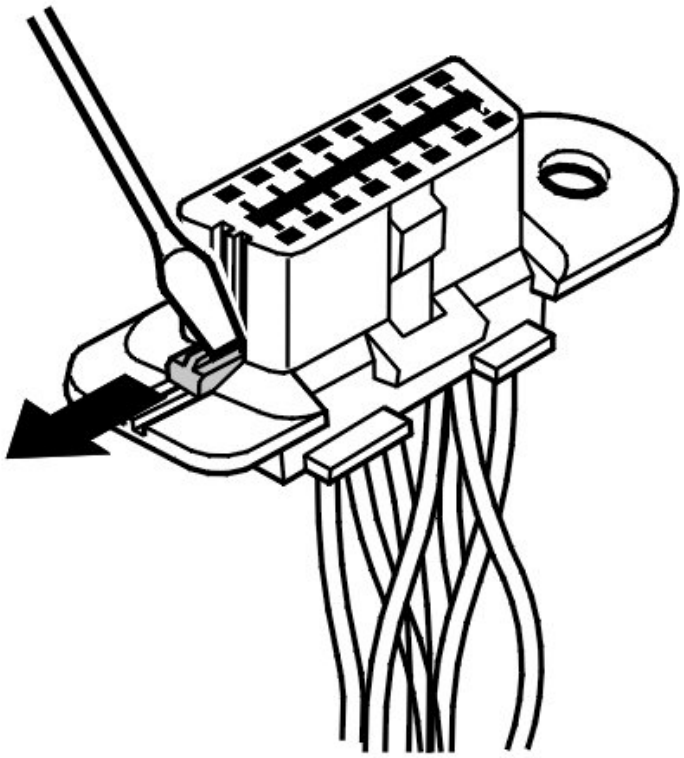
Special tools:
951 2636 Terminal removal tool See: Tools and Equipment/951 2636 Terminal Removal Tool

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

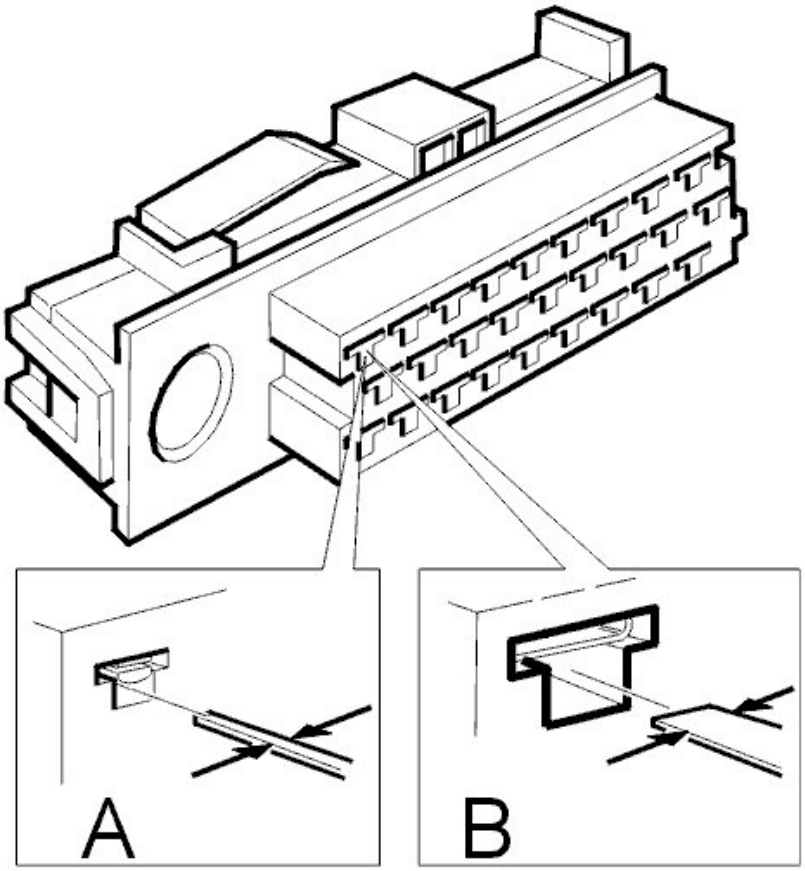
Data link connector (DLC), dismantling

Expose the data link connector (DLC).

Secondary lock



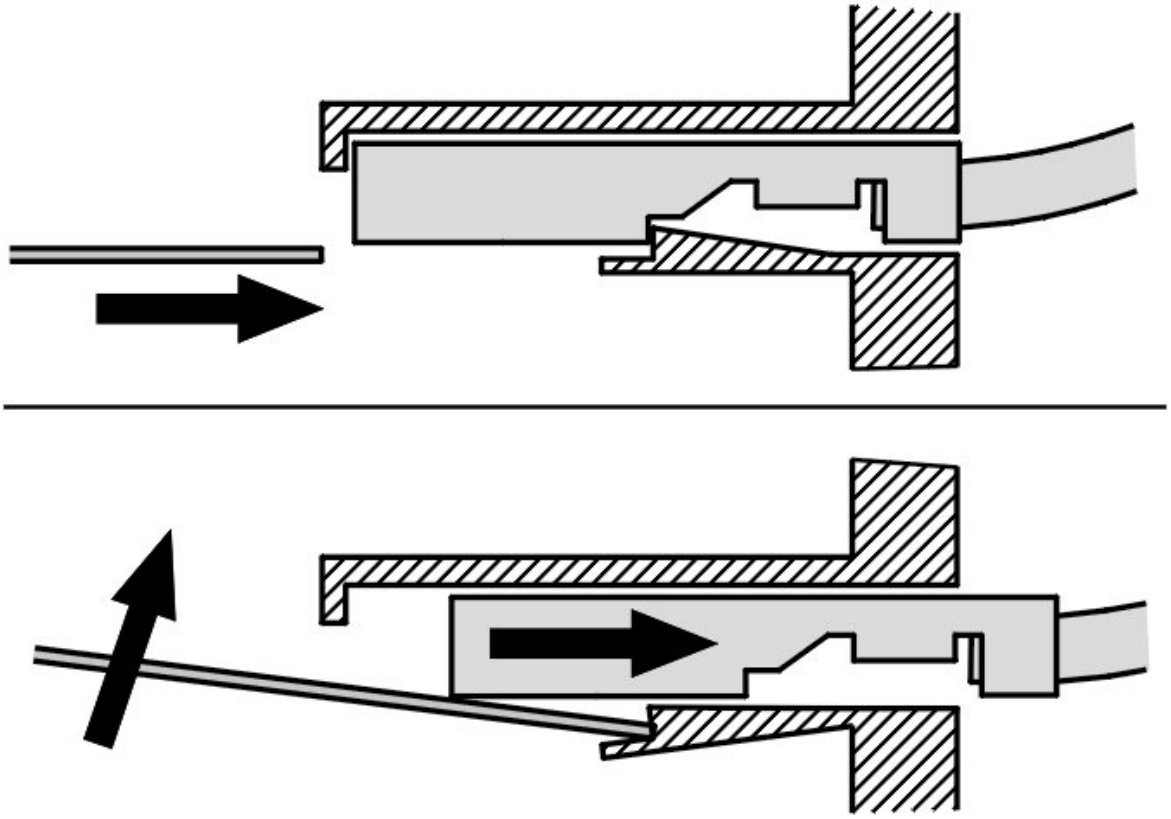
Pull the secondary lock out to the side. Use an electrician's screwdriver, as illustrated.



Use tool 951 2636 Terminal removal tool See: Tools and Equipment/951 2636 Terminal Removal Tool to remove the cable terminal lock, as illustrated.
At the same time pull the cable carefully backwards.

Data link connector, assembling

Primary lock



Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Supplemental Restraint System Module (SRS), Repair

Connector Supplemental Restraint System Module (SRS), repair

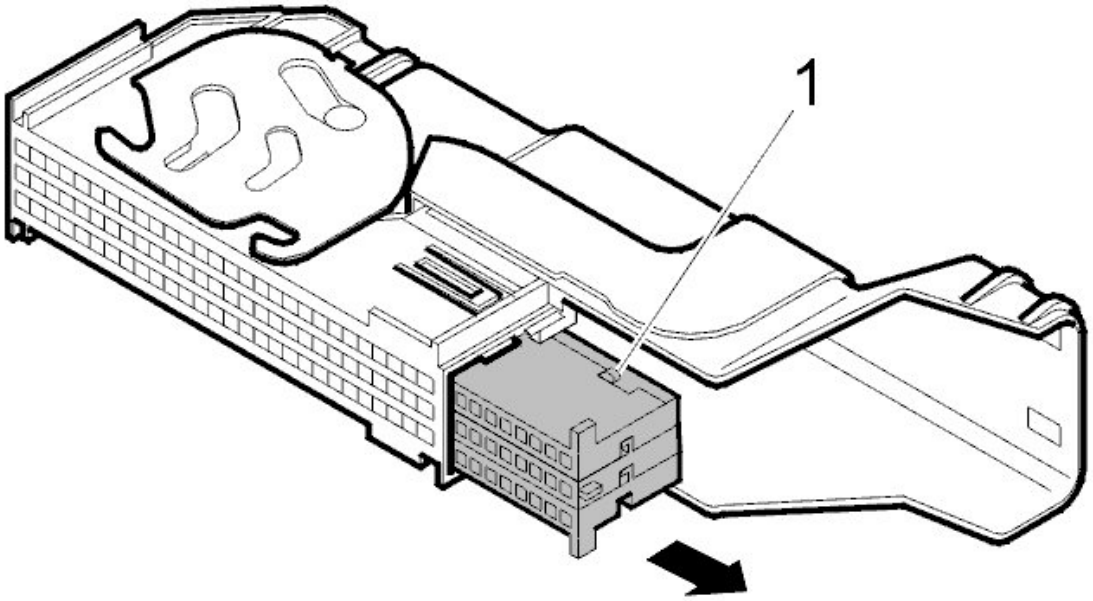
Special tools:
951 2812 Terminal removal tool See: Tools and Equipment/951 2812 Terminal Removal Tool

951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

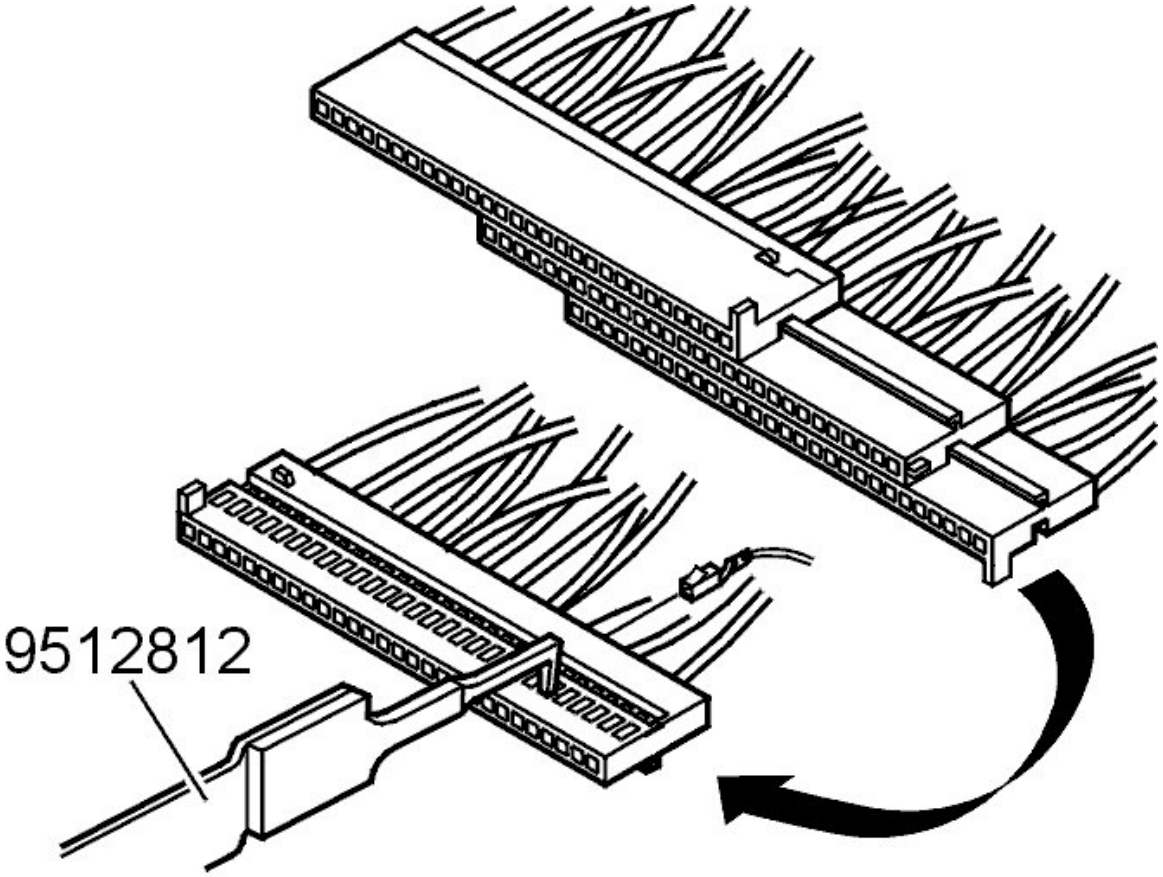
Secondary lock



Press in the active catches on both sides of the socket housing and slide out the receptacle housings.

Caution! Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

Primary lock



Press in the locking tab on the cable terminal and carefully pull out the cable and the cable terminal. Use tool 951 2812 Terminal removal tool See: Tools and Equipment/951 2812 Terminal Removal Tool or tool 951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool , as illustrated.

Connector, assembling

Primary locking

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary locking

Press the secondary lock into place.

Connector Type 1

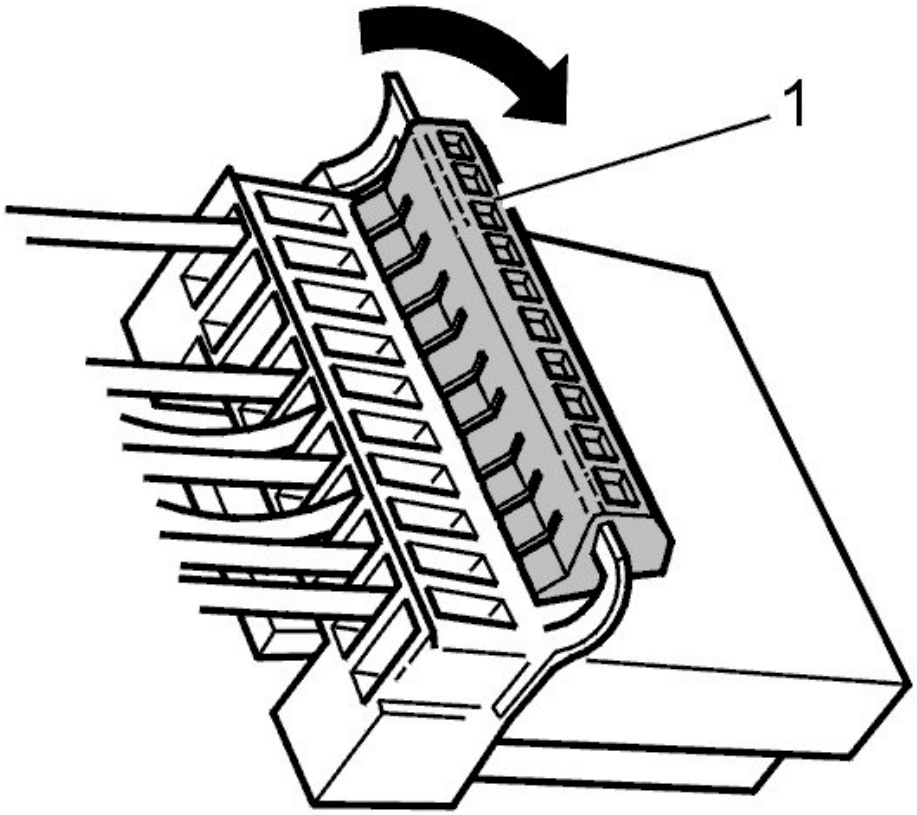
Connectors, repair

Special tool 951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

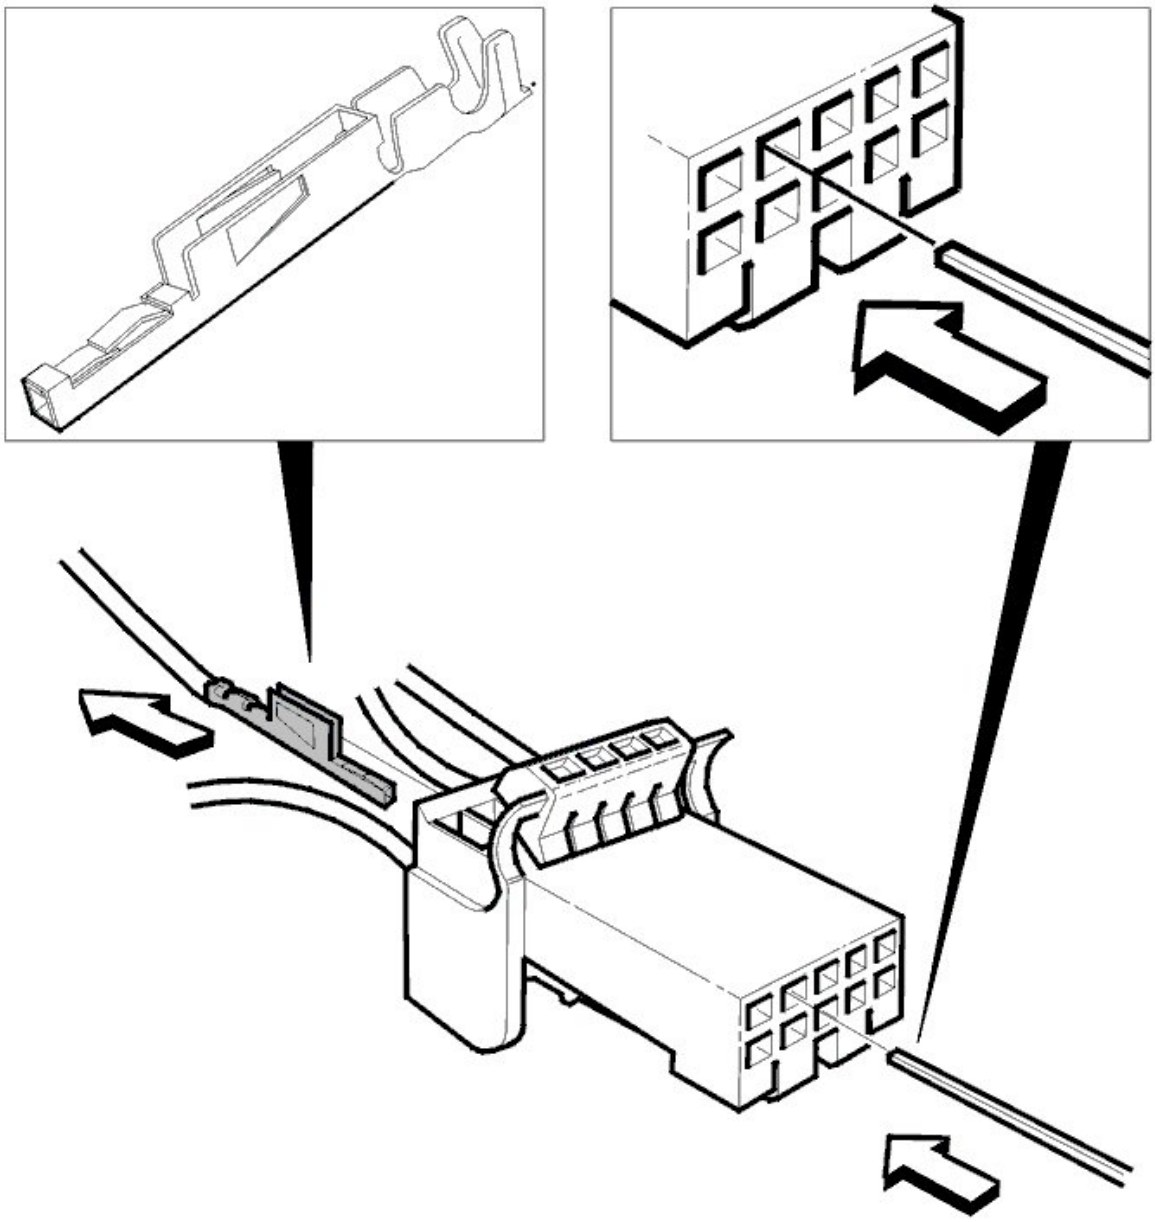
Connector, dismantling

Secondary lock



Fold up the secondary lock (1), as illustrated. Use an electrician's screwdriver.

Primary lock



Use tool 951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool to remove the primary lock, as illustrated.
At the same time pull the cable carefully backwards.

Connector, assembling

Primary locking

Check that the catches for the cable terminal are undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary locking

Press the secondary lock into place.

Connector Type 2

Connectors, repair

Special tools:
951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

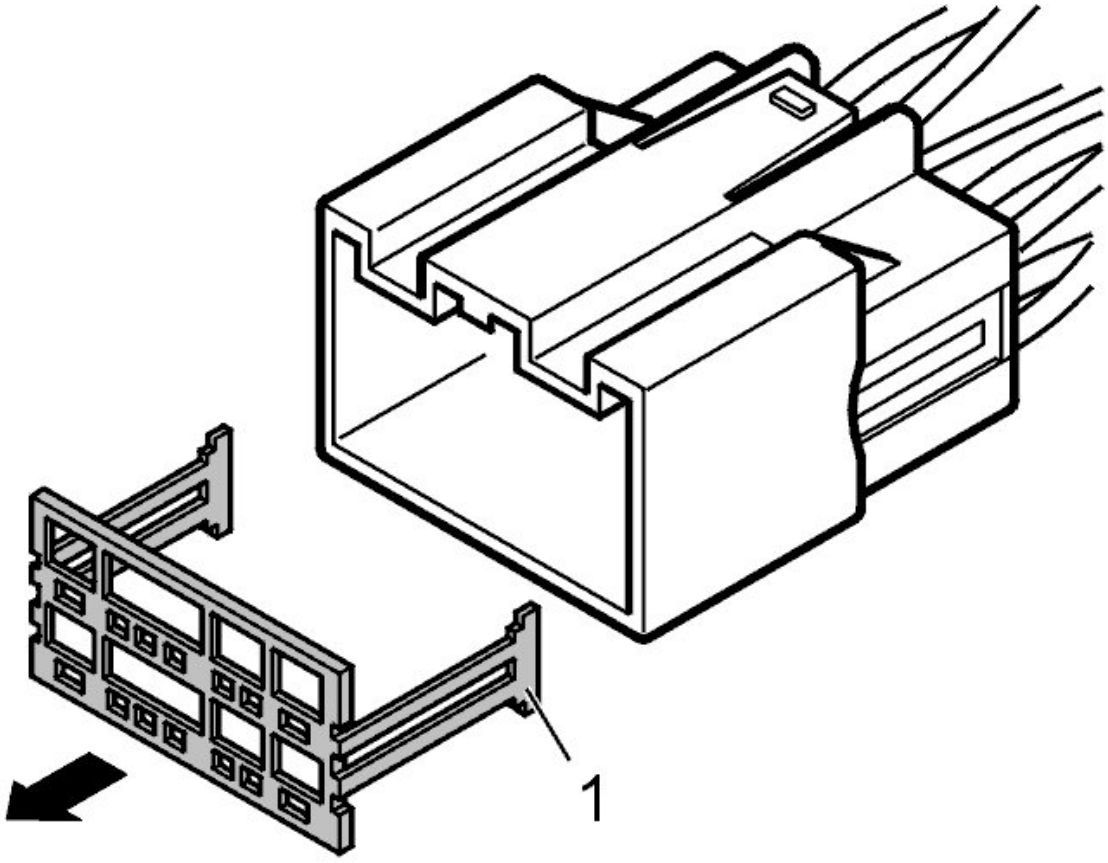
951 2853 Terminal removal tool See: Tools and Equipment/951 2853 Terminal Removal Tool

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

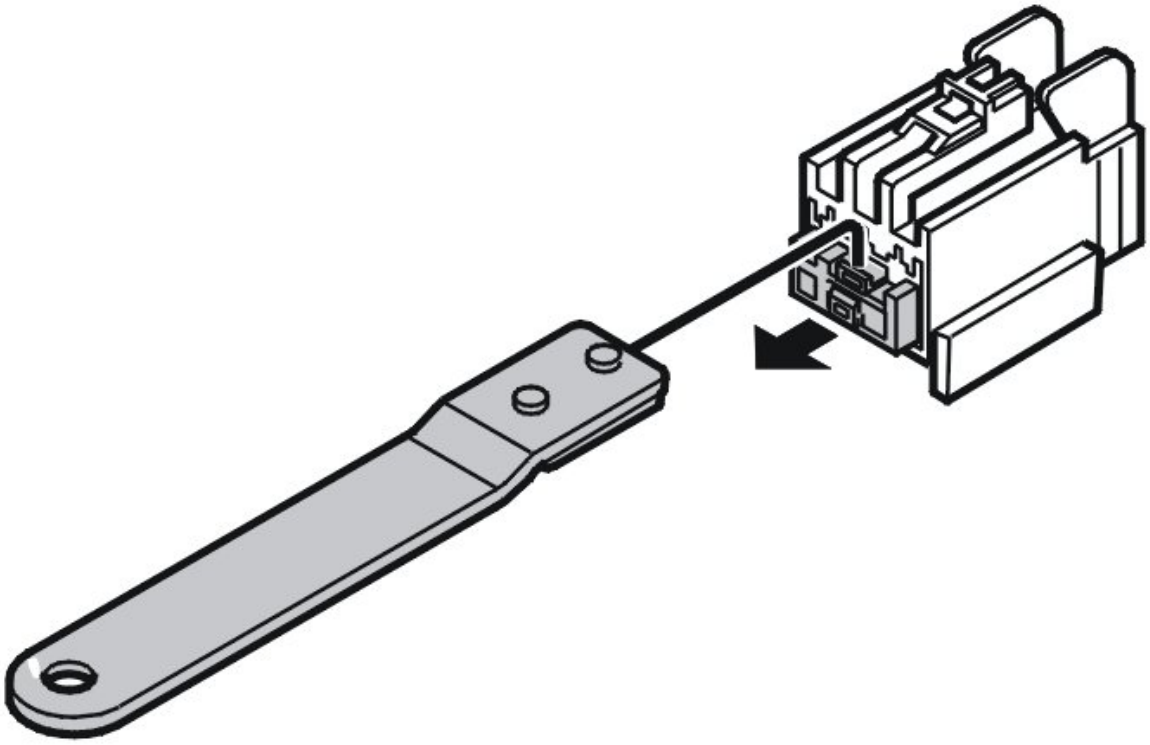
Connector, dismantling

Secondary lock



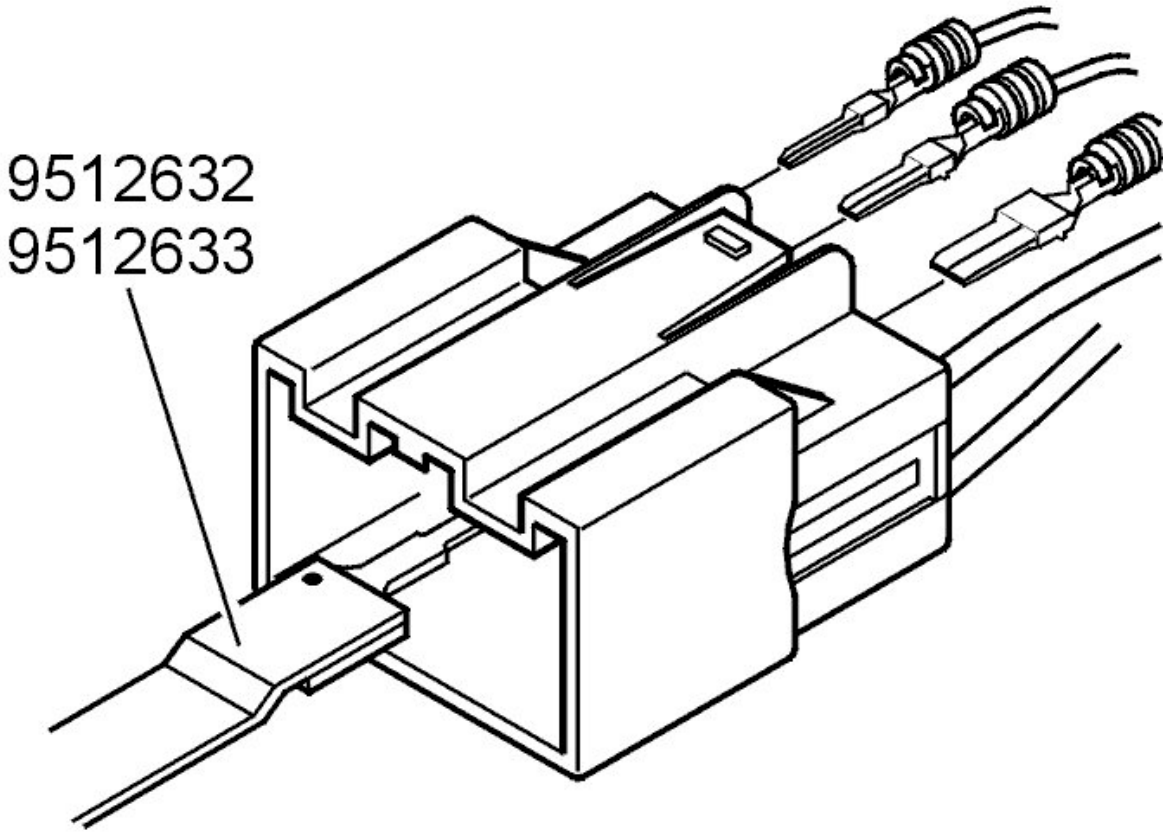
Pin housing

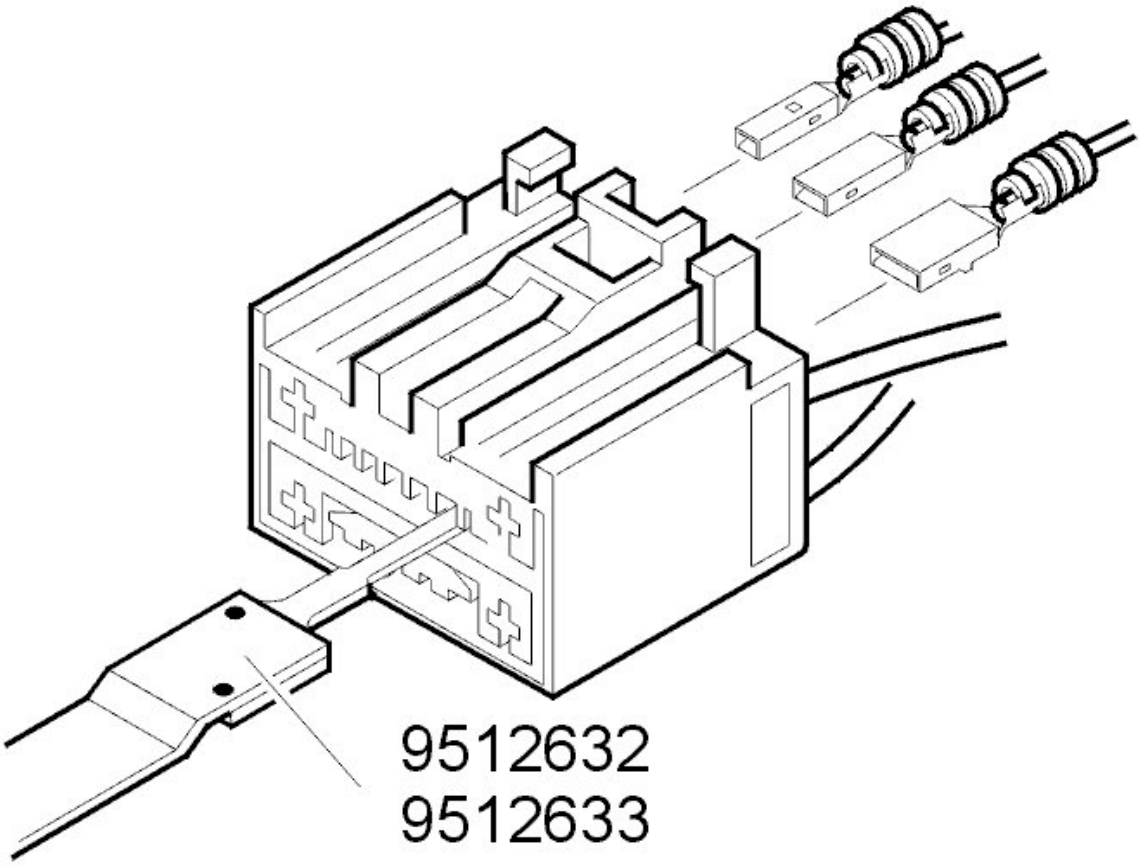
Release the front housing section on the pin housing by pulling out the rear catches while at the same time pressing the housing section forwards.



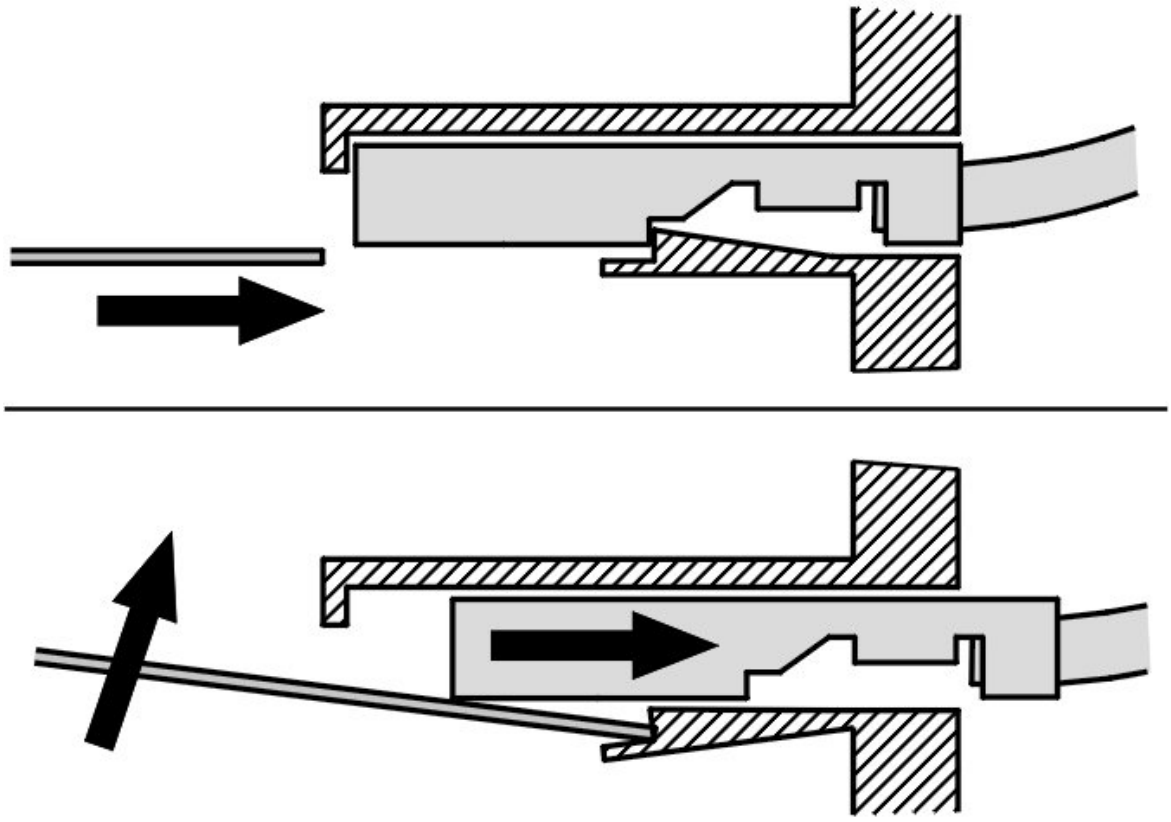
Socket housing

Open the catches and pull out the secondary lock, use tool 951 2853 Terminal removal tool See: Tools and Equipment/951 2853 Terminal Removal Tool or an electrician's screwdriver, as illustrated.





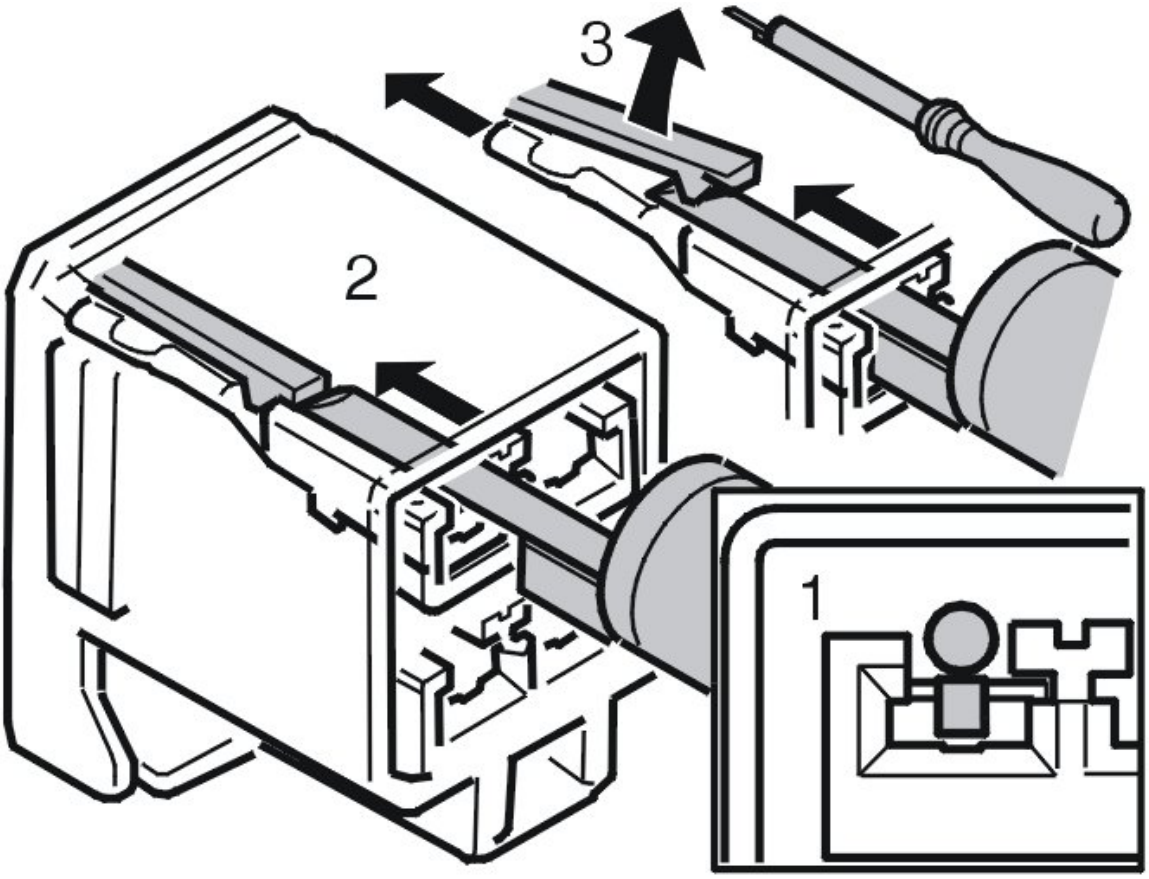
Primary lock



Use tools 951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.



Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Note! tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool can only be used for socket housings.

Connector, assembling

Primary locking

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary locking

Press the secondary lock into place.

Connector Type 3

Connectors, repair

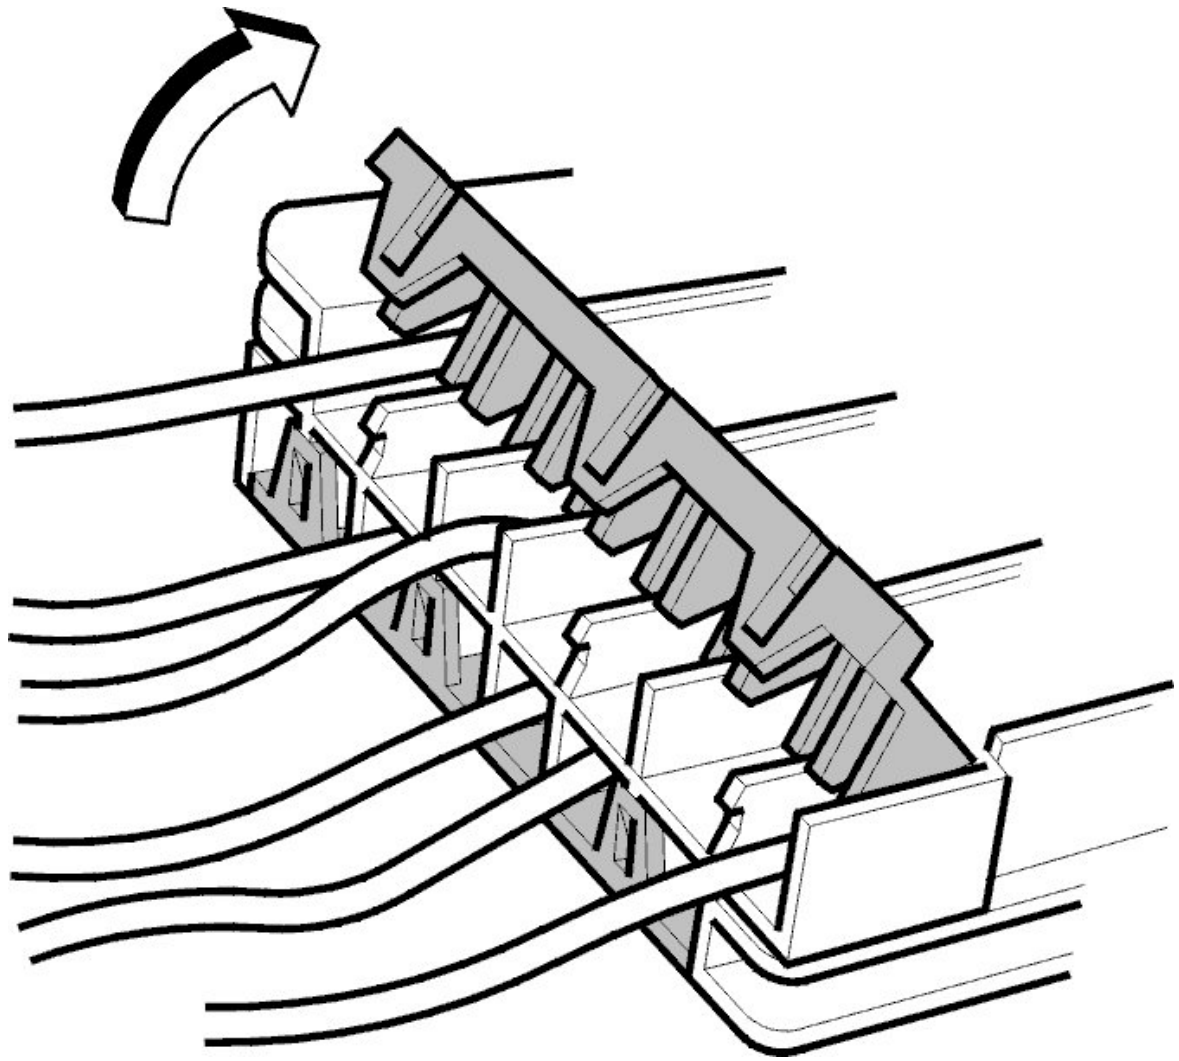
Special tools:
951 2630 Terminal removal tool See: Tools and Equipment/951 2630 Terminal Removal Tool

951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

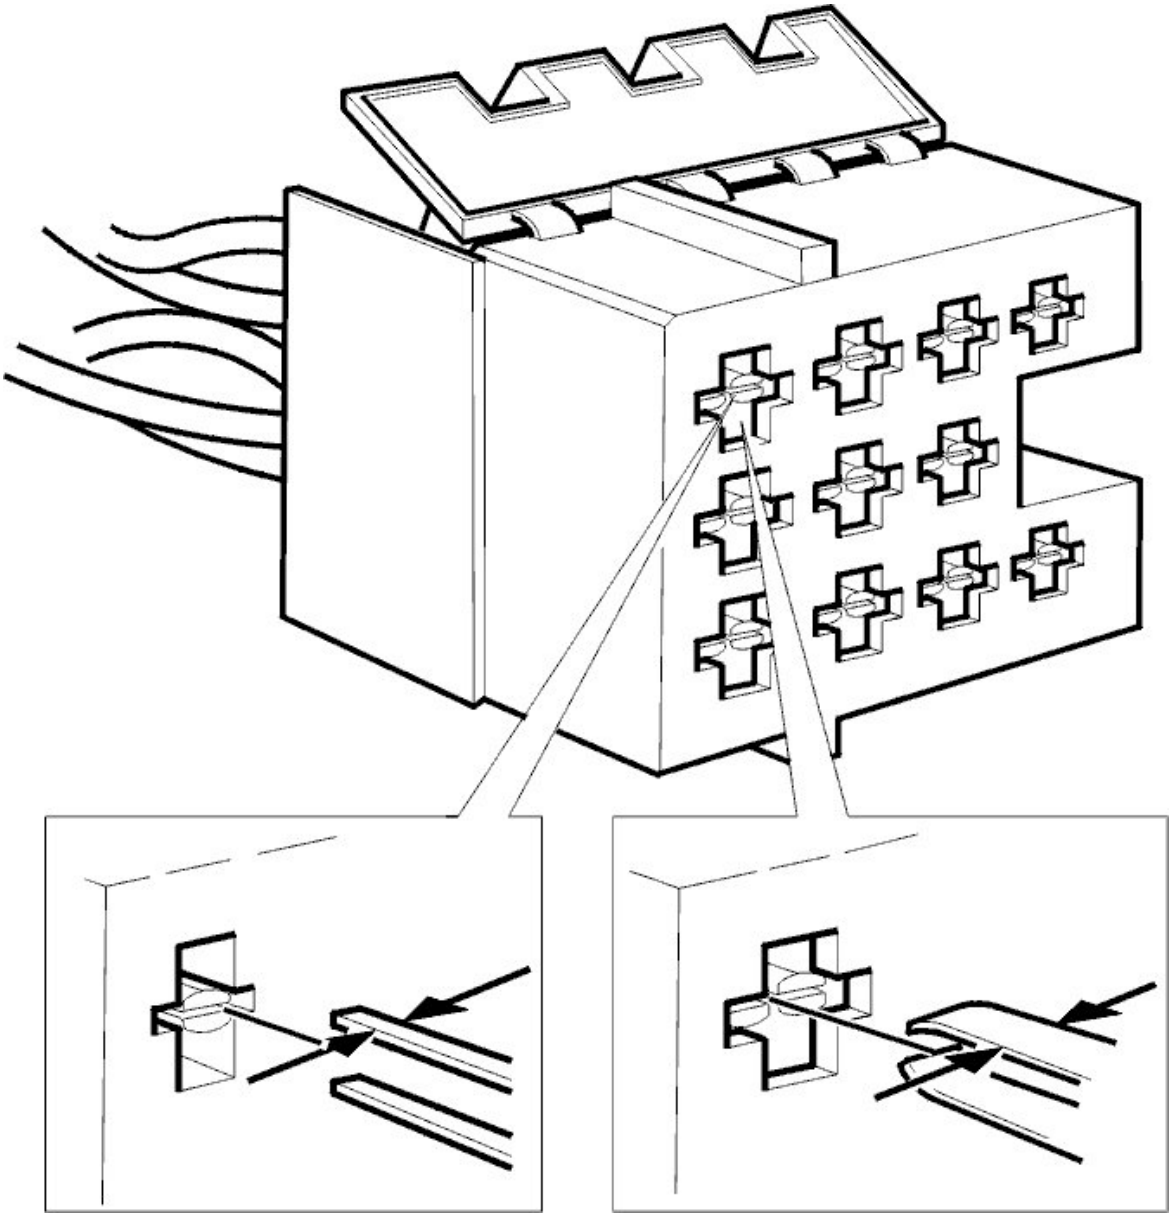
Connector, dismantling

Secondary lock



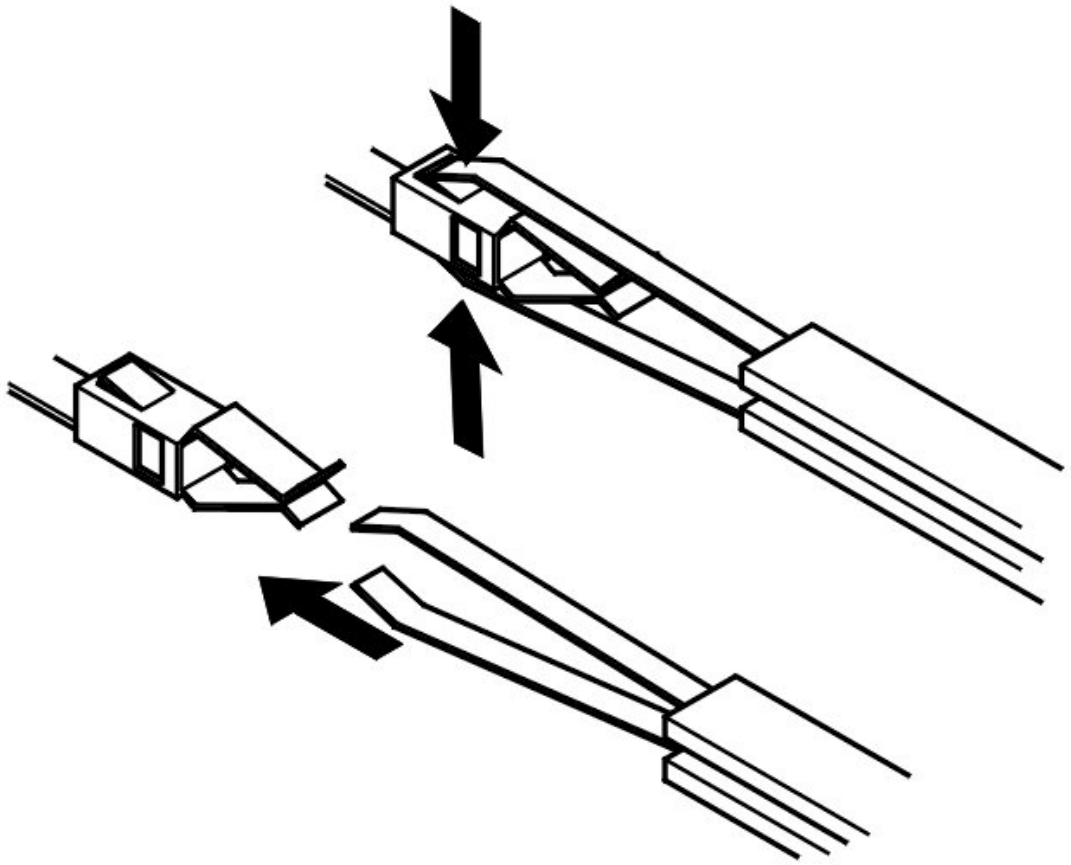
Fold up the secondary lock. If necessary use an electrician's screwdriver.

Primary lock



Use tools 951 2630 Terminal removal tool See: Tools and Equipment/951 2630 Terminal Removal Tool

951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool to remove the primary lock, as illustrated. Pull the cable carefully backwards.



Connector, assembling

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Type 4

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

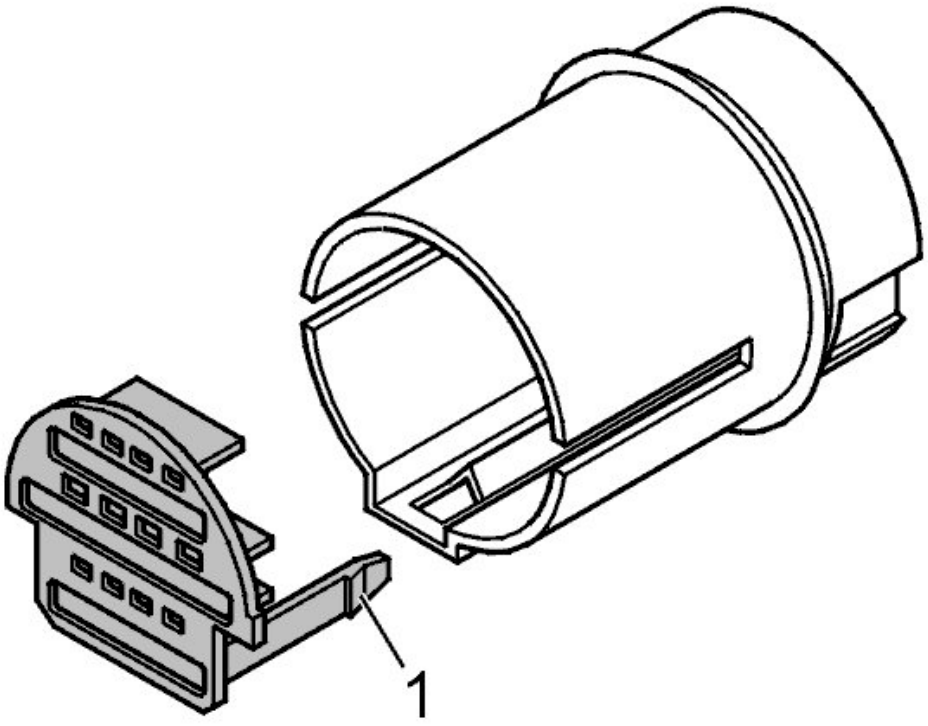
951 2810 Terminal removal tool See: Tools and Equipment/951 2810 Terminal Removal Tool

951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool.

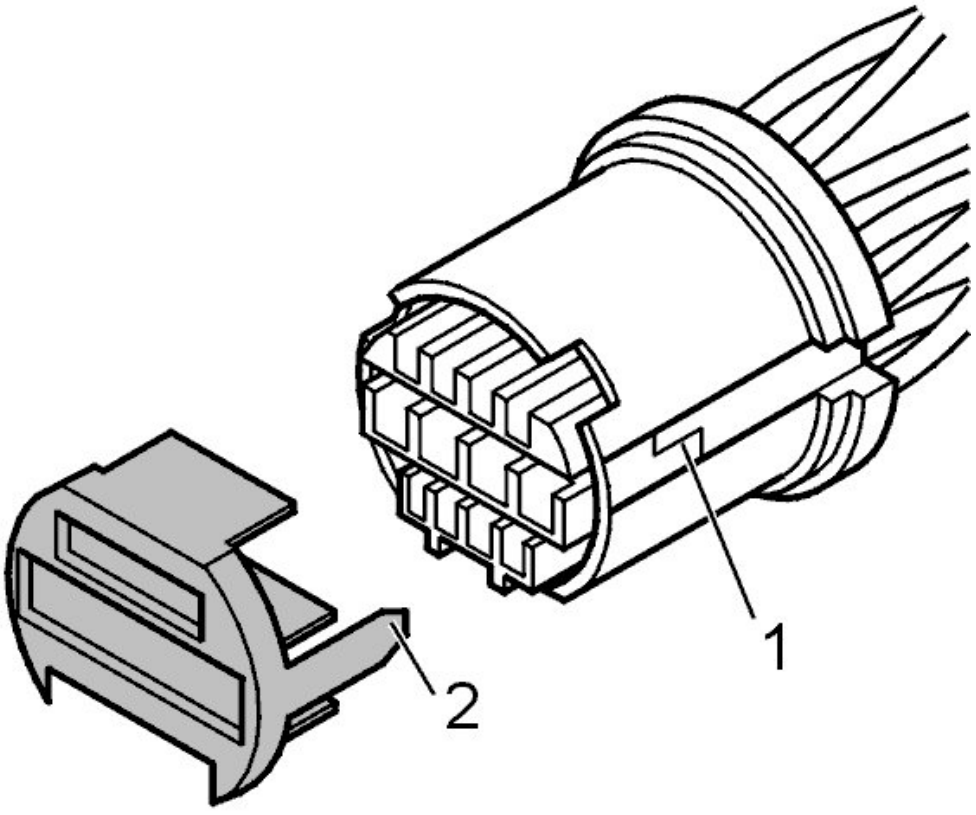
Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

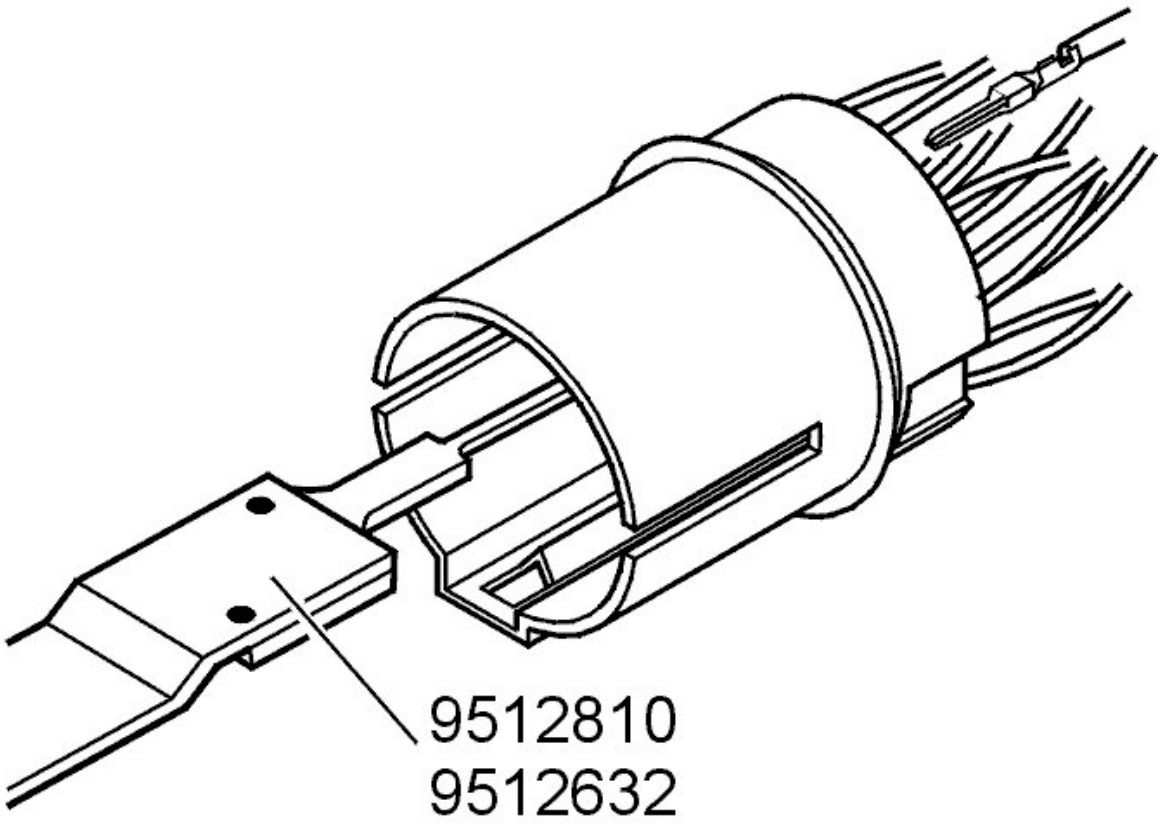
Secondary lock



Angle out the catches on both sides.
Pull out the secondary lock.



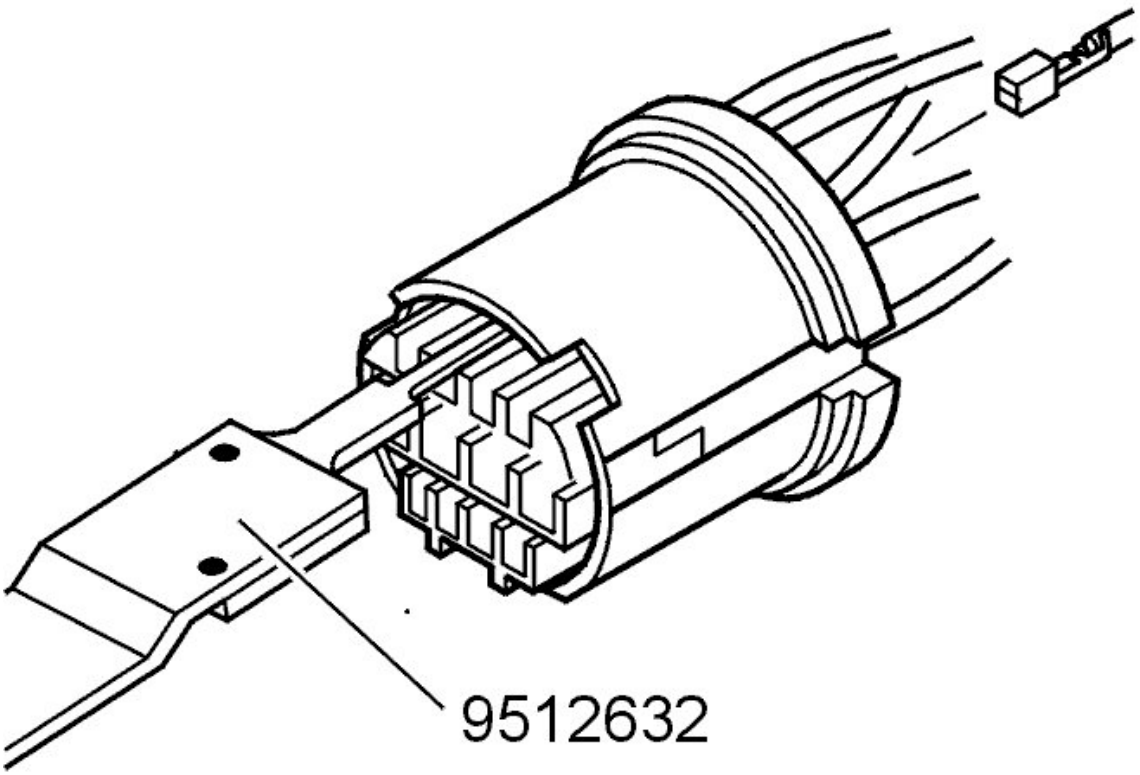
Primary lock

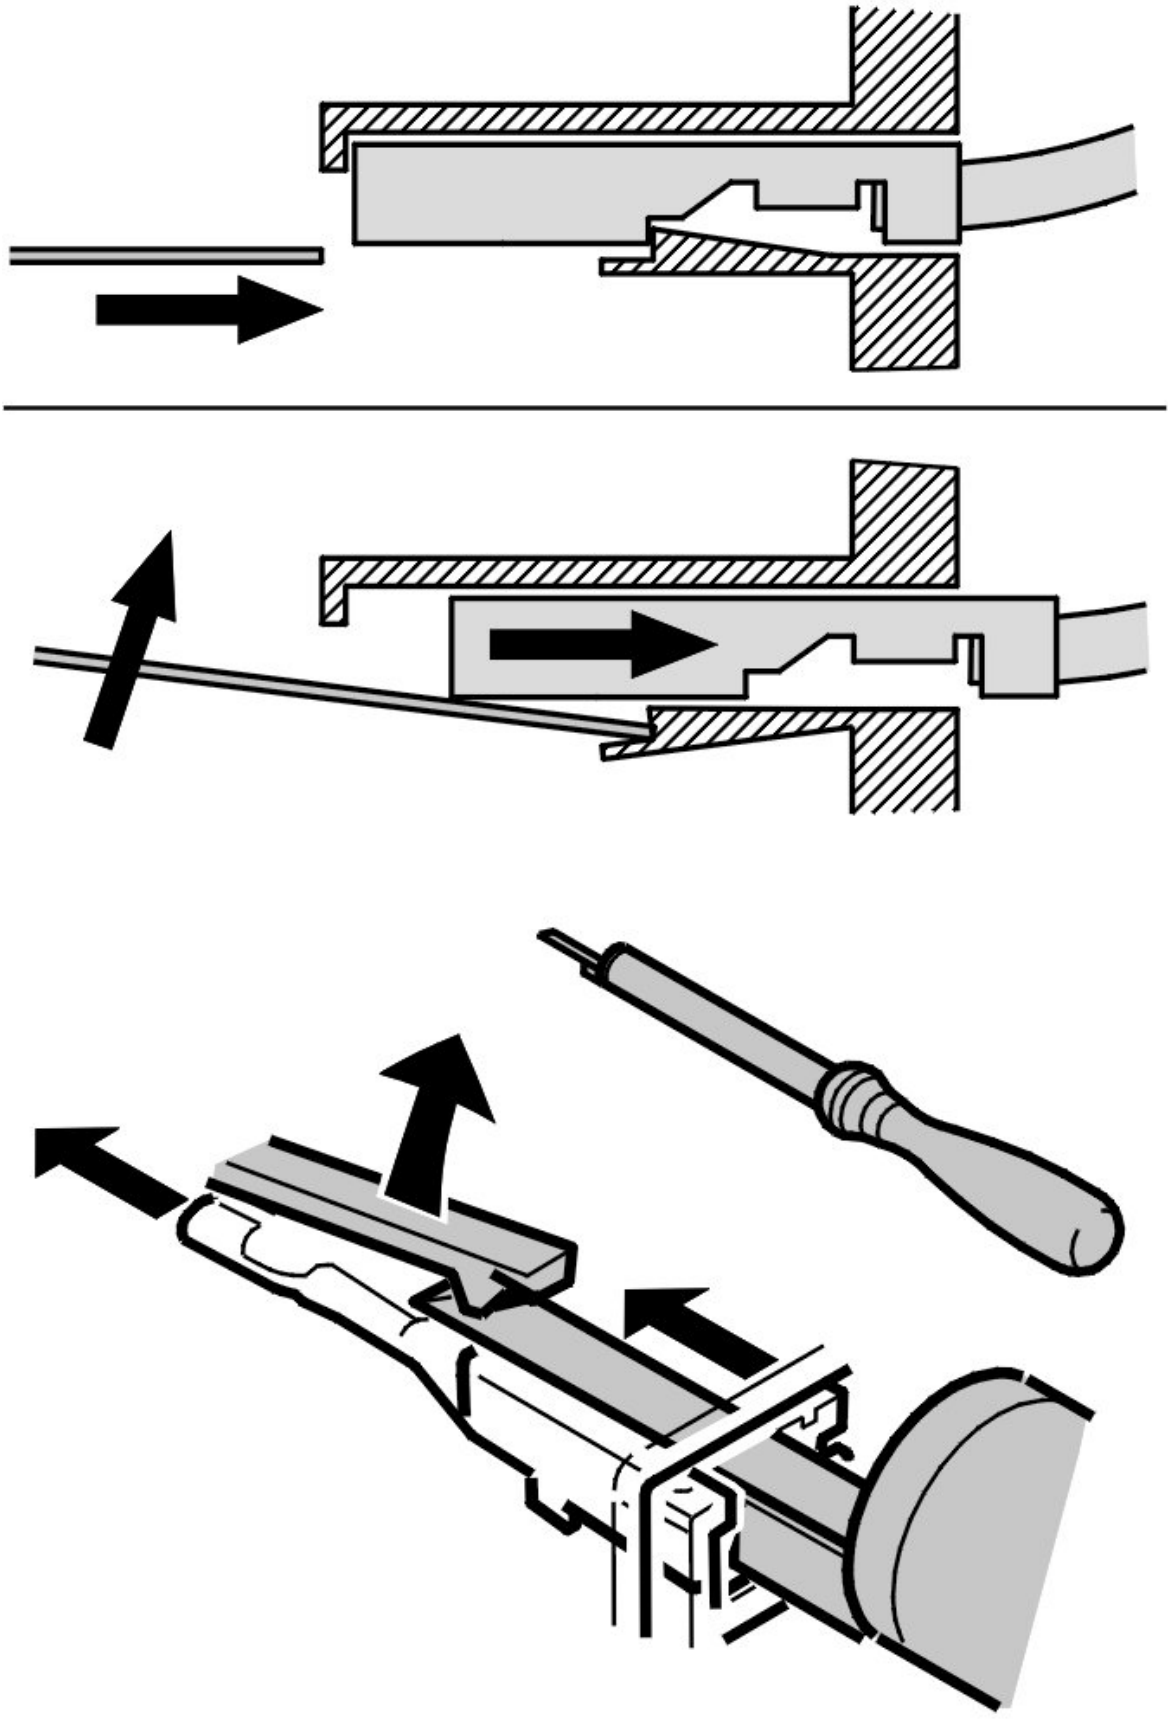


Use tools 951 2810 Terminal removal tool See: Tools and Equipment/951 2810 Terminal Removal Tool

951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.





Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Note! tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool can only be used for socket housings.

Connector, assembling

Primary lock

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Type 5

Connector door, repair

Special tools:
951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

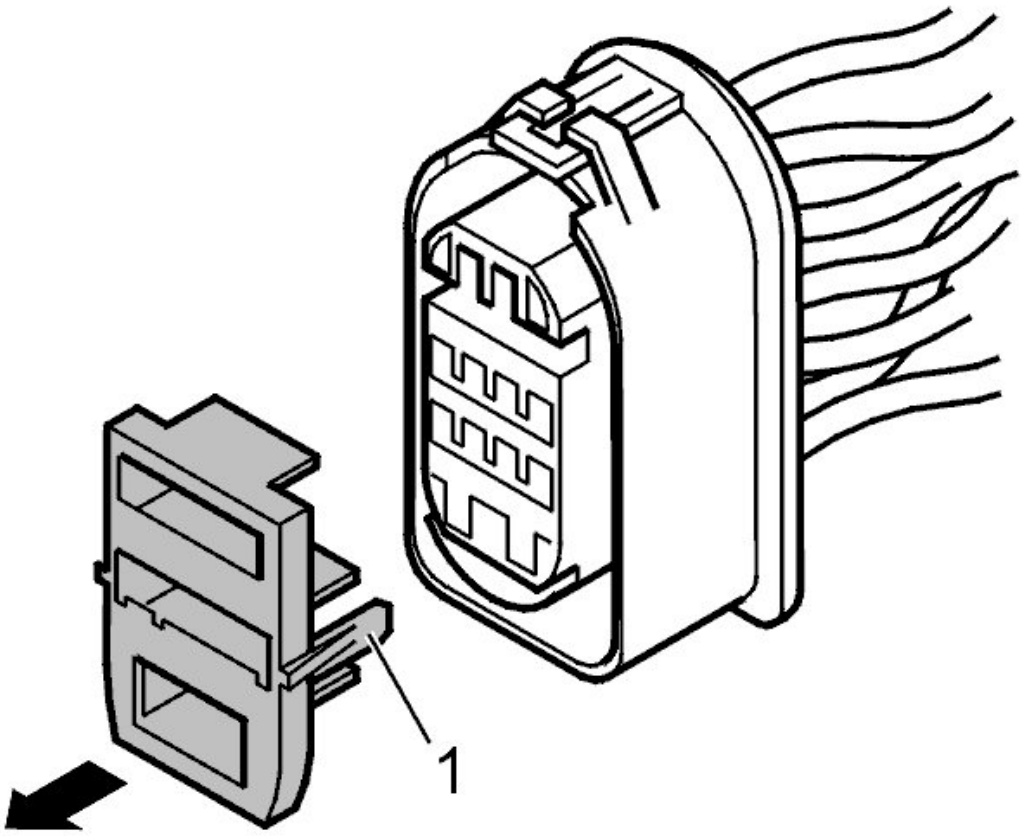
951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

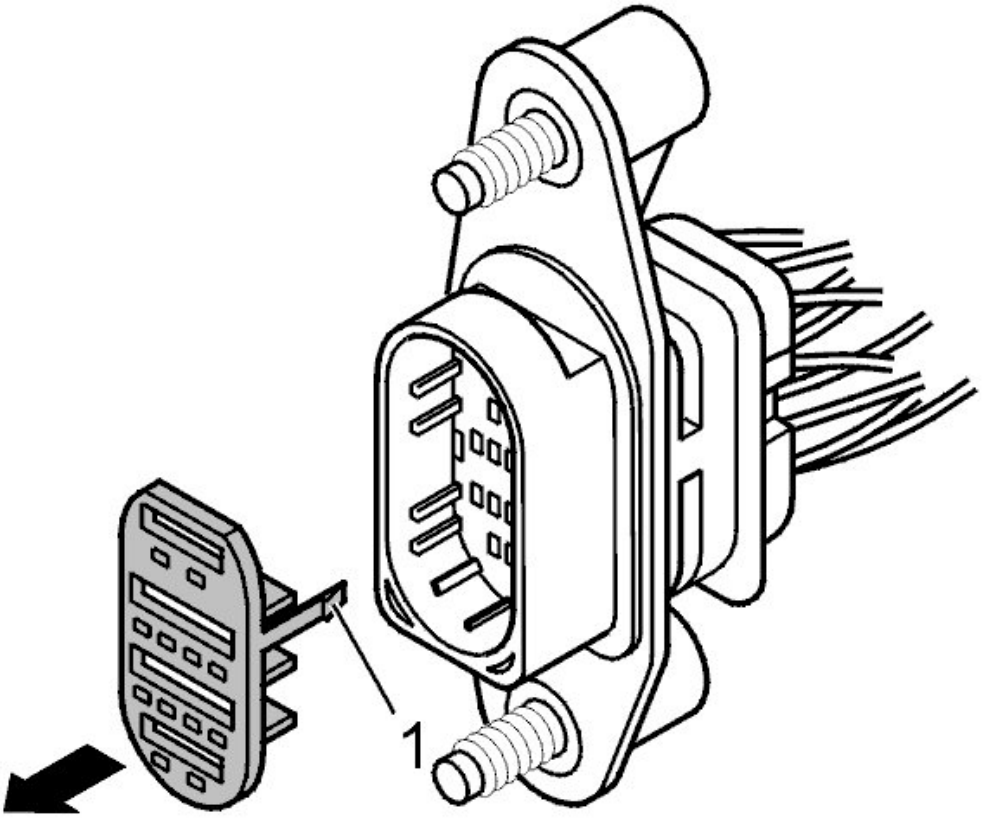
951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

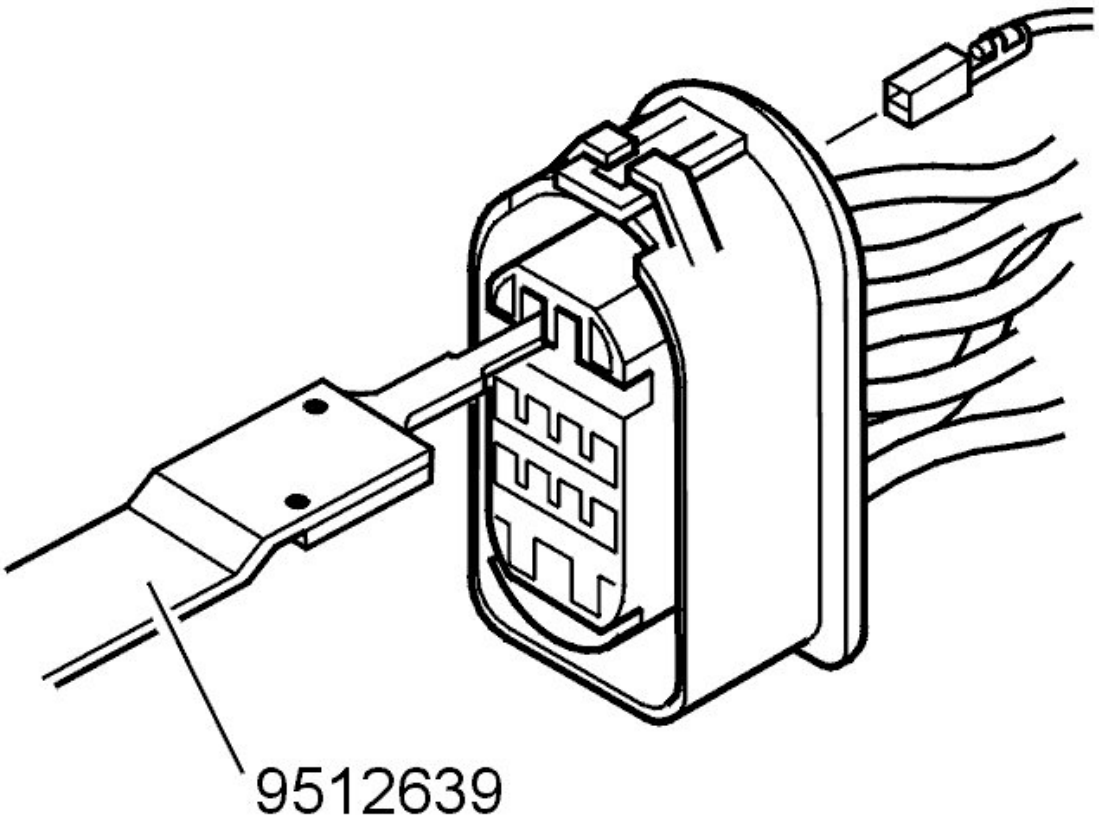
Secondary lock

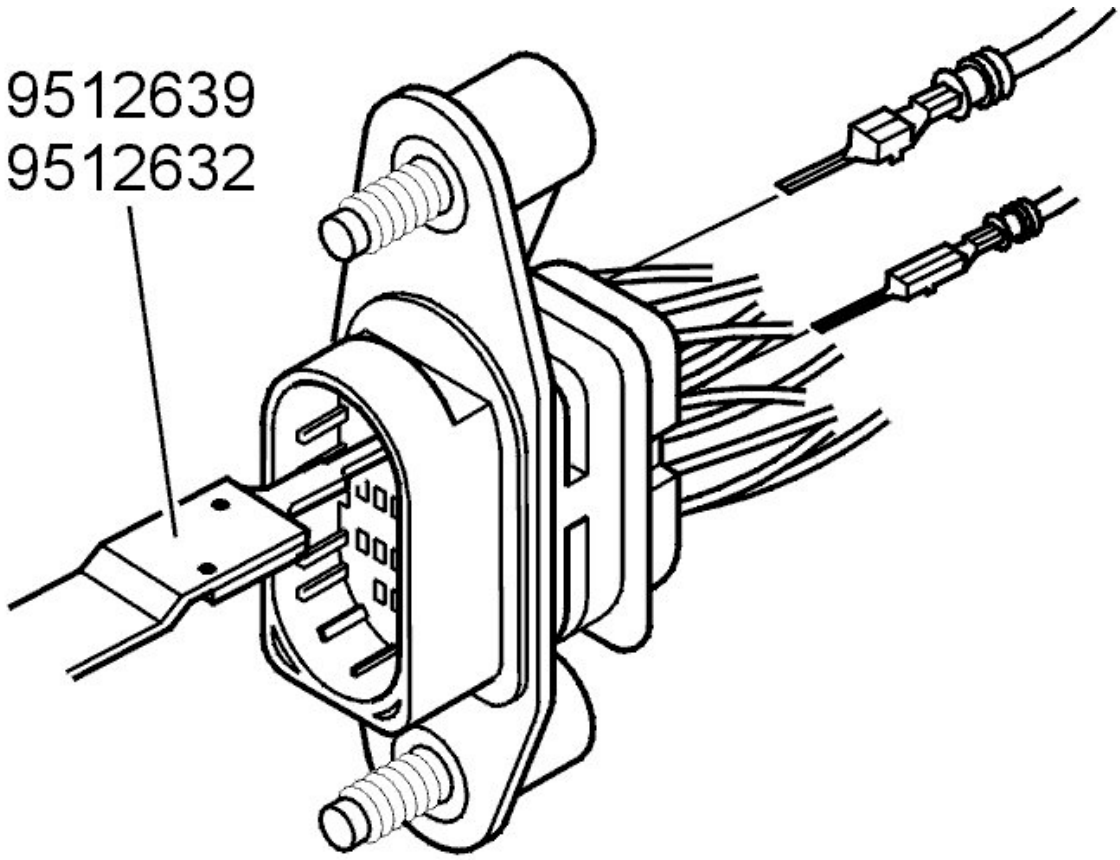




Angle out the catches on both sides.
Pull out the secondary lock.

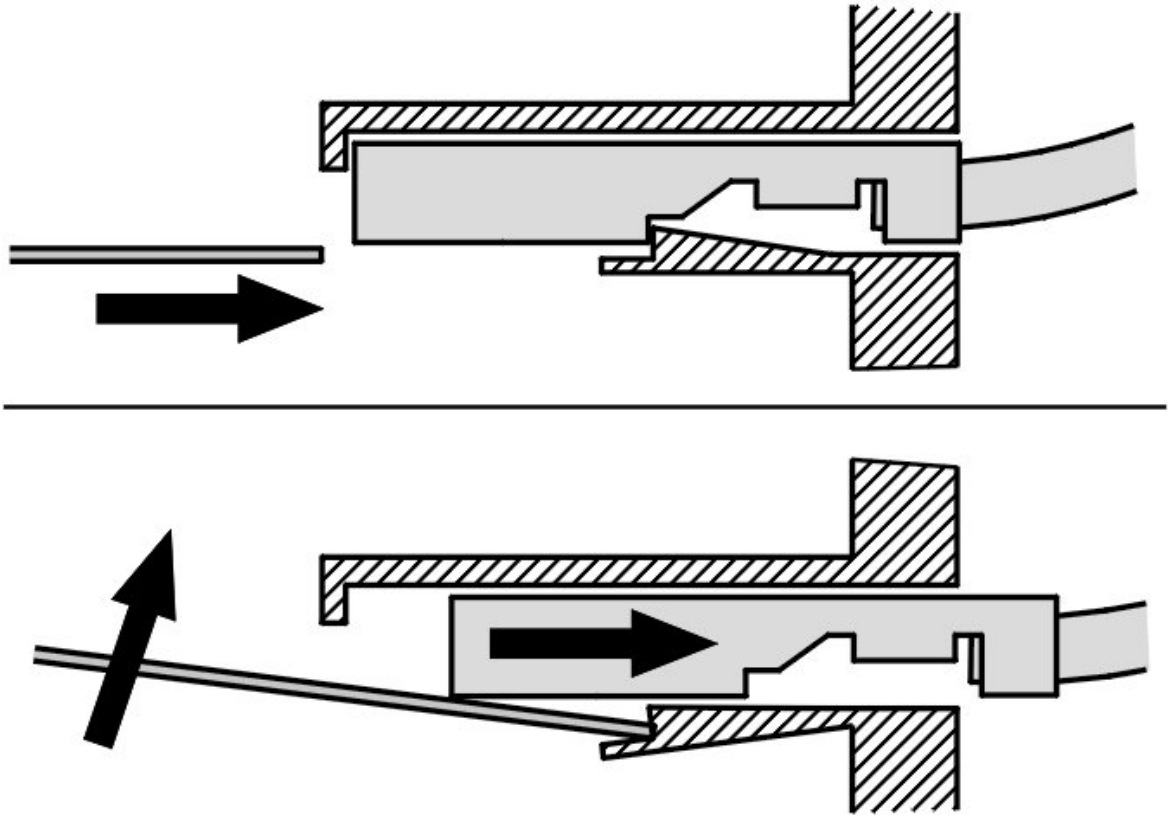
Primary lock

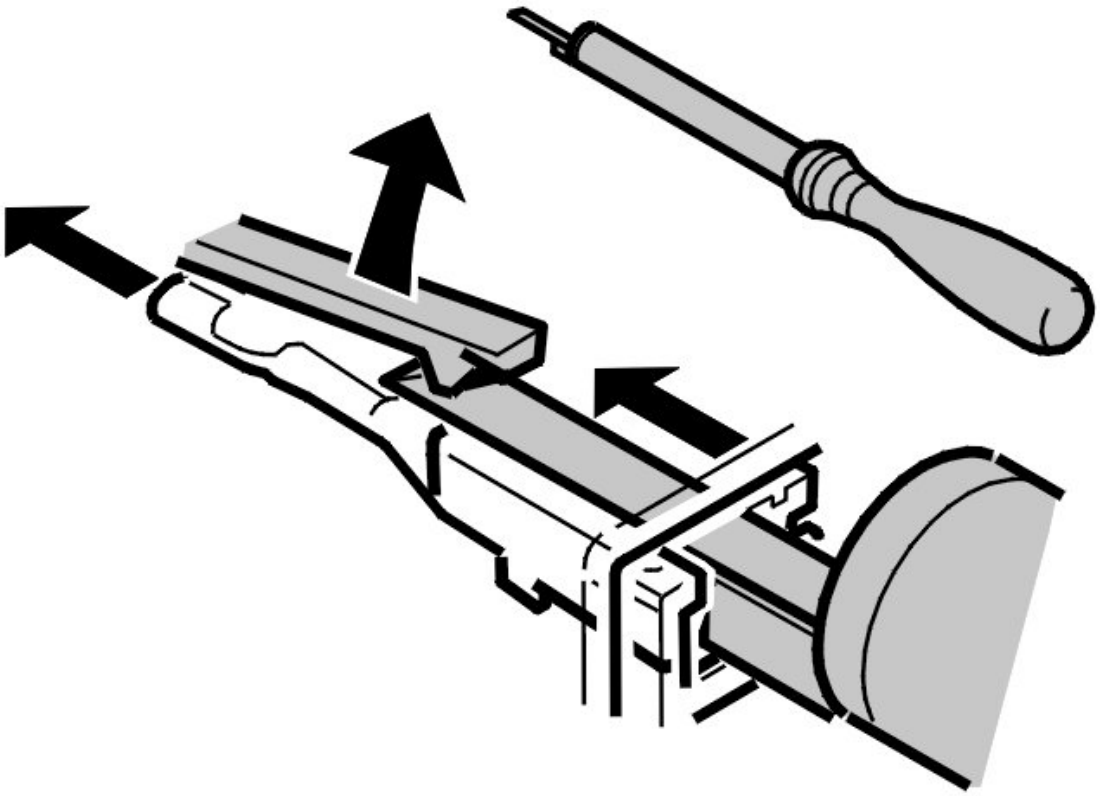




Use tools 951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.





Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Note! tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool can only be used for socket housings.

Connector, assembling

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Type 6

Connectors, repair

Special tools:
951 2811 Terminal removal tool See: Tools and Equipment/951 2811 Terminal Removal Tool

951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

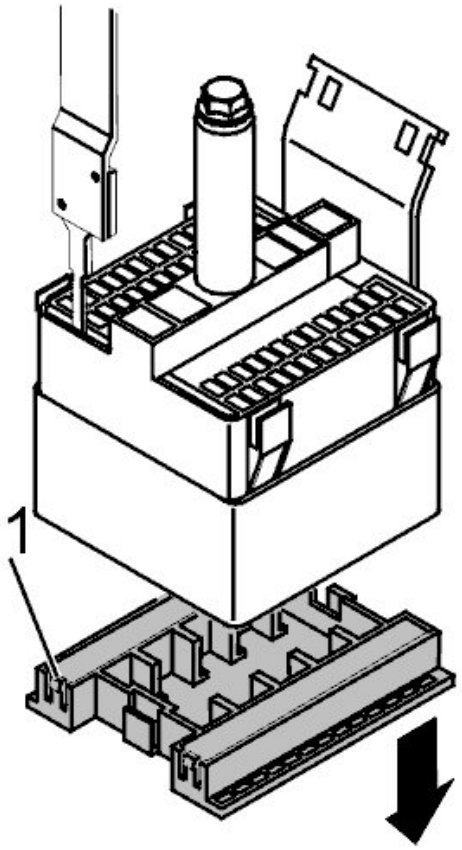
951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

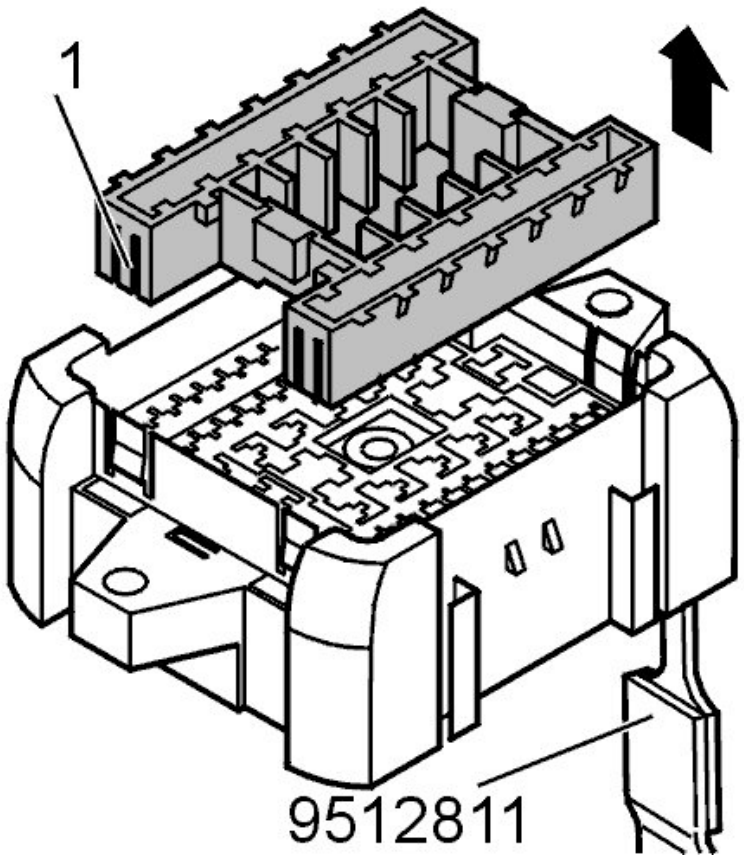
951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

Connector, dismantling

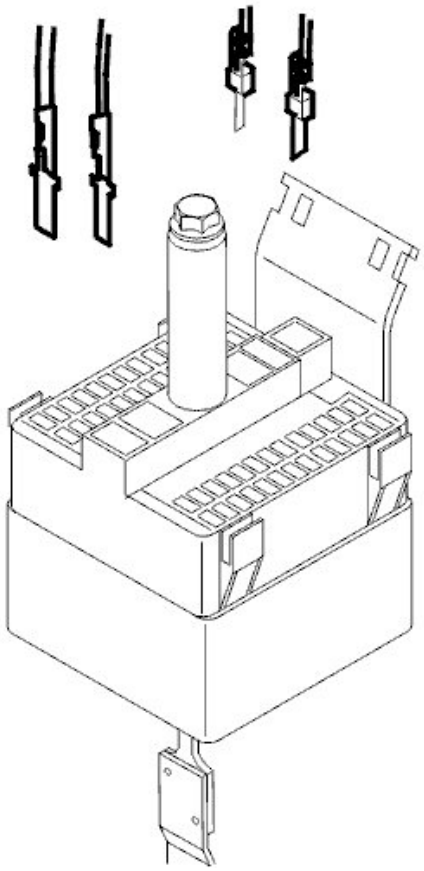
Secondary lock

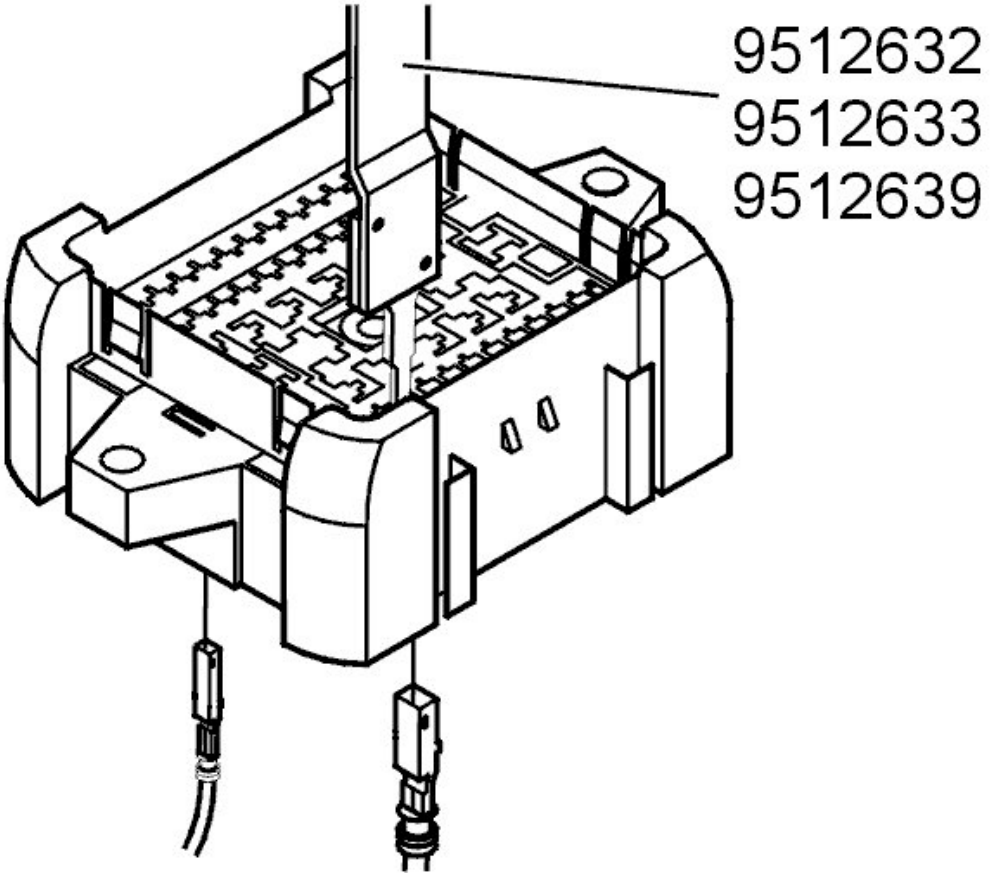




Press out the secondary lock from the cable side using tool 951 2811 Terminal removal tool See: Tools and Equipment/951 2811 Terminal Removal Tool or an electrician's screwdriver, as illustrated.

Primary lock

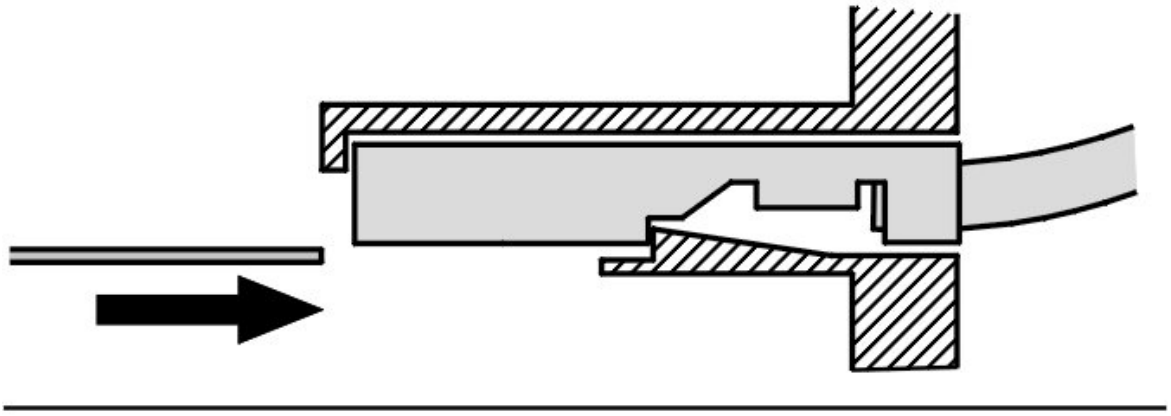


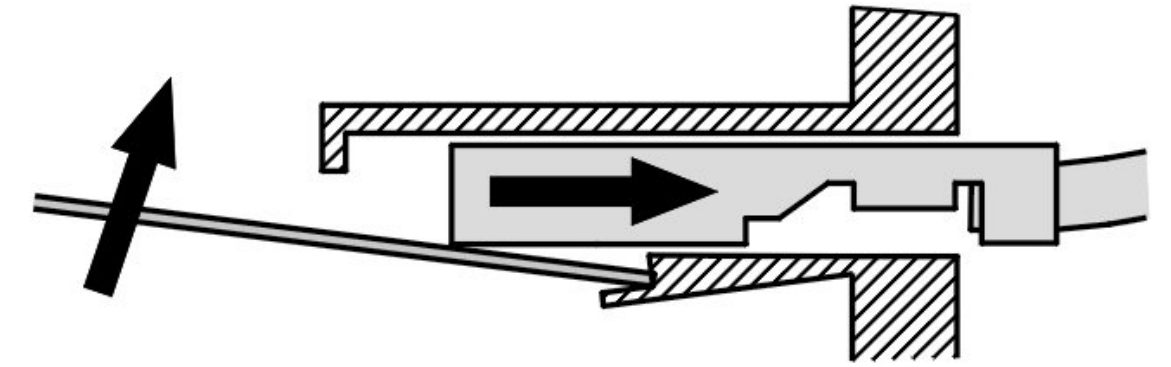


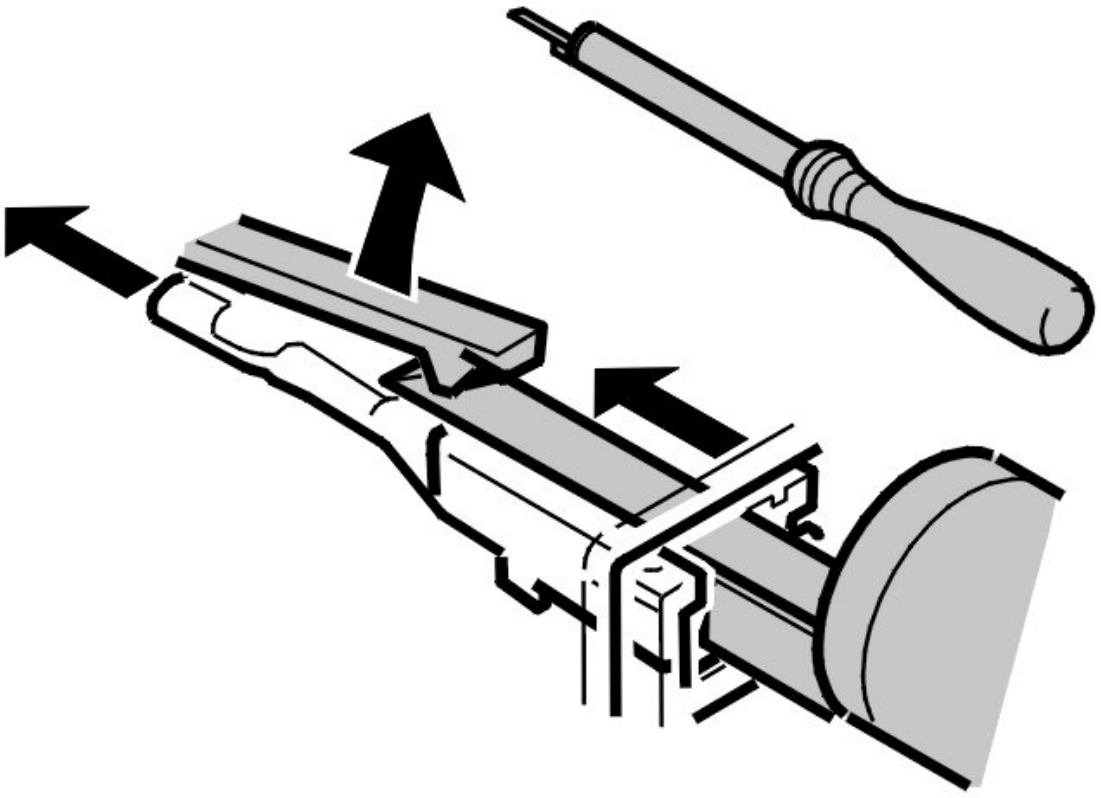
Use tools 951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.







Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Note! tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool can only be used for socket housings.

Connector, assembling

Primary lock

Check that the cable terminal is undamaged.

Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

The secondary lock

Press the secondary lock into place.

