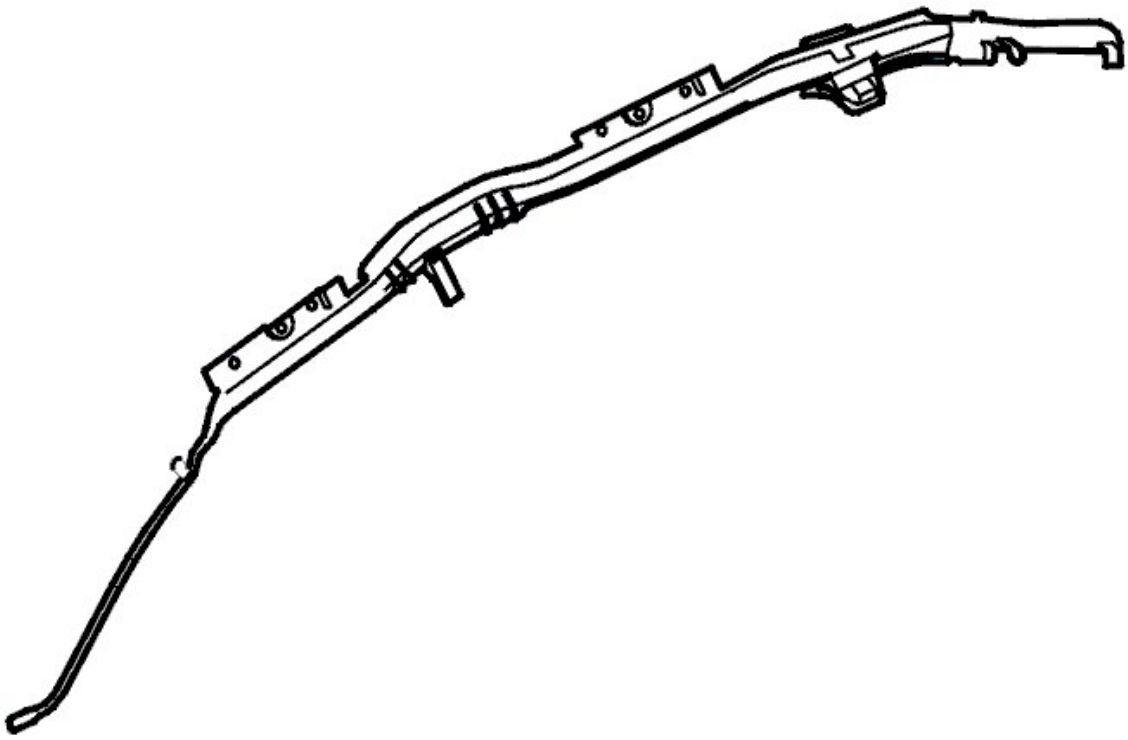
VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-0049 Diagnostic trouble code information

Condition



If the circuit voltage is too low (0 V) for more than 10 seconds, diagnostic trouble code SRS-0049 is displayed.

Substitute value
- Nothing.

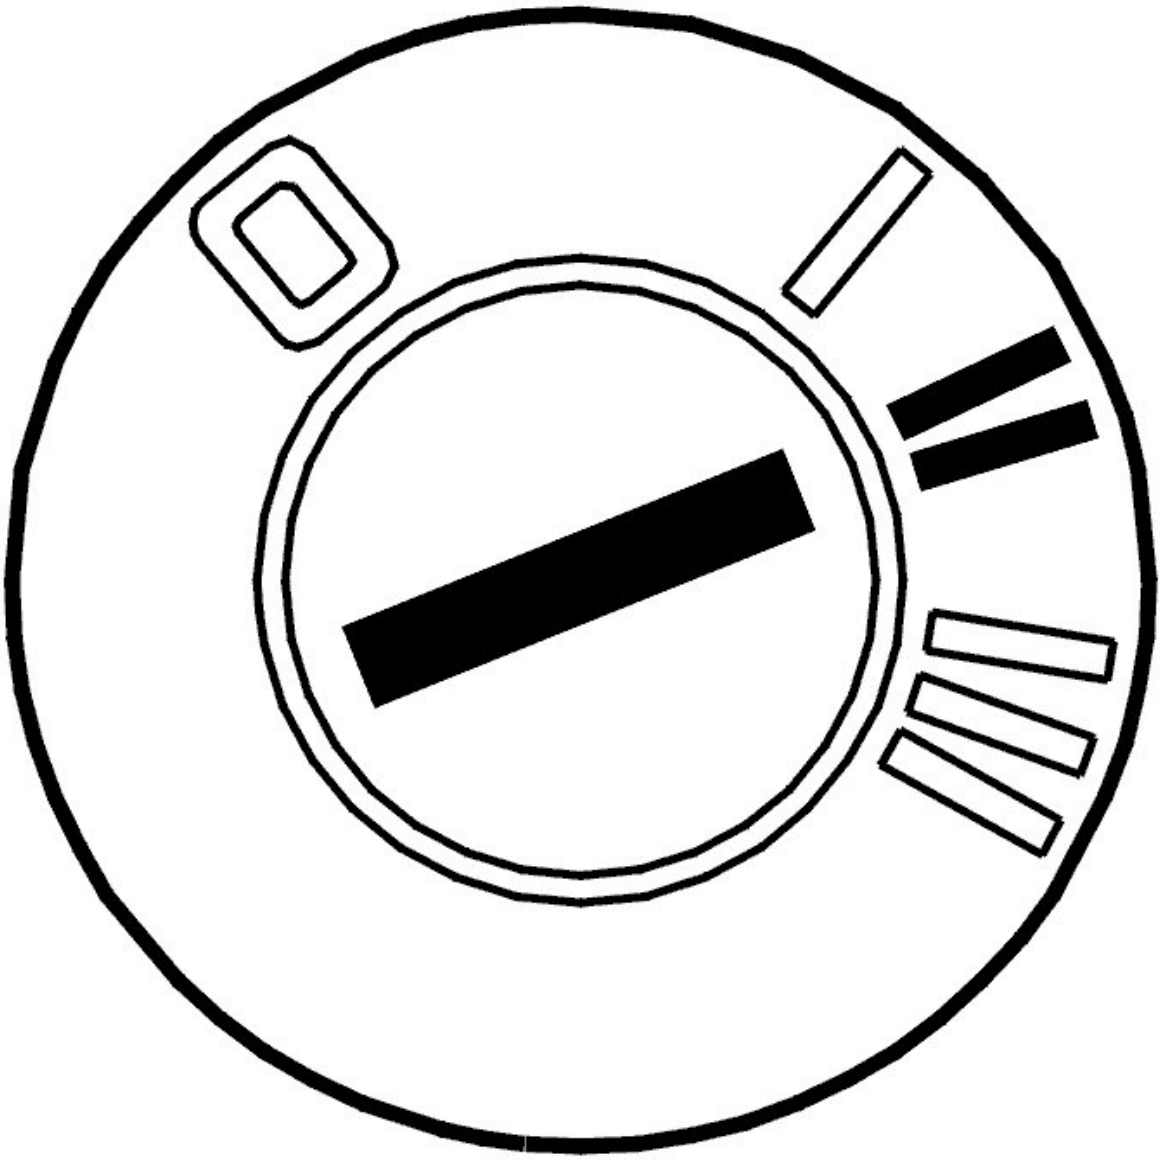
Possible source
- Short circuit to ground in igniter wire or connectors between the inflatable curtain and SRS control unit
- Short circuit to ground in inflatable curtain.

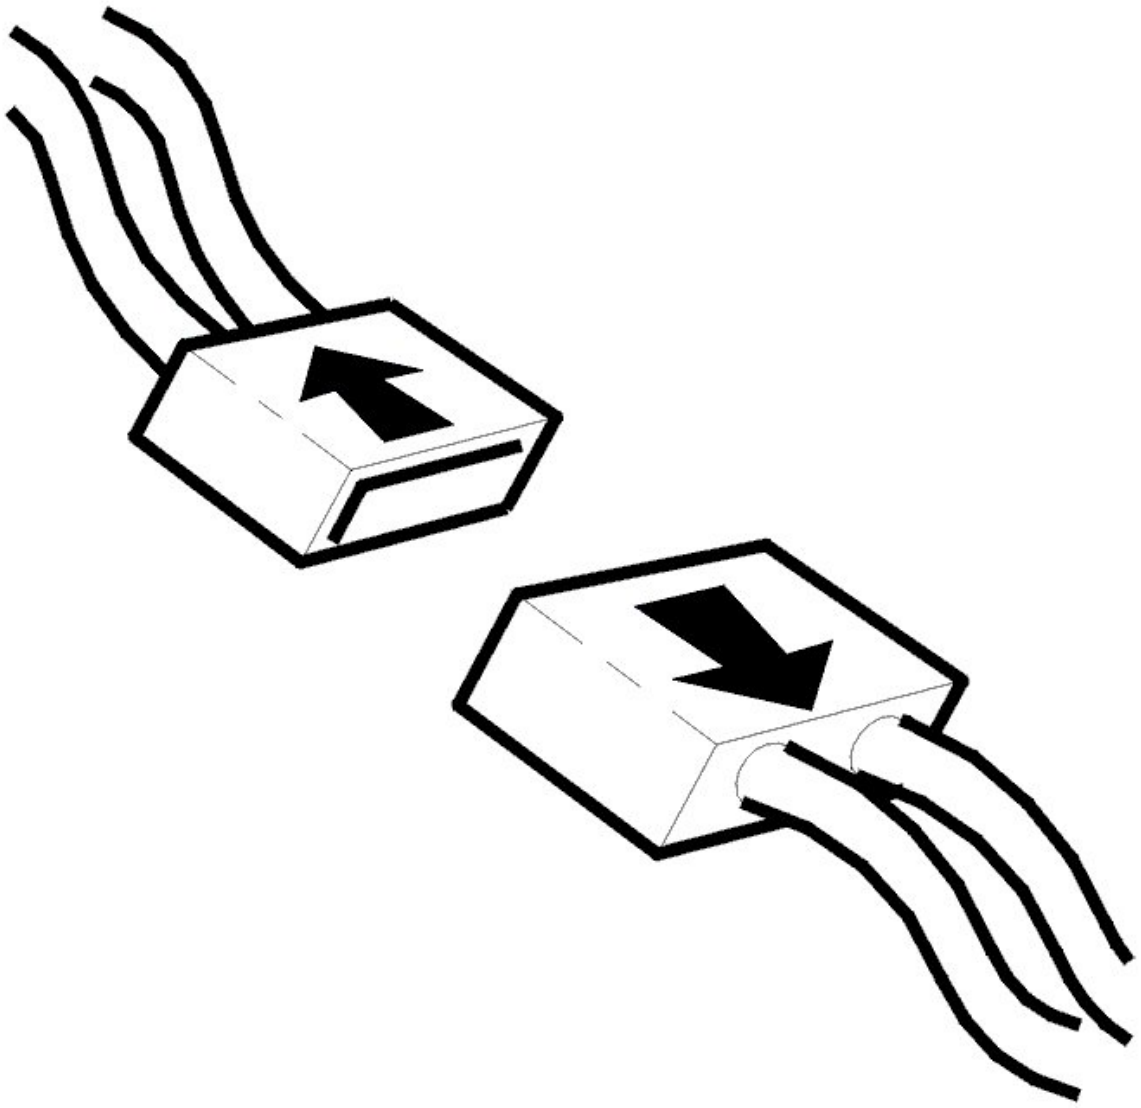
Fault symptom[s]
- SRS warning lamp on.

Signal Too Low

Signal too low. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the right-hand inflatable curtain
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the right-hand inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
If the status of the diagnostic trouble code (DTC) changes from permanent fault to intermittent fault, try replacing the right-hand inflatable curtain.

Other information:

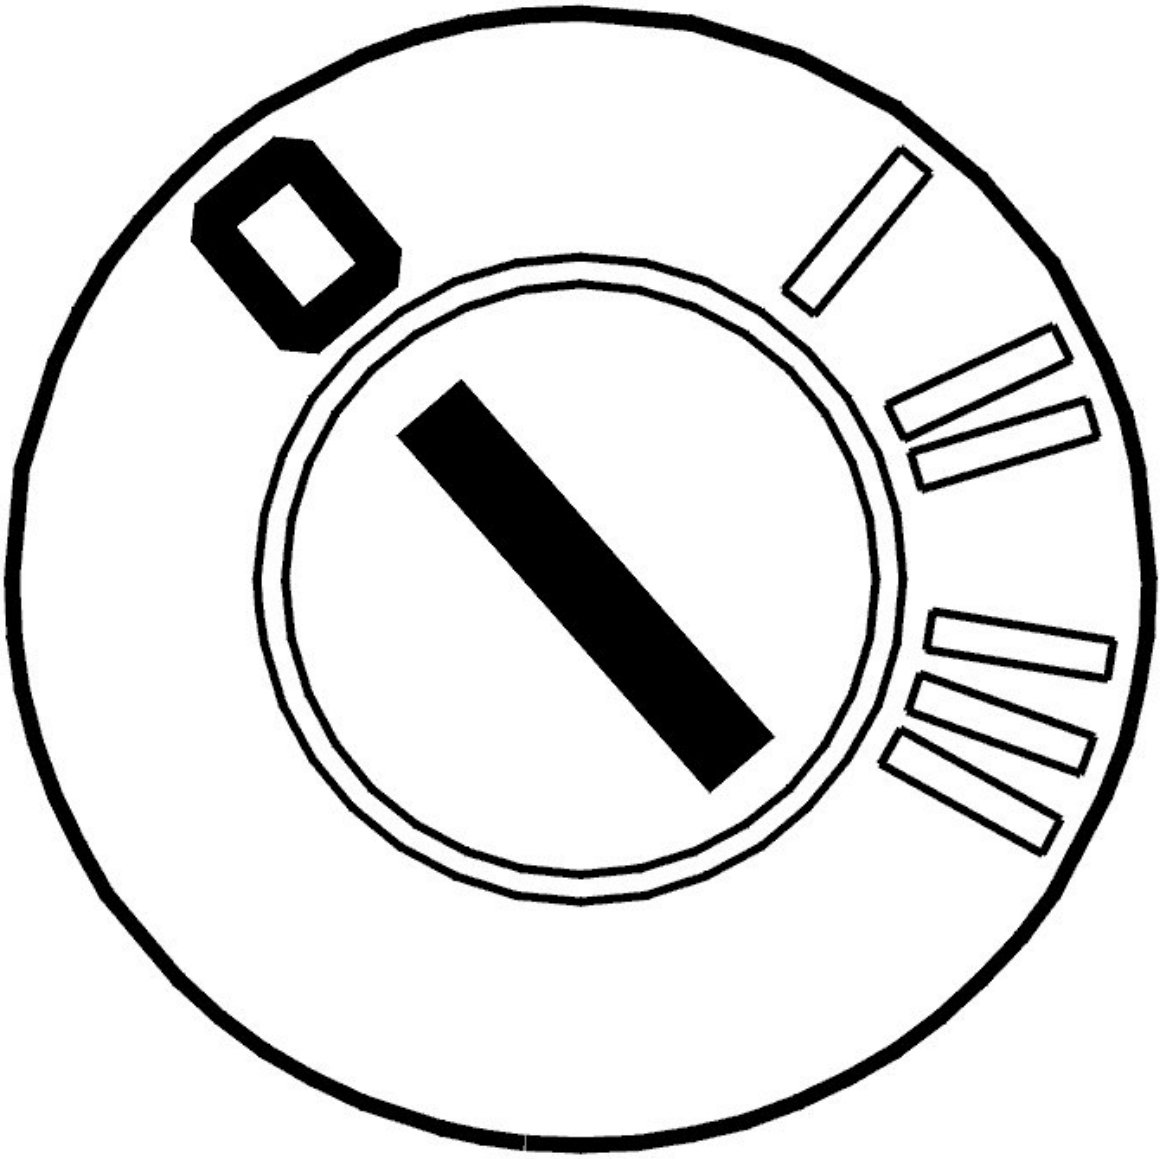
- To access and replace the right-hand inflatable curtain, see IC (inflatable curtain) module, replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair/IC (Inflatable Curtain) Module, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for the right-hand inflatable curtain.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between SRS control module terminals #21C (17) and #22C (18) and connector terminals #1 and #3 on the right-hand inflatable curtain for a short-circuit to ground according to Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To access and replace the connector for the right-hand inflatable curtain, see IC (inflatable curtain) module, replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair/IC (Inflatable Curtain) Module, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the right-hand inflatable curtain and for the SRS control module disconnected, the resistance

between inflatable curtain connector terminals #1 and #3 (SRS control module side) and ground should be infinite

- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Diagnostic Trouble Code (DTC) Information

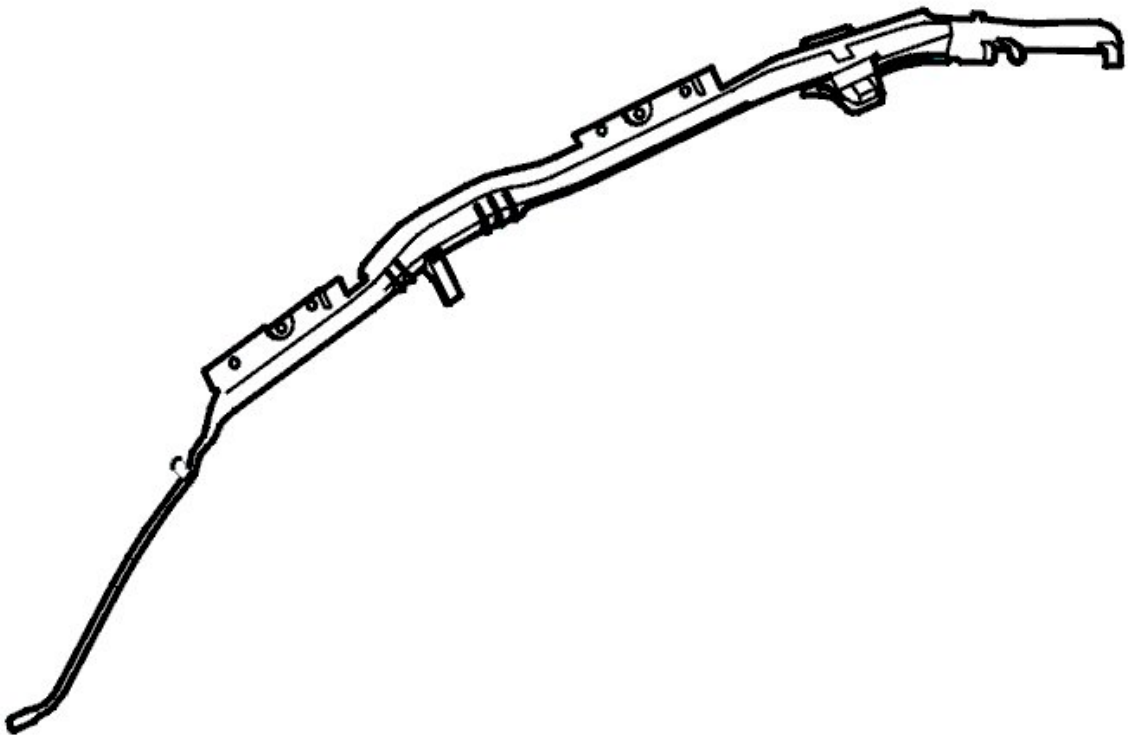
SRS-004B Diagnostic trouble code information

Condition



If the circuit capacitance is too low for more than 10 seconds, diagnostic trouble code SRS-004B is displayed.

Substitute value
- Nothing.

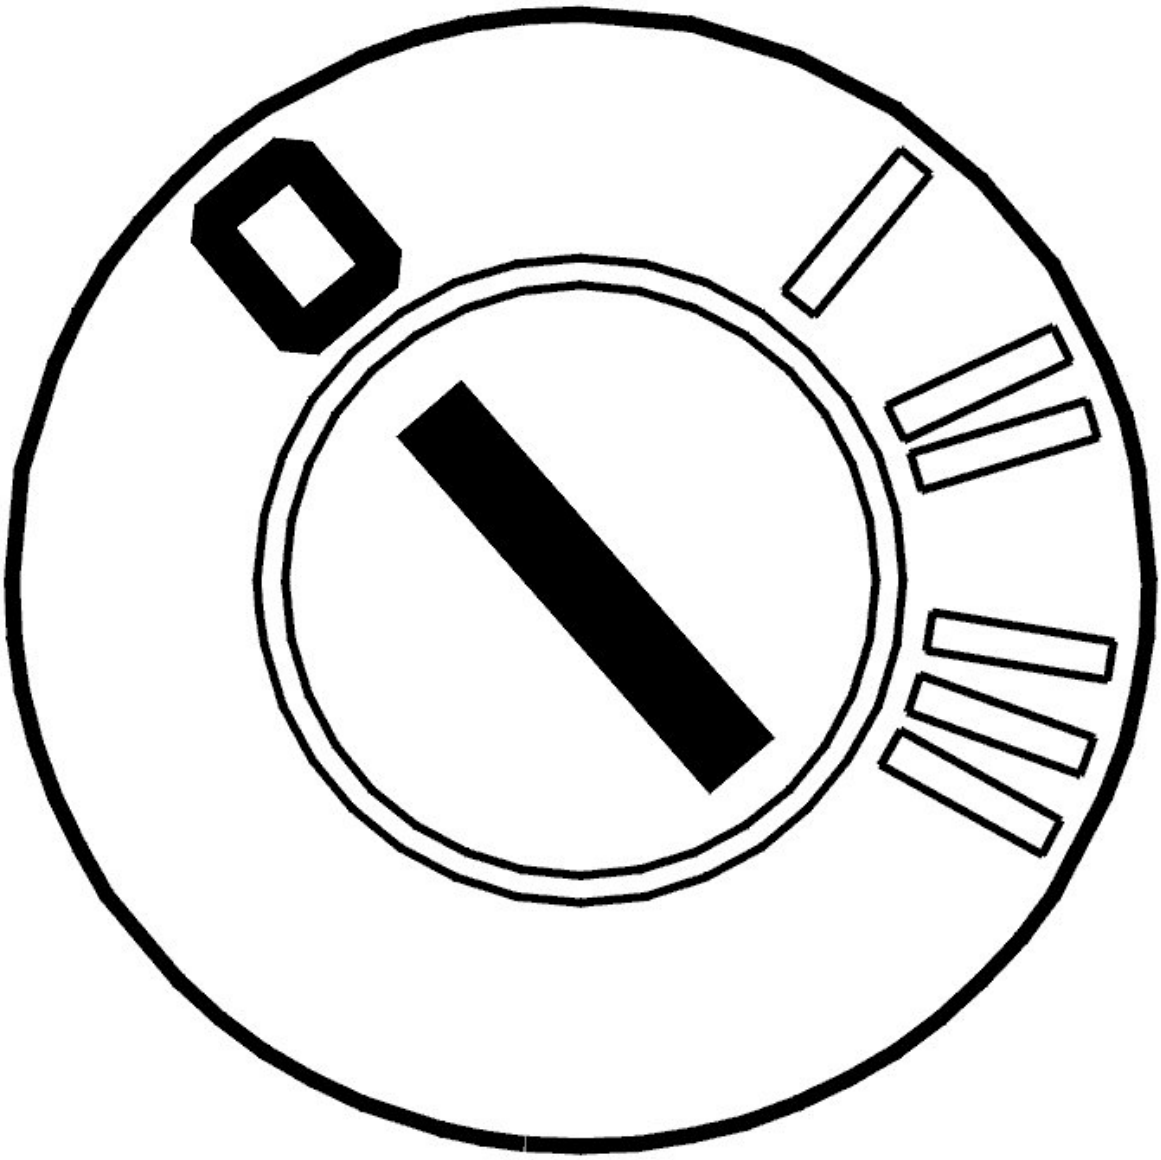
Possible source
- Capacitance too low or open circuit in in-built capacitor in igniter wire connector.

Fault symptom[s]
- SRS warning lamp on.

Capacitance Too Low

Capacitance too low. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and inflatable curtain. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Check the cable terminals in the female and male sections of the connector. The cable terminals must not be damaged or pressed back.
Check the cable between SRS control module terminals #21C (17), #22C (18) and connector terminals #1 and #3 on the right-hand inflatable curtain for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Hint: Check the integrated capacitor in the igniter connector: Measure the resistance.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

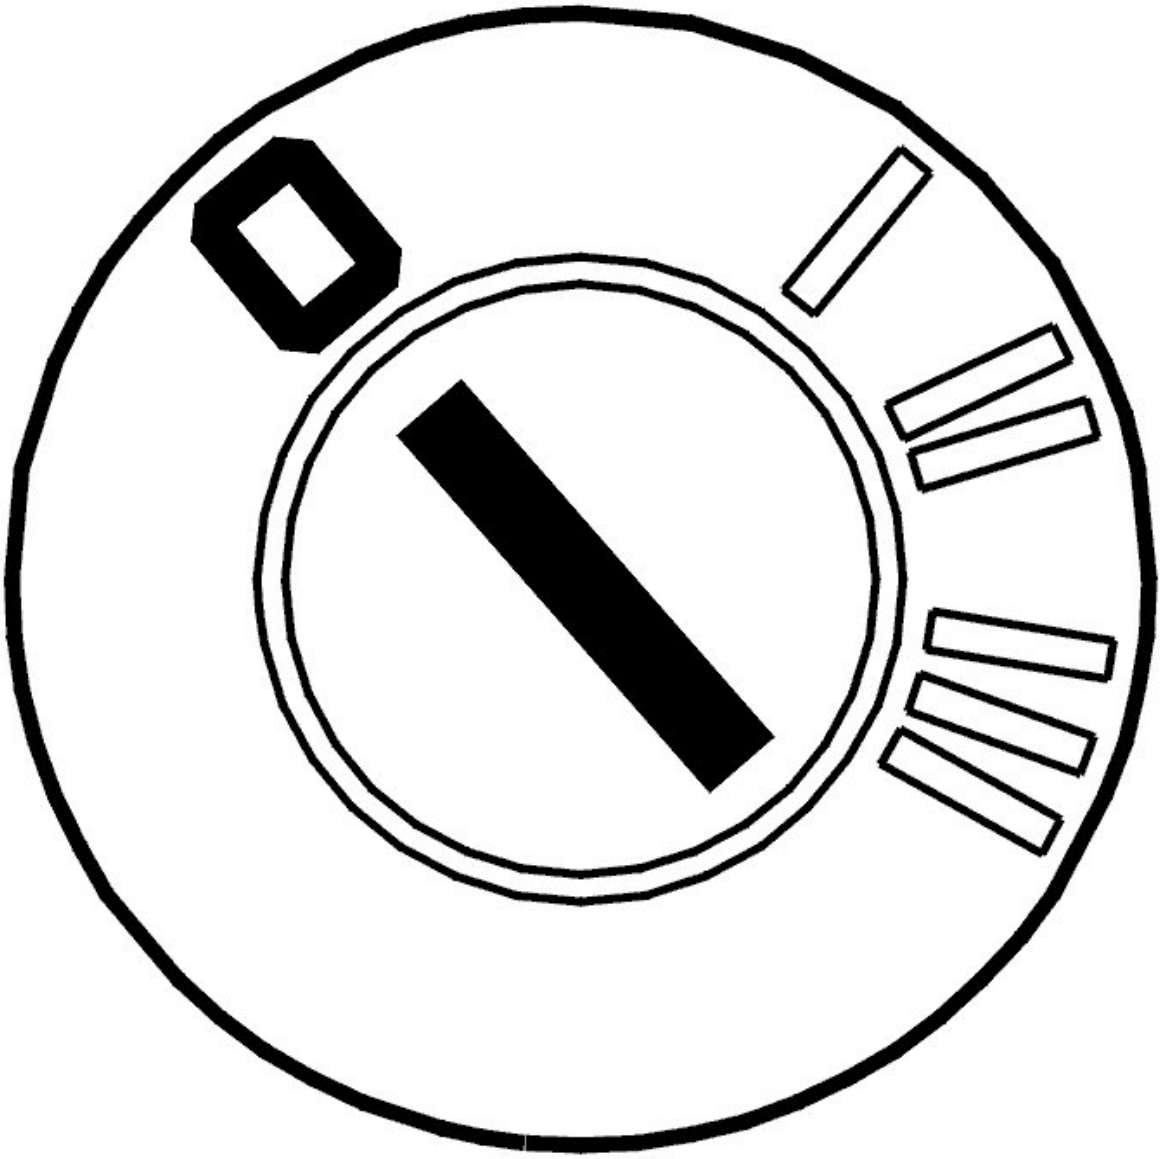
Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for the right-hand inflatable curtain.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the inflatable curtain. The cable terminals must not be damaged or pressed back.
Check the cable between SRS control module terminal #21C (17), #22C (18) and connector terminals #1 and #3 on the right-hand inflatable curtain for an open-circuit according to Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the SRS control module connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To access and replace the connector for the right-hand inflatable curtain, see IC (inflatable curtain) module, replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair/IC (Inflatable Curtain) Module, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout

Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)

- With the ignition off and the inflatable curtain connector disconnected, the resistance between the inflatable curtain connector terminals #1 and #3 (SRS control module side) should be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

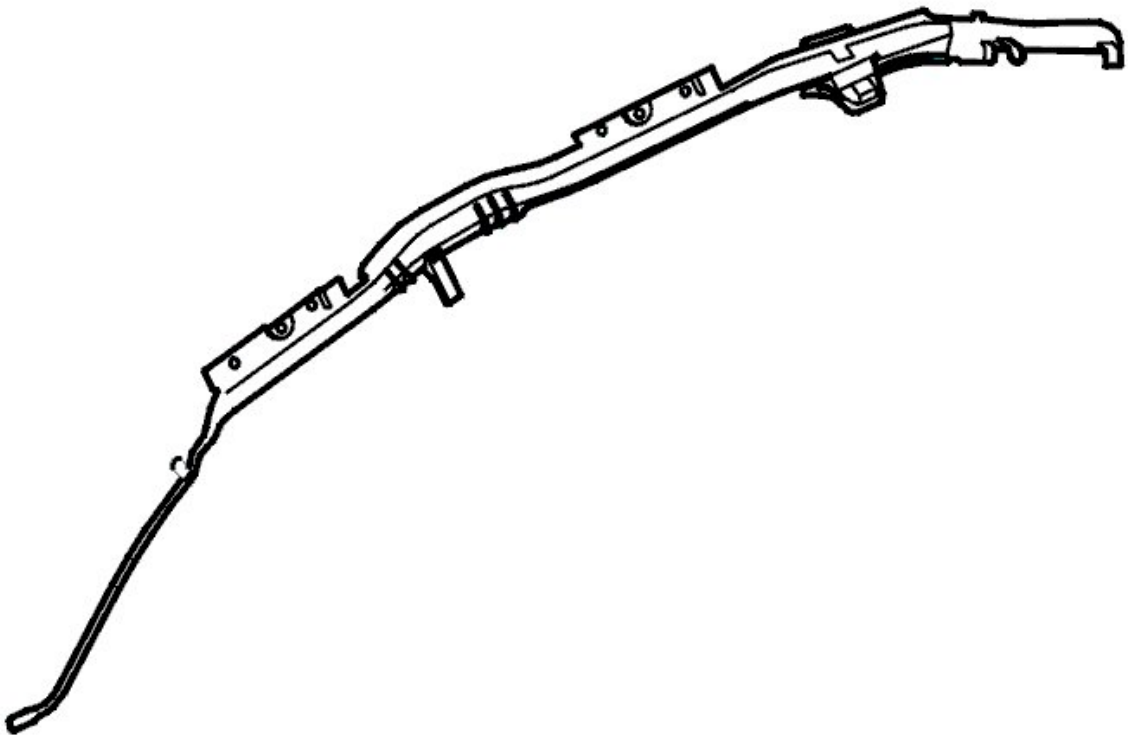
Diagnostic Trouble Code (DTC) Information

SRS-004D Diagnostic trouble code information

Condition



If the circuit resistance is too low for more than 10 seconds, diagnostic trouble code SRS-004D is displayed.

Substitute value
- Nothing.

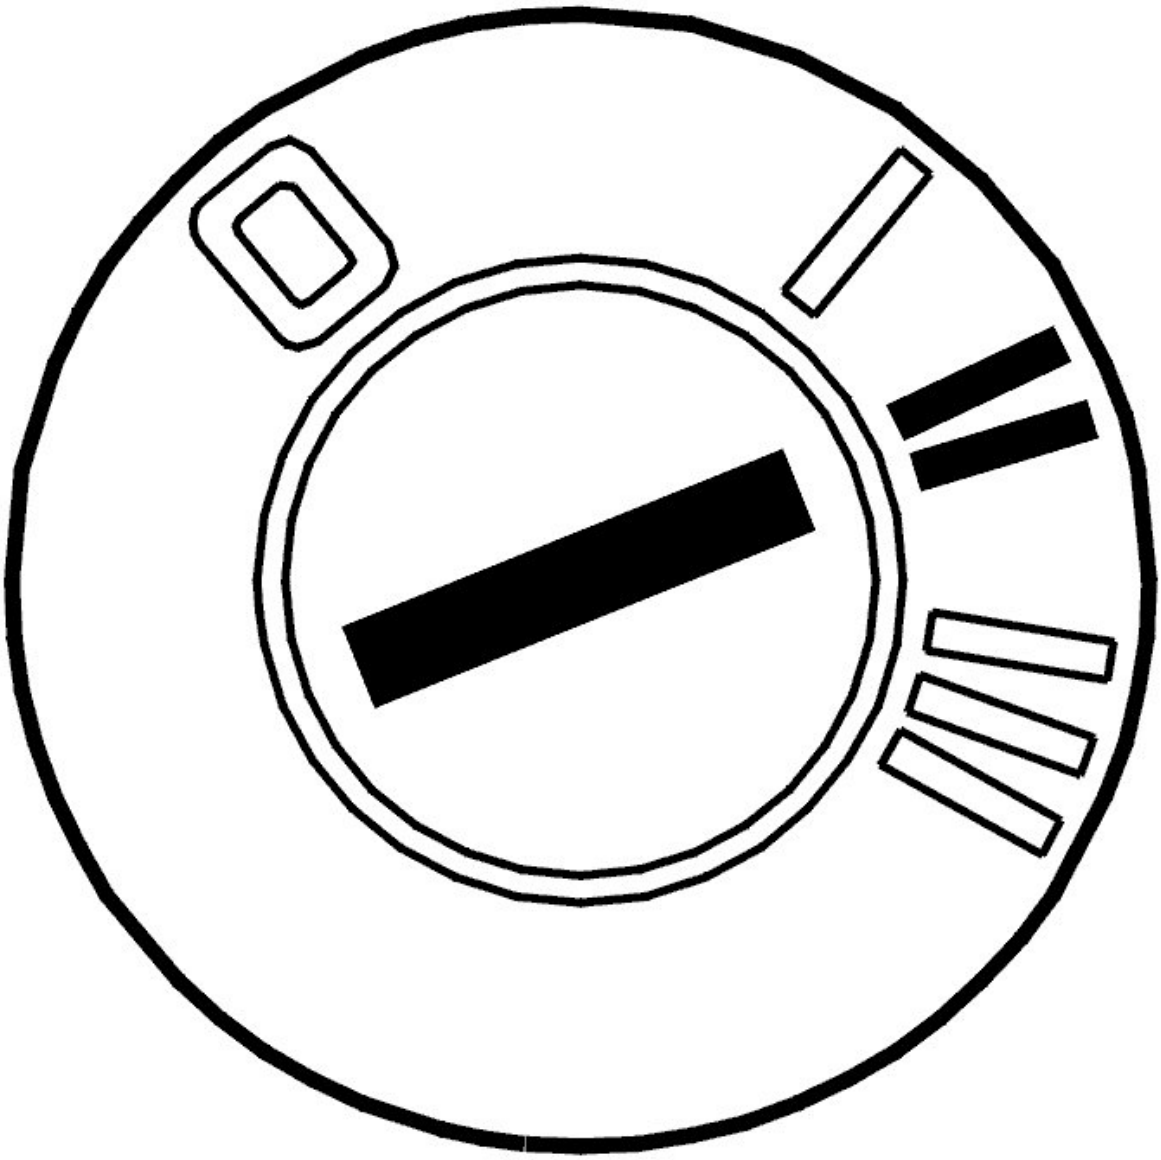
Possible source
- Short circuit in igniter wire or connectors between the inflatable curtain and the supplemental restraint system (SRS) control unit
- Short circuit in inflatable curtain (resistance in igniter too low).

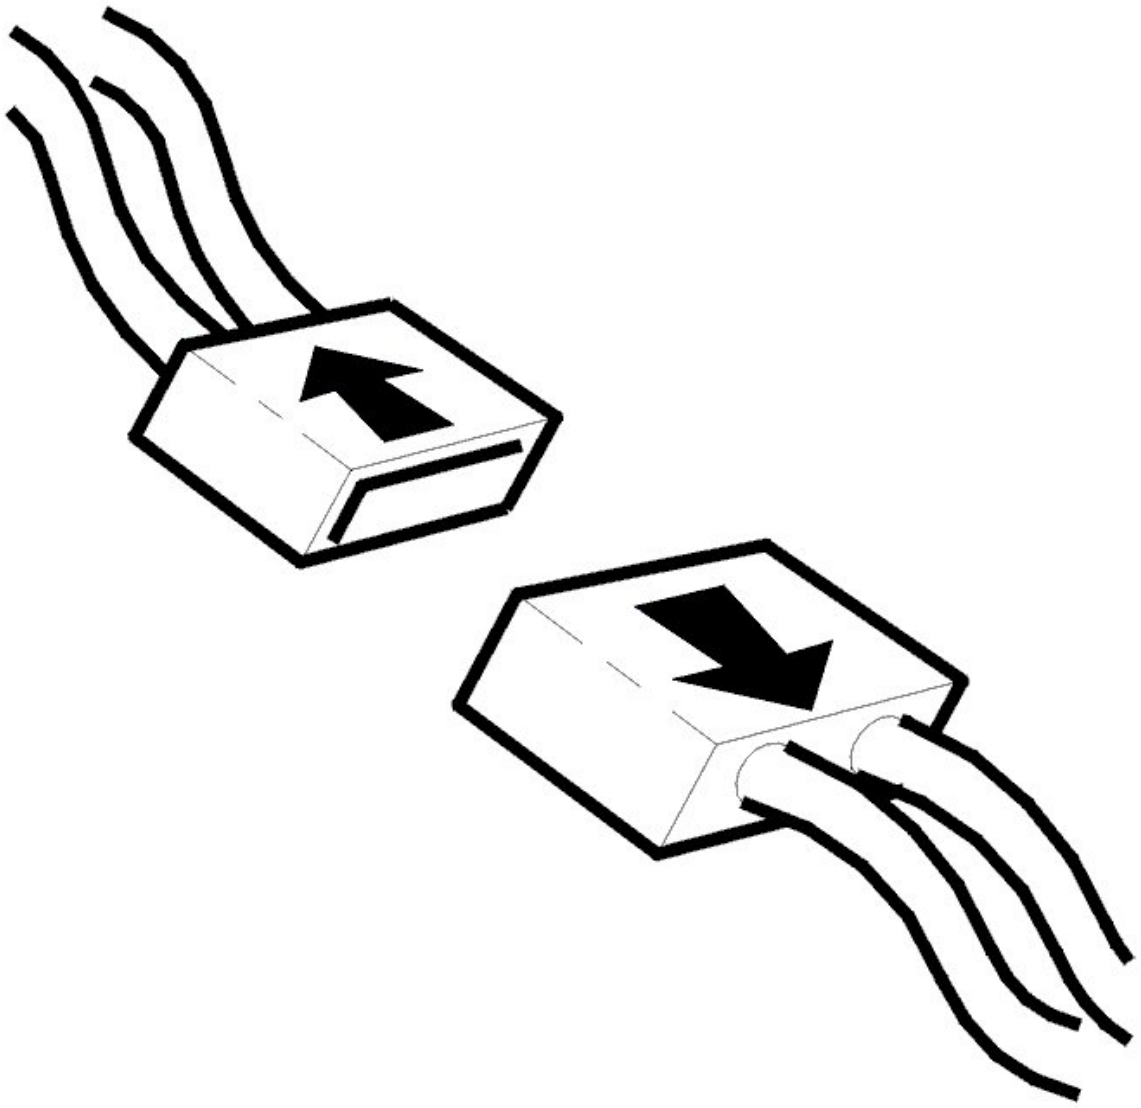
Fault symptom[s]
- SRS warning lamp on.

Resistance Too Low

Resistance too low. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the right-hand inflatable curtain
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the right-hand inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
If the status of the diagnostic trouble code (DTC) changes from permanent fault to intermittent fault, try replacing the right-hand inflatable curtain.

Other information:

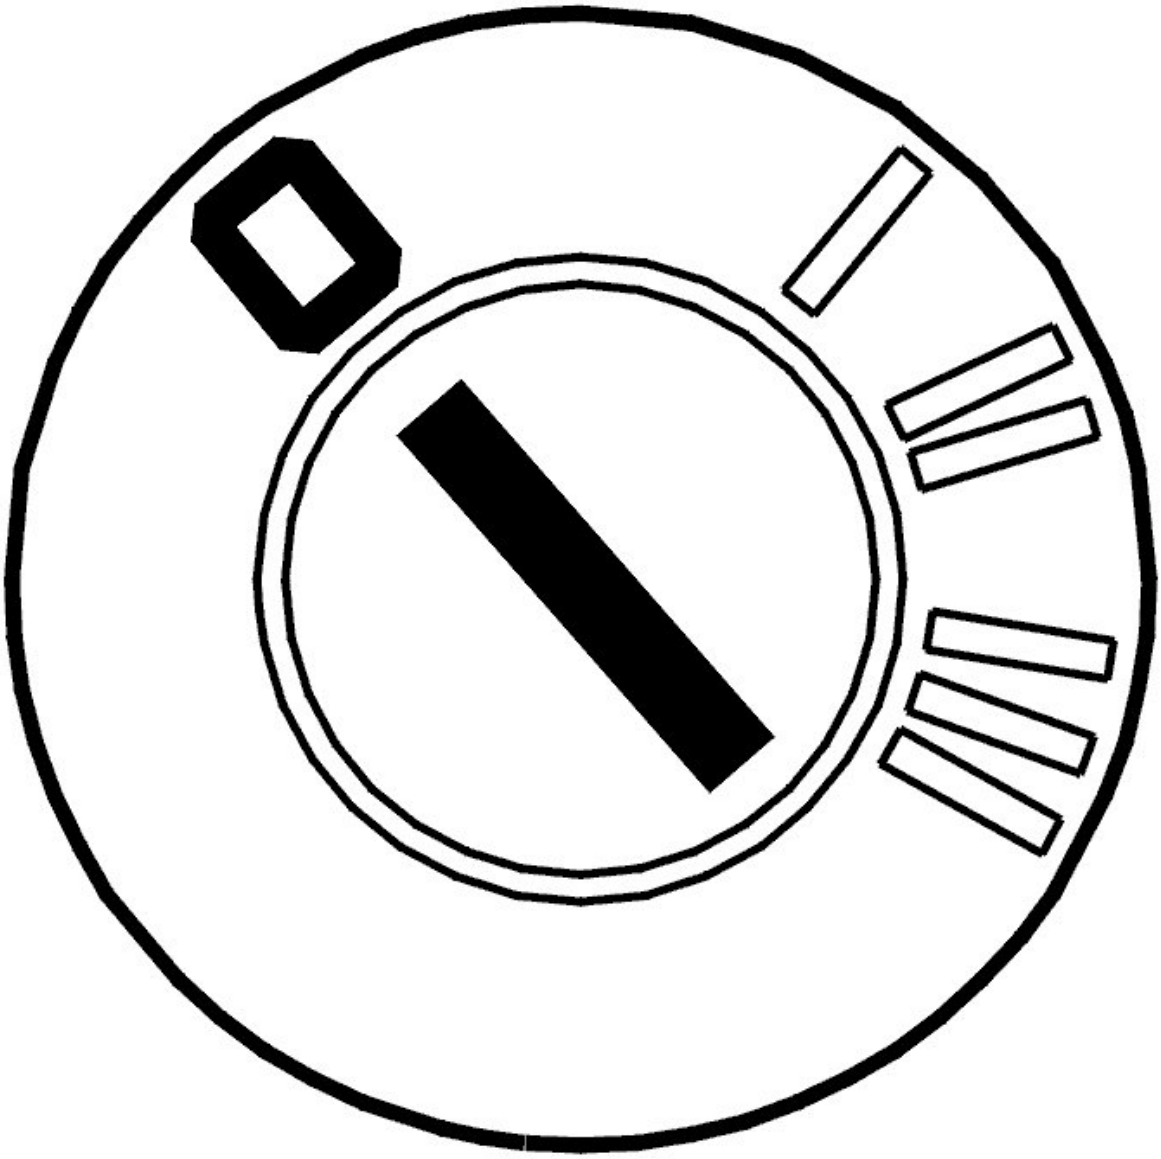
- To access and replace the right-hand inflatable curtain, see IC (inflatable curtain) module, replacing See: Restraint Systems/Air Bag Systems/Air Bag/Service and Repair/IC (Inflatable Curtain) Module, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for the right-hand inflatable curtain.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between SRS control module terminals #C21 (17) and #C22 (18) and connector terminals #1 and #3 on the right-hand inflatable curtain for a short-circuit to ground according to Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the SRS control module connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

Diagnostic Trouble Code (DTC) Information

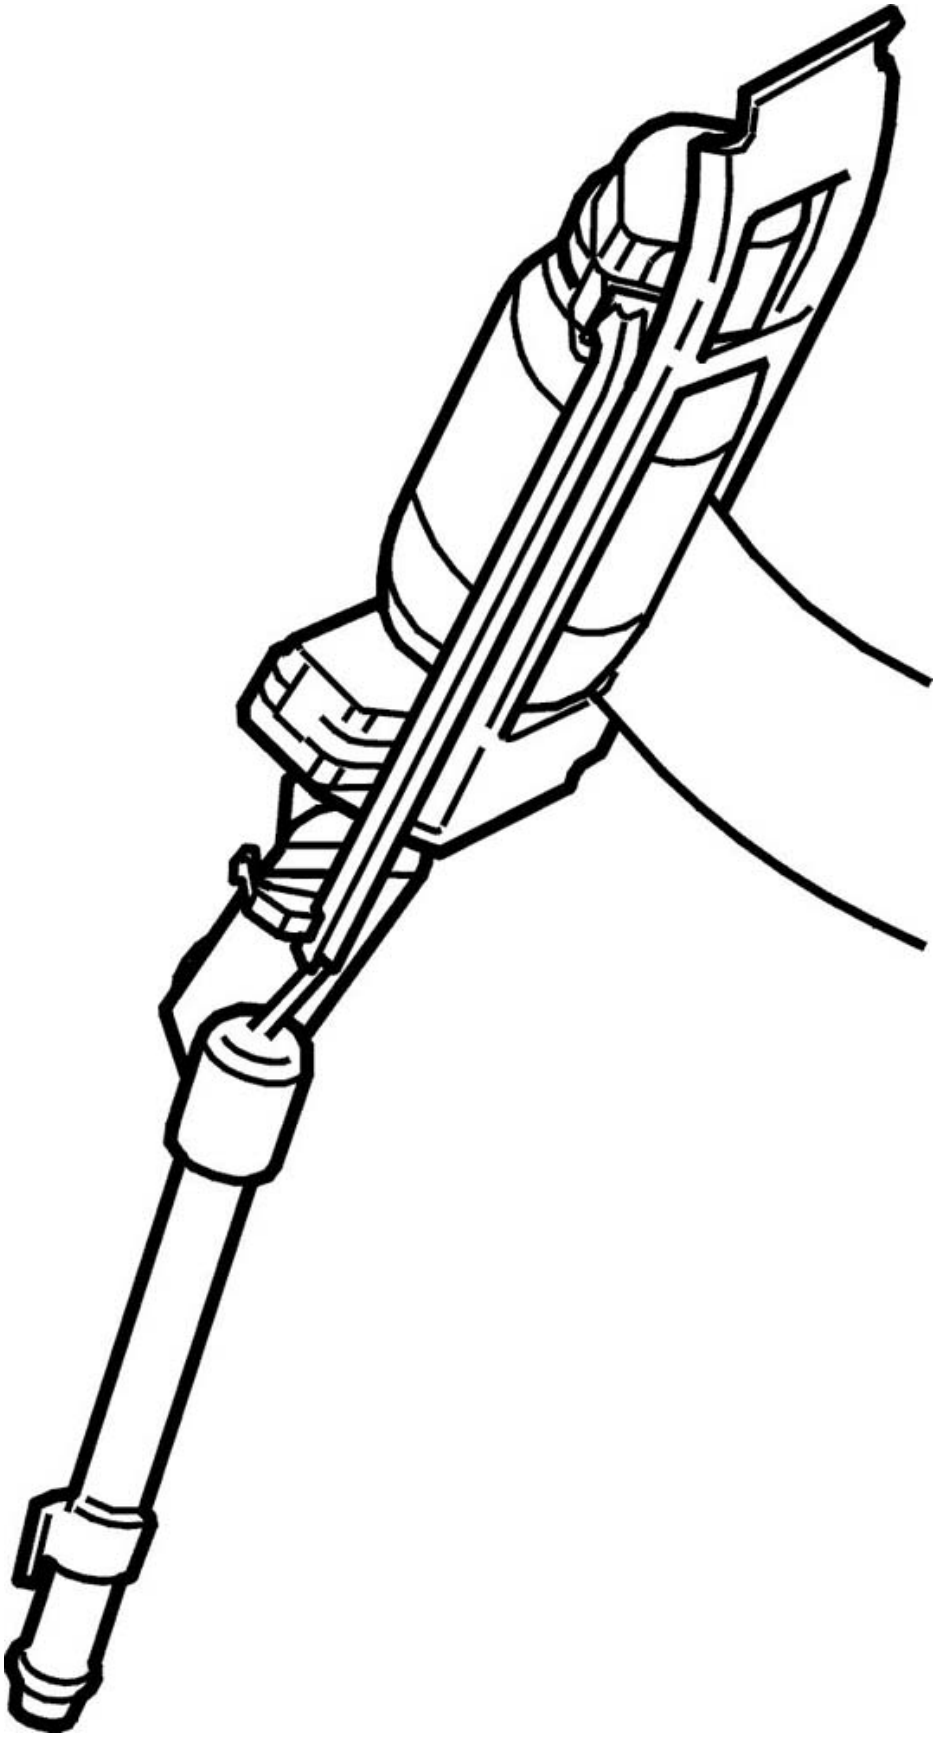
SRS-0060 Diagnostic trouble code information

Condition



If the circuit voltage is too high for more than 10 seconds, diagnostic trouble code SRS-0060 is displayed.

Substitute value

- Nothing.

Possible source

- Short circuit to voltage supply in connector
- Short circuit in the signal wire between driver seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to voltage supply in driver seat-belt tensioner.

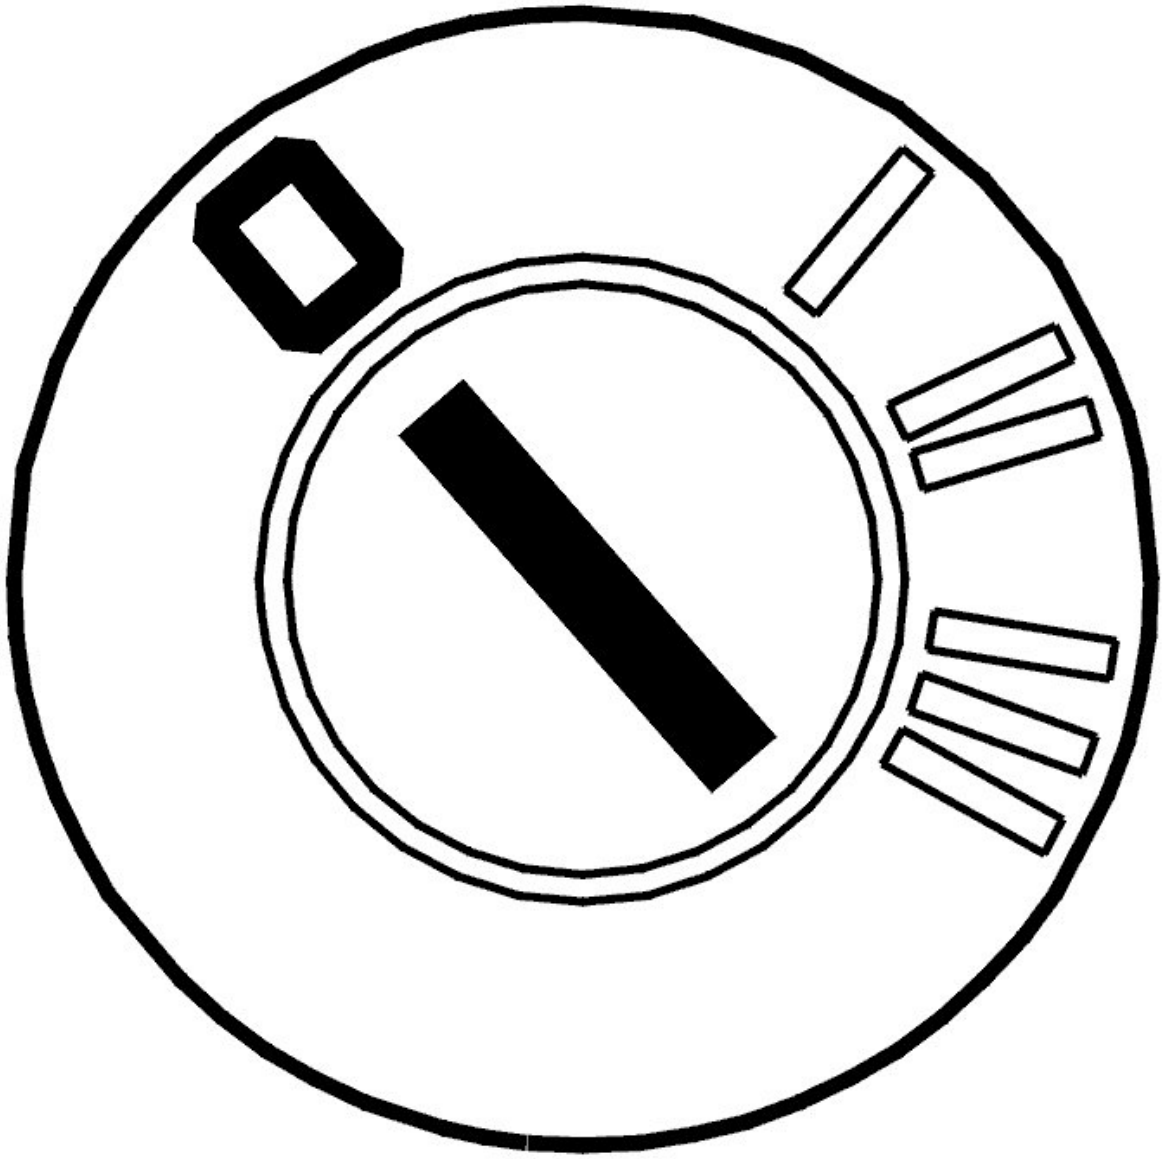
Fault symptom[s]

- SRS warning lamp on.

Signal Too High

Signal too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
check for an intermittent short-circuit to supply voltage according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

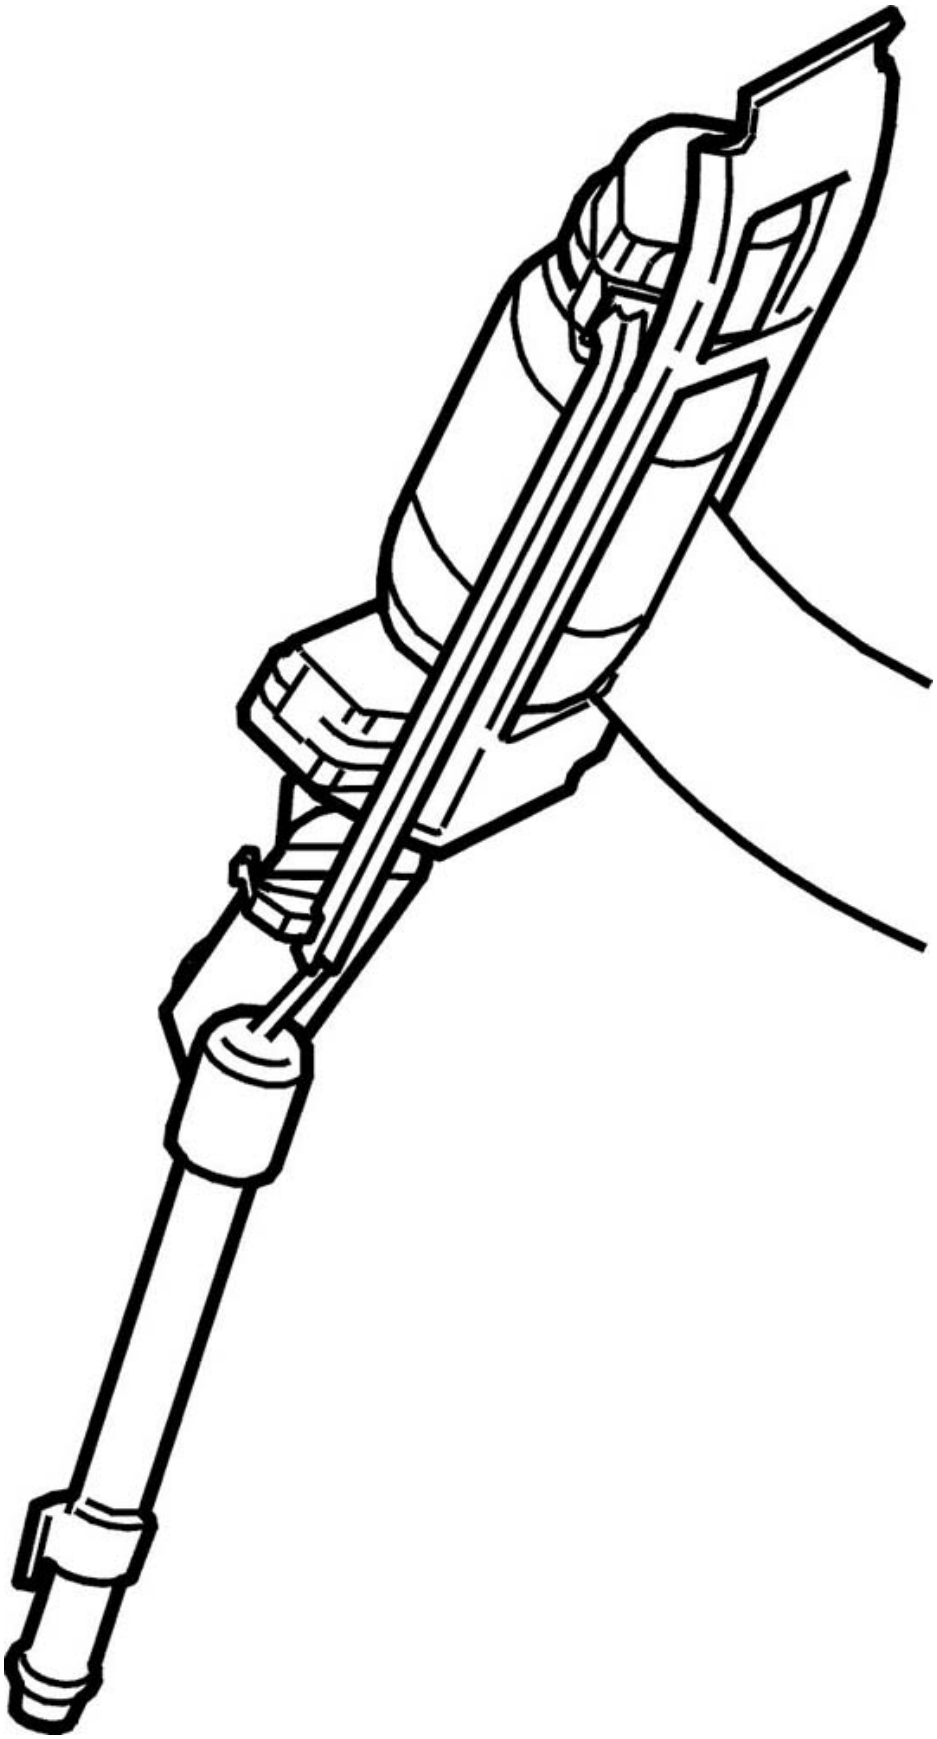
SRS-0060 Diagnostic trouble code information

Condition



If the circuit voltage is too high for more than 10 seconds, diagnostic trouble code SRS-0060 is displayed.

Substitute value

- Nothing.

Possible source

- Short circuit to voltage supply in connector
- Short circuit in the signal wire between driver seat-belt tensioner and the supplemental restrain system (SRS)

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

- Short circuit to voltage supply in driver seat-belt tensioner.

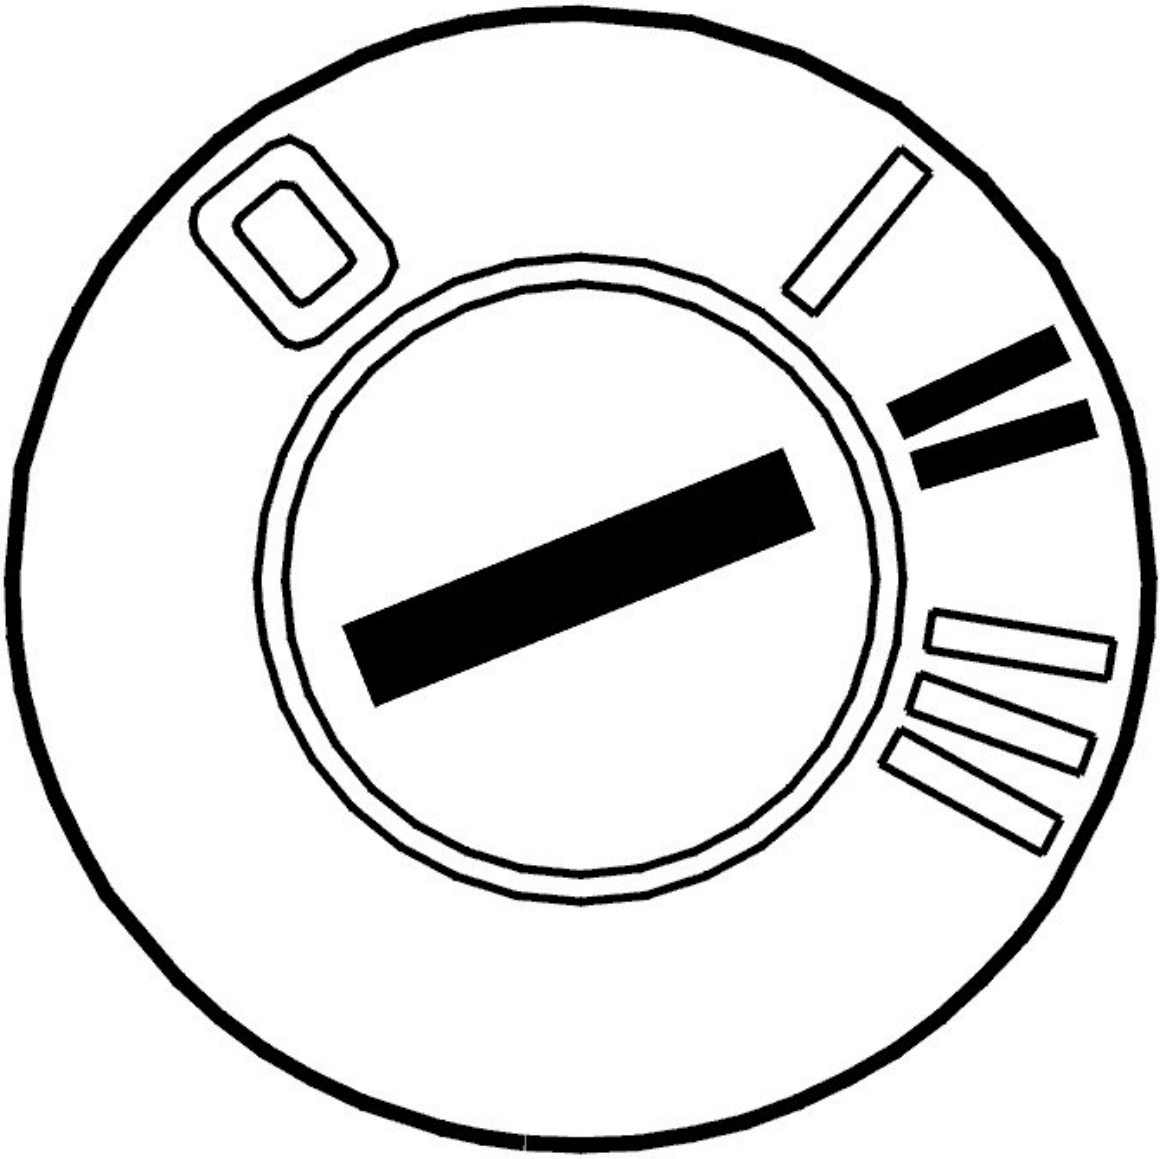
Fault symptom[s]

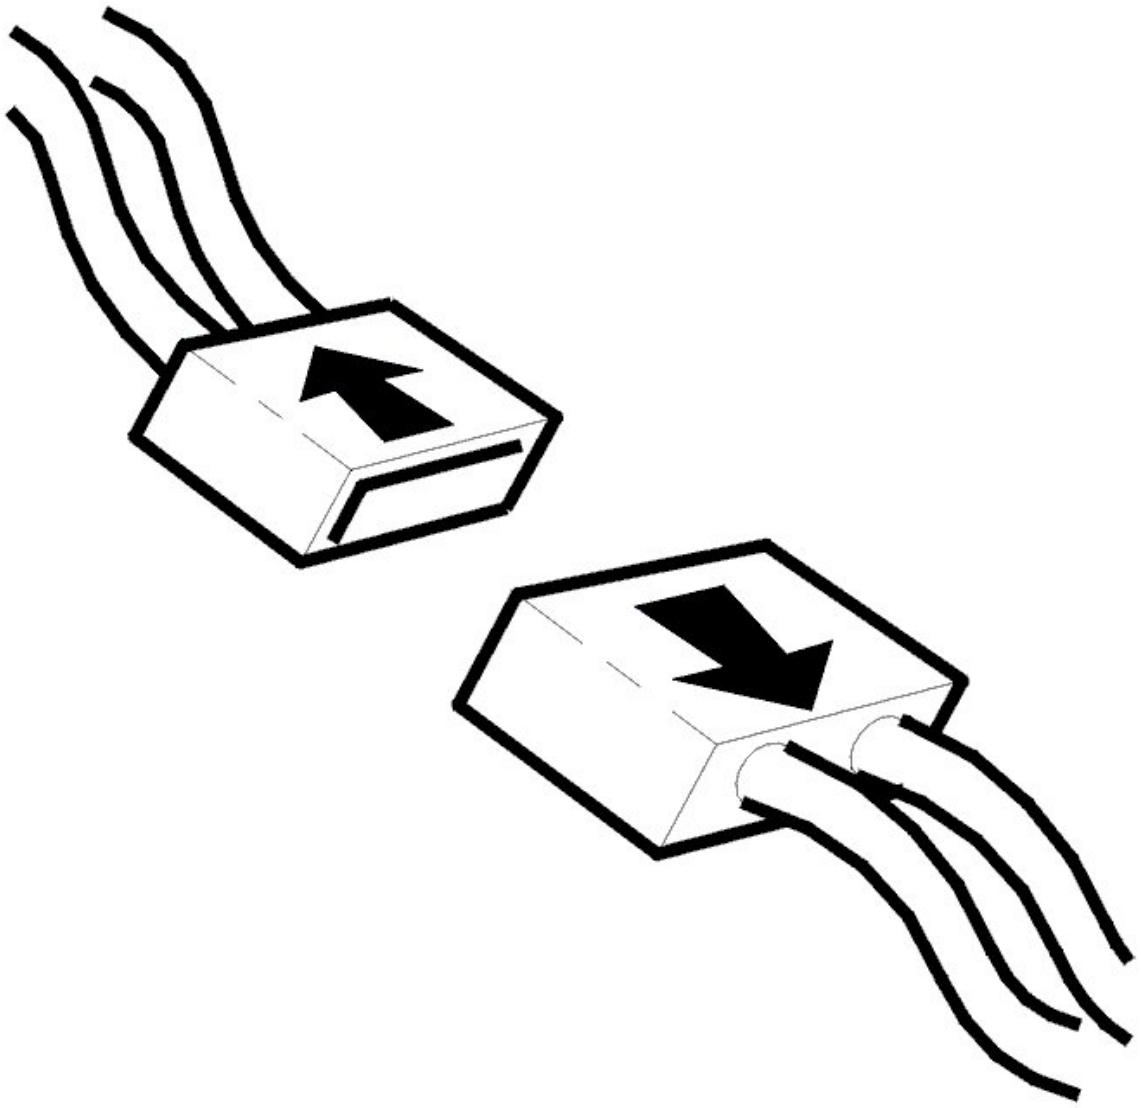
- SRS warning lamp on.

Signal Too High

Signal too high. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

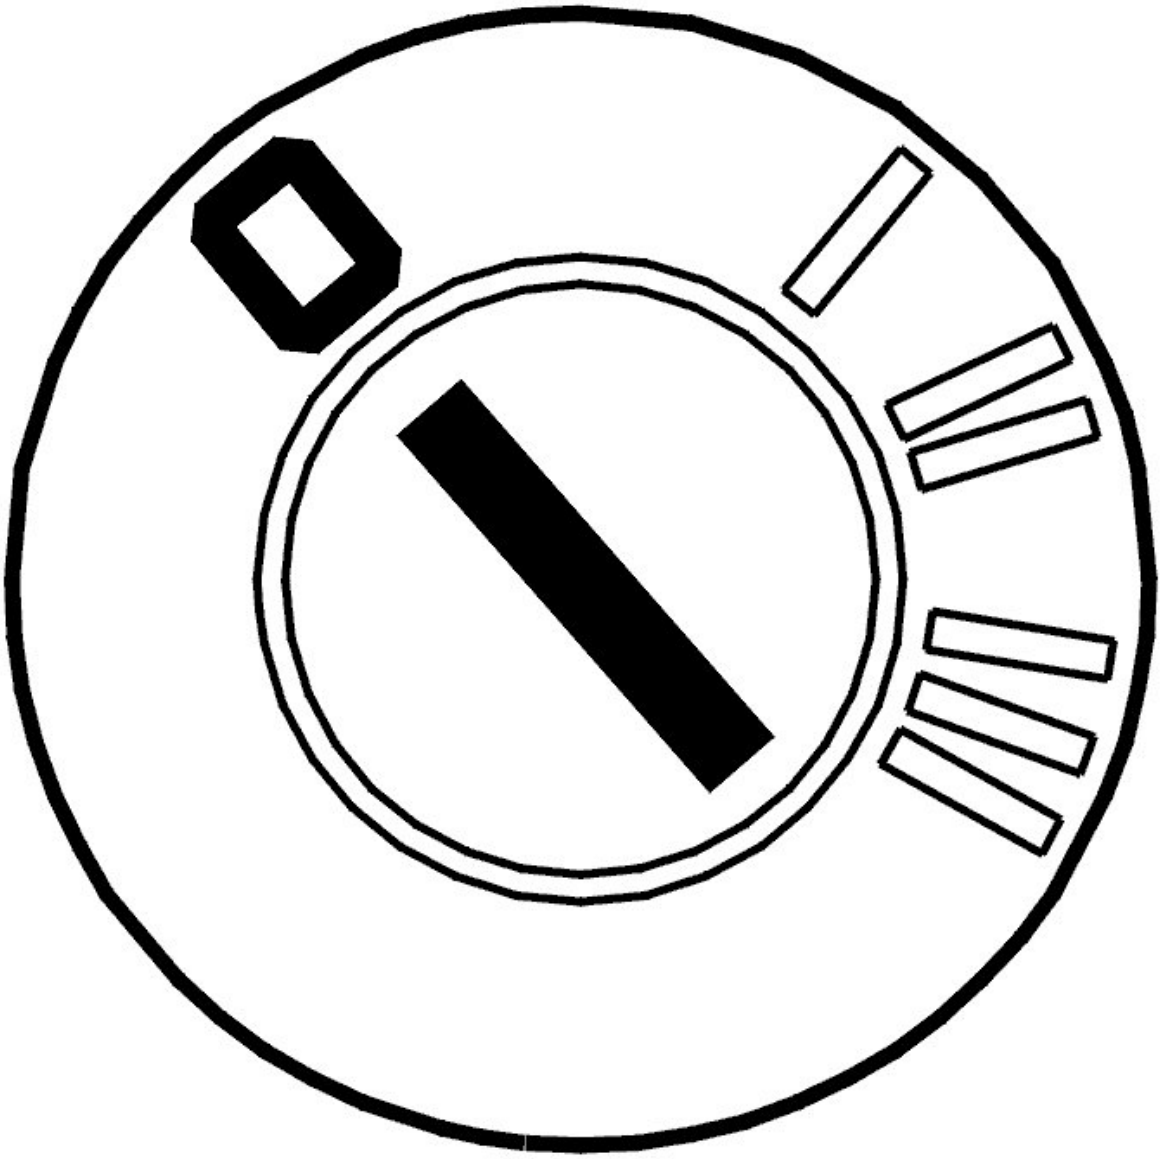
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the seat belt tensioner and Supplemental Restraint System Module (SRS) connectors disconnected, the resistance between seat belt tensioner connector terminals #1 and #3 (Supplemental Restraint System Module (SRS) side) and the disconnected battery positive pole must be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and the connector for the seat belt tensioner disconnected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - No Fault Found

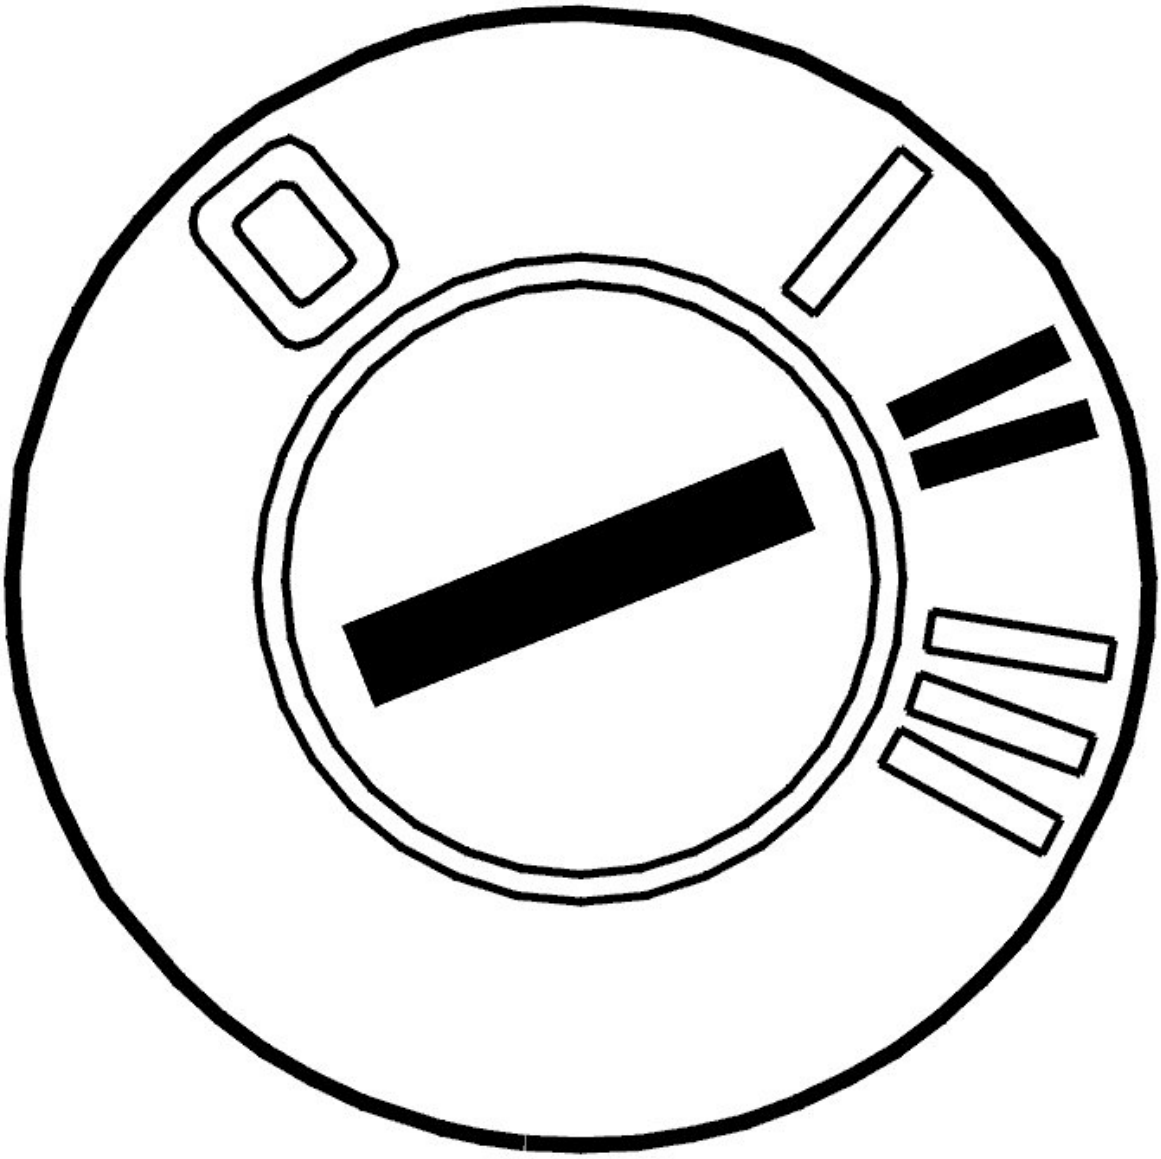
Attempt New Test - Checking the component

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.



- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

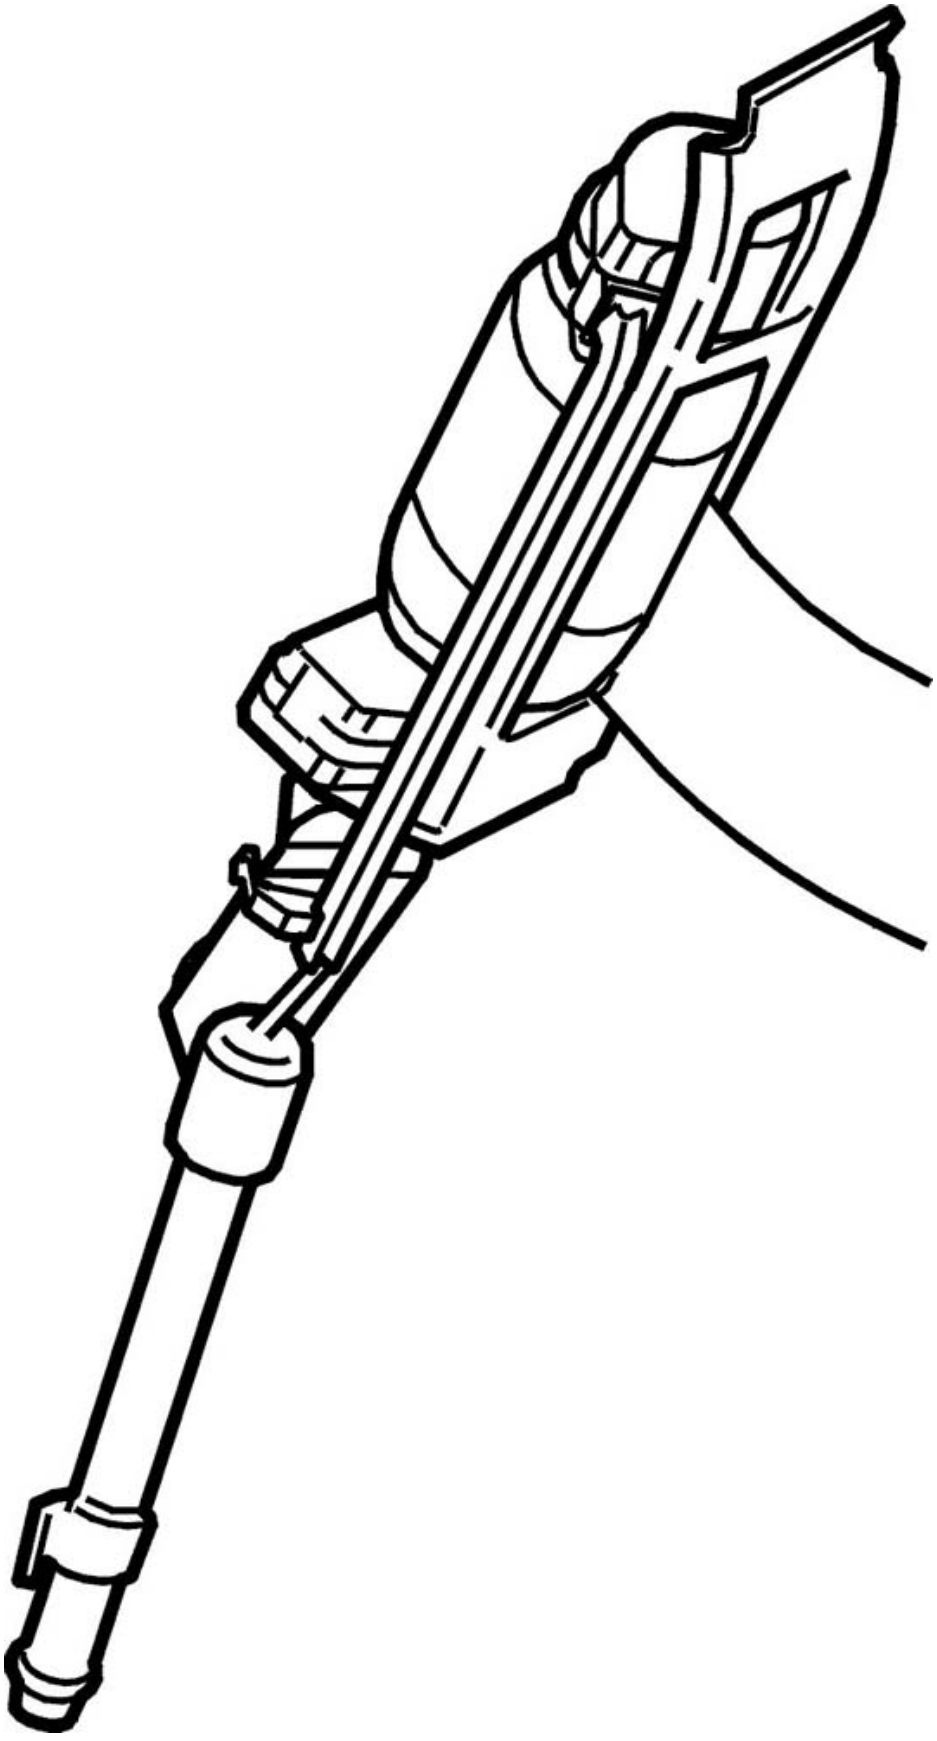
VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-0061 Diagnostic trouble code information

Condition



If the circuit voltage is too low (0V) for more than 10 seconds, diagnostic trouble code SRS-0061 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to ground in connector
- Short circuit to ground in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to ground in seat-belt tensioner.

Fault symptom[s]

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

- SRS warning lamp on.

Signal Too Low

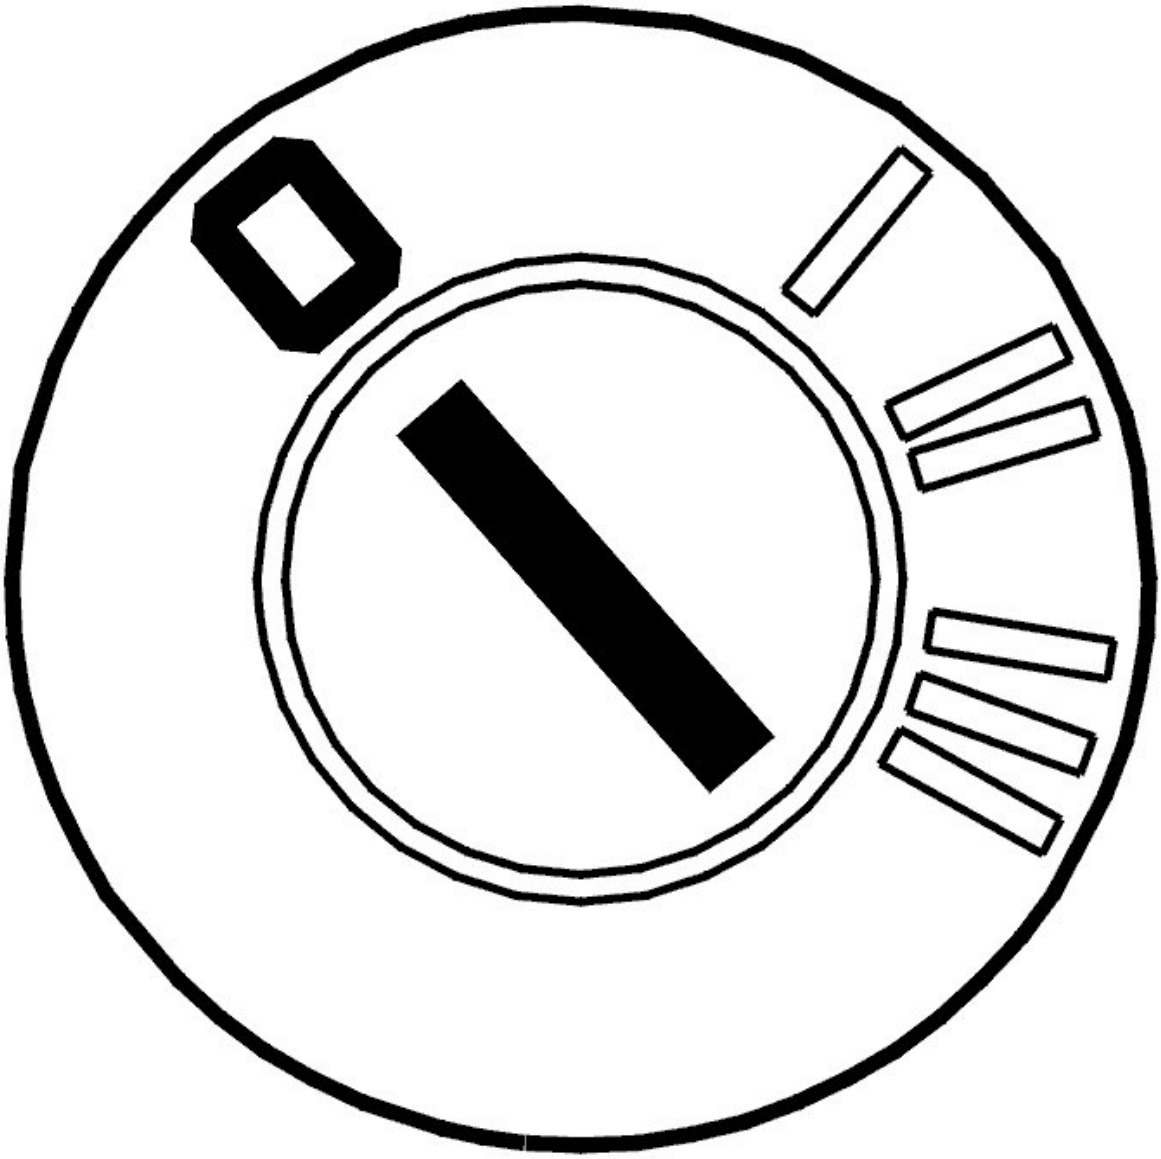
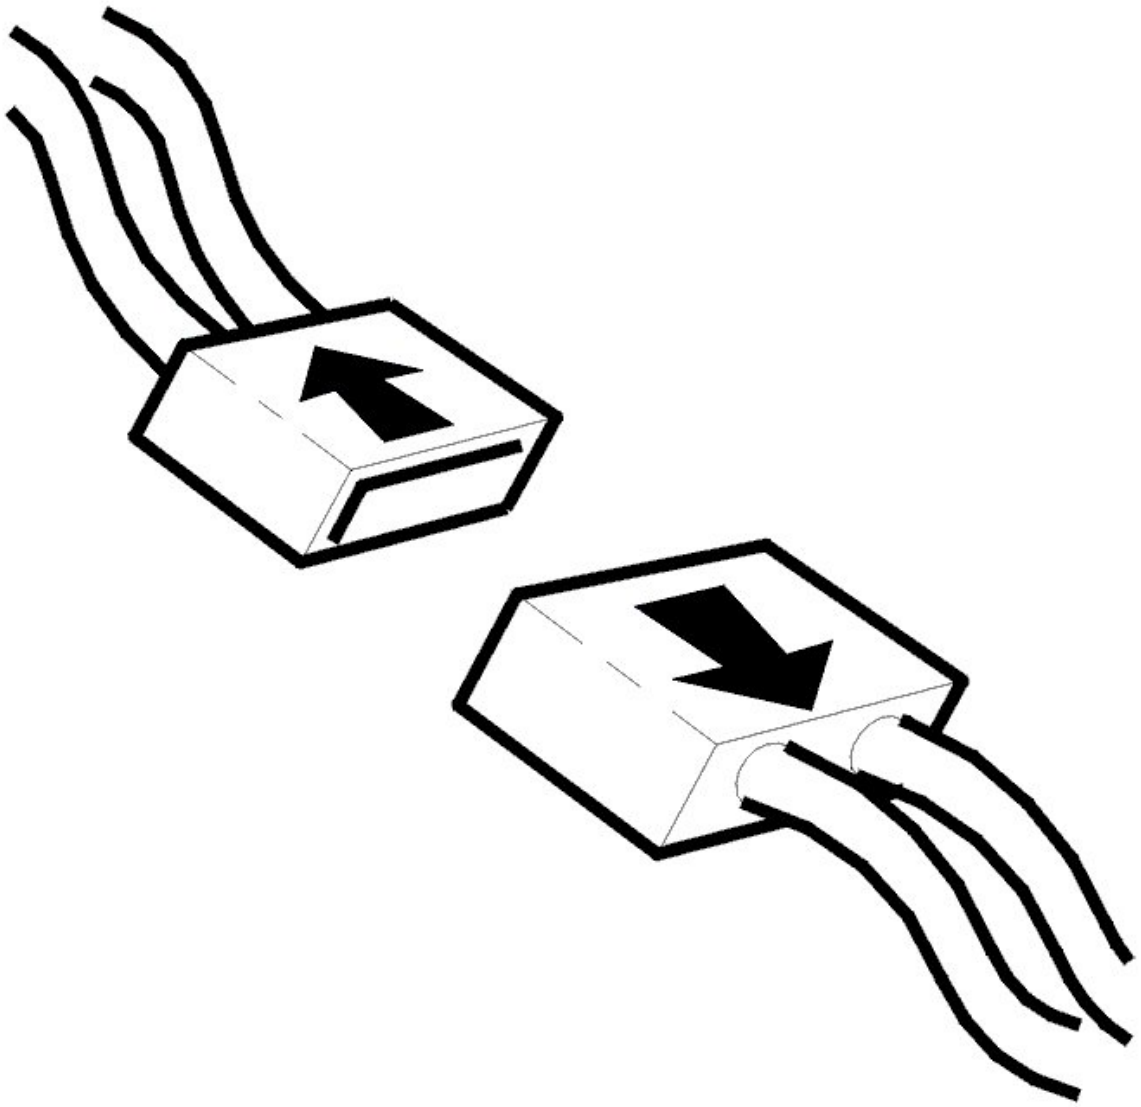
Signal too low. Intermittent fault

Intermittent fault





- Ignition off
- Disconnect the connector from the seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings from a disconnected undeployed seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0081 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0079).- If diagnostic trouble code (DTC) SRS-0079 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0081).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0061,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0069,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0071,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0079,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0081,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent short-circuit to ground according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures

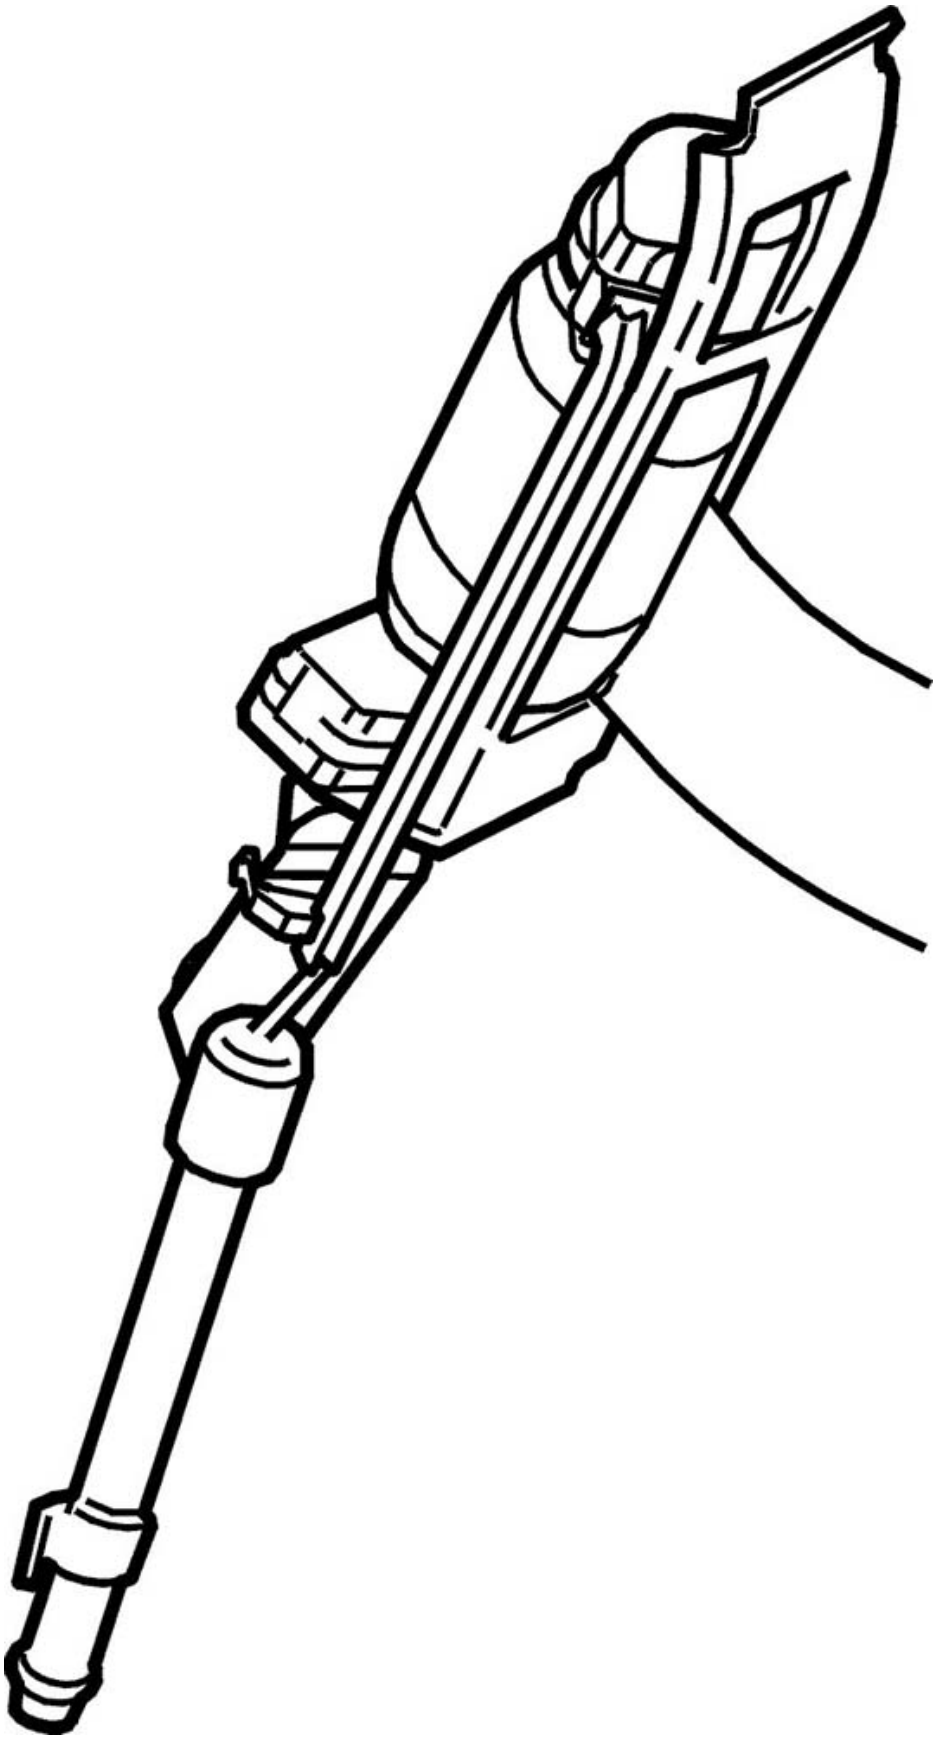
Diagnostic Trouble Code (DTC) Information

SRS-0062 Diagnostic trouble code information

Condition



If the circuit capacitance is too high for more than 10 seconds, diagnostic trouble code SRS-0062 is displayed.

Substitute value

- Nothing.

Possible source

- Capacitance too high in connector
- Capacitance too high in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

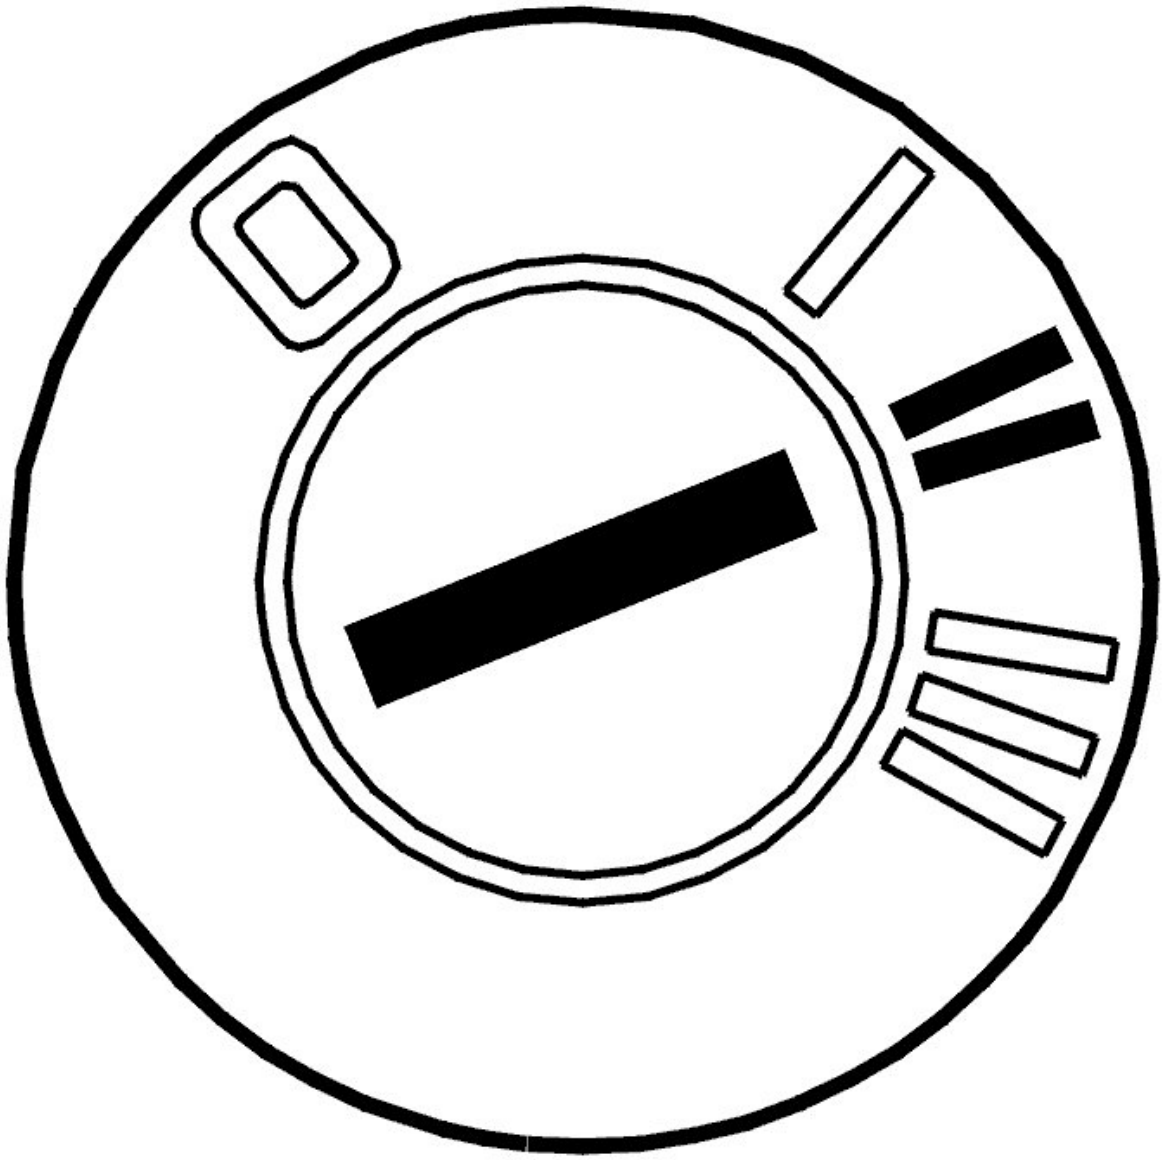
Fault symptom[s]

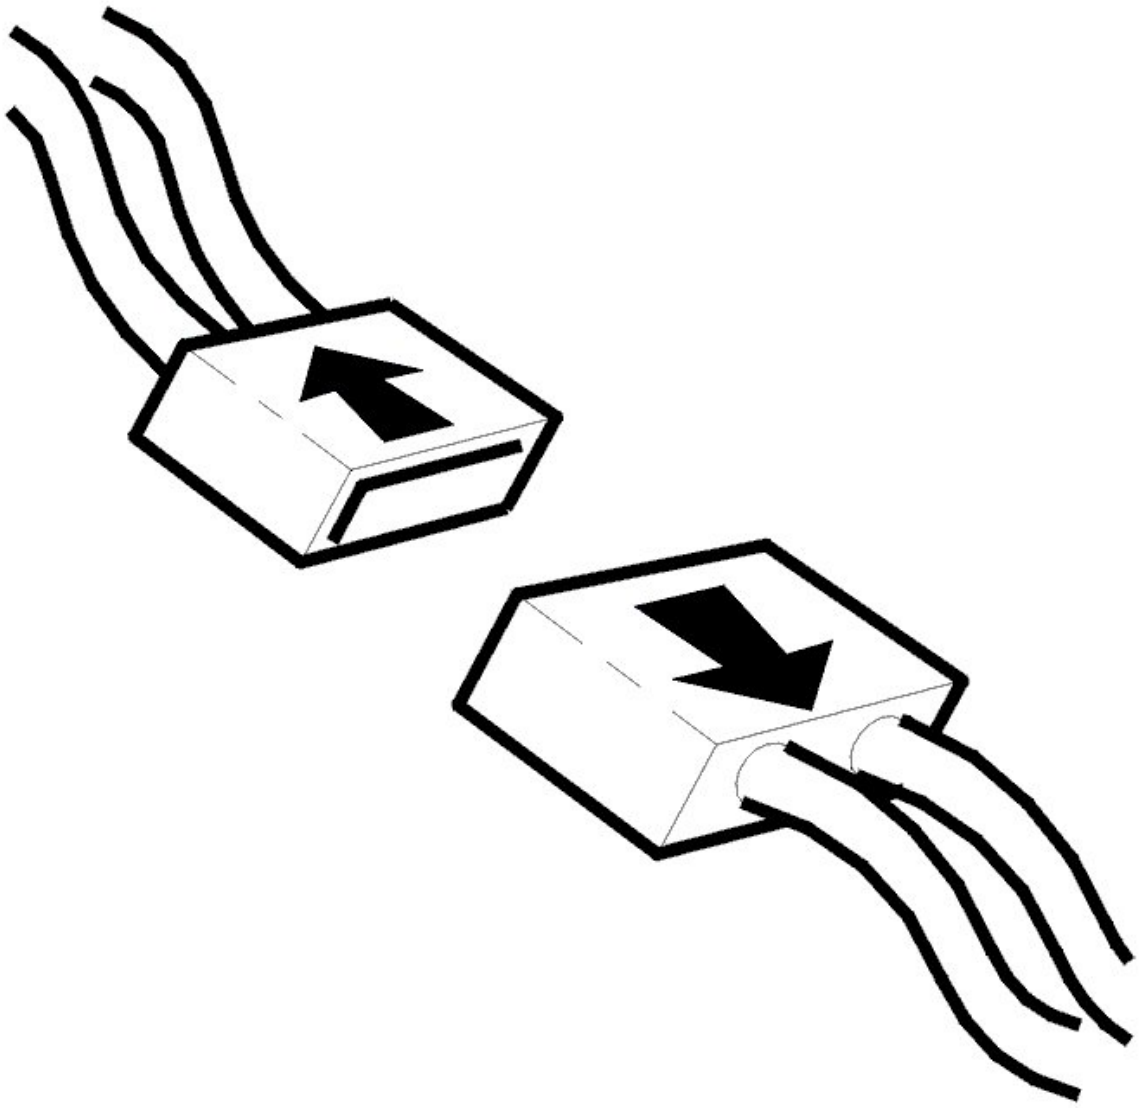
- SRS warning lamp on.

Capacitance Too High

Capacitance too high. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

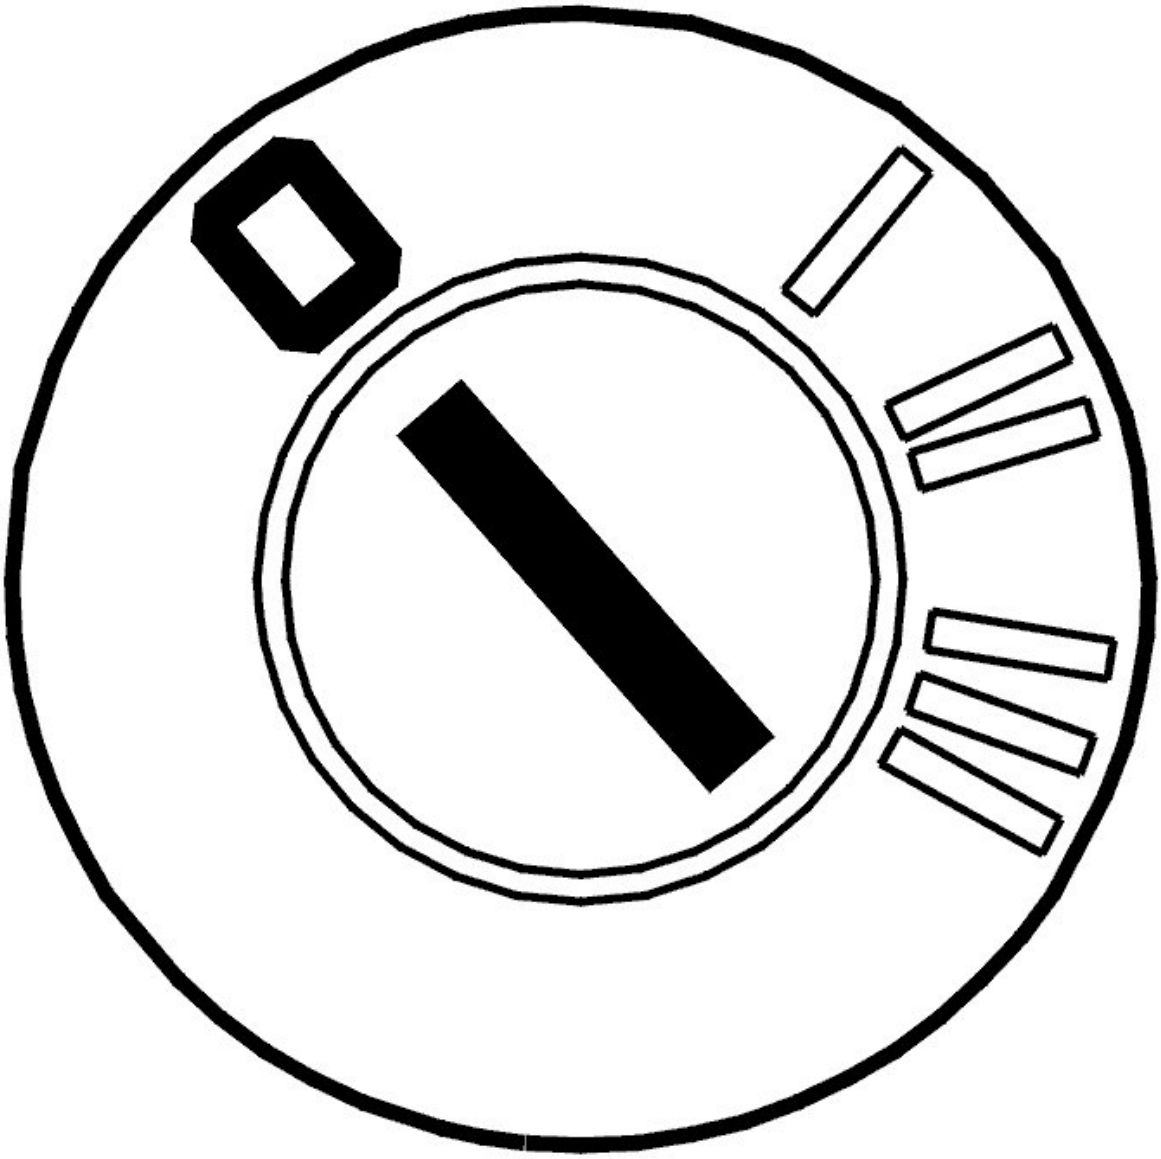
- To replace the front seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0082 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007A).- If diagnostic trouble code (DTC) SRS-007A for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0082).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0062

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006A

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0072

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007A

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0082

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Condition

The diagnostic trouble code (DTC) is stored if the resistance is too high in the circuit for longer than 10 seconds.

Substitute value

- None.

Possible source

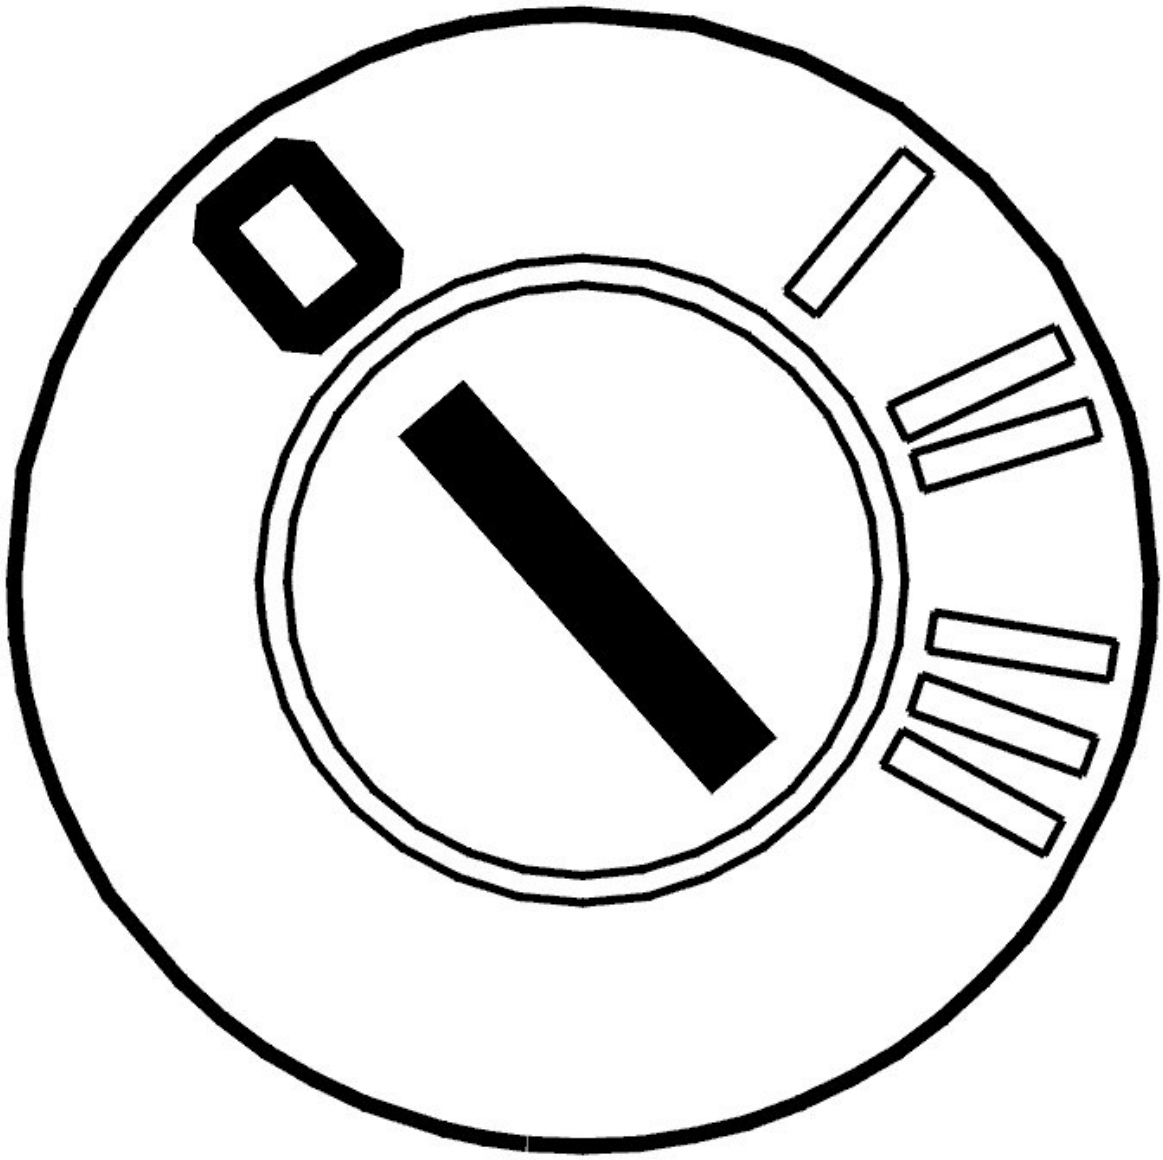
- Contact resistance or an open-circuit in the cable between the seat belt tensioner and the supplemental restraint system module (SRS).
- Open-circuit in the seat belt tensioner (the resistance is too high in the igniter).

Fault symptom[s]
- SRS warning light on

Resistance Too High

Resistance too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0084 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007C).- If diagnostic trouble code (DTC) SRS-007C for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0084).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0064,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006C,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0074,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007C,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0084,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) must be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Fault-tracing information

Information

Fault-tracing information

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.
It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

Do you want to view the information again?

Yes - Attempt New Test

No - Fault Found

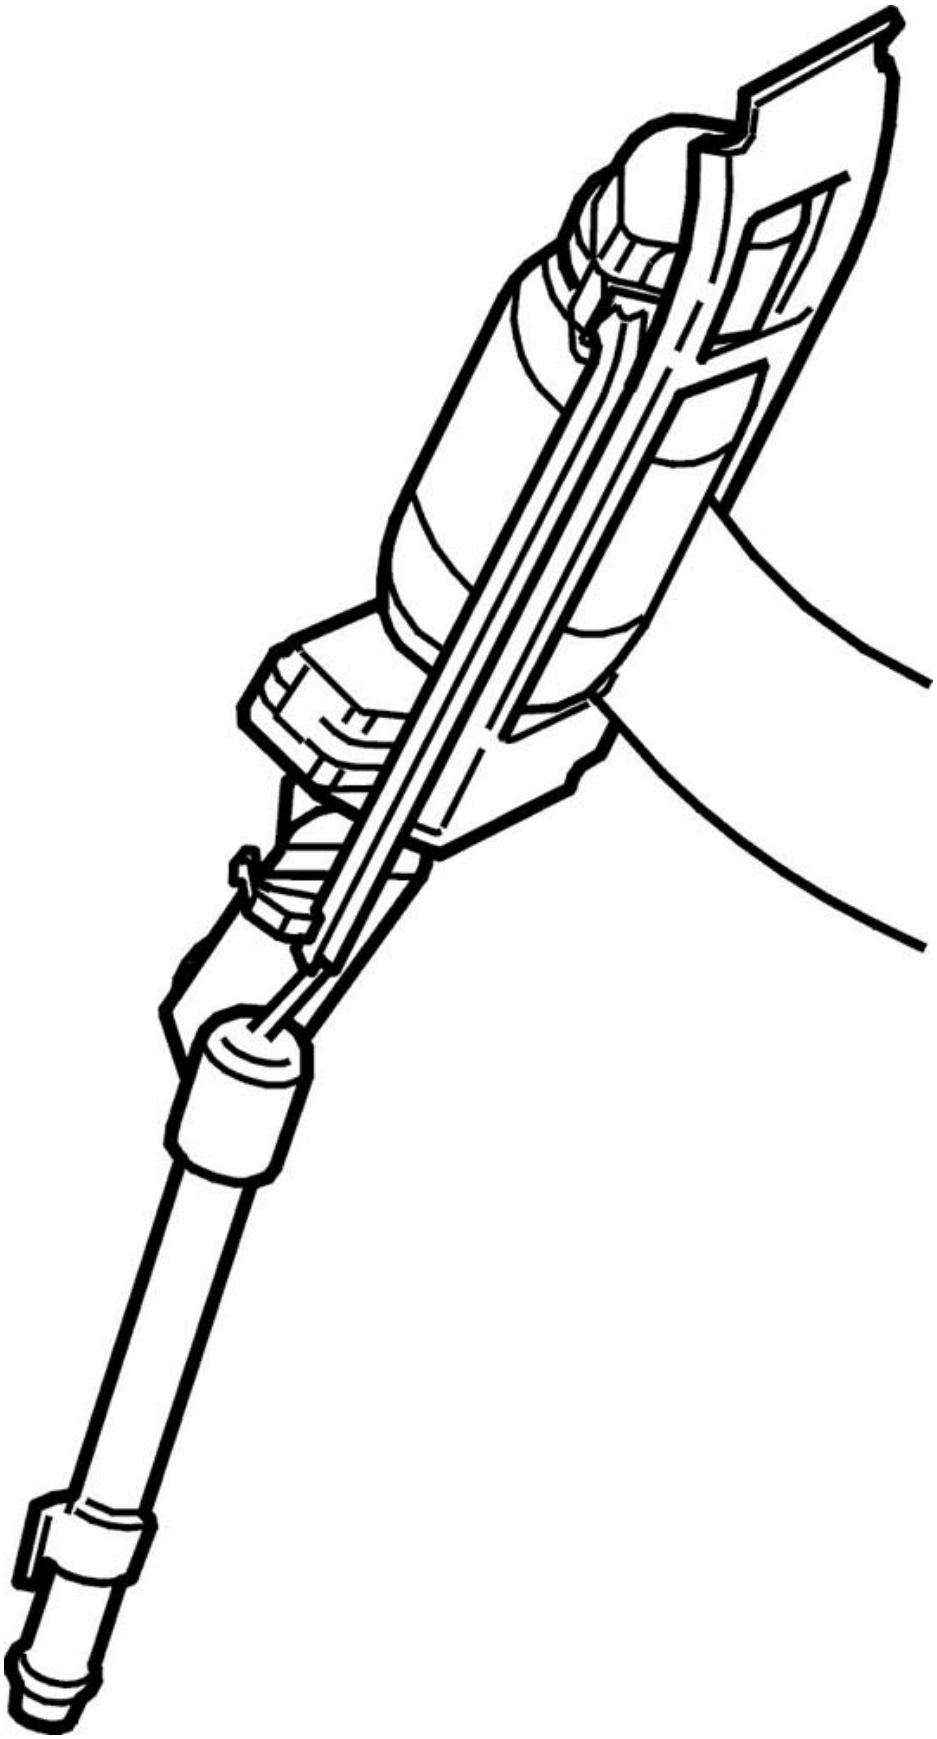
Attempt New Test - Intermittent fault

FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0064

Condition



The diagnostic trouble code (DTC) is stored if the resistance is too high in the circuit for longer than 10 seconds.

Substitute value

- None.

Possible source

- Contact resistance or an open-circuit in the cable between the seat belt tensioner and the supplemental restraint system module (SRS).
- Open-circuit in the seat belt tensioner (the resistance is too high in the igniter).

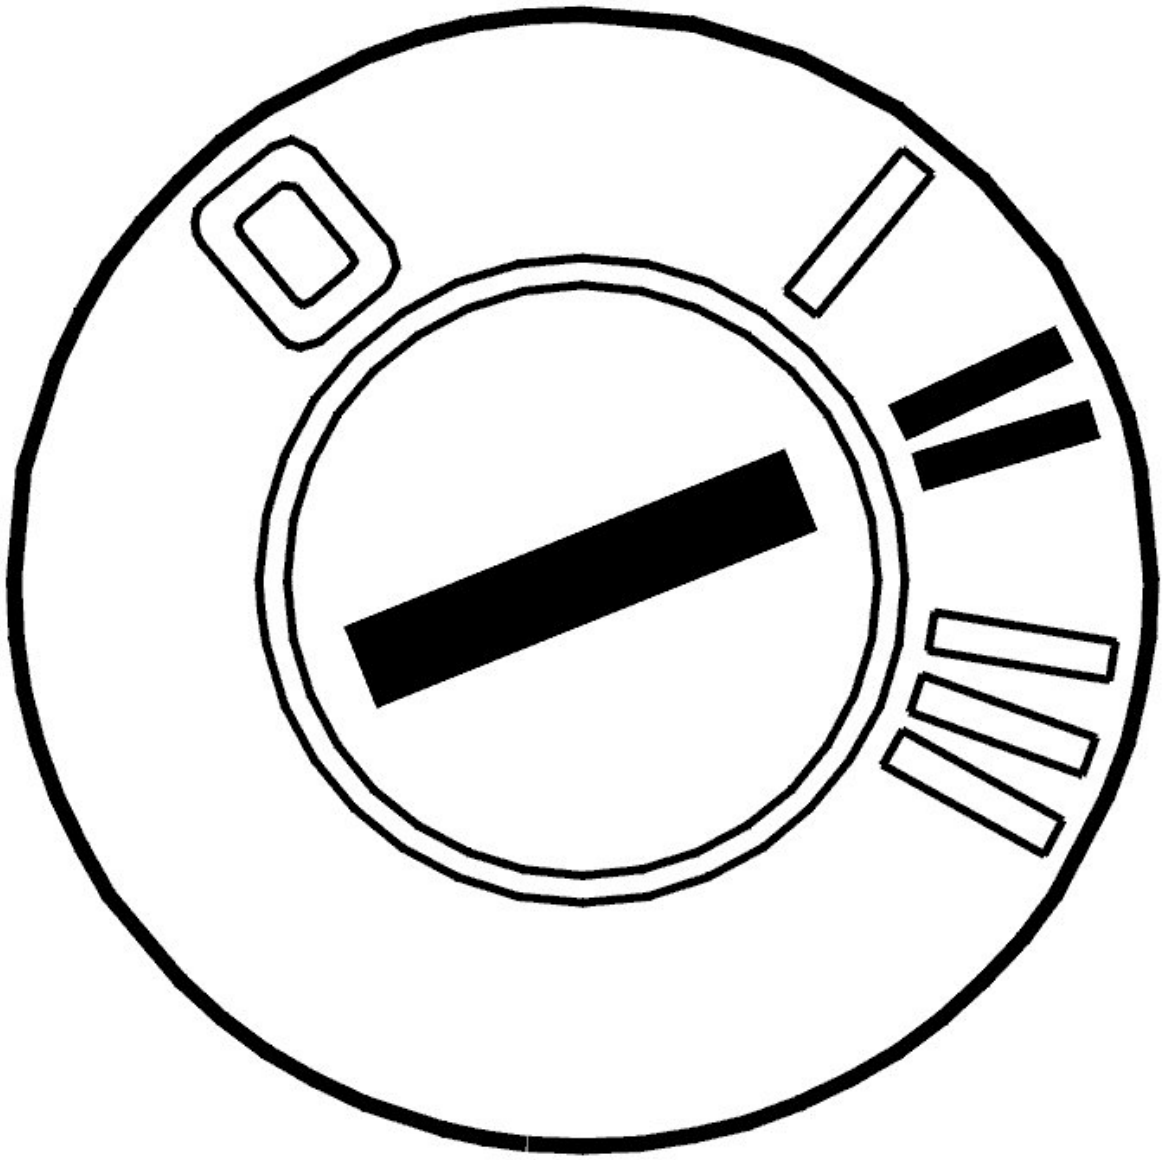
Fault symptom[s]

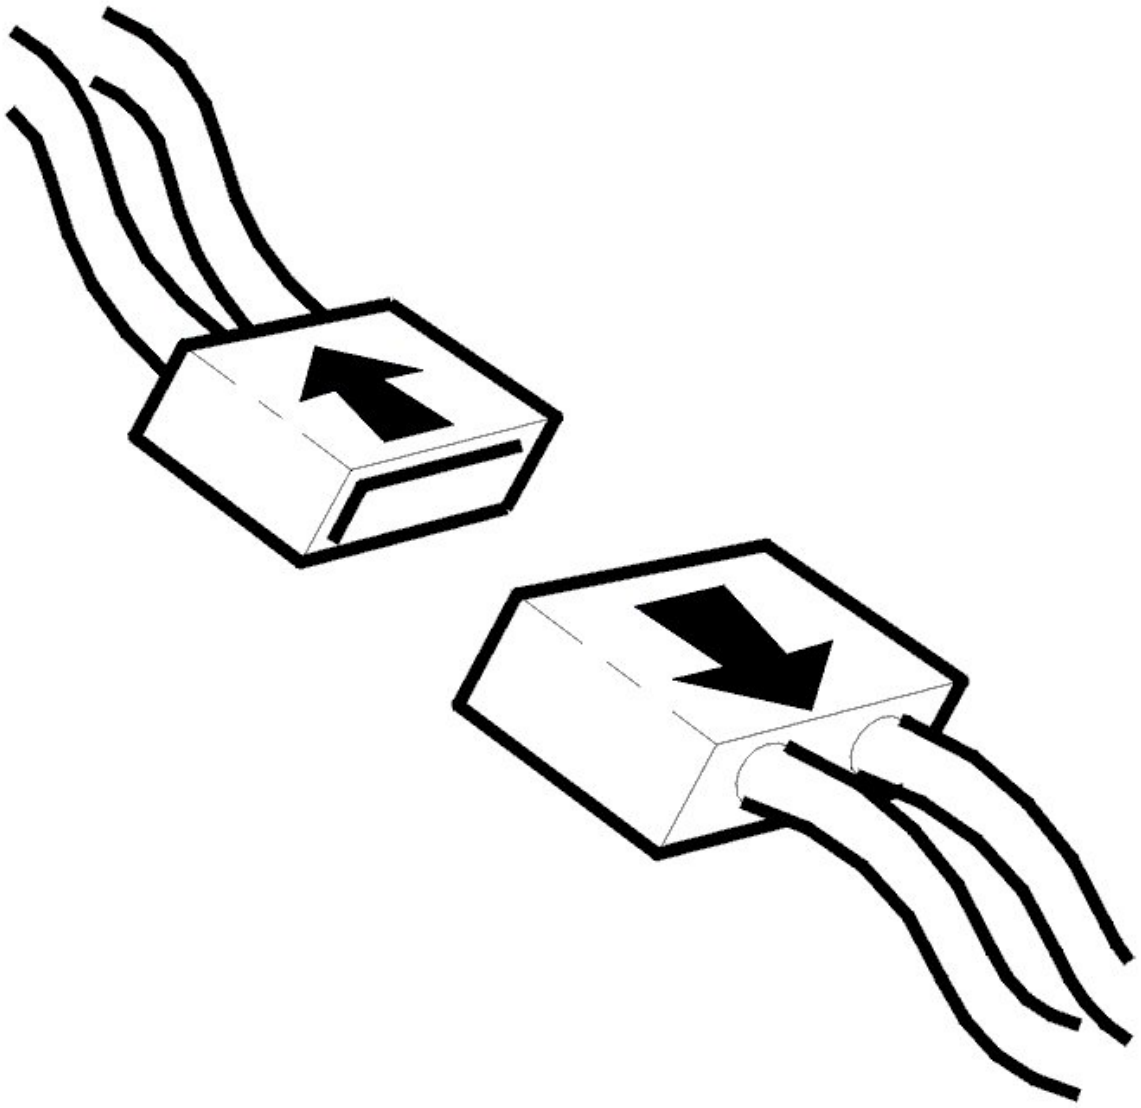
- SRS warning light on

Resistance Too High

Resistance too high. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

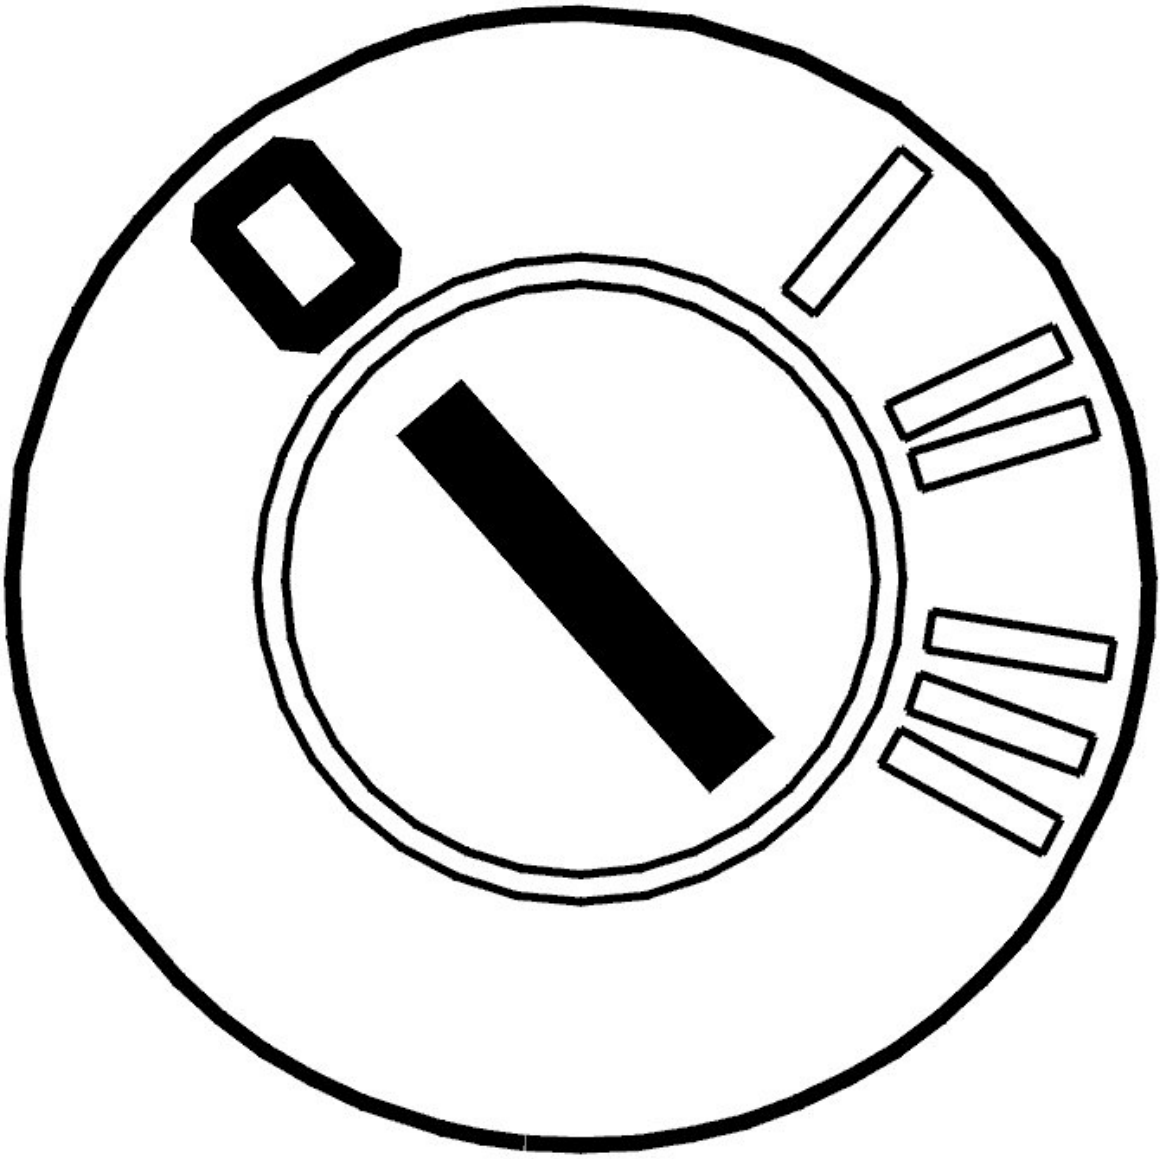
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0084 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007C).- If diagnostic trouble code (DTC) SRS-007C for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0084).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0064,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006C,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0074,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007C,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0084,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) should be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

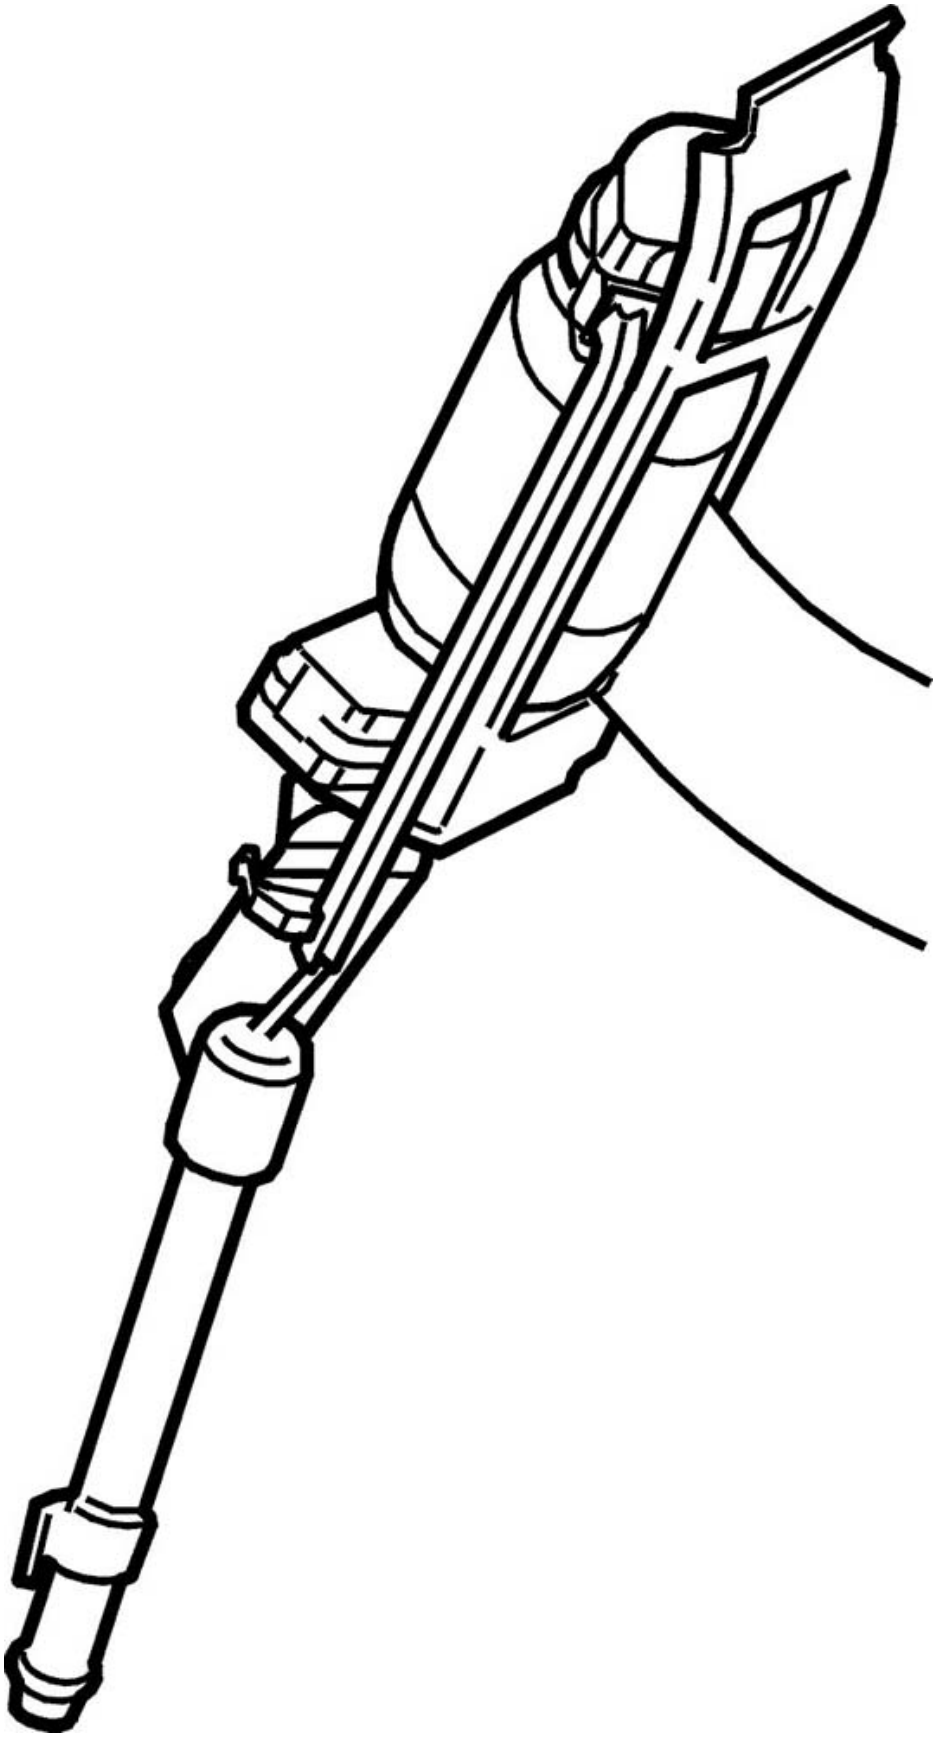
Diagnostic Trouble Code (DTC) Information

SRS-0065 Diagnostic trouble code information

Condition



If the circuit resistance is too low for more than 10 seconds, diagnostic trouble code SRS-0065 is displayed.

Substitute value
- Nothing.

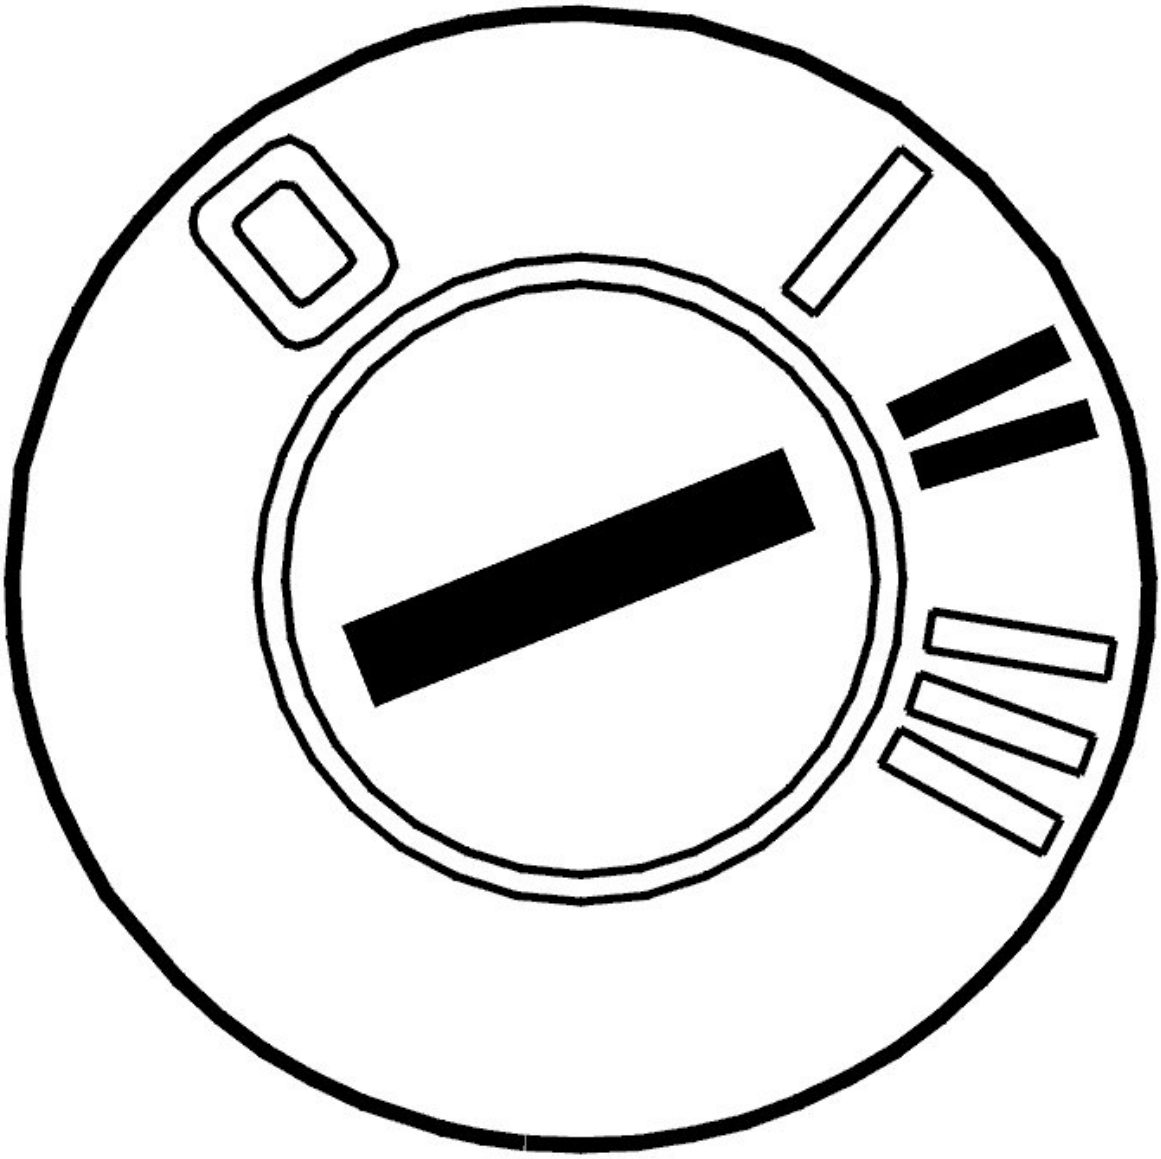
Possible source
- Short circuit in the connector or in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit in seat-belt tensioner (resistance in igniter too low).

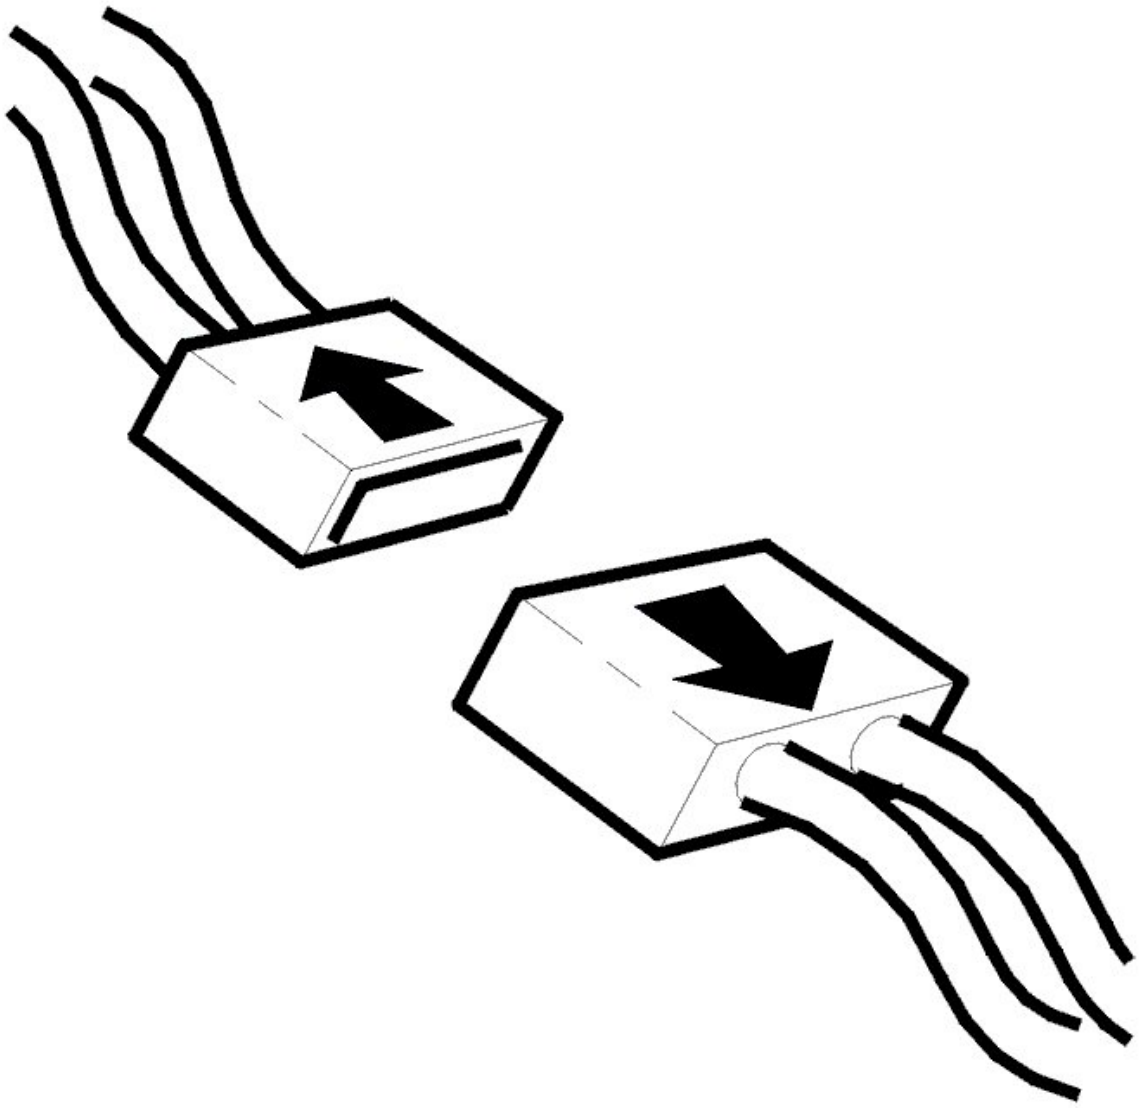
Fault symptom[s]
- SRS warning lamp on.

Resistance Too Low

Resistance too low. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

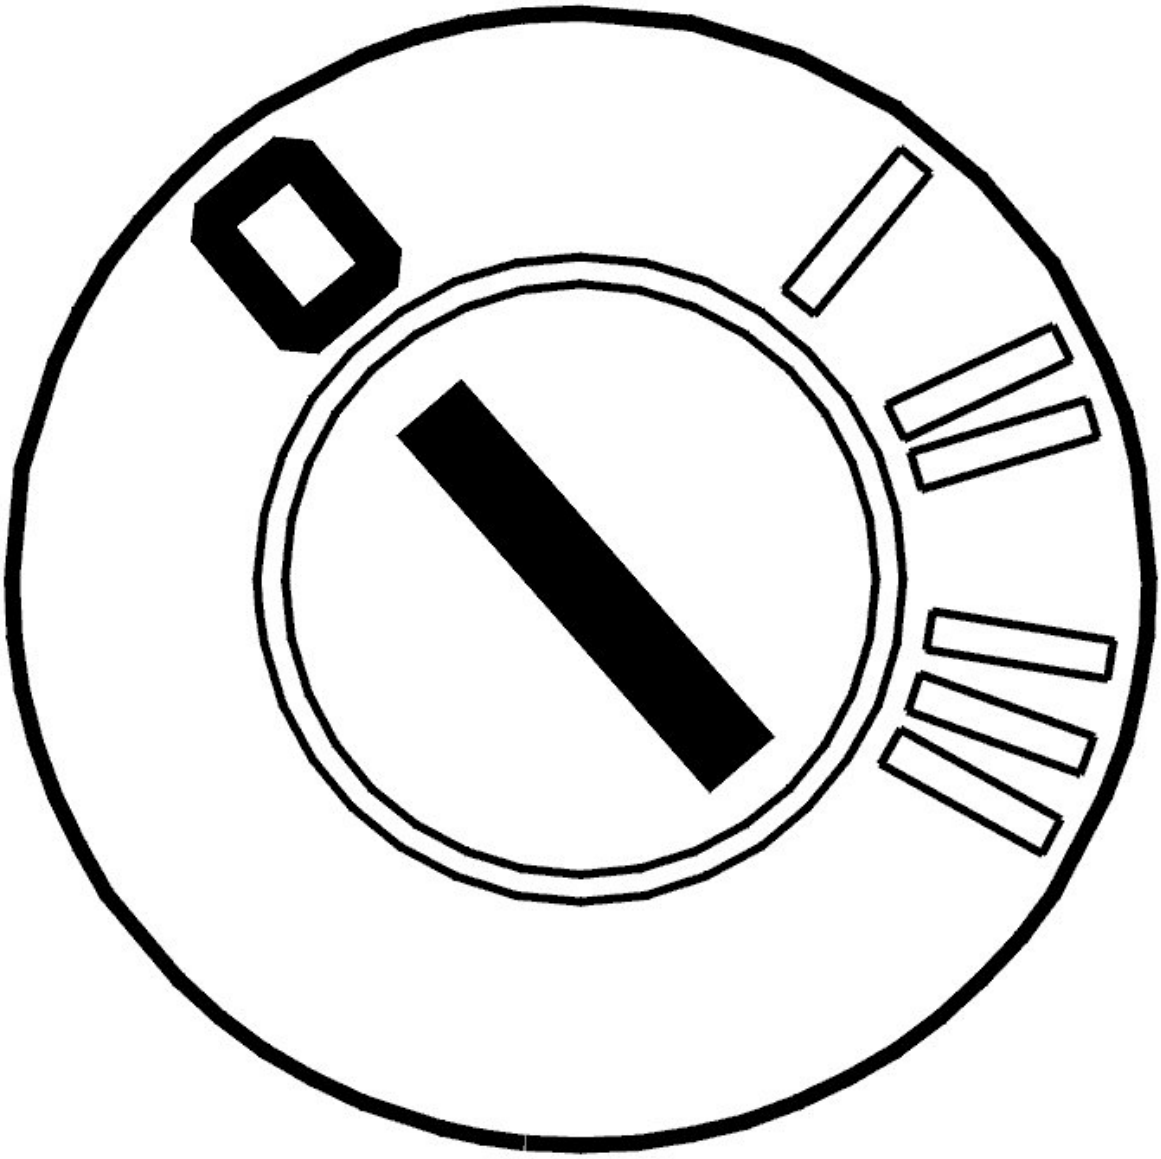
- To replace the front seat belt tensioner, see Buckle seat belt front, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt Buckle/Service and Repair/Front Seat. To replace the rear seat belt tensioner, see Buckle seat belt rear, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt Buckle/Service and Repair/Buckle Seat Belt Rear, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0085 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007D).- If diagnostic trouble code (DTC) SRS-007D for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0085).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0065,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006D,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0075,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007D,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0085,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

Possible source
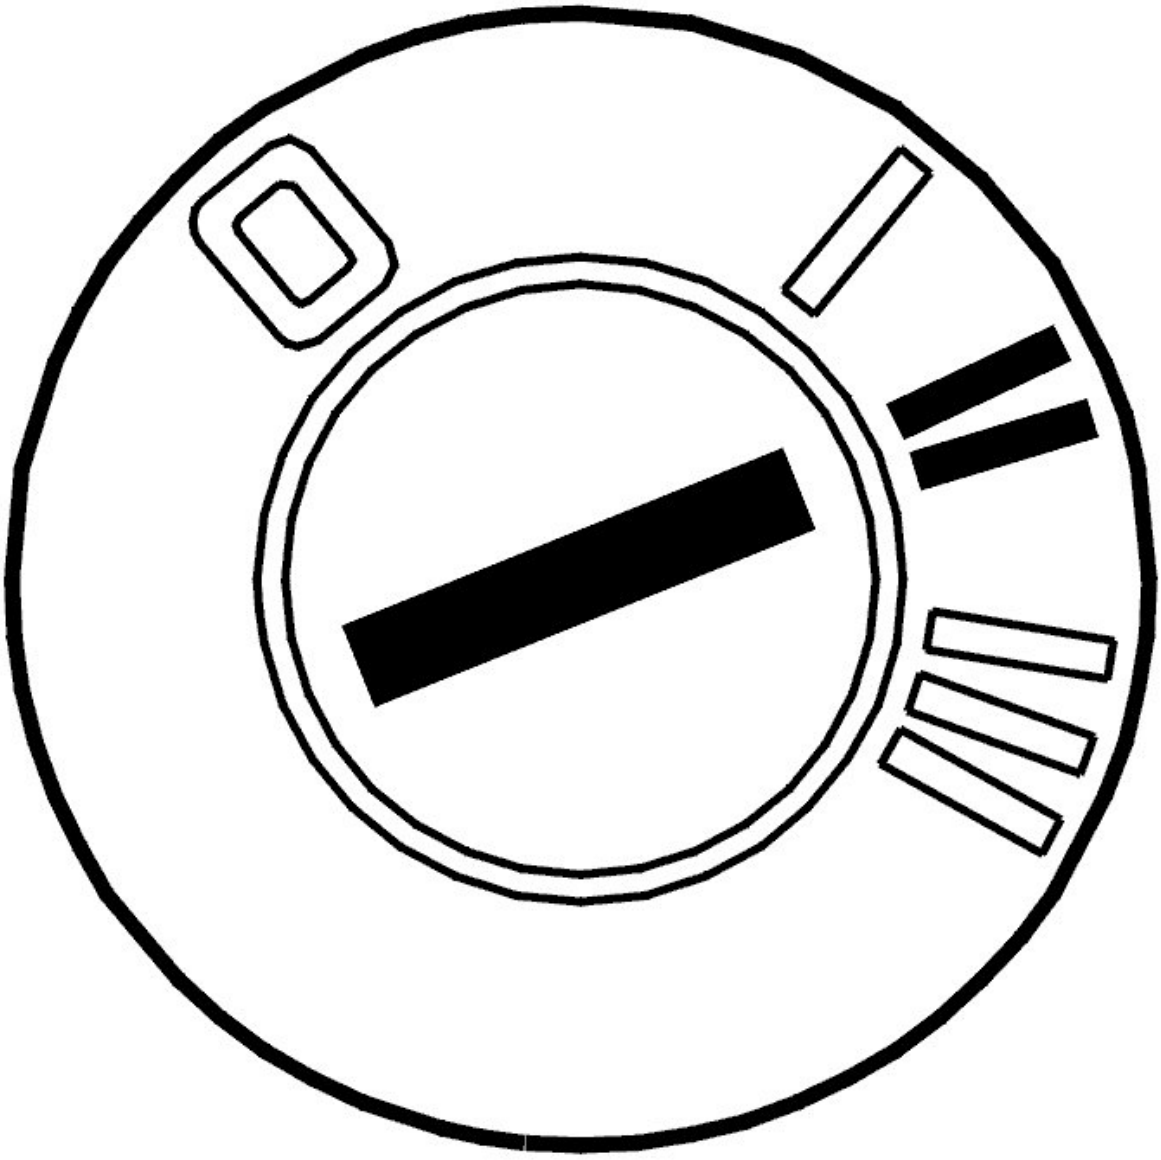
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to voltage supply in seat-belt tensioner.

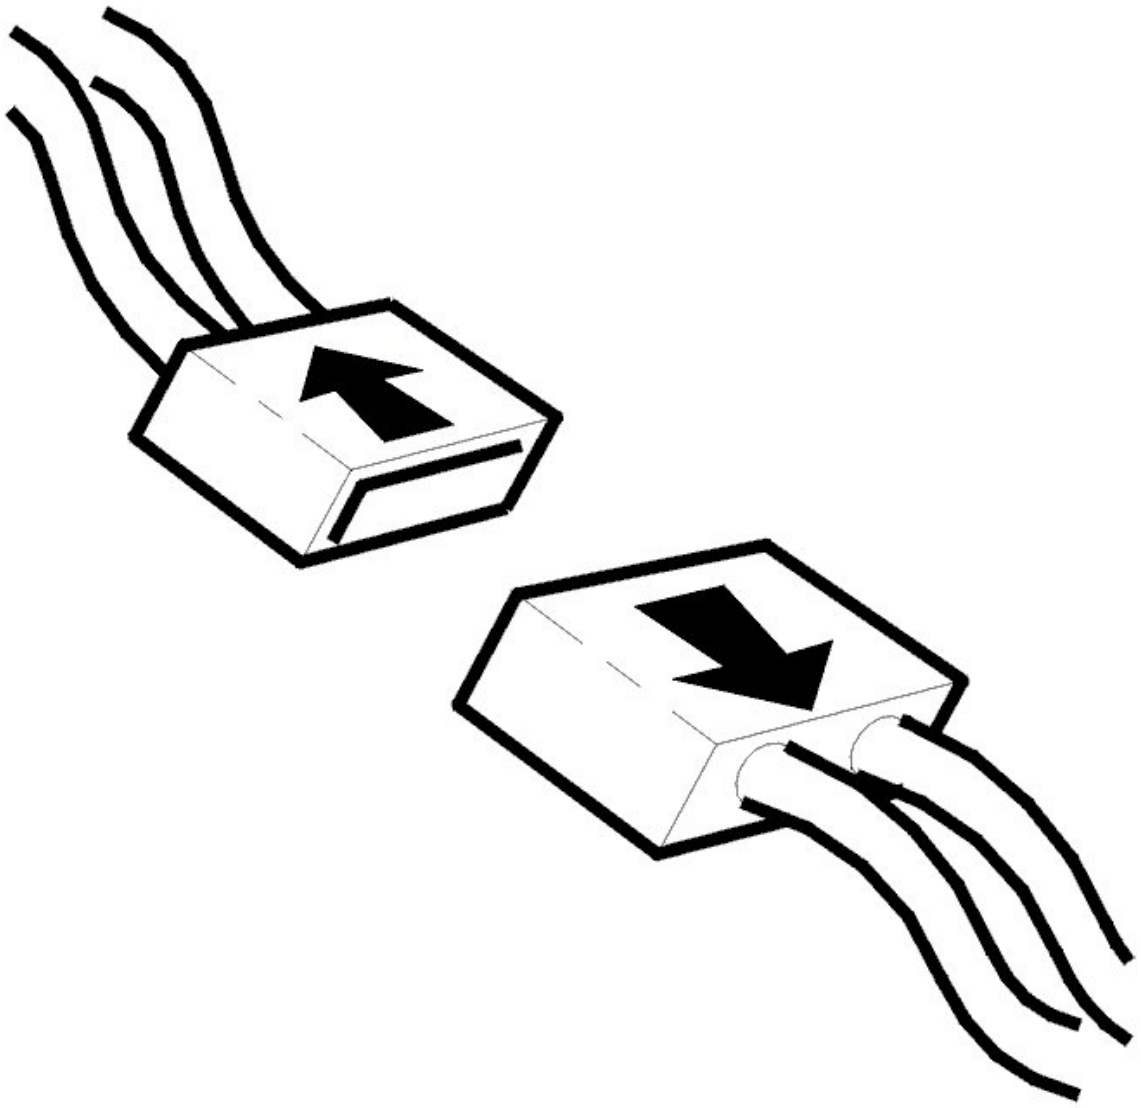
Fault symptom[s]
- SRS warning lamp on.

Signal Too High

Signal too high. Permanent fault

Checking the component





- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

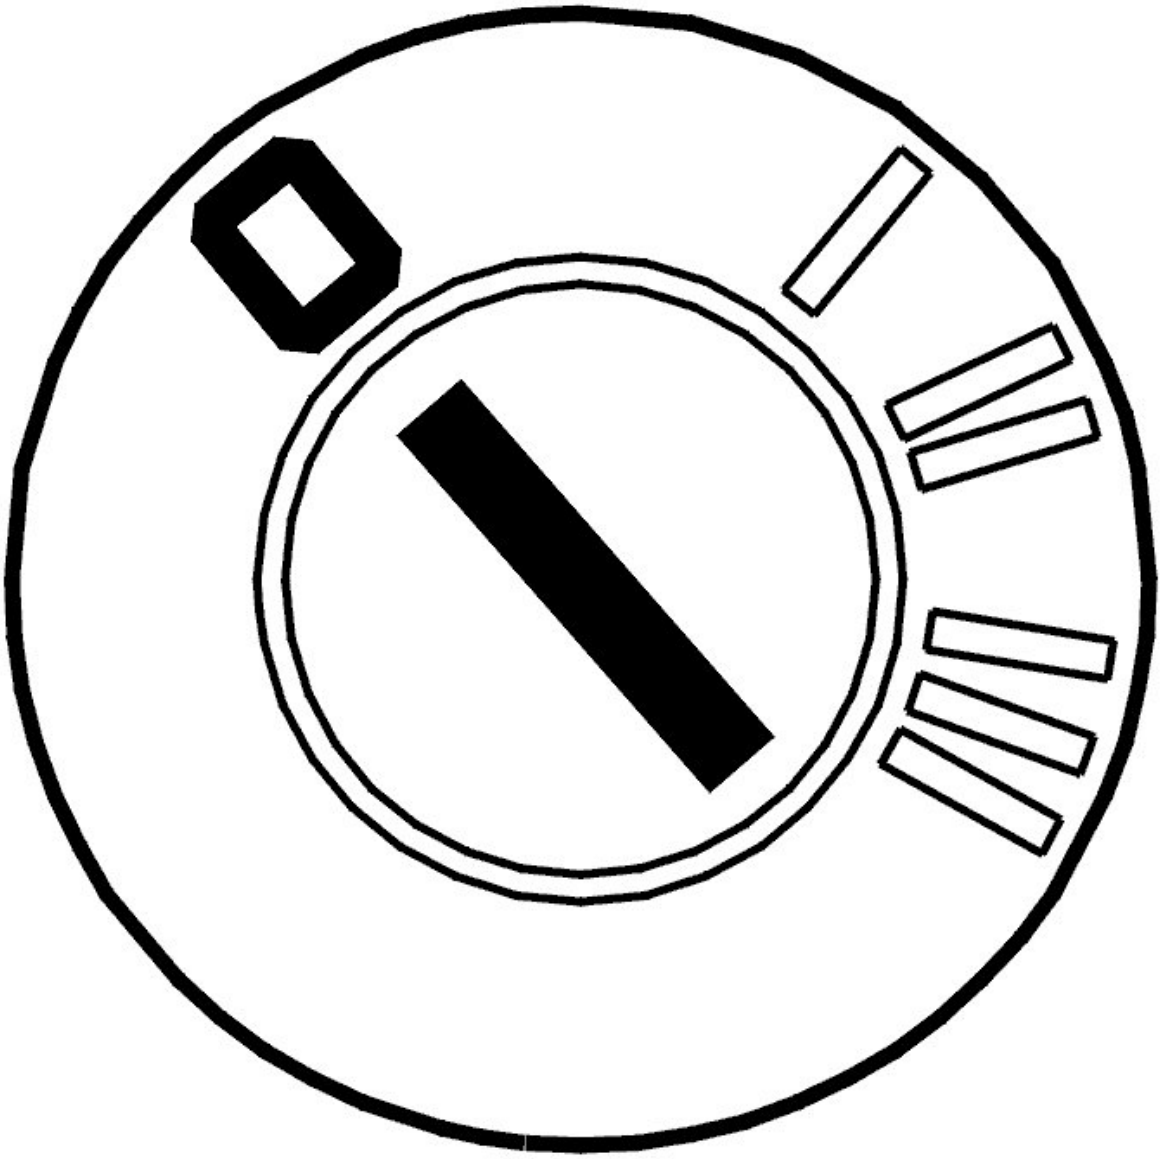
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

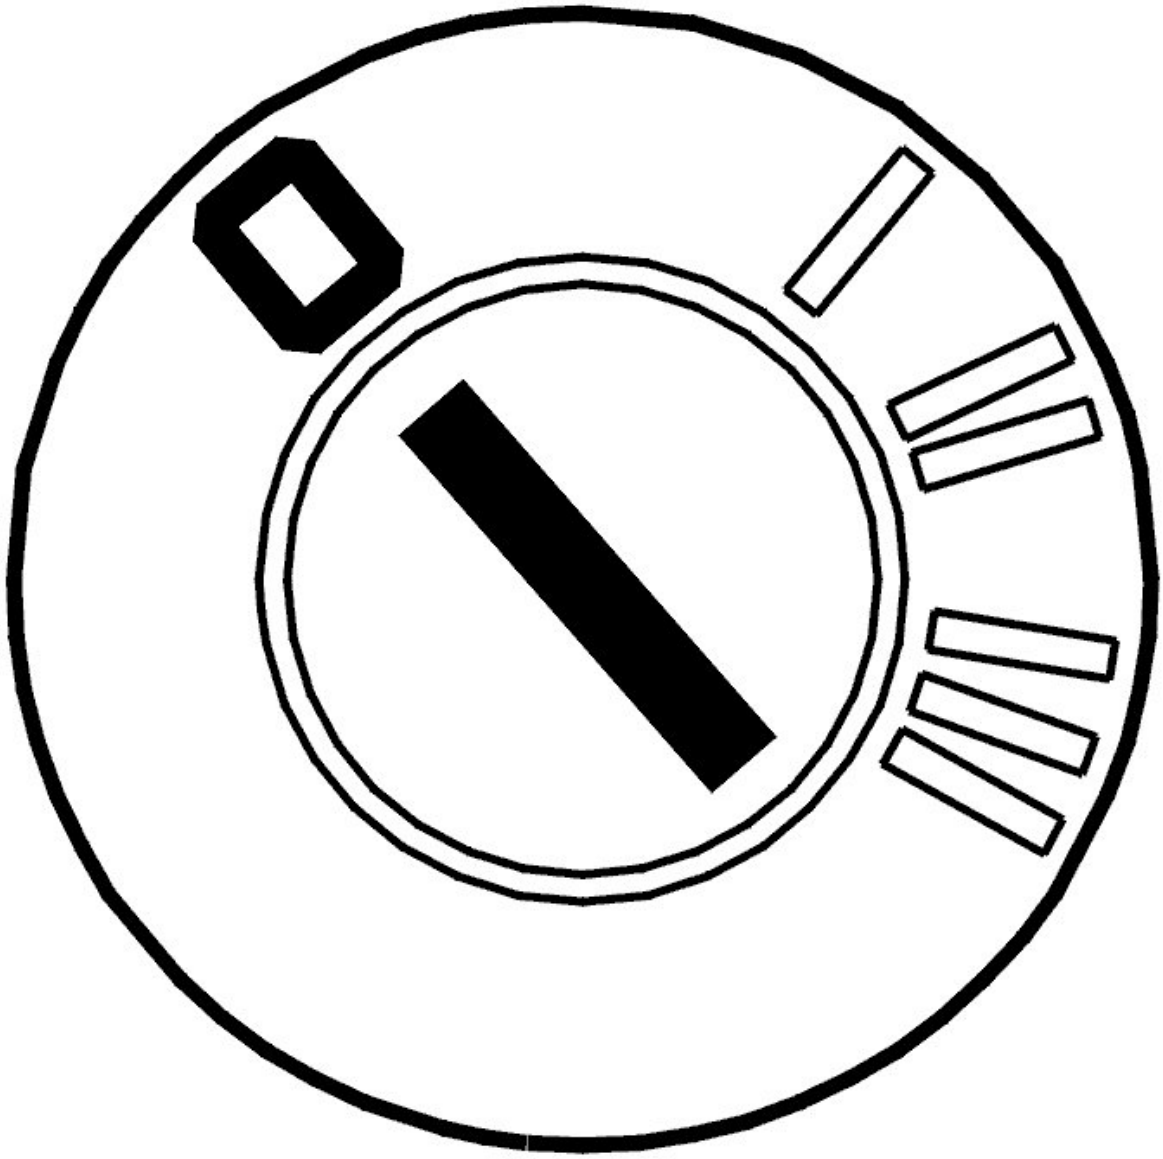
Fault symptom[s]
- SRS warning lamp on.

Signal Too High

Signal too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
check for an intermittent short-circuit to supply voltage according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminal #1, terminal #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and the connector for the seat belt tensioner disconnected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Fault-tracing information

Information

Fault-tracing information

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.
It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

Do you want to view the information again?

Yes - Attempt New Test

No - Fault Found

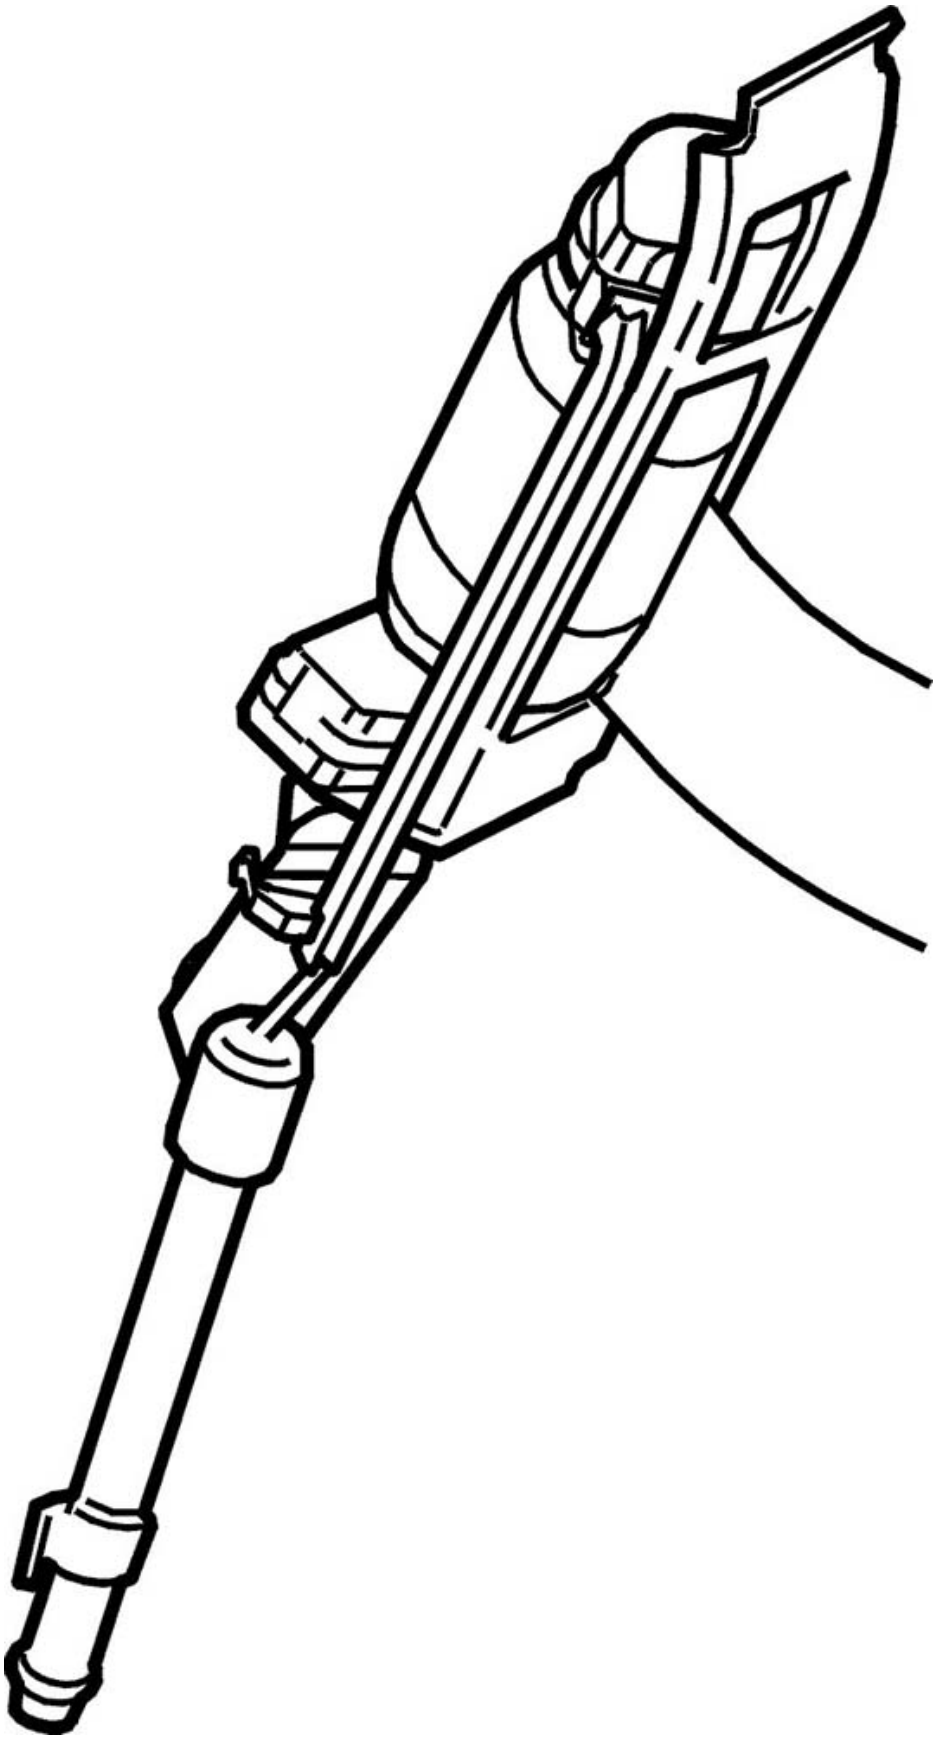
Attempt New Test - Intermittent fault

FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

SRS-0069 Diagnostic trouble code information

Condition



If the circuit voltage is too low (0 V) for more than 10 seconds, diagnostic trouble code SRS-0069 is displayed.

Substitute value

- Nothing.

Possible source

- Short circuit to ground in connector
- Short circuit to ground in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

- Short circuit to ground in seat-belt tensioner.

Fault symptom[s]
- SRS warning lamp on.

Signal Too Low

Signal too low. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0081 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0079).- If diagnostic trouble code (DTC) SRS-0079 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0081).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0061,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0069,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0071,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0079,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0081,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

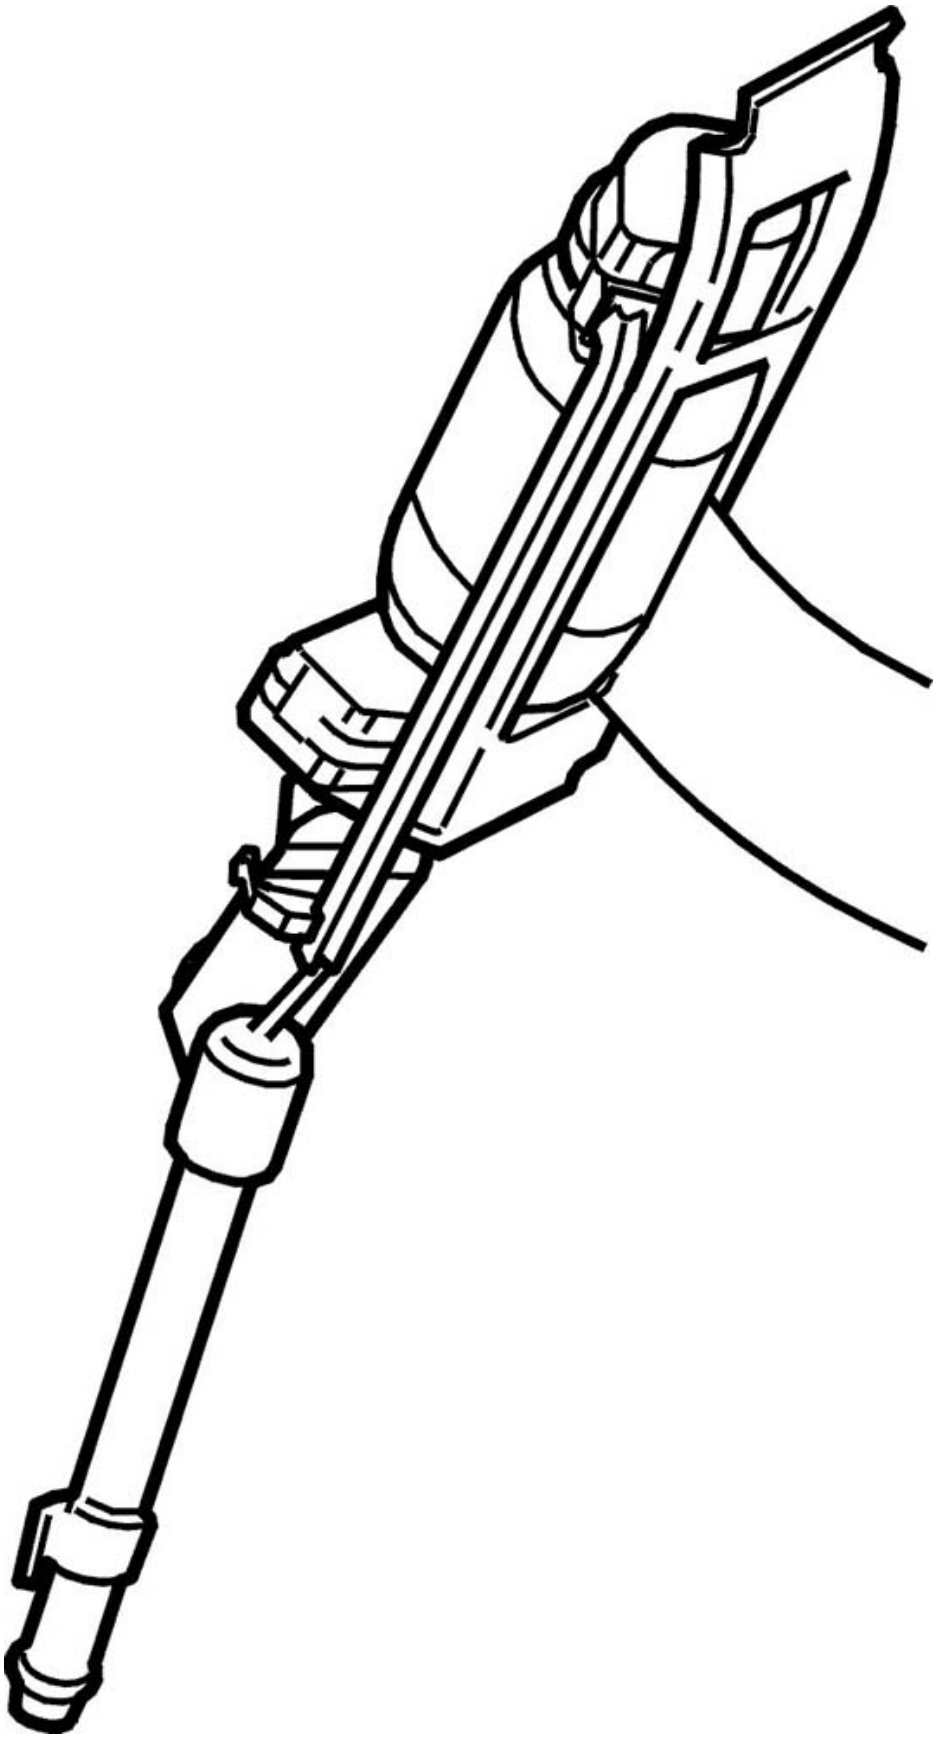
SRS-006B Diagnostic trouble code information

Condition



If the circuit capacitance is low for more than 10 sec, diagnostic trouble code SRS-006B is displayed.

Substitute value

- Nothing.

Possible source

- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- SRS warning lamp on.

Capacitance Too Low

Capacitance too low. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0063,

front left seat belt tensioner terminals #5A(5) and #6A(6) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-006B,

front right seat belt tensioner terminals #5C(1) and #6C(2) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0073,

rear left seat belt tensioner terminals #16A(16) and #15A(15) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-007B,

centre rear seat belt tensioner terminals 17A(17) and #18A(18) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0083,

rear right seat belt tensioner terminals #16C(12) and #15C(11) and connector terminals #1 and #3
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.

Hint: Checking the integrated capacitor in the igniter connector by taking resistance measurements.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS).
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) must be approximately 22 kohms.

Information

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - No Fault Found

Attempt New Test - Checking the component

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

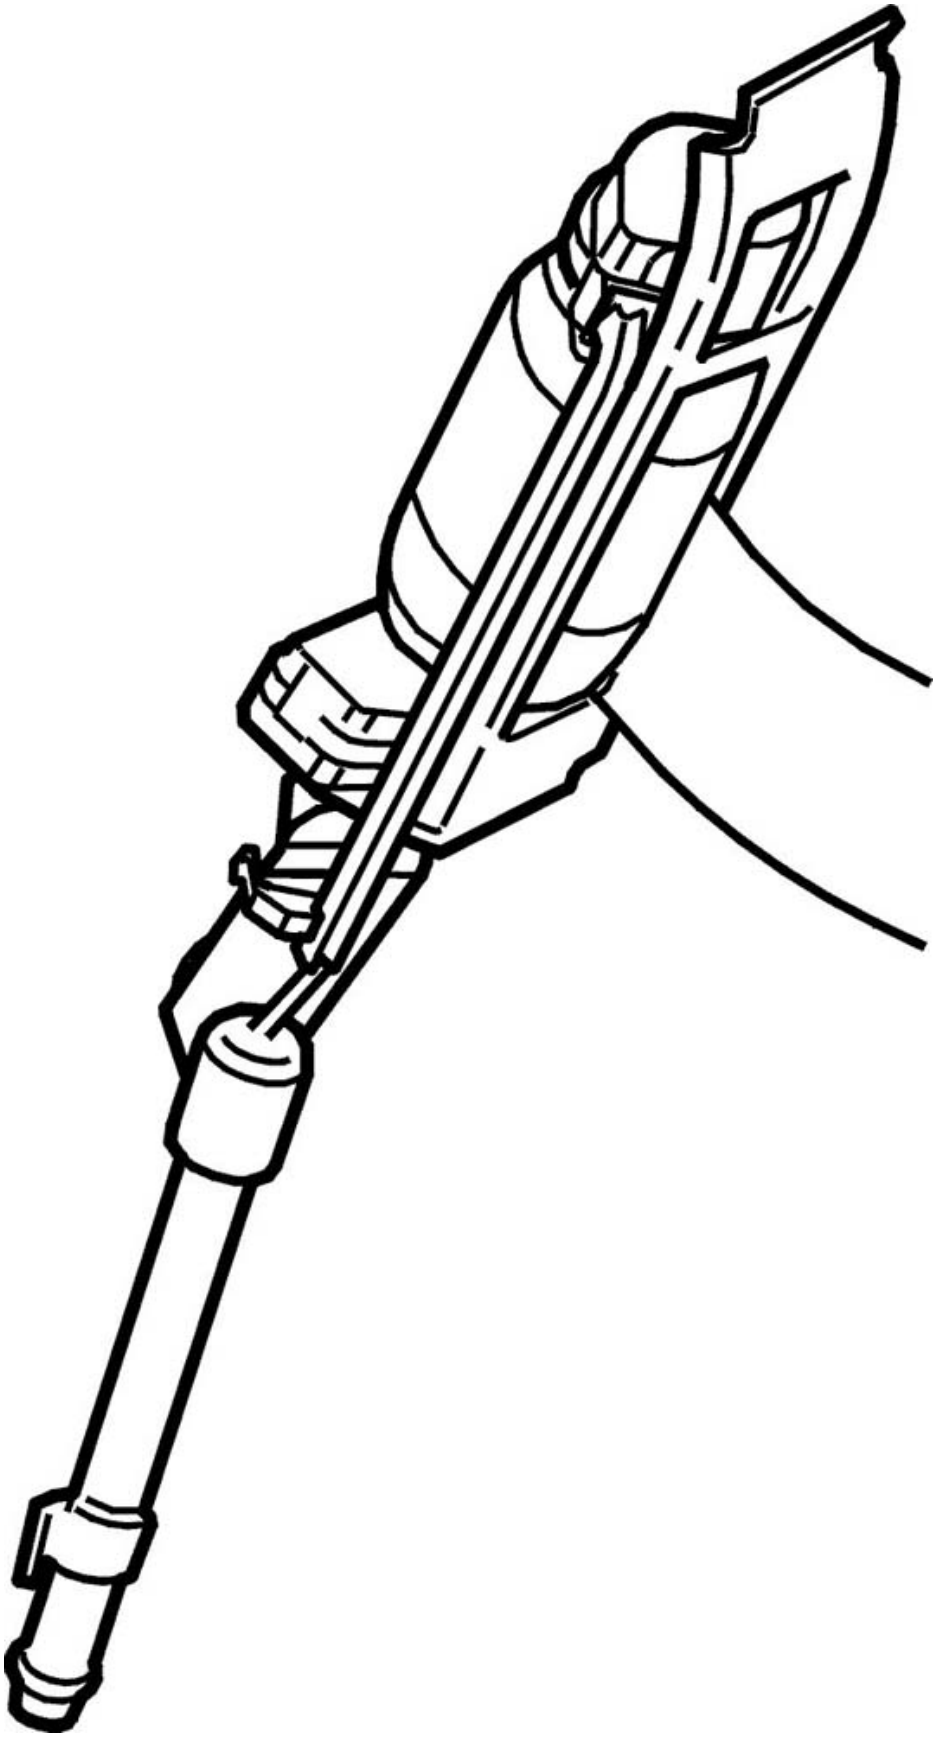
VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-006B Diagnostic trouble code information

Condition



If the circuit capacitance is low for more than 10 sec, diagnostic trouble code SRS-006B is displayed.

Substitute value
- Nothing.

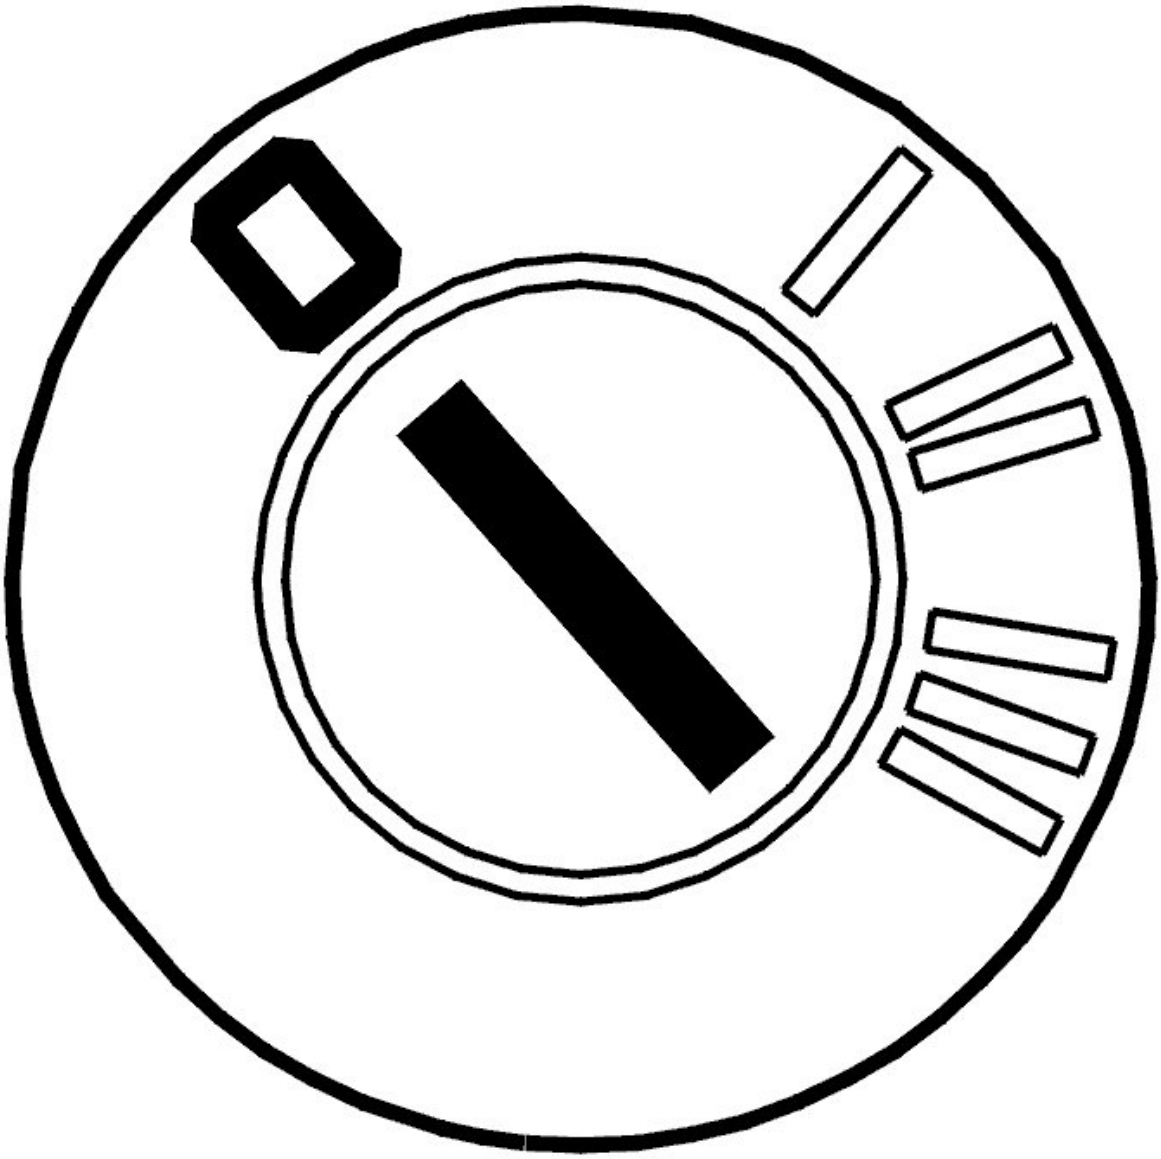
Possible source
- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- SRS warning lamp on.

Capacitance Too Low

Capacitance too low. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0063,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006B,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0073,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007B,

terminals #17A(17), #18A(18) of the centre rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0083,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Hint: Check the integrated capacitor in the igniter connector: Measure the resistance.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS).
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) should be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures.
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

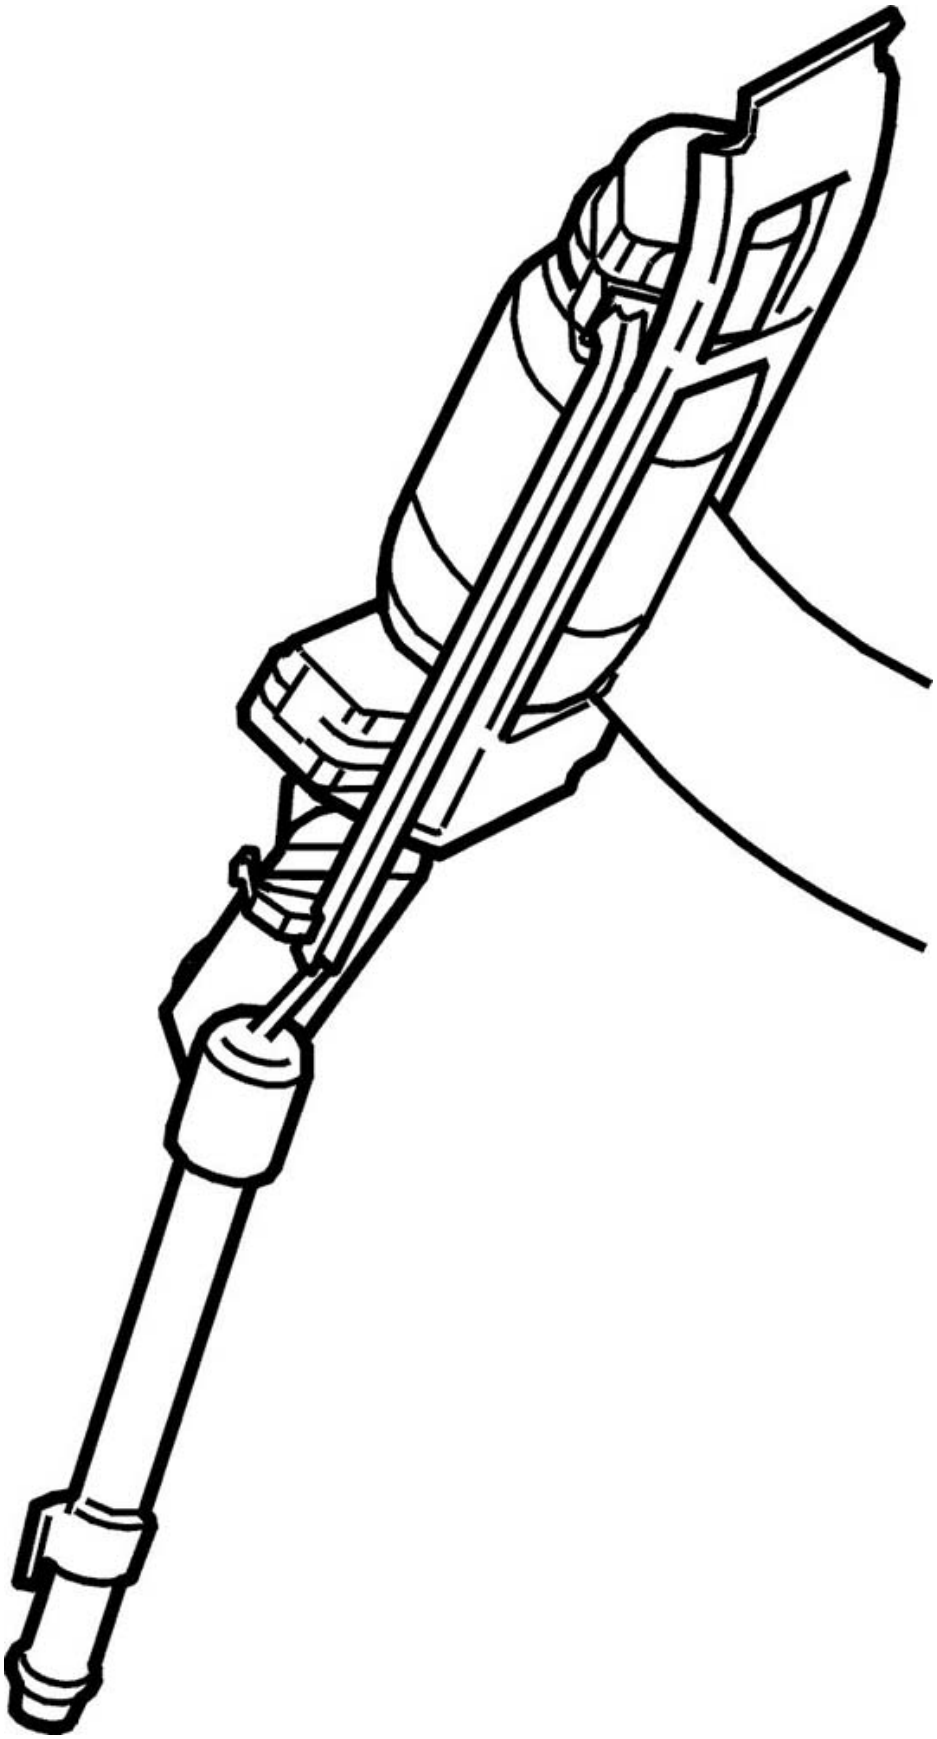
FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code information SRS-006C

Condition



If the circuit resistance is too high for more than 10 seconds, diagnostic trouble code SRS-006C is displayed.

Substitute value

- Nothing.

Possible source

- Contact resistance or open circuit in the wire between the seat-belt tensioner and supplemental restrain system (SRS)
- Open circuit in seat-belt tensioner (resistance in igniter too high).

Fault symptom[s]

- SRS warning lamp on.

Resistance Too High

Resistance too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0084 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007C).- If diagnostic trouble code (DTC) SRS-007C for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0084).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0064,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006C,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0074,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007C,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0084,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

One of the following diagnostic trouble codes (DTCs) will be stored if the resistance in any of the wiring circuits is lower than 10 ohms for longer than 10 seconds:
SRS-0066
SRS-006E
depending on which wiring circuit the fault is in.

Possible source
- If the SRS control module identifies that a seat belt tensioner is installed, despite the control module being programmed that a seat belt tensioner is not installed.

Fault symptom[s]

The SRS indicator lamp is lit.

Diagnostic Trouble Code (DTC) Information

SRS-0070 Diagnostic trouble code information

Condition

If the circuit voltage is high for more than 10 seconds, diagnostic trouble code SRS-0070 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in seat-belt tensioner
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
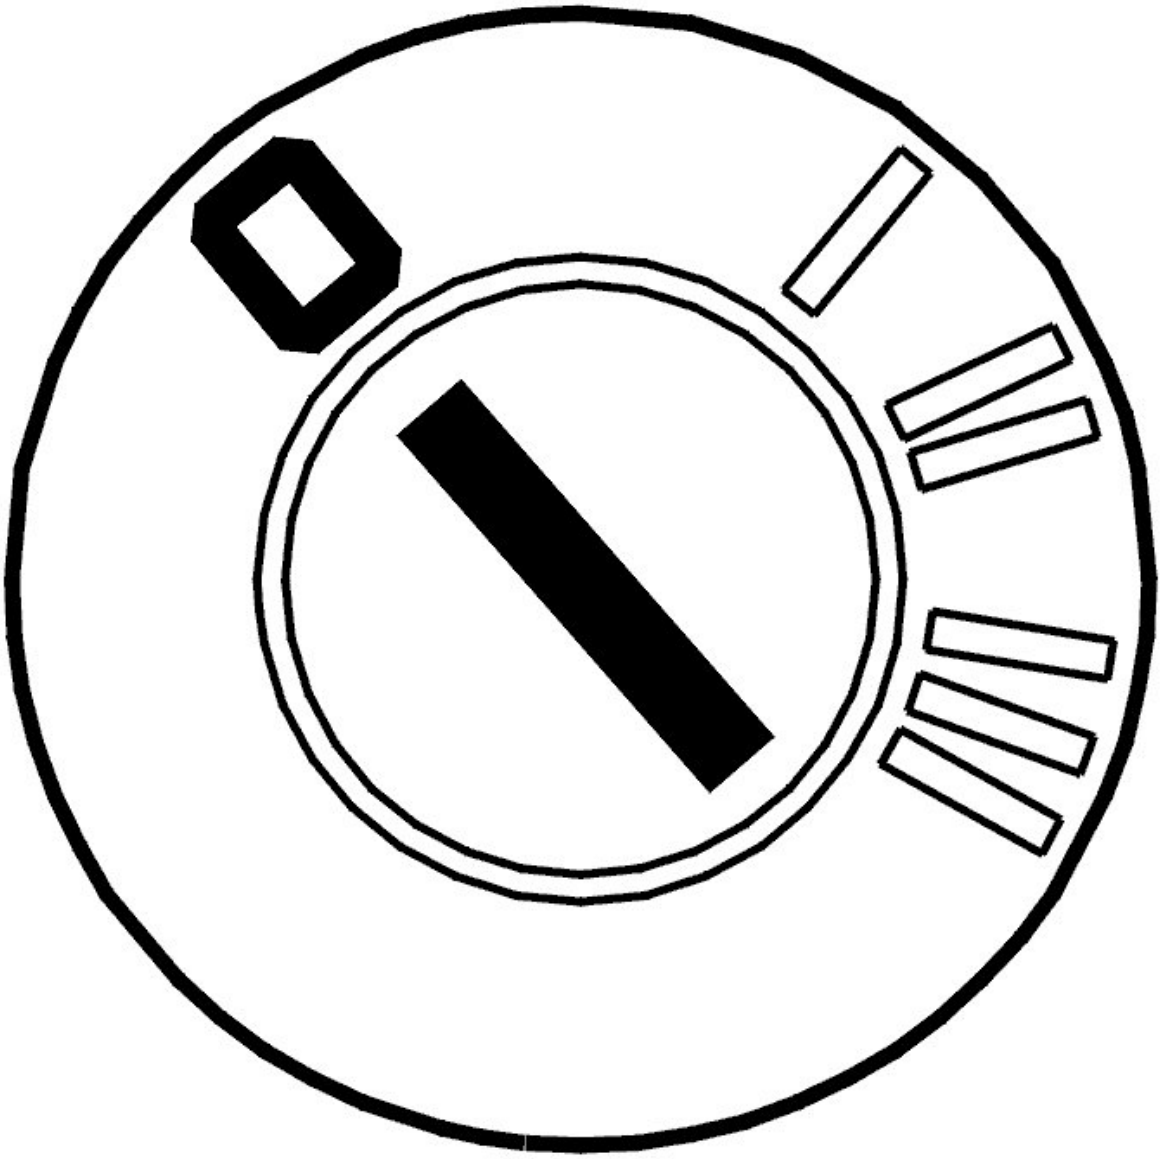
- Orange general warning lamp is on.

Signal Too High

Signal too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
check for an intermittent short-circuit to supply voltage according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminal #1, terminal #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and the connector for the seat belt tensioner disconnected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Diagnostic Trouble Code (DTC) Information

SRS-0070 Diagnostic trouble code information

Condition

If the circuit voltage is high for more than 10 seconds, diagnostic trouble code SRS-0070 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in seat-belt tensioner
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Signal Too High

Signal too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the seat belt tensioner and Supplemental Restraint System Module (SRS) connectors disconnected, the resistance between seat belt tensioner connector terminals #1 and #3 (Supplemental Restraint System Module (SRS) side) and the disconnected battery positive pole must be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and the connector for the seat belt tensioner disconnected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0082 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007A).- If diagnostic trouble code (DTC) SRS-007A for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0082).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0062,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006A,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0072,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007A,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0082,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent short-circuit to ground according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy connected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Fault-tracing information

Information

Fault-tracing information

If the fault is intermittent, do not verify fault-tracing if the fault does not recur.
It is possible to view the information again, or leave fault-tracing for this diagnostic trouble code (DTC).

Do you want to view the information again?

Yes - Attempt New Test

No - Fault Found

Attempt New Test - Intermittent fault

FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

SRS-0073 Diagnostic trouble code information

Condition

If the circuit capacitance is too low for more than 10 seconds, diagnostic trouble code SRS-0073 is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too Low

Capacitance too low. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0063,

front left seat belt tensioner terminals #5A(5) and #6A(6) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-006B,

front right seat belt tensioner terminals #5C(1) and #6C(2) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0073,

rear left seat belt tensioner terminals #16A(16) and #15A(15) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-007B,

centre rear seat belt tensioner terminals 17A(17) and #18A(18) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0083,

rear right seat belt tensioner terminals #16C(12) and #15C(11) and connector terminals #1 and #3
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.

Hint: Checking the integrated capacitor in the igniter connector by taking resistance measurements.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS).
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) must be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures.
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - No Fault Found

Attempt New Test - Checking the component

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-0075 Diagnostic trouble code information

Condition

If the circuit resistance is too low for more than 10 seconds, diagnostic trouble code SRS-0075 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit in connector
- Short circuit in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit in seat-belt tensioner (resistance in igniter too low).

Fault symptom[s]
- Orange general warning lamp is on.

Resistance Too Low

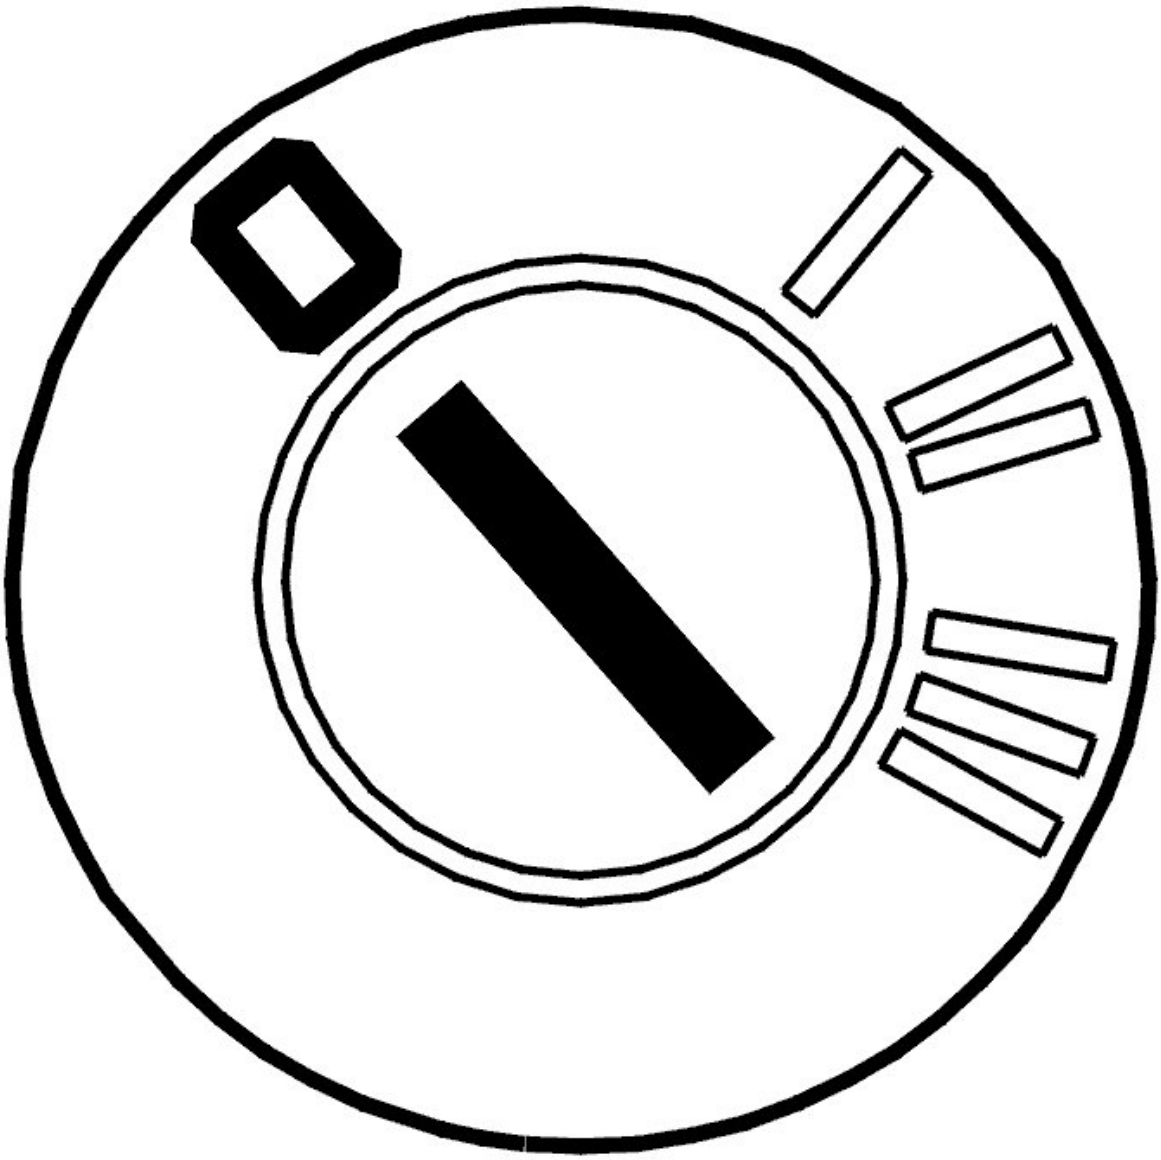
Resistance too low. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0085 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007D).- If diagnostic trouble code (DTC) SRS-007D for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0085).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0065,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006D,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0075,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007D,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0085,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent short-circuit to ground according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing

Diagnostic Trouble Code (DTC) Information

SRS-0078 Diagnostic trouble code information

Condition

If the circuit voltage is high for more than 10 seconds, diagnostic trouble code SRS-0078 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to voltage supply in seat-belt tensioner.

Fault symptom[s]
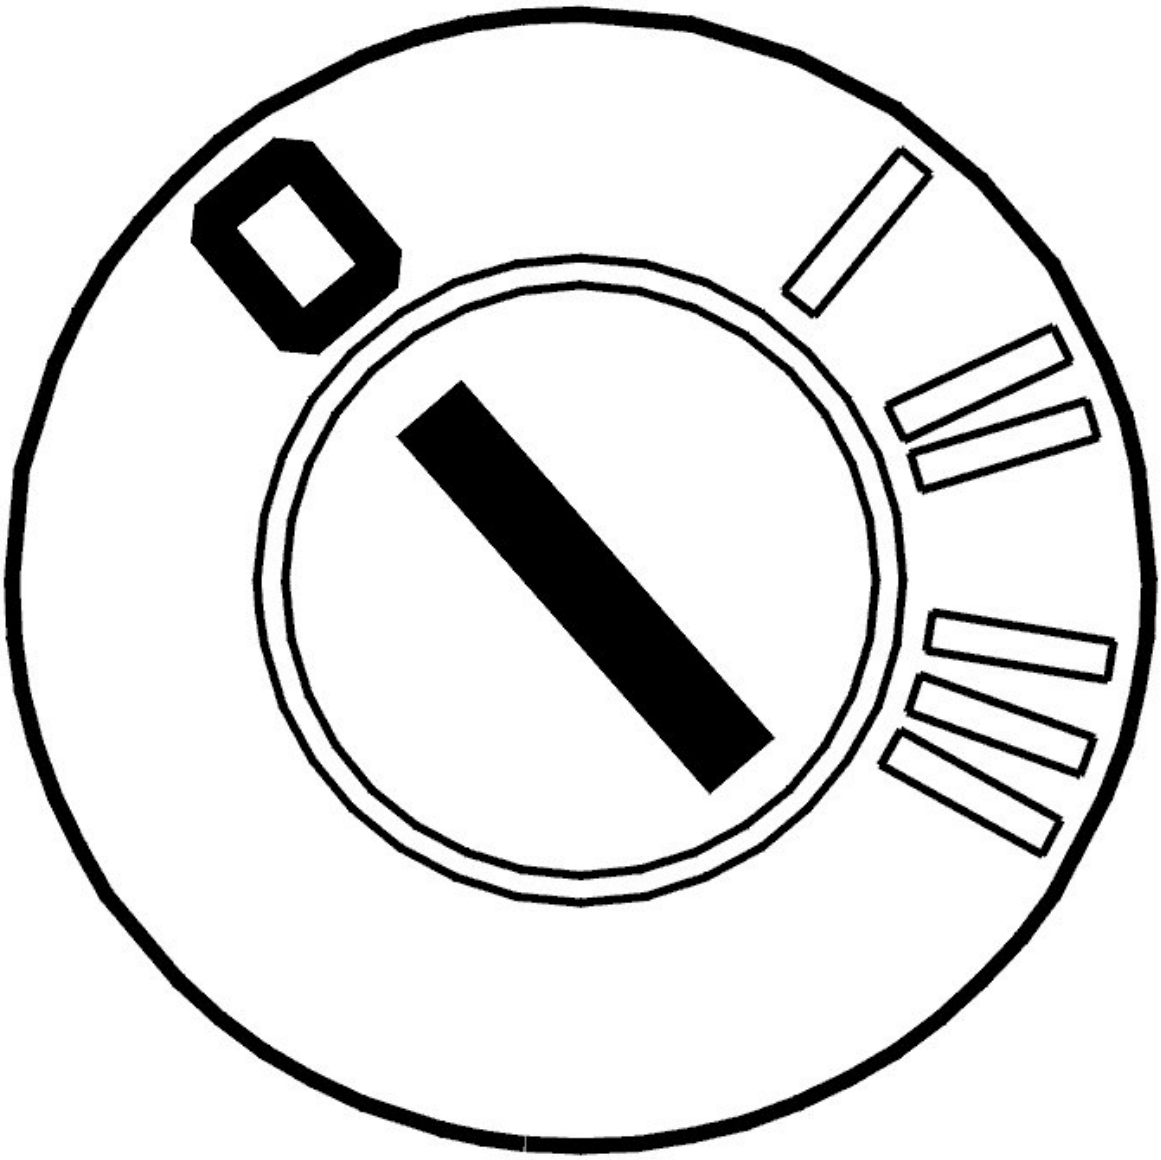
- Orange general warning lamp is on.

Signal Too High

Signal too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
check for an intermittent short-circuit to supply voltage according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Remedy as necessary.

If the circuit voltage is high for more than 10 seconds, diagnostic trouble code SRS-0078 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to voltage supply in seat-belt tensioner.

Fault symptom[s]
- Orange general warning lamp is on.

Signal Too High

Signal too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

FAULT FOUND - DONE

Diagnostic Trouble Code (DTC) Information

SRS-007A Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition

If the circuit capacitance is too high for more than 10 seconds, diagnostic trouble code SRS-007A is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too high in connector
- Capacitance too high in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too High

Capacitance too high. Intermittent fault

Intermittent fault

- Ignition off
- Disconnect the connector from the seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0082 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007A).- If diagnostic trouble code (DTC) SRS-007A for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0082).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0062,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006A,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0072,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007A,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0082,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent short-circuit to ground according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy connected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures

Diagnostic Trouble Code (DTC) Information

SRS-007A Diagnostic trouble code information

Condition

If the circuit capacitance is too high for more than 10 seconds, diagnostic trouble code SRS-007A is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too high in connector
- Capacitance too high in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too High

Capacitance too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the front seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0082 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007A).- If diagnostic trouble code (DTC) SRS-007A for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0082).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0062

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006A

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0072

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007A

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0082

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and the removed battery positive pole should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy connected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Select "Continue" when the fault has been remedied.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-007B Diagnostic trouble code information

Condition

If the circuit capacitance is too low for more than 10 seconds, diagnostic trouble code SRS-007B is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
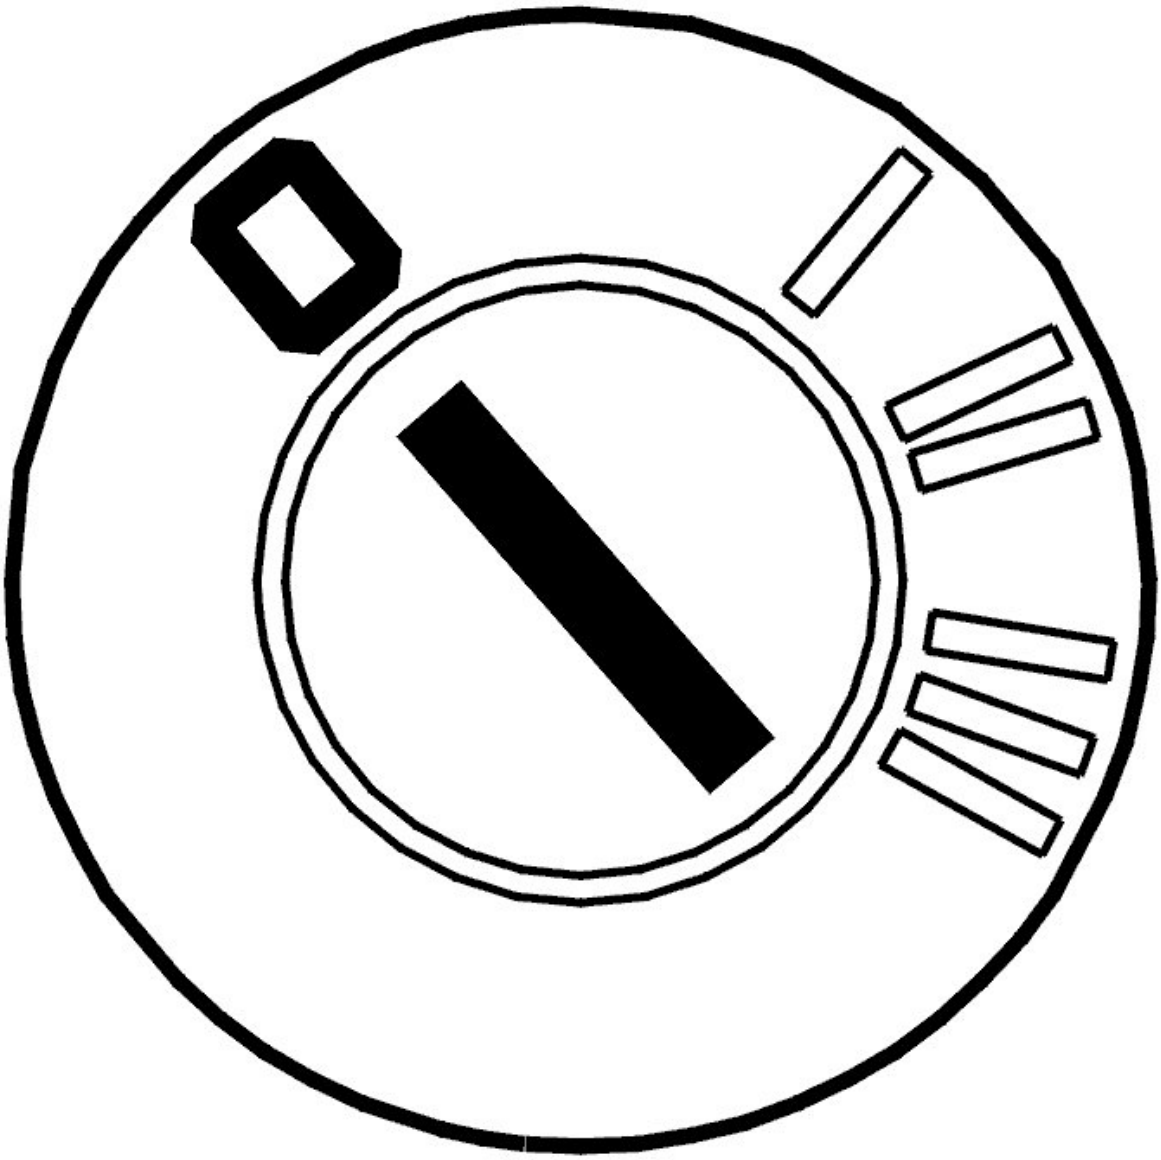
- Orange general warning lamp is on.

Capacitance Too Low

Capacitance too low. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0063,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006B,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0073,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007B,

terminals #17A(17), #18A(18) of the centre rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0083,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Hint: Check the integrated capacitor in the igniter connector: Measure the resistance.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS).
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) should be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures.

Possible source
- Contact resistance or open circuit in the wire between the seat-belt tensioner and supplemental restrain system (SRS)
- Open circuit in seat-belt tensioner (resistance in igniter too high).

Fault symptom[s]
- Orange general warning lamp is on.

Resistance Too High

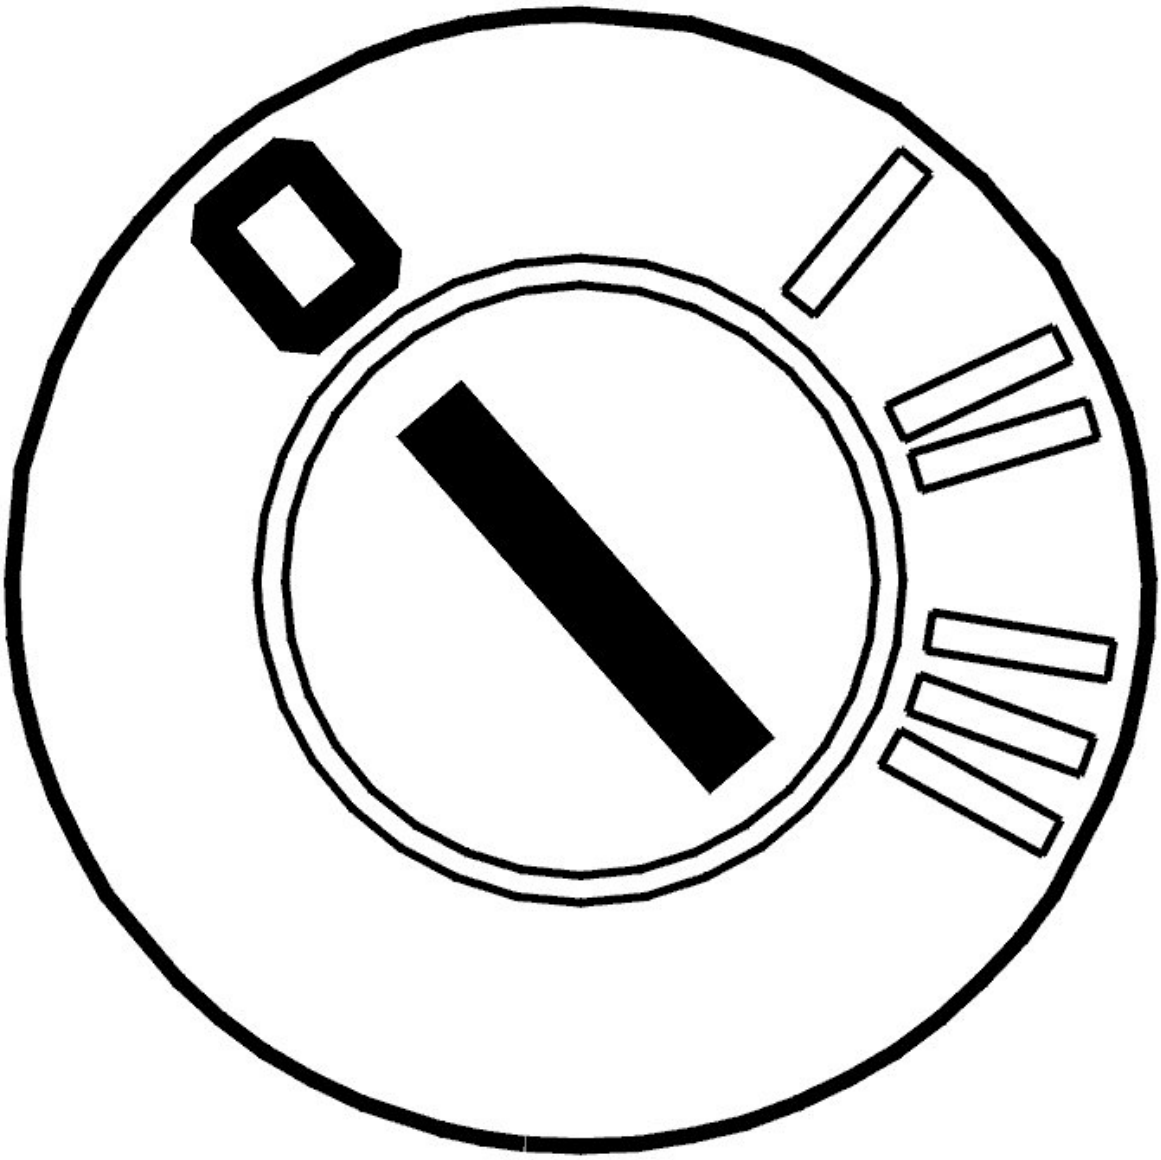
Resistance too high. Intermittent fault

Intermittent fault



- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0084 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007C).- If diagnostic trouble code (DTC) SRS-007C for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0084).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0064,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006C,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0074,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007C,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0084,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) must be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Diagnostic Trouble Code (DTC) Information

SRS-007D Diagnostic trouble code information

Condition

If the circuit resistance is too low for more than 10 seconds, diagnostic trouble code SRS-007D is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit in connector
- Short circuit in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit in seat-belt tensioner (resistance in igniter too low).

Fault symptom[s]
- Orange general warning lamp is on.

Resistance Too Low

Resistance too low. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the front seat belt tensioner, see Buckle seat belt front, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt Buckle/Service and Repair/Front Seat. To replace the rear seat belt tensioner, see Buckle seat belt rear, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt Buckle/Service and Repair/Buckle Seat Belt Rear, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0085 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007D).- If diagnostic trouble code (DTC) SRS-007D for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0085).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0065,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006D,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0075,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007D,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0085,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and the SRS control module disconnected, the resistance between terminals #1 and #3 on the seat belt tensioner connector (SRS control module side) must be infinite
- With the ignition off and special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy connected, the resistance between the different terminals for each diagnostic trouble code (DTC) (see above) on the SRS control module connector (seat belt tensioner side) must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

SRS-0080 Diagnostic trouble code information

Condition

If the circuit voltage is too high for more than 10 seconds, diagnostic trouble code SRS-0080 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to voltage supply in connector
- Short circuit to voltage supply in seat-belt tensioner
- Short circuit to voltage supply in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Signal Too High

Signal too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0080 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0078).- If diagnostic trouble code (DTC) SRS-0078 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0080).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0060,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0068,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0070,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0078,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0080,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0081 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0079).- If diagnostic trouble code (DTC) SRS-0079 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0081).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0061,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0069,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0071,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0079,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0081,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for a short-circuit to ground. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connector for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and ground must be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).

Information

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - No Fault Found

Attempt New Test - Checking the component

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.

- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-0081 Diagnostic trouble code information

Condition

If the circuit voltage is too low (0V) for more than 10 seconds, diagnostic trouble code SRS-0081 is displayed.

Substitute value
- Nothing.

Possible source
- Short circuit to ground in connector
- Short circuit to ground in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS)
- Short circuit to ground in seat-belt tensioner.

Fault symptom[s]
- Orange general warning lamp is on.

Signal Too Low

Signal too low. Intermittent fault

Intermittent fault

- Ignition off
- Disconnect the connector from the seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings from a disconnected undeployed seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0081 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-0079).- If diagnostic trouble code (DTC) SRS-0079 for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0081).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0061,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0069,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0071,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0079,

terminals #17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0081,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent short-circuit to ground according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

SRS-0082 Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition

If the circuit capacitance is too high for more than 10 seconds, diagnostic trouble code SRS-0082 is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too high in connector
- Capacitance too high in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too High

Capacitance too high. Intermittent fault

Intermittent fault

- Ignition off
- Disconnect the connector from the seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0082 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007A).- If diagnostic trouble code (DTC) SRS-007A for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0082).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0062,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006A,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0072,

SRS-0083 Diagnostic trouble code information

Condition

If the circuit capacitance is too low for more than 10 seconds, diagnostic trouble code SRS-0083 is displayed.

Substitute value
- Nothing.

Possible source
- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too Low

Capacitance too low. Intermittent fault

Intermittent fault

- Ignition off.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the SRS module and seat belt tensioner. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0063,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006B,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0073,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007B,

terminals #17A(17), #18A(18) of the centre rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0083,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an intermittent open-circuit according to Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.

Hint: Check the integrated capacitor in the igniter connector: Measure the resistance.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS).
- With the ignition off and the seat belt tensioner connector disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) should be approximately 22 kohms.
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures.

- Capacitance too low in connector
- Capacitance too low in the signal wire between seat-belt tensioner and the supplemental restrain system (SRS).

Fault symptom[s]
- Orange general warning lamp is on.

Capacitance Too Low

Capacitance too low. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing.
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0083 for the right seat belt tensioner is registered, follow fault-tracing for the centre seat belt tensioner (SRS-007B).- If diagnostic trouble code (DTC) SRS-007B for the centre seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0083).

Check the cable between the SRS control module and the connector terminal for the seat belt tensioner as follows:

for diagnostic trouble code (DTC) SRS-0063,

front left seat belt tensioner terminals #5A(5) and #6A(6) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-006B,

front right seat belt tensioner terminals #5C(1) and #6C(2) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0073,

rear left seat belt tensioner terminals #16A(16) and #15A(15) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-007B,

centre rear seat belt tensioner terminals 17A(17) and #18A(18) and connector terminals #1 and #3

for diagnostic trouble code (DTC) SRS-0083,

rear right seat belt tensioner terminals #16C(12) and #15C(11) and connector terminals #1 and #3
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.

Hint: Checking the integrated capacitor in the igniter connector by taking resistance measurements.
With the ignition off, connect the test instrument probes between terminals #1 and #3 on the connector for the driver's airbag. The ohmmeter reading should rise rapidly to infinity.
Reverse the position of the ohmmeter positive and negative test probes. Connect them to the connector as in the previous measurement. The ohmmeter reading should drop rapidly to approximately 0 ohms and then increase to infinity.

Remedy as necessary.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

VERIFIED - Fault Found

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

SRS-0084 Diagnostic trouble code information

Condition

If the circuit resistance is too high for more than 10 seconds, diagnostic trouble code SRS-0084 is displayed.

Substitute value
- Nothing.

Possible source
- Contact resistance or open circuit in the wire between the seat-belt tensioner and supplemental restrain system (SRS)
- Open circuit in seat-belt tensioner (resistance in igniter too high).

Fault symptom[s]
- Orange general warning lamp is on.

Resistance Too High

Resistance too high. Permanent fault

Checking the component

- Ignition off
- Disconnect the connector from the seat belt tensioner
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring

- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the female and male parts of the connectors for the SRS control module and the seat belt tensioner. The cable terminals must not be damaged or pressed back.

Caution! For V70 2000- with model year 2000 and 2001:- If diagnostic trouble code (DTC) SRS-0084 for the right seat belt tensioner is registered, follow fault-tracing for the center seat belt tensioner (SRS-007C).- If diagnostic trouble code (DTC) SRS-007C for the center seat belt tensioner is registered, follow fault-tracing for the right seat belt tensioner (SRS-0084).

Check the cable between the SRS control module and the terminal on the seat belt tensioner connector according to the following:

for diagnostic trouble code (DTC) SRS-0064,

terminals #5A(5), #6A(6) of the front left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-006C,

terminals #5C(1), #6C(2) of the front right seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0074,

terminals #16A(16), #15A(15) of the rear left seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-007C,

terminals 17A(17), #18A(18) of the center rear seat belt tensioner and connector terminals #1, #3.

for diagnostic trouble code (DTC) SRS-0084,

terminals #16C(12), #15C(11) of the rear right seat belt tensioner and connector terminals #1, #3.
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

Diagnostic Trouble Code (DTC) Information

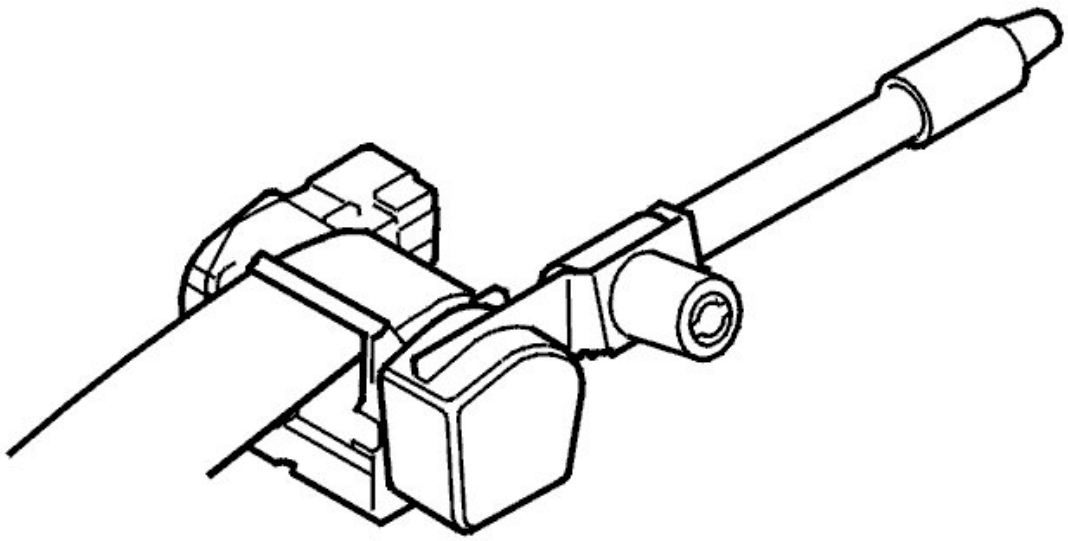
Diagnostic trouble code (DTC) information SRS-0090

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
Diagnostic trouble code (DTC) SRS-0090 is stored if the control module registers that the voltage in the signal cable is too high for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0090 can be diagnosed in ignition positions I, II or III.

Substitute value

- None.

Possible source

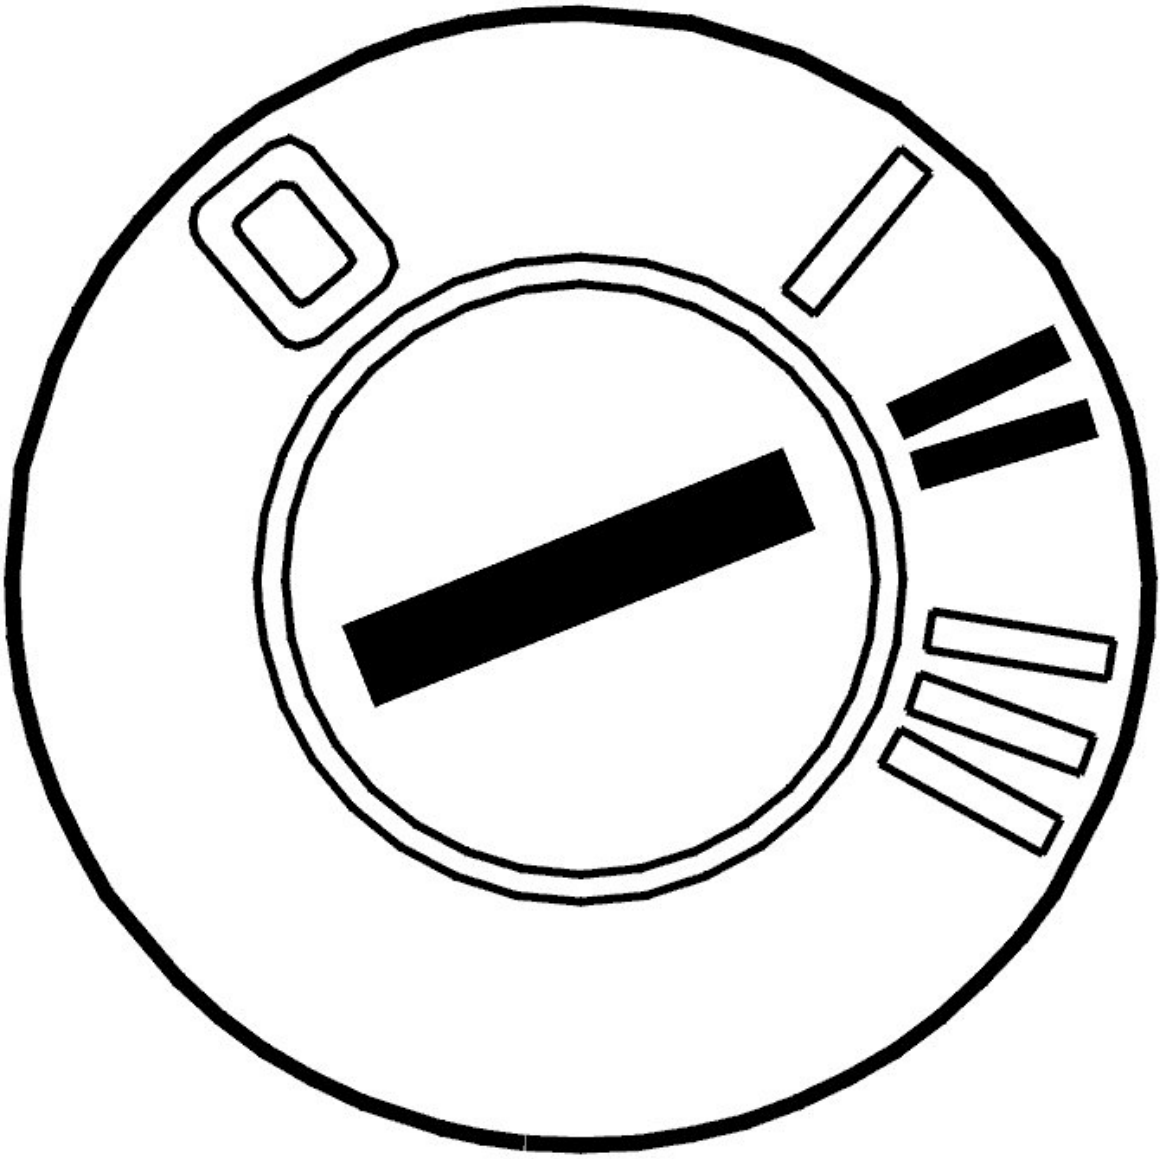
- Short-circuit to supply voltage in the signal cable between the seat belt tensioner and the Supplemental Restraint System Module (SRS)
- Short-circuit to supply voltage in the connector
- Short-circuit to supply voltage in the seat belt tensioner.

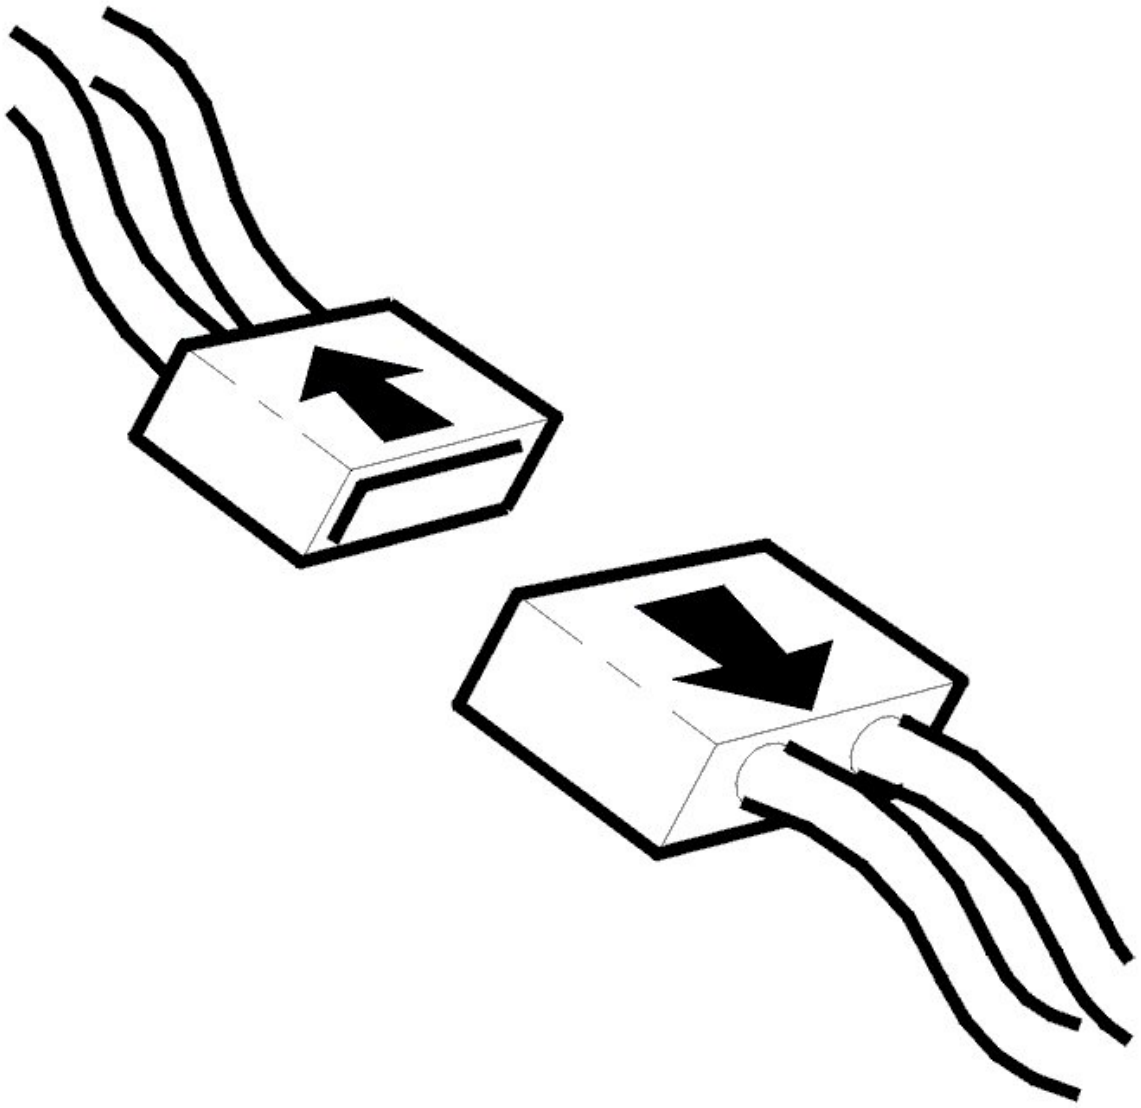
Fault symptom[s]
- General warning lamp lit.

Signal Too High

Signal too high

Checking the component





- Ignition off
- Disconnect the connector from the left seat belt tensioner on the 3rd seat row
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings from a disconnected undeployed seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

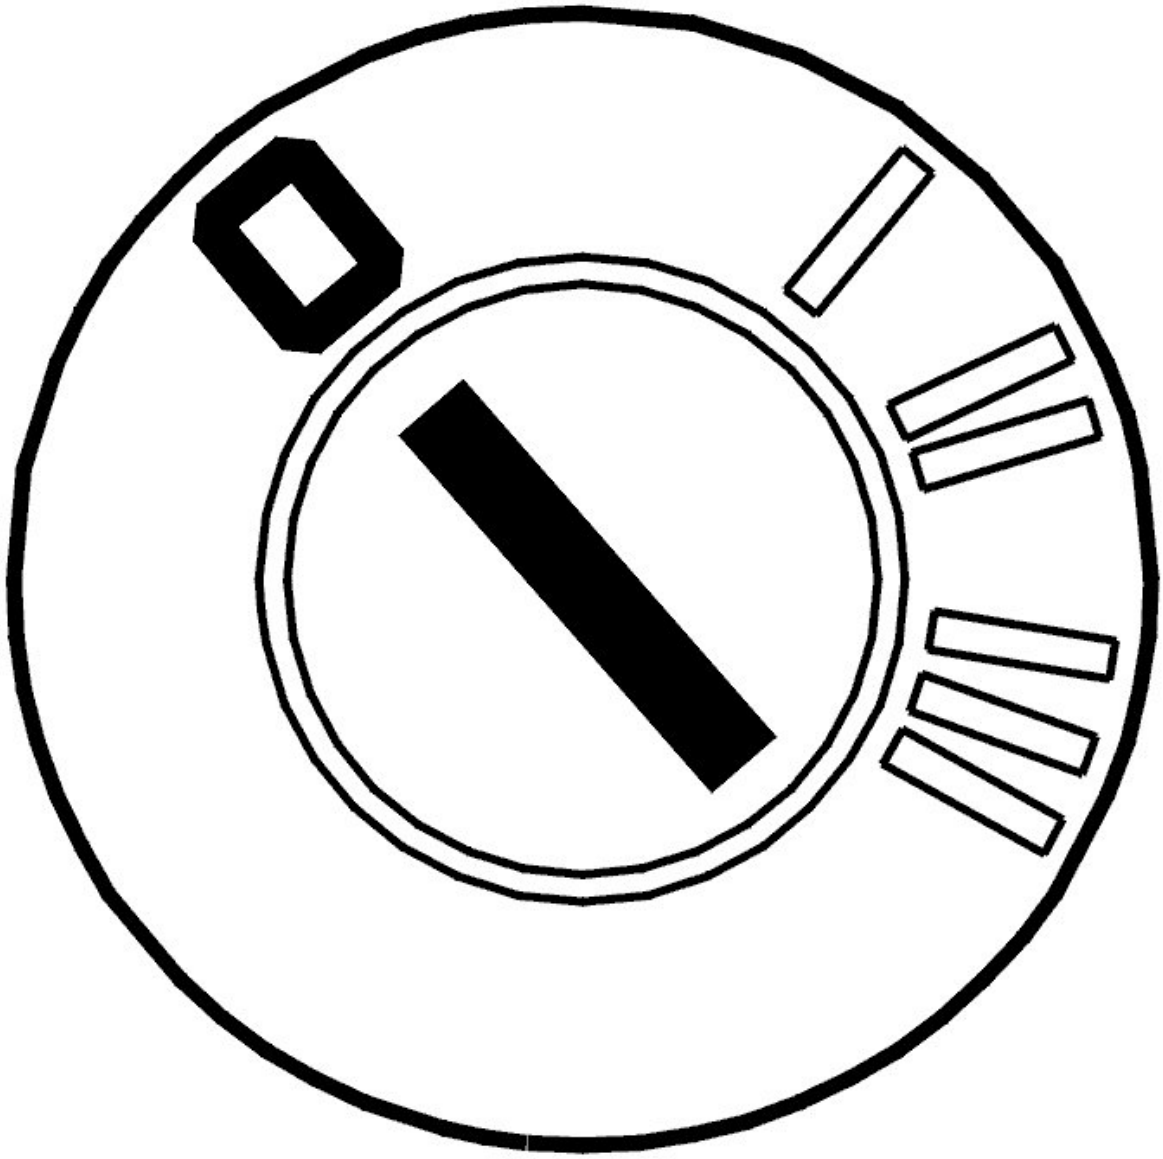
- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings from a disconnected undeployed seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the Supplemental Restraint System Module (SRS). There is a risk of static discharge. This could damage the Supplemental Restraint System Module (SRS).