Connector Type 7

Connectors, repair

Special tools:
951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

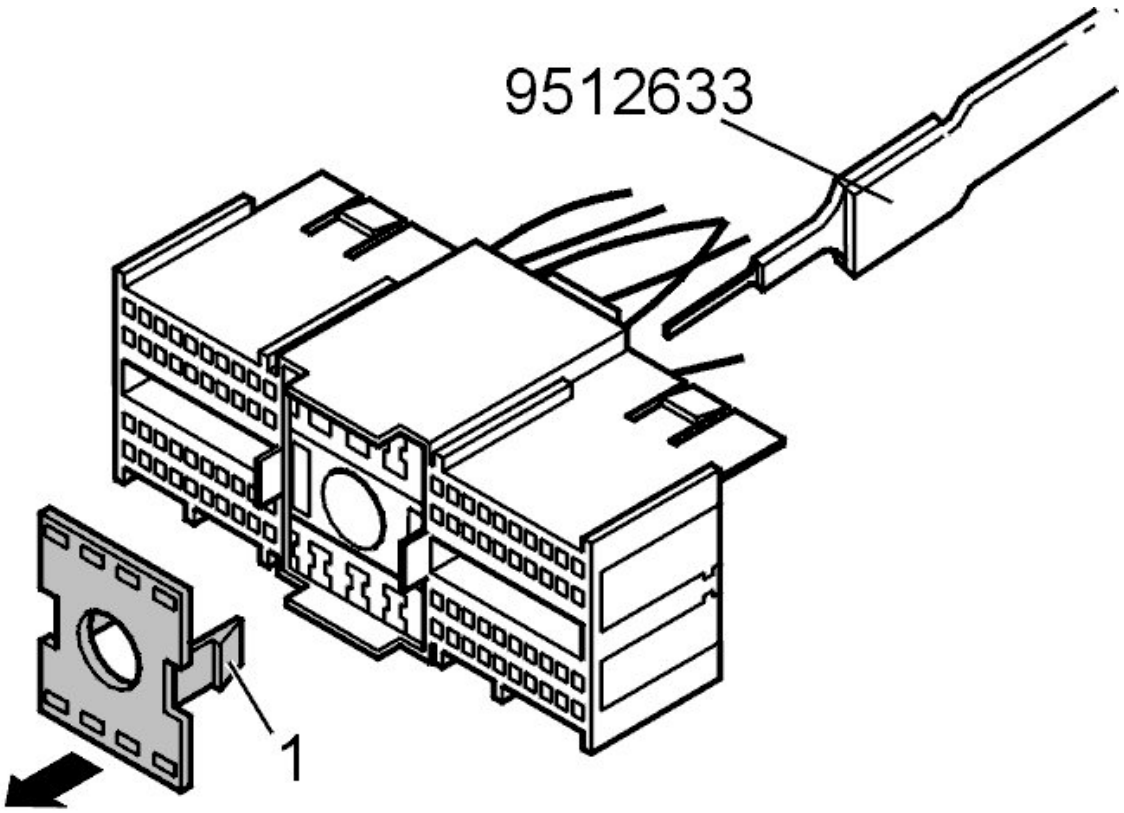
951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool

951 2812 Terminal removal tool See: Tools and Equipment/951 2812 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

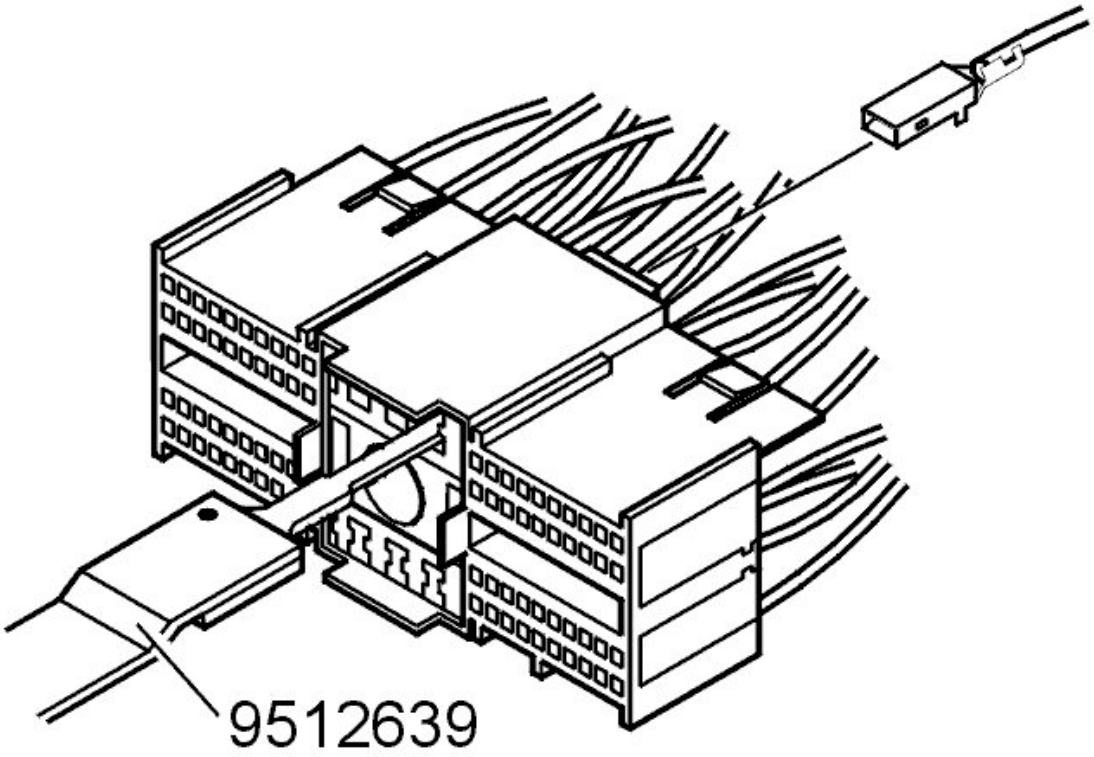
Connector, dismantling

Secondary lock

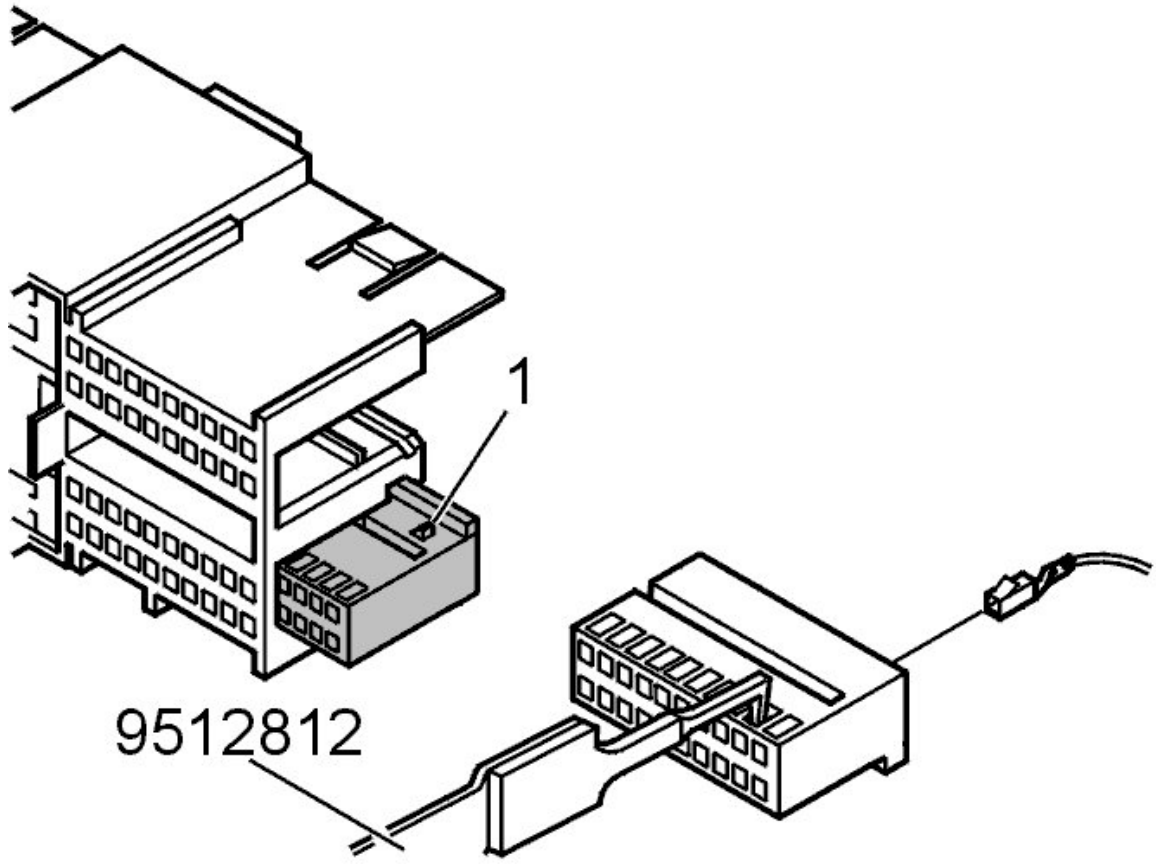


Press out the secondary lock from the cable side using tool 951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool or an electrician's screwdriver, as illustrated.

Primary lock



Use tool 951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the center cable terminals, as illustrated.
At the same time pull the cable carefully backwards.



Release the inner housing section on the socket housing by lifting the sleeve beside the catch and pulling the housing section outwards.
Disconnect the cable terminals. Use tool 951 2812 Terminal removal tool See: Tools and Equipment/951 2812 Terminal Removal Tool or951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool , as illustrated.
At the same time pull the cable carefully backwards.

Connector, assembling

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Slide the receptacle housing into the connector.
Press the secondary lock into place.

Sealed Connector Type 1

Connector sealed, repair

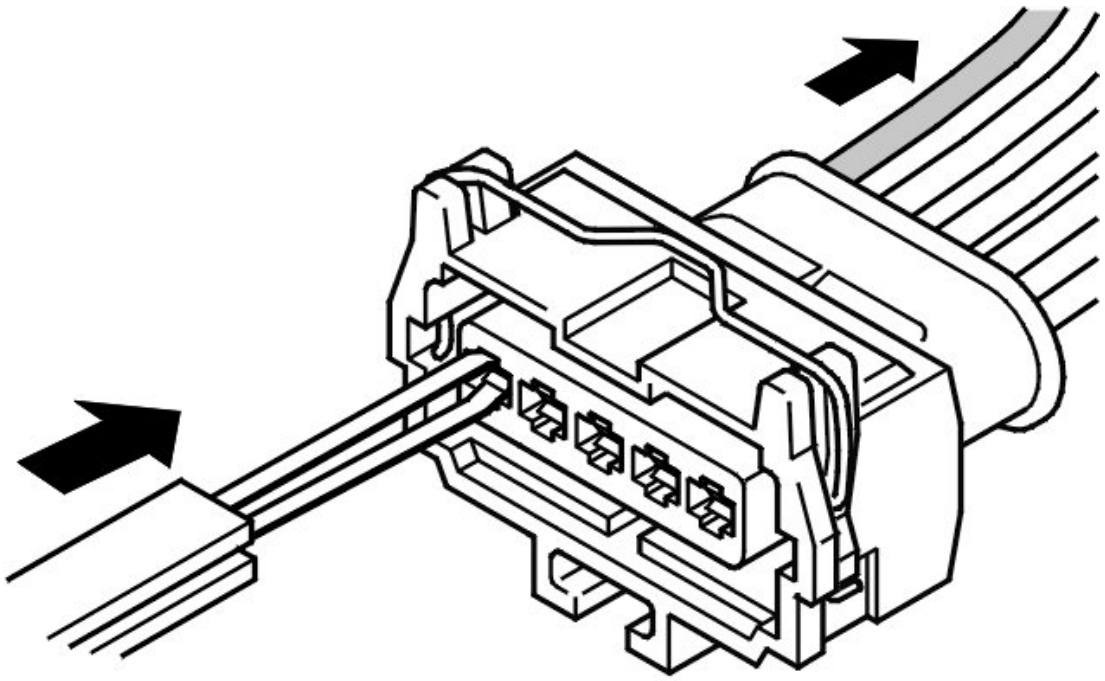
Special tools:
951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

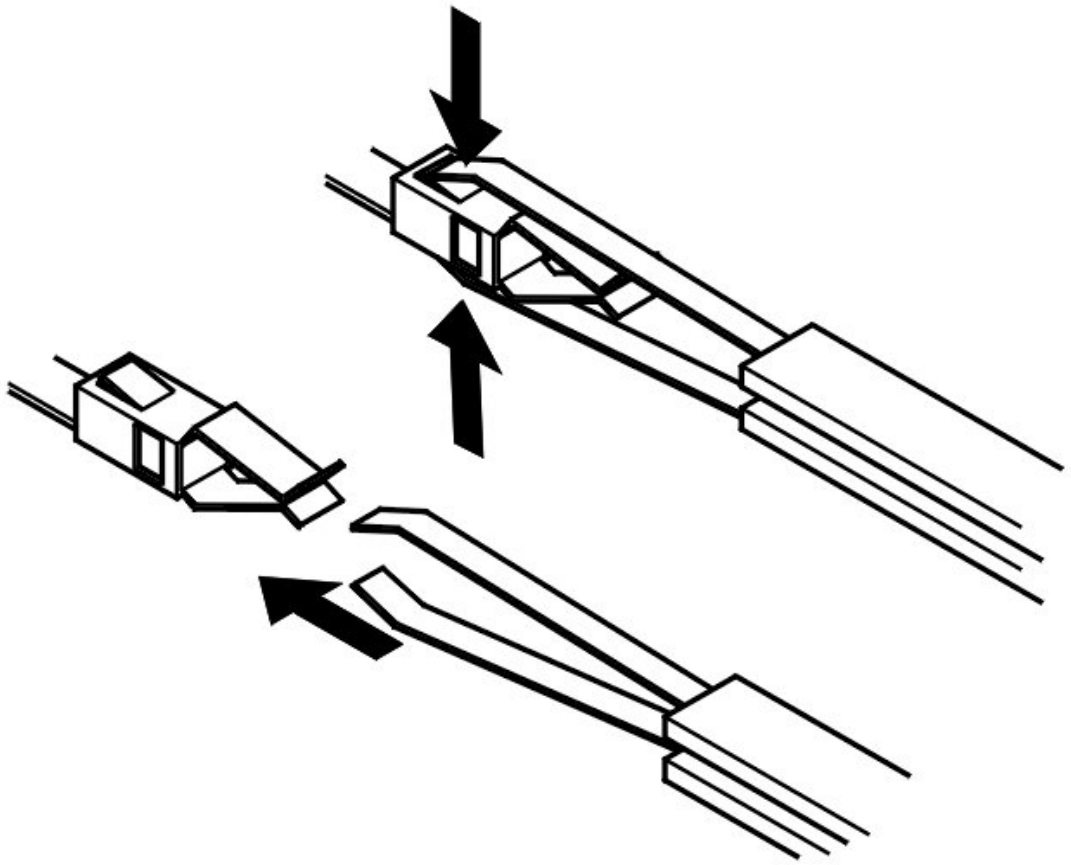
Connector, dismantling

The connector has no secondary lock.

Primary lock



Use tool 951 2631 Terminal removal tool See: Tools and Equipment/951 2631 Terminal Removal Tool to remove the primary lock, as illustrated.
At the same time pull the cable carefully backwards.



Connector, assembling

Primary locking

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the seal is correctly positioned and that the cable terminal is properly locked by pulling carefully on the cable.

Sealed Connector Type 2

Connector sealed, repair

Special tools:
951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

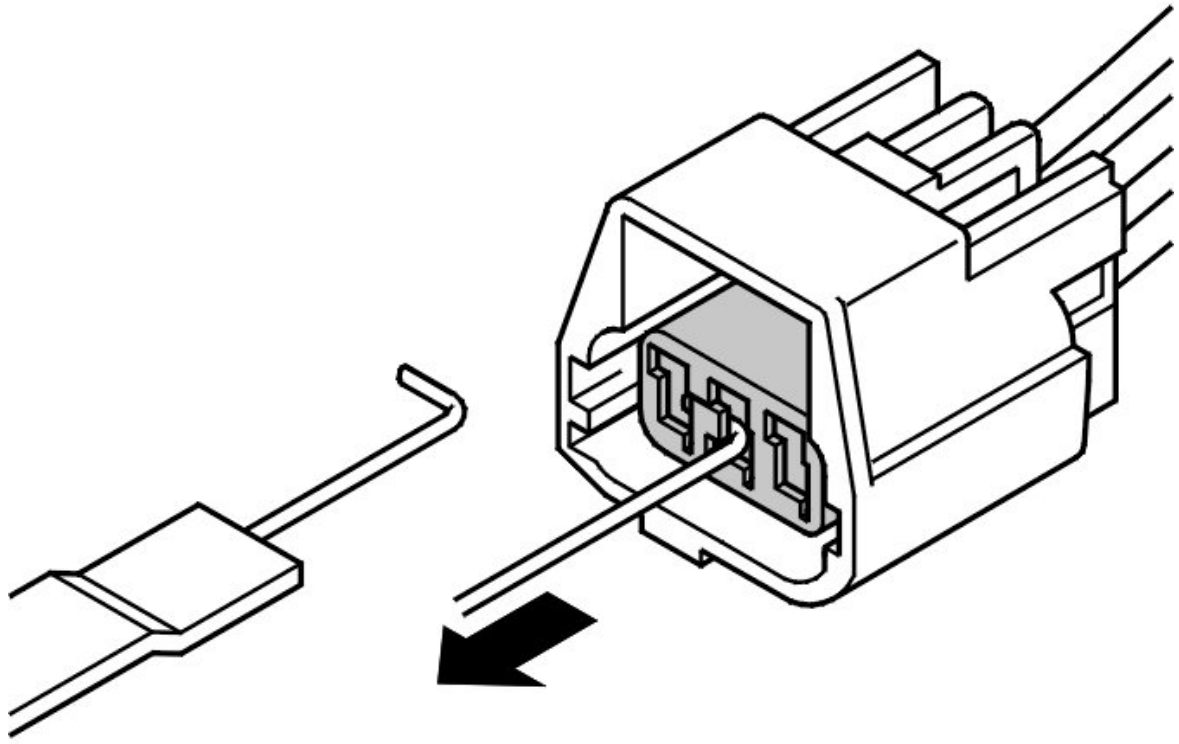
951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool

951 2853 Terminal removal tool See: Tools and Equipment/951 2853 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

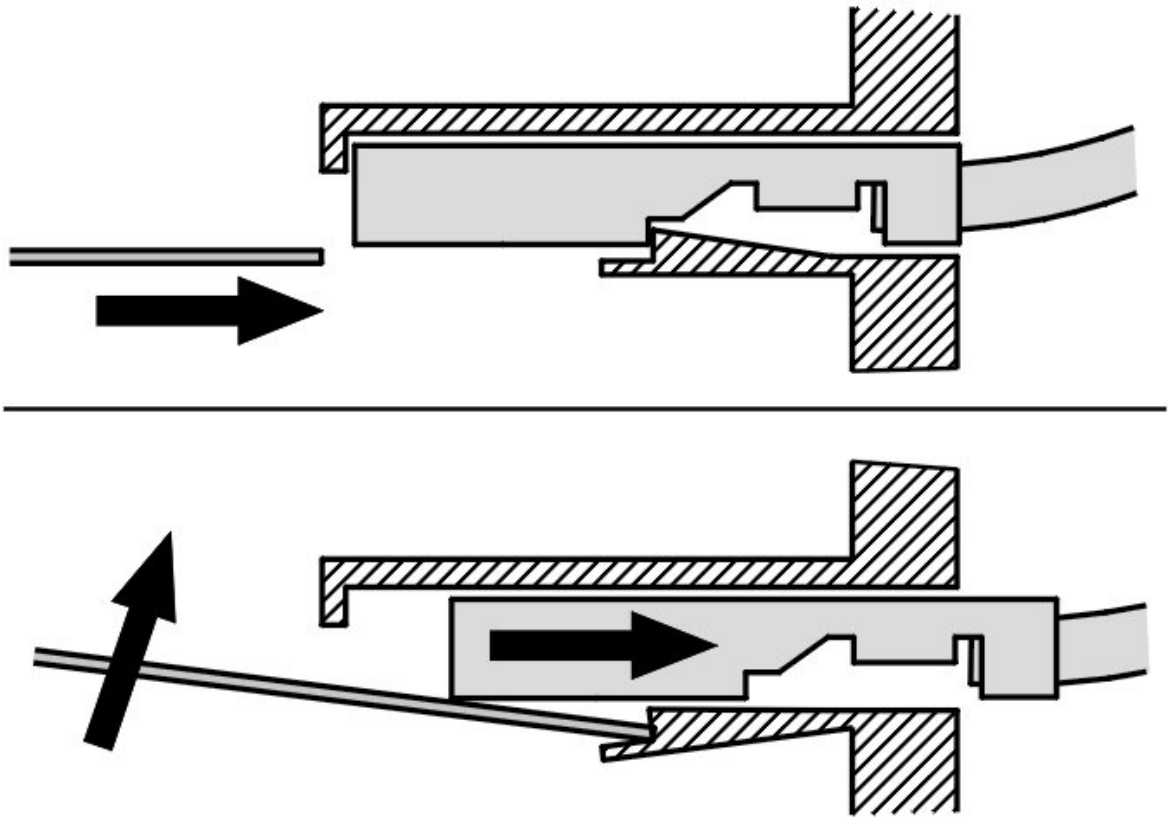
Connector, dismantling

Secondary lock



Open the catches and pull out the secondary lock, use tool 951 2853 Terminal removal tool See: Tools and Equipment/951 2853 Terminal Removal Tool or an electrician's screwdriver, as illustrated.

Primary lock



Use tools 951 2632 Terminal removal tool See: Tools and Equipment/951 2632 Terminal Removal Tool

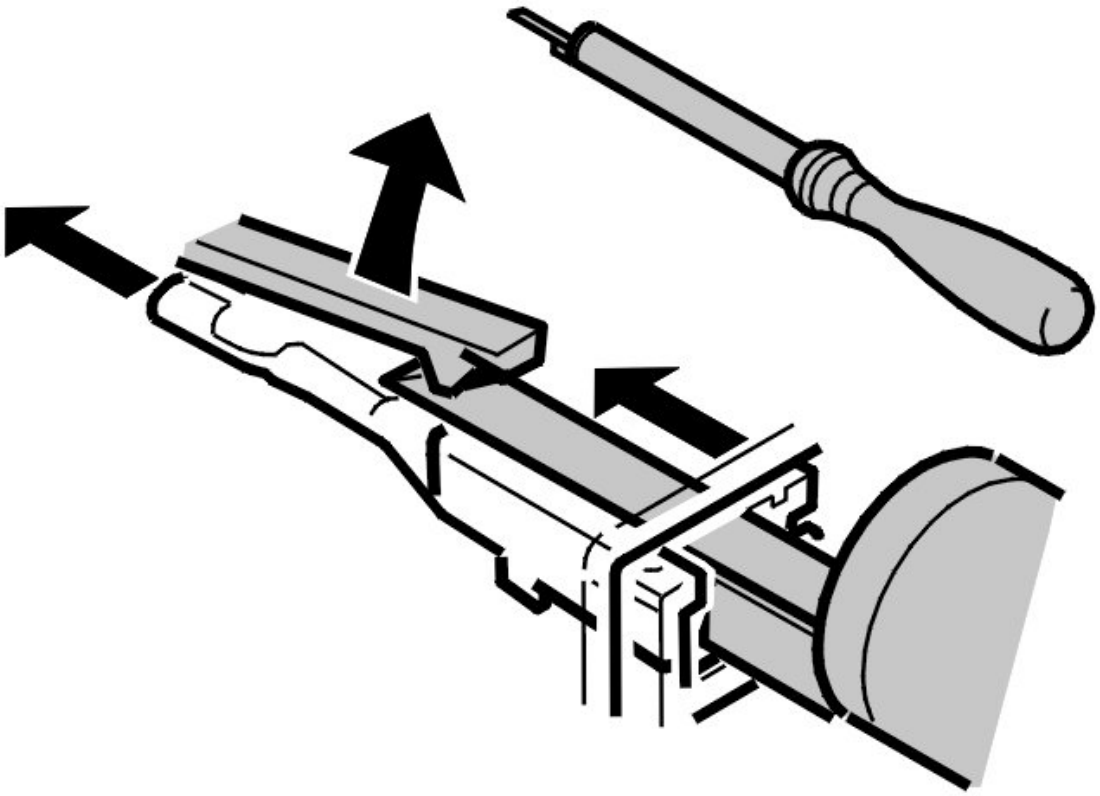
951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.

Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Note! tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool can only be used for socket housings.

Connector, assembling

Primary locking



Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the seal is correctly positioned and that the cable terminal is properly locked by pulling carefully on the cable.

Sealed Connector Type 3

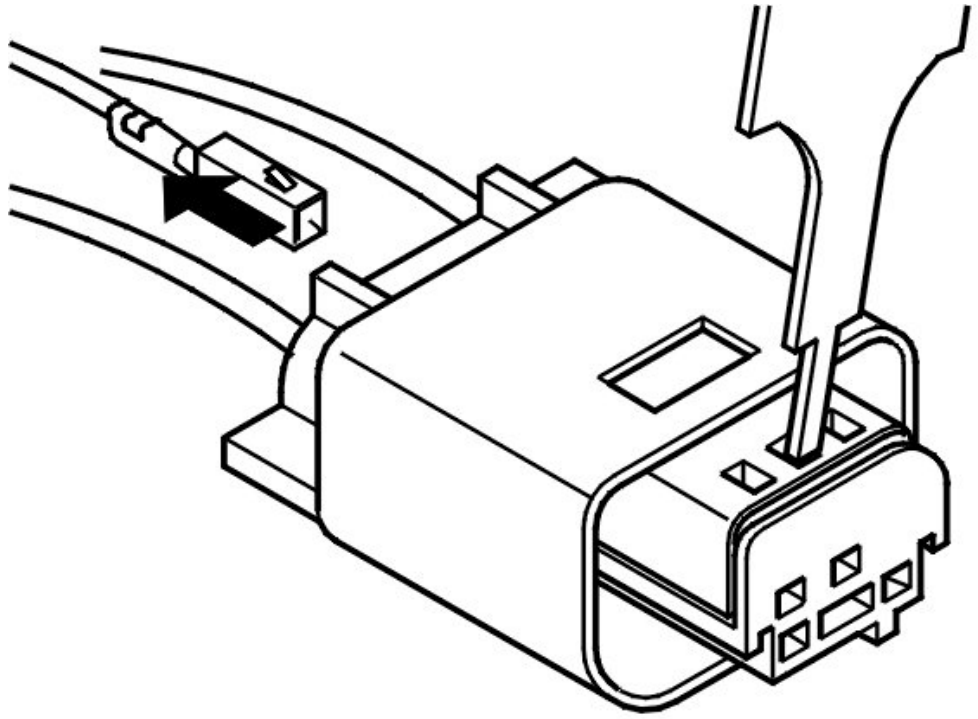
Connectors, repair

Special tools:
951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

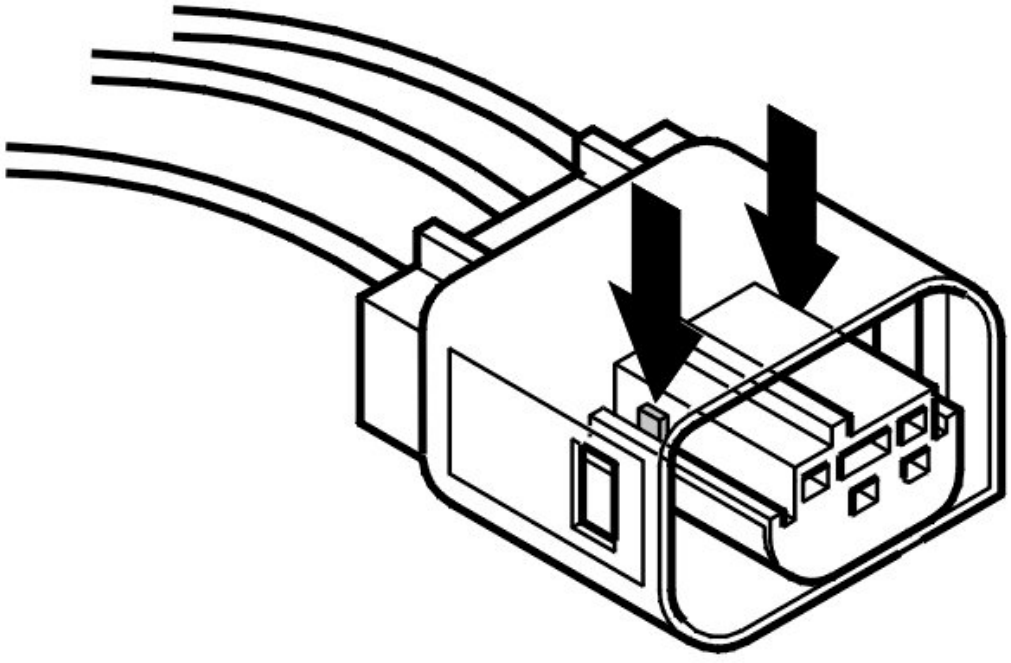
Connector, dismantling

Secondary lock



Adjust the lock pins using an electrician's screwdriver and press up the secondary lock, as illustrated.

The primary lock



Use tool 951 2637 Terminal removal tool See: Tools and Equipment/951 2637 Terminal Removal Tool to press down the cable terminal locking tab, as illustrated.
At the same time pull the cable carefully backwards.

Connector, assembling

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the seal is correctly positioned and that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Press the secondary lock into place.

Connector Fuse Holder, Repair

Connector fuse holder, repair

Special tools:
951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

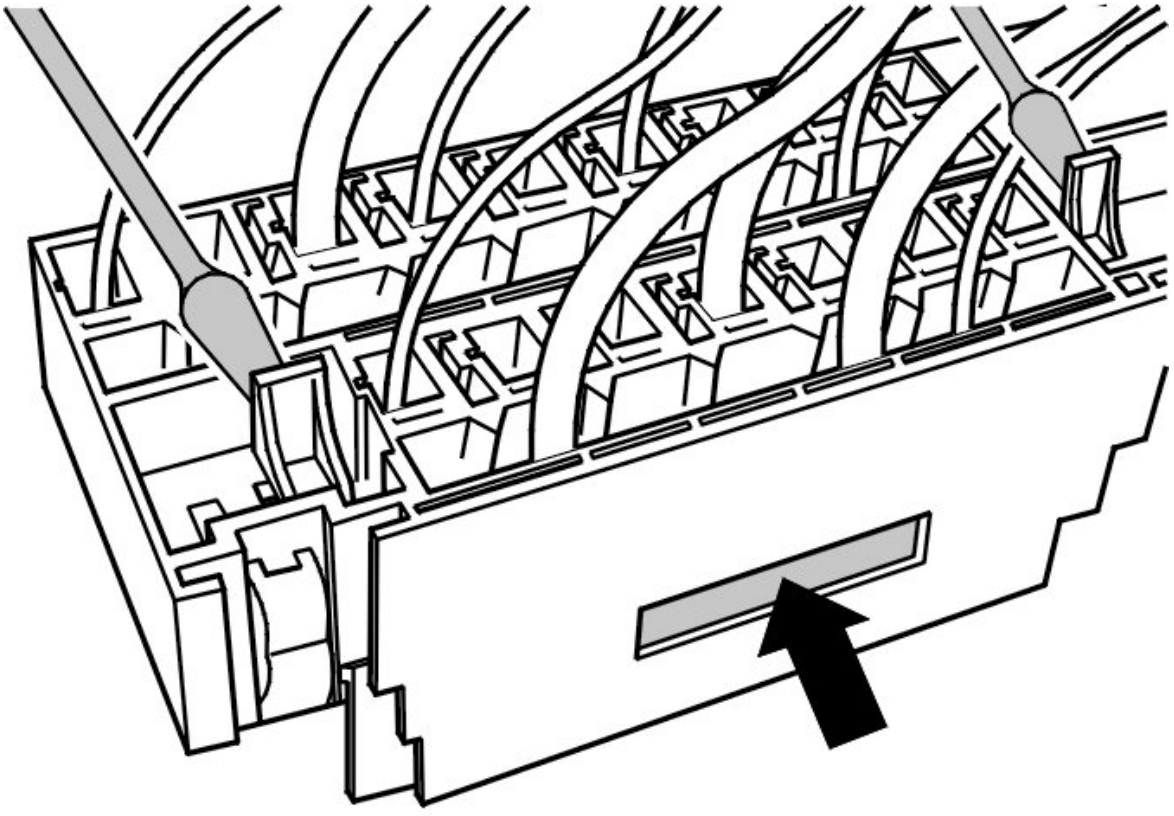
Preparatory work

Expose the relevant fusebox.
Remove the fuses. Note the positions of the fuses.

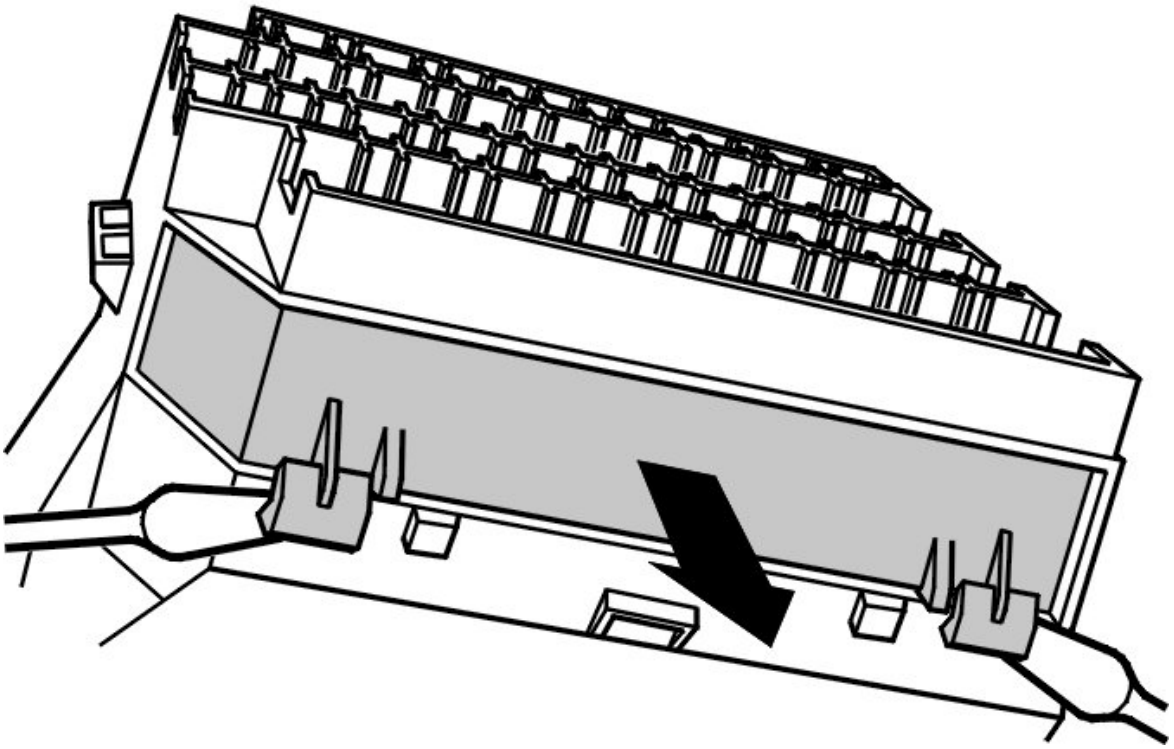
Dismantling

Secondary lock

Releases the catches for the secondary lock.
Slide the secondary lock to one side to access the primary lock, as illustrated.

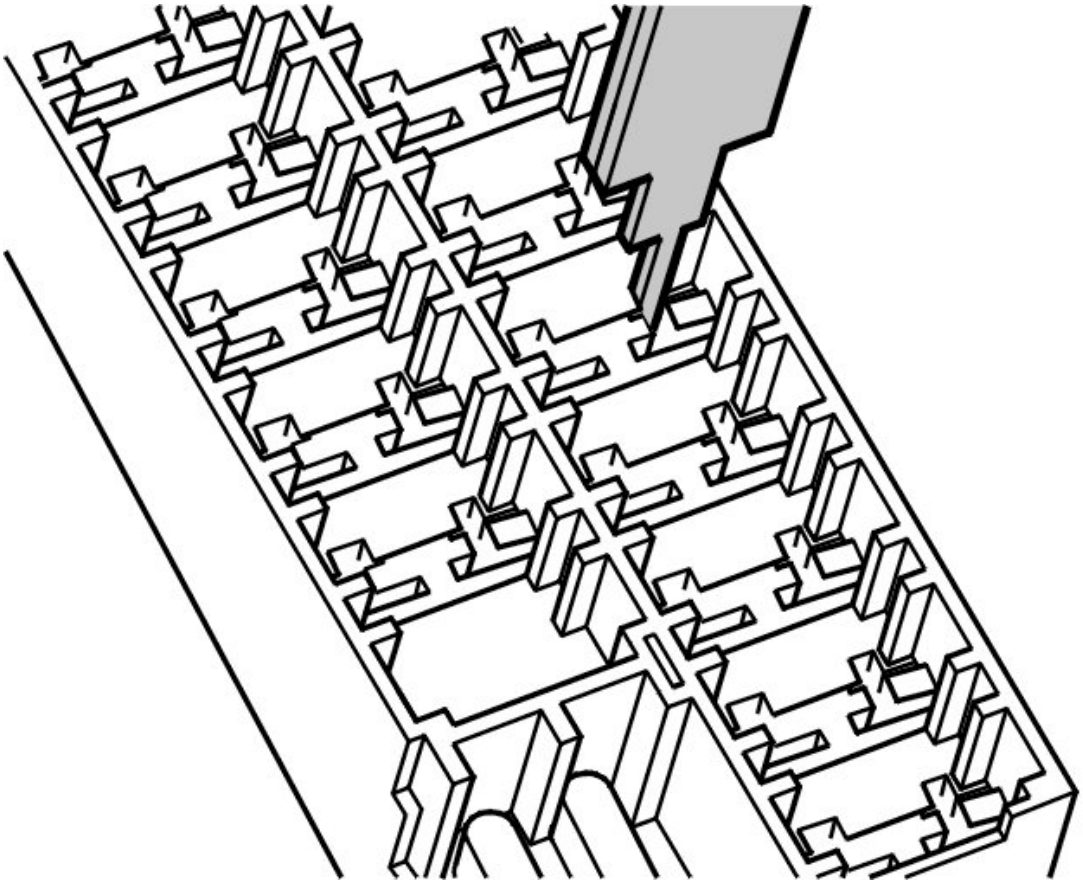


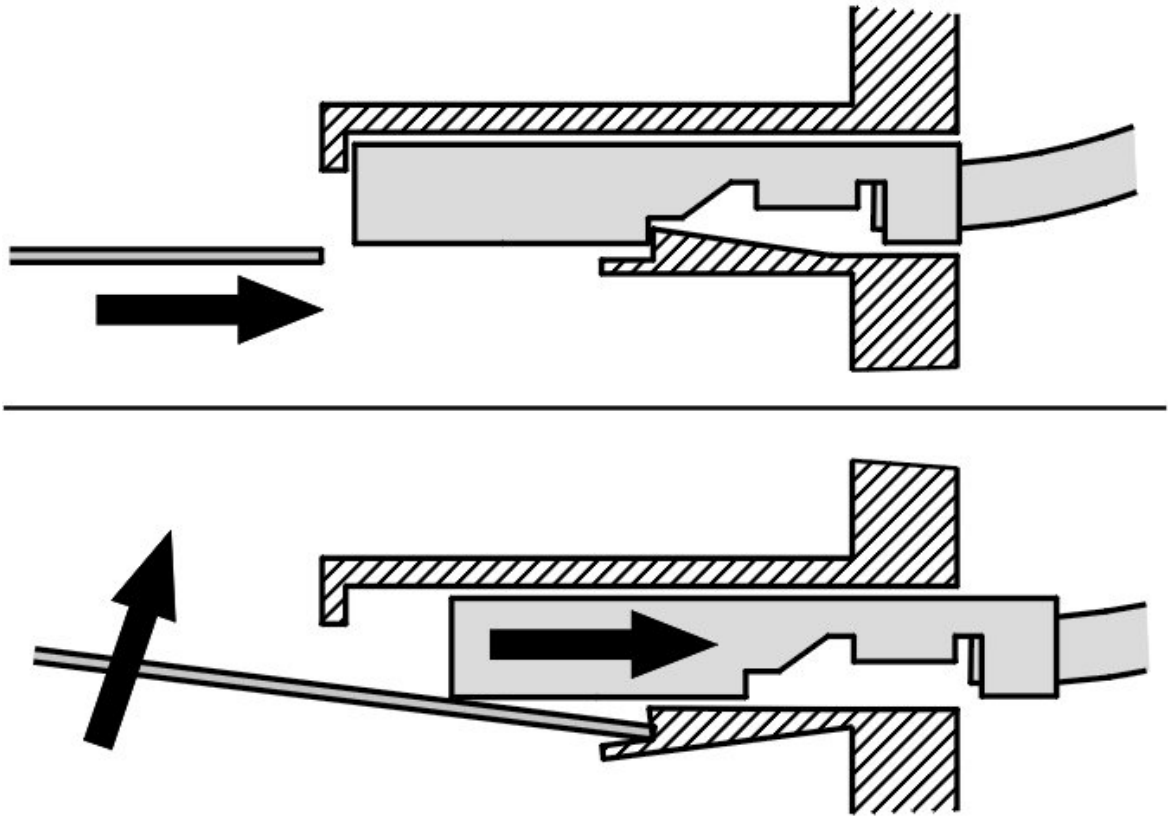
Fuse holder cargo compartment.



Fuse holder passenger compartment.

Primary lock



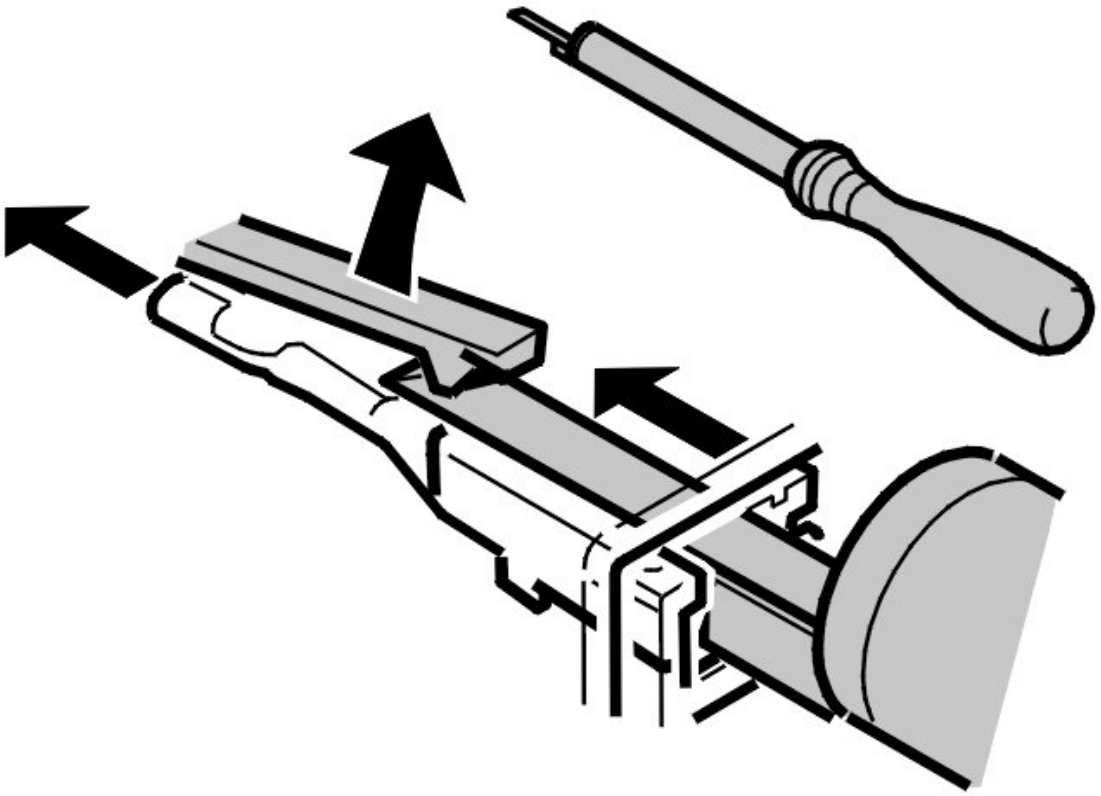


Use tools 951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated.

Note! The relay holders can be connected and several locks may need to be adjusted at the same time.

At the same time pull the cable carefully backwards.



Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Installation

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable.

Secondary lock

Slide back the secondary lock.

Finishing work

Install the relays.

Note! Take care with the positioning.

Reinstall the central relay box.

Connector Relay Box, Repair

Connector relay box, repair

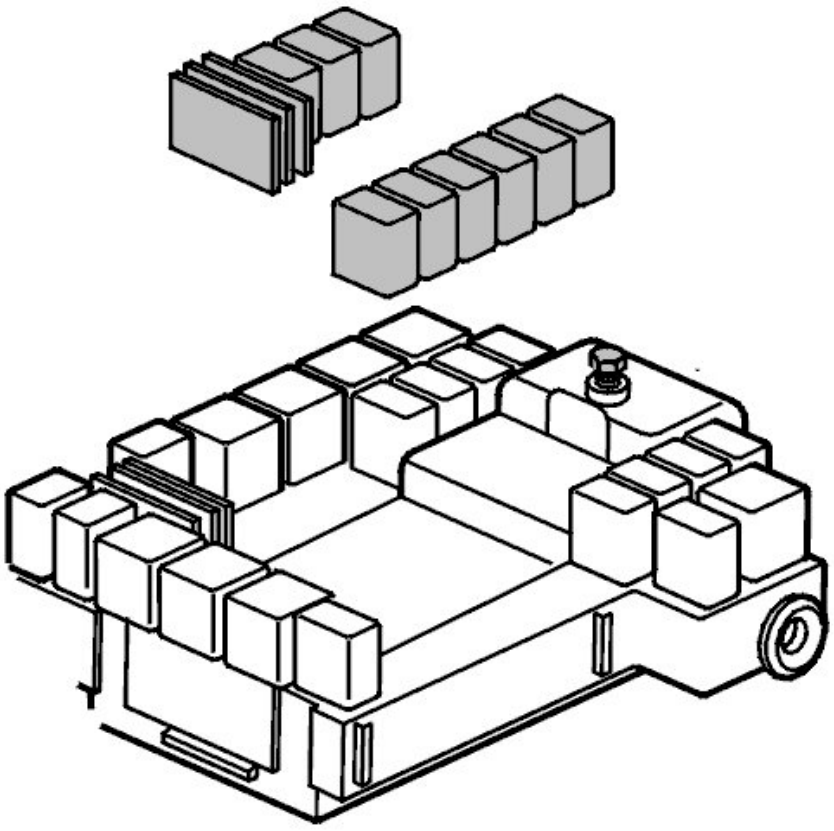
Special tools:
951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool

951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool.

Note! As the illustrations in this service information are used for different model years and / or models, some variation may occur. However, the essential information in the illustrations is always correct.

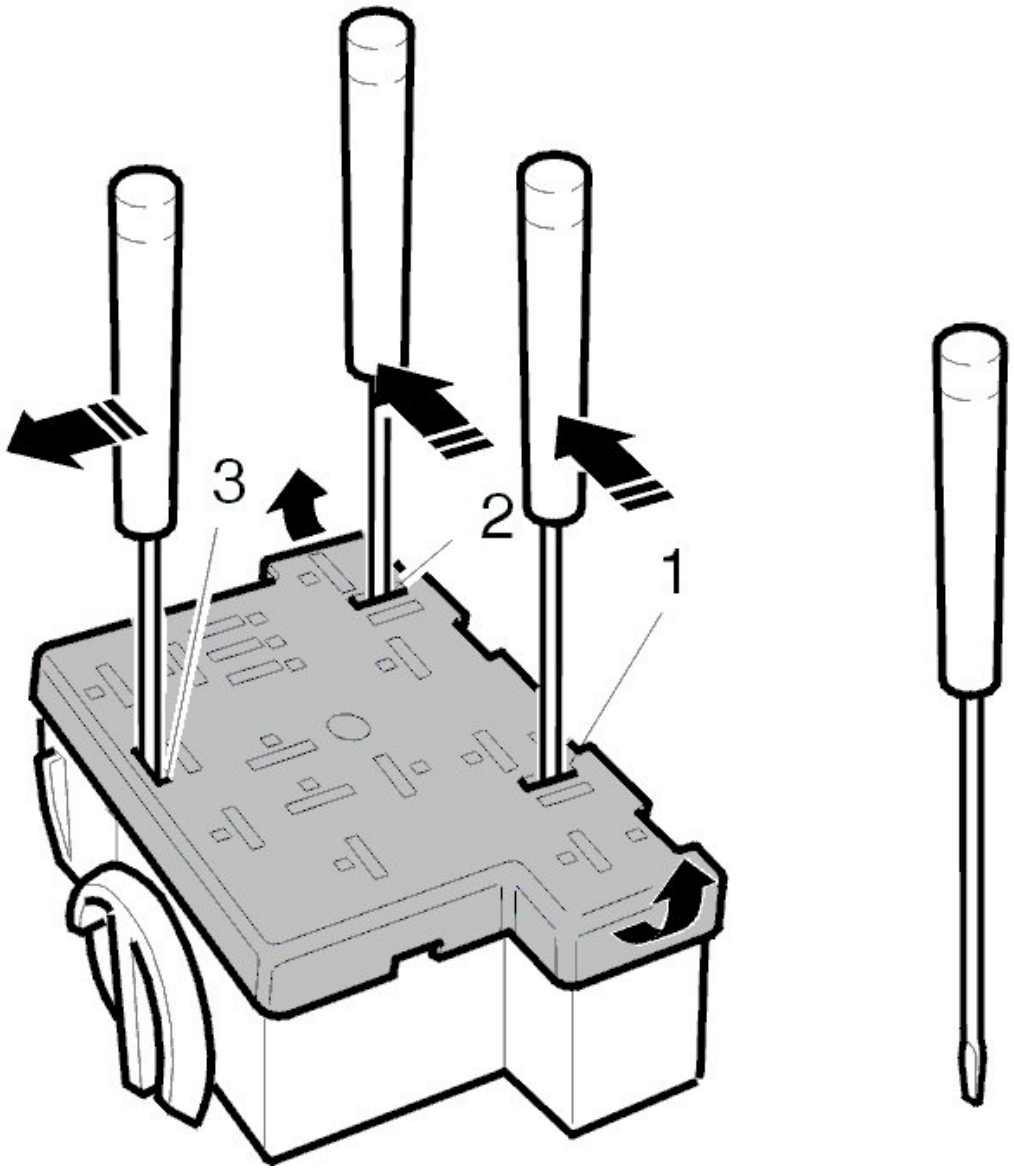
Preparatory work



Expose the relevant relay box.
Remove the relevant relays, noting their position.

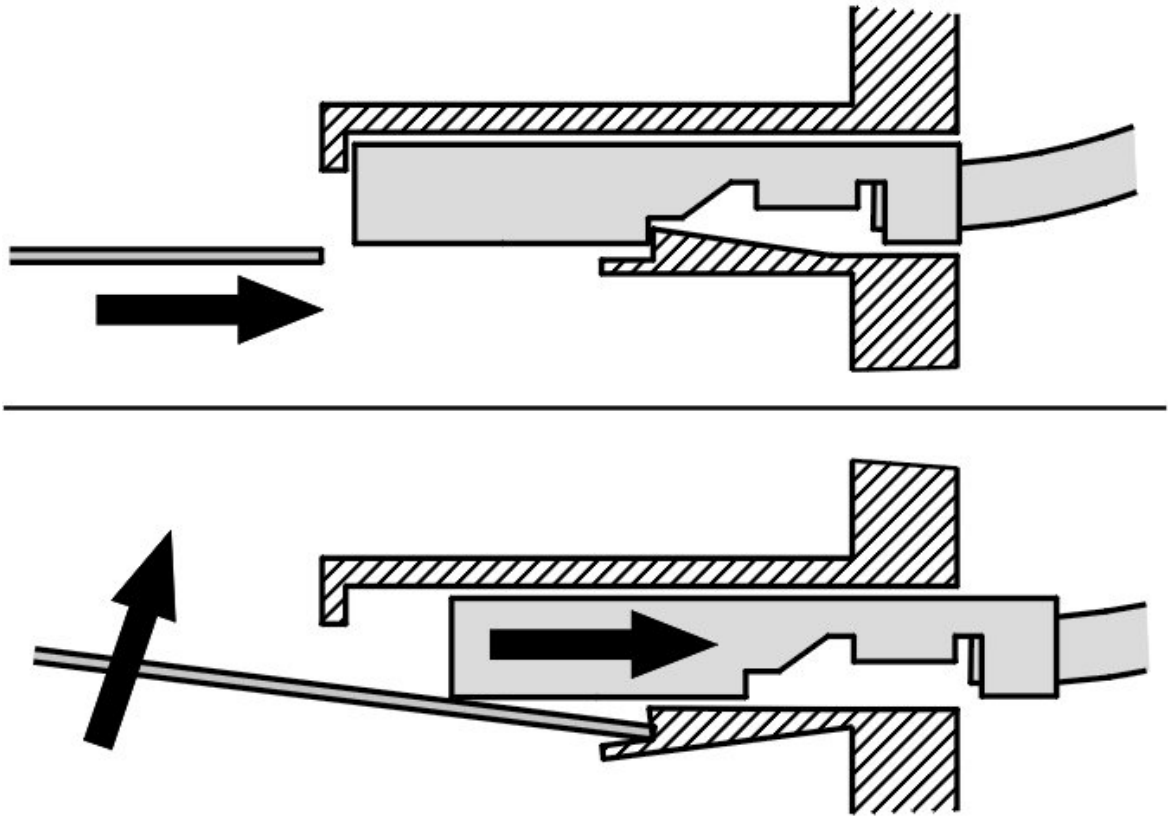
Dismantling

Secondary lock



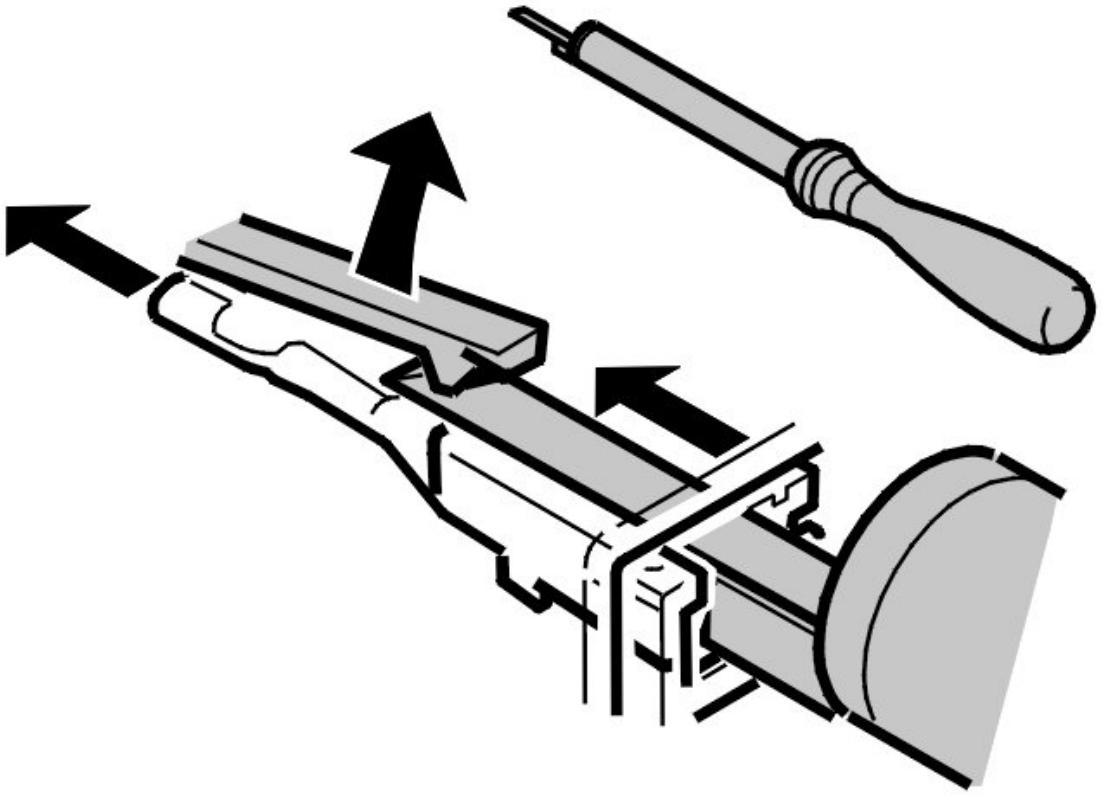
Release the relevant secondary lock by adjusting the locks with an electrician's screwdriver, as illustrated.

Primary lock



Use tools 951 2633 Terminal removal tool See: Tools and Equipment/951 2633 Terminal Removal Tool

951 2639 Terminal removal tool See: Tools and Equipment/951 2639 Terminal Removal Tool to remove the primary lock, as illustrated. At the same time pull the cable carefully backwards.



Alternatively use tool 951 2852 Terminal removal tool See: Tools and Equipment/951 2852 Terminal Removal Tool as illustrated.

Installation

Primary lock

Check that the cable terminal is undamaged.
Press the cable terminal into the housing.
Check that the cable terminal is properly locked by pulling carefully on the cable,

The secondary lock

Press the secondary lock into place.

Finishing work

Install the relays.

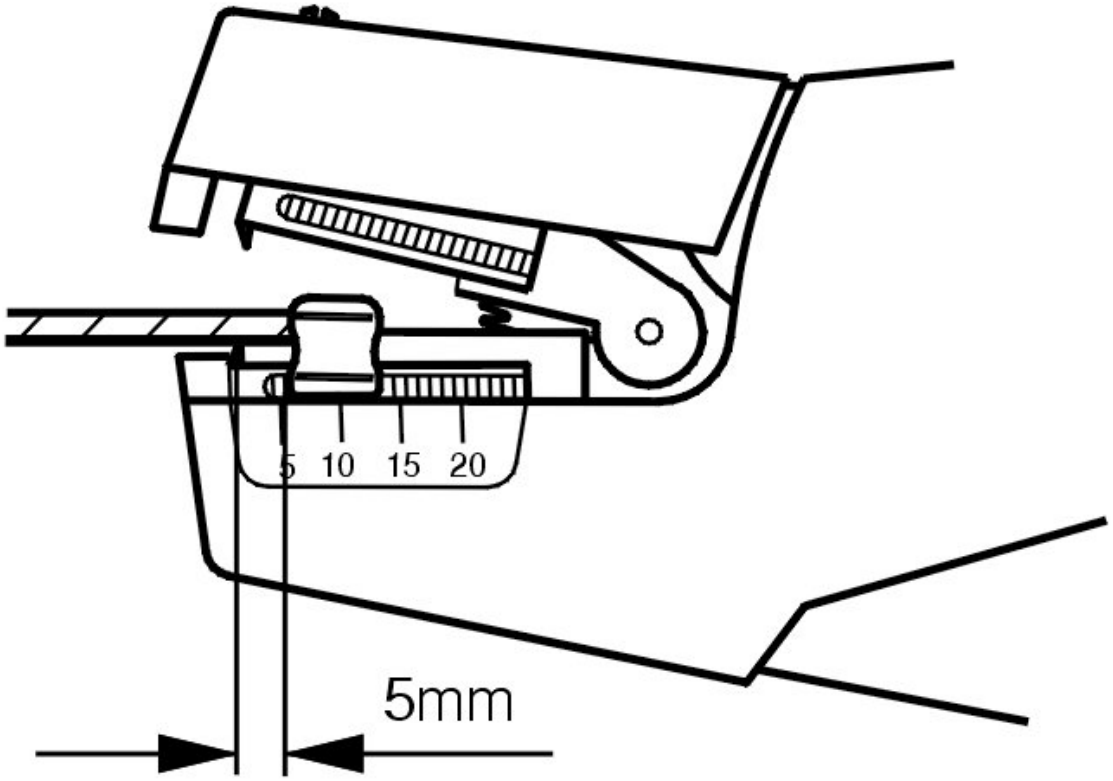
Note! Take care with the positioning.

Install the relevant relay box.

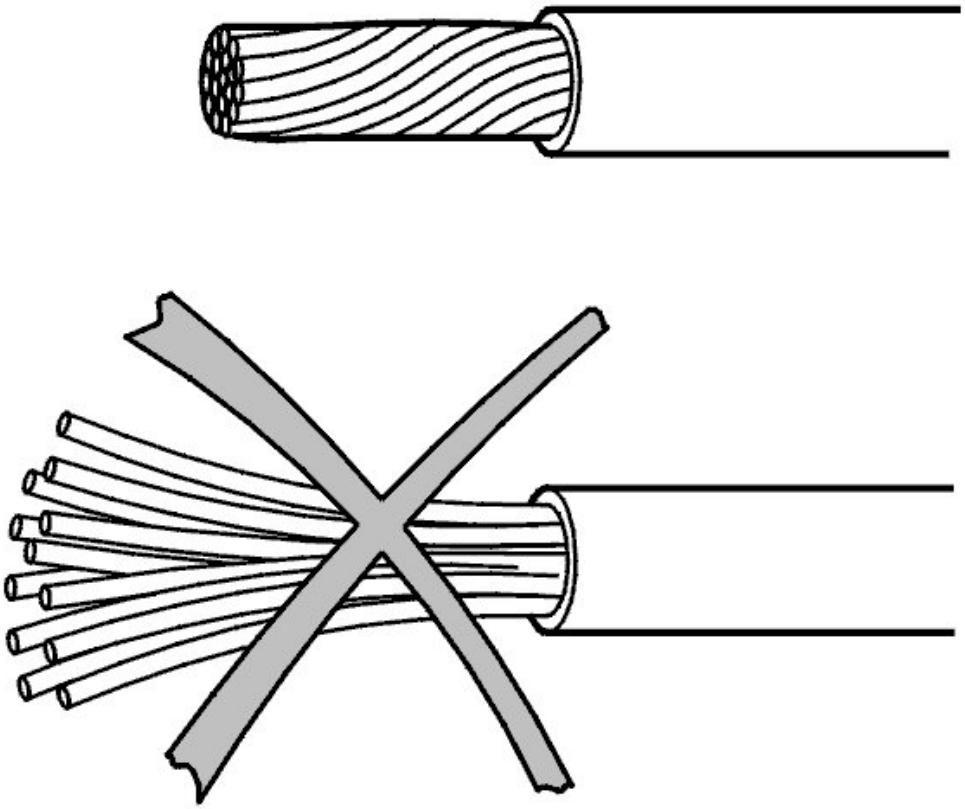
Splicing the Cables

Splicing the cables

Strip the wire



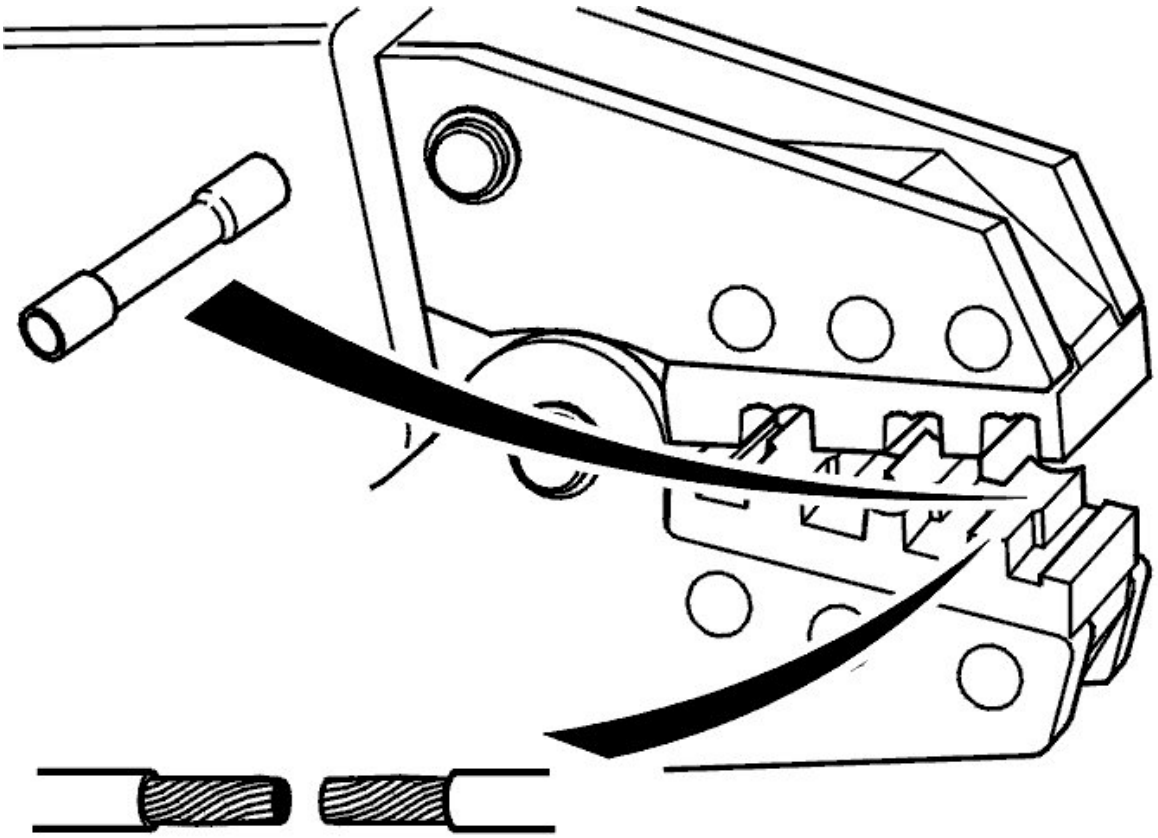
Peel 5.0mm / 0.2 in of the insulation off the 4 cable ends (13/64 inches) using pliers951 2620 Stripping tool See: Tools and Equipment/951 2620 Stripping Tool.



Twist the strands on the stripped wire ends. Do NOT forget to do this on all four wire ends.

Note! Make sure the strands are twisted.

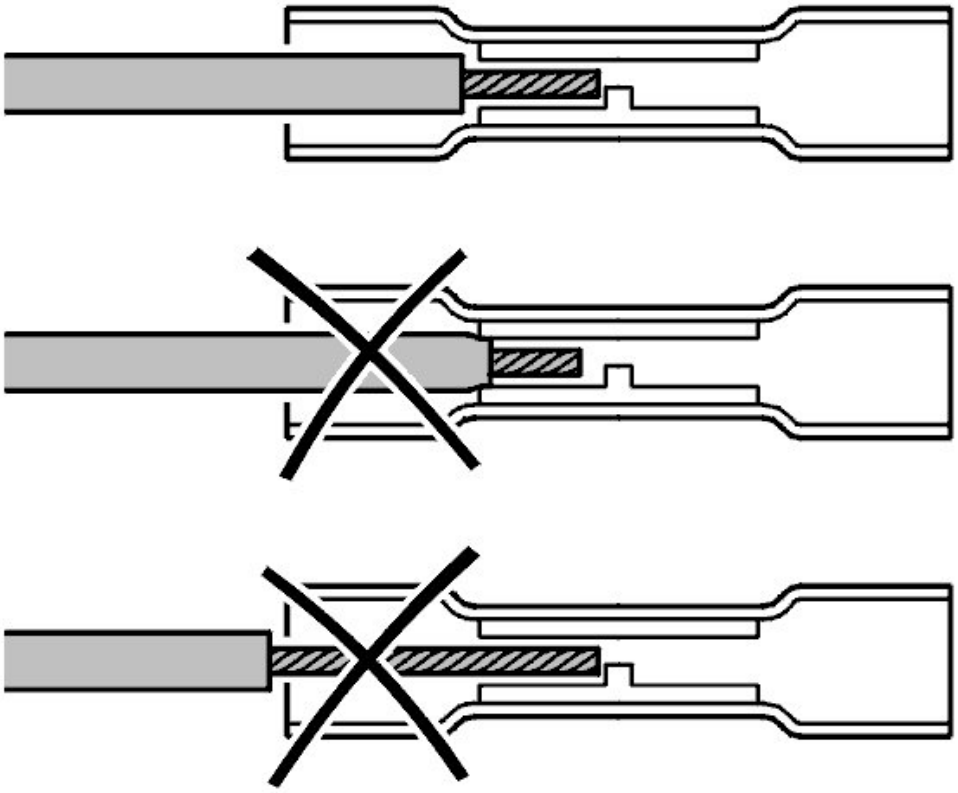
Joining the wire ends with the same colors/ single or multi-colored



Note! Cable should always be connected colour for colour, single colour to single colour or multiple colors to multiple colors. The cables must NOT under any circumstances be incorrectly connected, always colour for colour.

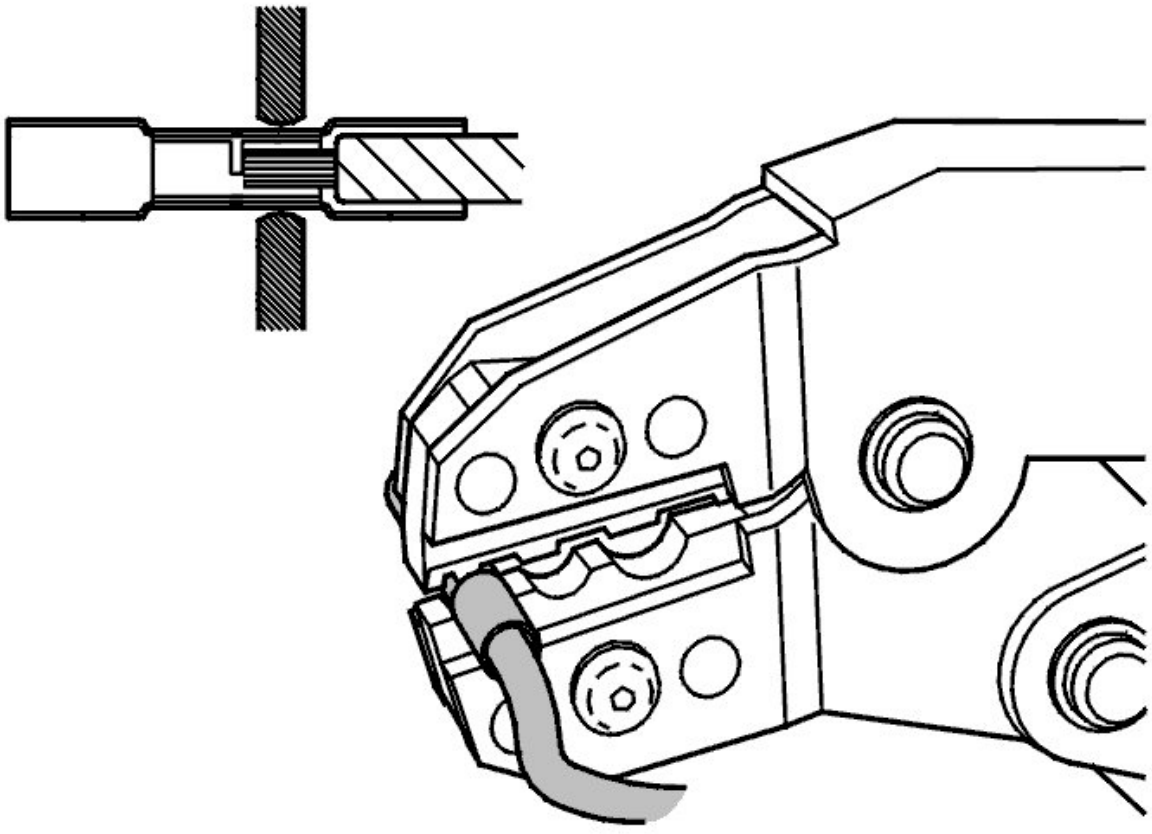
Install the shrink tubing 951 2783 in the pressure tool 951 2785 Crimping tool See: Tools and Equipment/951 2785 Crimping Tool in output

"Green". Clamp the pliers enough to hold the shrink tubing.

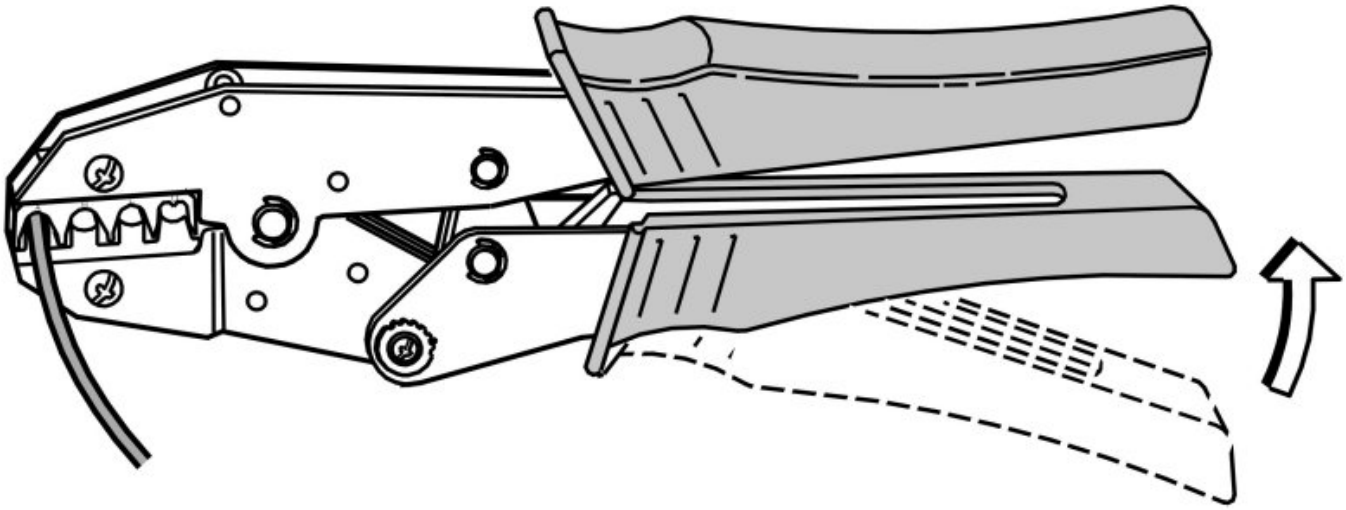


Note! The sleeve must sit in the correct output of the pressure tool, position "Green".

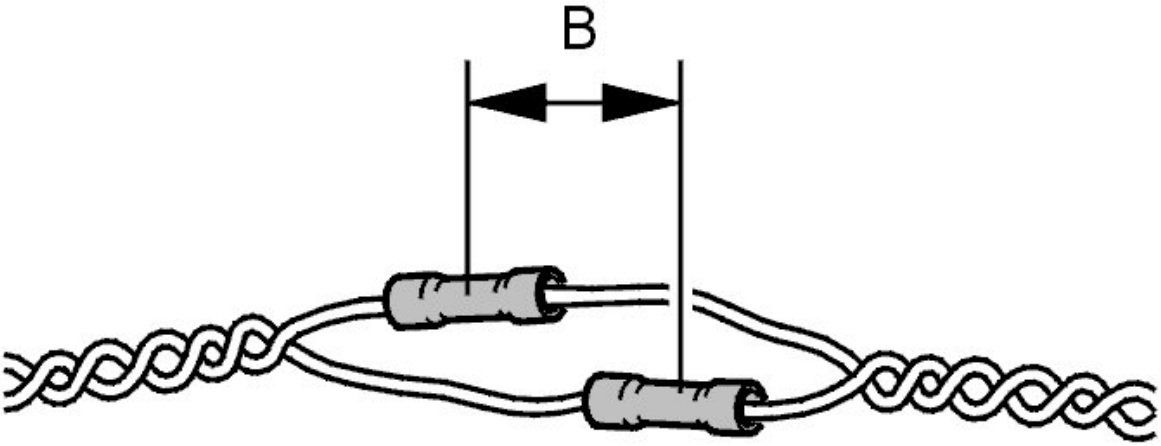
Feed the end of the wire in the shrink tubing that is held by the pliers. Feed the wire into the shrink tubing until it stops, make sure that the wire insulation does not go near the clamp on the sleeve or the stripped wire will protrude outside the sleeve.



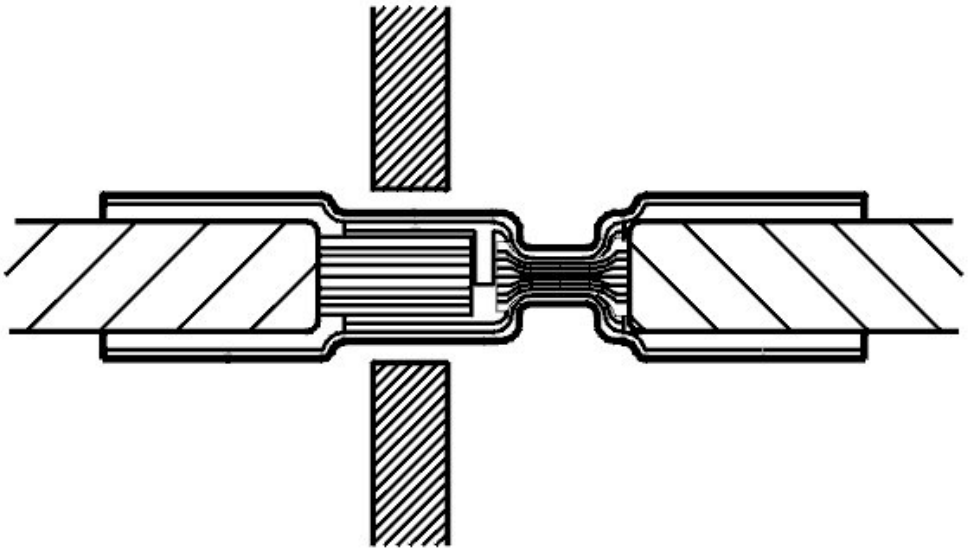
Clamp the shrink tubing tightly.



Press the handles of the pliers fully together to obtain a correct joint, the pliers automatically release their grip afterwards.



Feel by hand to make sure the shrink tubing is correctly installed.
Check that measurement B is 40mm (1-1/2 inches) between the joints from centre to centre.



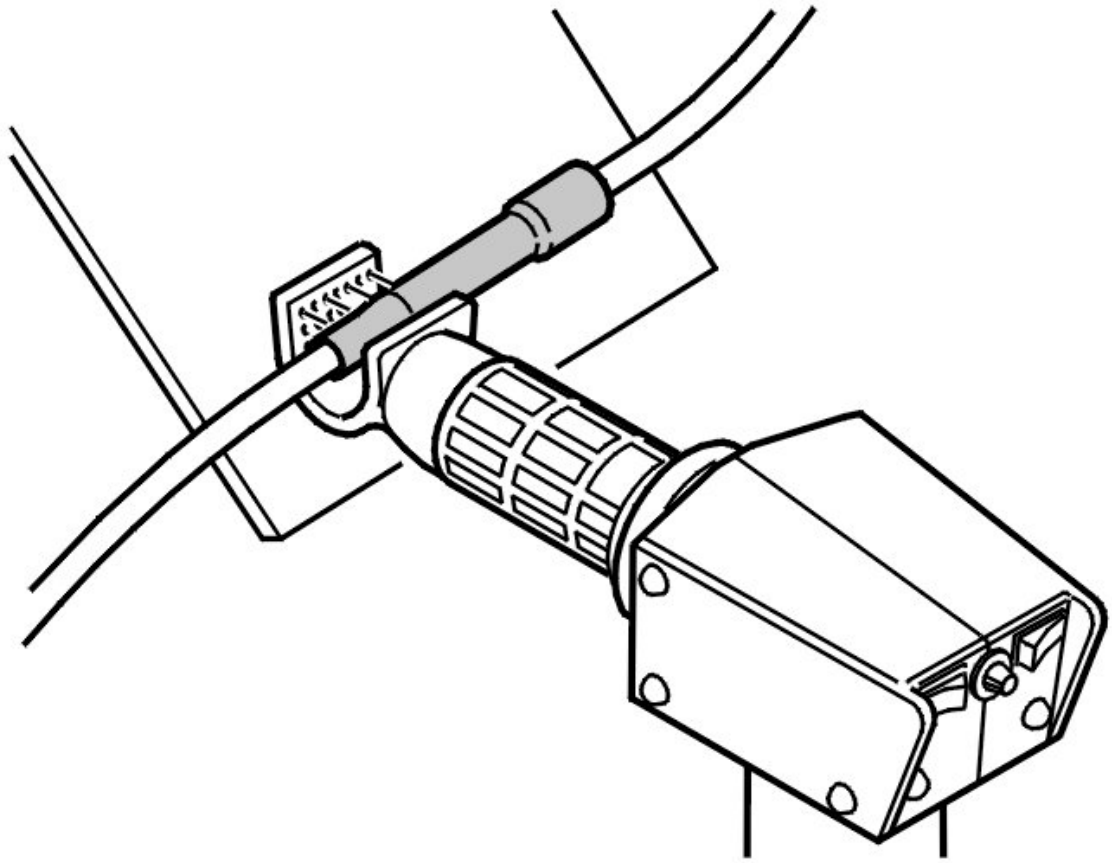
Note! Remember the cable, colour to colour (with same colour/ single or multi-colored).

When the first join is completed and checked, join the rest of the wire ends in the same way.

Heating the shrink tubing

The shrink tubing ensures the electric wire is satisfactory and provides a safe join.
Hold a pad or other item behind the shrink tubing to avoid heat escaping.

Hint: Suitable setting of heat gun951 2777 Hot-air gun See: Tools and Equipment/951 2777 Hot-Air Gun , air distribution switch in position 2 and potentiometer for temperature setting in position between 2 and 3.



Heat the sleeve using the hot air gun951 2777 Hot-air gun See: Tools and Equipment/951 2777 Hot-Air Gun and suitable jet kit. Heat the shrink tubing rapidly to avoid heat escaping. It is very important that the shrink tubing is correctly shrunk around the wire. It should be tight at both ends.

Note! Adjust the heat shield if necessary.

Joining the Cables

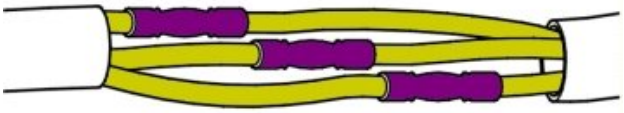
Joining the cables

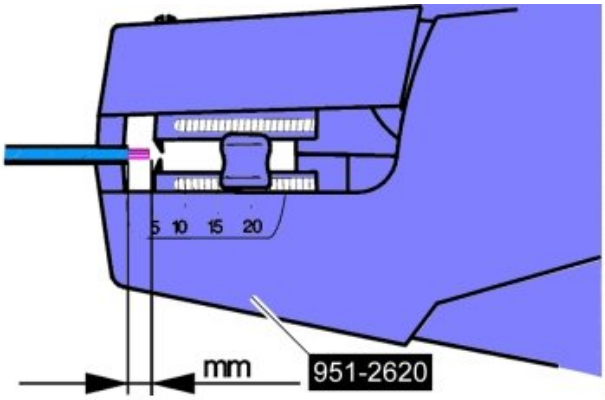
Connecting

see information about SRS cables: Refer to: Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures

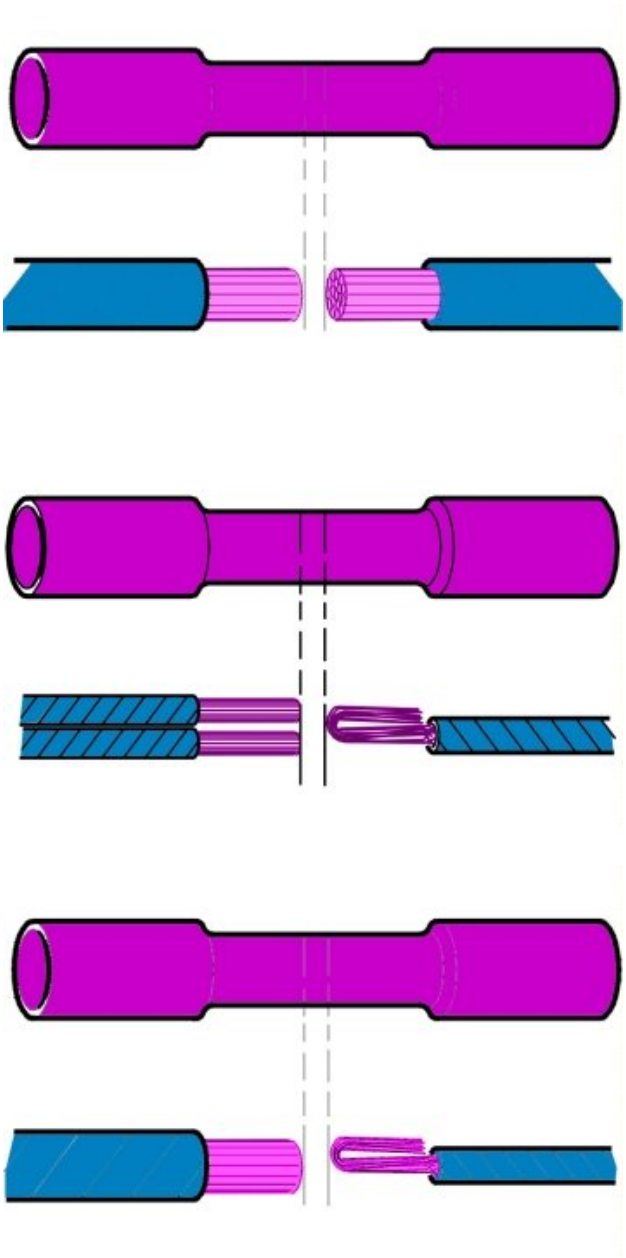
Perform battery disconnection. Refer to: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting

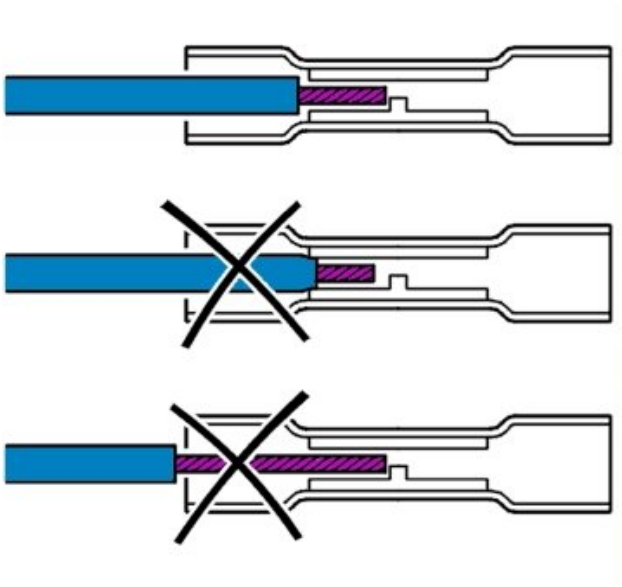
see information about cable terminals surface treatment. Refer to: Cable terminals surface treatment See: Power and Ground Distribution/Wiring Harness/Service and Repair/Cable Terminals Surface Treatment



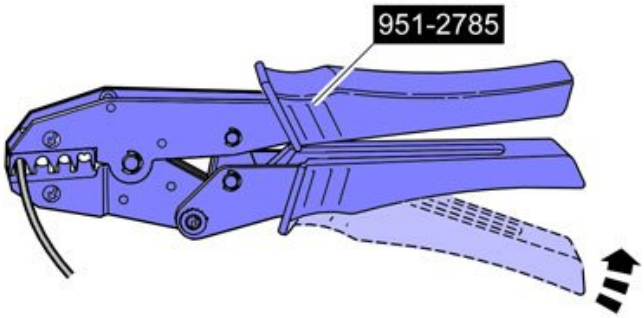


951 2620 Stripping tool See: Tools and Equipment/951 2620 Stripping Tool
See information about stripping length. Refer to: Junction sleeve See: Power and Ground Distribution/Wiring Harness/Service and Repair/Junction Sleeve

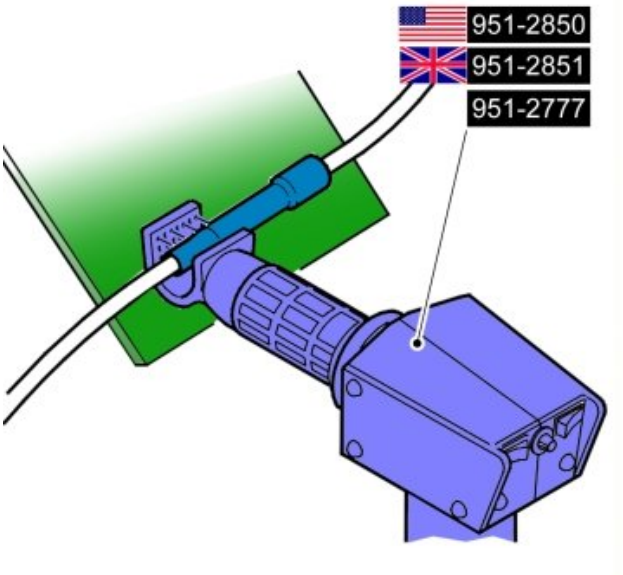




Junction sleeve

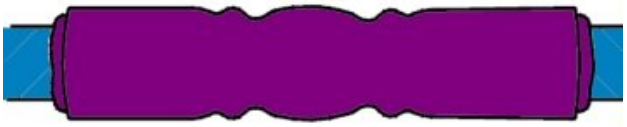


951 2785 Crimping tool See: Tools and Equipment/951 2785 Crimping Tool



Caution! Protect the surroundings from the heat.

951 2850 Hot air gun See: Tools and Equipment/951 2850 Hot Air Gun 951 2851 Hot-air gun See: Tools and Equipment/951 2851 Hot-Air Gun
951 2777 Hot-air gun See: Tools and Equipment/951 2777 Hot-Air Gun

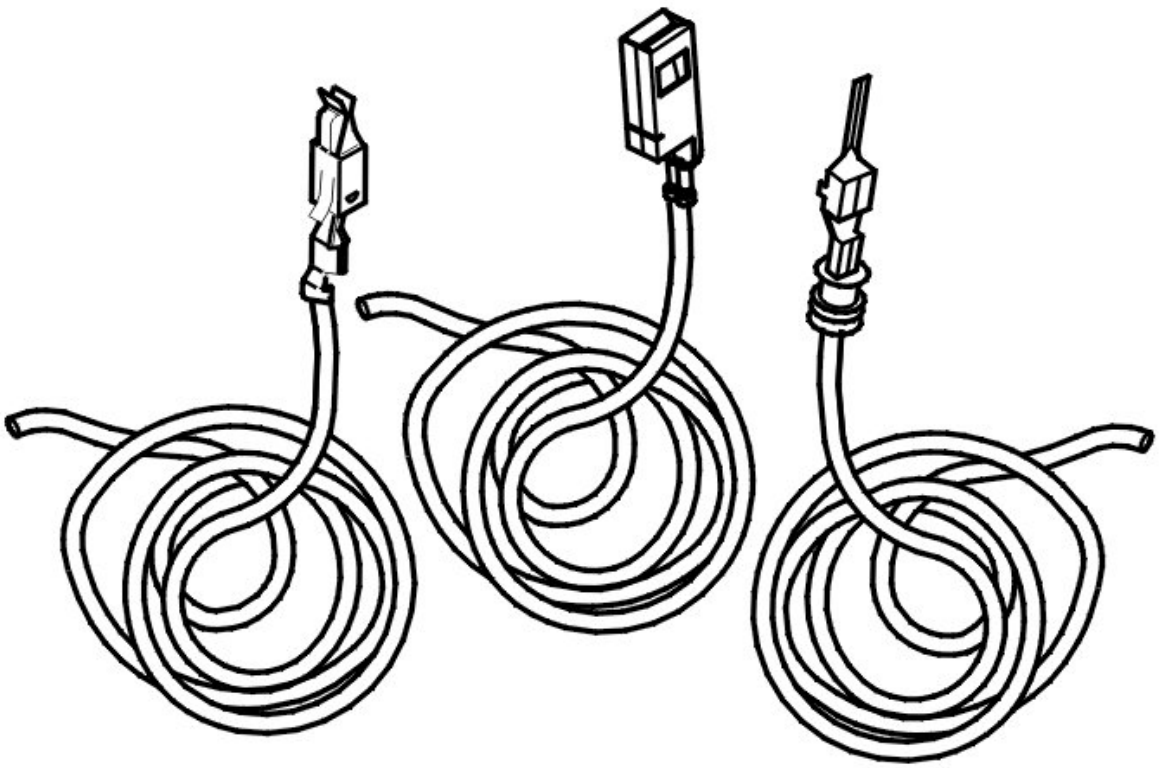


Cable Shoe

Cable shoe

Note! The illustrations in this service information are used for different model years and/or models. Some variation may occur. However, the essential information in the illustrations is always correct.

Information

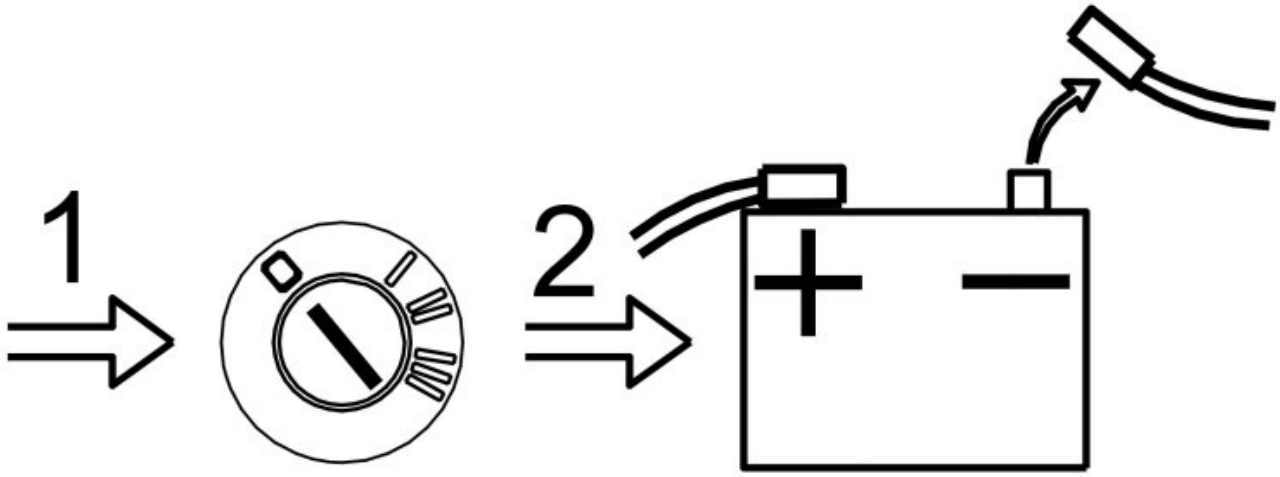


Note! In 2003 the cable terminal with a pre-crimped cable section was introduced to the Volvo range. See the illustration. This method applies for repairs with this type of cable terminal.

Caution! Ensure that the new pin has the same type of surface treatment as the old.

Caution! For repairing SRS wiring, see: Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures.

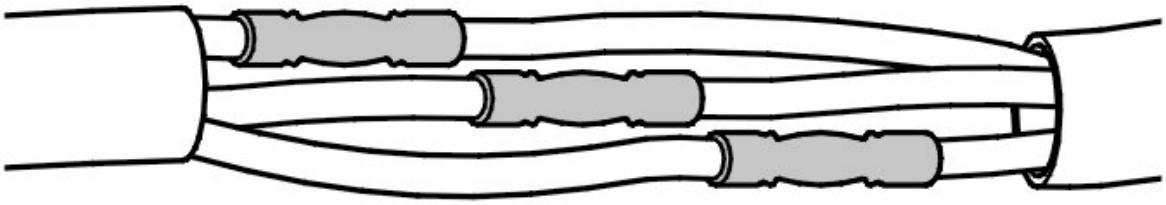
Preparatory work



Disconnect the battery negative cable. See: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

Removal

Caution! Disconnect and work with only one cable at a time to minimize the risk of mixing them up.

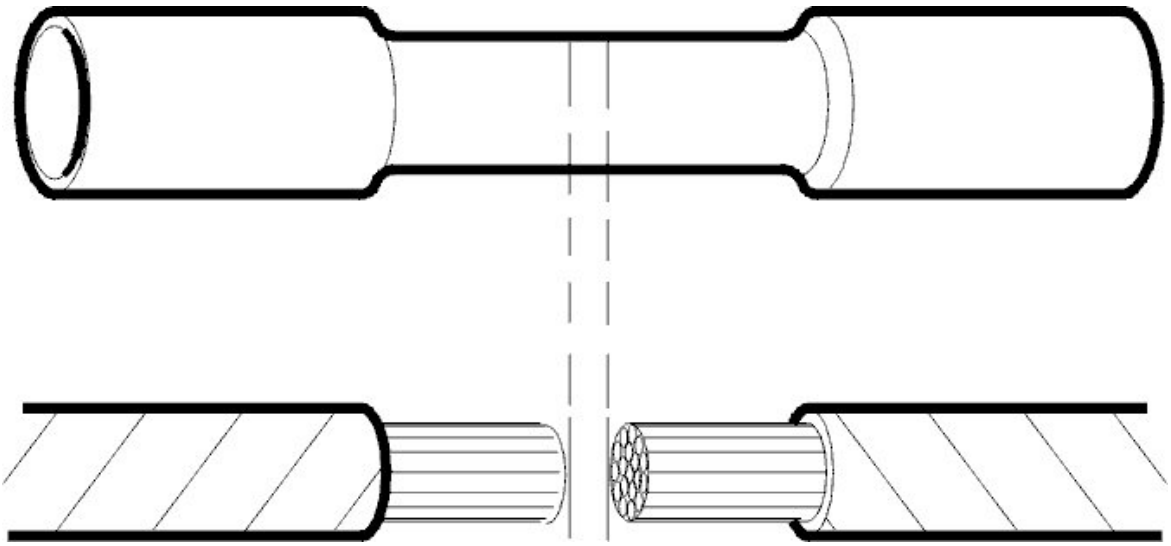


Disconnect the cable terminal that is to be replaced. See: Connectors, repair See: Diagnostic Aids/Connectors, Repair.

Hint: If several cable terminals are to be replaced at the same time, spread out the splice points, as illustrated.

Cut the cable at a suitable point. Note the length of the new cable terminal cable.

Installation



Select a cable terminal with the same area as the old one.
Select a butt connector that corresponds to the cable area. The butt connector is the same color as the cable terminal cable.
Cut the new cable terminal cable to a suitable length.
Splice the cables. See: Joining the cables See: Diagnostic Aids/Wiring/Joining the Cables.

Finishing work

Reinstall the cable harness. If necessary use a crimping sleeve and tie straps.
Connect the battery negative lead. See: Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.
Test the function.

Text
CSC* = Customer Symptom Code

NOTE!

This document supersedes the previous "RTJ 19245 - Vehicle type and platform" dated 7-01-2010. Correction to C70 (873) to include 2005 Model Year. PLEASE UPDATE YOUR FILES.

Background:

In our Service Literature, a vehicle is often referred to by its "type" not its "model". For example the 1999 - 2006 Model Year S80 is type "184". You may also see the designation, for example "P2X". This is referring to a platform type or vehicle family.

NOTE:

If a document states "P1X" or "5XX" as an example, it will apply to all models within the platform type. "54X" will apply to the "544", "545" and "542" models. "X" represents variable data.

Platform	Model	Type	Model Years
P1X	S40	544	2004 -
	V50	545	2005 -
	C30	533	2007 -
	C70	542	2006 -

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Platform	Model	Type	Model Years
P2X	S80	184	1999 - 2006
	V70	285	2001 - 2007
	XC70	295	2001 - 2007
	S60	384	2001 - 2009
	XC90	275	2003 -

Platform	Model	Type	Model Years
P3X	S80	124	2007 -
	V70	135	2008 -

	145	145	1967 - 1976	four cylinder, five door
	164	164	1967 - 1976	six cylinder, four door

The table above will clarify the vehicle type and platform designations:

Technical Service Bulletin # **TNN87-53** Date: **051101**

A/C - Musty Odors From Vents

NO: 87-53
DATE: 11-01-2005
MODEL: S60, S80, V70, XC7O, XC9O
M. YEAR: MYO3 - MYO6
SUBJECT:
Air Conditioning, "Afterblow" Function.
REFERENCE: VIDA

DESCRIPTION:
Under certain conditions, customers may complain about a musty odor from the A/C system.

Activating the afterblow function prevents this from occurring.

Type	Model	MY	Chassis	Plant
384	S60	MY03 - MY06	235000-501290	22
184	S80	MY03 - MY06	297035-426600	21
285	V70	MY03 - MY06	287167-531400	21
285	V70	MY03 - MY06	286000-531530	22
295	XC70	MY03 - MY06	095082-208900	21
275	XC90 (excl. V8)	MY03 - MY06	000690-226300	21

Note: Cars before and after the chassis breaks listed above have the afterblow function enabled from the factory.

VEHICLES AFFECTED:

SERVICE:
To avoid a musty odor from the A/C system, it is strongly recommended to enable the after blow function on all cars within the above chassis limits, especially in warm and humid climates.

For customer complaints matching the above description, perform following steps:

1) Check NC system for leaks (the PAG oil in the refrigerant has a very distinctive smell).

2) If you suspect a leak, perform fault tracing to locate the leak (use UV-light) and replace the faulty component.

3) If there is no indication of a leak, switch on the afterblow function according VIDA.

4) If activation of the afterblow function does not solve the problem, further fault tracing must be done:

Important notes:

^ Downloading new software in the 0CM may switch off the afterblow function (default value in the car configuration file is "OFF" for all cars in or above the chassis ranges listed under vehicles affected). After downloading or upgrading the 0CM software, always verify if the afterblow function is still enabled.

^ XC9O V8 variants DO NOT have the afterblow option feature.

General Information about the afterblow function:

When the afterblow function is activated and certain criteria are fulfilled (depending on driving cycle and use of the A/C system) the interior fan will start to blow 50 minutes after the car is switched off. The interior fan will blow for 5 minutes with external air directed to the dashboard air outlets.

If you activate the afterblow function, it is recommended to inform the customer about this function and the behavior of the car.

A/C - Vent Temperature Cycles From Hot to Cold

NO: 87-54
DATE: 11-30-2005
MODEL: S60, S80, V70, XC70, XC90
MY: MY05 MY06
SUBJECT: Temperature Coming Out of the Climate Vents may Start to Cycle from Max Hot Back to Full Cold When Max Hot is Req
REFERENCE: VIDA

This Tech-net note supersedes the previous 87-54 dated 11-02-2005. Please update your files.