Check the cable between the Supplemental Restraint System Module (SRS) terminal #12A(12), terminal #11A(11) and connector terminal #1, terminal #3 on the left seat belt tensioner on the 3rd seat row. Check for a short-circuit to supply voltage.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see
- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the seat belt tensioner and the Supplemental Restraint System Module (SRS) disconnected, the resistance between terminals #1 and #3 on the seat belt tensioner connector (Supplemental Restraint System Module (SRS) side) and the disconnected battery positive terminal should be infinite
- For information about removing the battery cables, see Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- With the ignition off and the connector for the seat belt tensioner disconnected, the resistance between terminals #12A(12) and #11A(11) on

the Supplemental Restraint System Module (SRS) connector should be infinite

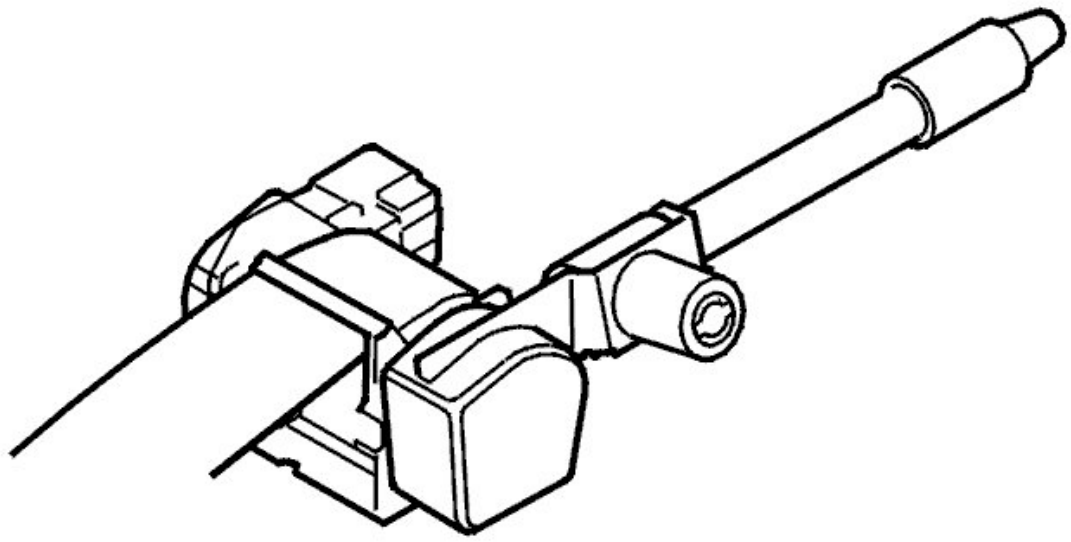
VERIFICATION FAILED - Fault-tracing information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0091

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
Diagnostic trouble code (DTC) SRS-0091 is stored if the control module registers that the voltage in the signal cable is too low for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0091 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

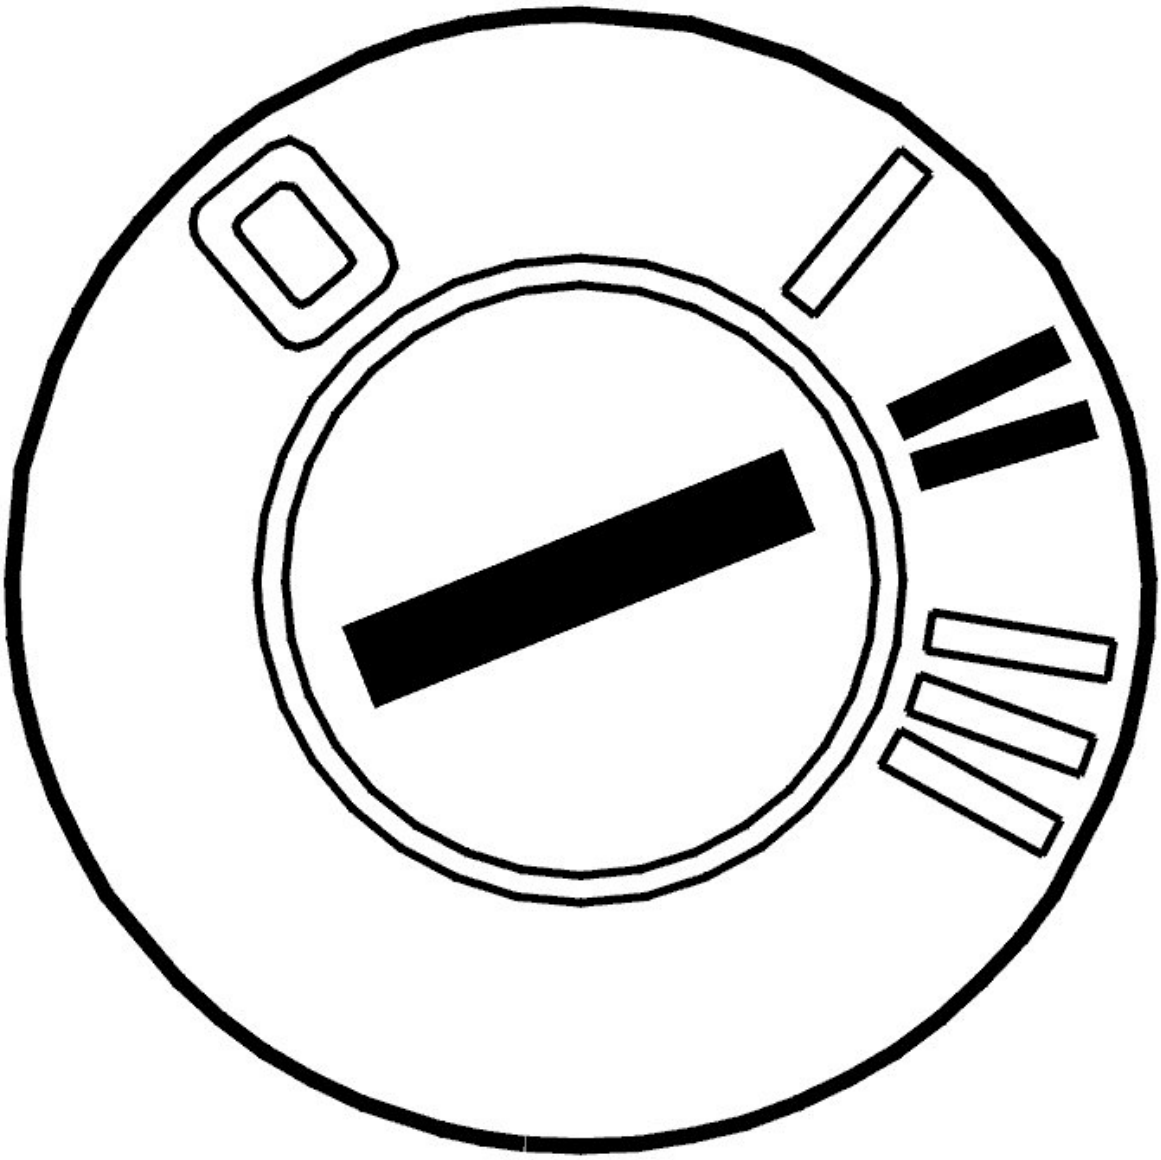
Possible source
- Short-circuit to ground in the signal cable between the seat belt tensioner and the Supplemental Restraint System Module (SRS)
- Short-circuit to ground in the connector
- Short-circuit to ground in the seat belt tensioner.

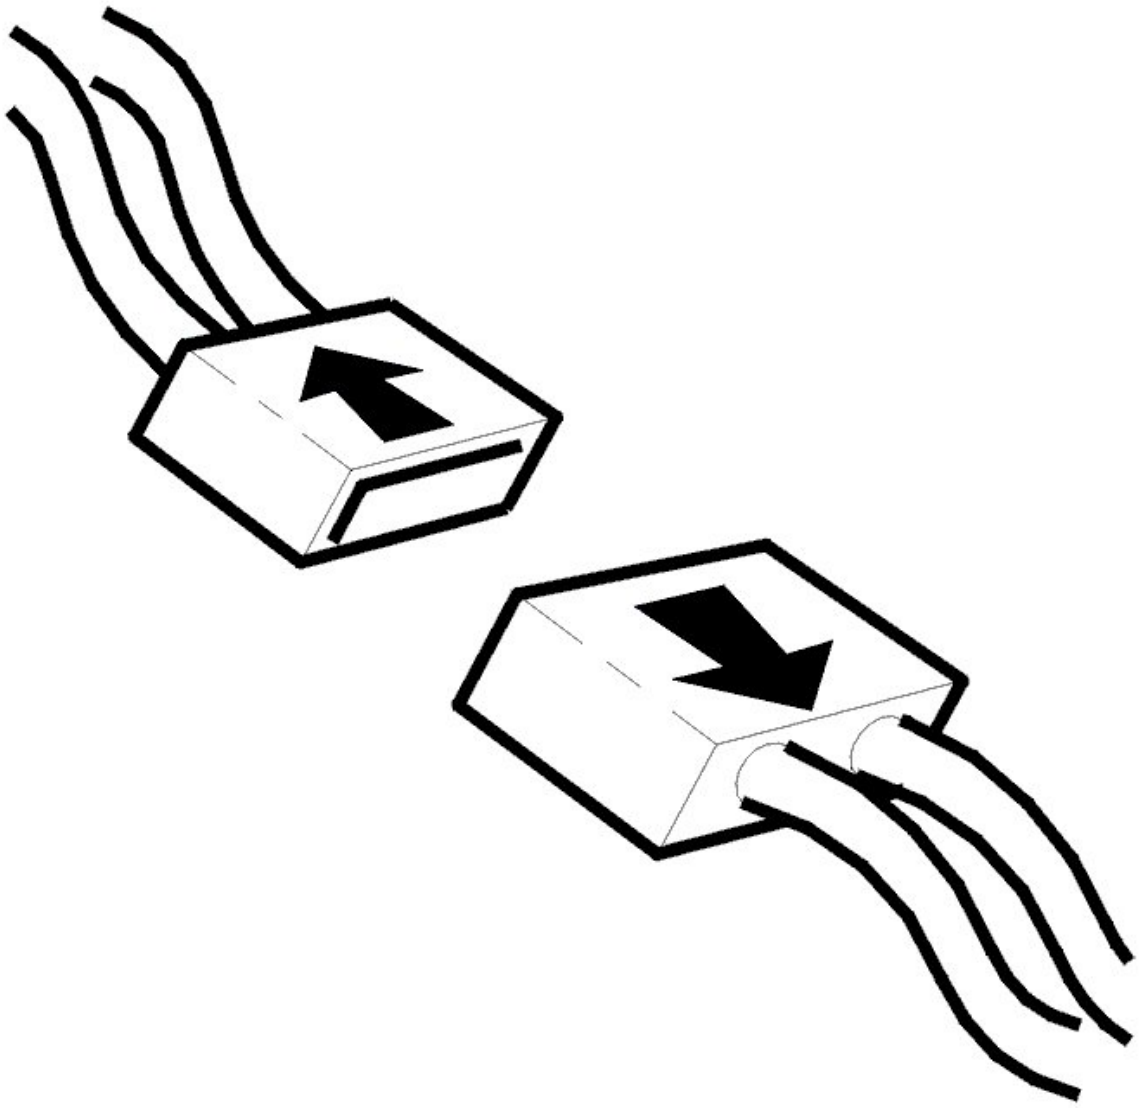
Fault symptom[s]
- General warning lamp lit.

Signal Too Low

Signal too low

Checking the component





- Ignition off
- Disconnect the connector from the left seat belt tensioner on the 3rd seat row
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

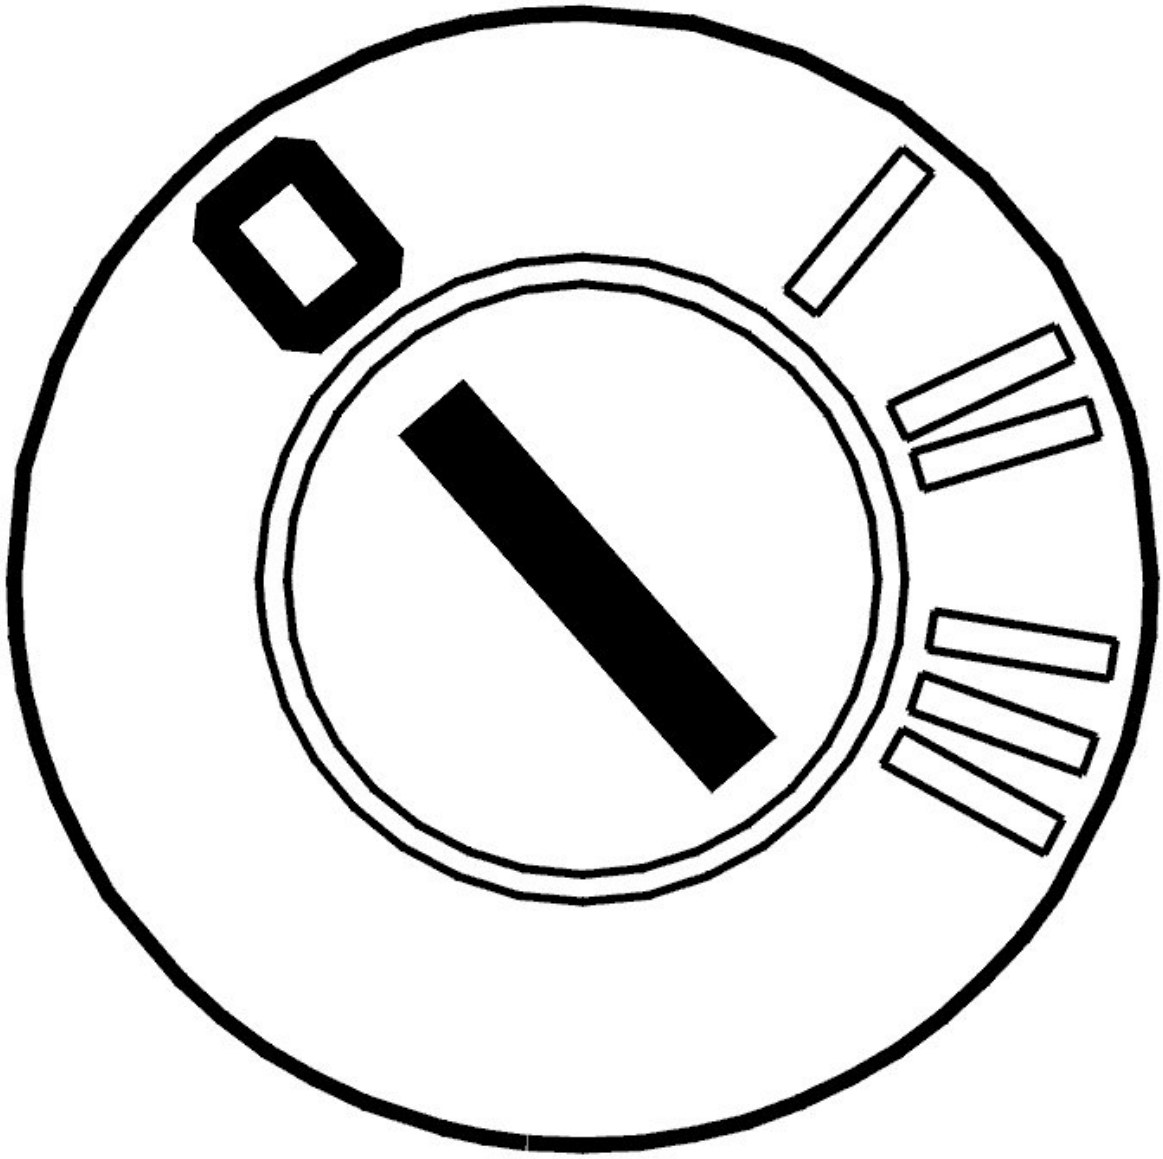
- To replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the Supplemental Restraint System Module (SRS). There is a risk of static discharge. This could damage the Supplemental Restraint System Module (SRS).

Check the cable between the Supplemental Restraint System Module (SRS) terminal #12A(12), terminal #11A(11) and connector terminal #1, terminal #3 on the left seat belt tensioner on the 3rd seat row. Check for a short-circuit to ground.
Remedy as necessary.

Other information:

- To access and replace the Supplemental Restraint System Module (SRS) and connector, see
- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the seat belt tensioner and for the Supplemental Restraint System Module (SRS) disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (Supplemental Restraint System Module (SRS) side) and ground should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures

Diagnostic Trouble Code (DTC) Information

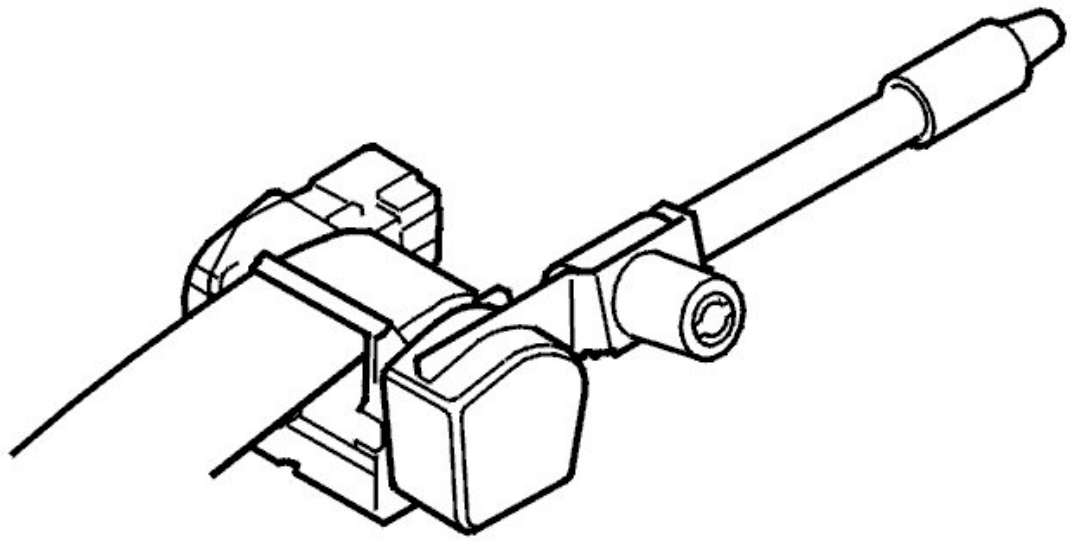
Diagnostic trouble code (DTC) information SRS-0096

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
One of the following diagnostic trouble codes (DTCs) will be stored if the resistance in any of the wiring circuits is lower than 10 ohms for longer than 10 seconds:
SRS-0096
SRS-009E
depending on which wiring circuit the fault is in.
Diagnostic trouble codes (DTCs):
SRS-0096
SRS-009E
can only be diagnosed when switching on the power (12 V). In other words, the diagnostic trouble codes (DTCs) can only be diagnosed when you switch from ignition position 0 to ignition positions I, II or III.

Substitute value
- None.

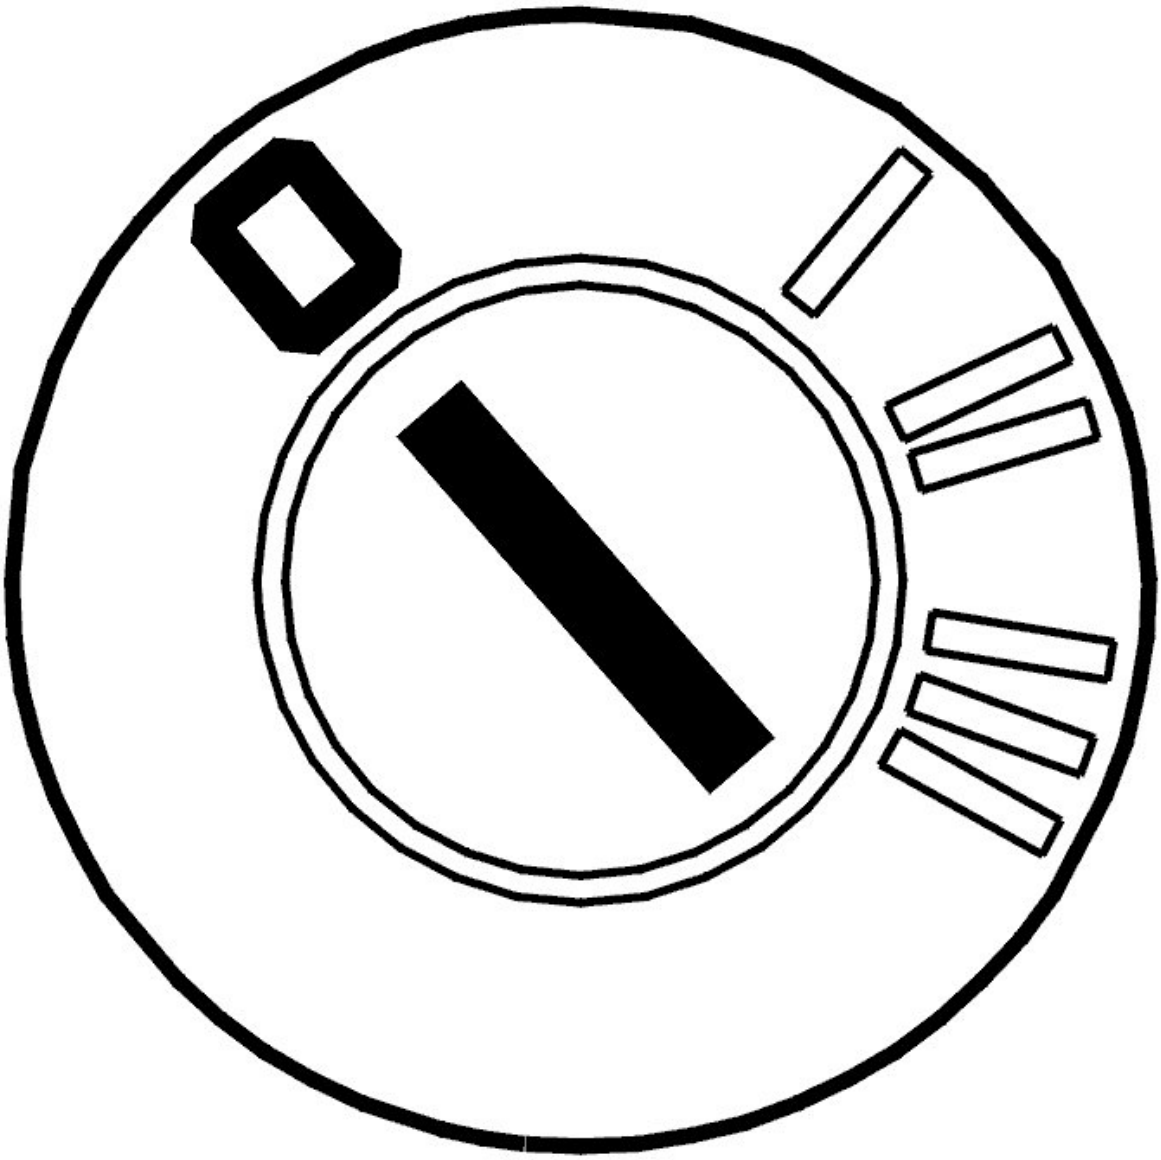
Possible source
- If the Supplemental Restraint System Module (SRS) identifies that a seat belt tensioner is installed, despite the control module being programmed that a seat belt tensioner is not installed.

Fault symptom[s]
- General warning lamp lit.

Configuration Fault

Configuration fault

Checking the component



- Ignition off.

Check the control module and SRS system connectors to ensure that no terminal pins are damaged. Also check the wiring.
Check that the correct control module is installed in the car. Read off by clicking the VCT2000 symbol.
Check that the switch for the left seat belt tensioner on the 3rd seat row is not connected to a seat belt tensioner if the car is a 5-seat model.
Replace the control module if no fault is found.

VERIFICATION FAILED - Fault-tracing information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

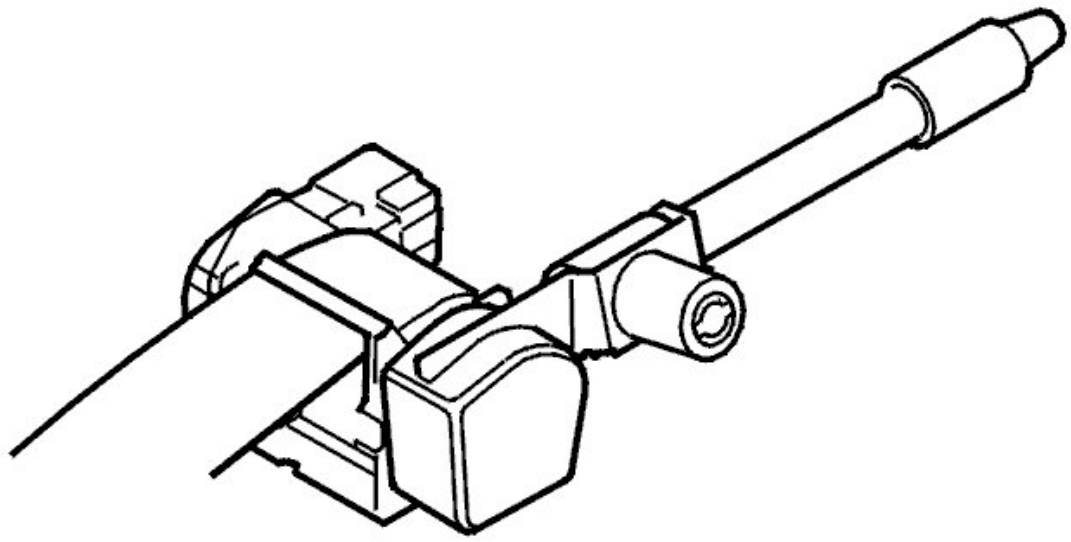
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0099

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
Diagnostic trouble code (DTC) SRS-0099 is stored if the control module registers that the voltage in the signal cable is too low for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0099 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

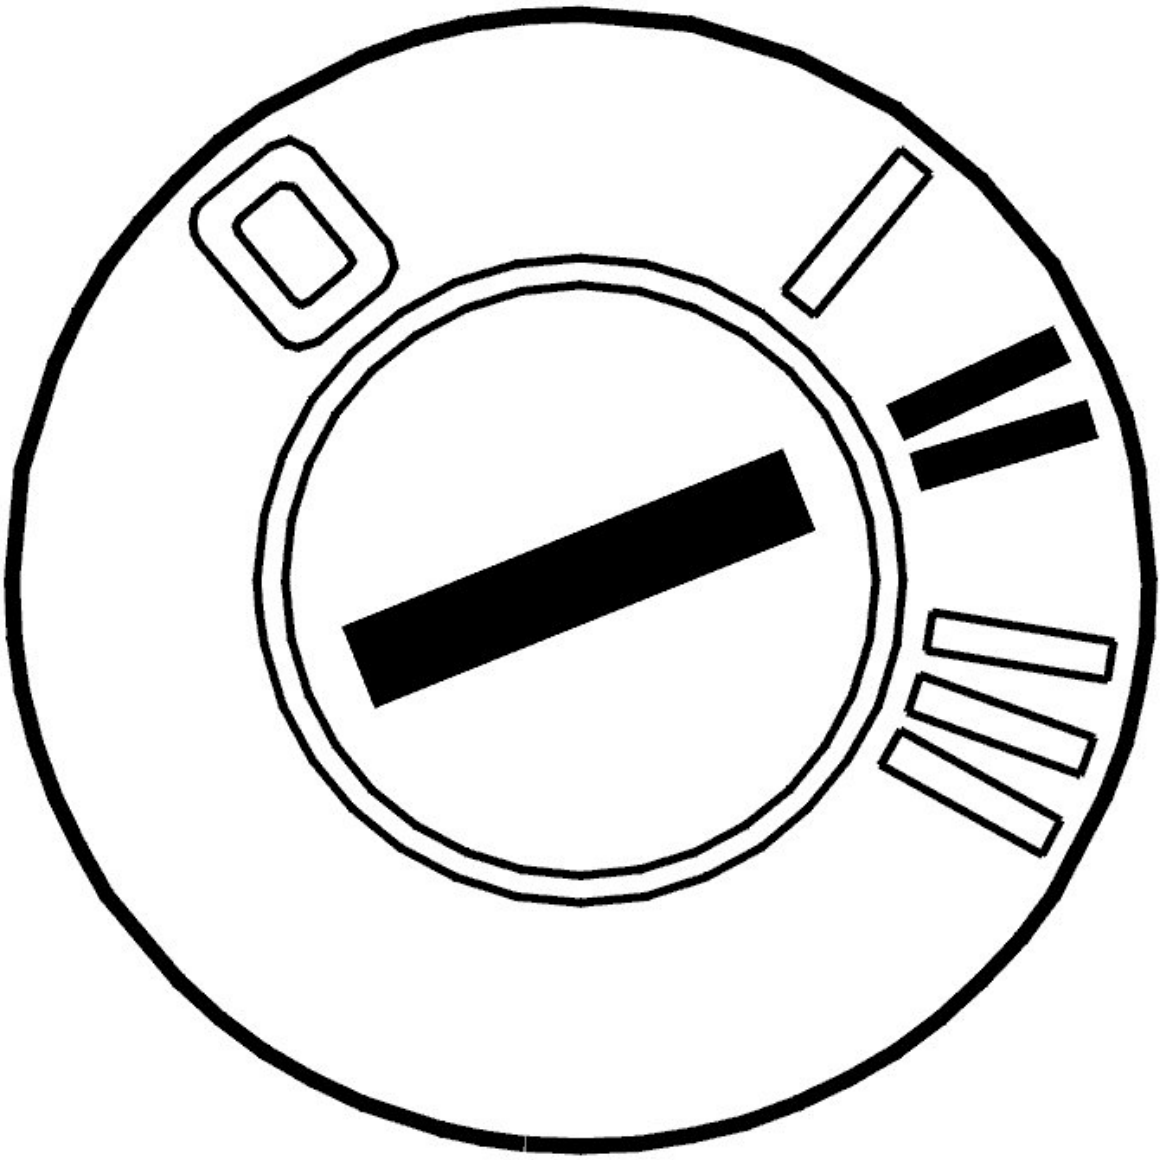
Possible source
- Short-circuit to ground in the signal cable between the seat belt tensioner and the Supplemental Restraint System Module (SRS)
- Short-circuit to ground in the connector
- Short-circuit to ground in the seat belt tensioner.

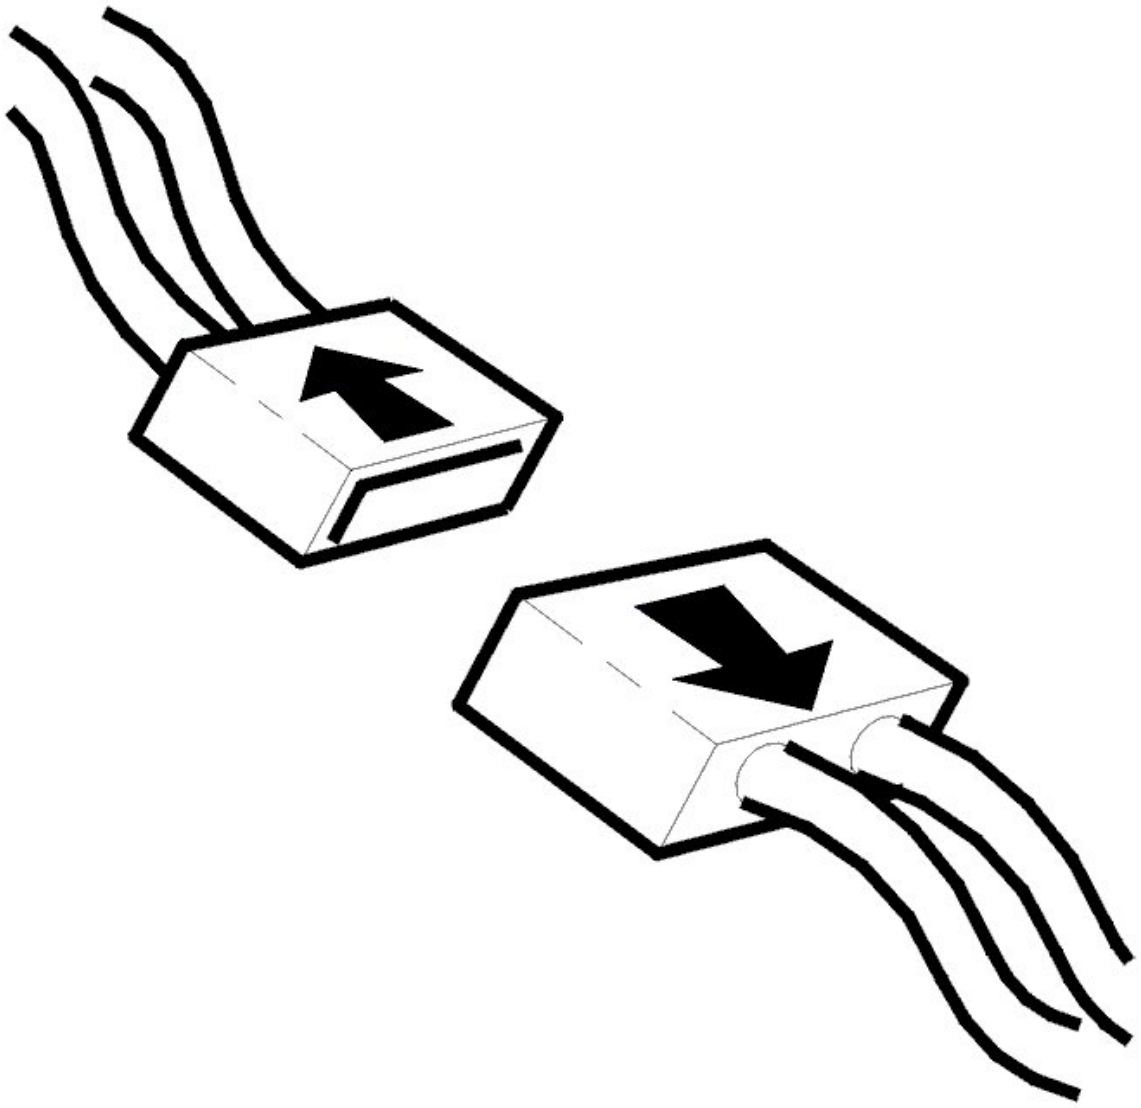
Fault symptom[s]
- General warning lamp lit.

Signal Too Low

Signal too low

Checking the component





- Ignition off
- Disconnect the connector from the right seat belt tensioner on the 3rd seat row
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

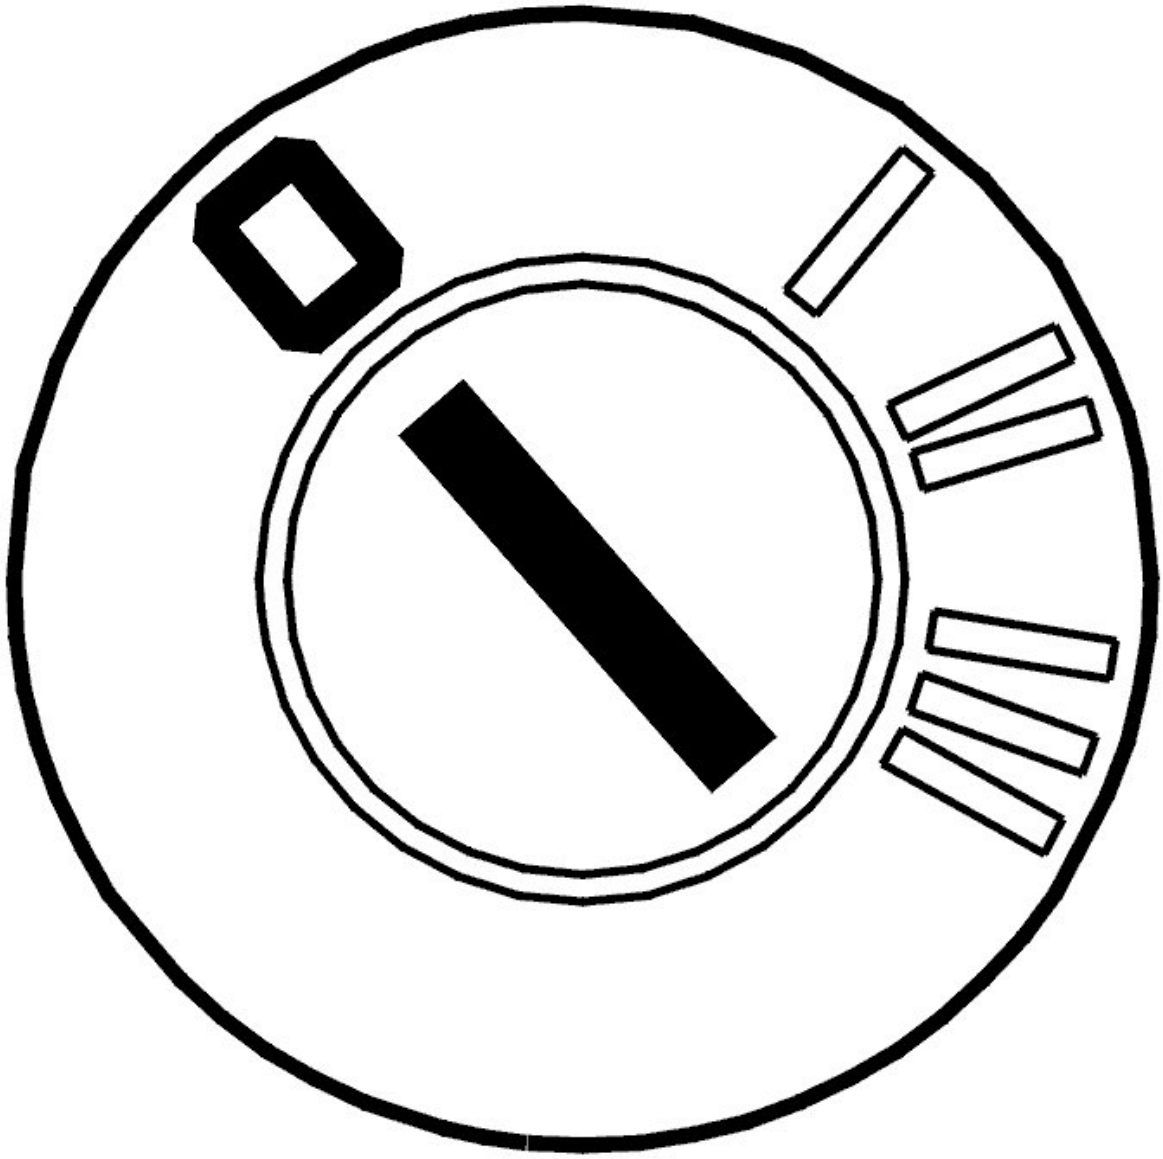
- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for seat belt tensioner.

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between the Supplemental Restraint System Module (SRS) terminal #13C(9), terminal #14C(10) and connector terminal #1, terminal #3 on the right seat belt tensioner on the 3rd seat row. Check for a short-circuit to ground.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see
- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the seat belt tensioner and for the SRS control module disconnected, the resistance between the seat belt tensioner connector terminals #1 and #3 (SRS control module side) and ground should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For information about signals, see
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and

Terminals/Checking Wiring And Terminals.

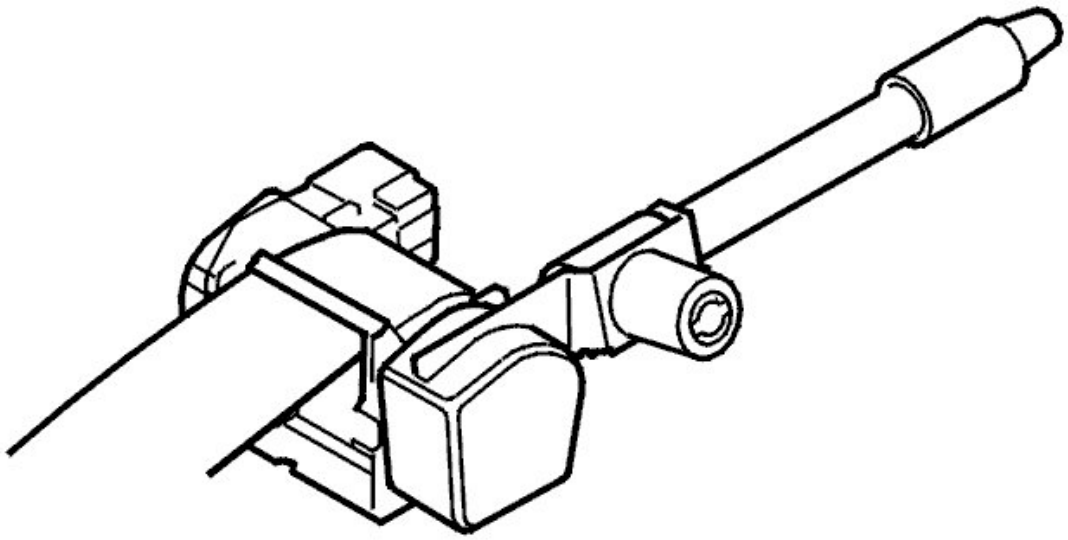
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-009A

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
Diagnostic trouble code (DTC) SRS-009A is stored if the control module registers that the capacitance in the signal cable is too high for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-009A can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

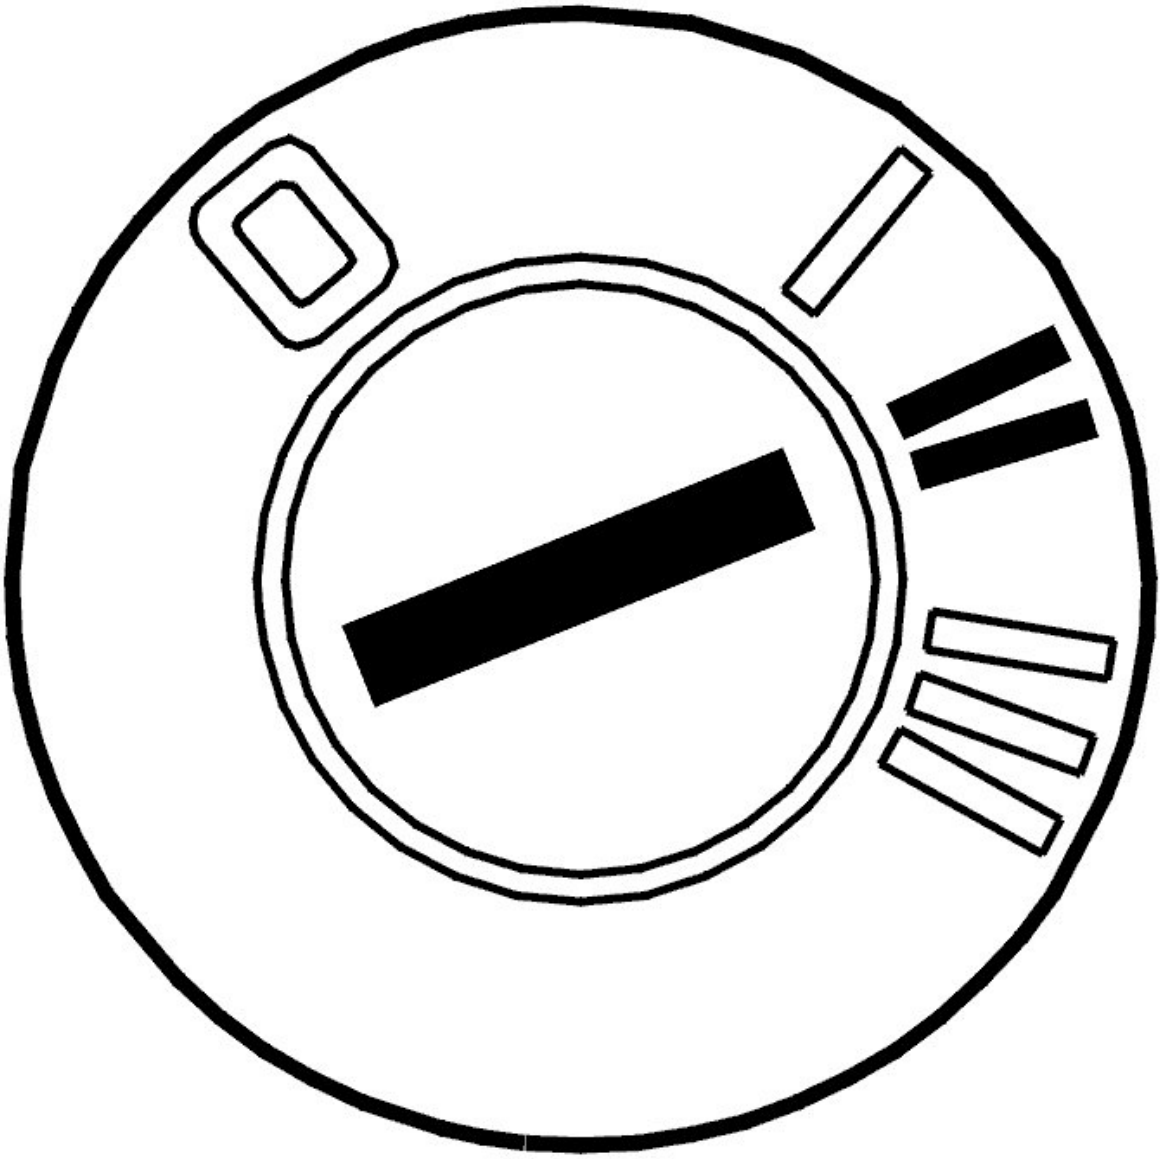
Possible source
- The capacitance is too high or there is a short-circuit in the integrated capacitor in the connector for the SRS ignition cable.

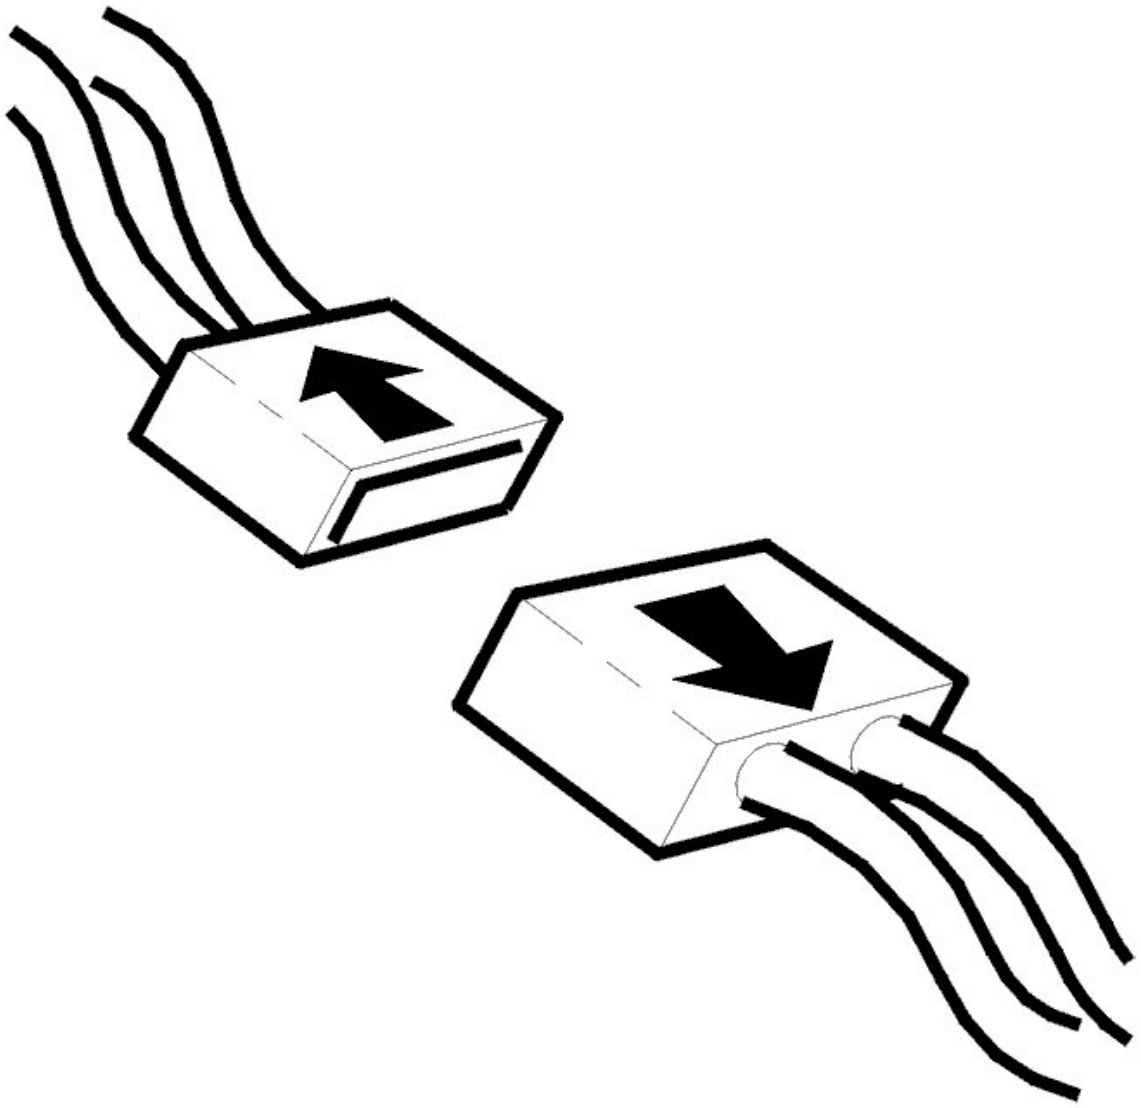
Fault symptom[s]
- General warning lamp lit.

Capacitance Too High

Capacitance too high

Checking the component





- Ignition off
- Disconnect the connector from the right seat belt tensioner on the 3rd seat row
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the seat belt tensioner

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new seat belt tensioner if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing

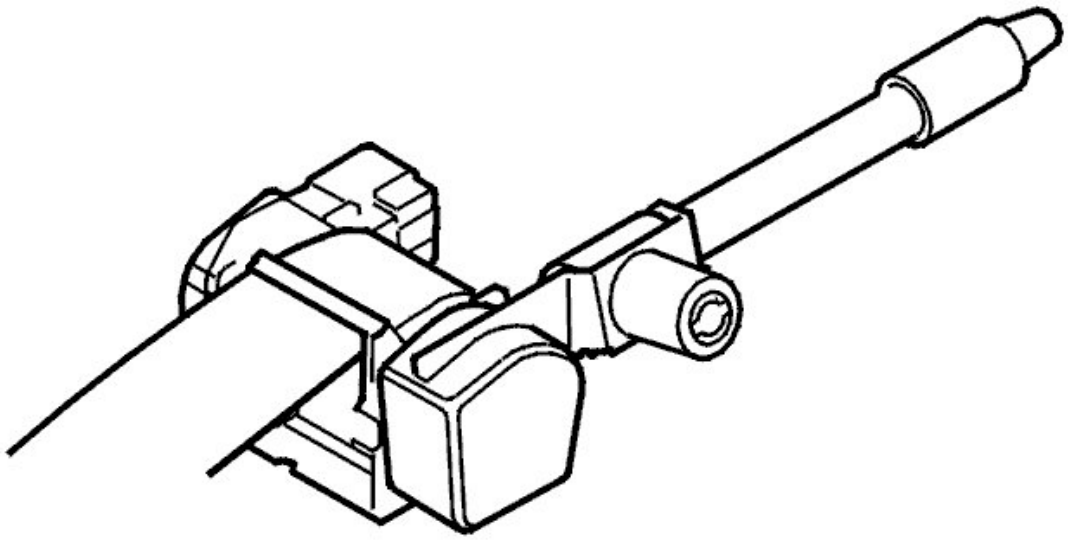
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-009B

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
Diagnostic trouble code (DTC) SRS-009B is stored if the control module registers that the capacitance in the signal cable is too low for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-009B can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

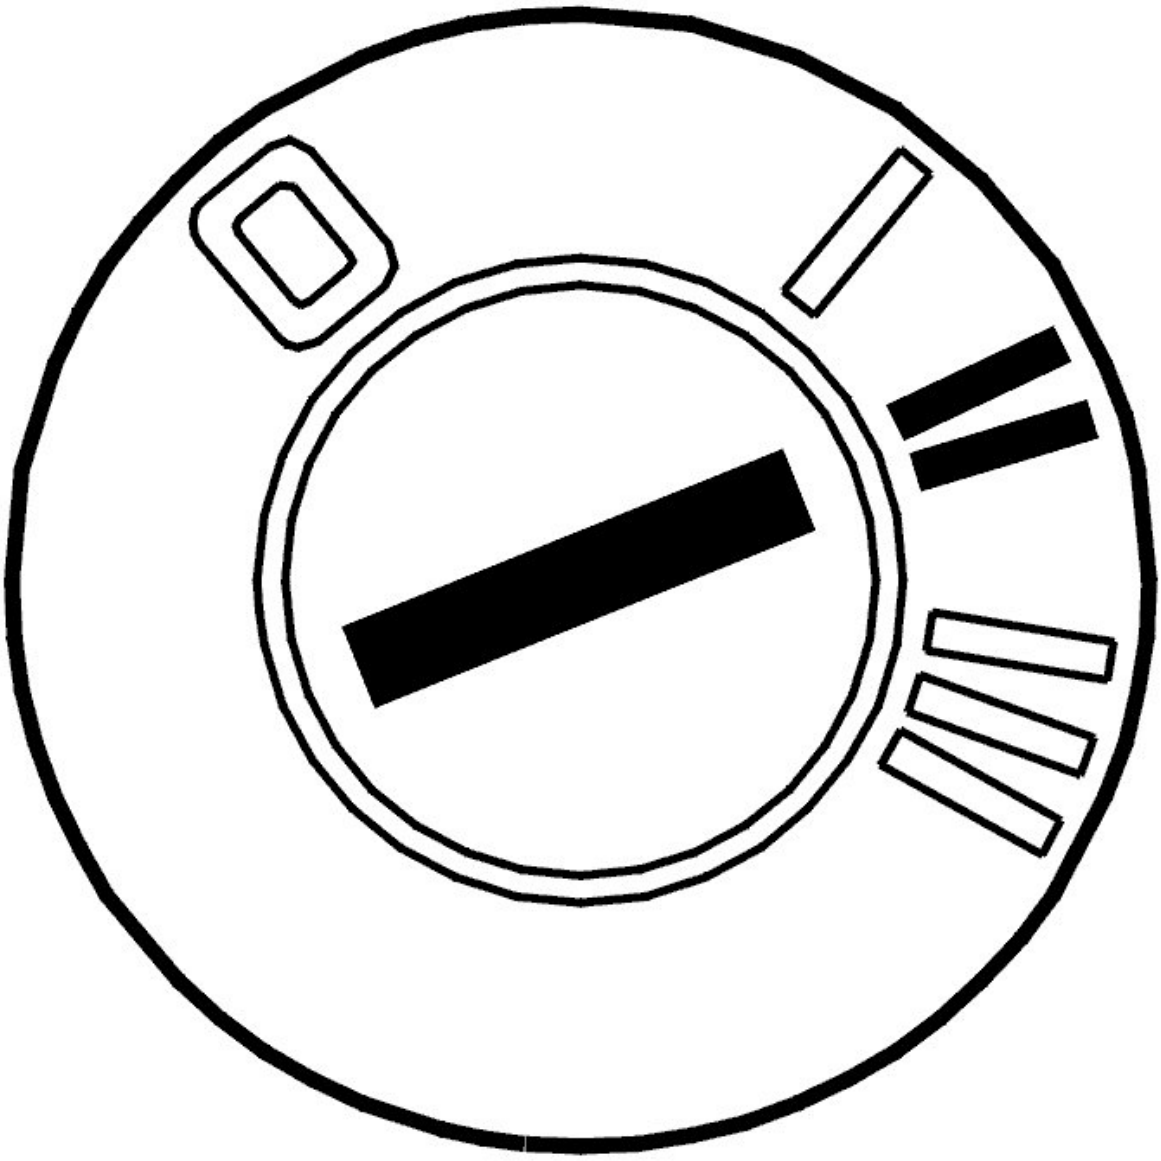
Possible source
- Too low capacitance in connector
- Too low capacitance in the signal cable between the seat belt tensioner and the SRS control module.

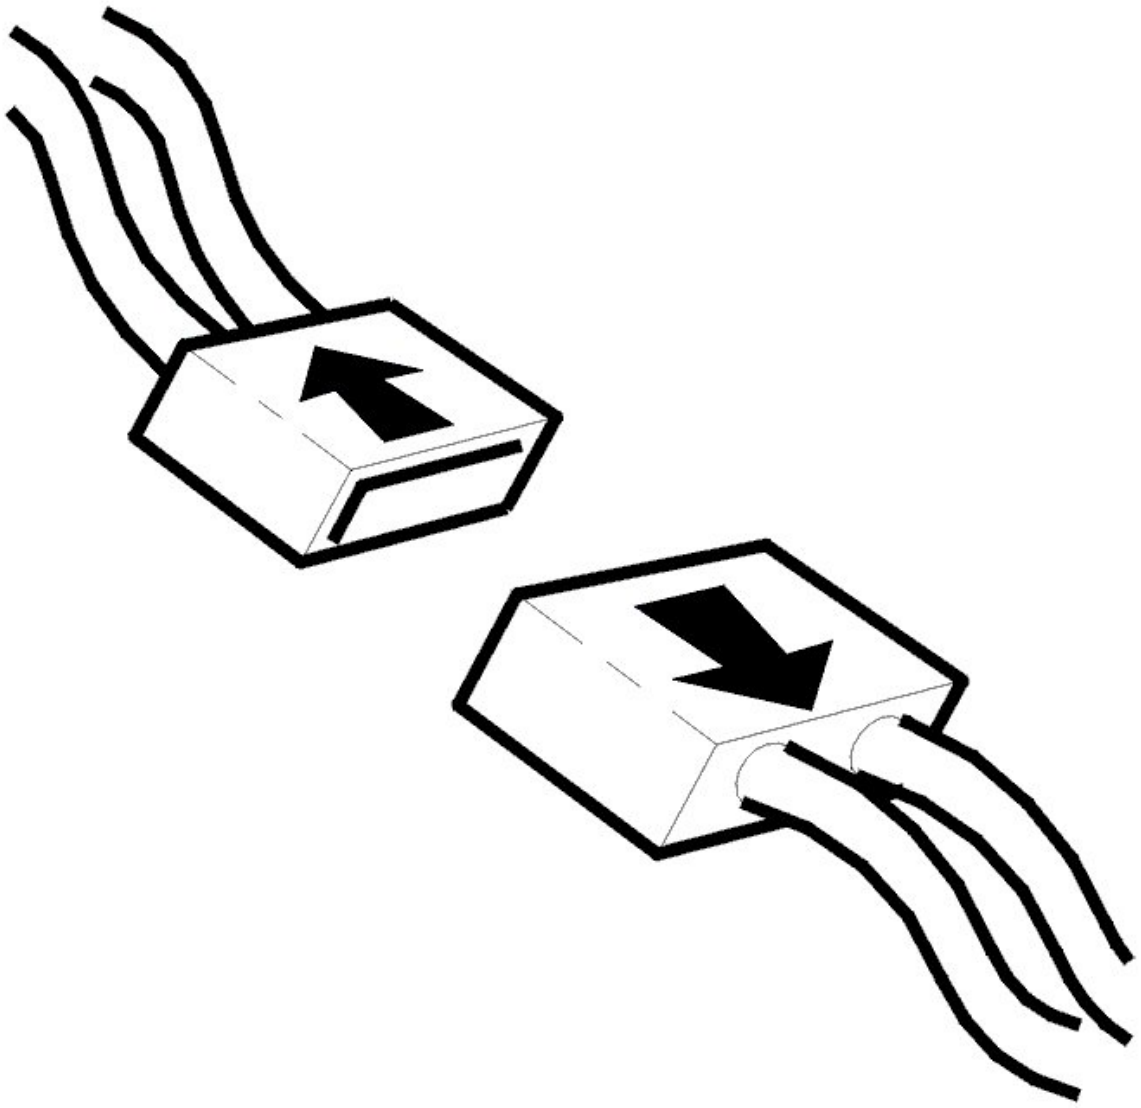
Fault symptom[s]
- General warning lamp lit.

Capacitance Too Low

Capacitance too low

Checking the cable





Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the seat belt tensioner!

The probable cause of this fault is that the terminal nearest the right seat belt tensioner on the 3rd seat row is defective. Try replacing the wiring for the seat belt tensioner.
Remedy as necessary.

Other information:

- To access and replace the seat belt tensioner, see Seat belts, replacing See: Restraint Systems/Seat Belt Systems/Seat Belt/Service and Repair/Seat Belts, Replacing

Diagnostic Trouble Code (DTC) Information

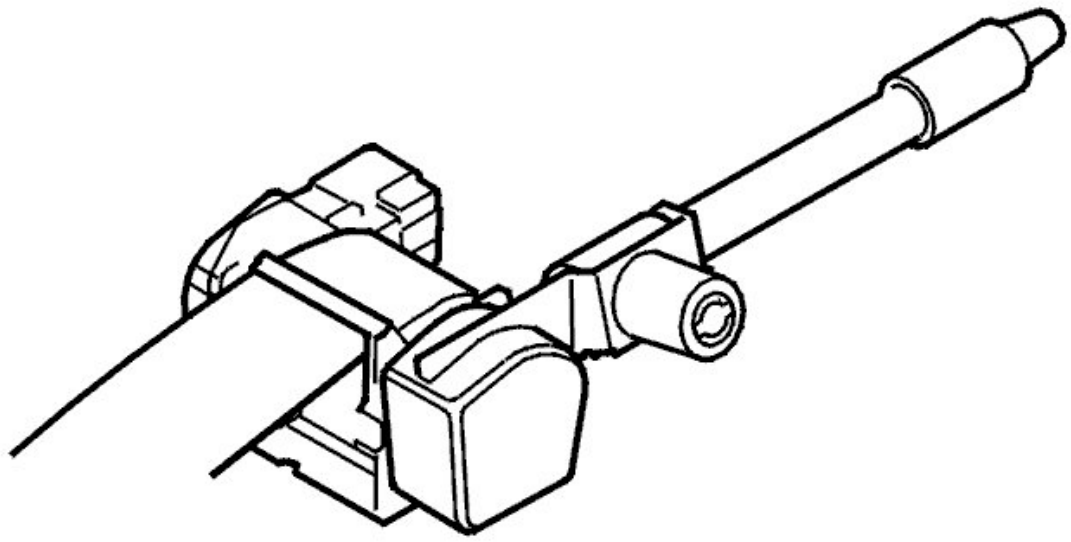
Diagnostic trouble code (DTC) information SRS-009E

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
One of the following diagnostic trouble codes (DTCs) will be stored if the resistance in any of the wiring circuits is lower than 10 ohms for longer than 10 seconds:
SRS-0096
SRS-009E
depending on which wiring circuit the fault is in.
Diagnostic trouble codes (DTCs):
SRS-0096
SRS-009E
can only be diagnosed when switching on the power (12 V). In other words, the diagnostic trouble codes (DTCs) can only be diagnosed when you switch from ignition position 0 to ignition positions I, II or III.

Substitute value
- None.

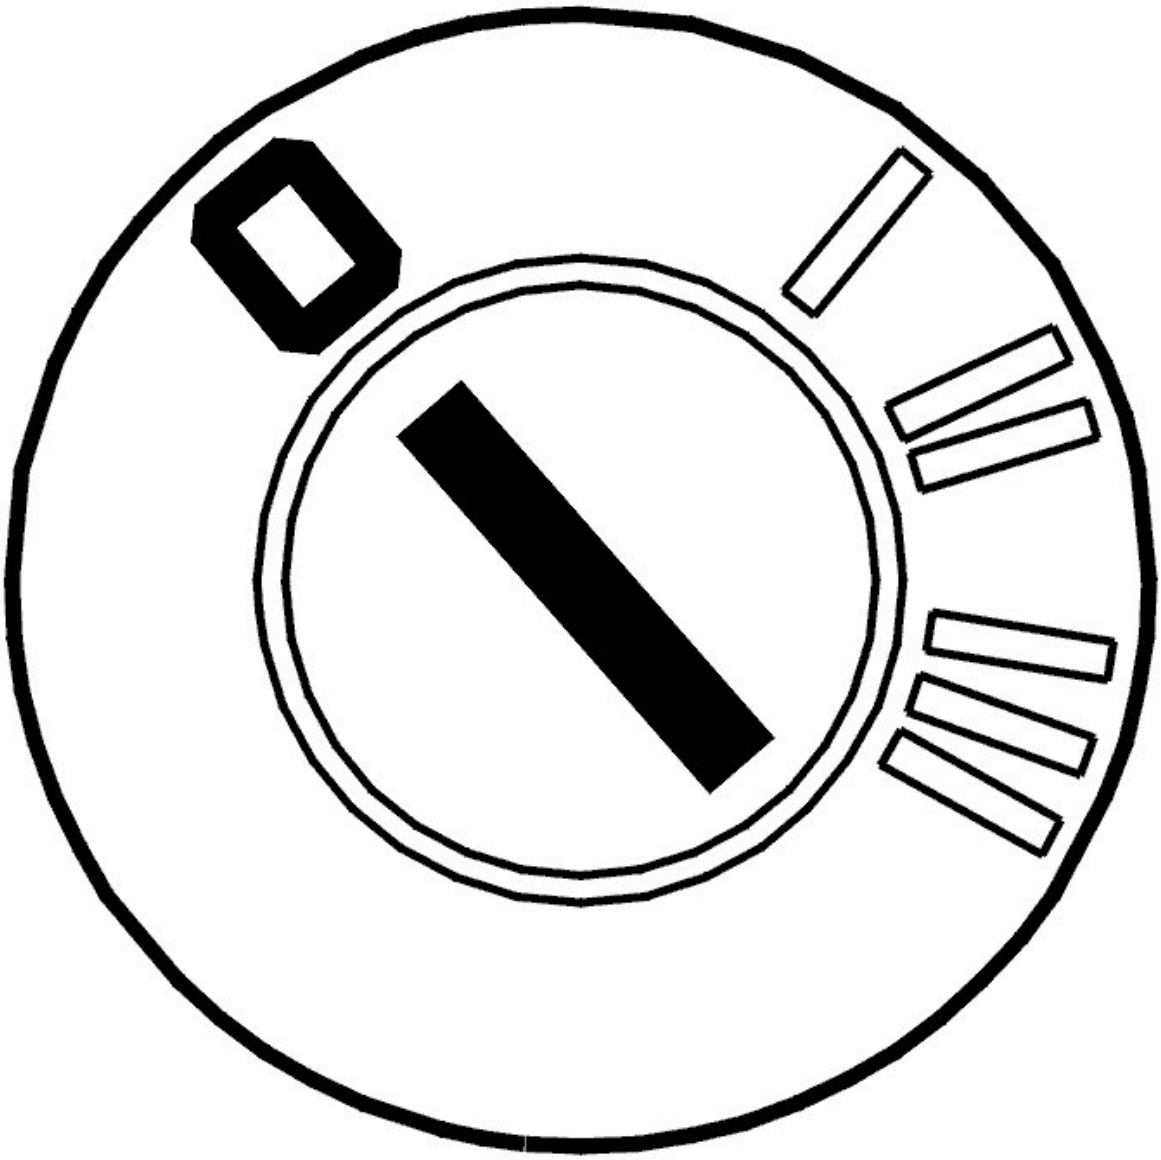
Possible source
- If the Supplemental Restraint System Module (SRS) identifies that a seat belt tensioner is installed, despite the control module being programmed that a seat belt tensioner is not installed.

Fault symptom[s]
- General warning lamp lit.

Configuration Fault

Configuration fault

Checking the component



- Ignition off.

Check the control module and SRS system connectors to ensure that no terminal pins are damaged. Also check the wiring.
Check that the correct control module is installed in the car. Read off by clicking the VCT2000 symbol.
Check that the switch for the right seat belt tensioner on the 3rd seat row is not connected to a seat belt tensioner if the car is a 5-seat model.
Replace the control module if no fault is found.

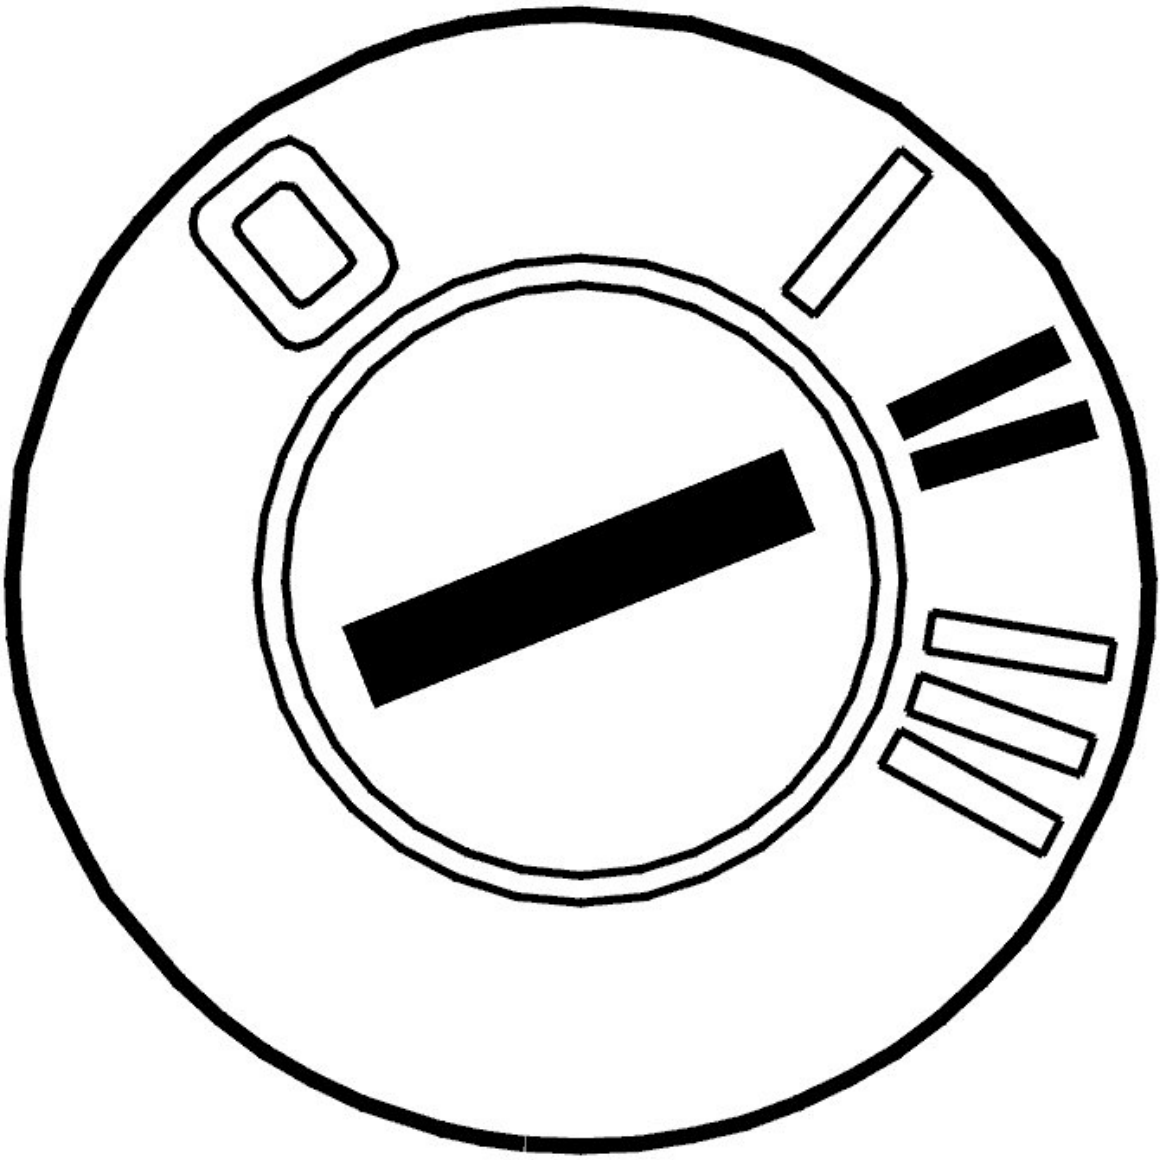
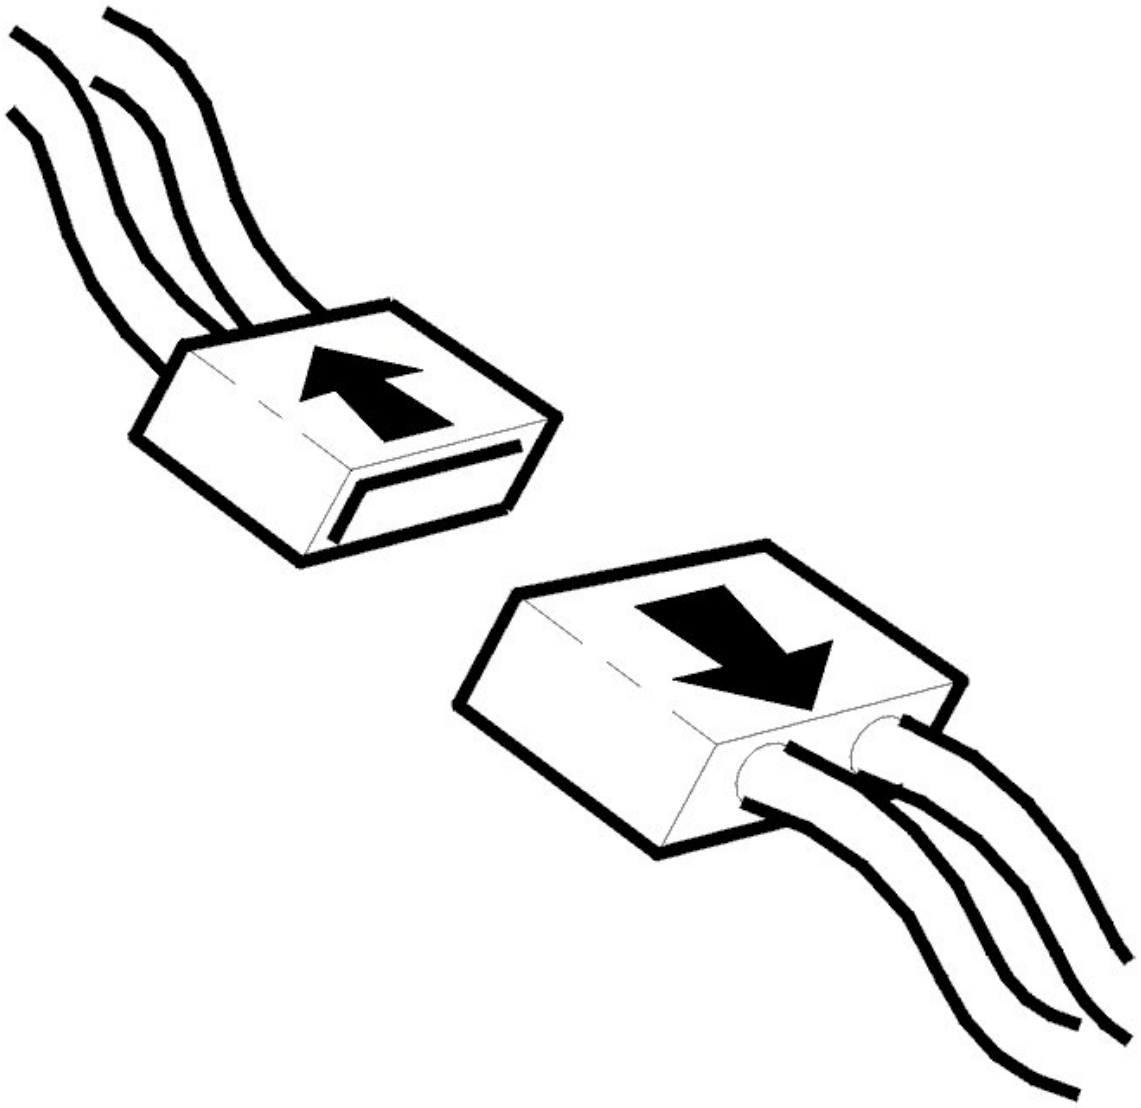
Signal too low

Checking the component





- Ignition off
- Disconnect the connector from the rear left-hand inflatable curtain
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new inflatable curtain if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

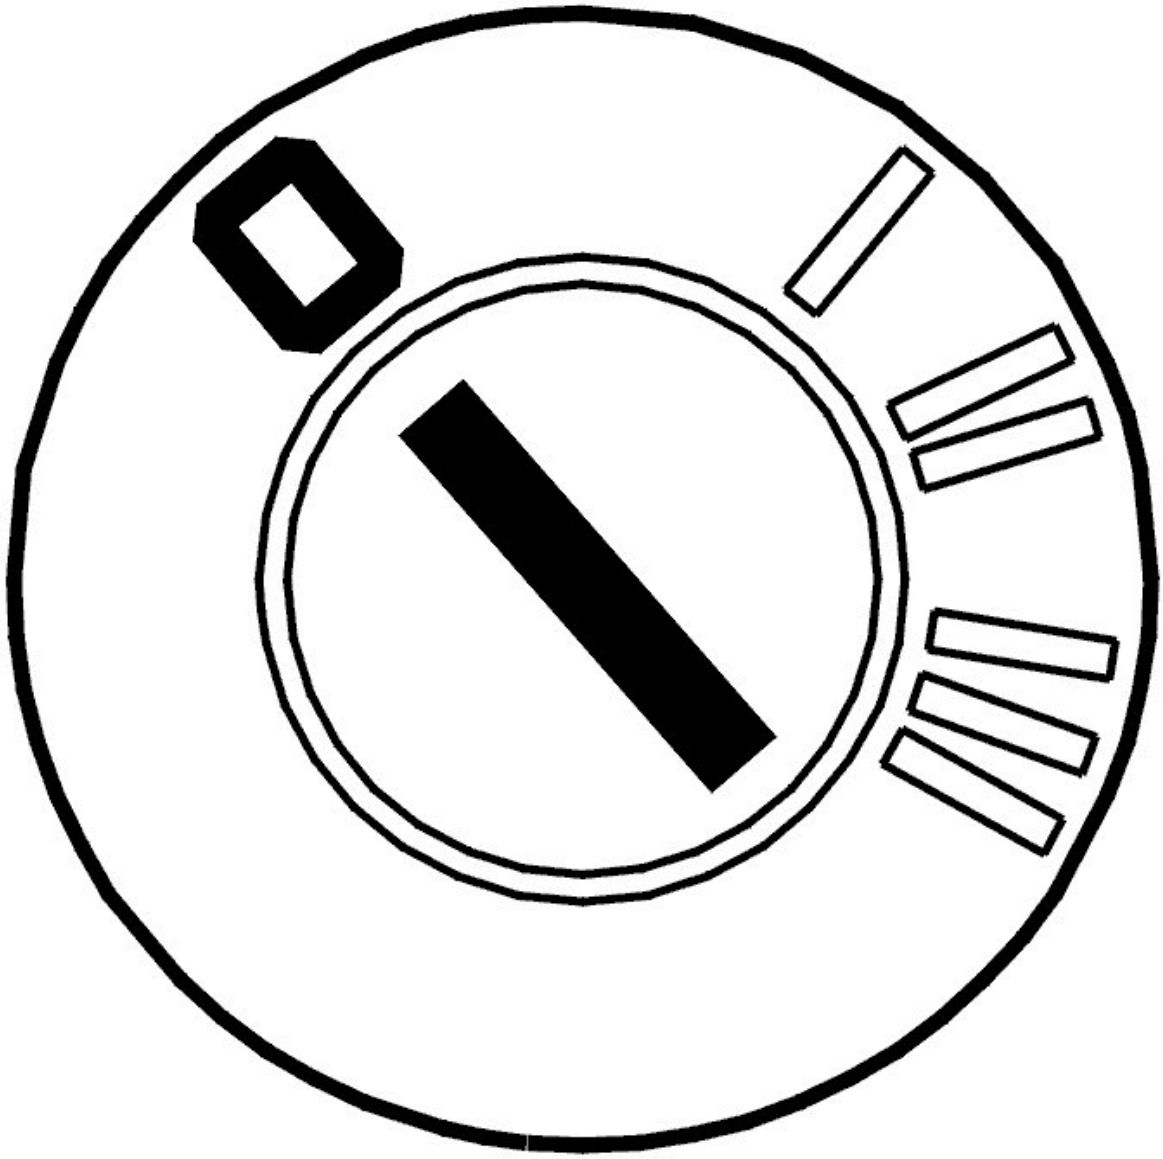
- To access and replace the inflatable curtain, see
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the connector for the inflatable curtain.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected non-deployed pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between Supplemental Restraint System Module (SRS) terminals #13A(13) and #14A(14) and connector terminals #1 and #3 on the rear left-hand inflatable curtain. Check for a short-circuit to ground.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see
- To access or replace the inflatable curtain connector, see
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the rear left-hand inflatable curtain and for the Supplemental Restraint System Module (SRS) disconnected, the resistance between terminals #1 and #3 on the inflatable curtain connector (Supplemental Restraint System Module (SRS) side) and ground should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air Bag Harness/Service and Repair/Procedures
- For information about signals, see

- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals.

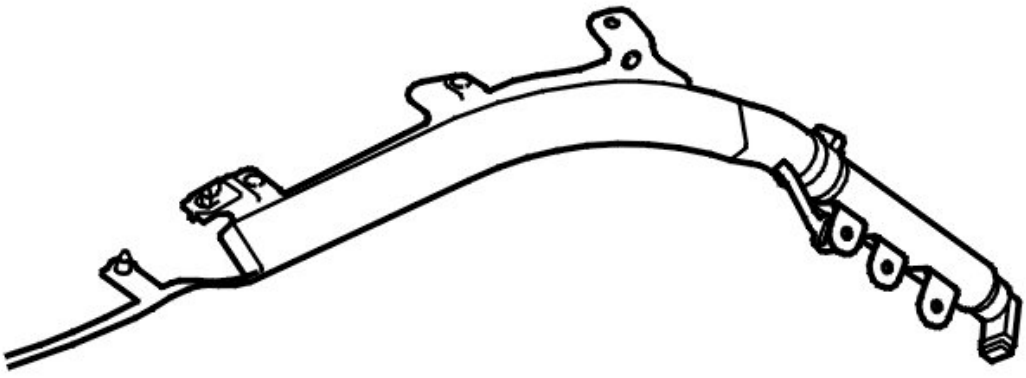
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00A2

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the inflatable curtain.
Diagnostic trouble code (DTC) SRS-00A2 is stored if the control module registers that the capacitance in the signal cable is high for longer than 10

seconds.
Diagnostic trouble code (DTC) SRS-00A2 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

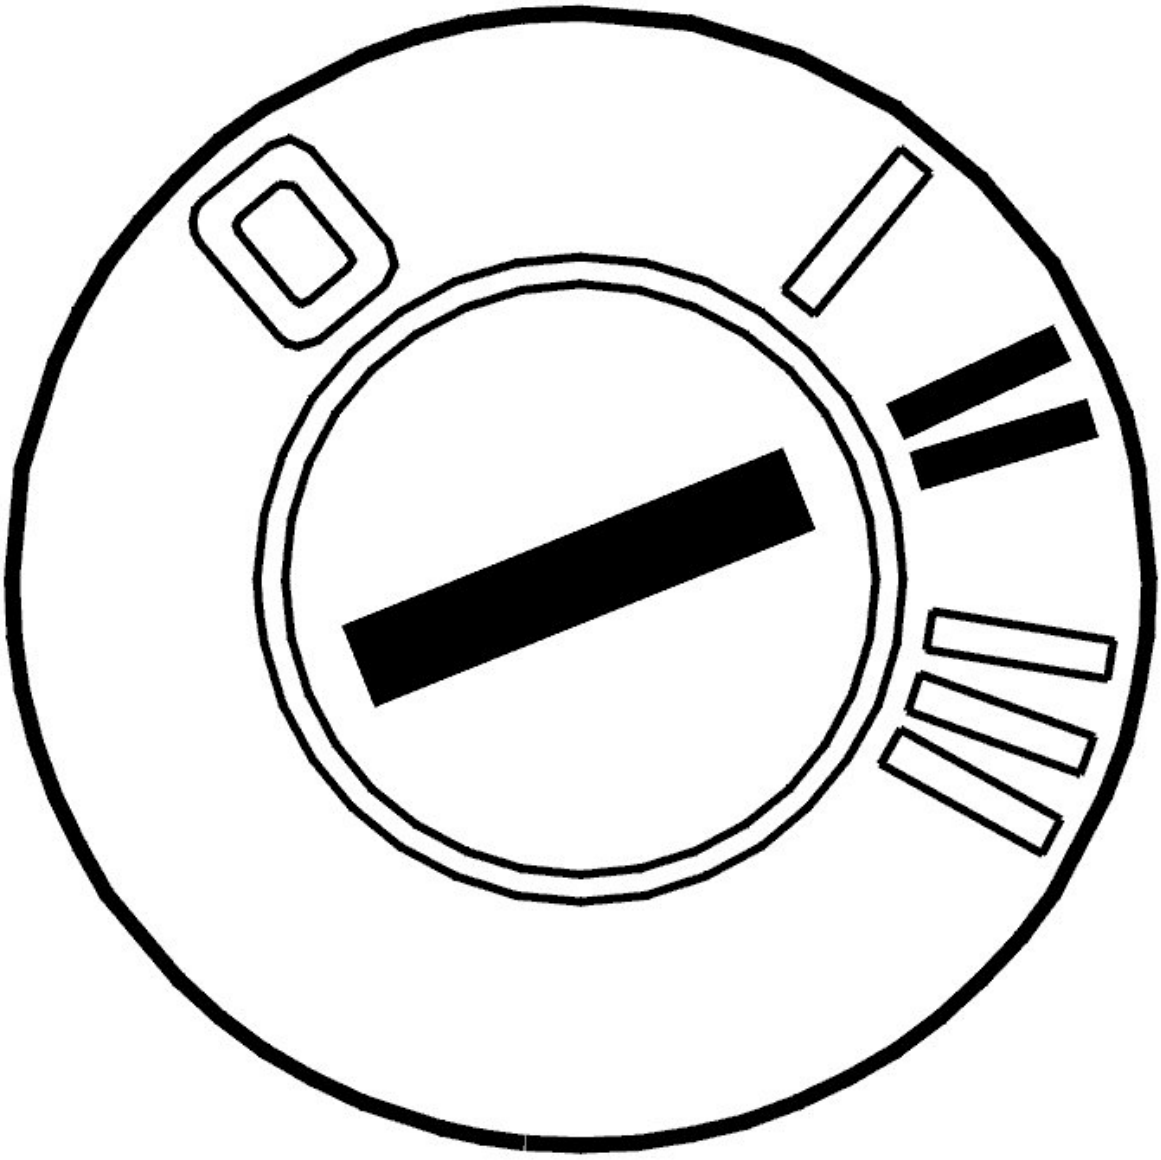
Possible source
- The capacitance is too high or there is a short-circuit in the integrated capacitor in the connector for the SRS ignition cable.

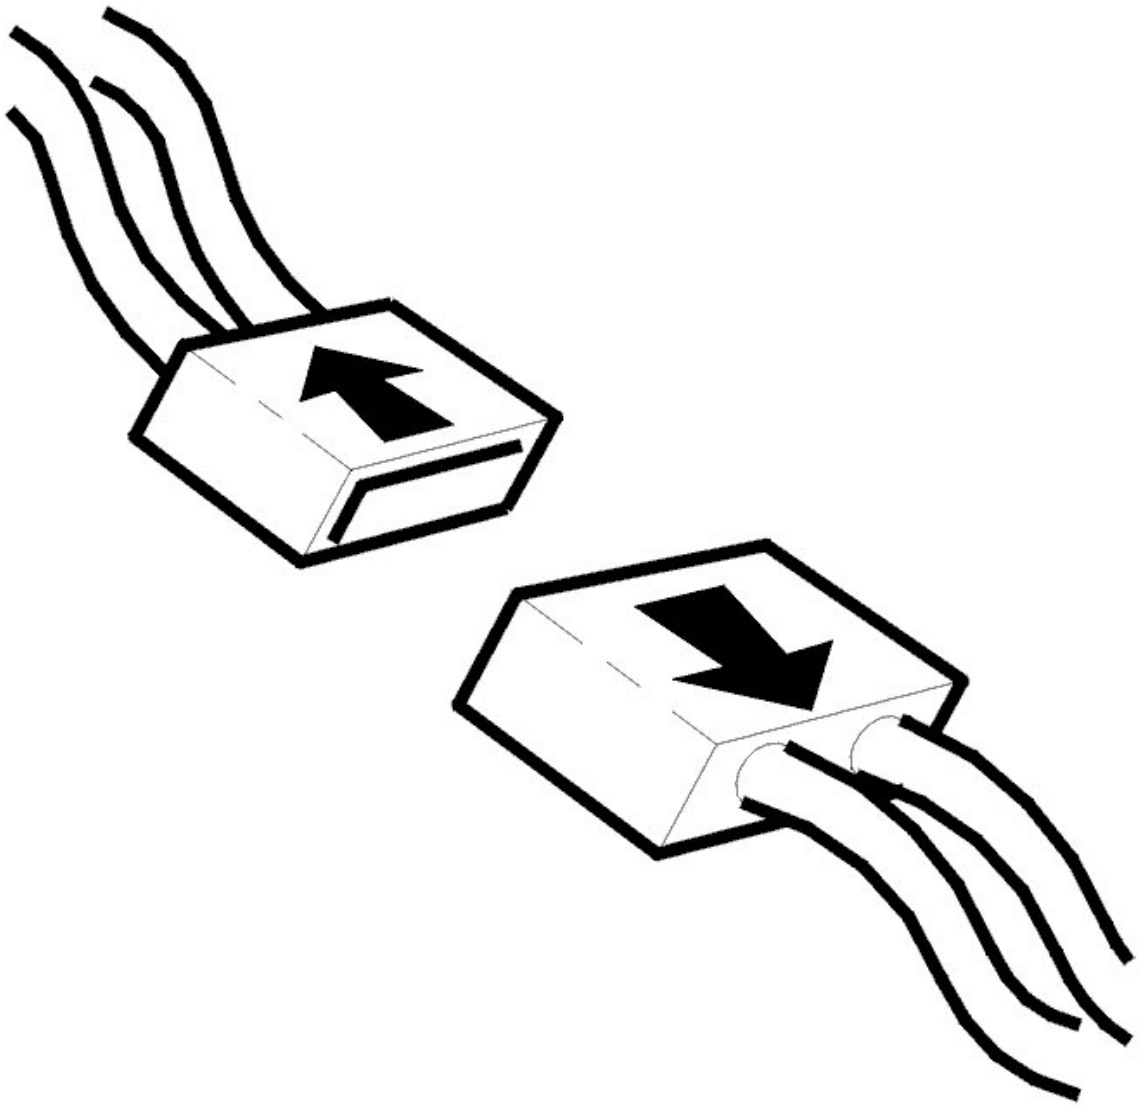
Fault symptom[s]
- The SRS indicator lamp is lit.

Capacitance Too High

Capacitance too high

Checking the component





- Ignition off
- Disconnect the connector from the rear left-hand inflatable curtain
- Connect special tool 951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Diagnostic Trouble Code (DTC) Information

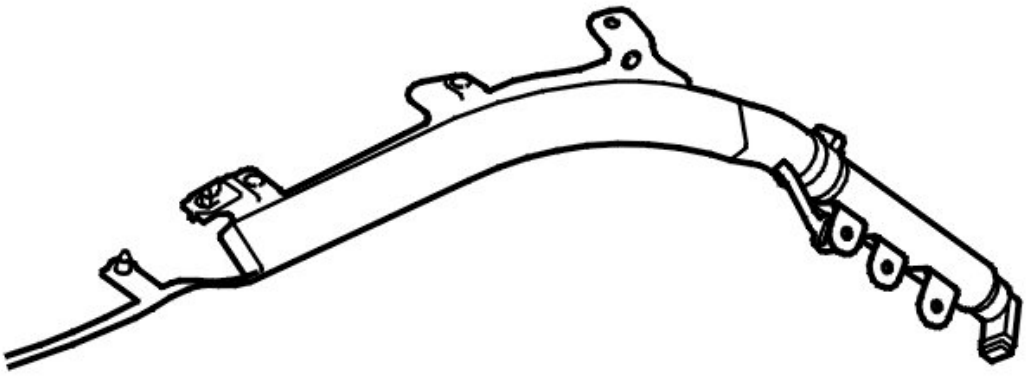
Diagnostic trouble code (DTC) information SRS-00A6

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
One of the following diagnostic trouble codes (DTCs) will be stored if the resistance in any of the wiring circuits is lower than 10 ohms for longer than 10 seconds:
SRS-00A6
SRS-00AE
depending on which wiring circuit the fault is in.
Diagnostic trouble codes (DTCs):
SRS-00A6
SRS-00AE
can only be diagnosed when switching on the power (12 V). In other words, the diagnostic trouble codes (DTCs) can only be diagnosed when you switch from ignition position 0 to ignition positions I, II or III.

Substitute value
- None.

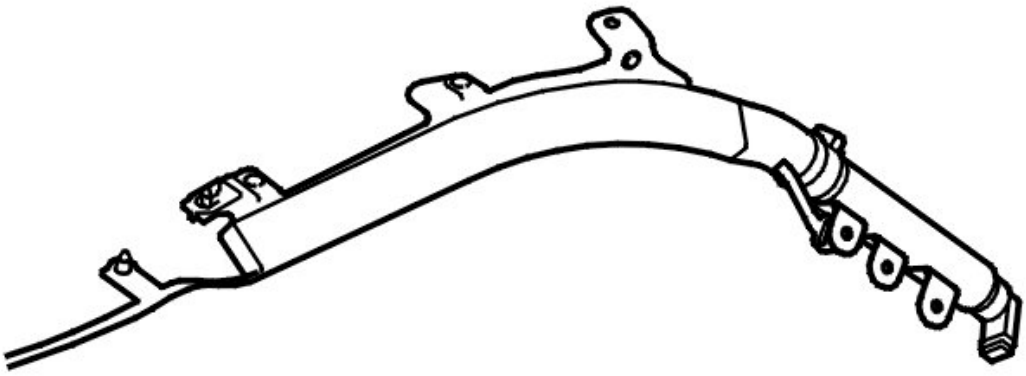
Possible source
- If the Supplemental Restraint System Module (SRS) identifies that an inflatable curtain is installed, despite the control module being programmed that an inflatable curtain is not installed.

Fault symptom[s]
- The SRS indicator lamp is lit.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00A8

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the inflatable curtain.
Diagnostic trouble code (DTC) SRS-00A8 is stored if the control module registers that the voltage in the signal cable is too high for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-00A8 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

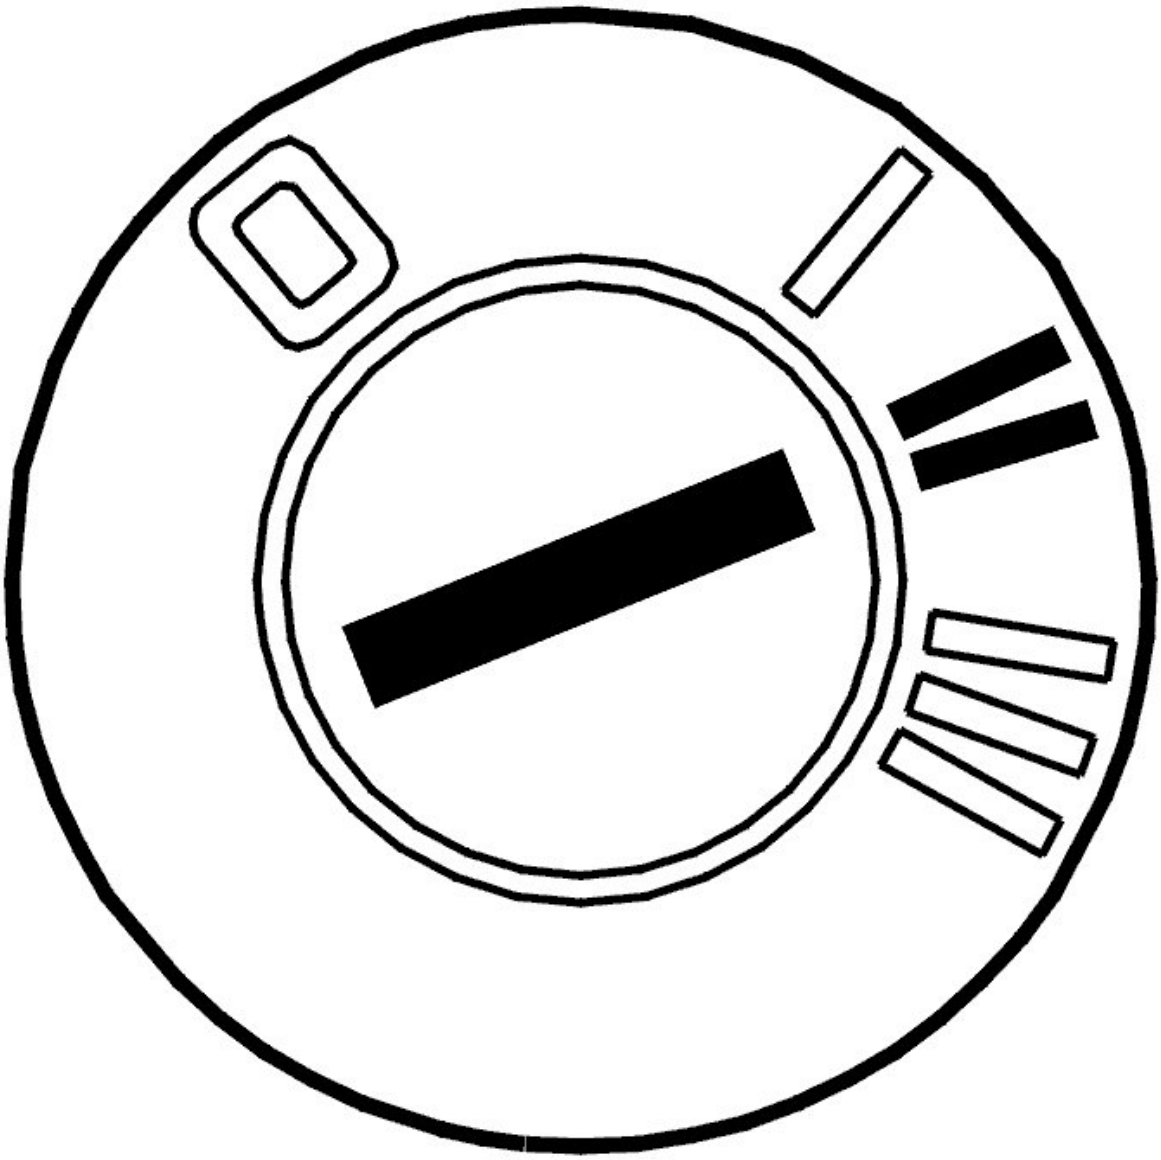
Possible source
- Short-circuit to supply voltage in the SRS ignition cable or in the connector between the inflatable curtain and the Supplemental Restraint System Module (SRS)
- Short-circuit to supply voltage in the inflatable curtain.

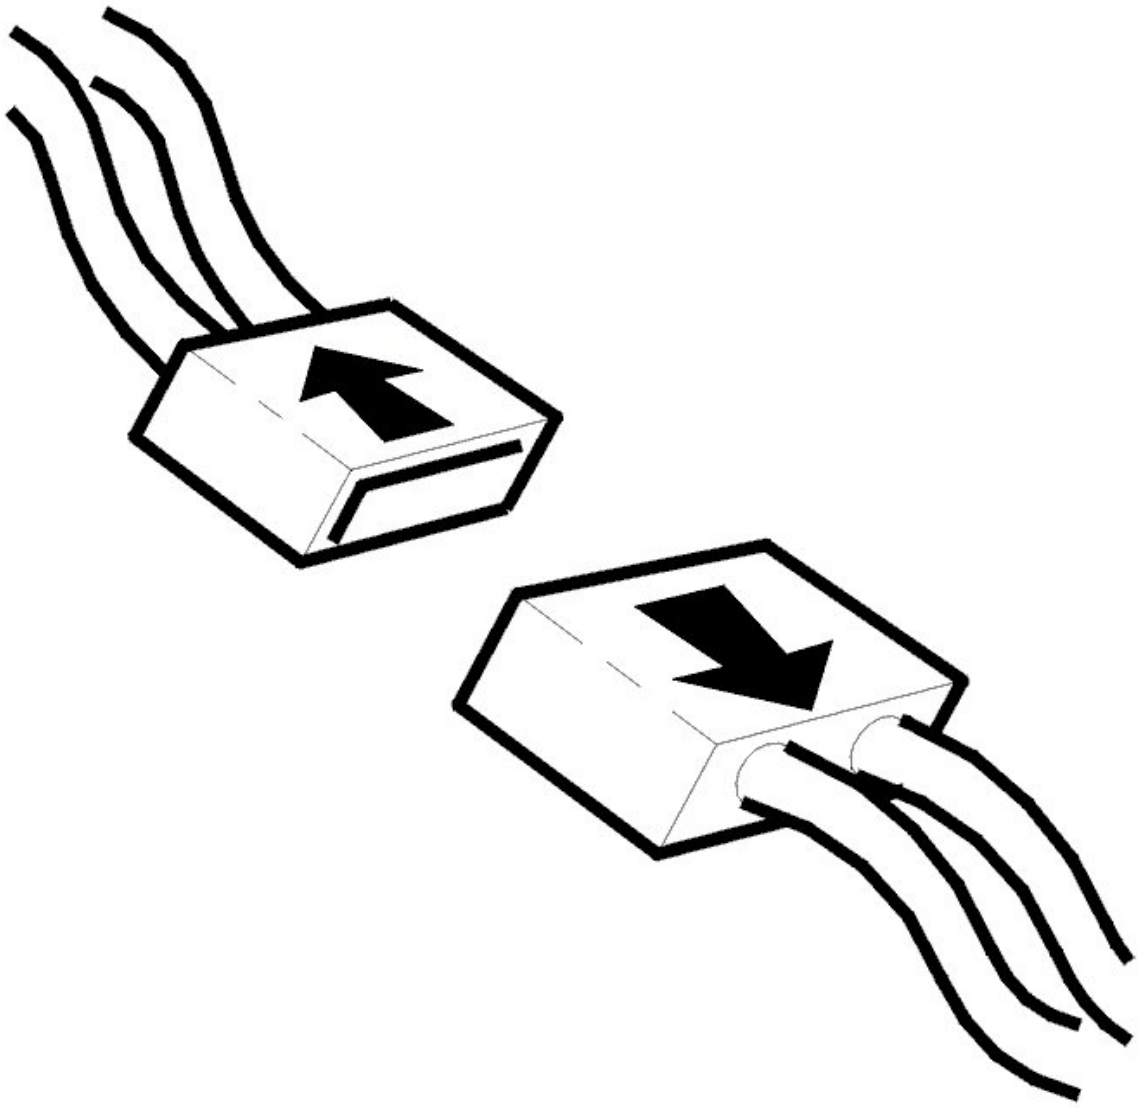
Fault symptom[s]
- The SRS indicator lamp is lit.

Signal Too High

Signal too high

Checking the component





- Ignition off
- Disconnect the connector from the rear right-hand inflatable curtain
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new inflatable curtain if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

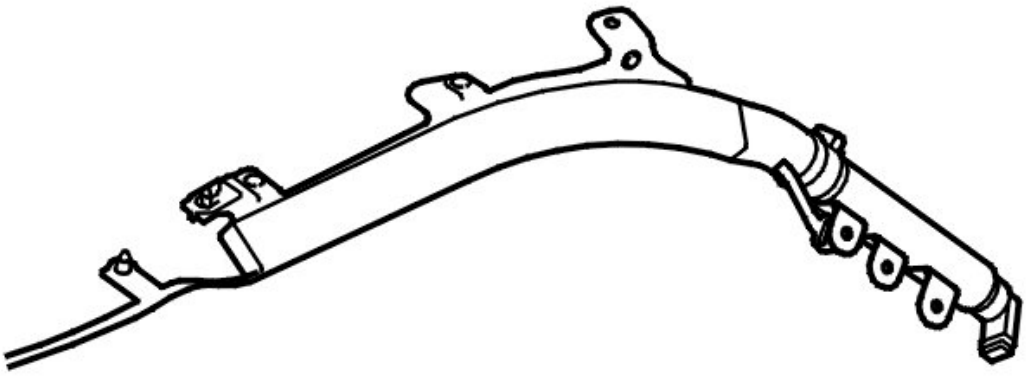
Diagnostic trouble code (DTC) information SRS-00AA

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the inflatable curtain.
Diagnostic trouble code (DTC) SRS-00AA is stored if the control module registers that the capacitance in the signal cable is high for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-00AA can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

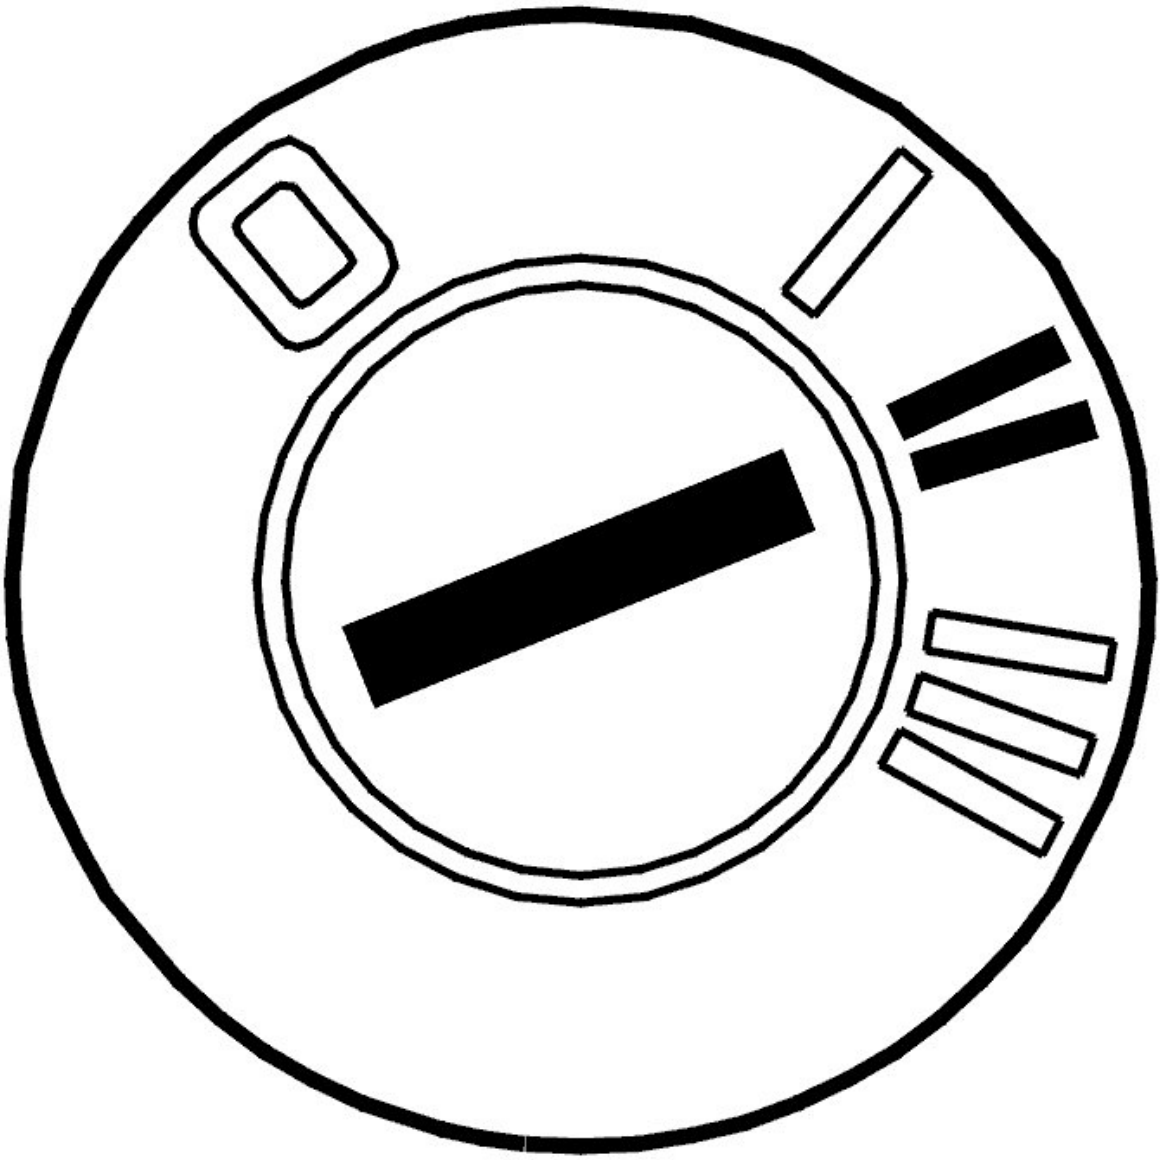
Possible source
- The capacitance is too high or there is a short-circuit in the integrated capacitor in the connector for the SRS ignition cable.

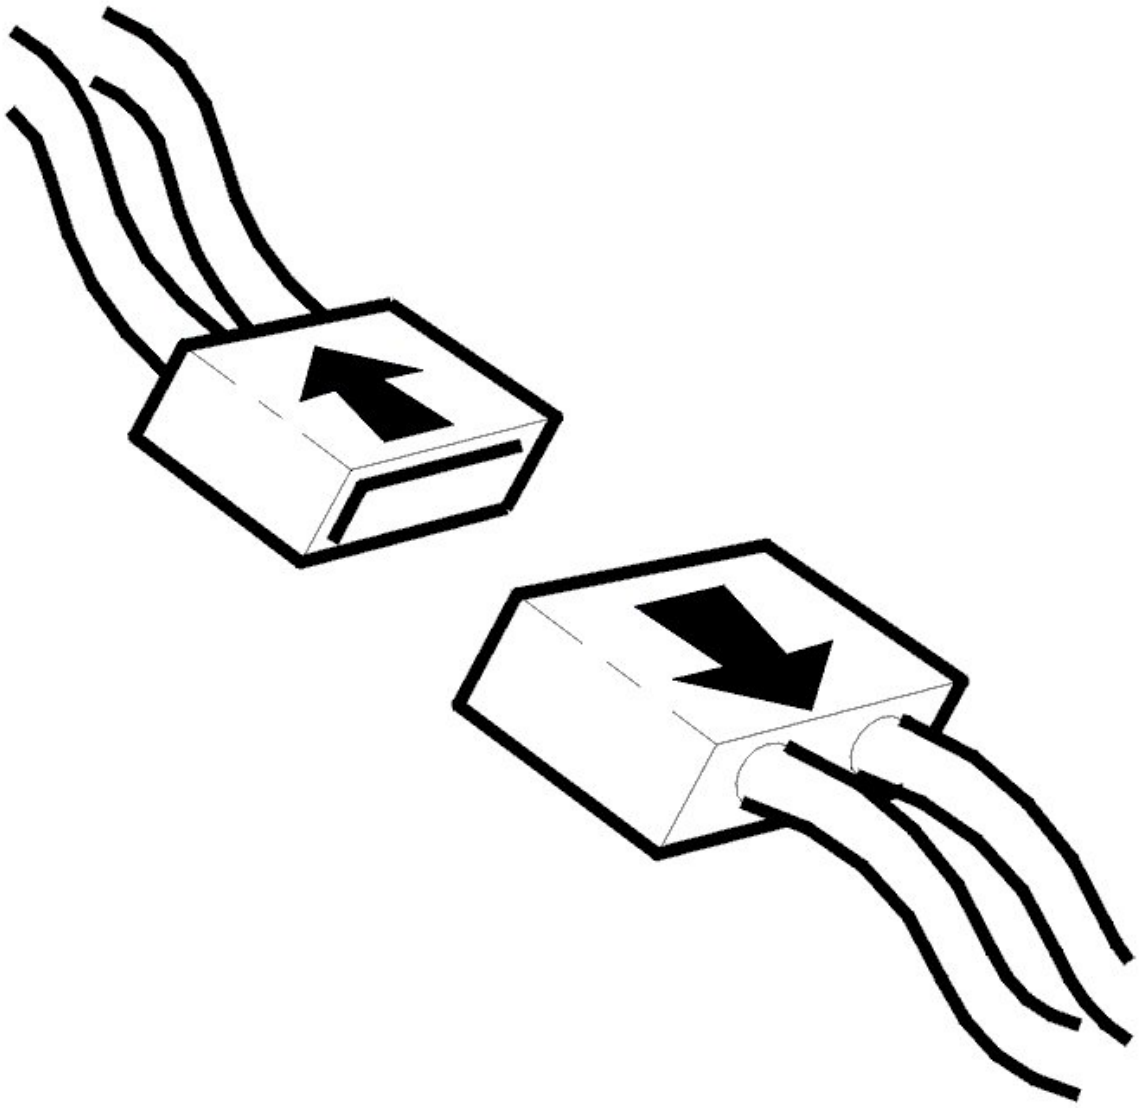
Fault symptom[s]
- The SRS indicator lamp is lit.

Capacitance Too High

Capacitance too high

Checking the component





- Ignition off
- Disconnect the connector from the rear right-hand inflatable curtain
- Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the inflatable curtain

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected, non-deployed, pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Note! The special tool must be checked and fault-free. If the tool is defective, the diagnosis readings will be incorrect. This will make fault-tracing harder.

- Switch on the ignition. Wait 10 seconds.

Read off diagnostic trouble codes (DTCs).
Try a new inflatable curtain if the diagnostic trouble code (DTC) changes status from a permanent to an intermittent fault.

Other information:

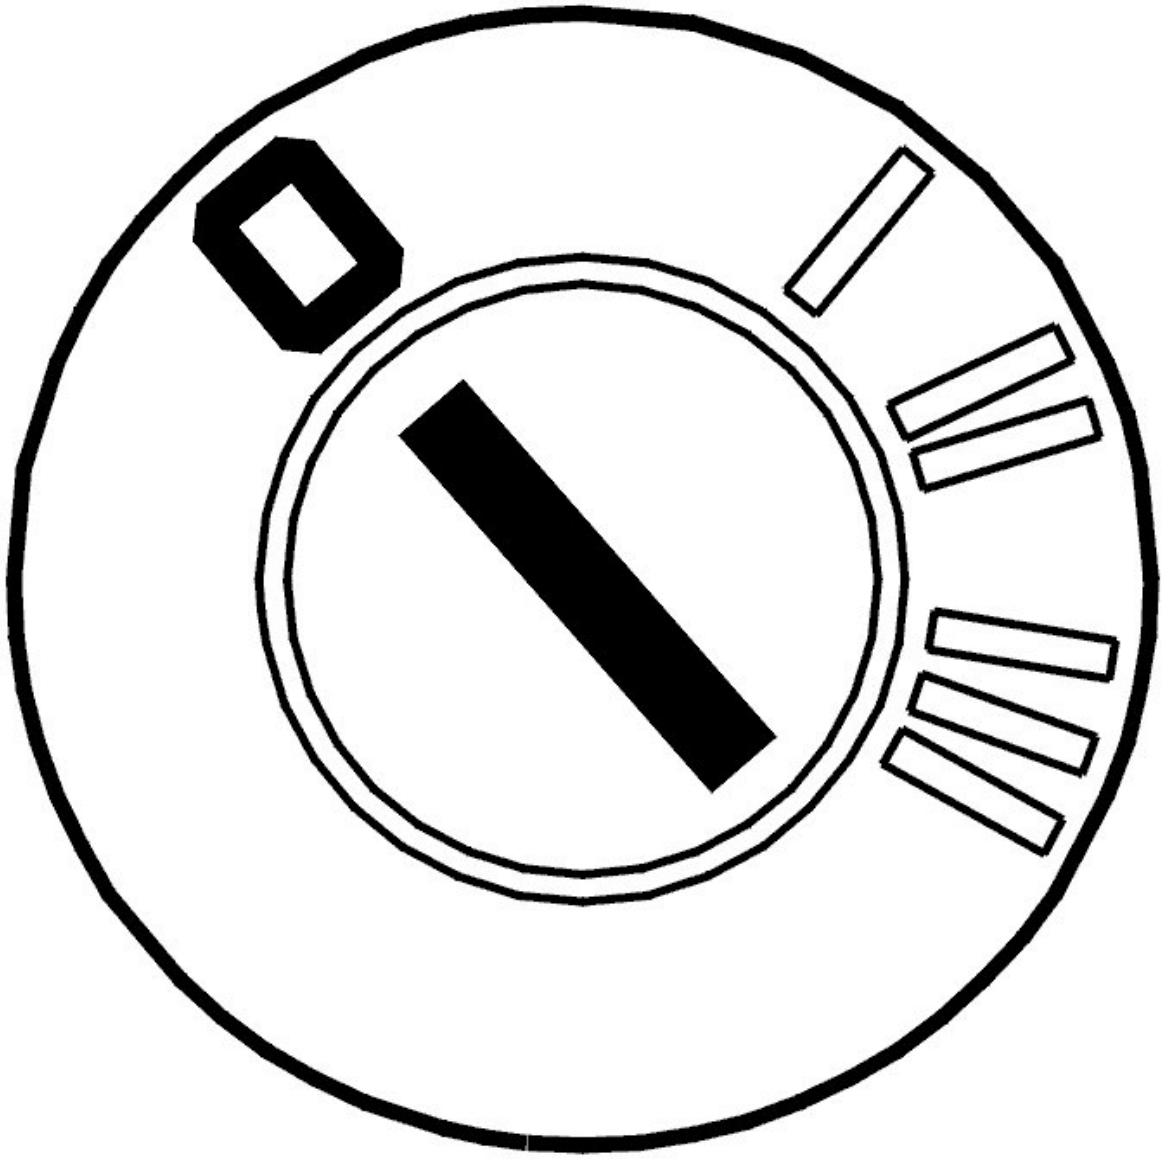
- To access and replace the inflatable curtain, see
- To check the special tool, see Calibration See: Restraint Systems/Service and Repair/Calibrating the Special Tool.

Does the status of the diagnostic trouble code (DTC) change?

Yes - Verification

No - Checking components and wiring

Checking components and wiring



- Ignition off
- Disconnect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy from the inflatable curtain.

Warning! Under no circumstances use an ohmmeter or other live measuring instruments to take readings on a disconnected non-deployed pyrotechnical inflatable curtain. This could deploy the inflatable curtain!

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between Supplemental Restraint System Module (SRS) terminals #11C(7) and #12C(8) and connector terminals #1 and #3 on the rear right-hand inflatable curtain. Check for a short-circuit to ground.
Connect special tool951 1506 Test dummy See: Tools and Equipment/951 1506 Test Dummy to the connector for the inflatable curtain.
Check the cable between the Supplemental Restraint System Module (SRS) terminals #12C(8) and #11C(7) for resistance between these terminals. The resistance between the terminals should be infinite.
Remedy as necessary.

Other information:

- To access and replace the SRS control module and connector, see
- To access or replace the inflatable curtain connector, see
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- With the ignition off and the connectors for the steering column and for the Supplemental Restraint System Module (SRS) disconnected, the resistance between the rear inflatable curtain connector terminals #1 and #3 (Supplemental Restraint System Module (SRS) side) and ground should be infinite
- For information about the repair of SRS wiring, see Cable harness SRS system, repair See: Restraint Systems/Air Bag Systems/Air Bag/Air

Bag Harness/Service and Repair/Procedures

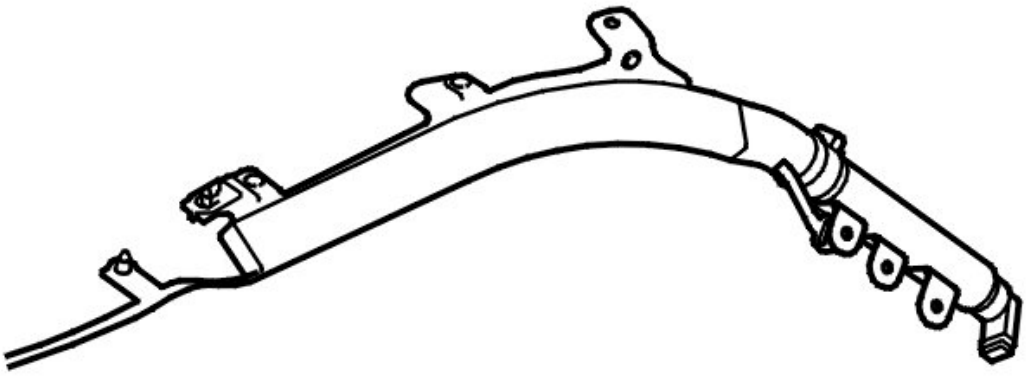
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00AB

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the inflatable curtain.
Diagnostic trouble code (DTC) SRS-00AB is stored if the control module registers that the capacitance in the signal cable is too low for longer than

10 seconds.
Diagnostic trouble code (DTC) SRS-00AB can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

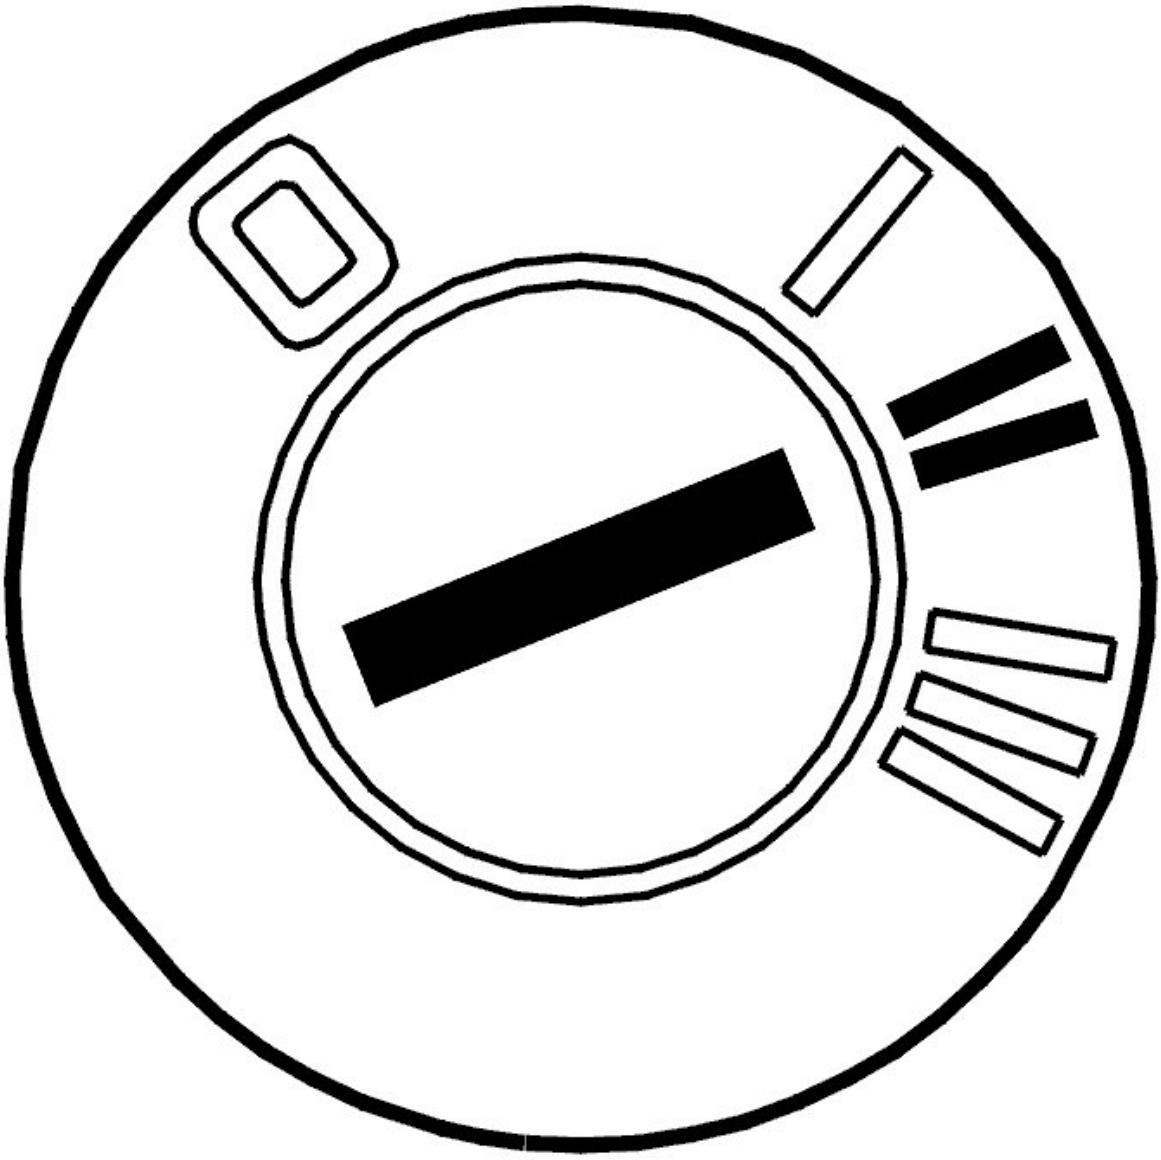
Possible source
- The capacitance is too low in the integrated capacitor in the connector for the SRS ignition cable.