DESCRIPTION:
If the temperature knobs are turned to max hot, the temperature coming out of the climate vents may start to cycle from max hot back to full cold with a period of 4-15 seconds. No Diagnostic Trouble Codes (DTCs) are stored.

The number of steps on a temperature Damper Motor Module (DMM) may have increased from factory settings, causing the affected DMM to set a "not calibrated" flag to the Climate Control Module (CCM). This causes the climate system to self-calibrate over and over again resulting in the cycling temperature from the vents.

Type	Model	MY	Chassis	MY	Chassis
384	S60	2005	0483037-0485503	2006	0500000-0514000
184	S80	2005	0414352-0415868	2006	0426000-0431150
285	V70	2005	0518612-0522632	2006	0530000-0540400
295	XC70	2005	0203013-0205202	2006	0208000-0215200
275	XC90	2005	0213964-0219021	2006	0224000-0234800

VEHICLES AFFECTED:

SERVICE METHOD:
The above mentioned symptom could be solved by a recalibration of the CCM.

For affected vehicles that are still in retailer stock, upgrade the cars during CPS or prior to customer delivery following the service method in VIDA:

1. Erase CCM DTCs.
2. Perform calibration of the CCM as follows:
   - Select the "Diagnostics" tab followed by the "Vehicle communication" tab.
   - Click the CCM box.
   - Select the "Advanced" tab.
   - Click "Checking LIN bus".
   - Click "No" if no Damper Motor Module (DMM) has been replaced.
   - Read and follow the instructions (to the right) carefully and click the VCT2000 symbol.
   - Click the "Start" button (left on screen tool).
   - Wait until status "Completed" is shown on the screen tool.
   - Regardless of DTCs or no DTCs it is now OK to click the "Hide" button to continue.
   - Click the "Continue" button to proceed.

3. Perform functional check of the climate system as follows:
   - Start engine.
   - Turn FAN speed to MAX.
   - Select DEMIST and check airflow to windscreen.
   - Select FLOOR and check airflow to floor.
   - Select VENT and check airflow to dashboard vents.
   - Turn to MAX COLD and check cold air from dashboard vents left and right.
   - Turn to MAX HOT and check hot air from dashboard vents left and right.
   - Turn temperature and fan speed controls to midrange.
   - Select Recirculation and check difference in airflow noise in climate system.

- Switch off Recirculation and check difference in airflow noise in climate system.

4. Use VIDA to read CCM DTCs.

5. If CCM DTCs are present repeat step 1 to 4. If CCM DTCs are persistent after the third attempt, perform fault tracing according to VIDA.

Technical Service Bulletin # **TNN21-17** Date: **021015**

Engine - Rear Main Seal Replacement

NO: 21-17

DATE: 10-15-2002

MODEL/YEAR:
All 1992 and Later Equipped with 4, 5 and 6 Cylinder White Engines

AFFECTED ENGINES:
B41xx, B52xx, B62xx, B63xx

SUBJECT:
Crankshaft Seal, Rear, Replacing

REFERENCE:
VADIS/TNN 21-13 Oil Weepage, Rear Engine Seal, Flywheel Retaining Bolts

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

DESCRIPTION:

Several recommended method changes have been made to the rear crankshaft seal replacement procedures in VADIS. Rear main seal replacement can be found in VADIS at:

Information Manager/Function group 2/Repair and installation/ 21 Engine/Crank Mechanism/Seal Rear, Replacing.

The changes include:

^ New Special Tools

^ New cleaning methods

^ New seal lubrication recommendations

^ New flywheel attachment procedure

From this time on we strongly recommend this new method be put into practice however not all tools are currently available; see service below for alternatives. Testing and follow-up evaluation has shown a considerable reduction in repeat repairs when they are applied.

SERVICE:

Special Tools: 9995112 extractor, tool and 9995678 Special Screws are not available at this time.

Continue to use extractor 9995919 until further notice and be especially careful not to scratch the engine block or crankshaft when removing the seal.

Removed flywheel screws can be used as a substitute for Special Screws 9995678.

Remove all remaining sealant from the threads and mark the screw heads using paint or a punch mark so they can easily be identified. The reason for drawing up the flywheel tight to the crankshaft flange, before installing new bolts and additional sealant, see TNN 21-13, is to avoid any sealant from becoming lodged between the crank flange and flywheel which can result in an axial run-out condition.

Cleaning cloth 9511024 is available from Volvo parts. It is extremely important that there is no thread sealant residue or other dirt remaining on the crankshaft or block before new seal is installed. It is equally important to remove and clean the flywheel flange screw holes. If debris remains it can be pushed inward when the new screws are installed and cause poor seal performance.

Lubrication, Only Volvo Approved engine oil may be used to lubricate the new seal. Under no circumstances should grease be used. Grease attracts dirt and results in the build up of contamination on the crankshaft flange causing poor seal performance.

Warranty Note:

Below you will find the applicable operation number and labor description for the above repair. Labor Time has not been added. Reason for this is the large number of variant combinations that this TNN covers. Consult the VSTG for the correct labor time as it applies to the repaired vehicle.

A/C - Damper Motor Module (DMM) ID & Calibration

NO: 87-48

DATE: 03-08-2005

MODEL:
All new S40 and V50, S60, V70, XC70, S80, XC90.

M. YEAR:
MY04 (All new S40) and MY05 (all models).

SUBJECT:
Damper Motor Module, Identification and Calibration.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

REFERENCE:
VADIS 2004F+

DESCRIPTION:

When replacing a Damper Motor Module (DMM), it is necessary to identify the DMM before performing the calibration. It may be difficult to find the identification process in VADIS version 2004F+.

SERVICE:

When a DMM is replaced, perform following steps:

Important Note:
Before performing identification or calibration, make sure that the climate unit has normal room temperature. It is possible that heater flaps may not go all the way to the end positions if the unit is too cold. This may result in temperature difference between left and right side.

1) Performing identification after replacing a DMM:

In VADIS version F+: Go to "Information Manager/Group 8/Diagnostic information/ Diagnostic trouble codes and associated procedures.

Select group 87, climate units, and open the DTC CCM-0071 - Damper motor, faulty position. In this page, click "continue" to proceed to the "Identification of damper motors" page. For certain variants, a selection for the structure week must be made. The structure week of a car can be found in VADIS under "Vehicle Communication/Group 0/General service/Reading off structure week".

2) After Identification, proceed with the calibration:

In VADIS version F+: Go to "Vehicle communication/group 8/ Climate Control Module/Checking LIN bus. Click on the VCT symbol to start calibrating the CCM.

For future VADIS/VIDA versions, the identification process will be moved to "Vehicle Communication".

USEFUL INFORMATION:

What is done during the identification?

The Climate Control Module (CCM) commands each DMM to move to its lower and upper end stop. The CCM counts the amount of steps the DMM moved.

Reference table with ranges for corresponding DMM's

DMM Position	All new S40/V50 (MY04 and later)		S60/V70/XC70/S80/XC90 (MY05 and later)	
	MCC	ECC	MCC	ECC
DEFROST	Default: 398 OK Range: 370 - 426	Default: 398 OK Range: 370 - 426	N/A	Default: 502 OK Range: 462 - 542
RECIRC/OSA	Default: 1340 OK Range: 1312 - 1368	Default: 1340 OK Range: 1312 - 1368	Default: 1017 OK Range: 977 - 1057	Default: 1026 OK Range: 986 - 1066
TEMPERATURE LEFT	Default: 456 OK Range: 428 - 484	Default: 456 OK Range: 428 - 484	Default: 342 OK Range: 302 - 382	Default: 334 OK Range: 294 - 374
AIR DISTRIBUTION	Default: 537 OK Range: 509 - 565	Default: 537 OK Range: 509 - 565	Default: 1878 OK Range: 1838 - 1918	Default: 1887 OK Range: 1847 - 1927
TEMPERATURE RIGHT	N/A	Default: 456 OK Range: 428 - 484	Default: 342 OK Range: 302 - 382	Default: 333 OK Range: 293 - 373

The amount of steps is then used to determine which function the DMM has in the system (see reference table shown). The CCM will then reprogram the DMM with the ID corresponding to that function.

What is done during the calibration?

The Calibration checks the configuration of the LIN bus 1 and LIN bus 2. The CCM checks the presence of the Damper Motor Modules, Seat heat modules (option) and Air Quality Sensor (option). The range for each DMM is also checked to ensure that they are within specification.

Hint for fault tracing:

Reading out the actual ranges between upper and lower end positions measured by the DMM's (see reference table) can be helpful during fault

tracing.

In VADIS, go to "Information Manager/Group 8/Diagnostic Information/Diagnostic trouble codes and associated procedures. Select group 87, climate units, and open the DTC CCM-0071 - Damper motor, faulty position. Click on the VCT symbol to proceed to reading out the actual range per DMM.

If you would run into a range of 0 or 4095, there may be an identification problem. Try to re-identify before continuing with fault tracing.

A/C - Uneven Temperature Drop Between L/H & R/H Vents

NO: 87-49

DATE: 03-15-2005

MODEL:
S60, S80, V70, XC70, XC90

M. YEAR:
2005

SUBJECT:
Climate Control Module, temperature drop during extended drive, or temperature deviation between left and right side.

REFERENCE:
VADIS

DESCRIPTION:

Cases have been reported of cars with temperature deviation, more than 7°F, between left and right air outlets after driving for a period of time. In other cases, the temperature dropped during extended driving.

Type	Model	MY	Chassis	Plant
384	S60	2005	425000-464304	22
184	S80	2005	390000-406836	21
285	V70	2005	459000-499621	21 & 22
295	XC70	2005	173000-192486	21
275	XC90	2005	134000-188365	21

If the vehicle is within the listed chassis range shown, follow the service procedure in this document. If the vehicle is above the listed chassis range, follow fault tracing as per VADIS.

SERVICE:

If a customer is complaining of these symptoms, follow steps 1 through 3:

Step 1: Check if there are any fault codes stored for Climate Control Module (CCM) or Damper Motor Modules (DMM). Do not replace parts if there are no fault codes found.

If fault codes are found, perform fault tracing according VADIS. If a DMM needs replacement, perform the identification and calibration as described in TNN No. 87-48 - Damper Motor Module, Identification and Calibration. Then proceed with step 2 below.

Step 2: Download upgraded CCM software, P/N 30677016. Auto calibration of the DMM's is included in the new software and will start immediately after the downloading is completed. The auto calibration procedure takes approximately 30 seconds (leave the key in the ignition in position II for at least one minute after the software download is completed).

Step 3: Check full functionality of the air distribution and temperature controls. Read CCM diagnostics to ensure that no fault codes were set during the software download.

If a communication/identification problem is detected, it may be the result of a communication failure between the Seat Heater Module (SHM) and

the CCM. Replace the Seat Heater Module to solve this problem.

Drivetrain/Wheels - Wheel Bolts Corroding

NO: 77-11
DATE: 1-13-2005
MODEL/YEAR2003 - 2005 XC90
2004-2005 S60/V70/XC70/580
CHASSIS: See list below
SUBJECT: Wheel Bolts Corroding

Type	Year	Assembly Plant	Chassis range
1 8 4	2004 – 2005	21	358743 – 401749
2 8 5	2004 – 2005	21	398507 – 486974
2 9 5	2004 – 2005	21	144620 – 186603
2 8 5	2004 – 2005	22	394133 – 485179
3 8 4	2004 – 2005	22	363918 – 450311
2 7 5	2003 – 2005	21	000001 – 171481

DESCRIPTION:
Under certain conditions the wheel bolts may have evidence of surface corrosion. If you should have a customer concern with this issue and the vehicle falls within the chassis range listed below, please install wheel bolt caps (kit PN 9139853).

SERVICE:
Install wheel bolt cap kit PN 9139853. The tweezer tool will need to be attached to the vehicle tool pouch using the rubber band supplied in the kit.

NOTE:
Each Volvo retailer will be supplied an initial allocation of tweezer tools, these tools should be distributed to the technicians.

Engine Controls - Software Download Fault Prevention

NO: 30-04

DATE: 10-13-2005

MODEL: All Vehicles

M. YEAR: All

SUBJECT:
Midtronics PSC-550 Vehicle Power Supply use required during Software Download. Includes Mobile Technician Program

REFERENCE:
Special tool bulletin no. 111-A // VADIS/VIDA repair instruction

This Tech Note supercedes the previous TNN 30-04 dated 10-11-05. Please update your files.

DESCRIPTION:
Software Download failure due to too high or too low voltage

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

When performing a software download as well as electronic diagnostics, activations and quick tests within VIDA, it is imperative that the vehicle's system voltage is maintained between apx. 13.0V and 14.0V.

We have found that certain SWDL (Software Download) faults may occur due to too high or too low a voltage. Among them are; Half loaded nodes and check sum errors.

Too high a voltage can be caused by using commonly available Constant current type chargers. These are the type used in most automotive shops. This type of charger will increase the charging voltage to maintain a constant current setting. Therefore, the Voltage may increase up to 17 Volts or higher depending on the condition (internal resistance) of the battery to maintain the current setting. While the higher voltages can be advantageous for charging batteries, it can also be the reason for failed Software Downloads, one or more nodes stuck in Program mode and misleading results while fault tracing certain circuits.

Too low a voltage can also cause nodes to become stuck in programming mode. Therefore, Battery Booster Packs are not acceptable for use during Software Downloads.

Fast chargers, Boost chargers, standard battery chargers, especially when set to "boost" should never be used during software downloads due to the excessive voltage and current they can supply under certain conditions.

Volvo now requires the use of the Midtronics PSC 550 when performing SWDLs and during fault tracing. This includes downloads performed by your Mobile technician if your retailer is using one. The Midtronics PSC 550 is a constant voltage power supply capable of 55 Amperes max while regulating the voltage to 13.6. The use of this power supply will prevent over voltages during SWDLs and fault tracing.

The Midtronics PSC-550 is classified as a mandatory tool and will be allocated to all US and Canadian retailers by SPX/Kent-Moore during October 2005. Please refer to Special Tool Bulletin 111-A for more information.

FOR MOBILE TECHNICIAN RETAILERS:

The Midtronics PSC-550 power supply unit is also required for all SWDLs in the field. As a Mobile Technician retailer you are required to add this mandatory tool to your inventory. This power supply supersedes the previous 20 AMP battery charger previously required.

Note:
The unit purchased for Mobile Technician use will be in addition to your allocated requirement.

Important Note:
Connection procedure:

Install the clamps at the battery before connecting the unit to the 115VAC outlet.

Technical Service Bulletin # **TNN32-04** Date: **051214**

Electrical - CEM DTC DD21/Alternator Not Charging

NO: 32-04

DATE: 12-14-2005

MODEL:
S60, S80, V70, XC70, XC90 (excl. V8)

Model YEAR:
2005 & 2006

SUBJECT:
CEM DTC DD21 due to faulty LIN-network, Alternator Not Charging

REFERENCE:
VIDA

DESCRIPTION:

DTC CEM-DD21 may be set because of faulty communication between the Alternator and CEM due to the installation of extra LIN wiring for the upcoming BLIS, (Blind Spot Information System). Customers may also report an intermittent DIM message "POWER SYSTEM SERVICE REQUIRED" It may be possible that there is a pinched LIN-bus wire from the CEM to the BLIS-system between A-pillar body and the dashboard assembly on the left side. See details below under "SERVICE".

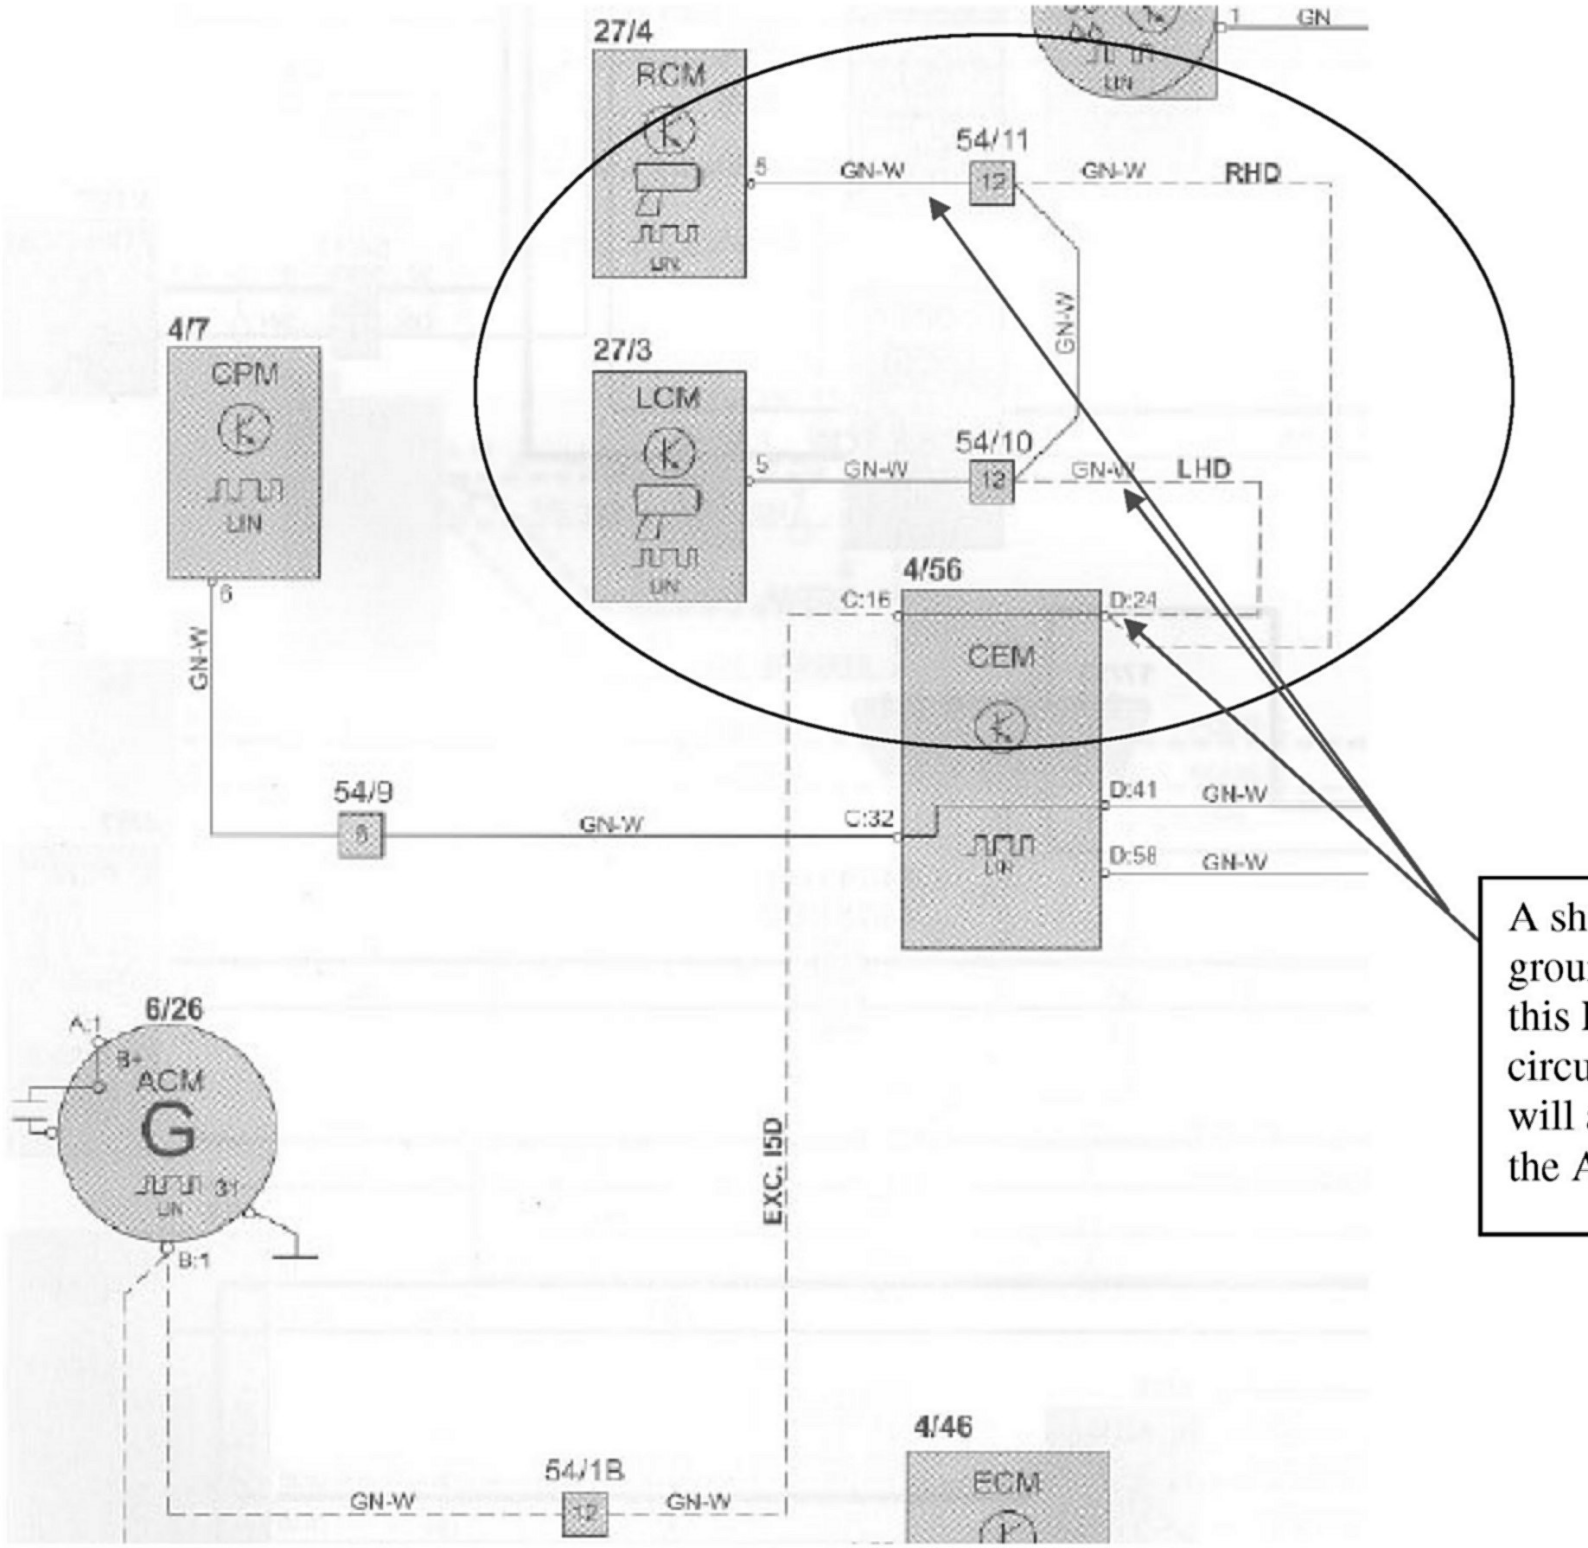
PRODUCT MODIFICATION:

A clip has been installed on the cars to prevent the LIN wire being pinched in production.

SERVICE:

BLIS = Blind Spot Information System
ACM = Alternator Control Module
LCM = Left-hand Camera Module
RCM = Right-hand Camera Module
CEM = Central Electrical Module
LIN = Local interconnect network

Although BLIS (BLind spot Information System) has not been introduced yet, vehicles are pre-wired in production. The cables from CEM to RCM (Right Camera Module) and LCM (Left Camera Module) are present up to the mirror connector in both front doors.



The LIN-bus is also connected internally inside the CEM (see updated wiring diagram shown). When fault tracing a CEM-DD21, please assure that the RCM and LCM circuits are not overlooked. The BLIS circuits are not indicated in the Wiring Diagram for MY2005, but have been corrected for MY2006.

If there is a short to ground in the circuit from CEM D24, repair the affected wiring as necessary.

If the DTC CEM-DD21 remains, perform normal fault tracing for the DTC per VIDA instruction.

Recall - Software Upgrade for EVAP System Performance

NO: 28 - 145
DATE: 6/16/05
MODEL/CHASSIS: See Table Below
YEAR: 2005
SUBJECT: Recall Campaign 145: Purge Performance
REFERENCE: SMB 28-145 VADIS/VIDA

Type	Engine Type from VIN	Engine Variants	Chassis Number Range
S80	59, 91	2.5T, T6	0390000 - 0398028
XC90	59, 91	2.5T, T6	0134000 - 0167185
V70	54, 59	T5, 2.5T	0459000 - 0477839
XC70	59	2.5T	0173000 - 0182285
V70	52, 54, 59	R, T5, 2.5T	0459000 - 0476102
S60	52, 54, 59	R, T5, 2.5T	0425000 - 0442350

NOTE:
RETAILER MUST CONFIRM VEHICLE ELIGIBILITY IN VRC2 PRIOR TO BEGINNING RECALL CAMPAIGN REPAIRS.

DESCRIPTION:
Certain model year 2005 S60, S80, V70, XC70 and XC90 vehicles do not meet the requirements of the Environmental Protection Agency (EPA) and the California Air Resource Board (CARB) for removing pollutants from the Evaporative Emissions System.

The requirement only pertains to purge performance and does not affect the safety or drivability of the vehicle. However in certain cases, this may cause the vehicle to fail a state inspection or Smog Check test.

The corrective action will be a software upgrade of the Engine Control Module (ECM).

SERVICE:

Upgrade Engine management software (SW) using the ECM upgrade option in the VADIS Software manager. SW product # 30677021

Technical Service Bulletin # **TNN28-60** Date: **050907**

Engine Controls - DTC 7300 (Gear Position Sensor)

NO: 28-60
DATE: 9-7-2005

Vehicle	Type	Model Year	Chassis Range	Structure Week
XC90	275	2005 - 2006	134000-236031	200425-200526
S80	1 8 4	2005 - 2006	390000-429460	200425-200526

Cell Phone - Bluetooth Hands Free Kit Information

NO: 39-50
DATE: 9-7-2005
MODEL:
XC90 All
2001- S60/V70/XC70/S80 (excl. Executive, Elite, Premier, 75th anniversary)
2005- S40 from ch. no. 80924 // V50 from ch. no. 78750
SUBJECT: Bluetooth Hands Free Kit Information
REFERENCE: VRC2/Aftersales information

The purpose of this TNN is to provide information

The Volvo Bluetooth hands free kit will integrate most Bluetooth enabled cell phones into the Volvo audio system. It consists of a base kit, and an adapter harness which is vehicle specific. The system is wired into the speaker output of the Volvo audio system and will automatically mute the audio and navigation system when making an outgoing call or receiving an incoming call.

In addition, the system uses speech recognition for initiating call and menu commands.

Frequently Asked Questions

Item	Question	Answer
	Microphone - Speech recognition/Audio Uplink	
1A	Where should I place my microphone for the best performance?	Securely mount the microphone on the overhead console or headliner between the driver and passenger. DO NOT mount on the visor or windshield. Vibrations will negatively impact audio and speech recognition performance.
2A	People on the other end of the line complain that the audio from my car kit is choppy. Is there anything I can do to improve the audio quality?	Make sure your microphone is installed properly. If the background noise on the other end of the line (the person you are talking to) is excessive, your voice may be muted or choppy to the person you are speaking with due to the noise cancellation software running. Verify that there is not an excessive amount of background noise (including car radio, climate control system, windshield wipers, or a passenger speaking) in the car, as it may impact voice quality and volume as well.
	Speaker - Audio Downlink/Mute	
1B	Even though I increased the volume of my last call, the next call seems to be quiet again. How can I get the car kit to retain the higher volume level?	To change the default volume setting, it should be increased or decreased during the voice prompt of one of the speech recognition menus.
2B	Why does the radio un-mute during dialling?	This is a limitation of the handset. The handset takes longer to dial. So the Volvo Handsfree System with Bluetooth times out and unmutes the radio. Handset may only support Handsfree Profile 0.96 profile.
	UIM	
1C	Why don't I get a visual indication when making an outgoing call from the Volvo Handsfree System with Bluetooth?	The Volvo Handsfree System with Bluetooth is dependent on call setup indication/AT command from the handset. Some handsets do not provide this indication.
2C	Why don't I get a visual indication when making an outgoing or accepting an incoming call from the Volvo Handsfree System with Bluetooth while turning on the ignition or returning into BT range?	The Volvo Handsfree System with Bluetooth is dependent on call setup indication/AT command from the handset. Some handsets do not provide this indication.
3C	Why does the call waiting visual indication stop?	The Volvo Handsfree System with Bluetooth is dependent on the handset sending call status indicators/AT commands. Not all handsets repeat the call waiting status indications and therefore the visual indication stops
	Bluetooth	
1D	Why does my handset complete the pairing process after passcode entry when I've terminated the pairing process before passcode entry screen?	This is a BT limitation of the handset. The handset is finishing its pairing process before it prompts for the passkey.
2D	Why does my handset reconnect before the SIM PIN is entered?	This is a handset limitation. The handset is finishing its re-connection process before prompting for the SIM PIN.
3D	How do I turn the Bluetooth on to link up my handset and car kit?	Follow the instructions provided by your handset's manufacturer to ensure that Bluetooth is turned on (for Motorola handsets this can be found from the main menu: Settings -> Connection -> Bluetooth Link -> Setup, then select Power and turn it on. The turn the phone off, then on again). The first time you link with the car kit, you will have to pair your handset (see user manual for instructions), but subsequent times your handset and car kit should connect automatically over the Bluetooth link.
4D	My handset has the Bluetooth headset profile. Can I use the car kit?	No, you cannot use the Volvo Handsfree System with Bluetooth car kit with a handset that does not have hands-free profile. You will not be able to complete the pairing process with a handset that has the BT headset profile.

5D	Why can I make a connection with the Volvo Handsfree System with Bluetooth from the handset quickly sometimes and other times it takes awhile?	-The Volvo Handsfree System with Bluetooth always tries to connect to the last connected handset. This process takes approximately 15 sec per each handset in its device list. -After the Volvo Handsfree System with Bluetooth has gone through its device list, there is a 20 sec idle state. It is during this idle state that you can connect to the Volvo Handsfree System with Bluetooth from your handset.
6D	Why can I connect another handset to the Volvo Handsfree System with Bluetooth, after a previous handset has moved out of BT range, quickly and other times it takes awhile?	-After a link loss of the BT signal between the Volvo Handsfree System with Bluetooth and a handset, the Volvo Handsfree System with Bluetooth continues to try to connect to the previously connected handset. This reconnection time depends some internal timing within the Volvo Handsfree System with Bluetooth. After it times out, It will go into a 10 Sec - idle state. This is the only time to connect to another device. The Volvo Handsfree System with Bluetooth will continue this cycle indefinitely.
Call Issues		
1E	Why do my active or held calls terminate when I press and release the END button?	This a handset limitation. The handset does not respond properly when the AT command, 'hangup', is sent by the Volvo Handsfree System with Bluetooth
2E	Why can't I store handset voice tags while connected to the Volvo Handsfree System with Bluetooth?	Some handsets do not support storing handset voice tags while connected to the Volvo Handsfree System with Bluetooth. Drop the BT connection to the Volvo Handsfree System with Bluetooth, store your handset voice tag and re-connect to the Volvo Handsfree System with Bluetooth.
3E	Why does a last number redial happen when I answer an incoming call?	This is due to a delay when the handset gets the call and notifies the Volvo Handsfree System with Bluetooth. Since the Volvo Handsfree System with Bluetooth has not been notified of the call, it interprets the ANSWER button press as a redial.
4E	Why can't I answer a call waiting after I've terminated an active call?	Due to some handset limitations, the call waiting call must be answered within 6 seconds of notification.
5E	Why does the ANSWER button continue to flash, indicating a call is still waiting, when the held call is terminated on the handset or remote handset?	The handset does not respond properly to the 'multi-party call' AT command from the Volvo Handsfree System with Bluetooth. This is a limitation of the handset, which could be improved with a software update of the handset.
6E	Why can't I toggle between active and held call with button presses of the ANSWER button?	The handset does not respond properly to the 'multi-party call' AT command from the Volvo Handsfree System with Bluetooth. This is a limitation of the handset, which could be improved with a software update of the handset.
7E	Why are DTMF tones heard as continuous tone on the remote handset?	This is a handset limitation. Sometimes the handset stops responding to the Volvo Handsfree System with Bluetooth's DTMF AT command. It will continue to play a tone until it recovers, which is to respond to another command.
8E	Why can't I terminate a call with the END button while the call is dialing on the network?	This is a handset limitation. The handset does not notify the Volvo Handsfree System with Bluetooth of a DIP when using the handset voice tags or the call button of the handset. Since the Volvo Handsfree System with Bluetooth was not notified of a DIP, it remains in the ready state. Therefore, the END button will not work. However, the Volvo Handsfree System with Bluetooth receives a DIP notification from the handset if a redial is made.
9E	When an active call is terminated with a call on hold, why does my handset continue to display call is active?	This is a handset limitation. The handset does not resume the held call automatically when an active call is terminated.
10E	Why can't I terminate an active and a held call with a press and hold of the END button?	This a handset limitation. The handset does not respond properly when the AT command, 'hangup', is sent by the Volvo Handsfree System with Bluetooth
11E	Why can't I answer a call after I turn the ignition on?	This is a handset limitation. The Volvo Handsfree System with Bluetooth does not get the DIP and or the ringing AT command to put the UIM in the state to answer the call. Therefore, you will not be able to answer the call from the Volvo Handsfree System with Bluetooth. However, the Volvo Handsfree System with Bluetooth may get the 'call connected' AT command, so the buttons may be set to an in call state which will allow the ability to switch, end etc.
12E	Why do I have HF audio when the call was put into private mode during DIP?	This is a handset issue. The Volvo Handsfree System with Bluetooth will not get the call indication while dialing. The indication will be received after the call is connected, so the call is in handsfree, but the ring will not

		be heard.
13E	Why can't I reject an incoming call when the active call is held?	The handset does not respond properly to the 'multi-party call' AT command from the Volvo Handsfree System with Bluetooth. This is a limitation of the handset, which could be improved with a software update of the handset.
14E	Why does the ringing stop or the call ends if the flip is closed during an incoming call.	This is a handset issue. It does this because when you open the flip on the handset for an incoming call it automatically answers the call even though it is connected to the Volvo Handsfree System with Bluetooth. In addition, something similar happens when the flip is closed. But it terminates the call.
15E	Why, when using hold and resume, do I hear a busy signal?	This is a handset issue. After it enters the HOLD mode, after a gap of about 20 seconds the handset automatically resumes. You will hear quick BeepBeepBeep when that happens.
16E	Why don't I hear call rejected when the END button is pressed with an incoming call?	This is a limitation of the handset, which could be improved with a software update of the handset.
17E	Why doesn't hold and resume work?	This is a limitation of the handset, which could be improved with a software update of the handset.
18E	Will the car kit announce the caller ID if I have an incoming call via call waiting?	No, the car kit will not announce the incoming number (caller ID) so as not to disturb the original call. The car kit will play a tone to notify you that there is a second call coming in.
21E	Why does the speed dial command dial the last number dialed?	This is a limitation of the handset, which could be improved with a software update of the handset.
22E	Why doesn't the HANG UP command work when a call is on hold?	This is a handset issue. The call needs to be resumed before ending the call
23E	Can I answer or end a call with voice recognition?	You cannot answer a call using the voice recognition. You must press the ANSWER button on the UIM. However, you can end a call by pressing the TALK button and saying "end call" after the listening beep. Alternately you can end the call by using the END button on the UIM.
24E	Why don't I hear a ring tone when making an outgoing call from the Volvo Handsfree System with Bluetooth?	The Volvo Handsfree System with Bluetooth is dependent on call setup indication/AT command from the handset. Some handsets do not provide this indication.
25E	Why don't I hear a ring tone when making an outgoing or accepting an incoming call from the Volvo Handsfree System with Bluetooth while turning on the ignition or returning into BT range?	The Volvo Handsfree System with Bluetooth is dependent on call status indications/AT command from the handset. Some handsets do not provide this indication.
26E	Why do I hear the ring tone from handset, not from the Volvo Handsfree System with Bluetooth's speaker?	This is handset specific behavior.
27E	Why don't I get an audio indication from the Volvo Handsfree System with Bluetooth for new messages or voicemail?	This is handset specific behavior.
28E	Why don't I get audio while answering an incoming call, and receiving an SMS?	This is a limitation of the handset, which could be improved with a software update of the handset.
29E	Why can't I transition the audio to Private Mode from Handsfree Mode via the UIM or SR?	This is a limitation of the handset, which could be improved with a software update of the handset.
30E	Why didn't I hear '+' on the Caller ID during an incoming international call?	This is a handset issue. The handset does not send the '+'.
31E	Why doesn't an active call switch to HF audio during a BT connection?	This is a limitation of the handset. When there is an incoming call and the BT connection is made there will not be any handsfree audio.
32E	Why doesn't mute work for held call?	After pressing the ANSWER button to place a call on hold, wait at least 5 seconds to press Mute button. Else the Mute will not be effective.
33E	I don't hear the touch tones while I'm dialing a call. Am I doing something wrong?	No, unless you are in a call, you will not hear the touch tones when your handset is linked up to the car kit.

34E	How do I maintain my call when I turn off my car?	First, if you have a flip handset, ensure the flip is open (if it is not, your call may disconnect when your car is turned off). Depending on your handset model, the call will either be automatically switched to the handset or it may prompt you to "switch to handset". These same steps apply if you are switching from hands-free to privacy mode while the car is running.
35E	Why does my handset end the call when I transfer the audio from Handsfree Mode to Private Mode?	This is a limitation of the handset, which could be improved with a software update of the handset.
36E	Why is there a pause in audio after I press the ANSWER button and before the person on the other end hears me?	This is a combination of delays from both the Volvo Handsfree System with Bluetooth and the handset. There is a slight delay from the Volvo Handsfree System with Bluetooth between when the call is setup and when the audio channel is opened. In addition, most handsets will pass the audio to the Volvo Handsfree System with Bluetooth when a call is setup. However, if the Volvo Handsfree System with Bluetooth doesn't receive the audio within a certain time, it will request the audio.
37E	Why don't I hear my handset's ring tone on the car kit?	This is a limitation of the handset, which could be improved with a software update of the handset.
38E	Ring tone audio quality sounds poor. Why is that?	This is a limitation of the handset, which could be improved with a software update of the handset.
39E	Why does the handset call timer continue to give an indication that a call is in progress after the call has been ended on the Volvo Handsfree System with Bluetooth?	This problem is caused by network delays.
40E	Why do I have to press the END button multiple times before a call is ended?	There is a delay in responding to the user due to network and handset delays
41E	Why, with low network signal, the Volvo Handsfree System with Bluetooth remains in an in-call status when redial is initiated by pressing the ANSWER button?	This is a handset/network issue. The Volvo Handsfree System with Bluetooth does not get the end notification. The handset may indicate "call failed, retry?"

Miscellaneous

NOTE: Some handset limitations may be overcome with a handset software update. Contact your handset provider for more information.

Abbreviations/Definitions

AT command - command set used for communication between the handset and Volvo Handsfree System with Bluetooth
BT - Bluetooth
CIP - call in progress
DIP - dial in progress
HF - handsfree
LED - light emitting diode
UIM - User Interface Module

Troubleshooting guide

Item	Symptom	Solution	Next-Level Solution	Last Solution
		UIM		
1A	System does not respond. UIM buttons not lit.	- Switch on ignition. - Check UIM connection.	- Check the UIM connection to the interface harness. Look for loose connectors, loose pins, and crimped or frayed wires.	Check the power connections to the module (Battery, Ignition, Ground). This is easily done by probing the 8 Pin Molex connector: pins 1 for Ground, 2 for Battery, 3 for Ignition. Voltages are nominally 12.5V. If voltage is not ok, check vehicle fuses. If fuses are intact replace the Mute Adaptor Harness. If voltages are ok, check the system fuses on the Interface Harness. If fuses are intact, replace the UIM. If not corrected, replace the Interface Harness. If not corrected, replace the ECU.
		Microphone - Speech recognition/Audio Uplink		
1B	Poor Speech Recognition (SR) performance	- Enter Digits in Segments. - Speak with no pauses. - Wait until after the listening prompt before speaking. If you speak too early, the Volvo Handsfree System with Bluetooth may not recognize what you are saying. - Talk Loudly. - Speak in the direction of the microphone. - Check position of the microphone (see microphone installation sheet). - Verify that there is not an excessive amount of background noise (including car radio, climate control system, windshield wipers, or a passenger speaking) while you are using the voice command functions as this could also interfere with the voice recognition. - If you are using the kit in English, you may find that UK English or US English works better depending upon your accent. You	- Check microphone connection to Interface Harness. Look for loose connectors, loose pins, and crimped or frayed wires.	Replace microphone. If not corrected, and the UIM is lit, replace the Interface Harness. If UIM is not lit see 1A. If not corrected, replace the ECU.

		can find instructions on how to switch the language in your user guide.		
2B	SR does not respond, or in-vehicle audio is not heard on the remote handset	- Check microphone connection	- Check microphone connection to Interface Harness. Look for loose connectors, loose pins, and crimped or frayed wires.	Is the UIM lit? If not, see 1A. Replace microphone. If not corrected, and the UIM is lit, replace the Interface Harness. If not corrected, replace the ECU.
3B	Poor uplink audio. Far side hears an echo. Etc.	- Check position of the microphone. - Ensure that your microphone is securely mounted. - Ensure air vent is not blowing into microphone.	- Reduce the volume of the speakers in the car kit as this may help to reduce the echo on the line as well. - Ensure there is not an excessive amount of background noise (including car radio, climate control system, windshield wipers, or a passenger speaking) in the car, as it may impact voice quality and volume as well.	
Speaker - Audio Downlink/Mute				
1C	No Speech Recognition (SR) prompts or Hands-Free (HF) audio is heard. Radio audio is muted.	- Check the speaker connections through the Mute Adapter Harness and Relay. - Check that the relay "clicks" when a SR of HF session starts and ends.	- Check speaker connections through the Interface Harness, Mute Adapter Harness, and Relay. Look for loose connectors, loose pins, and crimped or frayed wires.	Is the UIM lit? If not, see 1A. Check the power connections to the Mute Adapter Harness (Battery, Ground). This is easily done by probing the Mute Adapter Harness side of the 8 Pin Molex connector: pins 1 for Ground, 2 for Battery. Voltages are nominally 12.5V. If voltages are ok and the Volvo Handsfree System with Bluetooth fuses are intact, replace the Mute Adaptor Harness. If not corrected, replace the Interface Harness. If not corrected, replace the ECU.

2C	Vehicle Audio System does not Mute when an SR or HF session is active.	- Check the Mute Adapter Harness connection to the Relay. Check that the Relay "clicks" when a SR or HF session starts and ends.	- Check Mute line connections through the Interface harness, Mute Adapter Harness, and Relay. The Mute line is on pin 4 of the 8p White Molex connector of the Mute Adapter Harness and Interface Harness. Look for loose connectors, loose pins, and crimped or frayed wires.	Is the UIM lit? If not, see 1A. If the Mute signal does not show 0V (ground, active low) at the 8p White Molex connector when HF or SR audio should be present, replace the Interface Harness. If the Mute signal is still not active low, replace the Adaptor Harness. If the Mute signal is still not active low, replace the Mute Adaptor Harness.
3C	Vehicle Audio System is Muted all the time.	- Check Mute line connections through the Interface Harness and Mute Adapter Harness. Look for any place that the Mute line may be shorted to Ground through a crimped or frayed wire, loose connection of loose pin. - Short press the end key.	- Reset the system	Replace the ECU.
		Bluetooth		
1D	Cannot pair a new handset with the system	- The handset must support Bluetooth Handsfree Profile 0.96 or 1.0 - The system supports a maximum of 4 handsets at once. Make sure this limit is not exceeded. - Remove all previous pairings using the REMOVE ALL command. The system should be reset. - Delete the pairing information on the handset and ensure that the handset is removed from any other systems with which it is paired.	- Check handset Compatibility Matrix to see if the handset being used has been tested and is supported.	Is the UIM lit? If not, see 1A. Replace the ECU.
2D	Handset doesn't reconnect when starting car.	- Check is Bluetooth is switched on at handset. - Is ECU set as authorized on handset. - Is handset a paired device on ECU? - Is ECU a paired device on handset? - Is UIM lit? If not see 1A.	- Check handset Compatibility Matrix to see if the handset being used supports seamless mobility. - Restart vehicle or reset system.	Remove all previous pairings using the REMOVE ALL command. The system should be reset. Then delete the pairing information on the handset and ensure that the handset is removed from any other systems with which it is paired. Pair the handset to the system again. If not corrected, replace the ECU.

Call Issues				
1E	Digits not caller name is heard on incoming call.	- Add caller's number to contact list on ECU.		
2E	Handset voice tag not working.	- Check handset Compatibility Matrix to see if the handset being used supports handset voice tags.	- Check to see if handset voice tags are enabled on handset - Wait for handset to open audio channel before entering voice tag. Handset should sent a beep to indicate this.	Update handset SW.
3E	Speed dial not working?	- Check handset Compatibility Matrix to see if the handset being used supports speed dial.	- Is it a valid speed dial.	Update handset SW.
4E	Unable to switch audio back to handsfree when in Private Mode.	- Check to see if ECU is in the call menu in private mode. if not, handset has removed the BT link. - Check handset Compatibility Matrix to see if the handset being used supports private Mode to Handsfree Mode transition.	Use handset menu to transfer audio back to handsfree.	Purchase handset that supports Private Mode to Handsfree Mode transition.
5E	No ring tone is heard on system for incoming call.	- Check if handset ring mode is set to silent/vibrate. If so change.		
6E	No caller ID is heard.	- Check handset Compatibility Matrix to see if the handset being used supports caller ID. - Check if caller ID is hidden.	- Set 'Call Announce' to On in setup menu.	Purchase handset that supports caller ID.
7E	Incoming call is automatically answered.	- Check if handset is set to auto answer. If so change.		
8E	Radio is unmuted when switched to Private Mode.	- Check to see if the Volvo Handsfree System with Bluetooth is in the Call Menu in Private Mode. if not, handset has removed the BT link and unmuting the radio is expected behavior.	#NAME?	Purchase handset that supports Private Mode to Handsfree Mode transition.
9E	Unable to access contact list.	- Contact list is only available when a handset is connected to system.

IHF1000 Phone Interoperability Results

The IHF1000 car kit supports the Bluetooth® 'Hands-Free' Profile. In order for your compatible Bluetooth enabled phone to communicate with the IHF1000 car kit, it must also support this profile. However, even if your phone supports the Bluetooth 'Hands-Free' Profile, it may not be capable of taking advantage of all the advanced features/functionality of the IHF1000 car kit. The chart below outlines the compatibility of several popular Bluetooth enabled phones with many of the advanced features of the IHF1000 car kit. This chart was compiled based on testing conducted by Motorola, and is believed to be accurate, however product compatibility and/or features/functionalities are subject to change without notice or obligation. The IHF1000 car kit supports Bluetooth 'Hands-Free' Profile. Your phone should support this profile.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Above is a compatibility matrix chart as of 8/25/2005 * that will help you decide whether or not the customer's phone will work with the system

Application information;
The installation will consist two Part numbers, the base kit and the adapter harness.

The Base kit will include a Bluetooth Control unit, Control unit harness, a microphone and a controller module (UIM). The Adapter harness is specific to the vehicle and/or the audio system installed. Specific application info is below.

S40/V50

The Bluetooth hands free kit is only compatible with Integrated Audio Module (IAM) based systems (S40 from chassis no. 80924 and V50 from chassis no 78750). Cars built before the break points indicated are equipped with AFM systems, Bluetooth hands free cannot be installed in these vehicles.

S40/V50 base level audio system (availability mid October 2005)

Base Kit P/N	8640101
Adapter harness P/N	8640108

S40/V50 Premium Audio system

Base Kit P/N	8640101
Adapter harness P/N	8640104

2001 and newer S60 V70, XC70, S80 (availability mid to end of September 20
(Cannot be installed on S80 Executive, S80 Elite, S80 Premier or S80 75th An

Base kit	8640101
Adapter harness	8640105

XC90 all

Base kit	8640101
Adapter harness	8640106

There are 2 adapter harnesses available depending on the level of the Audio system. The photographs of the radio display during "boot up" will help identify which level system you are working with.

Antitheft System - Immobilizer System Overview

NO: 36-35
DATE: 8-01-2002
MODEL/YEAR: MY99- S80, MY01- S60, V70, V70XC
SUBJECT: Immobilizer System Information
CHASSIS: N/A
REFERENCE: N/A

BACKGROUND:
This Tech Net Note is intended to provide a general system overview of the Immobilizer system for 560, V70, V70 XC, and S80.

NOTE:
The C70, MY00 and older S/V/XC70, and S/V40 immobilizer system is significantly different than described in this document. Therefore, this Tech Net Note cannot be applied to those vehicles. Some specific real world" cases are also described from a technical point of view and a customer perspective. Although this information is accurate, it is impossible to describe all possible scenarios and faults in this document. This Tech Net Note is intended to supplement, not replace, the fault tracing provided in VADIS.

In order to ensure a proper repair, it is critical to have a detailed description of the customer complaint; "the car will not start" is not sufficient. The customer must describe the no start condition in terms of: no crank, crank no start, or start stall. The exact text displayed in the DIM message display is also important.

The immobilizer check is only performed during the initial start-up. Once the engine is running, the immobilizer check has passed. Therefore, in the event of engine stalling after initial start, the immobilizer system is not the cause.

DESCRIPTION:

Document layout:

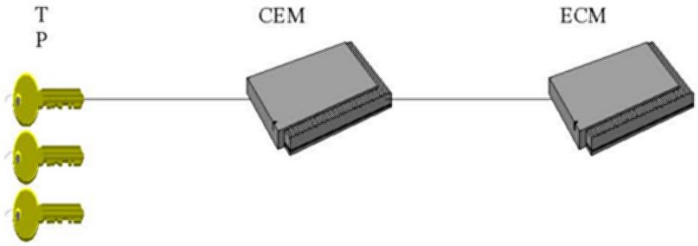
^ System functionality. This section gives some basic explanation of the immobilizer functionality.

^ Symptom Overview. This section provides examples of possible faults based on text message in the DIM and DTC's: No crank, no text (in DIM), no DTC's; no crank, text (in DIM), no DTC's; and No crank, text (in DIM), and DTC's.

^ Tips and Hints. This section includes some "quick sheets" which provide a system overview and some quick fault tracing tips. The "quick sheets" cover various starting situations described as: No crank, no start; Crank, no start; Start - stall.

The Three Parts of the S60, V70, V70XC, and S80 Immobilizer system are:

- The Ignition Key with a Transponder (TP)
- The Central Electronic Module (CEM)
- The Engine Control Module (ECM)

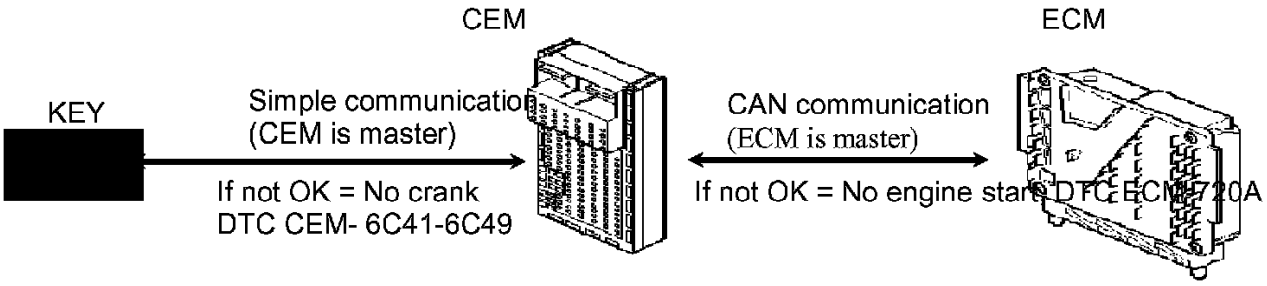


System Functionality

NOTE:
There are other components involved in transmitting the start request (such as immo antenna ring and wiring). The components listed above are vehicle specific and can not be swapped.

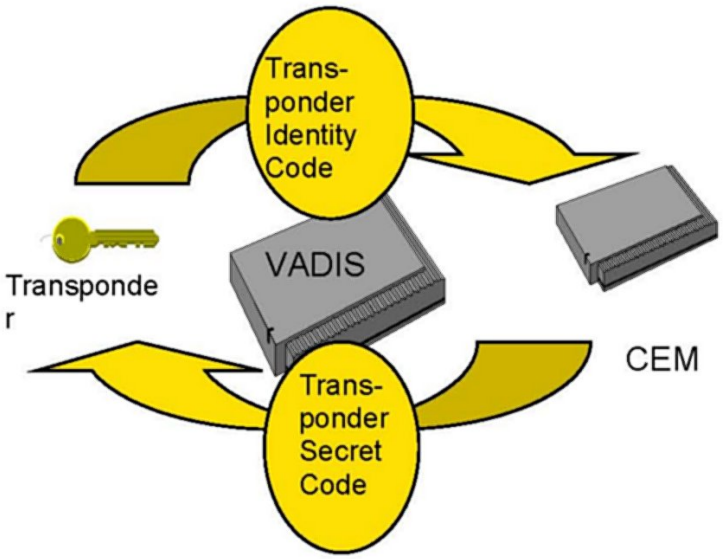
The functions controlled by the immobilizer are the starter motor, ignition and fuel supply.

S60, V70, V70XC, and S80 Immobilizer system and codes



S60, V70, V70XC and S80 Immobilizer system and codes

The GEM Transponder Secret code, is the same for all ignition keys (for a specific car) and is stored in a central database (VITaL). Each key also has a unique Transponder Identity code (stored in GEM) which is not stored in VITaL. When using the "ADD KEY" function, the transponder identity code is written and stored in GEM.



Another code is used in the communication between CEM and ECM. That code is also stored in the database and is automatically handled when replacing the ECM or CEM. Therefore, the CEM and ECM can not be swapped between vehicles; even for test purposes.

^ When programming new keys, the code handling is carried out by VADIS.

^ A spare transponder (key) is delivered with Transponder Identity code but without Transponder Secret code.

^ The new Transponder Identity code is transferred to the existing CEM and Transponder Secret code is transferred to the transponder from CEM when adding keys with VADIS. The Transponder Secret code can only be written once, i.e. a transponder can only be programmed to one vehicle.

^ If a transponder (key) is lost, it is necessary to erase all keys and then add all the remaining transponders (keys) again. In this sequence, the key in the ignition is programmed automatically.

Symptom Overview

NOTE:

^ As for all problems, always check the basics! fuel, fuel pressure, injectors, sparks, battery.

^ If the problem only occurs when parking downhill for example, make sure enough fuel gets to the engine.

^ Some no-crank or crank-no-start situations can occur in a workshop environment by a combination of key cycles. This means that it is not advisable to repeatedly crank and start engine to test the system. The Immo verification is only done once per key cycle and it will not add any value to stress ignition switch on and off. This may create false immo messages or DTCs.

No Crank, no text (in DIM), no DTC

S60, V70, V70XC, and S80 will not allow you to crank the car if:

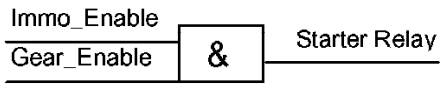
^ The gearshift is not in park / neutral mode

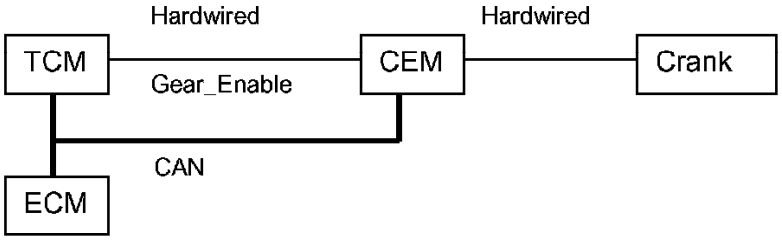
^ Clutch not pressed (Manual with start blocking)

The following information depends on vehicle equipment and structure week. The different versions are described below:

1. GM4T65 Transmission (early S80 production) with good ECM-TCM CAN communication.

Immo_Enable =1 when start is approved from the immobilizer
Gear_Enable = 1 when start is approved from start blocking due to gear position.

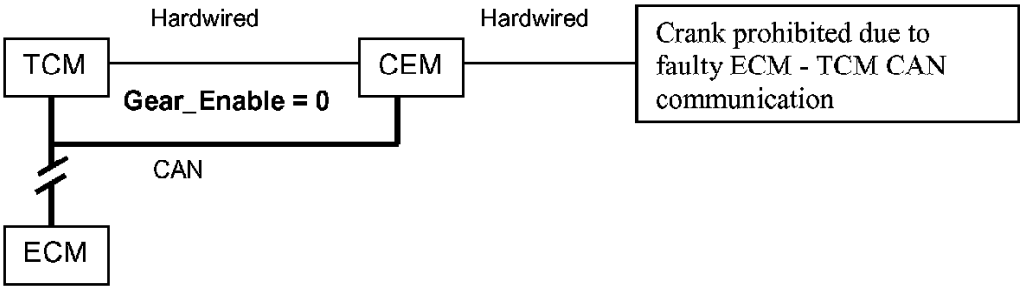




Two conditions must be fulfilled to let the starter motor run. Both logical states "Immo_Enable" and "Gear_Enable" must be set to true. (= 1)

NOTE:
Although these states can not be determined using VADIS, they can be concluded by using CAN communication DTC, gear position, and immobilizer parameter readouts.

2. GM4T65 Transmission (early S80 production) and Faulty ECM-TCM CAN communication.

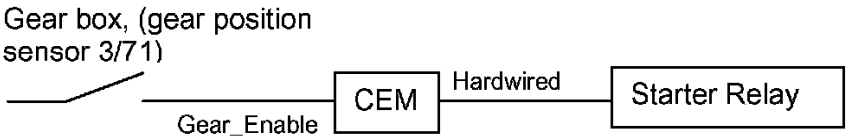


In the case with a 4T65 gearbox of early S80 production, the starter motor will not run if the TCM has lost CAN communication with ECM. The 1CM will then not set the hardwired signal Gear_Enable to 1. The starter motor will therefore not be enabled by CEM.

Note, in later MY vehicles this feature is taken away.

3. S80 GM4T65 (later production)
Will enable crank (Gear Enable=1) even with faulty ECM-TCM CAN communication.

4. S60, V70, and V70XC with AW 55-50



In the case with an AW gearbox the starter motor will be allowed to crank even with faulty ECM-TCM CAN communication. The signal Gear Enable is hardwired directly from the gearbox.

No Crank, Text (in DIM), No DTC

IMMOBILIZER SEE MANUAL

The above text message may be displayed in the DIM.

Verify that no metal objects or other transponder keys are on the key ring when the message was displayed.

NOTE:
Remember the customer may not leave the complete key ring when the car is left for service. It may be necessary to ask the customer about the "normal" key ring. Verify that starter motor gets power and is functioning properly.

START PREVENTED TRY AGAIN

The above text message may be displayed in the DIM.

Verify all ignition positions through VADIS together with other immo communication parameters.

No Crank, Text (in DIM), DTC

Text "Immobilizer start prevented"

DTC 6C41	ICK short to plus
DTC 6C42	ICK short to gnd/OC
DTC 6C43	IDS short to plus
DTC 6C44	IDS short to gnd/OC
DTC 6C46	IAU internal fault
DTC 6C48	Wrong, not programmed, not recognized or no transponder in key currently inserted
DTC 6C49	Wrong transponder response

ICK = Immo clock, IDS = Immo data signal, IAU = antenna

Points towards antenna ring or key, but can randomly occur due to other communication disturbances. NOTE! If this has been a single incident, it is not likely to be a faulty antenna ring. Check counters in the Vehicle communication / extended fault-tracing information window.

Crank - No Start

If a S60, V70, V7OXC, or S80 vehicle cranks but does not start there may be a CAN communication problem in the high speed network. This can be verified by checking CAN related fault codes from all nodes.

A crank and no start situation occurs also if the CEM is in pre-set mode, i.e. the diagnostic command for security access (code handling) has been sent to the CEM, but the command for closing the security access is not sent. This may occur after programming a CEM or installing new keys. "Crank - No start" can also occur if ECM and CEM are not coded to each other. (E.G. If for some reason the ECM has already been programmed to another car.)

Crank, Start and Stall

Crank, start and stall can occur if the ECM and GEM are not coded together in a certain circumstance,

If you turn the key very quickly from position 2 to position 3 the ECM may do a "prestart" . When the immobilizer communication gets NOK the ECM will then stall the engine.

For the normal symptom when ECM and GEM are not coded together, see above.

Tips and hints

^ Check the keys you get as spare parts. There is a red dot for S60, V70, V70XC, and S80 cars.

^ Make sure to check that coil is energized in the S60, V70, V70XC, and S80 starter motor relay. A volt meter can make you draw the wrong conclusions since you will measure 0V constantly on relay.

^ Use VADIS to check the key inserted in the ignition and all activity between key and CEM (very useful).

^ Check for "low relay" for the ECM and TCM.

^ Verify the function of any new key which has been programmed to the vehicle. If any of the keys fail to crank the vehicle, this may be due to a

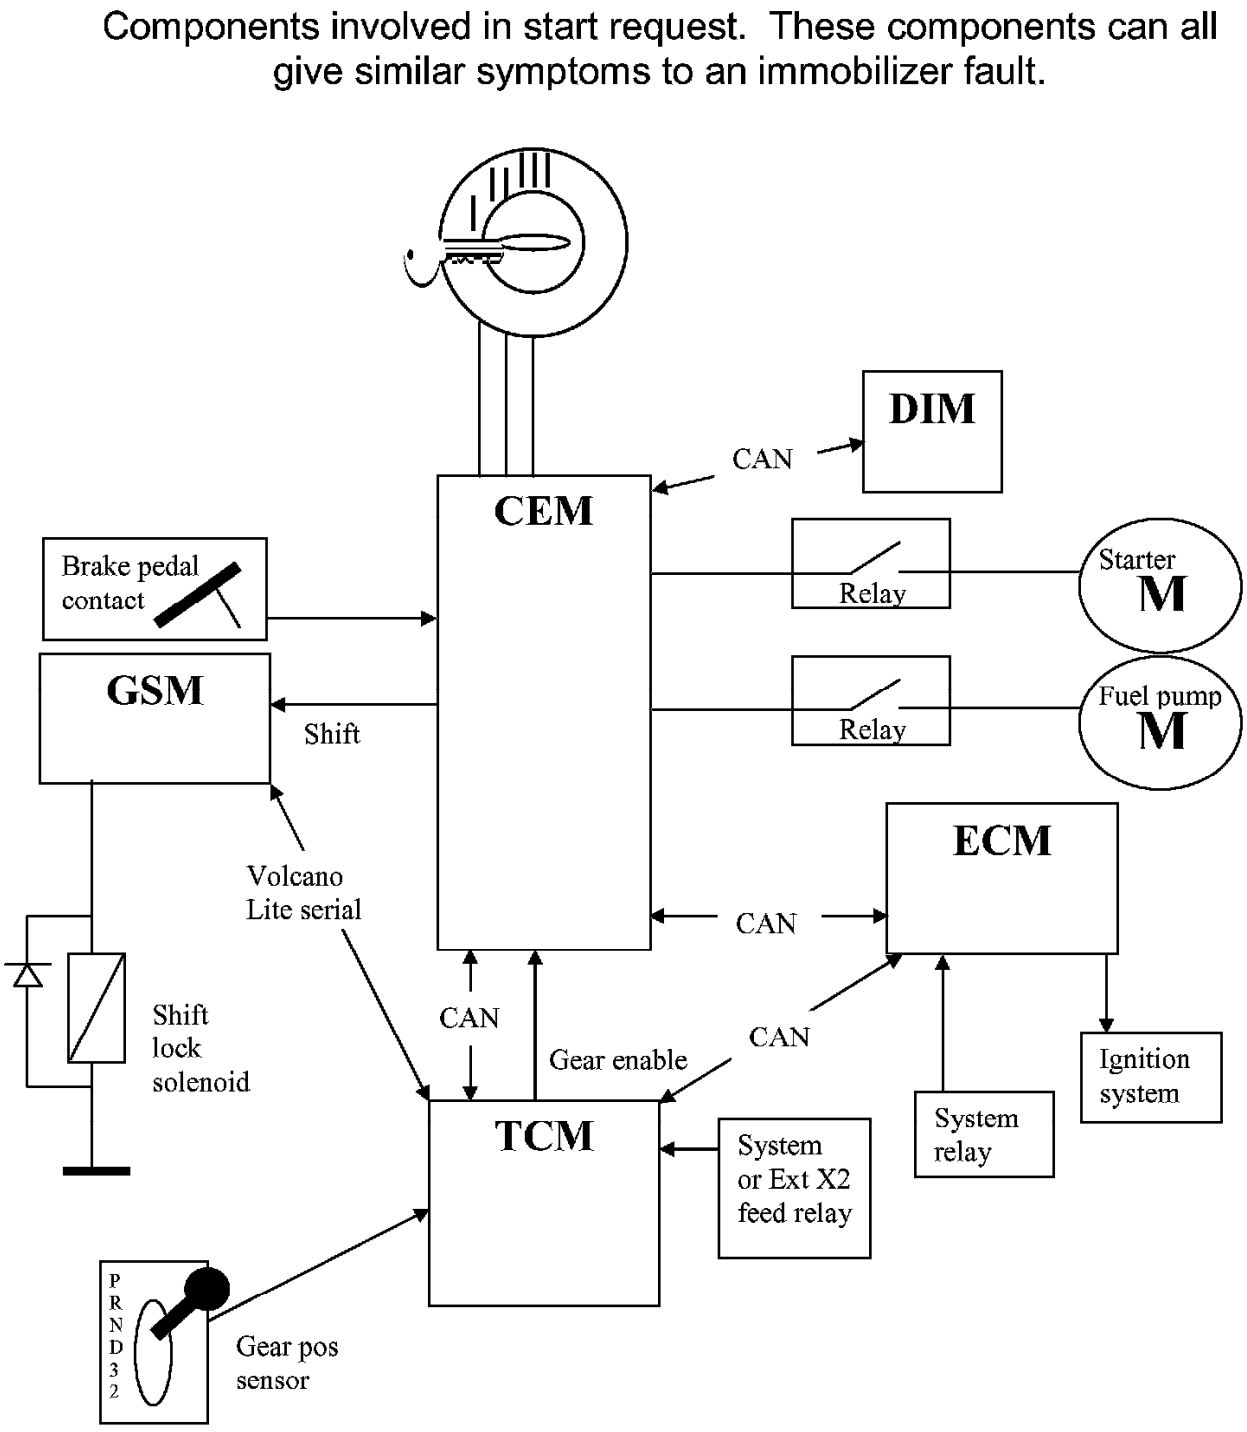
key programming error, not immobilizer system failure.

Quick Sheets:

This section provides examples of possible faults based on various cranking conditions: No crank, no start; Crank, no start; Start - stall.

This section is intended to provide a graphical overview of the components involved in cranking and starting.

Note! This is NOT to be viewed as the only possible causes. Refer to the section SYMPTOM OVERVIEW for more detailed information.



Components involved in start request. These components can all give similar symptoms to an immobilizer fault.

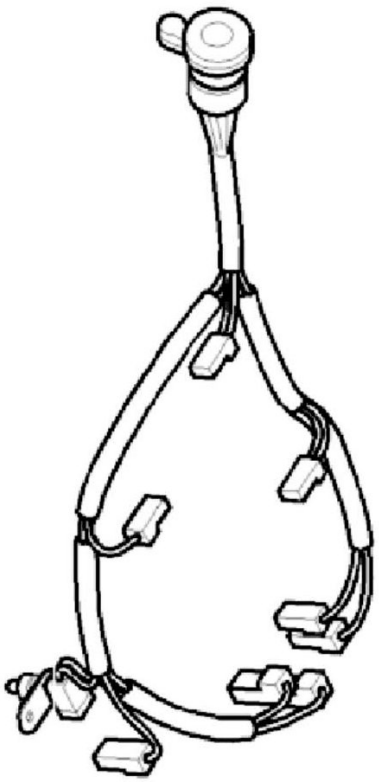
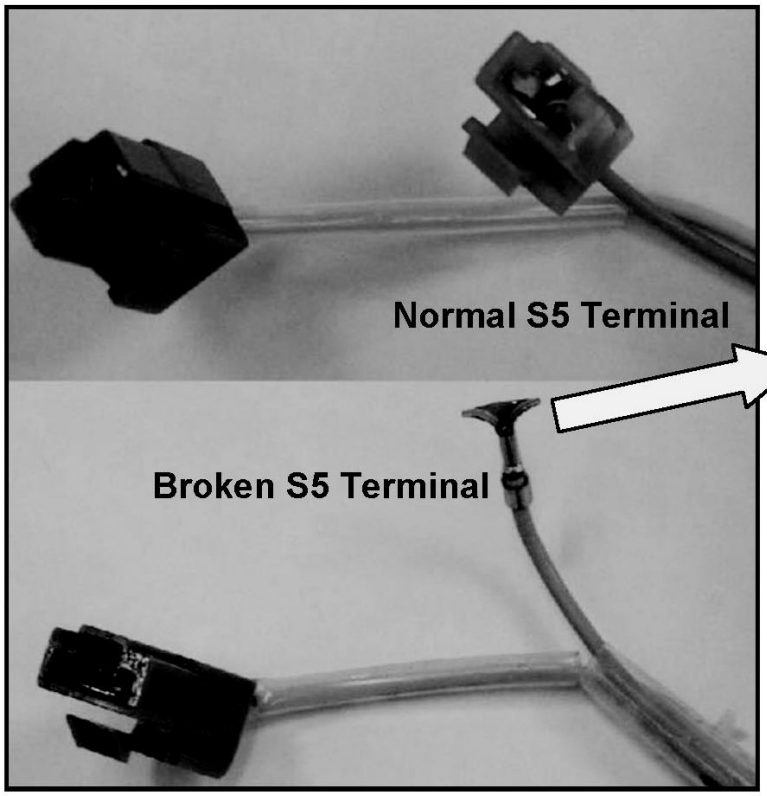
A/T AW55 - TCM DTC's 010A, 010B, 010C

NO: 43-49
DATE: 04-06-2006
MODEL: S40, V50, S60, V70, XC70, S80, XC90 with AW55 Transmission
YEAR: 2004-2005
SUBJECT:
AW55 TCM DTC 010A, 010B, 010C Shift Solenoid S5 signal low, high or missing





DESCRIPTION:
A likely cause for a DTC related to the S5 solenoid (010A, 010B, 010C) in the AW55 transmission on a model year 2004 or 2005 vehicle is a broken wiring terminal at the solenoid.

SERVICE:
Follow the VIDA fault tracing for these DTCs. Repair or replace the valve body wiring harness if necessary.Technical Service Bulletin #

Electrical - Fuse Box Label Error

NO: 36-48
DATE: 9-2-2004
MODEL: 860, 880, V70, XC70
M. YEAR: 2005
SUBJECT: Fuse Position Error DDM / PDM in Wiring Diagram and Decal
REFERENCE:

DESCRIPTION:

The fuse decal (P/N 30728024) which is located inside the lid of the fuse panel at the end of the driver's dashboard, is incorrect for S60, V70 and S80 M/Y 2005. The printed positions of fuses for the DDM and PDM have been switched.

Also, Wiring Diagrams TP 3976xx1 (S60, 880) and 3977xx1 (V70, XC90) have the same error.

Correct information about fuse positions:

Driver Door Module, DDM = Fuse # 11/C:5

Passenger Door Module, PDM = Fuse # 11/C:4

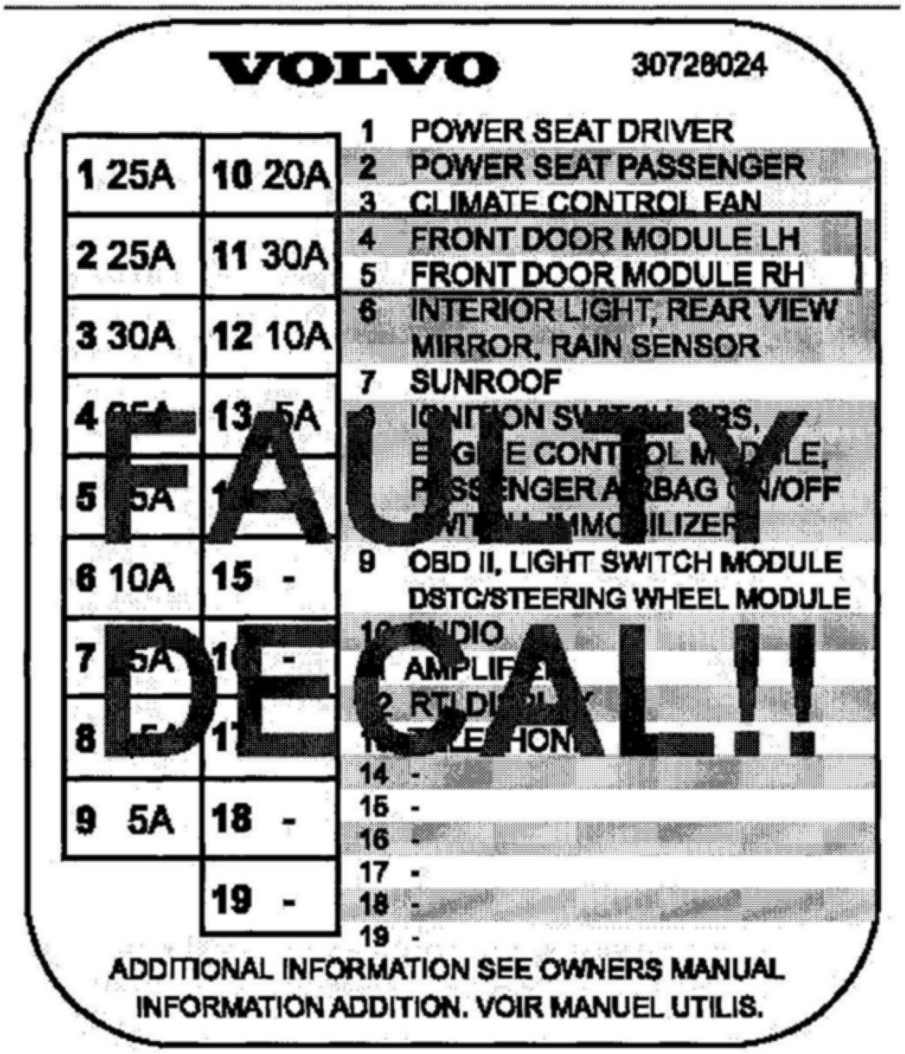
Note:

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Owner's Manuals are OK.

SERVICE INFORMATION PRODUCT UPDATE:

Updated Wiring Diagrams for S60, V70 and S80 will be available in November.



New decal will be available in Volvo production at the end of August 2004, P/N 30728433.

This decal will be available as a spare part later in 2004.Technical Service Bulletin # **TNN39-52** Date: **060209**

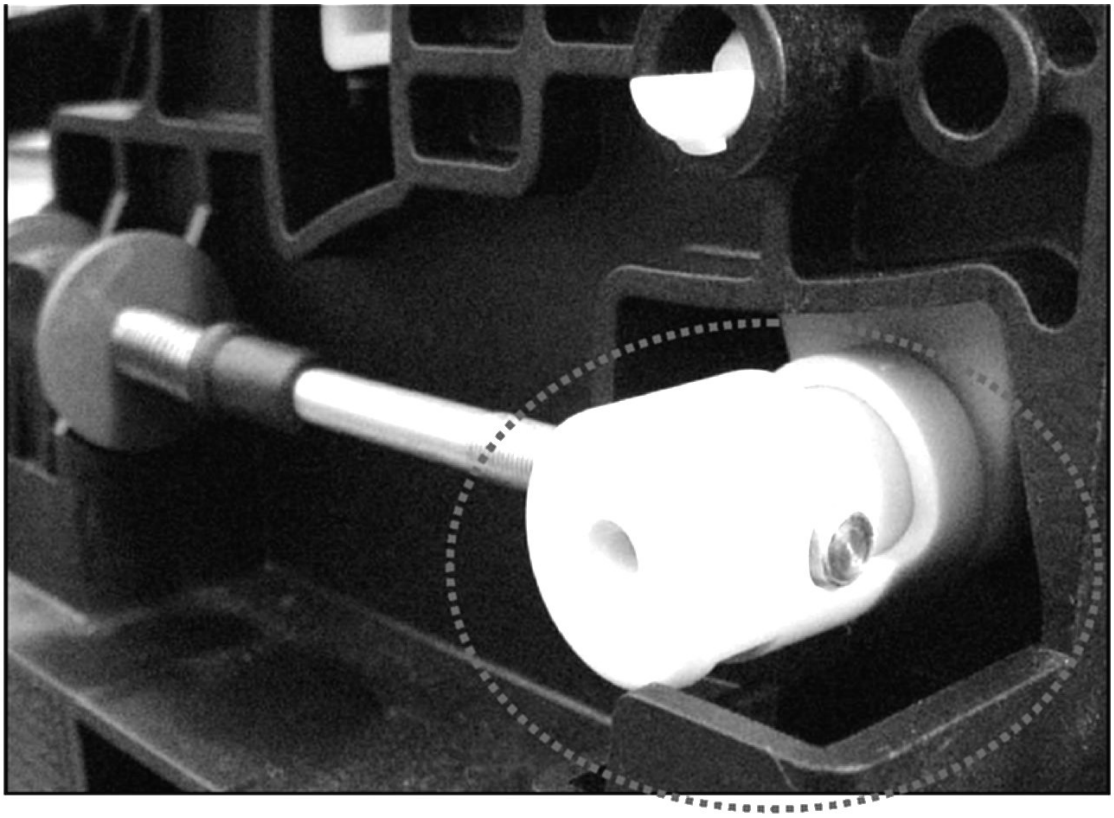
Ignition Interlock Cable Clip

DESCRIPTION:



The yellow plastic ignition interlock cable clip can be damaged when it is unlocked to perform a repair. Because of this, it should be replaced with a new clip (PN 30711794) whenever it is unlocked. Future VADIS versions will reflect this change in repair method.

Technical Service Bulletin # **TNN21-18** Date: **040504**

Body/Frame - Squeaking/Crunching Noise When Wet/Cold

NO: 21-18

DATE: 5-4-2004

MODEL:
S60, 2001 - S80, 1999 - V70, V70 XC, XC 70 & V70 AWD, 2001 - XC90, 2003 -

CHASSIS:
See chart below

SUBJECT:
Sub Frame Squeaking Noise

REFERENCE:
VADIS

DESCRIPTION:

Under certain conditions when driving in cold and or wet weather a squeaking or crunching type noise may be heard from the vehicle sub frame bushings.

Vehicle Type	Plant	Chassis #
184	21	377934 -
275	21	116392 -
285	21	438489 -
295	22	165147 -
384	22	408514 -

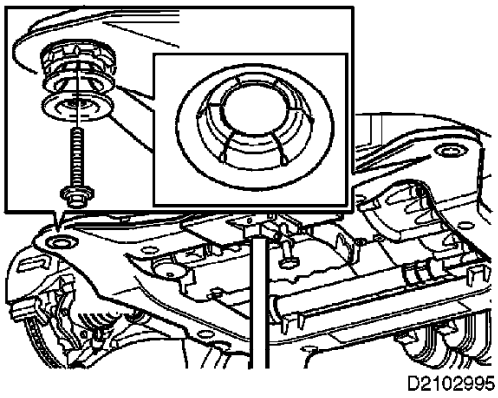
This noise may be more noticeable during low speed maneuvers or when braking at low speeds. From the chassis break point shown a new insulating washer PN 30660816 has been introduced in production and is available as a service solution. If the customer should experience this condition and the vehicle is below the chassis # listed the sub frame washers should be installed.

Description	Quantity	P/N
Washer	4	30660816
Bolt	4	981062

Parts Information

Service:

1. Support the front of the sub frame using a suitable jack.

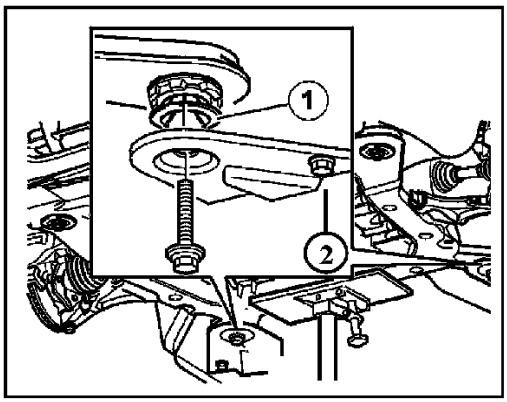


Remove the front bolts from the sub frame. Install the plastic washers PN 30660816 between the steel plate and the bushing as illustrated.

Use new bolts PN 981062 and torque to 105 Nm, + 120°.

2. Support the rear of the sub frame using a suitable jack.

Loosen the bolts (2) for the sub frame brackets 5 turns.



Remove the sub frame bolts. Install the plastic washer (1) between the plate and the bushing as illustrated.

Use new bolts PN 981062 and torque to 105 Nm, + 120°.

Torque the bolts (2) for the brackets to 50 Nm.

Interior - Front Seat Slide Rail Adjustment

NO: 85-25

DATE: 12-07-2004

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

MODEL:
S60 (01-)/V70 (01-)/V70XC and XC70 (01-)/S80 (99-)/XC90 (03-)

SUBJECT:
Mechanical front seats, adjusting seat slide rail locking position.

DESCRIPTION:

This TNN describes the method for proper front seat slide rail adjustment after replacing or removing a seat from the vehicle. If this is not properly done, front seat movement under acceleration or deceleration might be experienced.

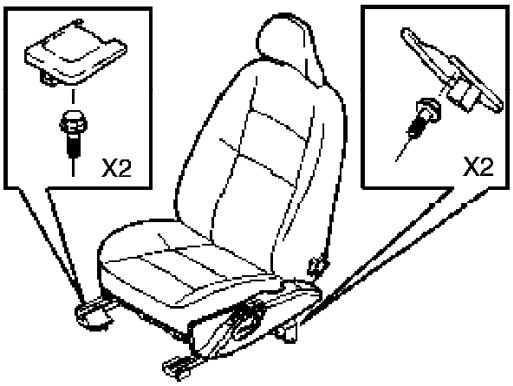
CHECKING PARALLELISM:

Verify that each adjustment mechanism can be locked individually to ensure that there is no problem with the slide rail lock mechanism (due to damage or foreign objects).

Sit on the seat. Lock one side and move the other side of the seat forward and rearward to determine if the seat adjustment mechanism must be moved forward or rearward in relation to the slide rails.

ADJUSTING THE SLIDE RAILS:

Step 1:



Remove the four cover panels for the slide rail bolts.

Unscrew front and rear slide rail bolts a couple of turns but do not remove them.

Step 2

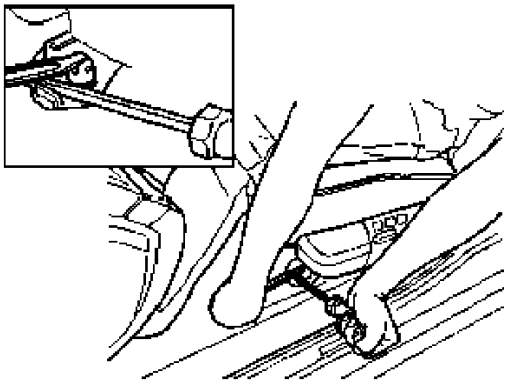
Check if both adjustment mechanisms can lock at the same time in each slide rail now that the slide rail bolts are loosened.

If both slide rails can be locked at the same time, tighten all bolts to 29.50 Lb ft (40 Nm).

Start with the front bolts, then rear bolts and proceed with step 4.

If the slide rails cannot be aligned, proceed with step 3.

Step 3:



Press one slide rail forward/rearward based on the result of step 1. While doing so, tighten the front bolt. Then tighten the rear bolt of the same rail. Make sure that the slide rail is locked when this is done.

Next, check that both sides can lock at the same time by sitting on the seat and adjusting its longitudinal position. With both slide rail mechanisms locked, tighten the two remaining loose bolts (front and rear). Check that the longitudinal position and height of the seat can be adjusted.

If the function is still not OK, start adjusting the other rail according the method described above and work in the opposite direction. Finally, tighten all four bolts to 29.50 Lb ft (40 Nm). Reinstall the cover panels.

Step 4:

Check the longitudinal and height position of the seat. If you can still feel play and hear a clicking sound see Service Bulletin 850036 for reducing the play/clicking sound at the lower mounting points of the front height adjuster.

Keyless Entry - Remote Transmitter Intermittently Inop.

NO: 36-49

DATE: 0516-2005

MODEL/YEAR: S60, S80, V70, XC70 and XC90.

M. YEAR: MY O5

SUBJECT:
Key Integrated Remote Control, Intermittent function

CHASSIS:
S60 468280-485113
S80 407494-415649
V70 500355-522330
XC70 193327-204897
XC90 190567-218294

REFERENCE: VADIS/VIDA repair instruction

DESCRIPTION:

Customers may report an intermittent function of the Key Integrated Remote Control (KIR).

This can be caused by a slightly misplaced battery spring clip connection.

Potential affected vehicles;

^ Cars with reported complaints of intermittent KIR functions within the above chassis limit

^ Cars undergoing Customer Preparation Service (CPS) within the above chassis limits

These vehicles shall have both KIRs checked and adjusted.

This TNN describes how the KIRs can be checked and corrected.

SERVICE:

^ Use cotton or latex gloves during handling of complete KIR assembly and battery to prevent cosmetic damage to the KIR and depositing oils on the battery and its contacts.

^ The tool to be used for removal of the KIR battery cover and for adjusting the battery spring clip shall be a bone tool or a similarly blunt edged soft tool.

^ When battery is replaced it must be possible to read "Panasonic" on top of battery, i.e. the + pole is upwards.

^ Function test must be performed after battery check. Lock and unlock the car by using KIR buttons.

Step 1

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Instruction:
Remove battery cover from the KIR with a bone tool. Use gloves during handling.

Step 2

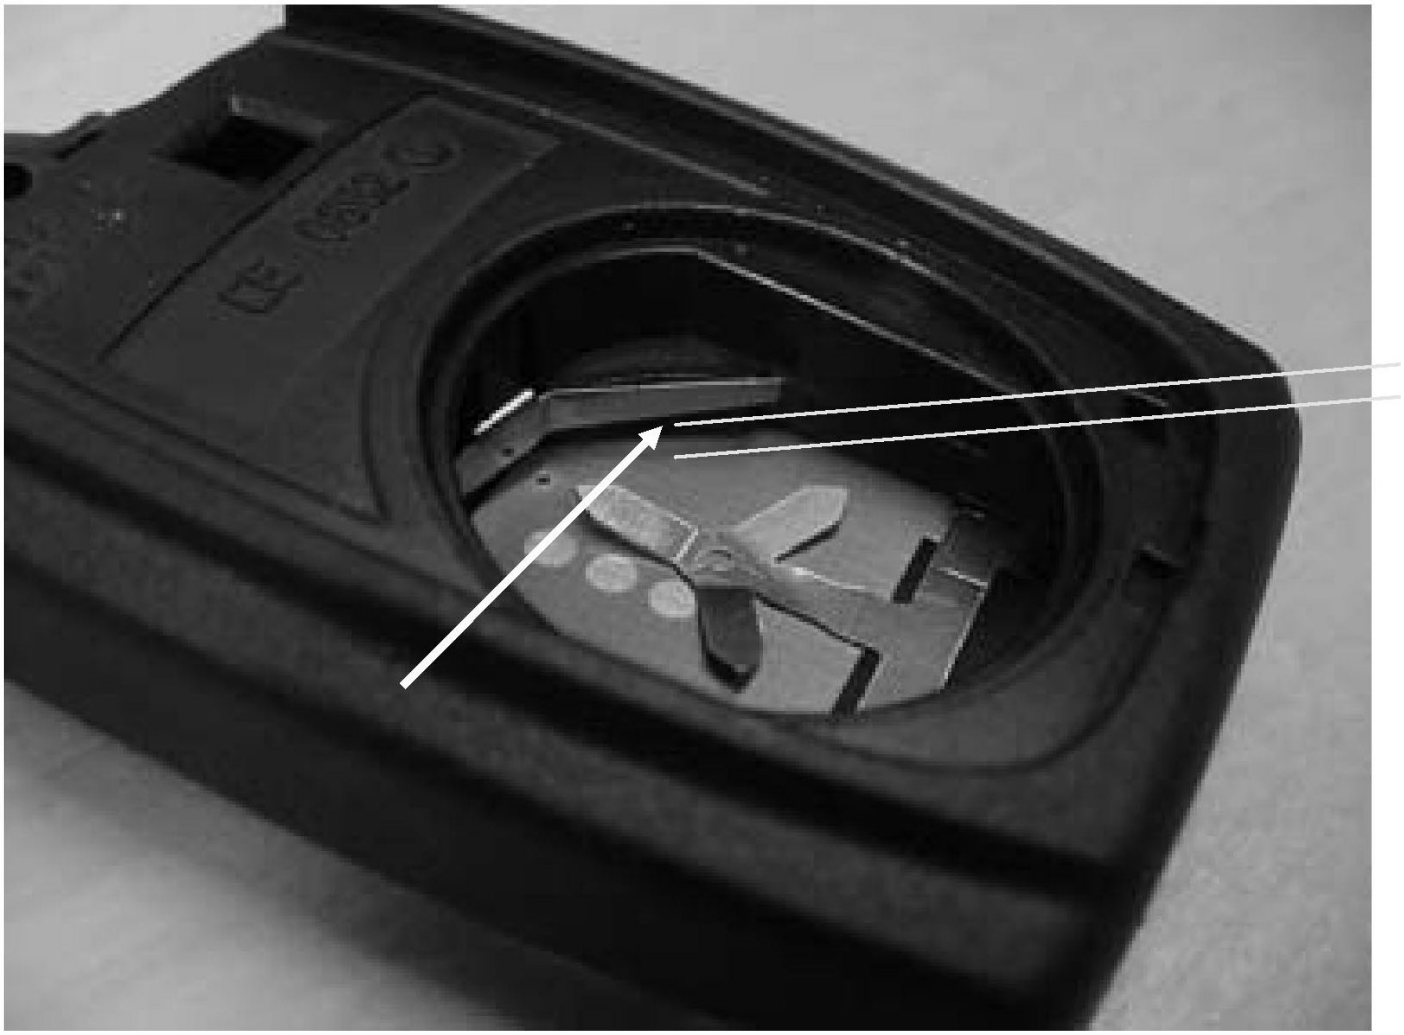
Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Instruction:
Turn the KIR with battery facing downwards. Shake gently and if battery falls out, proceed to Step 3, otherwise reinstall battery cover.

Step 3

Instruction:
Place upward force on Spring Battery holder (Right Hand Side) as shown above using a bone tool.

Step 4



Instruction:
Apply force as described in Step 3 until a visible gap occurs between the Printed Circuit Board, PCB (green color surface) and metallic spring clip.

Step 5

Instruction:
Reinstall Battery putting downward force on battery. When battery is reinstalled it must be possible to read '~Panasonic" on top of battery, i.e. the + pole is upwards.

Step 6

Instruction:
Repeat Step 2 to make sure battery is now secure. If not secure repeat Step 3

Step 7
Replace the battery cover. Function test must be performed after battery check.
Lock and unlock the car by using KIR buttons.

A/C - Stops Working Intermittently

NO: 87-51
DATE: 07-15-2005
MODEL: S60, S80, V70, XC70, XC90.
M. YEAR: MY05
SUBJECT: A/C System Intermittently Stops Working. Possibly Overcharged.
REFERENCE: VIDA

DESCRIPTION:
Under specific conditions, high temperatures and stop and go traffic, the A/C system may intermittently stop working. For cars with this symptom, check if the A/C system is filled with the correct amount of refrigerant. If the A/C system is found to be overcharged, refill the system with the correct amount of refrigerant.

MODEL	CHASSIS No.
S60	471445 - 500000
S80	409455 - 426000
V70 (Factory 22 - Belgium)	505663 - 530000
V70 (Factory 21 - Sweden)	506584 - 530000
XC70	195820 - 208000
XC90	196988 - 224000

VEHICLES AFFECTED:

Note:
The chassis ranges only indicate that a limited number of cars within these range are affected!

SERVICE METHOD:
For cars with a complaint as in the description above, verify the correct filling amount of refrigerant by evacuating the A/C system.

From the lower chassis numbers listed in the chassis number list above, the filling amount was reduced due to a new smaller condenser and new smaller receiver dryer.

If the A/C system is found to be overcharged, refill the system with the correct amount of refrigerant (see reference table). The correct filling amount can also be found on the A/C label in the engine compartment.

If the system was found to be charged correctly, continue with normal fault tracing.

CARS WITH NEW STYLE RECEIVER DRYER/CONDENSER (after breakpoints listed above)		
Variant	Correct A/C filling amount	Correct A/C label
S60, V70, XC70, S80 and XC90 with front A/C only.	1.54 lb. (700g)	30734536
XC90 with dual A/C.	2.31 lb. (1050g)	30734539

CARS WITH OLD STYLE RECEIVER DRYER/CONDENSER (prior to breakpoints listed above)		
Variant	Correct A/C filling amount	Correct A/C label
S60, V70, XC70, S80 and XC90 with front A/C only.	2.17 lb. (1000g)	9454292
XC90 with dual A/C.	2.87 lb. (1300g)	9454489

Overview with correct filling amounts & correct labels shown.

Audio System - AM Static Caused By PEM, Turbo Cars Only

NO: 39-49

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

DATE: 8/23/2005
MODEL:
XC70 173000-191800
S60 315000 - 462700
V70 349000 - 498300
S80 335000 - 406200
M. YEAR: 2004 & 2005
SUBJECT:
AM-Radio Static on Turbo Cars, Caused by PEM.
REFERENCE: VIDA

DESCRIPTION:
Analysis has found that the PWM (Pulse Width Communication) between the Engine Control Module (ECM) and the PEM (Pump Electric Module) can induce a whining noise on the lower frequencies of the AM-band.

From MY 2005 the PEM was introduced on all Turbo models.

PRODUCT MODIFICATION:

From 2005 week 4 (see chassis number limitations in header) a ferrite has been introduced in the cable harness to the PEM. This will minimize the noise on the AM-band.

SERVICE:
Install the service kit according to the instruction shown.

Material

Description	Quantity	Part No.
Ferrite Kit. (service solution 1), S60R, V70R, engine code 52 (B5254T4), Model year 2004 only. See steps 1 - 8.	1	30724619
Ferrite.Kit (service solution 2), S60, V70, S80, engine code 59 (B5254T2) with steel tank, model year 2004 only. See steps 9 - 13.	1	30739381
Ferrite Kit. (service solution 3), S60, V70, S80, engine codes 54 (B5244T5), 52 (B5254T4), 59 (B5254T2), 91 (B6294T), Model year 2005. all turbo engines See steps 14 - 21.	1	30739380

Special tools

Description	Part No.
Dismantling tool	951 2853
Dismantling tool	951 2639

Material

Service solution 1

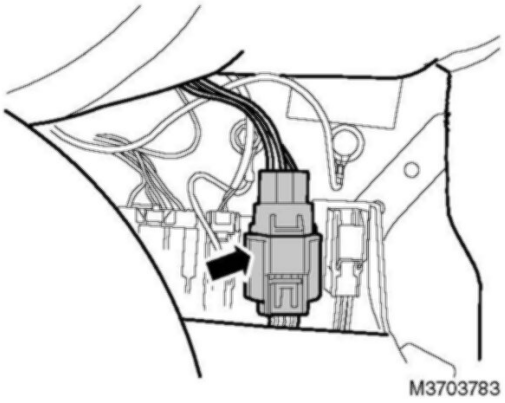
S60R, V70R, engine code 52 (B5254T4),
Model year 2004 only. Steps 1-8.

1.

Exposing connectors
Lift up the rear seat cushion, see:
Removal, replacement and installation
Body and interior
Interior
Rear seat, passenger seat, seat
Upholstery seat cushion, replacing

Lift the insulation on the right side and expose the connectors.
Dismantling

2.

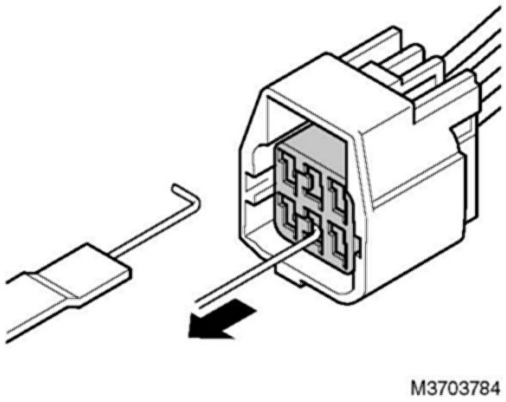


Dismantling connector
Remove the six-pin connector from the attaching plate.
Unplug the connector.

Removal

3.

Remove secondary lock



Release the catch and pull out the secondary lock.
Use dismantling tool 951 2853 or a radio screwdriver, see figure.

4.

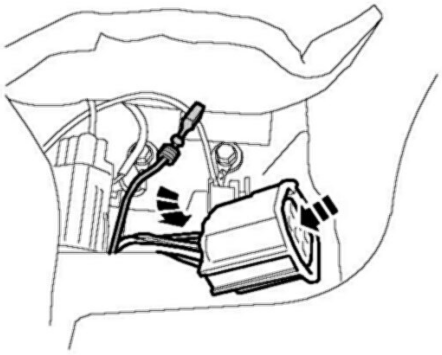
Remove cable

Remove the yellow cable in position 6. Use dismantling tool 951 2639, see figure.

Installation

5.

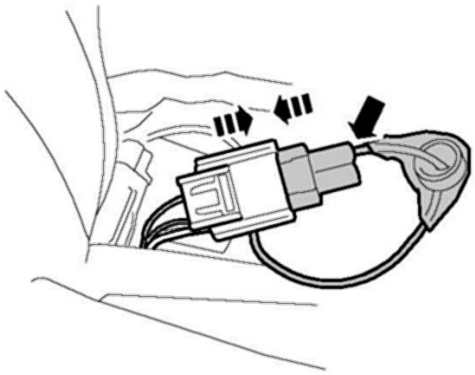
Install service kit



M3703686

Install the removed cable in position 1 of the loose connector that comes with the service kit.
Check that the terminal locks securely.
Press in the secondary lock.
Install the service kit's terminal in the unoccupied slot of the vehicle's connector (where the yellow terminal was removed from)

6.

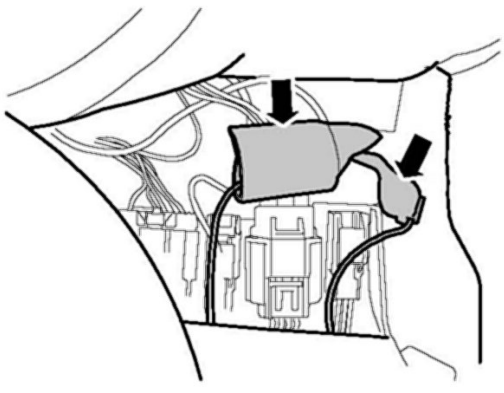


M3703787

Install both connectors.

7.

Install foam tape

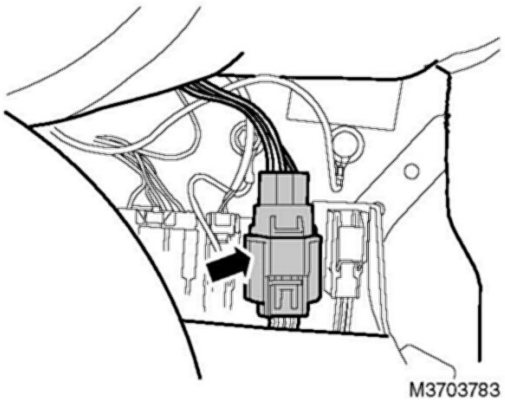


M3703788

Wrap foam tape around the two-pin connector.

8.

Install connector



Press in the new connector under the plastic protection and secure the six-pin connector on the holder.
Restore the insulation and reinstall the seat cushion.

Service solution 2

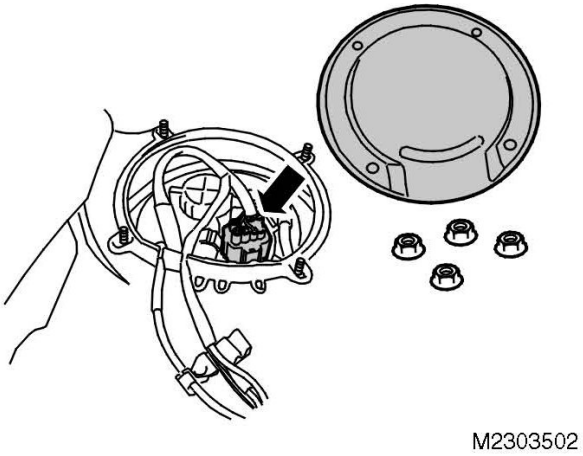
S60, V70, S80, engine code 59 (B5254T2) with steel tank,
Model year 2004 only. Steps 9 - 13.