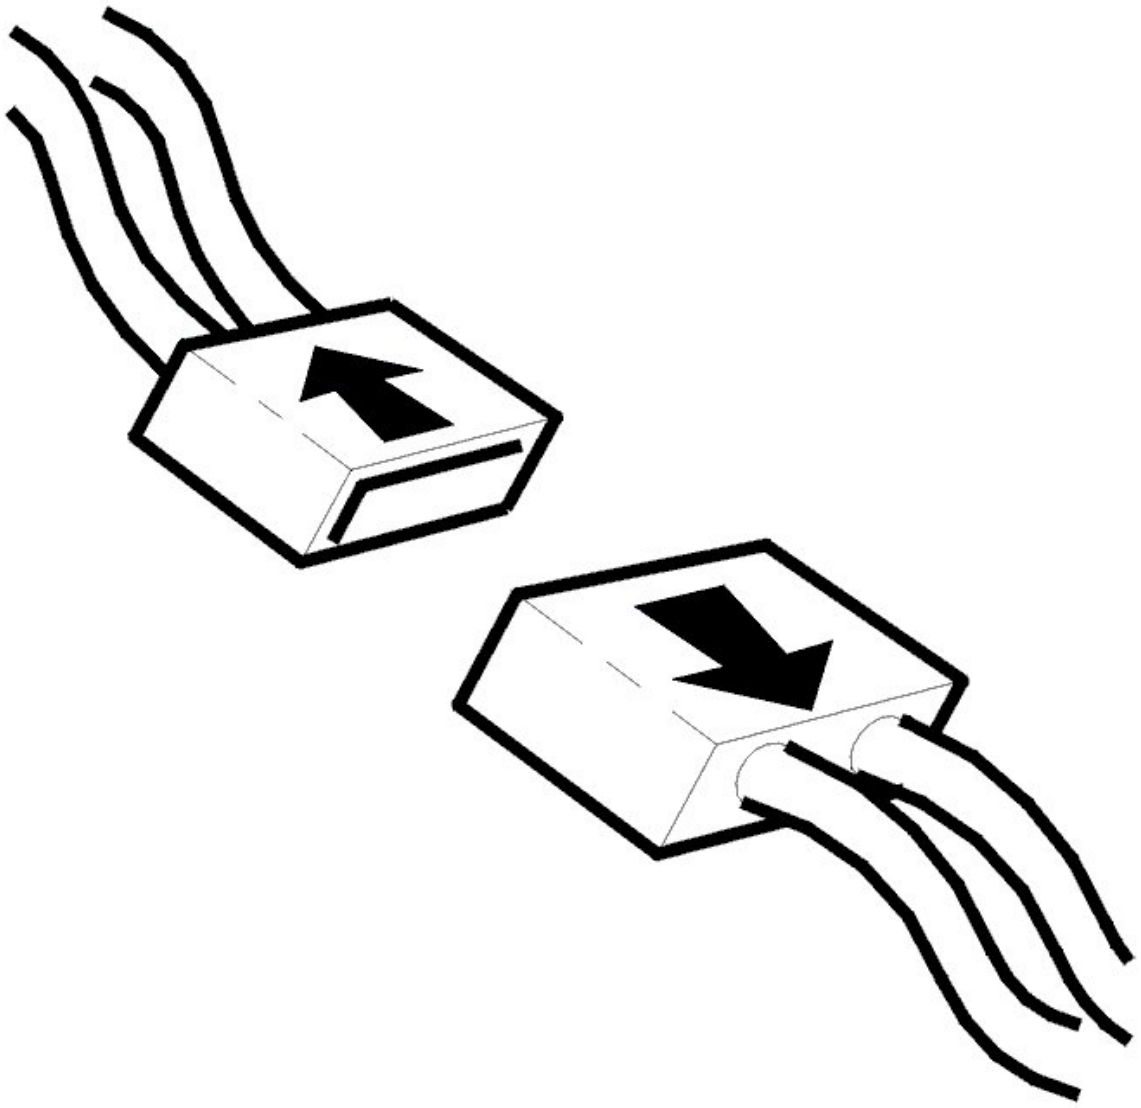
Fault symptom[s]
- The SRS indicator lamp is lit.

Capacitance Too Low

Capacitance too low

Checking the cable





Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical seat belt tensioner. This could deploy the inflatable curtain!

The probable cause of this fault is that the terminal nearest the rear right inflatable curtain is defective. Try replacing the wiring for the inflatable curtain.
Remedy as necessary

Diagnostic Trouble Code (DTC) Information

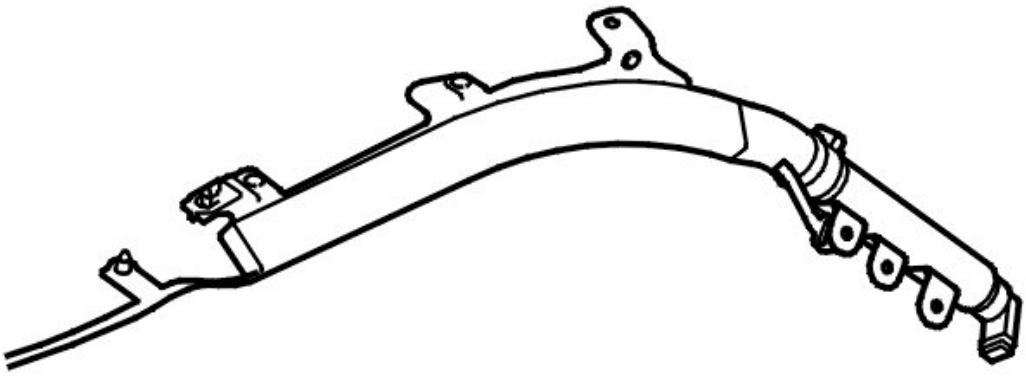
Diagnostic trouble code (DTC) information SRS-00AE

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the seat belt tensioner.
One of the following diagnostic trouble codes (DTCs) will be stored if the resistance in any of the wiring circuits is lower than 10 ohms for longer than 10 seconds:
SRS-00A6
SRS-00AE
depending on which wiring circuit the fault is in.
Diagnostic trouble codes (DTCs):
SRS-00A6
SRS-00AE
can only be diagnosed when switching on the power (12 V). In other words, the diagnostic trouble codes (DTCs) can only be diagnosed when you switch from ignition position 0 to ignition positions I, II or III.

Substitute value
- None.

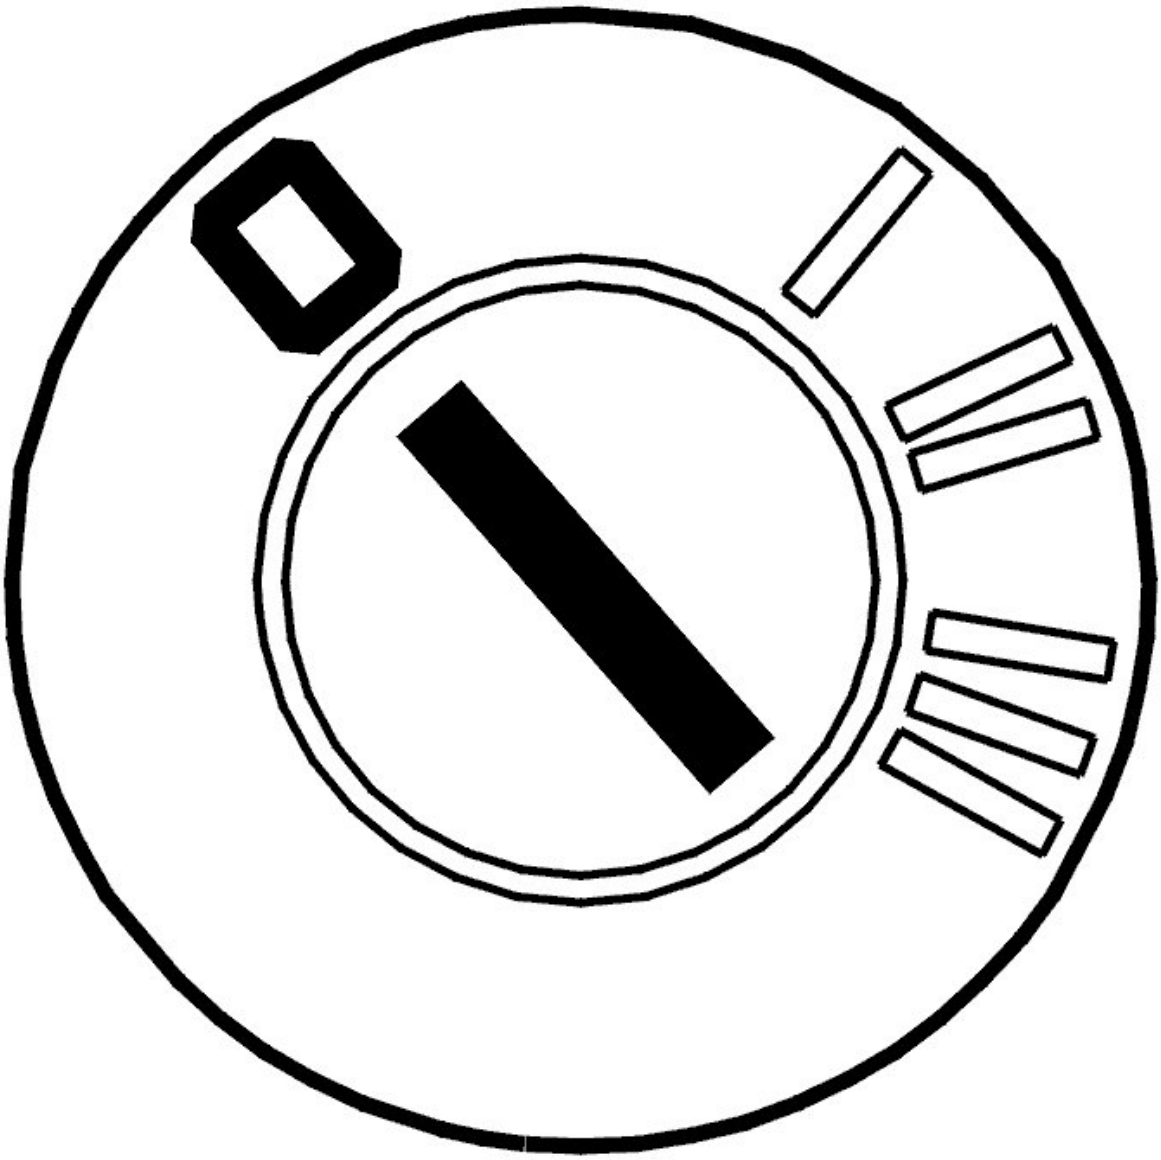
Possible source
- If the Supplemental Restraint System Module (SRS) identifies that an inflatable curtain is installed, despite the control module being programmed that an inflatable curtain is not installed.

Fault symptom[s]
- The SRS indicator lamp is lit.

Configuration Fault

Configuration fault

Checking the component



- Ignition off.

Check the control module and SRS system connectors to ensure that no terminal pins are damaged. Also check the wiring.
Check that the correct SRS control module is installed in the car. Read off by clicking the VCT2000 symbol.
Check that the switch for the rear right inflatable curtain is not connected to an inflatable curtain if the car is a 5-seat model.
Replace the control module if no fault is found.

- Ignition off.

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the connectors for the supplemental restraint system module (SRS) and side impact sensor. Check for contact resistance and oxidation. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for loose connections. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults.
Check the cable between the SRS control module and the terminal on the side impact sensor connector according to the following:

for diagnostic trouble code (DTC) SRS-00B0,

front left side impact sensor terminals #8A (8) and #9A (9) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00B5,

front right side impact sensor terminals #8C (4) and #9C (5) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00BA,

rear left side impact sensor terminals #27A (27) and #28A (28) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00BF,

rear right side impact sensor terminals #27C (23) and #28C (24) and connector terminals #1 and #2.
check for an intermittent short-circuit to supply voltage. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Intermittent Faults. Check for an intermittent short-circuit to ground. See Checking wiring and terminals. Intermittent faults See: Testing and Inspection/Component Tests and

Diagnostic Trouble Code (DTC) Information

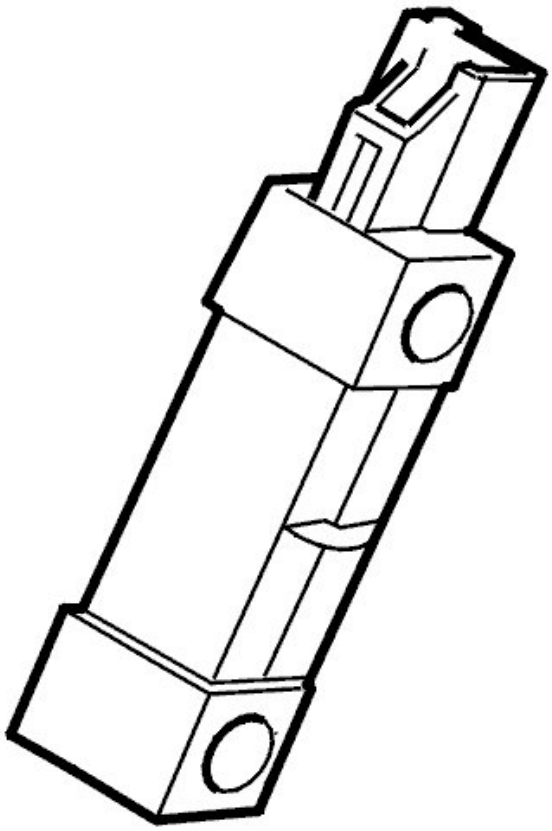
SRS-00BA Diagnostic trouble code information

Condition



If the circuit voltage is high or low for more than 10 seconds, diagnostic trouble code SRS-00BA is displayed.

Substitute value
- Nothing.

Possible source

Signal too high:
- Signal wire is short circuited to voltage supply
- Faulty side impact sensor.

Signal too low:
- Signal wire is short circuited to ground
- Faulty side impact sensor.

Fault symptom[s]
- SRS warning lamp on.

Faulty Signal

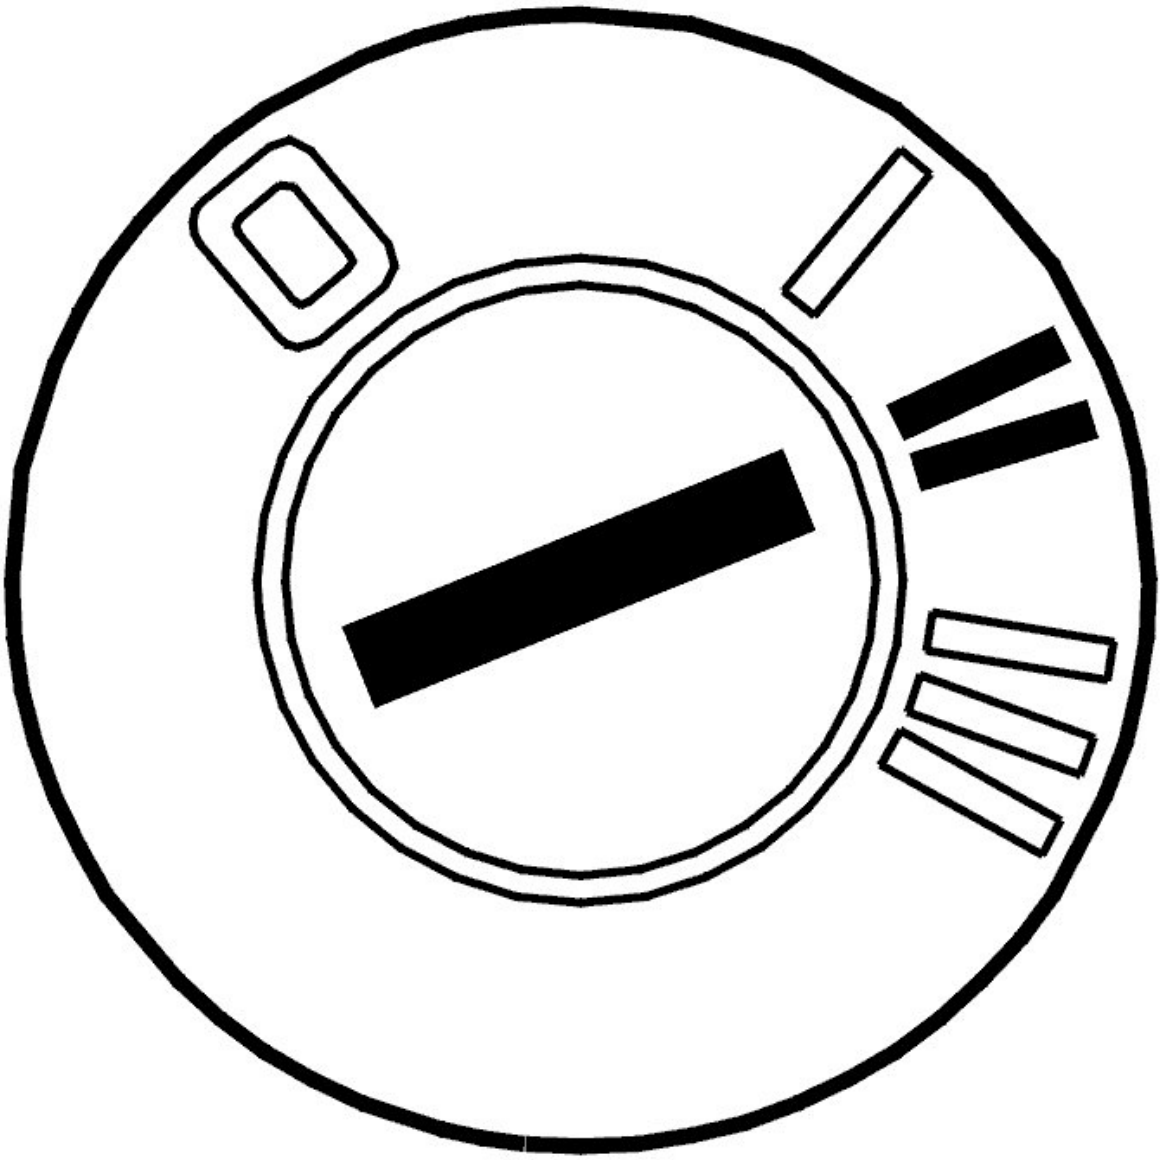
Faulty signal. Permanent fault

Checking the component and wiring



- Ignition off.

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Check the cable between the SRS control module and the terminal on the side impact sensor connector according to the following:

for diagnostic trouble code (DTC) SRS-00B0,

front left side impact sensor terminals #8A (8) and #9A (9) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00B5,

front right side impact sensor terminals #8C (4) and #9C (5) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00BA,

rear left side impact sensor terminals #27A (27) and #28A (28) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00BF,

rear right side impact sensor terminals #27C (23) and #28C (24) and connector terminals #1 and #2.
check for a short-circuit to supply voltage. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault. Check for a short-circuit to ground. FAULT FOUND - DONE

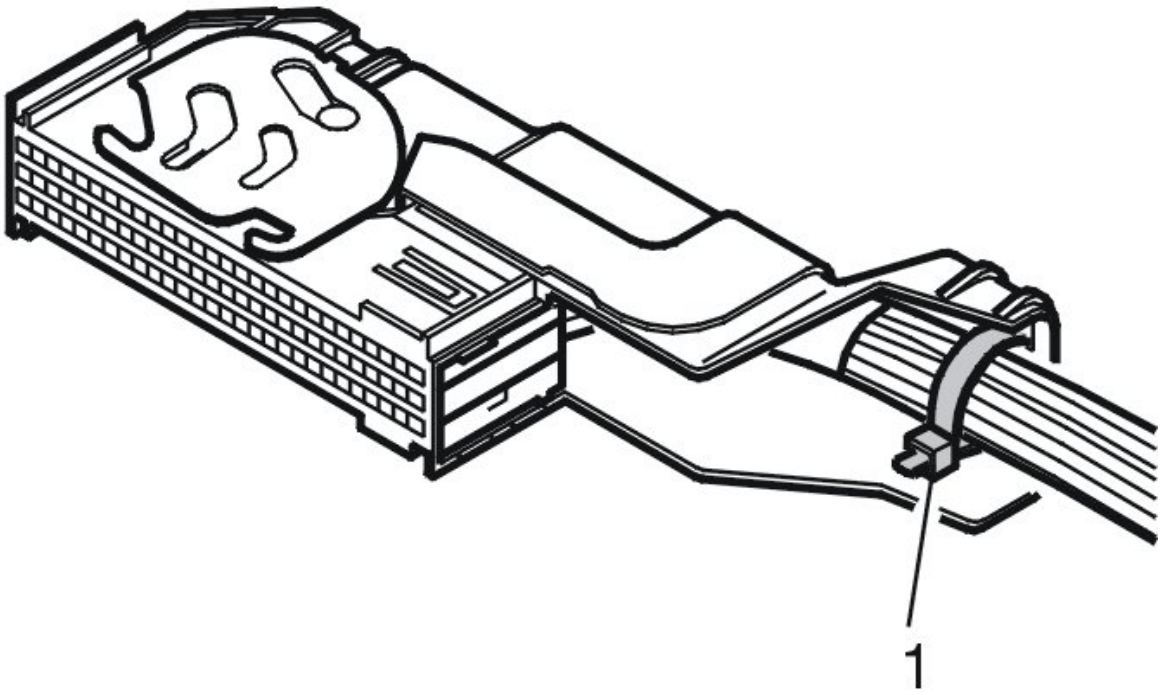
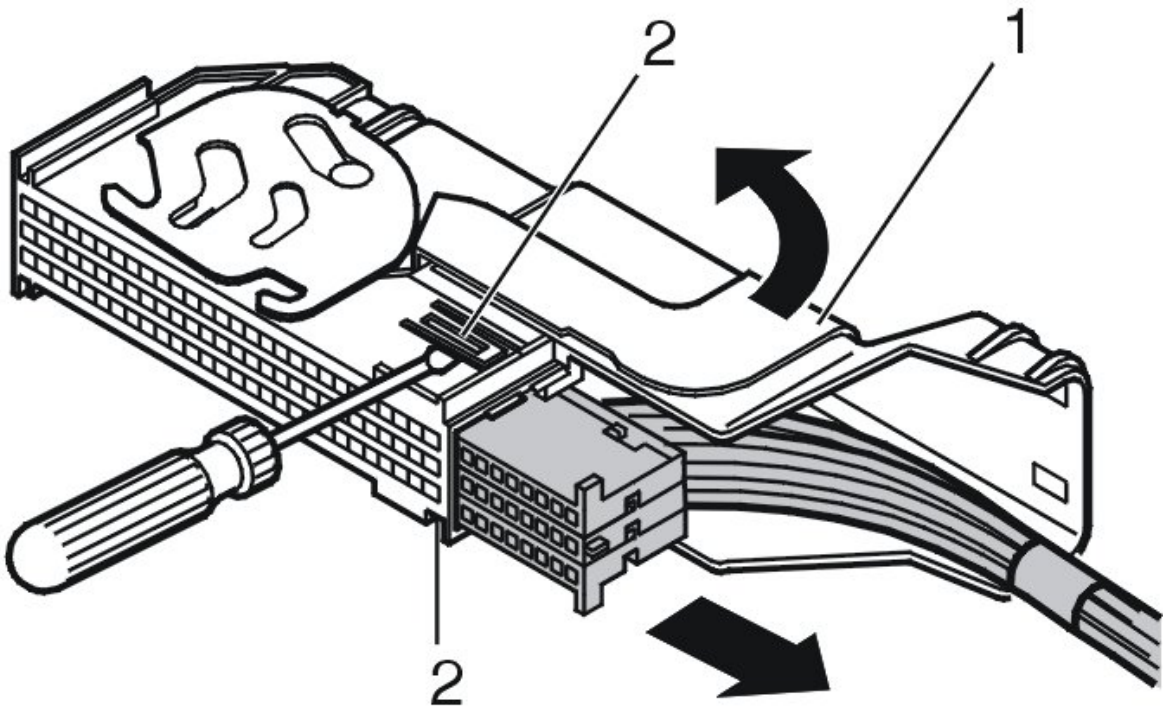
Diagnostic Trouble Codes (DTC) SRS 00BB and 00C0, Fault-Tracing and Repairing

Diagnostic Trouble Codes (DTC) SRS 00BB and 00C0, fault-tracing and repairing

Checking the cable terminals for the SRS sensor



If diagnostic trouble codes (DTC) SRS 00BB and 00C0 occur remove and check the cable terminal in the SRS (supplemental restraint system) sensor connector as follows.
Disconnect the connector for the SRS sensor, see: Removing, replacing and installing Supplemental restraint system (SRS), control module (SRS).
Remove the tie strap (1) around the wiring and connector.



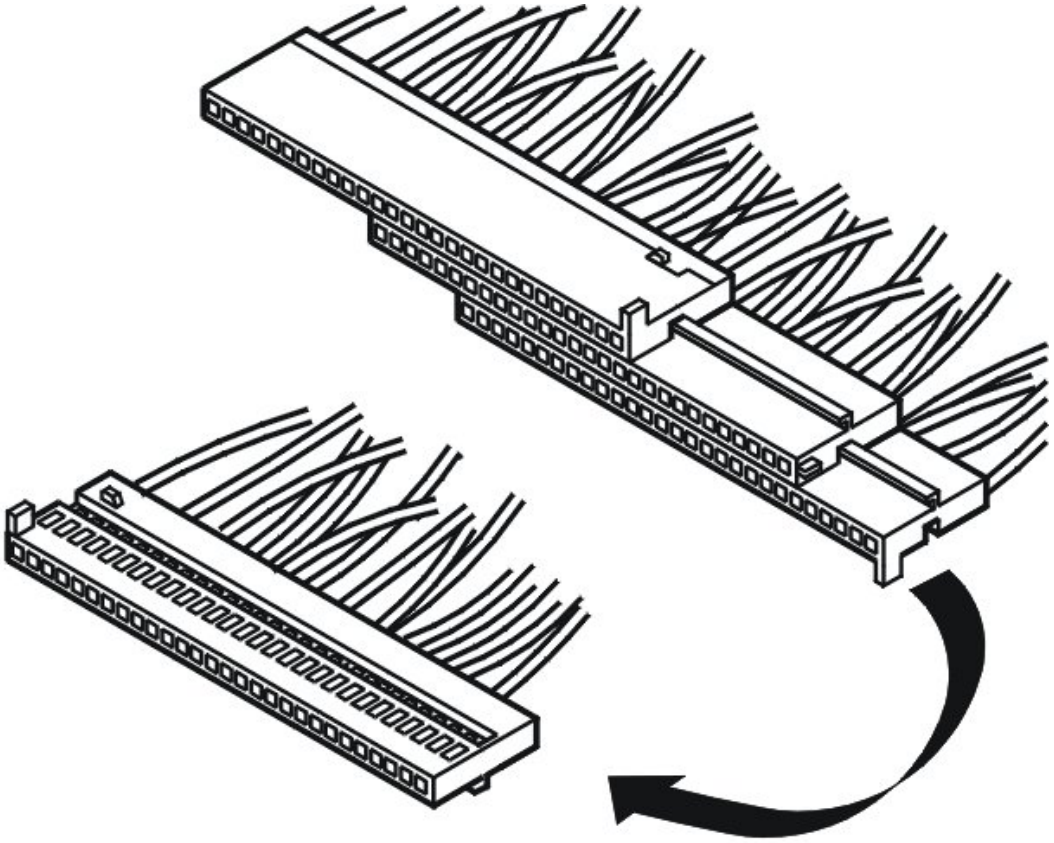
Open the catches (2) on both sides of the connector. Pull the receptacle housings from the casing (1).

Checking the cable terminals

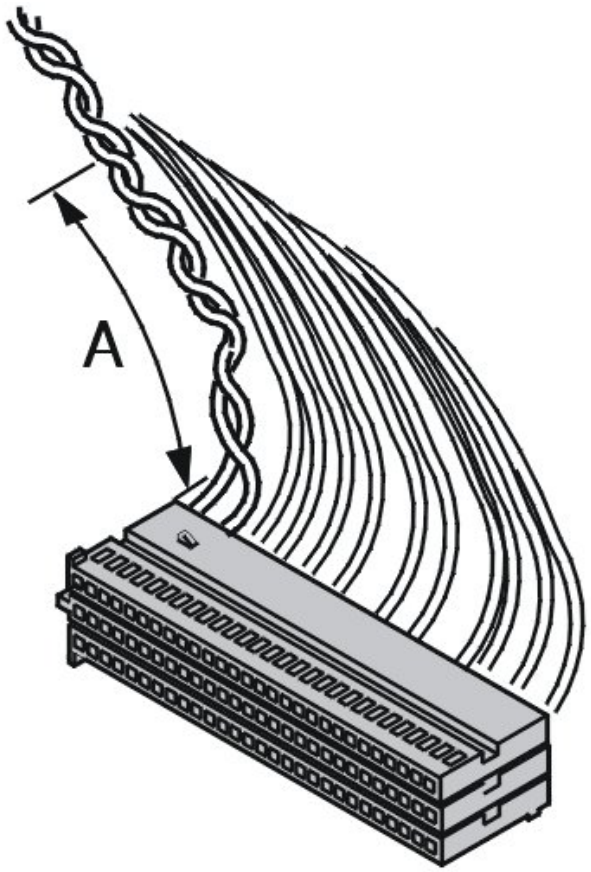
Check the cable terminals in the following terminals:

White receptacle housing terminals A27 and A28.
Blue receptacle housing terminals C27 and C28.
Black receptacle housing terminals B23 B24 B25 B26 B27 and B28.
Check that the cable terminals are not damaged by looking in the cable terminal opening.
The opening must be square, right angled and the cable terminal sides must be align with the receptacle housing.
Damaged receptacle housings are a sign that the cable terminals are also damaged.
If the cable terminals are undamaged, reinstall the connector. See step Installing the connector.
Carry out the final check according to: Removing, replacing and installing Supplemental restraint system (SRS), control module, final check (SRS).
If the cable terminals are damaged, replace the damaged wiring. See step Repairing the wiring.

Repairing the wiring



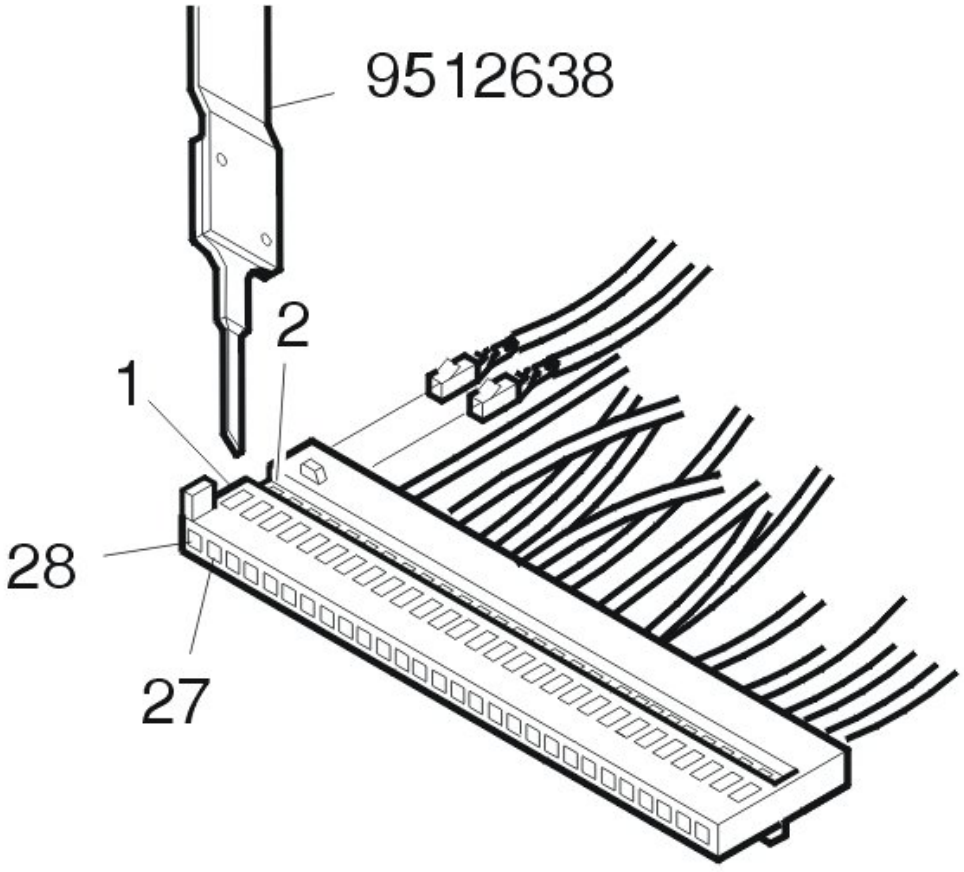
Disconnect the receptacle housings from each other.



Twisted wiring must be replaced in pairs.

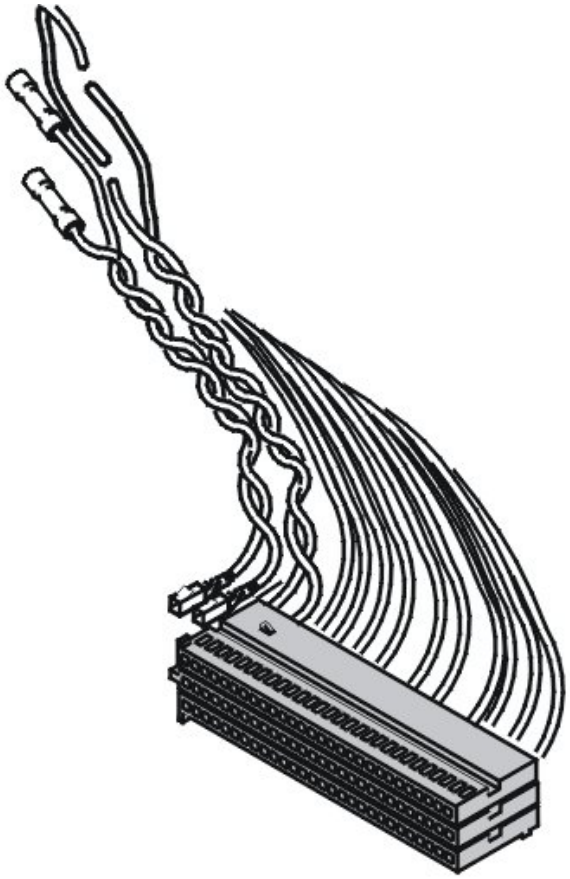
Note! To avoid confusion only replace one pair of cables, or one cable, at a time.

Remove the damaged cable or pair of cables



Note the position of each cable.
Remove the cable terminal by pressing the catch (1). Pull the cable.
Press the catch (2). Pull the cable out.
Use special tool951 2638 Terminal removal tool See: Tools and Equipment/951 2638 Terminal Removal Tool when disconnecting the cable

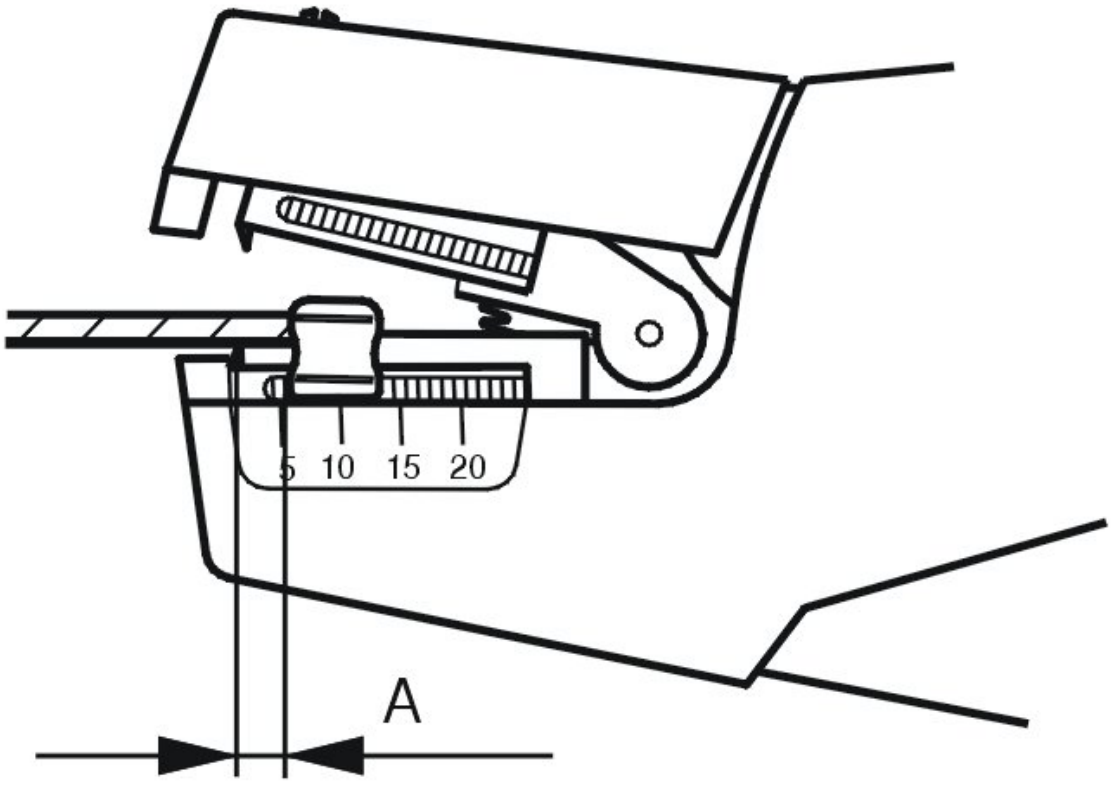
terminals.



Take a**new**cable or pair of cables with the same color markings as the disconnected cables.
Cut off the damaged cable to the same length as the new cable.

Note! The cable lengths are different so that the butt connectors are offset after installation.

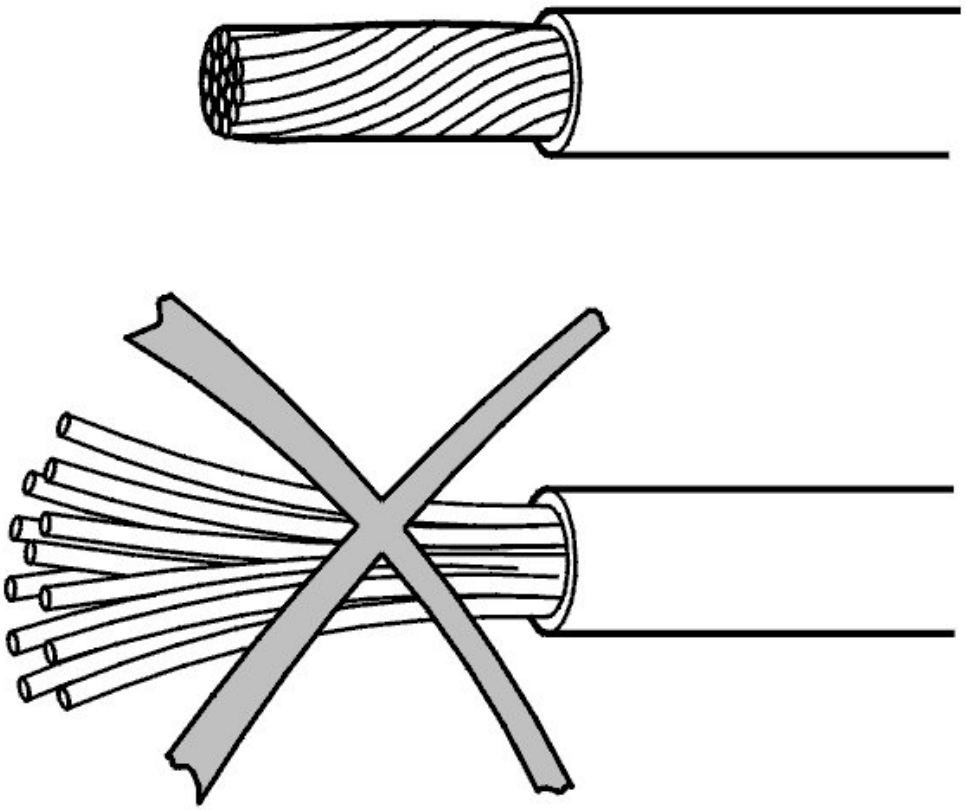
Stripping the cables



Strip**5 mm**(A) off the damaged cable.

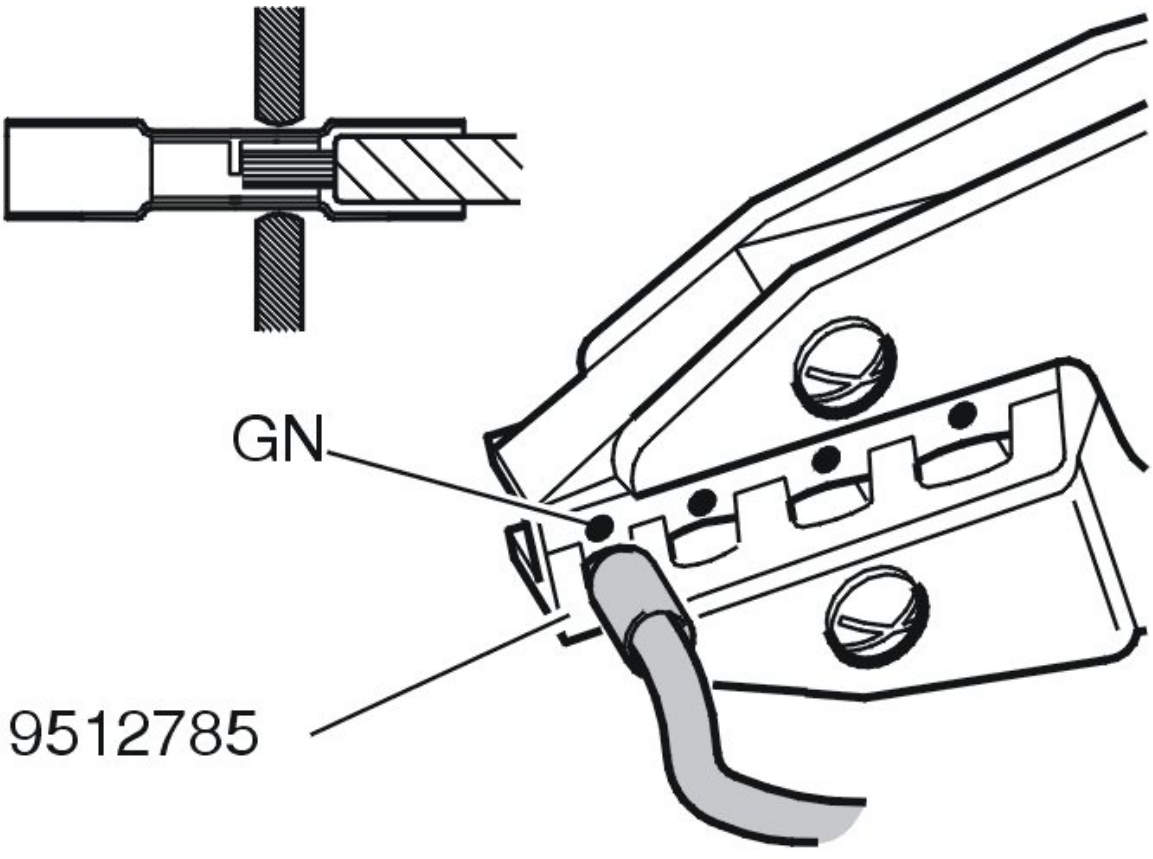
Use cable stripping tool951 2620 Stripping tool See: Tools and Equipment/951 2620 Stripping Tool.

Check the cable ends



Ensure that the cable ends look like the same as in the upper illustration.
It is important to ensure a good result when stripping.

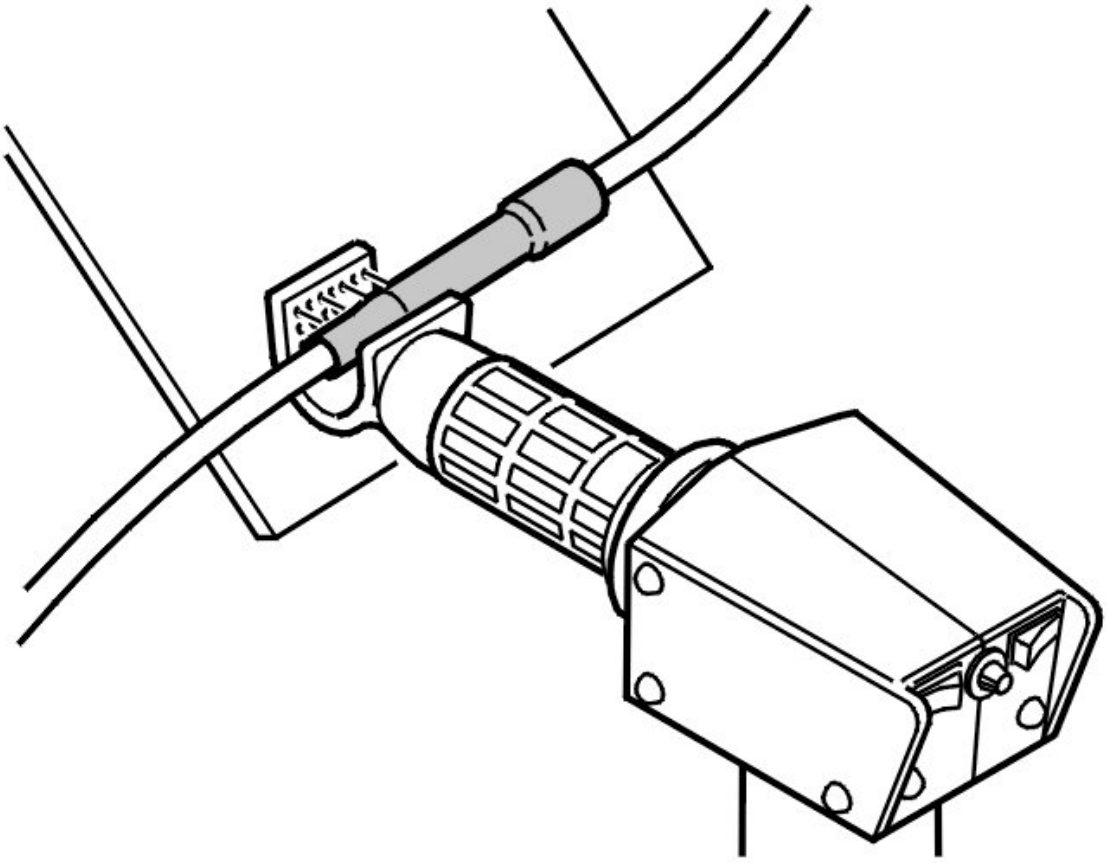
Crimping the butt connector



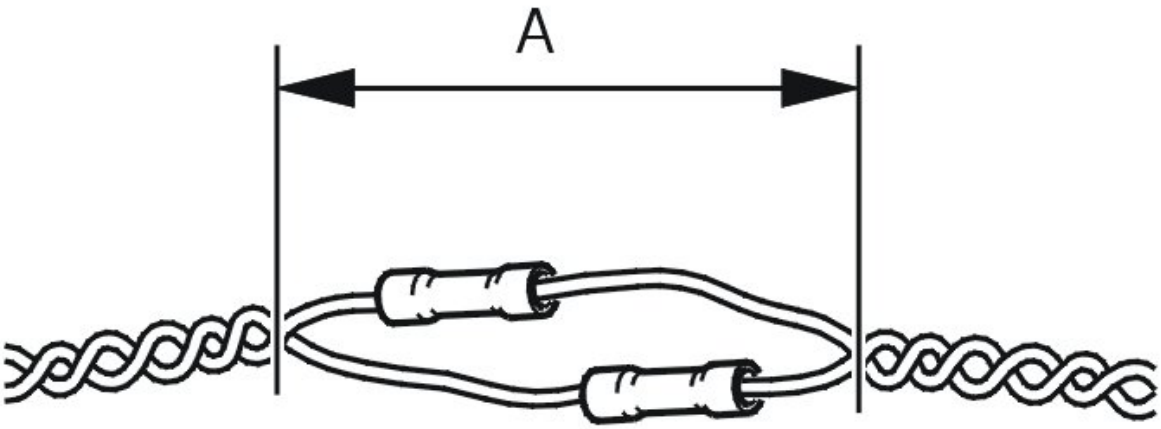
Insert the cable with the same color marking in the butt connector.

Crimp using the green marked cut-out on special tool951 2785 Crimping tool See: Tools and Equipment/951 2785 Crimping Tool.
Check the crimping by looking and feeling that the cable is correctly installed.

Crimping the butt connectors

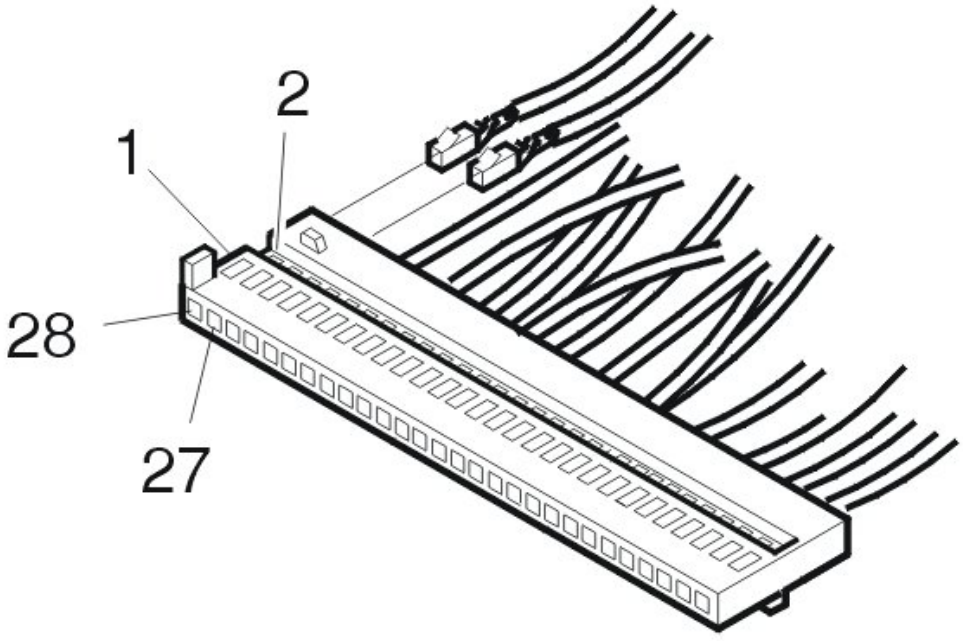


Use hot-air gun951 2777 Hot-air gun See: Tools and Equipment/951 2777 Hot-Air Gun and nozzle951 2778 Nozzle See: Tools and Equipment/951 2778 Nozzle.
Set the hot-air gun to flow 2 and set the temperature between 2 and 3.
Protect surrounding components from heat.
Position the butt connector in the nozzle and heat so that the adhesive forces its ways out of both ends.



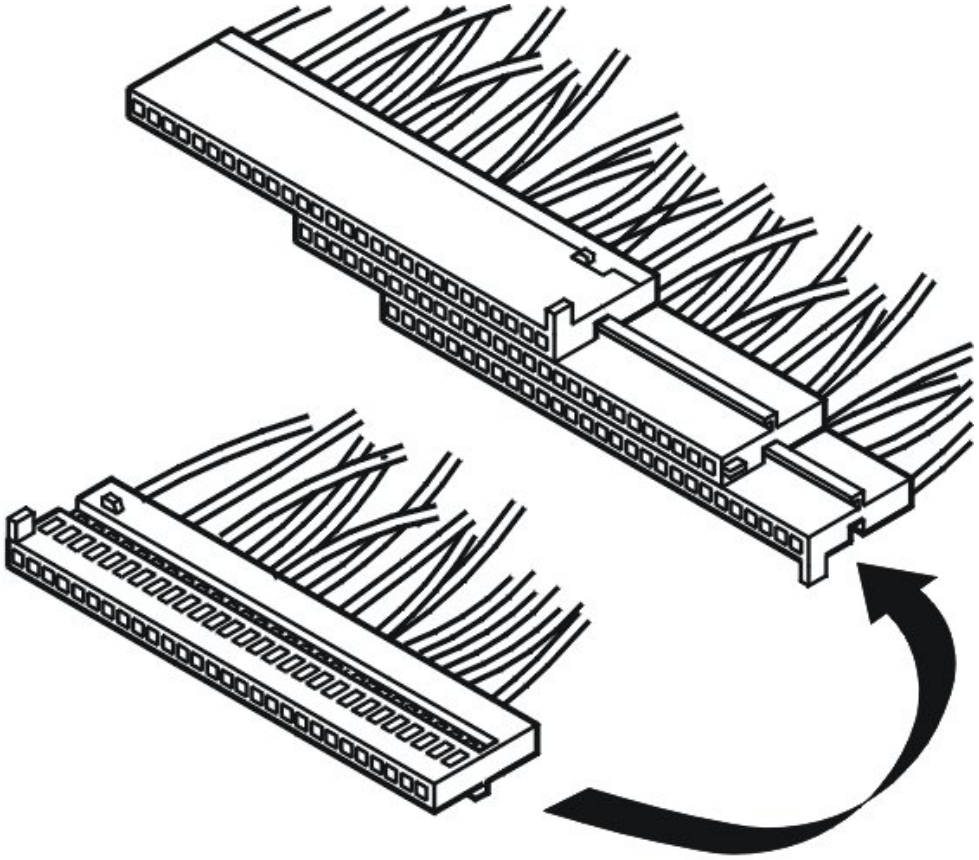
A maximum of**100 mm**(A) of the twisted wiring can be untwisted at the join.

Installing the wiring in the receptacle housing

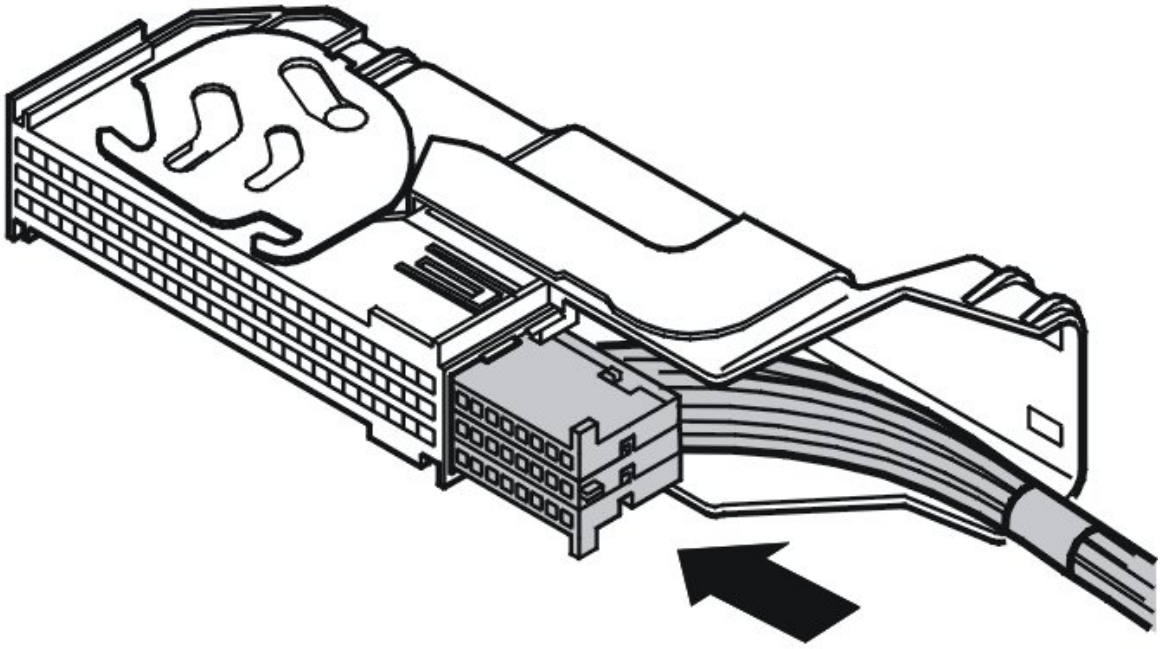


Install the cable terminals in the receptacle housing in the same position as earlier.
Check that the cable terminal is locked in the innermost position.

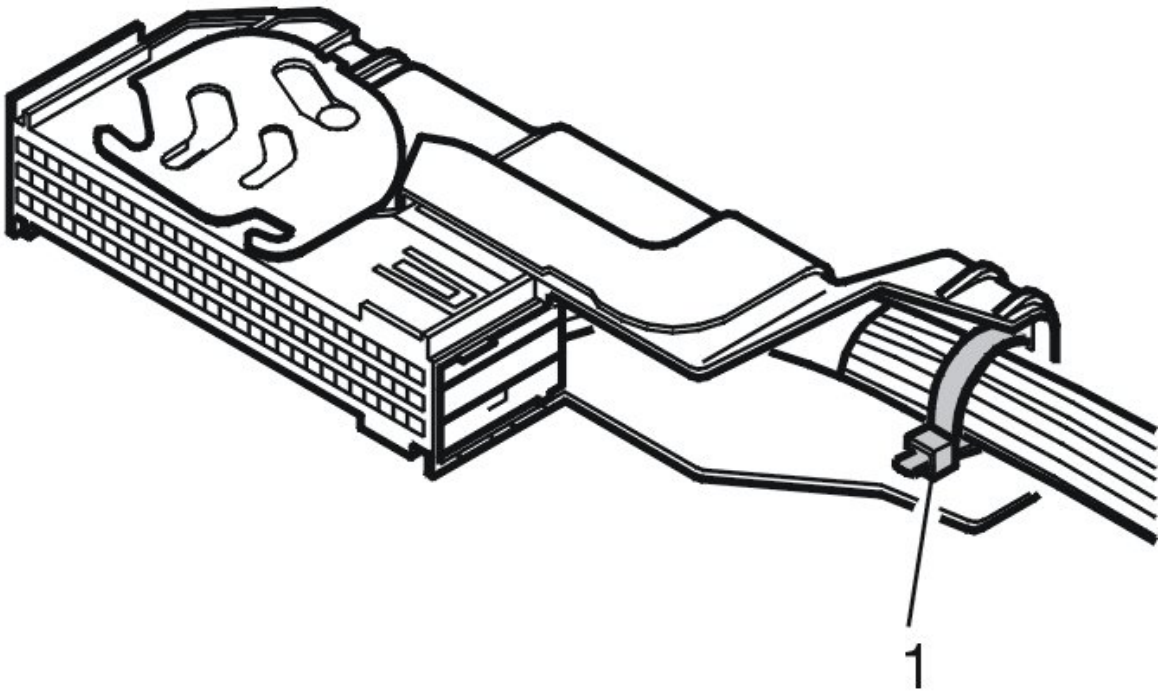
Installing the connector



Assemble the receptacle housings.



Install the receptacle housings in the connector.
Check that the receptacle housings lock in the side of the connector.



Install a new tie strap on the wiring around the cable harness and connector (1).

Installing the connector on the control module

Connect the connector on the control module, see: Removing, replacing and installing Supplemental restraint system (SRS), control module (SRS).

Checking diagnostic trouble code (DTC) 00BB

Check that the rear side impact sensor is correctly connected after finishing the repair.
Remove the connector on the left-hand rear side impact sensor, see: Removing, replacing and installing SRS (supplemental restraint system) Side impact sensor.
Switch the ignition to position II.

- Connect the battery negative lead
- Wait 15 seconds
- Read off diagnostic trouble codes (DTCs).

Diagnostic Trouble Code (DTC) 00BB should now be displayed.
Continue fault-tracing according to the ordinary fault-tracing routine if another diagnostic trouble code (DTC) is displayed.
Switch off the ignition.
Disconnect the battery negative lead.
Connect the cable on the left-hand rear side impact sensor, see: Removing, replacing and installing SRS (supplemental restraint system) Side impact sensor.
Connect the battery negative lead.

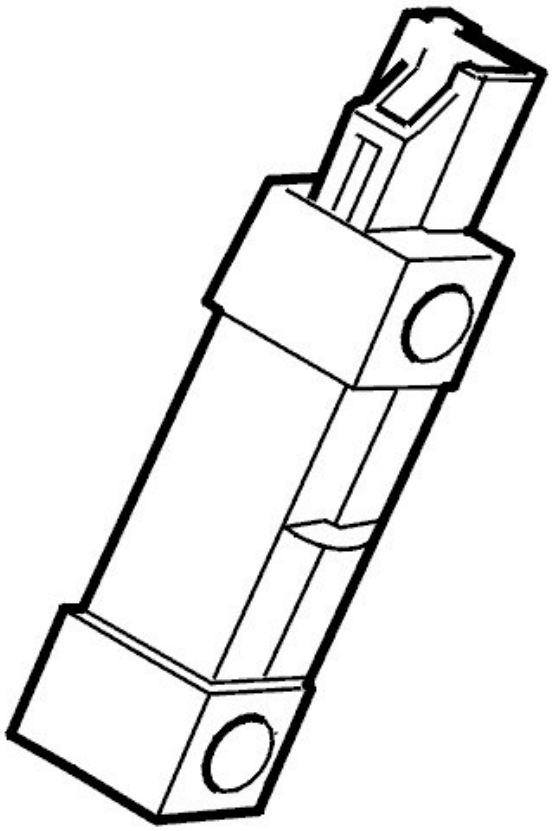
Final check

Carry out the final check according to: Removing, replacing and installing Supplemental restraint system (SRS), control module, final check (SRS).

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00BC

Condition



Diagnostic trouble code (DTC) SRS-00BC is stored if the SRS control module identifies an incorrect side impact sensor identity.

Possible source
- Incorrect side impact sensor identity.
- Incorrect side impact sensor.

Fault symptom[s]
- The SRS indicator lamp is lit.

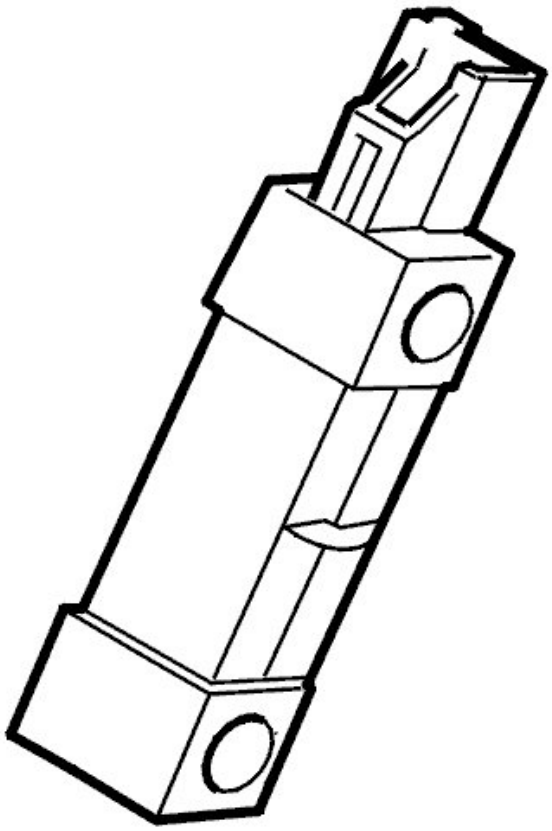
Faulty identity

Faulty identity. Permanent fault

Checking the component

The control module does not recognize the identity of the side impact sensor. Check that the P/N of the side impact sensor is correct.
Ignition on.
Read off the side impact sensor identity by clicking on the VCT2000 symbol.
Replace the side impact sensor if no fault is found.

Other information:
- To access or replace the side impact sensor, see Collision sensor B and C-post, replacing See: Restraint Systems/Air Bag Systems/Impact Sensor/Service and Repair/Collision Sensor, Replacing.



Select "Continue" when the fault has been remedied.

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - FAULT-TRACING FAILED

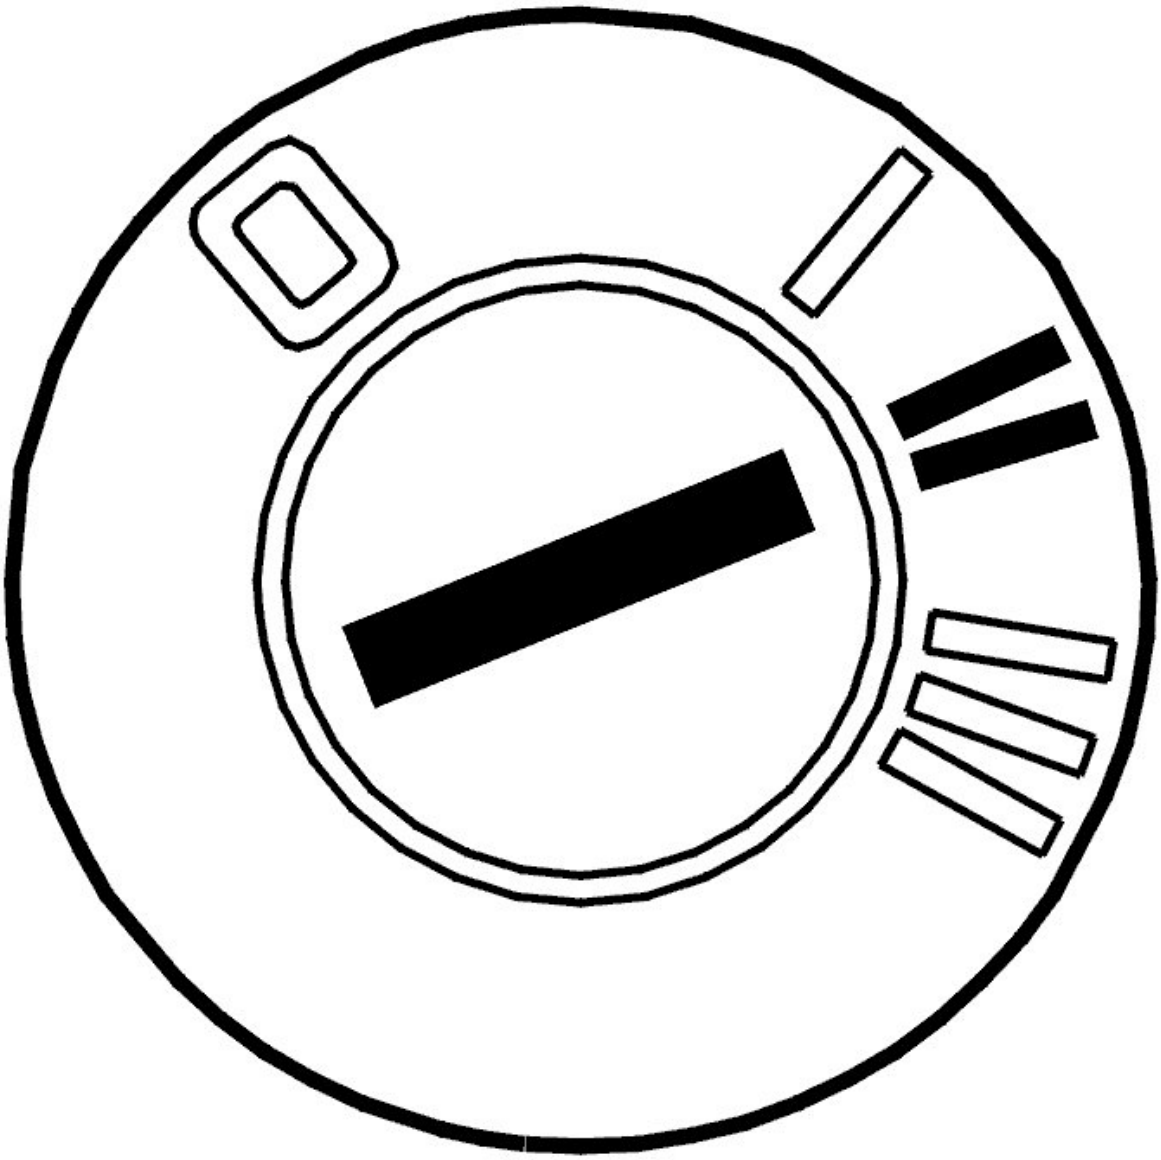
Attempt New Test - Checking the component and wiring

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.



- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

VERIFIED - Fault Found

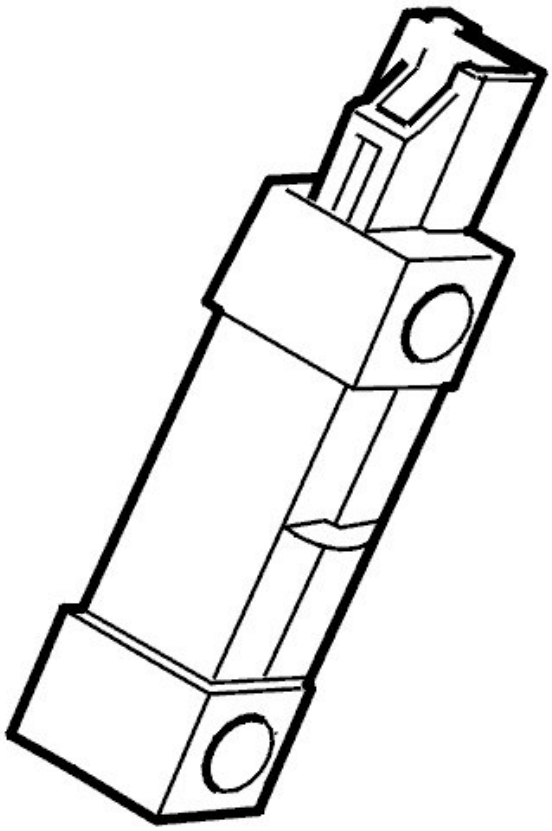
VERIFICATION FAILED - Fault-tracing information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Diagnostic Trouble Code (DTC) Information

SRS-00C0 Diagnostic trouble code information

Condition



If the supplemental restraint system (SRS) control unit cannot communicate with the side impact sensor, diagnostic trouble code SRS-00C0 is displayed.

Substitute value
- Nothing.

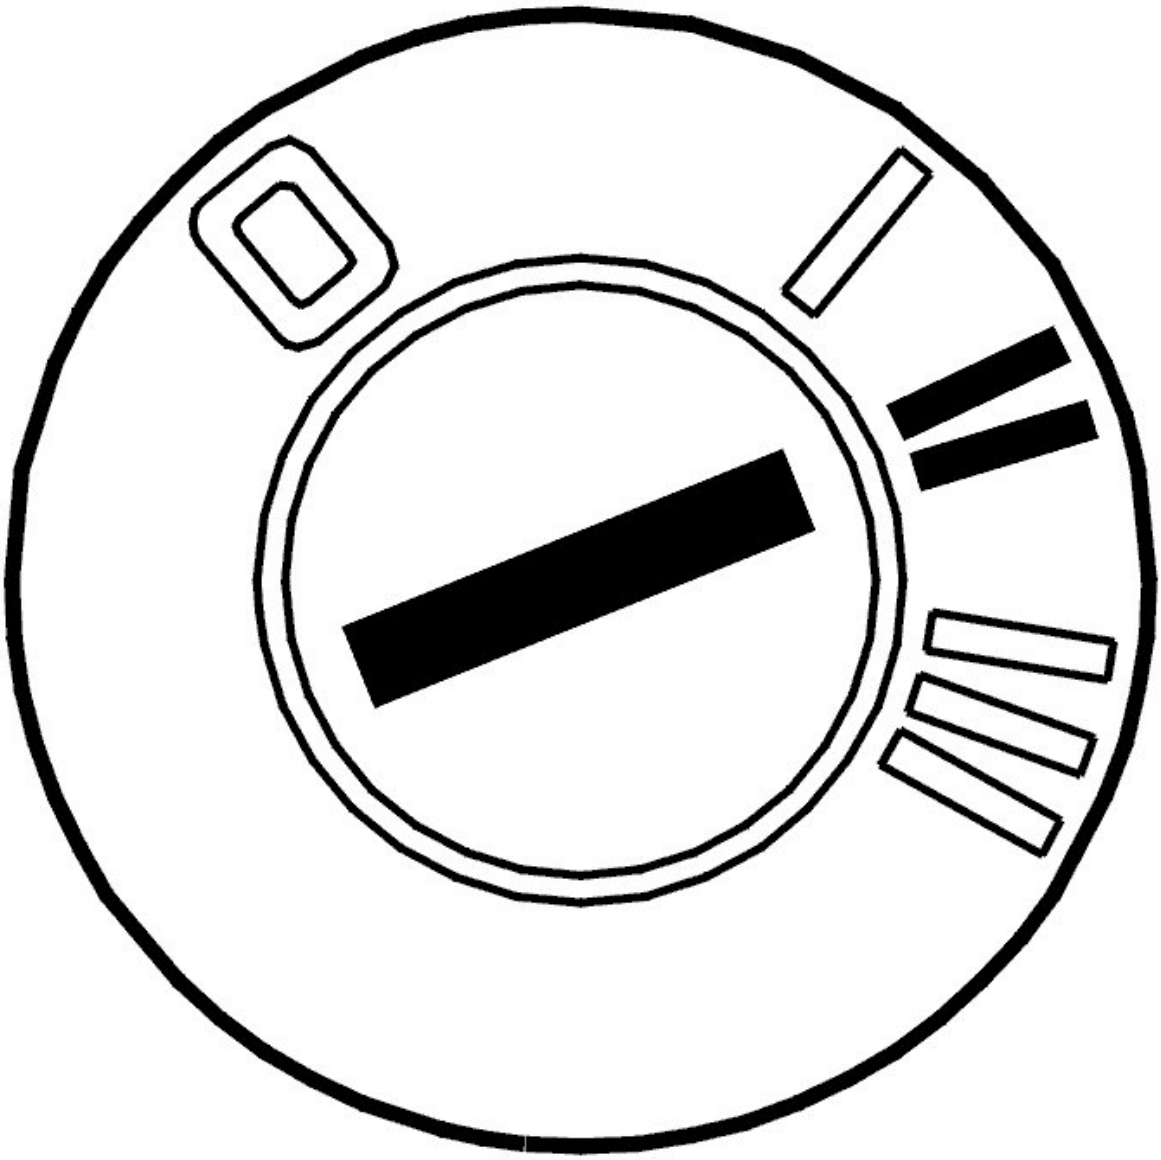
Possible source
- Open circuit in signal wire.

Fault symptom[s]
- SRS warning lamp on.

Communication Fault

Communication fault. Permanent fault

Checking the component and wiring



- Ignition off.

Caution! Do not touch the terminal pins in the SRS control module. There is a risk of static discharge. This could damage the SRS control module.

Note! Check that the side impact sensor is connected.

Check the cable between the SRS control module and the connector or terminal for the side impact sensor according to the following:

for diagnostic trouble code (DTC) SRS-00B1,

front left side impact sensor terminals #8A (8) and #9A (9) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00B6,

front right side impact sensor terminals #8C (4) and #9C (5) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00BB,

rear left side impact sensor terminals #27A (27) and #28A (28) and connector terminals #1 and #2.

for diagnostic trouble code (DTC) SRS-00C0,

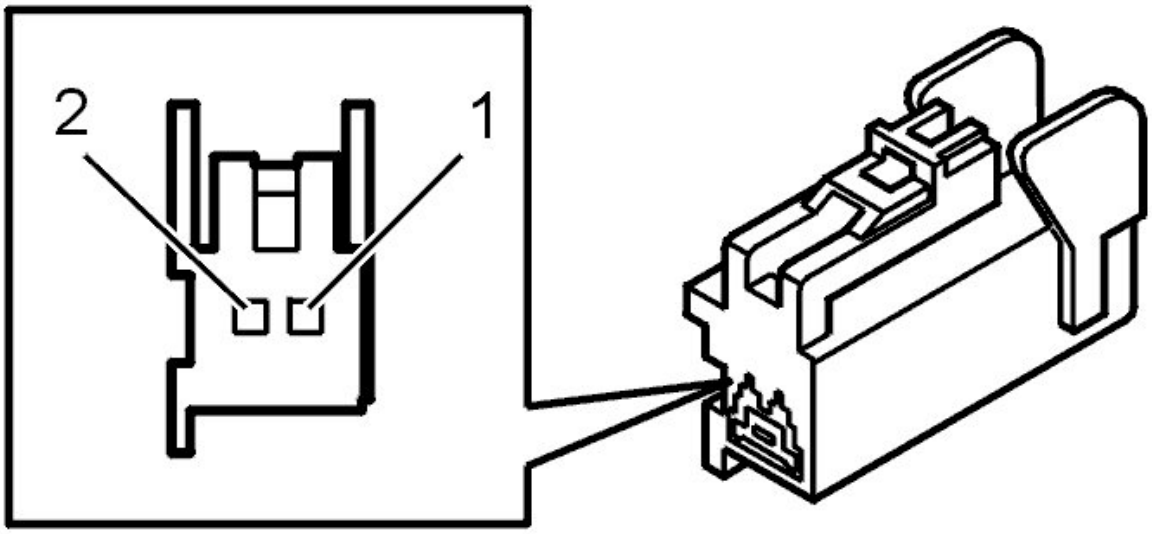
rear right side impact sensor terminals #27C (23) and #28C (24) and connector terminals #1 and #2.
for an open-circuit. See Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.
Remedy as necessary.

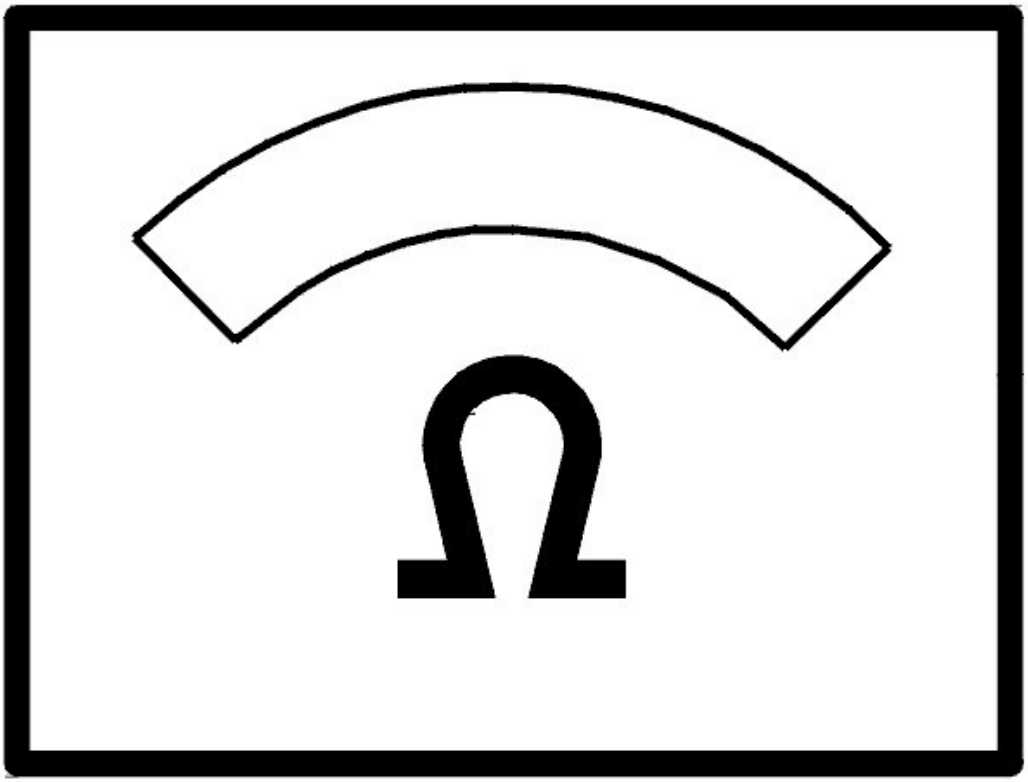
Other information:

- To access and replace the SRS control module and connector, see Control module SRS (supplemental restraint system), replacing See: Relays

and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

- To access or replace the side impact sensor, see Collision sensor B and C-post, replacing See: Restraint Systems/Air Bag Systems/Impact Sensor/Service and Repair/Collision Sensor, Replacing
- To connect the breakout box, see Connecting the breakout box See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Supplemental Restraint System Module (SRS)
- For other values, see Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS).





Was a fault detected?

Yes - Verification

No - Replacing side impact sensor

Replacing side impact sensor

Try a new side impact sensor according to Collision sensor B and C-post, replacing See: Restraint Systems/Air Bag Systems/Impact Sensor/Service and Repair/Collision Sensor, Replacing.

Select "Continue" when the fault has been remedied.

Continue - Verification

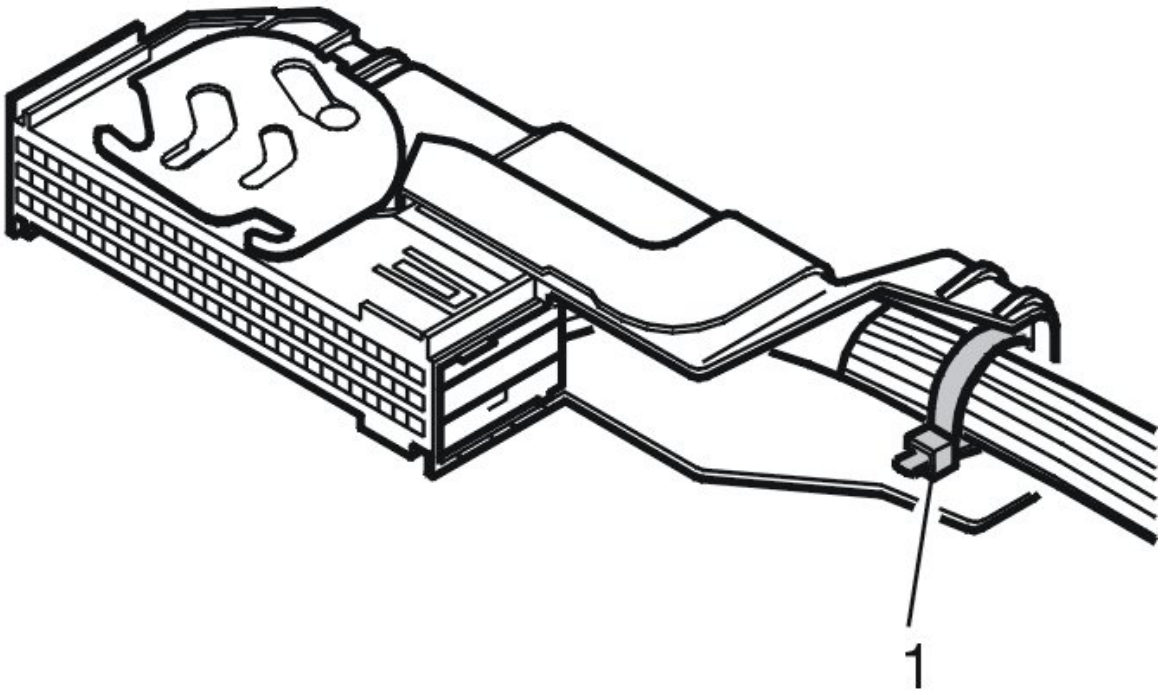
FAULT FOUND - DONE

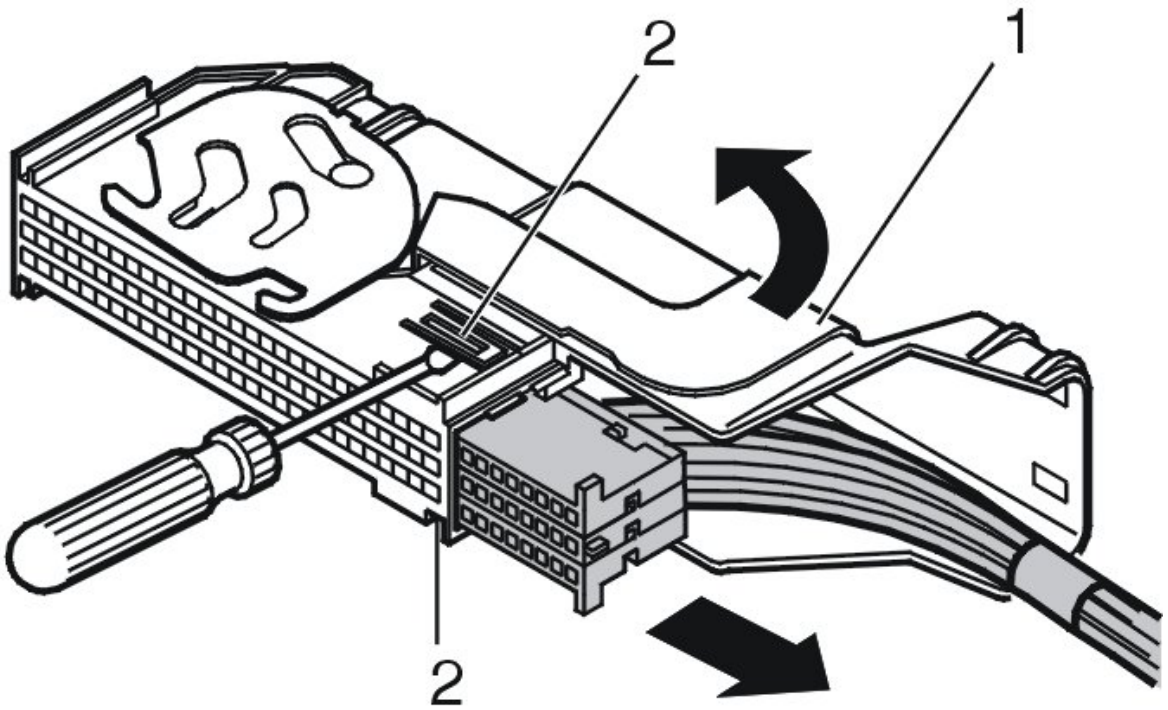
Diagnostic Trouble Codes (DTC) SRS 00BB and 00C0, Fault-tracing and Repairing

Diagnostic Trouble Codes (DTC) SRS 00BB and 00C0, fault-tracing and repairing

Checking the cable terminals for the SRS sensor



If diagnostic trouble codes (DTC) SRS 00BB and 00C0 occur remove and check the cable terminal in the SRS (supplemental restraint system) sensor connector as follows.
Disconnect the connector for the SRS sensor, see: Removing, replacing and installing Supplemental restraint system (SRS), control module (SRS).
Remove the tie strap (1) around the wiring and connector.



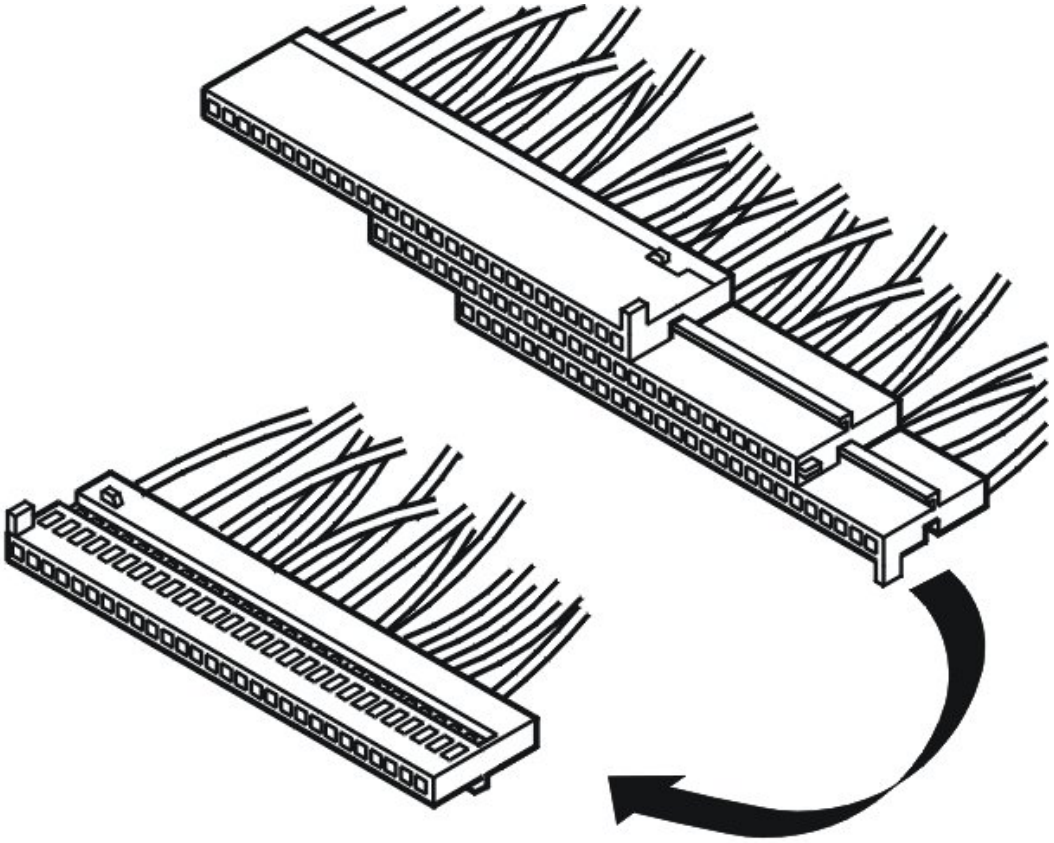
Open the catches (2) on both sides of the connector. Pull the receptacle housings from the casing (1).

Checking the cable terminals

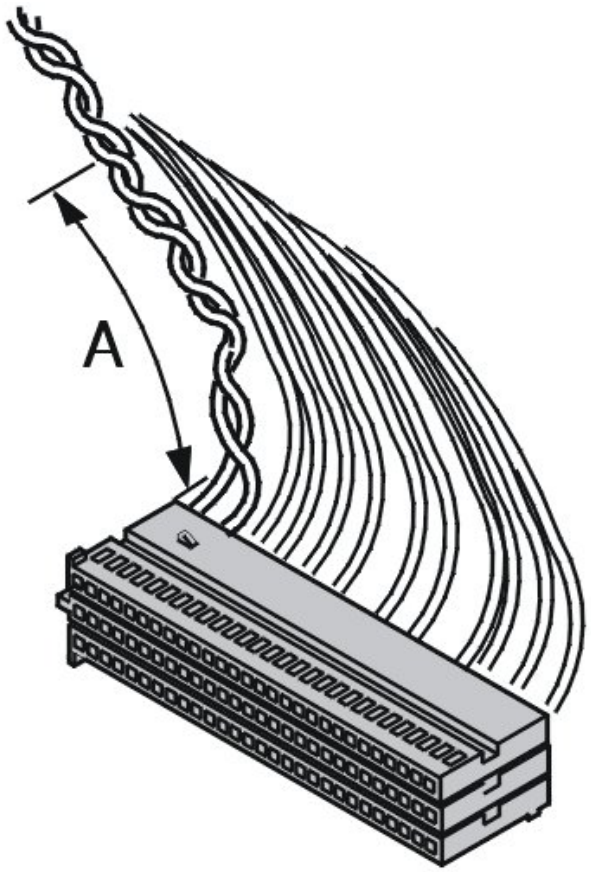
Check the cable terminals in the following terminals:

White receptacle housing terminals A27 and A28.
Blue receptacle housing terminals C27 and C28.
Black receptacle housing terminals B23 B24 B25 B26 B27 and B28.
Check that the cable terminals are not damaged by looking in the cable terminal opening.
The opening must be square, right angled and the cable terminal sides must be align with the receptacle housing.
Damaged receptacle housings are a sign that the cable terminals are also damaged.
If the cable terminals are undamaged, reinstall the connector. See step Installing the connector.
Carry out the final check according to: Removing, replacing and installing Supplemental restraint system (SRS), control module, final check (SRS).
If the cable terminals are damaged, replace the damaged wiring. See step Repairing the wiring.

Repairing the wiring



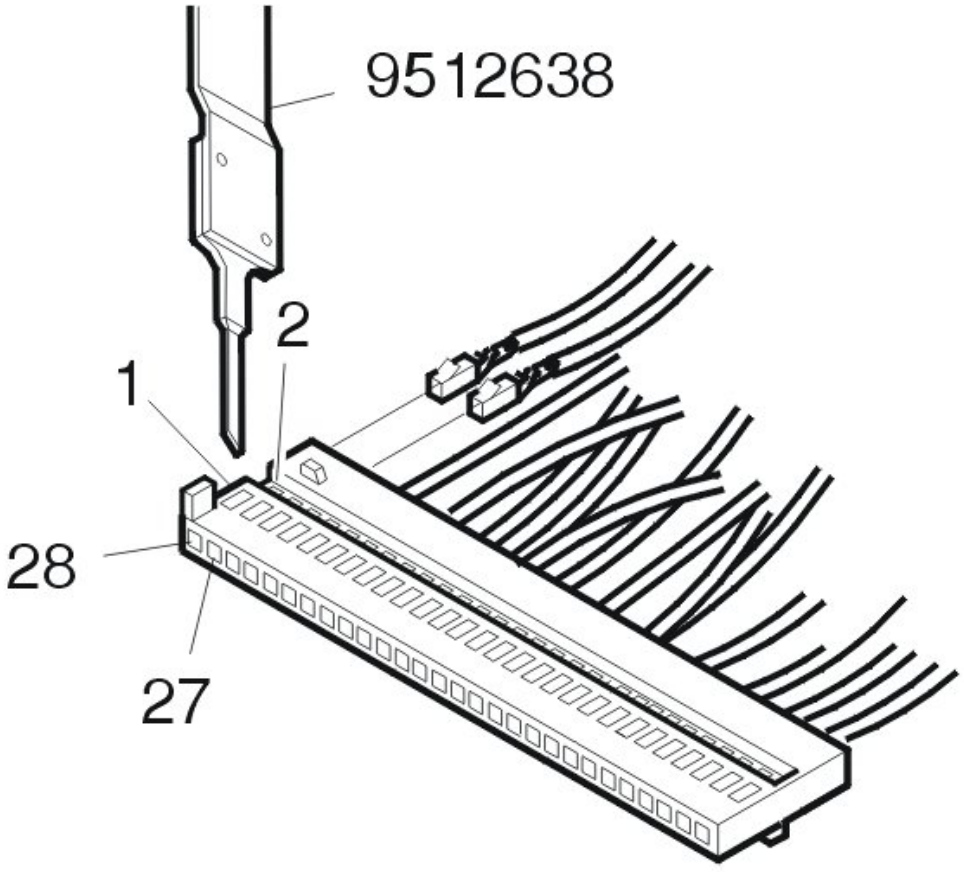
Disconnect the receptacle housings from each other.



Twisted wiring must be replaced in pairs.

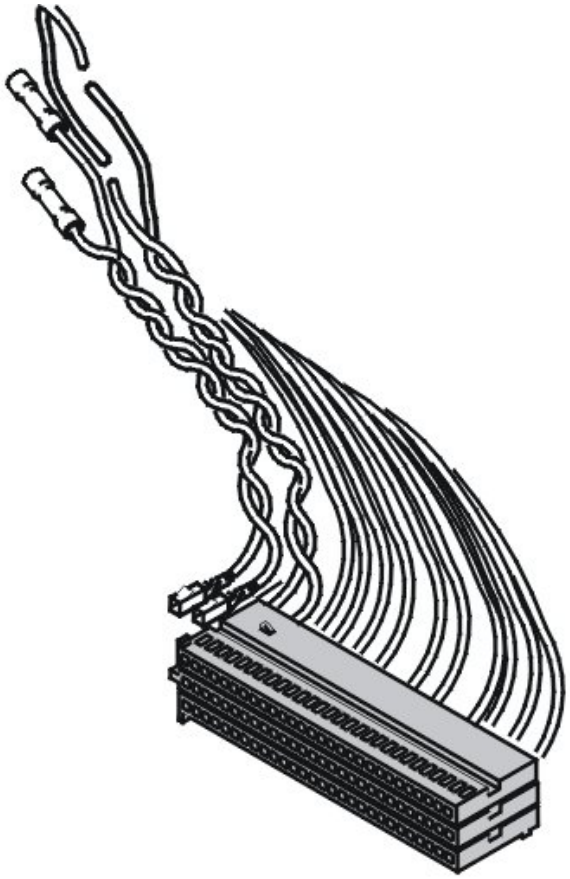
Note! To avoid confusion only replace one pair of cables, or one cable, at a time.

Remove the damaged cable or pair of cables



Note the position of each cable.
Remove the cable terminal by pressing the catch (1). Pull the cable.
Press the catch (2). Pull the cable out.
Use special tool951 2638 Terminal removal tool See: Tools and Equipment/951 2638 Terminal Removal Tool when disconnecting the cable

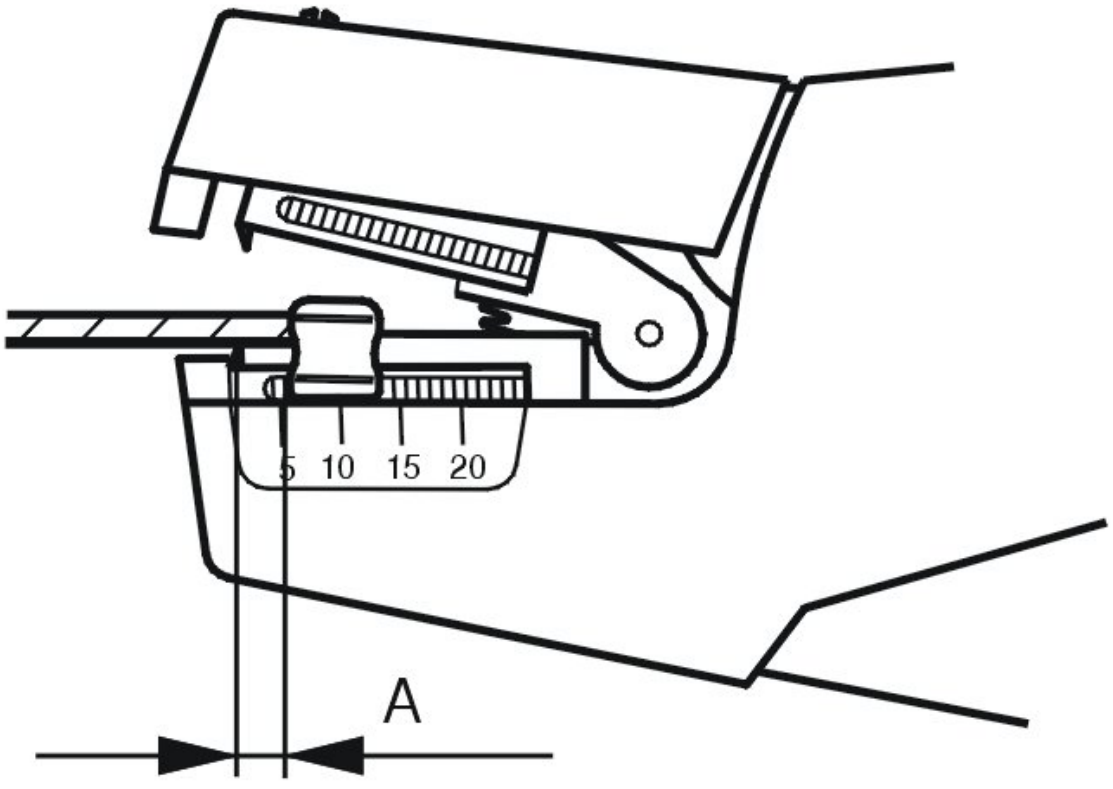
terminals.



Take a**new**cable or pair of cables with the same color markings as the disconnected cables.
Cut off the damaged cable to the same length as the new cable.

Note! The cable lengths are different so that the butt connectors are offset after installation.

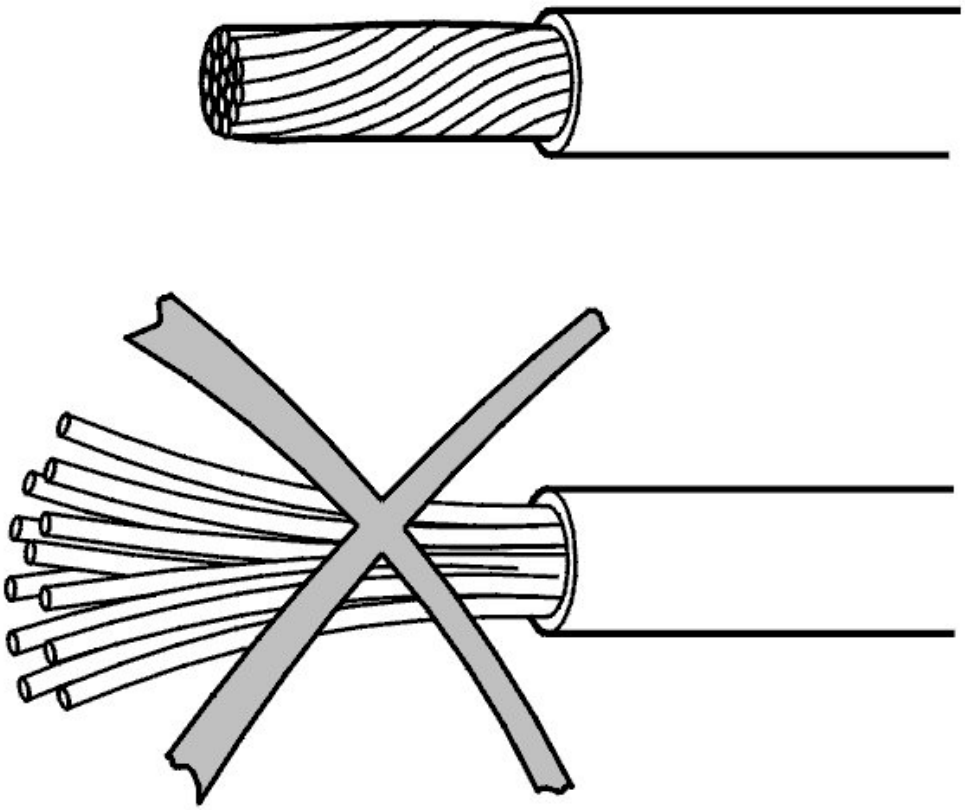
Stripping the cables



Strip**5 mm**(A) off the damaged cable.

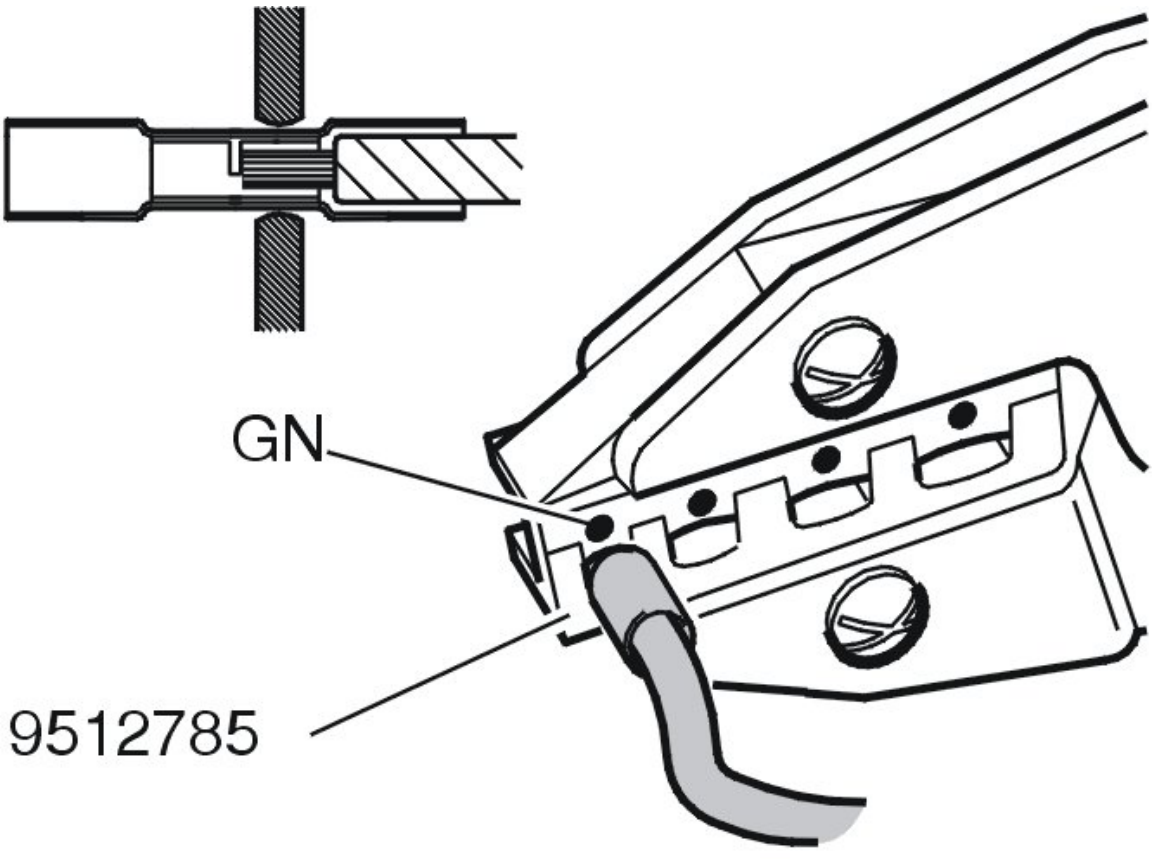
Use cable stripping tool951 2620 Stripping tool See: Tools and Equipment/951 2620 Stripping Tool.

Check the cable ends



Ensure that the cable ends look like the same as in the upper illustration.
It is important to ensure a good result when stripping.

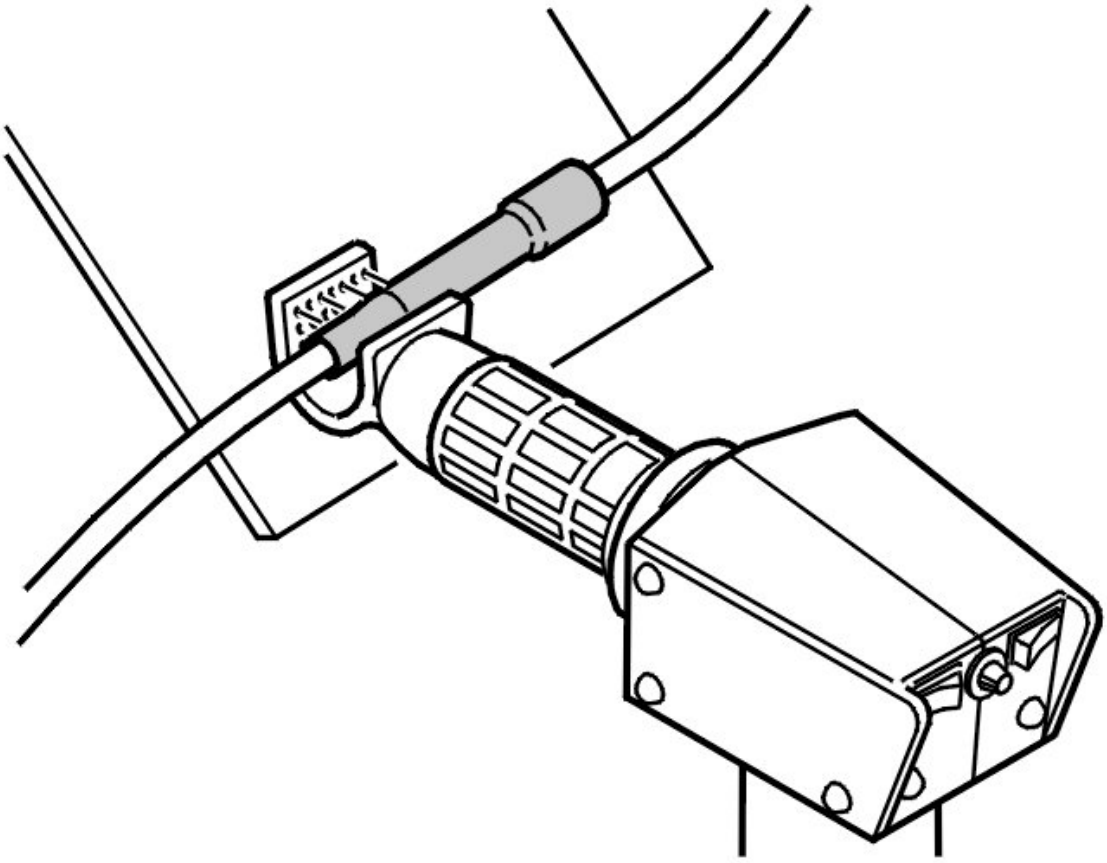
Crimping the butt connector



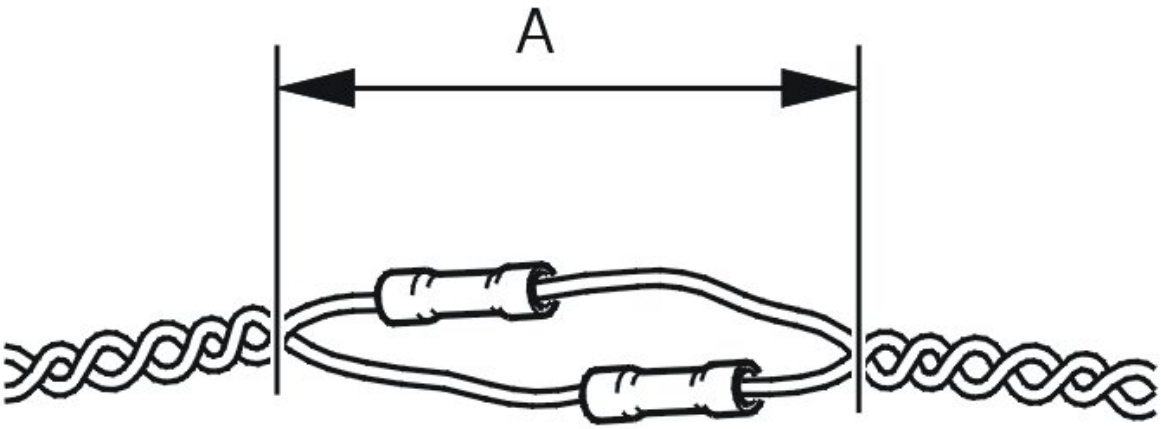
Insert the cable with the same color marking in the butt connector.

Crimp using the green marked cut-out on special tool951 2785 Crimping tool See: Tools and Equipment/951 2785 Crimping Tool.
Check the crimping by looking and feeling that the cable is correctly installed.

Crimping the butt connectors

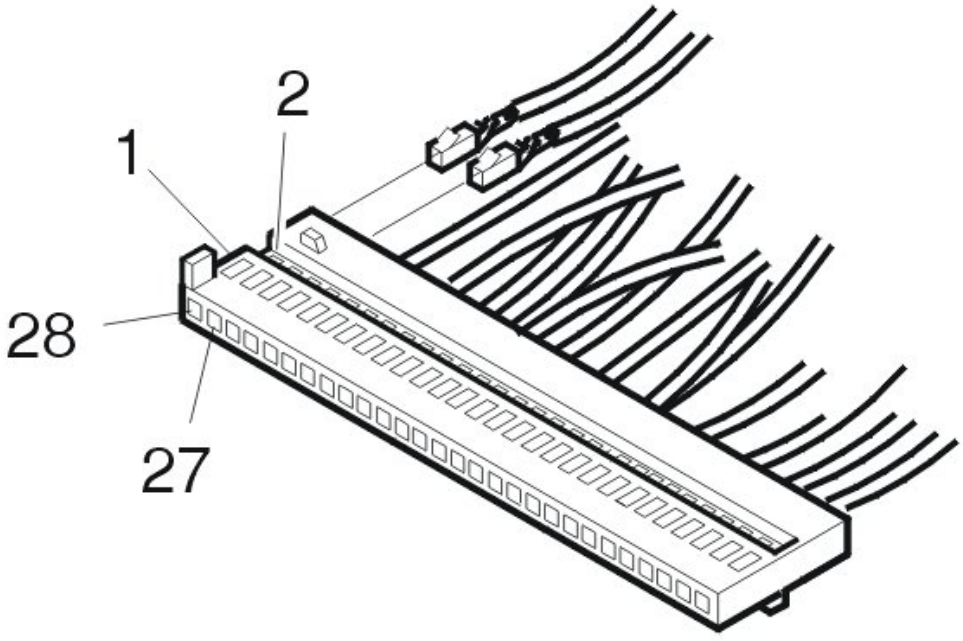


Use hot-air gun951 2777 Hot-air gun See: Tools and Equipment/951 2777 Hot-Air Gun and nozzle951 2778 Nozzle See: Tools and Equipment/951 2778 Nozzle.
Set the hot-air gun to flow 2 and set the temperature between 2 and 3.
Protect surrounding components from heat.
Position the butt connector in the nozzle and heat so that the adhesive forces its ways out of both ends.



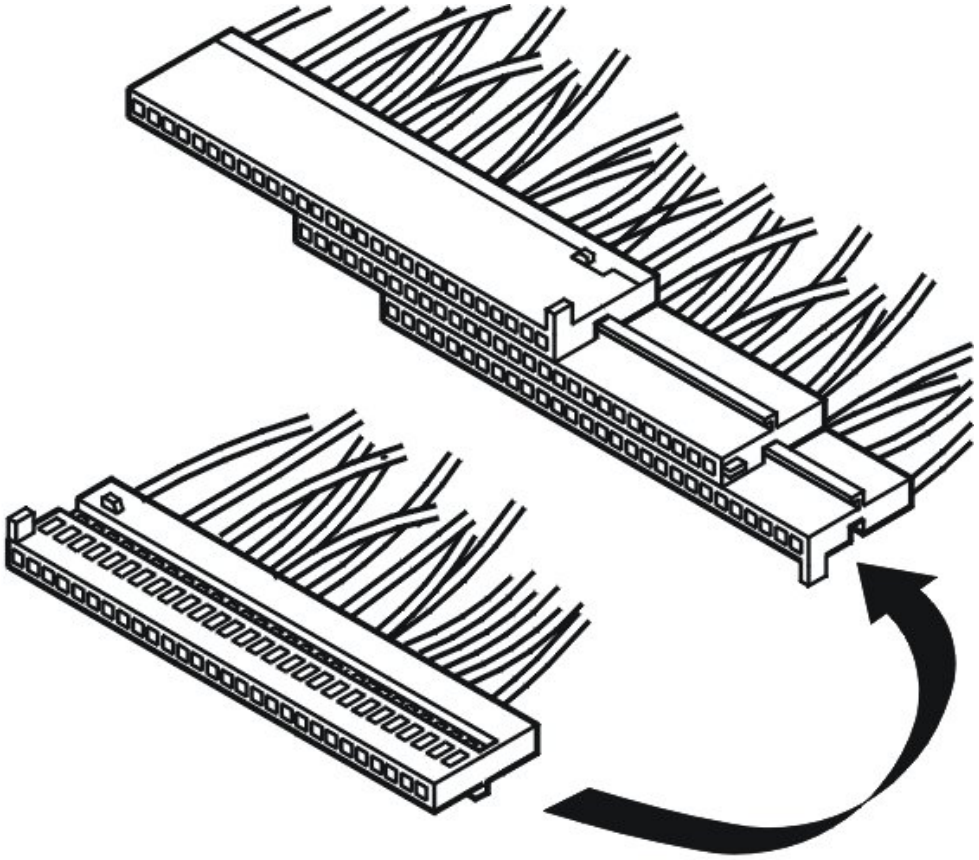
A maximum of**100 mm**(A) of the twisted wiring can be untwisted at the join.

Installing the wiring in the receptacle housing

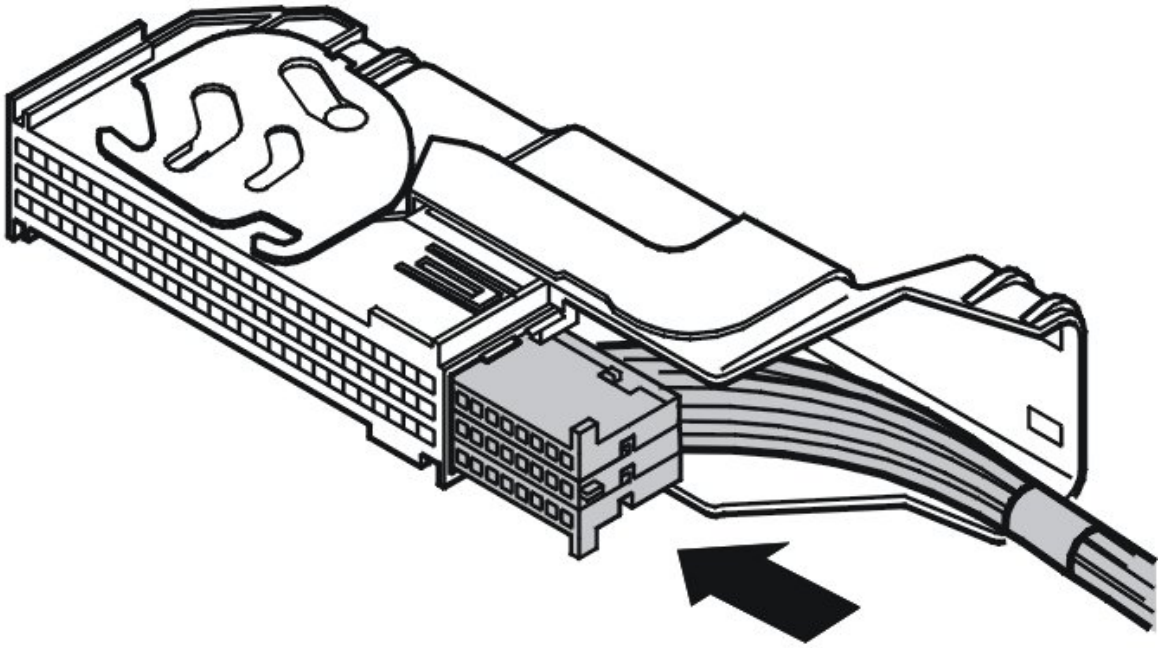


Install the cable terminals in the receptacle housing in the same position as earlier.
Check that the cable terminal is locked in the innermost position.

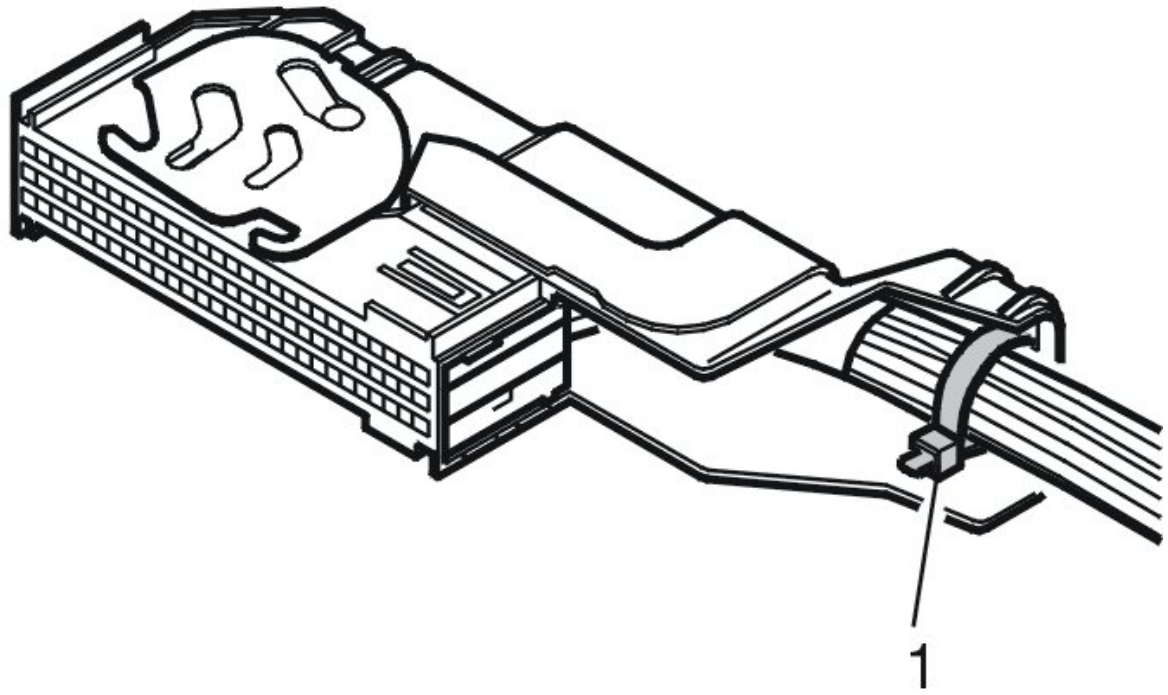
Installing the connector



Assemble the receptacle housings.



Install the receptacle housings in the connector.
Check that the receptacle housings lock in the side of the connector.



Install a new tie strap on the wiring around the cable harness and connector (1).

Installing the connector on the control module

Connect the connector on the control module, see: Removing, replacing and installing Supplemental restraint system (SRS), control module (SRS).

Checking diagnostic trouble code (DTC) 00BB

Check that the rear side impact sensor is correctly connected after finishing the repair.
Remove the connector on the left-hand rear side impact sensor, see: Removing, replacing and installing SRS (supplemental restraint system) Side impact sensor.
Switch the ignition to position II.

- Connect the battery negative lead
- Wait 15 seconds
- Read off diagnostic trouble codes (DTCs).

Diagnostic Trouble Code (DTC) 00BB should now be displayed.
Continue fault-tracing according to the ordinary fault-tracing routine if another diagnostic trouble code (DTC) is displayed.
Switch off the ignition.
Disconnect the battery negative lead.
Connect the cable on the left-hand rear side impact sensor, see: Removing, replacing and installing SRS (supplemental restraint system) Side impact sensor.
Connect the battery negative lead.

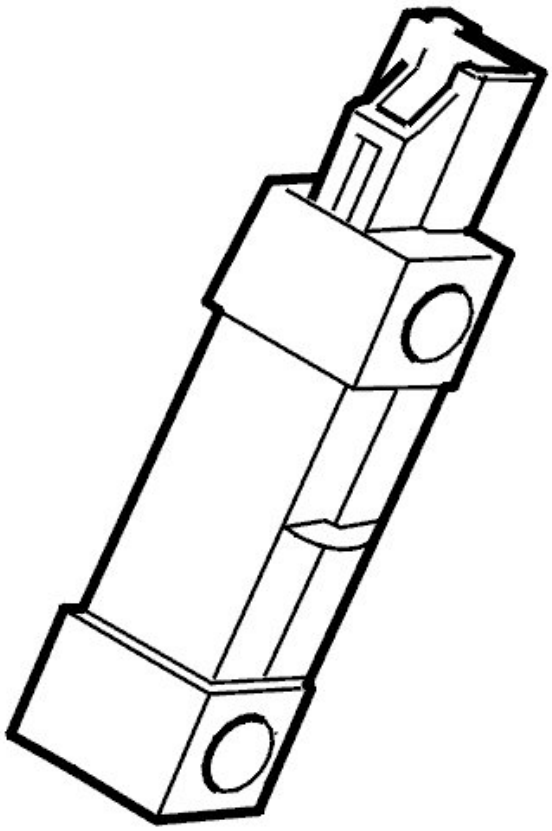
Final check

Carry out the final check according to: Removing, replacing and installing Supplemental restraint system (SRS), control module, final check (SRS).

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00C1

Condition



Diagnostic trouble code (DTC) SRS-00C1 is stored if the SRS control module identifies an incorrect side impact sensor identity.

Substitute value
- None.

Possible source
- Faulty side impact sensor identity.
- Faulty side impact sensor.

Fault symptom[s]
- The SRS indicator lamp is lit.

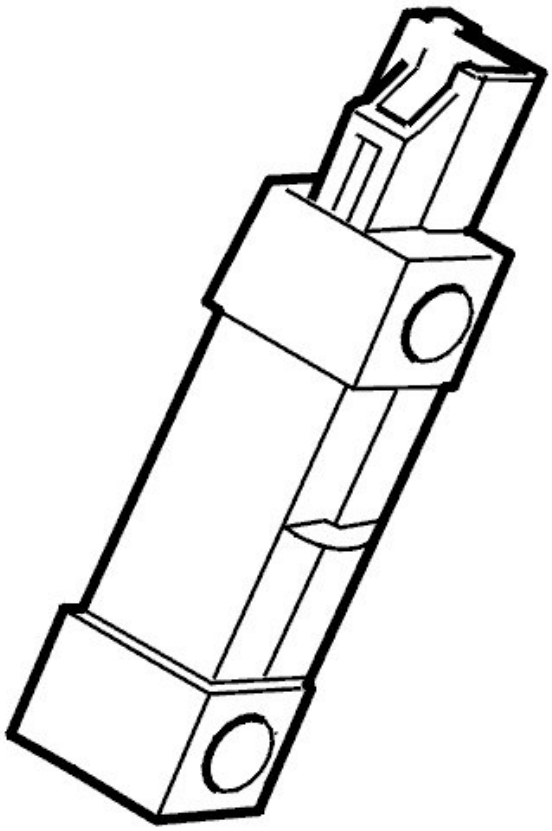
Faulty identity

Faulty identity. Permanent fault

Checking the component

The control module does not recognize the identity of the side impact sensor. Check that the P/N of the side impact sensor is correct.
Ignition on.
Read off the side impact sensor identity by clicking on the VCT2000 symbol.
Replace the side impact sensor if no fault is found.

Other information:
- To access or replace the side impact sensor, see Collision sensor B and C-post, replacing See: Restraint Systems/Air Bag Systems/Impact Sensor/Service and Repair/Collision Sensor, Replacing.



Select "Continue" when the fault has been remedied.

Diagnostic trouble code (DTC) information SRS-00D7

Condition
- Diagnostic trouble code (DTC) SRS-00D7 is stored if the supplementary restraint system (SRS) registers a collision signal.

Substitute value
- None.

Possible source
- The control module registers a collision signal.

Fault symptom[s]
- The SRS indicator lamp is lit.