9.
Exposing connector

Lift up the seat cushion and remove the backrest, see:
Removal, replacement and installation
Body and interior
Interior
Rear seat, passenger seat, seat
Upholstery seat cushion, replacing
Upholstery back rest, replacing

Removal

10.
Remove cover for fuel pump



M2303502

Remove:

^ Nuts, 4 pcs.

^ Cover

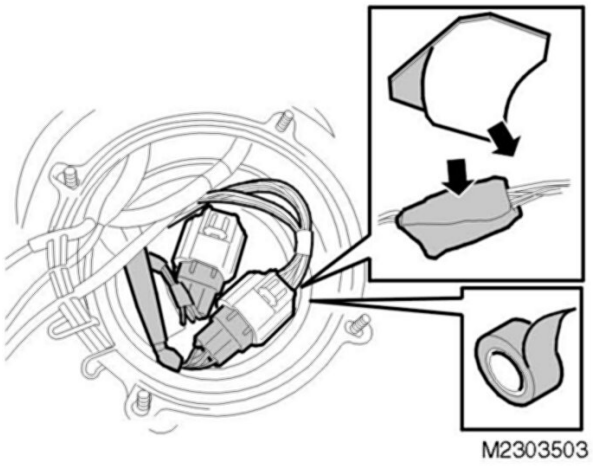
^ The six-pin connector.

Installation

11.

Install service kit

Install:



M2303503

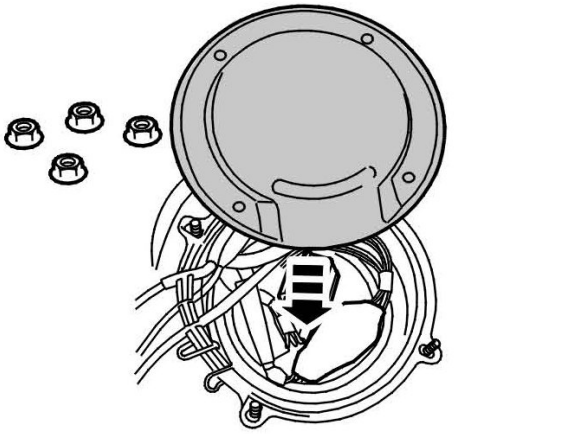
^ adapter cable harness between the fuel pump and the cable harness

^ Foam tape around the loose connector.

Fix the connector on the tank with the supplied tape.

12.

Install cover for fuel pump



M2303501

Install:

^ Cover

^ Nuts, 4 pcs. Tighten with 10 Nm.

13.

Install backrest and seat cushion
Install backrest and seat cushion, see:
Removal, replacement and installation
Body and interior
Interior
Rear seat, passenger seat, seat
Upholstery seat cushion, replacing
Upholstery back rest, replacing

Service solution 3

S60, V70, S80, engine codes 54 (B5244T5), 52 (B5254T4), 59 (B5254T2), 91 (B6294T),
Model year 2005. All turbo engines. Steps 14 21

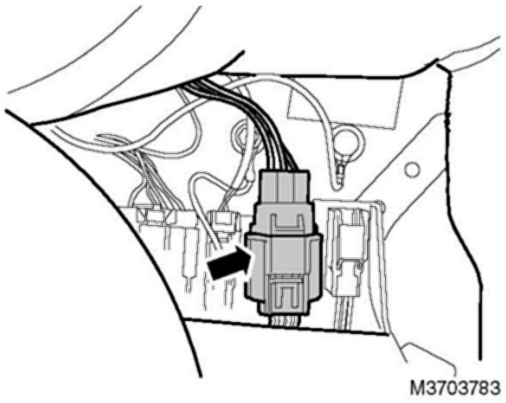
14.

Exposing connector

Lift up the rear seat cushion, see:
Removal, replacement and installation
Body and interior
Interior
Rear seat, passenger seat, seat
Upholstery seat cushion, replacing
Lift the insulation on the right side and expose the
connectors.

15.

Dismantling connector

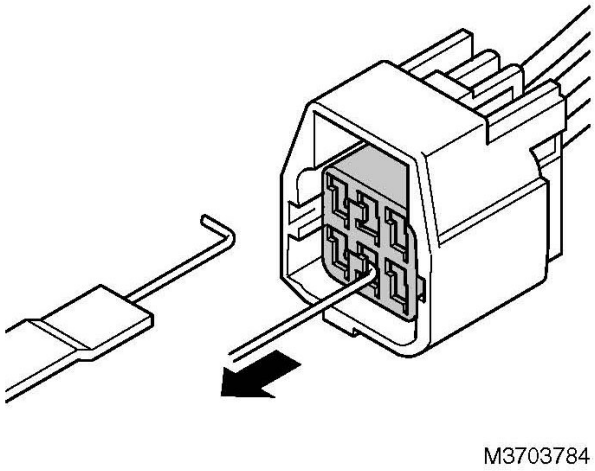


Remove the six-pin connector from the attaching plate. Unplug the connector.

Removal

16.

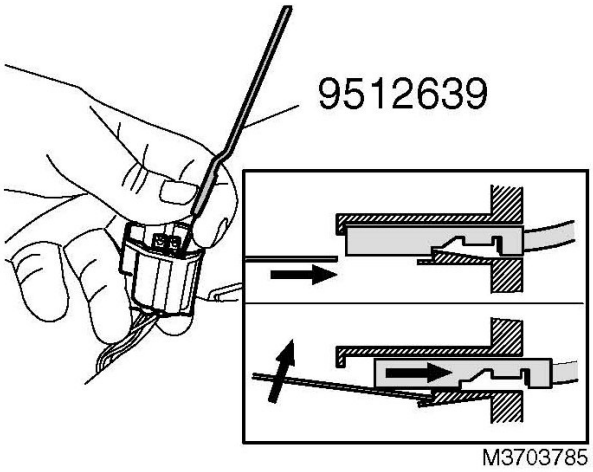
Remove secondary lock



Release the catch and pull out the secondary lock. Use dismantling tool 951 2853 or a radio screwdriver, see figure.

17.

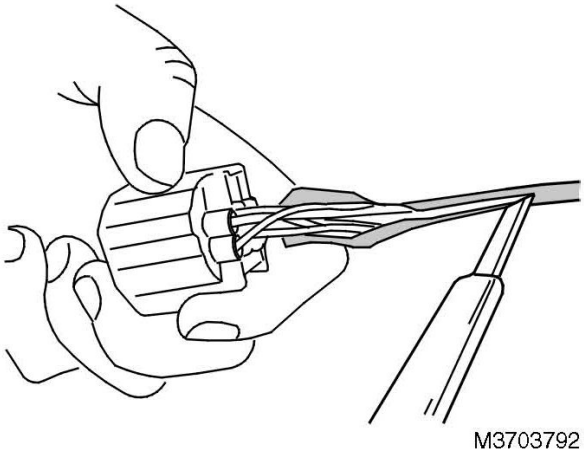
Remove cable



Remove the yellow cable in position 6. Use dismantling tool 951 2639, see figure.

Dismantling

18.



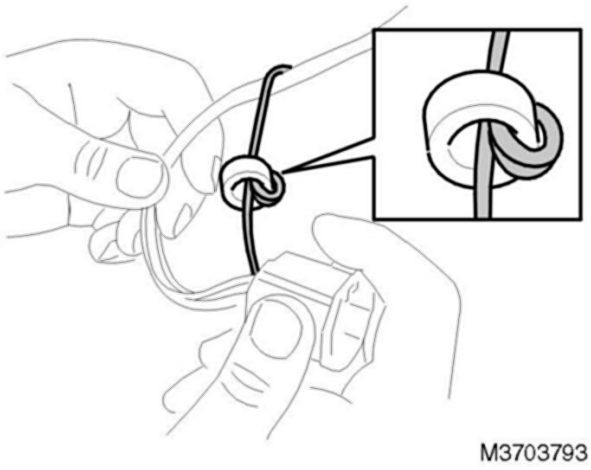
Opening cable harness

Carefully cut open the casing 150 mm.
Caution! Cut carefully so that no cable is damaged.

Installation

19.

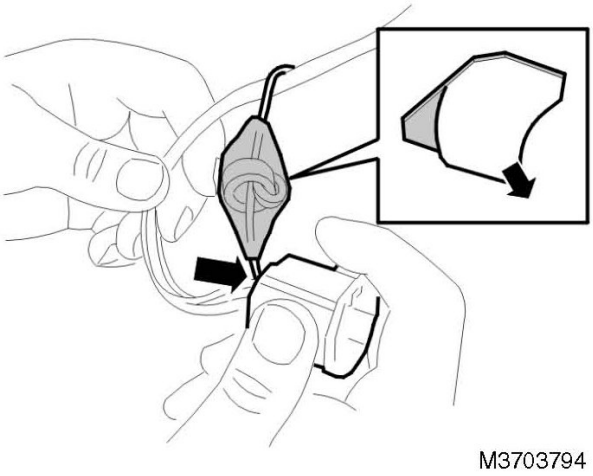
Install ferrite ring



Wrap the yellow cable three times around the ferrite ring, see figure.

20.

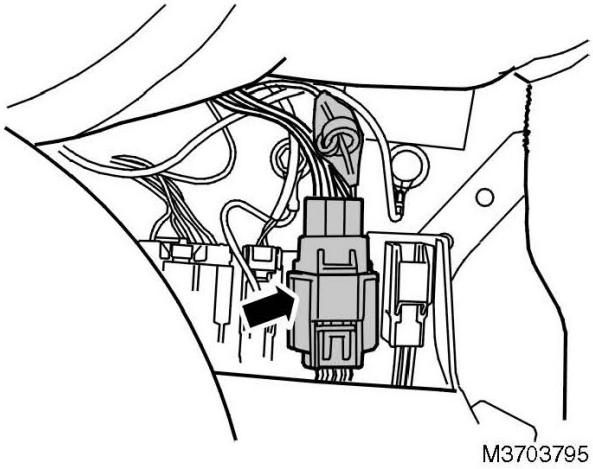
Install foam tape



Install foam tape around the ferrite ring and the cable.

Reinstall the cable in the connector, position 6.

21.



Install connector

Plug in the connector and secure it in the holder.
Reinstall the insulation and seat cushion.

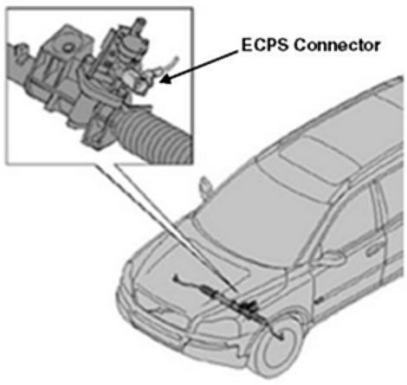
Power Steering - ECPS System Diagnostics

NO: 64-20
DATE: 12-02-2004
MODEL/ YEAR 2003 and later, XC90
2004 and later, S60, V70, XC7O, S80

SUBJECT: ZF Power Steering Diagnostics, (ECPS) Electronically Controlled Power Steering
REFERENCE: VADIS / VIDA

DESCRIPTION:
When Diagnosing Power steering problems on vehicles equipped with ZF ECPS (Electronically Controlled Power Steering) it is important to understand how the system is designed. The ZF steering rack used in these vehicles does not have diagnostics, meaning no DTCs. If the system should have an electrical malfunction (e.g. open fuse etc.) the default mode will be low assist, which can result in increased steering effort at low speed.

SERVICE:
If the vehicle is equipped with ECPS you should fault trace using VADIS / VIDA symptom entry.



It must first be determined if the vehicle is fitted with ECPS. ECPS can be identified by looking for the connector on the steering gear as illustrated.

Technical Service Bulletin # **TNN28-66** Date: **060707**

Engine Controls - False ECM DTC 434C

No: 28-66

DATE: 7-7-2006

MODEL YEAR:
S80, S60, V70, XC70, XC90, 2005 & 2006 (turbo engines only {type 91, 59, 54, 52})

CHASSIS:
S60 425000-520985
V70 459000-552728
S80 390000-434874
XC90 134000-254487
XC70 173000-220217

SUBJECT:
ECM DTC 434C Fuel tank system, leakage; Minor leak

REFERENCE: VIDA

This TNN supercedes the previous TNN 28-66 3/10/06 and replaces TNN's 28-63 & 28-57

DESCRIPTION:

ECM DTC 434C may be set in the above vehicles due to an over sensitivity in the engine management software. Perform the following tests:

^ Test the system for leakage using the methods in VIDA. If there are no actual leaks, proceed to upgrade the ECM software as described in the 'Service' section below.

^ Using the "quick-test of the fuel tank system" found in VIDA Vehicle Communication, fault trace any faults or leaks according to VIDA.

If a leak is found and remedied during fault tracing, thus solving the cause of the ECM 434C DTC, proceed to upgrade the ECM software as described in the 'Service' section below to prevent a false recurrence of DTC ECM 434C.

SERVICE:

Upgrade the engine management software using the ECM upgrade option in VIDA. SW P/N 30677021.

Air Bag System - System Life Expectancy

No: 88-41

DATE: 7-12-2006

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

MODEL:
All Models with Supplemental Restraint System (SRS)

MODEL YEAR:
All Model Years with Supplemental Restraint System (SRS)

SUBJECT:
Extended Supplemental Restraint System (SRS) Lifetime

REFERENCE: SMB 88-0017

DESCRIPTION:

BACKGROUND:

Based on testing and experience since the 1980's, Volvo has extended the lifetime of the Supplemental Restraint System (SRS) components to be the same as the lifetime of the car.

This lifetime extension supersedes all previous publications concerning Supplemental Restraint System (SRS) component lifetime. Periodic inspections and servicing of the Supplemental Restraint System (SRS) components, based solely on the age of the vehicle, are no longer required.

The lifetime extension applies to all pyrotechnic components in vehicles equipped with Supplemental Restraint System (SRS):

^ Driver airbag module

^ Passenger airbag module

^ Seat belts with pyrotechnic seat belt pretensioners

^ SIPS (Side Impact Protection System) airbag module

^ IC (Inflatable Curtain) airbag module

^ Adaptive Steering Column (ASC)

^ Adaptive Load Limiter (ADLL)

Note:
Equipment is different for different car models.

SERVICE:

Note!
If the vehicle has been involved in a collision, regardless of crash severity, or if the SRS warning lamp is lit, immediately contact an authorized Volvo dealer for further action and inspection.

TEMPORARY SOLUTION:

For customers who want to make an appointment for an inspection, explain the situation using this Tech Net Note.

For customers who still want to have an inspection, carry out the inspection and remove the SRS Airbag Service Decal from the vehicle according to the SRS Airbag Service Decal Removal Instruction below. Explain that no further inspection is necessary.

In case replacement of components is required, remove the SRS Airbag Service Decal from the vehicle according to the SRS Airbag Service Decal Removal Instruction below and explain that no further inspection is necessary after the replacement.

FINAL SOLUTION:

VIDA will be updated with information about the service life of pyrotechnic components on a running basis. All vehicles equipped with Supplemental Restraint System (SRS) are affected.

Path for general information in VIDA:

Information / Repair / General information / 8 Body and interior / 88 Interior equipment / General / Service life pyrotechnic components

VIDA will be updated regarding Supplemental Restraint System (SRS) components in the service programs on a running basis. All vehicles equipped with Supplemental Restraint System (SRS) are affected.

Path for service and maintenance in VIDA:

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Information / Repair / 1 Service programs / 17 Standard parts, service and maintenance material / Service and maintenance / Maintenance service / Service program A + B

VIDA will be updated regarding repair methods from MY 2007 onward.

Path for repair methods in VIDA:

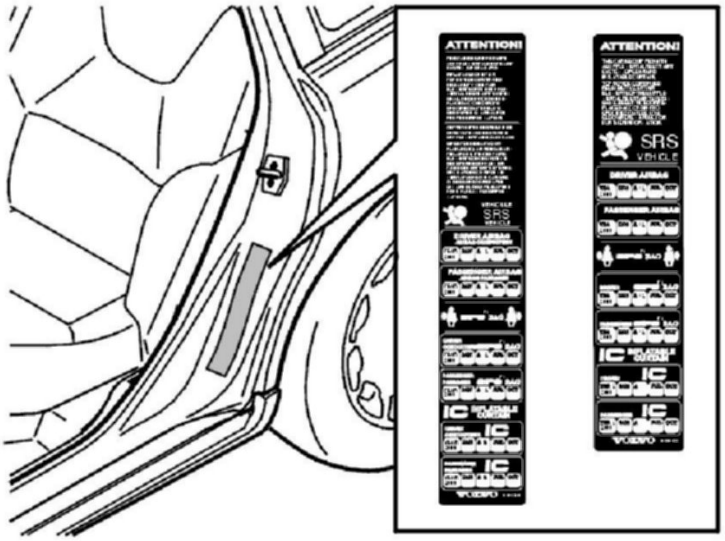
Information / Repair / Removal, replacement and installation / 8 Body and interior / 88 Interior equipment / Seat belts and other retention systems

Note!

From MY 2007, the SRS Airbag Service Decal on the B or C pillar will no longer be fitted at Volvo (concerns all models/variants).

SRS Airbag Service Decal Removal Instruction

General



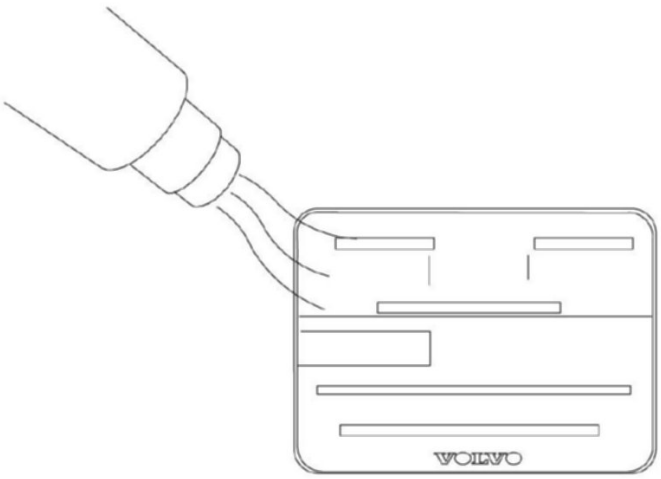
M8802638

Note!

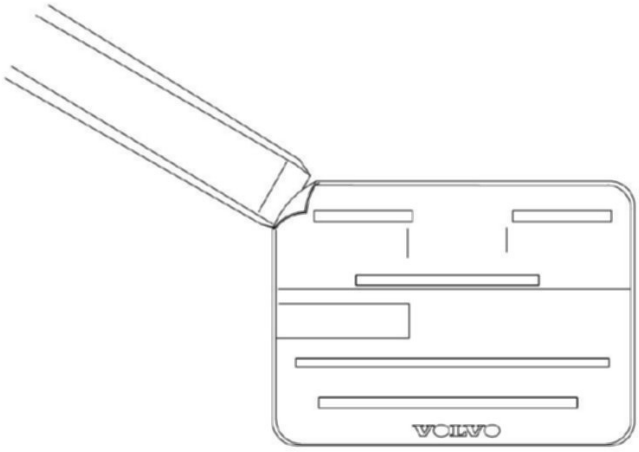
Since the illustrations are used for different model years and/or model variants, there may be certain deviations. However, the essential information in the illustrations is always correct.

The SRS Airbag Service Decal is found on either the B or the C pillar, depending on model/variant.

Removal

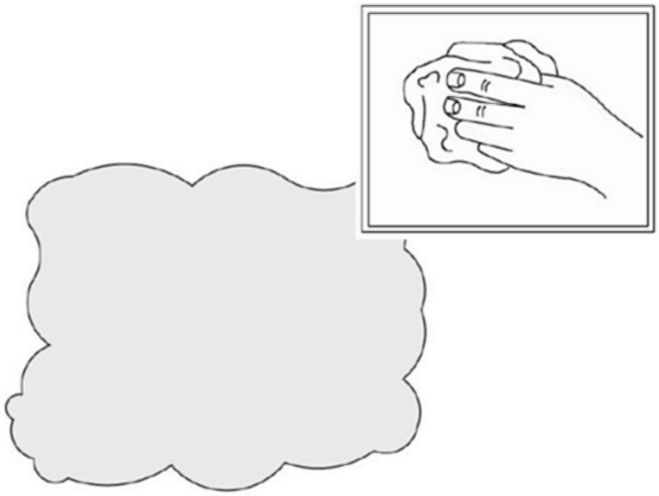


Warm the SRS Airbag Service Decal carefully using a hot air gun.



Scrape up a corner using a plastic scraper and pull off the SRS Airbag Service Decal.

Cleaning



Clean the area using a mixture of 50% isopropanol and 50% water.

SUBJECT:
CEM harness terminal corrosion due to water entrance in plenum
(Instruction for new harness installation)

REFERENCE: VIDA repair instruction

DESCRIPTION:
Various electrical function and communication symptoms may occur in M/Y 2005-2006 vehicles caused by wet corrosion in the CEM (Central Electrical Module) connector. The grommet that seals the harness entrance to the Plenum box may not seal properly if it has been incorrectly assembled.

This may cause a number of different functionality symptoms and DTC's to be set.

Examples include but not limited to:
> Headlight on, even if ignition key is taken out of ignition lock.
> Warning messages in DIM (Driver's Information Module) display.
> Warning lamps lit up.
> Brake lights always on.
> No start condition.

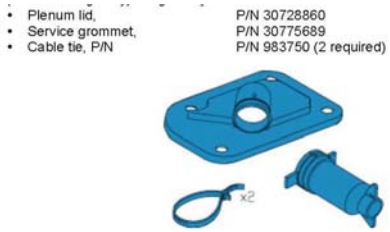
Modified replacement harness (Method1)

Production and supe harness with integrat cover (Method 2)

PRODUCT MODIFICATION:
A new plenum sealing strategy with integrated rubber grommet was introduced in production from structure week 200540. See photo below. This new sealing strategy will be carried over to the replacement engine bay harnesses on the chassis numbers indicated, either by modification of the replacement harness (method 1), or by a superseded harness P/N with an integrated cover and grommet (method 2).

SERVICE:
If there are signs of water penetration in plenum box and/or wet corrosion at the CEM connectors, it will be necessary to install a new CEM and replace the engine bay cable harness according to one of the 2 Methods below:

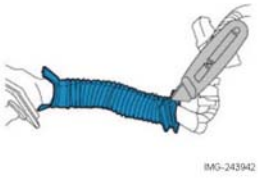
METHOD 1 (modification of the original type replacement harness)



Parts required;
^ Engine bay cable harness, check VIDA parts catalogue

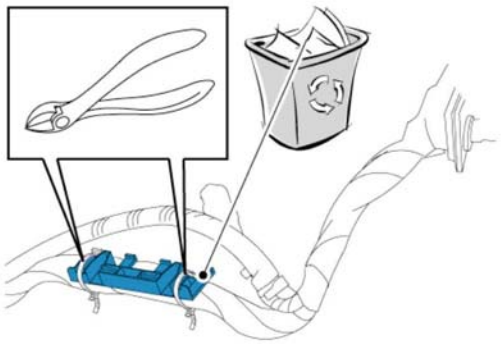
(This is the original type engine bay harness which will be modified with the instruction below)

Removing the existing rubber grommet



Remove the old rubber grommet using a knife.

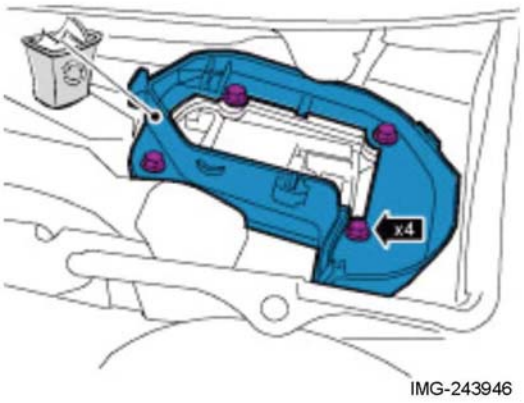
Caution! Make sure that no hoses or cables are damaged.



IMG-244520

Remove and discard the holder from the new cable harness.

Remove and discard the existing surround.



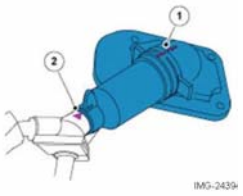
IMG-243946

Save the attachment screws to attach the new cover to the plenum floor.

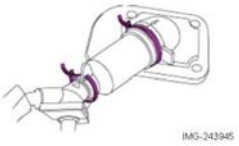
Installing the new seal

Route the cable harness through the new rubber grommet and cover.

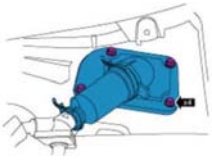
Caution! Exercise caution so that the rubber grommet is not damaged when the connectors are threaded through.



Align the arrows (1) towards each other.
Arrow (2) must point towards the handle on the rubber grommet.



Installing the cable ties



Installing the cover

Note:
After installation, the cable harness under the cover will be slightly over length. Clamp it up in a suitable manner to prevent chaffing.

Tighten the screws to 10 Nm.

Note;
There is a risk of altering the brake light switch adjustment when working in the pedal box area. Please verify that the brake light adjustment is correct after the work is performed.

Use the method in VIDA/ Vehicle communication/ BCM/ Advanced/ checking brake light switch adjustment.

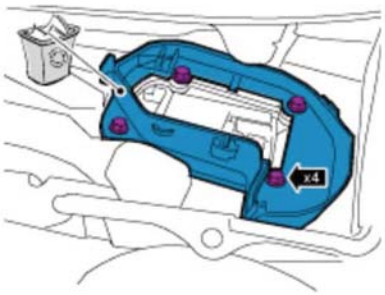
Method 2 (installation of superceded harness)

Parts required;

^ Engine bay cable harness, check VIDA parts catalogue

(This will be superseded engine bay harness with an integrated cover and grommet)

Remove and discard the existing surround.



Save the screws to attach the new cover to the plenum floor.

Install the harness as per VIDA instruction

Install the integrated harness cover

Tighten the screws to 10 Nm.

Note; There is a risk of altering the brake light switch adjustment when working in the pedal box area. Please verify that the brake light adjustment is correct after the work is performed using the method in VIDA/ Vehicle communication/ BCM/ Advanced/ checking brake light switch adjustment

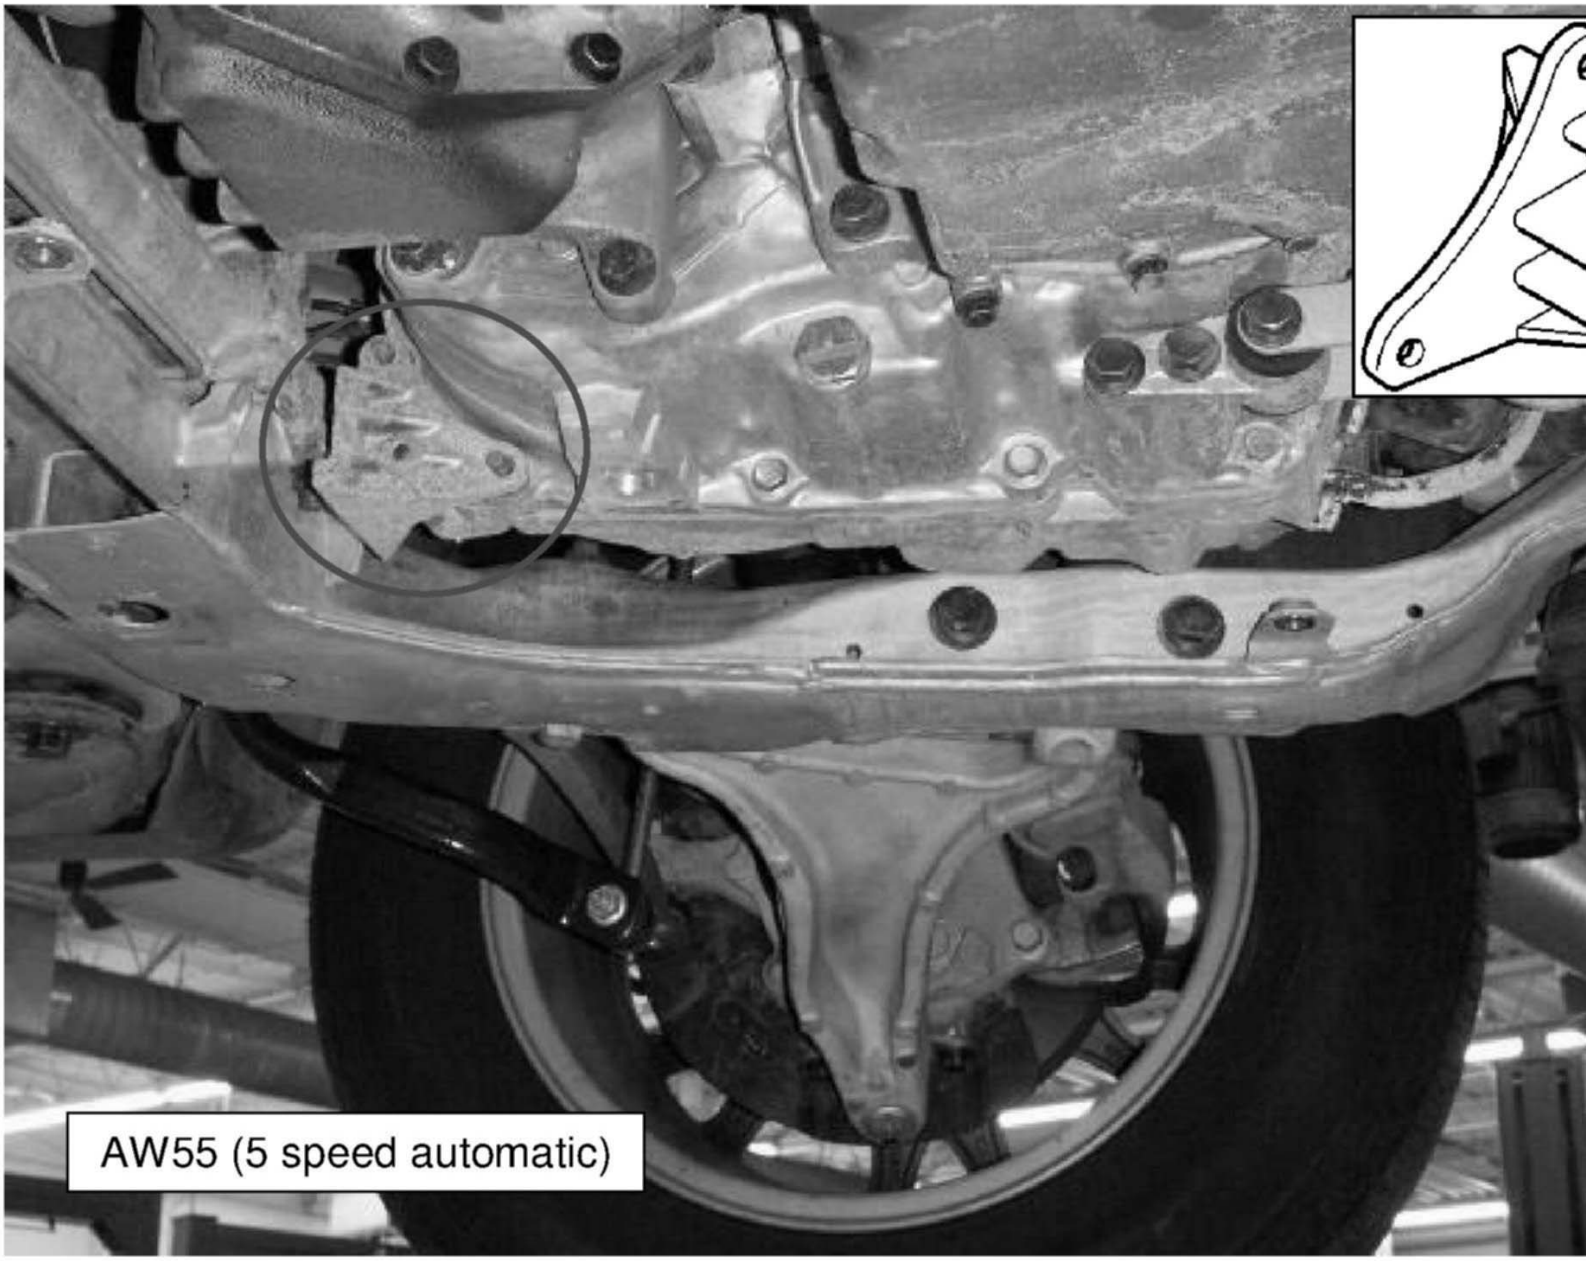
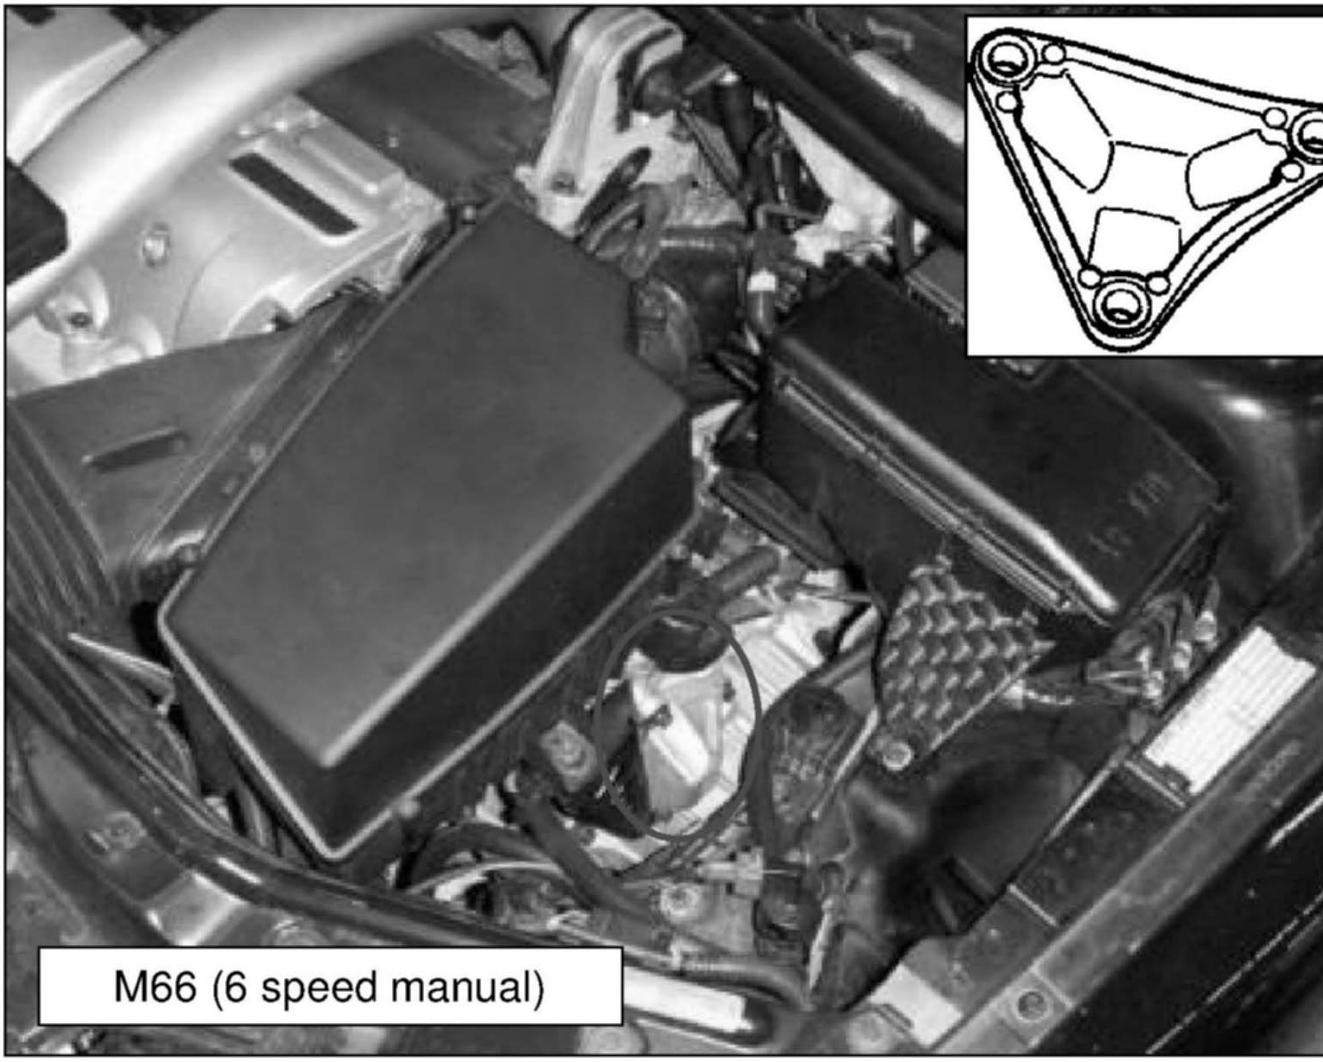
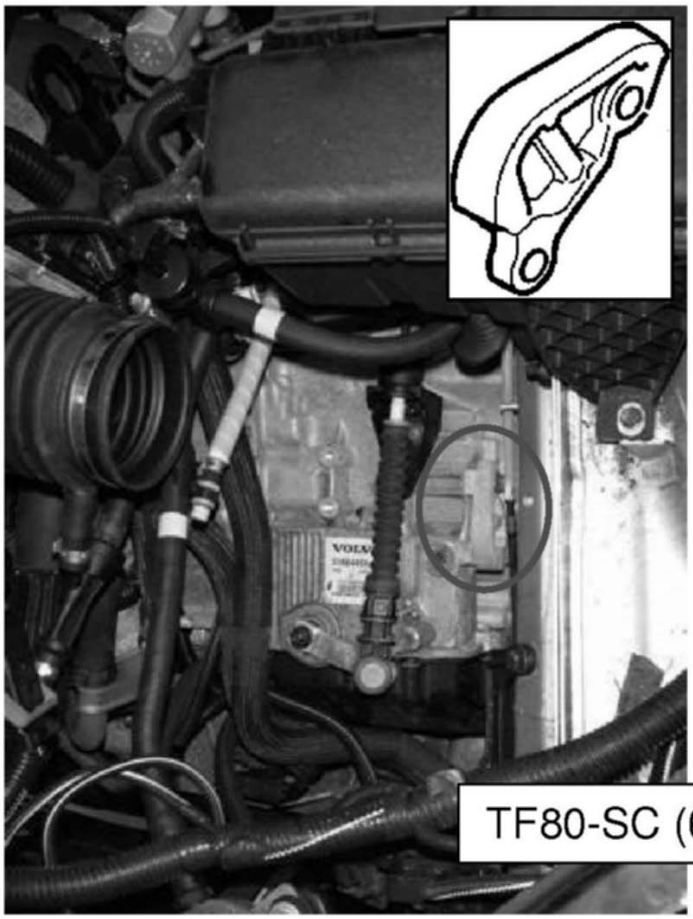
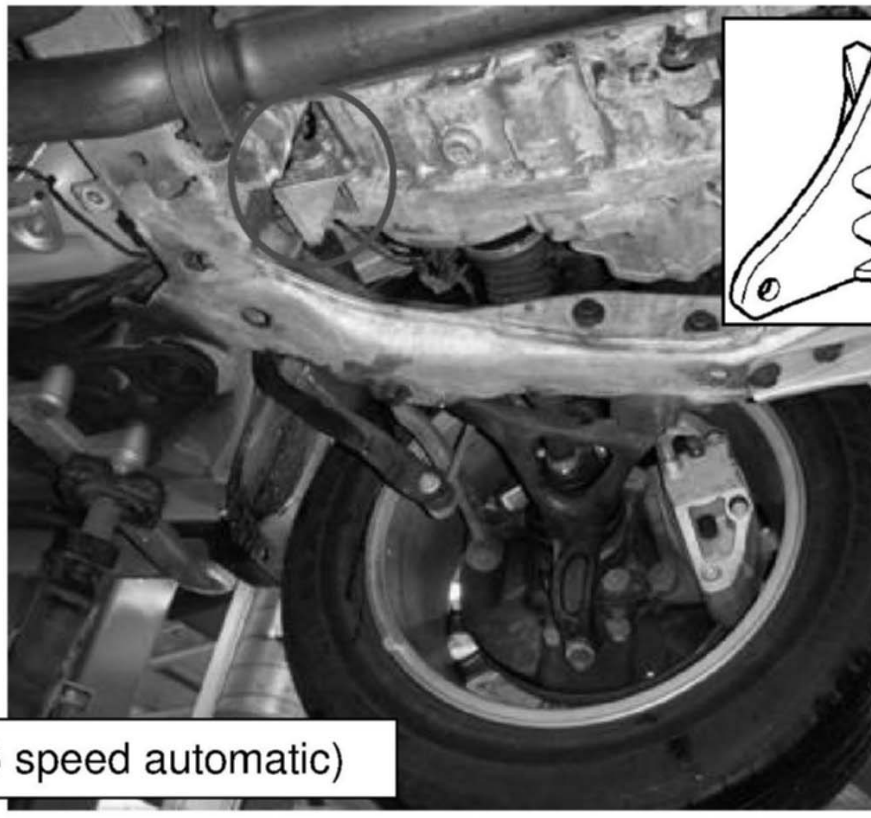
SUBJECT:
Transferring Components during Transmission Replacement



AW55 (5 speed automatic)







When replacing a transmission, follow the VIDA instructions for transferring parts to the new unit. The brackets highlighted in the images are part

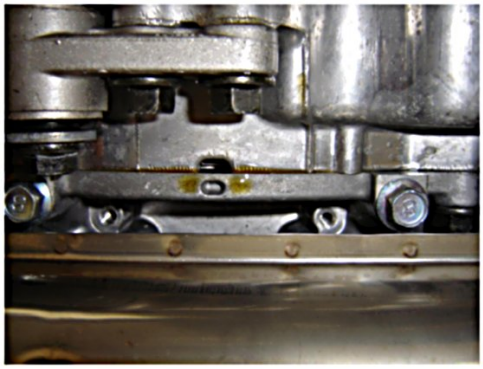
of the passive safety system designed to improve crash performance by helping to steer the powertrain in the correct direction during some crash situations.

Technical Service Bulletin # **TNN21-19** Date: **060922**

Engine - Fluid Weepage at Bell Housing Weep Hole

NO: 21-19
DATE: 09-22-2006
MODEL: All Models
MODEL YEAR: 2005 -
SUBJECT: Fluid Dripping from Weep Hole at Rear of Engine

This TNN has been updated to cover all Models from 2005 and on.
This TNN supersedes the previous 21-19 dated 2-9-05. Please update your files.



DESCRIPTION:

During inspection of the vehicle on a lift, a drip of fluid might be seen under the vehicle at the rear of the engine between the bell housing and the transmission. This fluid is the rust protection used on the torque converter during production. No action is needed.

Technical Service Bulletin # **TNN20-04** Date: **070122**

Engine Controls - Engine Management Software Usage

NO: 20-04
DATE: 1-22-2007
MODEL: C70, V70, S70, S60, S80, XC90, XC70, S40 (All new), V50, C30.
M. YEAR: 1999-
SUBJECT: Engine Management Software Usage
REFERENCE: VIDA

This TNN supersedes the previous TNN 20-04 dated 9-22-2003, please update your files

Description

In 2003 VADIS migrated from the PIE1 software ordering system to the PIE 2 software ordering system. Subsequently VIDA has replaced VADIS as the workshop diagnostic tool and information center, and has continued to use the PIE 2 software ordering system.

Service information that pre dated the migration to PIE 2 (e.g. TNN's, Service Bulletins), still refer to software ordering in the PIE 1 environment using software part numbers and Function ID's (FID). Where older service information indicates that a software upgrade should be performed for an engine management control unit (e.g. ECM, ETM), the PIE 2 software product number for that nodes software upgrade should be ordered. PIE 1 part numbers and function ID's will not be recognized by VIDA.

One software product number will be used for each control unit across all variants in a product platform. E.g. ECM upgrade for S60, S80, XC70 2001-, V70 2001- all share the same SW product number, 30677021, as they are all on the P2 platform.

Software product numbers for engine management upgrades:

C70	ECM	30677000	1999-2004
C70	ETM	30677001	1999-2002
X70	ECM	30677005	
X70	ETM	30677007	
P1	ECM	30668282	
P2	ECM	30677021	
P2	ETM	30677023	1999-2001/2

P3 ECM 30785201

An ECM/ETM upgrade is not an incremental upgrade to part of the control modules software, or to only parts of the control module memory, but a complete replacement of the control modules operating software. A confirmed download of an upgrade assures that all of the latest software for the specified control module has been delivered to the vehicle.

If a customer's vehicle required more than one service specifying an upgrade to the ECM or any other control module in the vehicle, the software download of an upgrade would only need to be done once, as an upgrade contains ALL changes or enhancements that were in prior software versions.

A "Reload" software product should only be used when installing a brand new control module in a vehicle, and at the direction of the Volvo Technical Hotline, or a Volvo Field Technical Specialist.Technical Service Bulletin # **TNN88-45** Date: **070208**

Air Bag System - 'PASSENGER AIR BAG OFF' Displayed

NO: 88-45
DATE: 2-8-2007
MODEL: S40, V50, C70, S60, S80, V70, XC70, XC90
MODEL YEARS: See below
CHASSIS: See below
SUBJECT: Lit PASSENGER AIRBAG OFF indication with belted adult passenger
REFERENCE: VIDA

DESCRIPTION:

Customers may experience a lit PASSENGER AIRBAG OFF indication in the overhead console (S40, V50, C70, S80 MY07) or interior rear view mirror (S60, S80 MY06, V70, XC70, XC90) with a belted adult passenger in the front passenger seat. When this happens, the PASSENGER AIRBAG OFF indication will typically remain lit until the passenger unbuckles the seat belt or moves out of the seat.

This could be caused by vibrations on the bracket for the Occupant Weight Sensor (OWS) control module. Follow the attached instructions only after all other root causes (e.g. the hose from the OWS bladder must not be kinked, twisted or otherwise restricted) have been ruled out using the fault tracing in VIDA.

MODEL	MODEL YEARS	CHASSIS NO. RANGE
S80	2007 (all new S80)	000850 – 024942
S80	2006	426000 – 446916
XC90	2005 – 2007	134000 – 379474
V70	2005 – 2007	459000 – 649851 (plant code 21) 459000 – 652379 (plant code 22)
XC70	2005 – 2007	173000 – 272176
S60	2006 – 2007	500000 – 631186
C70	2006 – 2007	000001 – 019268
S40	2004 – 2007	000295 – 294470
V50	2005 – 2007	000133 – 311051

Affected models, model years and chassis numbers:

MODEL	SEAT VARIANT	UPHOLSTERY CODES	CHASSIS NOS.
S80 MY07	Non-ventilated leather	240000, 210000, 240200, 210200, 241200, 211200	000850-24325
XC90	Sport	CB0B00	328000-378208
S60	Comfort	998000, 998100, 997000, 995100	500000-631019
S60	R-line	957600, 957700, 967500	500000-633235
V70	R-line	A57600, A57700, A67500	500000-655194

Additional seat and upholstery information:

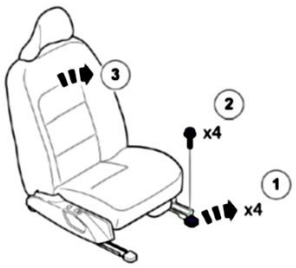
Material	Quantity	Part No.
Spring kit, OWS	1	30767457

SERVICE:

If the vehicle's chassis number is within the chassis number ranges above, install spring kit p/n 30767457 according to the instruction below.

General

The illustrations may contain some discrepancies, but the essential information is always correct.



IMG-259231

1. Preparations
   Remove:
   - covers over seat rails, 4 pcs (1)
   - the screws, 4 pcs (2)Fold the backrest forward (3).

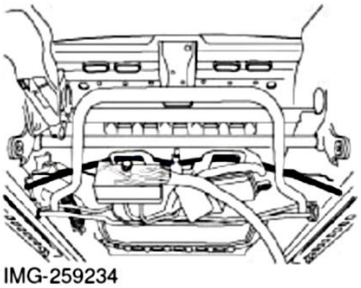
IMG-259232

2. Tilt the entire seat backward in the vehicle.

   NOTE: Do not disconnect any connections.

IMG-259233

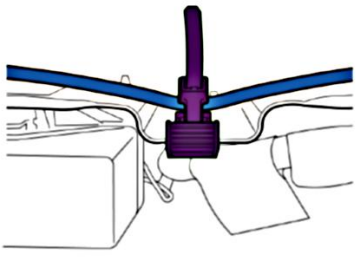
3. Install the service kit
   The service kit p/n 30767457 contains tie straps, 3 pcs and a spring. See image.



IMG-259234

4. Install the service kit p/n 30767457. See image.

   Important: Ensure that the spring does not conflict with any parts under the seat, such as the cable harness or the OWS hose.

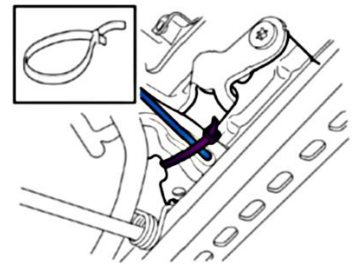


IMG-259235

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

5. **NOTE:** On certain vehicle models, there may be a tie strap from before. See location in image. Install the new tie strap close to the old one.

   Install tie strap on the bracket and tighten.



IMG-259236

6. Install the spring ends in the front groove (most forward in the vehicle, under the bracket that goes across the seat frame) and lock using the tie strap on each side. Tighten the tie straps. See image.

WARRANTY CLAIM INFORMATION

CANCELLATION NOTICE

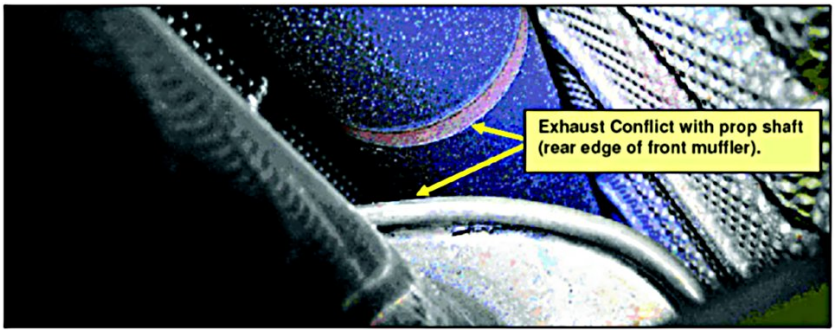
Tech Net Note 25-25, "Exhaust Clamp Kits Available for Repair" dated 8-10-2006

25-25 has been deleted from the TNN database
as the information is now obsolete
and the same information can now be found in VIDA.Technical Service Bulletin # **TNN25-26** Date: **070125**

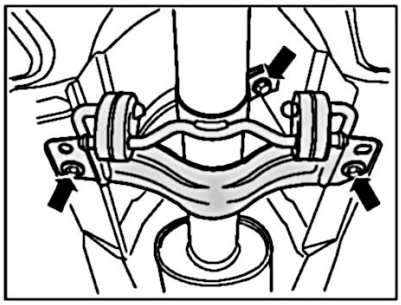
Exhaust System - Squealing/Pinging Noises

NO: 25-26
DATE: 1-25-2007
MODEL: 850 / S60 / S70 / V70 / XC70 / S80 / XC90
YEAR: 1993-
SUBJECT: Exhaust System Mounting

1. **2001- AWD Cars (S60/V70/XC70/S80/XC90)**



When driving through puddles of water, slush or snow, the exhaust may cool down fast enough to change shape and touch the propeller shaft, causing a high pitched squealing noise. This noise will be noticed by the driver for only a short time; once the exhaust temperature equalizes the noise will disappear. A tell-tale mark will be left on the propeller shaft. Should the customer experience this condition, install an exhaust support kit.



Remove the existing cross-member and install the new one. Tighten bolts to **25 Nm (18 ft/lbs)**.

Install the clamp on the exhaust pipe with the screw hand-tight.

Install the rubber blocks and adjust the clamp so that the rubber blocks are vertical.

Tighten bolts to **25 Nm (18 ft/lbs)**.

Kit for 2001- S60 / V70 / XC70 / S80 / XC90 cars except S60R/V70R....PN 30742265
Kit for S60R/V70R.....PN 30793619

WARRANTY CLAIM INFORMATION

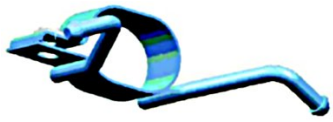
LABOR OP	LABOR DESCRIPTION	LABOR TIME
25293-2	Cross-member rear exhaust system	0.2 hr

Claims may be submitted under the new car warranty when there is a documented customer complaint using claim type: 01

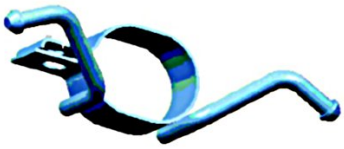
2. 850/S60/S70/V70/XC70/C70/S80

1993-1997 850 PN: 30681832

1998-2000 S70/V70 1998-2004 C70 PN: 30681638



2001- AWD (S60/V70/XC70/S80)
PN: 30681625



2001- FWD (S60/V70) 1999- FWD S80
PN: 30681626

Exhaust clamp kits are available as a service solution for damaged or missing hangers. These kits allow a repair to be made without replacing the entire exhaust system.The kits are designed to fit directly on the pipe without any welding. Install the new clamp in place of the old hanger. Remaining pieces of the old hanger may need to be cut off before the new part can be installed.

Kits are not currently available for 1998-2000 V70 XC, 2004-S60R/V70R, and XC90.

Kit for 2001- S60/V70/XC70/S80/XC90 cars except S60R/V70R.....PN 30742265
Kit for S60R/V70R.....PN 30793619

WARRANTY CLAIM INFORMATION		
LABOR OP	LABOR DESCRIPTION	LABOR TIME

A/C, Interior - Whistle From Right Side of Dash

NO: 87-56
DATE: 12-11-2006
MODEL:
XC90 2003 -
XC70 2001 -
V70 2001 -
S80 1999 -
S60 2001 -
SUBJECT: Whistling Sound from Windshield / Dashboard Area, Passenger Side

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

REFERENCE: VIDA, TNN 84-11 (Roof Rails Front Attachment)

Description	Quantity	Part Number
Seal (necessary only if missing)	1	8665647
Felt Tape (shop supply / used as needed)		9511099
Cleaner (shop supply / used as needed)		1161436

DESCRIPTION:

If a whistling sound or wind noise is heard from the passenger side dashboard area of the cabin. One reason for this may be that the foam sealing between the body and climate unit (air inlet) is incorrectly positioned. The sound may vary in strength but is more audible at higher speeds; **50 mph (80kph)** and above.

NOTE: This issue seems to be mainly XC90 related but other variants may be affected.

SERVICE:

Identify location of noise. Inspect the seal and reposition as described in the following.

Identify location of noise

If this is an XC90 and is within chassis numbers 003400 - 235925 ensure the noise is not from the upper windshield / roof rails front attachment area. If the noise is from this area refer to TNN 84-11 (if still applicable).

Inspect / Correct the Seal Position

In VIDA see: Remove wiper arms.
Remove cowl (plenum) cover. Remove water protection housing (snapped into the inlet).

Inspect seal and adjust if incorrectly positioned.

Make sure the foam seal is airtight all around the opening between the body and plastic housing.

If needed; with your hand reposition the seal to ensure any gap is filled.

Correct position of front area shown with dotted line here.

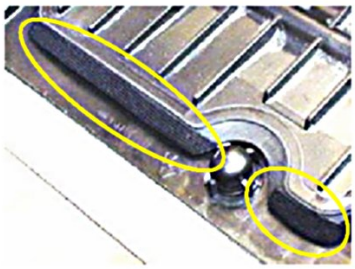
NOTE: This shape is normal in the rear area.

Hint: Use a mirror for this check.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Also inspect the alignment of the climate box housing and the collar so that there is no gap as indicated here.

If necessary; reposition for better sealing.



Inspect / Modify the Recirculation Seal

A similar sound may be heard with recirculation ON (door closed) if there is a small gap between the rubber door seal and plastic housing.

This may happen if the recirculation door has a rounded shape or if the pressure of the door is insufficient.

If needed; clean the rubber surface with P/N 1161436 or similar and apply felt tape (P/N 9511099) onto the rubber seal of the door as shown.

Steering - ZF System Fault Tracing & Repair

NO: 64-23
DATE G01-25-2007
MODEL: S60, V70, XC70, S80, XC90
MODEL YEAR:
2003- (XC90)
2004- (all other listed models)
SUBJECT: ZF Power Steering System Fault Tracing and Repair
REFERENCE: TNN 64-24; 64-09; TNN 64-20; TNN 64-21; VIDA

THIS TNN SUPERSEDES TNN 64-23 DATED 07-31-2006. A REFERENCE TO TNN 64-24 HAS BEEN ADDED, AND THE MODEL YEAR RANGE FOR THE S60/V70 HAS BEEN CORRECTED. PLEASE UPDATE YOUR FILES.

WARNING: These vehicles have pyrotechnical airbags and seat belt tensioners. The components in the SRS system must be treated very carefully during repair. This is to help prevent: 1.Personal injury when carrying out repairs 2.Damage to or malfunction of the SRS

system.

Refer to VIDA (Information > Repair > General Safety Information) for SRS warnings, information, and instructions.

MODEL	MODEL YEAR	CHASSIS NO.
S60	2004-	315000-
V70	2004-	349000-
XC70	2004-	123000-
S80	2004-2006	335000-
XC90	2003-	000001-

This Tech Net Note is designed to assist with overall identification and repair of various problems with ZF-manufactured steering systems. ZF steering gears were factory-equipped on the following models:

This TNN is divided into three major sections:

1. The first section, 'Overview', provides a simple description of the power steering system.
2. The second section, 'Description', defines the various problems, such as noise, leakage, and functionality.
3. The third section, 'Repair', defines the specific repairs for each Description.

The purpose of this TNN is to guide the technician through the proper diagnosis and repair of the ZF power steering system. As a general guideline, a complete customer description of the concern, followed by confirmation of that concern, are key.

The customer should be asked the following questions:

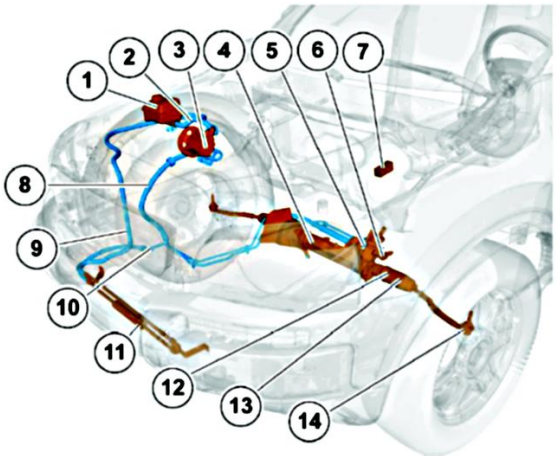
- What is the specific problem?
- How long has the problem existed?
- Is it intermittent or permanent?
- Is the steering complaint affected by any of the following conditions:
  - Stationary vehicle or while driving (and at what speed)?
  - Temperature (outdoor temperature and/or vehicle temperature)?
  - Condition of the road surface?
  - Engine speed?
  - Steering wheel position?

Answers to these questions should be incorporated into the text on the Repair Order as much as possible.

If the complaint is noise-related, a thorough check of the vehicle's entire front end is necessary, with a focus on components which may be worn or loose, before repairing the steering system. Likewise, a fluid leak complaint should be verified by cleaning and testing the affected area first, before any disassembly is begun.

The Section Table of Contents below allows the technician to turn to the appropriate section of this TNN as needed.
It should not be necessary to read the entire TNN every time a steering-related repair is made.

Section 1



Power steering system overview

1	Power steering fluid reservoir	6	Solenoid (ECPS only)	11	Oil cooler
2	Suction line	7	Power Steering Control Unit (PSU) (ECPS only)	12	Bellows
3	Pump	8	Delivery line	13	Inner tie rod end
4	Steering gear	9	Return hose	14	Outer tie rod end
5	Valve	10	Return line		

Overview

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

A simple description of the power steering system.

There are two types of steering gears: Standard power steering or electronically controlled power steering (ECPS). ECPS adapts power steering assistance based on vehicle speed.

Fluid is suctioned from the fluid reservoir (1) through the suction line (2) to the pump (3), which is a rotary vane pump. Pressure is increased in the pump through compression and supplies the steering gear (4) power steering fluid under pressure through the delivery line (8).

The power steering fluid then passes through the return line (10) [and optionally in some models, to the oil cooler (11)] and the return hose (9) back to the fluid reservoir.

The pump is mounted on the engine and is driven by the auxiliaries belt.

NOTE: The system is extremely sensitive to contaminants.

Section 2

Hydraulic noise		
Problem	Definition	Repair
Grunting/ trumpeting	Loud hydraulic resonance that is heard when the steering wheel is turned when the car is stationary (engine running) or in sharp turns when driving slowly. This noise can also occur when the driver releases the steering wheel after a turn. Worsens at high engine speed. This noise primarily occurs in systems with speed-dependent steering gears (Servotronic; see TNN 64-20 for identification). The trumpeting noise may cause a light vibration in the steering wheel.	1
Hydraulic knock	**Note!** This only applies to speed-dependent steering gears (Servotronic; see TNN 64-20 for identification). Occurs when the car is stationary (engine running) and during quick steering wheel movements back and forth. Loud hydraulic knocking. The hydraulic knocking can also be felt in the steering wheel.	2

Mechanical noise		
Problem	Definition	Repair
Knocking noise	Low pitched metallic knocking/striking when driving over uneven road surfaces, potholes or the like. The problem worsens when turning right.	3
Squeak/ grinding	Metallic friction/squeaking/scraping from steering gear area. The noise occurs during steering wheel movement when the car is stationary or during slow driving.	4
Click	High pitched metallic clicking/striking noise. Occurs when car is stationary or during slow driving when the steering wheel is moved back and forth quickly. **Note!** This noise can also be heard when the engine is off. Large steering wheel movements make the problem worse.	5

Description - Noise

Section 2

Pump leakage		
Problem	Definition	Repair
Suction hose coupling	Leakage between suction hose and pump. Also applies to leakage between suction hose and reservoir.	6
Power steering pump shaft seal	Leakage at pump's output shaft.	7

Steering gear leakage		
Problem	Definition	Repair
Internal pipes	Fluid leak at steering gear's internal pipes. Note! Internal pipes move fluid from the steering gear's valve to its cylinder area, and are routed alongside the gear assembly (see arrows). 	8
Bellows	Fluid leak into steering gear's rubber bellows at tie rods. For left-hand drive vehicles, fluid leaks into the right bellows. Careful removal of the bellows is required to locate and verify this leakage.	9

Description - Leakage

Section 2

Power steering fluid		
Problem	Definition	Repair
Fluid level	Fluid type: use Volvo synthetic power steering fluid (Pentosin CHF 11 S) or equivalent. Fluid level in reservoir: Measure when cold, with engine off. Fill the oil until the level is halfway between the 'cold' and 'hot' marks on the dipstick.	10

Sluggish steering		
Problem	Definition	Repair
Parking/driving	The driver must use a lot of force to turn the steering wheel when driving or parking or when the vehicle is stationary. Insufficient assistance from the power steering system.	11

Freeplay		
Problem	Definition	Repair
Play between steering wheel and front wheels	Too much steering wheel movement before the front wheels start to turn.	12
Play in tie rods	Play in steering gear's outer or inner steering tie rods that can be seen or felt.	13
Radial rack bar play.	**Note!** There is no noise associated with this freeplay. Radial rack bar play without play in tie rod ends. Detected by standing beneath the vehicle and pulling and pressing on the left side steering arm outside of the bellows. If noise is heard during this check, see repair number 5.	14

Description - Functionality

Section 3
Repair - Noise

Repair	Grunting / Trumpeting	
1	A	Some grunting is natural and unavoidable in a hydraulic system. Compare the problem to similar vehicles from the same model year to verify if the noise is abnormal. In the event of abnormal noise, replace the steering gear. **Note!** You must also replace the lower steering shaft if the car was built ***before*** the chassis numbers specified below: S60: 384-499999 V70: 285-529999 XC70: 295-207999 S80: 184-426007 XC90: 275-223999 See: VIDA Removing, replacing, installing Suspension, steering Steering gear, replacing > Steering wheel, steering wheel lock, steering column, shaft

Hydraulic Noise

Section 3
Repair - Noise

Repair	Hydraulic Knock	
2	A	Some hydraulic knocking is natural and unavoidable in a hydraulic system. Compare the problem to similar vehicles from the same model year to verify if the noise is abnormal.
	B	Adjust the yoke as necessary. See TNN 64-21.
	C	If Step B does not help, replace the steering gear. **Note!** You must also replace the lower steering shaft if the car was built ***before*** the chassis numbers specified below: S60: 384-499999 V70: 285-529999 XC70: 295-207999 S80: 184-426007 XC90: 275-223999 See: VIDA Removing, replacing, installing Suspension, steering Steering gear, replacing > Steering wheel, steering wheel lock, steering column, shaft

Hydraulic Noise

Section 3
Repair - Noise

Repair	Knocking Noise	
3	A	Some striking noise is normal. Compare the problem to similar vehicles from the same model year to verify if the noise is abnormal.
	B	Before focusing on the steering system, perform a complete inspection of the front end for obvious mechanical problems. Confirm the source of the noise before any disassembly or repair. As a general guideline, follow the checklist in Step C:
	C	i. Check the front suspension, including all bushings and mounting points. ii. Check the drive shafts. iii. Check the lower steering shaft and its coupling to the steering gear. iv. Check the steering column, including universal joints and bearings. **Note!** Refer to TNN 64-09. v. Check the inner and outer tie rods of the steering gear (take care when removing the rubber bellows of the inner tie rods). vi. If any loose, worn, or broken components are found during the above checks, make the needed repairs first before continuing with the steering diagnosis.
	D	If there is confirmation of a knocking noise in the steering gear, adjust the yoke as described in TNN 64-21.
	E	If Steps A-D do not help, replace the steering gear. **Note!** You must also replace the lower steering shaft if the car was built ***before*** the chassis numbers specified below: S60: 384-499999 V70: 285-529999 XC70: 295-207999 S80: 184-426007 XC90: 275-223999 See: VIDA Removing, replacing, installing Suspension, steering Steering gear, replacing > Steering wheel, steering wheel lock, steering column, shaft

Mechanical Noise

Section 3
Repair - Noise

Repair	Squeak / Grinding	
4	A	Before focusing on the steering system, perform a complete inspection of the front end for obvious mechanical problems. Confirm the source of the noise before any disassembly or repair. As a general guideline, follow the checklist in Step B:
	B	i. Check the front suspension, including all bushings and mounting points. ii. Check the drive shafts. iii. Check the lower steering shaft and its coupling to the steering gear. iv. Check the steering column, including universal joints and bearings. Note! Refer to TNN 64-09. v. Check the inner and outer tie rods of the steering gear (take care when removing the rubber bellows of the inner tie rods). vi. If any loose, worn, or broken components are found during the above checks, make the needed repairs first before continuing with the steering diagnosis.
	C	Check the seal in the firewall. Repair as necessary.
	D	Loosen the center bolt (located at arrow) which secures the steering gear to the subframe. If the squeak/grinding noise lessens with the bolt loose, add a washer to the bolt between the steering gear and the subframe. 	E	Detach the steering gear from the steering column and wheel spindles. **Warning!** Normally, the steering wheel should be locked when making repairs or replacing components. If it is necessary to unlock the steering wheel in order to locate the source of the noise, ensure that the steering wheel is not turned more than two full turns in either direction, or the SRS contact reel may be damaged. Locate the problem. Make necessary repairs. Note! Ensure that the steering wheel is centered when reattaching the steering column.

Mechanical Noise

Section 3
Repair - Noise

Repair	Click	
5	A	Some clicking noise is normal. Compare the problem to similar vehicles from the same model year to verify if the noise is abnormal.
	B	Before focusing on the steering system, perform a complete inspection of the front end for obvious mechanical problems. Confirm the source of the noise before any disassembly or repair. As a general guideline, follow the checklist in Step C:
	C	i. Check the front suspension, including all bushings and mounting points. ii. Check the drive shafts. iii. Check the lower steering shaft and its coupling to the steering gear. iv. Check the steering column, including universal joints and bearings. Note! Refer to TNN 64-09. v. Check the inner and outer tie rods of the steering gear (take care when removing the rubber bellows of the inner tie rods). vi. If any loose, worn, or broken components are found during the above checks, make the needed repairs first before continuing with the steering diagnosis.
	D	Try to reproduce the noise by tugging and pulling the steering arm on the valve (left) side. If reproduced, adjust the yoke as described in TNN 64-21. Clicking noise, if reproduced in this manner, will be repaired via the yoke adjustment.

Mechanical Noise

Section 3
Repair - Leakage

Repair	Suction Hose Coupling	
6	A	Check the fluid level in the reservoir. See Repair 10.
	B	Clean the pump, reservoir and hose to confirm the location and source of the leak.
	C	Make sure that the hose clamps are properly fitted. Replace clamps if necessary.
	D	Check the condition of the suction hose. Replace hose if necessary.
	E	Do not replace the pump or reservoir unless there are clear defects in the pump, pump nipple, or reservoir.

Repair	Power Steering Pump Shaft Seal	
7	A	Check the fluid level in the reservoir. See Repair 10.
	B	Verify that the pump leakage is from the pump shaft. Clean the pump and pulley to confirm the location and source of the leak. Apply leak tracer Volvo part #1161560 on the pump. Start the engine and turn the steering wheel back and forth.
	C	**Note!** Do not replace the pump unless there is verified leakage. Replace the pump if shaft leakage has been verified.
	D	If no shaft seal leakage can be found, check the hose connections and other potential leakage points around the pump.

Pump Leakage

Section 3
Repair - Leakage

Repair	Internal Pipes	
8	A	Check the fluid level in the reservoir. See Repair 10.
	B	Verify that the leakage is from the internal pipes (see photo on page 4).
	C	If the leakage is from the internal pipes, replace the internal pipes, by following steps i. through v. below:
		i. Remove the steering gear, see VIDA: Removing, replacing and installing > Suspension, steering > Steering gear > Steering gear, replacement
		ii. Note! Seal the inlet and outlet connections from the servo pump with plastic plugs immediately after removal.
		iii. To remove the old pipes: Remove the protective plate from over the pipes. Seal the inlet and outlet connections using plastic plugs. Carefully clean around the oil pipe connections and blow dry. Remove the pipes. Carefully check that there is no residue of the old sealing rings in the connections on the steering gear.
		iv. To install the new pipes: Install the new sealing rings on the oil pipes. Lubricate the sealing rings using power steering fluid. Carefully install the new pipes with the sealing rings to the steering gear. **Note!** Use a new bolt for the pipe's holder. Tighten the pipe nuts to 7 Nm (5 Lb-Ft) and the holder screw to 12 Nm (9 Lb-Ft). Install the protective panel over the pipes.
		v. A support must be installed on the longer of the two oil pipes as illustrated. The illustration shows the location of the support on the steering gear: it should be installed a minimum of 110 mm (4 3/8 in.) and a maximum of 132 mm (5 3/16 in) from the point indicated in the illustration. **Note!** Only **one** support must be used, the illustration shows the support in its minimum and maximum positions. 
Steering Gear Leakage

Section 3
Repair - Leakage

Repair	Bellows	
9	A	Check the fluid level in the reservoir. See Repair 10.
	B	Verify that fluid is leaking into the bellows by carefully detaching the right side bellows.
	C	If there is obvious leakage of fluid into the bellows, replace the steering gear. **Note!** You must also replace the lower steering shaft if the car was built ***before*** the chassis numbers specified below: S60: 384-499999 V70: 285-529999 XC70: 295-207999 S80: 184-426007 XC90: 275-223999 See: VIDA Removing, replacing, installing Suspension, steering Steering gear, replacing > Steering wheel, steering wheel lock, steering column, shaft

Steering Gear Leakage

Section 3
Repair Functionality

Repair	Fluid Level	
10	A	Fill the fluid if it is below specification. Fluid type: use Volvo synthetic power steering fluid (Pentosin CHF 11 S) or equivalent. Fluid level in reservoir: Measure when cold, with engine off. Fill the oil until the level is halfway between the 'cold' and 'hot' marks on the dipstick.
	B	Check the system for leakage. See Repairs 6, 7, 8, and 9.

Power Steering Fluid

Repair	Parking / driving	
11	A	Compare the problem to similar vehicles from the same model year to verify if the effort is abnormal. **Note!** Determine first if vehicle has speed-sensitive steering. See TNN 64-20.
	B	Check the fluid level in the reservoir. See Repair 10.
	C	If the fluid level is low, check for leaks in the system. See Repairs 6, 7, 8, and 9.
	D	Check the belt tensioner and the belt that drives the pump. Repair if necessary.
	E	Check the steering column and other wheel suspension components that move during steering. Make sure that nothing is binding or seizing.
	F	If nothing is binding or seizing, detach the steering gear from the steering column and wheel spindles. **Warning!** Normally, the steering wheel should be locked when making repairs or replacing components. If it is necessary to unlock the steering wheel in order to locate the source of the sluggishness, ensure that the steering wheel is not turned more than two full turns in either direction, or the SRS contact reel may be damaged. Examine the systems and components separately to locate any potential problem. **Note!** Ensure that the steering wheel is centered when reattaching the steering column.
	G	If the steering gear is speed sensitive (see TNN 64-20), check the cables and connections between the PSU and the steering gear. Repair as necessary.
	H	Measure the current strength of the signal from the PSU to the steering gear. Make the measurements at the cable connections on the steering gear valve. When the vehicle is stationary, current strength should be 860 mA (AC). Replace the PSU if the current strength is not within the range of 830-890 mA (AC).
	I	Measure pump pressure. See VIDA: Cleaning, checking and adjusting > Suspension, steering > Servo balance/pump pressure, checking Pumps marked 110 bar (on black label on pump): Max should be between 93 and 110 bar. Pumps marked 120 bar (on black label on pump): Max should be between 102 and 120 bar. **Note!** All XC90s, all S60R/V70R, and S80 MY04- use 120 bar pump. All other vehicles referenced in this TNN use 110 bar pump. Replace the pump if pressure levels lie below the specification.

Sluggish Steering

Section 3
Repair - Functionality

Repair	Freeplay between steering wheel and front wheels	
12	A	Compare the problem to similar vehicles from the same model year to verify if the freeplay is abnormal.
	B	Raise the vehicle on a front end alignment rack or similar, so that the front tires are loaded, with the engine off. Have another technician assist by turning the steering wheel back and forth. Check the play in the moving parts beneath the vehicle and in the steering column, including the wheel suspension and lower steering shaft. Remedy any problems found. If the problem remains, continue to step C below.
	C	Detach the steering gear from the steering column and wheel spindles. **Warning!** Normally, the steering wheel should be locked when making repairs or replacing components. If it is necessary to unlock the steering wheel in order to locate the source of the freeplay, ensure that the steering wheel is not turned more than two full turns in either direction, or the SRS contact reel may be damaged. Examine the systems and components separately to locate any potential problem. **Note!** Ensure that the steering wheel is centered when reattaching the steering column.
	Note! Do not replace the steering gear if radial play is found in the steering gear's rack. See Repair 14.	

Repair	Freeplay in tie rods	
13	A	Verify the problem using Steps B and C in Repair 12. Remove the rubber bellows to correctly assess the inner tie rods.
	B	Replace the tie rod in question.

Repair	Radial rack bar play	
14	A	Some radial rack bar movement on the left side, without an associated noise, is normal. This will not affect steering function. Compare the play to similar vehicles from the same model year to verify if the rack bar play is abnormal.
	B	Verify that there is no play in the steering gear's tie rods, steering column, lower steering shaft or other front assembly components. See Repairs 12 and 13.
	C	Some elastic play in the steering gear's rack is design related. Do not replace the steering gear because of this type of play. If there is a clicking noise during this check, see Repair 5.

Interior - Holes in Passenger Side Carpet

NO: 85-30

DATE: 2-9-2007

MODEL / YEAR: S60 (2001-) 000172 - 622972

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

CHASSIS:
S80 (1999 - 2006) 000500 -
S80 (2007-) 000850 - 015099
V70 (2000-) 000259 - 643520
XC70 (2001-) 000160 - 267282

SUBJECT:
Openings in Front Passenger Side Floor Carpet

REFERENCE:
VIDA

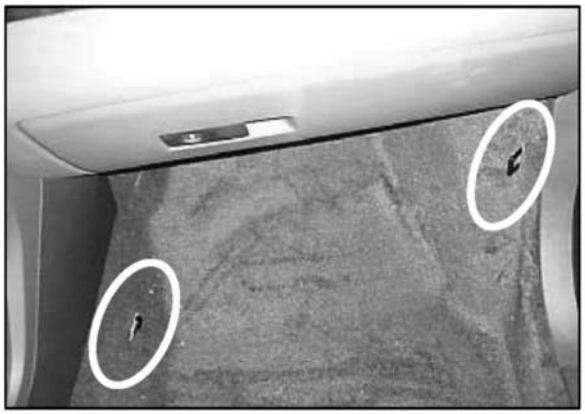
DESCRIPTION:

Other markets have optional child seat consoles installed from the factory; openings in the front passenger side floor carpet are there to accommodate this installation. Regardless of whether the vehicle was equipped from the factory with the child seat option, all models built in the above chassis ranges have the carpet openings. Over time, these openings may begin to become noticeable.

Note:
After these chassis ranges, variants without child seat consoles will no longer have the carpet openings.

SERVICE:

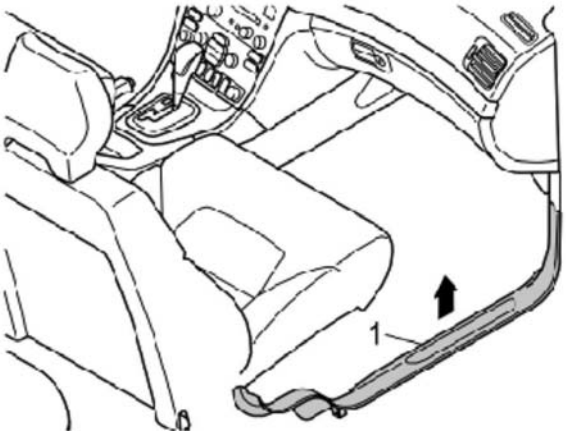
If the opening has become noticeable place a piece of strong tape on the backside to keep the opening tight and minimize the visibility as described in the following.



Note:
For reference / location of the openings, this sample picture shows the child seat consoles mounts installed.

The North American Market vehicles will not have these mounts.

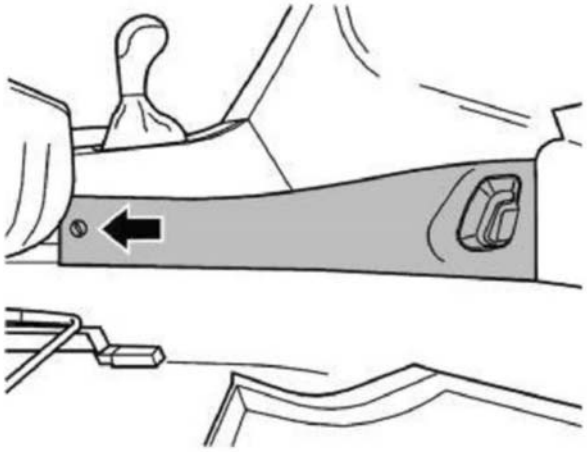
The front sill trim panel



Pull the sill trim panel straight up.

Pull out the sill trim panel at the front and rear edges.

Console side panel



Move the front seat to the rearmost position.

Turn the clip a 1/4 turn.

Slide the panel backwards.

Remove the panel.

Install tape

Pull the carpet to the side and place a piece of strong tape on the backside to keep the openings tight and minimize the visibility.

DVD Player - Won't Accept/Eject DVD's/Inoperable

NO: 39-58

DATE: 02-14-2007

MODEL: All with Factory Equipped RSE (Rear Seat Entertainment Systems)

SUBJECT:
Multiple discs inserted into RSE DVD player

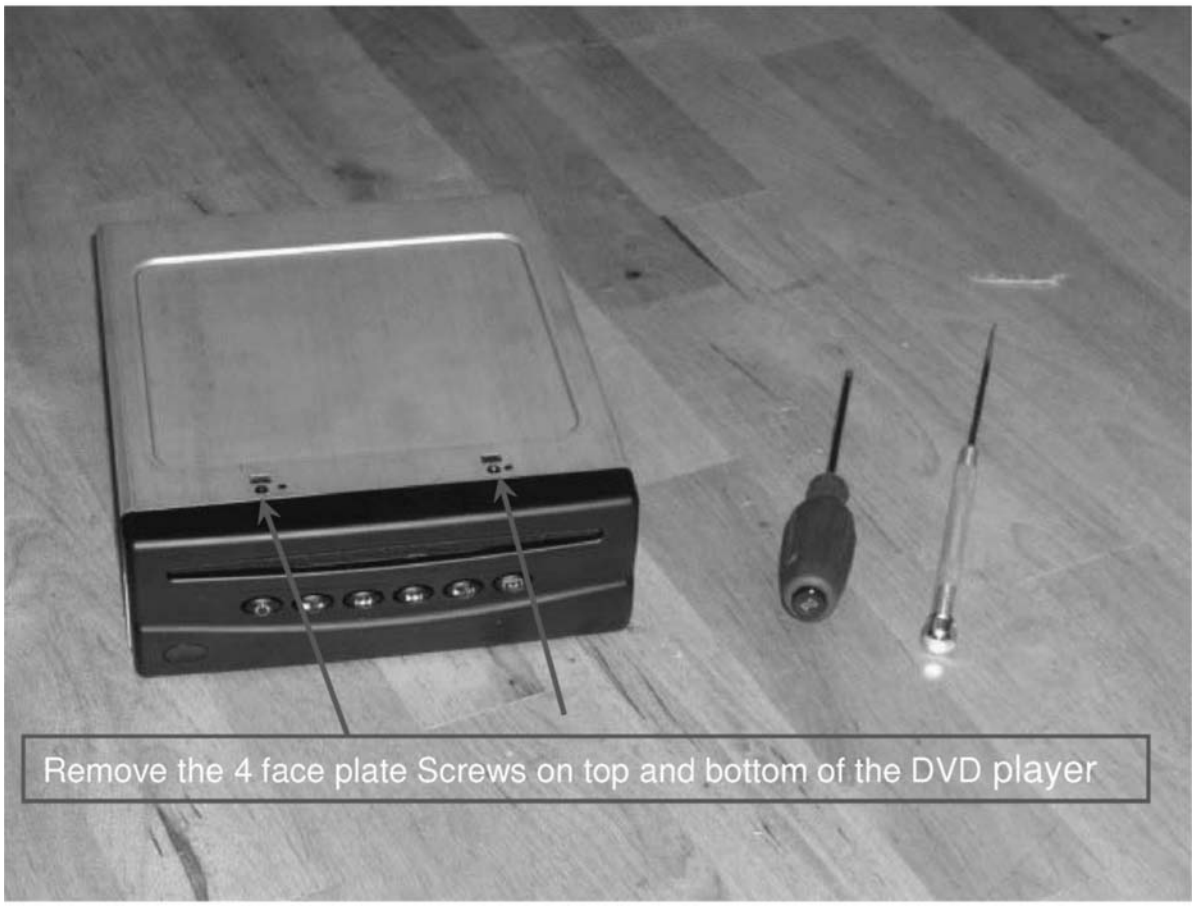
REFERENCE:
VIDA fault tracing information

DESCRIPTION:

Customers may report that their RSE Rear Seat Entertainment DVD Player will not accept DVDs (DVD player will not allow DVD discs to be inserted; DVD Player is inoperable or will not eject the DVD disc).

One possibility for this condition is that there may be 2 or more discs inserted into the DVD player. If multiple discs are found in the DVD player please do not submit the unit for warranty. If a DVD player is returned for warranty with 2 discs inside, the claim and part will be denied.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Refer to the illustration for a method to remove stuck multiple discs with customer approval.

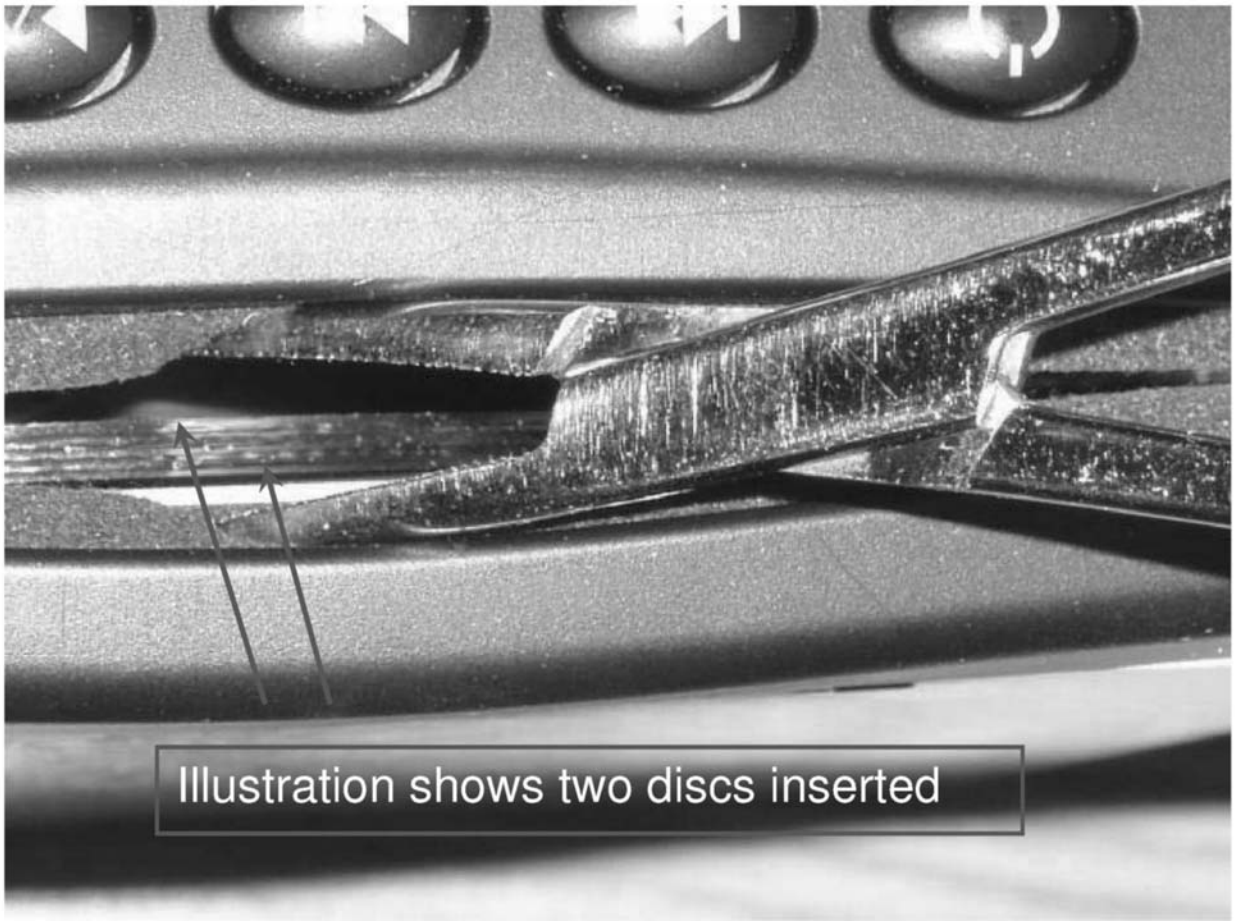
Note:
Any DVD Players returned to TMA disassembled or tampered with, will not be covered under warranty.

This TNN describes the method to inspect the DVD player for multiple disc insertion.

It is not necessary to remove the DVD player for inspection.

Carefully spread the protective dust cover apart using a hemostat or similar tool as described in this procedure. Be careful not to scratch the unit or damage the opening of the DVD Player or damage the customer's DVDs inside the unit.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



DO NOT ATTEMPT TO REMOVE THE DISCS WITH THE TOOL ABOVE. THE DVD PLAYER AND THE DISCS WILL BE DAMAGED

If there is one DVD stuck inside the unit and you were not able to eject the discs using the player's external control buttons, leave the disc in the unit and return the DVD Player to TMA under the normal warranty return program. Disc will be removed and returned to the Retailer.

The procedure below describes the method to remove the stuck DVDs from the player that has had multiple disc insertion if the customer so decides.

Note:

If you decide to remove the stuck Discs, please follow the procedure below. (DVD player must be removed to perform this operation)

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Pull back the faceplate exposing the 2 Disc

Important:

Once the unit is opened it is no longer covered under warranty and will be denied if submitted. Please advise your customer of this before proceeding. Volvo Cars of North America assumes no responsibility for damage to the player or discs if this method is used.

^ Carefully Insert pick as shown (without scratching the disc surface) below the spindle.

^ Gently lift up on the discs close the center hole so they will clear the spindle.

^ Grip the discs with your fingers and pull back to remove from player.

Return Discs to customers.

Technical Service Bulletin # **TNN21-25** Date: **070501**

Engine - Exchange Cylinder Block Modification

NO: 21-25

DATE: 05-01-2007

MODEL/YEAR:
S60/V70/V70-XC 2001- (C70 2002)

ENGINE:
B52X4T

SUBJECT:
Exchange Cylinder Block Modification.

REFERENCE:
Parts

Background:

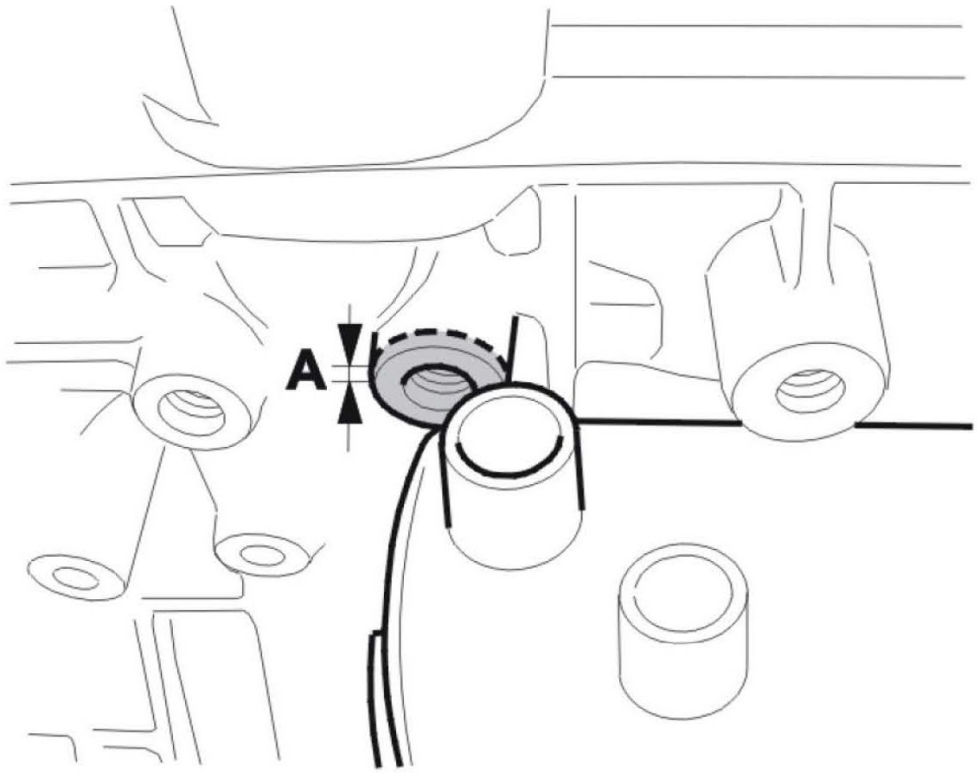
A new cylinder block was introduced in August 2003. The changes were also included on exchange engines for the above vehicles.

The exchange engines are supplied with oil separator box (Oil Trap) 8692211 and hose 8692217. On the S60/S80/V70 (00-)/V70XC (01-) up to model year 2001, and on the C70 up to model year 2002, there is a conflict between oil separator box and ETM.

The solution is to remove the oil separator box and hose supplied with the exchange engine & transfer the oil separator box 1271988 and hose 1271654 from the old engine after grinding down the attachment lug in accordance with the service bulletin.

Description

Remove the oil separator box from the old engine.



Cover the openings in the new block so that no grindings enter the engine. Grind down the attachment lug at least A = 5 mm (13/64 inch).

Align the oil separator box on the cylinder block and check that there is a clearance of 1-2 mm between the oil separator box with hose and clamp installed and the newly ground attachment lug. Install the old oil separator box on the new engine.

Tires - Pressure Requirements/Recommendations

NO: 77-18

DATE: 5-15-2007

MODEL:
All

MODEL YEAR:
All

SUBJECT:
Tire Pressures, Requirements and Recommendations

REFERENCE:
VIDA, SMB 17-006, owners' manuals

Description

Tire pressure is a critical element of vehicle performance. Correct tire pressure is important for:

^ achieving good fuel economy

^ achieving optimum comfort and good driving characteristics

^ helping to prevent flat-spotted tires due to low tire pressures

As stated in the Model Year 2007 owners' manuals:

^ Under-inflation is the most common cause of tire failure and may result in severe tire cracking, tread separation, or 'blow-out,' with unexpected loss of vehicle control and increased risk of injury.

^ Under-inflated tires reduce the load carrying capacity of your vehicle.

Over-inflation is also undesirable. Over-inflated tires can be stiff and unyielding, and will cause the vehicle to ride more harshly and loudly.

Under-inflation or over-inflation may cause uneven treadwear patterns.

There are many opportunities for the Volvo retailer to check and maintain proper tire pressure, from new vehicle storage, to delivery, through the service life of the vehicle. This TNN is designed to summarize and highlight Volvo's requirements and recommendations regarding tire pressures.

Service

GENERAL:

Tire pressures should always be checked cold. Tires are considered to be cold when they have the same temperature as the surrounding (ambient) air. This temperature is normally reached after the vehicle has been parked for at least 3 hours.

After driving a distance of approximately 1 mile (1.6 km), tires are considered to be hot.

When the weather temperature changes, tire inflation pressures also change. A 10-degree F (5-degree C) temperature drop causes a corresponding drop of 1 psi (7 kPa) in inflation pressure.

TRANSPORT PRESSURE:

All new Volvo vehicles are delivered from the port to the retail facility with tires at 'transport pressure', which is 43 psi (300 kPa). As indicated in Service Manager Bulletin 17-006, Retail Car Delivery Process, Stock Maintenance checks require that tire pressure be checked every 60 days, and be maintained at 43 psi (300 kPa). This is also true for vehicles on static display, such as the showroom or outside display areas. This transport pressure must be maintained until just before retail delivery.

Note!
Failure to maintain transport pressure in tires may result in tire damage not covered by the tire manufacturer's warranty.

CPS (CUSTOMER PREPARATION SERVICE):

SMB 17-006 also gives detailed information regarding operations to conduct during the CPS (Customer Preparation Service).

Note!
CPS should only be completed just prior to actual retail delivery of the vehicle to the customer.

Model Year 2007 U.S. specification vehicles have only one recommended tire pressure. This is the case whether the vehicle is equipped with a Tire Pressure Monitoring System (TPMS) or not. It is critical during CPS (and whenever tire pressures are checked and set) that all 4 tires be set exactly to the tire pressure indicated on the tire pressure label. This will assure that the customer has the best combination of ride, handling, and tire life.

Canadian specification vehicles continue to use labels with both a cold tire pressure and an optional tire pressure.

In all cases:

Use the recommended cold inflation pressure for optimum tire performance and wear.

NITROGEN:

There have been reports in the industry regarding the use of nitrogen for inflating tires. Volvo's position is that nitrogen is not required when servicing tires. While it is not harmful to use, it is also not necessary. This is true even for vehicles with TPMS.

CALIBRATION OF TIRE PRESSURE MEASURING EQUIPMENT:

VIDA can be used to check a vehicle's tire pressures.

This is the path in VIDA to follow:

Diagnostics > Vehicle communication > UEM> Advanced > Quick Test

As the tire pressure displayed in VIDA is extremely accurate, this display can be used to 'calibrate' tire pressure measuring equipment in the service

workshop. Compare the VIDA reading with a tire pressure gauge, and compensate accordingly.

TPMS (TIRE PRESSURE MONITORING SYSTEM):

TPMS (Tire Pressure Monitoring System) was optional on certain Model Year 2005 and 2006 vehicles fitted with SST (self-supporting tires). TPMS is standard equipment on all U.S. specification Model Year 2007 S60 (except S60R), V70 (except V70R), XC70, XC90, and S80 vehicles. It is planned to be standard equipment on 100% of the U.S. specification Model Year 2008 vehicles. TPMS is optional on Model Year 2007 Canadian specification vehicles.

The system must be regarded as a driver aid to maintain the correct tire pressure. TPMS does not take the place of good vehicle maintenance which requires that tire pressure be checked on a regular basis. The owners' manual recommends to the owner that tire pressures be checked monthly. When inflating the tire with air, you must, as much as possible, ensure that the tires are at same temperature as the outside temperature. When inflating with air, the tires must be filled to the pressure stated on the decal located on the car body. These pressures MUST be followed.

Technical Service Bulletin # **TNN36-59** Date: **070504**

Antitheft - No Start/DTC's CEM-6C48 or CEM-6C49

NO: 36-59

DATE: 5-04-2007

MODEL:
S80, XC90, V70, XC70, S60

MODEL YEAR:
2005-2006

CHASSIS:
See below

SUBJECT:
No Crank No Start: CEM-6C48, CEM-6C49, ECM-710B, ECM-720A, ECM-P160200, ECM-U014100

REFERENCE:
VIDA

DESCRIPTION:

Note:
This TNN covers two related concerns with different affected chassis ranges.

Affected chassis range:	
S60	425000 – 469337
S80	390000 – 408815
V70	459000 – 504618
XC70	173000 – 195007
XC90	134000 – 194801

1. MY 2005: DTC CEM-6C48, CEM-6C49

The customer may experience a no crank no start condition (starter motor not activated. An error message saying "Start prohibited, try again" will be displayed in the Driver Information Module (DIM) display and Diagnostic Trouble Codes (DTC) CEM-6C48 or CEM-6C49 will be stored in the Central Electronic Module (CEM). The engine will usually not start even after several attempts.

Note:
If DTC ECM-710B, ECM-720A, ECM-P160200 or ECM-U014100 is set in the Engine Control Module (ECM), please refer to 2) below.

Affected chassis range:	
S60	425000 – 545090
S80	390000 – 446916
V70	459000 – 584349
XC70	173000 – 235477
XC90	134000 – 290450

2. MY2005 - 2006: CEM-6C48 + ECM-710B, ECM-720A, ECM-P160200, ECM-U014100

The CEM may lose its EPROM memory. When this condition occurs, it will not be possible to start the car, since all security codes are lost including the Immobilizer PIN codes.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Involved DTCs:

Turbo engines: ECM-710B, CEM-6C48

Normally aspirated engines except V8: ECM-720A, CEM-6C48

Normally aspirated V8 engines: ECM-P160200, ECM-U014100, CEM-6C48

SERVICE:

Perform a CEM SW reload. Refer to VIDA for correct software product number.

Note:
Answer 'YES' at the question 'Has the CEM been replaced?'

Computers/Controls - CANbus Network Information

NO: 37-22
DATE: 12/07/2001
MODEL: All Models 1998 -->
SUBJECT: CANbus Network Information
REFERENCE:
CHASSIS: N/A:

This Tech Notes supercedes the previous 37-22 dated 11/30/2001. Please update your files.

DESCRIPTION:
This Tech Net Note is an explanation of how the CAN network is set up and functioning, including network diagnostics. It also describes conditions for DTCs to be set and some tips on how to fault trace the CANbus. CANbus errors are often complicated to fault-trace simply because it is a distributed system and error codes may be or may not be set in multiple nodes.

This information is best used as background information to understand the CANbus or system diagnostics and to fault trace the CAN network, and may not help to immediately find the root cause of a specific problem. This document will supplement the normal training material and it is recommended for technicians who have completed and thoroughly understand the training on "Volvo Automotive Networks"

The structure of this document is: general information on what role the CEM plays in CANbus faults, then each of the major types of DTCs are described. Each type of DTC has a description, explanatory picture, and some typical scenarios when it can be set.

CEM diagnostic functionality
Fault-codes for CANbus errors
  DTC CEM-DF03 to CEM-DF16
  DTC CEM-1A51 to CEM-1A64
  DTC E003 set in nodes other than CEM
  E000 and E001 DTCs set in any node (E000=HS-CAN / E001=LS-CAN)
  Codes posted due to signal missing, quick detection of CANbus error
Multiple codes and extended diagnostic (counters and freeze frames)
Limp home modes and characteristics of CAN faults
Tips for fault-tracing
CANbus hardware and measurement
Appendix. List of DTC codes for CAN bus errors
Appendix Data communication wiring diagram
  Denso EMS and Bosch EMS up until MY01
  Bosch EMS from MY02

SERVICE:

CEM diagnostic functionality

The CEM is the only node that truly monitors the voltage levels on the CANbus. Only the CEM can post the diagnostic trouble codes for CANbus

short-circuit to ground or 12V (e.g. DTC CEM-DF14), even though many nodes can post codes caused by the short circuit, e.g. E003 (this is a very subtle, but important difference).

Note:
The fact that the CEM has more diagnostics for the CANbus faults does not mean that the CEM is the root cause of the fault! Do NOT replace the CEM for CANbus failure unless there is a confirmed hardware internal error based on the fault tracing in VADIS and this TNN.

The CEM also has the functionality of detecting the absence of other nodes.

All nodes on the CANbus need to send and receive information. More specifically, all other nodes need to receive information from the CEM, and the CEM needs to receive information from all other nodes. If a node does not receive information from the CEM, it will set the code DTC-E003, and if the CEM does not receive information from a node it will post a code CEM-1A51 to CEM-1A64 for that node.

As an example, if the CCM does not receive information from CEM it will post DTC CCM-E003, and if the CEM does not receive information from CCM it will post DTC CEM-1A55. Further, if the DDM does not receive information from CEM, it will post DDME003, and if the CEM does not receive information from DDM it will post the code CEM-1A52.

If there is an open circuit on the CANbus, codes are thus posted in pairs, one in the CEM and one in the corresponding node. Note that this can mean that the CEM posts a lot of codes reaching its maximum number of codes (10).

These codes will be explained in detail under sections DTC CEM-1A51 to CEM-1A64.

Fault-codes for CANbus errors

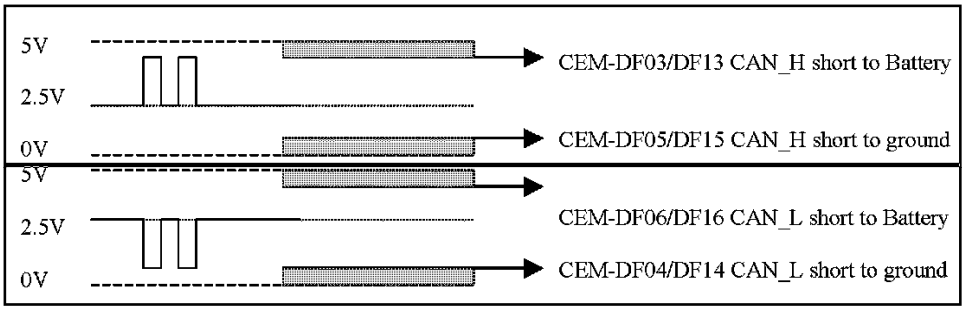
A list of different DTCs most related to CANbus errors can be found at the end of this TNN.

DTC CEM-DF03 to CEM-DF16.

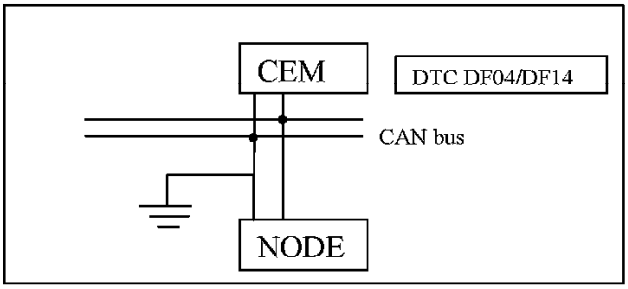
The CEM is the only node that has diagnostic functions to detect short circuit to ground or short circuit to voltage (B+). This is done by monitoring the electrical signal levels on the CANbus by an internal voltage measurement circuit in the CEM, and the DTCs CEM-DF03 to CEM-DF16 can be set.

Note. There are separate codes for low speed and high speed network. DF03, DF04, DF05, DF06 refer to the low speed net work and DF13, DF14, DF15, DF16 refer to the high speed network.

There is no strict electrical detection function for open circuit, but there will be a number of codes posted as a result of an open circuit.
DTCs CEM-DF03 to CEM-DF16 are the strongest evidence for a network fault, but the code does not locate the fault. Due to the detection criteria for these codes, they can in rare cases also be posted when driving in very high electromagnetic field areas.



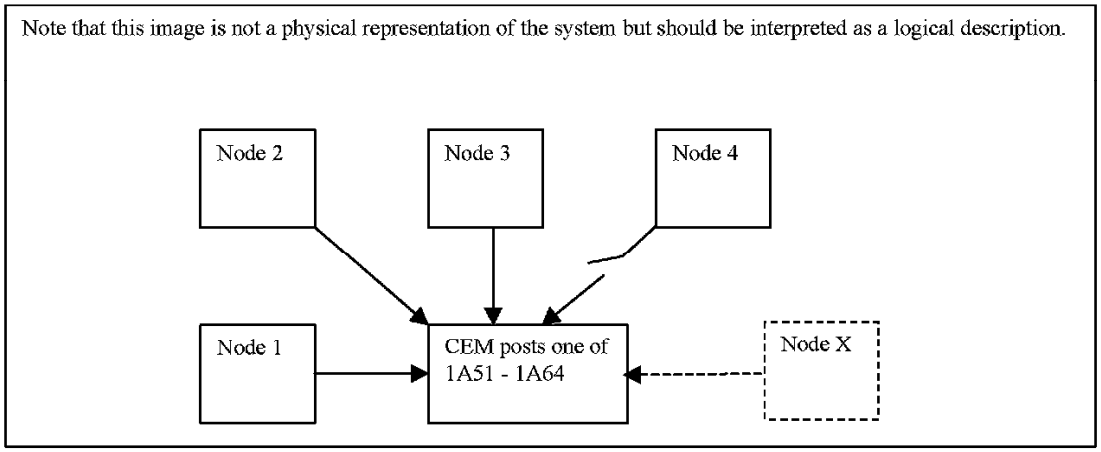
The detection for these codes is continuous. The detection time for a permanent fault can be up to 10 sec. CEM-DF03 to CEM-DF16 are posted when the voltage on the CAN lines are more than 4.5V or less than 0.5V respectively. See graph below.



A typical scenario when these codes are set is a pinched CAN wire to either ground or pinched together with a 12V wire, see illustration below.

Different combinations of codes are possible, and the codes mentioned in the graph are only examples.

DTC CEM-1A51 to CEM-1A64.

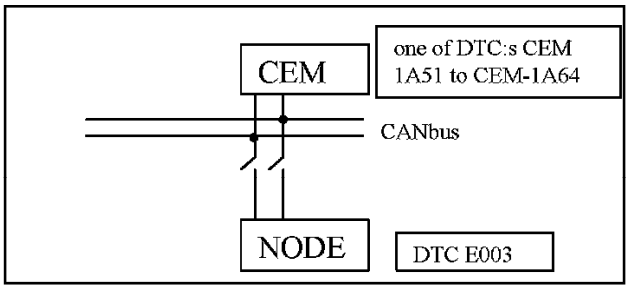


The CEM expects a signal sent from every node on the network. The CEM will post a code for communication with control module, or "Node not alive", if there is no communication from the concerned node for more than 10 seconds. See illustration.

Typically these codes come together with DTC E003 in the corresponding node. Depending on where the error occurs, there may be many CEM-1A51 to CEM-1A64 codes posted at the same time and the CEM reaches maximum number of DTCs stored (10). In this case not all codes will be represented even if the criteria for posting the code was met.

The codes will generally be posted when network is open-circuit, short-circuit, node is not powered, or if a node stops communicating to the CEM for other reasons.

Combinations of CEM-1A51 to CEM-1A64 codes are very useful for locating open circuit faults, see "Multiple codes and extended diagnostic (counters and Freeze Frames.)".



If there are intermittent CEM-1A51 to CEM-1A64 codes but not the corresponding E003 codes, first verify that, at the time of repair, communication can be established with all nodes. Then look at the power supply for the nodes. The reason is that the node will of course not post the E003 code if it lacked power when the intermittent fault occurred. The CEM however will post the CEM-1A5x code even if the other node lacks power or has a CAN communication problem. See illustration below for an example.

Different combinations of codes are possible, and the codes mentioned in the illustration are only examples.

DTC E003 set in nodes other than CEM

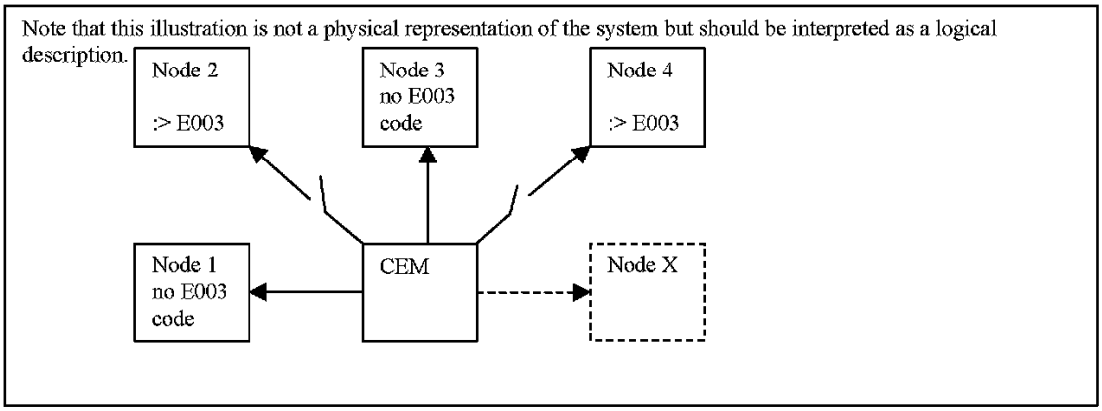
The DTC E003 code is posted when the incorrect CAN Configuration ID is received during 5 sec after Power up. This means that the nodes do not receive the data frame containing the correct master configuration ID from the CEM. Normally this is due to the CANbus has an open circuit or other disturbance.

This code is intended to detect if the CEM has the wrong software, but is more common for a network/power error. Combinations of E003 codes are useful to locate the fault, see section about multiple faults. However not all nodes set this code at the same fault time due to different power-on conditions as e.g. X / 15 / 15I / 30 powered nodes.

An E003 can be the result if a node gets the wrong signal configuration downloaded to it or as a result of swapping a node from another car. That is one of the reasons that swapping of nodes is prohibited.
If several or all nodes have E003 it can be a result of an incorrect signal configuration being downloaded to the CEM. In practice, this is however not likely to happen, it is more commonly a physical CANbus fault.

X / 15I / 15 powered nodes detect the fault 5 second after the node is powered up (IGN ON).
The nodes compare their internal CAN configuration ID (SW version) with CAN configuration ID continuously sent out from CEM. If the CEM ID is missing or not equal to the expected value at 5 sec after powered up, the E003 code is set. A wrong ID may come from swapping node between vehicle types, but most often this code is due to signal missing completely.
A node that has battery (30) feed does not get that hardwired power up, but gets its information about ignition position via CAN bus. This means that a 30 fed node will not post the E003 at that time if the error is permanent at power up. Instead it will be posted after an approximate 10 min timeout.

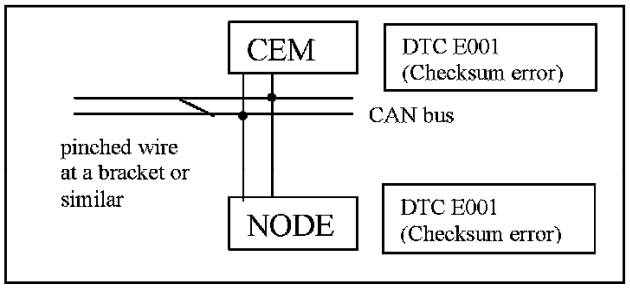
NOTE:
This means that for a 30 fed node the code may or may not be posted, all depending on when the error occurred.



The typical scenario when this code is set is an open circuit in the CANbus, and often together with the CEM-1A51 to CEM-1A64 codes.
See the illustration under "CEM-DTC CEM-1A51 to CEM-1A64." above.

E000 and E001 DTCs set in any node (E000=HS-CAN / E001=LS-CAN).

E001 code is an error in the data communication. It can be due to any disturbance on the CANbus or if a node is not sending correct data. The detection for these codes is continuous. It is originally designed to detect contact bouncing fault and corrupted message, but are also posted when there is a short circuit between CAN H and CAN L or when there is communication on only one of the two CANbus wires. Detection time for a permanent fault is within a few seconds.



Different combinations of codes are possible, and the codes mentioned in the illustration are only examples.

Other common causes for these DTCs is if a node is disconnected without first disconnecting the battery (Does not help if IGN key is out), or if CAN-message is "weak" or disturbed. That can happen if only one of the two CAN wires is operational or if one of the two network resistors is inoperative. Low speed network resistors are located in the UEM and REM. For the high speed network, the resistors are located in the ABS/BCM and
ETM, except for Bosch EMS MY02 and later where the resistors are in BCM and ECM.

Special cases with permanent E000/E001 exist, e.g. if one node is transmitting with slightly wrong baud rate, or if the crystal in a node is faulty.

Codes posted due to signal missing, quick detection of CANbus error

Some nodes, typically ECM, ETM, ABS and TCM, are checking each other's presence and are setting codes for absent signals. These codes are driving condition dependent and often combinations of codes can be set which may confuse fault-tracing. When trying to duplicate the driving condition / fault, it is not necessarily the same combination of codes that are set.
These are often more sensitive and are set more quickly than 1A51 - 1A64 or DF03 DF16 codes and can therefore be an indication that an intermittent quick error condition has occurred on the CAN bus.

Below you will find a sample of codes that may or may not be set in case of a CAN intermittent failure:

ECM 928C (Bosch), 922A (Denso), only with running engine. The codes are for cruise control signal missing and indicate that the cruise control signals were not received by ECM.

ECM 901A, 901E, 902A, 911A, 912A 913F for Bosch and 901A, 902A, 902B, 911A 912A, for Denso
SRS 00D6, Buckle signal timeout, indicate that the SRS have not received the buckle status from the CEM. (The buckle sensor is hardwired to the CEM)
SRS 00D5 bulb status signal from DIM.

ECM Bosch.

959F	AP12T APU (Analog Pedal Unit) Analog/PWM (via ETM) comparison fault

ECM DENSO

9520	ETS, APM, PWM, Electrical fault, low

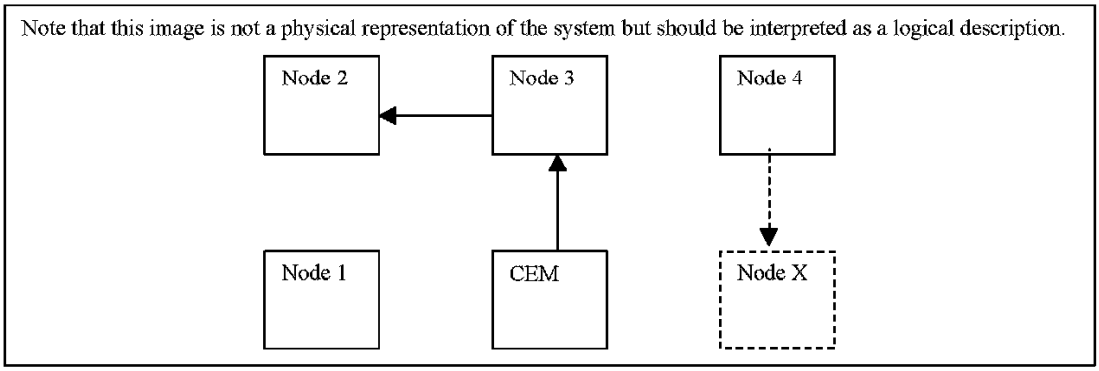
ECM monitoring:
Bosch:

510F	Vehicle speed signal

Denso:

510D	Vehicle speed signal missing
A02B	Signal missing from ABS/BCM
902A	Throttle Communication signal missing

Pedal sensor signal discrepancy between hardwired signal and CAN signal:



See the illustration below for a rough picture of how signals may or may not involve several nodes.

Multiple codes and extended diagnostic (counters and freeze frames)

The detection time for CANbus error DTCs differ for different codes. This means that for a specific error condition there may be a number of DTCs set in different nodes. Multiple codes in different systems can be confusing, but should be reviewed at the beginning of fault tracing to find a common link between all the codes.

Now it is possible in VADIS to read off extended diagnostics, typically counters and freeze frames. This is valuable also for CANbus diagnostics since it gives a possibility to determine which faults were posted at the same time. Remember that the counters are implemented in different ways in different control units which may make a comparison of driving cycles between different nodes difficult.

When fault-tracing a vehicle with many intermittent E003 and CEM-1A51 to CEM-1A64 codes it is useful to identify which nodes are affected. Print a copy of the "Data communication" wiring diagram in the appendix and write down all the DTCs and counters at each node. Analyze if there is a pattern that can describe where the fault can be located e.g. if the codes are grouped at one end of the CANbus. That will give a good indication where the fault is.

Limp home modes and characteristics of CAN faults

When a node does not receive any data frames from the CEM, it will enter a limp home mode. This mode may have different level of functionality depending on node.

If the error has occurred after the startup of the nodes, the nodes will normally keep the last recorded values as limp home values. Exceptions do exist though, e.g. fuel gauge for DIM.

For the Low speed network there are some distinct characteristics:

DIM: Since the DIM is a display of signals on the CANbus, it will quickly be visible if signals are missing. Depending on the filtering of signals internally in DIM, the displayed information will disappear at slightly different times. Normally the gauges freeze for 10 seconds and then they go to 0 and the DIM goes dark.

If only one node has disappeared, the DIM may give the first indication of that. An example is if the REM stops communicating, the first indication would be that the fuel gauge goes to zero.

CCM: This module has to keep a certain functionality in the absence of CAN communication. It is also a very good indicator that the CAN communication is lost, since it will light the diodes exactly ten seconds after ignition position 1 or 2 is chosen.
Other symptoms: if the AC-compressor is not cycling, except for the initial 1 sec activation controlled by ECM on power up, it can indicate a communication problem in the chain CCM>CEM>ECM. An obvious symptom is also that fan is running for one to ten minutes when IGN key turned off. This is due to that CCM is powered by Extended-X from CEM and it normally turns fan and other functionality off based on a CAN

command from CEM notifying ignition key out. If there is no CAN communication, the CCM will run until the power is lost.

DDM: The DDM will operate the functions in the driver's door but not in other areas of the car such as window lifts for rear windows and door locks for rear and passenger doors. Also the memory mirror will not work but it will be possible to maneuver the driver side mirror with the knob.

PSM: The seat memory functionality will not work. Stored seat and mirror locations will not function for the remote and seat memory.

UEM: Buckle up is displayed even when the seat belts are buckled if no communication from CEM to UEM. Also no remote function since there is no communication UEM to CEM.

AUM: Audio has most functionality left, except e.g. steering wheel switches control.

PDM: Windows and locks will not operate from driver side switches.

REM: The fuel gauge does not function and the rear doors will not lock with the central lock button. Also Defroster and foldable headrests will be inoperative.

SAS: No DSTC functionality

SWM: The steering wheel switches and turn signals do not work, but the horn works due to a redundant hardwired signal to CEM.

And for high speed network:
Engine: no start can be caused by no communication CEM>ECM+TCM.

ETM: has three levels of limp home:
Level 1. Cruise inoperative
Level 2. Throttle dull, no quick response.
Level 3. Default limp home. The RPM is controlled by means of the injectors.

TCM: GSM functions inoperative, only certain gears active. Note that once the TCM goes into its limp home mode for no CAN communication, it will not come back in that driving cycle even if the error disappears.

ABS/BCM: Generally limp home modes depend on fault. AYC sensor fault gives loss of DSTC and lamp lit. Wheel sensor fault gives lamp lit, loss of anti-lock but power assist still functions. May lose diagnostic possibility if in limp home mode.

CEM: Major loss of functionality. Note that the CEM has separate buses for CAN H and CAN L, which means that it is possible to communicate to e.g. the CEM via high speed bus even if the low speed network has an interruption.

Tips for fault-tracing

If the CEM has DTC CEM-DF14, CAN low short to ground, it does NOT mean that the CEM is shorting the CANbus. The short is from any point on CAN low to ANY grounding point, either in the wiring harness, which is most common, or in any control unit. Note that an E001 can be set in certain nodes but not others, and the short-circuit can still be far from the control unit.

Statistically there is a high likelihood it is a cable harness problem (check behind radio, by the SRS control unit, TCM/ECM CANbus female terminals).

Note that a male terminal p/n 9441394 can successfully be used to probe the tension at the female CANbus terminals. If the female terminal does not provide the proper tension it should be replaced by p/n 9442486.

If E001 occurs permanently and the cable harness is OK, a good tip is to remove all nodes having E001 in them (except the CEM) , clear the codes in the remaining nodes and read them again to see if the code disappears. Then reinstall them one by one until the code reappears. If it is possible to communicate with the vehicle in ignition position 0 and 1 but not in 2, look for a 15 fed node corrupting the CANbus.

The above method is also useful in another error scenario. At rare occasions a node can start sending irrelevant information on the CAN bus. This may block the correct messages from coming through. The result may be one or more E003 or 1A51 to 1A64 codes. It is very difficult to know which node is disturbing so the above method can be the only way to find the root cause.

If there is no response from any of the low speed nodes, but the high speed nodes respond...

The CEM protects the CANbus from short-circuits occurring by the Data Link Connector. This is achieved by four relays internally in the CEM, one for each wire on CAN high speed bus and CAN low speed bus. The relays are closed when CEM receives a command on the K-line from VADIS.

So if you encounter this, check the following:

1. VCT2000 cable, this has caused problems before. Try another cable and VCT200.

2. Continuity and signal level of K-line wire.

3. Continuity on CAN wires between Data Link Connector and CEM.

If 1-3 check OK, there is most likely a permanent CANbus failure in the wires or a node. Continue fault-tracing according to CANbus hardware and measurement below.

CANbus hardware and measurement

The CAN network system is set up with network resistors of 120 Ohms placed inside some nodes, and connected between the two CAN wires (Green(GN) for CAN low and White(W) for CAN high)

The two nodes in the low speed network (basically passenger compartment) that have the network resistors are REM and UEM. For the high speed network (basically engine compartment) it depends on engine type and model year. For MY99-MY01 the nodes that have the network resistor are ABS and ETM. From MY02 and later vehicles with Bosch EMS, the ETM is no longer on the high speed network.

Instead that end resistor is in the ECM.

Method

To identify a permanent fault condition in the CANbus it is possible to measure the CANbus resistance. The CANbus must be measured with the negative battery cable off and should be close to 60 Ohms. An open in one or both of the CAN wires will result in a reading of 120 Ohms. It is recommended to measure the resistance with the CEM breakout box connected. That gives the following advantages:

1. The networks will be tested including the CEM. Note however that open circuits in ABS/BCM, SAS, PSM, PDM, DDM and AUM will still not affect the 60 Ohm measurement since these nodes are not connected in series. A short between the green and white will however be detected.

2. You will have easy access to the low-speed network, high-speed network and the wires between CEM and the data link connector.

3. Having the multimeter in the footwell area, wiggle the cables/connectors in the bulkhead above the CEM and look for changes in Ohm reading.

4. As under 3. wiggle also the cables/splice behind radio where radio cables meet firewall harness.

5. As under 3. wiggle cables/connector at A pillar that connects the roof harness.

6. As under 3. have someone wiggle the cables under the coolbox for ECM and TCM.

If for some reason the CEM breakout box can not be used, the low speed network can either be measured using a breakout box or on the cable side of the connector to the PSM, with the PSM disconnected.

These measurements are particularly useful when CEM-1A51to CEM-1A64 and E003 or E001 codes are present without CEM-DF03 to CEM-DF16 codes.

When making the resistance measurement, also verify that none of the wires has a short-circuit to ground or battery which could post the CEM-DF03 to CEM-DF16 codes. That resistance should be > kOhms.

For intermittent faults and for CEM-DF03 to CEM-DF16 codes, the oscilloscope is useful. This measurement should be made with all nodes powered up and using a breakout box. Verify that the CAN H voltage does not at any point exceed 4.5V and that the CAN L voltage does not go under 0.5V. Note that the VADIS oscilloscope is not useful (too slow sampling rate) for detailed CANbus data measurement but it will give an indication of voltage levels and whether there is communication or not.

Note:

NEVER test any female terminal with a multimeter probe. This may result in damage to the female terminal, causing an improper contact when the connection is reinstalled. It is often useful to use the male pin mentioned in this TNN to probe.

Appendix. List of DTC codes for CAN bus errors[1]:

NODE	Code	Comment
CEM	1A51	Communication with SRS control unit
CEM	1A52	Communication with DDM
CEM	1A53	Communication with PDM
CEM	1A54	Communication with Power Seat Module
CEM	1A55	Communication with CCM
CEM	1A56	Communication with DIM
CEM	1A57	Communication with RTI
CEM	1A58	Communication with PHM
CEM	1A59	Communication with AUM
CEM	1A5A	Communication with Rear Electronic Module
CEM	1A5B	Communication with Steering Wheel Module
CEM	1A5C	Communication with UEM
CEM	1A5D	Communication with Electronic Throttle Module
CEM	1A5E	Communication with SAS
CEM	1A5F	Communication with ABS
CEM	1A61	Communication with TCM
CEM	1A62	Communication with ECM
CEM	1A64	Communication with DEM
CEM	DF03	CAN_H (or CAN_L) short to battery low speed network
CEM	DF04	CAN_L short to ground, low speed network
CEM	DF05	CAN_H short to ground, low speed network
CEM	DF06	CAN_L or CAN_H short to battery , low speed network
CEM	DF13	CAN_H or CAN_L short to battery, high speed network
CEM	DF14	CAN_L short to ground, high speed network
CEM	DF15	CAN_H short to ground, high speed network
CEM	DF16	CAN_L or CAN_H short to battery, high speed network
CEM	E000	Communication with the control module, (CAN High speed checksum error)
CEM	E001	Communication with the control module, (CAN Low speed checksum error)
PSM	E001, E003	Communication problems with control module
AUM, DDM, PDM, AEM, DIM, CCM, REM, RTI, SRS, SWM, UEM	E001	Control module communication (LS CAN transmit / receive error)
AUM, DDM, PDM, AEM, DIM, CCM, REM, RTI, SRS, SWM, UEM	E003	Configuration fault ("Control module communication" for RTI)
ABS	0090	Control module communication
ABS	0091	Control module communication
ABS	0092	Control module communication
ABS	0093	Control module communication
ABS	0094	Control module communication
ABS	0095	Control module communication
SAS	E000	Communication fault with control unit
SAS	E003	Communication fault with control unit
TCM	E000	Control module communication
TCM	E003	Configuration fault
ECM	E000	Control module internal fault (CAN High speed checksum error)
ECM	E003	Control module internal fault (CAN configuration fault)

Note that the description in "Comment" is not always consistent. They are mostly taken from the Vadis description.

[1] Not including the codes that are posted as a consequence of lack of communication, e.g. 928C.

V50 2005-->
C70 2006-->
S60 2006-->
S80 2006
S80 2007--> (All New S80)
V70 2005-->
XC70 2005-->
XC90 2005-->

SUBJECT:
Occupant Weight Sensor (OWS) Installation Installation

This Tech-Net Note supersedes the previous TNN 88-44 dated 8-21-2006. Please update your files.

DESCRIPTION:
The hose between the Occupant Weight Sensor (OWS) bladder and pressure sensor must not get twisted, kinked, pinched, stuck under the spring wires or otherwise restricted during installation of the OWS spare part kit. Incorrect installation may lead to calibration problems and related Diagnostic Trouble Codes (DTCs):

S40, V50, C70, C30	SRS-0112, STS-0114
S60, S80*, V70, XC70, XC90	SRS-0250, SRS-0258
S80**	SRS-B00A054

*) MY 2006
**) MY 2007

SERVICE:
When installing an OWS spare part kit, make sure that the hose between the OWS bladder and pressure sensor is not twisted, kinked, pinched, stuck under the spring wires or otherwise restricted. Follow the instructions below in addition to the instructions in VIDA.

Repair > Removal, replacement and installation > 8 Body and interior > 85 Interior > Front seat, driver's seat, front seat > Occupant weight sensor (OWS), replacing

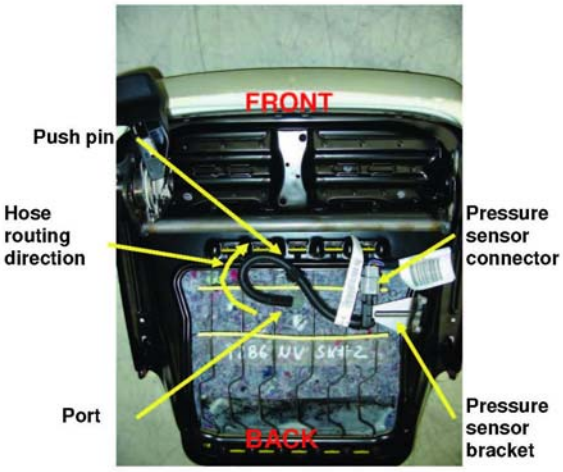
Information > Parts > Parts catalog > 8 Body and interior > 85 Interior > 852 front seat, drivers seat, seat bench type > Front seat padding, panels

Note:
Photos show MY2007 S80 installation. Installations in other car models are similar and the same principles apply.

1. OWS spare part kit and seat frame.

2. Route the wire harness with OWS ECU and pressure sensor through the 3rd and 4th spring wires.

3. Lay the bladder package on the springs with the hose below them.



4. Attach the push pin and attach the pressure sensor in the bracket. The hose port shall face the right outboard side of the seat (see photo above). Make sure that the port is not pushed up into the seat. The hose shall be looped in a smooth curve to the front of the seat in a clockwise direction (see photo above) and the pressure sensor shall be mounted with its connector facing the front of the seat.

5. Make sure that the hose is correctly installed (routed in a smooth curve below the spring wires) and the pressure sensor is attached in the bracket without external interference.

Note:
For vehicles with seat heating, install a new heating pad along with the OWS spare part kit. This is required in order to maintain a proper mechanical interface in the seat.

Interior - Play/Knocking Noise In Front Seat Backs

NO: 85-28

DATE: 6-18-2007

MODEL / MY:
See chart below

SUBJECT:
Front Seats, Play in Lower Part of Backrest / Adjust

REFERENCE:
VIDA

NOTE:
This TNN superceded the previous 85-28, dated March 3, 2006. Please update your files.

DESCRIPTION:

Some customers may complain about play in the lower part of the front seat backrest. The concern occurs mainly during stop and go driving. Sometimes the play is combined with a knocking noise that can be heard from the recliner area.

Type	Model	MY	Chassis	Plant
544	S40	2005 -	091836 -	22
545	V50	2005 -	090835 -	22
384	S60	2005 -	457937 -	22
184	S80	2005 - 2006	404529 - 446916	21
285	V70	2005 - 2007	493766 – End of Production TBD	21 & 22
295	XC70	2005 - 2007	189843 - 288671	21
275	XC90	2005 -	181227 -	21

For vehicles within the listed chassis range, follow the service method in this document.

Material	Quantity	Part No.
Anti-squeak tape	0.1	9511099*
Isopropanol	Shop Supply	1161721

* Included in anti-squeak repair kit, part number 9511025.

MATERIAL AND TOOLING

SERVICE:

This service solution reduces the concern with play and related noise in the lower part of the seat backrest. However, due to the Whiplash Protection System (WHIPS) assembly, there will always be a nominal play, as there is no fixed connection between the backrest and the seat frame.

Steps 1 through 10 are for the driver's seat adjustment
Steps 11 through 15 are for the passenger seat adjustment.

1. Adjustment of driver's seat

Move the seat to the most forward position. Raise the rear edge of the seat cushion to maximum height.

Remove:

- Screw on the inside at the front end of the side panel (1).
- Pull the side panel straight up in the rear (2). Fold the panel away.

2. Release seat belt

Release the quick fit connection from the seat belt fitting by pressing the catch pin (indicated in the picture).

3. Remove plastic cover, outer side

Remove:

- screw
- plastic cover.

4. Remove tunnel console.

Remove the complete tunnel tray on cars equipped with a removable tunnel tray (XC90) to gain better access to right side of the seat. Pull the release handle at the bottom and pull the console to the rear.

For cars not equipped with removable tunnel console: the correct combination of tools will allow sufficient access to right side of the seat.

5. Remove plastic cover, inner side.

Remove:

- screw
- plastic cover.

6. Pull seat backrest up.

Note!
One additional technician is needed for this step.

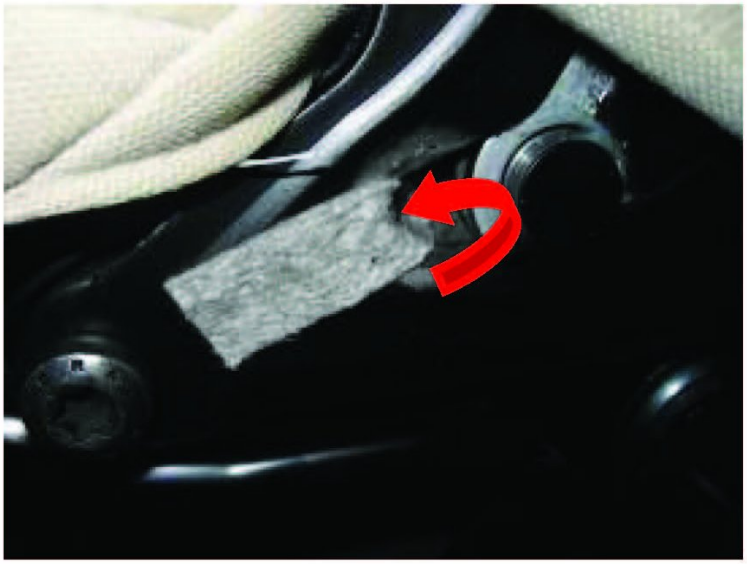
- Grab the backrest between the seat cushion and backrest and pull straight up (about two inches).

Note!
This requires some force. Hold the backrest in this position while the tape is being applied.

7. Degrease WHIPS slot.

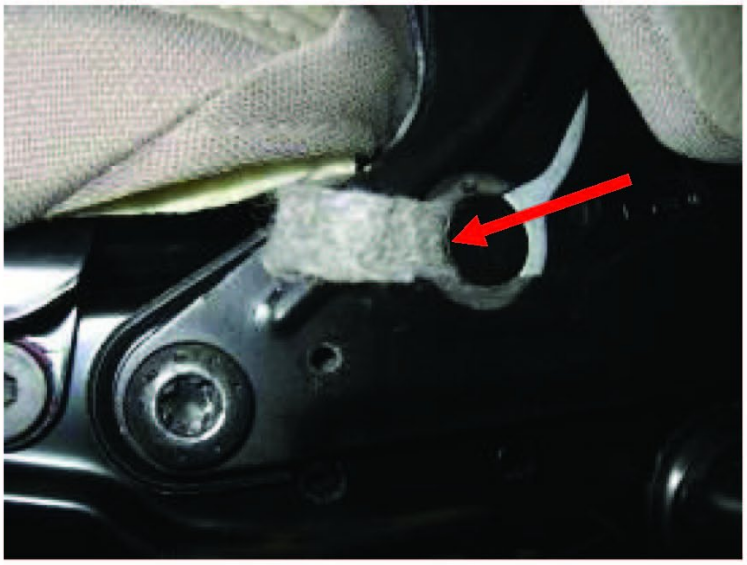
- Clean the slot area with isopropanol and wipe dry as indicated in the picture.

8. Applying felt tape on both sides.



- Cut a piece of felt tape - 1/2 x 2 inches (13 x 51 mm) Tape PN 9511099.
- Insert the felt tape strip in the exposed slot from the WHIPS assembly and fold the strip as indicated in the picture.
- Repeat the same operation on the opposite side of the seat.

9. Lowering the backrest.



- Lower the backrest and check if the pin slides back into the slot as indicated by the picture.

10. Re-assembly

Assemble:

- The cover on the inner side of the seat
- The screw for the cover. Tighten.
- The complete tunnel tray (only XC90)
- The cover on the outer side of the seat.
- The screw for the cover. Tighten.
- The seat belt to the seat belt fitting.

Attention:
A clicking noise MUST be heard when the seat belt quick-fit connection is snapped in the connection. Check by pulling several times to

be sure that the seat belt is correctly assembled into the end connection.

Assemble: Side panel. Press the side panel down in the rear.

- Screw at the front end on the inside of the side panel. Tighten.
- Re-adjust the seat into "normal" operation position.

11. Adjustment of passenger seat.

1) Move seat to the most rearward position.
2) Recline backrest to the most rearward position.
3) Bring backrest back to most forward position.
4) Tilt the whole seat frame forward (raising the rear end).
5) Move whole seat as far forward as possible.

12. Access to WHIPS slot.

- Press the seat backrest up in order to expose the slots in the WHIPS assembly as indicated in the picture.

13. Degrease WHIPS slot.

Clean the slot area with isopropanol and wipe dry as indicated in the picture.

14. Applying felt tape on both sides.

- Cut a piece of felt tape - 1/2 x 2 inches (13 x 51 mm) Tape PN 9511099.

- Insert the felt tape strip in the exposed slot from the whips assembly and fold the strip as indicated in the picture.
- Repeat the same operation on the other side of the seat.

15. Lowering the backrest.

- Lower the backrest and check that the pin slides back in the slot as indicated by the picture.
- Re-adjust the seat into "normal" operation position.

Entertainment System - 'Input Password' Displayed

NO: 39-57
DATE: 4-4-2007
MODEL:
V70 All w/ RSE
XC70 All w/ RSE
XC90 258729 - 371138

SUBJECT:
Generation 4 RSE, password request displayed on screen

REFERENCE:
VIDA fault tracing information

This Tech Note supersedes the previous 39-57 dated 1-31-07. Please update your files. Changes to this document from the previous version are, Supply disc re-ordering info.

DESCRIPTION:
Customers may report that "input password" is displayed on the screen of the Generation 4 RSE (Rear Seat Entertainment) system. This condition is permanent and in the past could only be recovered by replacing the RSE control unit (DVD player). A Firmware upgrade CD has been developed to recover the system and to avoid this portion of the menu from being accessed in the future. This CD was delivered to retailers on the week of January 29, 2007, along with a wiring diagram update for the Generation 4 RSE system.

Additional copies of the upgrade disc can be ordered through the website. The publication number is SP0386 and can be found under; Service Information/Model.

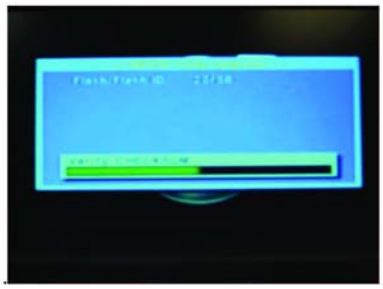
Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

SERVICE:
if the screen below is being displayed
DO NOT REPLACE THE RSE CONTROL UNIT (DVD player). Follow the instructions below to recover the system and to upgrade the RSE firmware which will prevent the condition from occurring again.

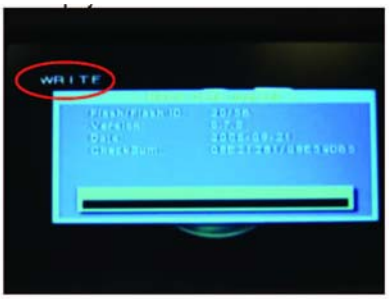
1. Turn on the RSE system and insert firmware upgrade CD

2. Select yes using the RSE remote "OK" button when the screen below appears.

3. This screen will appear while the system is checking the current version of the firmware



4. Once the version is identified as needing an upgrade~ this screen will appear as the firmware is upgraded. The text "WRITE" and 11ERASE11 will be seen flashing in the upper left corner of the display



5. Once the Firmware upgrade is complete, (apx. 45 seconds) the screen will go black. This is the only indication that the upgrade is completed.

6. Eject the upgrade disc with the following method.

   ^ Shut down the RSE system using either the remote or the power button on the DVD player

   ^ Eject the disc using the eject button on the DVD player.

NOTE:
The upgrade disc will not eject unless the RSE is shutdown after the upgrade

Steering - Power Steering Reservoir Fluid Leak

NO: 64-17

DATE: 8-24-2007

MODEL & MODEL YEAR:
S60 2001-
S80 1999-2006
V70 2001-2007
XC70 2001-2007
XC90 2003-

SUBJECT:
Power steering fluid leak at reservoir

REFERENCE:
VIDA

THIS TNN SUPERSEDES TNN 64-17 DATED 6-27-2007. THE CLAMP PART NUMBERS HAVE CHANGED. PLEASE UPDATE YOUR FILES.

Description

Under certain conditions the power steering may leak fluid at the reservoir suction hose connection. An improved suction hose was introduced into production in December 2004.

Service

If there is leakage at the reservoir/suction hose connection on the above vehicles, replace the suction hose and clamps only, according to VIDA.

Use the following parts:

^ Hose: as per VIDA

^ Clamps: quantity (2) pn 988024

Note!
These hose clamps are screw-type clamps. Do not use a crimp-style hose clamp for this repair.

After replacing the hose and clamps, top up the fluid level (see below), and check for leaks. If the leakage is still present, only then should you replace the reservoir.

When checking and topping up the fluid level in the reservoir after the repair, measure when cold and with the engine turned off. Fill the oil until the level is halfway between the 'cold' and 'hot' marks on the dipstick.

Note!
The Service Advisor and Warranty Administrator should include as much customer information on the Repair Order and warranty claim text as possible. Warranty claims which lack sufficient detail regarding 3 C's (complaint/cause/correction) may be subject to further warranty review and debit.

A/C - System Odors/Afterblow Function

NO.: 87-53

DATE: October 5, 2007

MODEL/YEAR

S60	2001 -
S80	1999-2006
V70, XC70	2001 - 2007
XC90	2003 -

SUBJECT:
Air Conditioning System Odor / Afterblow Function

REFERENCE:
VIDA

DESCRIPTION:

MY 2005 and later:

MATERIAL for 2005 and later:

Description	Quantity	Part Number
Activate afterblow software	1	30782577
Deactivate afterblow software (if needed to turn off)	1	30782664

Activation / Deactivation through VIDA:
- Software Tab
- Software product
- Select 30782577 (or 30782664 to deactivate if needed). *Enter part number if not listed*
- Download software

Read - Out the status "active / not active" in VIDA:
- Diagnostics
- Vehicle communication
- CCM / Advanced
- After - run passenger control status (wording may change in future VIDA updates.)
  Note: Active or Not-Activated

When certain criteria are met the interior fan will start to blow 50 minutes after the car has gone into the sleep mode. The fan will blow for ***15 minutes at half speed*** with the air directed to the dashboard air outlets.

Make sure the customer is informed of this new function.

ACTIVATION CRITERIA:
Battery voltage greater than 11.9 V
Ambient temp greater than 75°F (24°C) when engine is turned off.
Runs only one time every 20 hrs.

MY's 1999 – 2004:

Activation and Read - Out the status "active / passive" in VIDA:
- Diagnostics
- Vehicle communication
- CCM / Advanced
- Programming the Climate Control Module (CCM).

When certain criteria are met the interior fan will start to blow 50 minutes after the car has gone into the sleep mode. The fan will blow for ***7 minutes at full speed*** with the air directed to the dashboard air outlets.

Make sure the customer is informed of this new function.

There may be cases of odor from climate system vents on the vehicles listed above. Ensure the odor is not from some other source and all other A/C system checks have been completed. If necessary the Afterblow function can be activated to dry out the ventilation system and evaporator. There are two ways to activate the Afterblow function depending on the Model Year (MY). For MYs 2005 and later and for MYs 1999 - 2004 refer to image above.

NOTE:
Up through 2002 Afterblow was activated from the factory, 2003 and later Afterblow will be Retailer activated only.

SERVICE:

In all cases basic fault tracing needs to be performed prior to the afterblow activation. Once this has been completed see the appropriate instructions for Afterblow activation.

Check / Verify that:

- There are no refrigerant leakages (not PAG oil causing the odor).
- AC drain is not clogged - drains sufficiently i.e. no water standing in the climate box.
- No water standing underneath the floor carpets.
- Cabin air filter inspected / verify it's been replaced according to the maintenance schedule.
- Battery is in good condition.

If all the above has been checked and confirmed that they are not the cause of the odor then the Afterblow function should be activated to minimize the risk of odor.

NOTE:
MY 2005 and later it is only necessary to activate / deactivate Afterblow one time per vehicle. If ANY new software is downloaded the Afterblow function will stay activated.

Fuel System - Installing Extra Fuel Pump Feed Cable

NO: 23-29

DATE: 1-17-2008

MODEL: See chart below

M. YEAR: 2005-2007

SUBJECT:
Installing Extra Fuel Pump Feed Cable

REFERENCE:
VIDA, TNN 23-28

THIS TNN SUPERSEDES THE PREVIOUS VERSION DATED 8-23-2007. THE ENGINE CODE LIST HAS BEEN MODIFIED AND STEP 10 HAS BEEN CLARIFIED. PLEASE UPDATE YOUR FILES.

Note!
If using a printed version of this TNN, first check for the latest online version.

Description

Certain S60, S80, V70, XC70, and XC90 vehicles use a demand-controlled fuel system with a fuel pump control module (FP control module, or Pump Electronic Module [PEM]) and a fuel pump with two pump motors. The fuel system design was modified in production during the summer of 2006. Each motor within the pump was given its own fused electrical circuit.

Model Year	Type	Model	Chassis range	Engine Code
2005-2006	184	S80	390000-446919	59
2005-2007	275	XC90	134000-347345	59, 85, 98
2005-2007	285	V70	459000-630805	52, 54, 59
2005-2007	295	XC70	173000-262446	59
2005-2007	384	S60	425000-620296	52, 54, 59

If the fuel pump fuse is blown and it is determined that the fuel pump is defective, the additional circuit should be added for vehicles within the chassis range shown above. This TNN provides instructions for installing this circuit.

Note!
Always first check if there is a fuse in position 29 in the CEM, as the chassis ranges above may be approximate, depending on engine code.

Note!
This repair is not applicable to the following variants:

^ S80 T6 and XC90 T6 (engine code 91)

^ Model year 2004 S60R and V70R

^ S60 and V70 vehicles with steel fuel tanks

Material	Quantity	Part No.
Rear electronic module (REM): All above vehicles **excluding** XC90 **Note! Do Step 1 first to determine if REM replacement is needed**	1	30786646
REM reload (if REM is replaced)	1	As per VIDA
REM upgrade	1	30677030
Service cable	1	30773851
Tie strap	2	983748
Fuse	1	8688644
Electrical insulation tape	As needed	

Material

Special Tool	Part No.
Removal tool	9512638

Special Tool

Service

1. Read the rear control module (REM)

   Step 1 applies to all cars excluding the XC90.

   Read the control module's hardware number in accordance with VIDA:

   Diagnostics
   Network
   REM hardware number.

   If the REM responds with either part numbers 8676391 or 30728512, proceed to Step 2. If the REM does not respond with either of the part numbers 8676391 or 30728512, then it must be replaced according to VIDA:

   Information
   Repair
   Removal, Replacement, and Installation
   Cables and Fuses
   REM, replacing
   If REM is replaced, reload REM with software as per VIDA.

2. Perform REM upgrade

   Note!
   Step 2 applies to all cars whether REM is replaced in Step 1 or not.

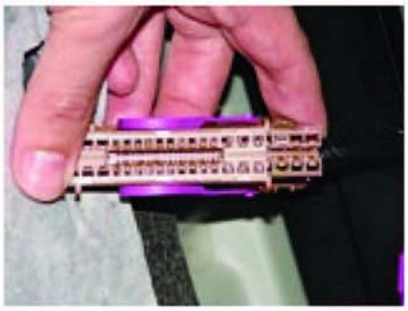
   Perform REM upgrade, P/N 30677030.

3. Access the cable harness

   Access the cable harness between the rear control module (REM) and the right-hand inspection cover for the fuel tank. See VIDA for information. Depending on model, this will include removal of trunk floor, trunk side panels, plastic cover along inside bottom of trunk, and right rear seatback. Remove the inspection cover (at arrows in photo) over fuel pump connector.

4. Disassemble the connector

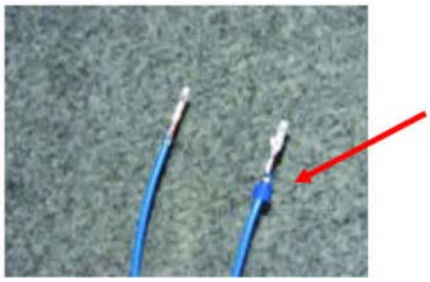
Remove the brown 32-pin connector on the rear control module (REM)



Cut the tie strap securing the wiring to the connector housing (red arrow in photo).

Using two small screwdrivers (see photo above), remove the housing from the connector block.

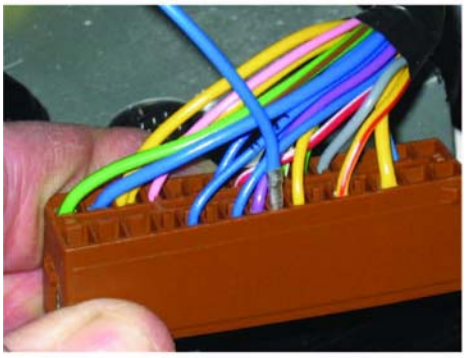
5. Install new cable at REM



Note!

The service cable, p/n 30773851, has identical metal terminals, but one terminal has a rubber seal. The end with the rubber seal goes to the fuel pump. The end without the seal is installed here:

Install the service cable (P/N 30773851), terminal without seal in position 25.

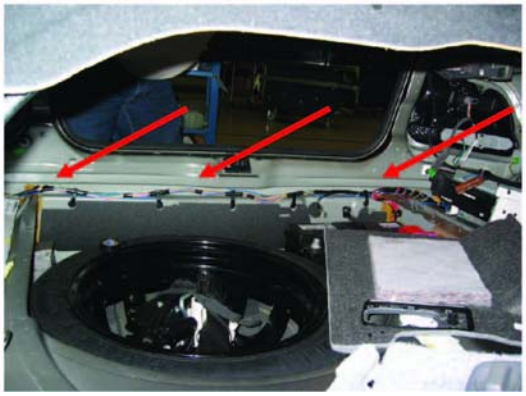


Reinstall the connector block into the housing, and resecure the cables to the connector using a new tie strap.

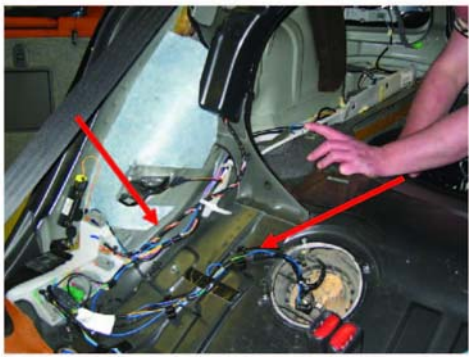
Reinstall the connector onto the REM.

6. Route New Cable

Open the cover on the cable duct (see photo in Step 3).



Route the new cable from the REM to the fuel pump inspection cover, along the existing cable harness. Secure the new cable with electrical insulating tape.

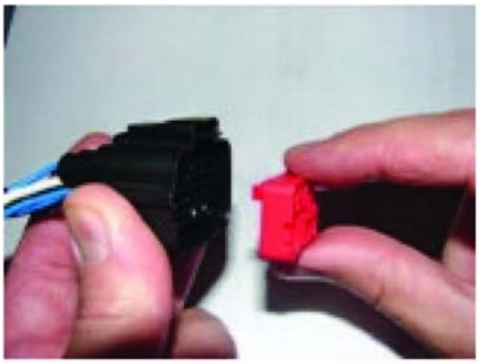


Note!

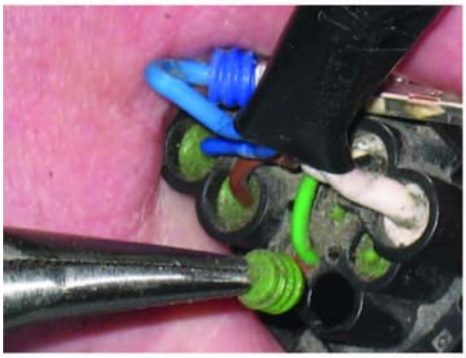
Both of these photos are taken from the interior of the vehicle, looking back toward the trunk area.

7. Install new cable at fuel pump

Remove the 12-pin connector on the fuel pump.



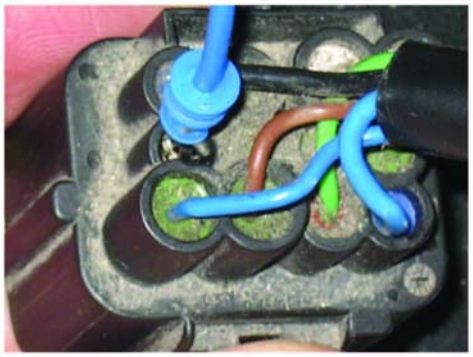
Remove the secondary catch on the connector (red piece in photo; remove by carefully prying upward with small screwdriver).



Remove the cover plug in position 1 on the connector.

Move the blue cable from position 8 to position 1, use tool 9512638.

Install the service cable terminal with seal in position 8.



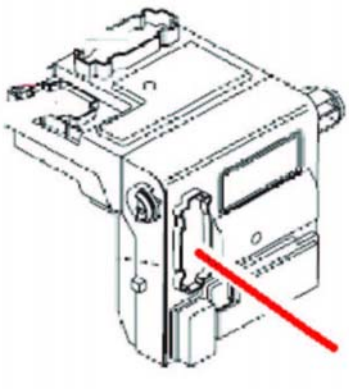
Reinstall the secondary catch and reinstall the connector onto the fuel pump.

8. Access the CEM (Central Electronic Module)

Remove the soundproofing panel under driver's side dashboard, see VIDA for information.

Note!
It should not be necessary to remove CEM from its position. Access to the connector in the next step is easier if the small connector below it in the CEM is unplugged, and if the ODBII access plug is unscrewed from its mounting.

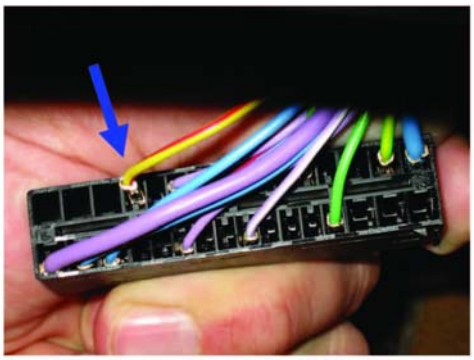
9. Disassemble the CEM connector



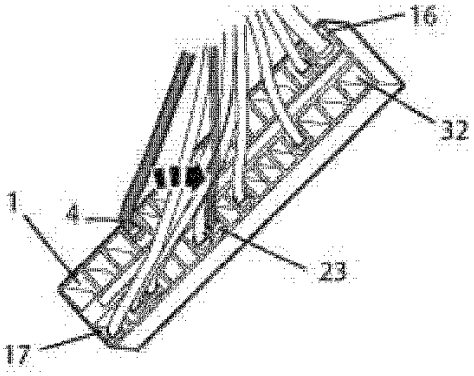
Remove the black 32-pin connector from the CEM.

Remove the tie strap and the housing from the connector. Follow the same procedure as shown in Step 4.

10. Move the cable at the CEM



Move the yellow/red cable from position 4 to position 23, use tool 9512638.



This photo shows the terminals in the connector block. The yellow/red cable was originally in position 4, which is the 4th position from the bottom in the left row. Position 23 is 7th from the bottom in the right row.

Reinstall the housing and use a new tie strap.

Reinstall the connector onto the CEM.

11. Install the fuse in the CEM

Install a new 7.5A fuse in position 29 in the GEM

12. Finishing steps

Reinstall all removed panels and seats, see VIDA for information.

Steering - Vehicle Pull On Acceleration/Cruise

NO.: 60-10

DATE: 10-25-2007

MODEL & M. YEAR:
MY99-06 S80
MY01-07 V70, V70XC, & XC70
MY01-S60
MY03-XC90

SUBJECT:
Repair of pulling condition during driving or acceleration

REFERENCE:
Service Bulletin 60-5500, TNN 60-09, VIDA

Description

STEP NO.	ACTIVITY	RESULTS OK	RESULTS NOT OK
1.	Check/adjust tire pressures in accordance with the specifications on the tire pressure label. Ensure there is minimal difference between left and right side.	Go to #2 a.	Adjust tire pressures, go to #2 a.
2 a.	Test drive on a level, smooth road. ***See* "TEST DRIVE NOTES" *on page 2.*** Check for pulling under: • Acceleration • Steady driving • Freewheeling	Completed.	NOK during acceleration, go to #2 c. NOK during other conditions, go to #2 b.
2 b.	Check the position of the steering wheel when driving straight ahead. If it is not centered, could this be the root cause for the complaint?	Completed.	Adjust steering wheel. If still NOK, go to #3.
2 c.	Does the fault occur ***only*** during acceleration?		Go to #7.
3.	Remove and mark the car's wheels (LF, RF, LR, RR) and rotate from front to rear on each side. ***Then test drive as in #2 a.***	Correct tire pull as necessary.	Go to #4.

STEP NO.	ACTIVITY	RESULTS OK	RESULTS NOT OK
4.	Check the wheel alignment. Adjust the camber angles to the maximum tolerances described below by using the play of the holes in the knuckles and strut. • When pulling LEFT: adjust left side camber to maximum negative and right side camber to maximum positive. • When pulling RIGHT: adjust right side camber to maximum negative and left side camber to maximum positive. ***Then test drive as in #2 a.***	Completed.	Go to #5.
5.	Check that the original springs are correct as per specifications. If incorrect or non-original springs are installed, correct as per VIDA. ***Then test drive as in #2 a.***	Completed.	Go to #6.
6.	Change the front springs according to the **"LIFT HEIGHT TABLE"** on page 4. First determine the springs assembled on the car based on color and number of dots. Find that spring in the table on page 4. • If the car is pulling to the *right*: ○ Go up one step in lifting force on the RIGHT side, and down one step on the LEFT side. • If the car is pulling to the *left*: ○ Go up one step in lifting force on the LEFT side, and down one step on the RIGHT side. If you cannot go up in lifting forces on that side which the car pulls to, you go down on the other side. Start with one step, and go to two steps if necessary. ***Then test drive as in #2 a.***	Completed.	Problem is beyond scope of this TNN, and may likely be worn or damaged suspension components.
7.	If the fault ONLY occurs under acceleration and if the car pulls to the right: • Fit spacer plate P/N 9485617 between the engine mount and the subframe on the right hand side. Start with one spacer. (Max. 2 spacers, or 4 mm in total.) • Check/adjust the alignment as described in step #4. ***Then test drive as in #2 a.***	Completed.	Problem is beyond scope of this TNN, and may likely be worn or damaged suspension components.

There may be complaints about vehicles which pull during steady driving or during acceleration. If an alignment is performed as per VIDA, using the specifications in Service Bulletin 60-5500, and this does not resolve the complaint, you may use the diagnosis & repair flow chart shown above to try to remedy the condition.

This flow chart presumes that the front and rear suspension are in good condition, without worn bushings, connections, etc. Tires must be checked to verify that they have tread life remaining, and are not worn unevenly which can cause pulling. There must be no existing accident damage, and any previous accident damage must have been properly repaired to Volvo standards.

Note!

The use of any alignment equipment, whether retailer-owned or sublet, presumes that the equipment is in good working order and has been calibrated to the alignment equipment manufacturer's specifications within the last 12 months. Volvo Cars of North America ("Volvo") reserves the right to request evidence of such calibration. Repeat repairs due to use of non-calibrated equipment, or failure to provide calibration documentation upon request, may result in warranty claim denial by Volvo.

Service

TEST DRIVE NOTES:

The test drive should be done as follows: Accelerate rapidly up to 50 mph, noting how the car behaves during acceleration. Then hold the car at 50 mph long enough to note how it behaves during steady driving.

Then place the transmission in neutral and let the car freewheel, carefully noting how the car behaves the instant you put the gear in neutral: do the side forces reduce or disappear, or are they the same?

Vehicles always have a tendency to veer towards the edge of a crowned road. This tendency will make the car pull towards the side when driving in the "normal" traffic lane. To verify if there is a fault in the car, drive it on a perfectly flat road, or on a road which is crowned in the other direction. This might best be accomplished on a multi-lane road which has road crowns in both the left lane (to the left) and right lane (to the right).

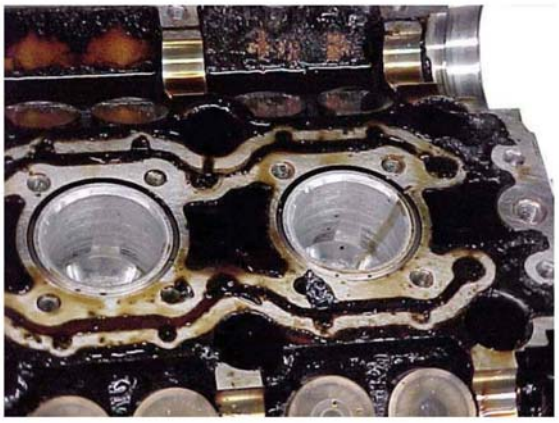
* depending on variant
** depending on diagnosis and variant

This TNN provides the customer with an alternative lower cost repair rather than engine replacement. It may be required to perform such cleaning if the engine has been contaminated due to the use of engine oil additives, use of engine oils that do not meet the manufacture's requirements, or not following the manufacture's recommended oil change intervals. Any engine related damage caused by the conditions stated is not considered warrantable.

SERVICE:

Introduction



One or more of the following conditions could cause the engine oil to thicken and leave deposits in the engine:

- wrong oil grade, quality and/or viscosity
- cars driven too many miles between oil changes
- cars frequently driven short distances with many cold starts
- excessive idling
- fuels of low quality and/or with high alcohol content
- additives added to oil or fuel
- high ambient temperature
- high air humidity

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Symptom

Possible symptoms are indicated as follows:

- Illuminated oil pressure lamp. Due to clogged oil suction strainer
  to oil pump and/or oil filter (see illustration)

- Noise (whistling)
  Noise due to high pressure in crankcase. Stops when the oil filler cap is removed. For model year 99-02, see TNN 25-149B

- Poor driveability
  Clogged crankcase ventilation can reduce the engine performance

- Uneven/oscillating idling
  Caused by clogged crankcase ventilation.

- Oil leak
  from engine seals due to restricted crankcase ventilation

- Noise (knocking)
  Low oil pressure can cause premature bearing wear

- High oil consumption / noise from turbo.
  Damaged bearing or seals in the turbo can cause these symptoms

If one or more of these symptoms presents itself, and an extremely dirty oil filler cap or screen is found, troubleshoot in the following order.

Diagnostics

IMG-245347

The first step is to inspect the oil filter to see if it is abnormally dirty.
An abnormally dirty filter is easily recognized by its thick, black deposits.
Engines with spin-on oil filters can be inspected by sawing the filter in half.

Oil trap check

IMG-245348

If the engine has a problem with carbon deposits, the passageways in the engine block and oil trap may be completely or partially clogged. See illustration. Remove and check the oil trap, hoses and their passageways in the engine block. There should not be any major collections of carbon deposits in the hoses or in the passageways in the block.

Oil sump/crankcase check

See information in VIDA for engine variant in question.
Drain the engine oil.
Remove the oil sump and check the oil sump and crankcase for deposits.
Normally, there should not be any deposits. A slight light brown discoloration is however normal.

IMG-245349

IMG-245350

The figures show an engine with heavy deposits.
Check the suction strainer on the oil suction line for contaminants and deposits.

If no trace of deposits has been found, no further checks are necessary and fault tracing can be considered complete.

If deposits have been detected in any of the above steps, follow the instructions below to remedy the problem.

Checking big-end bearings

See information in VIDA for engine variant in question.

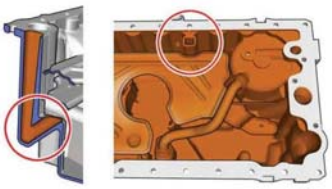
Note!
Mark the position of the big-end bearing caps.

Remove and check the big-end bearings for cylinder 2.
If the bearings are undamaged, reinstall the bearings and caps as marked.

If big-end bearing no.2 is damaged, replace all big-end bearings.

Note!
If any bearing is damaged, check the crankshaft for scratches.

If the crankshaft is damaged, discontinue troubleshooting and replace the engine.



Cleaning the oil sump

Clean the inside of the oil sump by removing any loose deposits.

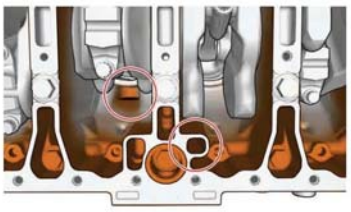
Note!
Make sure that the oil sump passageway from the oil trap is fully cleaned. See illustration. Blow clear with compressed air to ensure the duct is thoroughly cleaned.

Then clean the oil sump as described in the next step.
If it is not possible to properly clean the oil sump, oil sump replacement should be considered.

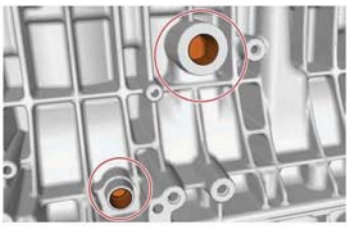
Cleaning/Washing

Washing should be done in a parts cleaning machine at no less than 70°C / 158°F for at least 30 minutes. Repeat if necessary. It is a good idea to change the position of the components several times during the cleaning/washing procedure.

Blow dry with compressed air after washing.



IMG-245353



IMG-245354

Cleaning the engine block

Clean the engine block passageway from the oil trap and the oil trap passageway in the block.
Use a screwdriver or similar small scraping tool and blow the passageways clean with compressed air.
Perform a general cleaning of the crankcase to remove all the carbon deposits. All loose deposits must be thoroughly cleaned.

Cleaning cylinder head

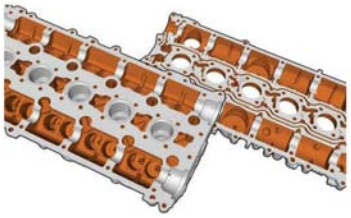
Note!
Remove the cylinder head from the engine before cleaning.

With the cylinder head removed from the engine. Use the information in VIDA for the variant in question.

Remove:

- valves
- springs

- valve stem seals.



Remove carbon deposits with a suitable tool, knife, scraper or the like. Then wash the cylinder head and cam carrier cover in a parts cleaning machine as described in step 8.

Note!
The VVT (Variable Valve Timing) unit and VVT solenoid must not be washed in a parts cleaning machine. Blow clean only.

Caution!
Be sure to lubricate the valve guides after washing in a parts cleaning machine to prevent the risk of corrosion!

Install the cylinder head

Install

- new valve stem seals
- valves
- springs
- new filter for VVT solenoid. (Does not apply to S40 (04-)/V50).

Install the cylinder head. Use information in VIDA for the variant in question.

Rebuilding the engine

Note!
Use new components.

Install:

- new oil suction line
- well cleaned or new oil sump
- new oil trap with new hoses and clamps
- new oil pressure switch
- new oil delivery line for turbocharger when applicable.

Engine oil, first change

Clean the oil filter casing and install the new oil filter.
Fill with new Synthetic Oil; this will assist in continuing the cleaning process. ACEA A1/B1, viscosity SAE 5W-30

Note:
Engines subjected to extreme driving conditions are to be filled with ACEA A1/B3, viscosity SAE 5W-30 Synthetic oil.
"Extreme" regards driving conditions that generate abnormally high oil temperature or oil consumption, such as driving in mountains with a lot of engine braking or when driving at high speeds on highways.
ACEA A3/B3, viscosity SAE 5W-30 Synthetic oil.

Customer information

Affix the oil decal (part no.30748024) on the upper radiator member. Remove any existing decal.

Caution!
Make sure that the customer is aware of the importance of following the prescribed oil change intervals and the benefits of using Synthetic oil to prevent engine oil deposits from reoccurring. Use the Synthetic oil grades specified in step 13.

Follow up oil and filter change

Drive 2,000 km/1,200 miles and then replace the oil and filter. Use one of the Synthetic oil grades specified at step 13.

Caution!
Follow the recommended oil change interval that applies to the vehicle in question.

Technical Service Bulletin # **TNN23-31** Date: **080416**

Fuel System - Starting Problems Parked on a Downhill

NO: 23-31
DATE: 04-16-2008
MODEL/MODEL YR:
S60 2001-
S80 1999-2006
V70 2001-2007
V7OXC, XC70 2001-2007, XC90 2003-
SUBJECT:
New Fuel Pump for Starting Problems When Parked Downhill
REFERENCE: VIDA

THIS TNN SUPERSEDES THE PREVIOUS VERSION DATED 11-28-2007. THE PART NUMBER LIST HAD BEEN UPDATED. PLEASE UPDATE YOUR FILES.

Note!
If using a printed version of this TNN, first check for the latest online version.

Description:
A vehicle may be difficult to start if it is parked facing downhill with a very small amount of fuel in the fuel tank. The vehicle will start normally if fuel is added to the tank or if the vehicle is moved to level ground.

Service:
A new style fuel pump has been introduced with an improved anti-siphon valve. If there is a customer complaint of this condition, use one of the new pumps listed in the chart below.

Old part no.	New part no.
30792852	31261127
30769013	31261128
30792854	31261130
30792477	31261131
30792857	31261133
30792859	31261135
30792861	31261137

Note!
See VIDA for the correct vehicle application. VIDA 2008A has been updated with the correct fuel pump application information.

Fuel System - Fuel Pump Control Module Replacement

NO: 23-32
DATE: 4-30-2008
MODEL: See chart below
M. YEAR: See chart below
SUBJECT:
Fuel Pump Control Module Replacement
REFERENCE: VIDA

Note!
If using a printed version of this TNN, first check for the latest online version.

Description:
A new fuel pump control module (also referred to as Pump Electronic Module, or PEM) has been introduced as a spare part, which requires a new location if it is replaced. This TNN applies to vehicles manufactured up to the chassis number in the chart below. If the PEM needs to be replaced, install the PEM in the new location as per the Service method below.

Model	Model Year	Type	Factory code*	Chassis No
S60 (plastic tank)	2005-2006	384	2	-509560
S60 R-line	2004-2006	384	2	-509560
S80	2005-2006	184	1	-430120
V70 (plastic tank)	2005-2006	285	1	-541131
V70 (plastic tank)	2005-2006	285	2	-539327
V70 R-line	2004-2006	285	1	-541131
V70 R-line	2004-2006	285	2	-539327
V70XC / XC70	2005-2006	295	1	-214136
* Factory code is position #11 in the vehicle's VIN.				
Note! S60/V70 cars with steel fuel tanks are not included in this method.				

Vehicles:

Description	Quantity	Part No.
PEM	1	30769225
Cable harness, **2004 S60R and V70R only**	1	30798698
Cable harness, **all other listed vehicles**	1	30798596
Flange screw	1	985191
Flange screw	1	985055
Flange lock nut	1	985869
Washer	1	960143

Parts:

Service

Information on new location

Note!
The pump electronic module (PEM) has a new location. The PEM has been moved from its previous location on the fuel tank, as illustrated. The new location is on the right rear edge of the spare wheel well.

Preparatory work

Removal of interior components

Ignition key in position 0.
Open the trunk lid/tailgate

Remove:
- the cargo compartment mat/floor hatches
- the rear seat cushion

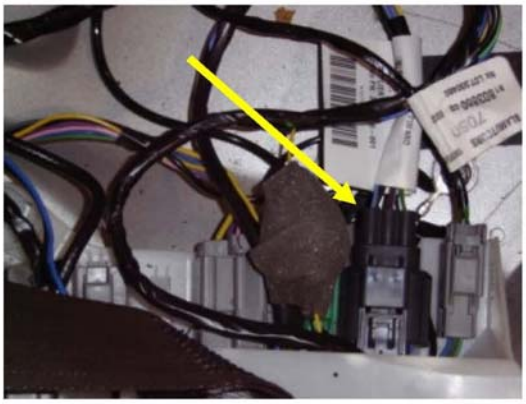
Fold forward the backseat's backrest.
Remove the side cushion. See:
> Removal, replacement and installation
> Body and interior
> Interior
> Rear seat, passenger seat, seat
> Upholstery, side cushion, replacing

Remove the right part of the backrest

Removing the child seat bracket:
- Remove the bracket from the floor
- Place the insulation to one side

Cable harness removal

Remove the right floor hatch over the fuel tank
Remove:



- the cable harness connector by the wheel housing/sill (arrow in photo)
- the cable harness connector at the fuel pump
- the cable from its mountings

Cut the cable harness as illustrated. This makes the cable harness easier to remove from the vehicle. Remove the remaining part of the cable harness with connector.

Removing the old PEM

Raise the vehicle. PEM is located at the fuel tank on the right side.
Remove:
- the connector from the PEM
- the PEM from the vehicle
- the cable harness from its mountings
- the cable harness from the vehicle

Check that the fuel line sits in its clamps.

Installation

Replacing the cable harness

Replace the rear cable harness with a new one according to the Parts chart on page 1.

Note!

Harness terminals for Model Year 2004 S60R/V70R only

Harness terminals for all other listed vehicles

The photos at left illustrate the two different types of terminals on the two harnesses. Ensure that the correct parts are used.

Cable harness installation

Connect the connectors at the sill and fuel pump.

Position the cable harness in the sealing ring socket and in the mounting on the body (arrow in photo).
Install the floor hatch. Tighten to 6 Nm (4.5 lb. ft.).
Carefully check that the seal is in place when the hatch is installed.

New PEM installation

The new PEM is to be positioned on the rear part of the spare wheel well on the right side between the two stampings and below the bead of sealant, as shown in the photo.
Remove the backing tape from the self-adhesive Velcro strap and install the PEM. Connect the cable's connector from the cable harness to the PEM.

Finishing work

Reposition the insulating mat.
Install:
- the child seat bracket to the floor.
  Use new screws:
  - 1 M1O tightened to 50 Nm (37 lb. ft.)
  - 1 M12 tightened to 80 Nm (60 lb. ft.).
- the backrest. Use new screw:
  - 1 M10, tightened to 50 Nm (37 lb. ft.)
- side cushion
- seat cushion
- cargo compartment carpeting/floor hatches.

Tire Monitor - Service Kit Part Numbers/Applications

NO: 77-21
DATE: 3-31-2008
MODEL: All with TPMS (Tire Pressure Monitoring System)
M. YEAR: 2005-
SUBJECT:
TPMS Sensor and Service Kit Part Numbers and Applications
REFERENCE: VIDA, TNN 77-18

Note!
If using a printed version of this TNN, first check for the latest online version.

Description

A Tire Pressure Monitoring System (TPMS) is required by the U.S. government to be fitted to 100% of the Model Year 2008 and newer vehicles. It is an optional system in Canada. TPMS was phased in during Model Years 2005-2007.

The parts information in VIDA regarding TPMS sensor part numbers is missing or incorrect. A future version of VIDA will be updated with the correct information. The most current information regarding TPMS sensor and service kit part numbers and model applications is below.

Service

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

For S40, V50, C70, C30 vehicles, and for MYO7- S80, MYO8- V70, and MYO8- XC70:

TPMS sensor with service kit pn: 30681555

Service kit alone (without sensor) pn: 31201796

For S60, -MYO6 S80, -MYO7 V70IXC70, and XC9O:
The original version of the TPMS sensor (pictured left) was used on:

^ -MY06 S60
^ -MY07 V70/XC7O
^ S60 up to chassis number -688292
^ XC90 up to chassis number -456766

This TPMS sensor pn: 30748991

For these models, the TPMS service kit pn: 30736598.

A newer version of the TPMS sensor (pictured left), with a rubber valve stem and a snap-in transmitter, was introduced in production from the following chassis numbers:

^ S60: 688293-
^ XC90: 456767- This TPMS sensor pn: 31200923

Note!
On Model Year 2008 S60 and XC90 vehicles, the appearance of a rubber valve stem does not indicate lack of TPMS sensors. As stated above, the sensor design changed. There is no need to replace the rubber valve stem type sensors with the earlier versions. Also, if service replacement is required, the two designs are compatible on the same vehicle.

All New S80	124	2007 - 2008	000850 - 067973
All New V70	135	2008	000359 - 027892
All New XC70	136	2008	000400 - 021605

* At the time of this writing

AFFECTED VEHICLES:

DESCRIPTION:

There may be a slight rattling noise from the front seat belts heard in the B-pillar area. This noise is caused by the metallic ball in the vehicle sensor (within the seatbelt). The vehicle sensor is used to detect the movements of the car. Example: (steep inclination and hard braking). The purpose is to activate the mechanical seat belt retractor locking unit.

If you have a documented and confirmed complaint of this noise, DO NOT replace the seat belt; proceed with the method on the following.

In order to avoid a repeat repair, be sure there is no other cause for this complaint.

SERVICE:

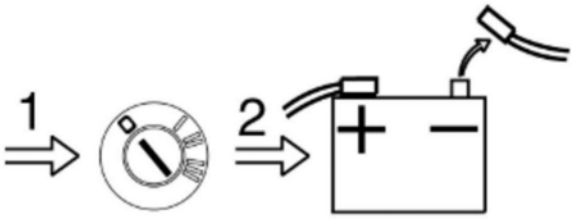
MATERIAL:

Description	Quantity	Part Number
Sound Absorber	2*	31267430

*1 per side

In documented and confirmed cases of seat belt rattle in the B-post area, install the sound absorber to the seat belt assembly according to the following.

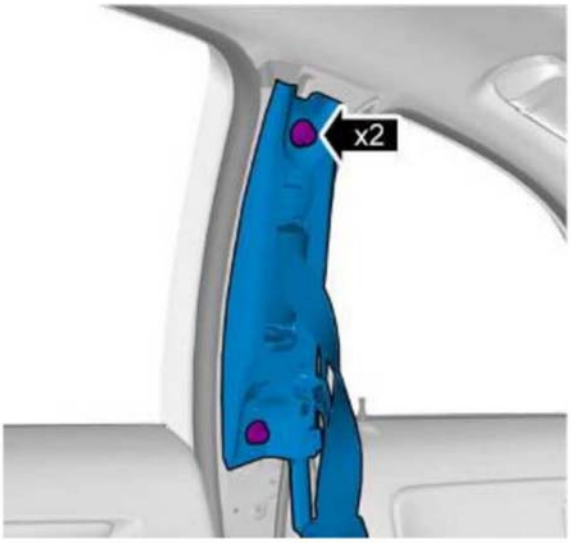
1. Preparation



Key in the off position

Disconnect the negative battery lead.

2. Removal

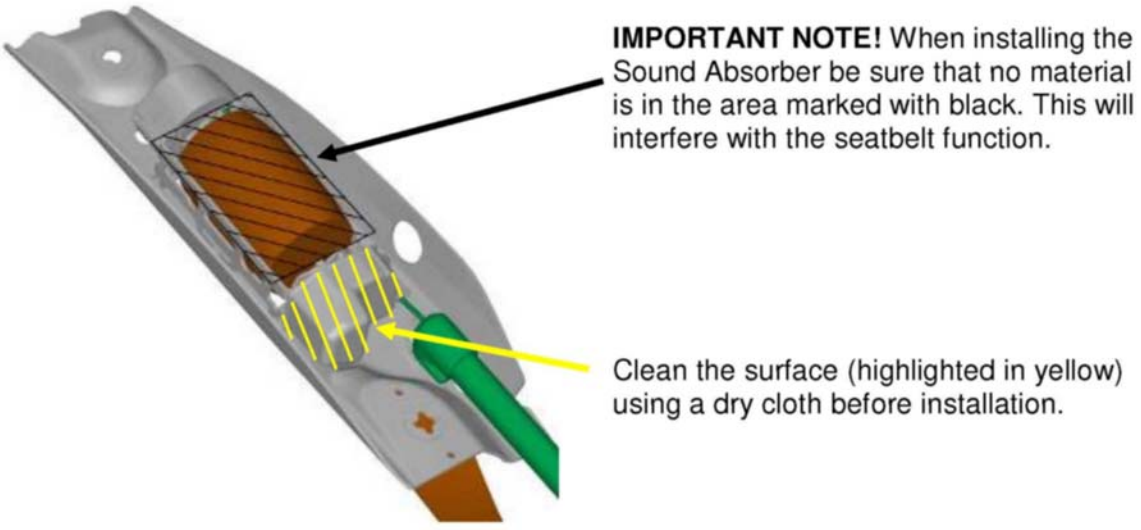


IMPORTANT NOTE!
DO NOT remove the SRS connector for this procedure.

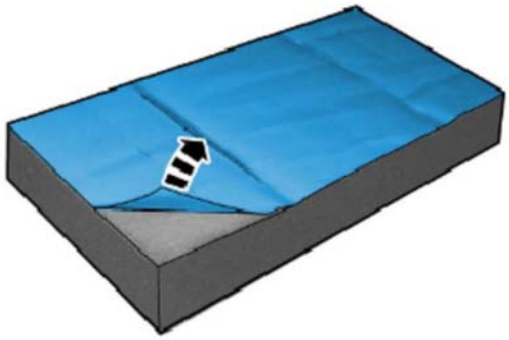
Remove the B-pillar panel, according to VIDA:

Removal, replacement, and installation

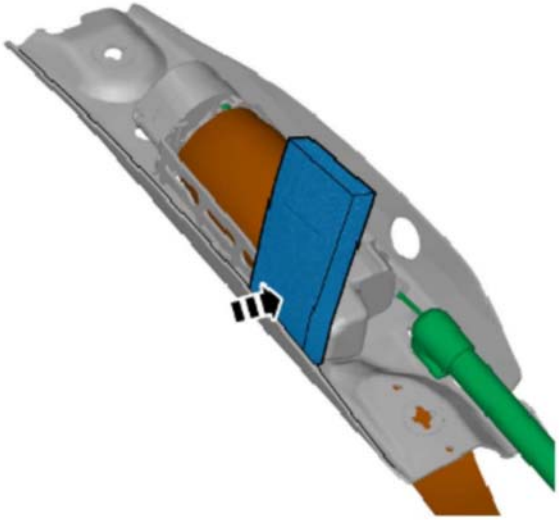
- 8 Body and interior
- 85 Interior
- Upholstery for wall/door, side, rear shelf, luggage rack
- Interior trim
- B-pillar trim panel



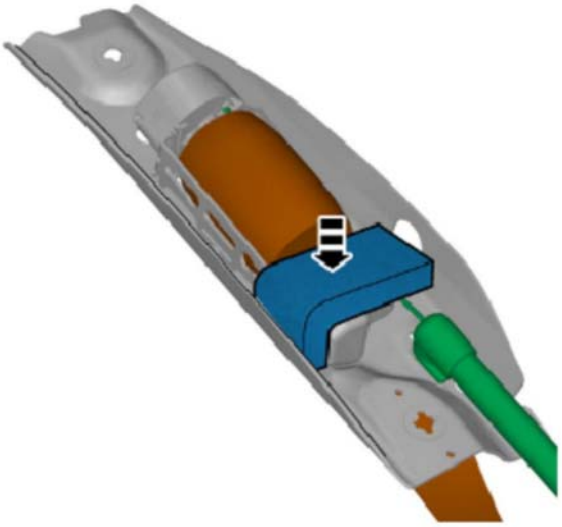
3. Sound Absorber Installation



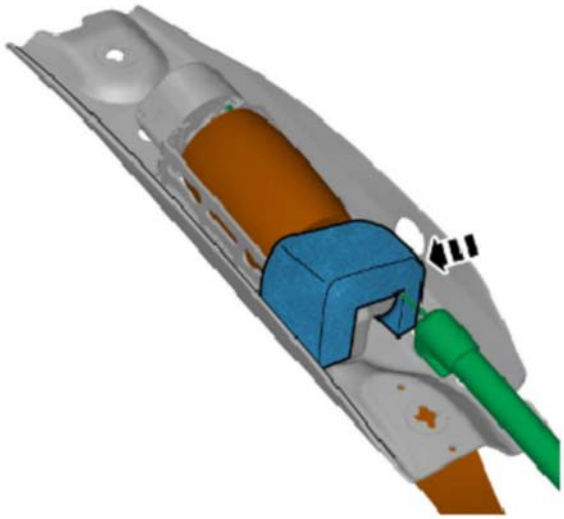
4. Peel the backing from the Sound Absorbing material and expose the adhesive.



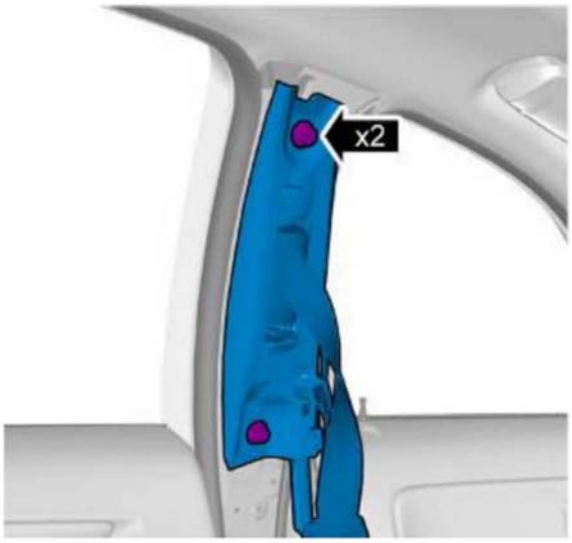
5. Position and adhere the Sound Absorber as shown.



6. Fold the Sound Absorber as shown and continue to apply to the seatbelt assembly.



7. Continue to fold the Sound Absorber as shown and apply to the seatbelt assembly.
8. Reinstall the seat belt assembly



Reposition the seat belt in the B-pillar as shown and torque to 29.5 lbs ft (40 Nm).

Install the B-pillar panel according to VIDA:

Removal, replacement, and installation

- 8 Body and interior
- 85 Interior
- Upholstery for wall/door, side, rear shelf, luggage rack
- Interior trim
- B-pillar trim panel

Verify operation of seatbelt by fully extending the belt and allowing it to retract.

Be sure the belt does not bind in any way when it is extended or retracted during this operation!

Drivetrain - Fluid Leakage From The Angle Gear

Retailer Technical Journal 18513
Angle gear leakage and resealing
5 cylinder AWD only
Date: 09-19-2008

Reference: VIDA, VSTG

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!
THIS DOCUMENT SUPERSEDES THE PREVIOUS RETAILER TECHNICAL JOURNAL 18513, DATED 07-08-2008. THE LABOR OPERATION CODES HAVE BEEN EDITED. PLEASE UPDATE YOUR FILES.

Model	Type	Model year	Chassis Range
S60	384	2002 - 2006	315000 - 502866
S80	184	2004 - 2006	335000 - 427792
V70	285	2001 - 2006	000000 - 533030
V70 XC / XC70	295	2001 - 2006	000000 - 209852
XC90	275	2003 - 2006	000000 - 228445

AFFECTED VEHICLES:

Description:

Oil leakage/moisture from the angle gear halves can be resolved by resealing the housing and replacing the seals. The angle gear itself does not normally need to be replaced.

There are two reasons an angle gear should not be resealed and instead should be replaced:

1.) There is angle gear noise/binding while driving.

2.) There is angle gear backlash, bearing damage, or excessive pinion shaft play found during disassembly.

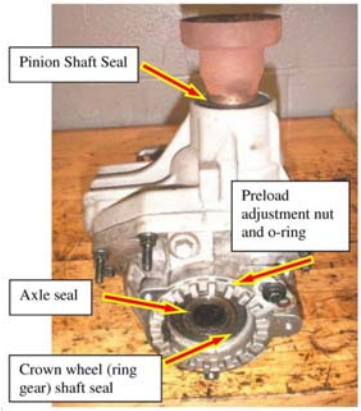
Ring gear shaft seal drift	999 7087	
Protractor (angle torque gauge)	951 2050	

** Part of the standard for Consumables/Chemicals.*
*** Items will be used for more than 1 repair.*
**** The filter and bleeder pipe will only be used if the angle gear does not already have the improved angle gear vent.*

If the leak is only from the angle gear vent, only replace the vent with the new style vent. If the leak is from the angle gear halves, separate and reseal the angle gear housing according to the following procedure in conjunction with the removal and replacement procedures in VIDA.

1. Remove the angle gear according to VIDA.

2. Drain the oil from the angle gear.



3. Remove the axle seal, right side crown wheel shaft seal, and preload adjustment nut o-ring from the angle gear according to VIDA under Sealing rings bevel gear, replacing.

   Remove the pinion shaft seal according to VIDA under Pinion seal bevel gear, replacing.

Note!
The ring gear will be referred to as a crown wheel in this document.

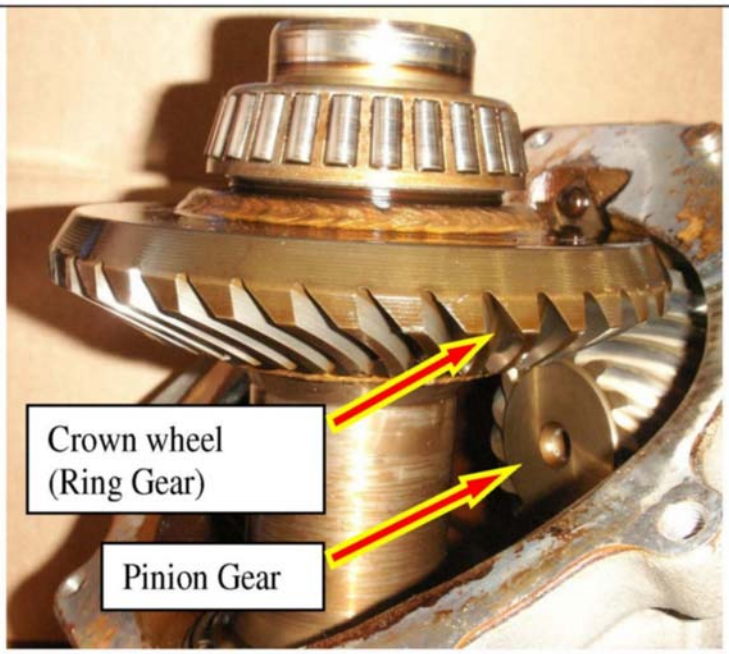
4. **Warning!**
   Use protective eyewear.

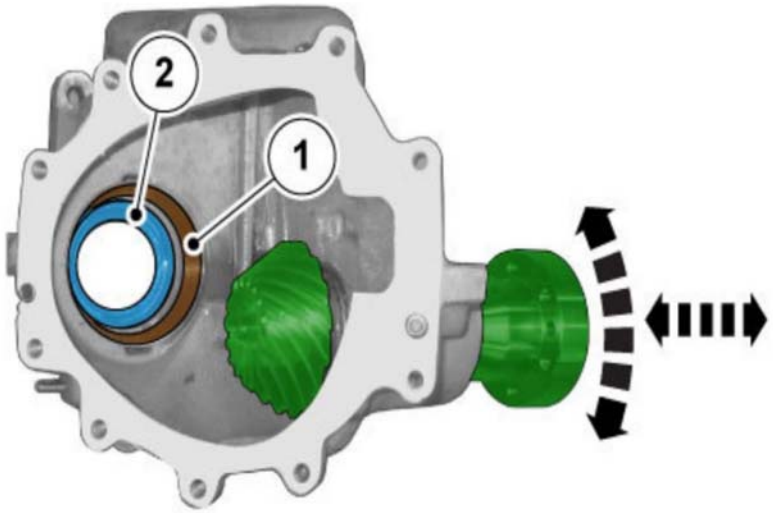
   Clean the angle gear using isopropanol 1161721 around the mating flange.

   Blow clean with compressed air.

   Remove the 10 screws and the cover. Carefully tap the cover using a plastic hammer to release it.

5. Remove the crown wheel.

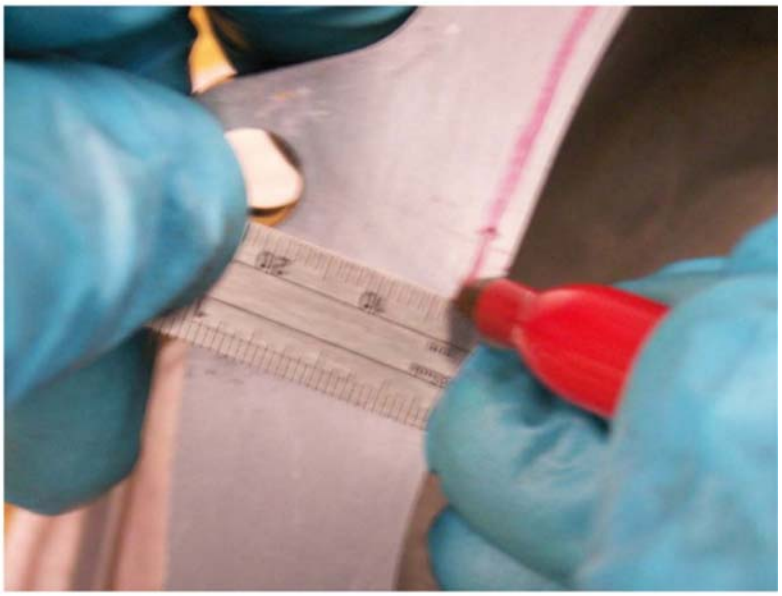


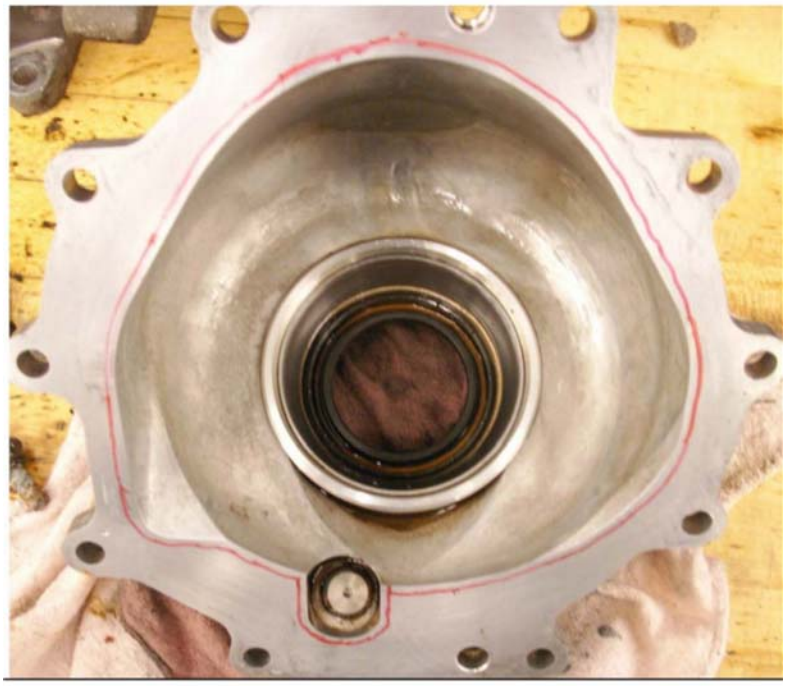


Check the pinion gear and crown wheel teeth for abnormal wear or damage. Check pinion shaft for axial play or any kind of binding. Check the bearing races (1) in both halves of the angle gear.

If a bearing race is damaged the pinion shaft has play, there is abnormal gear wear, or if there is any kind of binding, replace the angle gear.

If OK, remove the left side crown wheel shaft seal (2) according to VIDA under sealing ring, crown wheel shaft, left-hand side, replace and continue with the Step 6 of the resealing method.





6. Measure 3 mm (approx. 1/8") from the inside of the flange and make a line with a permanent marker.

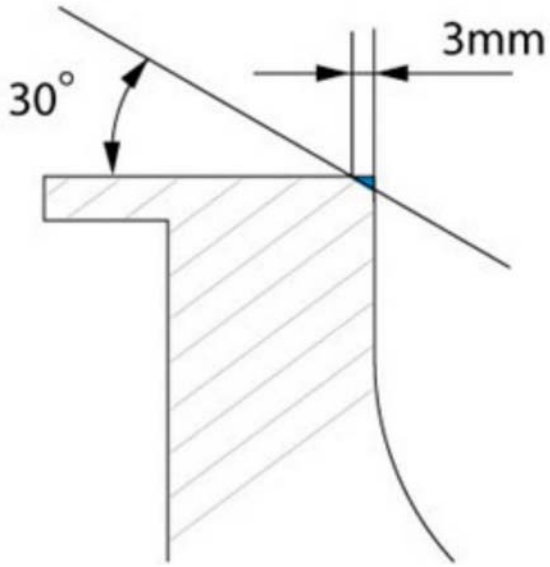
Note!

This procedure can be made easier by making a template which can be reused for several repairs.

7. **Caution!**
   Care must be taken to avoid damage to the bearing race while filing. A coffee cup can be used to cover the bearing race.

8. **Warning!**
   Use protective eyewear!

Flat-tail file (left) and half round file (right).



File off the inner edge of the cover as illustrated, following the marker line, using a file.

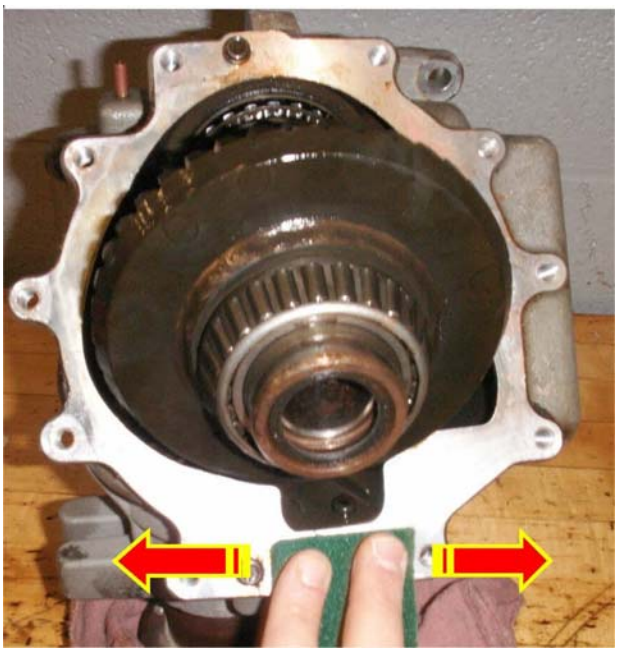
The finished product should look like this.

9. After filing, polish the chamfer using a fine emery cloth so that scoring in the chamfer goes along the chamfered edge.

Note!
Use the emery cloth radially, along the flange just as the arrows indicate.

10. Clean out filing swarf.

11. Clean the gasket from both flanges using gasket remover 1161847 and abrasive cloth 9511024. Cleaner H, 1161436 can be used as an alternative.



Note!
Use the abrasive cloth radially, along the flange.

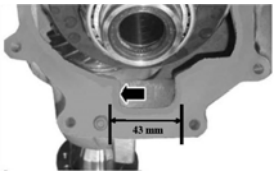
Clean the flange using isopropanol 1161721.

Cleaner H, 1161436 can be used as an alternative.

12. Apply a 5mm (approx. 3/16") bead of chemical gasket 1161771 approx. 1 mm (approx. 1/32") from the chamfered edge.

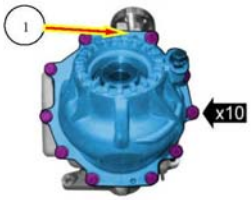
Note!
The next few steps should be done within 5 minutes so that the angle gear halves are torqued together while the sealant is still wet.

Pay close attention to the route of the sealant at **Note 1** in photo. This is for the opening on the opposite half of the angle gear case.



This is the opening that requires the 43 mm (approx. 1 - 11/16") spacing in the silicone.

Do not apply sealant to both halves.

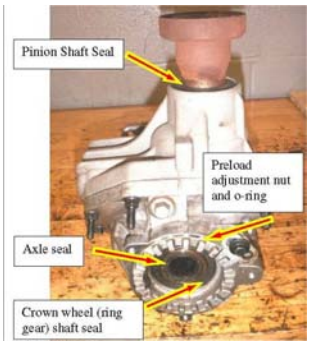


13. In order to aid in installation and to avoid affecting the silicone bead when reassembling the cover, set the cover over the locating pin marked "1" first, then carefully lay the cover down to lay flat on the flange.

    Use new screws and tighten the 10 screws crosswise to 18 Nm (13.25 ft. lbs.).

    Then angle tighten the 10 screws crosswise 85º.

    Note!
    Some models may use studs in place of 3 of the screws.



14. Install the axle seal and preload adjustment nut o-ring from the angle gear according to VIDA under Sealing rings bevel gear, replacing.

    Install the pinion shaft seal according to VIDA under Pinion seal bevel gear, replacing.

    Install new left side and right side crown wheel shaft seal according to VIDA under sealing ring, crown wheel shaft, left-hand side, replace.

    Note!
    Be sure to lubricate the sealing ring lips with wheel bearing grease, P/N 1161689 before installation.

15. If the angle gear does not have the improved vent in place, as shown, install new bleeder pipe and filter.

Note!
Some models may not use a vent.

16. Fill the angle gear with 0.65L (22 oz.) of oil P/N 1161648.

Install new drain plug gasket P/N 11998.

17. Install the angle gear according to VIDA.

Note!
New screws must be used to install the angle gear to the transmission.

A/C - Climate Control System Cleaning

Retailer Technical Journal 19292

Climate control system, cleaning

Date: 10-07-2008

Reference:

VIDA, Special Tools Bulletin 163

Retailer Technical Journal 17865

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!
THIS DOCUMENT SUPERSEDES THE PREVIOUS RETAILER TECHNICAL JOURNAL (RTJ) 19292, DATED 6-23-2008. THE OPERATION TIME FOR C30, S40, V50 AND C70 HAS BEEN INCREASED TO 0.4 HRS; ALSO ADDED, IS INFORMATION CONCERNING THE REMOVAL / REINSTALLATION OF THE ACCELERATOR PEDAL ON C30, S40, V50, AND C70. PLEASE UPDATE YOUR FILES.