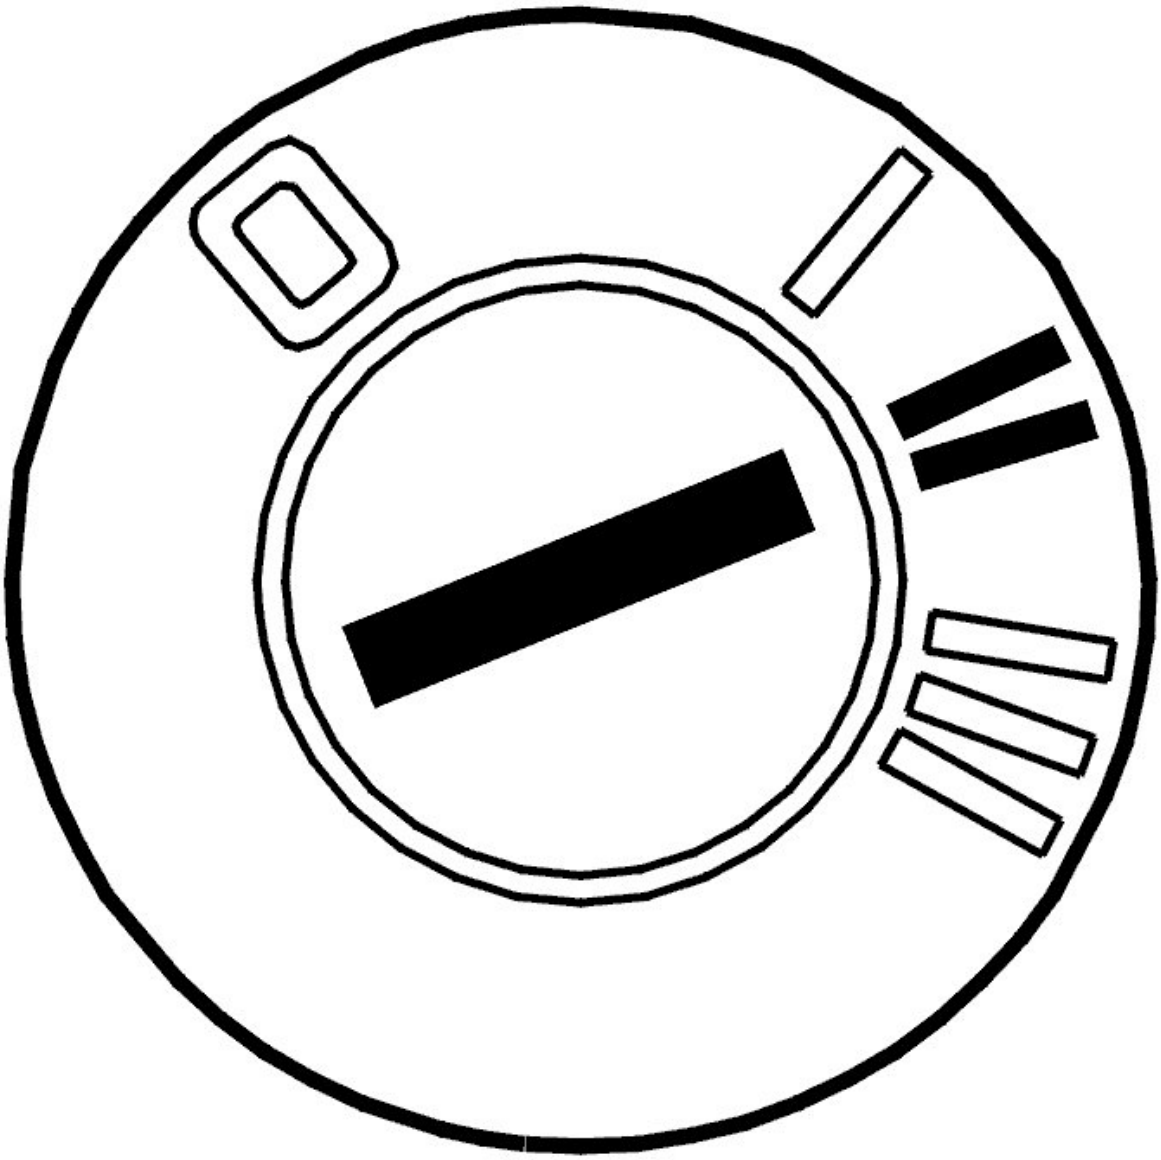
Collision Signal received

Collision signal received. Permanent fault

Checking the SRS indicator lamp

Erasing diagnostic trouble codes (DTCs)

Hint: Sometimes only the SRS indicator lamp may light if the SRS control module has registered a collision.

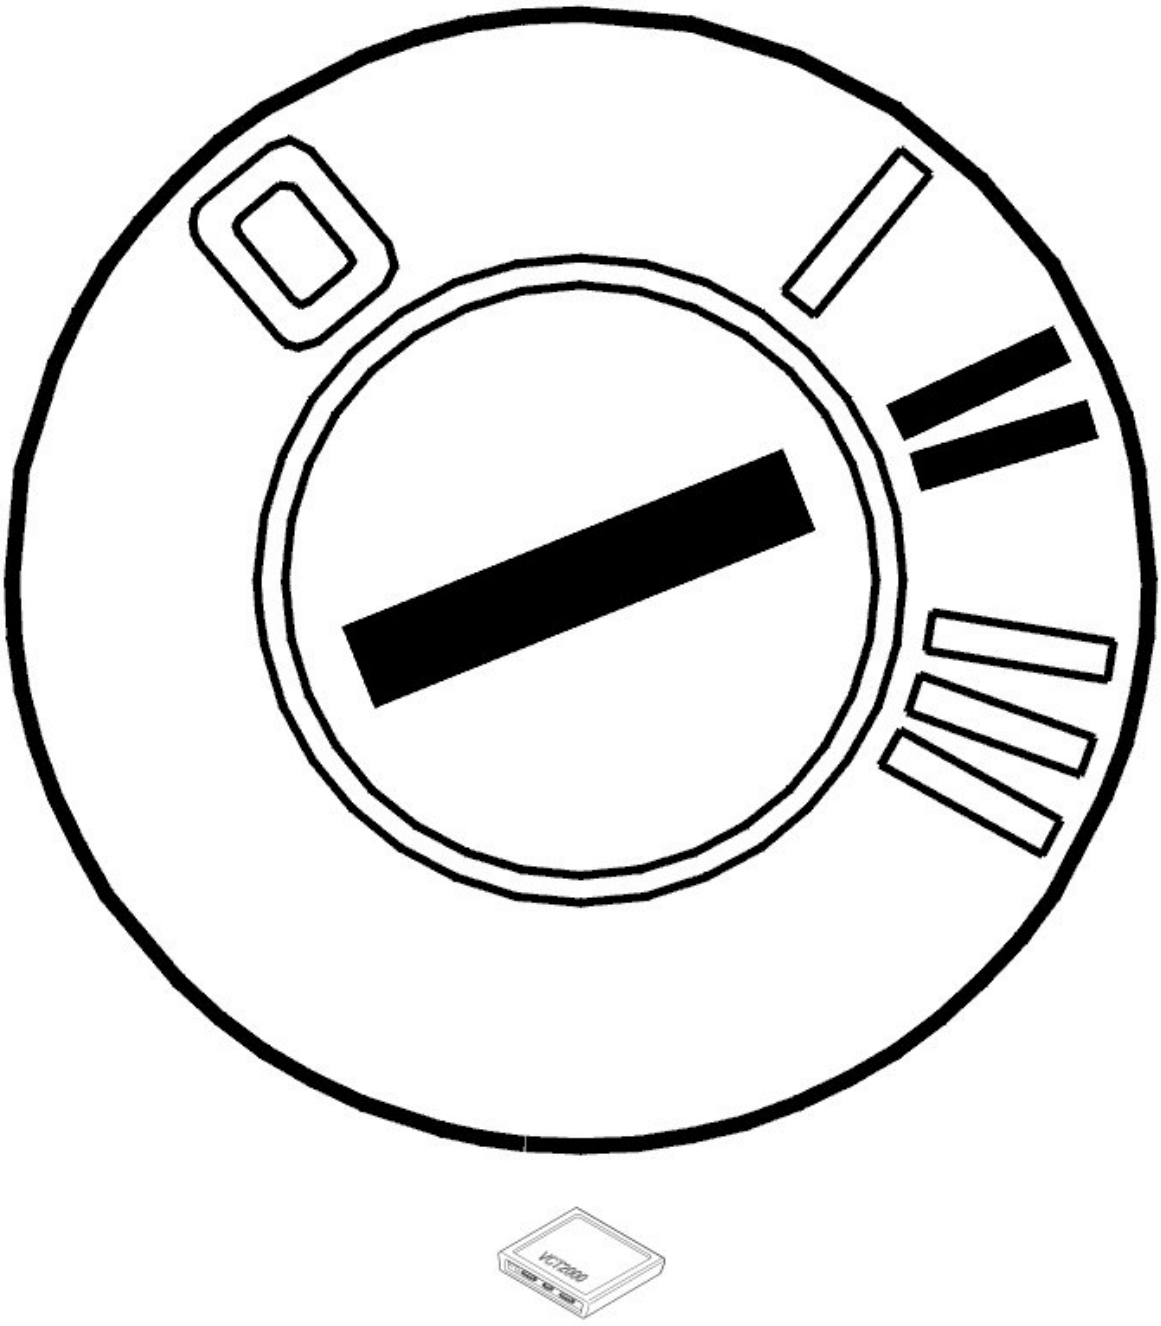


- Ignition on.

- Erase diagnostic trouble codes by clicking the VCT2000 symbol.

This will take at least 20 seconds.

Reading off diagnostic trouble codes (DTCs)



Note! Corrective action must be taken if the battery lead has been disconnected during fault-tracing. See Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting.

- Switch on the ignition. Wait 10 seconds
- Read off the diagnostic trouble codes (DTCs) by clicking on the VCT2000 symbol.
- Note any stored diagnostic trouble codes (DTCs).

No diagnostic trouble codes (DTCs) should be stored. The SRS indicator lamp must be off.

Fault-tracing information

Diagnostic trouble codes (DTCs) not stored earlier

Diagnostic trouble codes (DTCs) have probably been stored during repair work.
Check that all connectors and components have been correctly connected.

Diagnostic trouble codes (DTCs) stored earlier

Diagnostic trouble codes (DTCs) have probably been stored during incorrectly performed repair work
Check that fault-tracing has been carried out correctly according to the relevant fault-tracing instructions.
It is possible to interrupt or make a new attempt to erase diagnostic trouble codes (DTCs).

Do you want to repeat attempt?

Yes - YES

No - NO

NO - NOT ERASED

YES - Erasing diagnostic trouble codes (DTCs)

Information

- Diagnostic trouble codes (DTCs) have been correctly erased and not restored.

Fault-tracing information

Conditions

- A diagnostic trouble code (DTC) is stored if the on-board diagnostic system registers a fault in any of the internal functions of the control modules.

Fault cause

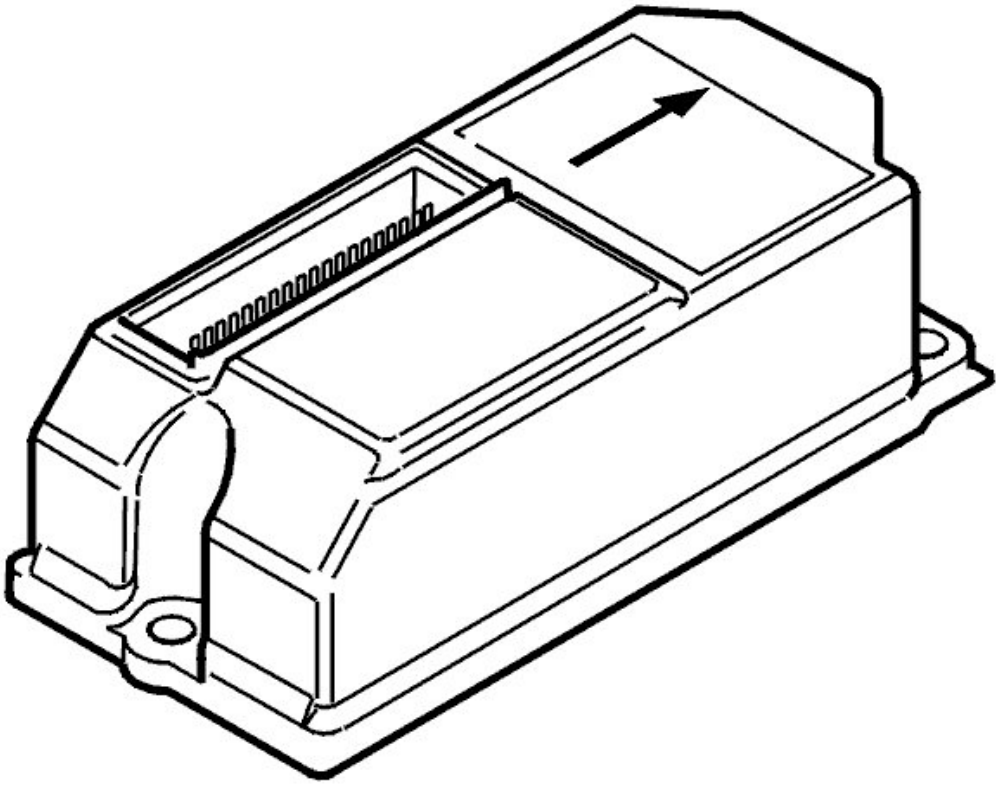
- Internal fault in the SRS control module.

Fault symptom

- The SRS indicator lamp is lit.

Warning! There is a risk that the SRS system will not function if this diagnostic trouble code (DTC) is stored.

Note! In the event of an internal fault, the diagnostic trouble code (DTC) must not be erased. The SRS control module must be returned to Volvo. See standard procedures.

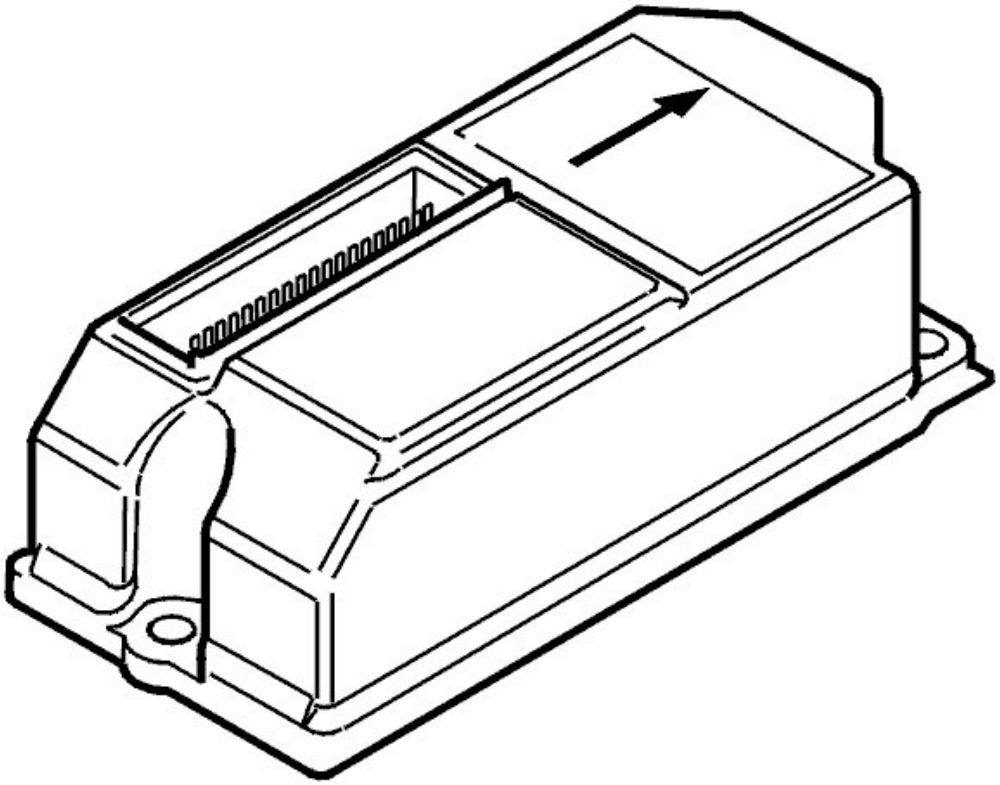


Replacing and programming the SRS control module

The SRS control module has registered an internal fault.

Note! A new SRS control module is delivered without software. The control module must be programmed in order to function after replacement.

For further information about programming and replacing the SRS control module, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.



Continue when the fault has been remedied.

Diagnostic Trouble Code (DTC) Information

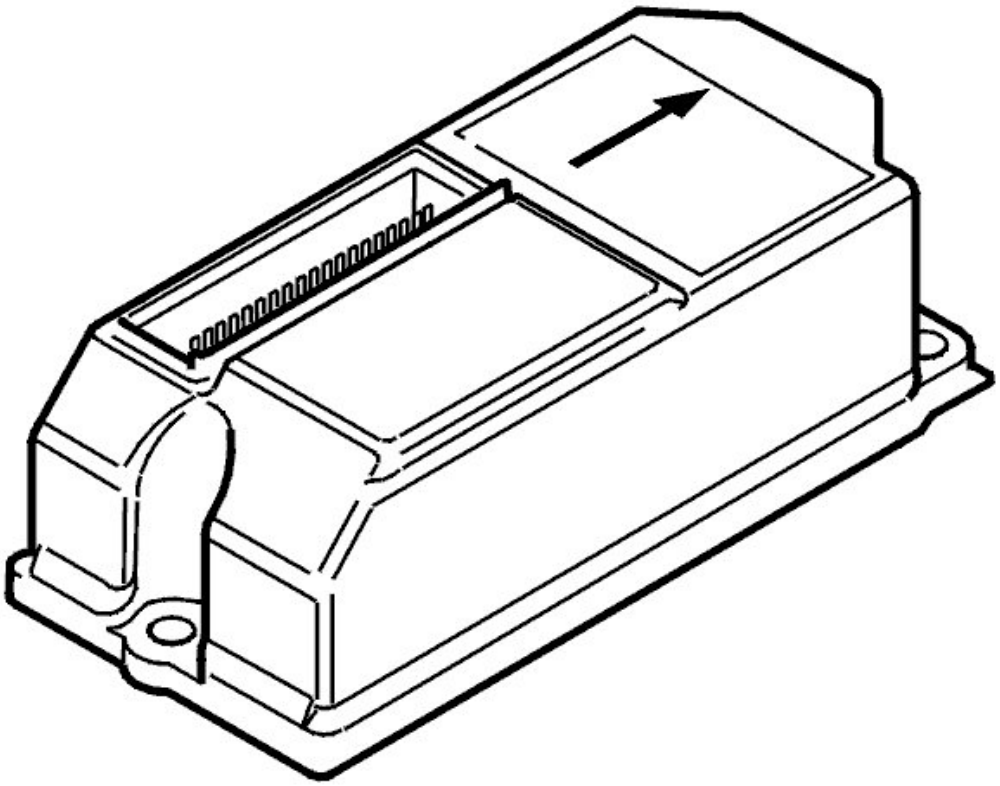
Diagnostic trouble code (DTC) information

Condition



Diagnostic trouble code (DTC) SRS-00DB will be stored in the event of a number of faults. If an incorrect parameter file has been downloaded into the SRS system. If an incorrect car configuration as to whether or not the car has a passenger airbag has been downloaded into the central electronic module (CEM). Or if the car configuration in the central electronic module (CEM) and the parameter file in the SRS system do not correspond to each other and to the model in which they are installed.
The diagnostic trouble code (DTC) can only be diagnosed when the ignition is switched on (12 V). In other words, the diagnostic trouble code (DTC) can only be diagnosed when the ignition is switched from position 0 to positions I, II or III.

Possible source

- Incorrect car configuration in the central electronic module (CEM) or incorrect parameter files in the SRS system
- The car configuration in the central electronic module (CEM) or the parameter file in the SRS system does not correspond to the car type.

Fault symptom[s]

- The SRS indicator lamp is lit.

Faulty Signal

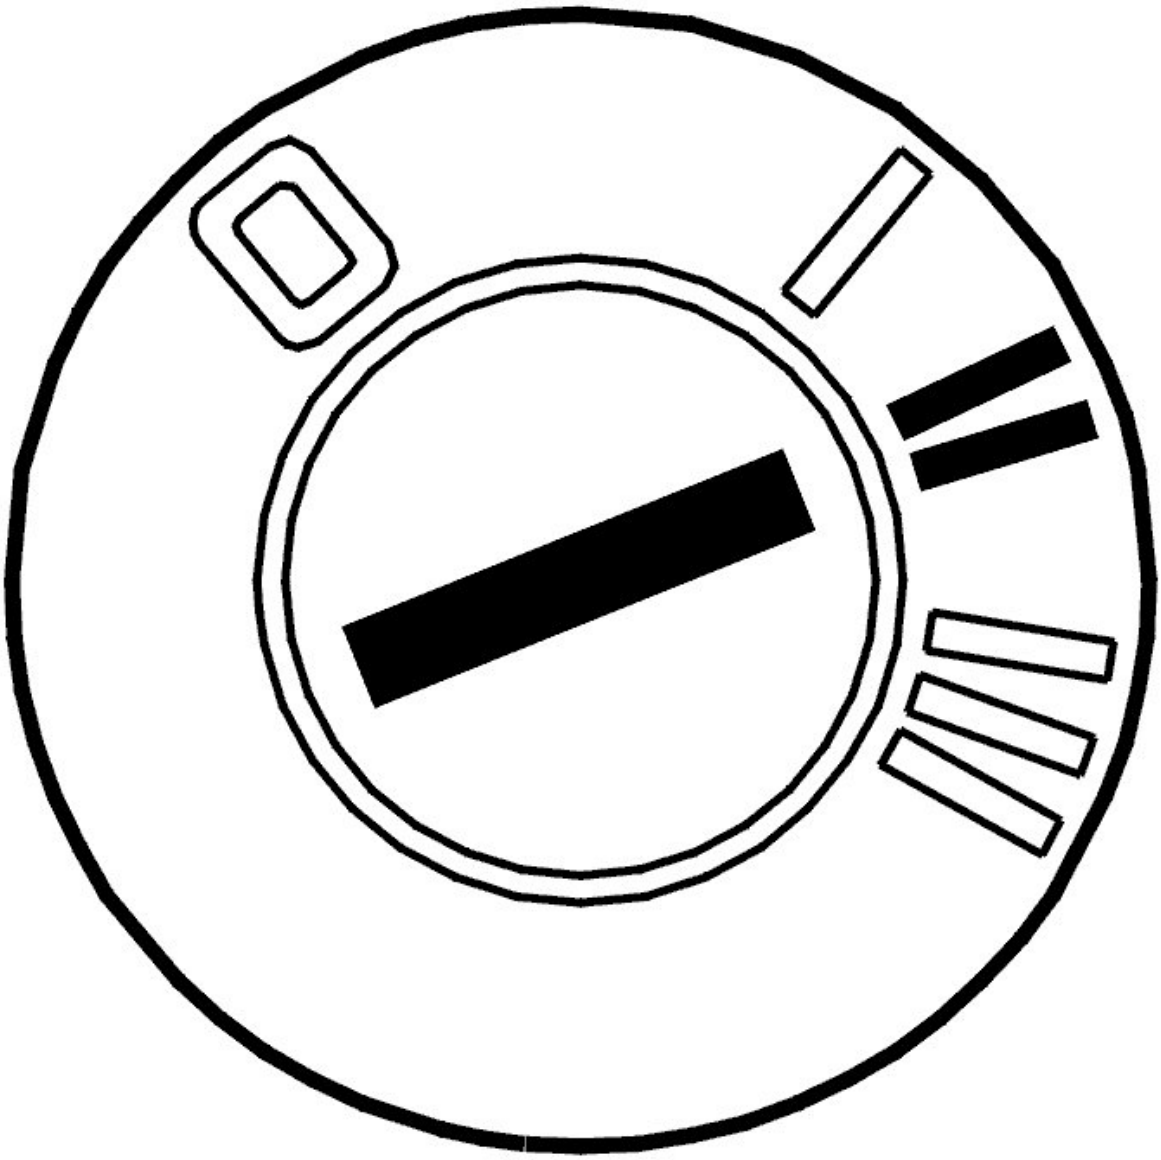
Faulty signal. Permanent fault

Checking parameters



- Visually check if the vehicle is equipped with a front passenger airbag.
- Ignition on.

Read out and compare the "front passenger airbag" parameter from the supplemental restraint system module (SRS) and the central electronic module (CEM).
Click the VCT2000 symbol to activate the readout.
If the vehicle is equipped with a front passenger airbag:
The supplemental restraint system module (SRS) should respond "With front passenger airbag".
The central electronic module (CEM) should respond "Yes".
If the vehicle is not equipped with a front passenger airbag:
The supplemental restraint system module (SRS) should respond "Without front passenger airbag".
The central electronic module (CEM) should respond "No".

Does the "front passenger airbag" parameter of both SRS and CEM match the equipment of the vehicle?

Yes - Verification

No - Programming the control module

Programming the control module

Try reprogramming the control module that indicates a faulty parameter value.

- Supplemental restraint system module (SRS): Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.
- Central electronic module (CEM): Central electronic module (CEM), replacing See: Body Control Module/Service and Repair/Central Electronic Module (CEM), Replacing.

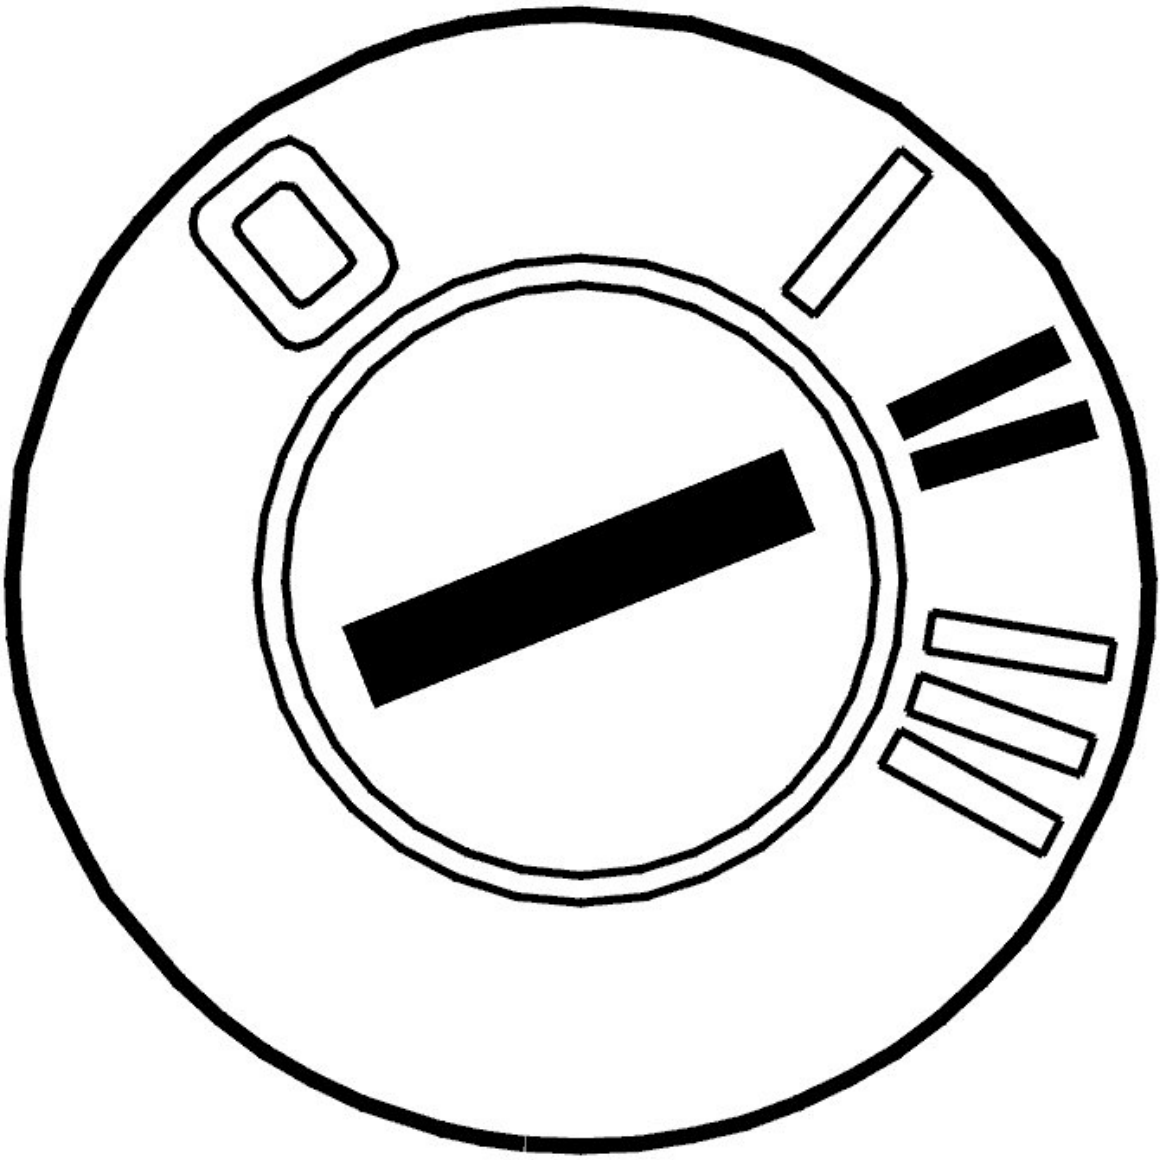
Continue - Verification

Verification

Verification

Verification

Hint: After carrying out the repair, check that the fault has been remedied.



- Ignition off
- Disconnect the battery negative lead
- Reinstall the connectors, components etc.
- Ignition on
- Connect the battery negative lead.

Warning! There must not be anyone inside the passenger compartment when the battery is connected.

- Read off diagnostic trouble codes (DTCs).

The fault is no longer present if the diagnostic trouble code (DTC) status is intermittent.

Is the diagnostic trouble code (DTC) intermittent?

Yes - VERIFIED

No - VERIFICATION FAILED

VERIFICATION FAILED - Fault-tracing information

VERIFIED - Fault Found

Fault-tracing information

Information

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - FAULT-TRACING FAILED

Attempt New Test - Checking parameters

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00DC

Condition

The Supplemental Restraint System Module (SRS) checks the signal in the control area network (CAN) bus.
Diagnostic trouble code (DTC) SRS-00DC is stored if the parameter file in the Supplemental Restraint System Module (SRS) and in the central electronic module (CEM) (car config) for the "seat configuration" parameter are not in accordance.
Diagnostic trouble code (DTC) SRS-00DC can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

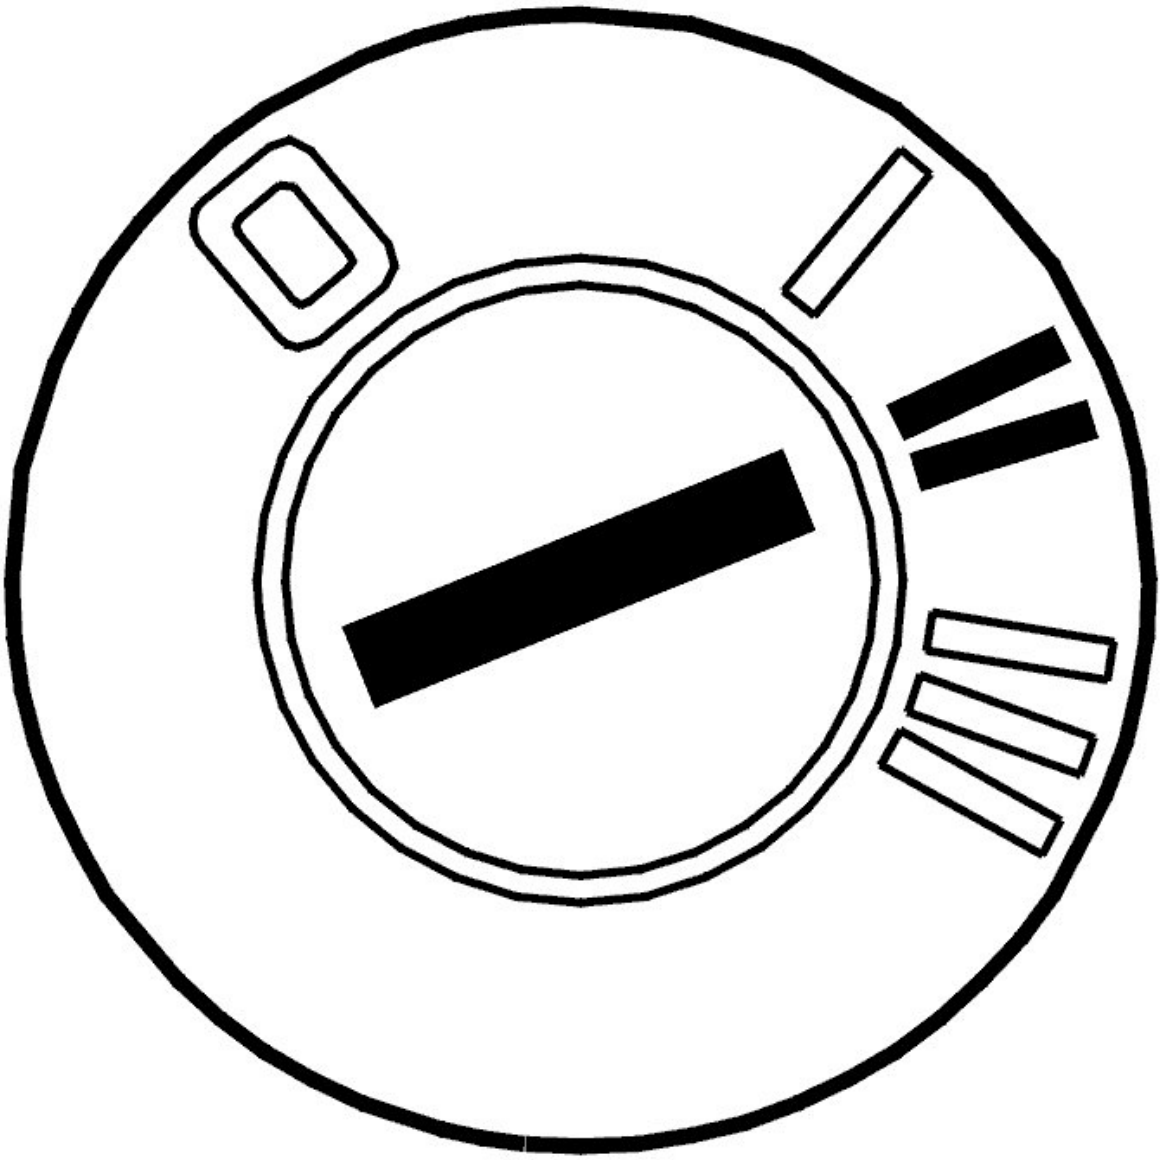
Possible source
- Incorrect car configurations in the central electronic module (CEM) or incorrect parameter files in the SRS system
- The car configuration in the central electronic module (CEM) or the parameter file in the SRS system does not correspond to the car type.

Fault symptom[s]
- The SRS indicator lamp is lit.

Faulty Signal

Faulty signal

Checking the component



- Switch on the ignition. Wait 20 seconds.

Read off the "seat configuration" parameter from the central electronic module (CEM) and the Supplemental Restraint System Module (SRS) by clicking on the VCT2000 symbol.
If the parameter value which is shown in the two columns is not the same in the Supplemental Restraint System Module (SRS) as for the central electronic module (CEM), the "seat configuration" parameter value in the Supplemental Restraint System Module (SRS) must be reprogrammed.
If the value is not the same in the central electronic module (CEM) as in the Supplemental Restraint System Module (SRS), carry out the following:

- If the central electronic module (CEM) shows 7 seats, press the button with the figure 7
- If the central electronic module (CEM) shows 5 seats, press the button with the figure 5.

This reprograms the "seat configuration" parameter value to the same number of seats as entered in the central electronic module (CEM).

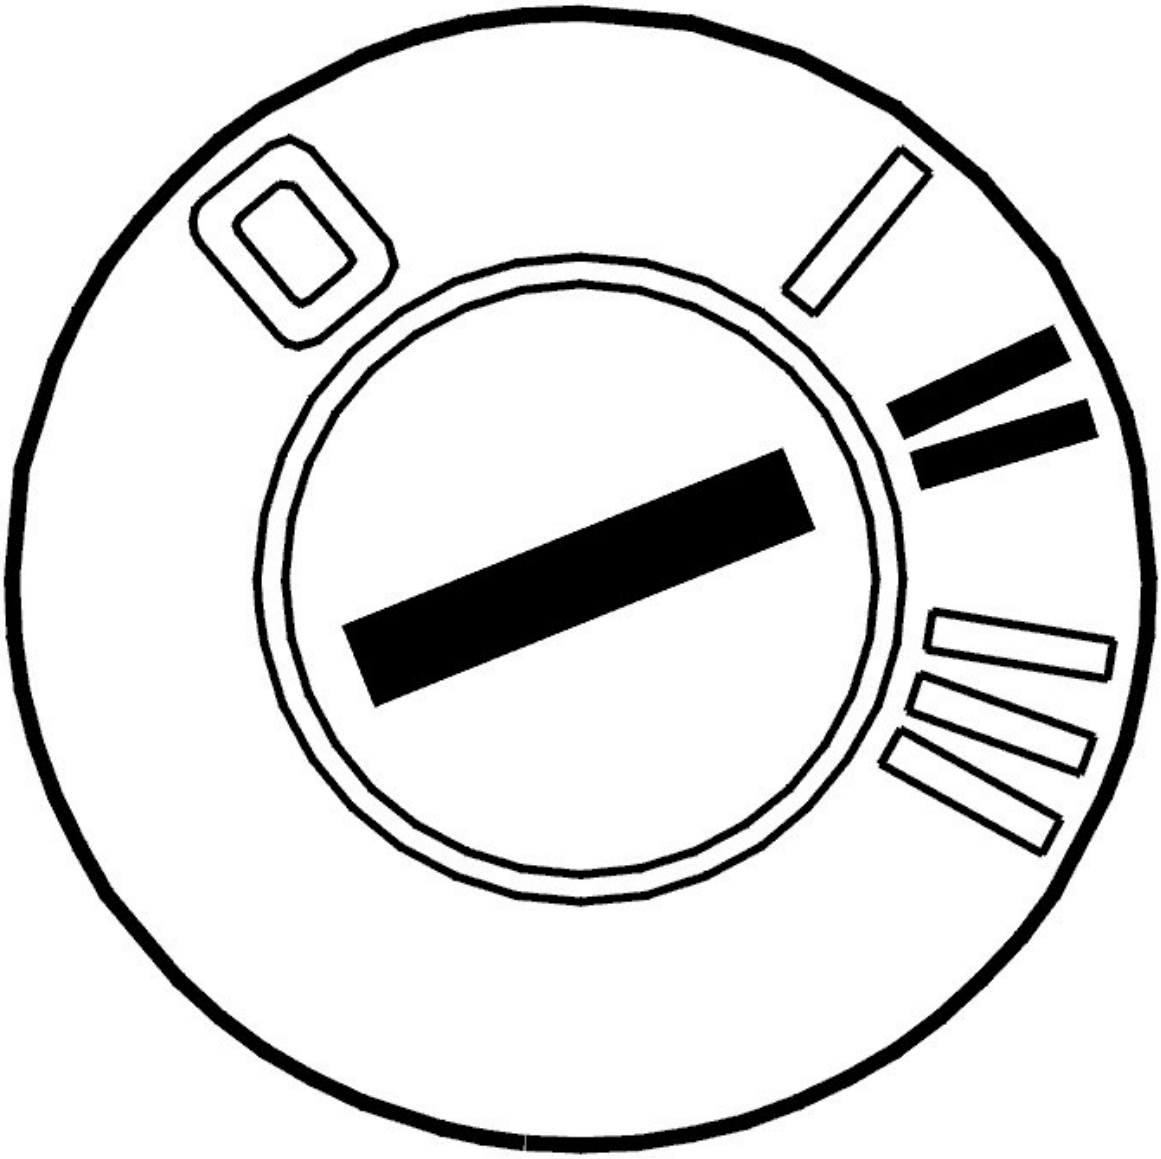
Caution! This diagnostic trouble code (DTC) can also cause diagnostic trouble codes (DTCs) to be stored for the rear inflatable curtains and the seat belt tensioners in the 3rd row of seats. Remedy diagnostic trouble code (DTC) SRS-00DC before continuing with the fault-tracing.

Did the parameter value change?

Yes - Verification

No - DONE

Verification



- Ignition off for at least 10 seconds
- Ignition on. Wait for 20 seconds.

If the diagnostic trouble code (DTC) status is intermittent, the fault has been eliminated.

Is the diagnostic trouble code (DTC) intermittent?

Yes - Fault Found

No - Fault-tracing information

Fault-tracing information

Diagnostic Trouble Code (DTC) Information

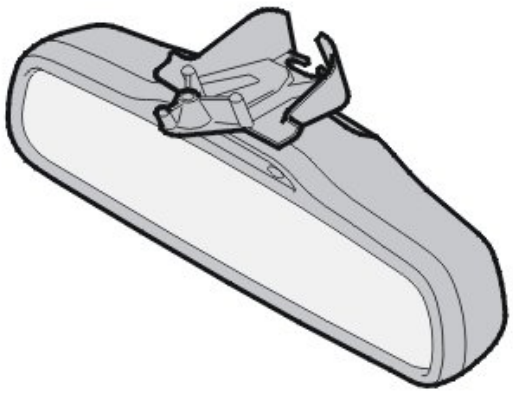
Diagnostic trouble code (DTC) information SRS-00E5

Condition



The supplemental restraint system module (SRS) checks the signal from the upper electronic module (UEM) on the CAN network.
The diagnostic trouble code is stored if the control module detects:
- Malfunction message regarding PAD-light.

The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

Possible source
- Damaged LED in the rear view mirror.
- Open-circuit in the power supply.
- Damaged supplemental restraint system module (SRS).

Fault symptom[s]
- The PAD (passenger airbag disconnected) lamp does not light
- The SRS indicator lamp is lit.

Faulty function

Faulty function

Checking the power supply

- Ignition off.

Ensure that the battery voltage exceeds 12 V.
Connect a battery charger if necessary.
Check the power supply to the Supplemental restraint system module (SRS).
Perform in accordance with:

- Turn the ignition key to position I.

The SRS (supplemental restraint system) indicator lamp in the driver information module (DIM) must come on.
If the power supply (X supply) to the Supplemental restraint system module (SRS) is OK, the SRS warning lamp must go out after a few seconds.
If the SRS warning lamp does not go out, the power supply (X supply) must be checked.
Remedy as necessary.

Other information

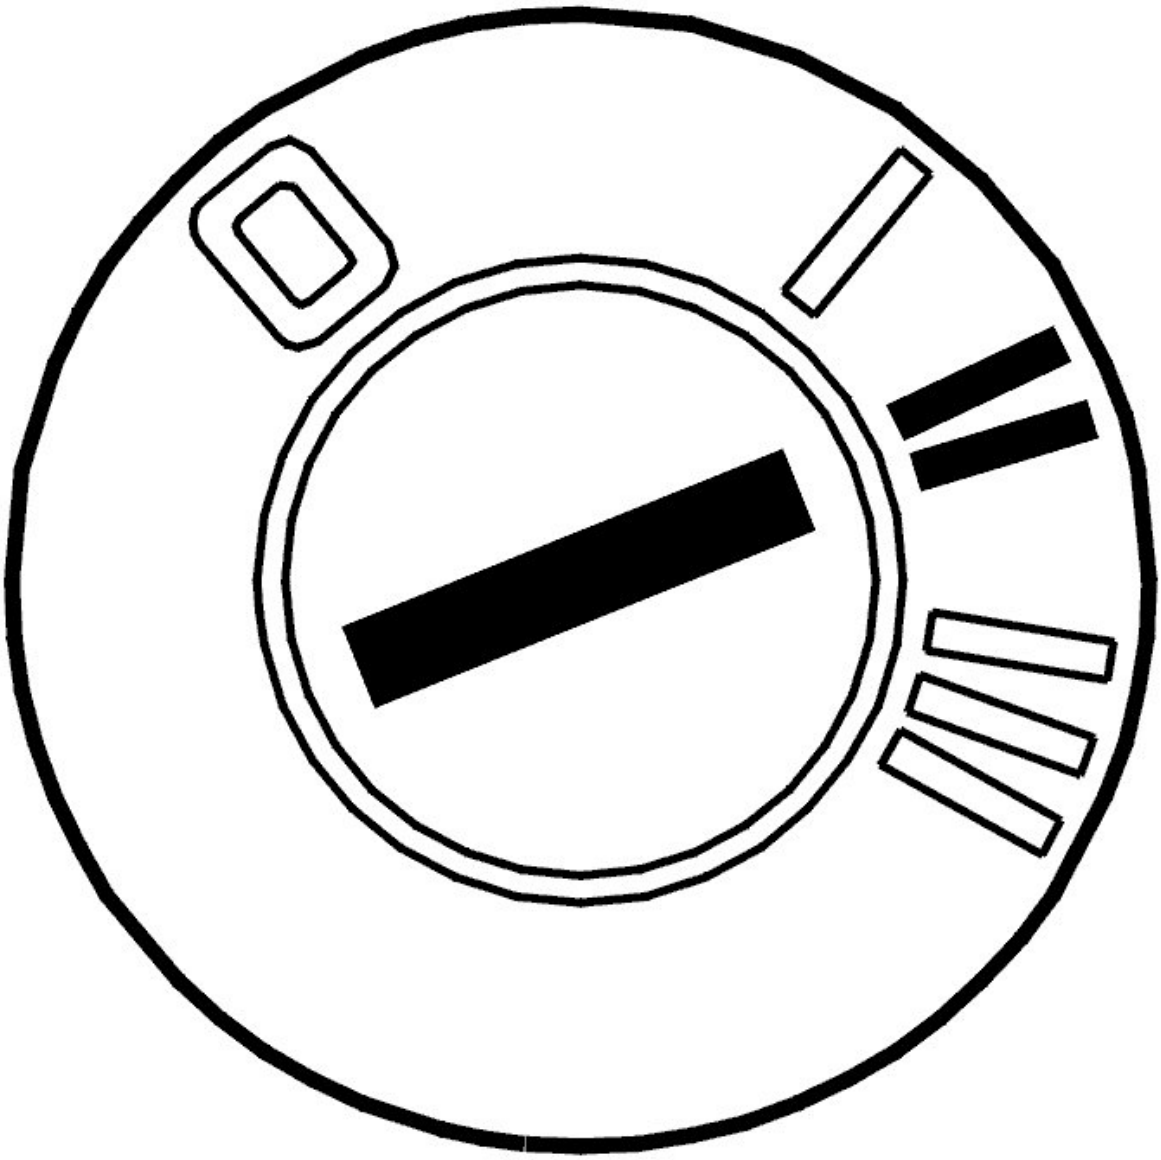
- Checking the supply voltage/ground terminal See: Restraint Systems/Air Bag Systems/Testing and Inspection/Component Tests and General Diagnostics
- Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Supplemental Restraint System Module (SRS)
- For further information, see the wiring diagram.

Was a fault detected?

Yes - Verification

No - Checking communication

Checking communication

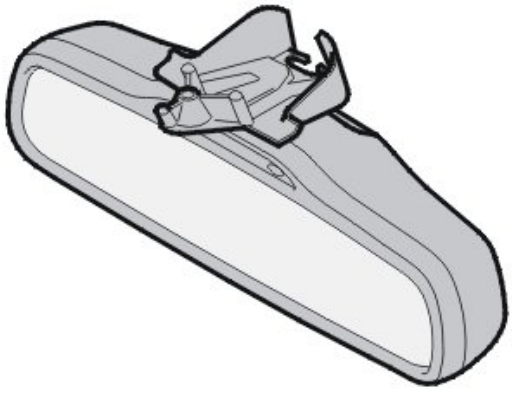


- Ignition off.

Ensure that the battery voltage exceeds 12 V.
Connect a battery charger if necessary.
Check the communication on the CAN network regarding the passenger airbag warning lamp (PAD).
If the Passenger airbag warning lamp (PAD) is OK and the communication on the CAN network functions as it should, the PAD lamp should come on immediately and remain lit for a few seconds to confirm the lamp is working.
Carry out checks according to:

- Note the Passenger airbag warning lamp (PAD).
- Turn the ignition key from position 0 directly to position II.

1. PAD lamp is not lit
2. Passenger airbag warning lamp (PAD) comes on immediately.
3. Passenger airbag warning lamp (PAD) comes on after a delay of 0.5 seconds or more.



Select alternative according to above.

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00F1

Condition

The Supplemental Restraint System Module (SRS) checks the signal from the seat belt buckle.
Diagnostic trouble code (DTC) SRS-00F1 is stored if the control module registers that the voltage is too low or that there is an open-circuit in the signal cable for longer than 3 minutes.
Diagnostic trouble code (DTC) SRS-00F1 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

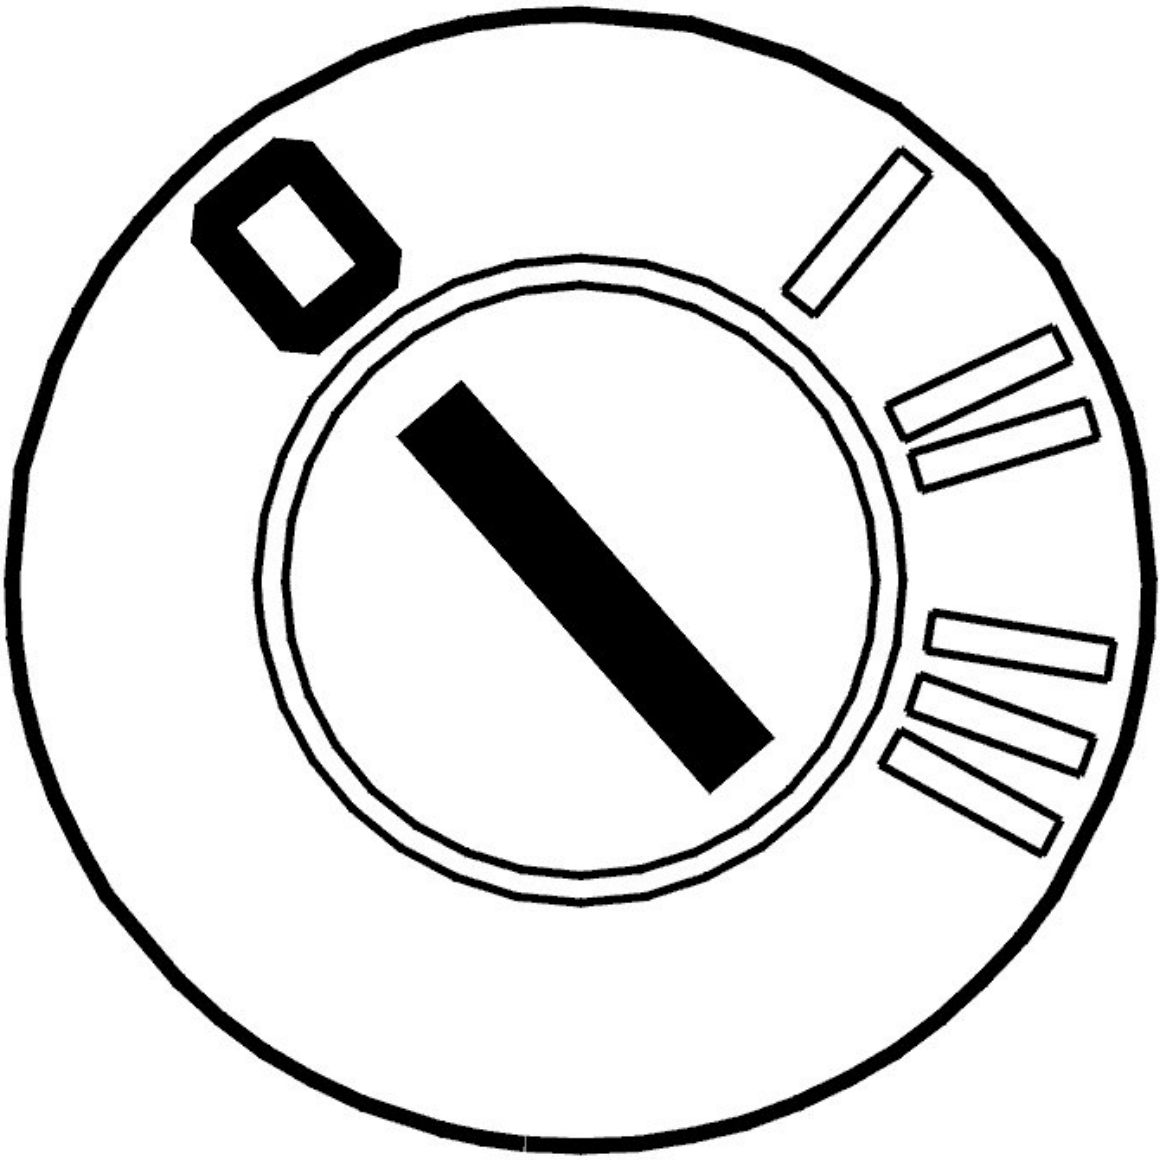
Possible source
- Short-circuit to ground in the signal cable between the left front seat belt buckle and the Supplemental Restraint System Module (SRS)
- Short-circuit to ground in the connector
- Open-circuit in the signal cable in the seat belt buckle
- Open-circuit in the signal cable between the left front seat belt buckle and the SRS system
- Cross-connection of signal cable between the seat belt buckle and the Supplemental Restraint System Module (SRS).

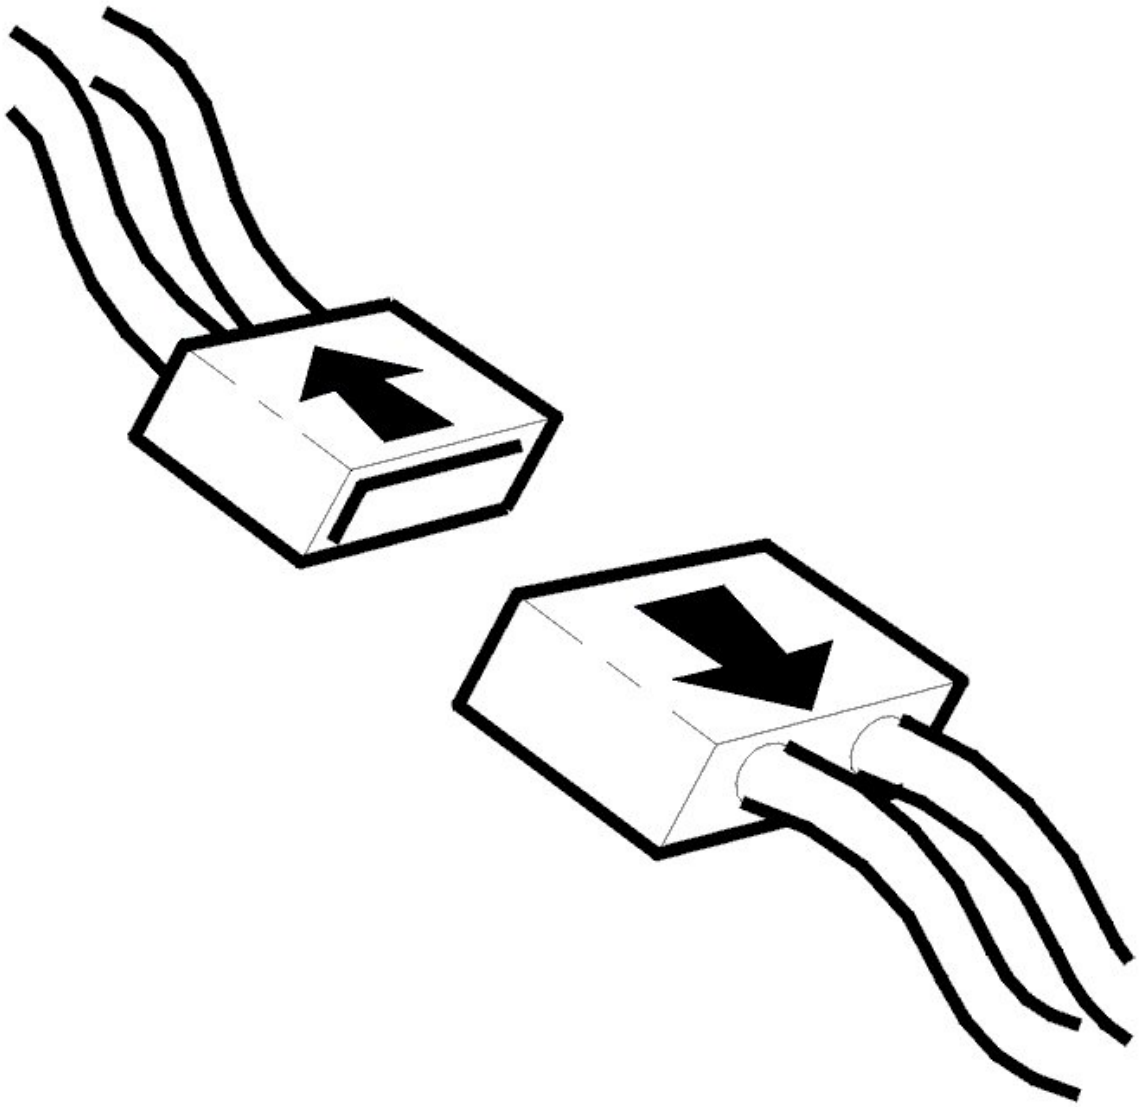
Fault symptom[s]
- General warning lamp lit.

Signal Too Low or Signal Missing

Signal too low or signal missing

Checking the component





- Ignition off
- Disconnect the 3-pin connector from the left front seat belt buckle
- Disconnect the connector from the Supplemental Restraint System Module (SRS)

Hint: The diagnostic trouble code (DTC) is not stored until the fault has been present continuously for at least 3 minutes.

Check the female and male parts of the connectors for the Supplemental Restraint System Module (SRS) and the seat belt buckle. The cable terminals must not be damaged or pressed back.
Check the cable between the Supplemental Restraint System Module (SRS) terminal #26A (26) and the seat belt buckle #54/24:5 left front. Check for a short-circuit to ground. Check for an open-circuit.
Check the resistance in the signal cable between the Supplemental Restraint System Module (SRS) terminal #26A (26) and seat belt buckle #54/24:4 left front. The resistance must be infinite.

Hint: If the signal cable between the Supplemental Restraint System Module (SRS) and the seat belt buckle connector is OK, the seat belt buckle may be damaged. Check the signal cable between the seat belt buckle connector and the seat belt buckle. The signal cable must not be damaged. Check that nothing has become jammed in the seat belt buckle.

If the fault is permanent and no fault is found, replace the seat belt buckle.
Remedy as necessary.

Other information:

VERIFICATION FAILED - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00F2

Condition

The Supplemental Restraint System Module (SRS) checks the signal from the seat belt buckle.
Diagnostic trouble code (DTC) SRS-00F2 is stored if the control module registers an incorrect signal level in the signal cable for longer than 3 minutes.
Diagnostic trouble code (DTC) SRS-00F2 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

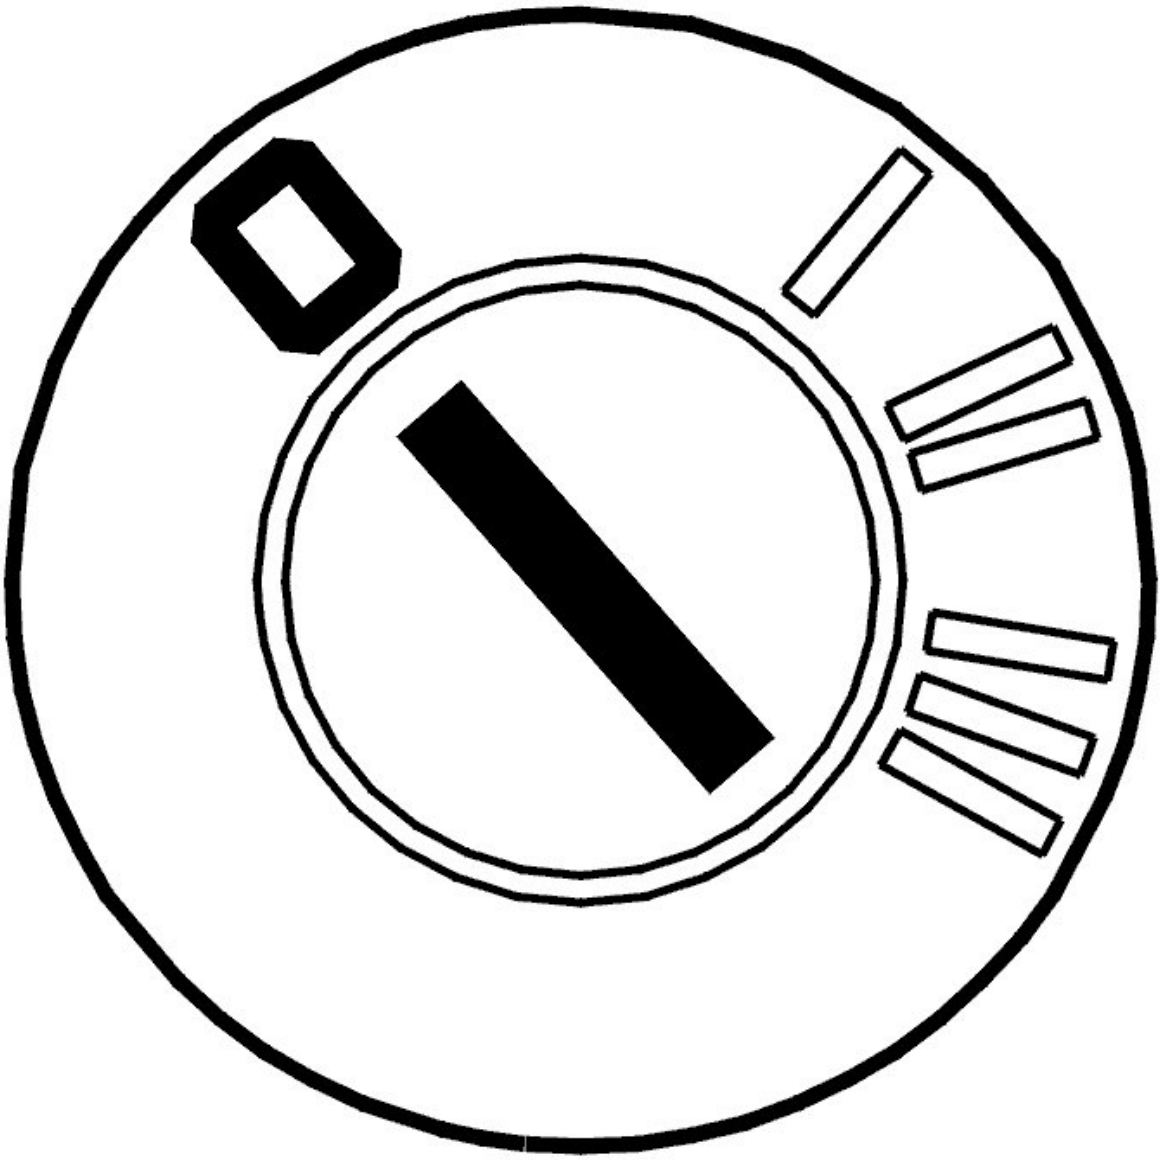
Possible source
- Damaged signal cable between seat belt buckle left front and Supplemental Restraint System Module (SRS)
- Defective seat belt buckle.

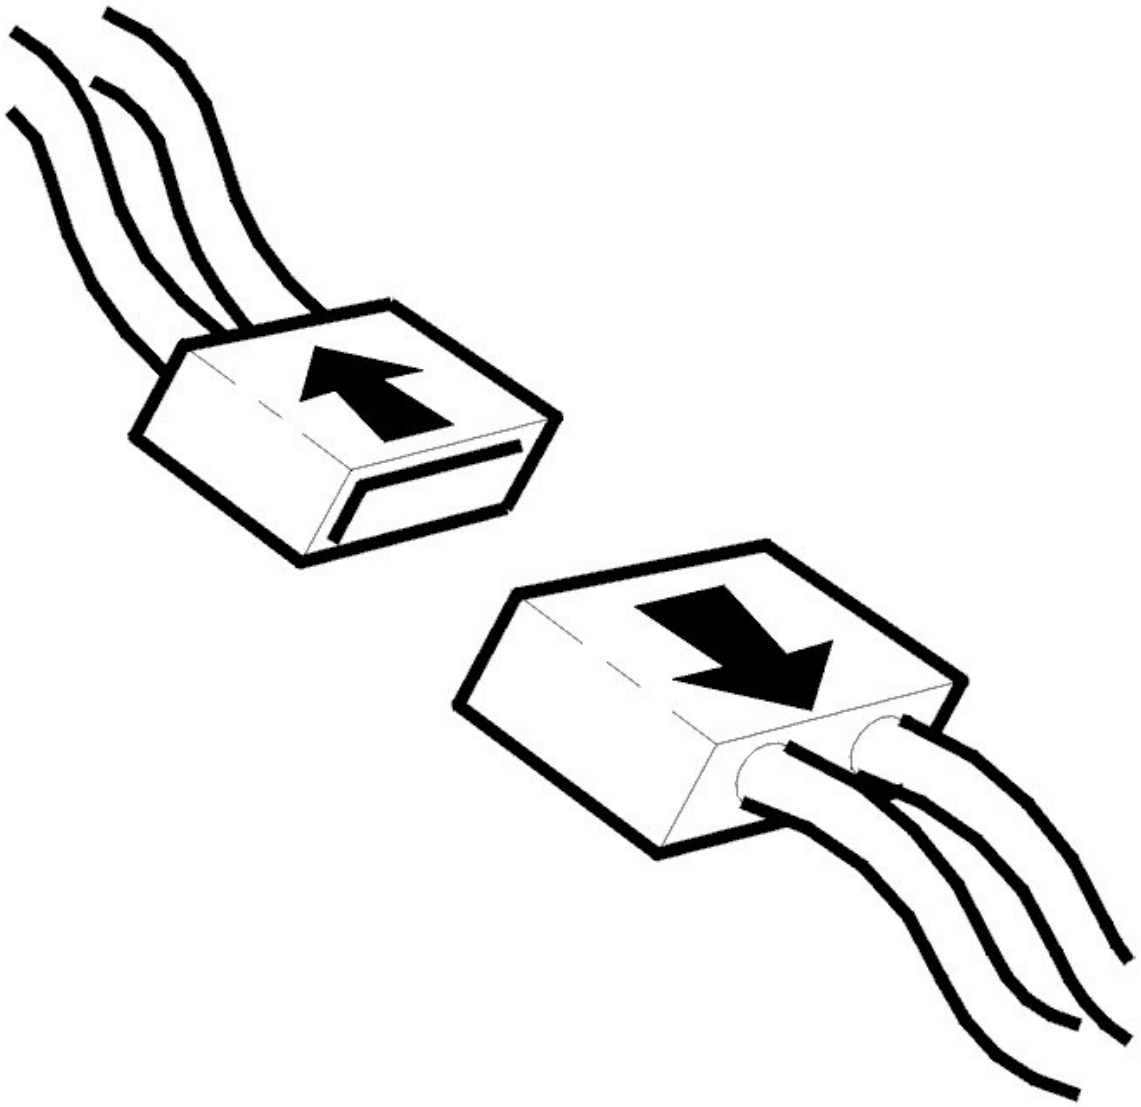
Fault symptom[s]
- General warning lamp lit.

Faulty Signal

Faulty signal

Checking the component





- Ignition off
- Disconnect the 3-pin connector from the left front seat belt buckle
- Disconnect the connector from the Supplemental Restraint System Module (SRS).

Hint: The diagnostic trouble code (DTC) is not stored until the fault has been present continuously for at least 3 minutes.

Check the female and male parts of the connectors for the Supplemental Restraint System Module (SRS) and the seat belt buckle left front. The cable terminals must not be damaged, pressed back or oxidized.
Check the cable between the Supplemental Restraint System Module (SRS) terminal #26A (26) and the seat belt buckle #54/24:5 left front. Check for an open-circuit. Try carefully bending the cable between the Supplemental Restraint System Module (SRS) and the seat belt buckle while checking for an open-circuit to see if the resistance alters.
Check the cable between the Supplemental Restraint System Module (SRS) terminal #25A (25) and the seat belt buckle #54/24:4 left front. Check for an open-circuit. Try carefully bending the cable between the Supplemental Restraint System Module (SRS) and the seat belt buckle while checking for an open-circuit to see if the resistance alters.

Hint: Objects that have become jammed in the seat belt buckle and damaged the signal cable between the Supplemental Restraint System Module (SRS) and the seat belt buckle can cause this fault. When the belt is pressed down into the seat belt buckle, check that it locks properly and that a click is heard.

If the fault is permanent and no fault is found, replace the seat belt buckle.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-00F3

Condition

The Supplemental Restraint System Module (SRS) checks the signal from the seat belt buckle.
Diagnostic trouble code (DTC) SRS-00F3 is stored if the control module registers that the voltage in the signal cable is too high for longer than 3 minutes.
Diagnostic trouble code (DTC) SRS-00F3 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

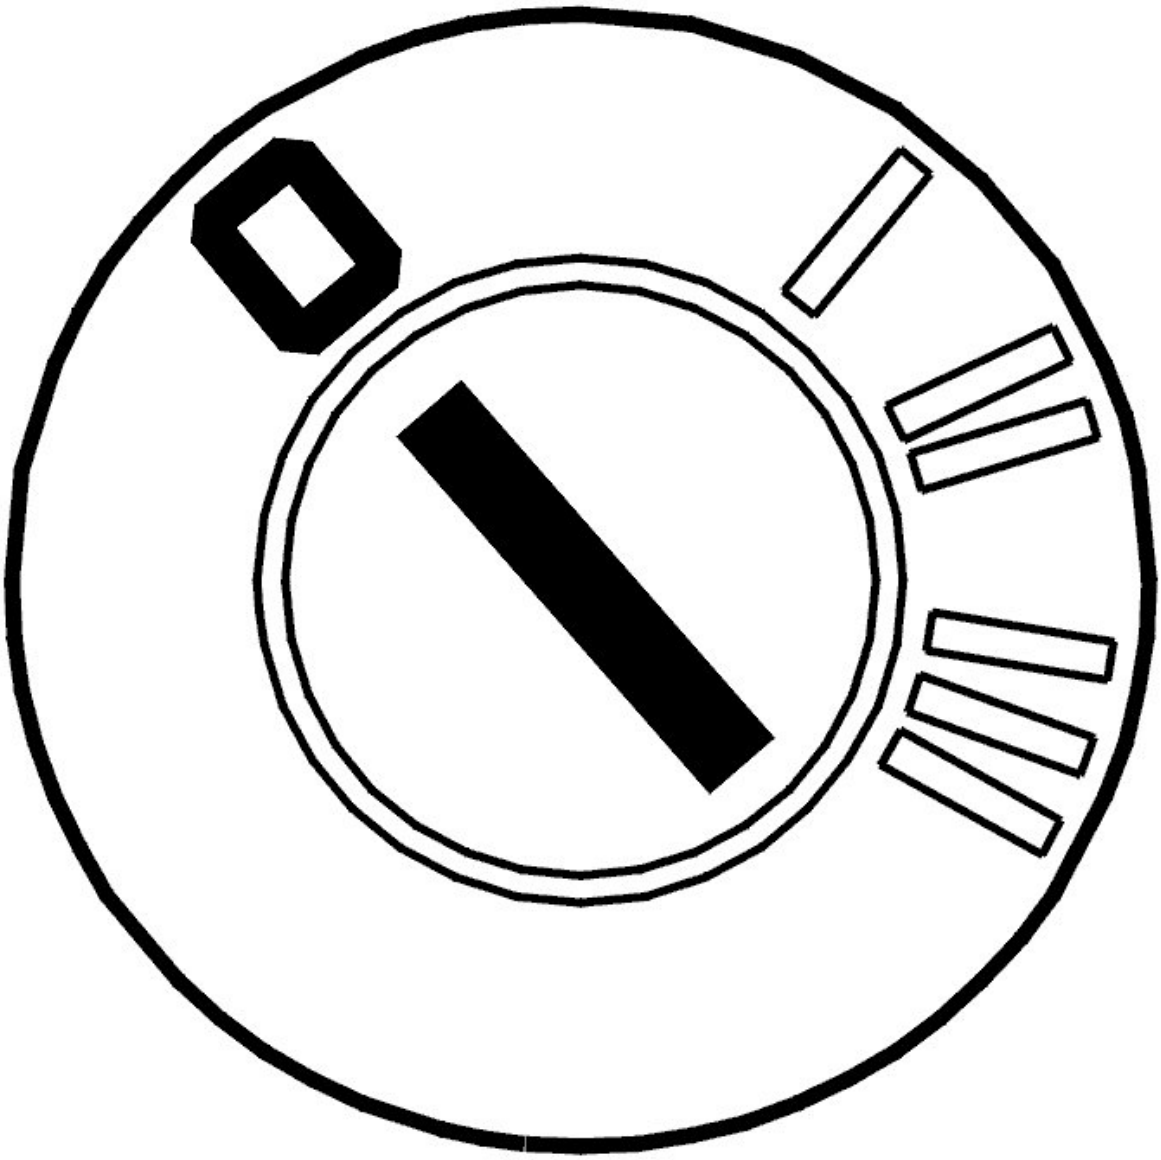
Possible source
- Short-circuit to supply voltage in the signal cable between the seat belt buckle and the Supplemental Restraint System Module (SRS)
- Short-circuit to supply voltage in the connector
- Short-circuit in seat belt buckle
- Cross-connection of signal cable between the seat belt buckle and the Supplemental Restraint System Module (SRS).

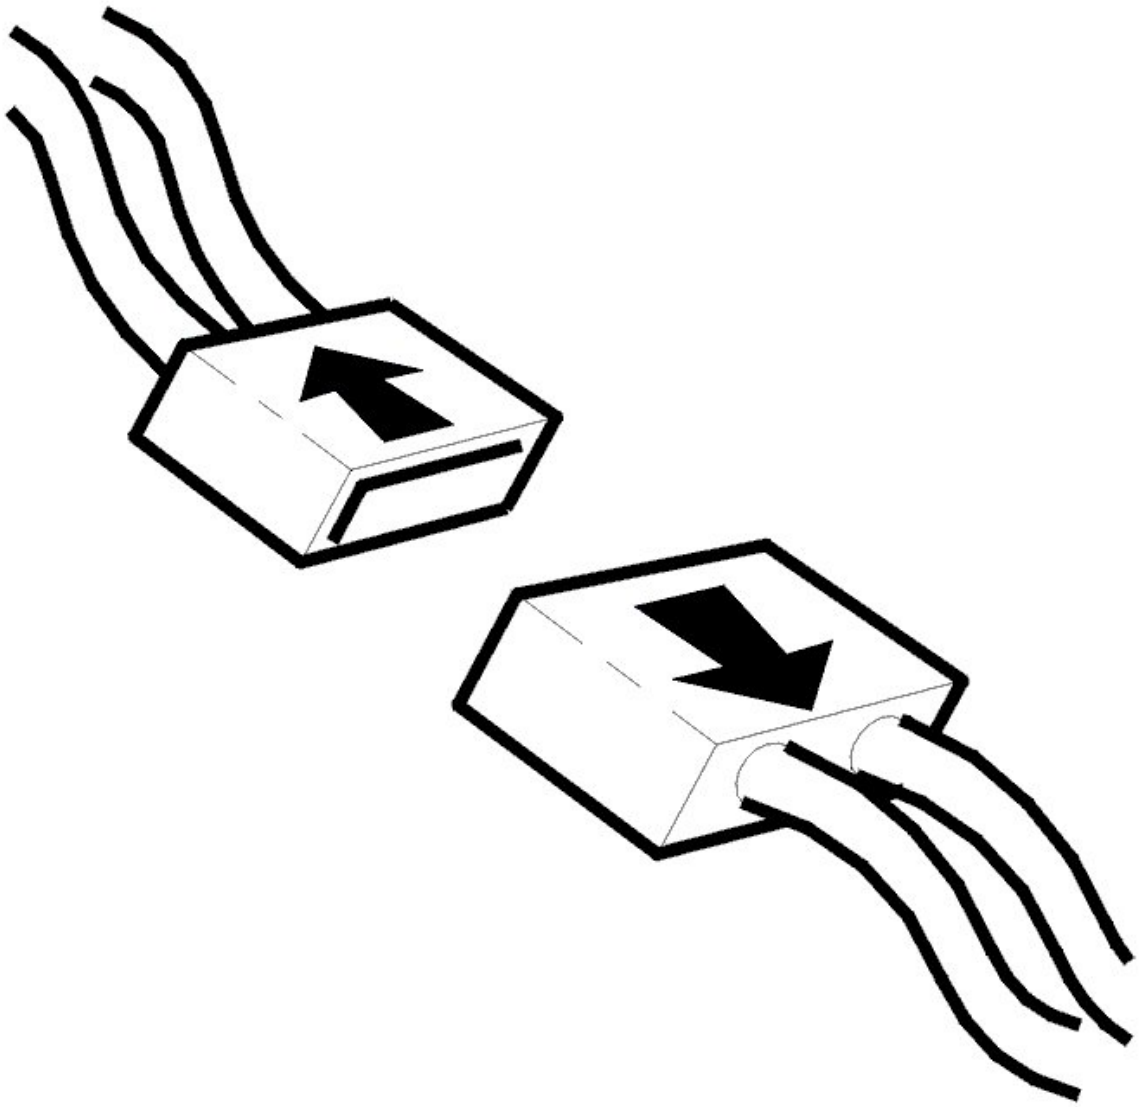
Fault symptom[s]
- General warning lamp lit.

Signal Too High

Signal too high

Checking the component





- Ignition off
- Disconnect the 3-pin connector from the right front seat belt buckle
- Disconnect the connector from the Supplemental Restraint System Module (SRS).

Hint: The diagnostic trouble code (DTC) is not stored until the fault has been present continuously for at least 3 minutes

Check the female and male parts of the connectors for the Supplemental Restraint System Module (SRS) and the seat belt buckle. The cable terminals must not be damaged or pressed back.
Check the cable between the Supplemental Restraint System Module (SRS) terminal #26C (22) and the seat belt buckle #54/25:5 right front. Check for a short-circuit to supply voltage.
Check the resistance in the signal cable between the Supplemental Restraint System Module (SRS) terminal #26C (22) and seat belt buckle #54/25:4 right front. The resistance must be infinite.
If the fault is permanent and no fault is found, replace the seat belt buckle.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0101

Condition

Note! If there are other diagnostic trouble codes, that indicate the same component, stored in the Supplemental restraint system module (SRS) then these shall be taken care of first.

The Supplemental restraint system module (SRS) checks the circuit for the driver's airbag, stage 1.
The diagnostic trouble code (DTC) is stored if the control module detects that:

- There is interference in the circuit.
- Contact with the impact protection's ignition part is interrupted.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition position I, II and III. Only during start-up of the supplemental restraint system.

Note! The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.

Substitute value
- None.

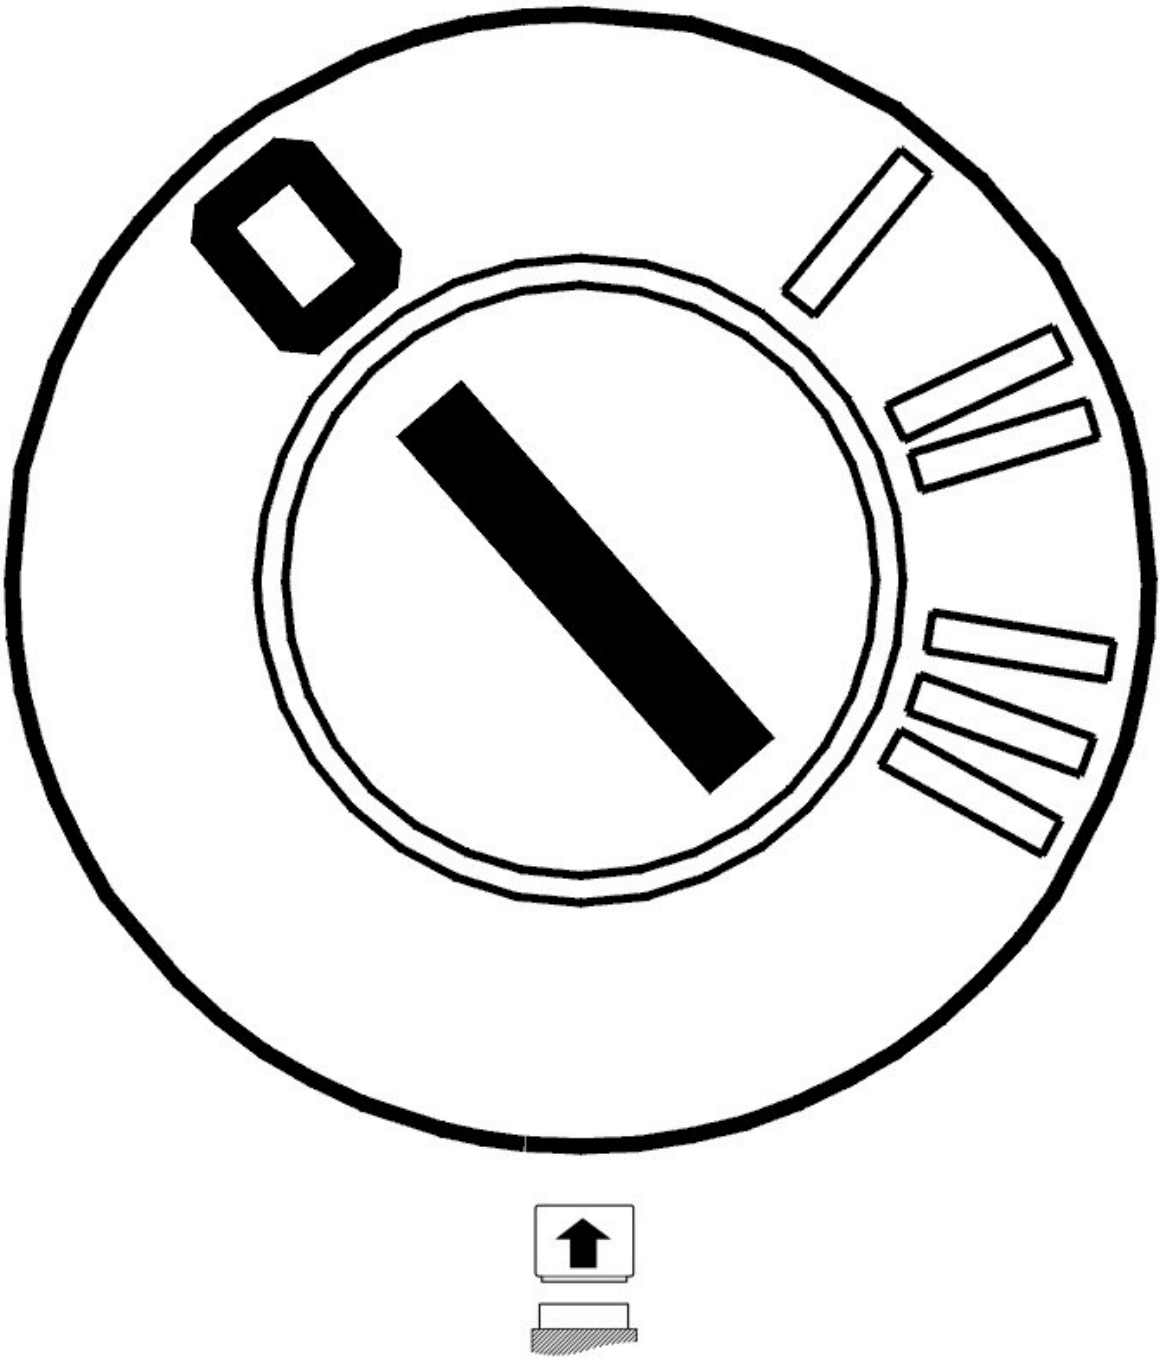
Possible source
- Contact resistance, oxidation or poor contact in connections.
- Damaged supplemental restraint system module (SRS).

Fault symptom[s]
- SRS warning light on

Circuit Error

Circuit error

Checking the wiring



- Ignition off, wait for 10 seconds.
- Disconnect the connector for the contact reel.
- Disconnect the green connector from airbag driver stage 1.
- Disconnect the connector for Supplemental restraint system module (SRS).

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical airbag. This could deploy the airbag!

Check connectors for damage to pins and connections.
Check the connectors. Check for loose connections. Check for contact resistance. Check for oxidation.
Also check other connectors and connections that connect cables between Supplemental restraint system module (SRS) and the airbag.
Check the cable. Check for loose connections. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.
Take readings between:

- Supplemental restraint system module (SRS) #8B/36(36) and connector for contact reel #1.
- Supplemental restraint system module (SRS) #7B/35(35) and connector for contact reel #2.

Connect the connector for the contact reel.
Take readings between:

- Supplemental restraint system module (SRS) #8B/36(36) and connector for airbag driver stage 1 #1.
- Supplemental restraint system module (SRS) #7B/35(35)and connector for airbag driver stage 1 #3.

Remedy as necessary.

- Ignition off, wait for 10 seconds.
- Disconnect the connector for the contact reel.
- Disconnect the purple connector from airbag driver stage 2.
- Disconnect the connector for Supplemental restraint system module (SRS).

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical airbag. This could deploy the airbag!

Check connectors for damage to pins and connections.
Check the connectors. Check for loose connections. Check for contact resistance. Check for oxidation.
Also check other connectors and connections that connect cables between Supplemental restraint system module (SRS) and the airbag.
Check the cable. Check for loose connections. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.
Take readings between:

- Supplemental restraint system module (SRS) #9B/37(37) and connector for contact reel #3.
- Supplemental restraint system module (SRS) #10B/38(38) and connector for contact reel #4.

Connect the connector for the contact reel.
Take readings between:

- Supplemental restraint system module (SRS) #9B/37(37) and connector for airbag driver stage 2 #1.
- Supplemental restraint system module (SRS) #10B/38(38) and connector for airbag driver stage 2 #3.

Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0103

Condition

Note! If there are other diagnostic trouble codes, that indicate the same component, stored in the Supplemental restraint system module (SRS) then these shall be taken care of first.

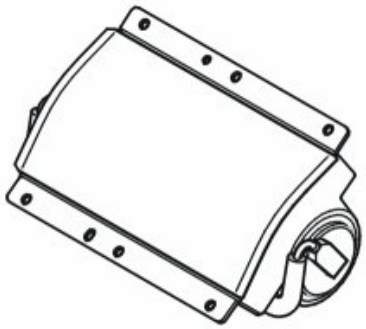
The Supplemental restraint system module (SRS) checks the circuit for the passenger airbag, stage 1.
The diagnostic trouble code (DTC) is stored if the control module detects that:

- There is interference in the circuit.
- Contact with the impact protection's ignition part is interrupted.

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

The control module's test for the diagnostic trouble code (DTC) starts in the event of:
- Ignition position I, II and III. Only during start-up of the supplemental restraint system.

Note! The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.



Substitute value
- None.

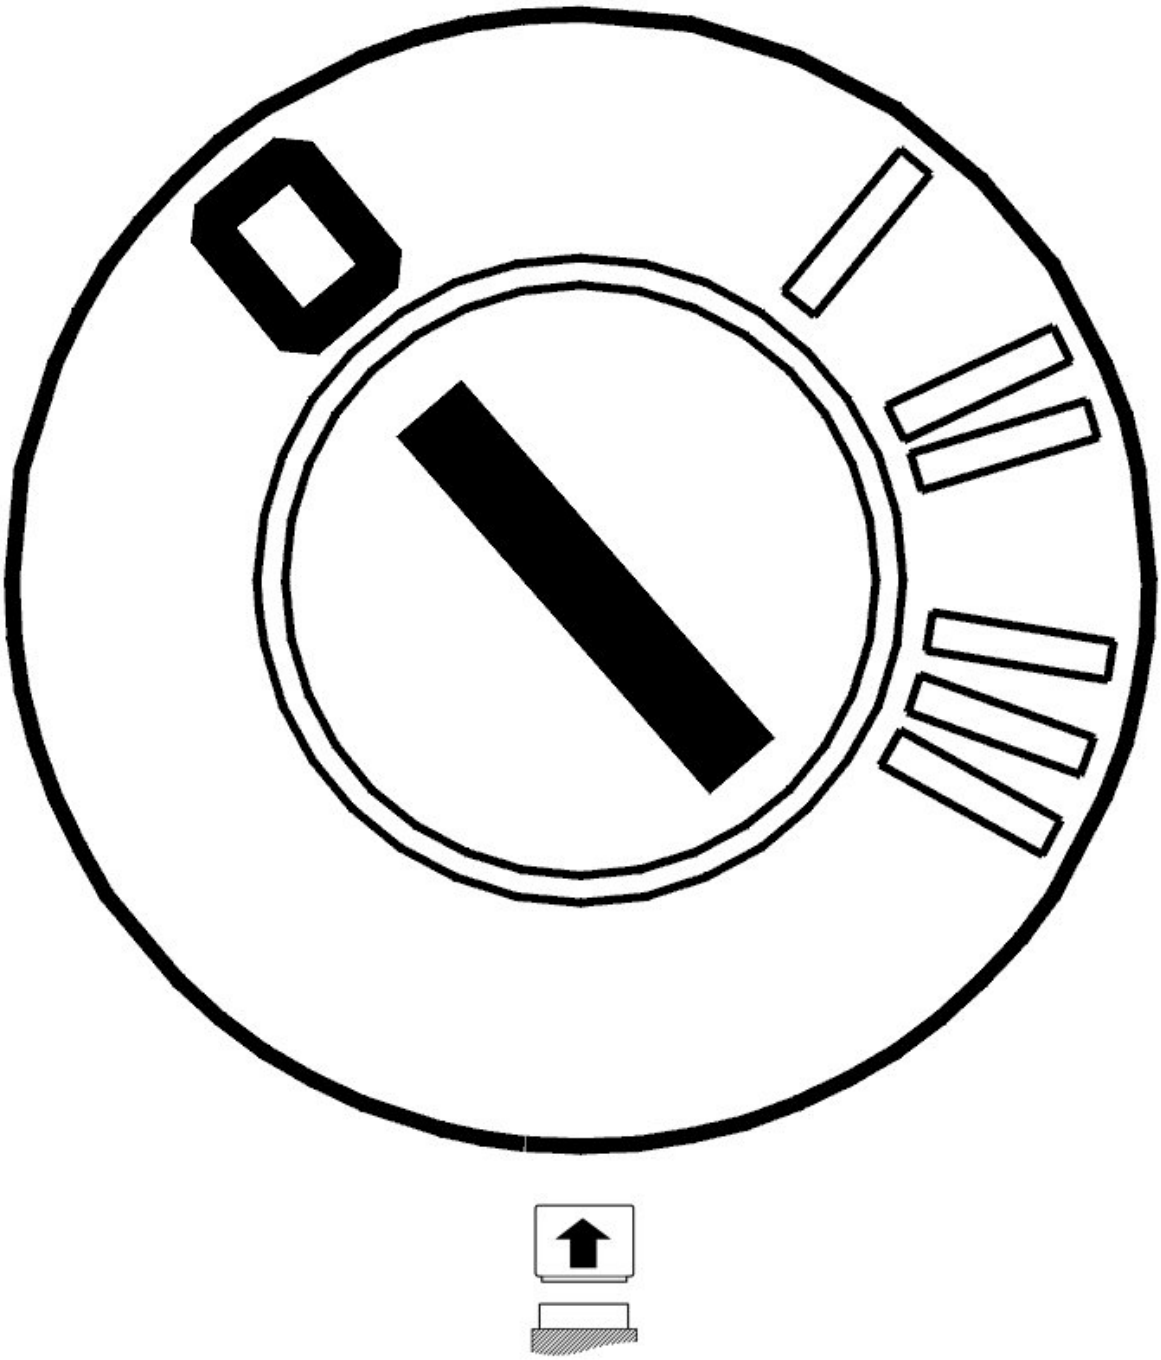
Possible source
- Contact resistance, oxidation or poor contact in connections.
- Damaged supplemental restraint system module (SRS).

Fault symptom[s]
- SRS warning light on

Circuit Error

Circuit error

Checking the wiring



- Ignition off, wait for 10 seconds.
- Disconnect the green connector from the passenger airbag stage 1.
- Disconnect the connector for Supplemental restraint system module (SRS).

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected, non-deployed, pyrotechnical airbag. This could deploy the airbag!

Check connectors for damage to pins and connections.
Check the connectors. Check for loose connections. Check for contact resistance. Check for oxidation.
Also check other connectors and connections that connect cables between Supplemental restraint system module (SRS) and the airbag.
Check the cable. Check for loose connections. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.
Take readings between:

- Supplemental restraint system module (SRS) terminal #12B/40(40) and the connector to passenger airbag stage 1 #1.
- Supplemental restraint system module (SRS) terminal#11B/39(39) and the connector to passenger airbag stage 1 #3.

Remedy as necessary.

No - Fault Found

FAULT FOUND - Fault Found

Attempt New Test - Checking the wiring

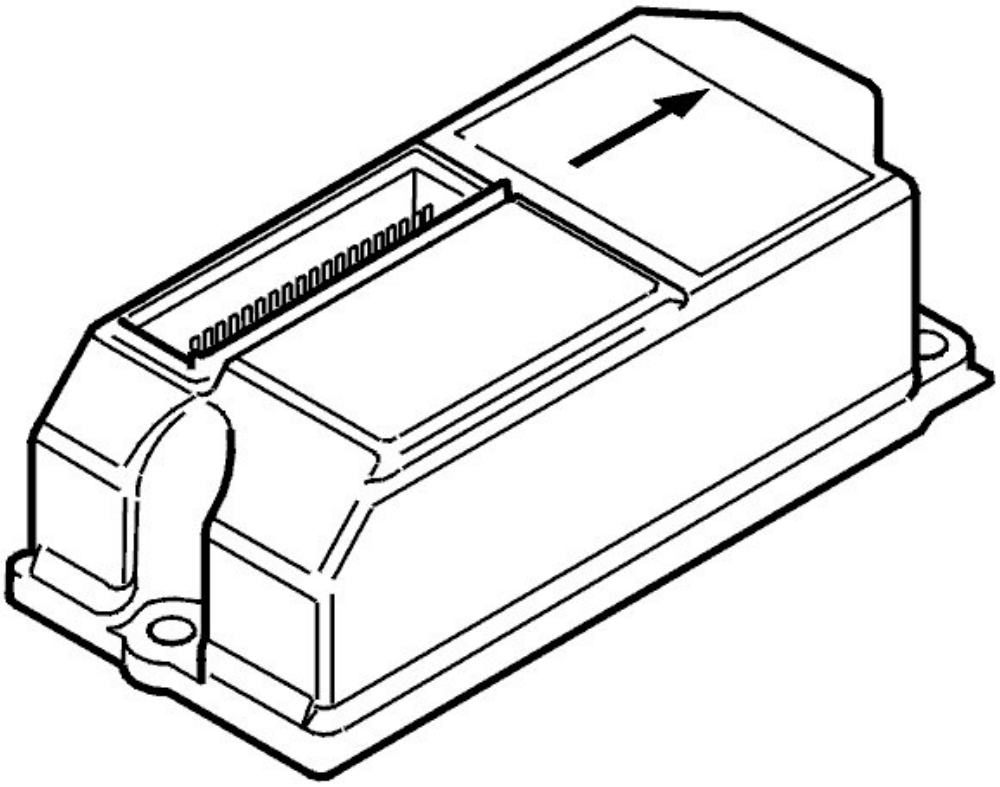
Replacing the control module

Note! Troubleshooting on connectors and wiring must be done before the control module may be replaced.

Since the malfunction may result in internal functions in the Supplemental restraint system module (SRS) not working, the control module must be replaced.

Other information

- Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair



Continue - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-010D

Condition

Note! If there are other diagnostic trouble codes, that indicate the same component, stored in the Supplemental restraint system module (SRS) then these shall be taken care of first.

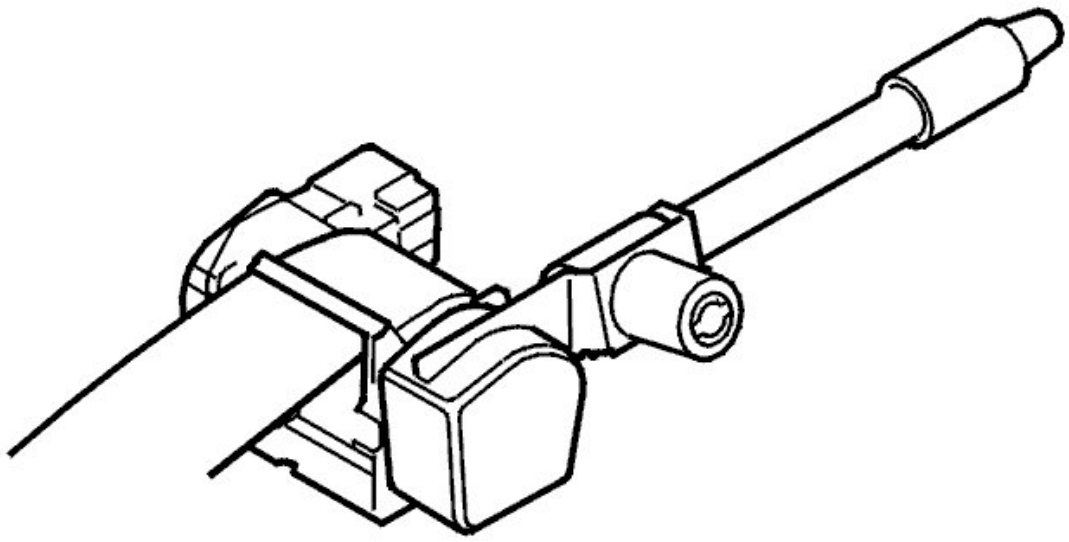
The Supplemental restraint system module (SRS) checks the circuit to the seat belt tensioner, left, rear.
The diagnostic trouble code (DTC) is stored if the control module detects that:

- There is interference in the circuit.
- Contact with the impact protection's ignition part is interrupted.

The control module's test for the diagnostic trouble code (DTC) starts in the event of:

- Ignition position I, II and III. Only during start-up of the supplemental restraint system.

Note! The control module can only detect the fault once the test has been started and the diagnostic trouble code (DTC) is stored when the conditions are met.



Substitute value
- None.

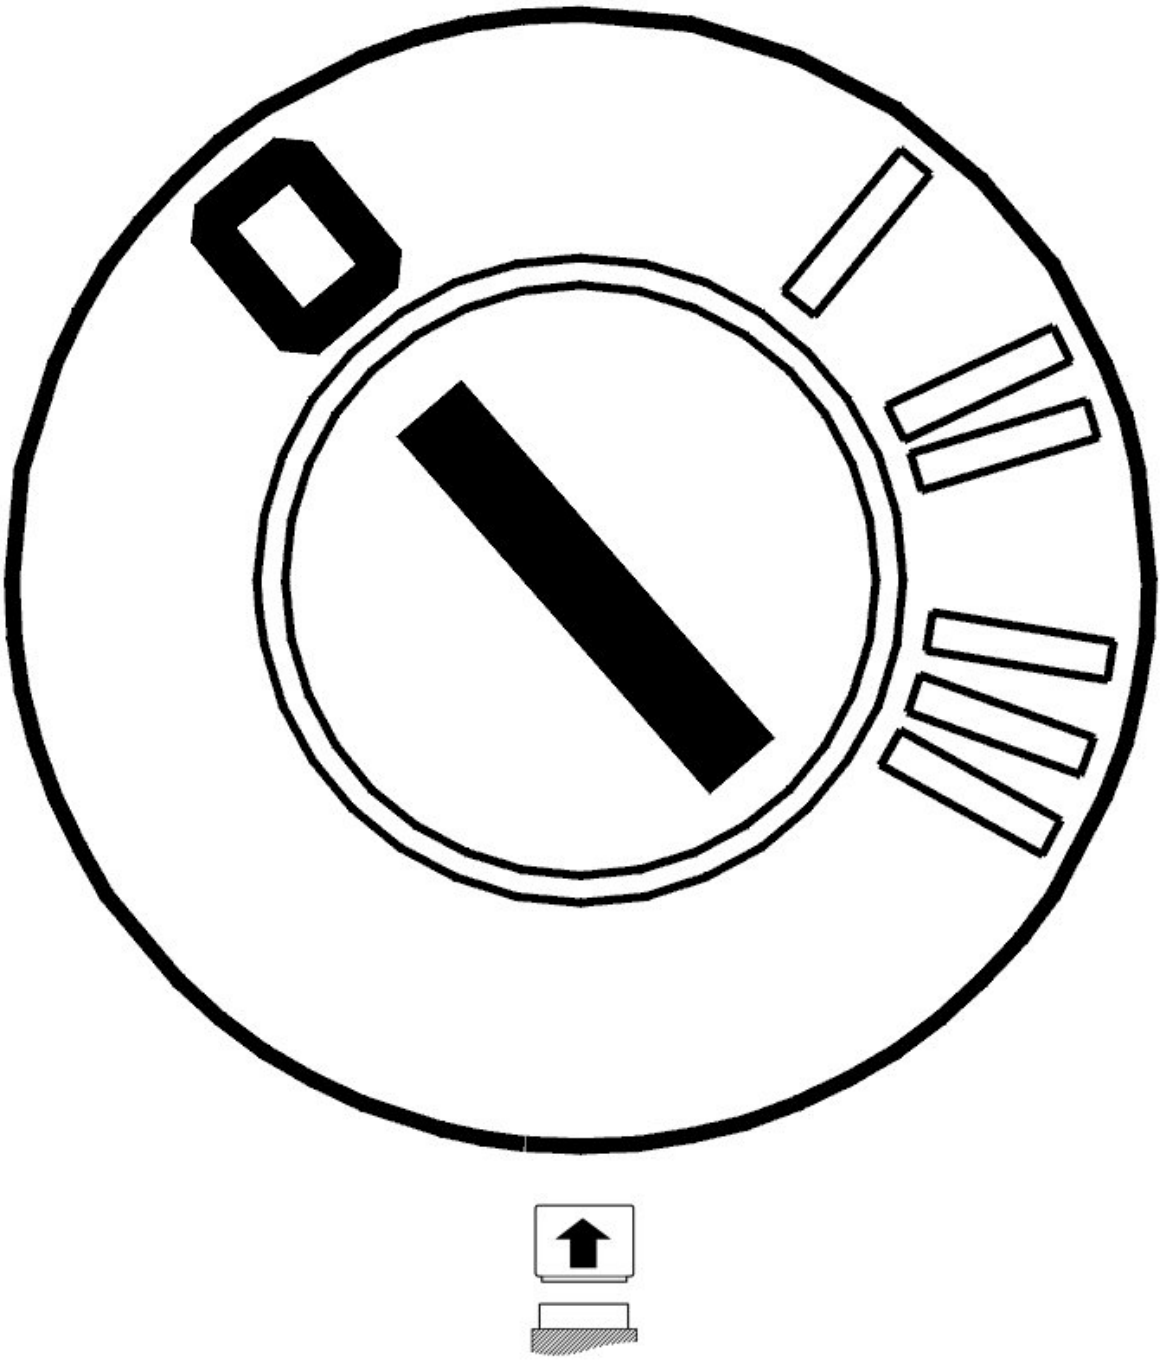
Possible source
- Contact resistance, oxidation or poor contact in connections.
- Damaged supplemental restraint system module (SRS).

Fault symptom[s]
- SRS warning light on

Circuit Error

Circuit error

Checking the wiring



- Ignition off, wait for 10 seconds.
- Disconnect the connector from the rear left-hand seat belt tensioner.
- Disconnect the connector for Supplemental restraint system module (SRS).

Warning! Under no circumstances use an ohmmeter or other live measuring instrument to take readings on a disconnected non-deployed seat belt tensioner. This could deploy the seat belt tensioner!

Check connectors for damage to pins and connections.
Check the connectors. Check for loose connections. Check for contact resistance. Check for oxidation.
Also check other connectors and terminals that connect the wiring between the Supplemental restraint system module (SRS) and the seat belt tensioner.
Check the cable. Check for loose connections. Check for an open-circuit. Check for a short-circuit to ground. Check for a short-circuit to supply voltage.
Take readings between:

- Supplemental restraint system module (SRS) terminal #16A/16(16) and the connector to seat belt tensioner, left, rear, terminal #1.
- Supplemental restraint system module (SRS) terminal #15A/15(15) and the connector to seat belt tensioner, left, rear, terminal #3.

Remedy as necessary.

FAULT FOUND - Fault Found

Diagnostic Trouble Code (DTC) Information

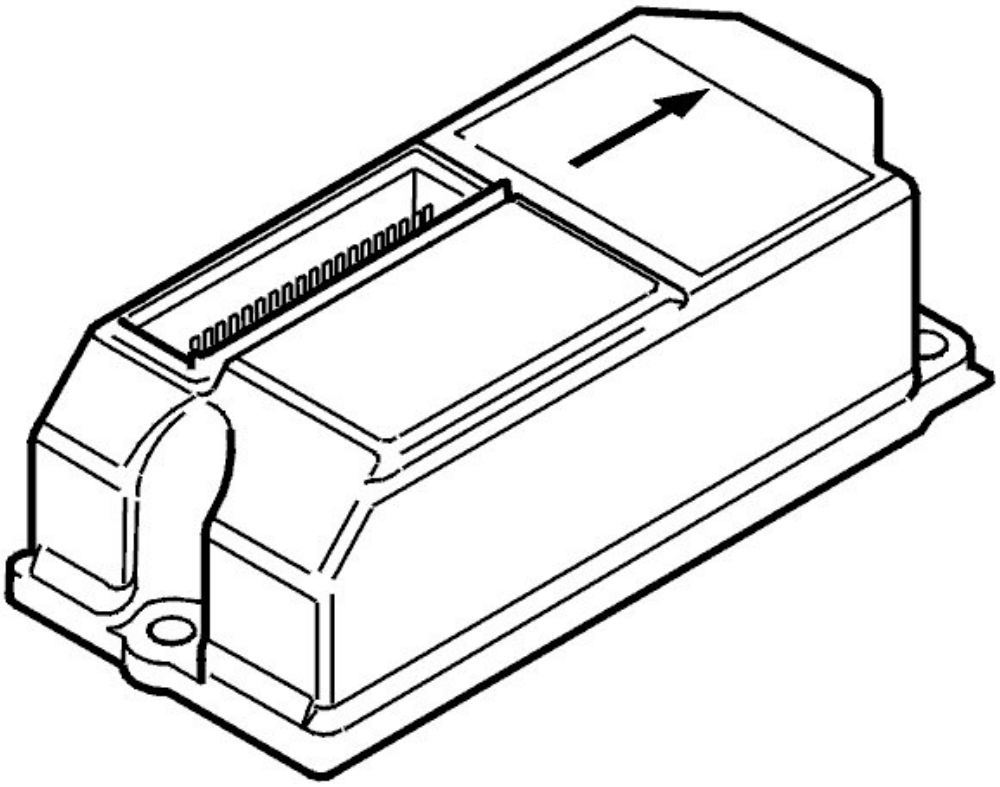
SRS-011A Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition



If the self-diagnosis registers a fault in one of the internal functions of the control unit, diagnostic trouble code SRS-011A is displayed.

Possible source

- Internal fault in the supplemental restraint system (SRS).

Fault symptom[s]

- SRS warning lamp on.

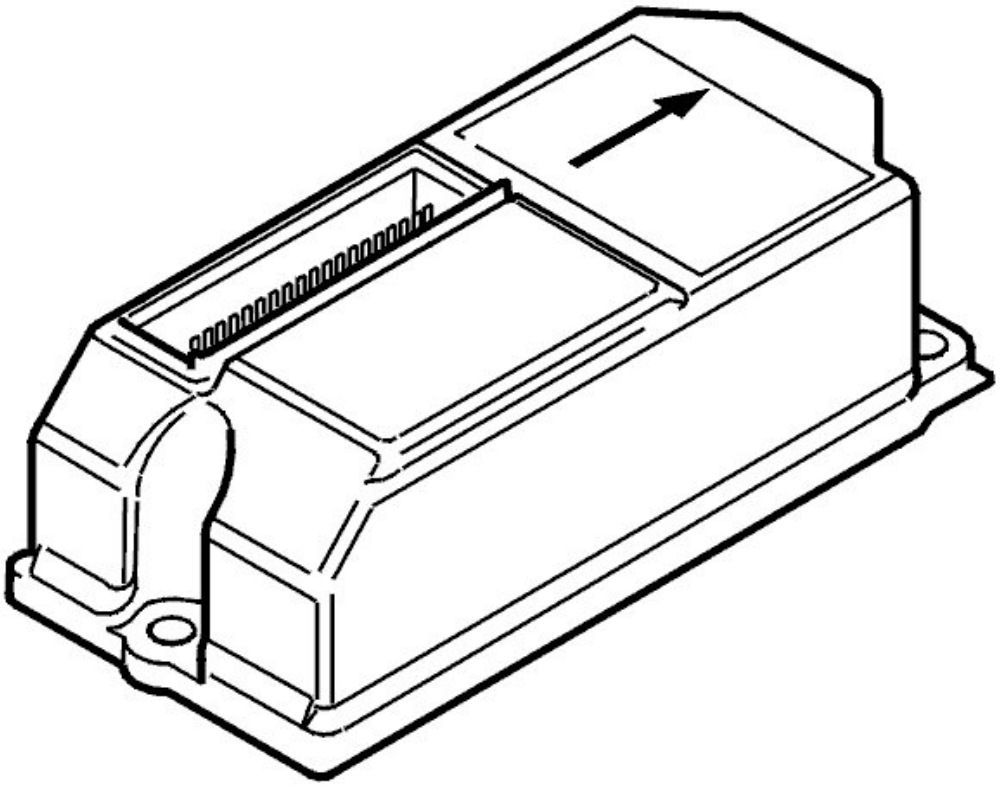
Warning! There is a risk that the supplemental restraint system (SRS) will not function if this diagnostic trouble code occurs.

Note! If there is an internal fault the diagnostic trouble code should not be erased but the supplemental restraint system (SRS) control unit should be returned to Volvo.

Internal Fault

Internal fault

Replacing and programming the SRS control module



The SRS control module has registered an internal fault.

Caution! A new SRS control module is delivered without software. The control module must be programmed in order to function after replacement.

For further information about programming and replacing the SRS control module, see Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair.

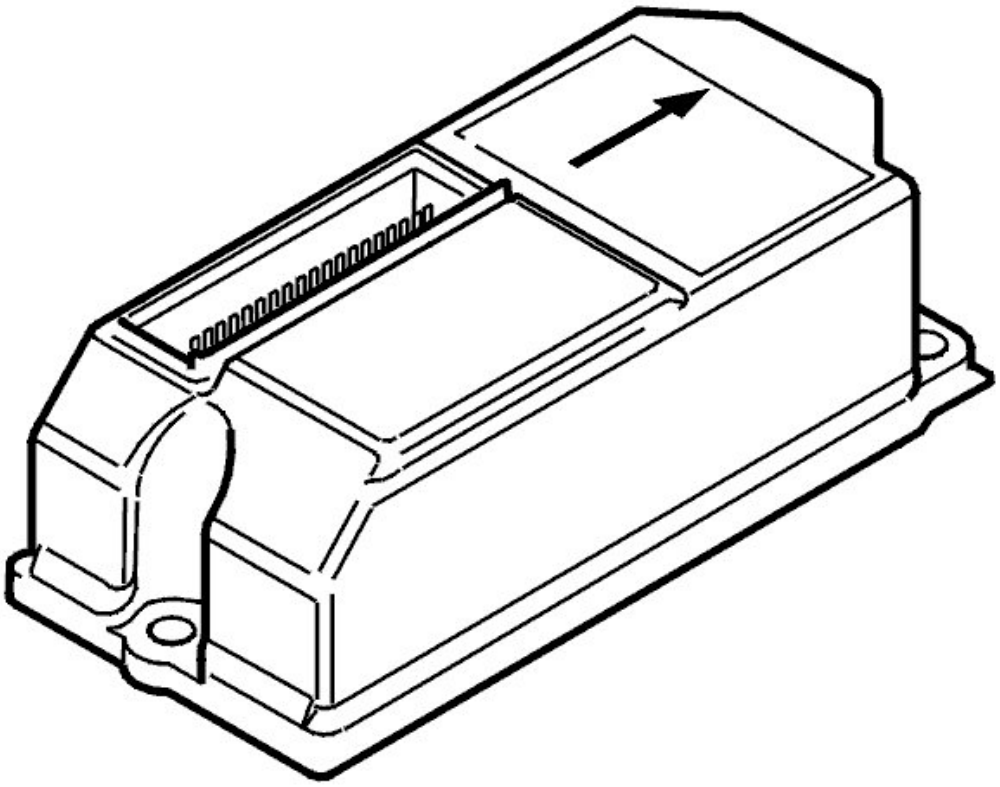
SRS-011B Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition



If the self-diagnosis registers a fault in one of the internal functions of the control unit, diagnostic trouble code SRS-011B is displayed.

Possible source

- Internal fault in the supplemental restraint system (SRS).

Fault symptom[s]

- SRS warning lamp on.

Warning! There is a risk that the supplemental restraint system (SRS) will not function if this diagnostic trouble code occurs.

Note! If there is an internal fault the diagnostic trouble code should not be erased but the supplemental restraint system (SRS) control unit should be returned to Volvo.

Internal Fault

Internal fault

Replacing and programming the SRS control module

Diagnostic trouble code (DTC) information

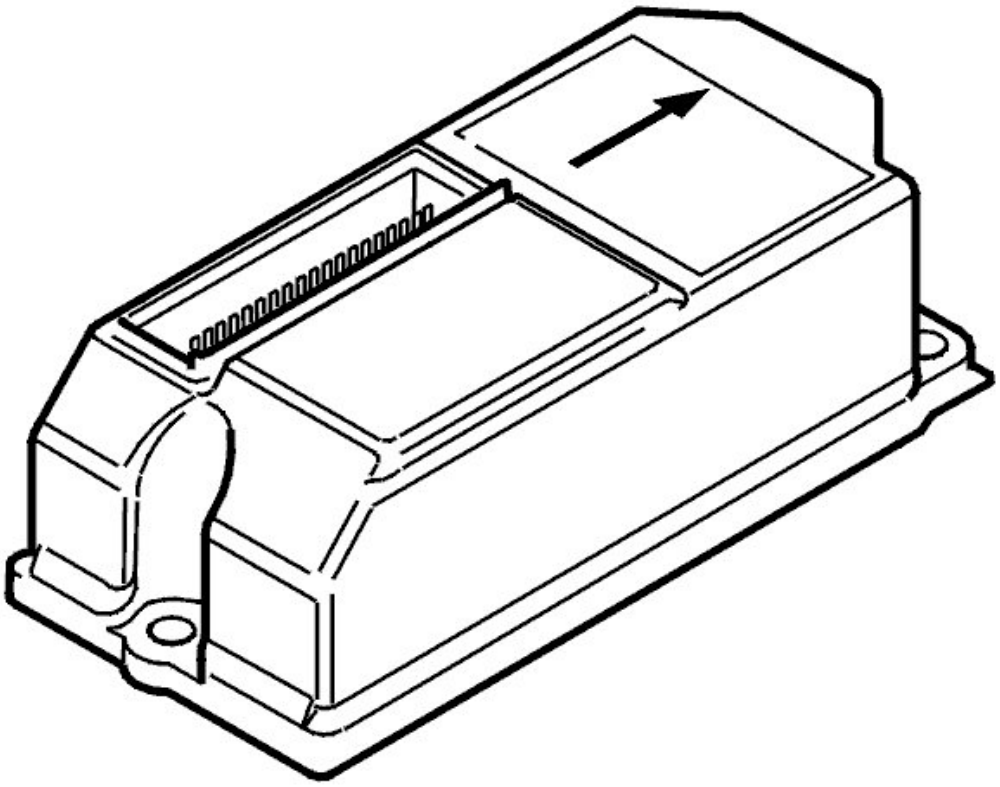
SRS-011C Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition



If the self-diagnosis registers a fault in one of the internal functions of the control unit, diagnostic trouble code SRS-011C is displayed.

Possible source
- Internal fault in the supplemental restraint system (SRS).

Fault symptom[s]
- SRS warning lamp on.

Warning! There is a risk that the supplemental restraint system (SRS) will not function if this diagnostic trouble code occurs.

Note! If there is an internal fault the diagnostic trouble code should not be erased but the supplemental restraint system (SRS) control unit should be returned to Volvo.

Internal Fault

Internal fault

Replacing and programming the SRS control module

The SRS control module has registered an internal fault.

Note! The hardware P/N for the supplemental restraint system module (SRS) must be checked if this diagnostic trouble code (DTC) is stored immediately after another control module has been programmed.

Read off ECU, hardware P/N by clicking on the VCT2000 symbol.
If the number is one of those shown below, the supplemental restraint system module (SRS) must only be reprogrammed using new software.
- 8651514
- 8651515
- 8696027
- 9467815.

If the diagnostic trouble code (DTC) is stored on another occasion or for a different type of vehicle, the supplemental restraint system module (SRS) assembly must be replaced.

Caution! A new SRS control module is delivered without software. The control module must be programmed in order to function after replacement.

Diagnostic trouble code (DTC) information

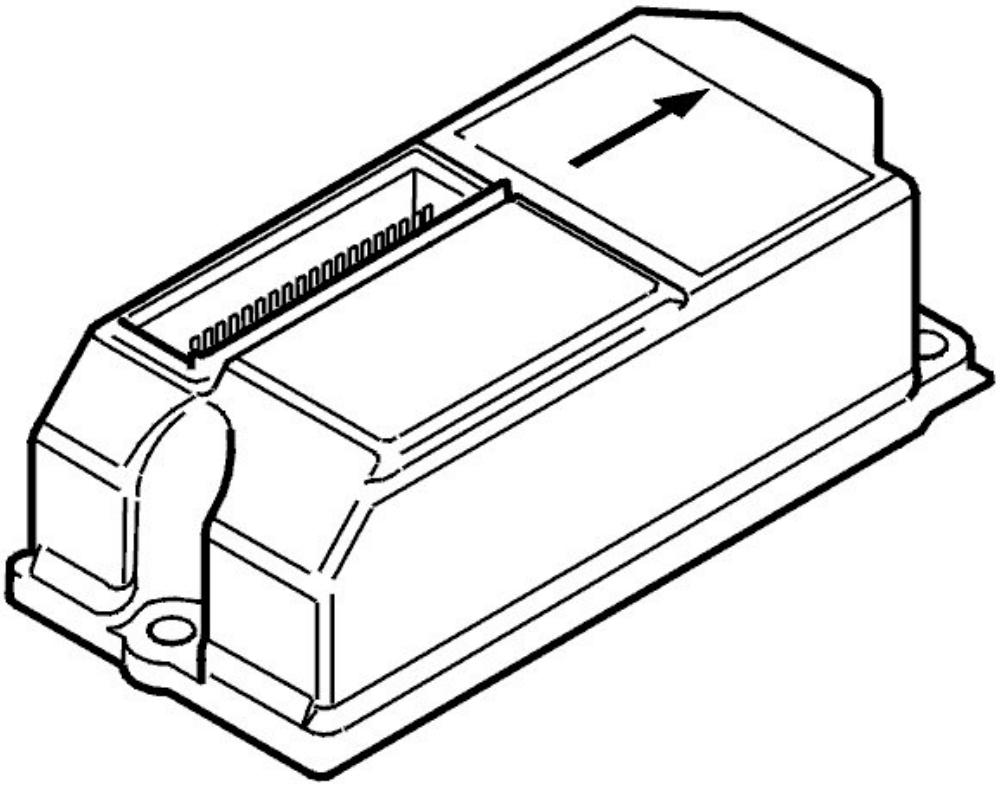
SRS-0125 Diagnostic trouble code information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition



If the self-diagnosis registers a fault in one of the internal functions of the control unit, diagnostic trouble code SRS-0125 is displayed.

Possible source

- Internal fault in the supplemental restraint system (SRS).

Fault symptom[s]

- SRS warning lamp on.

Warning! There is a risk that the supplemental restraint system (SRS) will not function if this diagnostic trouble code occurs.

Note! If there is an internal fault the diagnostic trouble code should not be erased but the supplemental restraint system (SRS) control unit should be returned to Volvo.

Diagnostic trouble code (DTC) SRS-013B is stored if the Supplemental Restraint System Module (SRS) registers an internal fault.
Diagnostic trouble code (DTC) SRS-013B can only be diagnosed when you switch from ignition position 0 to ignition positions I, II or III.

Substitute value
- None.

Possible source
- Internal fault in the supplemental restraint system module (SRS)
- Weak battery in the vehicle when programming a control module.

Fault symptom[s]
- The SRS indicator lamp is lit.

Warning! There is a risk that the SRS system will not function if this diagnostic trouble code (DTC) is stored.

Internal Fault

Internal fault

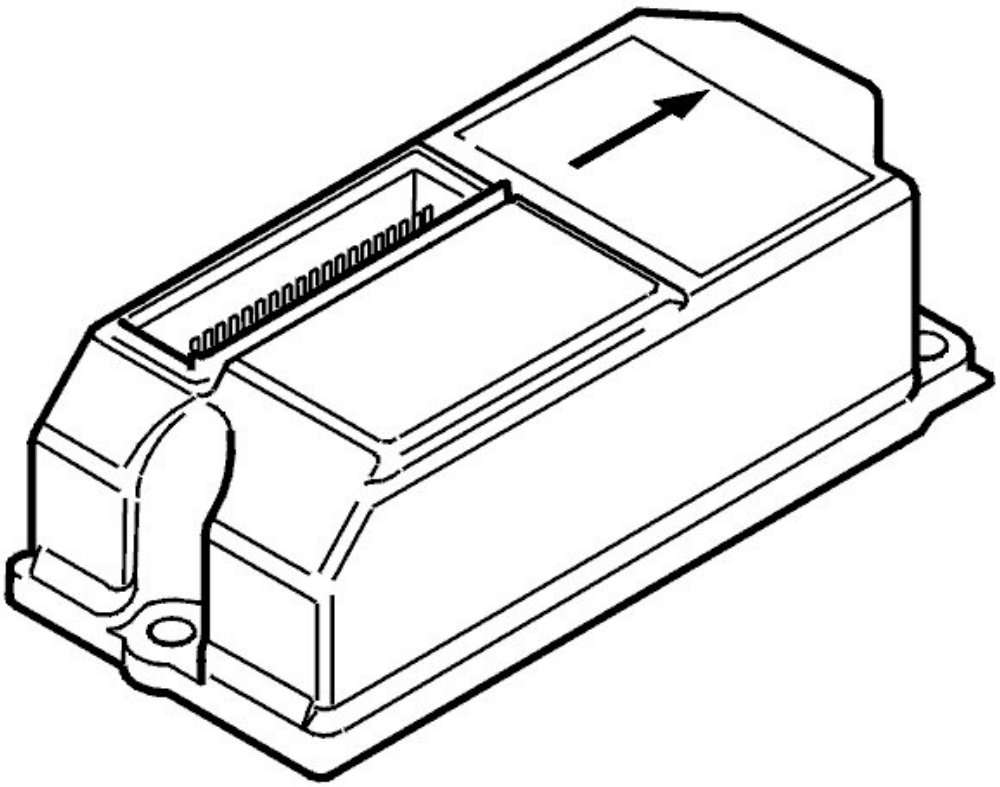
Internal fault

Note! This diagnostic trouble code (DTC) may be stored after programming one of the vehicle control modules. If this has occurred, the control module must only be reprogrammed. The control module must not be replaced.The battery must be fully charged before reprogramming is carried out!If the diagnostic trouble code (DTC) has been stored previously, the entire control module must be replaced.

The supplemental restraint system module (SRS) has registered an internal fault.

Caution! A new supplemental restraint system module (SRS) is delivered without software. The control module must be programmed in order to function after replacement.