Models	Type	Model year	Chassis range
ALL	ALL	ALL	ALL

AFFECTED VEHICLES:

DESCRIPTION:

A new tool and cleaning treatment designed to disinfect the climate system has been introduced. Should a customer report a climate system odor, the following should be treated, checked, and replaced. Included in this document is information related to the tool, treatment, and how to locate the instructions for use.

- Ensure the odor is not from some other source and all other A/C system checks have been completed. (No water standing underneath the floor carpets.)
- There are no refrigerant leakages (not PAG oil causing the odor).
- Climate housing drain hose is installed correctly, not clogged - drains sufficiently.
- Aircomatic treatment; tool and treatment agent listed.
- After the treatment is completed; replace the climate system (pollen) filter.
- Engage the Afterblow function on applicable vehicles, instructions for afterblow engagement can be found in RTJ 17865.

S60	2001 -
S80	1999 - 2006
V70, XC70	2001 - 2007
XC90	2003 –

Up through 2002 Afterblow was activated from the factory, 2003 and later Afterblow will be Retailer activated only.

NOTE:
At the time of this writing, afterblow is applicable to these vehicles:

Description	Quantity	Part Number
Cleaning Agent	1 per vehicle treatment	1161837

NOTE: To order additional cleaning agent use the part number listed above, stock order only, quantity 1 equals 1 case (12 bottles) and 1 bottle = 1 treatment.

MATERIAL:

Description	Quantity	Part Number
Aircomatic II	1	9814105

TOOLS:

SERVICE:

To complete the treatment with the Aircomatic unit and cleaning agent, see VIDA instructions.

IMPORTANT:
See Accelerator Pedal Removal / Installation; C30, S40, and C70 for information specific to C30, S40, V50, and C70.

NOTE:
At the time of this writing, not all vehicles / model years are included in VIDA 2008 C. Additional vehicles will be added with new versions of VIDA. The general instructions apply to all vehicles.

- Vehicle Profile / choose the appropriate vehicle - select OK
- Information
- Cleaning, Inspection and Adjustment
- 8 Body and Interior
- 87 Climate units
- 870 general

- Climate control system, general

- Climate control system, cleaning

IMPORTANT:
This treatment is designed to last 6 - 12 months, and may need to be completed again sometime in the future.

As noted in VIDA: "An odor is present for a few days after cleaning, which is usual". The odor is of a perfume type and be sure to advise the customer of this.

Accelerator pedal Removal / Installation; C30, S40, V50, and C70

In order to remove / replace the climate system (pollen) filter on C30, S40, V50, and C70 vehicles, the accelerator pedal needs to be removed / reinstalled. While removing the pedal, the bolts (studs) used to hold the accelerator pedal assembly in place may become loose when the "compressed nuts" are removed by the technician. The installation process of the bolts (studs) was modified to reduce the possibility of this from the following chassis numbers; S40-92141 / V50-91193. The nuts holding the accelerator pedal changed from compressed nuts to "regular" M6 nuts from the following chassis numbers; 544-276806 / 545-291234 / 542-14430.

IMPORTANT NOTE:
Many of the bolts (studs) loosened from their mounts have been caused by the use of pneumatic tools (i.e. air ratchets). Regardless of the chassis number or production modifications, pneumatic tools should never be used to remove / install the accelerator pedal mounting nuts!

During accelerator pedal reinstallation, any previously installed compressed nuts should be replaced with regular M6 nuts, P/N 985919 (x3).

LABOR OP	LABOR DESCRIPTION	LABOR TIME
87376	Climate control system, cleaning C30, S40 (2004.5-), V50, C70 (2006-)	0.4 hrs
	Includes removal / installation of accelerator pedal	
	S60	0.5 hrs
	XC90, S80 (1999 – 2006), V70 (2000 – 2007), XC70 (2001 – 2007)	0.6 hrs

Steering - ZF Steering Gear Fluid Line Replacement

Retailer Technical Journal 11280
ZF steering gear,
Oil pipes replacement procedure

Date 01-30-2009
Reference: VIDA, VSTG

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

Model	Type	Factory Code*	Model year	Chassis range
S80	184	1	2004 – 2006	335000 – 436803
XC90	275	1	2004 – 2006	032124 – 260610
V70	285	1	2004 – 2006	350636 – 558182
V70	285	2	2004 – 2006	349395 – 557371
XC70	295	1	2004 – 2006	123067 – 222169
S60	384	2	2004 – 2006	315516 – 524710

*Factory Code is in the 11th digit of the VIN (Vehicle Identification Number).

AFFECTED VEHICLES:

DESCRIPTION:
The procedure for removal and replacement of the oil pipes on the steering gear (rack) is missing in VIDA. These are not the power steering pressure and return hoses that route power steering fluid to and from the power steering pump/reservoir. These are the metal pipes on the steering gear itself. Also, a new clip has been implemented into production after
chassis limits listed above to hold the pipes to the steering gear.

Material	Part No.
Servo oil*	30741424

*Part of shop supply

MATERIALS:

Special tools	Part No.
Puller	999 5259
Lifting hook	999 5460
Lifting beam	999 5716
Fixture	999 5972
Lifting eyelet	999 7018

These tools will be used during removal and replacement of the steering gear per VIDA.

TOOLS:

SERVICE:
The oil pipes can be replaced according to the following instructions. A new clip comes with the pipes as part of a "pipe kit" (found in VIDA parts catalog).

Preparations

Remove the steering gear according to VIDA:
-Removing, replacing and installing
-Suspension, steering
-Steering gear
-Steering gear, replacement

Note!
Seal the intake and exhaust connections from the servo pump with plastic plugs immediately after removal.

Replacing the oil pipes

Remove the protective plate from over the pipes.

Seal the intake and exhaust connections using plastic plugs.

Carefully clean around the oil pipe connections and blow dry.

Remove the pipes.

Carefully check that there is no residue of the old sealing rings in the connections on the steering gear.

Install the new sealing rings on the oil pipes. Lubricate the sealing rings using servo oil 30741424 (1 litre).

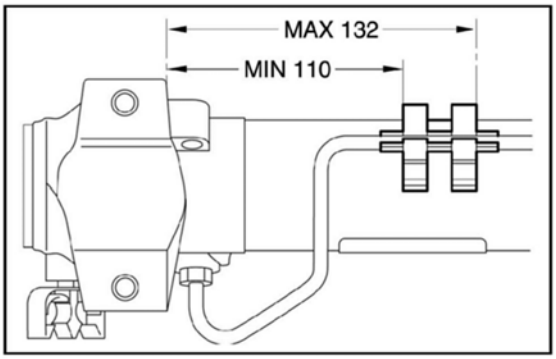
Carefully install the new pipes with the sealing rings to the steering gear.

Note!
Use a new screw for the pipe's holder.

Tighten the pipe nuts to 7 Nm (5.2 ft. lbs. or 62 in. lbs.) and the holder screw to 12 Nm (8.9 ft. lbs. or 106.2 in. lbs).

Install the protective panel over the pipes.

Install the support clip for the oil pipe



A support must be positioned on the longer of the two oil pipes as illustrated.
MAX 132 mm (5.2")
MIN 110 mm (4.3")

Note!
Only one support must be used, the illustrations show the support in its relevant outer positions.

Install the steering gear

Install the steering gear in reverse order.

Note!
Checking and adjusting Toe-in must not be carried out since no adjustable joints have been loosened.

A/T - Coolant Contamination Information

Retailer Technical Journal 16724

Coolant contamination in automatic transmissions

Date: 10-8-2008

Reference: VIDA

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!
THIS DOCUMENT SUPERSEDES THE PREVIOUS VERSION OF RTJ 16724 (TNN 43-48) DATED 4-18-2007. Changes have been made to the cooler and hose replacement guidelines. PLEASE UPDATE YOUR FILES.

Model	Type	Model year	Chassis range
ALL	ALL	ALL	ALL

AFFECTED VEHICLES:

BACKGROUND:

The root cause for some automatic transmission failures is glycol contamination from the engine/transmission cooling system. Severe cases of contamination are easy to detect by a visual inspection. The transmission fluid will have a milky appearance and there may be signs of transmission fluid in the coolant reservoir. Less severe cases are impossible to detect without doing a chemical analysis of the transmission fluid. This slight contamination is easy to overlook and will result in a repeat transmission failure.

A small leak from the cooling system into the transmission can cause driveability problems long before there are any visual signs of contamination.

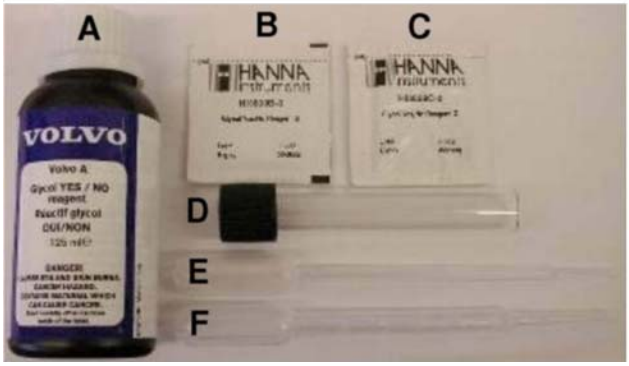
SYMPTOMS OF COOLANT CONTAMINATION:

The most common symptom of coolant contamination is shudder; a high frequency vibration.

^ On AW55 transmissions, the shudder normally occurs while in torque converter slipping lock-up mode. It is most easily reproduced by driving slightly uphill at about 40 MPH (65KPH) in 4th or 5th gear with light pedal at 122°-158°F (50-70°C) transmission oil temperature.

^ On the GM4T65 transmission, the shudder normally occurs during upshifts.

^ On all transmissions, other symptoms such as harsh shifts, slipping, flare, loss of drive, other DTCs, etc... are possible but not likely.



A: Volvo A reagent (clear liquid)
B: Reagent B (white powder)
C: Reagent C (purple powder)
D: Glass test tube with cap
E: Small pipette
F: Large pipette

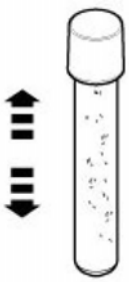
The Volvo test kit, PN 30783360, will accurately detect even very low levels of glycol contamination in transmission oil. One test kit contains materials to perform 25 tests.

1. Start with a clean test tube. Wash it with a soap solution and the brush which is supplied in the kit.

   Use the large pipette to put 5 ml (2 x 2.5 ml) of Volvo A (clear fluid) into the test tube.

2. Add 0.5 ml of the oil to be tested using the small pipette.

3. Add one packet of reagent B (white powder) to the test tube.

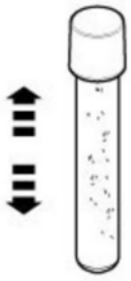


4. Screw on the cap & shake the tube until all the powder has dissolved.

5. Place the test tube in hot tap water for 5 minutes.

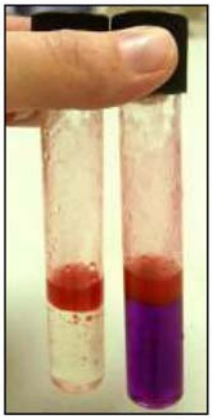
   (A coffee cup full of tap water which has been microwaved for 2 minutes is suitable.)

6. Unscrew the cap and add one packet of reagent C (purple powder) to the test tube.



7. Screw on the cap & shake the tube until all the powder has dissolved.

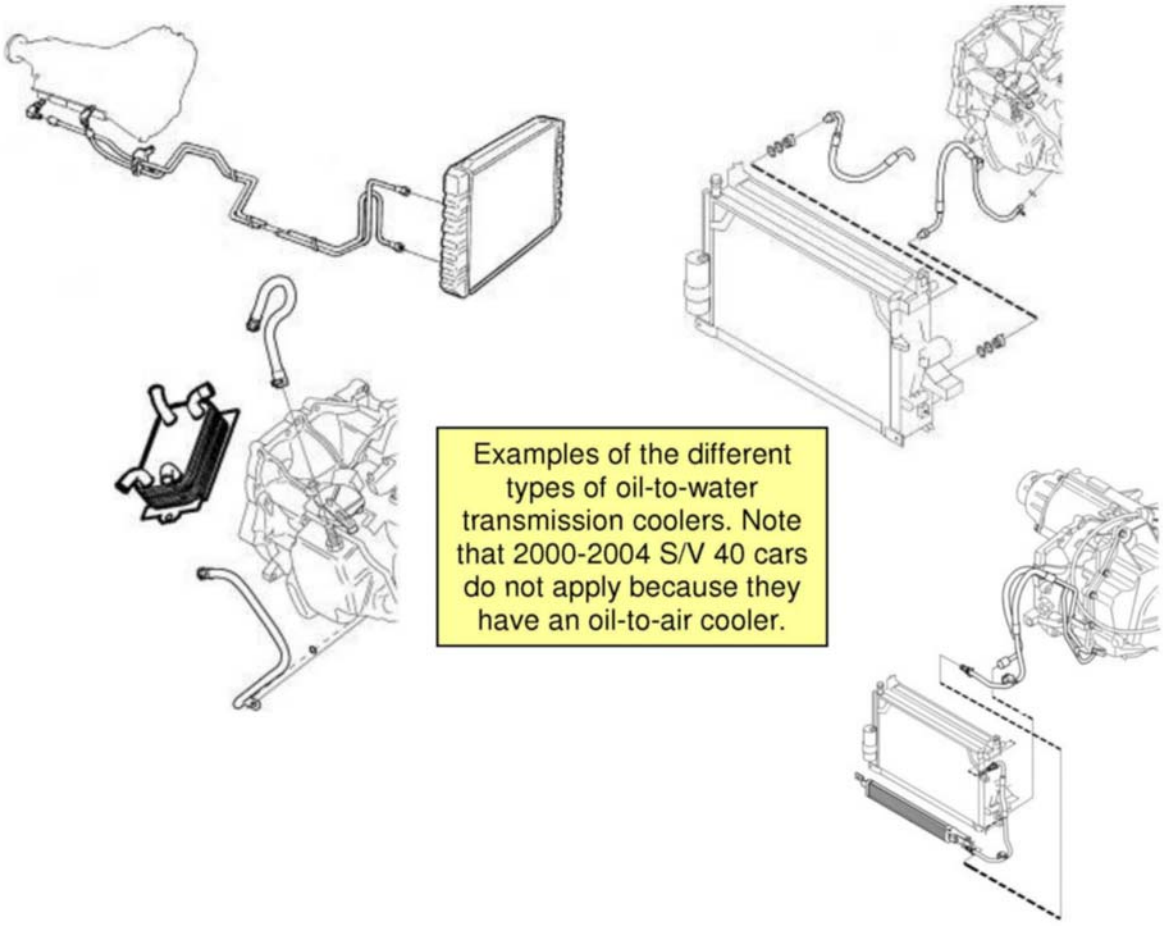
8. Place the test tube in hot tap water for 20 minutes.



9. A clear (no color) result indicates no glycol contamination.

   A purple result indicates glycol contamination.

SERVICE:



Examples of the different types of oil-to-water transmission coolers. Note that 2000-2004 S/V 40 cars do not apply because they have an oil-to-air cooler.

If the sample tests positive for glycol, the transmission and cooler will need to be replaced. The cooler hoses will need to be flushed with clean transmission fluid or replaced. For 1999- 2006 S80s and 2003-2005 XC90s with the GM4T65 transmission, replace the radiator, auxiliary cooler (if applicable), and all three cooler hoses in the case of glycol contamination.

WARRANTY CLAIM INFORMATION

LABOR OP	LABOR DESCRIPTION	LABOR TIME
04732-6	Coolant Contamination Test	0.2 hr

MATERIAL PART NUMBER	MATERIAL DESCRIPTION	COST
30783360	Test Kit	1/25th of kit cost

Claims may be submitted under the new car warranty when there is a documented customer complaint using claim type: 01

In the event of needing to test for coolant contamination as part of a warranty repair, the labor and part description shown above can be used.

Note:

The following kit is also available as an alternative, but not via a Volvo part or tool number. It can be purchased directly from the manufacturer. Each kit includes material to test 10 transmissions.

Nelco Company LLC, Glyt-Tek Test Kit
1047 McKnight Rd S, Saint Paul, MN 55119
Phone: 651.738.2014 Fax: 651.738.9447
E-mail: Cvnelco@aol.com
www.aviceda.com/nelco/index.htm

TESTING FOR GLYCOL CONTAMINATION WITH NELCO GLY-TEK KIT:

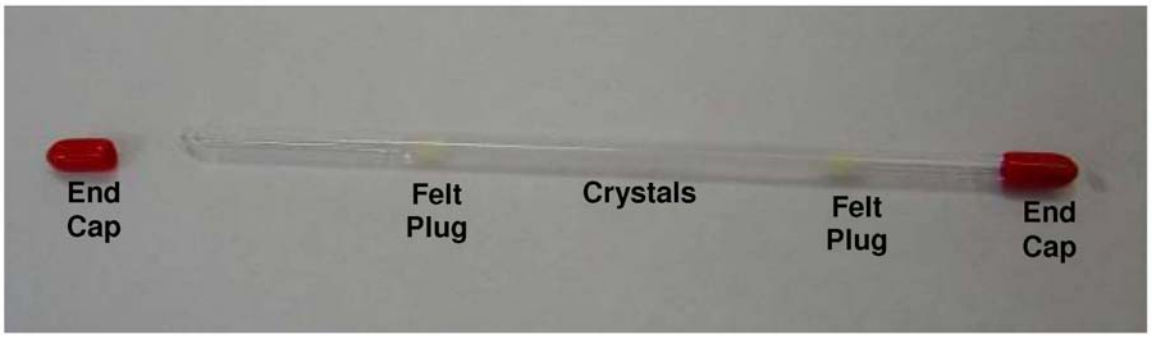
1. Let the vehicle sit for several minutes. Using a clean bottle, take a small sample of oil from the sump via the drain plug.

2. Open one vial. Twist the cap while removing it. Do not use the one with the red cap (it is a sample already containing glycol).

3. Using a new syringe, add oil to the vial. The vial should now have about 50% oil, 50% clear liquid.

4. Cap the vial and shake it vigorously for 20 seconds.

5. Remove the cap and let the vial sit until the liquids separate.



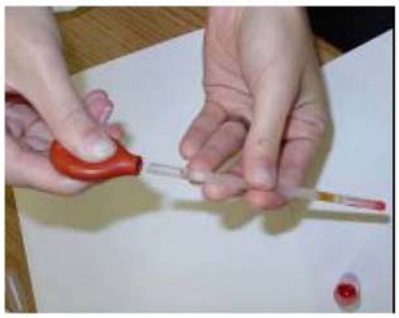
6. Remove the red caps from both ends of one glass tube. Note that for the remaining steps (7-12), care must be taken not to allow the crystals or felt plugs from coming out of the tube.

7. Protect your eyes and hands from any small pieces of glass by wrapping the tube in a paper towel. While holding the tube horizontally, break off both ends at the score marks.

8. While holding the tube horizontally, install the rubber bulb onto one end. Twist it while pushing it on.

9. While holding the tube horizontally, slowly squeeze the bulb to remove the majority of the liquid from the crystals.

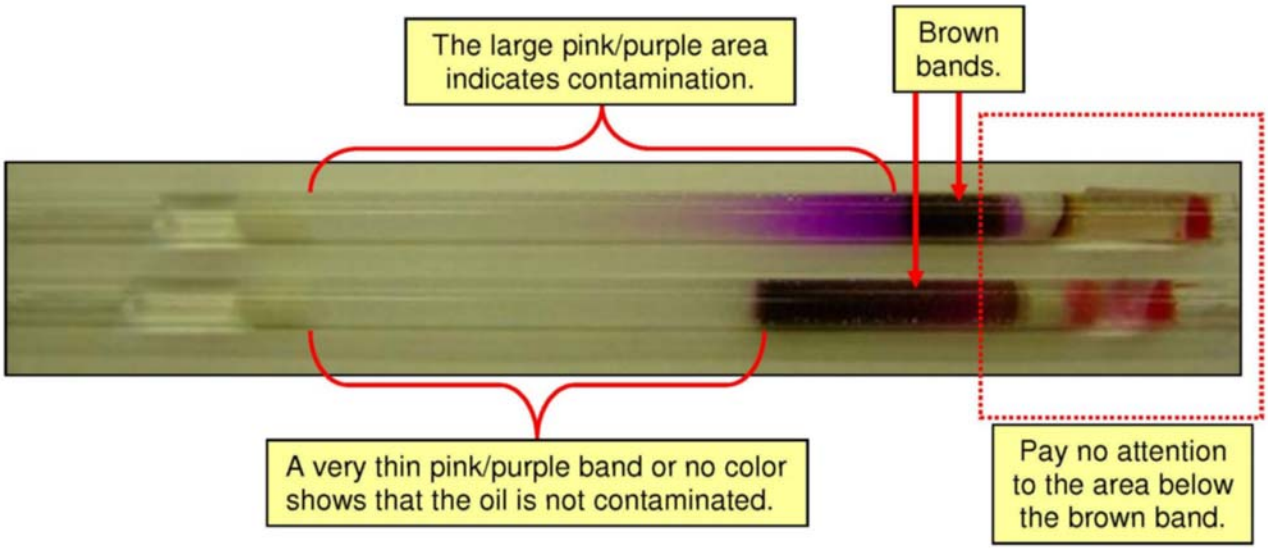
10. With the bulb squeezed, insert the open end of the tube into the bottom of the vial (through the oil, into the clear liquid).



11. Slowly release the bulb to draw liquid into the tube. Stop when the liquid is just past the top felt plug and remove the bulb. Do not draw liquid into the rubber bulb, as it will need to be kept clean for future tests.

12. Immediately lay the tube down flat and let it sit for exactly 15 minutes.

ANALYZING THE RESULTS:



After the tube has been laying flat for 15 minutes a brown band will have formed in the crystals above the bottom felt plug. A large pink/purple area above this brown band indicates the presence of glycol. A very thin pink/purple band or no color above this brown band shows that the oil is not contaminated.

MATERIAL PART NUMBER	MATERIAL DESCRIPTION	COST
16	Test Kit	1/10th of kit cost ($7)

Claims may be submitted under the new car warranty when there is a documented customer complaint using claim type: 01

INFORMATION FOR NELCO GLY-TEK KITTechnical Service Bulletin # **TJ20057** Date: **081112**

Cell Phone - Bluetooth(R) Software Upgrade Information

Retailer Technical Journal 20057
Accessory Bluetooth Software Upgrade information and procedures

Date 11-12-2008

REFERENCE:
VRC2/ Bluetooth SW compatibility matrix
Note! If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

AFFECTED VEHICLES:
All with accessory installed Bluetooth hands free telephone system

Background:
To be able to upgrade the Accessory Bluetooth hand free system with improved compatibility and functions, a new SW download procedure has been developed. By identifying the version of the present Accessory Bluetooth hand free control unit and its SW version, it may be possible to upgrade the Bluetooth system without replacing the control unit.

SW upgrade of the Bluetooth control module is not possible for all systems. See instruction at "SERVICE"

REASONS FOR UPGRADING THE CONTROL MODULE:

1. Customer has bought a new mobile phone that does not work together with the Accessory Bluetooth hand free system. (It did function with previous mobile phone) Please check that the new mobile phone is compatible with the Accessory Bluetooth hand free system before

performing the SW Upgrade.

2. Customer claims that it only is possible to call the 9 first phonebook entries, but it should be possible to call any of the present phonebook entries.

3. Customer wants the Russian or Portuguese language to be present in the Accessory Bluetooth hand free system

4. Customer wants to transfer new contacts from his mobile phone to the phonebook list in the Accessory Bluetooth hand free system.

Refer to the Accessory Bluetooth compatibility matrix on VRC2. Service tab / Business development / Bluetooth compatibility matrix

NOTE!

Performing a software upgrade for the following reasons will NOT be accepted for warranty:

^ Customer requests more functions

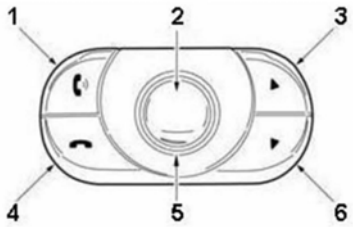
^ The customer has purchased a new mobile phone that is not compatible with the existing SW version in the vehicle.

Before any actions are performed, please check that the Bluetooth control module is programmable, See below control instruction at SERVICE.

SERVICE:

1. Check if the Bluetooth control module version is possible to upgrade by performing the following control steps:

^ Turn ignition off.



^ Press the "End-button" (4), see picture above, and keep it depressed while the ignition is turned on. Keep the button depressed for another 10 seconds until a voice confirmation stating "Language Menu" on the desired language. Release button (4).

^ Count the number of languages by pressing the "Volume Up" button (3) and wait for the voice confirmation stating the different languages.

^ Turn the ignition off

^ If the Accessory Bluetooth hand free system contains only 6 languages, it CANNOT be upgraded with a later software version.

^ If the Accessory Bluetooth hand free system contains 10 or 11 languages, it CAN be upgraded with a later software version.

2. Once it has been determined that the control unit is programmable, download the 2 attached upgrade software files as per the instructions.

Important: Please read the "reflashing overview" in it's entirety before proceeding.

Important: When you flash your hand free system, all contacts in your Contacts list, and devices in your Device list may be deleted.

^ The system can be put into reflash mode using the control panel.

^ While in reflash mode, the Blue LED flashes slowly indicating it is waiting for a file to be sent over Bluetooth.

^ While a file is being transferred over Bluetooth, the Blue LED flashes rapidly indicating a file is being downloaded.

^ Once the file is transferred, the Blue LED will continue to flash fast for several seconds while file is being written to memory.

^ You can flash only one image file at a time.

^ Once the file is written, the Blue LED is fully lit for 10 seconds indicating success.

^ An audio indicator of the flashing status is also supported for convenience, (turn on the radio with appropriate volume). Early bootloader SW does not support this feature

^ Reflash will automatically be exited if no files are transferred in a 10 minute period or simply by turning on and off the vehicle ignition.

The software files will be delivered to the Accessory Bluetooth control unit via Bluetooth communication from a properly prepared PC. *See setting up the PC for reflash*

USB Bluetooth unit, part number: **9513005**

USB cable **9513007**

Tools:

Software Reflash Files

The software files for downloading are provided as an attachment to this RTJ in TIE (Technical Information Exchange). Please save the attached software files to the desktop before starting the software download process.

There are 2 types of files:

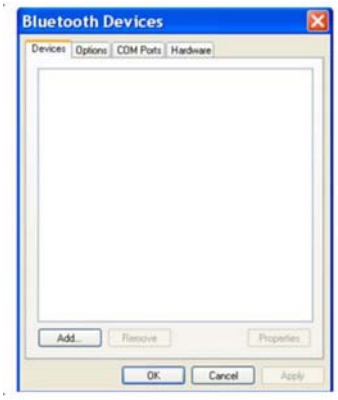
^ Bootloader - This is the software that bootups the control unit and controls the reflash process. It has the following naming format: xxxxxxxx_boot.mrf, where "xxxxxxxx" is the version number. The bootloader file takes 1 minute to flash.

^ Combined Application - This file contains the main application, configuration settings for your vehicle type e.g. hand free settings for different installation configurations and various languages of the system.

It has the following naming format: xxxxxxxx_comb.mrf, where "xxxxxxxx" is the version number. The combined file can take up to 10 minutes to flash.

Using the Bluetooth Reflash Feature

1. Setting up the PC for Reflash



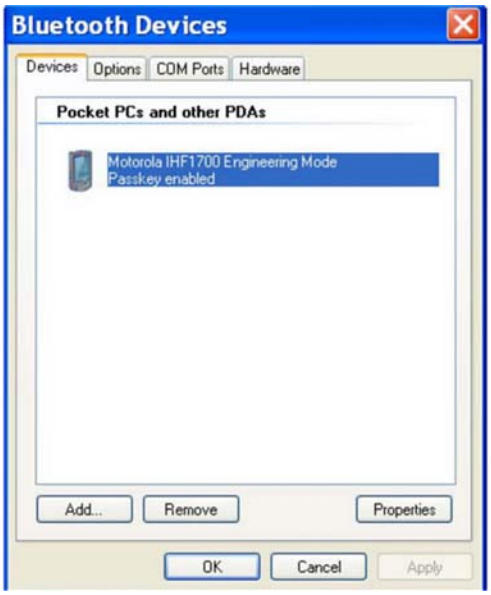
1:1 Click Start->Control Panel and double click on Bluetooth Devices. The "Bluetooth Devices' panel is displayed.

1:2 In the "Options' tab enable the "Show the Bluetooth icon in the notification area' box and click "Apply'. Click on "OK' to close the panel. Close the control panel.

1:3 A Bluetooth icon is now visible in the task bar.

2. Removing paired devices

2.1 Right click on the Bluetooth icon in the task bar and select "Show Bluetooth Devices'

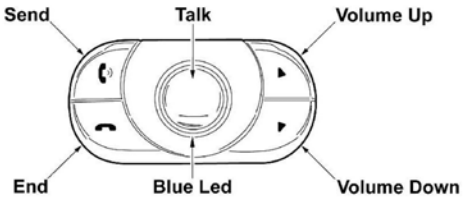


2:2 The "Bluetooth Devices' tab is now displayed. If any device called "Motorola IHF1700 Engineering Mode'. appear. Highlight the device and click "remove' (all other paired devices, including DICE, should remain). Click on "OK' to close the panel.

Flashing the Handsfree System Software

!!! Warning !!!
Do not turn ignition off or remove the battery while flashing the bootloader.
Use a battery charger to secure the power supply

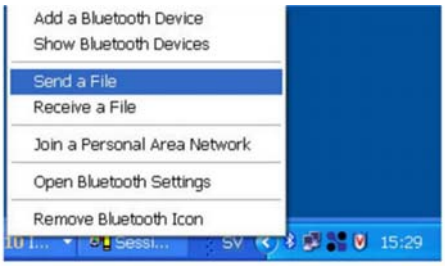
3. Setting the Handsfree System into Reflash mode



3.1 Turn off the vehicle ignition and wait until the blue led stops flashing.

3.2 Press and hold the "Send' button, turn on the vehicle ignition, and continue holding the "Send' button for at least 10 seconds until a voice prompt "Reflashing' will be heard and the blue led starts to flash slowly.

4. Flashing the bootloader

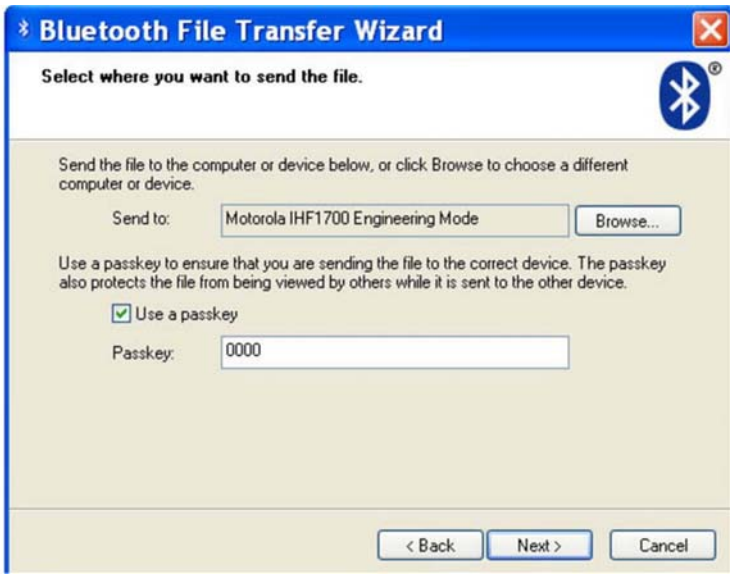


4:1 Right click on the Bluetooth icon in the task bar and click "Send a file'.

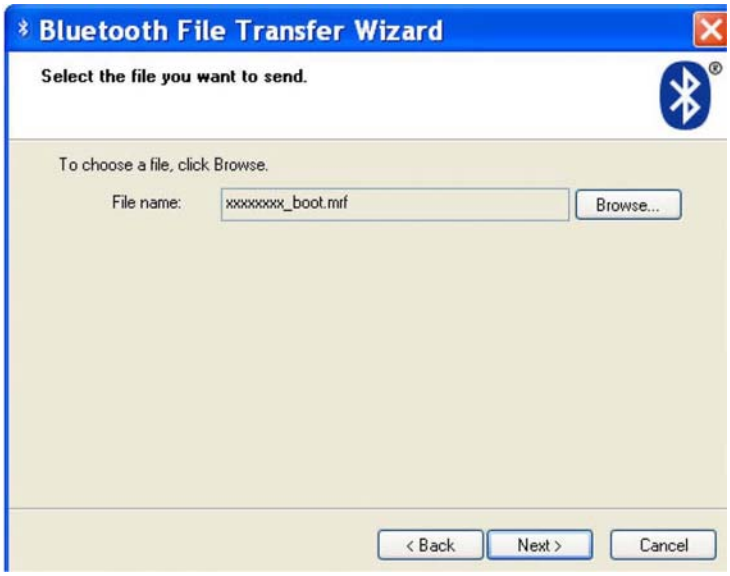
4:2 The following panel is displayed. Click "Browse'

4:3 The PC will now search for discoverable Bluetooth devices.

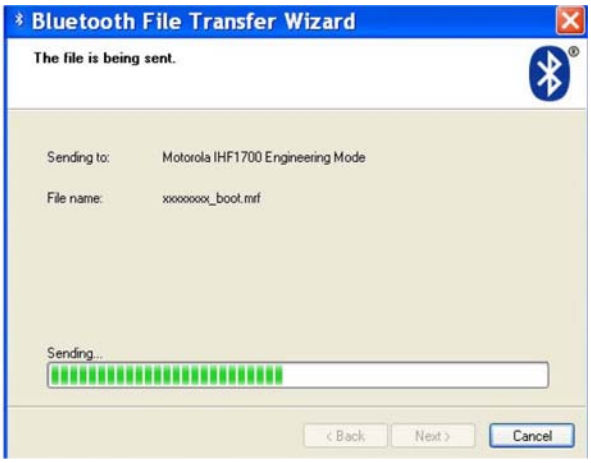
4:4 When the search is finished, a list of discovered devices is displayed. Click on "Motorola IHF1700 Engineering Mode' and click "OK'. If a device called "Motorola IHF1700 Engineering Mode' is not found, make sure the system is in reflash mode and go back to step 4:1.



4:5 Select the "Use a passkey' box and enter "0000' as the passkey. Click "Next'.

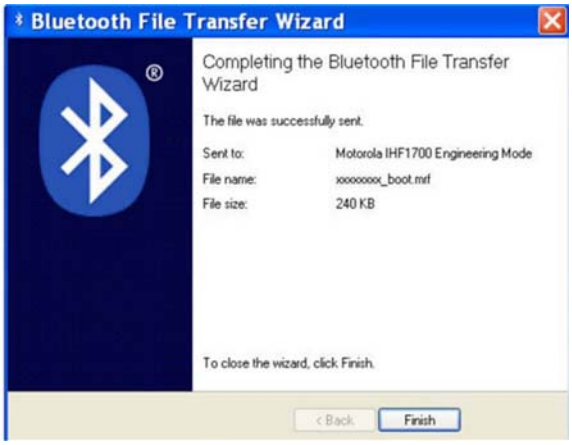


4:6 The hand free system will be paired and you will be asked to choose a file. Click "Browse', locate and Choose the bootloader file: "XXXXXXXX_boot.mrf' and click "Open'. Click "Next'.



4:7 The file transfer is started. The Blue LED will flash fast and the system will start to emit a continuous tone, while the file is being transferred.

Important: The audio indicator is a feature of the bootloader. Some old bootloader software may not contain this feature and hence this audio indicator will not be heard.



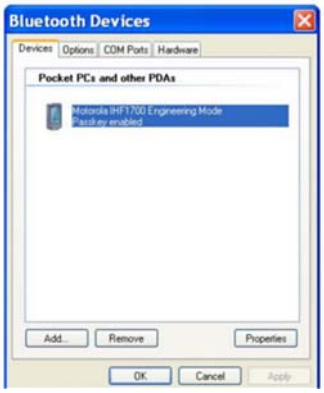
4:8 Once the file is fully transferred, the hand free system will write the data to memory. Once the file is fully programmed, the Blue LED will flash slowly and the tone will change to a slow beep. Click "Finish'.

Important: The audio indicator is a feature of bootloader. Some old bootloader software may not contain this feature and hence this audio indicator will not be heard.

4:9 **Turn ignition off.**

Bootloader SW delivery is complete.

4:10 Right click on the Bluetooth icon in the task bar and select "Show Bluetooth Devices'

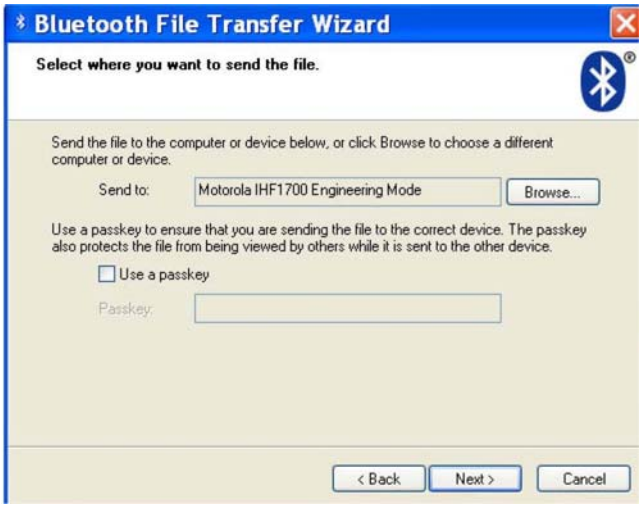


4:11 The "Bluetooth Devices' tab is now displayed. If any devices called "Motorola IHF1700 Engineering Mode'. appear. Highlight the device and click "remove'. Click on "OK' to close the panel.

5. Flashing the Combined Application

5:1 Put the hand free system into reflash mode.(See step 3:2)

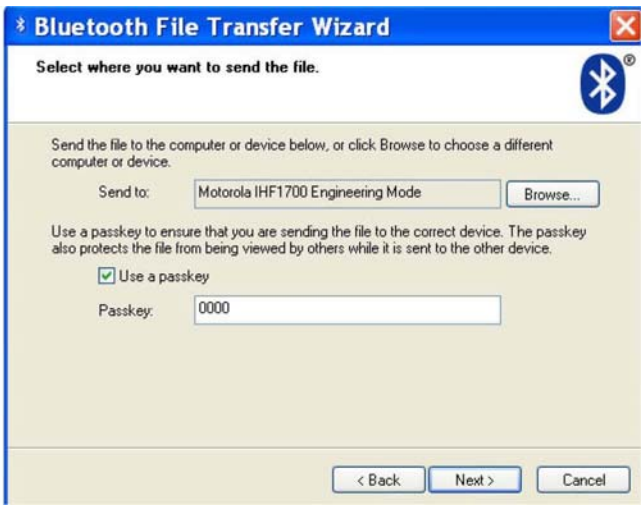
5:2 Right click on the Bluetooth icon in the task bar and click "Send a file'.



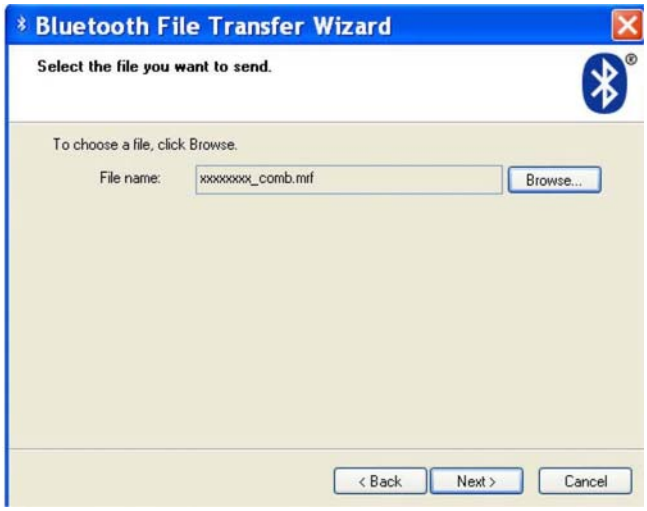
5:3 The following panel is displayed

5:4 Click "Browse'. The PC will now search for discoverable Bluetooth devices.

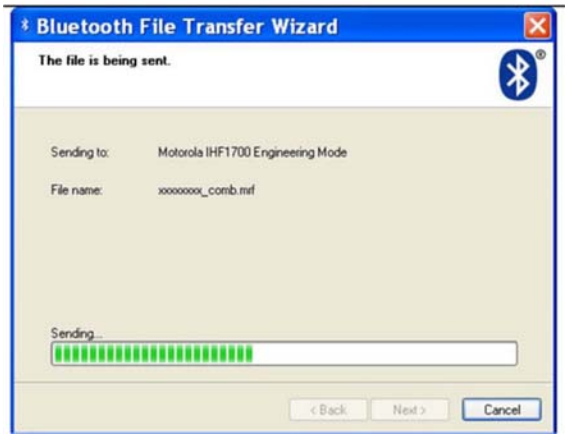
5:5 When the search is finished, a list of discovered devices is displayed. Click on "Motorola IHF1700 Engineering Mode' and click "OK'. If a device called "Motorola IHF1700 Engineering Mode' is not found, make sure the system is in reflash mode and go back to step5:2.



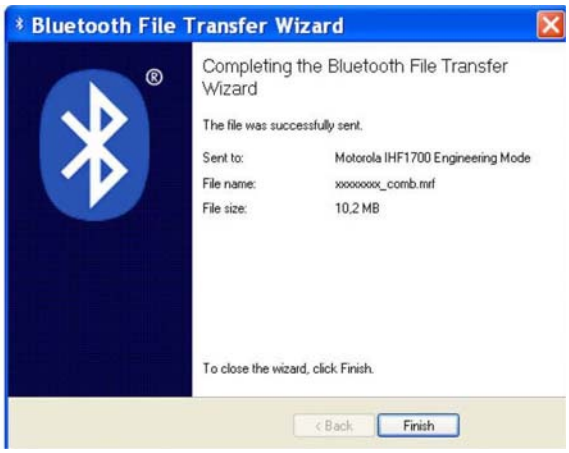
5:6 Select the "Use a passkey' box and enter "0000' as the passkey. Click "Next'.



5:7 The hand free system will be paired and you will be asked to choose a file. Click "Browse', locate and Choose the combined file: "XXXXXXXX_comb.mrf' and click "Open'. Click "Next'.



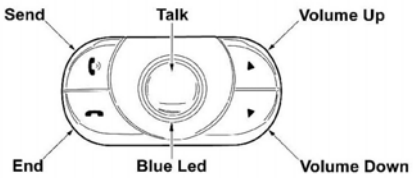
5:8 The file transfer is started. The Blue LED will flash fast and the system will start to emit a fast beeping tone while the file is being transferred.



5:9 Click "Finish'

5:10 Once the file is fully transferred, the hand free system will continue write the data to the unit's memory. Once the file is fully programmed, the Blue LED will flash slowly and the tone will change from a fast to a slow beep.

5:11 When the Blue LED starts to flash slowly and the tone changes to a slow beep, turn ignition off. Wait until the beep stops and the Blue LED is lit continuously.



5:12 Turn ignition on. Wait 20 seconds. Press the "Talk' button and verify the"Setup menu' voice prompt is heard. Press the "End' button and turn the ignition off

Note: It may be necessary to remove and re-add the DiCE bluetooth after performing this task. For guidance, reference DICE Tool Installation Instructions in VRC2 under the VIDA Information tab.

Q&A

Why can't I find the hand free system?

a. Make sure the hand free system is in reflash mode.

b. Remove any paired "Motorola IHF1700 Engineering Mode' devices before searching.

Why can't I pair to the hand free system?

a. Make sure the hand free system is in reflash mode.

b. Remove any paired "Motorola IHF1700 Engineering Mode' devices before searching so the correct device is being paired to.

c. Verify you are using the correct passkey.

Why can't I send a file to the hand free system?

a. Make sure the hand free system is in reflash mode. If not remove the device and pair again.

b. Verify you are using the correct files.

Why do I need to restart system after flashing the bootloader?

a. Bootloader may contain upgrades to speed up and aid the Reflashing process.

In order to use these upgrades system must be restarted.

AFFECTED VEHICLES:

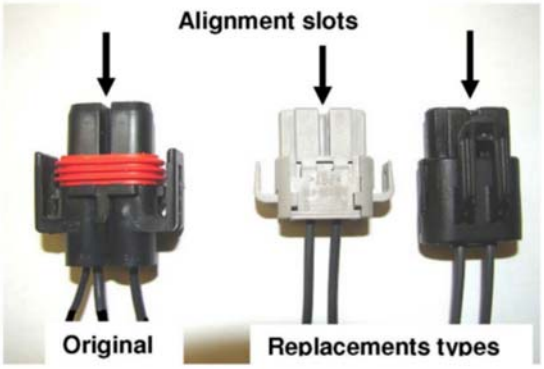
DESCRIPTION: In an effort to reduce warranty and customer expense for Halogen type low-beam headlamps, a new method of repair has been developed to address complaints for the vehicles listed above.

Description	Quantity	Part Number
Cable harness*	2	31294092
Splice	4	9130467

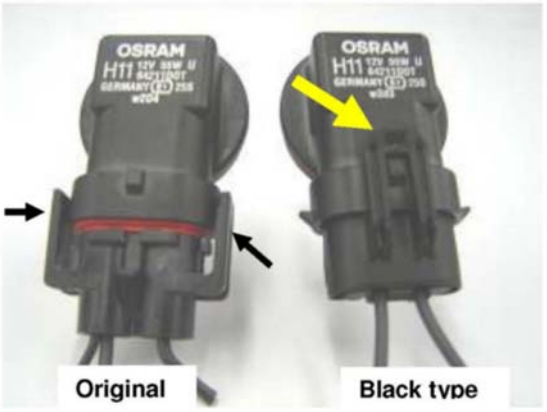
*This part number has been used for two replacement connector types, see the following page.

MATERIAL:

SERVICE: If the cause of the customer complaint is a bad Halogen low-beam bulb, replace both bulbs per Retailer Technical Journal 19636; dated 9/2/2008. If the cause of the complaint is that the harness within the headlamp assembly is damaged, DO NOT replace the headlamp assembly. Replace the low-beam harness on BOTH headlamps as described in the following. Read this complete document prior to beginning repair.



For reference here is a photo of the original and replacement connectors.



The original connector shown has three wires to it. The number of wires to the connector will vary based on the model.

See the instructions for two wire or three wire repair as needed.

Both the original and replacement connectors have an "alignment slot". This should be used to determine the position of the spliced wires

On the original and the "grey" replacement type; each terminal has an identification of "A" and "B"; they are not consistent from the original to the replacement. Disregard the labelling of the terminal and pay attention to the physical locations.

NOTE: The "black" type replacement does not have any terminal identification marks.

The black type also has a different locking tab. The original and the grey replacement types lock onto the bulb at the sides, the black type locks onto the bulb at the back as shown here.

ADDITIONAL NOTE: the orange seal (shown in these pictures) installed with the original connector should not be used when installing the replacement type connectors!

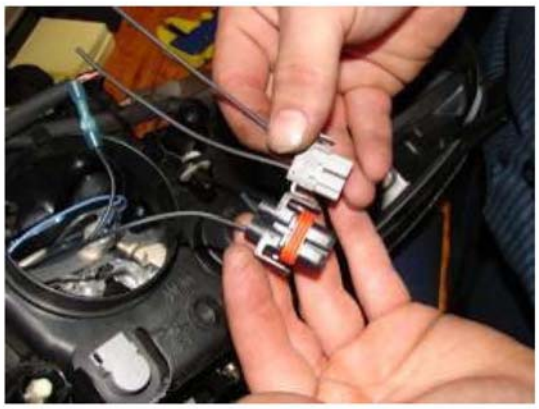
Remove Headlight Assembly

Remove headlamp according to VIDA:

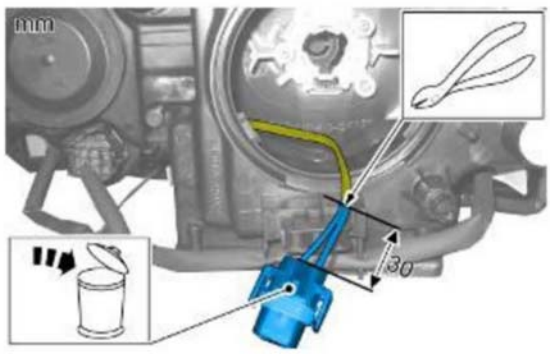
- Removal, replacement and installation
- 3 Electrical system
- 35 Lighting
- Lighting, front
- Headlight / bulb, replacing

Caution! The plastic lens on the headlight scratches easily. Do not place the headlight on a hard surface with the lens downwards. Original Replacements types Alignment slots Original Black type

For vehicles with two wire harness:

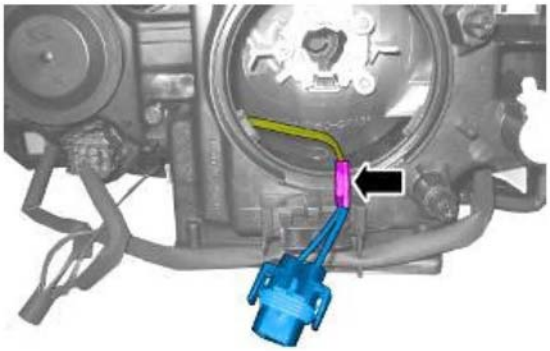


TIP: To simplify the process, cut and splice one wire at a time. Be aware of the physical location of the wire in the connector. Placing both original and replacement connectors next to each other, slot up and cutting and splicing the wires one at a time will ensure correct locations.



Cut off the original low beam headlight connector and up to 1 inch (30mm) of the replacement harness as shown here.

Discard the old connector.



Install the new connector; join the cables according to VIDA:

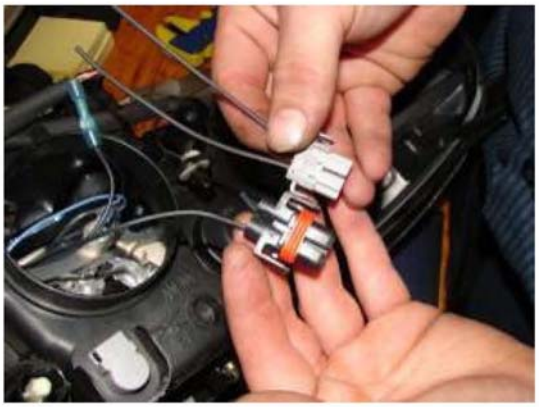
- Removal, replacement and installation
- 3 Electrical system
- 37 Cables and fuses
- Wiring
- Joining the cables

NOTE: These butt connectors are the heat-shrink type, be sure you heat shrink to install completely.

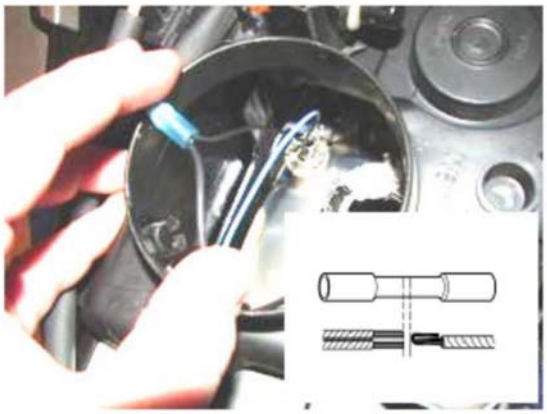
REMINDER: Replace the connector on both headlamps.

For vehicles with three wire harness:

IMPORTANT: For vehicles with three wires to the connector, as shown here, it is important that the wires are installed in their correct locations. Be sure when cutting and splicing that you follow the instructions below.



TIP: To simplify the process, cut and splice one wire at a time. Be aware of the physical location of the wire in the connector. Placing both original and replacement connectors next to each other, slot up and cutting and splicing the wires one at a time will ensure correct locations.



Cut off the original low beam headlight connector and up to 1 inch (30mm) of the replacement harness.

Discard the old connector.

Install the new connector; join the cables according to VIDA:

- Removal, replacement and installation
- 3 Electrical system
- 37 Cables and fuses
- Wiring
- Joining the cables

NOTE: T This picture shows the splicing of the two wires into one connector as shown in VIDA. Once this has been completed the replacement connector can be added as well.

These butt connectors are the heat-shrink type, be sure you heat shrink to install completely.

REMINDER: Replace the connector on both headlamps.

Reinstall Headlamp

Install the headlamp according to VIDA:

- Removal, replacement and installation
- 3 Electrical system
- 35 Lighting
- Lighting, front
- Headlight / bulb, replacing

Test the function.

Audio System - Stuck CDs in Audio System

GROUP:
39

NO:
004

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

TITLE:
Stuck CDs in Audio Units

ISSUING DEPARTMENT:
Warranty TMA

CAR MARKET:
United States, Canada

DATE:
01/16/2009

REFERENCE BULLETINS:
SMB 00-170

This SMB supersedes TNN 39-51 dated 04-16-2008 and RTJ 16506 issued 06-18-2008. Both will be deleted.

Description:

This document describes the process for returning audio units diagnosed with stuck CDs. Following are two basic procedures to use as applicable.

IMPORTANT:

IF A COMPACT DISC UNIT HAS BEEN DIAGNOSED WITH A DEFECT OTHER THAN STUCK CDs, PLEASE BE SURE TO EJECT THE CDs FROM THE UNIT WHILE IT IS STILL CONNECTED TO THE VEHICLE BEFORE RETURNING TO TMA OR YOUR LOCAL DC. PLEASE ENSURE THAT THE CD'S ARE PROMPTLY RETURNED TO THE CUSTOMER.

Procedure # 1: TMA WARRANTY RETURNS

For All Audio units that are requested to be returned to TMA for Testing and Analysis.

Compact Discs may get stuck in the CD-Changer drive. If this occurs, DO NOT ATTEMPT to remove them.

ATTENTION PARTS MANAGER

CUSTOMER CD RETURN FORM

For Audio Components Diagnosed with Stuck CDs

Please ensure all information is filled out and attach to the defective unit

Retailer Code _____

RO# _____

VIN _____

Part # _____

Contact Person _____

Phone _____

PLEASE FILL IN THE CUSTOMER'S SHIPPING ADDRESS BELOW

Customer Return
Shipping address _____

_____

_____

_____

IMPORTANT NOTE!
IT IS IMPORTANT THAT YOU INCLUDE THE CD RETURN FORM WITH THE DEFECTIVE UNIT.
IF THE CD RETURN FORM IS NOT INCLUDED WITH AN AUDIO UNIT DIAGNOSED WITH STUCK CDs, AND YOU DO NOT INCLUDE THE CUSTOMER'S RETURN ADDRESS, YOU WILL BE RESPONSIBLE FOR REIMBURSING THE CUSTOMER FOR THE COST OF THEIR CDs. VOLVO WILL ONLY OPEN AND REMOVE CDs FROM CHANGERS THAT ARE RETURNED WITH THE CD REMOVAL FORM.

Please fill out the CD Return Form shown completely and legibly.

The form must be visible inside the audio box.

IT IS MANDATORY THAT YOU OR THE CUSTOMER FILL IN THE CUSTOMER'S FULL NAME AND COMPLETE ADDRESS ON THE CD RETURN FORM.

Return the CD return form and the audio unit to TMA per established shipping instructions as detailed in SMB 00-170.

Upon removal, customer's CDs will be mailed to the Customer per the information on the CD Return Form within 2-3 weeks of receipt.

IMPORTANT NOTE!

IT IS IMPORTANT THAT YOU INCLUDE THE CD RETURN FORM WITH THE DEFECTIVE UNIT.

IF THE CD RETURN FORM IS NOT INCLUDED WITH AN AUDIO UNIT DIAGNOSED WITH STUCK CDs, AND YOU DO NOT INCLUDE THE CUSTOMER'S RETURN ADDRESS, YOU WILL BE RESPONSIBLE FOR REIMBURSING THE CUSTOMER FOR THEIR CDs. VOLVO WILL ONLY OPEN AND REMOVE CDs FROM CHANGERS THAT ARE RETURNED WITH THE CD REMOVAL FORM.

Note:
Audio units tampered with or opened, or damaged from foreign objects inserted into mechanism drives (e.g., coins, business cards or visibly evident peeling CD-R labels) will not be covered under warranty.

IMPORTANT

Please wait for the TMA Parts Return Request before returning these units.
Please ensure that all TMA Warranty claims, TMA Warranty Core reports and the CD Form are included with the unit.

Procedure # 2:
STRAIGHT CORE RETURNS

For returning a non requested or non-warranty audio core unit to your local Distribution Center with a CD Changer diagnosed with stuck CDs.

Please fill out the attached CD Return Form completely and legibly.

The form must be visible inside the audio box.

IT IS MANDATORY THAT YOU OR THE CUSTOMER FILL IN THE CUSTOMER'S FULL NAME AND COMPLETE ADDRESS ON THE CD RETURN FORM.

Continue to include all applicable Core Reports with the units. Return the unit to your local Distribution Center.

The local Distribution Center will process the units and forward the units to the refurbishment facility. CDs will be removed by the refurbishment facility. The CDs will be returned to the customer per the information on the CD Return Form. This process may require more than 3 weeks, depending upon the audio unit type and the refurbishment facility.

In order for this process to be successful, the CD Return form must be filled out and visible inside of the audio box with the audio unit and the customer's name and complete address filled out.

IMPORTANT NOTE!

IT IS IMPORTANT THAT YOU INCLUDE THE CD RETURN FORM WITH THE DEFECTIVE UNIT.

IF THE CD RETURN FORM IS NOT INCLUDED WITH AN AUDIO UNIT DIAGNOSED WITH STUCK CDs, AND YOU DO NOT INCLUDE THE CUSTOMER'S RETURN ADDRESS, YOU WILL BE RESPONSIBLE FOR REIMBURSING THE CUSTOMER FOR THE COST OF THEIR CDs. VOLVO WILL ONLY OPEN AND REMOVE CDs FROM CHANGERS THAT ARE RETURNED WITH THE CD REMOVAL FORM.

Note:
Audio units damaged from foreign objects inserted into mechanism drives (e.g., coins, business cards or visibly evident peeling CD-R labels) may result in a loss of core credit.

C70	872	1998-2005
C70	873	1998-2002

AFFECTED VEHICLES:

DESCRIPTION:

This fault tracing is based on the vehicle having Volvo original rims, hub caps, as well as Volvo recommended tire types.

This document presents fault tracing of vibrations that are connected to the vehicle's speed. The suggested method in this bulletin only applies to vibrations that are connected to wheels and tires. Some vibrations that are generated by the driveline can be mixed up with vibrations connected to wheels and tires. This document is used to differentiate between wheel vibrations and the driveline/chassis vibrations.

SERVICE
Test driving the vehicle, fill in the fault tracing card together with the customer and allow the customer to drive if possible. Use the check list to identify the origin of the problem.

Safety precautions:

All corrective action requires the safety precautions to be followed, which prevent damage to materials and people. The test drives described in this document must be carried out with regard to the local, state, and federal road & traffic regulations.

Possible sources of imbalance

Hub caps

^ Foreign object on or inside the hub caps (dirt, snow, asphalt, etc)
^ Damaged hub caps

Rims

^ Foreign object on or inside the rim (dirt, snow, asphalt, etc)
^ Deformed rim
^ Not Volvo original rims
^ Tightness of the wheel

Tires

^ Tire pressure
^ General status of tire wear, out-of-round etc
^ Volvo recommended tire types not used

The vibrations may come from a manufacturing defect in the tire's internal structure. This fault is not visible. To find this, a test drive must be performed.

Note! In the event of structure problems with tires, large balancing weights on the rim are often found from a previous attempt to eliminate a vibration.

Note! In the event of too high tire pressure, the vehicle feels jerky and can cause vibrations.

Note! The brakes are a source that can affect the analysis of the wheel balance. Ensure that all brakes work correctly.

Wheel imbalance is connected to the vehicle's speed* Speed +/- 3 MPH (+/- 5 km/h)		
VEHICLE	**SPEED (MPH)**	**SPEED (km/h)**
C30	68 – 75	110 – 120
S40	56 – 59	90 – 95
V50	75	120
S80 (07-)	65	105
S80 (-06)	68 – 71	110 – 115
S60	56 – 62	90 – 110
S60R	68 – 71	110 – 115
V70 (00-08)	75	120
V70 (08-)	59 – 65	95 – 105
V70R(01-07)	71 – 75	115 – 120
XC70(08-)	65 – 68	105 – 110
XC70(-07)	62 – 84	100 – 135
XC90	81 – 90	130 – 145
C70 (06-)	62 – 71	100 – 115
C70(-05)	71 - 75	115 – 120
XC60	65 - 68	105 - 110

Start from the remarks of the customer, regarding the type of fault (see the fault tracing card that the customer filled in). If possible, confirm during a recreation of the fault, e.g. the speed at which the vibrations occur (as near as possible). Compare the speed with the one in the table.

*NOTE: Observe all traffic rules including local speed limits and drive safely. The driver is responsible for safety at all times.

The table above shows the values that are directly connected to wheel imbalance. If the vibration or imbalance occurs at about half the indicated speeds, the wheel is probably defective or damaged.

Remarks regarding the Wheel imbalance table.

FAULT TRACING CARD - for fault tracing vibrations caused by wheels/tires

Date: _____

Vehicle type: _____

Chassis number: _____

When did the vibrations start?

Time, odometer reading, workshop visit or other event:
_____

Connected to speed?

YES / NO, don't know.

Occurred at: _____km/h, or between _____and_____km/h,

Other remarks: _____

_____
_____

_____
_____

Fault found:
_____

_____
_____

Performed adjustments:
_____

_____
__

If the customer has not indicated a speed, but the vehicle is included in the table, perform a test drive and fill in the fault tracing card.

THE FOLLOWING ARE JUST EXAMPLES FOR YOUR REFERENCE:

EXAMPLE 1 - Describes imbalance Customers with a C30 complain about vibrations at 110 km/h (68 MPH). This speed corresponds directly to the speed in the table for wheel imbalance and must be rectified.

EXAMPLE 2 - Describes probable defective/damaged wheel or tire Customers with a C30 complain about vibrations at about 55 km/h (34 MPH). This speed corresponds directly to half of the speed in the table for wheel imbalance and must be rectified.

TEST

Note! Perform test drives according to Road traffic regulations.

TEST 1 - Test drive to characterize any faults

1. Recreate the fault by performing a test drive. Check that the vibrations are connected to the vehicle speed.
2. Note within what speed range the vibrations occur and the speed for the highest vibration stop.
3. Read off the speeds that correspond to imbalance according to the.

ACTIONS

Checking for damage Wheel sides

Check:

- that no foreign objects are on or inside the hub caps (dirt, snow, asphalt etc)
- that the wheels sides are intact.

RIMS

Check:

- that no foreign objects are inside or on the outside of the rims (dirt, snow, asphalt etc)
- that the rims are not deformed
- rim type (Volvo rims are used?)
- tightness of the wheel.

TIRES

Check:

- tire pressure (follow the recommended air pressure values in the vehicle's user manual)
- general status of the tires, wear etc.
- tire type (are Volvo recommended tire types).

Check the vehicle's wheel balance. Perform wheel balancing on all 4 wheels and test drive again.

If the imbalance remains, replace all the vehicle's wheels with reference wheels and test drive again.

Reference wheels:
Wheels available at the workshop for checking purposes. Rims and tires must meet all requirements regarding roundness, balance and force vibrations. This wheels must be tested on a similar vehicle and must not cause any vibrations.

Alternatively, the workshop borrows four wheels from a problem free vehicle.

If the vehicle is now OK, replace one wheel at a time until the faulty wheel can identified.

If the vehicle no longer seems to have a wheel imbalance, but some form of vibration remains, during the test drive disengage/engage neutral and note any changes.

If changes occur, the fault source may trace back to other rotating parts in the driveline.

* At the time of this writing

AFFECTED VEHICLES:

DESCRIPTION:
We have discovered that in some cases the adhesion of the primary door
seal may deteriorate over time. If the customer has reported this condition, do not replace the door seal, see the instructions for how to correctly reinstall.

IMPORTANT NOTE:
The method / material currently listed in VIDA are incorrect.

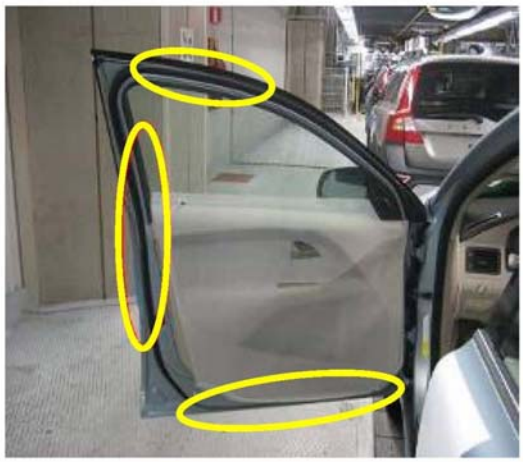
Description	Quantity	Part Number
Glue	shop supply	1161519

MATERIAL:

SERVICE: Reinstall the door seal as described on the following pages.
- identify the position of the loosened primary seal.
- carefully fold the primary seal so the surface to be glued becomes accessible.
- apply a small amount of glue.
- push the primary seal back in the original position, and hold it for 60 seconds.

NOTE:
Use a limited amount of glue in order to avoid spilling. Spilled glue needs to be removed immediately!

NOTE:
The areas of concern are shown in these pictures and would apply to any of the vehicle types affected.



Pictured here are areas of a front door that the seal may become unglued.

Pictured here are areas of a rear door that the seal may become unglued.

If the adhesive has failed the seal will look similar to these shown.

To reinstall; gently pull and twist the seal to apply the glue (PN 1161519) to the back of the seal. Be sure to cover as much of the loose area as possible.

Quickly reposition the seal and hold for 60 seconds.

NOTE:
Use a limited amount of glue in order to avoid spilling. Spilled glue needs to be removed immediately!!

Blind Spot Information Sys.(BLIS) - Function/Diag. Guide

RETAILER TECHNICAL JOURNAL 21232
BLIS Functionally and Diagnostic Guide

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

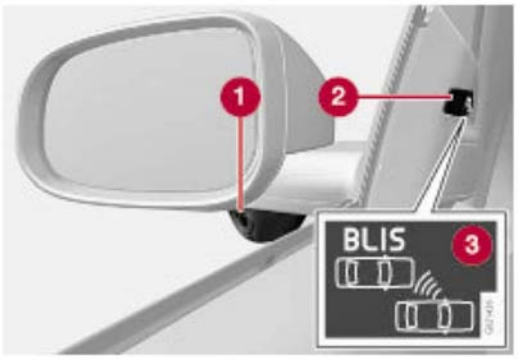
Date: 7-27-2009

Reference: VIDA, TIE

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

This document is applicable to all Vehicles equipped with the Blind Spot Information System (BLIS).



1 = BLIS camera
2 = BLIS indicator (LED)
3 = BLIS symbol

BLIS is an information system that's designed to alert the driver of another vehicle possibly in the "blind spot". BLIS is intended mainly as a driver aid for dense traffic on multi-lane highway driving. When another vehicle enters the detection area, such as the BLIS equipped vehicle is passing or being passed by another, the driver will get a continuous light from one of the two indicators (LED's) while an object is being detected. The purpose of this indication is to alert the driver of the possibility of another vehicle in the detection area and for them to check prior to taking action.

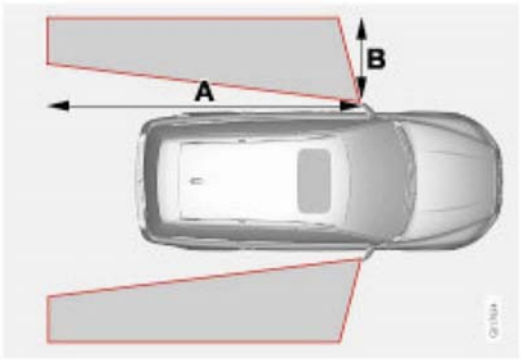
System limitations:

- BLIS does not work in sharp curves.
- BLIS does not function when the vehicle is backing up
- If you are towing a wide trailer, this may prevent the BLIS cameras from detecting other vehicles in adjacent lanes.
- BLIS does not react to cyclists or mopeds.
- BLIS is designed to alert the driver of vehicles driving alongside going in the same direction.
- The BLIS cameras have the same limitations as the human eye. In other words, their "vision is impaired" by adverse weather conditions such as heavy snowfall/rain, dense fog, etc.

Functional description

Detection area

The picture below shows the critical area that may not be seen in the outer rear view mirrors which also is the area where BLIS, is designed to at minimum, detect other vehicles.



A = approximately 31 ft. (9,5 m)
B = approximately 10 ft. (3,0 m)

Day/Night mode

In daylight the system reacts to the shape of the surrounding vehicles. The system is designed to help detect motor vehicles such as cars, trucks, buses and motorcycles.

In darkness the system reacts to the headlamps of surrounding vehicles. If the headlamps of surrounding vehicles are not switched on then the system does not detect the vehicles. This means for example that the system does not react to a trailer without headlamps which is towed behind another vehicle

When is BLIS operational

The system is "default on" (set to be on each time the vehicle is started). At vehicle speeds of 6 mph (10 km/h) and above the system will indicate another vehicle in the blind spot.

The system is designed to indicate another vehicle in the blind spot if:

- you pass another vehicle at a speed of up to 6 mph (10 km/h) faster than the other vehicle.
- another vehicle passes you travelling up to 43 mph (70 km/h) faster than you are travelling.

It is possible to stop the BLIS indications to the driver by selecting the "BLIS OFF/ON button".

When BLIS "OFF" is selected the LED in the button goes out and a text message is shown on the Driver Information Module (DIM).

IMPORTANT NOTE: this only turns off the communication to the driver, the system is still be operating in the background.

If there is a need to reset the system you need to turn the engine off and restart.

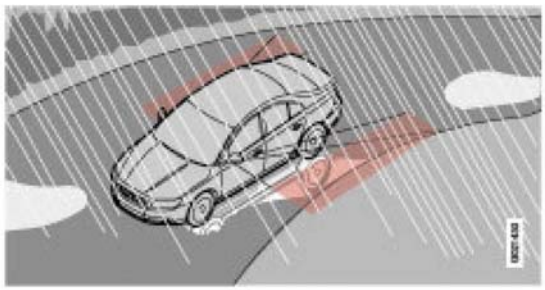
Technical description

BLIS is a camera based system; the camera's take 25 pictures per second and compares them to a pre-determined algorithm (step-by-step problem-solving procedure) based on picture size/shape and delta (changes in) velocity.

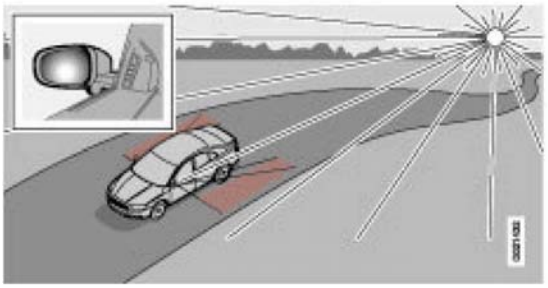
False indications

The system detection algorithm is designed to read sharp contoured shapes that are in the detection area (cars, busses, trucks, motorcycles). Light reflections and shadows can trigger warnings since the camera can't always distinguish these from real objects. Advise the customer the system is operating as intended. Inform the customer why and how the continuous light from one of the two indicators (LED's) is present and that BLIS is an information system.

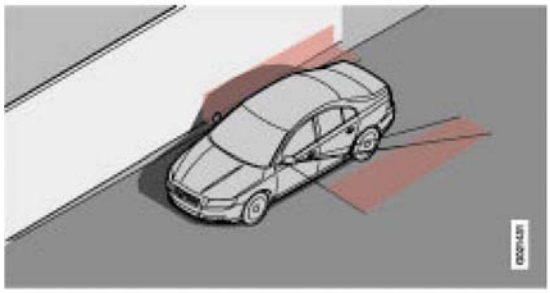
Here are some examples of situations where the BLIS indicator lamp may illuminate even if there is no other vehicle within the blind spot.



Reflections from shiny wet road surface or puddle.



Low sun shining into the camera.



Own shadow on large light smooth surface, e.g. noise barrier or concrete road surface.

Decreased system functionality / Messages in DIM

The BLIS system has a self diagnostic system to inform the driver about potential decreased system functionality. The diagnostic system software (SW) is included in the camera module units and the LH - RH cameras operate independently of each other. If either one of the camera's meet the criteria for decreased functionality the driver will be informed via flashing LED indicators and/or DIM message.

In addition to the "OFF/ON" indications there are three possible DIM messages to the driver:

1. BLIS Reduced function

This message informs the driver that the light conditions for either of the cameras is reduced and that the camera may not detect all objects due to low contrast conditions. The camera resets itself when the environment has returned to "normal". The "counters" in the diagnostic algorithms are reset to zero automatically when the light conditions are back to normal or an object with the headlamps on (night mode) is entering the BLIS detection area. The DIM message is removed automatically. Each of the cameras will continuously monitor the images and reset themselves when considered normal.

Examples of conditions that may give "Reduced function" message in DIM:

1. During dusk/dawn due to low light (most common cause of "reduced function").

2. Driving in complete darkness for longer than 10 minutes (safety reason since the cameras can not decide whether they are blocked or that there is no objects to detect).

3. Heavy rain or snow due to low light

4. Moisture on the Lens

5. Thin layer of dirt caused by dust, salt, etc

6. Strong light that saturates the image in a way that objects can not be recognized

What to do?

- Verify outside conditions noting amount of sunlight, weather, driving direction (North, South, East, West), time of day.

- Ensure the lens is clean: Clean with a soft cloth or a damp sponge. Clean the lenses carefully so that they are not scratched.

- Check the function of the lens defroster: The heater is active in temperatures below 82°F (28°C). You should be able to feel the heater with your finger; the area around the chrome ring/lens should be "warm to the touch", or use ice spray (PN 1161731) spray on the lens and see if the ice melts.

If the system does not reset, turn the engine off and restart.

AGAIN NOTE! The BLIS system will not be reset by selecting the OFF/ON button. This will only stop/start the LED indication to the driver. The

system will still work under the same conditions in the background.

Inform the customer that the system is OK. The message is to inform the driver of the actual status of the system in the current driving conditions.

2. Camera blocked

When the camera has been reporting "Reduced function" in excess of 10 minutes without change the system shifts over to the "Camera Blocked" message in the DIM, and will be displayed together with a constant flashing from the BLIS LED's. This is the BLIS systems way to inform the driver that the BLIS system can't work under the current driving conditions.

Examples of conditions that may give Camera Blocked message in DIM

- During dawn / dusk - Low sun, it's dark on one side of the car and bright on the other.
- Heavy rain or snow - The camera gets blocked.
- Moisture on the Lens

What to do?

- Verify outside conditions noting amount of sunlight, weather, driving direction (North, South, East, West), time of day.
- Ensure the lens is clean - Clean with a soft cloth or a damp sponge. Clean the lenses carefully so that they are not scratched.
- Check the function of the lens defroster: The heater is active in temperatures below 82°F (28°C). You should be able to feel the heater with your finger; the area around the chrome ring/lens should be "warm to the touch", or use ice spray (PN 1161731) spray on the lens and see if the ice melts.

If the system does not reset, turn the engine off and restart.

AGAIN NOTE! The BLIS system will not be reset by selecting the OFF/ON button. This will only stop/start the LED indication to the driver. The system will still work under the same conditions in the background.

Inform the customer that the system is OK. The message is to inform the driver of the actual status of the system in the current driving conditions.

3. BLIS Service Required

"BLIS Service Required" message in the DIM informs the driver that there can be an internal failure within the system. i.e. communication internally within the camera, between the cameras and car communication system or a short circuit of one of the indicator LED's. This means that there is a risk that the camera may not correctly identify another vehicle in the detection area or being able to inform the driver.

What to do?

- Check the function of the lens defroster: The heater is active in temperatures below 82°F (28°C). You should be able to feel the heater with your finger; the area around the chrome ring/lens should be "warm to the touch", or use ice spray (PN 1161731) spray on the lens and see if the ice melts.
- Check for any relevant Retailer Technical Journals and follow the instructions
- Read out fault codes and consult the CSC symptom based fault tracing in VIDA; take appropriate action.
- Reset the system and see if the message returns, if the message returns; replace the mirror.

Engine - Pressure Washing Precautions

Retailer Technical Journal 21507
Pressure washing engines

Date 09-30-2009

Reference: VIDA

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Model	Type	Model year	Chassis range
ALL	ALL	ALL	ALL

AFFECTED VEHICLES:

DESCRIPTION:
VCNA suggests that in general engines and engine compartments not be washed with high pressure water due to the following points:

- Increased amount of electronic equipment installed in the compartment.
- Run off water could be contaminated with toxic fluids if there are leaks present.

The components are protected from road water spray with various devices such as the lower splash shield and weather proof seals on the protective covers, but are not designed to prevent high pressure water from getting in.

The areas circled are very sensitive to direct water pressure and should be avoided.

WARRANTY CLAIM INFORMATION

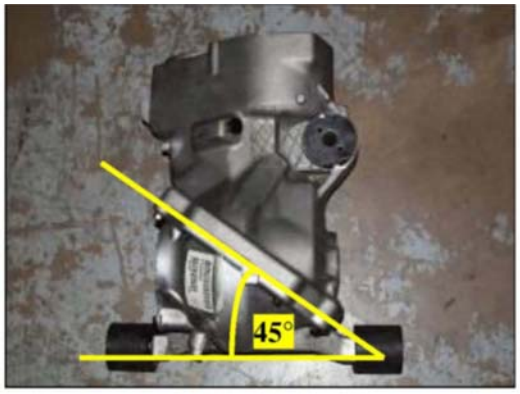
Service

If the leak is confirmed to be coming from the rear differential housing halves, separate and reseal the rear differential housing according to the following procedure in conjunction with the removal and replacement procedures in VIDA.

1. **Note!** Some variation in the illustrations may occur, but the essential information is always correct.

Final drive, removal



2. This method applies to all final drives with a 45° mating flange.

Remove the final drive from the vehicle according to VIDA:

INFORMATION

REPAIR

Removal, replacement and installation

Power transmission

Rear axle, drive shafts

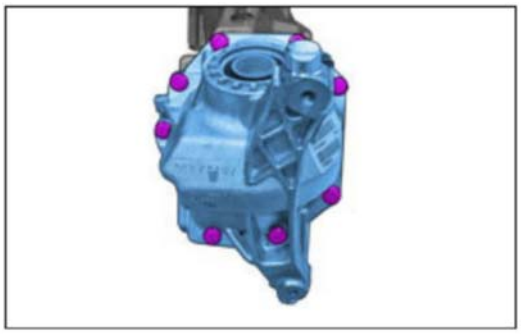
Final drive

Drain the oil from the final drive.

General (applies to all models)

3. **Warning!** Use protective eyewear.

Clean the final drive using isoproponal PN 1161721 around the mating flange.



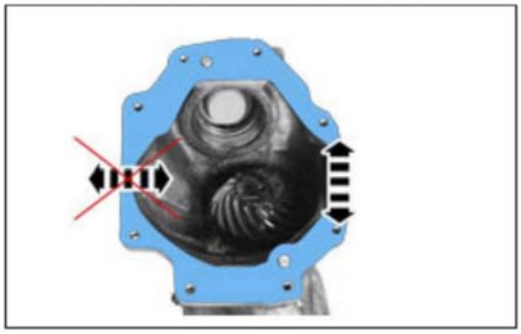
Blow clean with compressed air.

Remove:

- The screws, quantity (qty) 8 or 9, depending on model.

Final drive, cleaning

4. Clean the oil from the flange using isoproponal PN 1161721.



Clean all gasket material from the flange using gasket remover PN 1161847 and abrasive cloth PN 9511024.

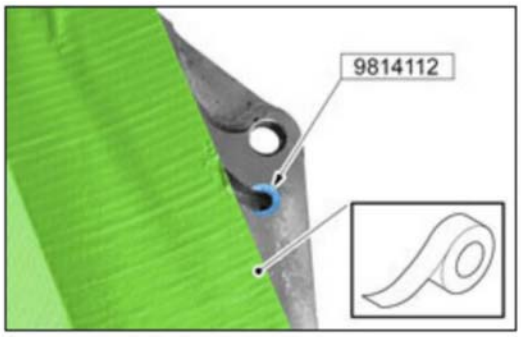
Note!

Use the abrasive cloth along the flange as the arrows indicate.

Clean the flange using isoproponal PN 1161721.

Caution!

Ensure that gasket residue does not end up in the final drive.

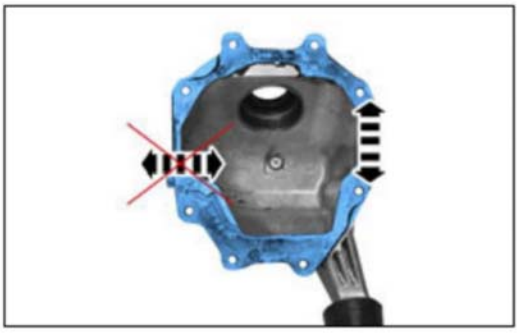


5. Cover the opening in the case with masking tape.

Countersink the surface at the bleed hole to prevent the hole from becoming blocked by sealing compound. Use special tool 9814112.

Check that the hole is open with 1 mm (approx 1/32") welding rod or similar.

Cover, cleaning



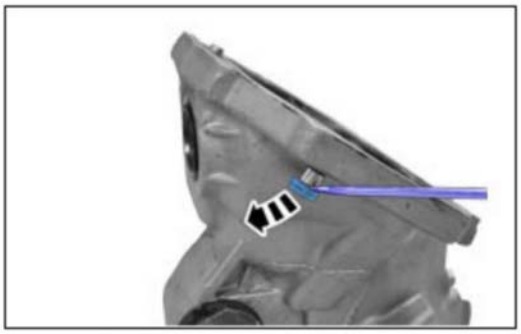
6. Clean the oil from the flange using isoproponal PN 1161721.

Clean all gasket material from the flange using gasket remover PN 1161847 and abrasive cloth PN 9511024.

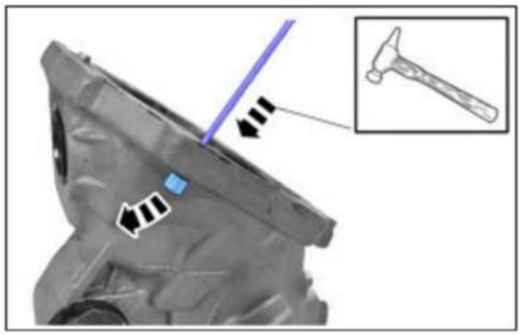
Note!

Use the abrasive cloth along the flange as the arrows indicate.

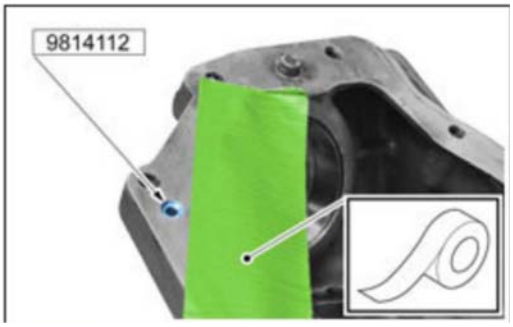
Steps 7-9 apply only to S40/V50



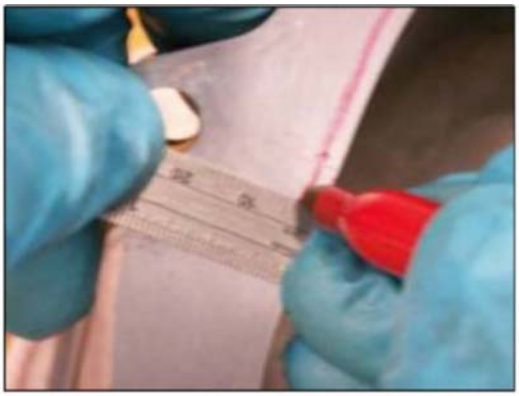
7. Remove the filter on the bleed nipple.



8. Remove the bleed nipple. Use a mandrel and a hammer.



9. Countersink the surface at the bleed hole to prevent the hole from becoming blocked by sealing compound. Use special tool 9814112.



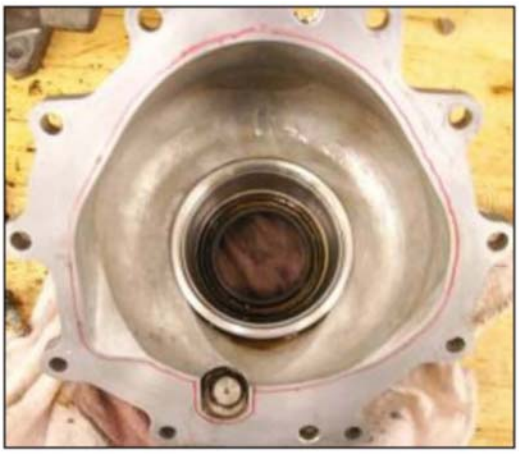
10. Measure 3 mm (approx 1/8") from the inside of the flange and make a line with a permanent marker.

Note!

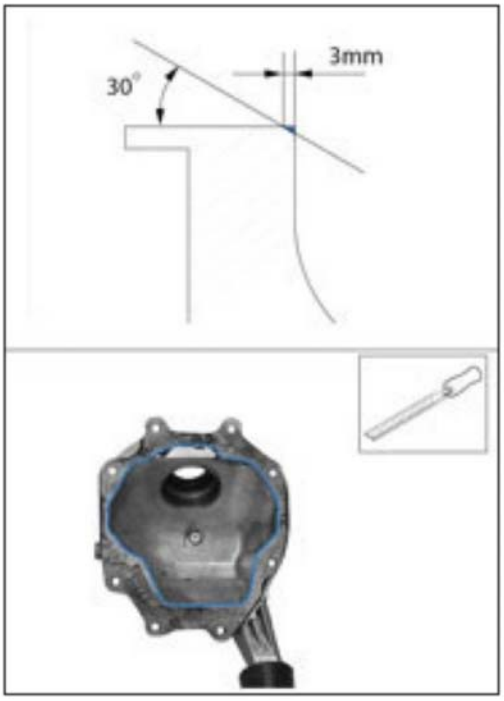
This procedure can be made easier by making a template which can be reused for several repairs.

Note!

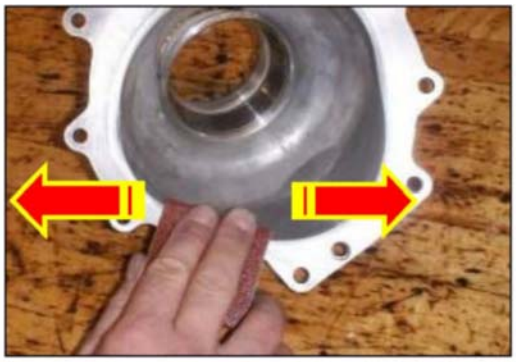
General illustrations were used for steps 10, 11, and 12, but the method is the same.



11. **Caution!** Care must be taken to avoid damage to the bearing race while filing. A coffee cup can be used to cover the bearing race.



12. File off the inner edge of the cover as illustrated, approx. 3 mm (approx 1/8").

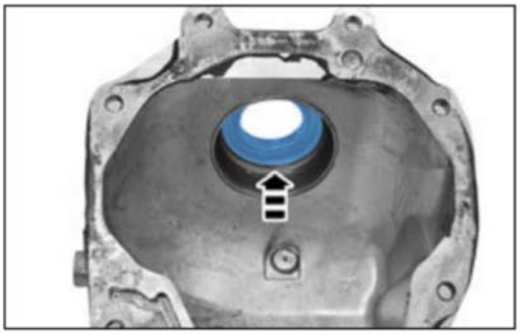


After filing, polish the chamfer using a fine emery cloth so that scoring in the chamfer goes along the chamfered edge.

Note!

Use the emery cloth radially, along the flange just as the arrows indicate.

The finished product should look like this.



13. Remove the seal.

Warning!

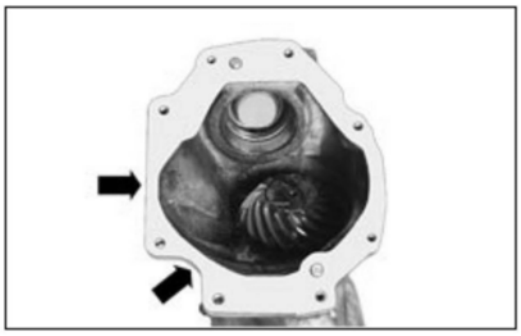
Use protective eyewear.

Clean the cover and blow clean using compressed air.

Note!

Ensure that there are no metal filings in the cover.

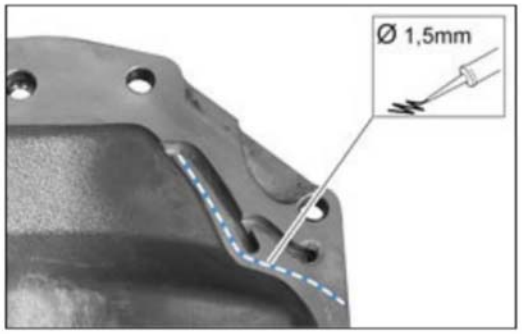
S40/V50 only: Install the bleed nipple and filter.



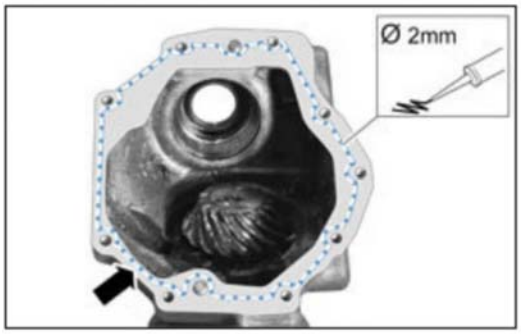
14. The mating surface between the cover and the final drive housing is narrow at certain places.

There are 2 critical areas, see the arrows. It is important that the sealant bead is applied correctly at these locations.

Apply a short bead of sealing compound at these locations only and install the cover. Remove the cover and check that the bead is not outside the cover's mating surface. Wipe away the sealing compound and clean using isoproponal PN 1161721.



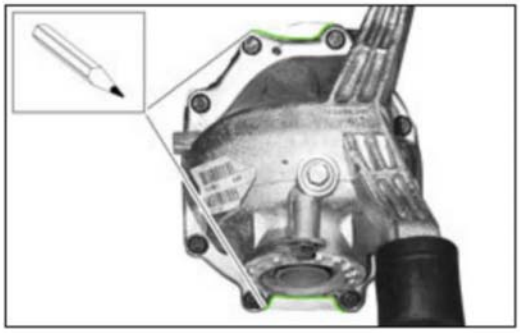
15. Applies to covers on all vehicles: Apply a 1.5 mm (approx 1/16") bead of sealing compound to the cover.



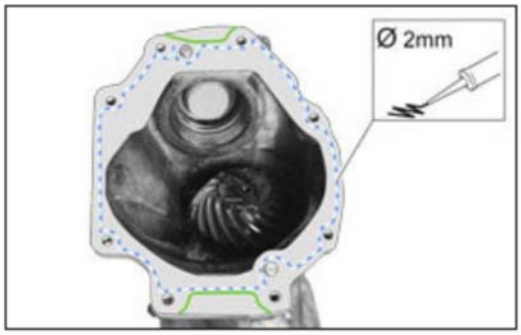
16. **Applies to XC90:** Apply a bead of 2.0mm (approx 5/64") sealing compound as illustrated.

Note!

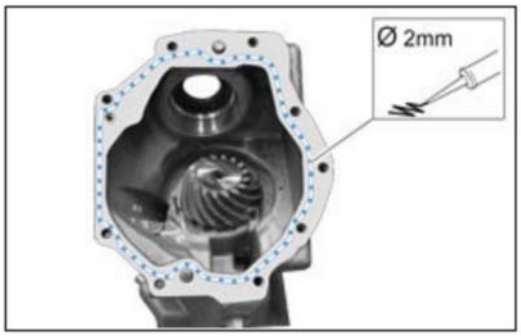
Note where the bead is to be applied at the arrow.



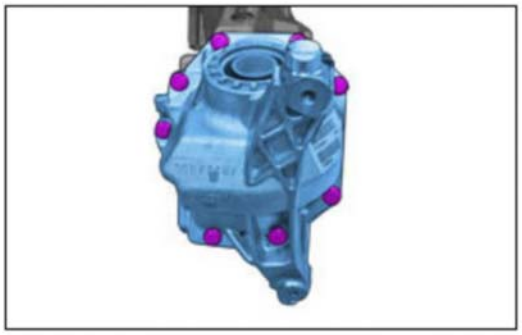
17. Steps 17 and 18 apply to XC70/V70/S60: Mark up the mating surface for the cover using a marker pen.



18. Apply a bead of 2.0mm (approx 5/64") sealing compound as illustrated.



19. **Applies to S40/V50:** Apply a bead of 2.0mm (approx 5/64") sealing compound as illustrated.



20. **Applies to all vehicles:** Request the assistance of a colleague to align the differential housing and install the cover.

Tightening torque, 29 Nm (21.4 lbf-ft).

Seal ring, installation

21. Install a new seal ring (removed in step 13) according to VIDA:

INFORMATION

REPAIR

Removal, replacement and installation

Power transmission

Rear axle, drive shafts

Drive shaft

Oil, filling

22. Fill with oil according to VIDA:

For oil filling, see:

Removal, replacement and installation

INFORMATION

REPAIR

Power transmission

Rear axle, drive shafts

Center differential

Final drive, replacing

Final drive, installation

23. Install the final drive according to VIDA:

INFORMATION

REPAIR

Removal, replacement and installation

Power transmission

Rear axle, drive shafts

Center differential

A/T - Cooler/Line Flushing Information

Retailer Technical Journal 19495
Automatic transmission
cooler/lines flushing

Date 09-11-2009

Reference: VIDA, VSTG, RTJ 16724

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!
THIS RTJ SUPERSEDES THE PREVIOUS VERSION OF RTJ 19495 RELEASED 10-8-2008. A LABOR OPERATION HAS BEEN REMOVED. THE DESCRIPTION OF BURNT OIL HAS BEEN EDITED. PLEASE UPDATE YOUR FILES.

Model	Type	Model year	Chassis range
ALL	ALL	ALL	ALL

AFFECTED VEHICLES:

DESCRIPTION:

The purpose of this RTJ is to work as a guideline for technicians when an automatic transmission is being replaced. In order for modern automatic transmissions to properly adapt to transmission wear while maintaining comfortable shift quality, the pressure control is closely monitored. For this reason, the automatic transmission fluid (ATF) must meet the transmission manufacturer's specifications.

A faulty transmission often has debris in the ATF, the coolers, the lines, and throughout the transmission. This debris must be properly flushed out before a new transmission is installed. Flushing the ATF using the transmission oil pump of the newly installed transmission will not suffice and can possibly cause damage to the new unit. Depending on the condition of the ATF, the transmission coolers and lines may need to be replaced. The information below is copied directly from VIDA.

SERVICE:

Once a transmission is properly diagnosed to be faulty and needs to be replaced, it is important that the proper procedures are followed for flushing out the used ATF from the ATF coolers and lines. Note that some vehicles have two coolers; the cooler in the side of the radiator and the auxiliary cooler.

When an automatic transmission is replaced, follow VIDA to reset adaptive memory. Simply disconnecting the TCM (Transmission Control Module) or power from the TCM does not reset adaptive memory!

On all vehicles, always flush the radiator, coolers, and lines before installing the new transmission. The guidelines and procedures for flushing vary with each model.

There is a procedure for flushing coolers and lines found in a hyperlink in the VIDA transmission/gearbox installation procedure called Transmission, preparations before installing for AW (Aisin Warner) 5- and 6- speed automatics and in the VIDA transmission replacement procedure for the AW 4-speed automatic.

The guidelines for flushing coolers on a GM 4T65 4-speed automatic are in VIDA/Information/Repair/Transmission, removing and there is a hyperlink in VIDA/Information/Repair/Transmission, installing for a flushing procedure called Oil cooler, flush cleaning. The guidelines for the 1999-2005 S80 will be updated to match the XC90.

More details about these guidelines can be found below.

On a GM 4T65 (2003-2005 XC90 T6 and 1999-2005 580 6-cyl), if there is:

^ glycol in the transmission fluid (refer to RTJ 16724 for more information on checking for glycol contamination), this would indicate an internal leak in the radiator requiring complete replacement of the ATF cooling system (radiator, auxiliary cooler [if applicable*], and cooler lines).

^ metal in the transmission fluid, this would indicate an internal transmission problem. **Note!** Metal in the ATF is nearly impossible to flush out completely. In order to be rid of all metal particles, complete replacement of the ATF cooling system (radiator, auxiliary cooler [if applicable*], and cooler lines) is required. See photo.

^ fine black sediment in the pan or on the pan magnet, this is normal. This can be flushed out according to VIDA. See photo.

^ dirty oil or burnt oil, this would indicate friction component (band or clutch disc) breakdown and in order to be sure all of the debris is out of the ATF cooling system, complete replacement of the ATF cooling system (radiator, auxiliary cooler [if applicable*], and cooler lines) is required. See photo.

***Note!** All 2003-2005 XC90 T6 vehicles have an auxiliary automatic transmission fluid cooler.

Labor operation code 49115 should be used when the ATF cooling system is flushed, not replaced.

XC90 (P2)	275	2005 – 2008	134000 – 436241
V70 (P2)	285	2005 – 2008	459000 – 687719
XC70 (P2)	295	2005 – 2007	173000 – 288671
S60	384	2005 – 2008	425000 - 677840

AFFECTED VEHICLES:

PLEASE UPDATE YOUR FILES.

DESCRIPTION:

Cracks in buttons on DDM (Drivers door module), rear door switches and PDM (Passenger Door module) have been found on vehicles after 1-2 years, mostly in high humidity markets. The button is manufactured in several steps with different material layers. The material used in the button is required for good illumination properties, but has also low chemical resistance.

PRODUCT MODIFICATION:

After August 18, 2007 (date code 18/08/07) the melt temperature was increased to relieve residual stress in the button molding process.

SERVICE:

Replace the button according to the VIDA repair instruction. Group 36/other electrical equipment/Electrical connector/Window control switch button. There is one kit with 4 buttons P/N 31295247 and a single button with P/N 31295164.

Description	Quantity	Part No.
Repair kit (4 buttons)	As required	31295247
Repair kit (1button)	As required	31295164

Note: Use Volvo cleaning products such as P/N 1161721 Cleaner 1 liter or 9192678 cleaning agent / serviette fabric when cleaning the switches. The use of any other compound may damage the button surface.

Emissions - Improved EVAP Leak Detection Diagnostics

Retailer Technical Journal 16629

Leakage Detection Diagnostics

improvements to remedy DTC's

Date 11-18-2009

Reference: VIDA

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!
This document supersedes the previous version of Retailer Technical Journal 16629 as well as all versions of TNN 28-74 released 11212008, 1210412007 1012212007, 812412007, 711312007, 61112007, 51112007, 51712007, 111212007 & 511512009.

Volvo Cars of North America is continuing its prior approval process for any claims submitted for the replacement of a Leakage Diagnostic Pump (LDP/DM-TL).

Claims for repairs including a Leakage Diagnostic Pump with a repair order date on or after May 15th 2009 require a Prior Approval Department authorization code. Authorization codes for leakage diagnostic pumps will only be available via the Prior Approval Dept., M-F 8:30 am - 6:00 pm Eastern Time. See below for details.

Prior Authorization is not required for customer pay replacement of the LDP.

Technicians who think they need to replace an LDP to make a repair, should contact the Prior Approval Dept before installing an LDP and have the information detailed below ready to discuss with the Prior Approval Department agent.

Model	Type	Model year	Chassis range

DO NOT fax or email any documentation unless requested by the Prior Approval Department.

Description

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

The diagnostic monitor for the evaporative emission system small leak from model year 2003 to present, has used a software function that calculates leakage based on a pressure inferred from the current consumed by an electric pump that pumps air into the fuel tank system. Our analysis has shown that the current consumption characteristic of the pumps electric motor which is part of the DM-TL (Diagnostic Mode-Tank Leakage) can change as the pump ages. This can cause a small leak to be falsely detected and the Malfunction Indicator Lamp (Check Engine Light) to illuminate with one of the following DTCs: ECM - 4308, ECM - 434C or ECM - P044200.

Solution

A new functionality has been developed which uses a new method to accurately diagnose the leakage status of the tank system, independent of any fluctuations or aging in the DMTL or other components. This new method calculates the pressure in the tank and the mass air flow through the fixed displacement pump and uses these values together with the common gas law to make an accurate calculation of the actual leak size.

Service:

The quick test won't work properly unless the improved ECM software is installed. Therefore, the first step with the new quick test is to check if the ECM software includes the improved leakage detection functionality software.

Note:
All model year 2009 and UD vehicles have the improved functionality from production.