For further information about programming and replacing the supplemental restraint system module (SRS): Control module SRS (supplemental restraint system), replacing See: Relays and Modules/Relays and Modules - Restraint Systems/Air Bag Control Module/Service and Repair

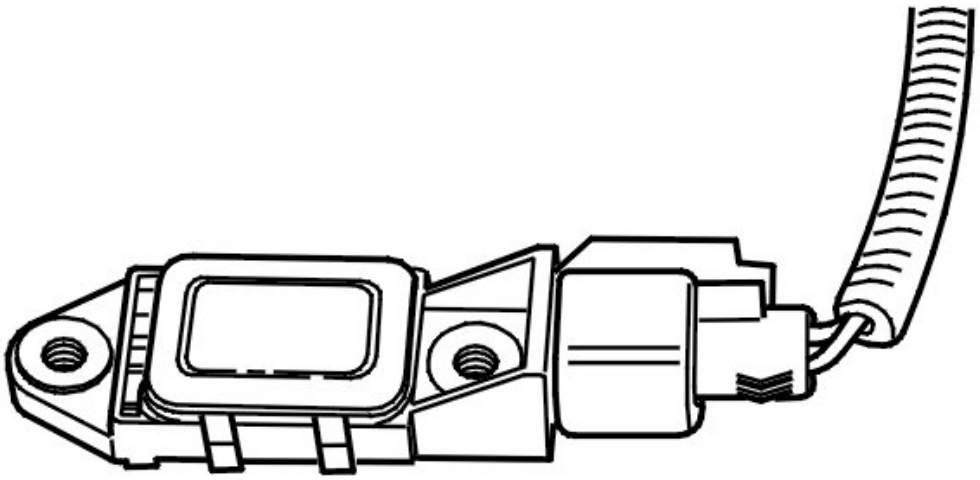


Continue - Fault Found

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0210

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the front right front impact sensor.
Diagnostic trouble code (DTC) SRS-0210 is stored if the control module registers an incorrect signal, i.e. that the signal in the signal cable is too low or too high for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0210 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

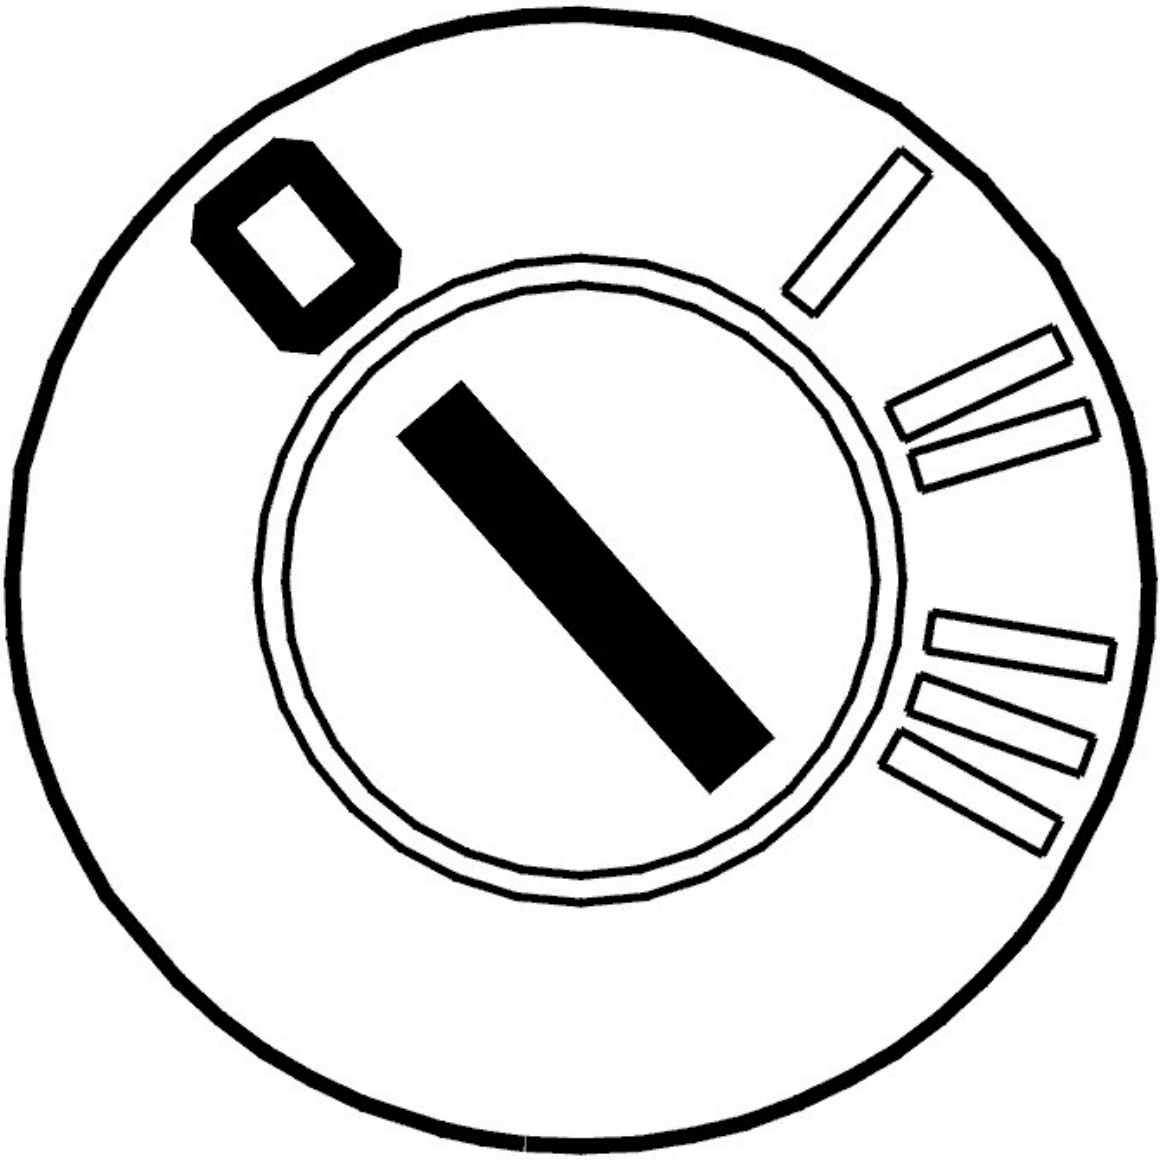
Possible source
- Short-circuit to supply voltage in the signal cable between the front right front impact sensor and the Supplemental Restraint System Module (SRS)
- Short-circuit to ground in the signal cable between the front right front impact sensor and the Supplemental Restraint System Module (SRS)
- Short-circuit to supply voltage in the connector
- Short-circuit to ground in the connector
- Short-circuit to ground in the connector
- Short-circuit between signal cables to the front impact sensor from the Supplemental Restraint System Module (SRS)
- Short-circuit in the front impact sensor (defective front impact sensor).

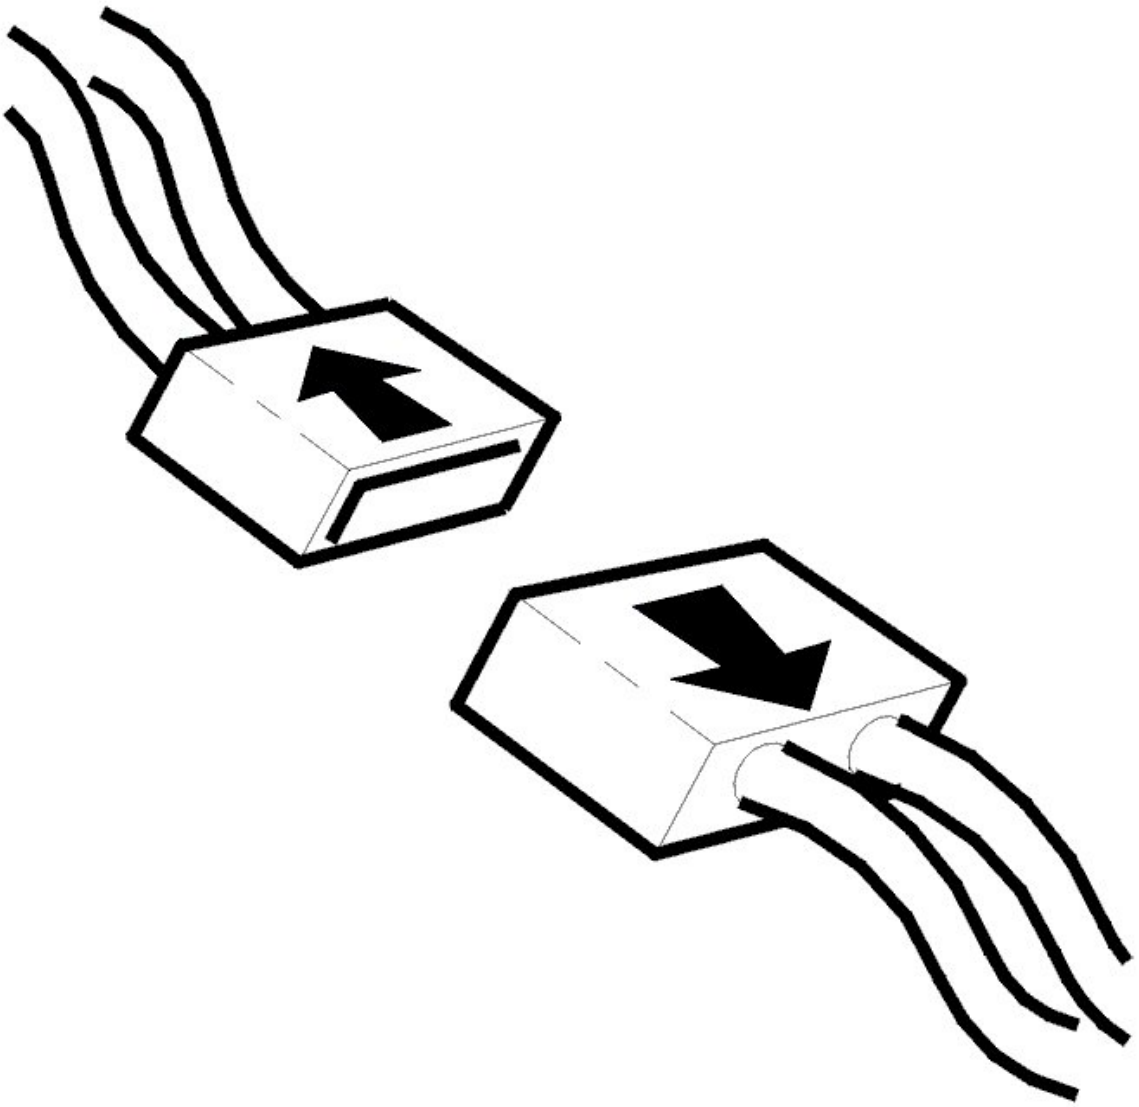
Fault symptom[s]
- The SRS indicator lamp is lit.

Faulty Signal

Faulty signal

Checking the component





- Ignition off
- Disconnect the connector from the front right front impact sensor.

Check the female and male parts of the connectors for the Supplemental Restraint System Module (SRS) and the front impact sensor. The cable terminals must not be damaged or pressed back.
Check the signal cable between the Supplemental Restraint System Module (SRS) terminals #21B (49), #20B (48) and terminals #1 and #2 on the front impact sensor. Check for a short-circuit to supply voltage. Check for a short-circuit to ground
Check the resistance in the signal cable between terminals #21B (49) and #20B (48) for the Supplemental Restraint System Module (SRS). The resistance must be infinite.
If no fault is found, replace the front collision sensor.
Remedy as necessary.

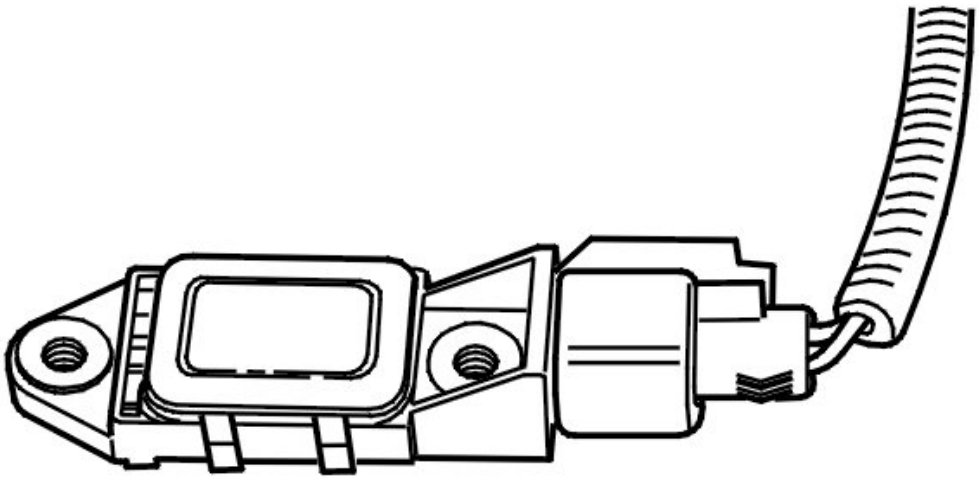
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0211

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the front right front impact sensor.
Diagnostic trouble code (DTC) SRS-0211 is stored if the control module registers a communication fault in the signal cable for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0211 can be diagnosed in ignition positions I, II or III.

Substitute value

- None.

Possible source

- Contact resistance or open-circuit in the signal cable between the front right front impact sensor and the Supplemental Restraint System Module (SRS)
- Open-circuit in the front impact sensor (defective front impact sensor).

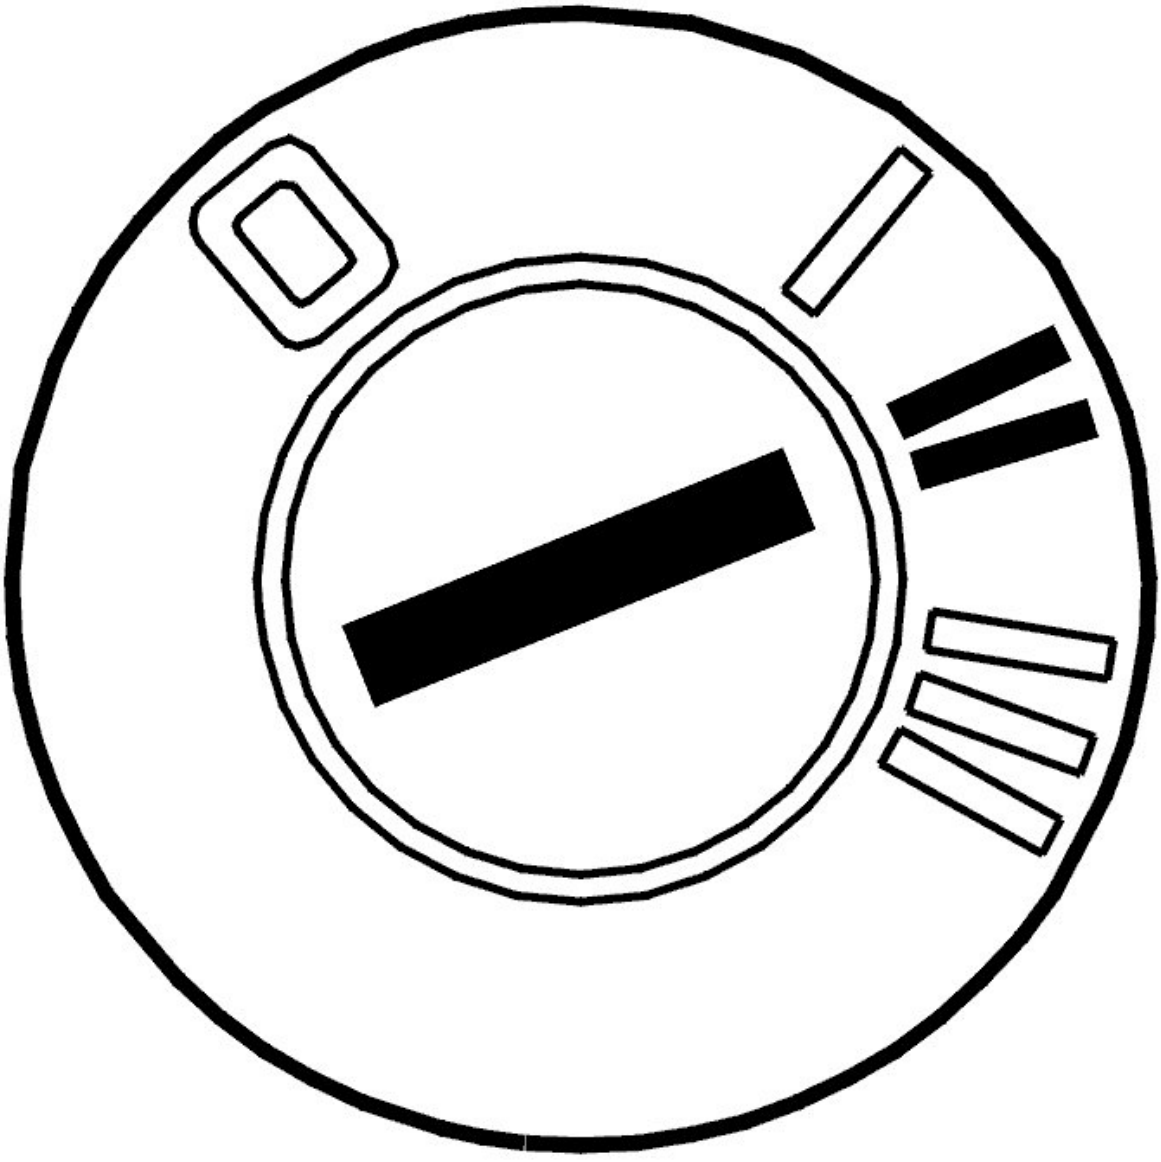
Fault symptom[s]

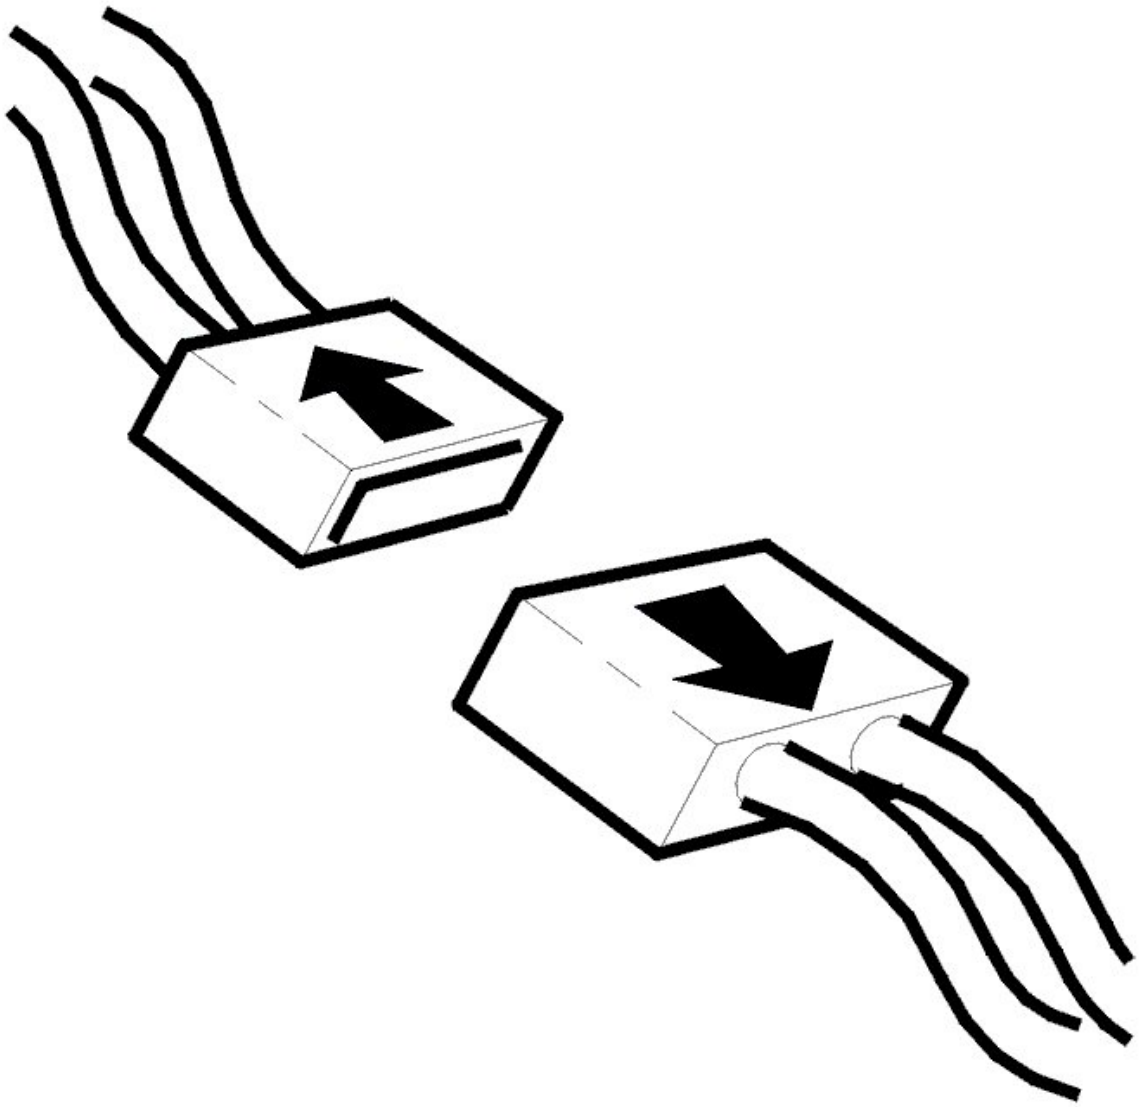
- The SRS indicator lamp is lit.

Communication Fault

Communication fault

Checking the component





- Ignition off
- Disconnect the connector from the front right front impact sensor.

Check the female and male parts of the connectors for the Supplemental Restraint System Module (SRS) and the front impact sensor. The cable terminals must not be damaged, pressed back or oxidized.
Connect special tool951 2887 UFS test tool See: Tools and Equipment/951 2887 UFS Test Tool to the front impact sensor.
Check the resistance between terminal #21B (49) and #20B(48) on the Supplemental Restraint System Module (SRS). The resistance should be 10Kohms.
Remedy as necessary.

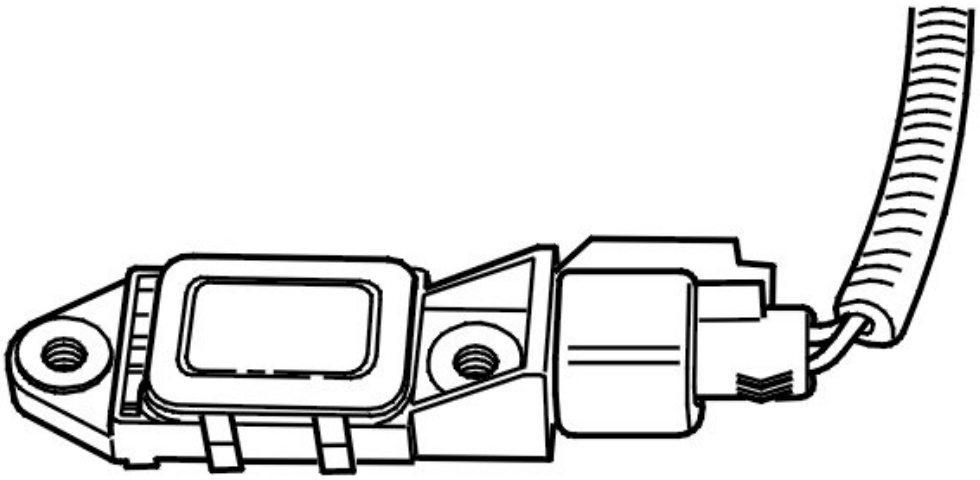
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0212

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the front right front impact sensor.
Diagnostic trouble code (DTC) SRS-00212 is stored if the control module registers an incorrect identification of signal in the signal cable for longer than 10 seconds.
Diagnostic trouble code (DTC) SRS-0212 can be diagnosed in ignition positions I, II or III.

Substitute value
- None.

Possible source
- Faulty front impact sensor installed in the Supplemental Restraint System Module (SRS)
- The signal between the front impact sensor and the Supplemental Restraint System Module (SRS) has been affected by electrical interference. This causes the front impact sensor to respond with an incorrect identification signal.

Fault symptom[s]
- The SRS indicator lamp is lit.

Incorrect identification

Incorrect identification

Replacing the component

Supplemental Restraint System Module (SRS) has registered that an incorrect front impact sensor model has been installed.
If this fault occurs, replace the front right front impact sensor. Check against the replacement parts catalogue which front impact sensor model is used in the relevant Supplemental Restraint System Module (SRS).
In the event of a permanent fault, replace the front impact sensor. see the relevant service procedure.
Remedy as necessary.

Continue - Fault Found

Diagnostic Trouble Code (DTC) Information

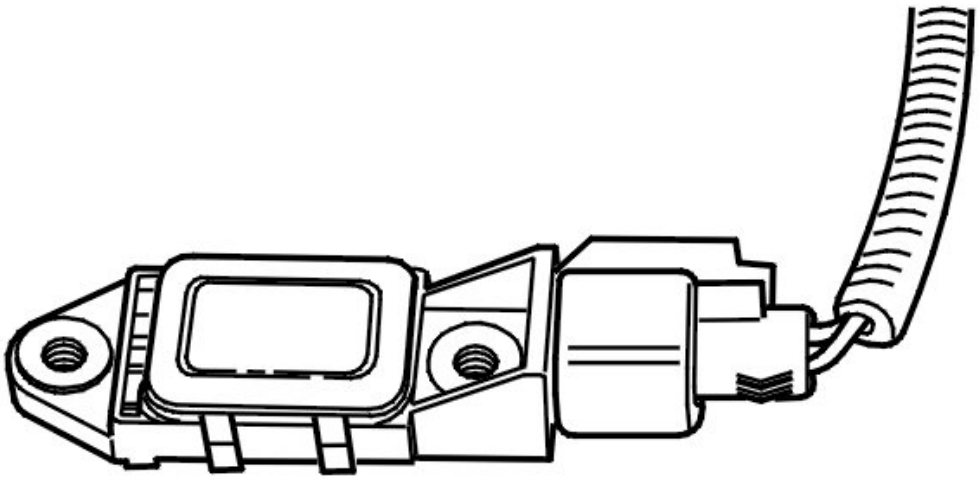
Diagnostic trouble code (DTC) information SRS-0215

Condition



The Supplemental Restraint System Module (SRS) checks the signal from the front right front impact sensor.
Diagnostic trouble code (DTC) SRS-0215 is stored if the control module registers that the signal cable is cross-connected.
The diagnostic trouble code (DTC) can only be diagnosed when the ignition is switched on (12 V). In other words, the diagnostic trouble code (DTC) can only be diagnosed when the ignition is switched from position 0 to positions I, II or III.

Substitute value
- None.

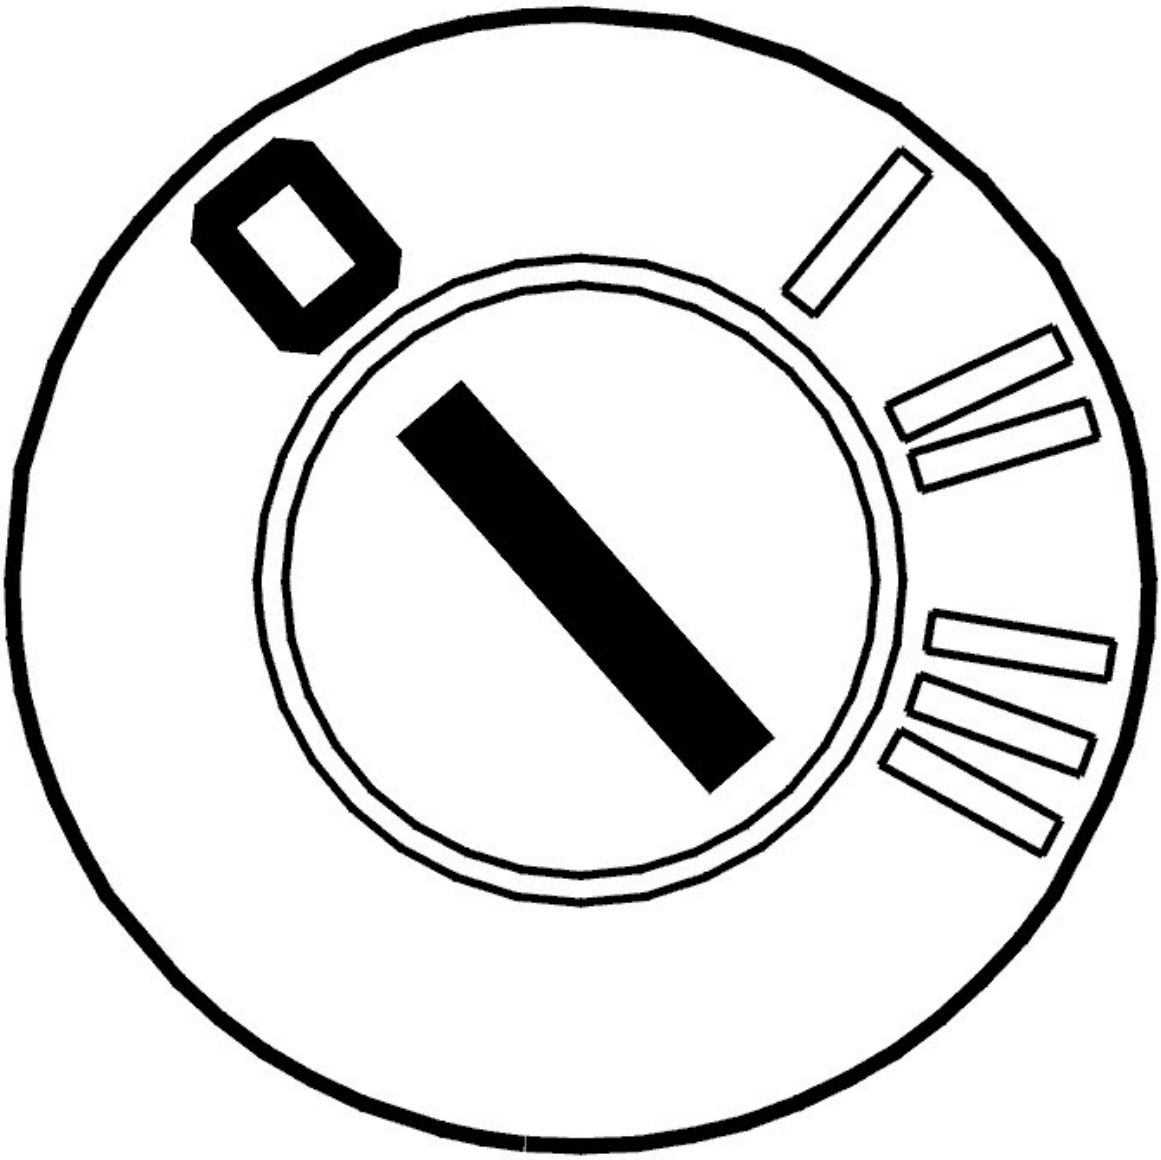
Possible source
- Incorrect connection of the signal cables between the front right front impact sensor and the Supplemental Restraint System Module (SRS). The signal cables are reversed between the two terminal pins in the front impact sensor or in the Supplemental Restraint System Module (SRS)
- Incorrect repair of SRS wiring. The signal cables to the two terminal pins on the front impact sensor have been reversed.

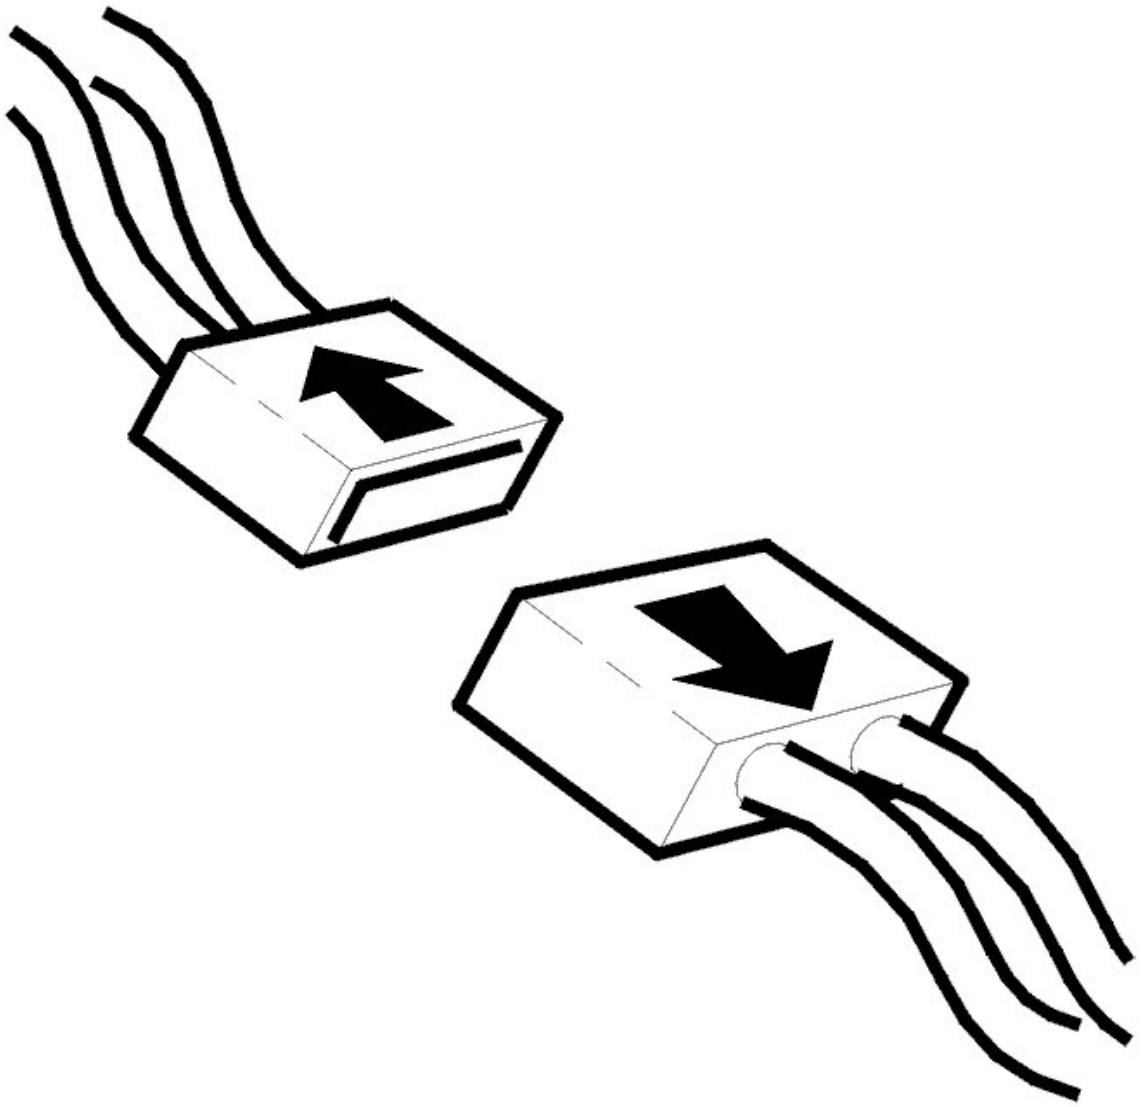
Fault symptom[s]
- The SRS indicator lamp is lit.

Cross-connected

Cross-connected

Checking components and wiring





- Ignition off
- Disconnect the connector from the front right front impact sensor.

Check the signal cable between the Supplemental Restraint System Module (SRS) terminal #21B (49) and the front impact sensor #1. Check for an open-circuit.
Check the signal cable between the Supplemental Restraint System Module (SRS) terminal #20B (48) and the front impact sensor #2. Check for an open-circuit.
Check the resistance between the Supplemental Restraint System Module (SRS) terminal #21B (49) and the front impact sensor #2. The resistance should be infinite.

Check the resistance between the Supplemental Restraint System Module (SRS) terminal #20B (48) and the front impact sensor #1. The resistance should be infinite.

Hint: If repairs have been carried out on the wiring, these signal cables may have been reversed. Check that connections between the Supplemental Restraint System Module (SRS) and the front impact sensor are correct.

Remedy as necessary.

Possible source
- The supplemental restraint system module (SRS) and the central electronic module (CEM) have different configurations for the switch for the passenger airbag.

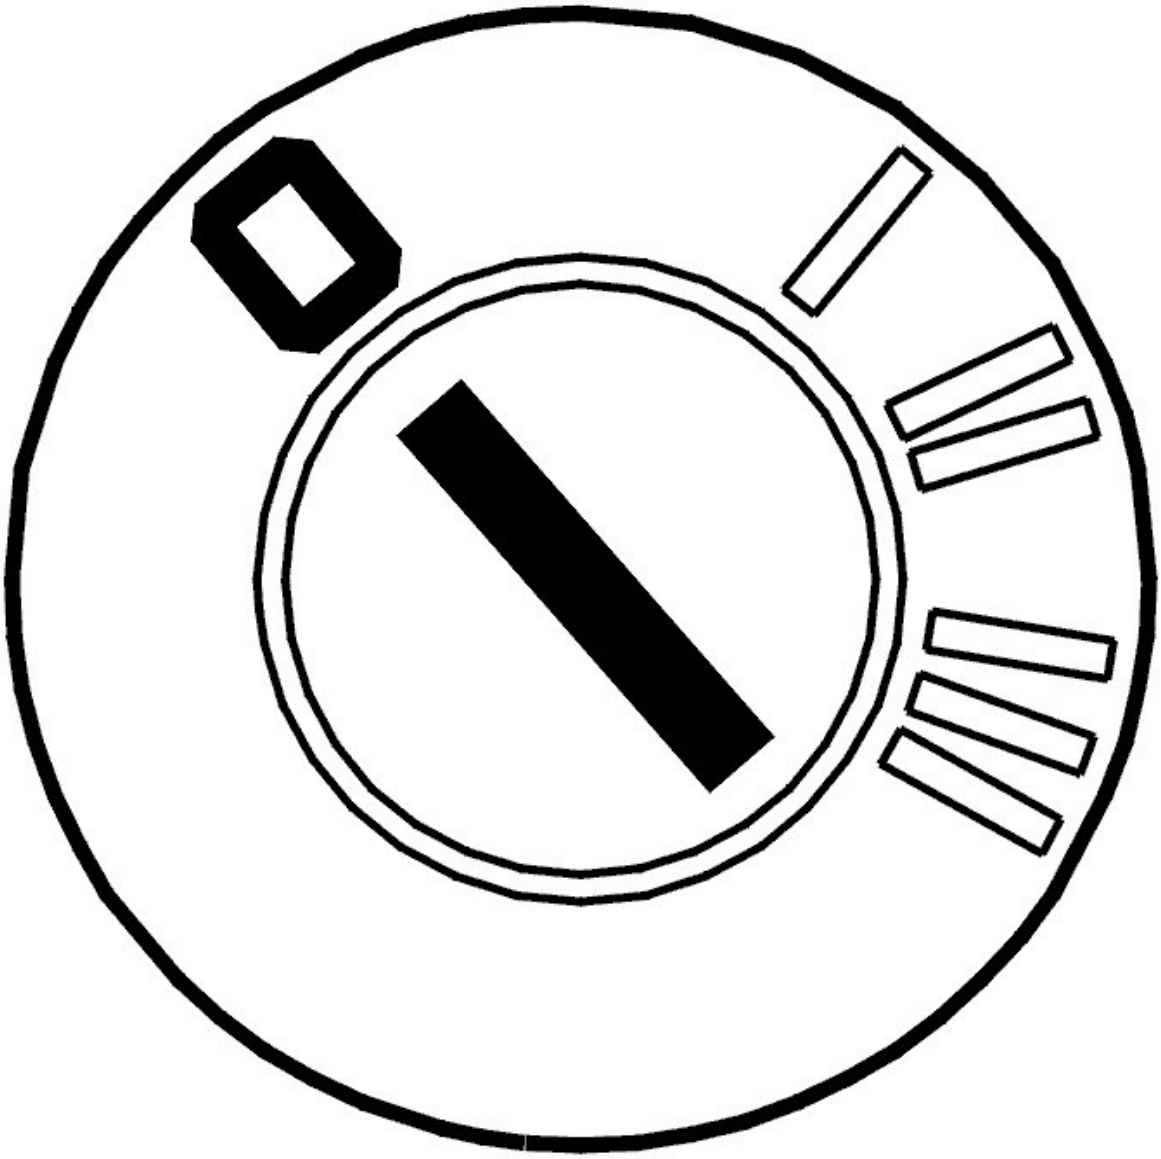
Fault symptom[s]
- The SRS indicator lamp is lit.

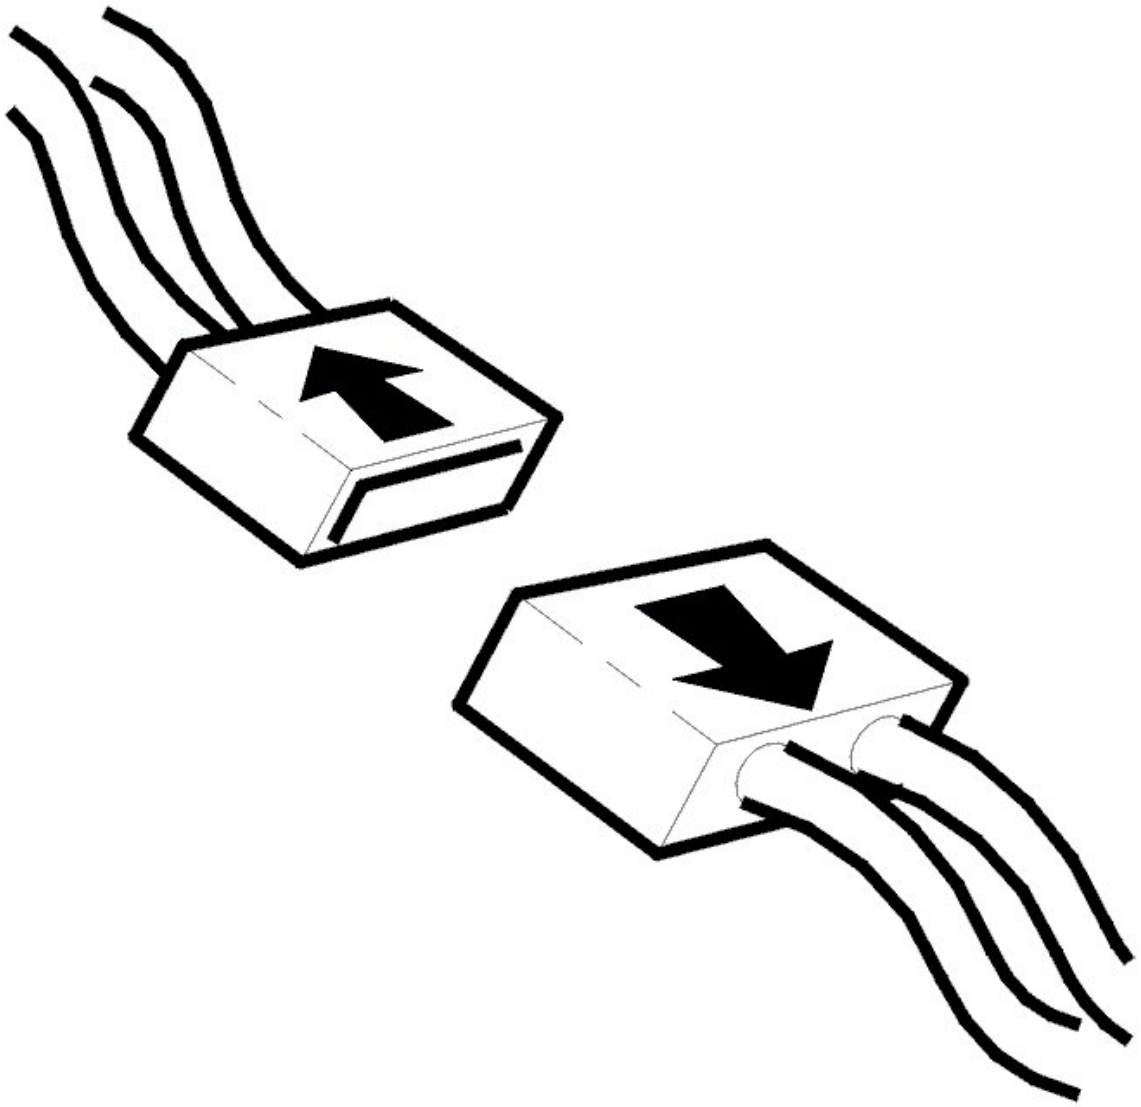
Configuration Fault

Configuration fault

Checking the component

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS) and the central electronic module (CEM). There is a risk of static discharge. This could damage the supplemental restraint system module (SRS) and the central electronic module (CEM).





- Switch off the ignition. Wait 10 seconds
- Disconnect the connector from the supplemental restraint system module (SRS)
- Disconnect connector D from the central electronic module (CEM).

Check the connectors for the supplemental restraint system module (SRS) and the central electronic module (CEM). Check for damage to pins and terminals in the connectors. Also check the wiring.
Remedy as necessary.
Check what type of crash safety equipment the central electronic module (CEM) and the supplemental restraint system module (SRS) are programmed for.

- Connect the connector for the supplemental restraint system module (SRS)
- Connect the connector for the central electronic module (CEM)
- Switch on the ignition. Wait 10 seconds
- Read off by clicking the VCT2000 symbol.

As part of the check, a comparison is performed regarding whether the control modules are programmed for the following:

- Switch for passenger airbag.

If the control modules are programmed for different types of crash safety equipment:
Check whether the crash safety equipment that does not correspond in the comparison between the control modules is installed in the vehicle.
Remedy faulty equipment and/or download new software into the incorrectly programmed control module.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0235

Condition

The supplemental restraint system module (SRS) checks the signal from the switch for the passenger airbag.
The diagnostic trouble code (DTC) is stored if the control module registers that the voltage in the signal cable is too low.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- None.

Possible source
- Short-circuit to ground in the signal cable or in the connectors between the supplemental restraint system module (SRS) and the switch for the passenger airbag
- Short-circuit to ground in the switch for the passenger airbag.

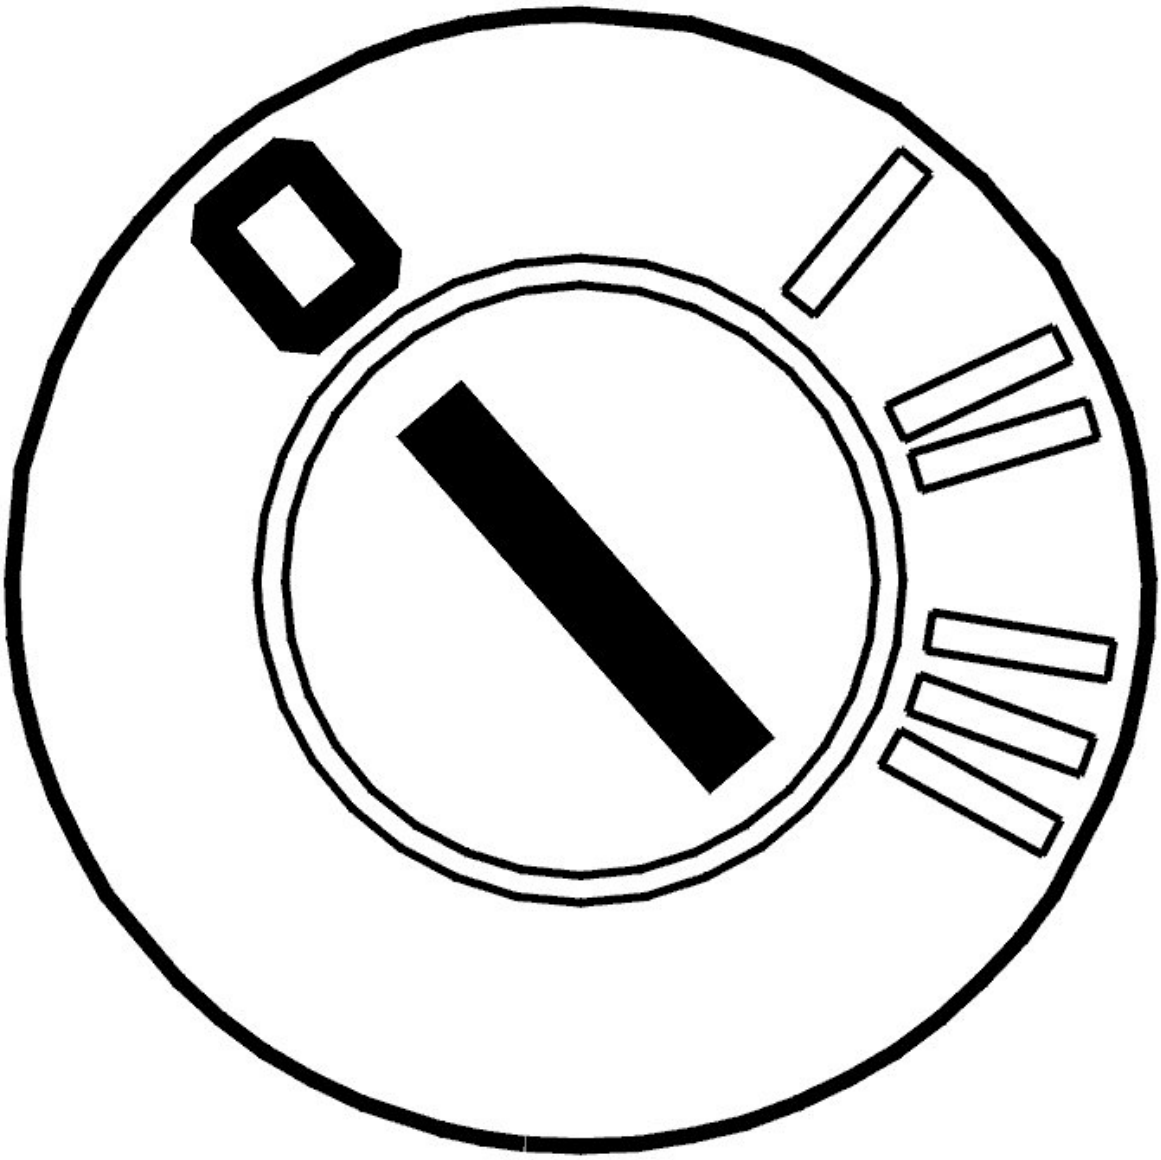
Fault symptom[s]
- The SRS indicator lamp is lit.

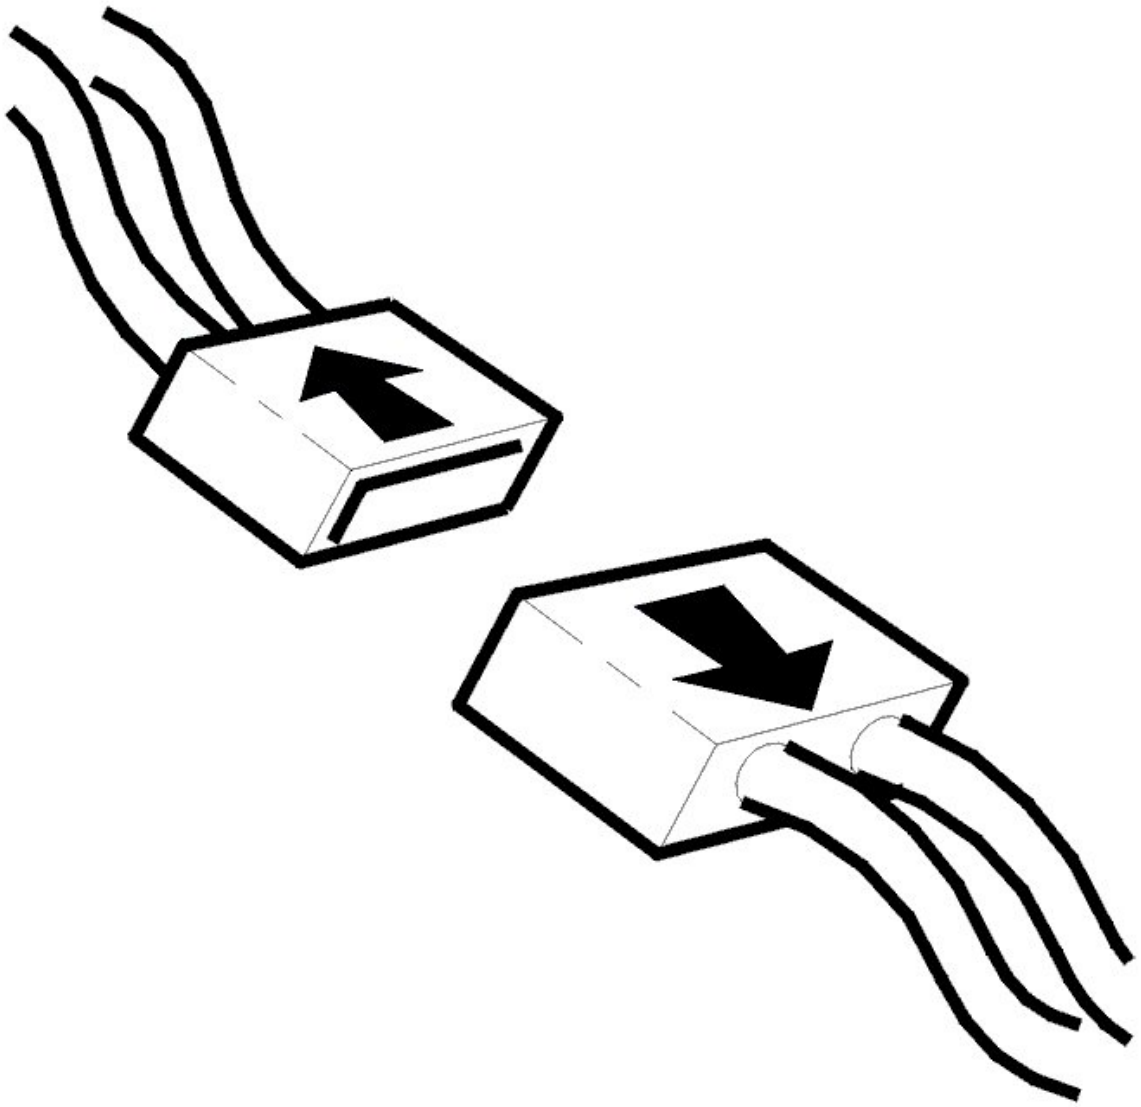
Signal Too High

Signal too high

Checking components and wiring

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS). There is a risk of static discharge. This could damage the supplemental restraint system module (SRS).





- Switch off the ignition. Wait 10 seconds
- Disconnect the connector from the switch for the passenger airbag
- Disconnect the connector from the supplemental restraint system module (SRS).

Check the connectors for the switch and the supplemental restraint system module (SRS). Check for damage to pins and terminals in the connectors.
Remedy as necessary.
Check the cable between the supplemental restraint system module (SRS) and the switch connector. Check for a short-circuit to supply voltage.
Check the cable between:

- Supplemental restraint system module (SRS) terminal #45 and switch connector terminal #4
- Supplemental restraint system module (SRS) terminal #50 and switch connector terminal #5.

Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0236

Condition

The supplemental restraint system module (SRS) checks the signal from the switch for the passenger airbag.
The diagnostic trouble code (DTC) is stored if the control module registers that the switch has an internal fault which causes incorrect operation.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- None.

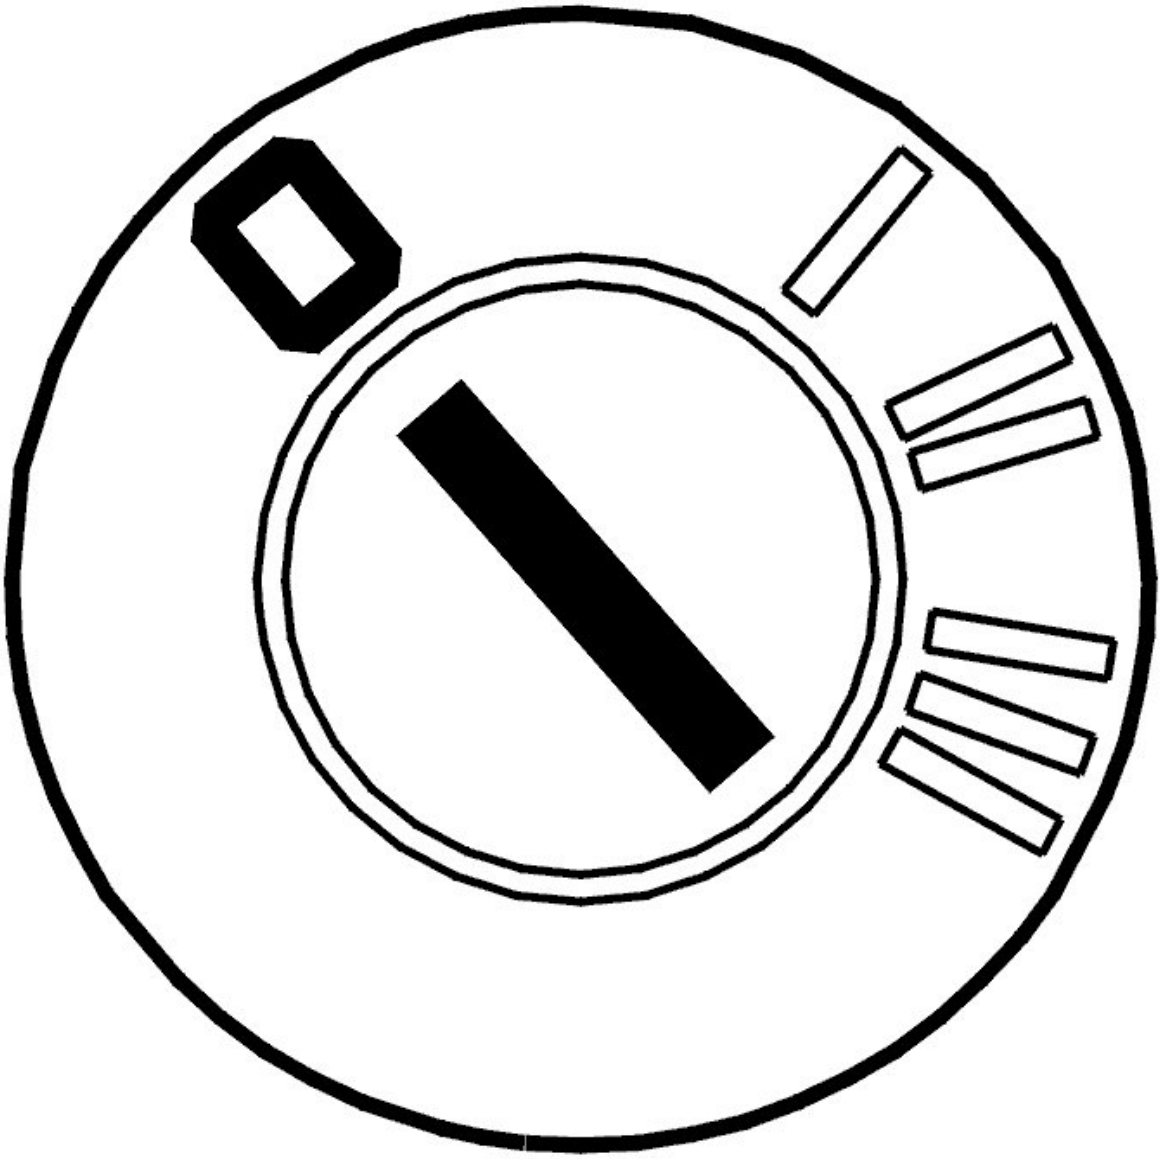
Possible source
- Fault in the switch for the passenger airbag.

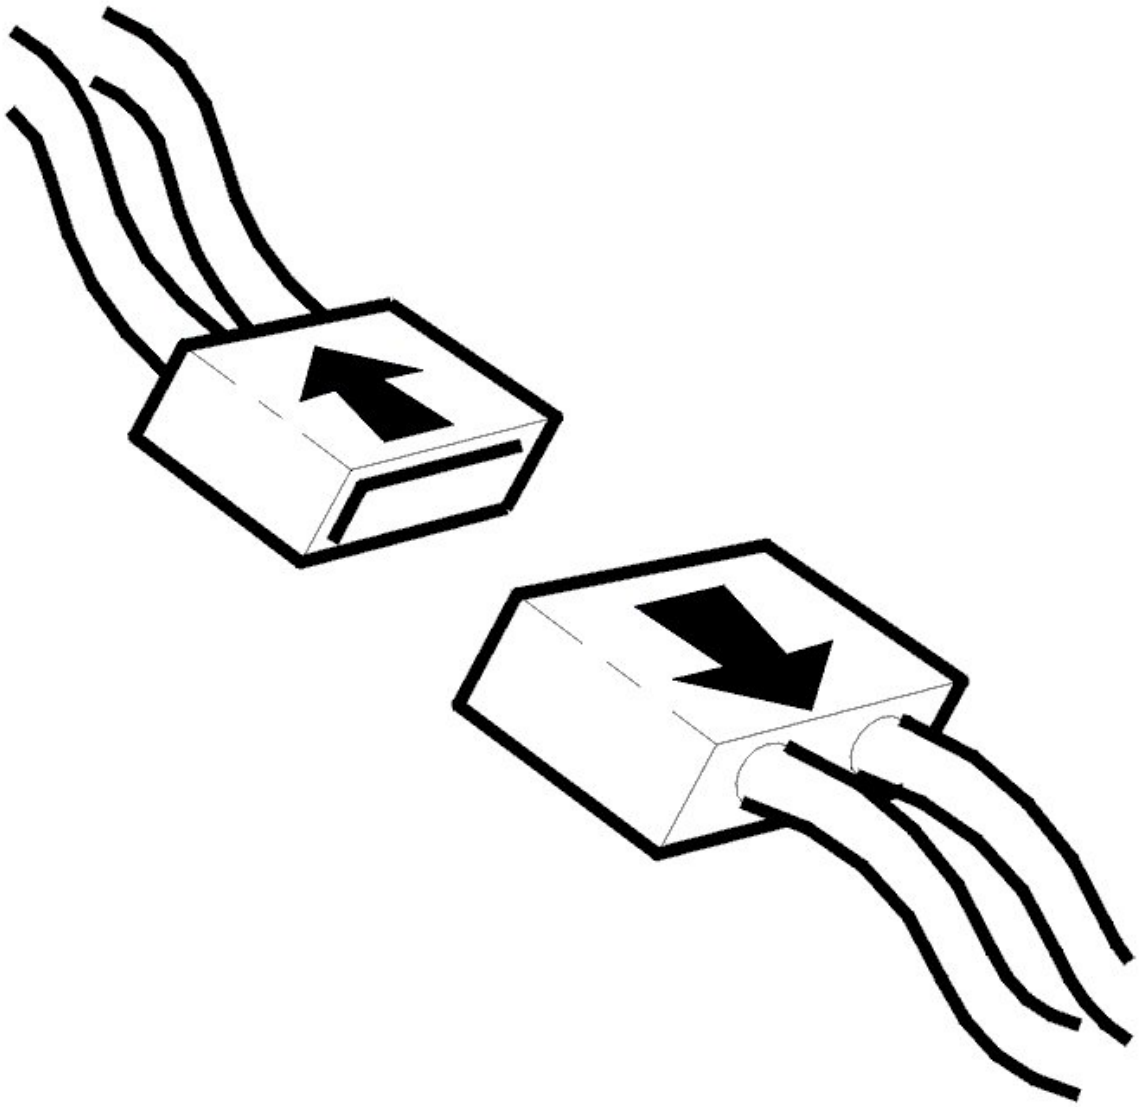
Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Faulty function

Faulty function

Checking the component





- Switch off the ignition. Wait 10 seconds
- Set the switch to the**ON**position
- Switch on the ignition. Wait 10 seconds.

Check the current running through sensors A and B in the switch.
When the switch is in the**ON**position, the current level in sensor A must be in the range of 1.6-6.4 mA and the current level in sensor B must be in the range of 12.8-20.1 mA.
Click on the VCT2000 symbol to read off the current level.
Replace the switch if any of the current levels are outside the listed ranges.

- Switch off the ignition. Wait 10 seconds
- Set the switch to the**OFF**position
- Switch on the ignition. Wait 10 seconds.

Check the current running through sensors A and B in the switch.
When the switch is in the**OFF**position, the current level in sensor A must be in the range of 12.8-20.1 mA and the current level in sensor B must be in the range of 1.6-6.4 mA.
Click on the VCT2000 symbol to read off the current level.
Replace the switch if any of the current levels are outside the listed ranges.
Select**Continue**to erase the diagnostic trouble code (DTC) if not fault is found.

Diagnostic Trouble Code (DTC) Information

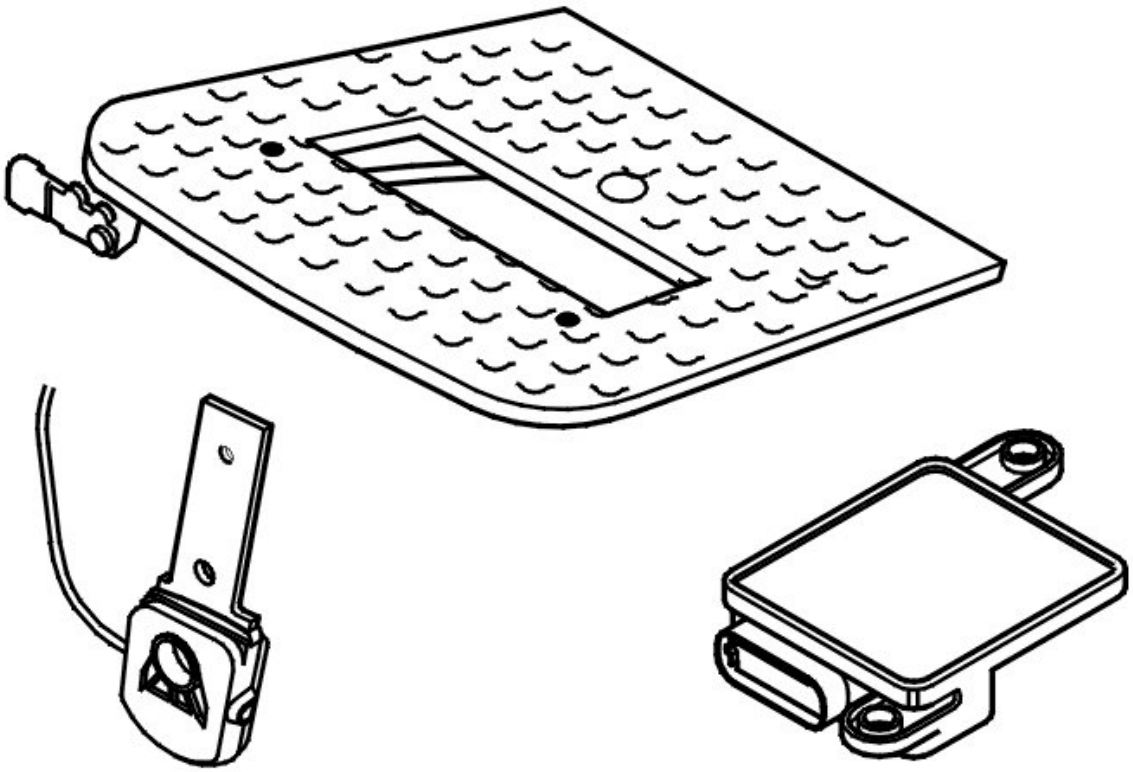
Diagnostic trouble code (DTC) information SRS-0253

Condition



The supplemental restraint system module (SRS) checks the signal from the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module registers a communication fault.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- Passenger airbag is deactivated.

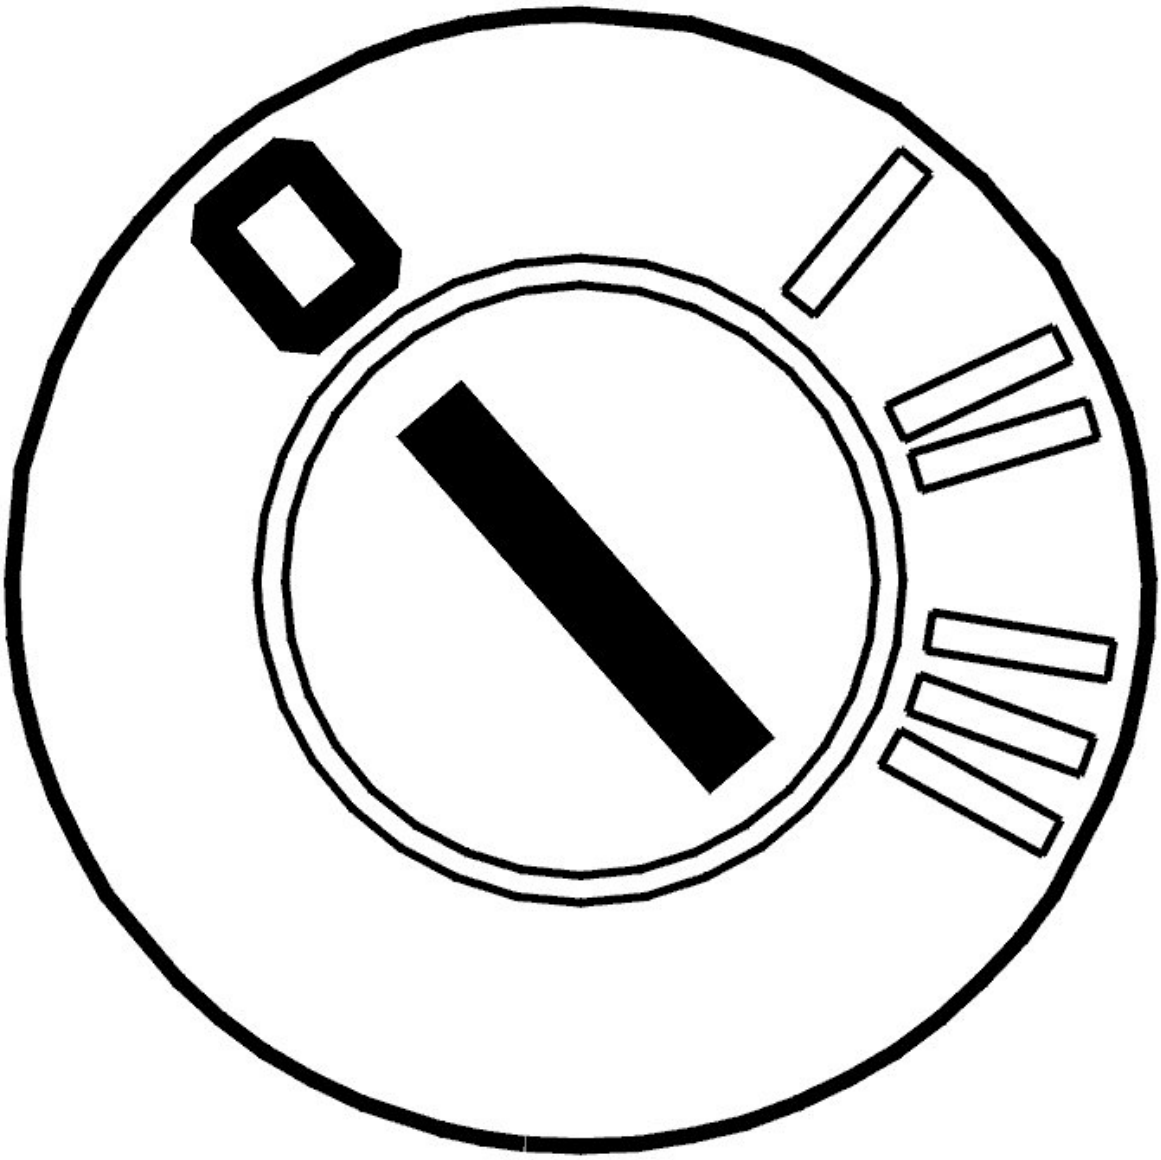
Possible source
- Open-circuit in the signal cable or in the connectors between the occupant weight sensor (OWS) and supplemental restraint system module (SRS)
- Damaged occupant weight sensor (OWS).

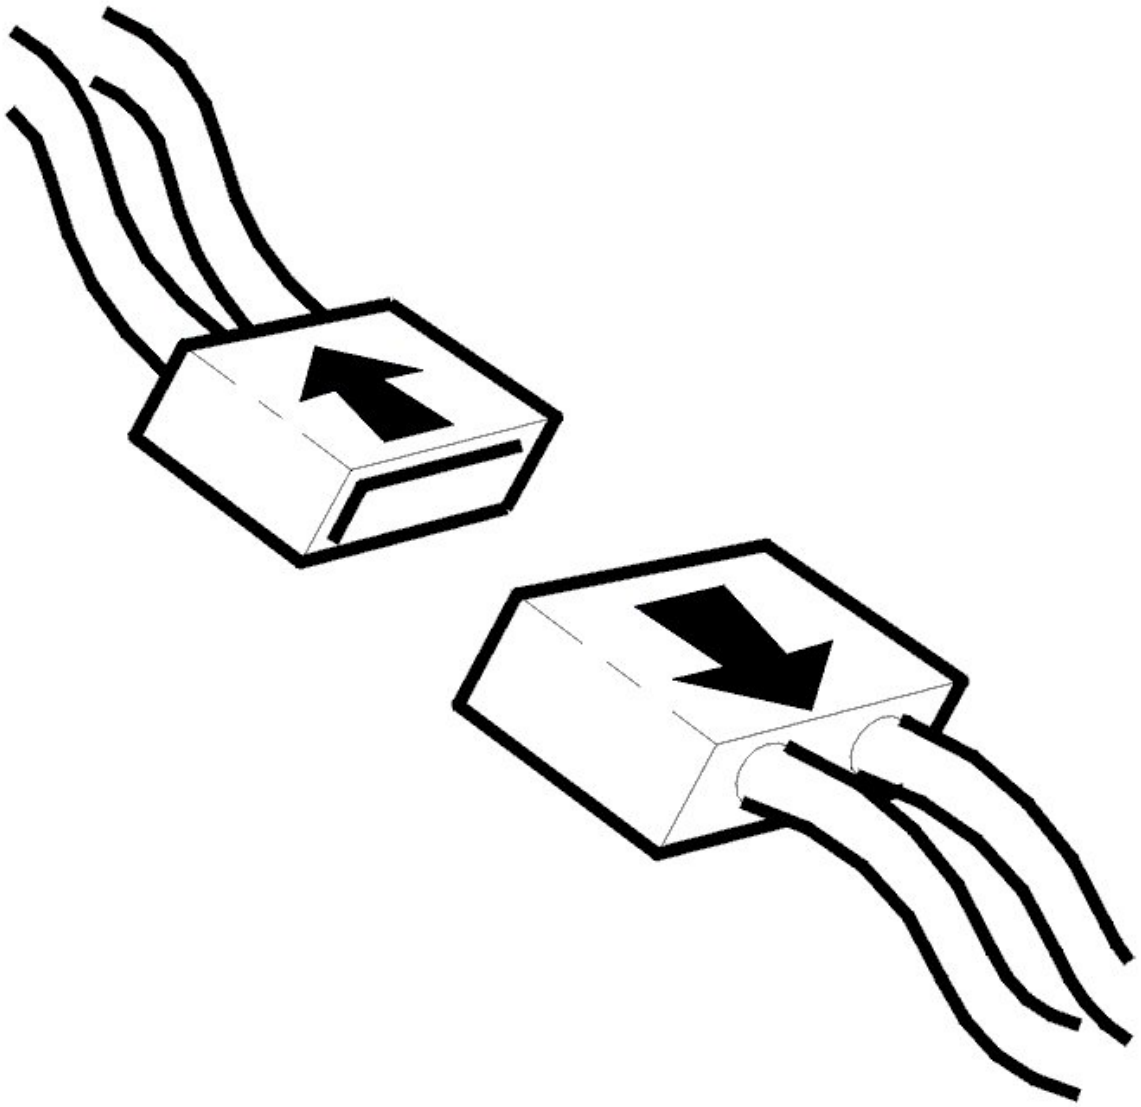
Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Communication Fault

Communication fault

Checking the component





- Switch off the ignition. Wait 10 seconds
- Disconnect the 10-pin connector from the occupant weight sensor (OWS)
- Disconnect the connector from the supplemental restraint system module (SRS).

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). There is a risk of static discharge. This could damage the supplemental restraint system module (SRS) and the occupant weight sensor (OWS).

Check the connectors for the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). Check for damage to pins and terminals in the connectors. Check for contact resistance.
Also check the other connectors that connect the communication cable between the supplemental restraint system module (SRS) and the occupant weight sensor (OWS).
Remedy as necessary.
Check the communication cable (LIN-bus) between the supplemental restraint system module (SRS) and the 10-pin connector for the occupant weight sensor (OWS). Check for an open-circuit.
Check the cable between supplemental restraint system module (SRS) terminal #57 and the 10-pin connector for occupant weight sensor (OWS) terminal #10.
Remedy as necessary.
Replace the pressure sensor and the occupant weight sensor module (OWS) if no fault is detected. The pressure sensor and occupant weight sensor (OWS) module are included in the occupant weight sensor (OWS) system.

Note! After replacing the pressure sensor and the occupant weight sensor (OWS) module in the occupant weight sensor (OWS) system, the supplemental restraint system module (SRS) must be configured. This is done by storing the ID number for the occupant weight sensor (OWS).The occupant weight sensor (OWS) must also be calibrated.

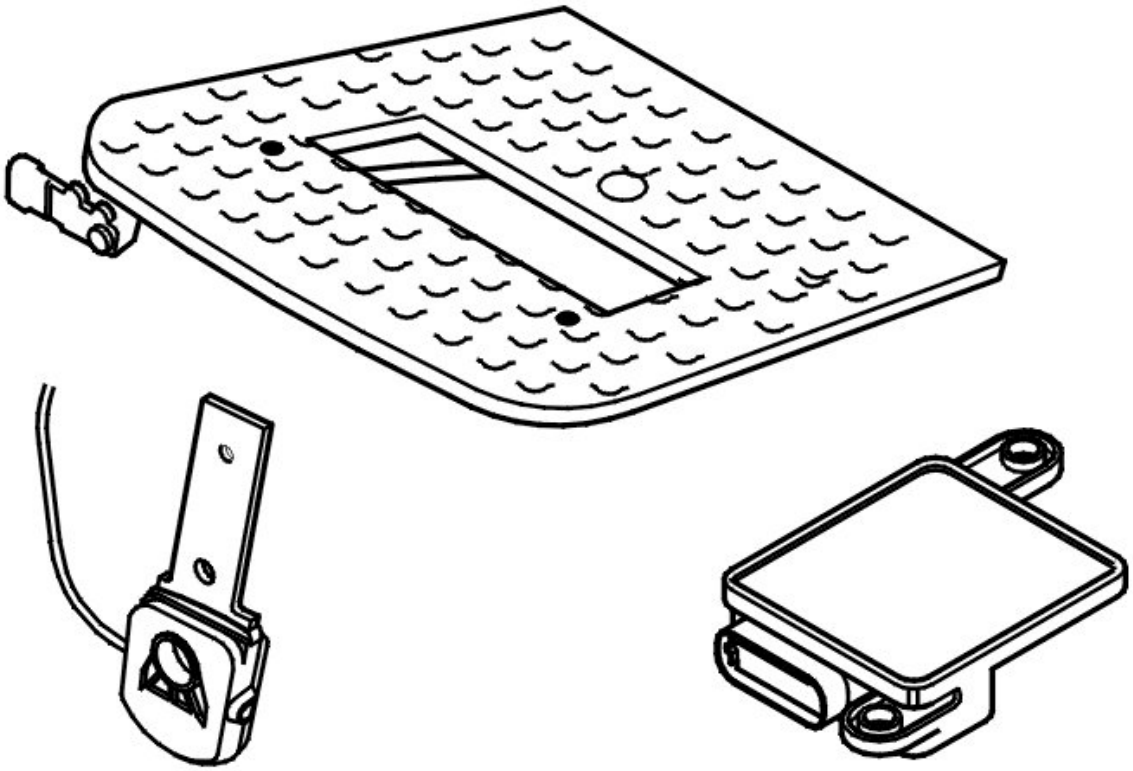
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0254

Condition



The supplemental restraint system module (SRS) checks the signal from the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module registers a communication fault.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value

- Passenger airbag is deactivated.

Possible source

- Open-circuit in the signal cable or in the connectors between the occupant weight sensor (OWS) and supplemental restraint system module (SRS)
- Damaged occupant weight sensor (OWS).

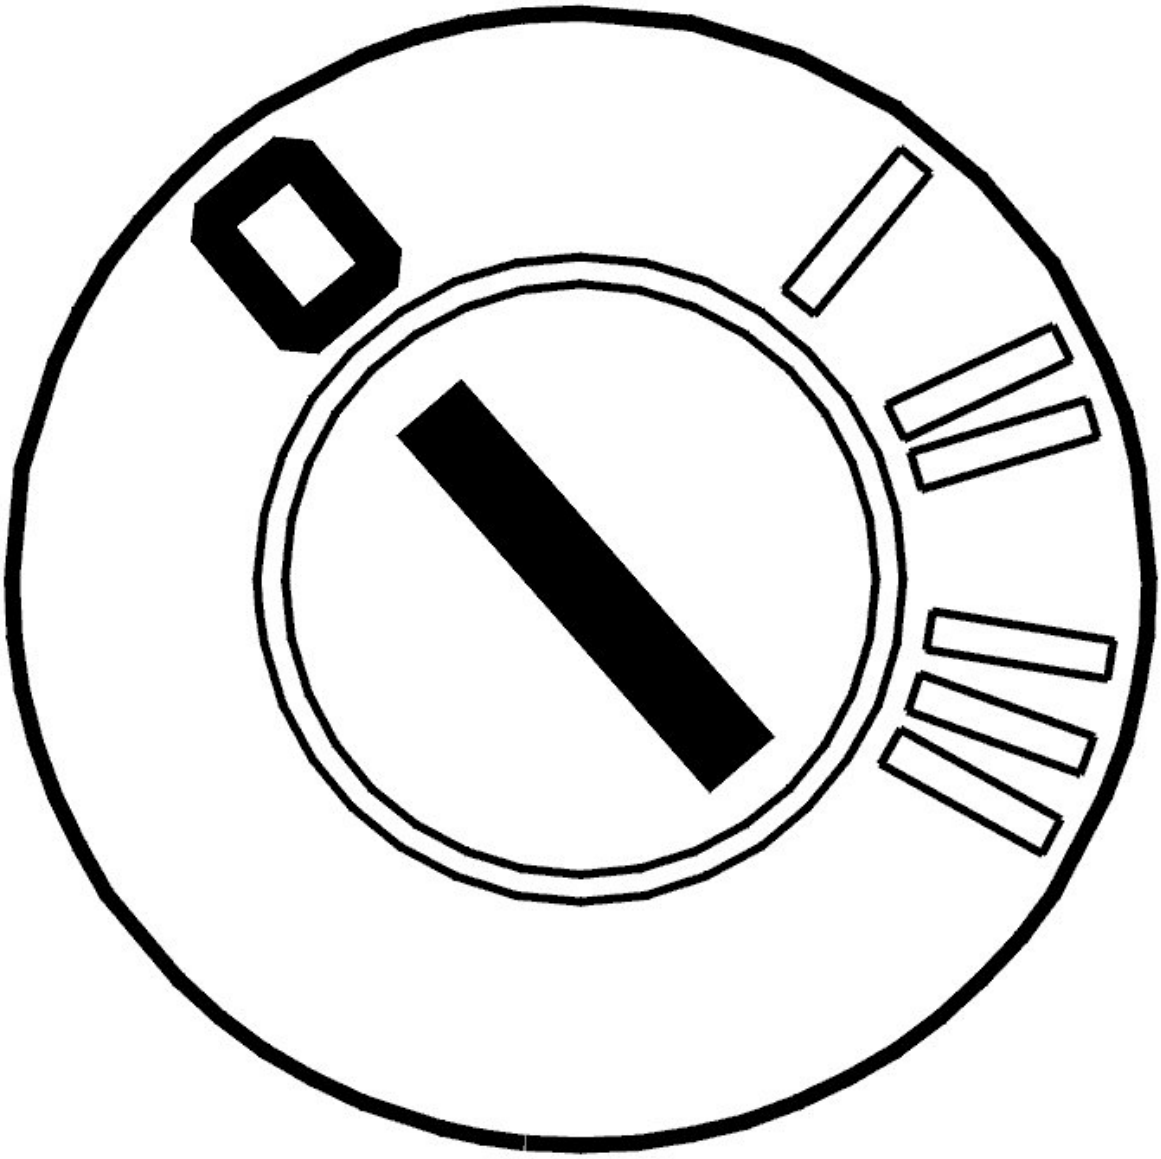
Fault symptom[s]

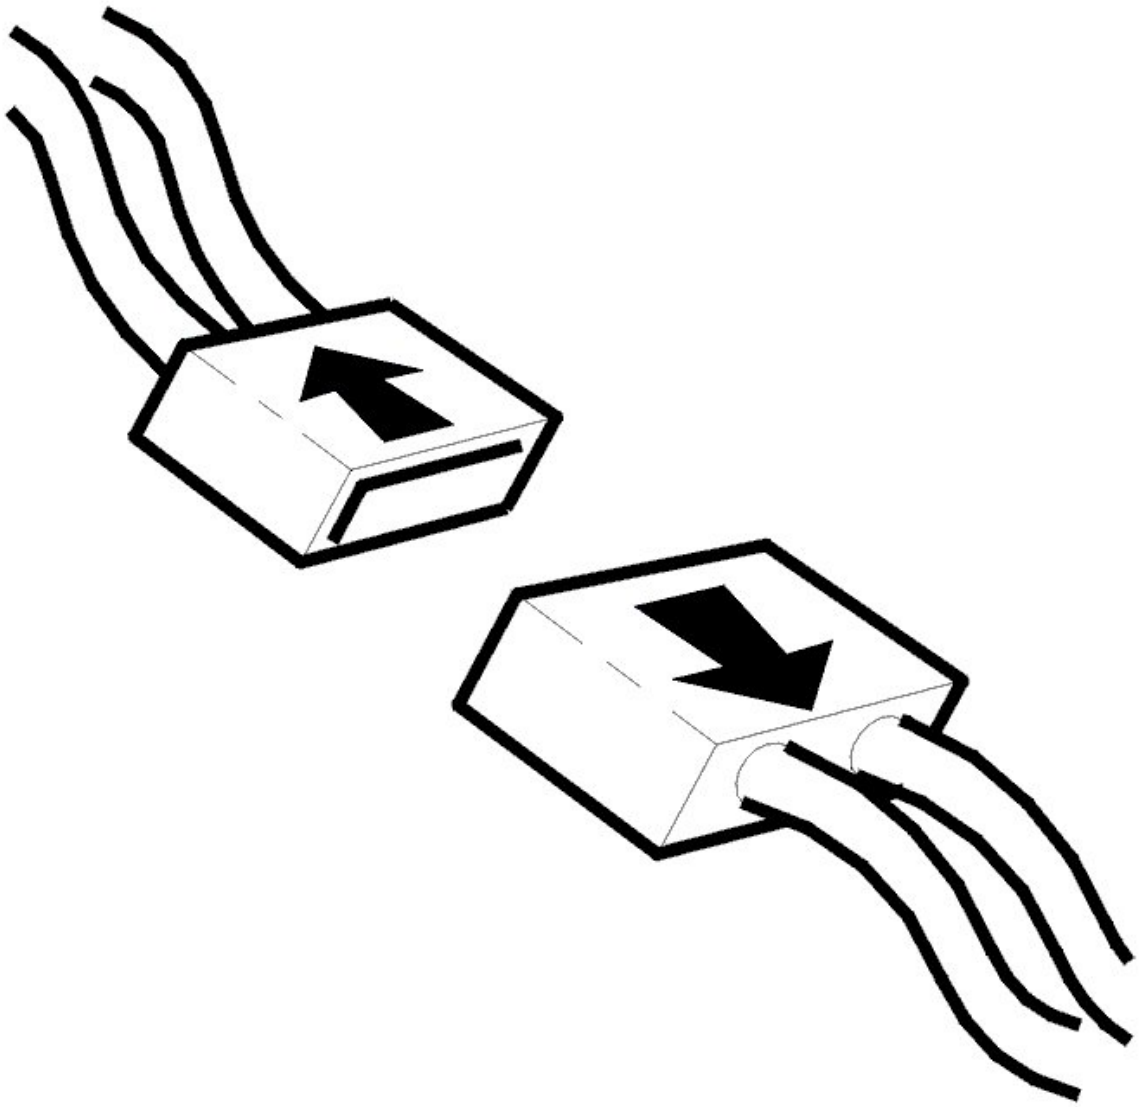
- SRS indicator lamp lit
- PAD lamp lit.

Communication Fault

Communication fault

Checking the component





- Switch off the ignition. Wait 10 seconds
- Disconnect the 10-pin connector from the occupant weight sensor (OWS)
- Disconnect the connector from the supplemental restraint system module (SRS).

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). There is a risk of static discharge which could damage the control modules.

Check the connectors for the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). Check for damage to pins and terminals in the connectors. Check for contact resistance.
Also check the other connectors that connect the communication cable between the supplemental restraint system module (SRS) and the occupant weight sensor (OWS).
Remedy as necessary.
Check the communication cable (LIN-bus) between the supplemental restraint system module (SRS) and the 10-pin connector for the occupant weight sensor (OWS). Check for an open-circuit.
Check the cable between supplemental restraint system module (SRS) terminal #57 and the 10-pin connector for occupant weight sensor (OWS) terminal #10.
Remedy as necessary.
Replace the pressure sensor and the occupant weight sensor module (OWS) if no fault is detected. The pressure sensor and occupant weight sensor (OWS) module are included in the occupant weight sensor (OWS) system.

Note! After replacing the pressure sensor and the occupant weight sensor (OWS) module in the occupant weight sensor (OWS) system, the supplemental restraint system module (SRS) must be configured. This is done by storing the ID number for the occupant weight sensor (OWS).The occupant weight sensor (OWS) must also be calibrated.

Diagnostic Trouble Code (DTC) Information

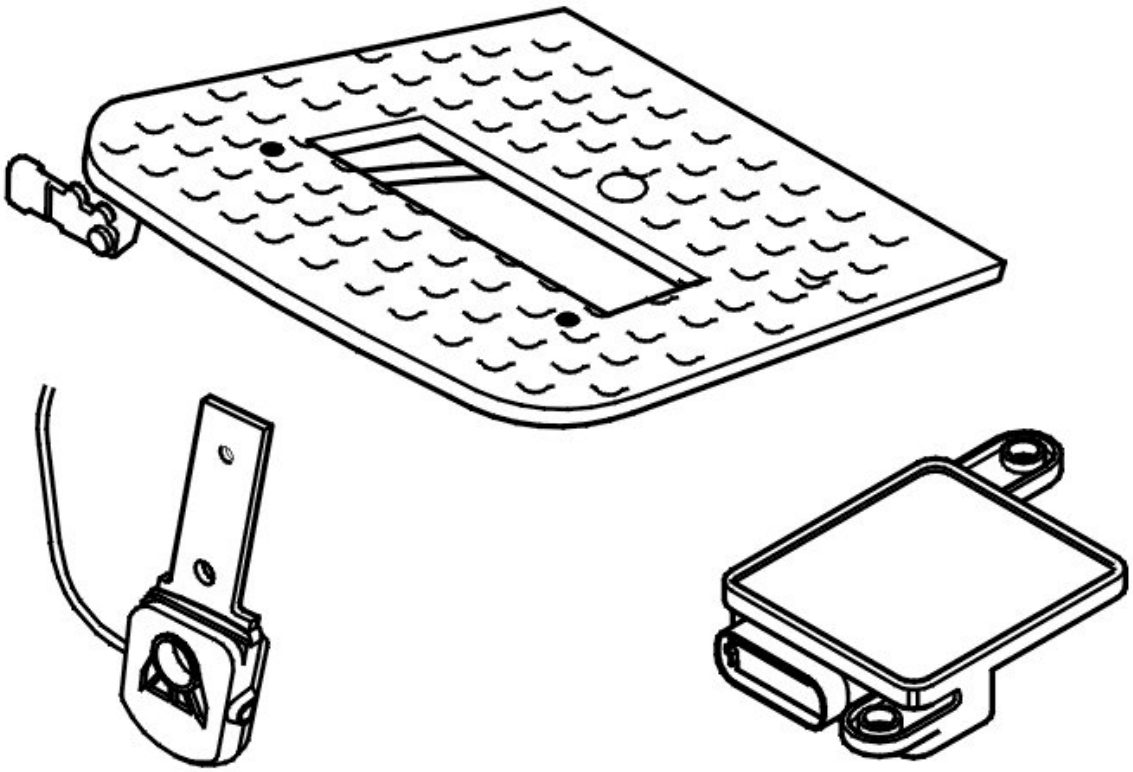
Diagnostic trouble code (DTC) information SRS-0258

Condition



The supplemental restraint system module (SRS) checks the signal from the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module registers a calibration fault.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- Passenger airbag is deactivated.

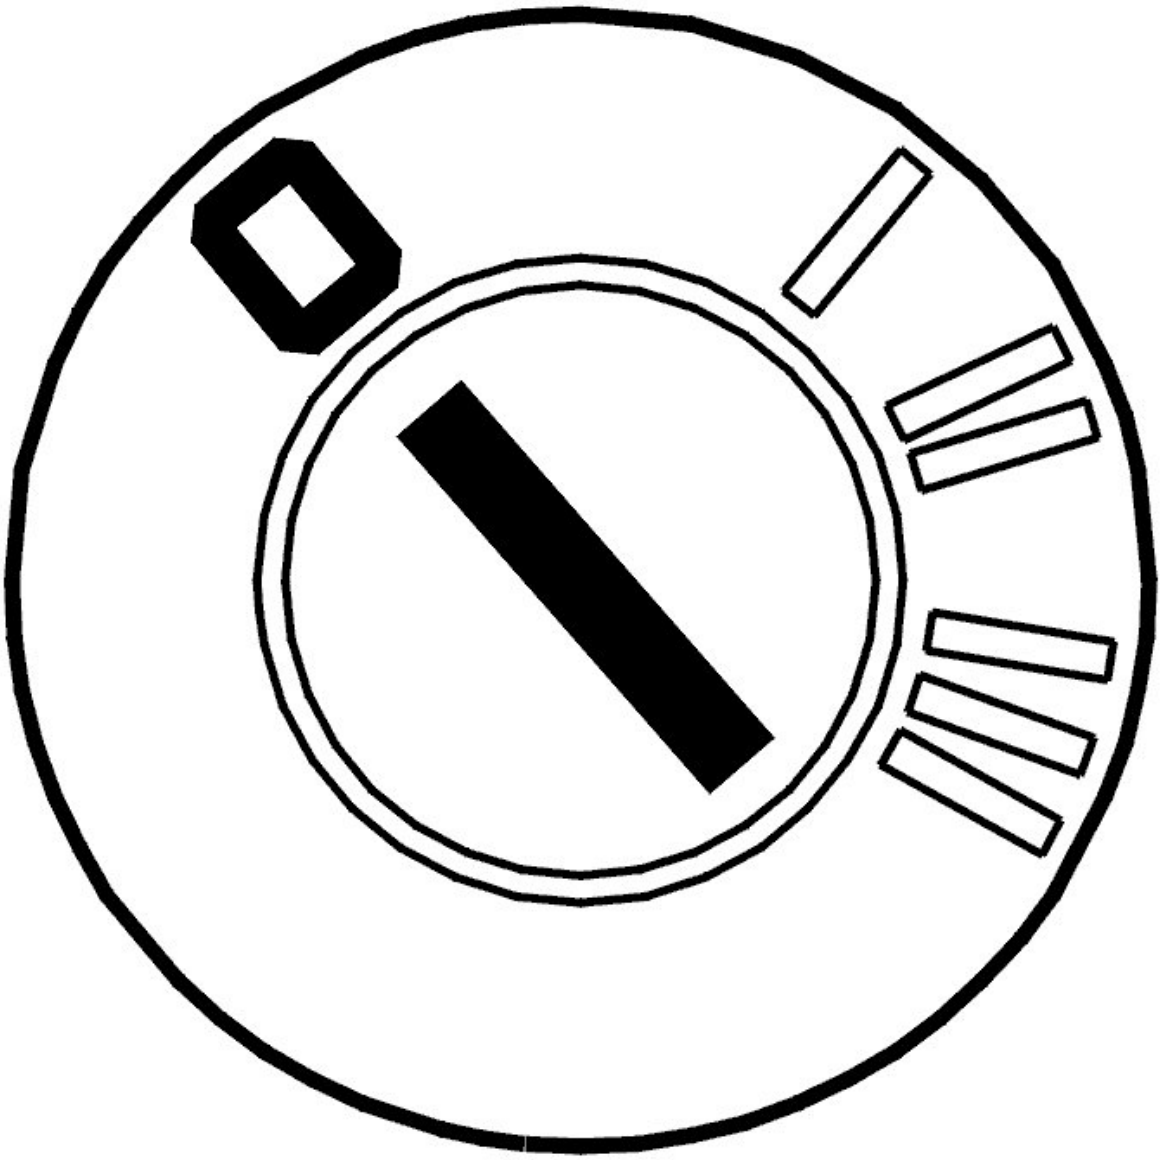
Possible source
- Incorrect calibration of the occupant weight sensor (OWS).

Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Calibration Fault

Calibration fault

Replacing the component



- Switch off the ignition. Wait 10 seconds

Caution! Avoid touching the terminal pins in the occupant weight sensor (OWS). There is a risk of static discharge which could damage the occupant weight sensor (OWS).

If this diagnostic trouble code (DTC) is generated after unsuccessful calibration of the occupant weight sensor (OWS):
- Recalibrate the occupant weight sensor (OWS).

If the diagnostic trouble code (DTC) was set at another point:
- Replace the pressure sensor and the occupant weight sensor (OWS) module. The pressure sensor and occupant weight sensor (OWS) module are included in the occupant weight sensor (OWS) system.

Note! After replacing the pressure sensor and the occupant weight sensor (OWS) module in the occupant weight sensor (OWS) system, the supplemental restraint system module (SRS) must be configured. This is done by storing the ID number for the occupant weight sensor (OWS).The occupant weight sensor (OWS) must also be calibrated.

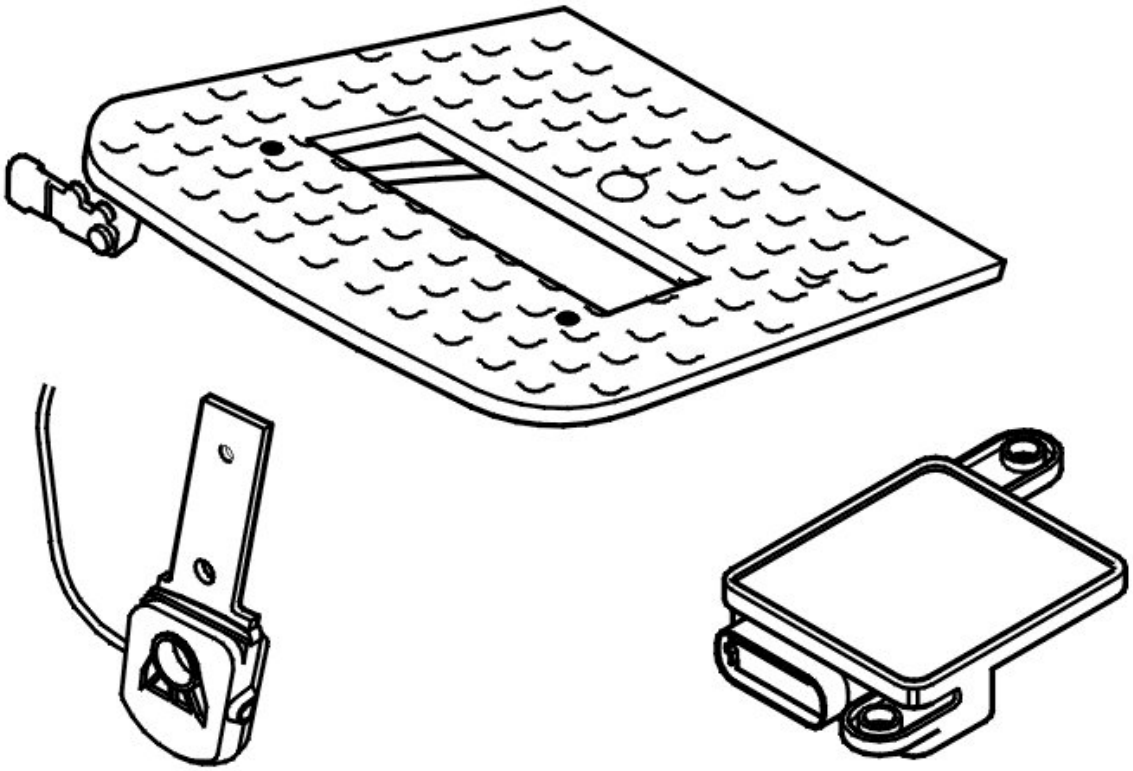
Select continue when the defect has been remedied.

Continue - Verification

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-0260

Condition



The supplemental restraint system module (SRS) checks the signal from the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module receives a message indicating that the voltage is too high in the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- Passenger airbag is deactivated.

Possible source
- Damaged occupant weight sensor (OWS).
- Short-circuit to supply voltage in the signal cable or in the connectors between the components in the occupant weight sensor (OWS).

Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Signal Too High

Signal too high

Checking the wiring and terminals
- Ignition off, wait for 10 seconds.
- Unplug the 10-pin connector from the occupant weight sensor (OWS).
- Unplug the 3-pin connector from the pressure sensor.

Caution! Avoid touching the contact pin of the occupant weight sensor (OWS). Risk of electrostatic discharge that may cause damage in occupant weight sensor (OWS).

Check the connectors between the pressure sensor and the occupant weight sensor (OWS) for damaged pins and connections.
Remedy as necessary.
Check the leads between pressure sensor and the occupant weight sensor (OWS) for short-circuiting to voltage/ground and open circuit.
Remedy as necessary.

Other information

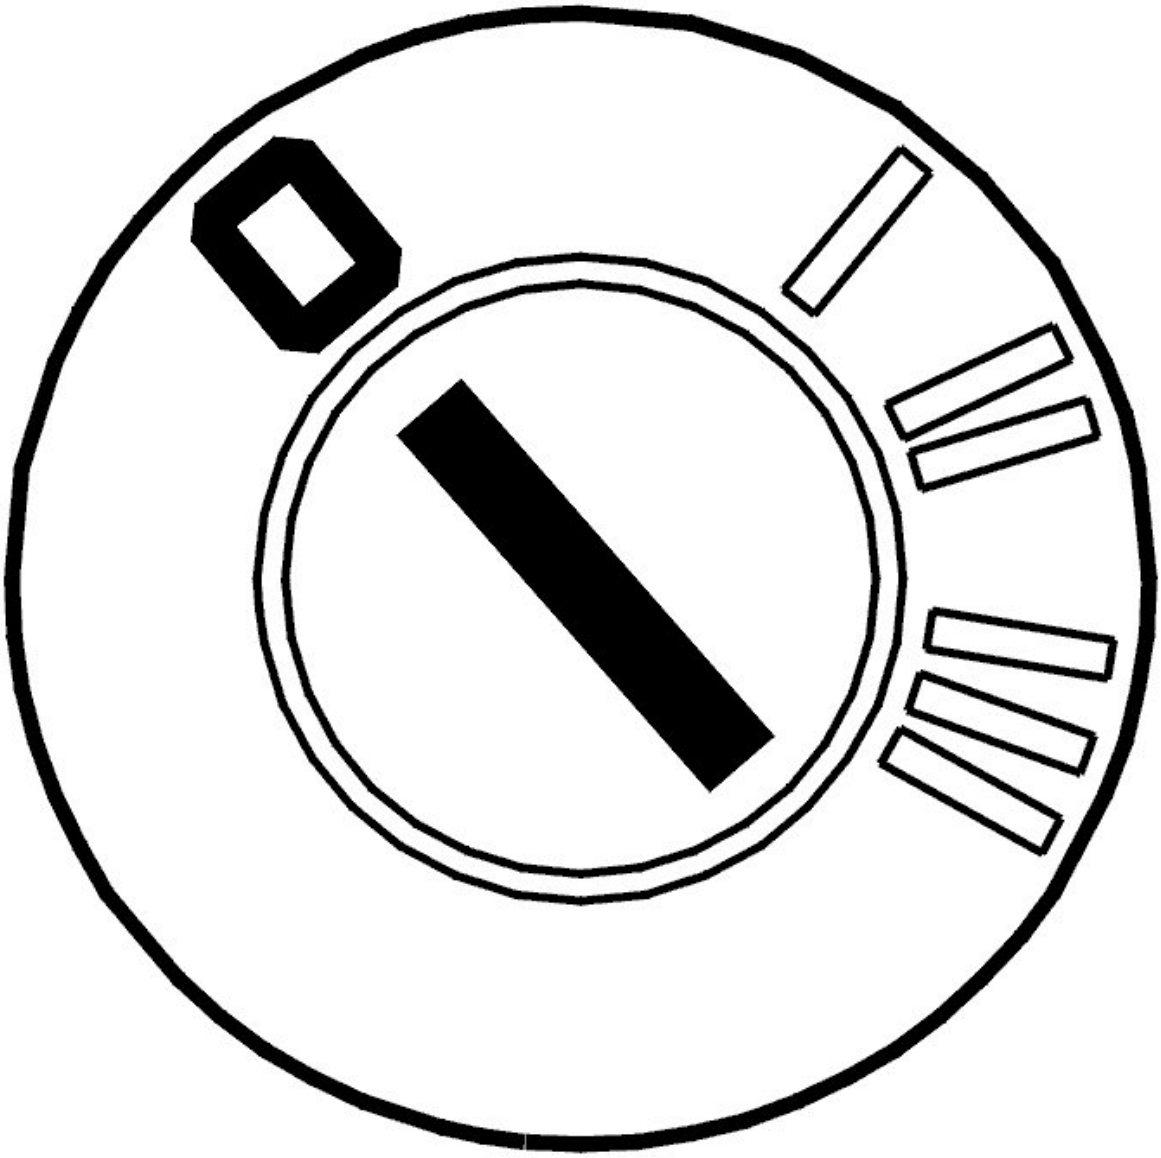
- For further information about cable routing and terminals, see the wiring diagram
- Signal specification See: Restraint Systems/Air Bag Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Occupant Weight Sensor (OWS)

Has the fault been remedied?

Yes - Verification

No - Replacing the component

Replacing the component



- Switch off the ignition. Wait 10 seconds.

Caution! Avoid touching the terminal pins in the occupant weight sensor (OWS). There is a risk of static discharge which could damage the occupant weight sensor (OWS).

Change pressure sensor and occupant weight sensor (OWS). Pressure sensor included in system occupant weight sensor (OWS).

Note! After change of pressure sensor and occupant weight sensor (OWS) then the supplemental restraint system module (SRS) must be configured. This is done by storing ID-number for occupant weight sensor (OWS).The occupant weight sensor (OWS) must also be

calibrated.

Other information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information SRS-DD00

Condition

The supplemental restraint system module (SRS) checks communication between the control module and the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module registers a communication fault.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- Passenger airbag is deactivated.

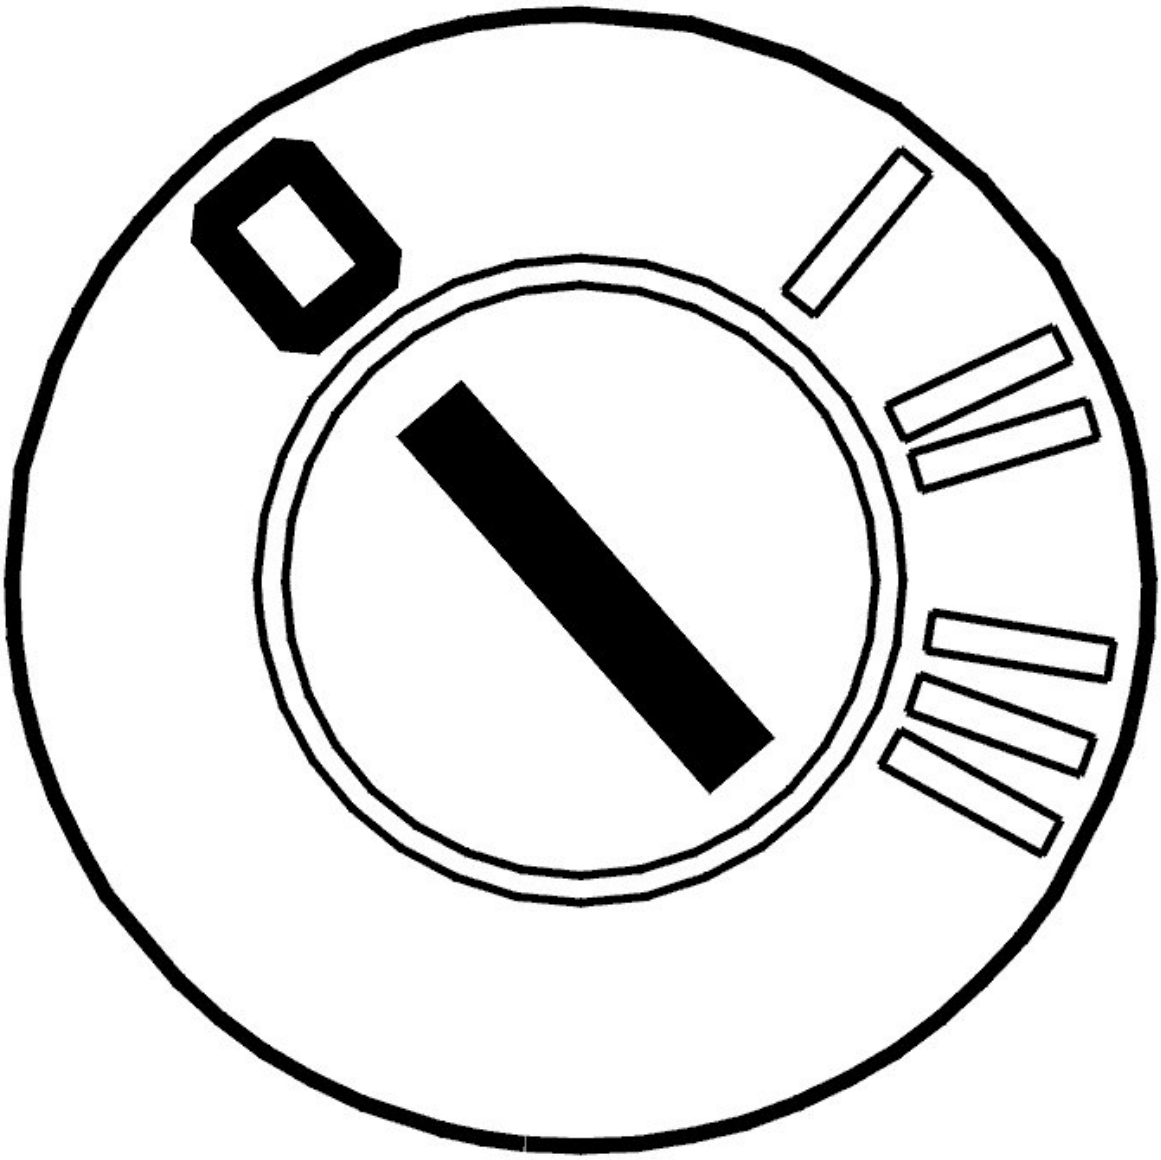
Possible source
- Damage to the signal cable (LIN-bus) or in the connectors between the supplemental restraint system module (SRS) and the occupant weight sensor (OWS)
- Damaged occupant weight sensor (OWS).

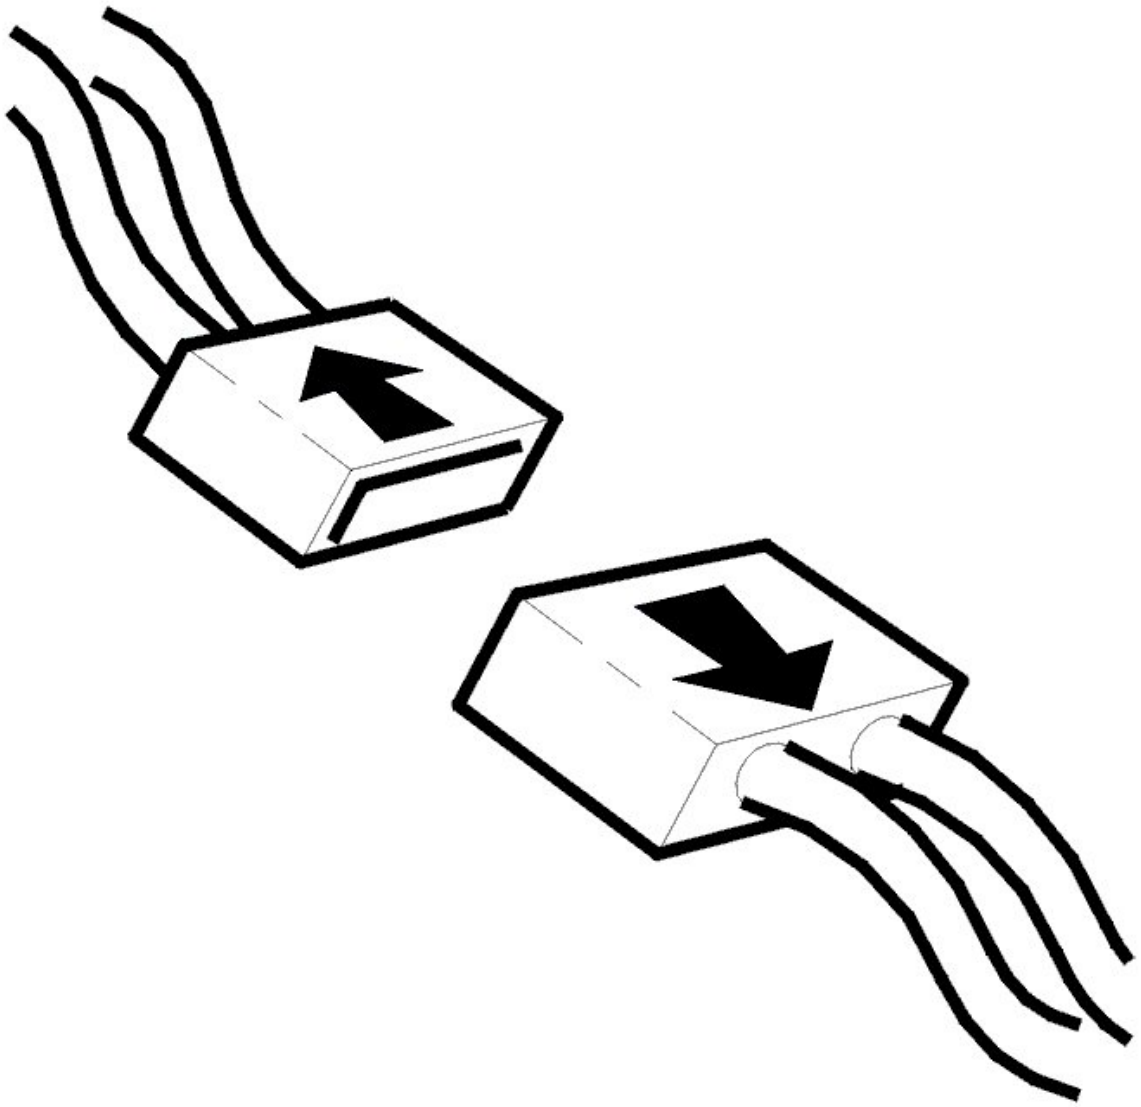
Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Faulty Communication

Faulty communication

Checking the component





- Switch off the ignition. Wait 10 seconds
- Disconnect the 10-pin connector from the occupant weight sensor (OWS)
- Disconnect the connector from the supplemental restraint system module (SRS).

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). There is a risk of static discharge which could damage the control modules.

Check the connectors for the supplemental restraint system module (SRS) and the occupant weight sensor (OWS). Check for damage to pins and terminals in the connectors. Check for contact resistance.
Also check the other connectors that connect the communication cable between the supplemental restraint system module (SRS) and the occupant weight sensor (OWS).
Remedy as necessary.
Check the communication cable (LIN-bus) between the supplemental restraint system module (SRS) and the 10-pin connector for the occupant weight sensor (OWS). Check for an open-circuit.
Check the cable between supplemental restraint system module (SRS) terminal #57 and the 10-pin connector for occupant weight sensor (OWS) terminal #10.
Remedy as necessary.
If no fault is found, replace the supplemental restraint system module (SRS).
Remedy as necessary.
Replace the pressure sensor and the occupant weight sensor module (OWS) if a fault is still not detected. The pressure sensor and occupant weight sensor (OWS) module are included in the occupant weight sensor (OWS) system.

Note! After replacing the pressure sensor and the occupant weight sensor (OWS) module in the occupant weight sensor (OWS) system, the supplemental restraint system module (SRS) must be configured. This is done by storing the ID number for the occupant weight sensor (OWS).The occupant weight sensor (OWS) must also be calibrated.

Diagnostic trouble code (DTC) information SRS-DD10

Condition

The supplemental restraint system module (SRS) checks communication between the control module and the occupant weight sensor (OWS).
The diagnostic trouble code (DTC) is stored if the control module registers a communication fault.
The diagnostic trouble code (DTC) can be diagnosed in ignition positions I, II and III.

Substitute value
- Passenger airbag is deactivated.

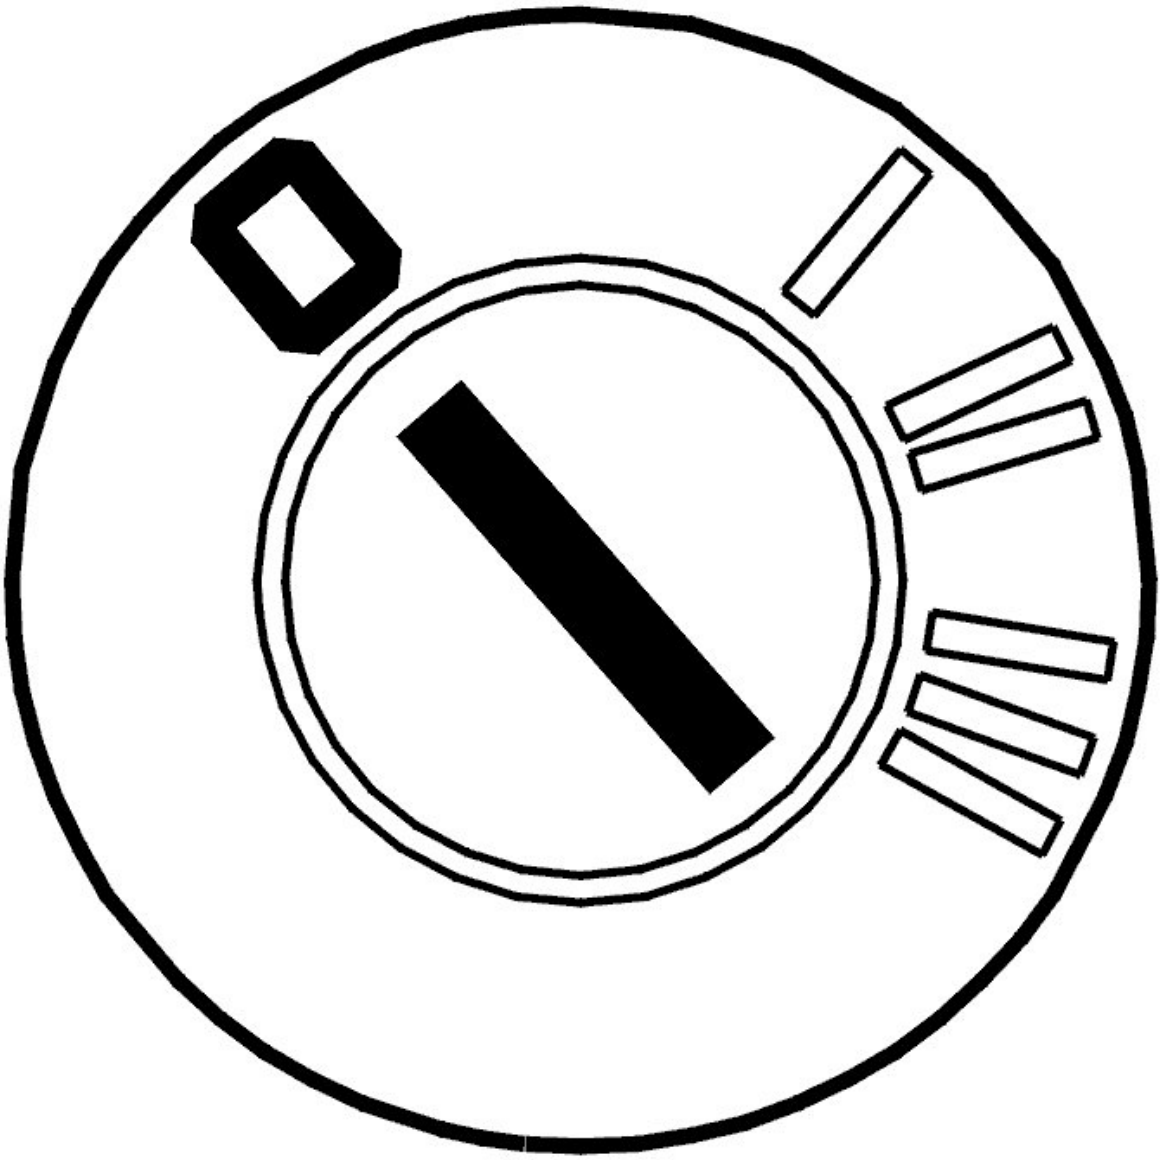
Possible source
- Open-circuit in the signal cable (LIN-bus) or in the connectors between the supplemental restraint system module (SRS) and the occupant weight sensor (OWS).

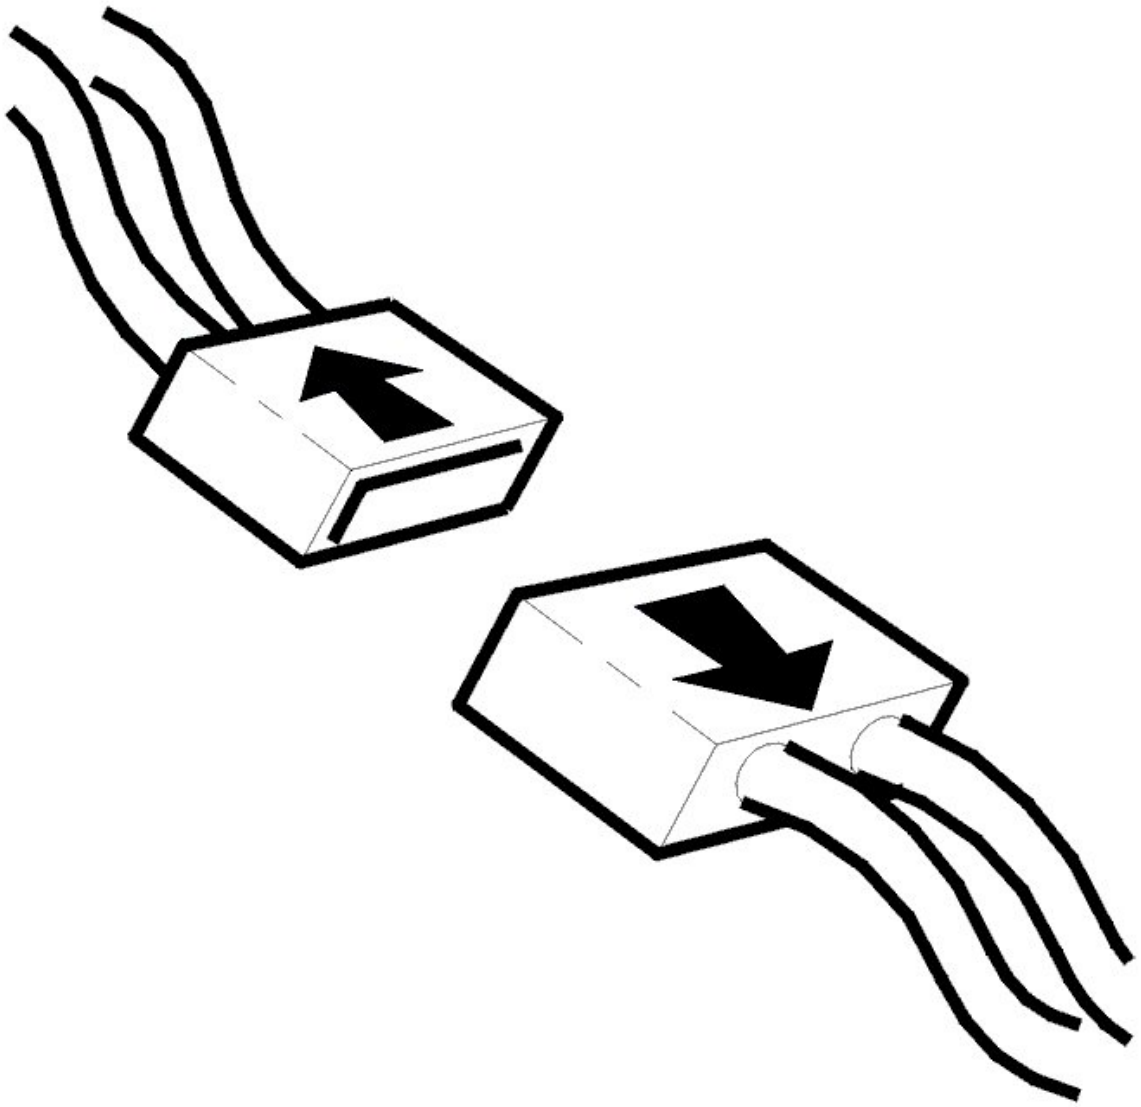
Fault symptom[s]
- SRS indicator lamp lit
- PAD lamp lit.

Faulty Communication

Faulty communication

Checking the component





- Switch off the ignition. Wait 10 seconds
- Disconnect the 10-pin connector from the occupant weight sensor (OWS)
- Disconnect connector A from the central electronic module (CEM).

Caution! Do not touch the terminal pins in the supplemental restraint system module (SRS), the central electronic module (CEM) and the occupant weight sensor (OWS). There is a risk of static discharge which could damage the control modules.

Check the connectors for the central electronic module (CEM) and the occupant weight sensor (OWS). Check for damage to pins and terminals in the connectors. Check for contact resistance.
Also check the other connectors that connect the power supply cable between the central electronic module (CEM) and the occupant weight sensor (OWS).
Remedy as necessary.
Check the power supply cable between the central electronic module (CEM) and the connector for the occupant weight sensor (OWS). Check for an open-circuit. Check the fuse.
Check the cable between:

- Central electronic module (CEM) terminal #A10 and the 10-pin connector for occupant weight sensor (OWS) terminal #2.

Remedy as necessary.
Check the ground connection for the occupant weight sensor (OWS). Check for an open-circuit. Check for contact resistance.
Check the cable between the 10-pin connector for the occupant weight sensor (OWS) terminal #9 and the ground terminal.
Remedy as necessary.
Disconnect the connector from the supplemental restraint system module (SRS). Check the communication cable (LIN-bus) between the supplemental restraint system module (SRS) and the 10-pin connector for the occupant weight sensor (OWS). Check for an open-circuit.
Check the cable between:

- Supplemental restraint system module (SRS) terminal #57 and the 10-pin connector for occupant weight sensor (OWS) terminal #10.

Remedy as necessary.
Replace the pressure sensor and the occupant weight sensor module (OWS) if no fault is detected. The pressure sensor and occupant weight sensor (OWS) module are included in the occupant weight sensor (OWS) system.

Note! After replacing the pressure sensor and the occupant weight sensor (OWS) module in the occupant weight sensor (OWS) system, the supplemental restraint system module (SRS) must be configured. This is done by storing the ID number for the occupant weight sensor

(OWS).**The occupant weight sensor (OWS) must also be calibrated.**

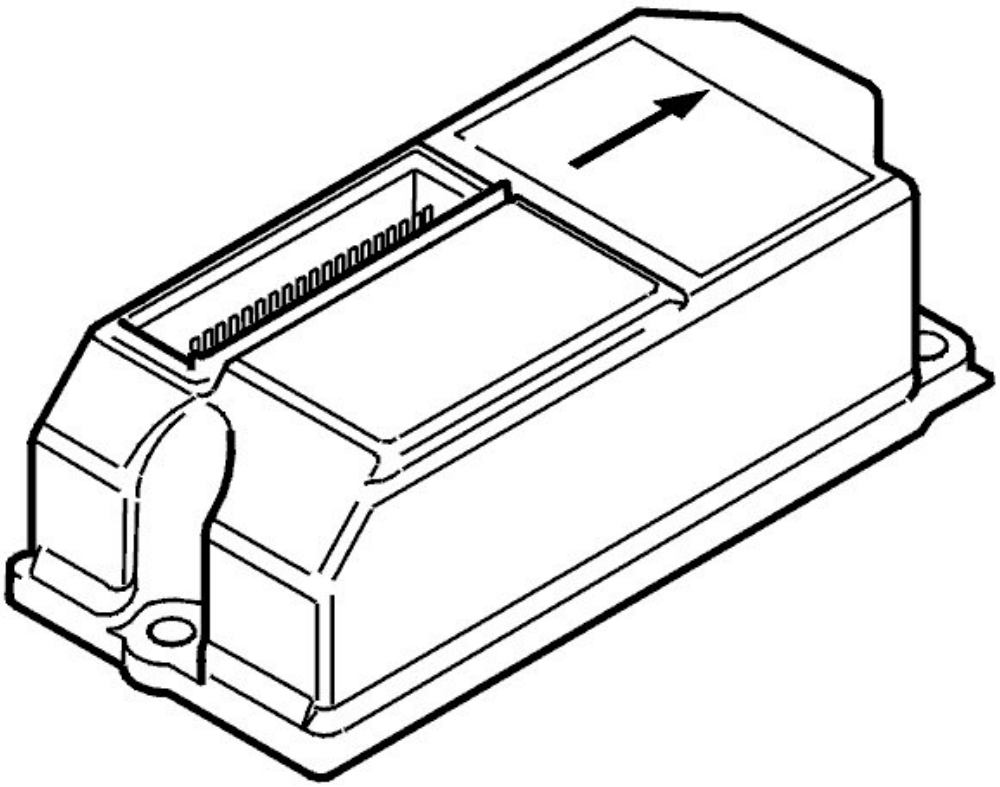
SRS-E001

Diagnostic trouble code (DTC) information SRS-E001

Condition



The control modules transmit and receive information via a standardized serial communication method - CAN (Controller Area Network). The diagnostic trouble code (DTC) is stored if the control module registers serious interference (CAN communication blocked).

Note! In the event of system communication problems, it is not possible to communicate with the control module. Therefore it will only be possible to read off the fault if it is intermittent.

Substitute value

- The control module shuts itself off ("bus-off").

  Hint: The control module will remain shut off until the power supply is broken (15, 30, X). When the power supply is connected the control module will make a new attempt to communicate.

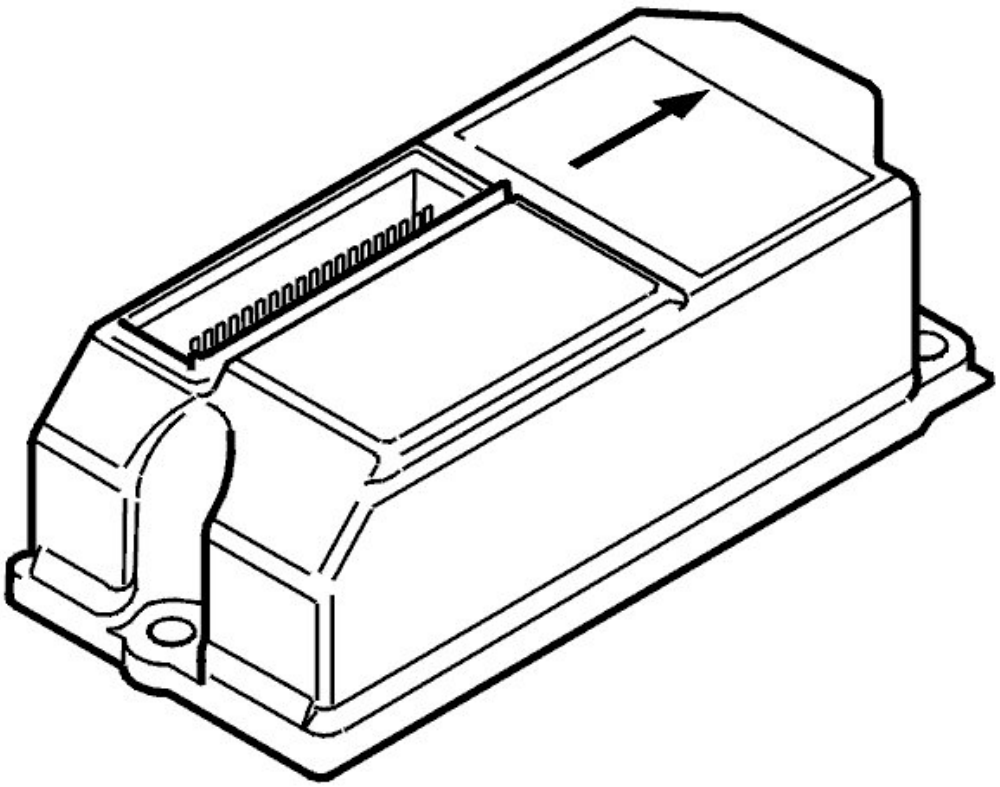
Possible source
- Short-circuit between the control area network (CAN) wiring
- Open-circuit in the control area network (CAN) wiring
- Internal fault in the control module
- Internal fault in another control module in the same part of the control area network (CAN).

Fault symptom[s]
- The SRS indicator lamp is lit.

SRS-E003

Diagnostic trouble code (DTC) information SRS-E003

Condition



The control module compares its configuration ID with the signal configuration transmitted on the control area network (CAN) by the central electronic module (CEM). If the configuration IDs do not correspond the fault code is stored. The diagnostic trouble code (DTC) is also stored if the communication between the control module and the central electronic module (CEM) is interrupted.

Note! In the event of open-circuit in both the control area network (CAN) cables, it is not possible to communicate with the control module. Therefore it will only be possible to read off the diagnostic trouble code (DTC) if this type of fault is intermittent. When the diagnostic trouble code (DTC) is stored, the control module responds to the diagnostic command, however normal control area network (CAN) communication does not work. ("Expulsion mode")

Substitute value
- None.

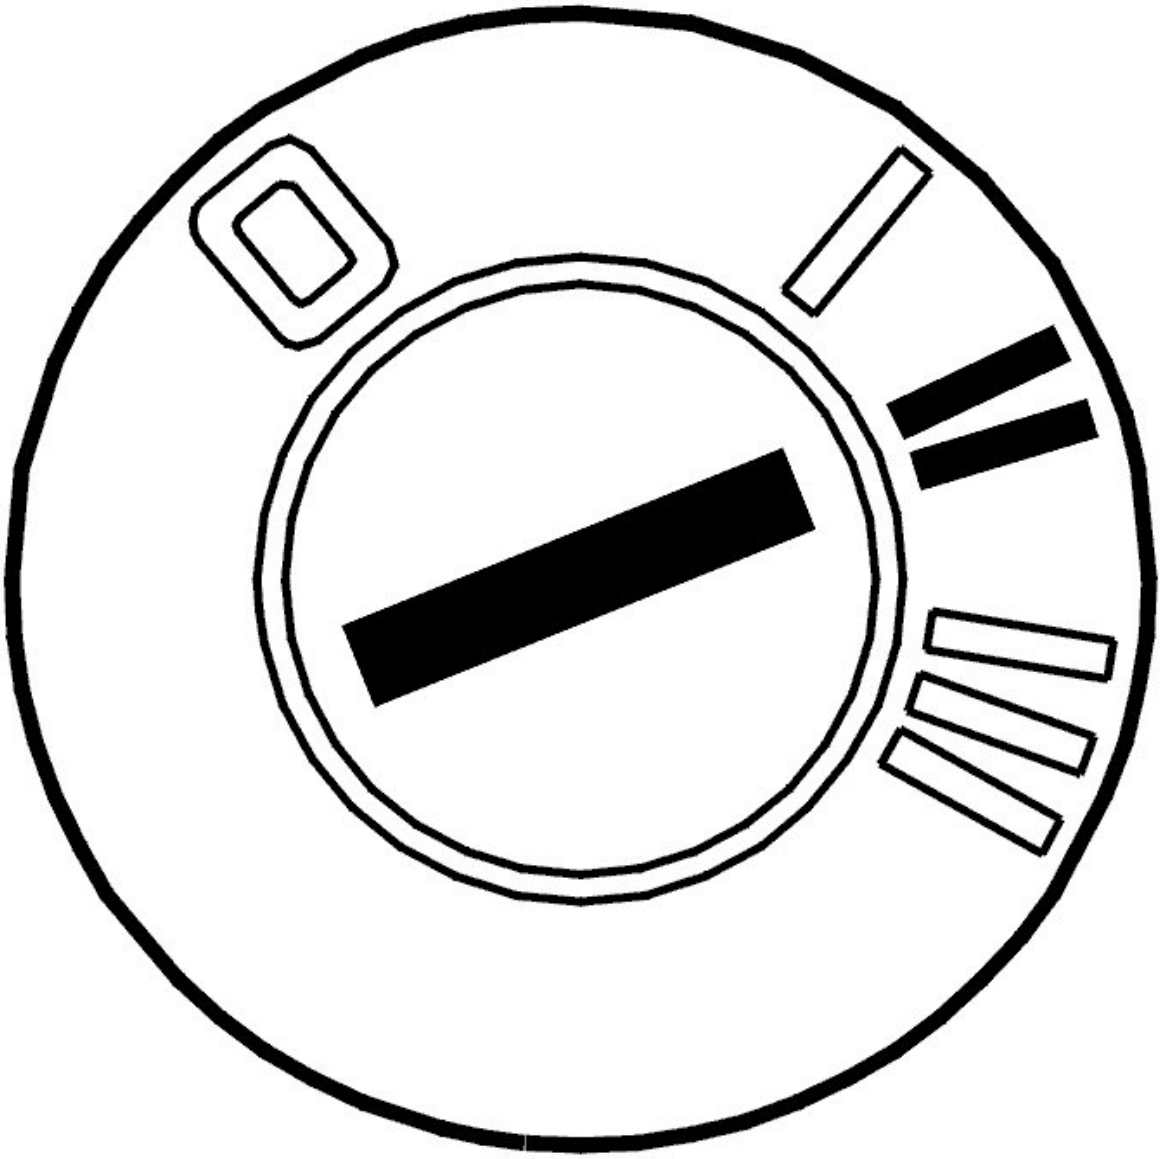
Possible source
- Faulty control area network (CAN) configuration ID. (The node is not intended for this car, for example a used control module with different software/hardware.)
- Open-circuit in the control area network (CAN) wiring between the control module and the central electrical module (CEM).

Fault symptom[s]
- The SRS indicator lamp is lit.

SRS-XXXX

Unknown diagnostic trouble code (DTC) for the current control module version

Reading off diagnostic trouble codes (DTCs)



- Ignition on.

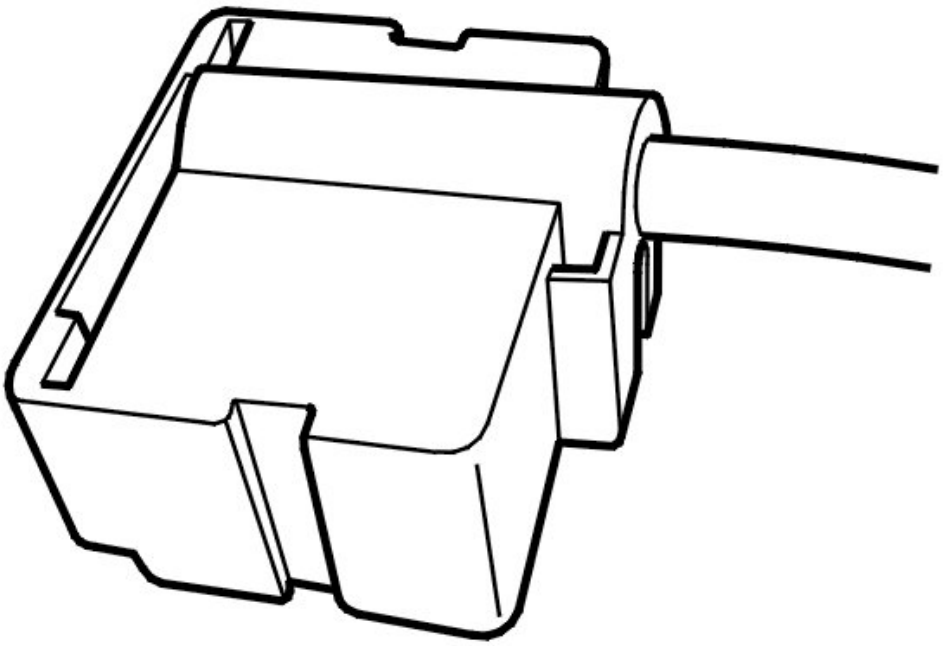
Read off the diagnostic trouble code (DTC) that is stored in the car.
Make a note of the code. Report the code to VIDA customer support.

Continue - DONE

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The Suspension Module (SUM) receives information about the vertical movement of the front wheels from the acceleration sensors on the shock absorbers. Diagnostic trouble code (DTC) SUM-0011 or SUM-0021 is stored if the control module registers that the signal from one of the acceleration sensors is too low when the ignition is switched on.

- SUM-0011: Left front acceleration sensor
- SUM-0021: Right front acceleration sensor.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to ground in the signal cable from the acceleration sensor
- Open-circuit or short-circuit to ground in the power supply to the acceleration sensor
- Contact resistance in the terminals
- Defective acceleration sensor.

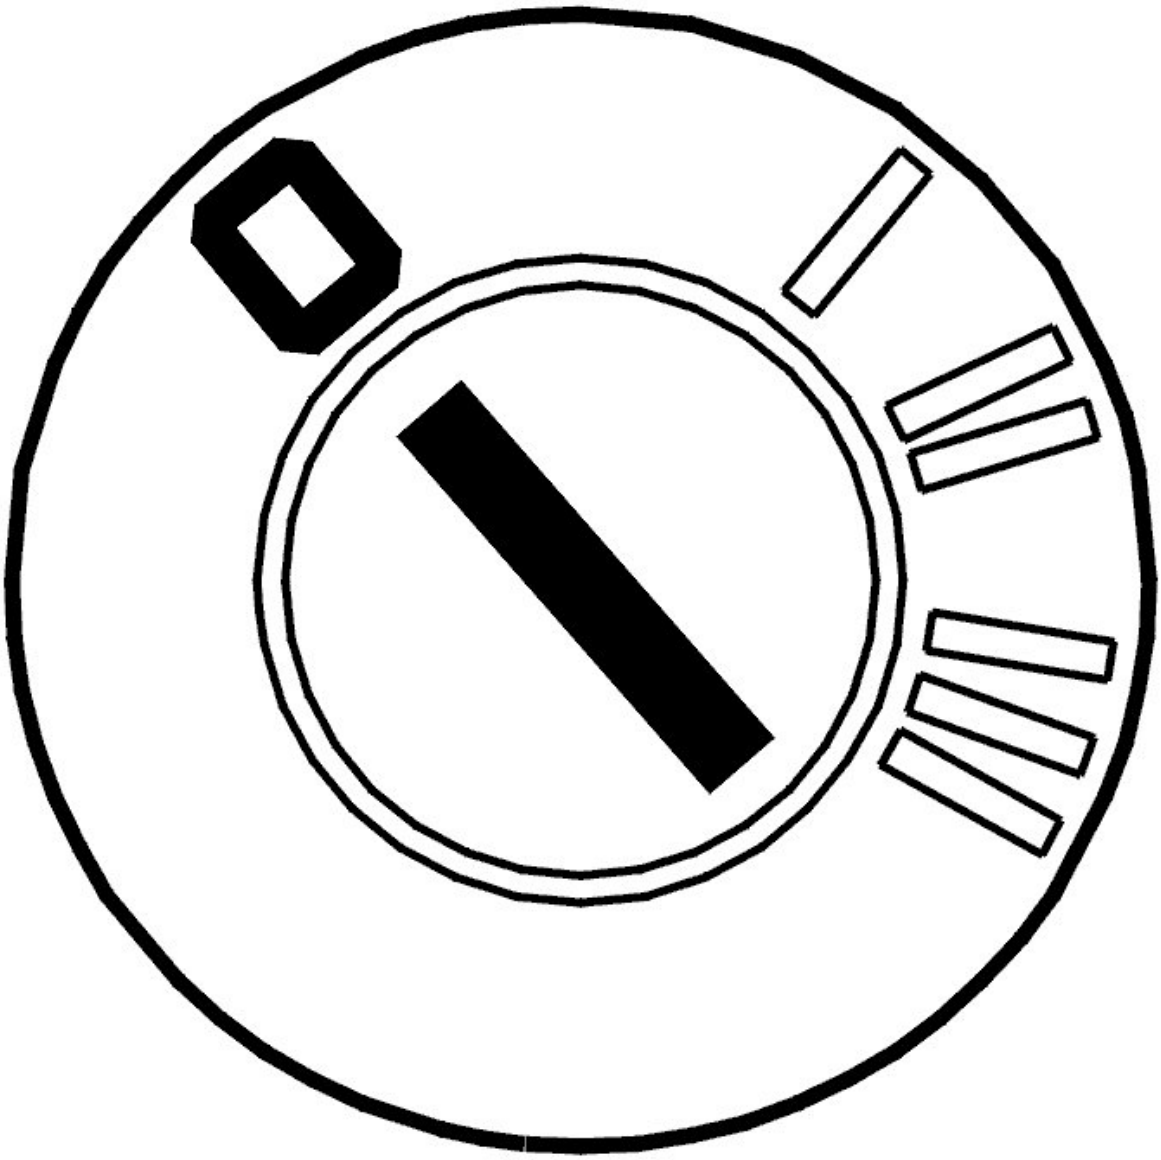
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too Low

Signal too low

Checking components and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the position sensor. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0011, front left acceleration sensor:

- Check the signal cable between control module terminal #A12 and acceleration sensor terminal #2. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A13 and acceleration sensor terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

For diagnostic trouble code (DTC) SUM-0021, front right acceleration sensor:

- Check the signal cable between control module terminal #A27 and acceleration sensor terminal #2. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A13 and acceleration sensor terminal #1. Check for an open-circuit. Check for a short-circuit to ground.

Hint: Click on the VCT2000 symbol to check the signal from the acceleration sensors.

Try a new acceleration sensor if no fault is found in the wiring.
Remedy as necessary.

Other information:

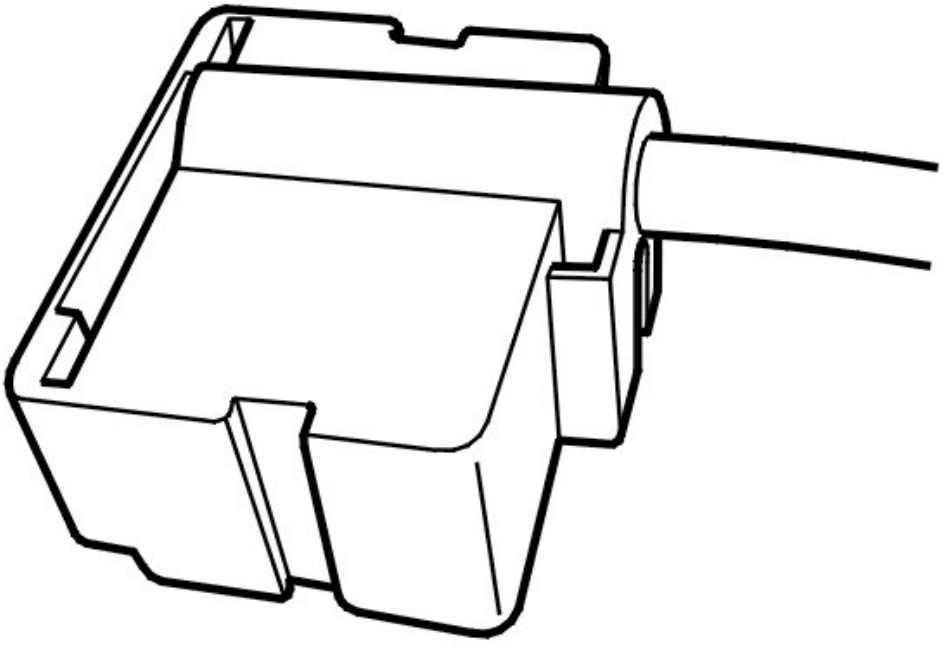
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The Suspension Module (SUM) receives information about the vertical movement of the front wheels from the acceleration sensors on the shock absorbers. Diagnostic trouble code (DTC) SUM-0012 or SUM-0022 is stored if the control module registers that the signal from one of the acceleration sensors is too high when the ignition is switched on.

- SUM-0012: Left front acceleration sensor
- SUM-0022: Right front acceleration sensor.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and

Suspension/Suspension/Description and Operation.

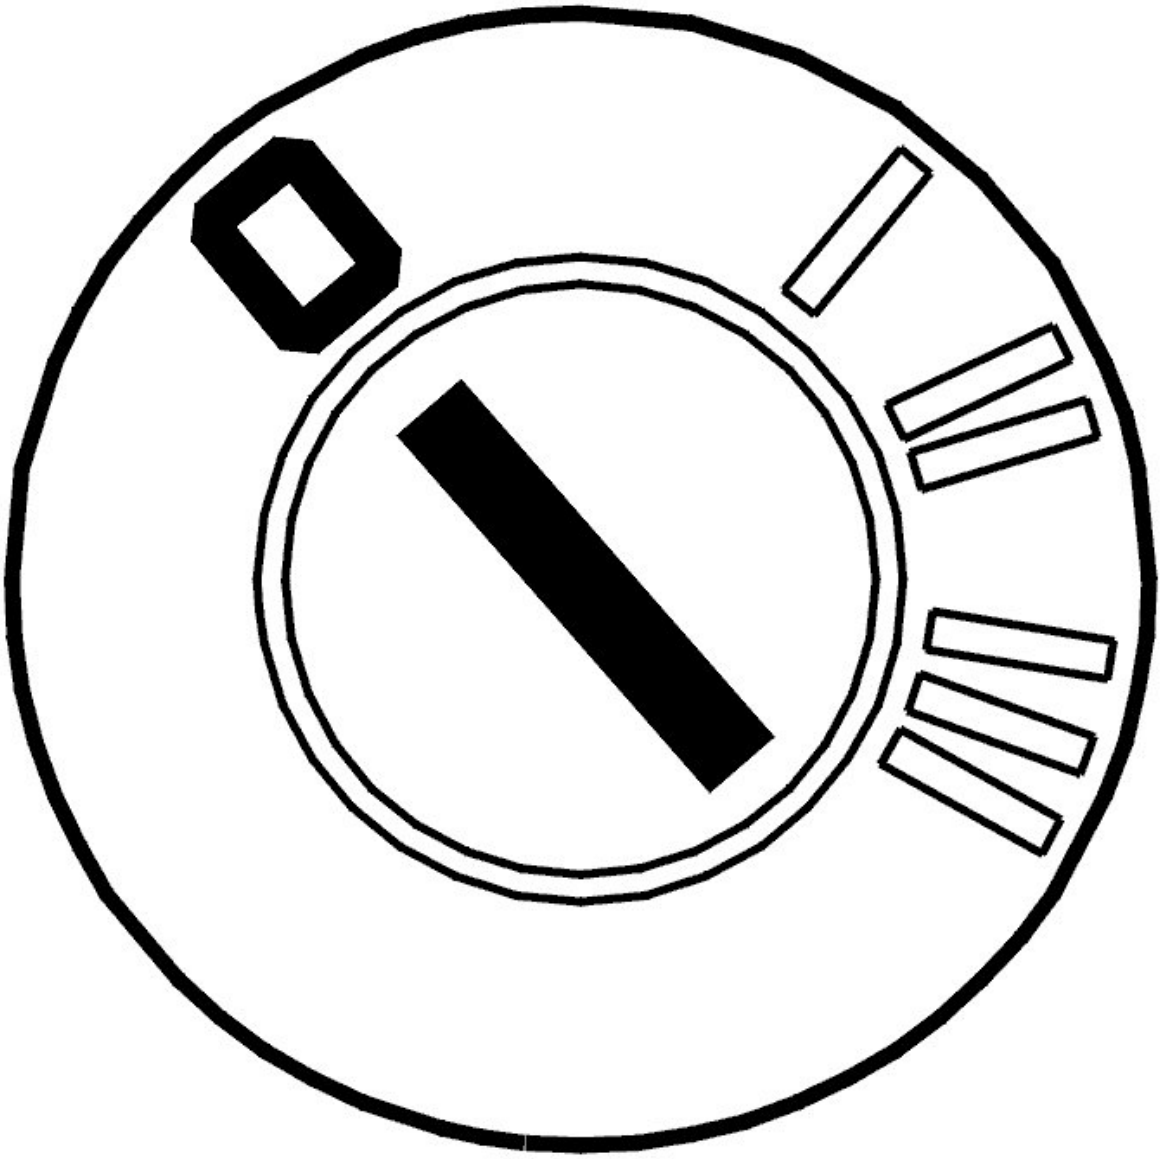
Possible source
- Short-circuit to supply voltage in the signal cable
- Defective acceleration sensor.

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too High

Signal too high

Checking the component and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the position sensor. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0012, front left acceleration sensor
- Check the signal cable between Suspension module (SUM) #A12 and acceleration sensor #2 for short-circuiting to voltage.

For diagnostic trouble code (DTC) SUM-0022, front right acceleration sensor
- Check the signal cable between Suspension module (SUM) #A27 and acceleration sensor #2 for short-circuiting to voltage.

Hint: Click on the VCT2000 symbol to check the signal from the acceleration sensors.

Try a new acceleration sensor if no fault is found in the wiring.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information about the vertical position of the rear wheels from the position sensors mounted on a bracket in the body. Diagnostic trouble code (DTC) SUM-0031 or SUM-0041 is stored if the control module registers that the signal from one of the position sensors is too low when the ignition is switched on.

- SUM-0031: Left rear position sensor
- SUM-0041: Right rear position sensor.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to ground in the signal cable from the position sensor
- Open-circuit or short-circuit to ground in the power supply to the position sensor
- Contact resistance in the terminals
- Defective position sensor.

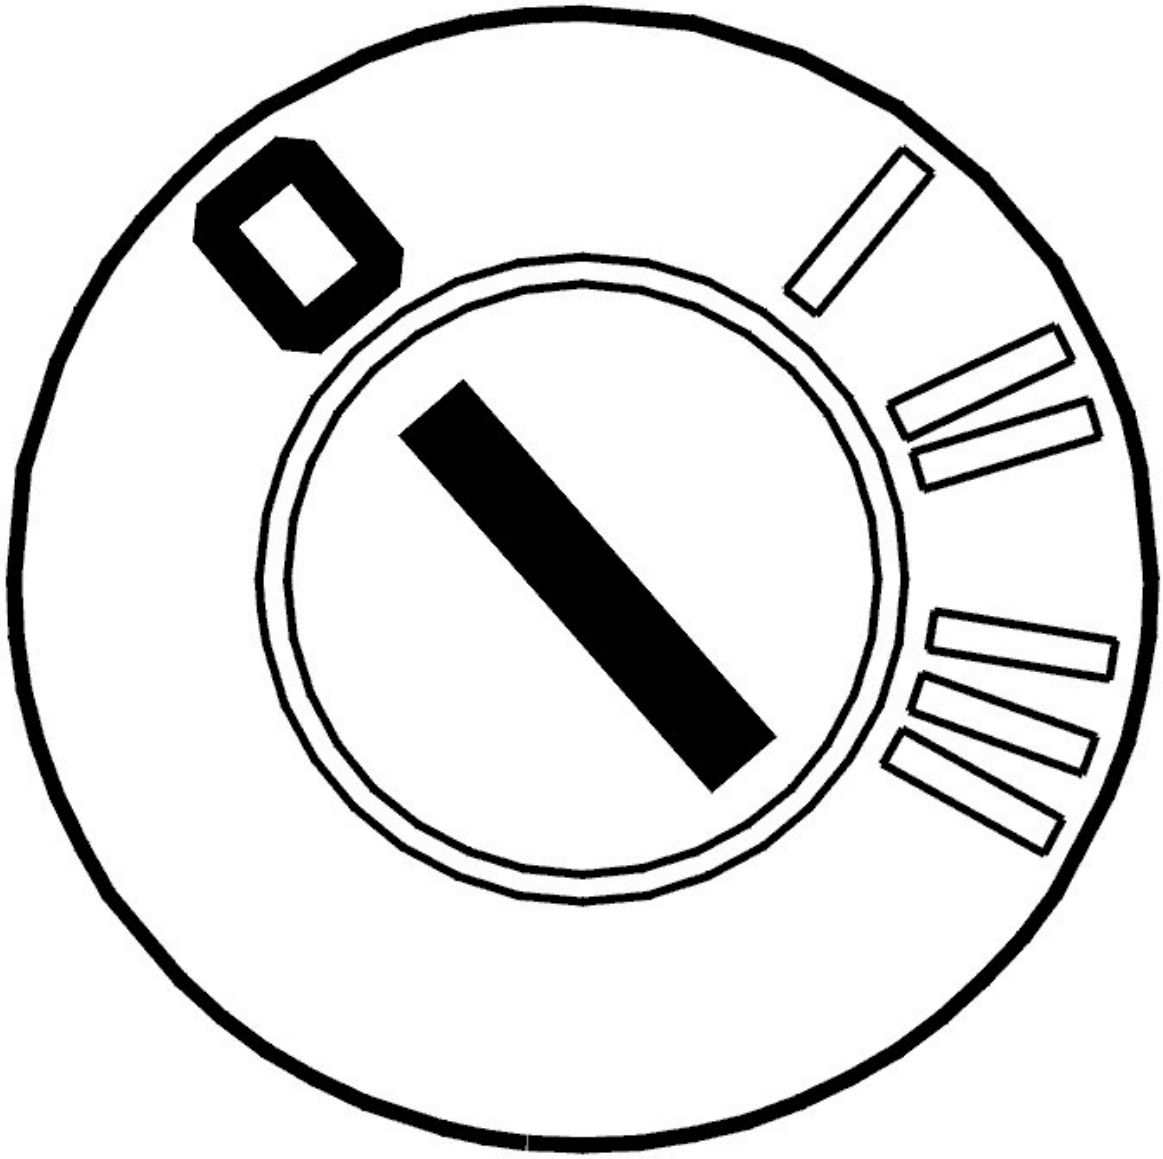
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too Low

Signal too low

Checking components and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the position sensor. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0031, rear left position sensor:

- Check the signal cable between control module terminal #A28 and position sensor terminal #4. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A25 and position sensor terminal #5. Check for an open-circuit. Check for a short-circuit to ground.

For diagnostic trouble code (DTC) SUM-0041, rear right position sensor:

- Check the signal cable between control module terminal #A14 and position sensor terminal #4. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A13 and position sensor terminal #5. Check for an open-circuit. Check for a short-circuit to ground.

Hint: Click on the VCT2000 symbol to check the signal from the position sensors.

Try a new position sensor if no fault is found in the wiring.
Remedy as necessary.

Other information:

- To access or replace the position sensor, see Position sensor suspension rear (Four-C), replacing See: Sensors and Switches/Sensors and Switches - Steering and Suspension/Sensors and Switches - Suspension/Ride Height Sensor/Service and Repair
- For information about components, see Component specifications See: Specifications/Electrical Specifications/Suspension Control (Automatic - Electronic Level)
- To connect the breakout box, see Connecting the breakout box See: Steering and Suspension/Suspension/Suspension Control (Automatic - Electronic Level)/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Suspension Module

(SUM)

- For information about signals, see Signal specification See: Steering and Suspension/Suspension/Suspension Control (Automatic - Electronic Level)/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Suspension Module (SUM)
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information about the vertical movement of the car body from three acceleration sensors mounted at the corners of the car body. Diagnostic trouble code (DTC) SUM-0053, SUM-0063 or SUM-0073 is stored if the control module registers that there is no signal from one of the acceleration sensors when the ignition is switched on.

- SUM-0053: Left front bodywork acceleration sensor
- SUM-0063: Right front bodywork acceleration sensor
- SUM-0073: Left rear bodywork acceleration sensor.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Open-circuit in the ground lead
- Open-circuit in the signal cable
- Short-circuit between the signal cable and the power supply cable
- Contact resistance in the terminals
- Defective acceleration sensor.

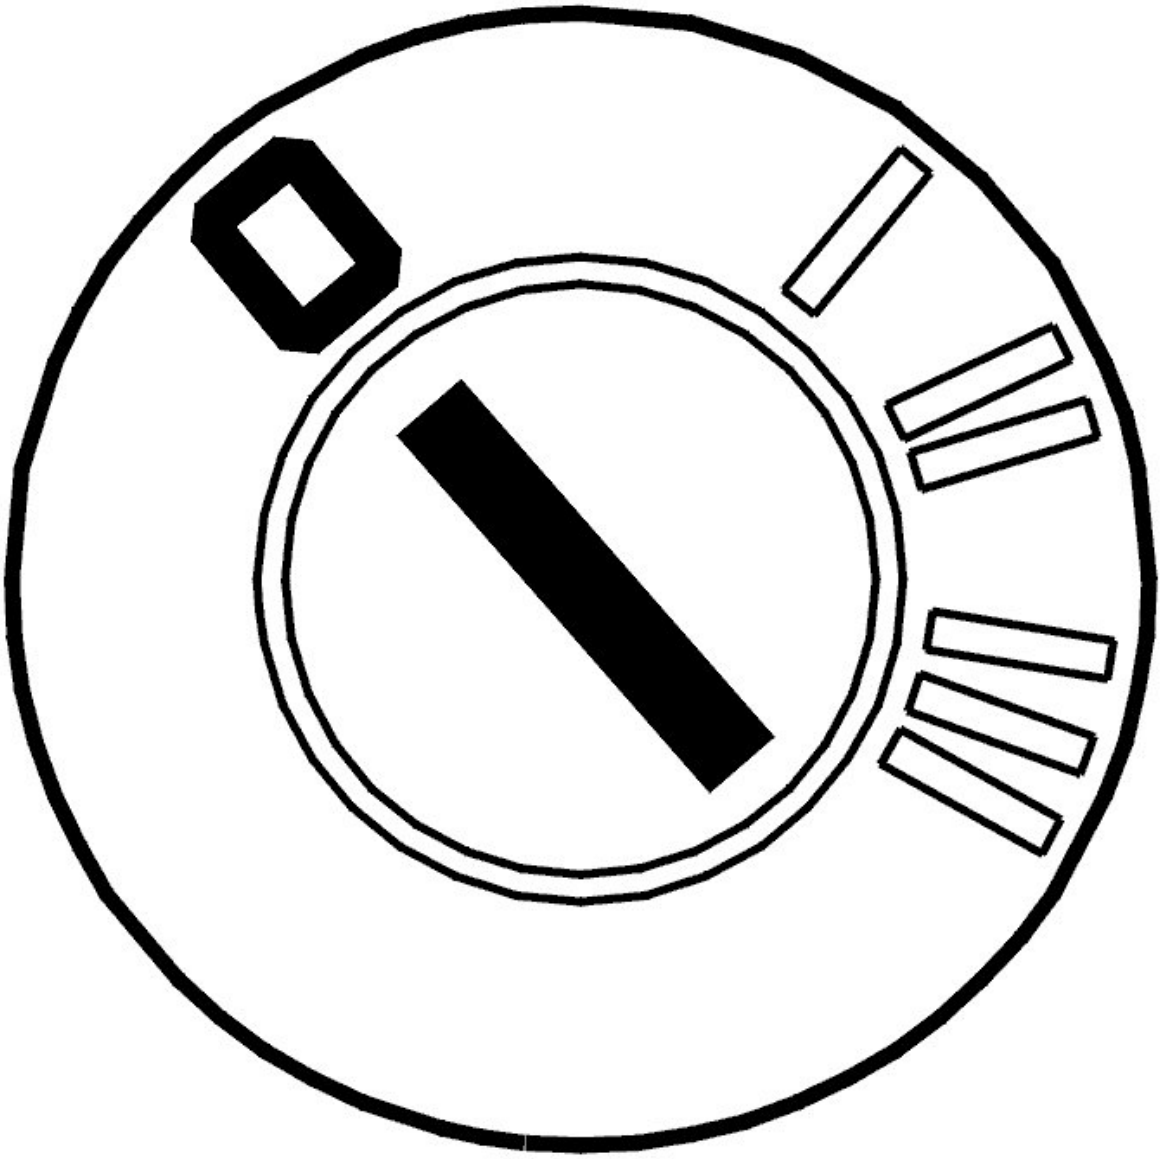
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Missing

Signal missing

Checking components and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the acceleration sensor. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0053, front left bodywork acceleration sensor:

- Check the signal cable between control module terminal #A10 and acceleration sensor terminal #1. Check for an open-circuit or a short-circuit to the power supply cable
- Check the ground lead between control module terminal #A19 and acceleration sensor terminal #2. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0063, front right bodywork acceleration sensor:

- Check the signal cable between control module terminal #A22 and acceleration sensor terminal #1. Check for an open-circuit or a short-circuit to the power supply cable
- Check the ground lead between control module terminal #A19 and acceleration sensor terminal #2. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0073, rear left bodywork acceleration sensor:

- Check the signal cable between control module terminal #A28 and acceleration sensor terminal #1. Check for an open-circuit or a short-circuit to the power supply cable
- Check the ground lead between control module terminal #A19 and acceleration sensor terminal #2. Check for an open-circuit.

Hint: Click on the VCT2000 symbol to check the signal from the acceleration sensors.

Try a new acceleration sensor if no fault is found in the wiring.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The acceleration and position sensors for the right-hand rear suspension have a common power supply internally in the control module. Diagnostic trouble code (DTC) SUM-0081 is stored if the Suspension Module detects that the power supply to one of the sensors is too low. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0081: The acceleration sensors for the front suspension, the position sensor for the right-hand rear suspension and the acceleration sensors on the car body.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to ground in the power supply to one of the sensors
- Contact resistance in the terminals
- Defective acceleration or position sensor
- Defective control module.

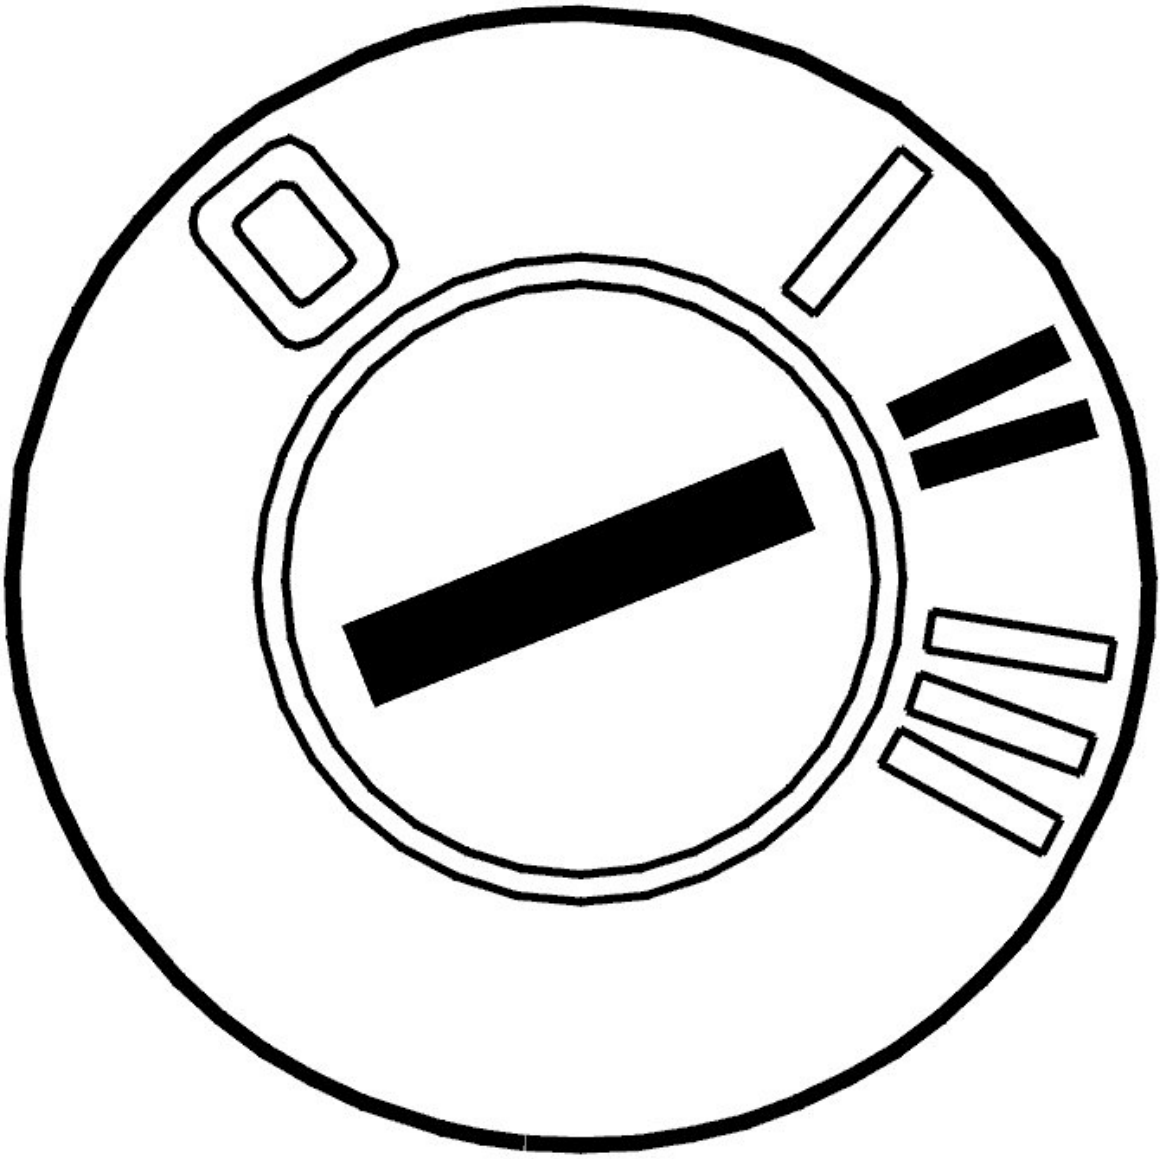
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too Low

Signal too low

Checking other diagnostic trouble codes (DTCs)



Note! The diagnostic trouble code (DTC) may be the result of defective acceleration and/or position sensors. If any diagnostic trouble code (DTC) is stored in the Suspension Module (SUM) for these sensors, these must be fault-traced first. Check that no diagnostic trouble code (DTC) is stored.

- Ignition on
- Read off diagnostic trouble codes (DTCs).

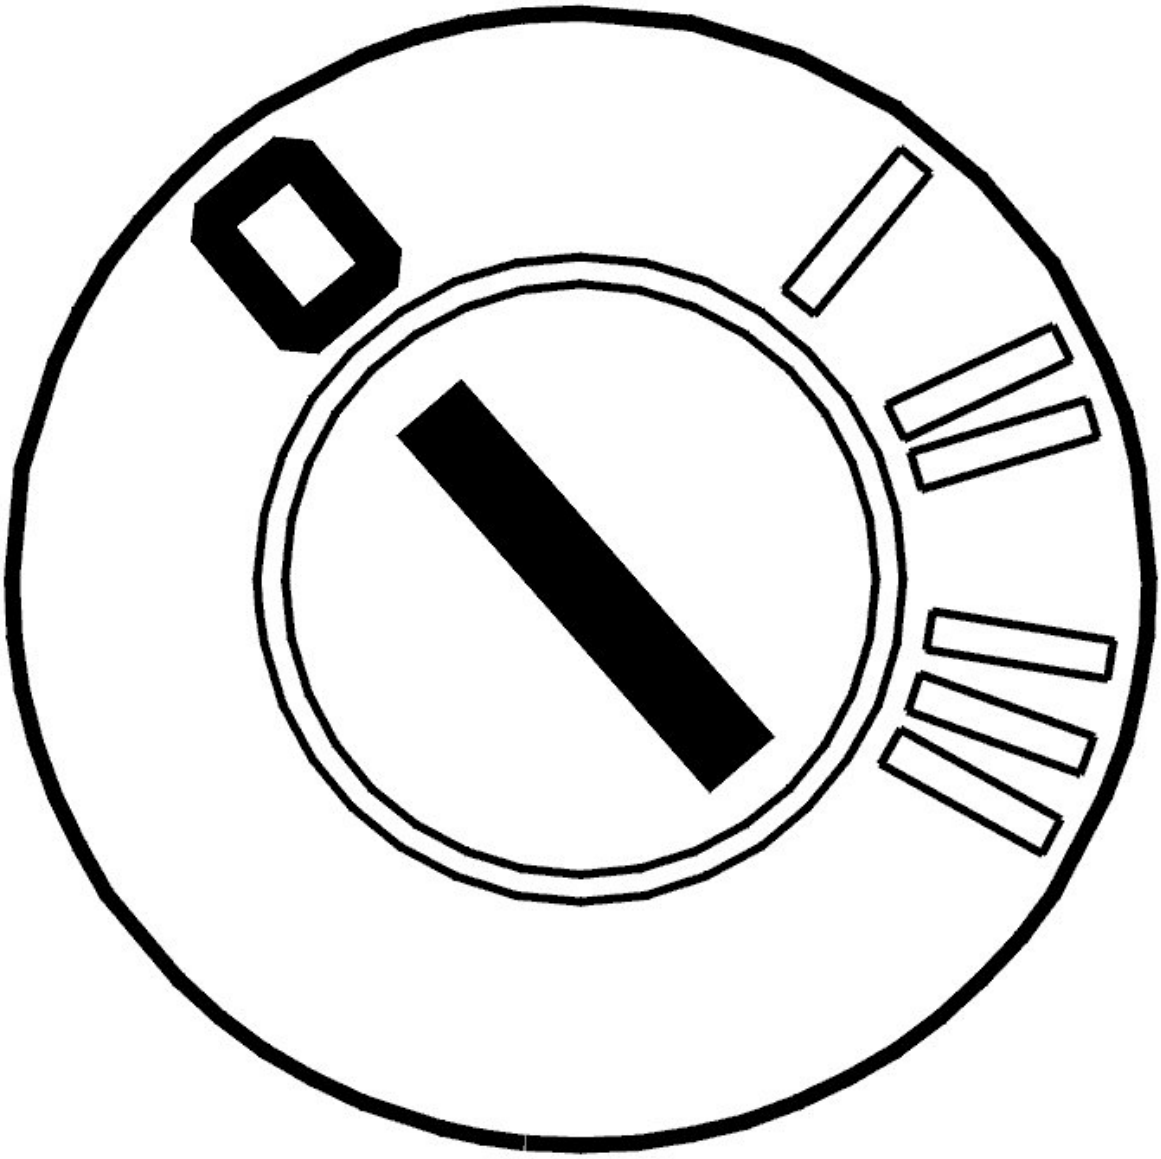
Any stored diagnostic trouble code (DTC) for the acceleration or position sensors must be remedied and erased first.

Has a diagnostic trouble code (DTC) been stored for any of the acceleration or position sensors?

Yes - No Fault Found

No - Checking components and wiring

Checking components and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the position sensor. Check for contact resistance and oxidation.

- Check the cable for power supply between control module terminal #A13 and the acceleration sensors for the front suspension terminal #1. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A13 and the position sensors for the right rear suspension terminal #5. Check for a short-circuit to ground
- Check the cable for power supply between control module terminal #A13 and the acceleration sensors on the bodywork terminal #3. Check for a short-circuit to ground.

Hint: The sensors are usually supplied with 5 V from control module terminal #13 when the ignition is on. There is no power supply if a diagnostic trouble code (DTC) is stored. Click on the VCT2000 symbol to activate the power supply. This will make fault-tracing easier.

Try a new control module if no fault is found in the wiring.
Remedy as necessary.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to ground in the power supply to the sensor
- Contact resistance in the terminals
- Defective position sensor
- Defective control module.

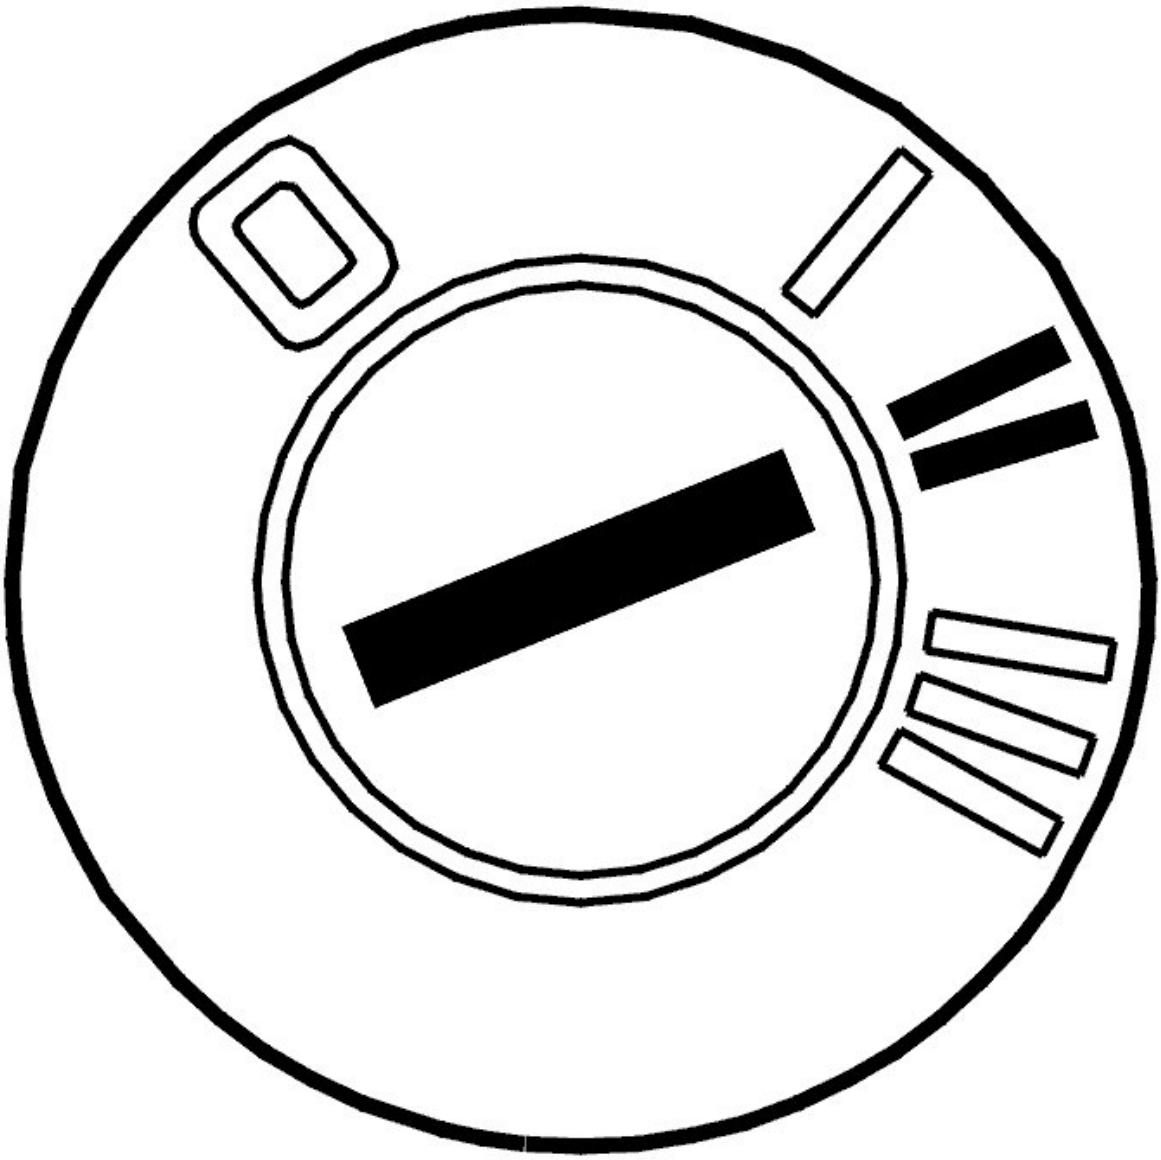
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too Low

Signal too low

Checking other diagnostic trouble codes (DTCs)



Note! The diagnostic trouble code (DTC) may be the result of a defective position sensor. If any diagnostic trouble code (DTC) is stored in the Suspension Module (SUM) for this sensor, this must be fault-traced first. Check that no diagnostic trouble code (DTC) is stored.

- Ignition on
- Read off diagnostic trouble codes (DTCs).

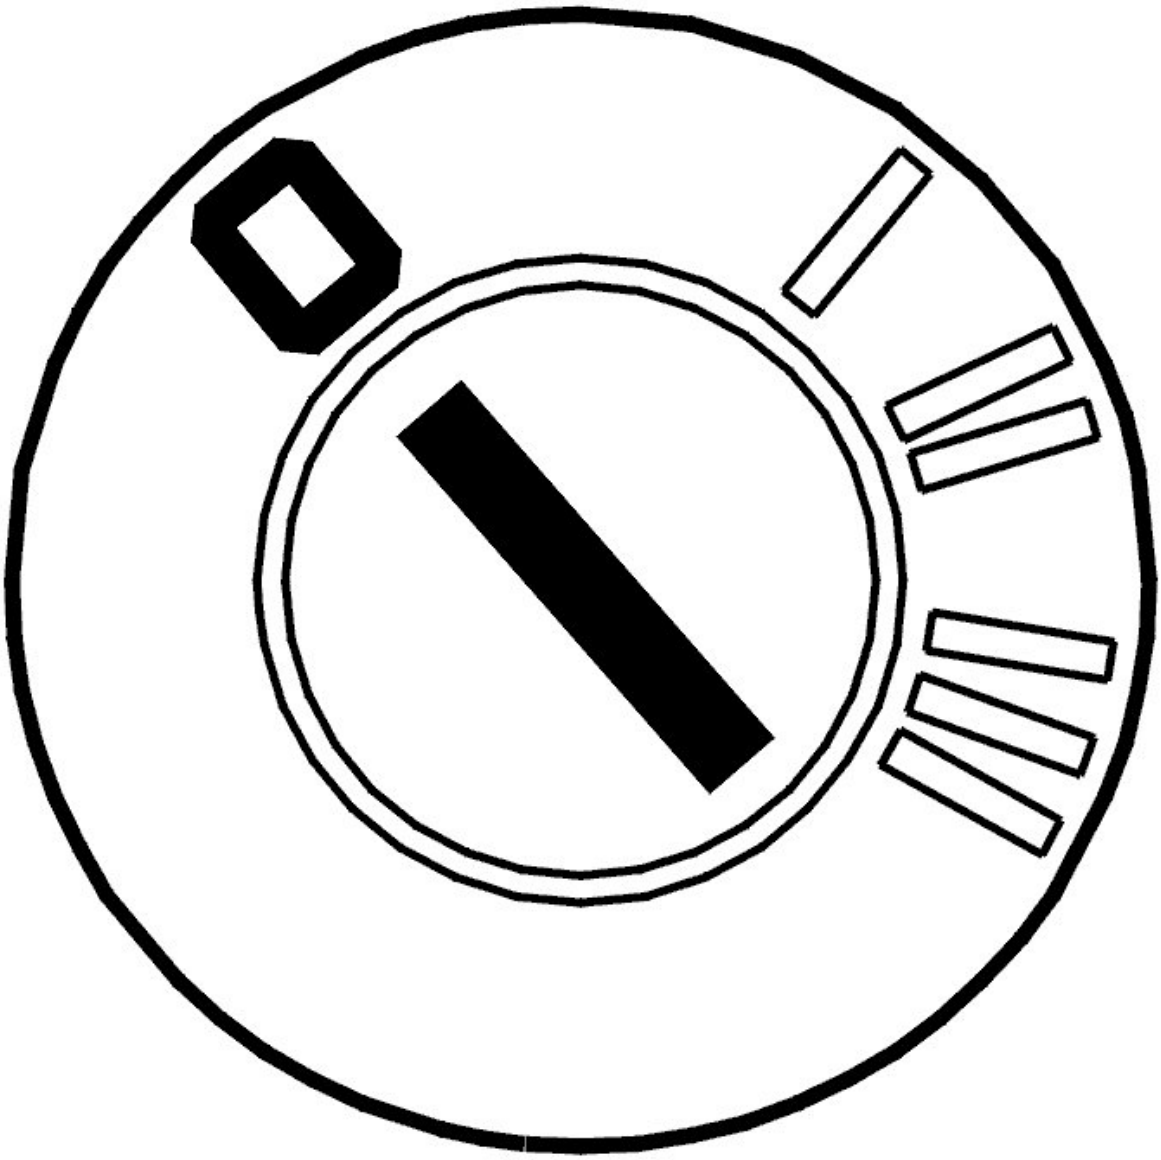
Any stored diagnostic trouble code (DTC) for the position sensor must be remedied and erased first.

Is there a diagnostic trouble code (DTC) stored for the position sensor?

Yes - No Fault Found

No - Checking components and wiring

Checking components and wiring



- Ignition off.
- Check the connectors for the control module and sensors. Check for contact resistance and oxidation
- Check the cable for power supply between control module terminal #A25 and the position sensors for the left rear suspension terminal #5. Check for a short-circuit to ground.

Hint: The sensor is usually supplied with 5 V from control module terminal #25 when the ignition is on. There is no power supply if a diagnostic trouble code (DTC) is stored. Click on the VCT2000 symbol to activate the power supply. This will make fault-tracing easier.

Try a new control module if no fault is found in the wiring.
Remedy as necessary.

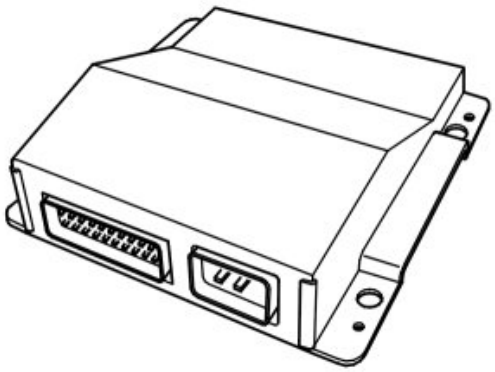
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The position sensor for the left rear suspension is powered from the Suspension Module (SUM). Diagnostic trouble code (DTC) SUM-0092 is stored if the control module detects that the power supply to the sensor is too low. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0092: Position sensor for the rear suspension.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- Four-C control is switched off.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to supply voltage in the power supply to the sensor
- Open-circuit in the signal cable from the sensor
- Defective position sensor
- Defective control module.

Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

The Suspension Module (SUM) receives information from the solenoids on each suspension unit. Diagnostic trouble code (DTC) SUM-0117, SUM-00127, SUM-0137 or SUM-0147 is stored if the control module registers that the current from one of the solenoids is too high when the ignition is switched on.

- SUM-0117: Solenoid, left front
- SUM-0127: Solenoid, right front
- SUM-0137: Solenoid, left rear
- SUM-0147: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to signal cable from the solenoid in the power supply cable for the solenoid
- Short-circuit to supply voltage in the signal cable from the solenoid
- Defective solenoid.

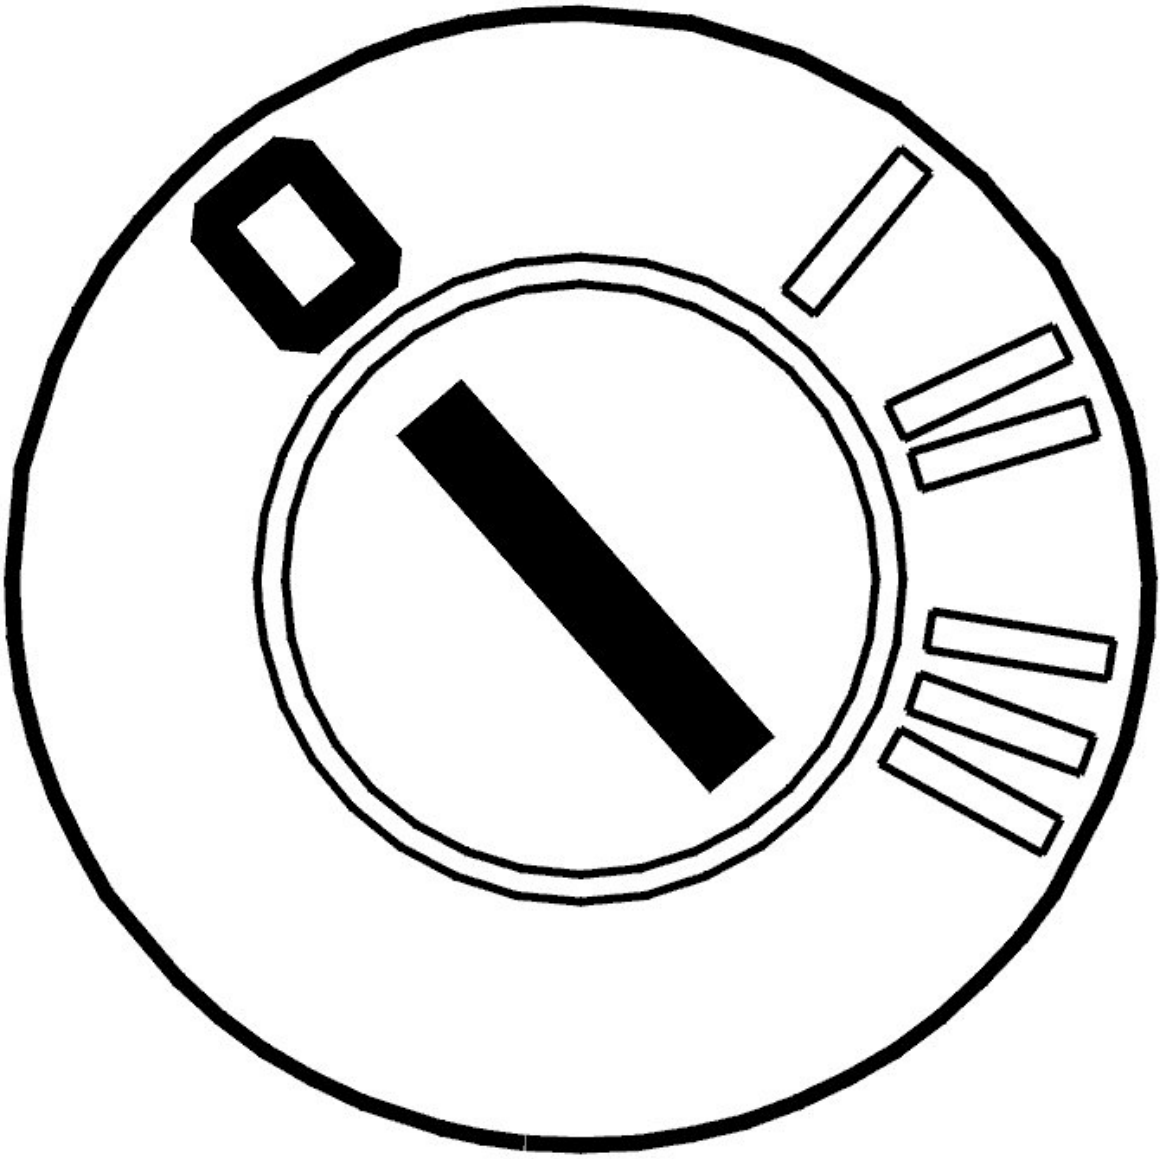
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Current Too High

Current too high

Checking components and wiring



- Ignition off.

Check the resistance of the solenoids.
Check the connectors for the Suspension Module (SUM) and the solenoids. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0117, front left solenoid:
- Check the signal cable between control module #A7 and solenoid terminal #2. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0127, front right solenoid:
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0137, rear left solenoid:
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0147, rear right solenoid:
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

Hint: Click on the VCT2000 symbol to activate the power supply to the solenoids. This will make fault-tracing easier. Measure the current on the signal cable. The value must be approximately 0.5 A.

Remedy as necessary.

Other information:

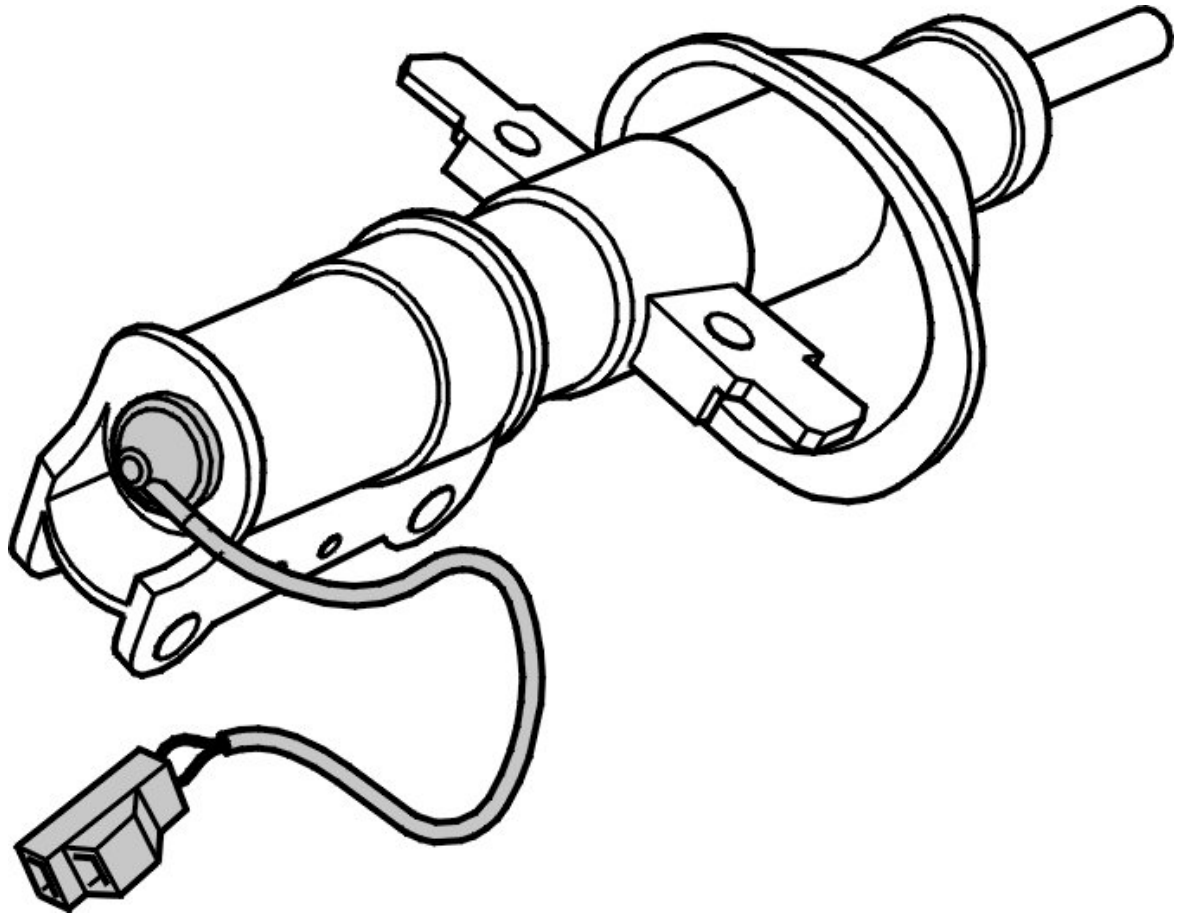
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The diagnostic trouble code (DTC) is stored if the suspension module (SUM) registers that the temperature of any of the solenoids is too high. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0118: Solenoid, left front
- SUM-0128: Solenoid, right front
- SUM-0138: Solenoid, left rear
- SUM-0148: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C (Continuously Controlled Chassis Concept) function is limited.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Contact resistance in the terminals
- Hard driving.

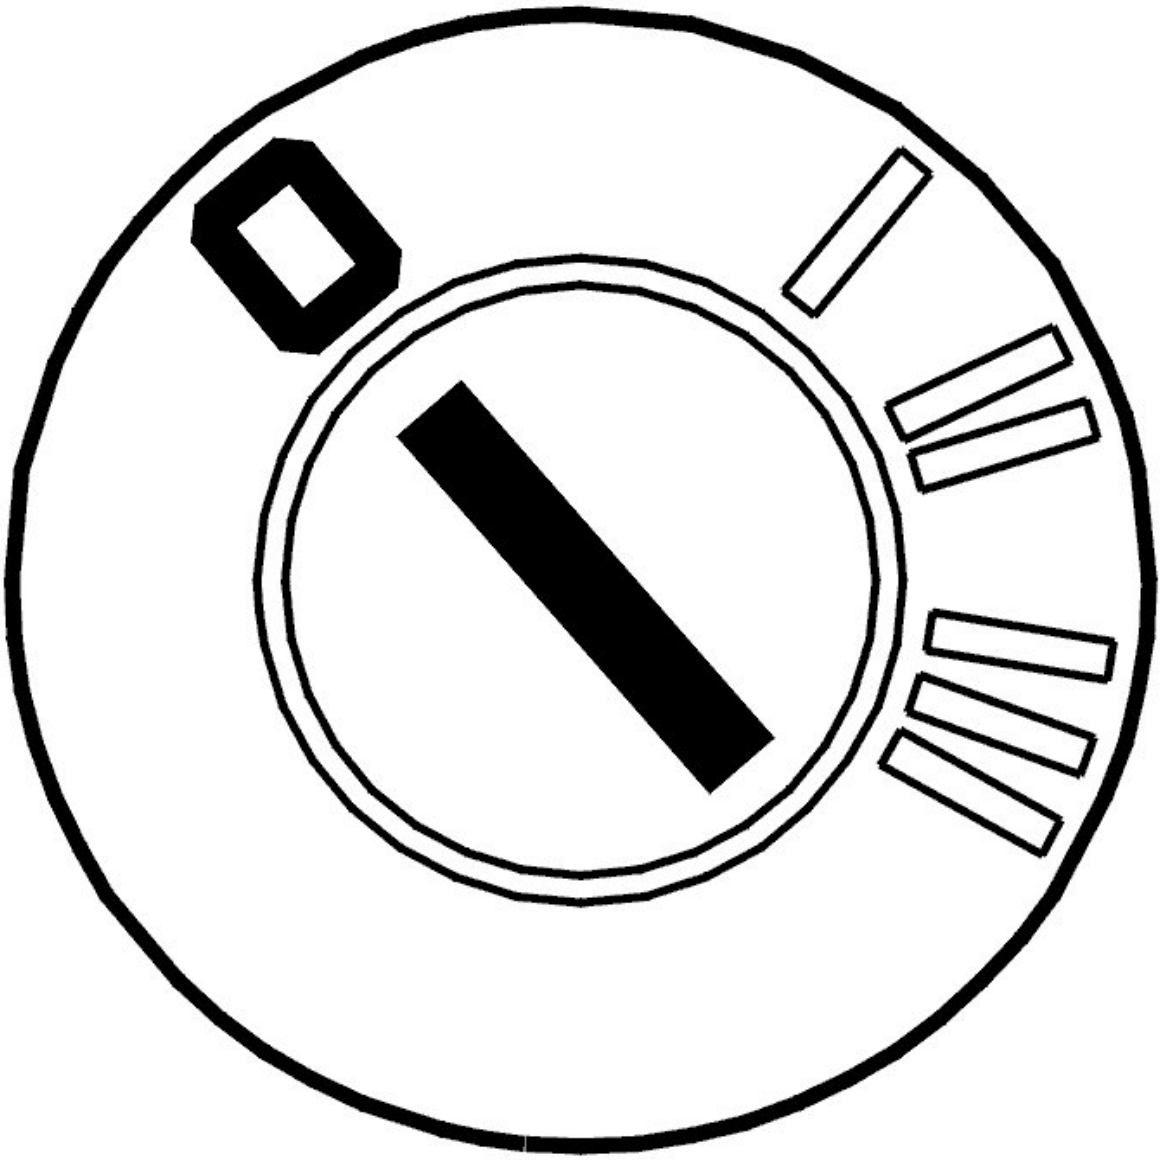
Fault symptom[s]

- None.

Temperature Too High

Temperature too high

Checking the component and wiring



- Ignition off.

Check the solenoids and connectors for the Suspension Module (SUM). Check for contact resistance. Check for oxidation.
Check the resistance of the solenoids.

For diagnostic trouble code (DTC) SUM-0118, front left solenoid:

- Check the power supply cable between control module terminal #A6 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A7 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0128, front right solenoid:

- Check the power supply cable between control module terminal #A9 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0138, rear left solenoid:

- Check the power supply cable between control module terminal #A2 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0148, rear right solenoid:

- Check the power supply cable between control module terminal #A5 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information from the solenoids on each suspension unit. Diagnostic trouble code (DTC) SUM-0117, SUM-00127, SUM-0137 or SUM-0147 is stored if the control module registers that the current from one of the solenoids is too high when the ignition is switched on.

- SUM-0117: Solenoid, left front
- SUM-0127: Solenoid, right front
- SUM-0137: Solenoid, left rear
- SUM-0147: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to signal cable from the solenoid in the power supply cable for the solenoid
- Short-circuit to supply voltage in the signal cable from the solenoid
- Defective solenoid.

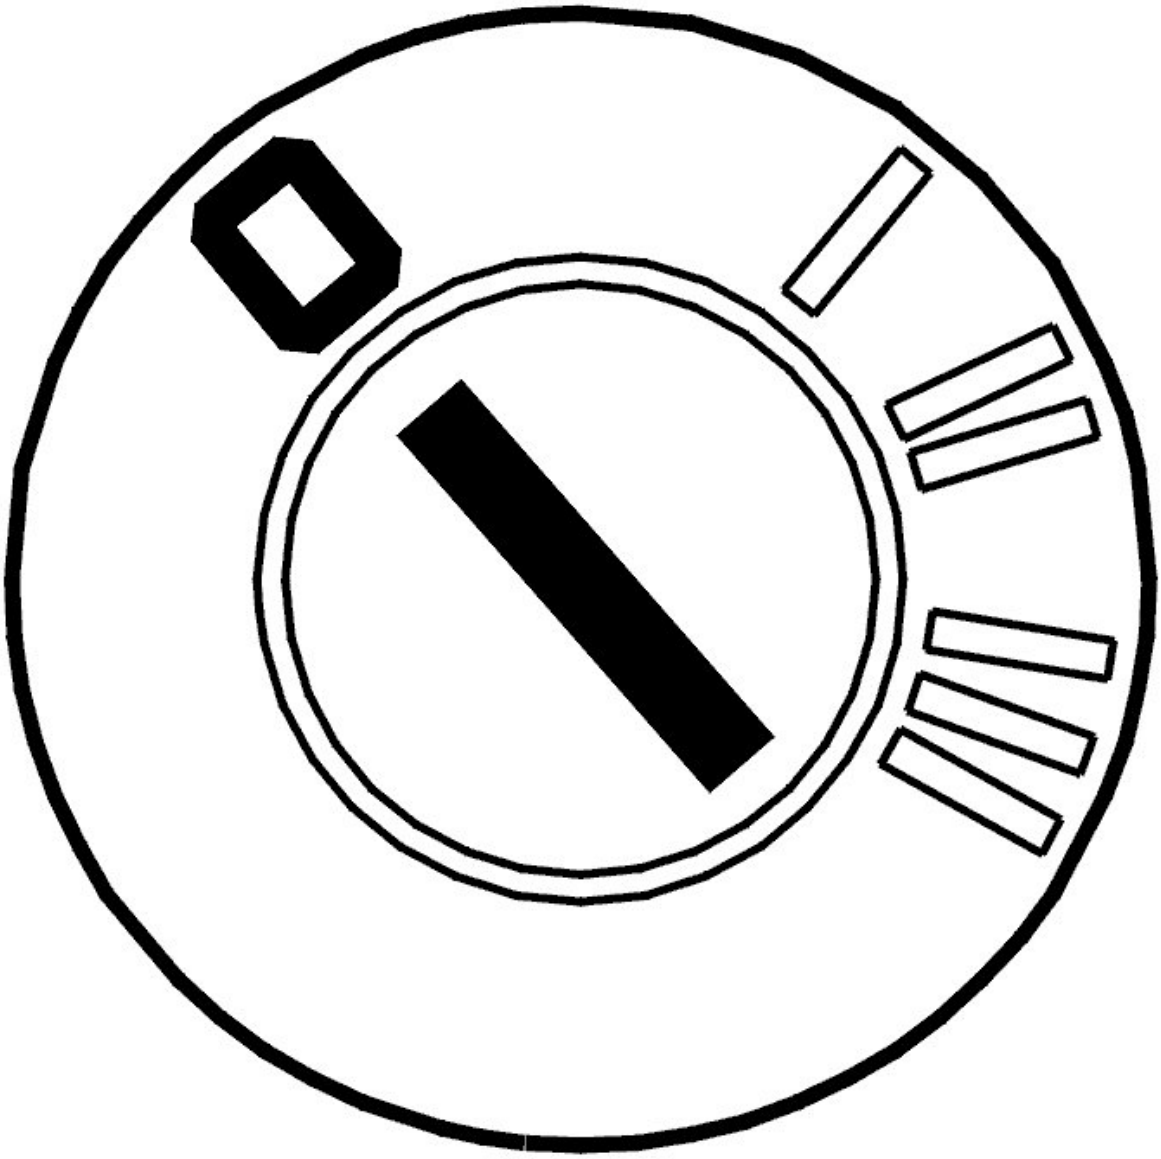
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Current Too High

Current too high

Checking components and wiring



- Ignition off.

Check the resistance of the solenoids.
Check the connectors for the Suspension Module (SUM) and the solenoids. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0117, front left solenoid:
- Check the signal cable between control module #A7 and solenoid terminal #2. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0127, front right solenoid:
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0137, rear left solenoid:
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0147, rear right solenoid:
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

Hint: Click on the VCT2000 symbol to activate the power supply to the solenoids. This will make fault-tracing easier. Measure the current on the signal cable. The value must be approximately 0.5 A.

Remedy as necessary.

Other information:

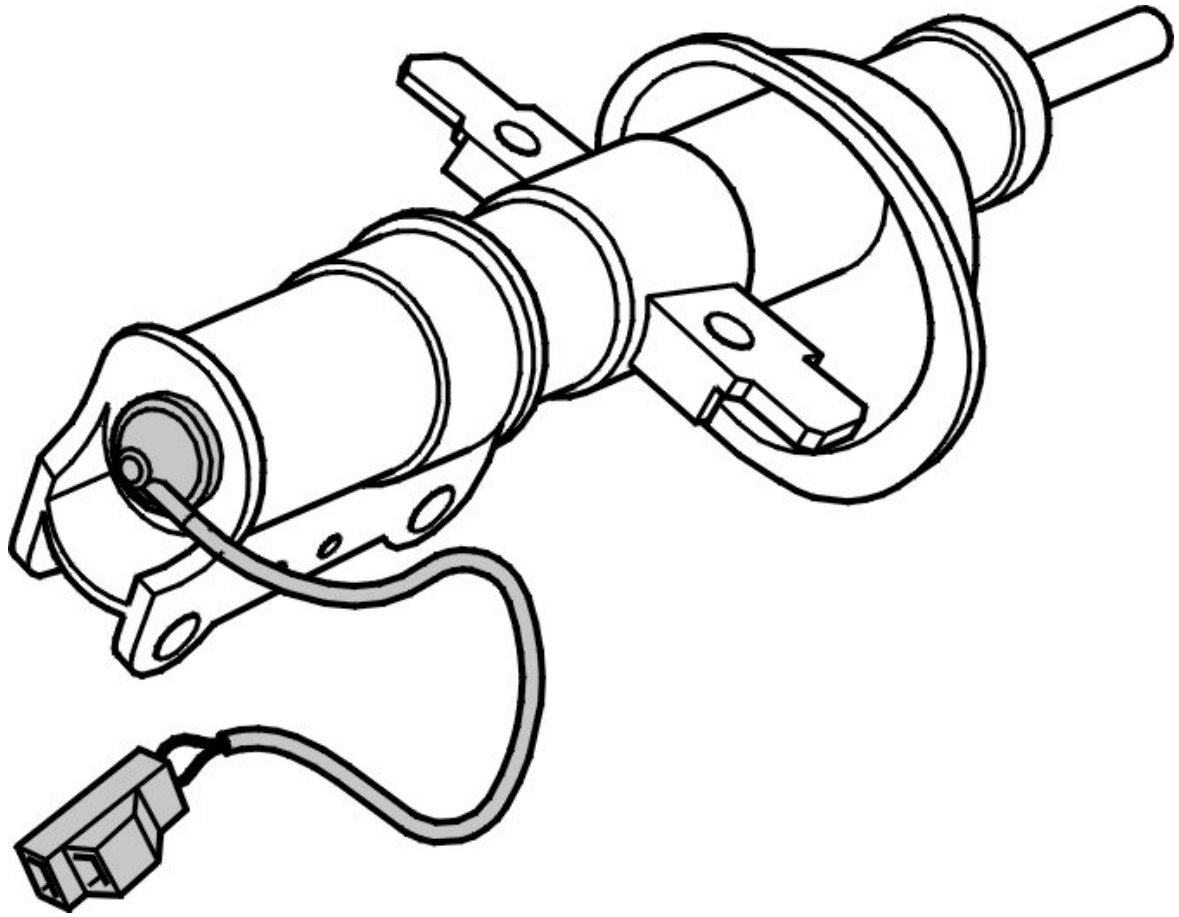
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The diagnostic trouble code (DTC) is stored if the suspension module (SUM) registers that the temperature of any of the solenoids is too high. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0118: Solenoid, left front
- SUM-0128: Solenoid, right front
- SUM-0138: Solenoid, left rear
- SUM-0148: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C (Continuously Controlled Chassis Concept) function is limited.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Contact resistance in the terminals
- Hard driving.

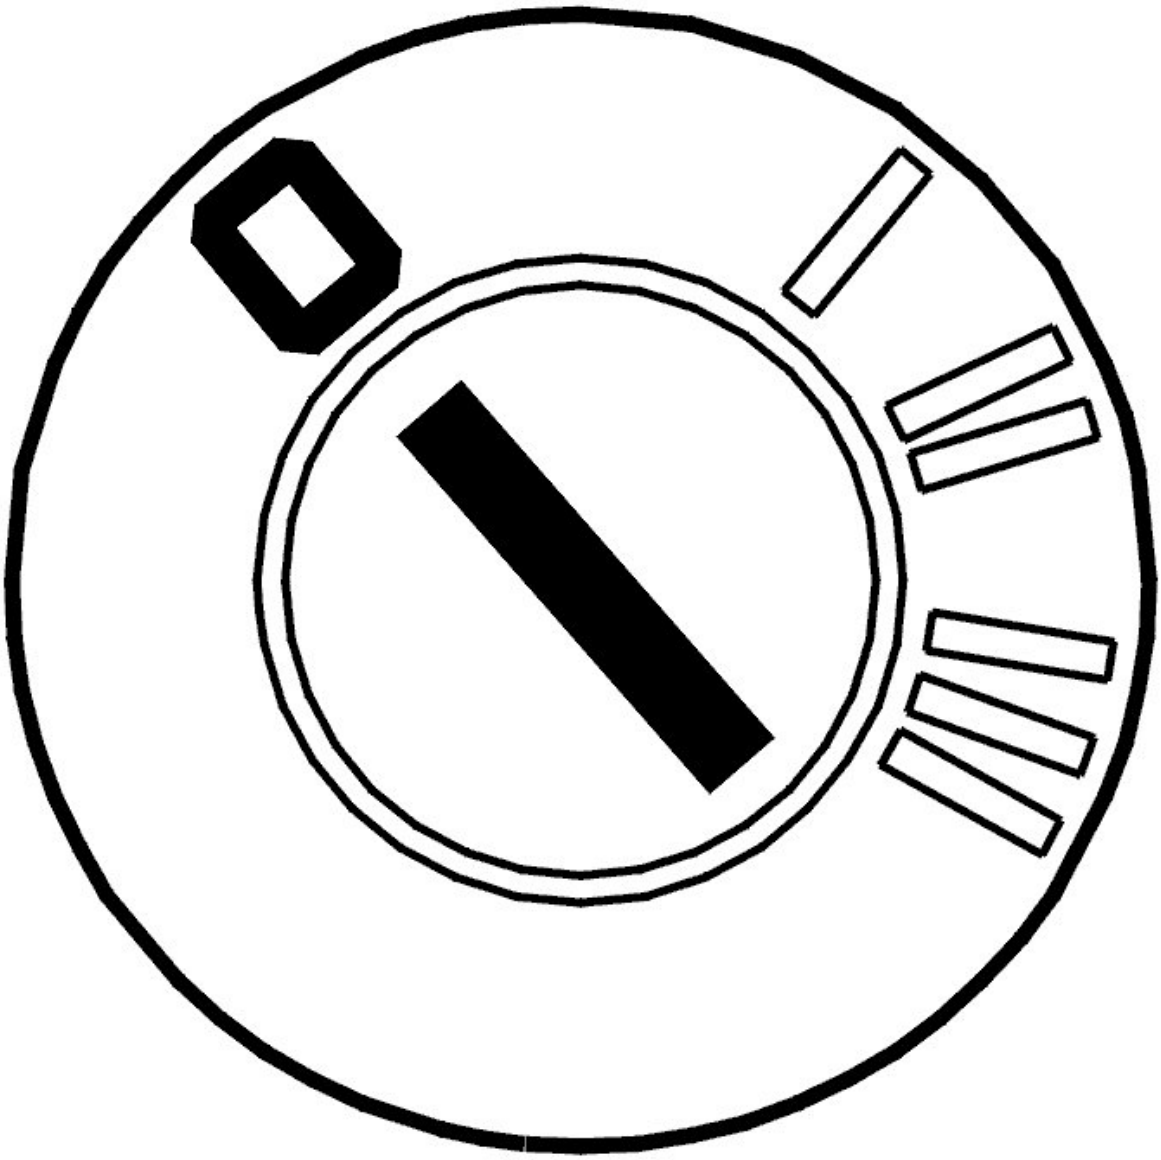
Fault symptom[s]

- None.

Temperature Too High

Temperature too high

Checking the component and wiring



- Ignition off.

Check the solenoids and connectors for the Suspension Module (SUM). Check for contact resistance. Check for oxidation.
Check the resistance of the solenoids.

For diagnostic trouble code (DTC) SUM-0118, front left solenoid:

- Check the power supply cable between control module terminal #A6 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A7 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0128, front right solenoid:

- Check the power supply cable between control module terminal #A9 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0138, rear left solenoid:

- Check the power supply cable between control module terminal #A2 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0148, rear right solenoid:

- Check the power supply cable between control module terminal #A5 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

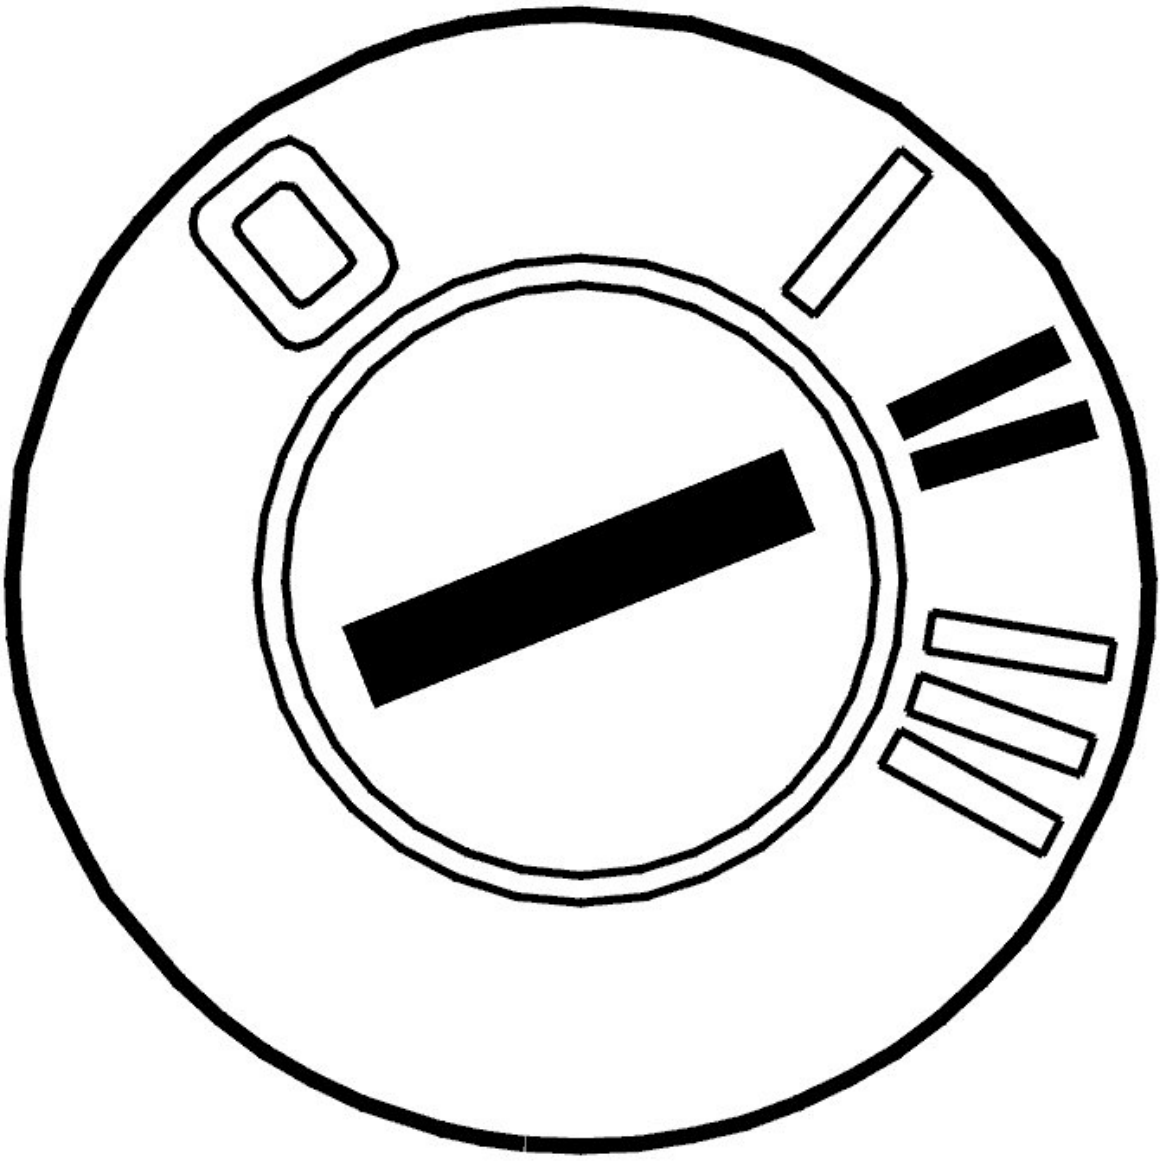
Continue - Calibrating the control module

Calibrating the control module

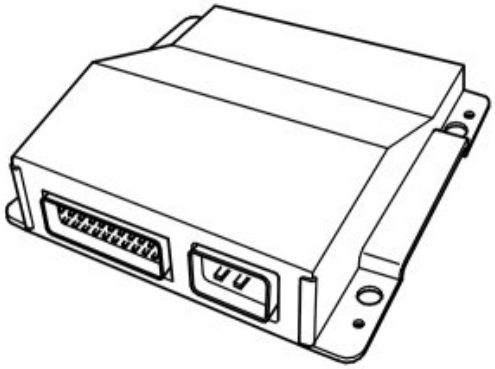


Note! In order for the Four-C (Continuously Controlled Chassis Concept) function to work correctly after repair, the adaptive data in the Suspension Module (SUM) must be calibrated.

- The car and its components must be kept at room temperature if the calibration is to be correct
- Ensure that the car is unloaded and on a flat surface with the wheels pointing straight ahead

- Ignition on.

Calibrate the control module by clicking the VCT2000 symbol.



Continue - Verification

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information from the solenoids on each suspension unit. Diagnostic trouble code (DTC) SUM-0117, SUM-00127, SUM-0137 or SUM-0147 is stored if the control module registers that the current from one of the solenoids is too high when the ignition is switched on.

- SUM-0117: Solenoid, left front
- SUM-0127: Solenoid, right front
- SUM-0137: Solenoid, left rear
- SUM-0147: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to signal cable from the solenoid in the power supply cable for the solenoid
- Short-circuit to supply voltage in the signal cable from the solenoid
- Defective solenoid.

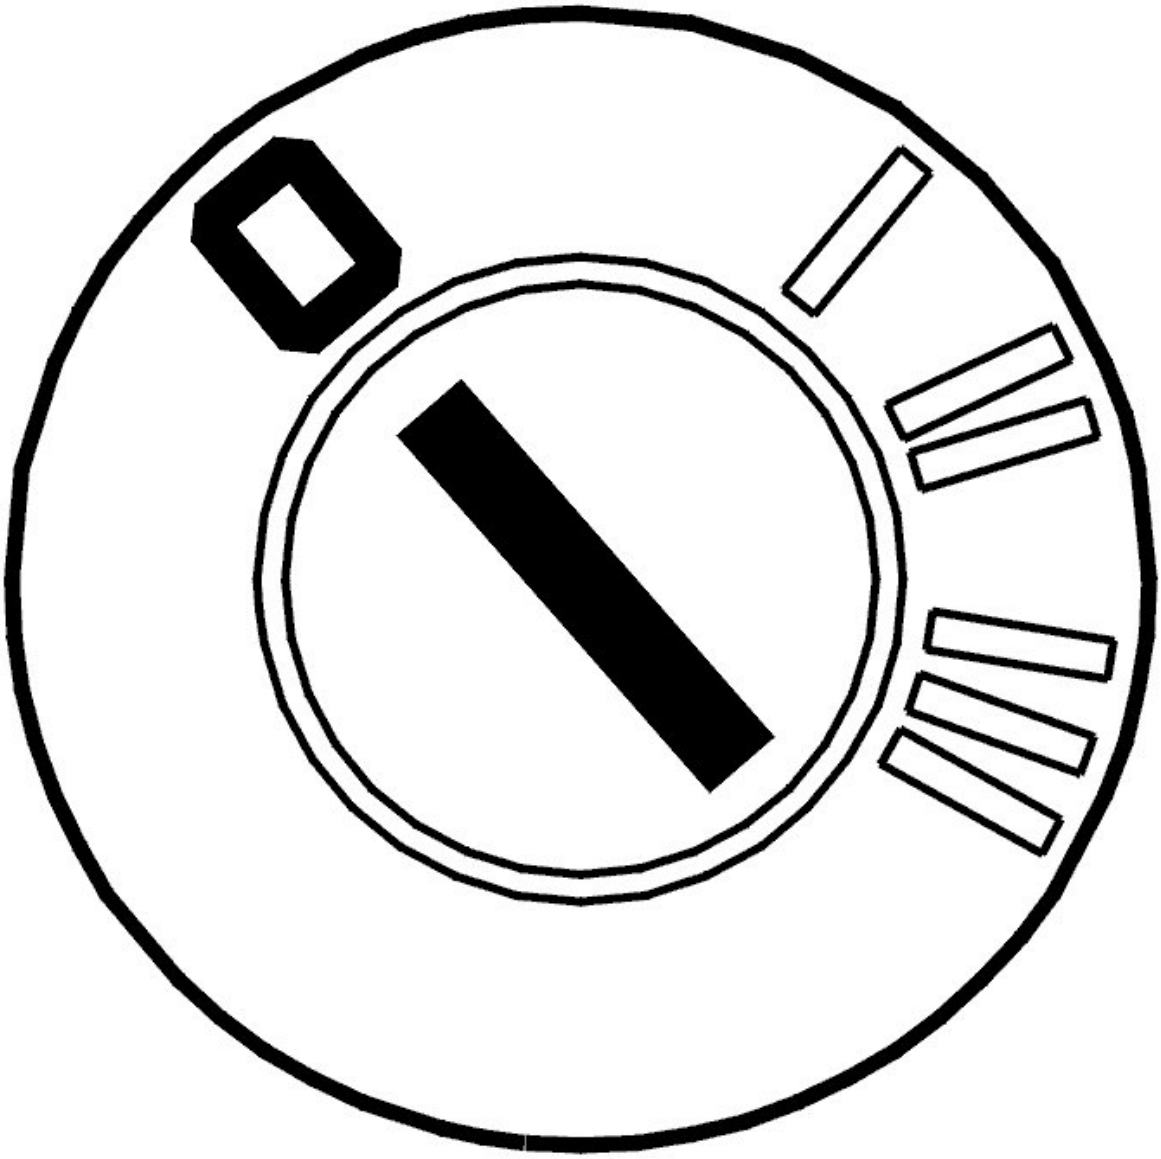
Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Current Too High

Current too high

Checking components and wiring



- Ignition off.

Check the resistance of the solenoids.
Check the connectors for the Suspension Module (SUM) and the solenoids. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0117, front left solenoid:
- Check the signal cable between control module #A7 and solenoid terminal #2. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0127, front right solenoid:
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0137, rear left solenoid:
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0147, rear right solenoid:
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

Hint: Click on the VCT2000 symbol to activate the power supply to the solenoids. This will make fault-tracing easier. Measure the current on the signal cable. The value must be approximately 0.5 A.

Remedy as necessary.

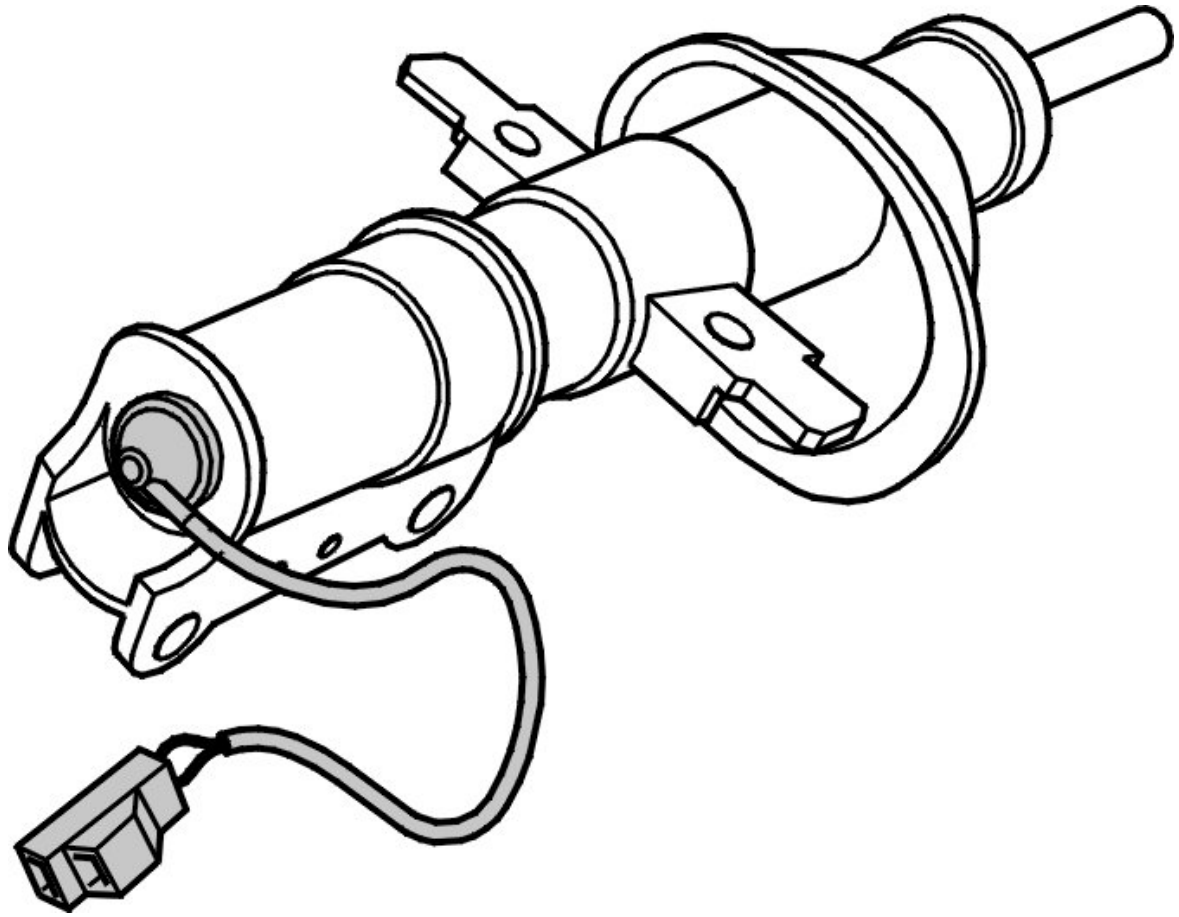
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The diagnostic trouble code (DTC) is stored if the suspension module (SUM) registers that the temperature of any of the solenoids is too high. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0118: Solenoid, left front
- SUM-0128: Solenoid, right front
- SUM-0138: Solenoid, left rear
- SUM-0148: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C (Continuously Controlled Chassis Concept) function is limited.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Contact resistance in the terminals
- Hard driving.

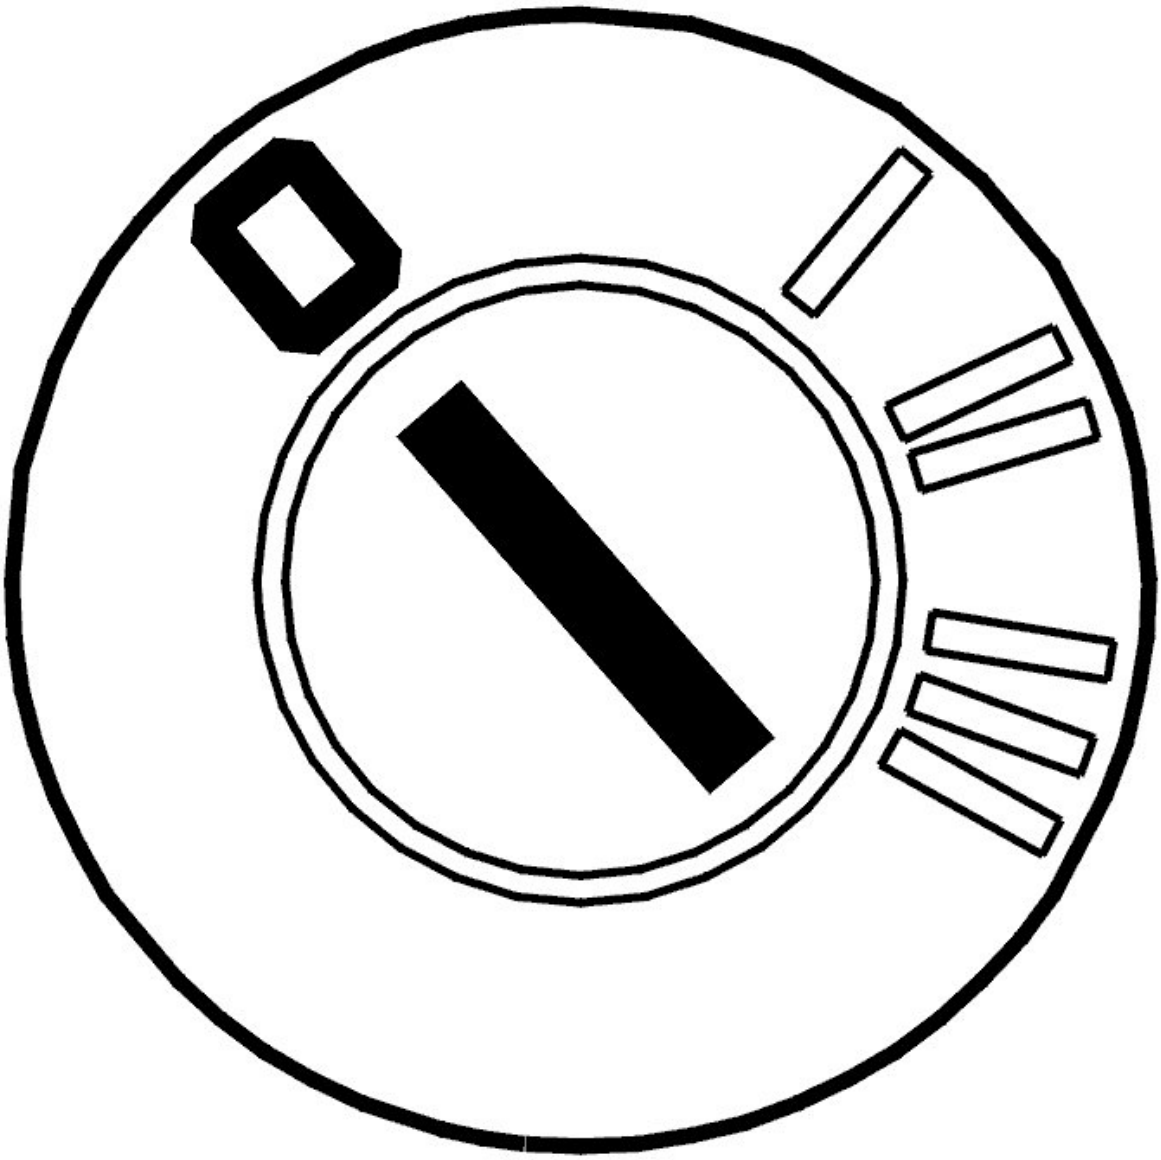
Fault symptom[s]

- None.

Temperature Too High

Temperature too high

Checking the component and wiring



- Ignition off.

Check the solenoids and connectors for the Suspension Module (SUM). Check for contact resistance. Check for oxidation.
Check the resistance of the solenoids.

For diagnostic trouble code (DTC) SUM-0118, front left solenoid:

- Check the power supply cable between control module terminal #A6 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A7 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0128, front right solenoid:

- Check the power supply cable between control module terminal #A9 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0138, rear left solenoid:

- Check the power supply cable between control module terminal #A2 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0148, rear right solenoid:

- Check the power supply cable between control module terminal #A5 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

Check the connectors for the Suspension Module (SUM) and the solenoids. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0116, front left solenoid:

- Check the power supply cable between control module terminal #A6 and solenoid connector terminal #1. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0126, front right solenoid:

- Check the power supply cable between control module terminal #A9 and solenoid connector terminal #1. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0136, rear left solenoid:

- Check the power supply cable between control module terminal #A2 and solenoid connector terminal #1. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0146, rear right solenoid:

- Check the power supply cable between control module terminal #A5 and solenoid connector terminal #1. Check for a short-circuit to supply voltage.

Hint: Click on the VCT2000 symbol to activate the power supply to the solenoids. This will make fault-tracing easier. Measure the current on the signal cable. The value must be approximately 0.5 A.

Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information from the solenoids on each suspension unit. Diagnostic trouble code (DTC) SUM-0117, SUM-00127, SUM-0137 or SUM-0147 is stored if the control module registers that the current from one of the solenoids is too high when the ignition is switched on.

- SUM-0117: Solenoid, left front
- SUM-0127: Solenoid, right front
- SUM-0137: Solenoid, left rear
- SUM-0147: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Short-circuit to signal cable from the solenoid in the power supply cable for the solenoid
- Short-circuit to supply voltage in the signal cable from the solenoid
- Defective solenoid.

Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Current Too High

Current too high

Checking components and wiring

- Ignition off.

Check the resistance of the solenoids.
Check the connectors for the Suspension Module (SUM) and the solenoids. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0117, front left solenoid:
- Check the signal cable between control module #A7 and solenoid terminal #2. Check for a short-circuit to supply voltage.

For diagnostic trouble code (DTC) SUM-0127, front right solenoid:
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0137, rear left solenoid:
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

For diagnostic trouble code (DTC) SUM-0147, rear right solenoid:
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to supply voltage or to the power supply cable for the solenoid.

Hint: Click on the VCT2000 symbol to activate the power supply to the solenoids. This will make fault-tracing easier. Measure the current on the signal cable. The value must be approximately 0.5 A.

Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The diagnostic trouble code (DTC) is stored if the suspension module (SUM) registers that the temperature of any of the solenoids is too high. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

- SUM-0118: Solenoid, left front
- SUM-0128: Solenoid, right front
- SUM-0138: Solenoid, left rear
- SUM-0148: Solenoid, right rear.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C (Continuously Controlled Chassis Concept) function is limited.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Contact resistance in the terminals
- Hard driving.

Fault symptom[s]

- None.

Temperature Too High

Temperature too high

Checking the component and wiring

- Ignition off.

Check the solenoids and connectors for the Suspension Module (SUM). Check for contact resistance. Check for oxidation.
Check the resistance of the solenoids.

For diagnostic trouble code (DTC) SUM-0118, front left solenoid:

- Check the power supply cable between control module terminal #A6 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A7 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0128, front right solenoid:

- Check the power supply cable between control module terminal #A9 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A8 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0138, rear left solenoid:

- Check the power supply cable between control module terminal #A2 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A1 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0148, rear right solenoid:

- Check the power supply cable between control module terminal #A5 and solenoid connector terminal #1. Check for an open-circuit. Check for a short-circuit to ground
- Check the signal cable between control module terminal #A4 and solenoid terminal #2. Check for a short-circuit to ground. Check for an open-circuit.

Remedy as necessary.

For diagnostic trouble code (DTC) SUM-0192, ADVANCED indication:

- Check the power supply cable between control module terminal #A29 and keypad terminal #4. Check for an open-circuit. Check for a short-circuit to supply voltage
- Check the ground lead between control module terminal #A21 and keypad terminal #6. Check for an open-circuit.

Try a new acceleration sensor if no fault is found in the wiring.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information from the keypad unit. Diagnostic trouble code (DTC) SUM-0171, SUM-0181 or SUM-0191 is stored if the control module registers that the signal for indication in the keypad is too low when the ignition is switched on.

- SUM-0171: Keypad, COMFORT indication. Signal too low
- SUM-0181: Keypad, SPORT indication. Signal too low
- SUM-0191: Keypad, ADVANCED indication. Signal too low.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source

- Contact resistance in the terminals
- Short-circuit to ground in the power supply cable for indication
- Defective keypad.

Fault symptom[s]

- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too Low

Signal too low

Checking components and wiring

- Ignition off.

Check the connectors for the Suspension Module (SUM) and the keypad. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0171, COMFORT indication:

- Check the cable between control module terminal #A26 and keypad terminal #2. Check for a short-circuit to ground.

For diagnostic trouble code (DTC) SUM-0181, SPORT indication:

- Check the cable between control module terminal #A11 and keypad terminal #3. Check for a short-circuit to ground.

For diagnostic trouble code (DTC) SUM-0191, ADVANCED indication:

- Check the cable between control module terminal #A29 and acceleration sensor terminal #4. Check for a short-circuit to ground.

Try a new keypad if no fault is found in the wiring.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The Suspension Module (SUM) receives information from the keypad unit. Diagnostic trouble code (DTC) SUM-0172, SUM-0182 or SUM-0192 is stored if the control module registers that the signal for indication in the keypad is too high when the ignition is switched on.

- SUM-0172: Keypad, COMFORT indication. Signal too high
- SUM-0182: Keypad, SPORT indication. Signal too high
- SUM-0192: Keypad, ADVANCED indication. Signal too high.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source
- Open-circuit in the cable for indication in the keypad
- Open-circuit in the ground lead for indication in the keypad
- Short-circuit to supply voltage in the cable for indication in the keypad
- Defective keypad.

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Too High

Signal too high

Checking components and wiring

- Ignition off.

Check the connectors for the Suspension Module (SUM) and the acceleration sensor. Check for oxidation.

For diagnostic trouble code (DTC) SUM-0172, COMFORT indication:
- Check the power supply cable between control module terminal #A26 and keypad terminal #2. Check for an open-circuit. Check for a short-circuit to supply voltage

- Check the ground lead between control module terminal #A21 and keypad terminal #6. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0182, SPORT indication:

- Check the power supply cable between control module terminal #A11 and keypad terminal #3. Check for an open-circuit. Check for a short-circuit to supply voltage
- Check the ground lead between control module terminal #A21 and keypad terminal #6. Check for an open-circuit.

For diagnostic trouble code (DTC) SUM-0192, ADVANCED indication:

- Check the power supply cable between control module terminal #A29 and keypad terminal #4. Check for an open-circuit. Check for a short-circuit to supply voltage
- Check the ground lead between control module terminal #A21 and keypad terminal #6. Check for an open-circuit.

Try a new acceleration sensor if no fault is found in the wiring.
Remedy as necessary.

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Condition

Diagnostic trouble code (DTC) SUM-0201 is stored if the Suspension Module (SUM) registers that the battery voltage is too low when the ignition is switched on.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

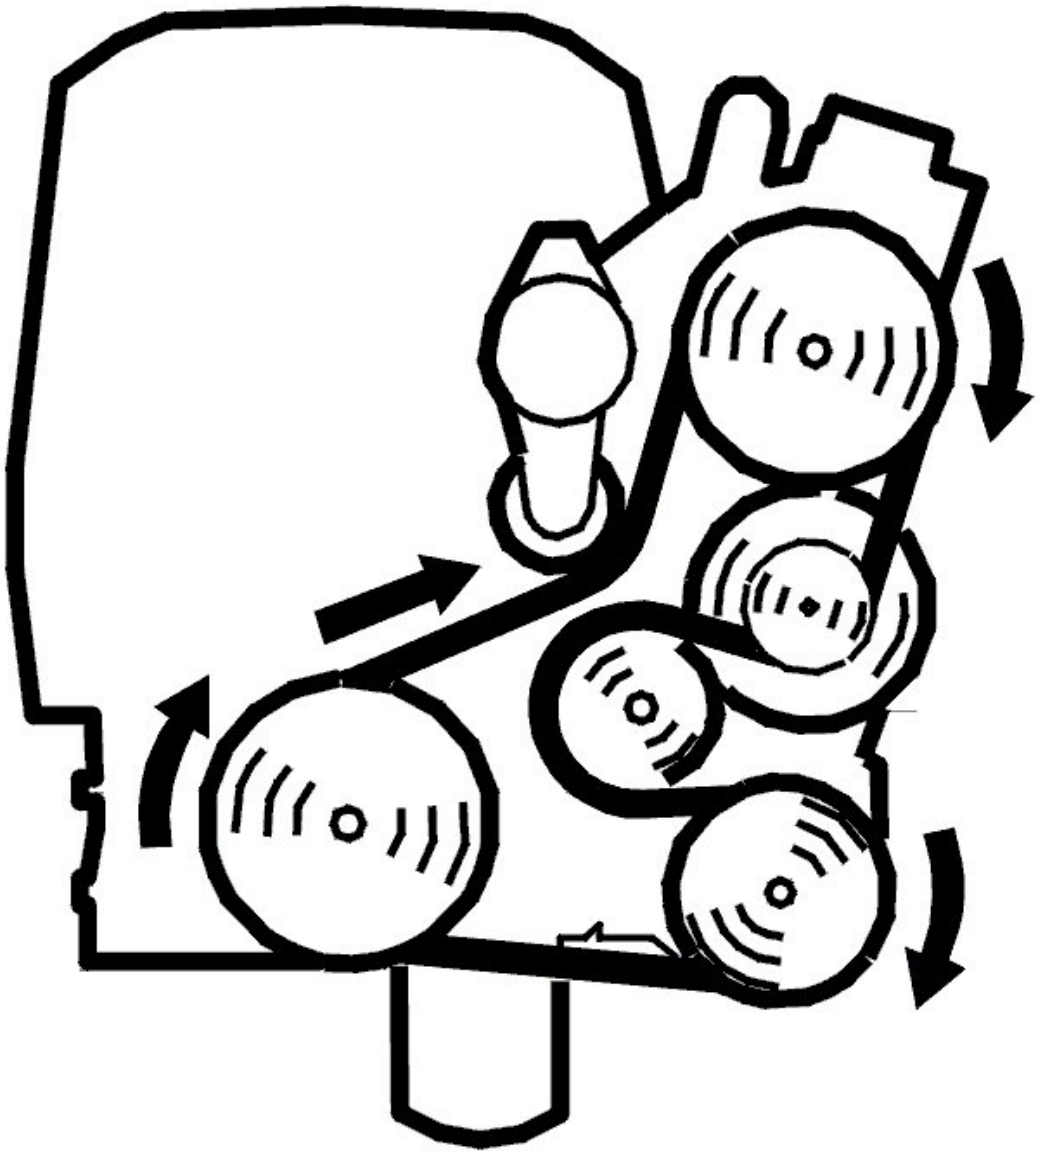
Possible source
- Battery voltage too low
- Contact resistance in the terminals
- Open-circuit or short-circuit to ground in the power supply to the Suspension Module (SUM)
- Defective Suspension Module (SUM).

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Voltage Too Low

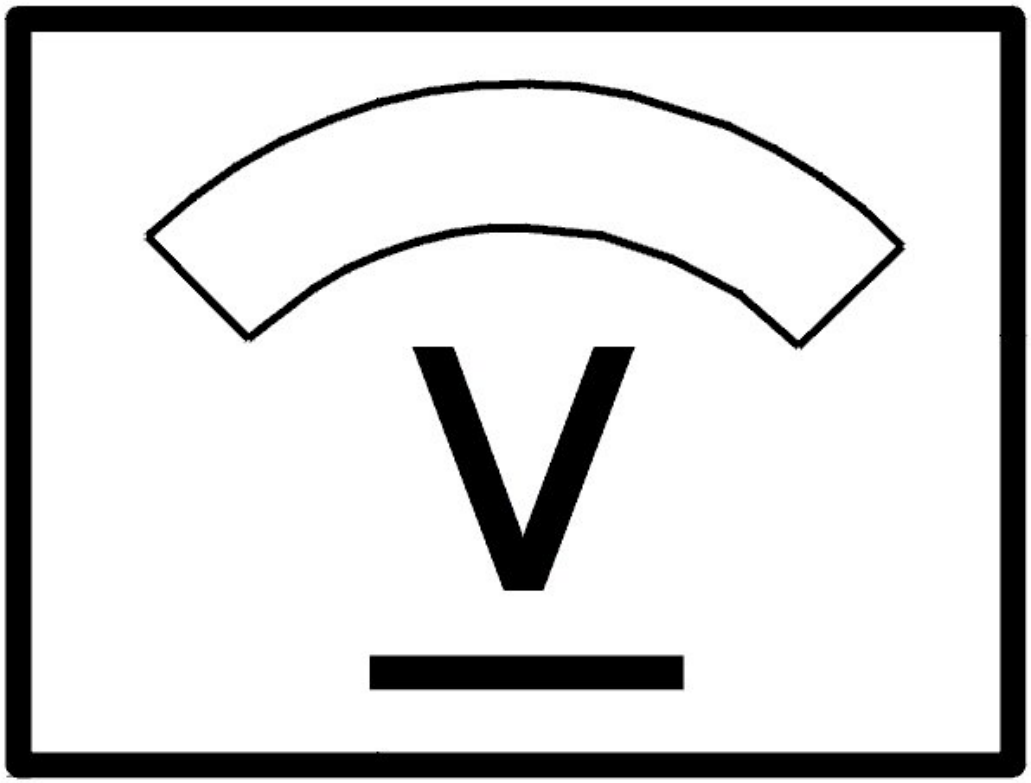
Voltage too low

Checking the battery voltage



- Start the engine. Allow the engine to idle
- Connect a voltmeter between the battery positive and negative terminals.

The voltage must be normal system voltage.
If the voltage is too low, check the charging system according to the relevant information.