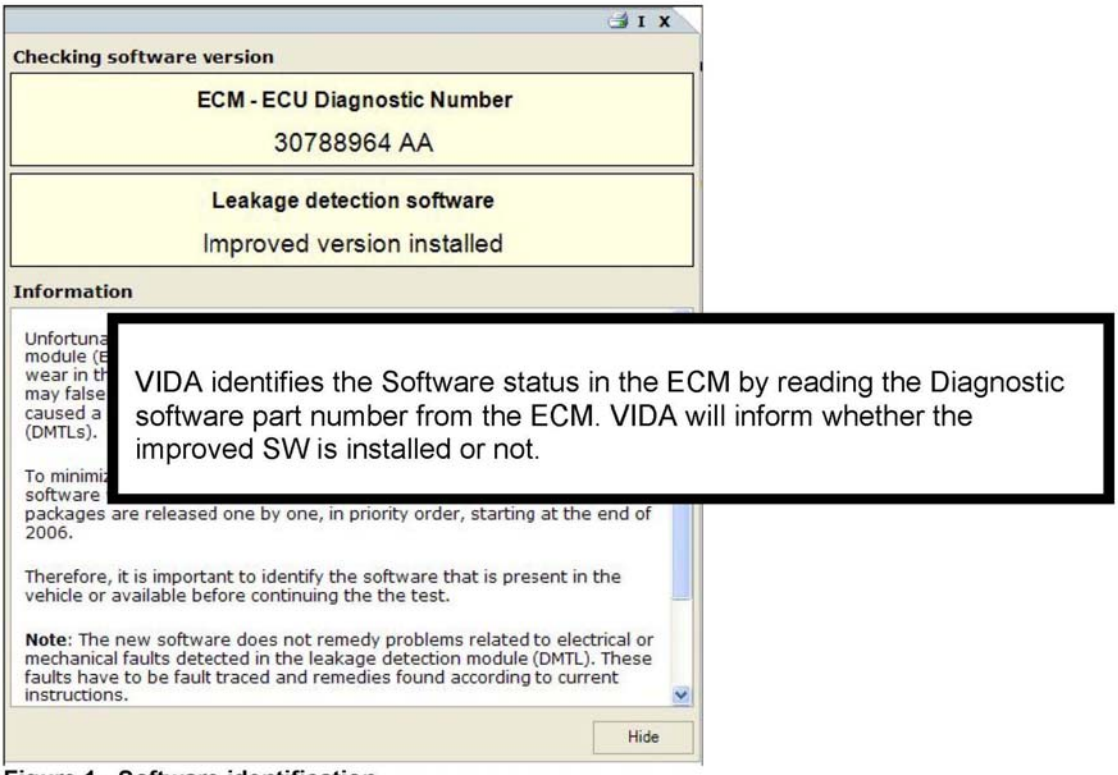

Figure 1 - Software identification

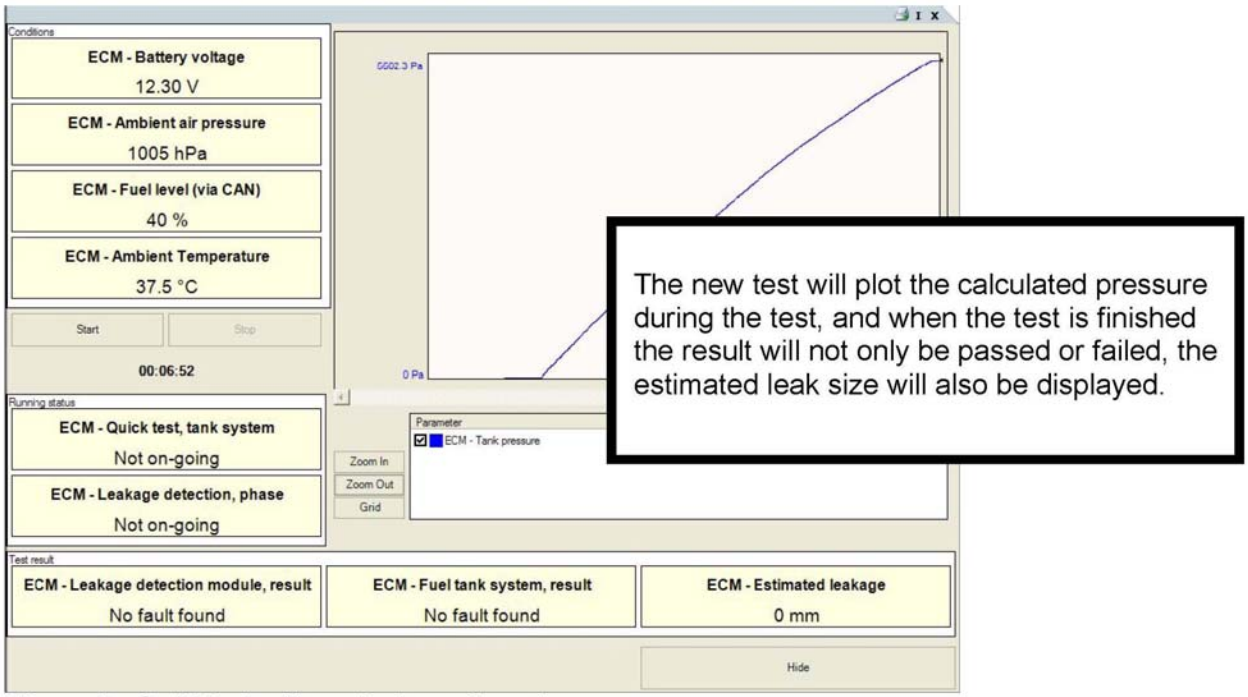

Figure 2 - Swift test with no leakage found

Important Note!

After an ECM upgrade VIDA will correctly identify the improved software is installed, but in order for the correct diagnostic database to be used, VIDA will need to read out the part numbers from the control modules again. Reading out the control modules can be best achieved by clicking the "UPDATE" button under the Network tab and must be done before the quick test is attempted. The test will display confusing and conflicting data in its output windows if VIDA uses the wrong diagnostic database.

Important Note:

The engine must NOT be running even though the old test in some cases advises so. The Midtronics Constant Voltage power supply PSC-550 (Tech Journal # 16405) should be used to maintain the battery voltage during the test, because in the most extreme cases the test could take up to 15 minutes to complete.

This is not a parts restriction process. Parts availability questions should be directed to the Parts Retailer Services Department.

Global Positioning - Erratic Garmin(R) 765 Operation

Retailer Technical Journal 21291
Garmin(R) 765 power issue and SW updates

Date 09-24-2009

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

This Document was created as information only. SW updates to the Garmin accessory units are to be performed by the Customer.

AFFECTED VEHICLES:
All vehicles with accessory installed Garmin 765 portable navigation unit

DESCRIPTION:
It has been brought to our attention that there is a bug in the Garmin 765 Software.

If the Garmin 765 displays the message "Updating GPS firmware" or "GPS Update Complete" and will no longer power on when plugged into a computer, a home charger or a car charger, the Garmin unit will require replacement to correct this issue.

PLEASE NOTE:
If your unit will power on when using battery power, or when plugged into a computer, a home charger or a car charger, a software update is now available to correct this issue. Please use Garmin's WebUpdater program to install this update onto your Garmin 765.

PRODUCT MODIFICATION:
The SW is being upgraded in the units at parts stock.

SERVICE: There are 2 Service scenarios:

1) The unit displays a message "Updating GPS firmware" or "GPS Update Complete" and will no longer power on when plugged into a computer, a home charger or a car charger. In this case, the unit must be sent to Garmin for servicing.

2) THE UNITS CAN BE SAVED if the customer loads new software to the units before the message "Updating GPS firmware" or "GPS Update Complete" is displayed.

This can be done by visiting: https://buy.garmin.com/shop/store/downloadsUpdates.jsp?product=010-00715-70&cID=134&pID=14926

Follow the directions on the website. This upgrade is free of charge.

Mandatory Software Update

Today, Garmin released a free, mandatory GPS software update to correct a software issue that has been discovered to cause the nuvi 7x5 devices to repeatedly attempt to update GPS firmware, and then either shut down or no longer acquire GPS satellite signals.

Garmin nüvi 7x5 series products that are no longer able to acquire a GPS satellite signal may download a firmware update immediately that will correct the software issue. This firmware update may be downloaded using Garmin's WebUpdater program.

Garmin nüvi 7x5 customers who are no longer able to power on their GPS device will need to visit www.garmin.com/support, and select the first FAQ titled "My nüvi 755T, 765T, 775T or 785T is giving me the message 'Updating GPS Firmware' or will no longer power on..." Customers will then need to follow the instructions to request a return authorization so that the device may be repaired under warranty.

We know our customers rely upon their Garmin GPS device(s), especially during the summer travel season, and we regret any inconvenience this situation may have caused. We are committed to developing products that are known for their quality and reliability and will continue to work diligently to earn the trust of our customers.

NOTE:
All customers who have registered their 765 would have received the e-mail notifying them that they would need to use the Web Updater to download a critical software update.

Cooling System - Engine Oil/A/T Fluid Contamination

Retailer Technical Journal 21965
New cleaning method developed for
Oil in cooling system

Date 02-08-2010

Reference: VIDA

Note!
If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE! THIS DOCUMENT SUPERSEDES THE PREVIOUS RETAILER TECHNICAL JOURNAL 21965 DATED 01-19-2010. PLEASE UPDATE YOUR FILES.

V50	545	ALL	ALL

AFFECTED VEHICLES:

DESCRIPTION:

If engine oil or automatic transmission fluid is found in the cooling system, there is a new cleaning method using a flush gun.

Description	Quantity	Part No.
Cleaning gun	1	9814122
Radiator hose	1	30776224
Radiator hose	1	30761633

TOOLS:

Description	Quantity	Part No.
Radiator hoses		See parts catalog in VIDA
Expansion tank and cap		See parts catalog in VIDA
Thermostat / Thermostat kit		See parts catalog in VIDA
Coolant	See relevant engine in VIDA	See parts catalog in VIDA

MATERIALS:

SERVICE:

The root cause of the oil contamination must be remedied prior to performing this cleaning procedure. Some examples of where to start looking are:

-Defective engine oil cooler

-Defective radiator

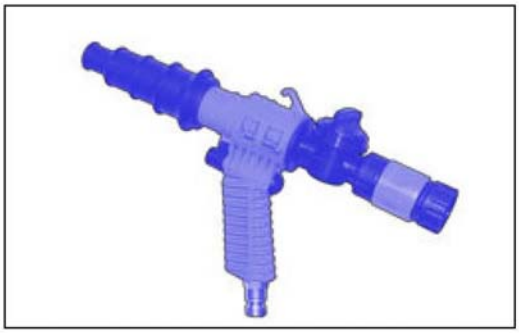
-Defective cylinder head gasket

Once the root cause of the oil contamination is remedied, use the following instructions in order to clean the cooling system.

1.

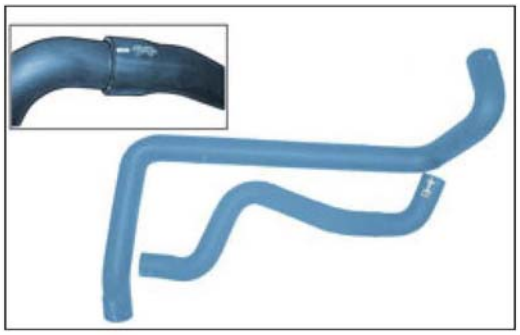
Note! Some variation in the illustrations may occur, but the essential information is always correct.

General



2. Special tool, PN 9814122, has been introduced for flushing the cooling system. The tool uses water and compressed air. After flushing, the thermostat, all rubber radiator hoses and the expansion tank with cover must be replaced.

   Note! The thermostat must be removed from the thermostat housing and the thermostat housing reinstalled for flushing to be effective.



3. The hose that is connected to the thermostat housing during flushing must reach outside of the engine compartment.

   Tip! Use radiator hoses PN 30776224 and PN 30761633 as tools. These are suitable for the different diameters on the outgoing connector on the thermostat housings. These can be reused for multiple jobs.

   Thermostat removal

4. Drain the cooling system.

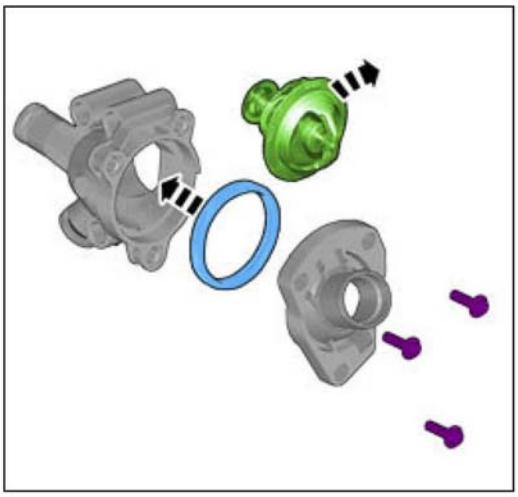
   Remove the thermostat according to VIDA:
   INFORMATION
   REPAIR

   Removal, replacement and installation Engine with mountings and equipment Cooling system Thermostat/temperature sensor coolant, replacement

5. On most engines the thermostat housing with thermostat is only available as a spare part. In these cases, the thermostat must be removed from the thermostat housing The following steps show how to do this.

   Removal of the thermostat from the thermostat housing

6. Step 6 applies to vehicles with B6324S or B630412 engines. Step 7 applies to C301S40N50 vehicles with B5254Sx/Tx engines.



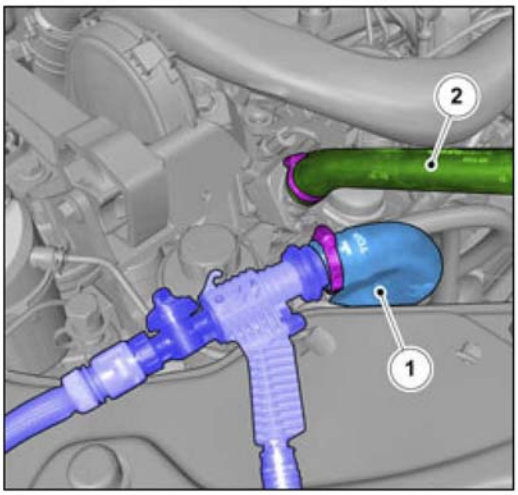
7. Remove the thermostat.

   Remove the rubber gasket from the thermostat.

   Install the rubber gasket in the thermostat housing.

   Assemble the thermostat housing. Reinstall the thermostat housing on the engine.

   Other engines not shown in steps 6 or 7:
   See relevant model and engine in VIDA.
   Flushing cooling system



11. Connect the cleaning gun to hose (1). Connect the water hose and compressed air to the cleaning gun.
Connect a long hose (2) to the thermostat housing, which extends outside the engine compartment.
Suggestion: use radiator hose 30776224 and 30761633.

    Hot water is recommended. Use skin protection to prevent burns.

    Note! When flushing, the first 20 litres (5.25 gallons) must be flushed out into a container because the fluid contains coolant that must not be flushed out into the drainage network. Flushing can then occur over a flush plate with oil separation.

    Flush the cooling system for at least 10 minutes if hot water is used. If hot water is not available, extend the time to 20 minutes.

12. After flushing, the thermostat, all rubber radiator hoses and the expansion tank with cover must be replaced.

    For thermostat replacement, see VIDA:
    INFORMATION
    REPAIR
    Removal, replacement and installation Engine with mountings and equipment Cooling system Thermostat/temperature sensor coolant, replacement

    To replace radiator hoses and expansion tank, see the spare parts catalogue for the relevant model and engine. There is no method to be followed for the replacement of radiator hoses and expansion tank.

Wheels/Hubs - Vibrations While Driving

Retailer Technical Journal 22403
Incorrect wheel hub, Wheel vibrations

Date 02-17-2010

Reference: VIDA, VSTG

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

Model	Type	Model year	Chassis range
S80	184	1999 – 2006	ALL
V70	285	2001 – 2007	ALL
V70 XC / XC70	295	2001 – 2007	ALL
S60	384	2001 – 2009	ALL

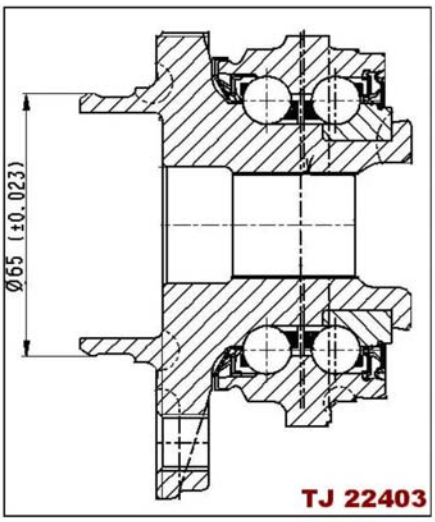
AFFECTED VEHICLES:

DESCRIPTION:

Wheel vibrations may occur if the wheel is not installed in the exact center position on the wheel hub. To avoid radial misalignment between the wheel and the hub, they must have the same diameters.

It has been discovered on some cars that the wheel hubs (spare parts as well as production parts) may have a center cone with a too small outer diameter. If a wheel is installed on such a hub, it is possible that the wheel is installed with an offset of 1.5 mm (0.059"), which can cause wheel vibrations while driving.

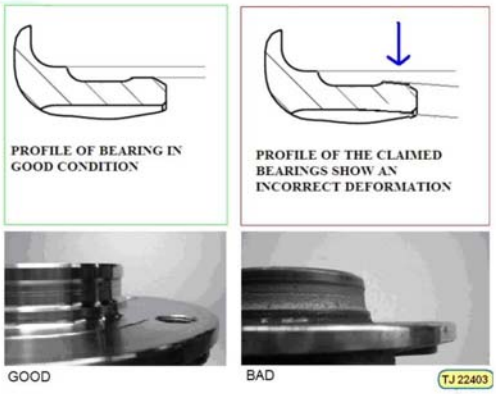
SERVICE:



1. If a customer complains about wheel vibrations and it is hard or impossible to remedy the vibration with normal wheel balancing, then check and measure the center cone diameter on the wheel hub.

   Correct diameter = 65.0 mm (2.559")

   Incorrect diameter found on some cars = 63.5 mm (2.500")



2. Check that the hub is not deformed, regardless of diameter.

   If this is the case, replace both, the hub and the wheel on the corner of the vehicle where this deformation is found. It is possible that the wheel, in this case, caused the deformation of the hub.

   For replacing the wheel, follow VIDA:
   INFORMATION

REPAIR
Springs and wheels
Wheels, tyres, hubs
Wheels

For replacing the hub, see step 3.

3. If a hub with the incorrect diameter is found, replace only the hub with the incorrect diameter according to VIDA:

   INFORMATION REPAIR
   Springs and wheels Wheels, tyres, hubs Hub and bearing

4. Check that the wheels have a center diameter of approximately 65 mm (approximately 2.6").

5. If a wheel with the incorrect center diameter is found, replace only the wheel with the incorrect diameter.

6. When replacing a hub for any reason, first measure the center cone diameter of the new hub in order to prevent repeat repairs. If a new hub is found with incorrect center cone diameter, send in a Service Product Report (SPR) and do not use that hub. Do not send in an SPR for an original hub that has the incorrect diameter.

Note! Include in the repair order text if the hub is original from the factory or if it is a spare Part. Also include if the wheel was replaced.

Instruments - Fuel Gauge Reads '0' With Fuel In Tank

Retailer Technical Journal 22294

Fuel level shows 0 even with fuel in tank

Date 02-03-2010

Reference:
VIDA DTC information

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Model	Type	Model year	Chassis range
S80	184	2005-2006	390000-446916
XC90	275	2005-2010	134000-553921
V70	285	2005-2008	459000-693560
XC70	295	2005-2008	173000-288671
S60	384	2005-2009	425000-741211

AFFECTED VEHICLES

DESCRIPTION:
The fuel gauge may intermittently show 0 in the DIM (Drivers Information Module). Customers may also report that the fuel level will show correctly after a key cycle. The following DTCs (Diagnostic Trouble Codes) will be set with an intermittent status:

DIM 0001 Driving distance. Incorrect value

CEM 4A31 Ejector sensor. Faulty signal (ejector side) Only posted on cars with 2 sensors.

CEM 4A35 Fuel level sensor. Faulty signal (pump side)

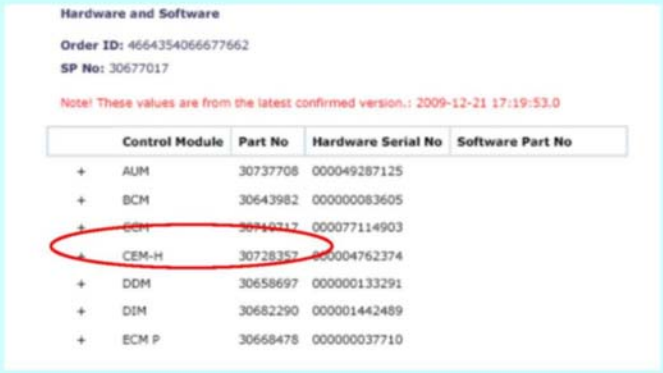
PRODUCT MODIFICATION: The root cause has been found within the CEM (Central Electronics Module) software. The CEM looses the distance information for 0.2 seconds and then goes back to its correct value. DTC CEM-4A35 and/or 4A31 will be set as a result of the CEM not being able to see the fuel level drop during a set distance. This will cause CEM to send out a low quality value for the fuel level signal that the DIM cannot interpret.

New CEM software has been introduced for service and production for all affected vehicles at the chassis end limits above.

NOTE:
There are vehicles built between Structure weeks 200425 and 200448 equipped with CEM Hardware part numbers (HW PN) that will not accept the SW correction package. Those CEM Hardware part numbers are:

- 30728357
- 30682981
- 30682982

The CEM HW PN can be identified in VIDA **Vehicle Details / HARDWARE and SOFTWARE**



Hardware and Software

Order ID: 4664354066677662
SP No: 30677017

Note! These values are from the latest confirmed version.: 2009-12-21 17:19:53.0

	Control Module	Part No	Hardware Serial No	Software Part No
+	AUM	30737708	000049287125	
+	BCM	30643982	000000083605	
+	ECM	30749717	000077114903	
+	CEM-H	30728357	000004762374	
+	DDM	30658697	000000133291	
+	DIM	30682290	000001442489	
+	ECM P	30668478	000000037710	

In this case, there will be a SW package delivered and loaded; however, the package will **not** include the correction for the fuel gauge symptoms.

If the vehicle is equipped with one of the CEM hardware P/Ns mentioned, the CEM must be replaced and reloaded to correct the symptoms described above.

SERVICE: If the customer reports the symptoms described above and the vehicle is within the chassis number limits in the affected vehicle table, Please perform a CEM upgrade P/N 30677017. Please see note above

AFFECTED VEHICLES

DESCRIPTION

Several software upgrade (SW) discs have been developed to take care of several known bugs in DVD based RTI systems. If the customer reports strange behavior from the RTI system, i.e. system restart, reset, arrow not moving, strange route choices, abnormal ETA (estimated time of arrival) displayed, voice guidance while system is shut down, etc. Always start with upgrading the unit to the latest SW. By doing this, we can eliminate problems from the earlier software.

Note:

Map data is not included in the SW upgrade discs.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

SERVICE:
1) RTI system off and key in position 2
2) Remove the map disc and install the appropriate SW upgrade disc. (See chart below)

3) Turn on RTI system. The screen will indicate "LOADING NEW PROGRAM" and a scroll bar will appear. When the upgrade has finished loading, the screen will go blank and then retract.

4) Remove upgrade disc and reinstall the customer's map disc if needed.

NOTE:

If when installing the upgrade disc, the screen reads "THIS IS NOT A MAP DISC" the system is already loaded with the latest SW indicated in the chart.

System	Model year/variant	Service disc P/N	Service disc upgrades to SW version no.
CD based (with 6 disc changer)	MY 1999 – 2001 S80 MY 2001 V70 MY 2001 S60	*N/A* *Not upgradeable w/ service disc*	*N/A* *Not upgradeable w/ service disc*

MMM+ HDD (Hard disc drive) *(Upgradeable w/2 disc set)*	XC90 2007 – All P1X 2008 -	31310029 Please follow loading instructions contained in package and in RTJ 20475. (see note 1 below) ***Version 1022 31328472***	1404/002400 ***1630/2400***
MMM2 (DVD based)	*All P3x*	version 920 31288884 version 948 31310271 ***version 1022 30630953***	8BA8 8BB7 ***8BC6***

Note 1
Applies to MMM+ and service disc 31310029
CAUTION! It is very important that battery voltage stability is maintained with a vehicle power supply and that no other operations are done on the car while the boot loader disc is being loaded. (i.e. engine start or crank). Failure to so may damage the primary boot loader SW in the MMM's hard drive. It will be necessary to replace the MMM if this occurs.

Service discs can be obtained through the normal parts ordering routine and may be used to upgrade multiple vehicles.

The current SW version can be found in the RTI system menu as follows:

Settings/help/about or, settings/System options/about (depending on variant and model year).

NOTE!
THIS DOCUMENT SUPERSEDES THE RETAILER TECHNICAL JOURNALS 19468 and 19316, DATED 07-29-2008 and 07-01-2008 respectively. RTJ 19468 is for parts information and this information can be found in VIDA as well as in this RTJ. RTJ 19316 is no longer valid and the new information can be found in VIDA as well as in this RTJ. PLEASE UPDATE YOUR FILES.

DESCRIPTION:

The purpose of this RTJ is to update the information concerning the criteria to switch off the low tire pressure message and give some additional basic information about the TPMS system and thereby help in fault tracing in order to take the right corrective actions.

TPMS description:

TPMS is a monitoring system for the driver to keep the right tire pressure in the tires. The sensors begin transmitting the signals to the Upper Electronic Module (UEM) when the vehicle's speed is higher than 40 km/h (25mph).

The driver will get a message in the Driver Information Module (DIM) if the tire pressure drops a certain percentage from the recommended tire pressure. Recommended tire pressure is present in the owner's manual and in the fuel filler lid (model specific).

If vehicles with TPMS are driven with the "comfort pressure" set there will be unnecessary tire pressure warnings to the driver (in the DIM) in cold weather conditions. Volvo does not recommend using comfort pressures due to the sensitivity of TPMS.

Criteria to switch on the low tire pressure message:

^ The tire pressure has dropped more that 22% of the recommended pressure see the Table 1 in the attached document.

Criteria to switch off the low tire pressure message:

^ The tire pressure must the filled up at least to 95% of the recommended pressure AND then the vehicle needs to be driven for 5 minutes at a speed higher than 40 km/h (25mph).

OR

^ Fill the pressure to at least 95% of the recommended pressure with ignition on.

Fault tracing:

^ Fault trace according to VIDA by using CSC LI this will guide you to a smart tool that will help you to find the faulty sensor.

OR

^ Use Diagnostic/reference information/UEM and the stored DTC in VIDA.

Example on an XC90	US Front / Rear (psi)	CDN Front / Rear (psi)	CDN Front / Rear (psi)
	Tire Pressure	Tire Pressure	Tire Pressure
	1-5 persons	1-5 persons	1-3 persons
Recommended tire pressure(RTP)	36/36	39/39	35/35
DIM Alarm low tire pressure 22% of RTP	28.08	30.42	27.3
Minimum pressure to switch off message in DIM	34.2	37.05	33.25

Table 1

Photo 1

Note!
When using the special tool to ping the sensor make sure that the tool used matches the tool in the attachment (see Photo 1).

MATERIALS:

A snap-in transmitter has been introduced during structure week 2007W48 in production. This part can be used on all cars that are fitted with Schrader style TPMS (all vehicles in this RTJ).

PN 30748991 = Old PN before 2007W48

PN 31200923 = New PN after 2007W48

SERVICE:

If a customer claims of having a "Low tire pressure warning" message in the DIM fill the tire pressure to the recommended pressure and make a test drive with the criteria above.

DESCRIPTION:
When turning the steering wheel, a scraping or creaking noise may be heard from behind the steering wheel. The contact reel may not be correctly fitted to Steering Wheel Module (SWM), so that the knob on the contact reel will scrape against the SWM housing. See Photo 1 in the attachment.

PRODUCT MODIFICATION:
Plastic washers are fitted to the SWM to center the contact reel towards the steering column.

SERVICE:
Check that the contact reel is correctly fitted to the SWM. Loosen the screws for the SWM and try to center the SWM / contact reel to the steering column. If symptom remains, replace the SWM using procedures in VIDA and RTJ 19989.

DTC = Diagnostic Trouble Code

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!

THIS DOCUMENT SUPERSEDES THE PREVIOUS VERSION OF RETAILER TECHNICAL JOURNAL 16761 DATED 12-23-2009. New AW TF80SC software has been added for the Winter mode function. PLEASE UPDATE YOUR FILES.

DESCRIPTION:
The TCM Upgrades in the attached document are available to correct the complaints / symptoms listed in the attachment.

SERVICE:
If the vehicle fits in the model year or chassis range for the symptom in the attachment, download a TCM Upgrade.

VOLVO STANDARD TIMES GUIDE (VSTG) INFO:

Operation number 36004-2 - Control module, software download- See VSTG

- Claims may be submitted under the new car warranty when there is a documented customer complaint using claim type: 01

- Labor times are valid at the time of release and are subject to change.

Car Customer Service		
	TJ Instruction	
	TJ No 16761	
		Date June-10 Issue 08
Title	Transmission Control Module (TCM), Software (SW)	

Vehicle	Complaint / Symptom	Reset Adaptation to Zero	Adaptive Test Drive
	GM4T65		
2003-2005 XC90 T6	This TCM SW should be used when the customer is complaining of gearbox related symptoms, when any parts are replaced in the gearbox, or when the complete gearbox is replaced. This TCM SW has modified torque handling at 1-2 and 2-3 shifts to reduce the shift force. With this download, the adaptation in the gearbox is reset, and therefore **it is important to do a re-adaptation of the gearbox.** **IMPORTANT:** Adaptation instruction for GM transmission: 1: Let the car stand on idle until the gearbox temperature have reach 50º C (122 ºF) or higher. 2: Drive the car in D-position with steady acceleration pedal, start from low pedal position, and let the car shift up. 3: Repeat step 2 until the shifts feels ok. 4: Increase the pedal position, and let the car shift up. 5: Repeat step 4 until the shifts feels ok.	Yes	Yes
1999-2001 S80	TCM DTCs (Diagnostic Trouble Code) 0028, 002F, 0045, 0053, 008D, 0099 ECM(Engine Control Module) 530D DIM (Driver Information Module) message with no DTC Harsh 1-2 upshift, 4-2-4 shift and garage shifts Geartronic Downshift Shudder Engine RPM Oscillations During Highway Driving	Yes	No
2002-2004 S80 2003-2005 XC90	TCM DTC 0028 TCM DTC 0099 (Reset Adaptation to Zero before clearing code) 1-2 Upshift Quality: Slipping, Harshness, Delay, Hesitation 2-1 Downshift Shock	Yes	No

Vehicle	Complaint / Symptom	Reset Adaptation to Zero	Adaptive Test Drive
AW 5 Speed (AW55-50/51)			
2007-2008 S60 2007 V70 B5244S ONLY	Transmission shifts normally from 1st to 2nd but does not shift into 3rd. After cycling the ignition, the symptom is gone. This generally occurs after customer comes to a stop and puts the transmission into N while stopped.	Yes	Yes
2007 S60/V70/XC70/XC90 (New, February 2007)	Slip / Flare / Harsh Shifts during the first few accelerations after a cold start.	Yes	Yes
2002-2006 S60/S80/V70/XC70/XC90	General Shift Quality 2-3 Flare, especially when cold or after Highway Driving 3-2 Power-On Downshift Quality, after coastdown Power-On Downshift Response TCM DTC 002E, 002F Slip / Flare / Harsh Shifts during the first few accelerations after a cold start. Applies to 2005-2006	2002-2004 No 2005-2006 Yes	2002-2004 No 2005-2006 Yes
2001 S60/V70/V70XC	General Shift Quality Shift Pattern Power-On Downshift Response Neutral Control Symptoms (Described in TNN 43-38, RTJ 17906)	Yes	Yes

Text
CSC = Customer Symptom code

If using a printed copy of this document, always check for the latest online version.

BACKGROUND:

The EFF function can be an aid in fault tracing intermittent CAN network problems by providing a visible indication of error frames that are being transmitted on the network when the fault becomes active. Error frames will be transmitted when there is a critical fault in the network or network wiring such as open circuits i.e. terminal/connector problems broken wiring short circuits i.e. chaffed/pinched wiring and defective nodes i.e. "babbling" nodes.

The advantage of using the EFF function is that error frames are usually transmitted on the network before a vehicle symptom can occur. Hence if the fault is very intermittent in nature it may be possible for example to induce the wiring fault for a short duration by manipulating the vehicle harnesses and connectors. The electrical fault will occur and be detected by the EFF without ever having a vehicle symptom appear.

		Volvo Cars of North America
		TJ attachment
		TJ No 20402
		Date: September 20, 2010 Issue 01
Title	Use and setup of DICE error frame finder	
Recomended Technician level	Expert	

DESCRIPTION:

This document describes how to setup and use the Error Frame Finder (EFF) functionality that is part of DICE.

It is structured into six parts:

1: Installing the CAN recorder Browser to your PC
2: Loading the SD card with the configuration file
Note: steps 1 and 2 are only necessary if a generic SD card is used. Special tool 9513010 is pre loaded with the configuration file for a 500Kb/sec CEM
3. How to use the DICE error Frame Finder mode
4. Tips on CAN fault tracing with the EFF
5. Tips on CAN fault tracing using the multi-meter method

BACKGROUND:

The EFF function can be an aid in fault tracing intermittent CAN network problems by providing a visible indication of error frames that are being transmitted on the network when the fault becomes **ACTIVE**. Error frames will be transmitted when there is a critical fault in the network or network wiring such as open circuits, i.e. terminal/connector problems, broken wiring, short circuits, i.e. chaffed/pinched wiring and defective nodes, i.e. "babbling" nodes.

The advantage of using the EFF function is that error frames are usually transmitted on the network before a vehicle symptom can occur. Hence, if the fault is very intermittent in nature, it may be possible, for example, to induce the wiring fault for a short duration by manipulating the vehicle harnesses and connectors. The electrical fault will occur and be detected by the EFF without ever having a vehicle symptom appear.

NOTE:
For error frames to occur there must be network communication. Error frames will only be generated for a short time during the actual sporadic occurrence of the fault. Once the fault is permanent, for example a network short to ground, the network communication stops and therefore no more error frames will be generated.

More detailed fault tracing information will be provided elsewhere in this document.

TOOLS:

Description	Quantity	Part No.
DICE	1	9513000
Memory card	1	9513010 or locally sourced equivalent SD card with a minimum capacity of 1 Gigabyte. *Note: SD cards over 2GB that are classified as SDHC (high capacity) and have a FAT32 config may not be supported by DICE.*

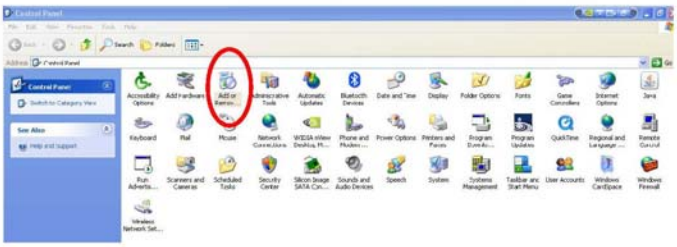
USB communication cable	1	9513003 supplied in the originally allocated DICE kit or equivalent
VIDA application disc	1	VIDA version 2010B or later

1: Installing the CAN recorder Browser to your PC

Note: User must be logged on as an administrator to install programs on a VIDA workstation

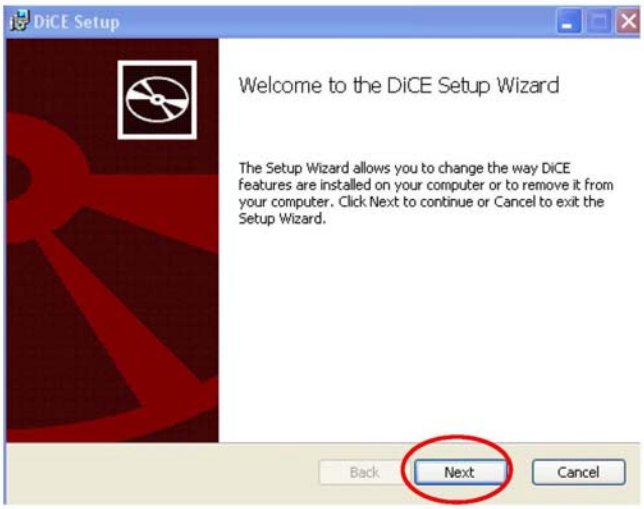
The CAN recorder browser application files are included on all VIDA application discs from version 2010B and later.
This application will enable you to transfer the different EFF configuration files to the SD card via the DICE unit depending on the HS CAN speed (250 Kbit/s or 500Kbit/s). There is also a CAN Flight recorder function included in the application but **it will not be supported**.

1) Make sure to have the VIDA disc in the computer.

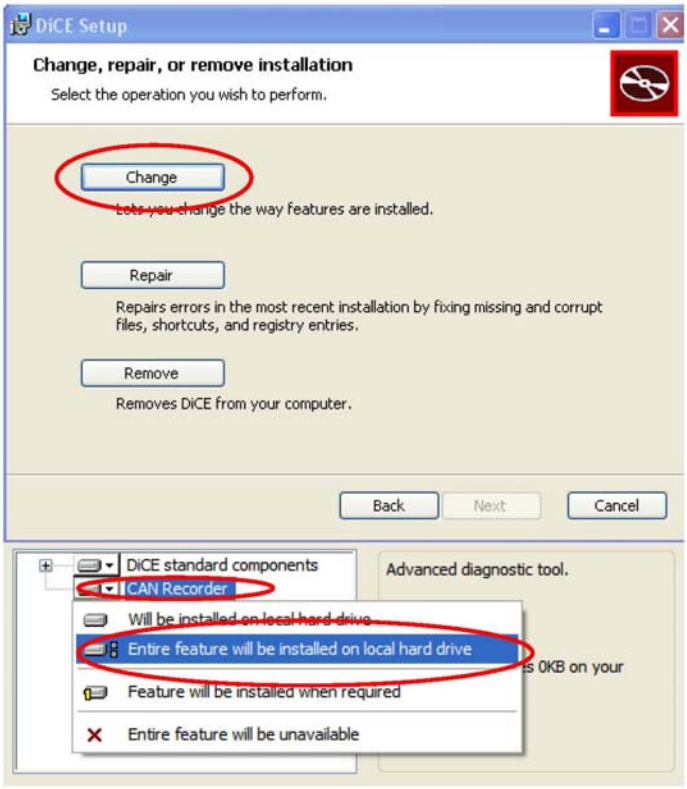


2) Select ***"control panel"*** from the start menu. Then click on *"Add or Remove programs"* in Control Panel

3) Select ***"DICE"*** in the list and click ***"CHANGE"***

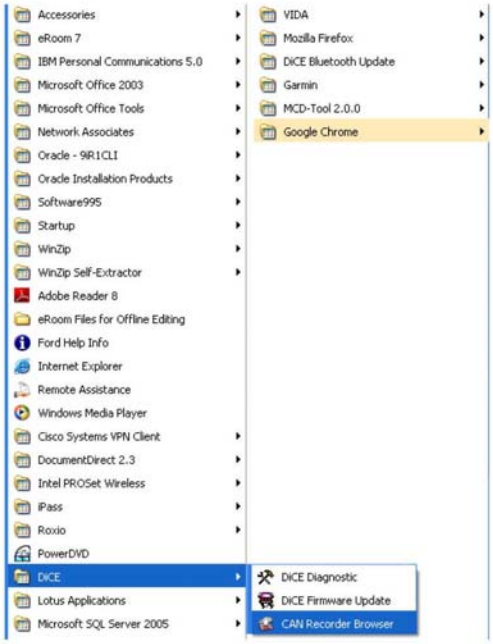


4) Click ***"NEXT"*** to start the installation



5) Click ***"Change"*** to add the browser option

6) Click ***"CAN Recorder"*** and select ***"Entire feature will be installed on local hard drive".***



Done.

The application should now be installed on your computer.
It can be accessed in the start menu/ *All programs / Dice / Can recorder browser.*

2: Loading the SD card with the configuration file

There are different config files used for the EFF function depending on the HS CAN bus speed and vehicle type. There are also files for the CAN recorder function (which is not supported) Use the chart below to select the correct file to load to the SD card.

File name	Application	HS (High Speed) CAN bus speed	Comments
config.cfg	P1X, P2X 2005- and P3X	500 Kb/sec	Preferred
P2X -2004 Key.cfg	P2X up to 2004	250 Kb/sec	Preferred
X70 1999-2000.cfg	X70 1999 – 2000	250 Kb/sec	Preferred
P2X -2004 VBAT.cfg	P2X up to 2004	250 Kb/sec	**Do not use.** The configuration is designed to shut down the dice if the measured voltage is below 13V
Y286,P1,P2x 2005 -.cfg	P1X, P2X 2005- and P3X	500 Kb/sec	The same as config.cfg
Y286,P1,P2x 2005-.cfg	P1X, P2X 2005- and P3X	500 Kb/sec	The same as config.cfg but with some changes for trigger conditions that will not affect the EFF mode

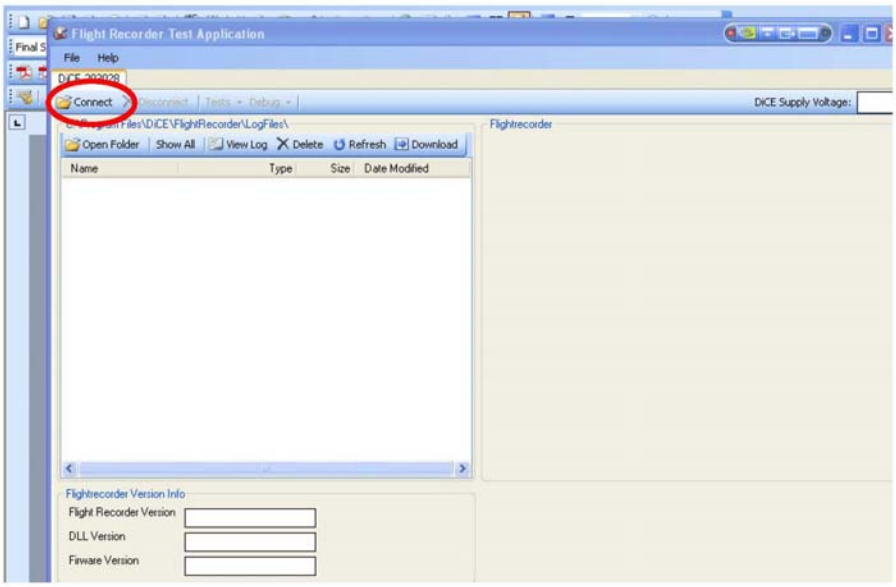
Note: Only one config file can be loaded to an SD card at a time. It may be more convenient to load 3 different SD cards and label them for use as needed.

1) Make sure to have the VIDA disc in the computer

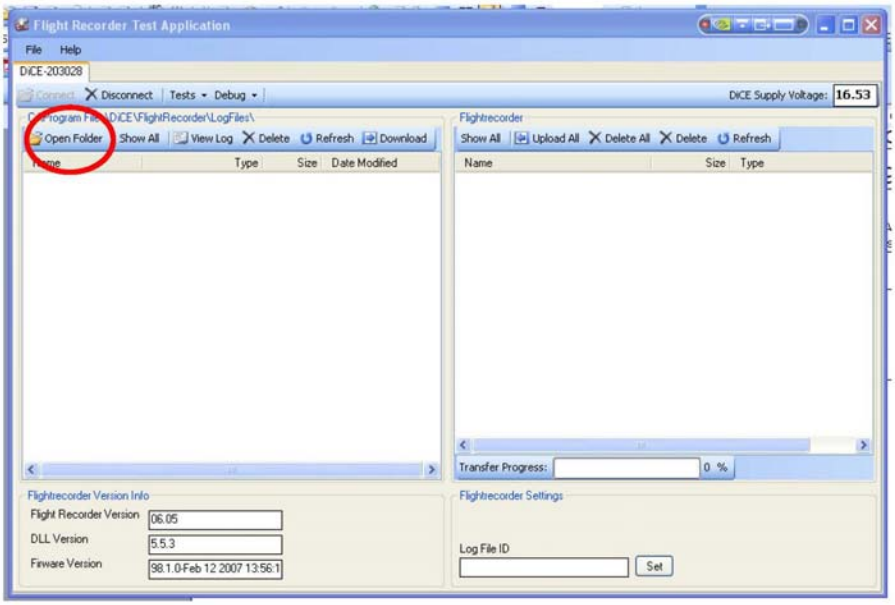
Power up the DICE unit.
Use the power supply plug from the VIDA "toughbook"

- Connect a USB communication cable to the PC and to the DICE unit
- install an SD card

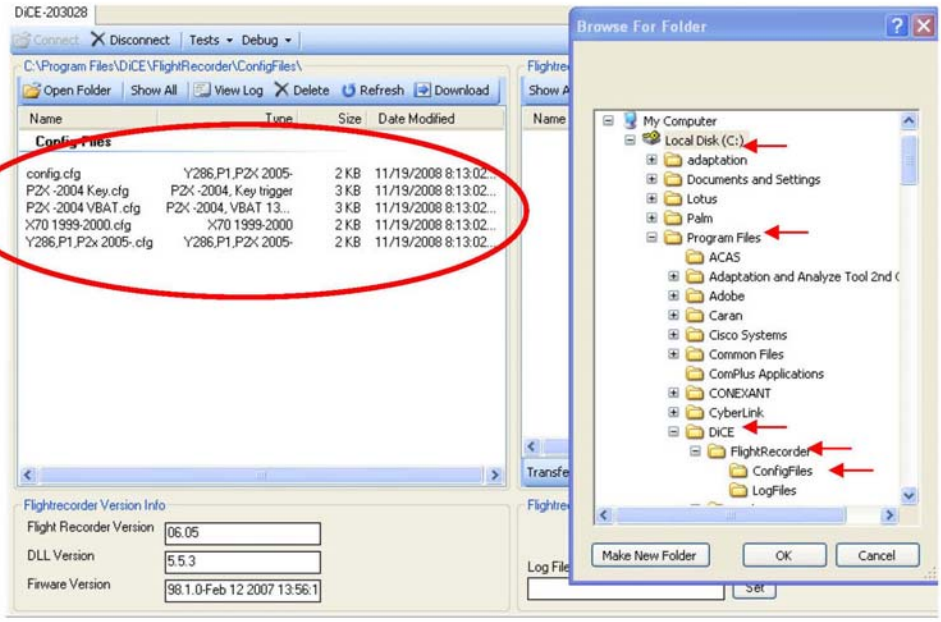
Remove the Bluetooth adapter from the PC as this may cause a communication conflict with the DICE unit.



Open the CAN recorder browser and click on *"connect"*



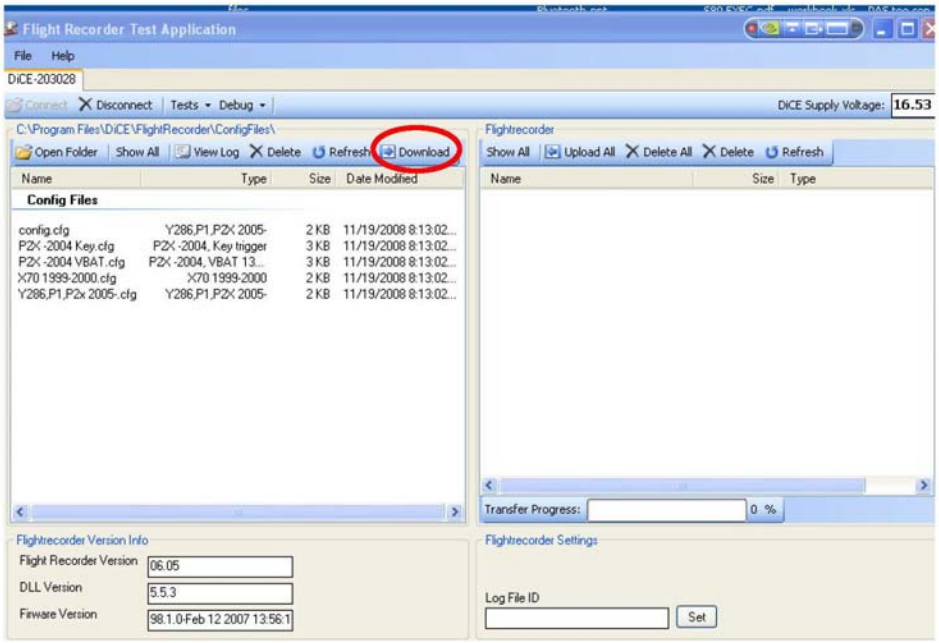
Click *"open folder"* and a file browser window will appear.



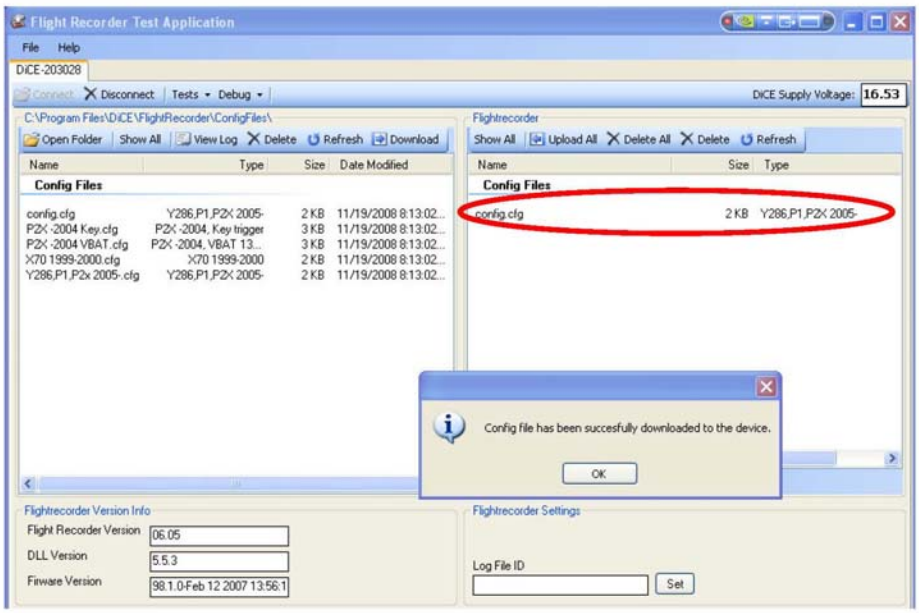
Chose File path;
C/Program files/DICE/flightrecorder/ configfiles

Click OK.

5 different config files will be displayed in the left hand window



Highlight the file to be loaded to the SD card and click "download"

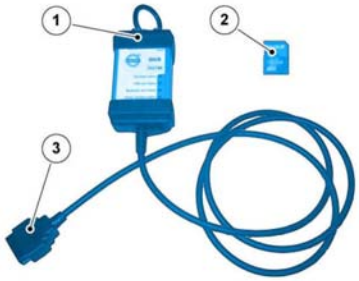


The selected file will appear on the right window when the transfer is complete and a confirmation window will be displayed

DONE !
Your SD card is now configured to start the EFF function.

If you wish to remove the config file from the card, highlight the file in the right window and click "*delete*"

3. How to use the DICE error Frame Finder mode



1,
Insert an SD card with the appropriate config file into the DICE unit.

2.
Remove the Bluetooth adapter from the VIDA workstation.
If the DICE unit is within range of a VIDA workstation it will attempt to pair with it and prevent the EFF from functioning.

3.
Plug the DICE unit into the OBD connector and turn the key to position 2 or start engine.

4.
The following indications will be noticed given a normal operating network.

1. **Flashing at 4 sec intervals**
   DICE in EFF mode
2. **Flashing or continuously lit** data flow on CAN high speed
3. **LED not lit.**

Short flashes of this LED indicate there are error frames being sent on CAN low or high speed network.

4. **Flashing or continuously lit**
   Data flow on CAN low speed network

4.Tips on CAN fault tracing with the EFF

1.

"Error Frame Finder" (EFF)

When using the "Error Frame Finder", There is an indication lamp (blue LED) that flashes if an error frame is discovered on the CAN network.
This does not indicate which network, LS or HS network, has a problem, just that there is a problem.
Connect "Error Frame Finder" to the OBD connector, ignition in position 2.
It is also possible to drive the vehicle with the EFF installed. In this case it is possible that vehicle movement, e.g. chassis twisting, engine movement, braking or acceleration can induce the electrical fault that will cause error frames to be sent.

2.

Fault types that can be found with "Error Frame Finder"

- Problems with cable harnesses
- Communicating/defective modules
- Connector problems
- Ground connections

3.

Cable harness problem

If the problem is suspected to be a cable problem, start by bending, pulling or pushing the cable harnesses back and forth and check whether the blue LED starts to flash. If the blue LED starts to flash, the source of the problem has probably been found.

4.

Communicating/defective modules (babbling nodes)

This is the most difficult type of problem to find.

Connect the "Error Frame Finder" and set the ignition to position 2.

Check to see if the blue LED flashes, if not, the fault is not currently active.

Leave the vehicle in key pos 2 with a power supply connected and wait. It can take hours and in a few cases days before the fault occurs but it usually does occur sooner or later. It may also help to let the network go into sleep mode and wake it up repeatedly to induce the fault.

Once the fault is active, start by removing fuses for the CAN modules (remove module by module) and check when the blue LED stops flashing. When the correct fuse has been found, confirm the fault by inserting the fuse again and checking if the blue LED starts to flash again.

5.

Connector problems

Connect "Error Frame Finder" and if the problem is active, disconnect the connector from module and check if the blue LED stops flashing. If not, check the next connector to another module etc.

Connector problems can consist of:

- Voltage problem, check the voltage at the CAN connector pins. Check for a loose male connection at the connection.
- Oxidised connector pin, this causes poor contact.

6.

Miscellaneous

- Typical behaviour of the "Error Frame Finder" when a problem has occurred:
  The blue LED flashes several times at short intervals and then stops and then starts flashing again.
- **"Error Frames Finder" can sometimes be detected without the vehicle having any faults such as for example, when making a start attempt. This is normal**
- The "Error Frame Finder" can indicate a problem before some symptoms have started to appear on the vehicle.
- The "Error Frame Finder" is best used for detecting CAN faults of intermittent nature. If the network is not operating, use an ohmmeter and measure network resistance first.
- Physically disconnecting a terminating resistor node from the network could result in error frames

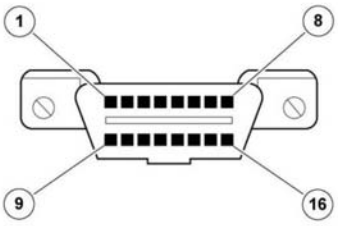
5. Tips on CAN fault tracing using the multi-meter method

Types of fault that can be found when measuring using the multi-meter method

- The resistance value indicates whether there is a permanent cable harness problem or permanent short-circuit inside a module and whether the CAN network is correctly connected.
- The CAN network works with only a terminating resistor connected.
- When the network is active and operating, the voltage indicates that the network is running correctly from an electrical point of view. If the voltage is too high, this is an indication that the network is heavily loaded and there are too many messages on the network. In this case the fault may be due to a "babbling node"

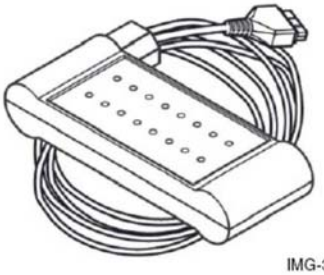
.

Measuring network resistance and operating voltages using a multi-meter



.

#16:	Power supply
#4 and #5:	Ground
#3 and #11:	LS network
#6 and #14:	HS network



IMG-328833

Special tool 9513015 can be an aid in accessing the OBDII connector.
Reference special tool bulletin #168

Breakout box for OBD II connector. The tool has the following 2 functions:
1. Allows measurement of voltage and resistance from the OBD II connector.
2. Allows a safe ground point via OBD II connector.
Suitable for all models with OBD II connector.

LS Low speed network resistance

Disconnect the battery and measure via the OBD connector

- Measure the resistance between terminals #3 and #11, value should be approx. 60 ohm
- Measure the resistance between terminals #3 and #4 (ground), the value should be >1 kohm
- Measure the resistance between terminals #11 and #4 (ground), the value should be >1 kohm
- Measure the resistance between terminals #3 and #16 (power supply), the value should be >1 kohm
- Measure the resistance between terminals #11 and #16 (power supply), the value should be >1 kohm

HS High speed network resistance

Disconnect the battery and measure via the OBD connector

- Measure the resistance between terminals #6 and #14, value should be approx. 60 ohm
- Measure the resistance between terminals #6 and #4 (ground), the value should be >1 kohm
- Measure the resistance between terminals #14 and #4 (ground), the value should be >1 kohm
- Measure the resistance between terminals #6 and #16 (power supply), the value should be >1 kohm
- Measure the resistance between terminals #14 and #16 (power supply), the value should be >1 kohm

LS-Low speed network normal operating voltages

Battery connected, key position 2. Measure via the OBD connector

- Measure the voltage between terminals #3 and #11, the normal value should be between 0.55 - 0.90 V
- Measure the voltage between terminals #3 and #4, the normal value should be approx. 2.8 V
- Measure the voltage between terminals #11 and #4, the normal value should be approx. 2.3 V

HS-High speed network normal operating voltages

Battery connected, Key position 2. Measure via the OBD connector

- Measure the voltage between terminals #6 and #14, the normal value should be between 0.55 - 0.90 V
- Measure the voltage between terminals #6 and #4, the normal value should be approx. 2.8 V
- Measure the voltage between terminals #14 and #4, the normal value should be approx. 2.3 V

See the attached document for use and setup of DICE error frame finder.Technical Service Bulletin # **TJ23502** Date: **100914**

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

DESCRIPTION:

This Technical Journal describes the usage of RELOAD software (SW). There are two main types of downloads; RELOAD and UPGRADE. By description a RELOAD shall be used when a node has been replaced and an UPGRADE shall be used when new SW version shall be downloaded to an existing node.

In the SW System Structure there is a blockage which stops you from purchasing an UPGRADE to a node if the node already contains the latest SW. In this case VIDA will show "error 133 - the node to be upgraded already contains the latest SW".

If the node already contains the latest SW there is absolutely no reason to perform a RELOAD to that node. This will only bring down the same SW as the node already contains and will make no difference for the customer concern.

A lot of warranty cost is spent on these unnecessary RELOADs and they do not offer anything to the customer's concern(s).

The warranty department will start looking into these unnecessary RELOADs both to reduce the cost and also to ensure that the correct remedy is performed in order to solve the customer's concern(s).

SERVICE:

Do not use RELOAD SW to solve a SW problem if the node already contain the latest SW (error 133 when trying to perform UPGRADE as described above) as this will not add any extra value.

There are occasions when a reload is necessary even if the node contain the latest SW. For example if a node does not respond at downloading it is sometimes necessary to perform a RELOAD SW even if the node is not replaced. Also on recommendation from Technical Support a RELOAD is sometimes applicable to use.

Note!

If using a printed copy of this Retailer Technical Journal, first check for the latest online version.

NOTE!

THIS DOCUMENT SUPERSEDES THE PREVIOUS RETAILER TECHNICAL JOURNAL 19674 DATED 02-09-2010. Wheel angle specifications for the 2011 S60 have been added. PLEASE UPDATE YOUR FILES.

DESCRIPTION: Wheel angle specifications must be updated more often than the standard VIDA DVD update. Until further notice, Volvo Cars of North America (VCNA) will use this Retailer Technical Journal (RTJ) to update and publish current wheel angles for Front Wheel Drive (FWD) and All Wheel Drive (AWD) models. This RTJ is updated when the designing department at Volvo Car Corporation (VCC) modifies a value for one or more wheel angles or when a new vehicle model is released.

SERVICE:
For the current wheel alignment specifications, please refer to the attached tables. Be sure the alignment equipment at your facility is updated.

		Car Customer Service
		TJ Instruction
		No. 19674
		Date July -10 Issue 05
Title	Wheel angle specifications	

Issue	Date	Reason
05	July -10	Toe measurement across both wheels, front XC90 2009- Thrust angle S60 (11-)
04	July - 10	Wheel angle specifications for new model – S60
03	Febr -10	Variation and adjustment values are added to all previous control values. A number of specific values are updated.
02	April -09	Wheel angle specifications for new model - S80L

1.

Note! Some variation in the illustrations may occur, but the essential information is always correct.

2.

This instruction will be updated when the designing department at Volvo Car Corporation (VCC) decides to modify a value for one or more wheel angles or when a new vehicle model is released.

Note! New toe values. The check value is used when measuring wheel angles. When adjusting, use the adjustment value, however, if the value is within the check value, adjustment is not necessary.

3.

Toe

Adjusting to positive values generates toe-in angle while adjusting to negative values generates toe-out angle.

Note! All published toe values are for total toe measurement (left and right wheels together).

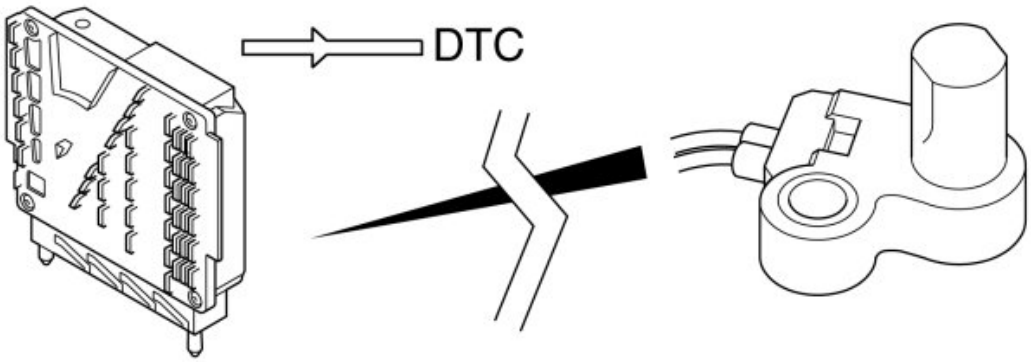
Computers and Control Systems: Testing and Inspection

General

General



A malfunction that is detected is assessed by the control module's self-diagnosis. First after, e.g., a certain time, a certain number of driving cycles, certain driving/operation or other conditions, the control module decides if it is a real malfunction or not.
When self-diagnosis has determined that a real malfunction exists, you can say that the **malfunction is confirmed** and the malfunction is stored in the control module's trouble code memory in the form of diagnostic trouble codes.
If a malfunction disappears, the diagnostic trouble code will remain for a tome in the diagnostic trouble code memory, but the status of the diagnostic trouble code changes. How long the diagnostic trouble code is stored in the diagnostic trouble code memory is different from control module to control module, as well as between different vehicle models (generation of vehicle model).
In some systems the diagnostic trouble code will be stored until it is erased with the diagnostics tool. In other systems the diagnostic trouble code is erased automatically by the control module after, e.g., a certain number of malfunction-free driving cycles. A new driving cycle (operation cycle) is usually started every time the ignition is turned on.

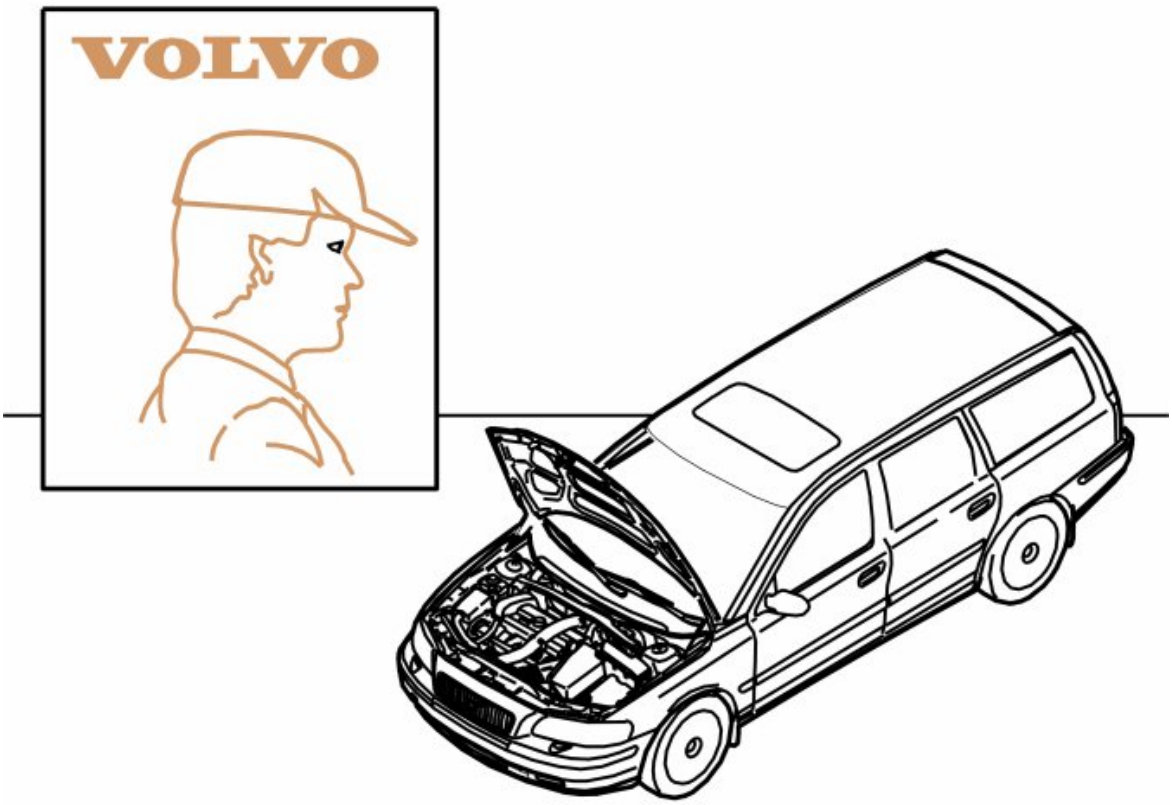
Information about the nature of the malfunction is stored for every diagnostic trouble code:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (diagnosis) (status identifier)
- how frequent the malfunction is (counter).

Exactly what is stored is different from control module to control module, , as well as between different vehicle models (generation of vehicle model).
If the system is provided with warning light, it is lit when the ignition key is turned to position II. The warning light will go off after a certain number of seconds when no malfunction is detected on the control system.
The warning light will be on in case of a malfunction of the control system. The warning light will be lit first after the malfunction is confirmed as a real malfunction.

Introduction

Introduction



Volvo has developed a wide range of tools and information for easier and faster troubleshooting of the vehicle and its different systems. The range includes service and troubleshooting information, integrated self-diagnostics in control modules, measuring instrument for exhaust analysis, diagnostic tools, etc.
Troubleshooting or diagnostics are performed by the mechanic using two different concepts; Off Board Diagnostics (diagnostics outside the vehicle) or On Board Diagnostics (diagnostics system in the vehicle).
Off Board Diagnostics (diagnostics outside the vehicle) is done **without** help from the control module's self-diagnosis. Examples of these are:

- Breakout box and multimeter to measure signals.
- Mechanic's troubleshooting using hearing, touch, and vision as well as experience.
- Diagnostic tools that are connected in parallel between control module and connector.
- Cylinder leak tester.

On Board Diagnostics (diagnostic systems in the vehicle) **is done using the control module's self-diagnosis** and is read out and presented using a diagnostics tool.

	Off Board Diagnostics	On Board Diagnostics
Advantages	• A few tools to develop compared to functionality/software in all control modules. • Can probably be used for several models.	• Store information about the nature of the malfunction (malfunction frequency, test status, driving conditions), making it possible to troubleshoot intermittent malfunctions. • Require a diagnostic tool to convey information to the mechanic.
Disadvantages	• If the malfunction has disappeared (intermittent), the malfunction will probably not be found.	• Software and its functionality must be in every control module (great quantity). • If a malfunction in the software is detected, many units must be updated.

The term **Diagnostics** refers to true recognition and designation of an illness. The term comes from the Greek **dia** = through, and **gnosis** =

knowledge. The purpose of a diagnosis is to give a summarized term for the different symptoms that the "sick" describes, and thus be able to give a specific treatment.
The control module in the vehicle includes software to manage intended function (e.g., control all functions of an engine), to monitor the system's components and functions. Monitoring (self-diagnosis) detects any malfunctions, stores these, activates protective actions (back-up modes) and, in some cases, warns the driver.
Monitoring (diagnosis) is always activated when the system is on but tests are started and run according to different pre-defined conditions. A malfunction that is detected is first assessed by monitoring, after, e.g., a certain time, a certain number of driving cycles, certain driving/operation cases or other conditions, the control module decides if it is a real malfunction or not. When monitoring determines that a real malfunction exists, it can be said that the malfunction is confirmed and the malfunction is stored.
The basic goal of self-diagnosis in control modules is to detect and report malfunctions in a control module or its connected components and cables. Part of the goal (found in legal requirements) is also to detect malfunctions that affect emissions as well as malfunctions that may cause subsequent damage to emission-related components.
Self-diagnosis shall also warn for malfunctions that mean a safety risk for drivers, passengers, and vehicles that otherwise would not cause a symptom and thus not be detected. This applies to, e.g., brake system and SRS-system.
Self-diagnosis shall be used by workshops as one of the tools for taking care of the symptom (property/malfunction) that the customer experiences. After the malfunction cause is found (via troubleshooting) and taken care of (via repair), self-diagnosis can also be used to verify that the malfunction cause has been fixed and that the customer's symptom does not exist any longer.

Note! The control module's self-diagnosis (diagnostic trouble code tests) cannot detect all malfunctions that may occur in a vehicle. This primarily applies to mechanical malfunctions but also some electrical malfunctions, e.g., poor connection to battery, or relay spools for a relay are monitored but the function/circuit that the relay controls is not monitored.Unfortunately, sometimes the control module's self-diagnosis can miss to generate a diagnostic trouble code for a malfunction where the customer experiences a symptom (malfunction), and sometimes it may generate a diagnostic trouble code despite the customer not experiencing any symptom (malfunction). This is because customers have different sensitivity to malfunctions (how easily the symptom is detected) and because it is not always to optimize self-diagnosis for all conditions that may occur during the vehicle's life.That is why you should not entirely rely on the vehicle's diagnostic trouble codes.Diagnostic trouble codes should only be regarded as indicators of probably malfunction sources. If the customer experiences a symptom (malfunction) but diagnostic trouble codes are not stored, this does not mean that the vehicle is trouble-free!

Worth keeping in mind when troubleshooting:

- When there is so much electronic equipment in the vehicles, it is easy to blame the "complex" electronics and forget the normal basics for, e.g., an engine's function. But the basics are the same today as when we had carburetor engines!
- A common mistake in troubleshooting is to quickly restricting yourself to a certain area without having checked basic functions, e.g., that the ignition system and engine are in good mechanical condition, the battery is fully charged, fuses are intact.
- Troubleshooting information gives very good guidance when troubleshooting and is almost impossible to do without. By using the customer's symptom, developed troubleshooting methods with, e.g., diagnostic trouble code information, you are quickly guided to being able to pin-point the malfunction.

Note! The electronic components in the control systems are very reliable and seldom cause any malfunctions.

This document describes the following:

- Background to why self-diagnosis is found in the vehicle.
- Diagnostic services, what they do.
- Using the self-diagnosis.
- Diagnostic versions and its communication method.
- Tools for reading out diagnosis.
- Where I find the information.

Background

Background

General

Factors that have improved safety, increased comfort, added functions and increased environmental friendliness, have made modern vehicles more and more complicated.
The more complicated the vehicle is, the more important is the diagnostics system in the vehicle with the diagnostics tool when it comes to ensuring fast, safe and economic test, service and repair.
To reduce emissions from the vehicle, the diagnostic systems shall also, according to legislation, detect emission-influencing problems as well as defects that may cause follow-up damage on emission-related components.

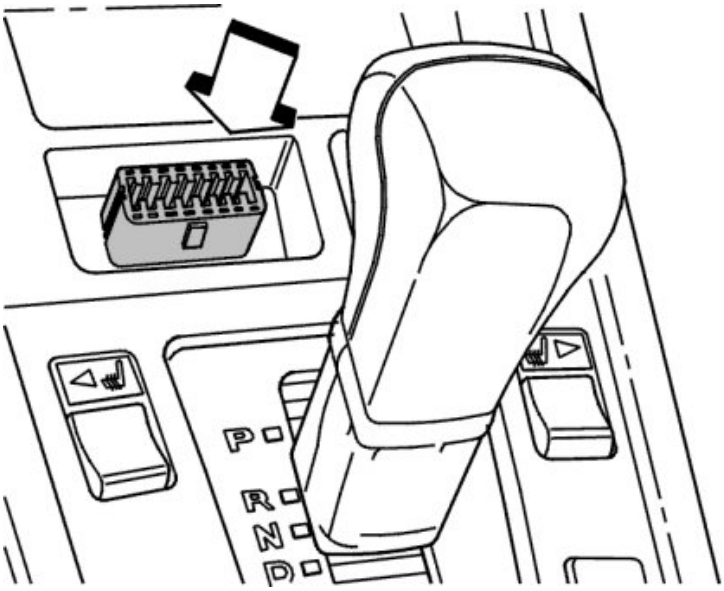
Legal requirements emissions

OBD I - On Board Diagnostic I

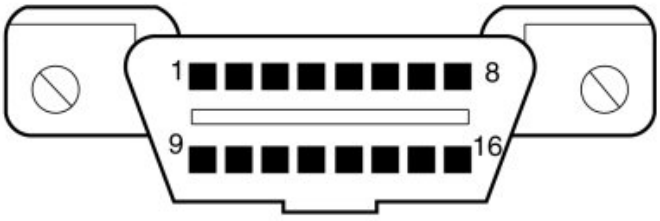
On Board Diagnostic I (diagnostic system in the vehicle) was 1988 a requirement from CARB (California Air Resource Board) which is an air quality board. The purpose of these regulations was to ensure that component or function defects that affected exhaust emissions are detected by the control module's diagnostic functions.
OBD I included diagnosis of control module, emission-related components connected to the control module as well as exhaust gas recirculation. Using the diagnostic socket in the engine compartment, the information about the system was accessible to all, both brand-name workshops and

independent workshops.
In case of a detected emission-related problem, a warning light is activated in the driver information module (MIL= Malfunction Indicator Light), when the problem is confirmed as a real malfunction. Thus, the light is not activated immediately upon detection, only first when the malfunction is confirmed, which may be, e.g., following a few driving cycles.

OBD II - On Board Diagnostic II



On Board Diagnostic II was another requirement from CARB that applied from 1996. CARB demanded additional and refined diagnosis for emission-related component and systems in the drivetrain (engine and transmission).
Also, a standardized communication method was required for reading out of diagnosis (Standard SAE J1979 and J2190, where J2190 is voluntary and includes Enhanced Diagnostics - the vehicle manufacturer's own diagnosis in addition to legal requirements).
It should be possible to read out diagnostic trouble codes and their format, information connected to diagnostic trouble codes as well as parameters*, according to this standard. OBD II's diagnostic trouble codes are five-digit and begin with the letter P followed by four digits.
This standardized communication method means that anyone shall be able to manufacture and sell an instrument for reading out, a so-called Generic Scan Tool. Thus, the vehicle owner is not dependent on using a brand-name workshop.
The standard OBD II requires a standardized diagnostic socket in the passenger compartment near the driver's seat, where this instrument is to be plugged in. This means that the diagnostic socket (connector) is the same on all vehicles regardless of manufacturer or model.
However, there is a difference between manufacturers regarding which pins are used in the connector. This depends on the OBD II standard supports four types of communication protocols.
A protocol may be said to be the "language" that is to be used for communication with the control module.



Standardized pins on OBD II-connector:

- Pin 2 SAE J-1850 bus +
- Pin 4 Chassis ground
- Pin 5 Signal ground
- Pin 6 SAE J-2284, CAN-bus (CAN-H)
- Pin 7 SAE J1979, ISO 9141-2 / ISO14230-4, K-line
- Pin 10 SAE J-1850 bus -
- Pin 14 SAE J.2284, CAN-bus (CAN-L)
- Pin 15 ISO 9141-2 / ISO14230-4, L-line
- Pin 16 Voltage feed

Other pins in the connector are permitted for the vehicle manufacturer's own specific use. On pin 7 (K-line), two-way communication is permitted, on pin 15 (L-line) only one-way communication is permitted to the control module. Therefore, the L-line is missing in many vehicles.
ISO14230-4 = Protocol KWP2000.

OBD II was first introduced for Volvo on engine management system Motronic 4.3, Motronic 4.4, and automatic transmission AW 50 42, AW 30 40/43 in model 850/960 for market USA/CDN.
With time, OBD II-communication with control modules via CAN is introduced.
The legal requirement also includes the function Readiness Monitoring, see other section.
* Parameter refers to, e.g., rpm, engine temperature, battery voltage, etc., with associated value 800 rpm, 87 °C as well as 14,2 V, etc.

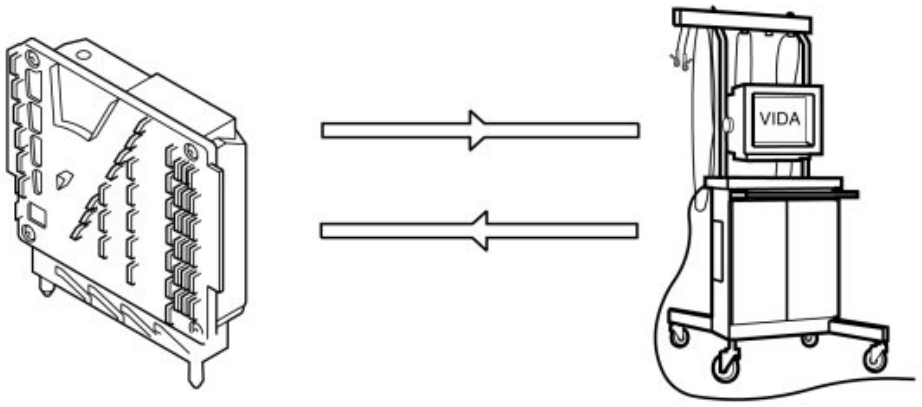
EOBD - European On Board Diagnostic

EOBD, European On Board Diagnostic is a legal requirement in Europe which, in principle, includes the same requirements as OBD II. EOBD applies to spark plug engines (gasoline engines) registered year 2000 and later, and self-igniting engines (diesel engines) registered 2003 and later. For information about, among other diagnostic socket, see OBD II above.

Diagnostics and Services

Diagnostics and services

General



The control module's diagnostics can perform and present the following using a connected diagnostics tool:
- Store malfunction indicator (diagnostic trouble codes) and in certain cases activate warning light or show text message.
- Store information about the nature of the malfunction:
  - Counter that indicates how frequent the malfunction is
  - Status indicators for the diagnostic trouble code test.
  - Frozen values that were generated when malfunction was detected for the first time.
- Erase information about malfunction and its information.
- Present values (parameters) for different connected input signals and output signals from, e.g., components as well as other calculated values.
- Present part number, version number, component number, etc. for both software and hardware.
- Present and change certain special customer settings and configurations.
- Trigger/control (activate) the connected output signals.
- Start special built-in check programs/tester such as, e.g., calibrations of gear position sensor, quick-test of tank system.
- Access check to limit access to certain parameters and functions. Accessible first after unlocking with, e.g., PIN-code.

Exactly what each control module's diagnostics can perform depends both on model year and system.

Diagnostic trouble codes (malfunction indicator)
- General See: Testing and Inspection/Initial Inspection and Diagnostic Overview/General
- Conditions for diagnosis to find a malfunction See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Conditions for Diagnosis to Find a Malfunction
- Driving cycle/operation cycle See: Testing and Inspection/Monitors, Trips, Drive Cycles and Readiness Codes
- Emergency mode, back-up mode "Limp-home" See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Emergency Mode, Back-up Mode "Limp-home"
- Classification of diagnostic trouble codes See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Classification of Diagnostic Trouble Codes
- Designation of trouble codes See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Designation of Trouble Codes
- Status identifier See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Status Identifier
- Counter See: Initial Inspection and Diagnostic Overview/Counter
- Frozen values See: Testing and Inspection/Scan Tool Testing and Procedures/Frozen Values
- Erasing diagnostic trouble codes See: Testing and Inspection/Initial Inspection and Diagnostic Overview/Erasing Diagnostic Trouble Codes
- Readiness Monitor (certain markets only) See: Description and Operation/Engine Management System/Diagnostic Functions/Readiness Monitor (Certain Markets Only)

Parameters

Parameters or values are data that are read out from the control module's memory positions to, e.g., check the signal from a sensor or identify the control module's software version.

In principle, parameters can be divided into two parts:
- one for **dynamic values** continuously updated in the control module
- one for **static values** not changed by the control module and always stored.

Parameters, dynamic

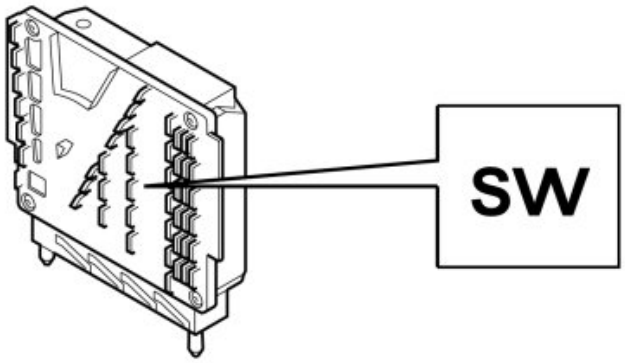
The **dynamic values** are stored in the control module's RAM-memory, which means that the values disappear when the memory's power supply is turned off (control module is turned off). As soon as the control module's power is turned on (ignition on), values are stored again.

Example of values are:
- Outside temperature
- Engine speed
- Load
- Coolant temperature
- Vehicle speed
- Battery voltage

Values are updated continuously after a pre-determined time interval.This means that certain values are updated with very short time interval, while other values are updated more seldom. Update rate is determined by how important the value is to the control module.
By reading off the value from, e.g., a sensor or switch, it can be decided if the signal is correct or not.

Note! When a malfunction is detected and a diagnostic trouble code is stored, it may well be that the displayed value is a replacement value and not the real value. If the value does not change, e.g., if the sensor is disconnected, it may be the replacement value that is shown.

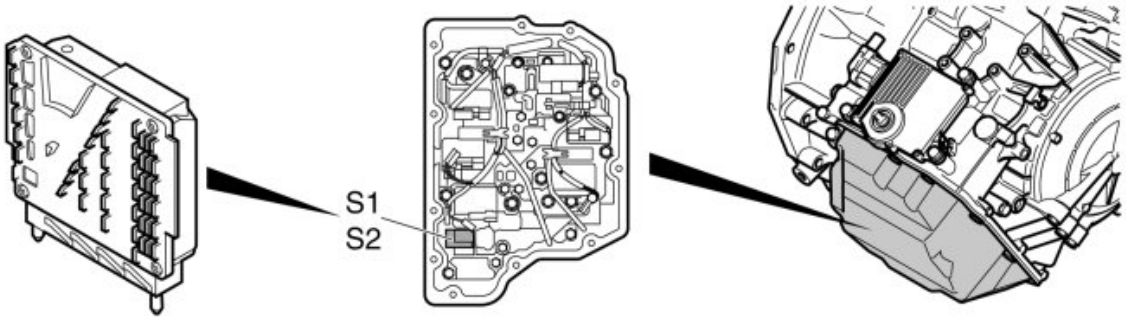
Parameters, static



The **static values** are stored in the control module's EEPROM, which means that these values are always stored regardless of if the control module is on or off. These values are normally not updated by the control module, instead they are only changed using, e.g., the diagnostics tool at vehicle manufacture in the factory or reprogramming during a workshop visit.

Example of values are:
- Hardware P/N (control module without software).
- Hardware serial number (control module without software).
- Software P/N.
- Diagnostic software P/N.
- Customer-programmed values, e.g., passenger compartment temperature, alarm on and off.
- The vehicle's configuration, that is, the vehicle's content and equipment that can be used to compare the vehicle's equipment physically with how the vehicle is configured. The configuration may be affected/changed, e.g., when downloading software.

Activations



Wit this service it is possible to trigger (activate) the components that are connected to the control module. Examples of components are:
- Relays
- Solenoids
- Lock motors
- Damper motors
- Signals to other control modules.

Note! If a malfunction is detected, diagnostic trouble code is stored and emergency functions or modes, etc. are activated to "protect" the system, the control module can prevent activation.

Depending on the system, the control module or diagnostics tool can perform activations in different ways, for some the component is activated according to a certain pattern, e.g., OFF, ON, OFF, ON, OF, ON, etc. in a sequence.
For other systems, the component is activated, e.g., ON, and remain on until the activation is stopped.

Quick-tests, calibrations

Quick-tests or calibrations are functions or checks that are integrated in the control module's software and are started by the control module using commands from the diagnostics tool.
Wit this service it is possible to start certain pre-defined checks or teach-ins. Examples of these are:
- Quick-test of fuel tank system
- Quick-test of camshaft control
- Resetting of adaptations and counter for oil
- Calibration of gear position sensor
- Calibration of components for Brake control module (BCM)

Note! To enable start and running of these services, it is often that certain start conditions must be fulfilled.

Software downloading

New software can be downloaded to the control modules. When ordering software the vehicle software and hardware are compared to Volvo's central database. If the comparison corresponds the new software is downloaded to the control module.
If the comparison between the car and Volvo's central database does not correspond, then the database is updated with the vehicle's configuration. When this is complete the software is downloaded.
For further information regarding downloading, see Design and Function, Downloading Software.

Practical Use Of Diagnostics

Practical use of diagnostics

General

There are several ways to decide if the malfunction is active right now or not as well as when the malfunction occurred:
- **Read off the diagnostic trouble code's counter, status identifier and frozen values.** By interpreting these you can find out when the malfunction was stored, how often the malfunction has occurred (intermittence) and what the driving conditions were when the malfunction was stored.
- **Read off a parameter** for component/system and decide if the value is correct or not. By, e.g., manually affecting the sensor or the switch, you can decide immediately if the parameter (signal) with its circuit is correct.
- **Trigger a component** (activate) and decide if the component/function is affected or not. By triggering, e.g., the relay and listening for its clicking sound or the function which is to be affected, it is possible to decide immediately if the component is correct.
- **Decide if the vehicle shows any symptom (malfunction).** If the vehicle no longer shows the symptom, one may suspect that the malfunction no longer is active.

The following accounts in detail for some of the above.

To decide the intensity of a malfunction

Note! Examples 1-5 (below) are based on counters for diagnostic concept Generic Global Diagnostic (GGD).

When a malfunction is intermittent or has unknown status, the diagnostic trouble code's counter is very useful to decide:

- How many driving cycles that have passed since the malfunction was detected the first time as well as since the malfunction was detected.
- During how many driving cycles that the control module has detected the malfunction during a certain period, as well as how many driving cycles that the control module has not detected the malfunction. That the control module has not detected the malfunction may be due to the control module not having started the test for the malfunction, conditions to detect the malfunction are not fulfilled, or that the malfunction no longer exists.

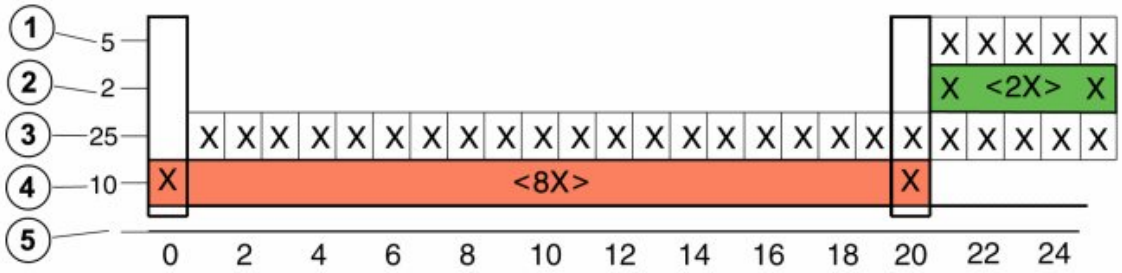
The purpose of interpreting the counters is that it is possible to understand the malfunction's intensity, that is, show "how much" intermittent the malfunction is, as well as help in assessing if the chances to repeat the malfunction and customer symptom, and then succeed with troubleshooting. If you read out the diagnostic trouble code information and it shows that the diagnostic trouble code test runs at least once every driving cycle (e.g., when driving), the counters' value may be very important when assessing the diagnostic trouble code's status and actions. However, if start of diagnostic trouble code test and its conditions are difficult to achieve, the counters' values should be considered to be of less importance. Counters 1 and 3 show driving cycles. Counters 2 and 4 also show driving cycles, but then really a "share" of counters 1 and 3, respectively. In principle, counter 4 shows how many times that the customer should have detected symptoms.

Note! For systems with diagnostic concept Generic Global Diagnostics (GGD). If many diagnostic trouble codes are stored at the same time, then certain diagnostic trouble codes (the oldest) will have these frozen values/counters erased, this to save memory in the control module. These diagnostic trouble codes will then only have counter 2 left. Note also that counter 2 will also be erased when the memory is full, but often later than when other counters are erased.

Note! For system with diagnostic concept Volvo Diagnostics II. If many diagnostic trouble codes are stored at the same time, the control module keeps at least half of the oldest and half of the newest diagnostic trouble codes in the trouble code memory.

Note! For diagnostic trouble codes where the malfunction is not detected for many driving cycles and where the malfunction is detected again, then frozen values and counter values are written over with new values, that is, the diagnostic trouble code is considered "new".

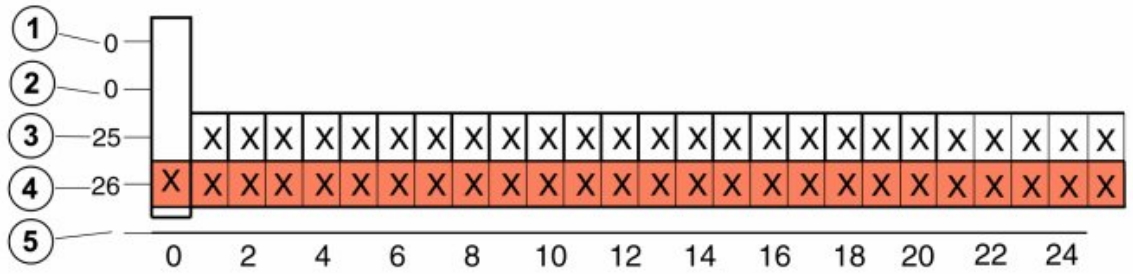
Example 1, Intermittent malfunction



1. Counter 1 = 5
2. Counter 2 = 2
3. Counter 3 = 25
4. Counter 4 = 10
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) the malfunction has been detected again in 9 of the first 20 driving cycles (counter 4 = 10). Using this, the conclusion can be drawn that in 11 driving cycles (20-9=11) the test has not been run or the malfunction has not been found, or a combination of these. After the last time that the malfunction was detected (in driving cycle 20), 5 driving cycles have passed (counter 1 = 5), where the test was run in 2 driving cycles without detecting a malfunction (counter 2 = 2).
Conclusion: Intermittent malfunction
Assessment: Good possibility to repeat the malfunction and customer symptom, and thus succeed with troubleshooting, as the malfunction has been found quite recently in several driving cycles.

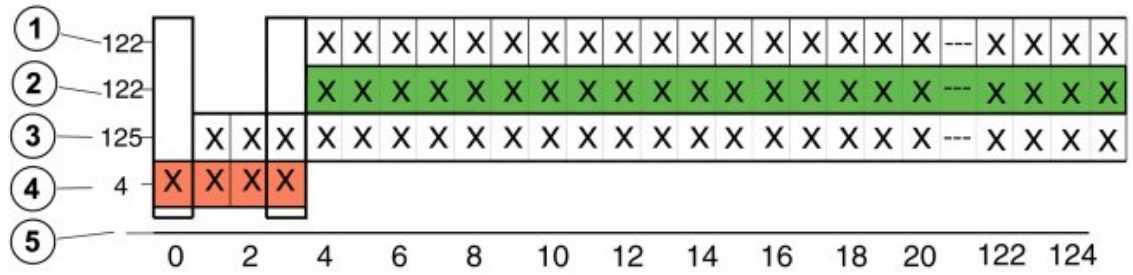
Example 2, Permanent malfunction



1. Counter 1 = 0
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 26
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) the malfunction has been detected again in all following driving cycles (counter 3 = 25, and counter 4=26).
Conclusion: Permanent malfunction
Assessment: Very good possibility to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in every driving cycle. Since the malfunction has been detected during the present driving cycle (no. 26) it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not.
The counter show more how "sure" the malfunction is as well as that it can confirm if the customer experienced the malfunction as the counter indicates.

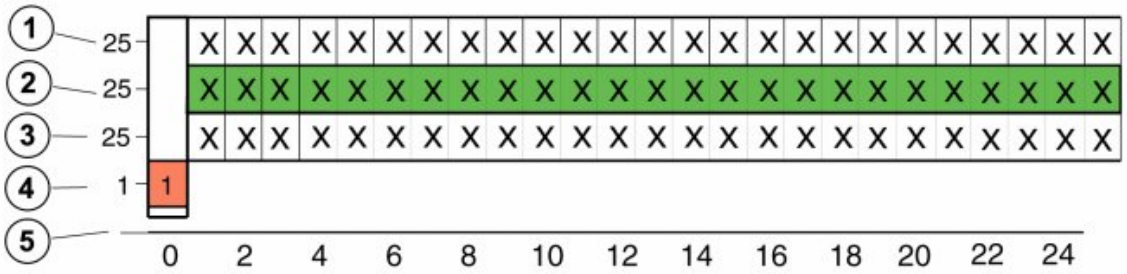
Example 3, Intermittent malfunction



1. Counter 1 = 122
2. Counter 2 = 122
3. Counter 3 = 125
4. Counter 4 = 4
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) the malfunction has been detected again in the 3 following driving cycles (counter 4 = 4). After the last time that the malfunction was detected (in driving cycle 3), 122 driving cycles have passed, where the test has been run in 122 driving cycles without detecting a malfunction.
Conclusion: Intermittent malfunction
Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in a few driving cycles a very long time ago.
The less driving cycles a malfunction has been detected in and the greater the number of driving cycles since the malfunction was detected the last time, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.
This can be read off by the lower value is on counter 4 and the higher the value is on counter 1 and 2, as well as the lower the difference is between the value on counter 3 and counter 2, the more difficult it is expected to be to repeat the malfunction and the customer symptom and thus succeed with troubleshooting.

Example 4, Intermittent malfunction



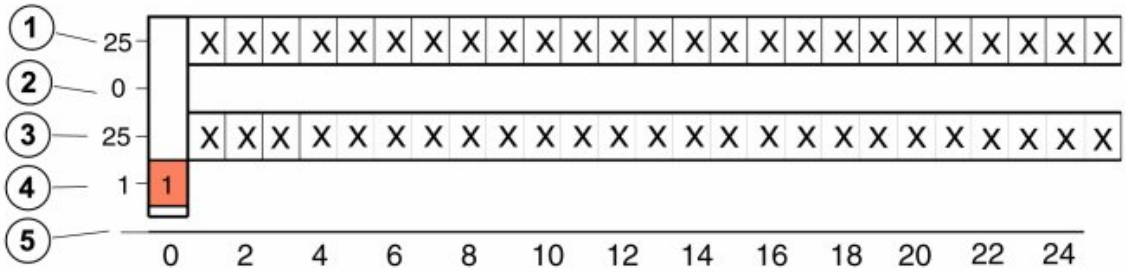
1. Counter 1 = 25
2. Counter 2 = 25
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) (counter 4=1), the malfunction has never been detected again. After the last time that the malfunction was detected, 25 driving cycles have passed, where the test has run in 25 driving cycles without detecting a malfunction.

Conclusion: Intermittent malfunction

Assessment: Not very good chance to repeat the malfunction and the customer symptom and thus succeed with troubleshooting, as the malfunction has only been detected in one driving cycle quite a long time ago.

Example 5 Unknown status



1. Counter 1 = 25
2. Counter 2 = 0
3. Counter 3 = 25
4. Counter 4 = 1
5. Driving cycles

After the malfunction has been detected for the first time (driving cycle 0) (counter 4=1), the malfunction has never been tested and/or detected. After the last time that the malfunction was detected, 25 driving cycles have passed where the test has not been started. Since the diagnostic trouble code test has not started anymore, it cannot be decided if the malfunction exists or not.

Conclusion: Unknown status

Assessment: Read diagnostic trouble code information and try to achieve condition so that the diagnostic trouble code test is started and run, which makes it possible to detect the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting when the malfunction has been found in the current driving cycle.

If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

To decide diagnostic trouble code test's status

By reading out the diagnostic trouble code with associated status identifier, then **status for the diagnostic trouble code test (diagnosis) that detects the malfunction and generates the diagnostic trouble code, is obtained.**

Example 1, Permanent malfunction

Status identifier:

SB00	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	Yes
SB01	Malfunction found at least once during the current driving cycle	=	Yes
SB02	Malfunction found at least once during the current and previous driving cycles	=	Yes
SB03	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
SB04	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
SB05	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
SB06	Diagnostic trouble code test run at least once during the current driving cycle	=	Test run
SB07	Request for lit warning light/text message	=	Yes

The diagnostic trouble code test has been run in both current driving cycle and in earlier driving cycles. Malfunction has been detected both in current driving cycle and in previous driving cycle, which indicates that the malfunction is active right now. The control module has requested lighting of the warning light.
Conclusion: Permanent malfunction.
Assessment: Very good chance to repeat the customer symptom and thus succeed with troubleshooting, as the malfunction has been found in current and in previous driving cycle. Since the malfunction has been detected during the present run cycle, it does not really matter for troubleshooting if the malfunction has been detected in all previous driving cycles or not. If this information is supplemented with the counters' values you can decide how "permanent" the malfunction is.
If the vehicle is stationary, e.g., with the ignition on, this means that the test runs directly when the ignition is turned on. This makes it easier to both fins the malfunction and to verify that the malfunction cause has been take care of.

Example 2, Unknown status

Status identifier:

SB00	Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle	=	No
SB01	Malfunction found at least once during the current driving cycle	=	No
SB02	Malfunction found at least once during the current and previous driving cycles	=	Yes
SB03	Malfunction found recently since erasing of diagnostic trouble codes	=	Yes
SB04	Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes	=	Test run
SB05	Malfunction found at least once since erasing of diagnostic trouble codes	=	Yes
SB06	Diagnostic trouble code test run at least once during the current driving cycle	=	Test not run
SB07	Request for lit warning light/text message	=	No

The diagnostic trouble code test has been run in previous run cycles but not in current driving cycle. Malfunction has been detected in previous run cycle, but not in current driving cycle since the test has not started. Warning light is on.
Conclusion: Unknown status
Assessment: Since the test has not started in the current driving cycle it is not possible to decide if the malfunction is "active" right now. First read the diagnostic trouble code information and try to obtain conditions so that the test is started and run, which enables detection of the malfunction. If the malfunction is detected, chances are very good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has been found in the current driving cycle.
If the malfunction was not detected even though conditions are fulfilled, then chances are less good to repeat the customer symptom, and thus succeed with troubleshooting as the malfunction has not been found in the current driving cycle.

To decide operation conditions when the malfunction was detected

Malfunctions in a system may be intermittent. It is important to remember this when troubleshooting a possible malfunction cause. If the malfunction is not in the vehicle when it is in the workshop you can miss a malfunction cause since the values may be correct when troubleshooting takes place. A good indication of when the malfunction first occurred for the first time are the frozen values that can be read out for every diagnostic trouble code.
The frozen values are stored immediately after a malfunction has been detected. Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction has been detected, e.g., engine rpm, load, coolant temperature, vehicle speed and battery voltage. Some of them have been selected to give a better understanding of the specific malfunction.
Diagnostic trouble code **ECM-903F Electronic throttle unit, internal malfunction** cam be used as an example of how frozen values can be used. The first possible source indicated in VIDA is the voltage feed to the electronic throttle unit and then continues by suggesting that you check the battery and charging system. However, the battery's condition when the vehicle is in the workshop does not necessarily show the battery voltage when the malfunction was detected.
Instead, the best information is found in the frozen values, that is, voltage that the Engine control module (ECM) detects when Electronic throttle module (ETM) indicated the malfunction.
However, you should remember that this is not an indication of voltage feed to Electronic throttle module (ETM), it is voltage feed to Engine control module (ECM). If Engine control module (ECM) according to frozen values has had good voltage the battery was okay. Therefore, voltage feed to Electronic throttle module (ETM) should be checked separately.

Frozen values for ECM 903F:

- Condition, heated oxygen sensor control bank 1 = LR: Closed circuit with two sensors
- Condition, heated oxygen sensor control bank 2 = LR: Closed circuit with two sensors
- Calculated load = 4.71%

- Engine temperature = 87 °C
- Fuel adaption, quick adjustment, bank 1 = 15.63%
- Fuel adaption, slow adjustment, bank 1 = -0.78%
- Fuel adaption, quick adjustment, bank 2 = 23.44%
- Fuel adaption, slow adjustment, bank 2 = -0.78%
- Engine speed = 760 rpm
- Vehicle speed = 0 km/h
- Boost pressure = 30%
- Battery voltage = 12.50 V
- Throttle angle, desired value = 14.84%
- Air mass = 23.8 kg/h
- Outside temperature = 33 °C

In this case we assume that the vehicle had low battery voltage in the workshop. However, as can be seen in the frozen values, battery voltage was okay when the malfunction occurred, so this was probably not the cause.
This is an example of how frozen values can be used to increase efficiency of troubleshooting and avoid using too much time for incorrect troubleshooting. This prevents troubleshooting and fixing a malfunction that was not the real cause of the problem that was to be solved.
The odometer reading (km) is sometimes included in frozen values in Engine control module (ECM). This enables a quick comparison with the odometer so that you can assess if the malfunction occurred as part of the troubleshooting and can be ignored. For example, CAN-network-related diagnostic trouble codes are saved when the battery voltage drops during work on the vehicle since passenger compartment lighting and other loads drain the battery.
The frozen values indicate odometer reading in km. If you multiply this value by factor 0.62 you obtain driving distance in miles. Current driving distance in both miles and km can be read out with VIDA.
Keep the following in mind when using frozen values for troubleshooting.
The frozen values to be used with care are those stored for the CAN-net and are related to diagnostic trouble codes for Electronic throttle module (ETM).
If Electronic throttle module (ETM) detects that communication to Engine control module (ECM) is interrupted, then malfunction flags will be generated in Electronic throttle module (ETM). These malfunction flags will be sent to Engine control module (ECM) first when communication on the CAN-net works again.
This means that Engine control module (ECM) will store the diagnostic trouble codes first when Electronic throttle module (ETM) delivers them, which in turn means that it is at this point in time that the frozen values are saved. For Electronic throttle module (ETM) this means that the frozen values will be from a point in time after the malfunction first occurred.

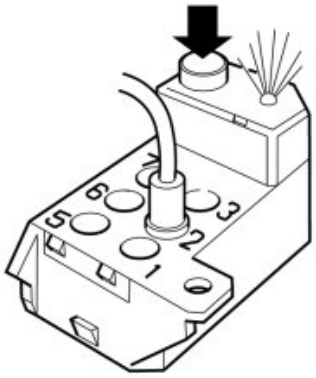
Diagnostic Versions and Communication Methods

Diagnostic versions and communication methods

General

Since the end of the 1980s, the control module's diagnosis has developed from detecting simple problems and storing a small amount of information to including more complicated tests and checks.
Today a large amount of information can be read out both about the detected problem as well as parameters from the control module's input and output signals.
The following accounts for the main principles for this development.

Volvo Diagnostics I - first version



A Volvo standard was introduced **(Volvo Diagnostics I) 1988**, which means diagnosis of several on-board systems (On Board Diagnostic).
This Volvo Diagnostics included:

- Store problem indicators (diagnostic trouble codes) for various components as well as delete them (check function 1).
- Confirmation of activating components or functions (check function 2).
- Cyclic activation of components/functions (check function 3).

A diagnostic tool (diagnostic socket with light-emitting diode) was located in the engine compartment for reading out a Volvo Diagnosis from the various control modules.
Volvo Diagnostics, the first version is found on, e.g., fuel control system LH 2.4 and ignition system EZ 116K for model 240 and 740.

Volvo Diagnostics I - second version

Volvo Diagnostics, the second version, was introduced in 1991 meant that additional services were made available, such as:

- Possibility to control transfer rate for data between the control module and the diagnostic socket.
- Individual activation of components/functions (check function 4).
- Read in and out signals (check function 5), where every value is represented by a three-digit code.
- Enter data (check function 6), where you could enter data via three-digit codes.

Services are introduced to varying extent on the different control modules.
The diagnostic socket with light-emitting diode is used to read out Volvo Diagnostics from the various control modules.
The tool Volvo Diagnostic Key and then Volvo System Tester were introduced to make communication easier with the control module.
Volvo Diagnostics, the second version is found on, e.g., Transmission control module (TCM)a AW 30-40/43 in model 960 and AW 50-42 in model 850.
For further information on the diagnostic socket and its functions, see service information for each system.

Non-standardized serial communication

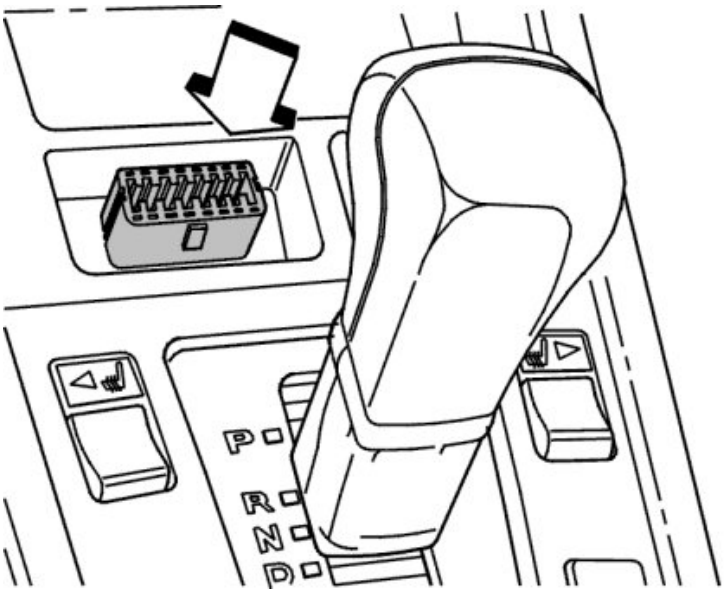
As a supplement to Volvo Diagnostics - first and second version, the supplier of engine management systems developed their own diagnostic and communication methods (On Board Diagnostic). These were introduced during **1991**/**92**.
These serial* communication methods were supplier-specific and varied a lot between systems. To communicate quickly and directly with control modules was a pre-condition for developing the control system and opened for new possibilities.
The access to more information about the detected problem as well as the possibility to, e.g., quickly read out parameters, enabled improvement of troubleshooting methods. Therefore, these communication methods were used by the workshops' diagnostics tools.
The cable in the vehicle used for this serial communication is connected to the diagnostic socket in the engine compartment and is the same one used for Volvo Diagnostics, first and second version.

Included functions are, among others:

- Reading out and erasing diagnostic trouble codes.
- Reading off frozen values.
- Reading off values of signals such as coolant temperature, voltage on heated oxygen sensor, etc.
- Activating components and functions.
- Programming of customer parameters and functions.
- Calibration of functions.
- Resetting of adaptations.

The tool Volvo System Tester was developed to make communication easier with the control module.
Non-standardized serial communication was introduced on engine management system Motronic 1.8 in model 960 and engine management system Fenix 5.2, Motronic 4.3, and LH3.2/EZ129K in model 850.
* Serial means that the information is sent as a series of signals in the form pulse trains (= series of pulses) via a cable between the tool and control module.

Volvo Diagnostics II - first version



Volvo Diagnostics II - first version was a new Volvo standard introduced in **1996**. This meant that control modules communicated serially in the same way, and that diagnostic functions in the different systems were designed in a similar manner.
The communication cable in the vehicle used for this communication is common to all control modules in question. The control modules are connected to the same connection in the diagnostic socket (pin 7).
The diagnostic socket is located in the passenger compartment and for certain markets it is common with the diagnostics system OBD II.

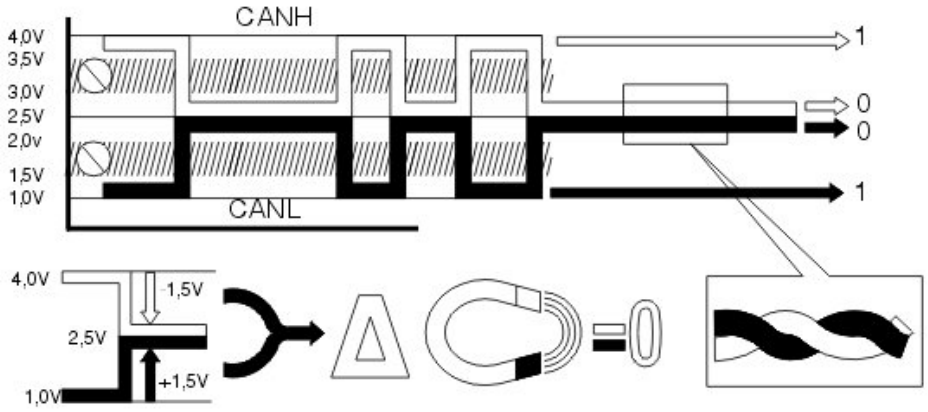
Volvo Diagnostics II, first version, was introduced in 1996 on, among others:

- Engine management system Motronic 4.4
- Automatic transmission AW 50 42/AW 30 40/43

- Control module Airbag SRS6.2
- Immobilizer
- Control module Brakes ABS 850
- Combined instrument panel 850
- Power seat 850/960
- and was gradually introduced for additional systems and car models.

For certain models, the diagnostics tool for this diagnosis is still Volvo System Tester (car models from and incl. model year 1998 as well as certain systems for model year 1999).
The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

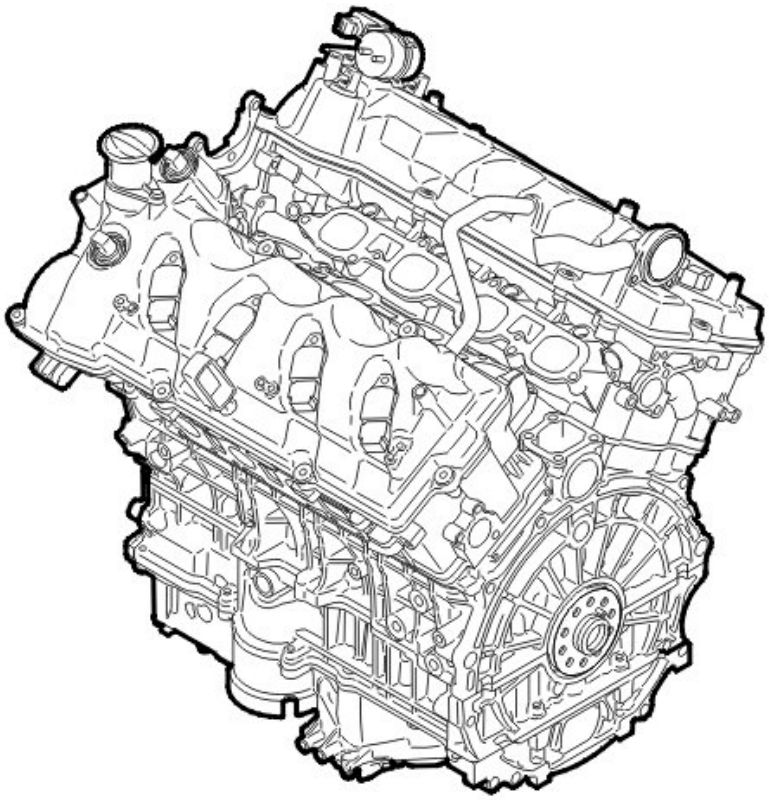
Volvo Diagnostics II - second version



Volvo Diagnostics II - second version was introduced in **1999** and is a development of the first version. The major difference is that communication between the diagnostics tool and the control modules takes place via CAN-communication instead of on a communication cable. The control modules also communicate with each other to exchange information on the CAN-net instead of via separate cables between the control modules.
This version introduced the possibility to download software to the control modules.
With the introduction of this version, the rate in the low-speed network was (LS CAN) 125 kbit/s and the rate in the low-speed network was (HS CAN) 250 kbit/s. Depending on model and model year, the speed of the network has increased with time.
For further information about CAN, see Design and Function, CAN-net as well as Design and Function, Downloading Software.
Volvo Diagnostics II, second version, was introduced in model S80/S60/V70 (00-)/V70 XC (01-)/XC70/XC90 model year 1999- as well as S70/V70 (-00)/V70 XC (-00)/C70 for model year 1999 and thereafter in future models.
The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 1999 and later.

Generic Global Diagnostics (GGD)

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Generic Global Diagnostics (GGD) is a mutually developed diagnostics concept within the Ford company.
Communication and services are similar to Volvo Diagnostics II - first version. Communication between the diagnostics tool and control modules takes place via CAN-communication. The services that can be performed are similar.
Designation of trouble codes adheres to standard ISO/DIS 15031-6.4 and consist of a letter and six characters.
The control modules also communicate on the CAN-net with each other to exchange information.
It is also possible to download other software to the control modules.
Volvo Diagnostics, fifth version, was introduced in model XC90 model year **2005** with engine B8444S (only high-speed network) and then in model S80 (07-).
The diagnostics tool VIDA, now replacing VADIS, is used for car models of model year 2005 and later.

Tools For Diagnostics

Tools for diagnostics

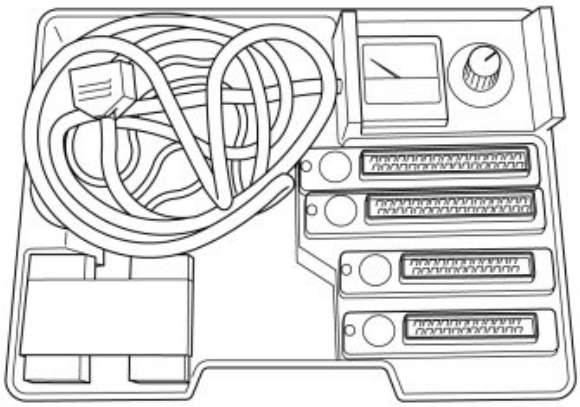
General

Tools used for troubleshooting and diagnostics are divided into two different types, tools for **Off Board Diagnostic** (diagnostics outside the vehicle) or **On Board Diagnostic** (diagnostics system in the vehicle) where the control module's diagnosis is used.
There are several tools used for Off Board Diagnostics, a few intended for diagnosis of a control module and its systems are mentioned in this document.

Note! There are control modules with integrated diagnosis, where read-out of diagnosis only is possible with a built-in "tool". This applies to, e.g., climate control module MCC for model S70/V70/C70, where read-out takes place via light-emitting diode on the front of the panel. For, e.g., audio unit HU 1205 for model S40/V40, the audio unit is not connected to the diagnostics socket in the vehicle. All diagnostics as well as other settings are controlled directly by menus in the display.

Tools for Off Board Diagnostics

Troubleshooting instrument ("Carpenter's toolbox")

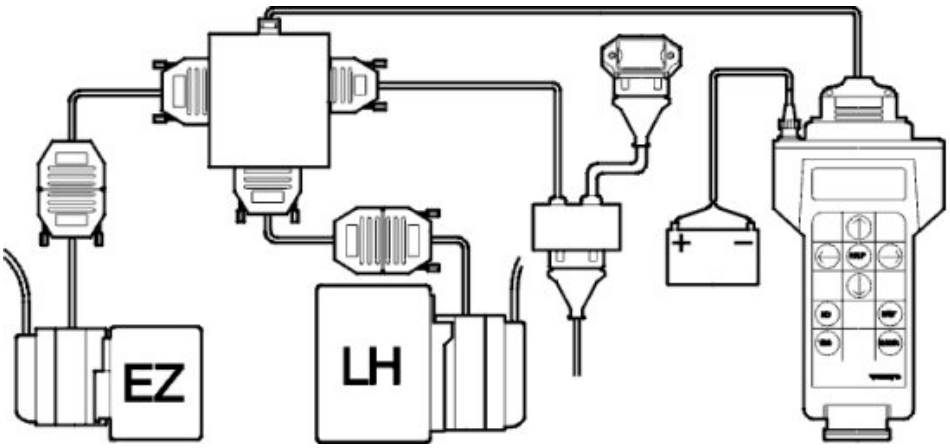


This troubleshooting instrument ("Carpenter's toolbox") (998-8195) is connected in parallel with the fuel control module and the vehicle's cable harness. Using the control on the box itself, you choose which values that the analogue display is to show.
The box also contains two light-emitting diodes, one green and one red which are turn on/off, e.g., at released or pressed down accelerator (check of throttle switch).
A number of different adapters made it possible to connect to different control modules.

Example of fuel systems where the tool can be used:

- LH-Jetronic, B200/230-engines for model 200/700.
- LE/LU-Jetronic, for model 360.
- Fenix, model 400.
- Motronic, model 740/760 Turbo.

Volvo System Tester - parallel connection



Volvo System Tester - parallel connection was introduced for model year 1986, as a troubleshooting instrument where you connected in parallel between the control module and the cable harness.
Volvo System Tester measured input and output signals in analogue mode and signals were then shown in Volvo System Tester. It was also possible to detect intermittent malfunctions.

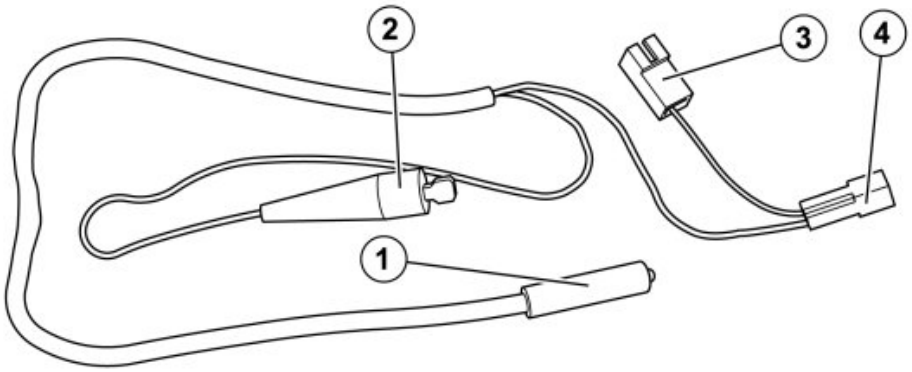
With Volvo System Tester connected, it was possible to:

- Reading off values of signals such as coolant temperature, voltage on heated oxygen sensor, etc.
- Monitor certain signals and compare with pre-programmed values as well as register and store deviations.

A number of different adapters made it possible to connect to different control modules.
Thus, at parallel connection, diagnosis is performed of Volvo System Tester.

Tools for On Board Diagnostics

Test diode



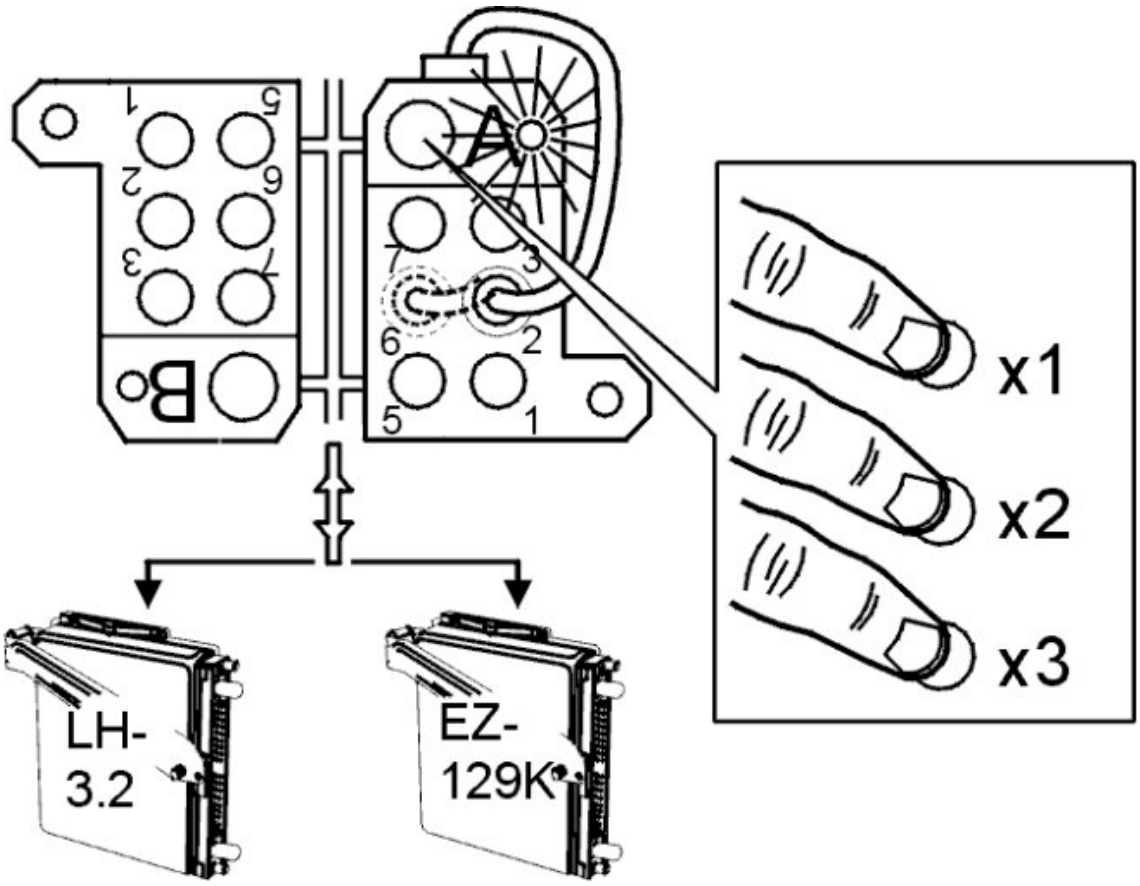
The test diode (999-5280) is used to "flash" diagnostic trouble codes. The test diode is connected to a connector (located in engine compartment on certain vehicles) and using this, the control module "flashes" diagnostic trouble codes from certain ignition systems.
The test diode can also for some vehicles be used to check the CO-content from the engine. Then the test diode is connected to another connector than when reading out diagnostic trouble codes.

1. Light-emitting diode
2. Connection to voltage feed.
3. Connection control module for reading out diagnostic trouble codes
4. Connection control module for checking CO-content.

Example of ignition systems where diagnostic trouble codes can be read out:

- Rex, model 240 with engine 230K (4 diagnostic trouble codes).
- EZ 102K, model 760 Turbo-84 engine B23 FT (5 diagnostic trouble codes).
- EZ 115K, model 760/780 engine B280E/F (6 diagnostic trouble codes).

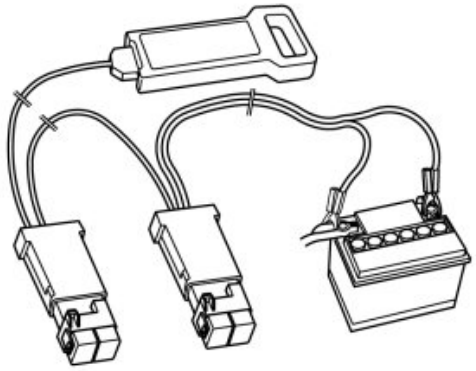
Diagnostic socket with light-emitting diode



A diagnostic socket with light-emitting diode was located in the engine compartment for reading out Volvo Diagnostics from the various systems. It was introduced for model year 1988. Every control module in the vehicle was connected to one of the diagnostic socket's six positions.
As the number of control modules in the vehicles increased and one diagnostics socket was not enough for all control modules, later on two diagnostics sockets were introduced, marked A and B.
For communication with a certain control module, the portable connector is connected to the control module's position in the diagnostics socket. Then the different checking functions are activated by pressing down the diagnosis button a different number of times.
When the button is pressed down, the cable to the control module is grounded, the ground pulse indicates to the control module that communication is initiated and the diode is lit. Then you release the button. Then control module then answers by grounding the cable in different patterns, making

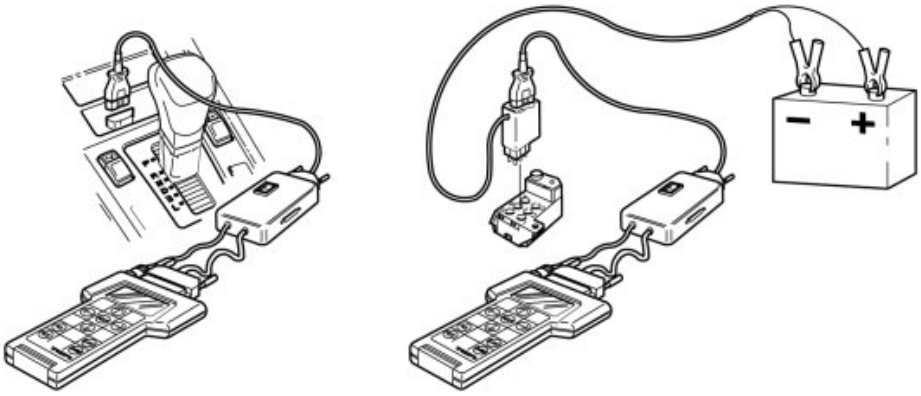
the diode turn on and off. Then these "flash codes" must be translated.
Volvo Diagnostics I, the first version is found on, e.g., fuel control system LH 2.4 and ignition system EZ 116K for model 240 and 740.
This diagnostics socket is found in car models 240, 440/460, 740, 940/960 and 850 until model year 1995. For the 400-model, this diagnostics socket is still used after model year 1995.
For further information on the diagnostic socket and its functions, see service information for each system.

Volvo Diagnostic Key



All communication performed using the diagnostics socket with light-emitting diode requires both knowledge about which commands are to be sent as well as how flashes from the control module should be interpreted.
Volvo Diagnostic Key - plain text reading was introduced for model year 1991 to facilitate reading out, interpreting and entering flash codes when communicating.
The tool is connected to the diagnostics socket/sockets with the light-emitting diode and sends, via menu selections, the right commands, then translates the control module's answer (light-emitting diode's flashes) to plain text.

Volvo System Tester

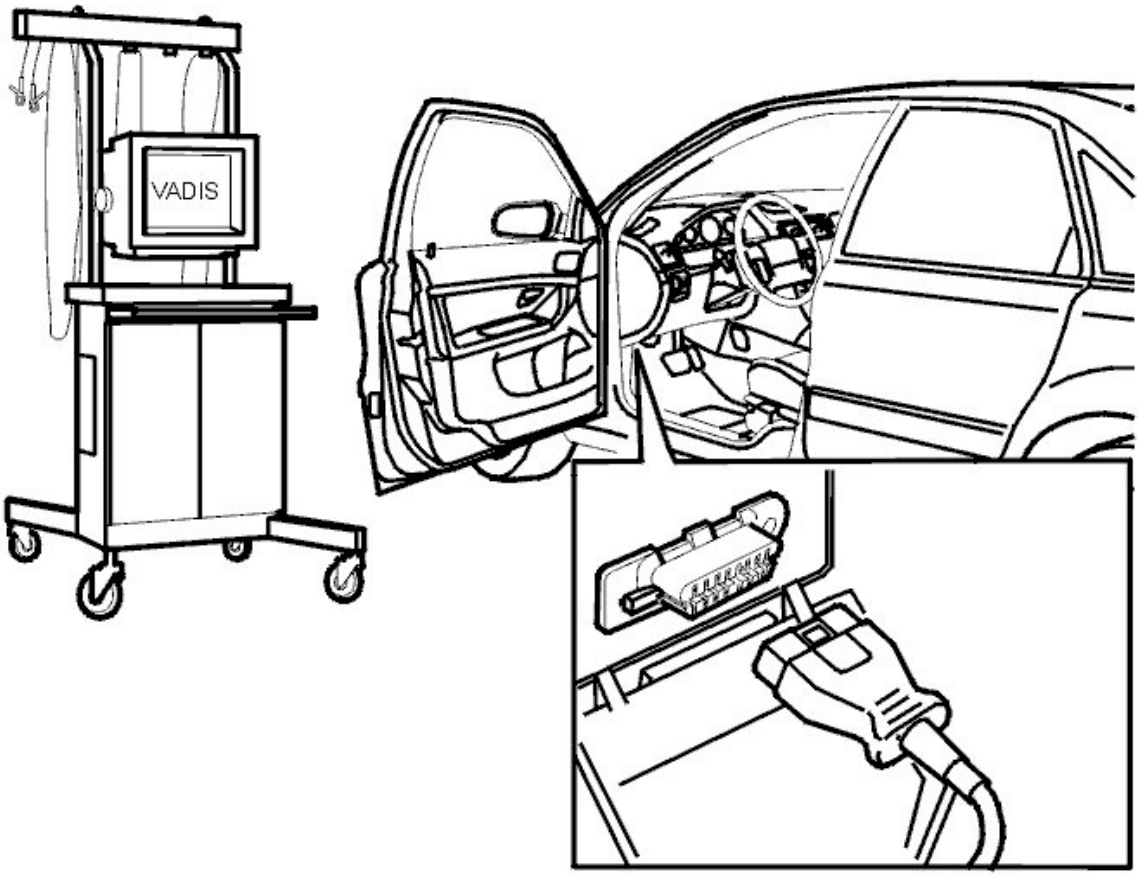


Serial communication

When non-standardized serial communication was introduced in 1991/1992, Volvo System Tester was developed to communicate serially with the control modules. This was so that the new possibilities with serial communication could be used, that is, use the built-in diagnosis in the control module (On Board Diagnostic).
In connection with the introduction of Volvo Diagnostics II, model year 1996, the Volvo System Tester was also developed for this standard.
Plain text reading

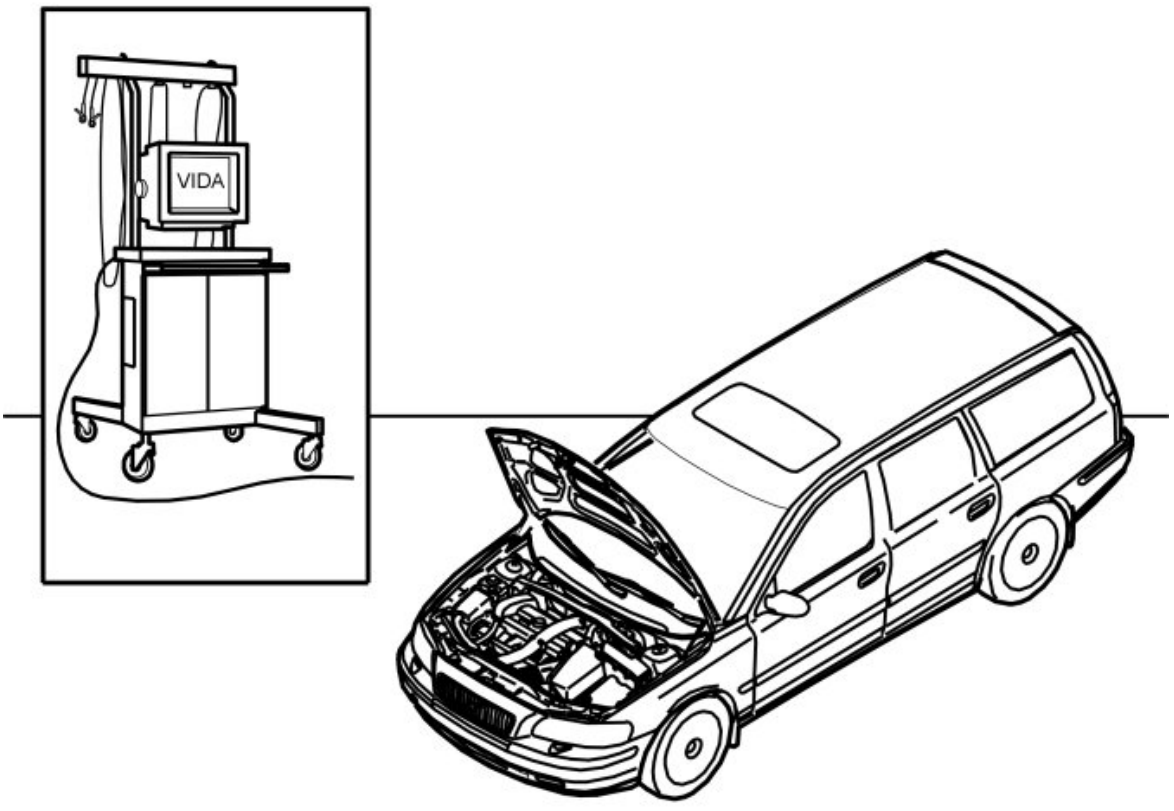
Volvo System Tester was also developed to handle the same functionality as Volvo Diagnostic Key, that is, to work as a plain text reader.
Volvo System Tester can be connected to diagnostic socket (OBD II) as well as to diagnostic socket with light-emitting diode via an adapter.

VADIS - Volvo Aftersales Diagnostic and Information System

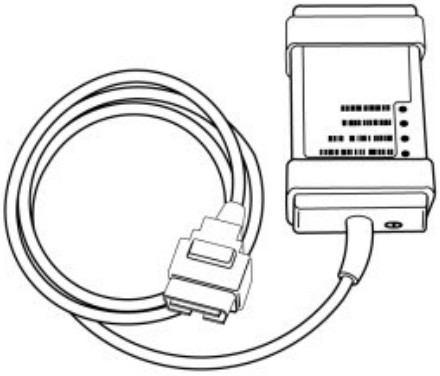


At the end of the 1990s, VADIS was introduced as diagnostics tool. Volvo System Tester was first used as communication tool between the vehicle and PC, thereafter Volvo Communication Tool 2000 (VCT2000).
For a time both tools were used, depending on which system and model year you worked with. From 2005, VADIS is replaced by the tool VIDA.

VIDA - Vehicle Information & Diagnostic for Aftersales



During 2005, VADIS was replaced by VIDA as the mandatory tool for diagnostics, among other things. Volvo Communication Tool 2000 (VCT2000) is used as communication tool between the vehicle and PC.



Beginning in 2007, VCT2000 will be replaced by DiCE (Diagnos Communication Equipment).

Where Do I Find the Information In VIDA

Where do I find the information in VIDA

Information is found in VIDA.

Note! Information for older cars (model year -1998) is read out using Volvo System Tester, Diagnostic socket with light-emitting diode or Volvo Diagnostic Key.

Counter, status identifier and frozen values

Counter, status identifier and frozen values are always found in VIDA/DIAGNOSTICS/DIAGNOSTICTROUBLECODE. Can also be found in certain troubleshooting.

Parameters
Parameters, dynamic are always found in VIDA/DIAGNOSTICS/CARCOMMUNICATION. Normally also found in troubleshooting.
Parameters, static are always found in VIDA/DIAGNOSTICS/DETAILS, VIDA/DIAGNOSTICS/NETWORK or VIDA/DIAGNOSTICS/CARCOMMUNICATION. Can also be found in troubleshooting.

Activations, Quick-tests
Activations and Quick-tests are found in VIDA/DIAGNOSTICS/CARCOMMUNICATION. Normally also found in troubleshooting.

Conditions for Diagnosis to Find a Malfunction

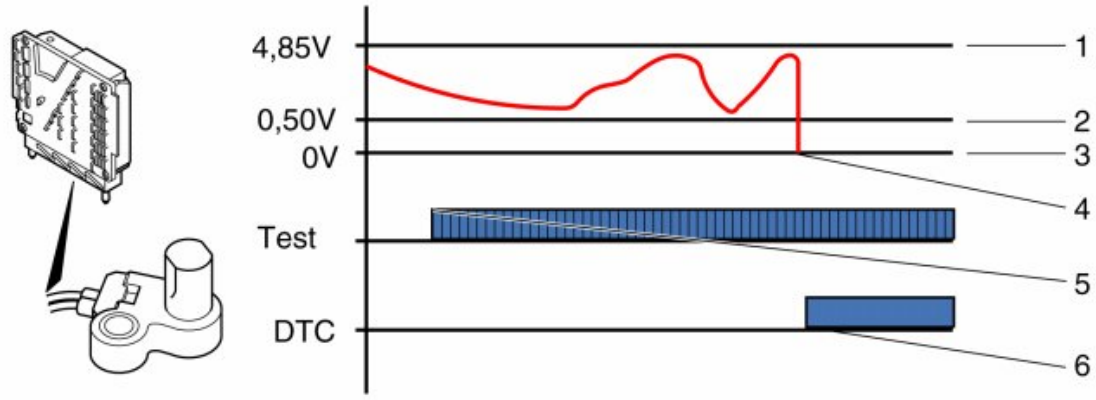
Conditions for diagnosis to find a malfunction

For the control module's self-diagnosis of a component or function to start and run (one or several times) special conditions must be fulfilled. Conditions for diagnosis varies depending on which component or function is to be monitored. When the diagnosis has started and is run, the signal, value or function must go above or below the limit value for the control module to detect a malfunction.

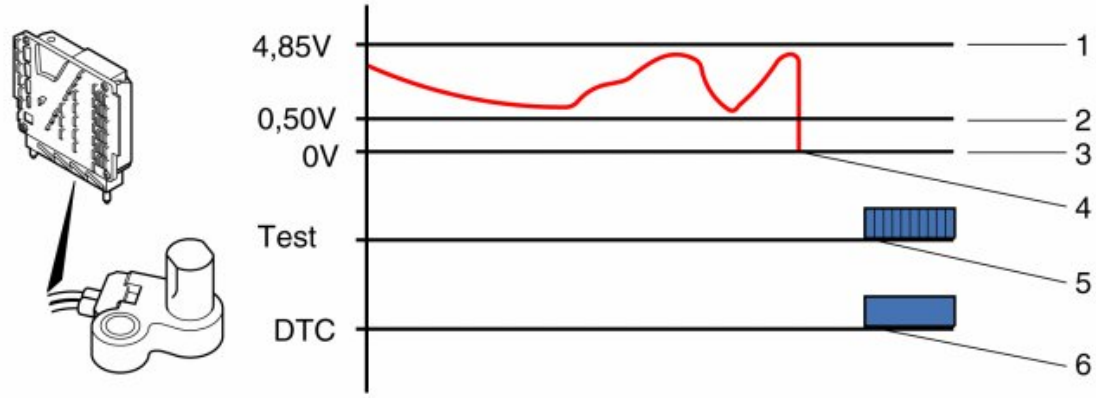
Example of conditions for the control module to start the diagnosis/test:
- Engine speed higher than 500 rpm.
- Ignition position II.
- Speed above 40 km/h.
- 4th gear selected.

Example of limit values for detecting malfunction:
- Direct voltage from outside temperature sensor lower than 0.495 V for a time longer than 1 second.
- After the engine has run for approx. 10 minutes, the control module receives an unchanged signal from the oil temperature sensor even though the signal should have changed according to a set pattern.
- Malfunction shall be active (permanent) for at least 2 driving cycles.

Example



The illustration shows an imagined scenario when a malfunction occurs in a circuit for a signal.
First the signal varies normally during driving. The diagnostic trouble code test starts after some time (5), is then run cyclically in a pre-defined pattern and monitors the signal. Limit values for monitoring to consider the signal as incorrect is a voltage lower than 0.50 V (2) or higher than 4.85 V (1). An open circuit occurs in the circuit and the signal becomes 0 V (4). Monitoring detects this, waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6).



If the diagnostic trouble code test (5) starts after the malfunction (4) occurs, then monitoring will detect the malfunction fist when the test starts. Then monitoring waits so that the malfunction is confirmed and then stores a diagnostic trouble code (6). If you want the control module to detect a malfunction in the vehicle, you have to make sure that the control module's diagnostic trouble code test starts or is started.

Hint: If a malfunction occurs which has not yet been detected by the control module's monitoring, since the diagnostic trouble code test has not started, the vehicle may still exhibit a symptom!

Note! Conditions for diagnosis are described in the diagnostic trouble code information for every diagnostic trouble code.

Most diagnosis (at least non-emission-related diagnosis) are repeated periodically during the driving cycle, and every time they are repeated, a test is run that either results in a malfunction being detected or no malfunction being detected.
To enable the emission-related diagnosis to be completed and the diagnostic trouble code to be confirmed (with MIL-light activated as a result), several driving cycles in a row must be completed with a detected malfunction.
To enable the non-emission-related diagnosis to be completed (at least once), in principle the start conditions must be fulfilled for a certain time (from fractions of a second to a number of seconds).
Certain diagnoses require a completed driving cycle (e.g., ignition on, ignition off, and ignition on again) for the diagnosis to be considered as complete. Other diagnoses requires several other conditions to be fulfilled, e.g., with regards to:

- vehicle speed
- engine coolant temperature (ECT)
- time since start
- different load and engine speed relationships in the same trip
- a certain event (for example, that the component operates).

Hint: To assess if a test/diagnosis for the diagnostic trouble code is started or completed, status identifiers can be used. Turning off the ignition and then turning it on again often results in start of a new driving cycle/operation cycle, which results in update of status identifiers. See also section Driving cycle/Operation cycle below.

When, e.g., the engine control module (ECM) has run all diagnostics, the control module has completed a "trip". An extensive driving schedule in various conditions is required to complete a trip. The engine may also need to be shut off for a certain amount of time and then switched on again to complete a trip.
Emissions related diagnostic functions

Control modules that have and control emission-related components or functions, e.g., Engine control module (ECM) and Transmission control

module (TCM), check that emission-related systems work. These systems are checked by running a diagnostic function. The diagnostic function checks the included components and that the function itself works in the system.

Lighting the malfunction indicator lamp (MIL)

In the event of emissions related diagnostic trouble codes (DTCs), a counter counts down to determine when to light the malfunction indicator lamp (MIL). The conditions for lighting the malfunction indicator lamp (MIL) vary depending on which diagnostic trouble code (DTC) is stored.

Note! If a malfunction becomes intermittent or the malfunction disappears, then the MIL-light turns off first after 3 driving cycles in a row are completed with malfunction detection.

Self-erasing of emission-related diagnostic trouble codes

After 40 driving cycles without detected malfunction with start of cool engine, where the engine temperature (coolant temperature) increases more than 5 °C (approx. 9 °F) and the final temperature is above approx. +71 °C (159.8 °F), then the diagnostic trouble code is erased. Diagnoses (diagnostic trouble code tests) for misfire and fuel adaptations require 80 driving cycles. These driving cycles are defined as a "warm-up cycle".

Emergency Mode, Back-Up Mode "Limp-Home"

Emergency mode, back-up mode "Limp-home"

When a malfunction has occurred in the system that is confirmed (permanent malfunction) and is registered by the control module, modes are activated for certain systems and functions to handle the malfunction.
The purpose of these actions is to "protect" the control system and at the same time retain as much functionality or driving function as possible.
The minor malfunctions do not activate any back-up modes, there are different programs depending on type of malfunction and which control system to which it applies. All control systems do not have emergency modes or back-up modes.
Sometimes emergency modes must be activated immediately when a malfunction is detected, even if there has been no time to confirm and store any diagnostic trouble code. This is to maintain certain function, e.g., in case of malfunction of the mass air floe sensor for the engine management system, when the emergency program tries to prevent the engine from stopping.

Hint: Limp-home, emergency mode or back-up mode that may appear in case of malfunction is described in diagnostic trouble code information under replacement values.

For, e.g., automatic transmission TF-80SC AWD (XC90, B8444S) there are two back-up modes:

- Failsafe action (temporary action)
- Emergency/limp-home mode

Failsafe action is activated at the first detection of the malfunction, if the malfunction disappears the system returns to normal function.
Emergency mode is activated in case of less serious malfunctions Limp-home mode is activated for the most serious malfunctions.
The warning light in the driver information module lights up, and a text message is shown in the text window in the driver information module that emergency/limp-home mode has been activated. When the ignition is turned off and on again, no text is shown until the malfunction is detected again.

Note! If the malfunction disappears (intermittent malfunction) the control module returns to normal function first when the ignition is turned on the next time.

For automatic transmission's emergency mode, the following may take place, e.g.:

- Adaption function is blocked.
- Lock-up function is blocked.
- Function slipping lock-up is blocked.
- Function neutral check is blocked.
- The transmission only shifts to 3rd gear and reverse gear. All other shifting is blocked.

The above actions will be noticed by the driver since only one gear can be sued. Some may also notice that lock-up is not engaged. Then the vehicle comes to the workshop with a **symptom** for some form of lost driving function, probably also with the warning light on.
This symptom shall not be confused with the malfunction itself, instead it is a symptom of the back-up mode. The symptom that the malfunction itself causes (it it causes any) may be noticed briefly or not at all.

Note! If the malfunction is confirmed (permanent) it may be that the control module resumes normal function at ignition off and on again (symptom does not exist any longer). First when the malfunction is detected again (diagnostic trouble code test started and conditions fulfilled), the back-up mode is activated. The malfunction may then first be interpreted as if it was intermittent (non-existent or not active).

Status Identifier

Status identifier

General

There are status indicator (status identifiers) that can be read out for every diagnostic trouble code. The control module tests every connection (signal) or function more or less periodically, depending on the self-diagnosis' conditions for start.
By reading out the diagnostic trouble code with associated status identifier, then you obtain **status for the diagnostic trouble code test that detects the malfunction, as well as if the malfunction exists now or not.**

Note! Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

All status identifiers (or malfunction detection counters) do not have to be introduced in one control module, this varies from system too system. All status identifiers restarts the count every time a new driving cycle/operation cycle starts or when erasing diagnostic trouble codes. Status identifiers should be read off continuously as the different identifiers can be updated later on.
The following describes possible status identifiers.

Note! Status identifiers for systems with diagnostics Volvo Diagnos II is slightly different from status identifiers for diagnostic version Generic Global Diagnostics (GGD). See below.

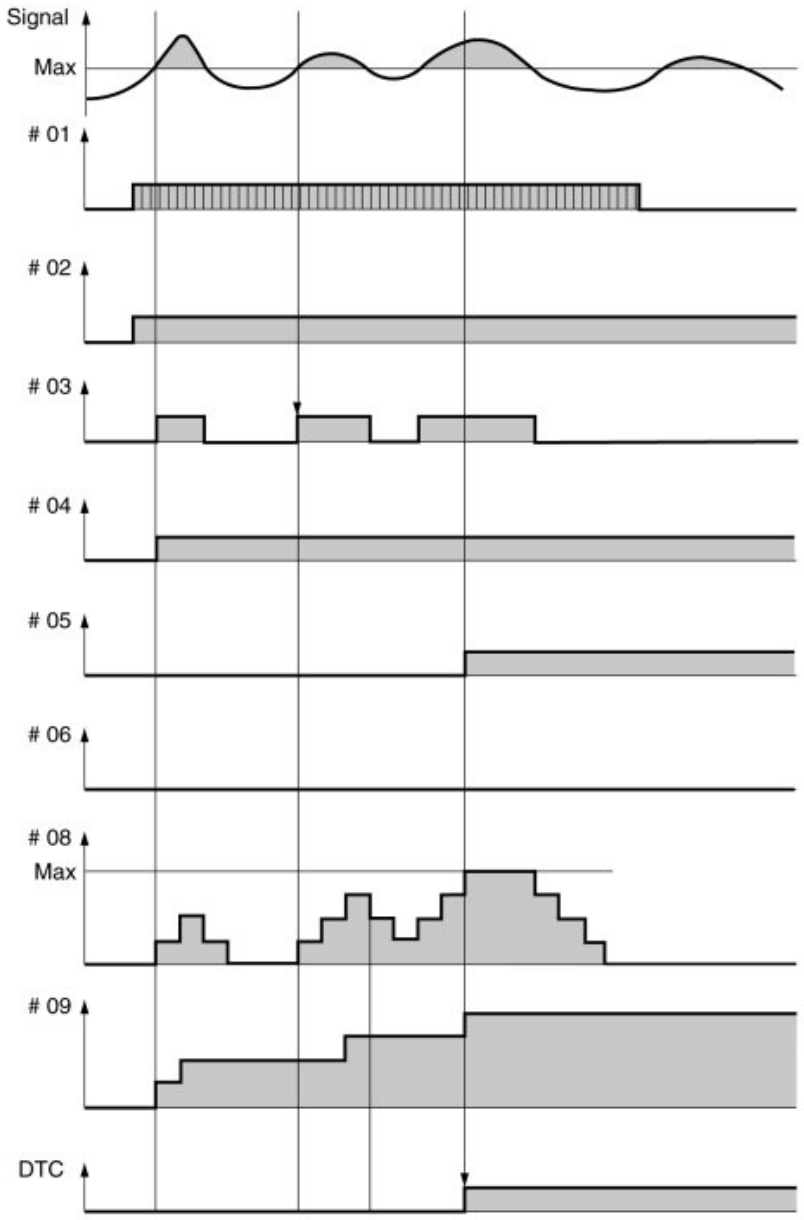
When erasing diagnostic trouble codes, the diagnostic trouble code's status identifier is erased.

Status identifier Volvo Diagnostics II

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 01 Diagnostic trouble code test run in progress.
- SB 02 Diagnostic trouble code test run at least once during current driving cycle.
- SB 03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle/operation cycle.
- SB 04 Sporadic/single malfunctions found at least once during current driving cycle.
- SB 05 Request light warning light/text message due to detected malfunction.
- SB 06 Diagnostic trouble code test blocked due to malfunction found by another diagnostic trouble code test.
- SB 08 Malfunction detection counter, current value.
- SB 09 Malfunction detection counter, maximum value reached some time during current operation cycle.

Abbreviation SB is from the English 'Status Bit'.



The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.
The text below uses the term Driving cycle, which may also be called Operation cycle.

Note! If the diagnostic trouble codes are erased, the status identifiers are also erased!

SB01 Diagnostic trouble code test run in progress (second paragraph from top).

Shows if the diagnostic trouble code test runs or not right now (in current driving cycle). It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes.
Grey-marked surface means that the test runs and can detect a malfunction if it occurs. The surface is "dashed", showing that when the diagnostic trouble codes runs, it runs in a cyclic, pre-determined pattern.
Status identifier 03 and 04 shows if a malfunction is detected or not. In this case, a malfunction is detected 3 times, see status identifier 03.
Status alternative when reading out is Yes (test runs now) or No (test is not run now).
SB02 Diagnostic trouble code test run at least once during current driving cycle (third graph from the top).

Shows if the diagnostic trouble code test has been run or not during the current driving cycle. If it has been possible for the control module to detect malfunctions and generate diagnostic trouble code any time during the current driving cycle.
Grey-marked surface means that the diagnostic trouble code test has been run at some time. If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No.
Status identifier 03 and 04 shows if a malfunction is detected or not.
Status alternative when reading out is Yes (test completed) or No (test not completed).
SB03 Sporadic/single malfunctions found the last time diagnostic trouble code test was run during current driving cycle (fourth graph

from the top).

A sporadic malfunction (intermittent malfunction) has been detected 3 times **the last** time the diagnostic trouble code test was run during current driving cycle. During the diagnostic trouble code test run the last time (see status identifier 01) a malfunction has been detected 3 times.
Status alternative when reading out is Yes (sporadic malfunction found) or No (no sporadic malfunction found).

Note! When the control module detects the malfunction for the first time(status identifier 03 and 04), a diagnostic trouble code has not yet been stored (see last graph). It is first when the malfunction detection counter 08 reaches a certain value that the control module considers that a real malfunction exists (a confirmed malfunction) and the diagnostic trouble code is stored.

SB 04 Sporadic/single malfunctions found at least once during current driving cycle (fifth graph from the top).

A sporadic malfunction (intermittent malfunction) has been detected at some time during current driving cycle. Grey.marked surface means that a malfunction has been detected at some time.
If the diagnostic trouble code test has been run at some time in this driving cycle, status will always be Yes and remain so until the ignition is turned on off and a new driving cycle starts. When a new driving cycle starts, status identifiers are "reset" and is initially No. Status identifier 03 and 04 shows if a malfunction is detected or not.
Status alternative when reading out is Yes (test has been run earlier) or No (test has not been run).
SB 05 Request light warning light/text message due to detected malfunction (sixth paragraph from the top).

Information that diagnostic trouble code activates a warning light or text message in driver information module. In this case, lighting of warning light is requested when the diagnostic trouble code has been confirmed and stored.
Status alternative when reading out is Yes (request performed) or No (no request).
SB06 Diagnostic trouble code test blocked (seventh graph from top).

Information that diagnostic trouble code test is turned off as a result of another malfunction and diagnostic trouble code is generated where the root cause is detected. If this in turn results in subsequent malfunctions, it prevents generation of subsequent diagnostic trouble codes. In this case, the diagnostic trouble code test is not blocked.
Status alternative when reading out is Yes (diagnostic trouble code test blocked) or No (diagnostic trouble code test not blocked).
SB08 Malfunction detection counter, current value (eight graph from top).

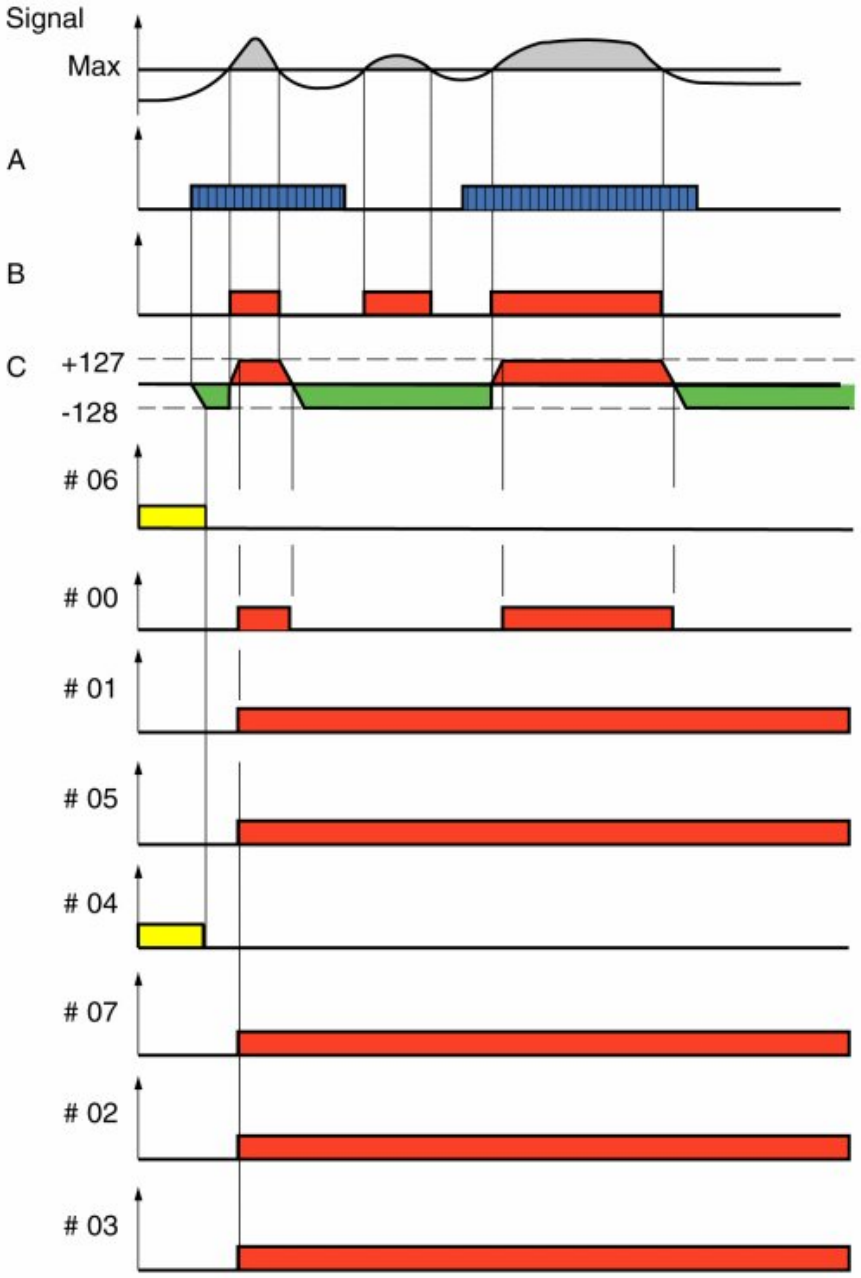
When a sporadic malfunction is detected by the control module the malfunction detection counter counts up as long as the malfunction exists. When the malfunction no longer exists the counter counts down again. This is the basis for the control module's decision to store the diagnostic trouble code and the diagnostic trouble code is stored in the vehicle first when the counter reaches a certain max. value. This max. value varies between different diagnostic trouble codes.
Count rate of the counter is controlled as long as the malfunction exists before it causes customer symptom. The counter is used to decide if it is a real malfunction that has occurred and that has existed for some time. It is the control module's way of confirming the diagnostic trouble code, that is, confirming that a real malfunction exists.
SB09 Malfunction detection counter, max. value during current operation cycle

Shows max. value that status identifier 08 has reached during current driving cycle. When a new driving cycle starts, the counter is "reset".

Status identifier Generic Global Diagnostics (GGD)

The following identifiers are available (showed values apply until updated with a new read-out):

- SB 00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle
- SB 01 Malfunction found at least once during the current driving cycle
- SB 02 Malfunction found at least once during the current and previous driving cycles
- SB 03 Malfunction found recently since erasing of diagnostic trouble codes
- SB 04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes
- SB 05 Malfunction found at least once since erasing of diagnostic trouble codes
- SB 06 Diagnostic trouble code test run at least once during current operation cycle.
- SB 07 Request light warning light/text message due to detected malfunction.



The upper graph shows a varying signal value. If the signal value exceeds a max. value, which is considered a malfunction by the control module, then a sporadic malfunction is registered, that is, a malfunction is about to occur. Then the grey-marked surface indicates the signal considered to be incorrect.
The text below uses the term Driving cycle, which may also be called Operation cycle. The order of status identifiers in illustration and in the list below are presented as they belong to each other, not in numerical order!

Note! If the diagnostic trouble codes are restored, the status identifiers are also restored!

Graph A Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. The surface is "dashed", which shows when the diagnostic trouble code test runs it runs in a cyclically pre-determined pattern. Not included as a status identifier.
Graph B Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.
Graph C Counter 6 malfunction detection (C#6)

The counter counts the number of internal detections of the malfunction that have been performed for the diagnostic trouble code. Not included as a status identifier, see section further on in the information. When this counter reaches value +127 the control module considers the malfunction to be active right now.
When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.
If the value increases towards +127, the control module has detected a malfunction and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.
The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the

control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.
In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts (graph A). When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.
SB**06 Diagnostic trouble code test run at least once during current operation cycle**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in **current** driving cycle. When the diagnostic trouble code test starts and counter 6 (malfunction detection) counts down to -128 (no malfunction found) or up to +127 (malfunction found), the control module considers that diagnostic trouble code test has been run.
Yellow-marked surface means that diagnostic trouble code test **is not yet** run.
Status alternative when reading out is Run or Not run.
SB**00 Malfunction found the last time that the diagnostic trouble code test was run during current driving cycle**

Shows if the control module detects the malfunction right now. It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. A malfunction has been detected 2 times during the current driving cycle. Note that only when counter 6 (malfunction detection) reaches the value +127 is it considered to be a malfunction. When the value gas dropped from +127 to 0, it is considered that there is no longer a malfunction.
Status alternative when reading out is Yes (malfunction detected right now) or No (no malfunction detected right now).
SB**01 Malfunction found at least once during the current driving cycle**

Shows if the control module has detected the malfunction**anytime during the current driving cycle.** It is only when the test runs that the control module can detect malfunctions and generate diagnostic trouble codes. The diagnostic trouble code test has started and a malfunction has been detected at least 1 time during the current driving cycle.
Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).
This status identifier is generated at the same time as status identifier SB00 and will remain in status Yes for the rest of the current driving cycle. At start of a new driving cycle, it has changed to status No until a malfunction is detected again.
SB**05 Malfunction found at least once since erasing of diagnostic trouble codes**

Shows if the control module has detected the malfunction during **earlier** driving cycle. A malfunction has been detected at least 1 time since the diagnostic trouble code was erased the last time.

Status alternative when reading out is Yes (malfunction found) or No (malfunction not found).
This status identifier is generated at the same time as status identifier SB 00 and will remain in status Yes until diagnostic trouble codes are erased once again.
SB**04 Diagnostic trouble code test run at least once since erasing of diagnostic trouble codes**

Shows if the control module has performed diagnostic trouble code test for this diagnostic trouble code in **current and/or earlier driving cycle** since the diagnostic trouble code was erased the last time. This means that if diagnostic trouble code test has been run after erasing of diagnostic trouble codes, it will remain in Run until diagnostic trouble codes are erased once again.
Yellow-marked surface means that diagnostic trouble code test **has been** run.
Status alternative when reading out is Run or Not run.
This status identifier is generated at the same time as status identifier SB 06.
SB**07 Request for lit warning light/text message**

Information about the diagnostic trouble code activates a warning light or text message. In this case, lighting of the warning light is requested when a diagnostic trouble code is stored.
Status alternative when reading out is Yes (request performed) or No (no request).
SB**02 Malfunction found at least once during the current and previous driving cycles**

Pending not yet confirmed diagnostic trouble code.
Status alternative when reading out is Yes (malfunction found but not confirmed) or No (no malfunction found).
This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. Number of driving cycles required depends on the system.
SB**03 Malfunction found recently since erasing of diagnostic trouble codes**

Confirmed diagnostic trouble code.
Status alternative when reading out is Yes (malfunction found and confirmed) or No (no malfunction found).
This status identifier is generated at the same time as status identifier SB 00 is generated for the first time and will remain in status Yes until certain driving cycle conditions are fulfilled and no malfunctions are detected. After a certain number of driving cycles without detected malfunction, it returns to status No. That is, if a malfunction becomes intermittent and no longer is detected, the status will change to No. Number of driving cycles required depends on the system.

Note! For emission-related control system, this status identifier is generated to status Yes (Malfunction found and confirmed), first after status identifier SB02 has had status Yes (Malfunction found but not confirmed) for 2 driving cycles in a row with malfunction detected.

Counter

Counter

General

For every diagnostic trouble code , the control modules stores a number of counters. These counters count the number of driving cycles that have been performed in the control module with or without malfunctions, if the malfunction is detected or not. In control systems older than model year 1999, there may be control systems, depending on control system, without counters or with few counters. From model year 1999, there are systems with several counters. The following counters may appear:

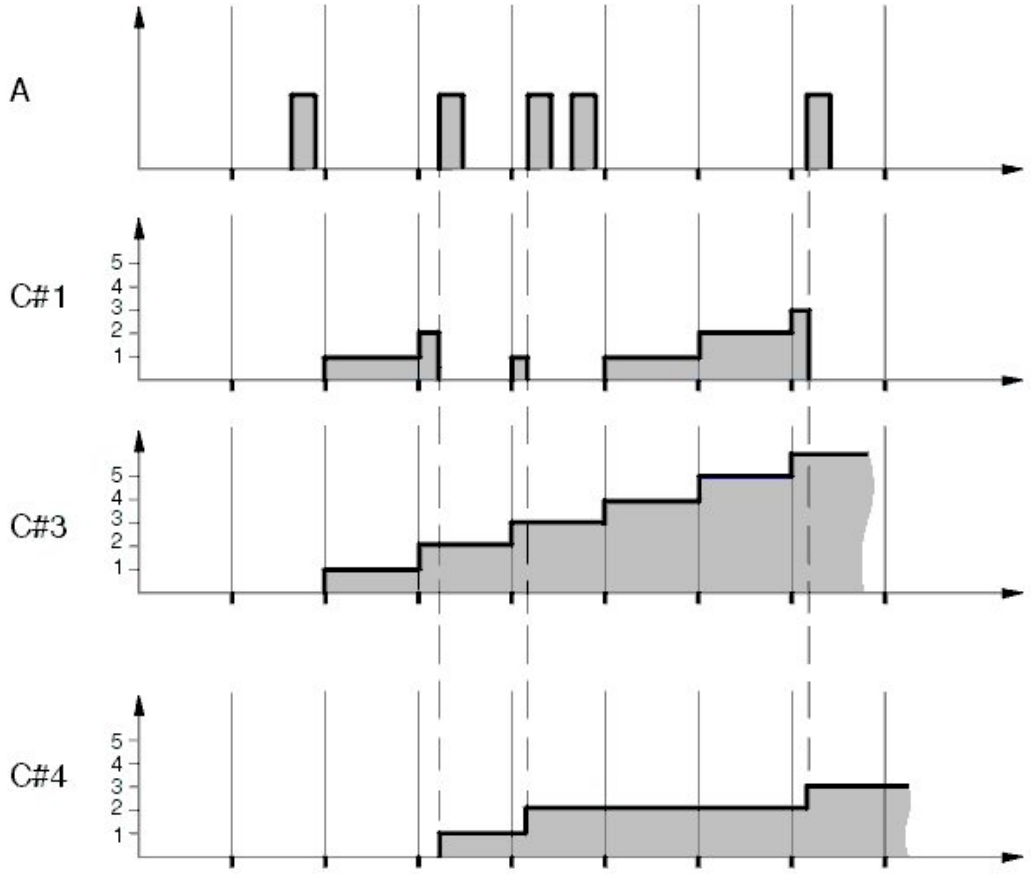
- Counter 1
- Counter 2 *
- Counter 3
- Counter 4
- Counter 5**
- Counter 6
- Counter 7
- Counter 8

The text uses the term driving cycle, which may also be called Operation cycle.
* In principle, only systems with the diagnostic concept Generic Global Diagnostic (GGD).
** Only for emission-related systems.
When erasing diagnostic trouble codes, the diagnostic trouble code's counter is erased.

Note! Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

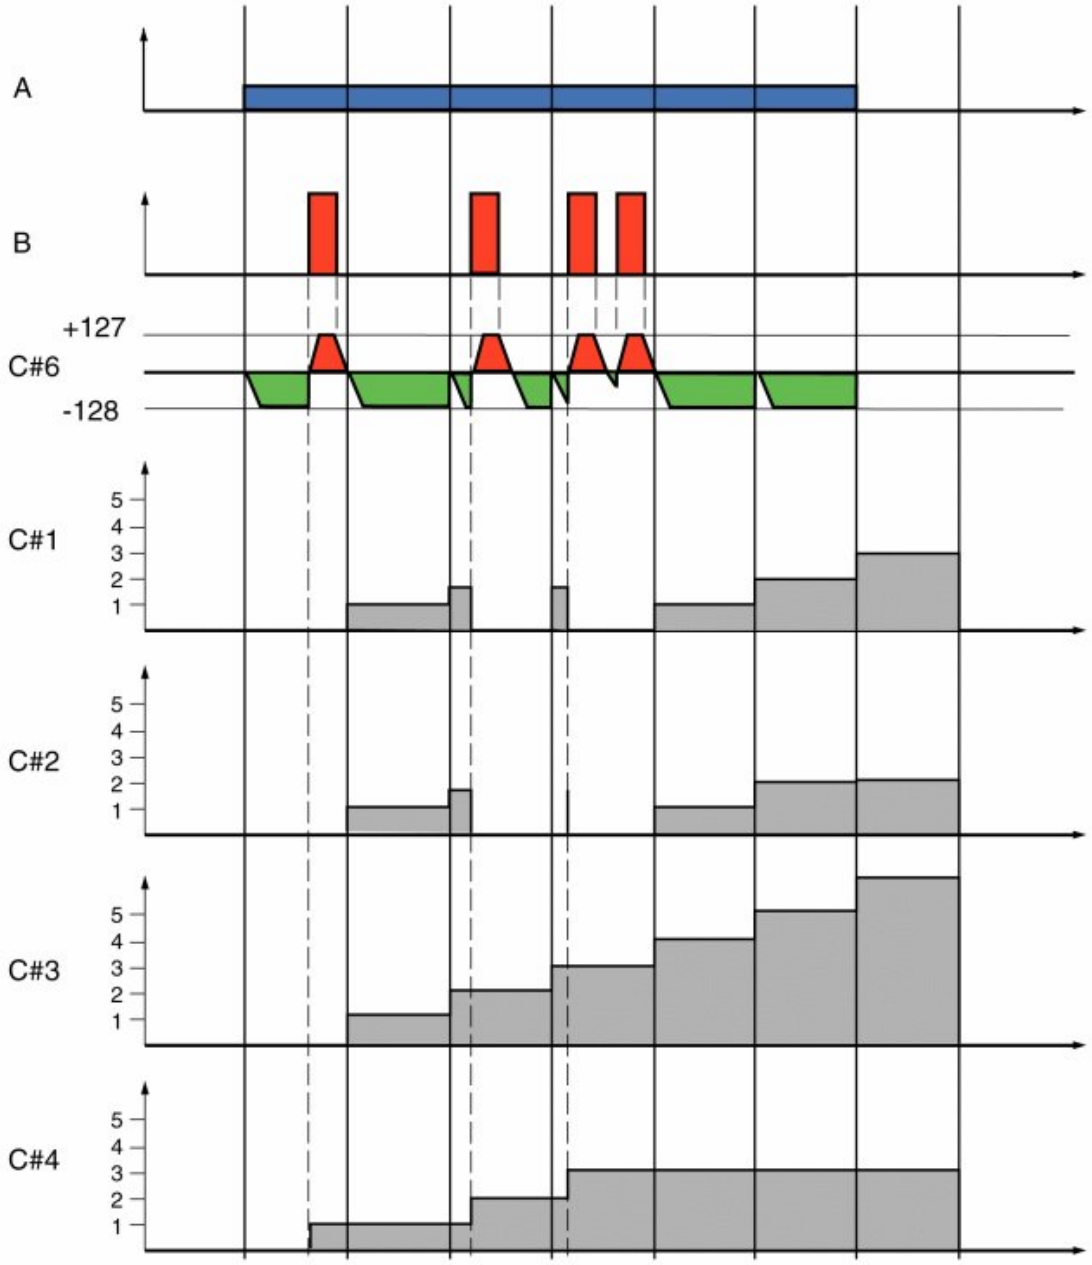
Counter Volvo Diagnostics II



Graph A illustrates when in time that the malfunction occurs. In the illustration, the control module has detected a malfunction in the second driving cycle (graph's x-axis) and this malfunction then appears 4 more times, a total of 5 times. Counters can be read out for every diagnostic trouble code in the control module which have this introduced. Driving cycles are marked with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.
Counter 1 (C#1). Counts number of cycles performed since the malfunction was confirmed **last**. As soon as a malfunction is detected and confirmed, the value is reset.
When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.
In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed

and the counter's value is reset. This sequence is repeated once again in driving cycle 5.
With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted so that a new driving cycle is initiated (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.
Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.
Counter 3 (C#3) (see graph). Counts the number of driving cycles performed since the malfunction was confirmed the **first** time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.
A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.
Counter 4 (C#4) (see graph). Counts the number of driving cycles in which the malfunction has been confirmed since it was confirmed the first time. The graph shows that after the malfunction was detected the first time, the malfunction has been detected in 3 driving cycles. Thus, after the malfunction was detected the first time, another 6 driving cycles (counter 3), have passed and in these the malfunction has been detected 3 times (counter 3). Simplified, one can say that in this example, the malfunction has occurred/been detected in every other driving cycle, and the malfunction can be assessed as relatively frequent.
A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.
If counters 3 and 4 have the same value, the malfunction has been detected in every driving cycle, which means that the malfunction is frequent.
Counter 5 (C#5). The counter sums up the time in seconds that **the control module has been operating** since the malfunction first was confirmed and the diagnostic trouble code was stored. The time that the control module has been operating is only counted when it is active, not in "sleep mode". The counter is not shown in the illustration.
Counter 6 (C#6). The counter sums up the time in seconds that **the diagnostic trouble code test has been in progress** since the malfunction first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.
Counter 7 (C#7). The counter sums up the time in seconds that **malfunction has been confirmed** since it first was confirmed and the diagnostic trouble code was stored. The counter is not shown in the illustration.

Counter Generic Global Diagnostics (GGD)



Graph A. Diagnostic trouble code test active

Shows if the control module's diagnostic trouble code test is active or not. The blue surface indicates when the test is active. Not included as a status identifier.

Graph B. Malfunction active

Shows if the malfunction in the vehicle is active or not. The red surface indicates when the malfunction is present (active). Not included as a status identifier.

In the illustration, the control module has detected a malfunction in the second driving cycle, and this malfunction occurs a total of 4 times. Counters can be read out for every diagnostic trouble code in the control module which has this implemented. Driving cycles are indicated with vertical lines. A driving cycle often begins with ignition on and ends with ignition off.

Counter 1 (C#1). Counts number of driving cycles performed since the malfunction was confirmed **last**. As soon as a malfunction is detected and confirmed, the value is reset. When the malfunction is both detected and disappears in the second driving cycle (graph A), counter 1 will count up to 1 first in the following driving cycle (driving cycle 3), that is, a driving cycle has been run through since the last time the malfunction was confirmed.

In driving cycle 4, the counter is updated again, now to value 2. Just after that, the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.

With other words, one can say that if the value is zero, the malfunction exists now or has existed earlier in the current driving cycle. If the vehicle is restarted (often requires ignition off and on again) in this position and the counter's value still is 0, then you probably have a permanent malfunction.

Values near zero indicate that the malfunction has been detected recently. It may also be that the malfunction exists but the diagnostic trouble code test has not started in these driving cycles, which means that the counter has not been reset. A high counter value indicates that the malfunction was last detected a number of driving cycles ago.

Counter 2 (C#2). Counts the number of driving cycles since the last confirmation of the malfunction and where the diagnostic trouble code was

performed **without** detecting malfunction and confirmation of malfunction. Thus, when diagnostic trouble code is performed and no malfunction is detected, the counter will count up by 1 for every driving cycle. As soon as a malfunction is detected and confirmed, the value is reset.
When the malfunction is detected and disappears in the second driving cycle (graph A), counter 2 will count up to 1 first in the following driving cycle (run cycle 3). In driving cycle 4 the counter is updated again (diagnostic trouble code test has been run without detecting malfunction), now to value 2. Immediately after that the malfunction is detected (graph A), the malfunction is confirmed and the counter's value is reset. This sequence is repeated once again in driving cycle 5.
During driving cycle 6 and 7, the diagnostic trouble code test was run without detecting malfunction and the counter receives the value 2. In driving cycle 8, the diagnostic trouble code test is not run and thus the counter is not updated.
Counter 3 (C#3). Counts the number of driving cycles performed since the malfunction was confirmed the **first** time. When a malfunction is confirmed the first time, the counter will count up by 1 for every subsequent driving cycle, regardless of if the malfunction is detected or not. Thus, the counter tracks the the number of driving cycles since the malfunction was detected the first time. See graph where the counter increases by 1 for every subsequent driving cycle and the value of the counter is finally 6.
A low value indicates that the malfunction was detected for the first time relatively recently. However, a high value indicates that a first detection was performed some time ago.
Counter 4 (C#4). Counts the number of driving cycles in which the counter's value has been updated first when the malfunction was detected in the driving cycle. The counter has a final value of 3.
A certain indication of a malfunction's intensity can be obtained if you compare the value for counter 4 with counter 3. The closer the value for counter 4 the value is to the value of counter 3, the more frequent the malfunction.
Counter 5 warm-up (C#5). Counts the number of warm-up cycles that have been run since the malfunction light (MIL) has gone off. The counter is not shown in the illustration. Note! Only applies to emission-related systems.
Counter 6 malfunction detection (C#6). The counter counts the number of internal detections of the malfunction that have been run for the diagnostic trouble code. When this counter reaches value +127, the control modules decides that the malfunction is active right now.
When the counter is at value -128, the malfunction is not active. The value is reset for every new driving cycle.
If the value increases towards +127, the control module has detected a malfunction, and for every internal test the value is counted up. When the malfunction no longer exists, the control module counts down to minimum -128.
The value on the control module can only be changed when it has started the test for the diagnostic trouble code. How big each step is that the control module counts up or down the value by to reach the limits +127 or -128 may vary between control modules. Limits +127 and -128 are pre-defined limits in the control module.
In the graph, the counter first counts down to -128 when the diagnostic trouble code test starts. When a malfunction occurs (graph B) and the diagnostic trouble code test detects the malfunction, first the counter's value is reset to 0, then it scrolls up to +127. Only then the malfunction is considered to exist. If the malfunction disappears and the diagnostic trouble code test is active, the counter counts down to -128.
Counter 7 malfunction detection - max. current (C#7). Shows maximal value that counter 6 has in the present driving cycle.
The counter is not shown in the illustration.
Counter 8 malfunction detection - max. earlier (C#8). Shows maximal value that counter 6 has in the present and/or has had in earlier driving cycle.
The counter is not shown in the illustration.

Visual and Physical Check

Visual and physical check

Large and slow leaks will often result in air conditioning (A/C) compressor oil being drawn out with the refrigerant.
A visual inspection can localize the point where the oil gathers and identify the source of the leak.

- Check the system for corrosion which could cause refrigerant to leak
- Check that there are no loose components.

Frozen Values

Frozen values

For every diagnostic trouble code, pre-defined parameters are frozen and stored in the control module. The frozen values are stored immediately after the malfunction has been detected and gives a "picture" of the conditions when the malfunction was stored.

Note! Status identifier, Counter and Frozen values are the most important factors to deciding the malfunction's nature, that is, to decide:

- when the malfunction was detected (frozen values, counters)
- what the driving conditions were at the time (frozen values)
- status for the test (self-diagnosis) (status identifier)
- how frequent the malfunction is (counter).

In newer car models, frozen values consist of a number of global (common) general parameters as well as a number of control model-unique parameters. Global may be:

- Road distance
- Battery voltage
- Passenger compartment temperature
- Outside temperature
- Engine running

In addition to these, the diagnostic trouble code-unique parameters are stored which are especially selected parameters for the diagnostic trouble code.
Most parameters in the frozen values are the same for all malfunctions and indicate a general condition when a malfunction was detected, for

example:

- Road distance
- Outside temperature
- Engine speed
- Load
- Coolant temperature
- Vehicle speed
- Battery voltage
- etc.

Some of them have been selected to give a better understanding of the specific malfunction.

Note! When erasing diagnostic trouble codes, stored frozen values are also erased.

Hint: Reading out and interpreting these frozen values make it easier to understand when in time the malfunction occurred, as well as under what driving and environment conditions the malfunction was detected, related to when and how the customer experienced the symptom.

VIDA (Vehicle Information & Diagnostics For Aftersales)

VIDA (Vehicle Information & Diagnostics for Aftersales)

During the second half of 2004, VADIS (Volvo Aftersales Diagnostic and Information System) was phased out and replaced by VIDA (Vehicle Information & Diagnostics for Aftersales). The purpose of VIDA is to support service providers in repairing and servicing Volvo vehicles. VIDA provides Service and Parts information, as well as diagnostic fault tracing, and software downloads. As in VADIS, these areas are integrated into one single application. All functionality that could be found in VADIS will be found in VIDA. However, in some particular areas, e.g., the diagnostic work flow, search functionality, and the Parts catalogue, VIDA contains considerable enhancements when compared to VADIS.

Volvo's VIDA (Vehicle Information & Diagnostics for Aftersales) system ties together service and repair data, parts data, service bulletins, software (firmware) downloads, fault tracing and on-board diagnostic as well as other related information to decrease service time.

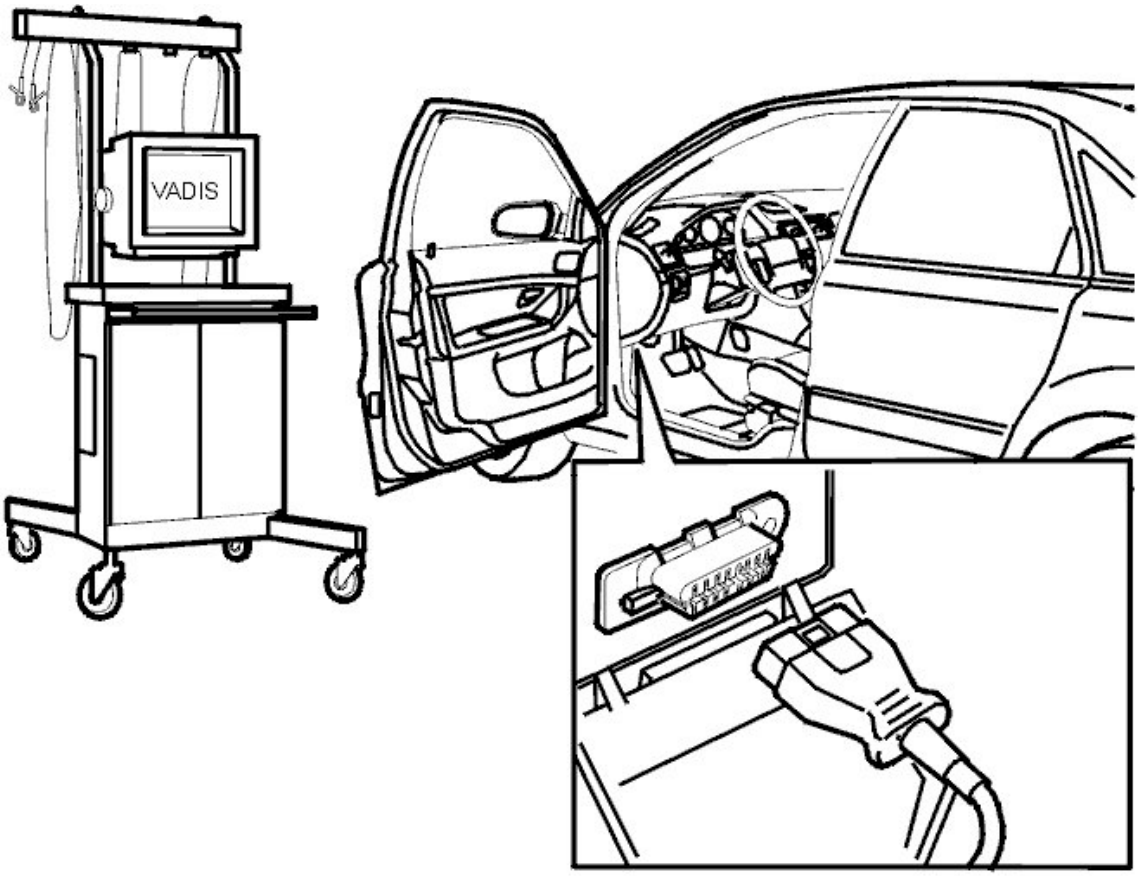
Much of the diagnostic information provided here is presented in a manner that assumes the technician is using the web-based Volvo diagnostic system (VIDA) to diagnose the vehicle. Volvo does not provide any information based on performing diagnosis with a third party diagnostic tool aside from a conversion from P Codes to Volvo ECM Codes for some systems.

Connecting the Volvo Communication Tool 2000 (VCT 2000)

Connecting the Volvo Communication Tool 2000 (VCT 2000)

Connecting the Volvo Communication Tool 2000 (VCT 2000)

In order to be able communicate with the car control modules, the VCT 2000 must be connected to both the VIDA PC and the car data link connector (DLC).
For further information about connection see Connecting VCT2000 See: Reading and Clearing Diagnostic Trouble Codes/Scan Tool Connecting/Connecting VCT2000.



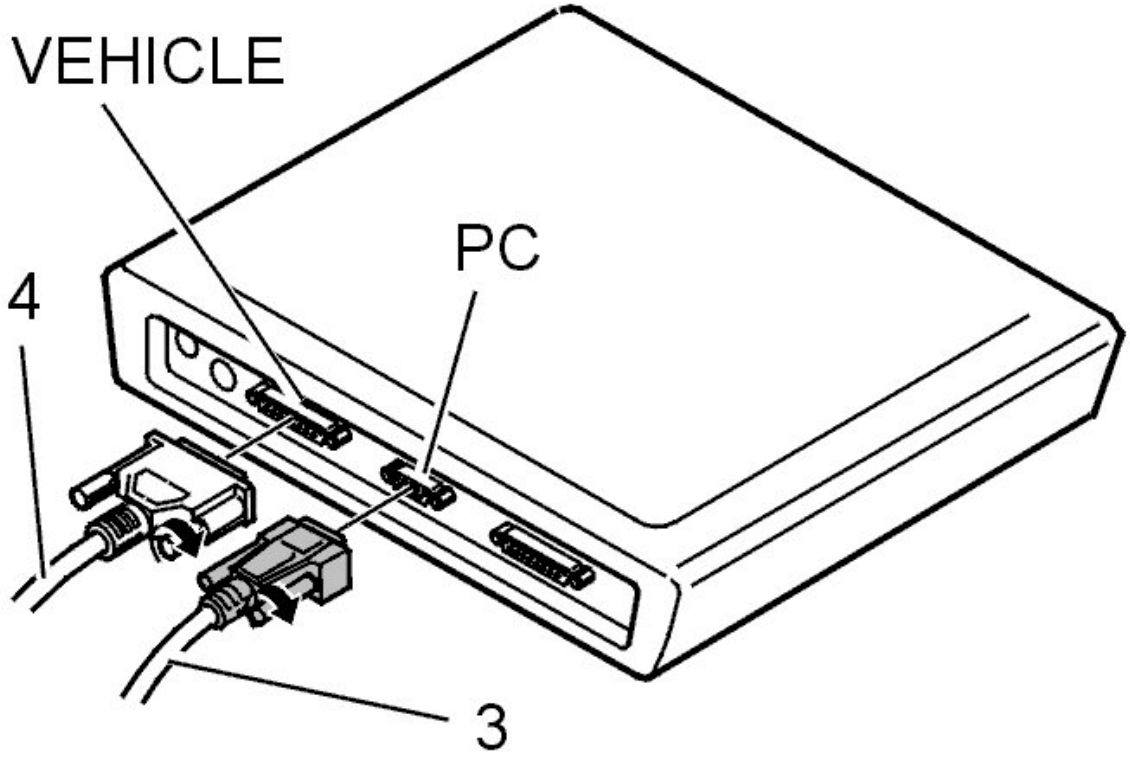
Continue - DONE

Connecting VCT2000

Connecting VCT2000

Connecting the wiring to VCT2000

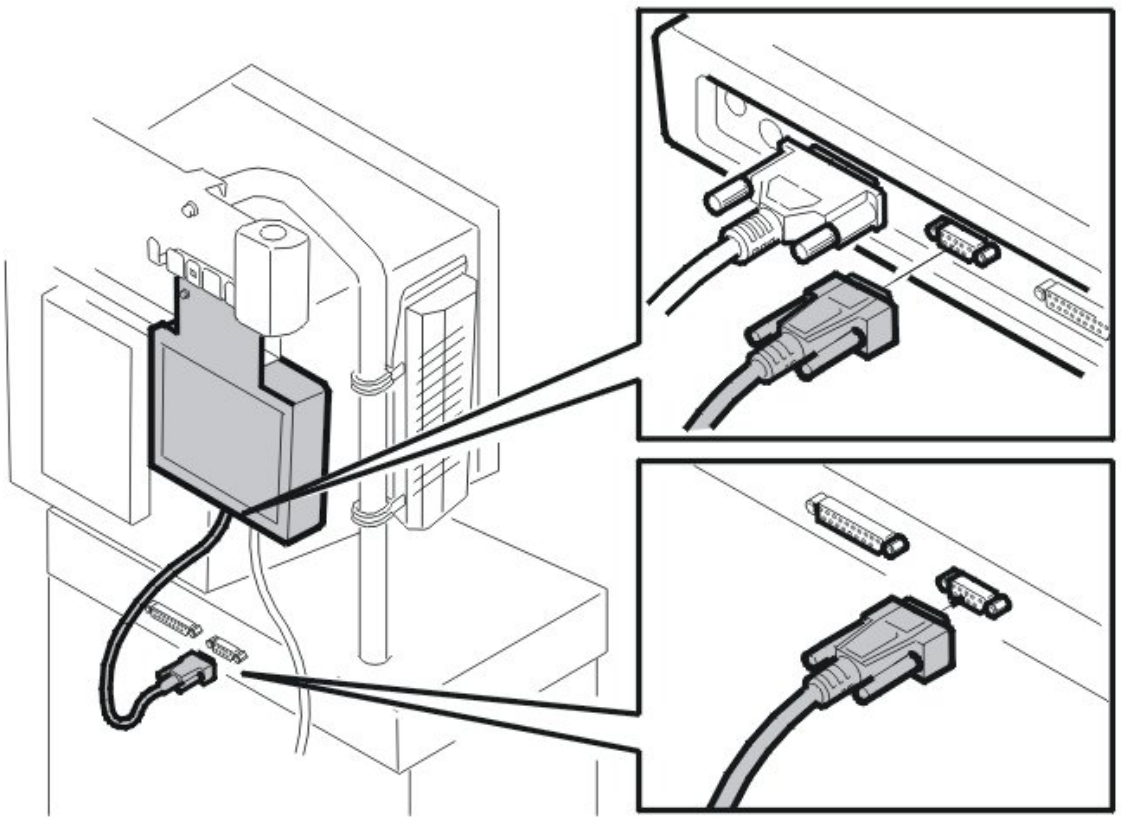
Warning! When connecting the VCT2000 to a car via vehicle cable951 1477 Cable See: Tools and Equipment/951 1477 Cable , must always be connected to the VCT2000 before it is connected to the car (supplied with power). This is to prevent damage to the electronic systems.



Connect:

- long PC cable951 2715 cable See: Tools and Equipment/951 2715 Cable (3) to the PC socket on the VCT2000
- vehicle cable (4)951 1477 Cable See: Tools and Equipment/951 1477 Cable to the VEHICLE socket on the VCT2000.

Connecting VCT2000 to the VIDA station



- Position the VCT2000 on the VIDA station as illustrated
- Connect the cable to the socket on the reverse of the VIDA station.

Note! Make sure that the vehicle cable is correctly connected to the VCT2000 before connecting the cable to the car.

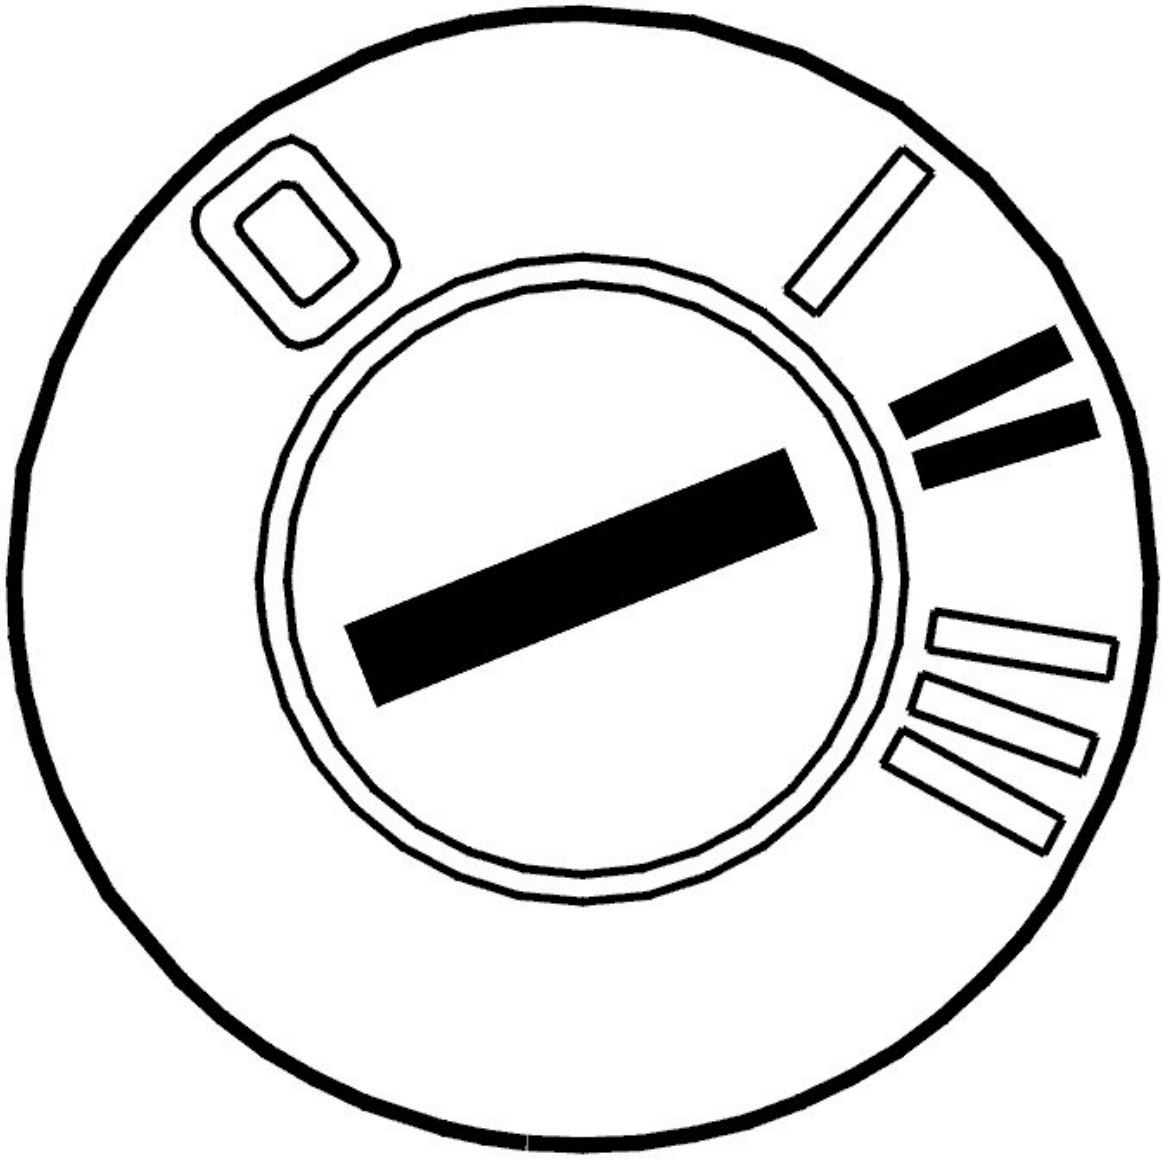
Erasing Diagnostic Trouble Codes (DTCs) for All Systems

Erasing diagnostic trouble codes (DTCs) for all systems

Reading off diagnostic trouble codes (DTCs) from all systems before erasing

Caution! This function erases all diagnostic trouble codes (DTCs) in all the systems in the car.The procedure begins with the reading off and display of diagnostic trouble codes (DTCs). The diagnostic trouble codes (DTCs) can then be erased.

Note! When erasing diagnostic trouble codes (DTCs) in all systems, alarm causes are also erased.



- Check that the transmission and engine type have been selected
- Ignition on.

Note! The engine must not be running.

Click on the VCT2000 symbol to **read off** the diagnostic trouble codes (DTCs).
After the read off, it will be possible to access the function for erasing diagnostic trouble codes (DTCs).

Hint: The read off may take up to 1 minute.

Note! Always fault-trace any stored diagnostic trouble codes (DTCs) via the VIDA symptom input before diagnostic trouble codes (DTCs) are erased.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Communication fault

Communication has been interrupted for one of the following reasons:
- The ignition is switched off
- VCT2000 disconnected from the data link connector (DLC)
- VCT2000 disconnected from the VIDA cart
- Communication problems in VIDA application or in car.
- No voltage in the data link connector (DLC).

Check therefore:
- That the control module power supply and ground terminal are fault-free.
- That the fuse for the data link connector (DLC) is intact.
- that the ignition is on
- that the battery voltage (system voltage) is normal (approximately 12 V).

If necessary a battery charger can be connected during the test.
For information about charge currents and the battery, see: Battery, charging See: Starting and Charging/Battery/Service Precautions/Technician Safety Information/Battery, Charging
- that VCT2000 is correctly connected to the VIDA cart and the data link connector (DLC)
- that VCT2000 and the wiring is fault-free.

Other information
- For information about fuse and terminal numbers, see the relevant Wiring Diagram.

Try to establish communication again or exit reading off diagnostic trouble codes (DTCs). Depending on the communication fault, select one of the following options.
1. Try again
2. Fault-trace more comprehensively for the communication problem that has occurred
3. Exit fault-tracing / Read off from the next system.

Which alternative is requested?

1 - Reading off diagnostic trouble codes (DTCs) from all systems before erasing

2 - Checking communication faults

3 - **FAILED**

Checking communication faults

Checking communication errors

Selecting car model

Select car model to obtain relevant troubleshooting information.

Select one of the following model alternatives
1. S40 (04-) / V50.
2. V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90.
3. V70 (-00), V70 XC and S70 / C70.
4. S40 (-04)/ V40.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

1 - car model S40 (04-) / V50

2 - car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

3 - car model V70 (-00), V70 XC and S70 / C70

4 - Checking communication errors car model S40 (-04) / V40

Checking communication errors, car model S40 (04-) / V50

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B11/ #B12 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B16/#B15 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules
- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA
- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals

Continue - Fault Found

Checking communication errors, car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.
- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on " Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".
If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:
- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:
- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM). This relay is only found on vehicles of model year -2004.

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/ #B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

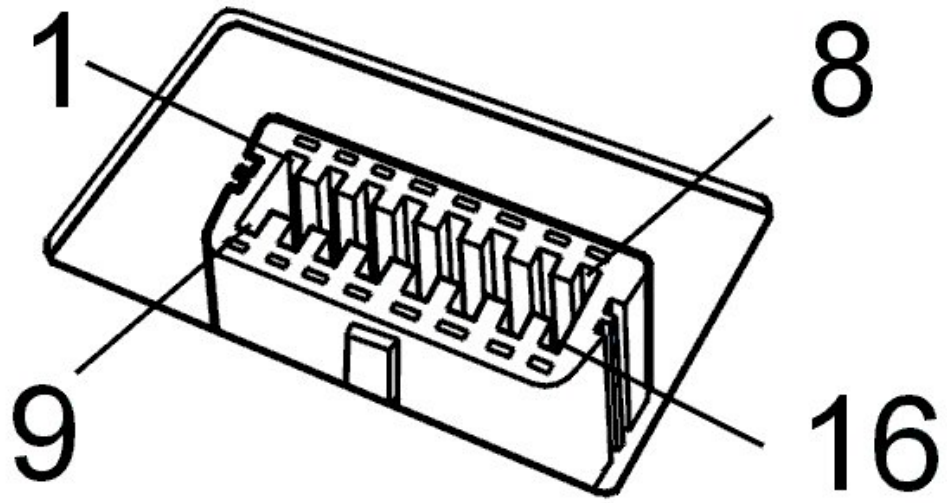
Control modules
- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA
- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



Continue - Fault Found

Checking communication errors, car model V70 (-00), V70 XC and S70/C70

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and the driver information module (DIM) #B4 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on the high-speed network. First when communication takes place on this cable, the high-speed cables between the diagnostic outlet and driver information module (DIM) are connected to the high-speed network in the vehicle. This is controlled via a relay in the driver information module (DIM).

- Check communication cables between diagnostic outlet #6/#14 and the driver information module (DIM) #A19/#A20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the**high-speed network**between the driver information module (DIM) and the other connected control modules according to troubleshooting above.

Communication cable for cruise control as own system (not integrated)

- Check the communication cable between diagnostic outlet #13 and cruise control for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Communication cable for engine management system Fenix 5.2

- Check the communication cable between diagnostic outlet #3 and engine control module (ECM) for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! Model year 99- and control modules on the CAN-network. If none of the above checks help, try reading out diagnostic trouble codes in the driver information module (DIM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the driver information module (DIM) is active and can be communicated with. If communication is not possible with the driver information module (DIM), check the voltage feed and ground for the control module.

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then

the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B11/ #B12 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B16/#B15 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

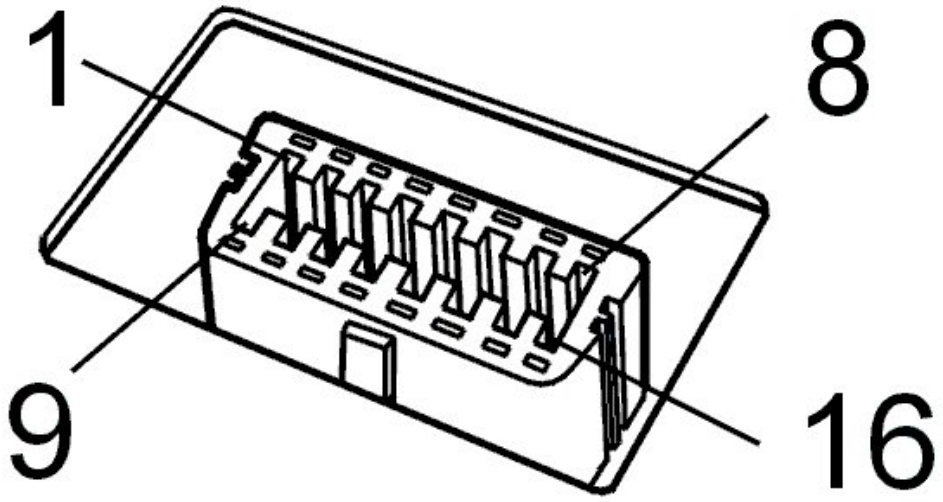
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information

- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



Continue - Fault Found

Checking communication errors, car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.

- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally

done by pressing on " Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".
If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:

- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:

- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM). This relay is only found on vehicles of model year -2004.

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/ #B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information

- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Checking communication errors, car model V70 (-00), V70 XC and S70/C70

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- Check the communication cable (k-line) between diagnostic outlet #7 and the driver information module (DIM) #B4 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on the high-speed network. First when communication takes place on this cable, the high-speed cables between the diagnostic outlet and driver information module (DIM) are connected to the high-speed network in the vehicle. This is controlled via a relay in the driver information module (DIM).

- Check communication cables between diagnostic outlet #6/#14 and the driver information module (DIM) #A19/#A20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the**high-speed network**between the driver information module (DIM) and the other connected control modules according to troubleshooting above.

Communication cable for cruise control as own system (not integrated)
- Check the communication cable between diagnostic outlet #13 and cruise control for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Communication cable for engine management system Fenix 5.2
- Check the communication cable between diagnostic outlet #3 and engine control module (ECM) for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Control modules
- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! Model year 99- and control modules on the CAN-network. If none of the above checks help, try reading out diagnostic trouble codes in the driver information module (DIM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the driver information module (DIM) is active and can be communicated with. If communication is not possible with the driver information module (DIM), check the voltage feed and ground for the control module.

VCT2000 and cable harness
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates

a malfunction.

- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.