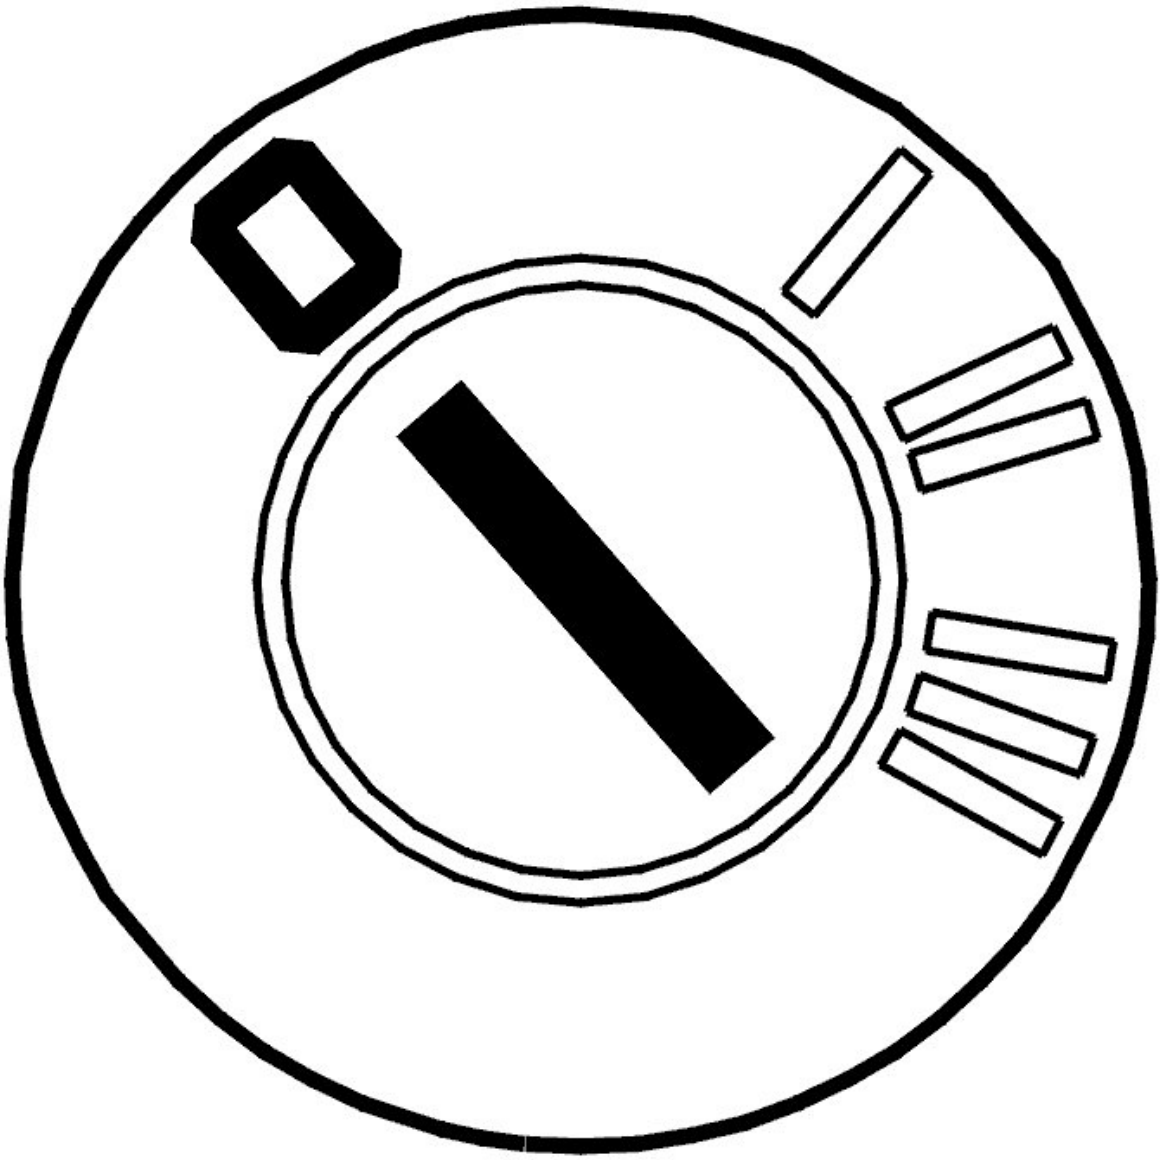


Was the voltage too low?

Yes - DONE

No - Checking the power supply

Checking the power supply



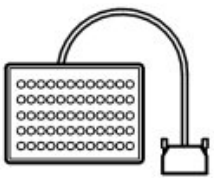
- Ignition off.

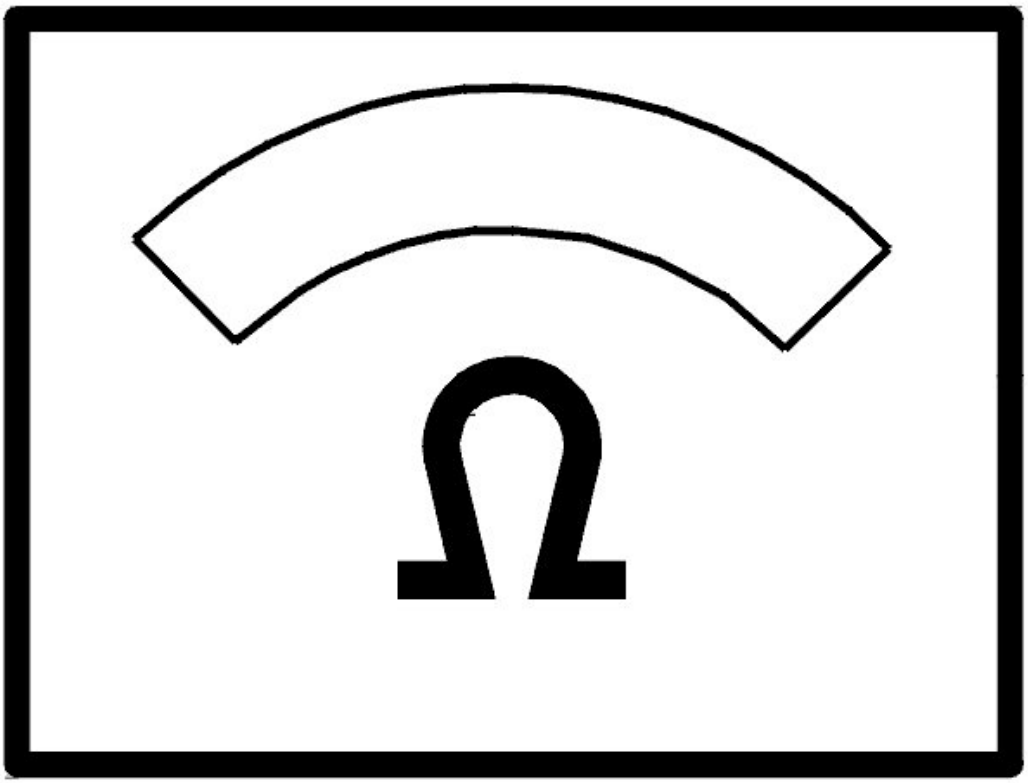
Check the connector on the Suspension Module (SUM). Check for contact resistance and oxidation.
Check the power supply cable between the fuse for the Suspension Module (SUM) and the integrated relay/fusebox in the engine compartment.
Also check the connector on Suspension Module (SUM) terminal #C1 (#31). Check for a short-circuit to ground.

Hint: With the ignition on and the voltmeter connected between terminals #C1 (#31) and #C2 (#32) on the breakout box, the voltmeter should read battery voltage.

Other information

- To connect the breakout box, see Connecting the breakout box See: Steering and Suspension/Suspension/Suspension Control (Automatic - Electronic Level)/Testing and Inspection/Pinout Values and Diagnostic Parameters/Connecting the Breakout Box, Suspension Module (SUM)
- For information about signals, see Signal specification See: Steering and Suspension/Suspension/Suspension Control (Automatic - Electronic Level)/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Specification, Suspension Module (SUM)
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals
- For further information about the fuses and relays, see the Wiring Diagram.



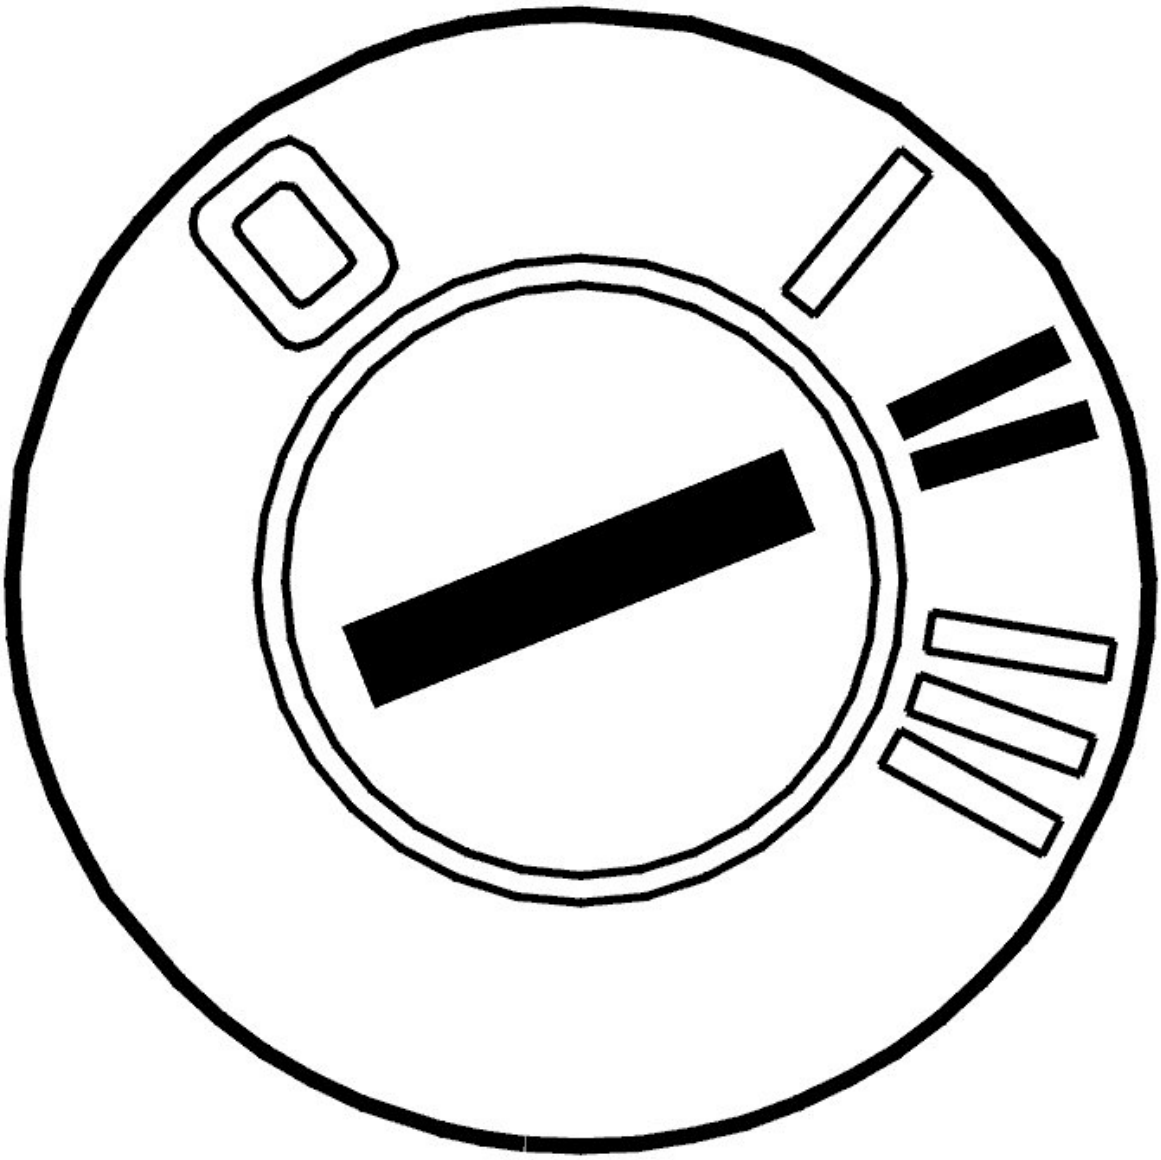


Was a fault detected?

Yes - Verification

No - Checking the supply voltage to the system

Checking the supply voltage to the system



- Ignition off
- Reinstall the connectors, components etc.
- Ignition on
- Read off the power supply to the Suspension Module (SUM).

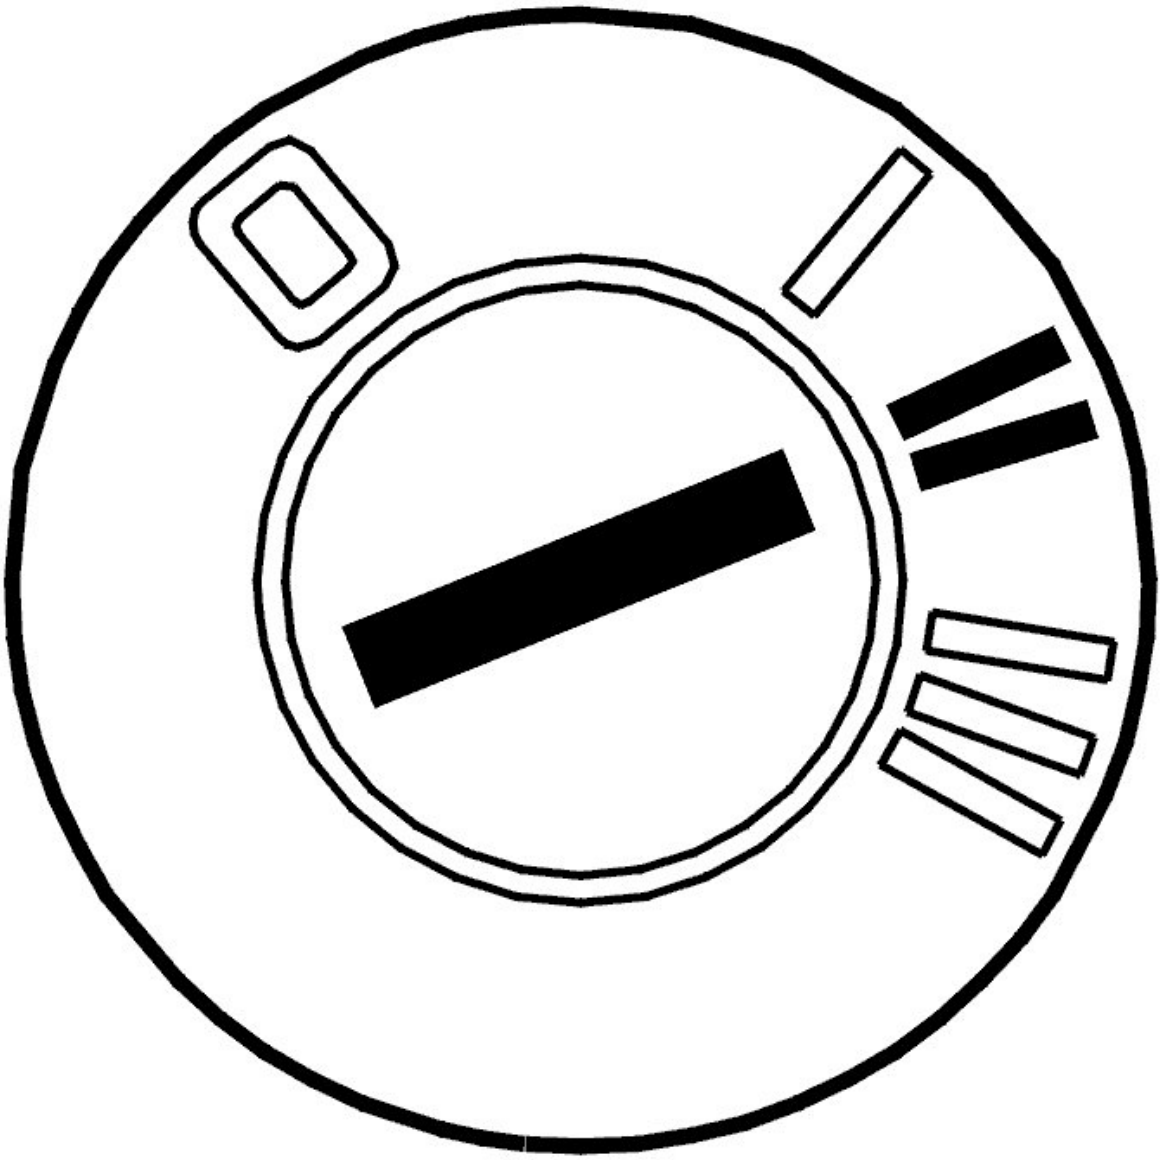
The voltage must be normal system voltage.

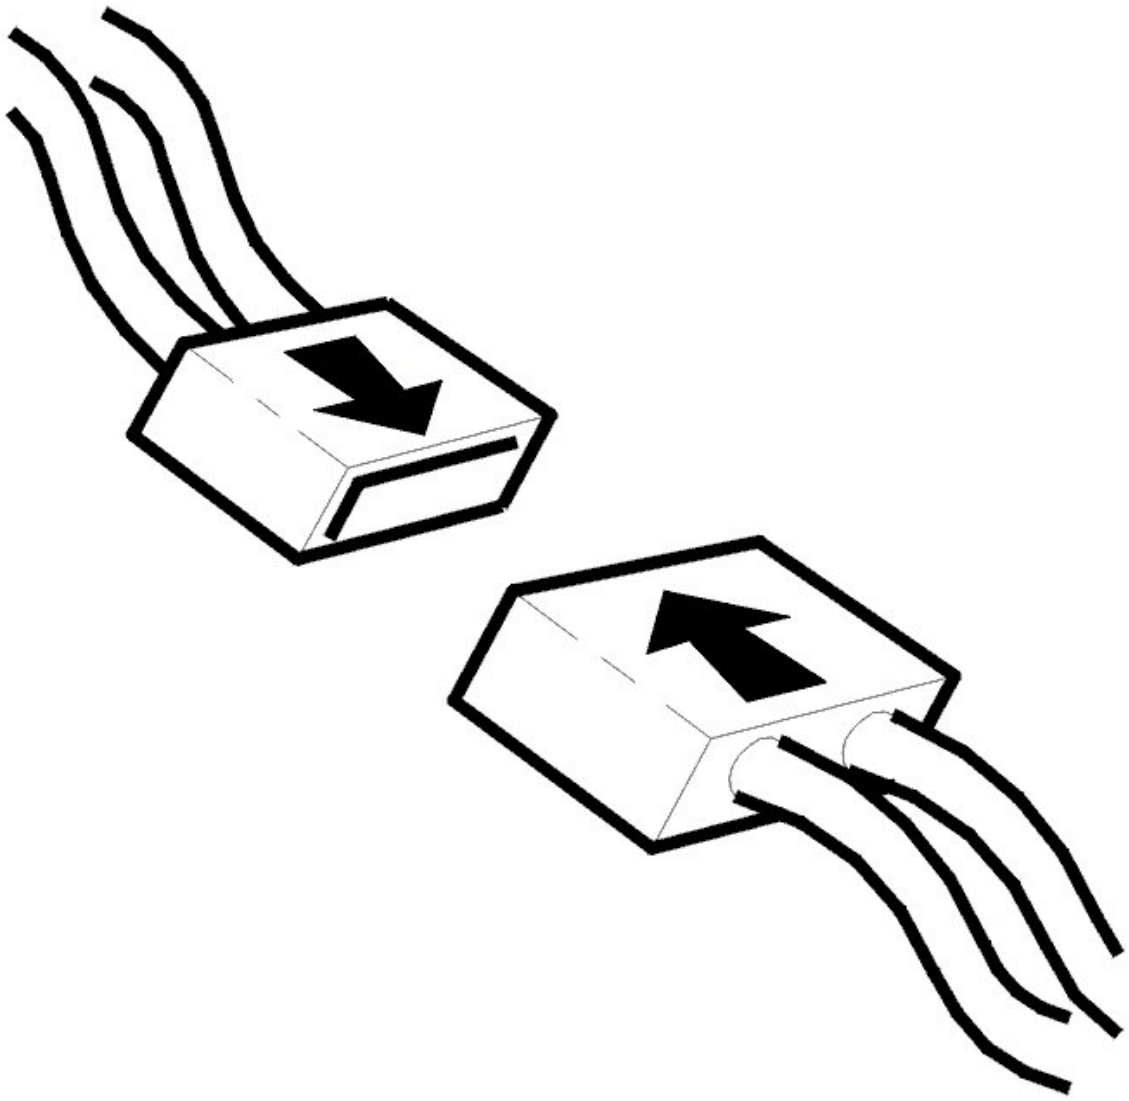
OK - **Fault Found**

Not OK - Fault-tracing information

Verification

Hint: After carrying out the repair, check that the fault has been remedied.





- Ignition off
- Reinstall the connectors, components etc.
- Ignition on.

Read off the voltage to the Suspension Module (SUM).

The voltage should be battery voltage.

OK - Fault Found

Not OK - Fault-tracing information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

Diagnostic trouble code (DTC) SUM-0202 is stored if the Suspension Module (SUM) registers that the battery voltage is too high when the ignition is switched on. The diagnostic trouble code (DTC) can be diagnosed when the ignition is on.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- The Four-C function is blocked.

Hint: For information about abbreviations for the suspension system, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source
- Fault in the charging system
- Defective control module.

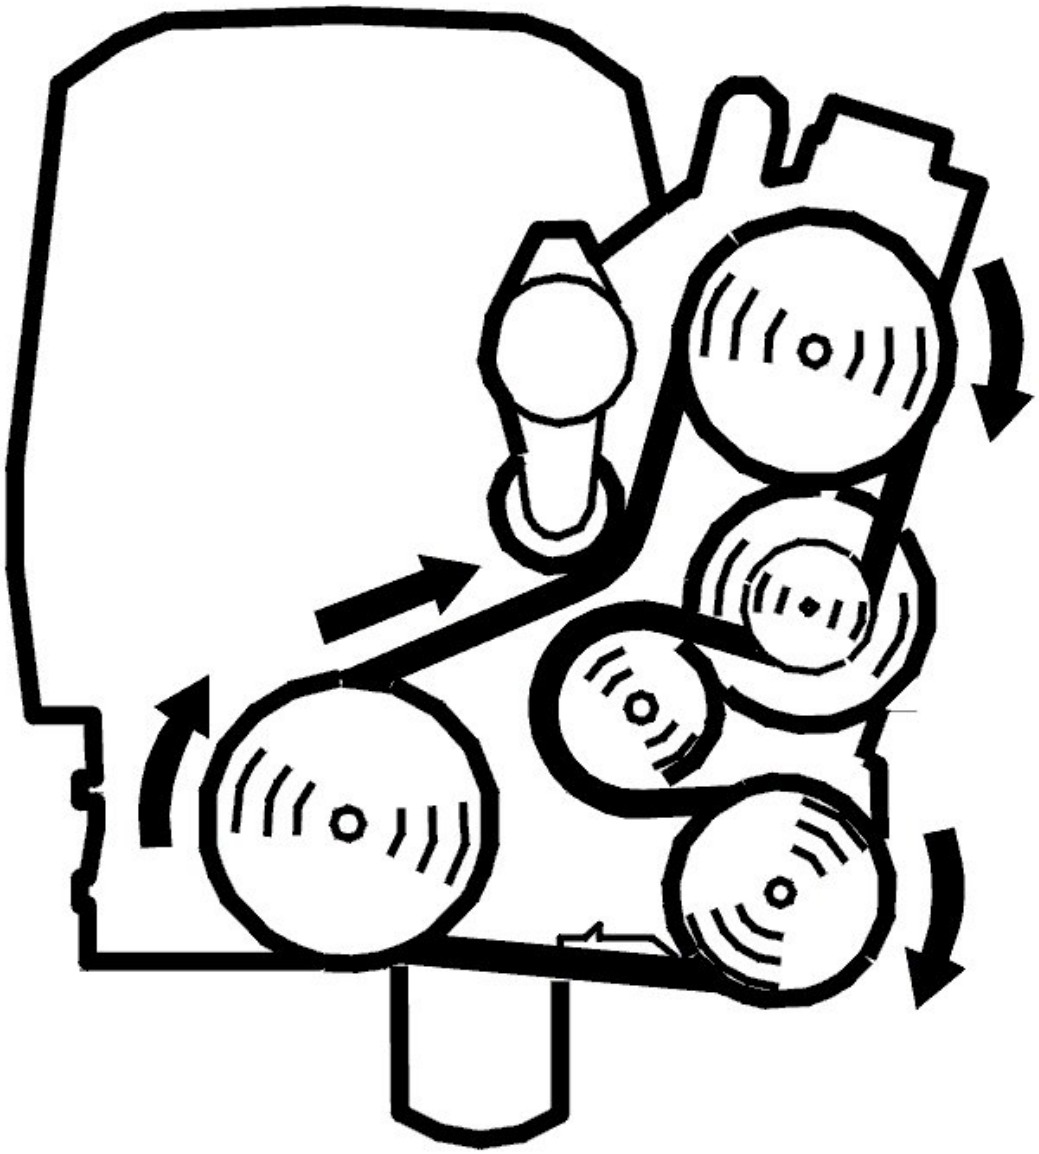
Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Note! If the fault is intermittent the ABS warning lamp will not go out until the vehicle speed exceeds 10 km/h in the next operating cycle.

Voltage Too High

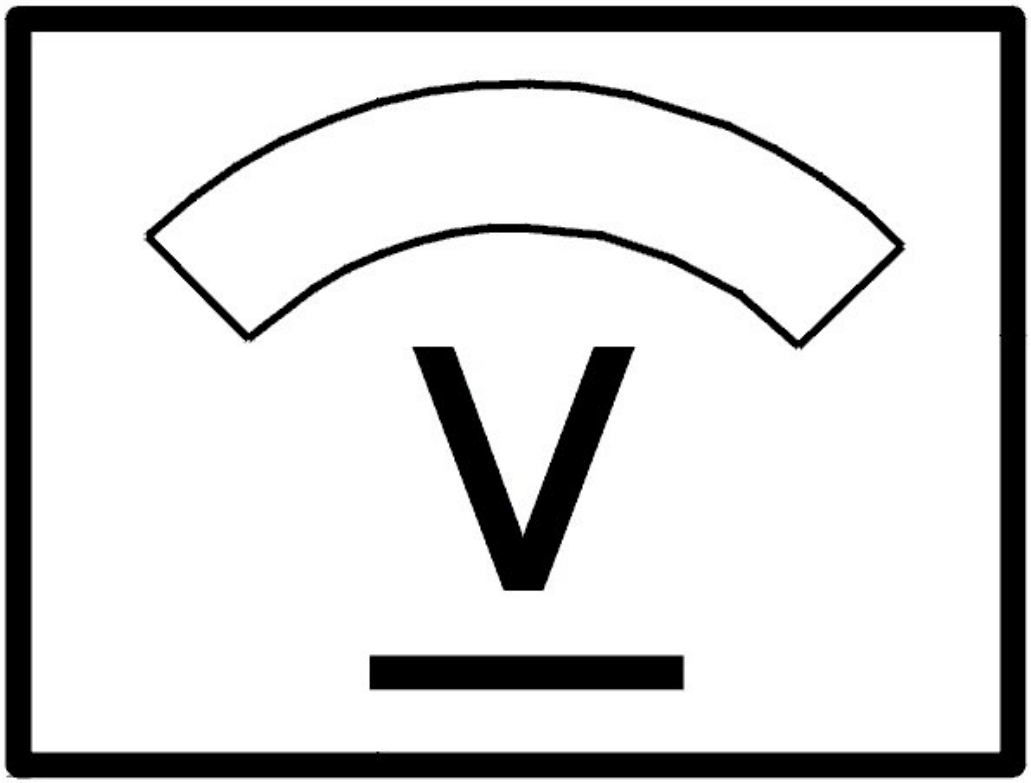
Voltage too high

Checking the battery voltage



- Start the engine and let it run at idle speed
- Connect a voltmeter between the battery positive and negative terminals.

The voltage must be normal system voltage.
If the voltage is too high, check the charging system according to the relevant information.



Was the voltage too high?

Yes - Fault Found

No - Fault-tracing information

The fault-tracing indicates that the control module has previously registered a fault but that the fault is no longer active.

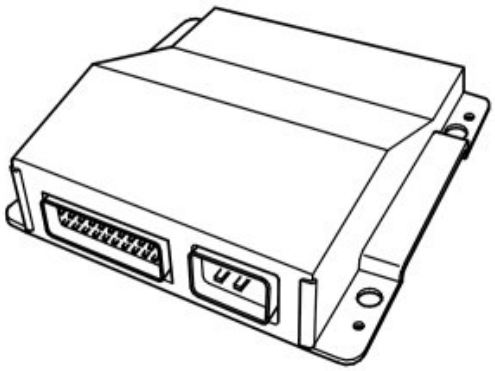
Continue - No Fault Found

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Diagnostic trouble code (DTC) SUM-0203 is stored if the suspension module (SUM) registers that the difference in voltage between the central electronic module (CEM) and the suspension module (SUM) is greater than 2 V.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- Four-C control is switched off.

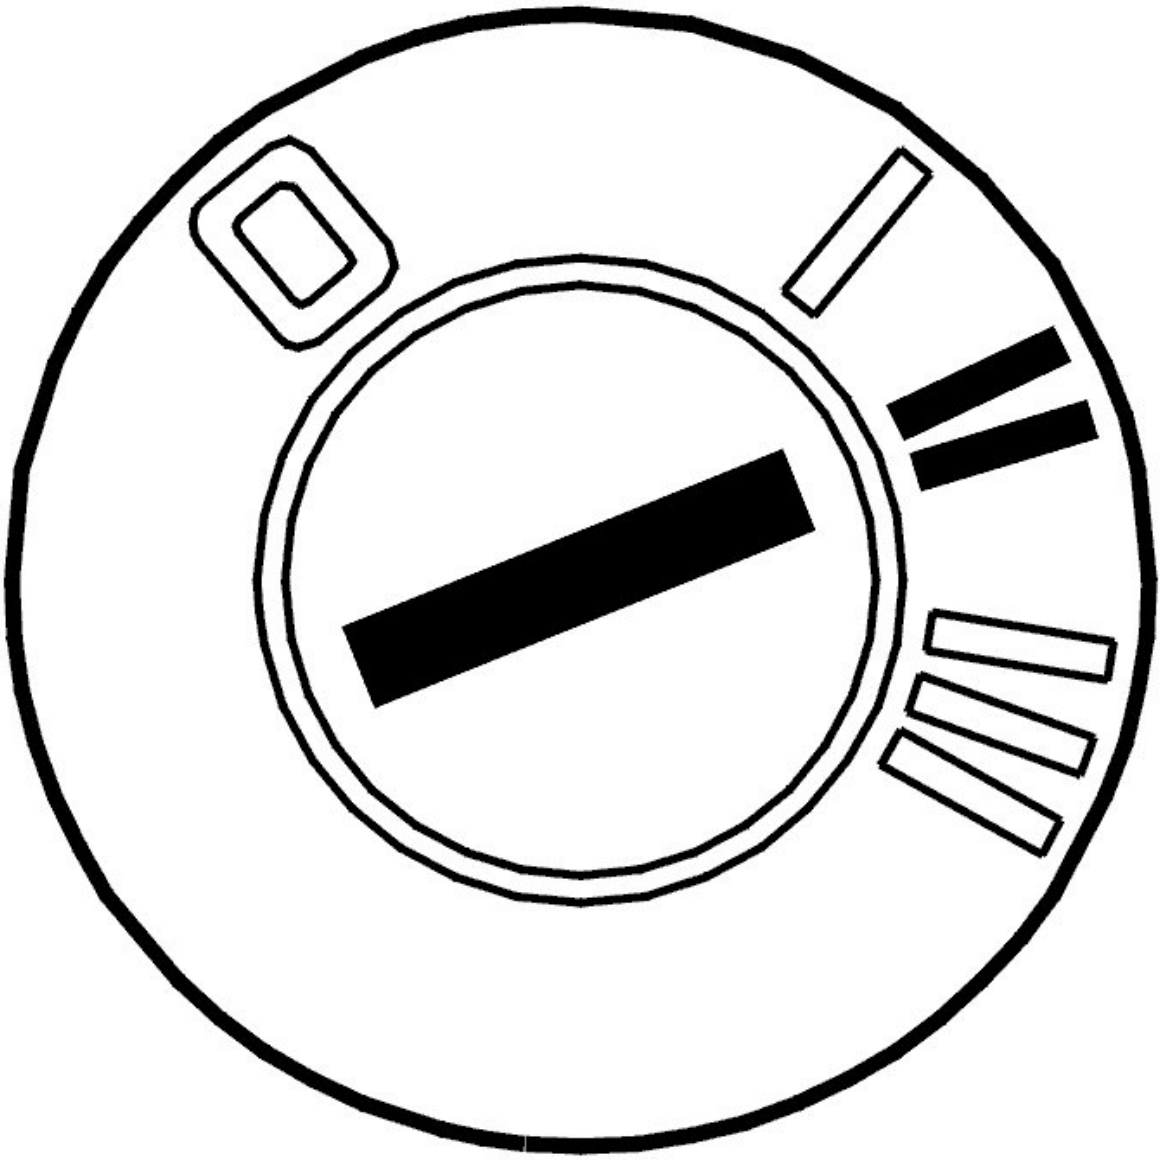
Possible source
- Contact resistance or oxidation in the connectors on the suspension module (SUM) or central electronic module (CEM)
- Internal fault in the control module.

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Faulty Signal

Faulty signal

Checking the voltage



- Ignition off
- Disconnect the connector for the suspension module (SUM)
- Disconnect the connector for the central electronic module (CEM)
- Check these connectors. Check for contact resistance and oxidation
- Reinstall the components, reconnect the connectors etc.
- Ignition on
- Read off the voltage for the suspension module (SUM) and the central electronic module (CEM).

The voltage must be approximately 12 V.

Other information:

- To disconnect the connector for the suspension module (SUM), see Suspension module (SUM), replacing See: Relays and Modules/Relays and Modules - Steering and Suspension/Relays and Modules - Suspension/Suspension Control Module/Service and Repair
- To disconnect the connector for the central electronic module (CEM), see Central electronic module (CEM), replacing See: Body Control Module/Service and Repair/Central Electronic Module (CEM), Replacing

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

Diagnostic trouble code (DTC) is stored if the suspension module (SUM) registers that there is no control of the circuit for power supply to the solenoids. The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- Four-C (Continuously Controlled Chassis Concept) control is switched off.

Hint: For information about abbreviations, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

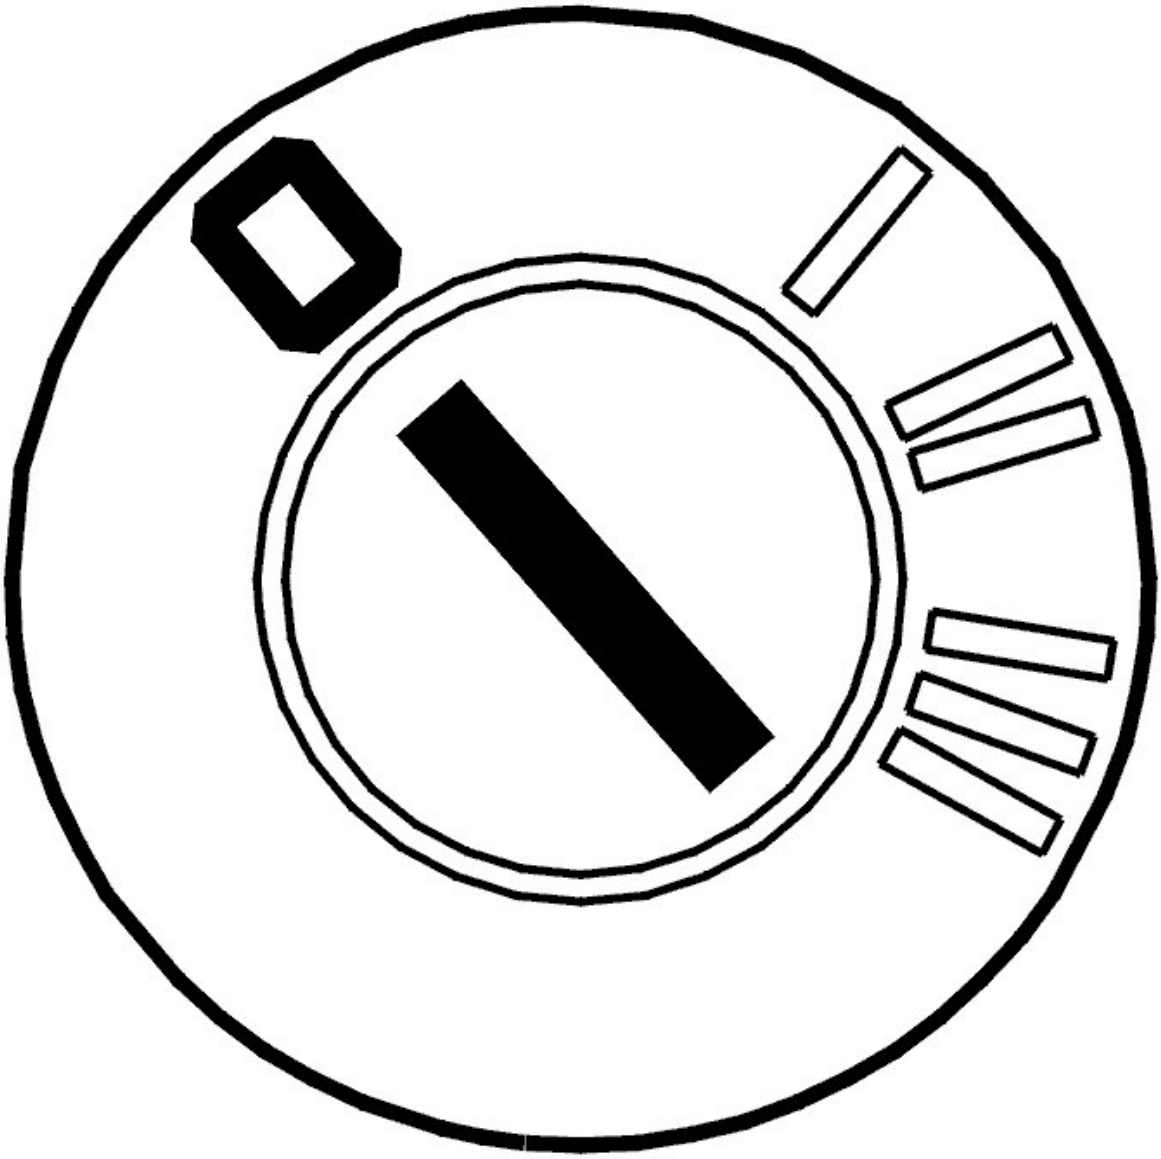
Possible source
- Short-circuit to ground in the power supply cable for one of the solenoids
- Short-circuit to ground in one of the solenoids
- Damaged control module.

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C (Continuously Controlled Chassis Concept) does not work.

Internal Fault

Internal fault

Checking components and wiring



- Ignition off.

Check the connectors for the Suspension Module (SUM) and the solenoids. Check for contact resistance and oxidation.

For diagnostic trouble code (DTC) SUM-0207, control module, internal fault:

- Check the cable for power supply between suspension module (SUM) terminal #A6 and front left solenoid terminal #1. Check for a short-circuit to ground
- Check the cable for power supply between suspension module (SUM) terminal #A9 and front right solenoid terminal #1. Check for a short-circuit to ground
- Check the cable for power supply between suspension module (SUM) terminal #A2 and rear left solenoid terminal #1. Check for a short-circuit to ground
- Check the cable for power supply between suspension module (SUM) terminal #A5 and rear right solenoid terminal #1. Check for a short-circuit to ground.

Check all the solenoids by measuring the resistance between terminals #1 and #2. Check for a short-circuit.
Try a new control module if no fault is found in the wiring or solenoids.
Remedy as necessary.

Reading off diagnostic trouble codes (DTCs)

Click on the VCT2000 symbol to read off the diagnostic trouble codes (DTCs).
Diagnostic trouble code (DTC) SUM-0220/SUM-0222 must have been erased if the calibration was successful.

Is the diagnostic trouble code (DTC) erased?

Yes - **Fault Found**

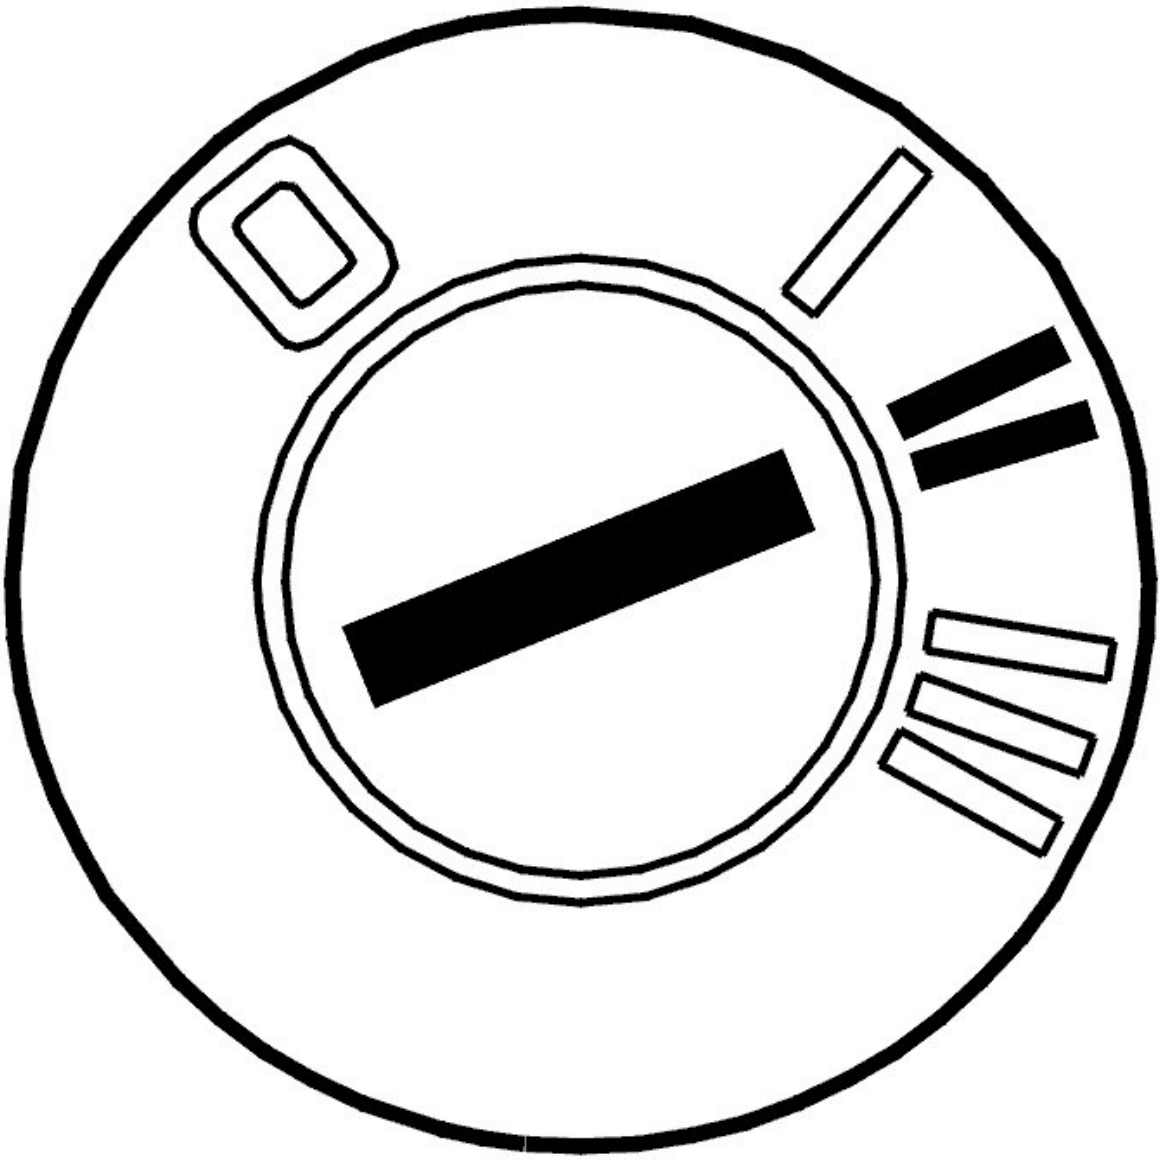
No - Fault-tracing information

Calibrating the system

Calibration

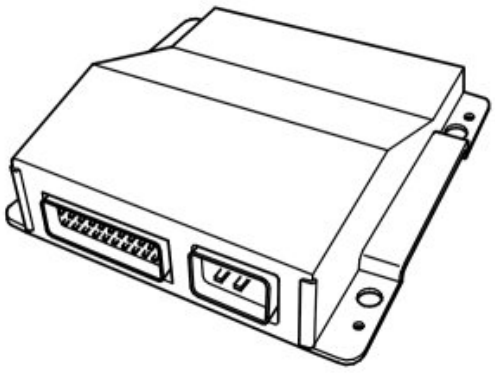
Note! In order for the Four-C function to work correctly after repair, the adaptive data in the Suspension Module (SUM) must be calibrated after replacing:

- control module
- the shock absorber
- the position sensor for the rear suspension.



- The car and its components must be kept at room temperature if the calibration is to be correct
- Ensure that the car is not loaded and on a flat surface with the wheels pointing straight ahead
- Ignition on.

Calibrate the control module by clicking the VCT2000 symbol.



Continue - **DONE**

Numeric Result 0 - Communication fault

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Communication fault

Communication has been interrupted for one of the following reasons:
- The ignition is switched off
- VCT2000 disconnected from the data link connector (DLC)
- VCT2000 disconnected from the VIDA cart
- Communication problems in VIDA application or in car.
- No voltage in the data link connector (DLC).

Check therefore:
- That the control module power supply and ground terminal are fault-free.
- That the fuse for the data link connector (DLC) is intact.
- that the ignition is on
- that the battery voltage (system voltage) is normal (approximately 12 V).

If necessary a battery charger can be connected during the test.
For information about charge currents and the battery, see: Battery, charging See: Starting and Charging/Battery/Service Precautions/Technician Safety Information/Battery, Charging
- that VCT2000 is correctly connected to the VIDA cart and the data link connector (DLC)
- that VCT2000 and the wiring is fault-free.

Other information
- For information about fuse and terminal numbers, see the relevant Wiring Diagram.

Try to establish communication again or exit reading off diagnostic trouble codes (DTCs). Depending on the communication fault, select one of the following options.
1. Try again
2. Fault-trace more comprehensively for the communication problem that has occurred
3. Exit fault-tracing / Read off from the next system.

Which alternative is requested?

1 - Calibration

2 - Checking communication

3 - **FAILED**

Checking communication

Checking communication errors

Selecting car model

Select car model to obtain relevant troubleshooting information.

Select one of the following model alternatives
1. S40 (04-) / V50.
2. V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90.
3. V70 (-00), V70 XC and S70 / C70.
4. S40 (-04)/ V40.

1 - car model S40 (04-) / V50

2 - car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

3 - car model V70 (-00), V70 XC and S70 / C70

4 - Checking communication errors car model S40 (-04) / V40

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Checking communication errors, car model S40 (04-) / V50

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B11/ #B12 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B16/#B15 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

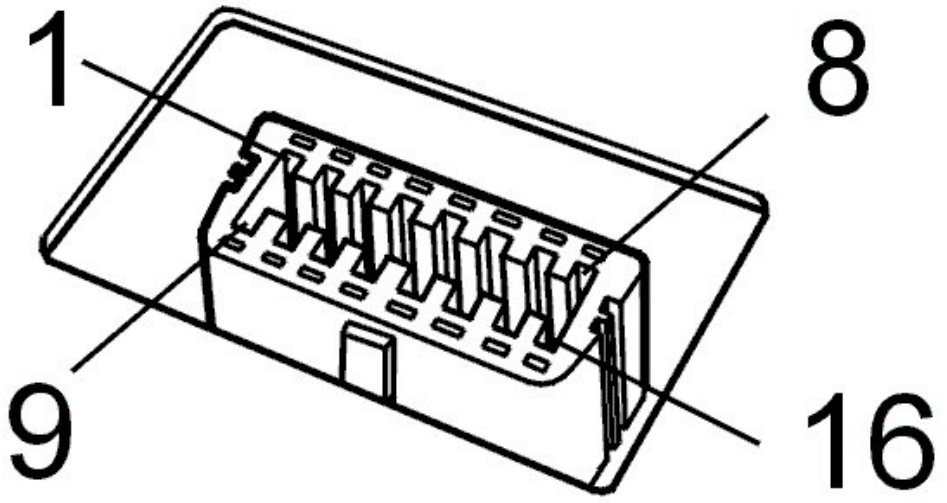
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information

- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



Continue - Fault Found

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Checking communication errors, car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.
- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on " Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".
If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:
- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:
- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM). This relay is only found on vehicles of model year -2004.

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/ #B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules
- Check that the control module's voltage feed and ground connection are trouble-free.

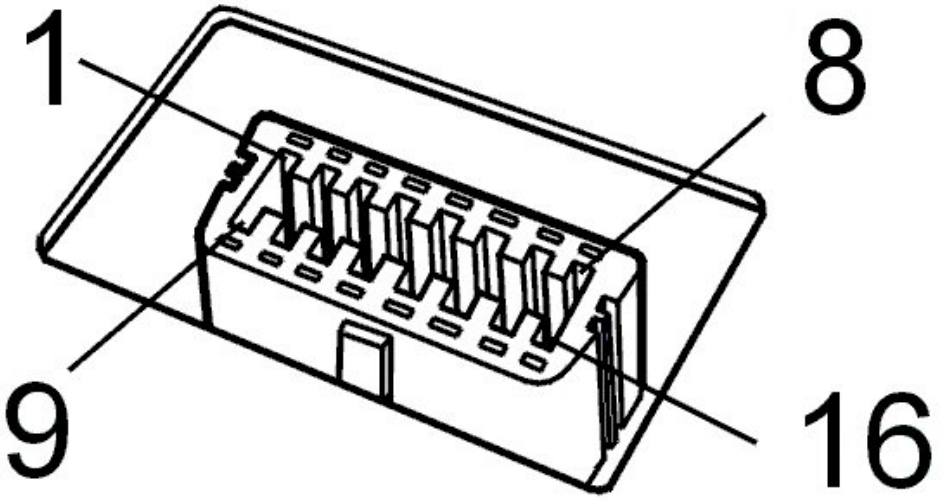
Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates

a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA
- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



Continue - Fault Found

Checking communication errors, car model V70 (-00), V70 XC and S70/C70

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- Check the communication cable (k-line) between diagnostic outlet #7 and the driver information module (DIM) #B4 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on the high-speed network. First when communication takes place on this cable, the high-speed cables between the diagnostic outlet and driver information module (DIM) are connected to the high-speed network in the vehicle. This is controlled via a relay in the driver information module (DIM).

- Check communication cables between diagnostic outlet #6/#14 and the driver information module (DIM) #A19/#A20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the**high-speed network**between the driver information module (DIM) and the other connected control modules according to troubleshooting above.

Communication cable for cruise control as own system (not integrated)
- Check the communication cable between diagnostic outlet #13 and cruise control for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Communication cable for engine management system Fenix 5.2
- Check the communication cable between diagnostic outlet #3 and engine control module (ECM) for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! Model year 99- and control modules on the CAN-network. If none of the above checks help, try reading out diagnostic trouble codes in the driver information module (DIM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the driver information module (DIM) is active and can be communicated with. If communication is not possible with the driver information module (DIM), check the voltage feed and ground for the control module.

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

Checking communication errors, car model S40 (04-) / V50

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet

- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B11/ #B12 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B16/#B15 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

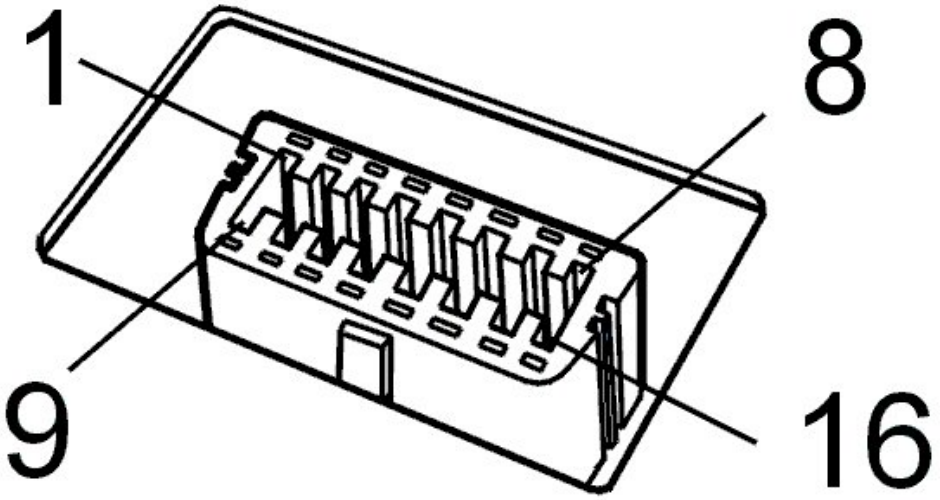
VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information

- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



Continue - Fault Found

Checking communication errors, car model V70 (00-), V70 XC (01-) / XC70, S60, S80 and XC90

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Different speed on the CAN-communication can lead to problems

Volvo's vehicles have different speed of communication on the high-speed part of the CAN-network (HS-CAN), depending on model year.
- Model year -2004 communicates with 250 kbit/s.
- Model year 2005- communicates with 500 kbit/s.

Due to this, it is very important to specify correct vehicle profile before any communication is started with the vehicle's HS-CAN. This is normally done by pressing on " Retrieve VIN" or by manually specifying vehicle parameters under "Vehicle profile".
If the wrong model year has been selected, it may lead to blocking of the CAN-net, diagnostic trouble codes being stored in several control modules or missing response from control modules at continued communication. The following control modules may be affected by this problem:
- Brake control module (BCM)/(ABS)
- Engine control module (ECM)
- Electronic Throttle Module (ETM)
- Suspension Module (SUM)
- Central electronic module (CEM)
- Transmission control module (TCM)
- Steering wheel angle sensor module (SAS)
- Steering Wheel Module (SWM)
- Electrical Power Steering Module (EPS)

If this happens, take the following action:
- Turn off the ignition and remove the ignition key. Insert the key again in position II.
- If the above does not work, remove the battery cable and connect it again after a minute to reset the control modules.
- Select the correct vehicle profile in VIDA and erase the diagnostic trouble codes. Check that the symptoms have disappeared.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables
- Check the communication cable (k-line) between diagnostic outlet #7 and central electronic module (CEM) #D6 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on either the low or high-speed network. First when communication takes place on this cable, the low and high-speed cables between the diagnostic outlet and central electronic module (CEM) are connected to the rest of the network in the vehicle. This is controlled via a relay in the central electronic module (CEM). This relay is only found on vehicles of model year -2004.

- For communication problems with control units on**the high-speed network**, check communication cables between diagnostic outlet #6/ #14 and central electronic module (CEM) #B7/ #B8 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- For communication problems with control units on**the low-speed network**, check communication cables between diagnostic outlet #3/#11 and central electronic module (CEM) #B19/#B20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the low and high-speed net between the central electronic module (CEM) and the other connected control modules according to troubleshooting above.

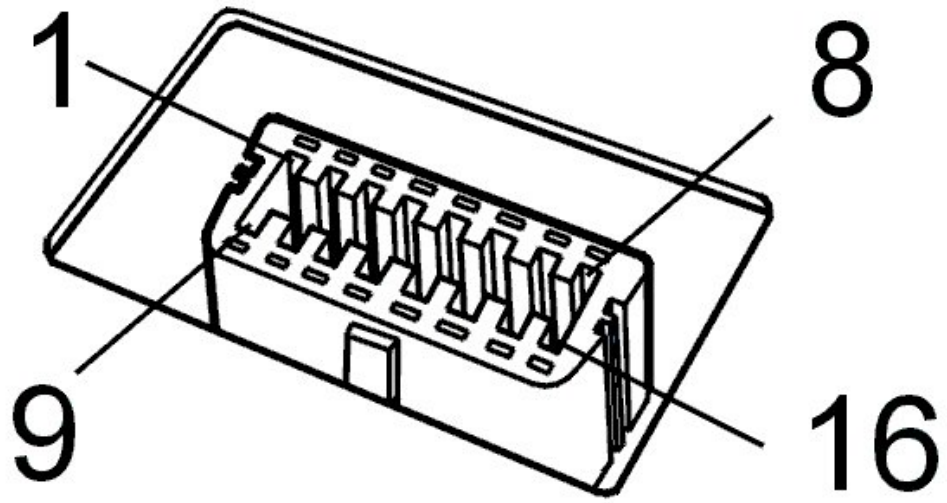
Control modules
- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! If none of the above checks help, try reading out diagnostic trouble codes in the central electronic module (CEM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the car is that the central electronic module (CEM) is active and can be communicated with. If communication is not possible with the central electronic module (CEM), check the voltage feed and ground for the central electronic module (CEM).

VCT2000 and cable harness
- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA
- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

Other information
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



Continue - Fault Found

Checking communication errors, car model V70 (-00), V70 XC and S70/C70

Hint: Test the communication with another corresponding vehicle to decide if the malfunction is in the vehicle or in VIDA/VCT/cable harness. If the communication works on another vehicle, the malfunction is in the vehicle.

Hint: For current information about each circuit and signals, see wiring diagram and signal description for each system.

Diagnostic outlet
- Check the voltage feed to diagnostic outlet #16. The voltage shall match battery voltage.
- Check the cable for power ground and signal ground to diagnostic outlet #4 and #5.

Hint: When VCT2000 is connected to the diagnostic outlet (is supplied with voltage), the indicator diode shall be activated with a green light. Then the indicator diode flashes quickly when communication takes place with a control module. In case of certain internal malfunctions on VCT2000 the indicator diode is activated with a red light!

Communication cables

- Check the communication cable (k-line) between diagnostic outlet #7 and the driver information module (DIM) #B4 and other connected control modules for open circuit, short-circuit to ground and short-circuit to voltage.

Caution! In case of malfunction on this communication cable, communication cannot be established on the high-speed network. First when communication takes place on this cable, the high-speed cables between the diagnostic outlet and driver information module (DIM) are connected to the high-speed network in the vehicle. This is controlled via a relay in the driver information module (DIM).

- Check communication cables between diagnostic outlet #6/#14 and the driver information module (DIM) #A19/#A20 for open circuit, short-circuit to ground and short-circuit to voltage according to references above.
- Also check the communication cables for the**high-speed network**between the driver information module (DIM) and the other connected control modules according to troubleshooting above.

Communication cable for cruise control as own system (not integrated)

- Check the communication cable between diagnostic outlet #13 and cruise control for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Communication cable for engine management system Fenix 5.2

- Check the communication cable between diagnostic outlet #3 and engine control module (ECM) for open circuit, short-circuit to ground and short-circuit to voltage according to references above.

Control modules

- Check that the control module's voltage feed and ground connection are trouble-free.

Caution! Model year 99- and control modules on the CAN-network. If none of the above checks help, try reading out diagnostic trouble codes in the driver information module (DIM). Done via VIDA vehicle communication. A prerequisite for being able to communicate with the control modules in the vehicle is that the driver information module (DIM) is active and can be communicated with. If communication is not possible with the driver information module (DIM), check the voltage feed and ground for the control module.

VCT2000 and cable harness

- Connect VCT2000 to the vehicle so that it is supplied with voltage. Test VCT2000 by selecting the system's self-test and VCT Test in the VIDA main menu. If any malfunction is found according to the test, first replace the cable harness then the VCT2000, if the test still indicates a malfunction.
- If no malfunctions were found after troubleshooting according to above, try with a new cable harness and/or new VCT2000.

VIDA

- If no malfunctions were found after troubleshooting according to above, try performing a complete system reset of VIDA.

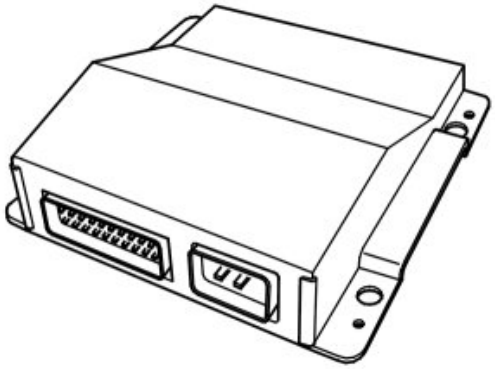
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



The Suspension Module (SUM) must be calibrated after repair or after new software is downloaded. Diagnostic trouble code (DTC) SUM-0223 is stored if a value is incorrect when calibrating the solenoids on the shock absorbers.
The diagnostic trouble code (DTC) can be diagnosed when the ignition is switched on.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- None.

Hint: For information about abbreviations, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

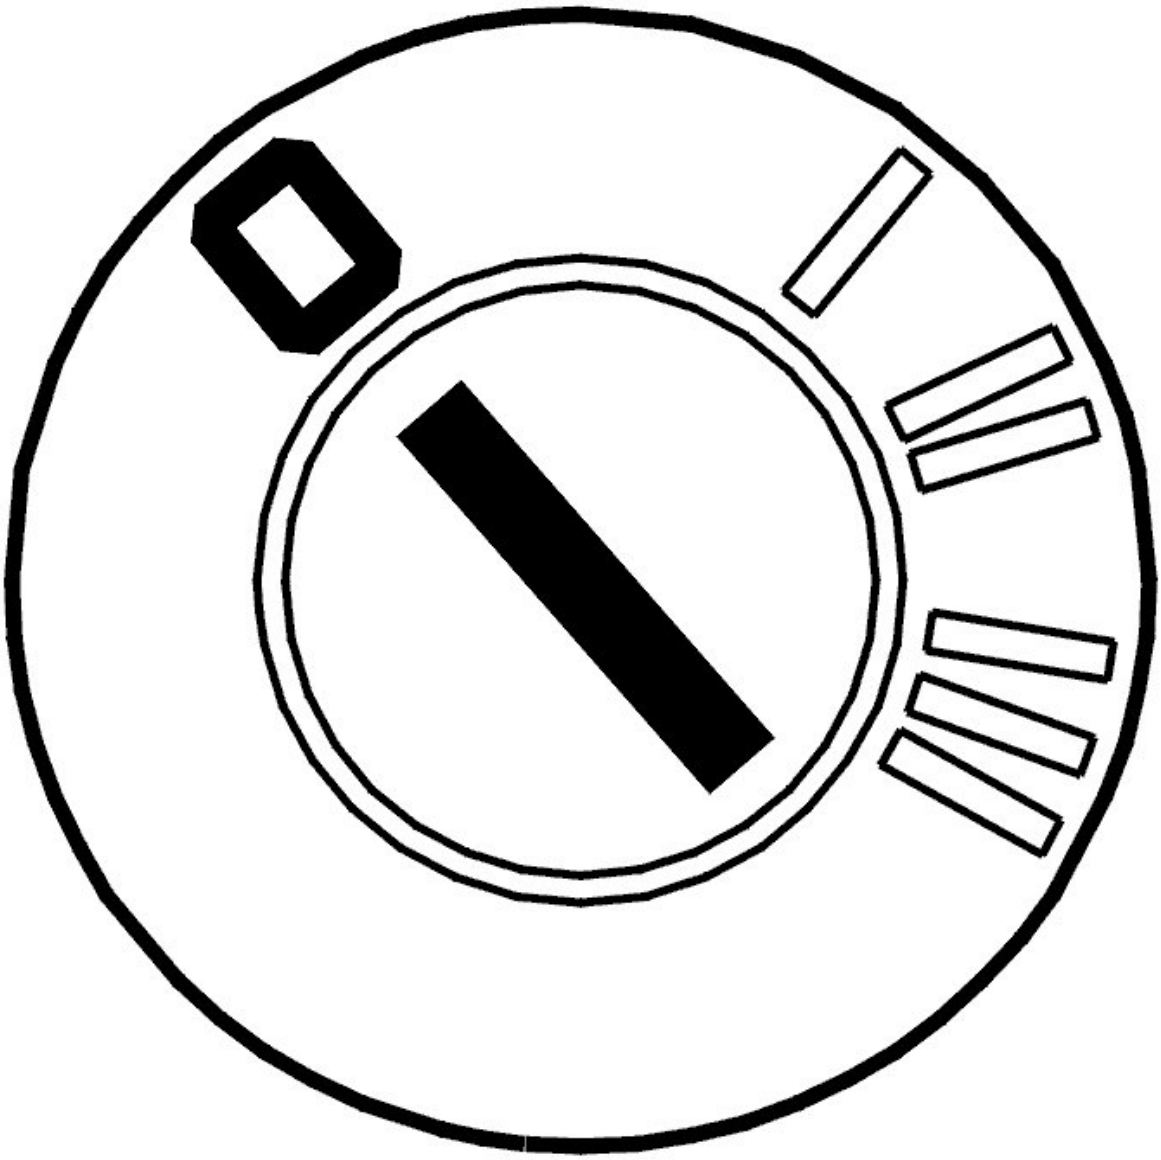
Possible source
- Open-circuit in the cable for the shock absorber
- Fault in one of the solenoids
- Internal fault in the Suspension Module (SUM).

Fault symptom[s]
- General warning lamp lit
- Message in the display.

Non-Approved Value

Non-approved value

Checking components and wiring



- Ignition off.
- Check the connectors for the Suspension Module (SUM) and the solenoids. Check for contact resistance and oxidation
- Check the wiring between the control module and the solenoids. Check for an open-circuit
- Check that the solenoids are correctly installed.

Remedy as necessary.

After this fault-tracing, the control module must be calibrated according to VIDA vehicle communication. Select Pause. Then save a bookmark so that the fault-tracing can be resumed from this point.

Other information:

- To replace the front solenoid/shock absorber, see Shock absorber front, replacing, M58, M66 AWD, AW50/51 AWD See: Steering and Suspension/Suspension/Shock Absorber/Service and Repair/Front Suspension/Shock Absorber Front, Replacing

Diagnostic trouble code (DTC) information

Condition

Diagnostic trouble code (DTC) SUM-0322 is stored if there is a fault in the communication between the Suspension Module (SUM) and the central electronic module (CEM).

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value

Four-C control is switched off.

Possible source
- Communication problems in the CAN network
- Defective Suspension Module (SUM)
- Defective central electronic module (CEM).

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Fault-Tracing Information

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

The control modules in the car communicate with each other in a network via a standardized serial communication interface - Controller Area Network (CAN) - to exchange information. Diagnostic trouble code (DTC) SUM-E000 is stored if the Suspension Module (SUM) registers that there is no CAN communication.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- CAN communication is disabled
- Four-C control is blocked.

Hint: For information about abbreviations, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source
- Contact resistance in the terminals
- Open-circuit in one or both signal cables
- Short-circuit to ground, voltage or each other in one or both signal cables
- Defective Suspension Module (SUM).

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal missing

General information

Note! Figures shown are only examples.

Hint: For general information about CAN-troubleshooting, see:
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

General about CAN-related diagnostic trouble codes.
CEM-DF01 - DF17can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.
CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.
XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.
XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

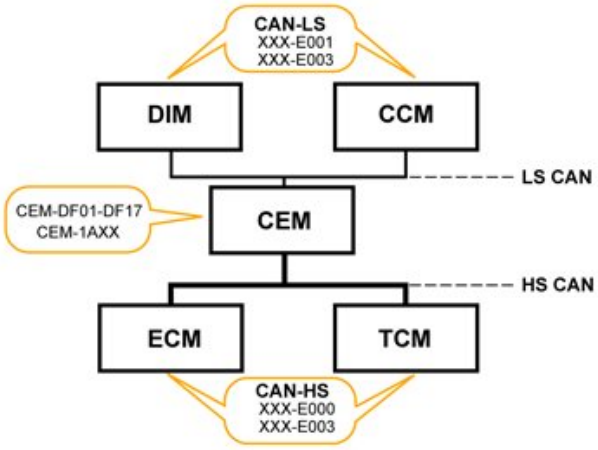
Note! In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

If a communication diagnostic trouble code can be read from the control module, the malfunction is probably intermittent.
Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

Note! Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.

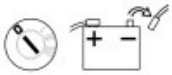
Caution! During this fault-tracing use the wiring diagram to provide support when taking readings.



Select "Continue".

Continue - Checking resistance in CAN-net

Checking resistance in CAN-net



- Ignition off
- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #14. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

Hint: For HS-CAN (High Speed) the terminating resistors are located in Brake control module (BCM) and in Engine control module (ECM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

Note! Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules. See wiring diagram for vehicle model in question.Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

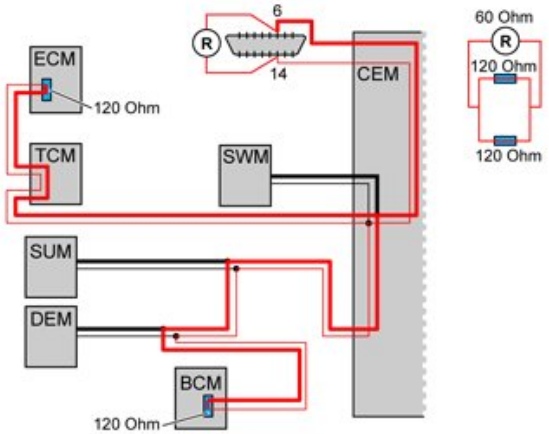
Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

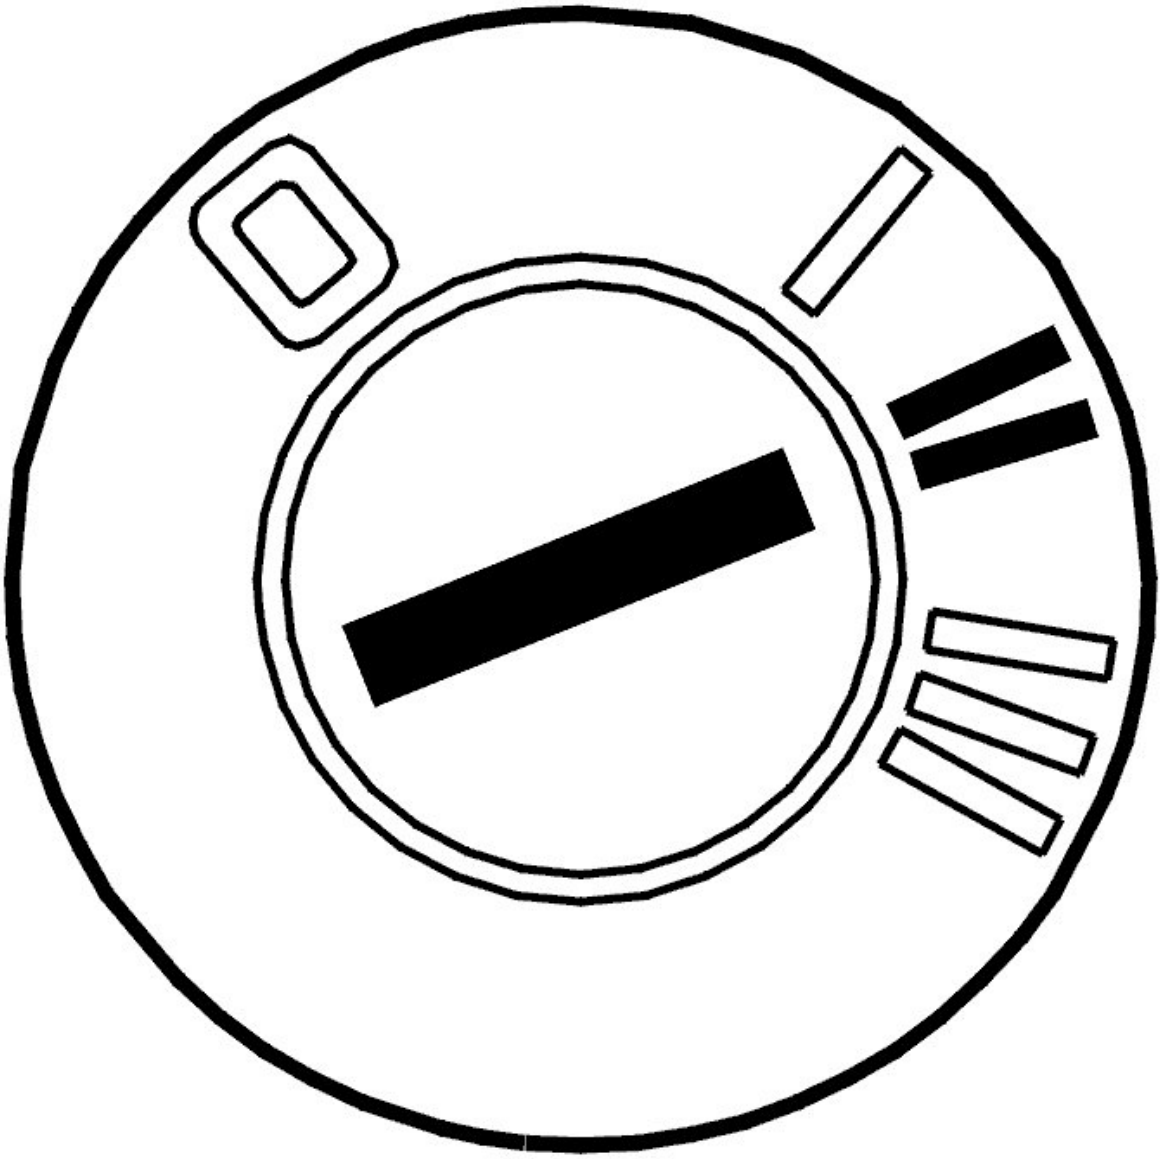


Was a fault detected?

Yes - Verification

No - Checking short-circuiting to ground/voltage in CAN-net

Checking the traffic load on the CAN cables



- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.
For further information, see the wiring diagram.
Measure voltage between the following connections on the OBDII-box/diagnostics socket.
- #6 and #4 (ground). The voltage should be approx: 2,8 - 3,2 V.
- #14 and #4 (ground). The voltage should be approx: 1,8 - 2,2 V.
- #6 and #14. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Hint: DiCE Error Frame Finder can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools: **951 3010** (memory card) as well as associated TJ 20402.

- Ignition on.
- Connect DiCE Error Frame Finder to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

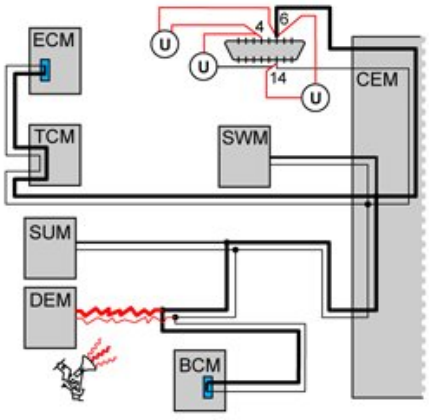
Note! Certain interference may occur without any real fault!

Cable fault
- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules
- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Other information
- Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals



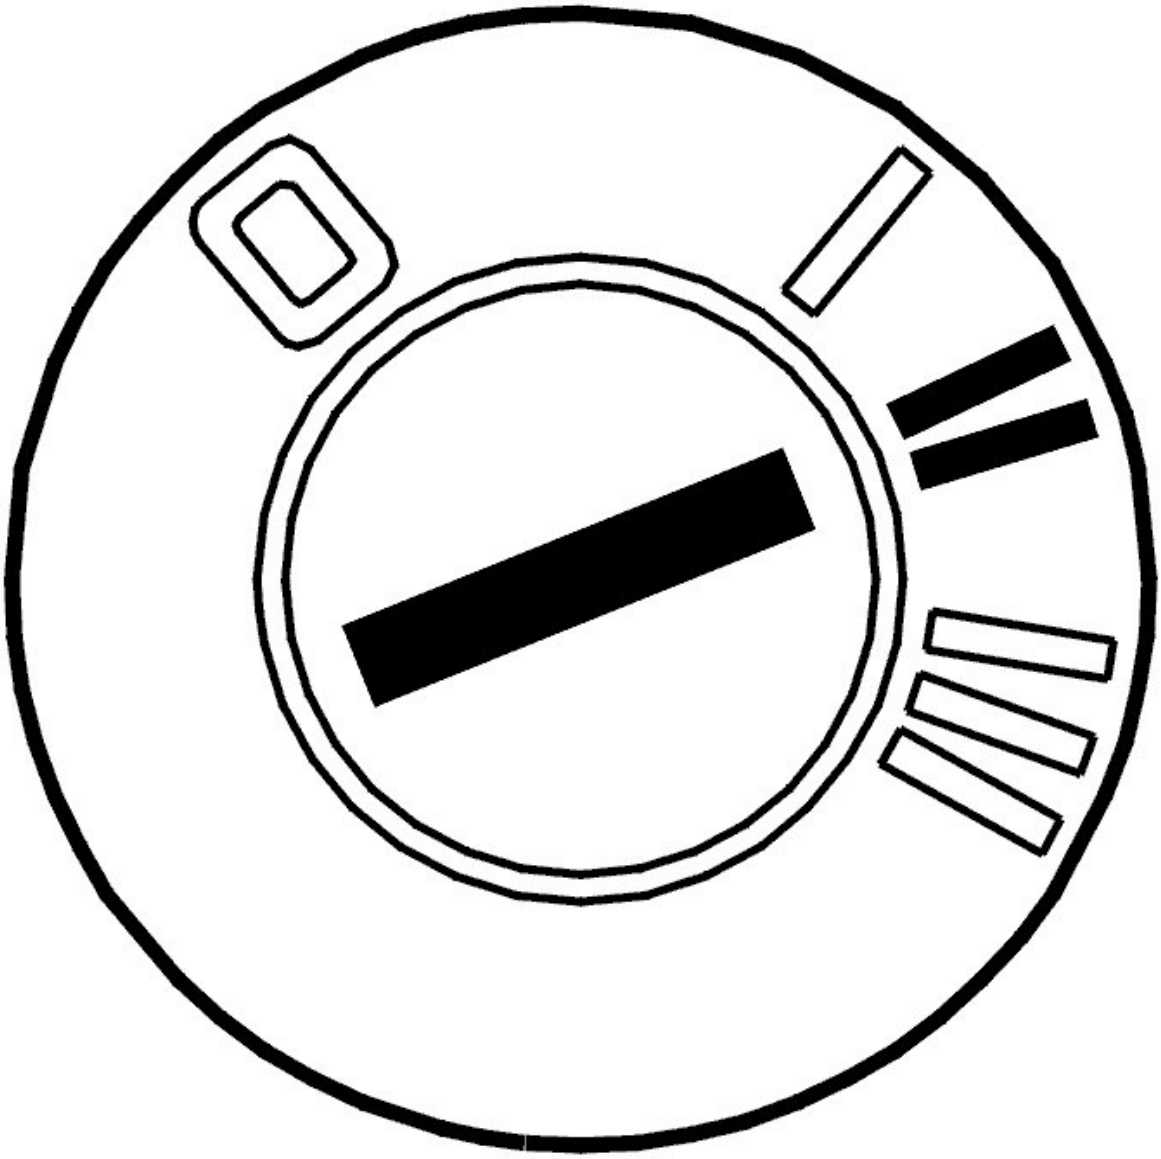
Was a fault detected?

Yes - Identifying a control module in the CAN network

No - respectively

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

Identifying a control module in the CAN network



Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:

- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Hint: DiCE Error Frame Finder can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools: **951 3010** (memory card) as well as associated TJ 20402.

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Note! It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating faultily. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections

on the OBDII-box/diagnostics socket.

- #6 and #14. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

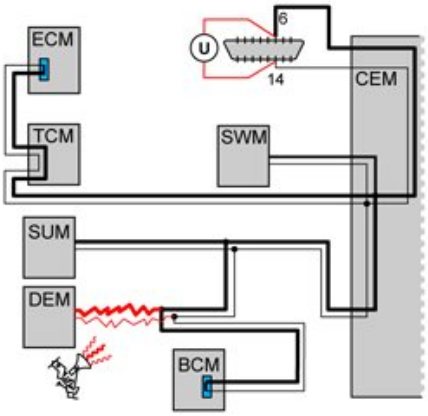
Note! When connecting and disconnecting individual control modules, other diagnostic trouble codes (DTCs) may be stored in certain control modules.

Hint: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and disappears. Switch off the ignition between each check.

Note! Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

A control module that is communicating incorrectly must be replaced. See Repairing and installing/Removing, replacing and installing.

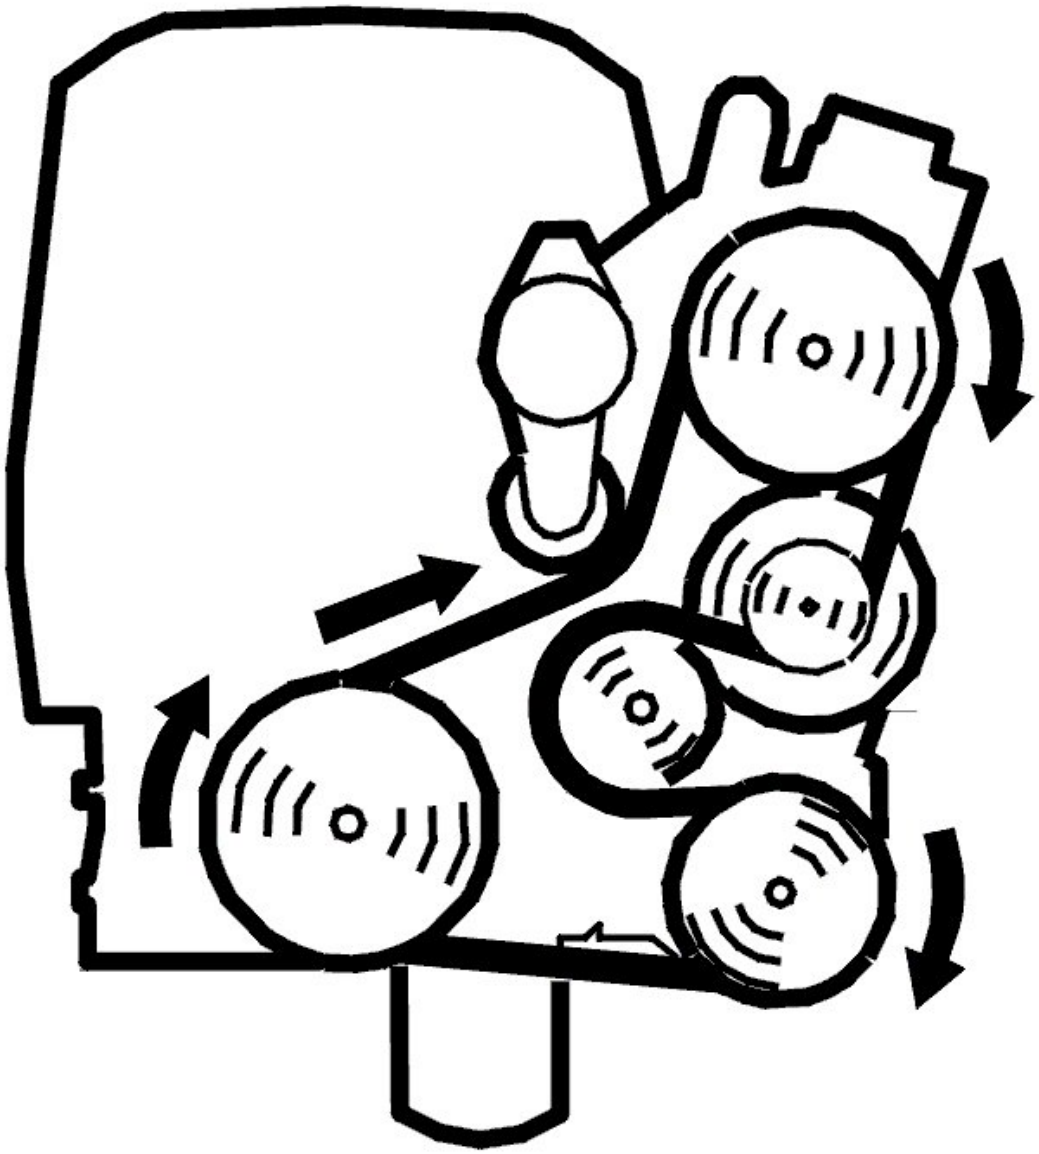
Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

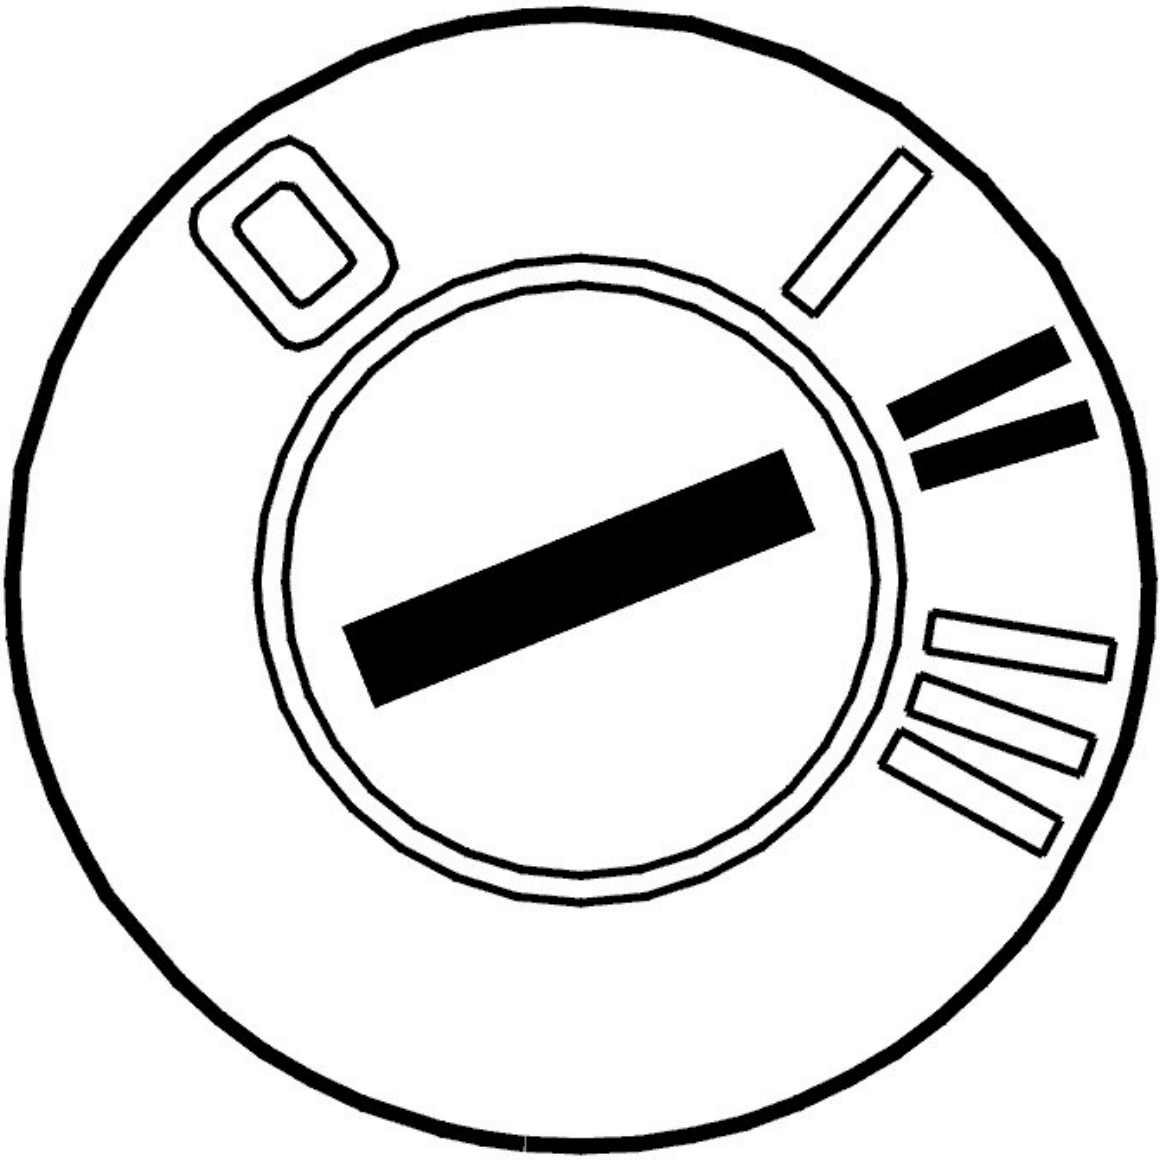


Continue - Verification

Verification

Hint: After rectifying a fault, a verification should be carried out.





- Reinstall the connectors, components etc.
- Ignition on.

Note! For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes.
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

Yes - Fault-tracing information

No - Fault Found

Fault-tracing information

Information

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

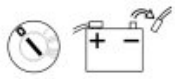
Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - FAULT-TRACING FAILED

Attempt New Test - General information

Checking short-circuiting to ground/voltage in CAN-net



- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Checking for a short-circuit to ground

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #4 (ground). Measurement is shown in the figure. The resistance should be above 1 kohms.
- #14 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #16 (voltage). Measurement is shown in the figure. The resistance should be above 1 kohms.
- #14 and #16 (voltage). The resistance should be above 1 kohms.

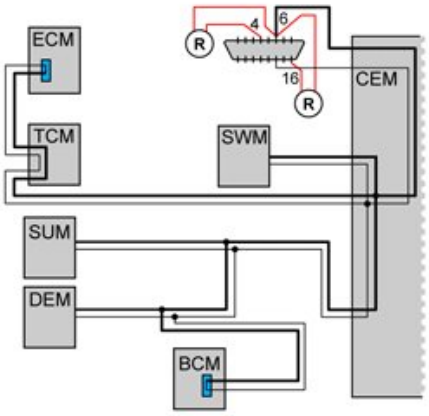
If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.
Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

Hint: Part the CAN-net at suitable points to decide where a short-circuit may be found.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

Other information
- Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals

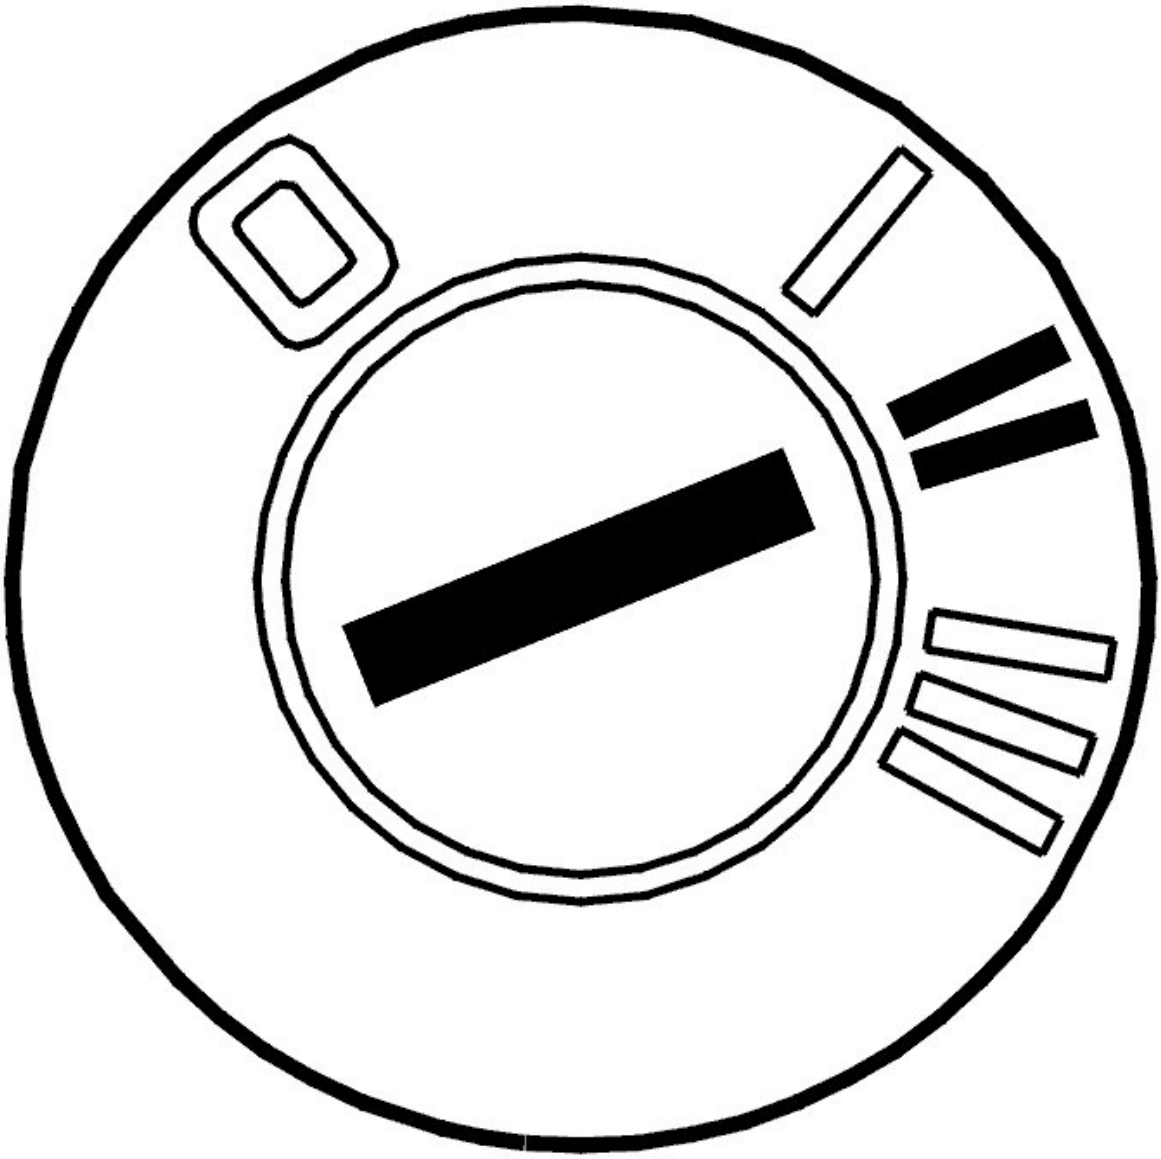


Was a fault detected?

Yes - Verification

No - Checking the traffic load on the CAN cables

Checking voltage-drop in cable for CAN-H and CAN-L, respectively



- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e.g., contact resistance in a connector or branching, communication may be lost/interfered with.
Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.
Carry out the following:
Measure voltage between the following connections on the OBDII-box/diagnostics socket.
- #6 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.
- #14 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

Other information

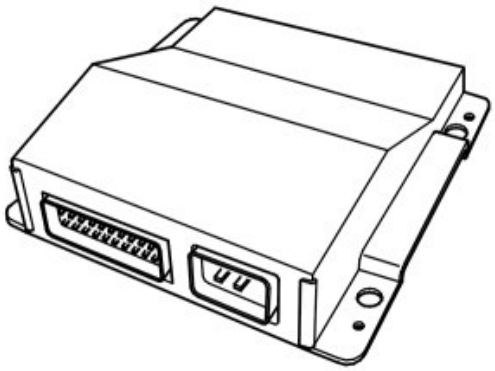
Continue - Verification

Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition

Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2



The control modules in the car continually transmit and receive information over the CAN (Controller Area Network) data network. Diagnostic trouble code (DTC) SUM-E003 is stored if the Suspension Module (SUM) registers that the network configuration ID is incorrect.

Note! The test is carried out every other operating cycle. The Suspension module (SUM) defines an operating cycle as ignition on and ignition off.

Substitute value
- Four-C control is blocked.

Hint: For information about abbreviations, see Suspension system, abbreviations See: Steering and Suspension/Suspension/Description and Operation.

Possible source
- Fault in the signal database between the Suspension Module (SUM) and the Central Electronic Module (CEM).

Fault symptom[s]
- General warning lamp lit
- Message in the display
- Four-C does not work.

Signal Missing

Signal missing

General information

Note! Figures shown are only examples.

Hint: For general information about CAN-troubleshooting, see:
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

General about CAN-related diagnostic trouble codes.
CEM-DF01 - DF17can only be stored in Central electronic module (CEM). These diagnostic trouble codes are stored when an electric fault is detected in CAN-lines. Start with these diagnostic trouble codes first.
CEM-1AXX only stored in Central electronic module (CEM). One diagnostic trouble code for every control module on the CAN-net. These diagnostic trouble codes indicate that Central electronic module (CEM) does not receive any reply from other control modules.
XXX-E000 (HS-CAN)/E001 (LS-CAN) can be stored in all CAN-connected control modules. These diagnostic trouble codes indicate that the control module has detected interference on the CAN-net.
XXX-E003 can be stored in all CAN-connected control modules except in Central electronic module (CEM). The control modules on the CAN-net listen for a message (identity number) that is sent out at regular intervals from Central electronic module (CEM). This diagnostic trouble code indicates that the control module has not received any identity number, or that the expected number is not correct. Interference on the CAN-net can also store this diagnostic trouble code.

Note! In case of CAN-related faults, it is likely that a combination of above diagnostic trouble codes occur.

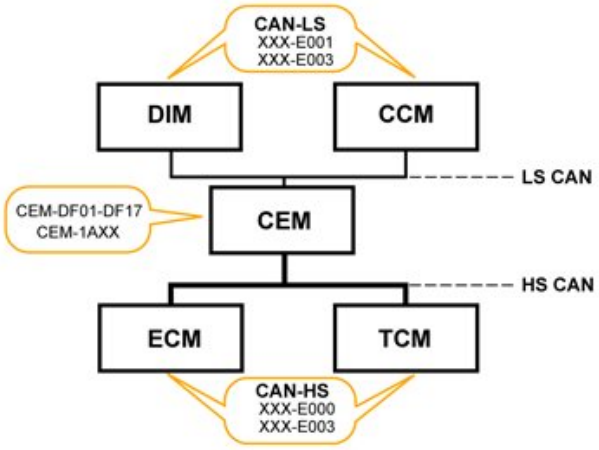
Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

If a communication diagnostic trouble code can be read from the control module, the malfunction is probably intermittent.
Intermittent fault in the voltage supply and ground to a control module on the CAN network results in the Central electronic module (CEM) storing a diagnostic trouble code (DTC) for an open-circuit in communication with the control module where the voltage supply does not work. There will probably not be a diagnostic trouble code (DTC) in the control module where the open-circuit in the voltage supply occurred as the control module

cannot store a diagnostic trouble code (DTC) when it is not supplied with power.

Note! Central electronic module (CEM) should not be replaced in case of CAN-fault, unless troubleshooting reveals that Central electronic module (CEM) has an internal fault.

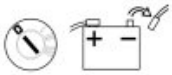
Caution! During this fault-tracing use the wiring diagram to provide support when taking readings.



Select "Continue".

Continue - Checking resistance in CAN-net

Checking resistance in CAN-net



- Ignition off
- Disconnect the battery negative lead
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #14. The resistance should be approx. 55 - 65 ohms.
- If resistance is approx. 120 ohms, this indicates open circuit in the circuit so that only one terminating resistor (120 ohms) has been measured.
- If resistance is above 1 kohms this indicates open circuit/high contact resistance somewhere in the circuit.
- If resistance is below 55 ohms this indicates short-circuiting/contact resistance between the CAN-lines somewhere in the circuit.

Hint: For HS-CAN (High Speed) the terminating resistors are located in Brake control module (BCM) and in Engine control module (ECM).

Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

Note! Resistance measurement measures only main lines in the CAN-net (in circuit where both terminating resistors are found), not branches to certain control modules. See wiring diagram for vehicle model in question.Open circuit on branching without a terminating resistor cannot be detected with this measurement. However, short-circuiting on a branch can be detected. To measure resistance in the CAN-net to control modules located in a branching of their own, the measurement shall be done against the CAN-net at that control module. The values shall be as above.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

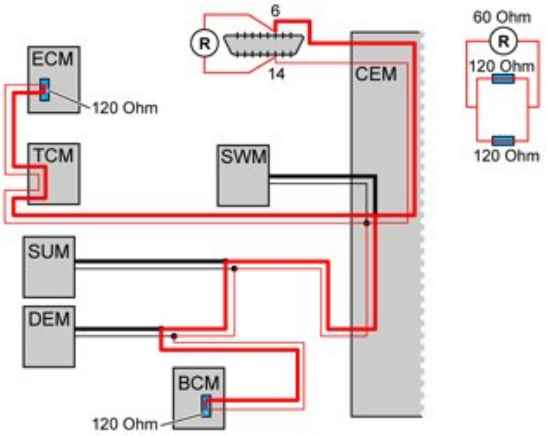
- Battery, disconnecting See: Starting and Charging/Battery/Service and Repair/Procedures/Battery, Disconnecting
- Checking wiring and terminals See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring And Terminals

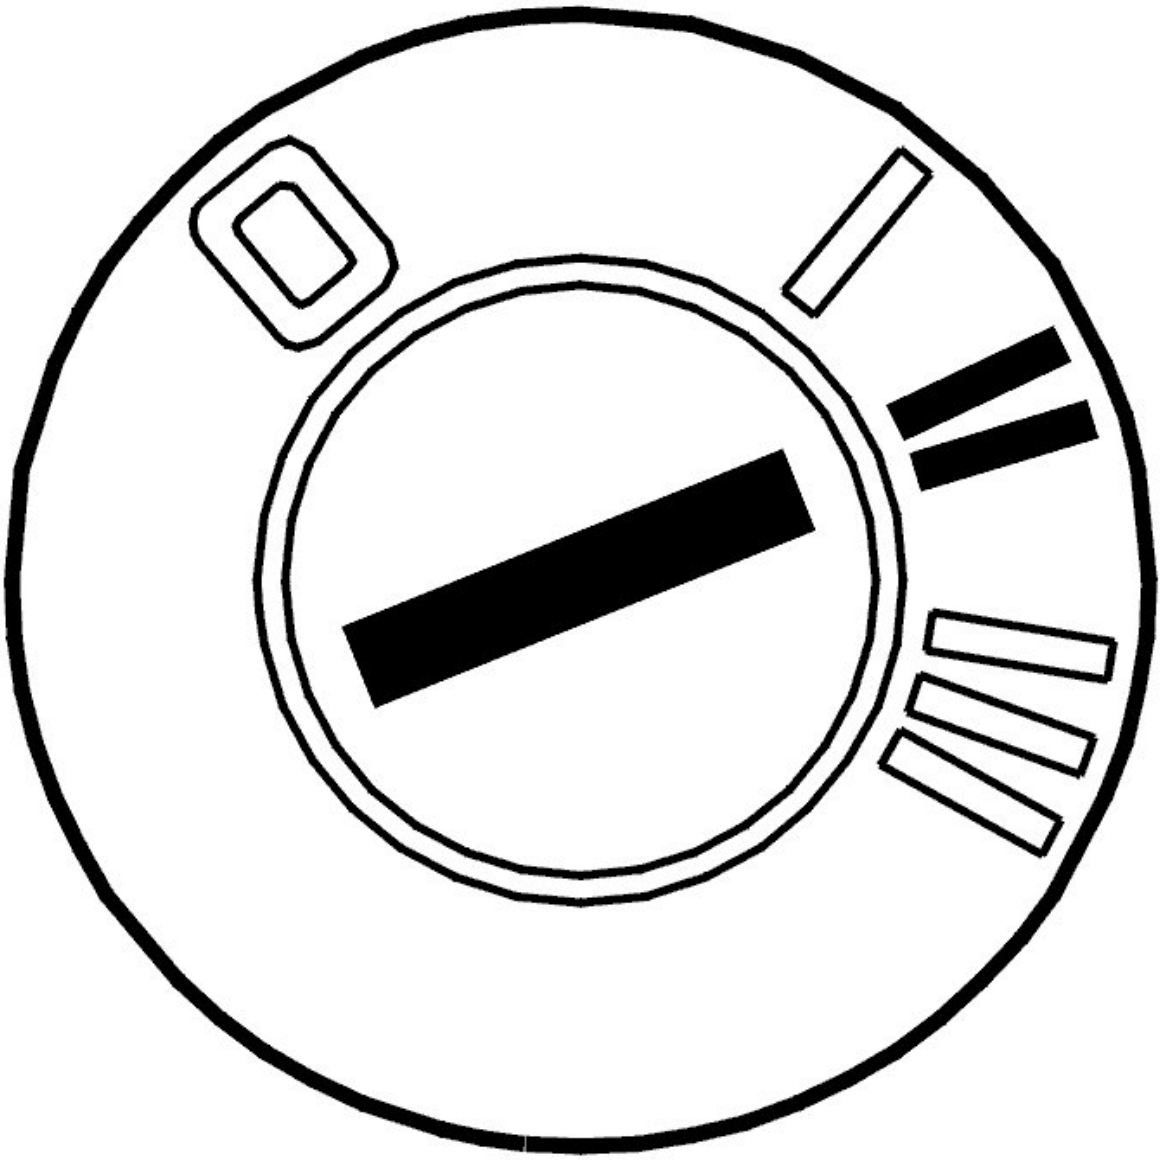


Was a fault detected?

Yes - Verification

No - Checking short-circuiting to ground/voltage in CAN-net

Checking the traffic load on the CAN cables



- Connect the battery
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Faults in the CAN network may be due to a control module sending faulty messages that disrupt normal communication. When messages are sent incorrectly, this results in a considerable increase in the amount of traffic on the CAN network. Check the load by measuring the average voltage value on the CAN cables in relation to ground.
For further information, see the wiring diagram.
Measure voltage between the following connections on the OBDII-box/diagnostics socket.
- #6 and #4 (ground). The voltage should be approx: 2,8 - 3,2 V.
- #14 and #4 (ground). The voltage should be approx: 1,8 - 2,2 V.
- #6 and #14. The voltage shall be between approx. 0.55-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Hint: DiCE Error Frame Finder can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools: **951 3010** (memory card) as well as associated TJ 20402.

- Ignition on.
- Connect DiCE Error Frame Finder to the diagnostics socket.
- Note the blue LED-indicator. The indicator flashes to show detection of fault messages.

Note! Certain interference may occur without any real fault!

Cable fault

- Shake the cables lightly and pull lightly on the connections during the check to locate any fault. Note the blue LED-indicator.

"Chatting" control modules

- "Chatting" control modules may be difficult to find and troubleshooting may take time. Let the vehicle stand with DiCE connected for an extended time period. Afterwards, activate functions to provoke a malfunction. It may take up to several hours before the fault messages are sent. When the indicator starts to flash, remove the fuse for one control module at a time until the indicator stops flashing. When the indicator stops flashing, restore the fuse for the relevant control module and check that the indicator starts to flash again. Then it is likely that the problem is identified.

Remedy wiring as necessary.

Other information

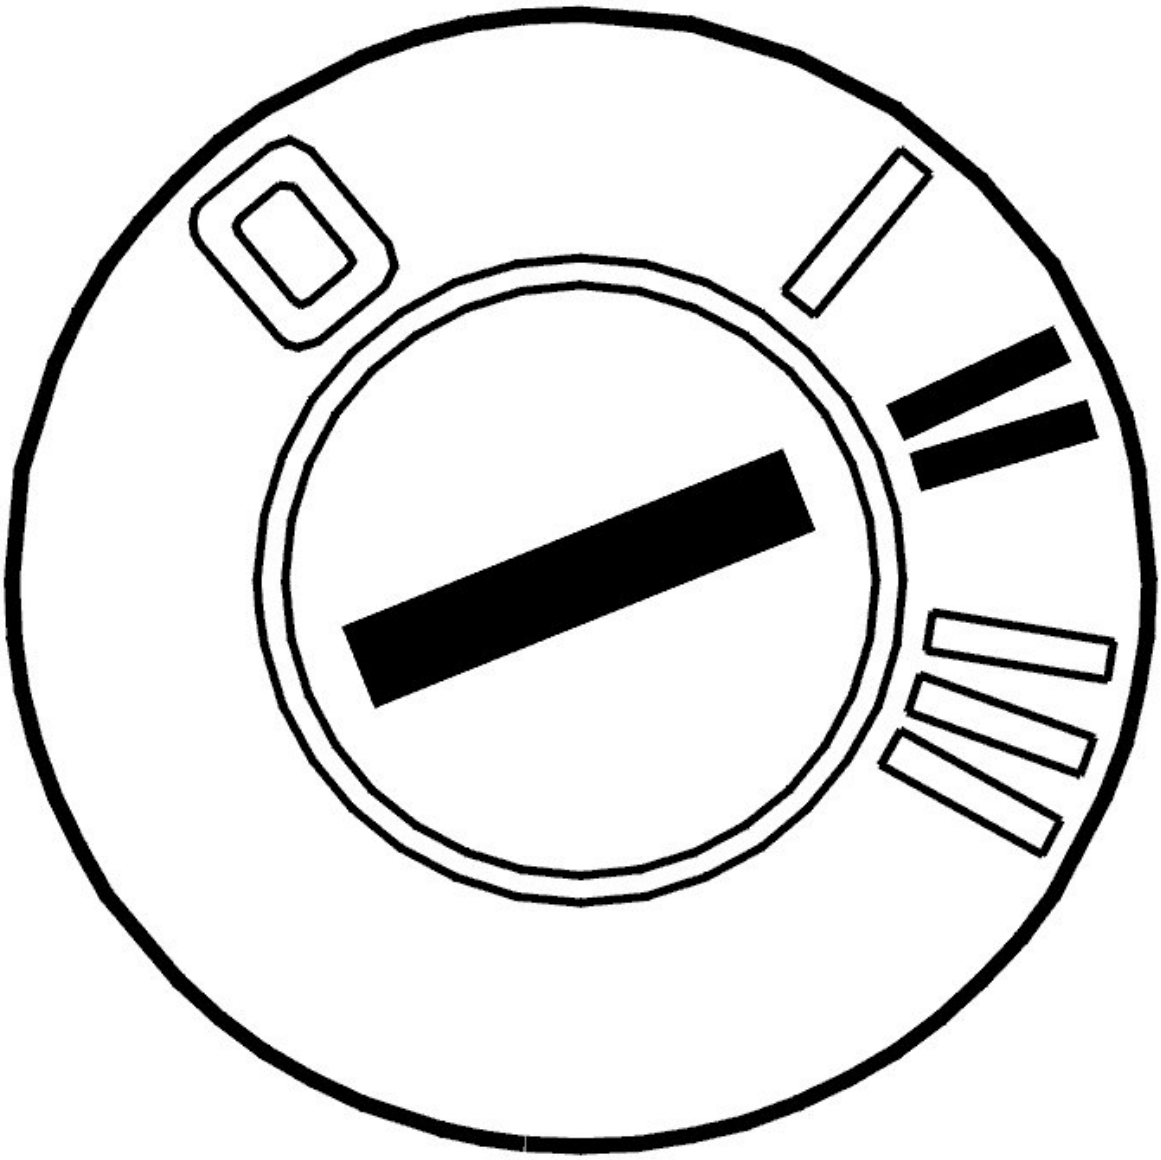
Was a fault detected?

Yes - Identifying a control module in the CAN network

No - respectively

Identifying a control module in the CAN network



Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:

- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Hint: DiCE Error Frame Finder can be used as fault detection tool if fault is suspected on the CAN-net that cannot be detected with normal troubleshooting. Interference, intermittent faults, faulty messages on the CAN-net (chattering control modules) etc., are examples of such faults. The tool registers fault messages used on the CAN-net. Fault messages may be caused by short intermittent malfunctions on the CAN-net or by a control module sending fault messages. See tools: **951 3010** (memory card) as well as associated TJ 20402.

If the load on the CAN network is too high, this may be due to a control module sending faulty messages on the CAN network (known as a disruptive control module). The fault may also be due to an intermittent short-circuit to supply voltage or ground in one of the CAN cables. This results in the control modules on the CAN network starting to send faulty messages. The faults can occur without a diagnostic trouble code (DTC) being stored by the control modules. The voltage can be measured between the CAN cables in order to check the load on the CAN network.

Note! It is not necessarily the control module(s) that stored the diagnostic trouble code (DTC) that is communicating faultily. Faulty messages can come from any control module in the same section of the CAN network. However, faulty communication in one network cannot affect the communication on the other network. In other words, faulty communication on the LS-CAN cannot disrupt communication on the HS-CAN and vice versa.

- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Check communication/load on CAN-net by measuring voltage between CAN-L and CAN-H. Measure voltage between the following connections on the OBDII-box/diagnostics socket.

- #6 and #14. The average value of the voltage must be approximately 0.6-1.4 V. The voltage shall normally be between 0.55 - 0.90 V. A higher voltage may indicate increased traffic on the CAN-net. In case of fault in communication/too high traffic on the CAN-net, the voltage is considerably higher than the above stated values.

In order to identify which control module has faulty communication, cut the power supply to one control module at a time. Check the voltage in the

CAN cables again. The easiest way to cut the power supply is to remove the fuse(s) for the relevant control module. Repeat until the voltage between the CAN wiring drops to the normal level.

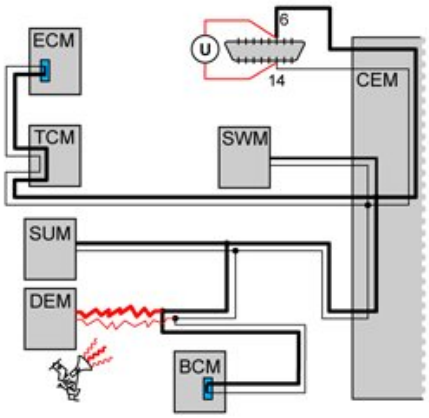
Note! When connecting and disconnecting individual control modules, other diagnostic trouble codes (DTCs) may be stored in certain control modules.

Hint: When the suspected defective control module has been identified, connect and disconnect the supply voltage to the control module a number of times to verify that the malfunction appears and disappears. Switch off the ignition between each check.

Note! Do not cut the power to the central electronic module (CEM) unless it is the last control module left to check.

A control module that is communicating incorrectly must be replaced. See Repairing and installing/Removing, replacing and installing.

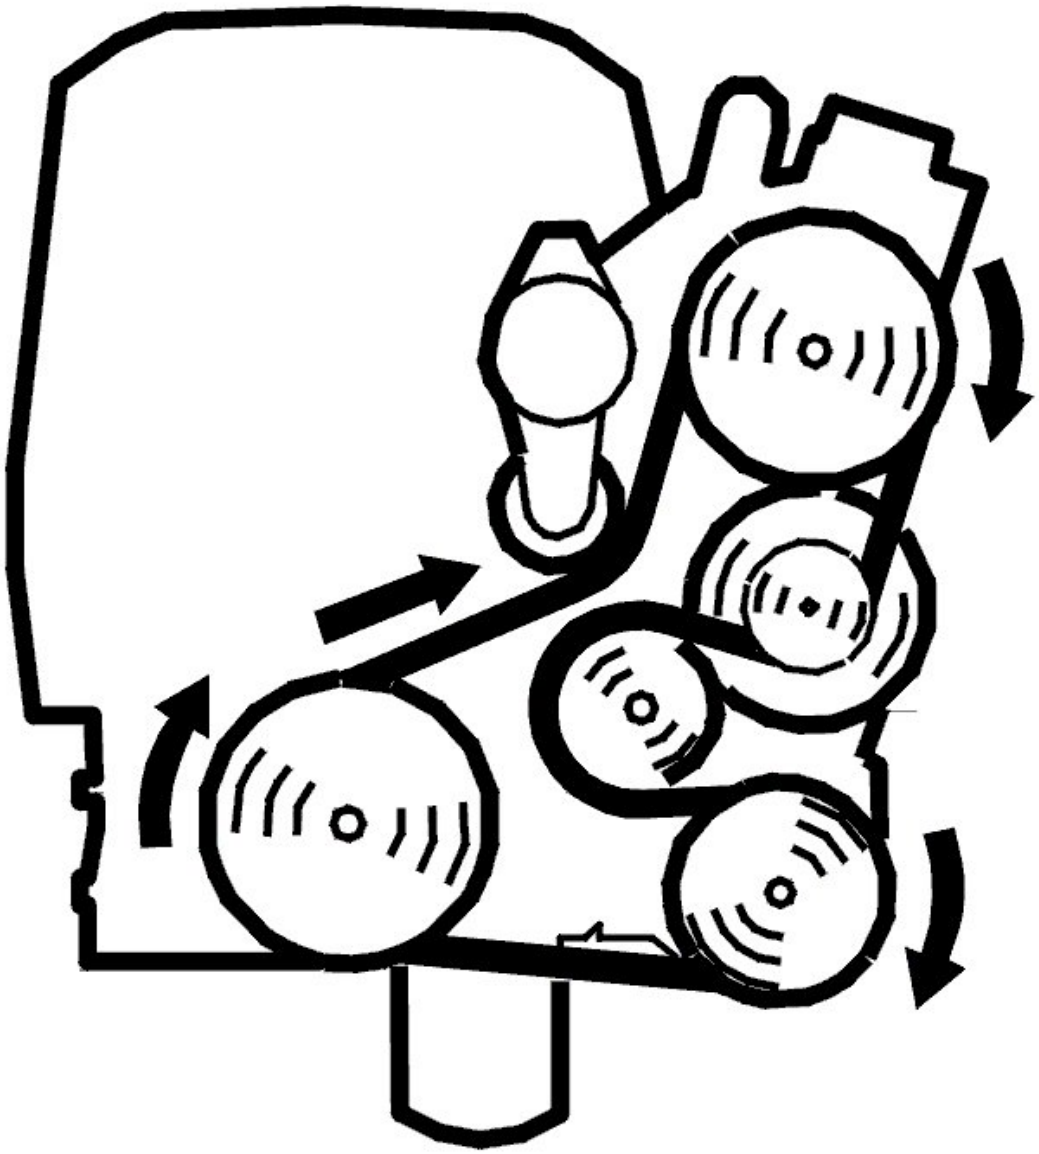
Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

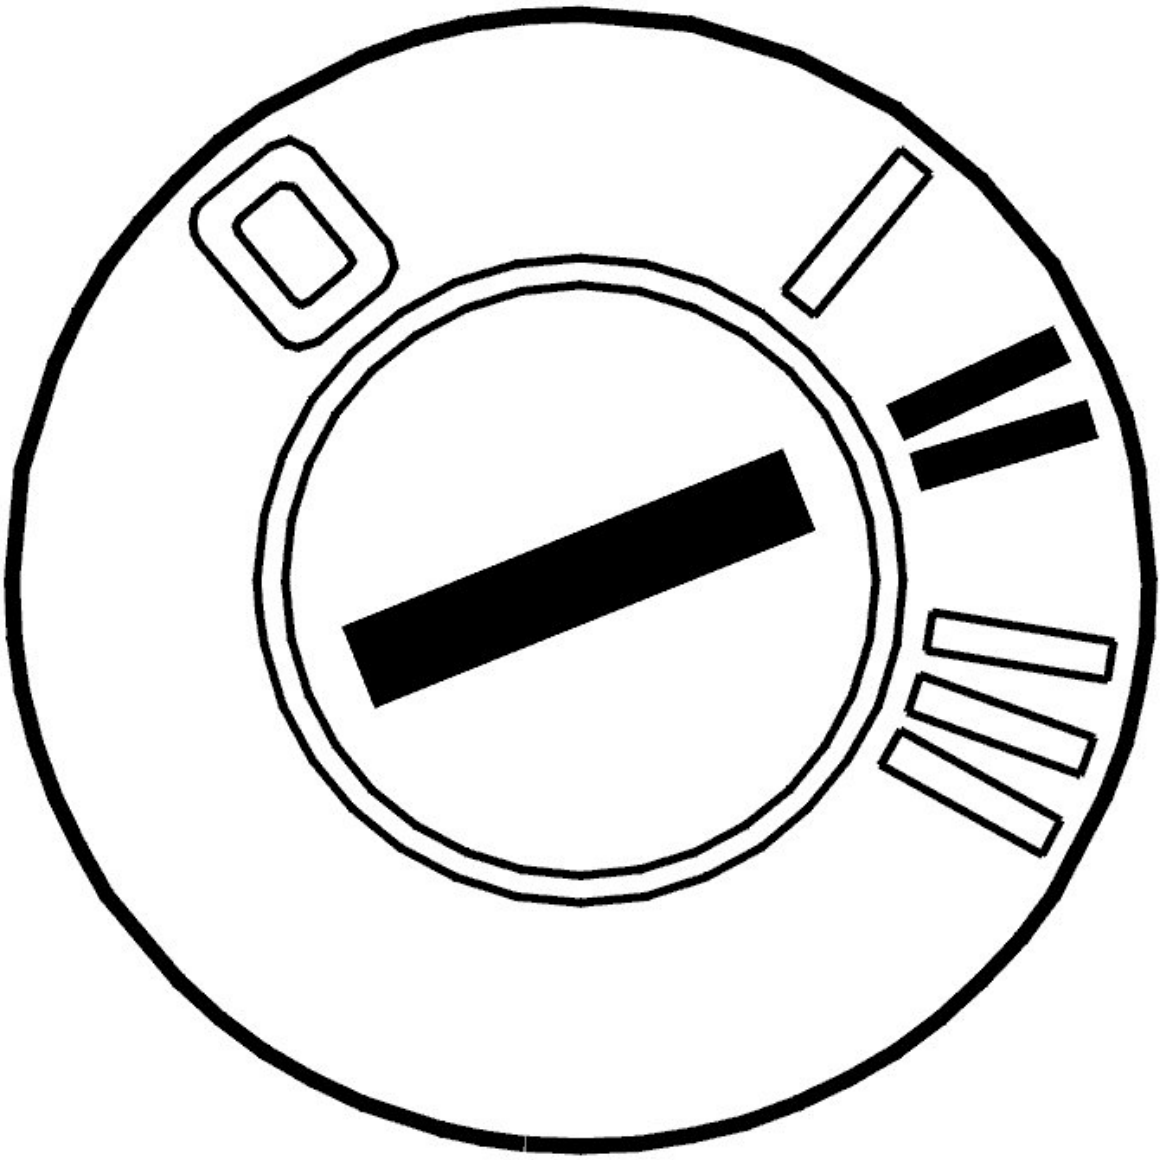


Continue - Verification

Verification

Hint: After rectifying a fault, a verification should be carried out.





- Reinstall the connectors, components etc.
- Ignition on.

Note! For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

- Erase diagnostic trouble codes (DTCs) in all control modules.
- Ignition off.
- Ignition on.
- Start the vehicle. Allow the vehicle to run for 10 minutes.
- Read out the diagnostic trouble codes in the vehicle via the DIAGNOSTICS tab.

Does the diagnostic trouble code (DTC) for faulty communication return?

Yes - Fault-tracing information

No - Fault Found

Fault-tracing information

Information

Fault-tracing information

The fault should have been detected and remedied. As this is not the case fault-tracing has failed.
Exit fault-tracing for this diagnostic trouble code (DTC) or make another attempt.

Do you want to exit fault-tracing?

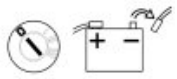
Yes - FAULT-TRACING FAILED

No - Attempt New Test

FAULT-TRACING FAILED - FAULT-TRACING FAILED

Attempt New Test - General information

Checking short-circuiting to ground/voltage in CAN-net



- Ignition off.
- Disconnect the battery negative lead.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

Checking for a short-circuit to ground

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #4 (ground). Measurement is shown in the figure. The resistance should be above 1 kohms.
- #14 and #4 (ground). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and ground.

Checking for a short-circuit to voltage

Measure resistance between the following connections on the OBDII-box/diagnostics socket.
- #6 and #16 (voltage). Measurement is shown in the figure. The resistance should be above 1 kohms.
- #14 and #16 (voltage). The resistance should be above 1 kohms.

If resistance is below 1 kohms this indicates short-circuiting between the CAN-line and voltage cable.
Twist the cable harness and wiggle connectors where they can be accessed along the cable harness during every measurement, and note if the resistance changes to detect intermittent short-circuits or open circuit.

Hint: Part the CAN-net at suitable points to decide where a short-circuit may be found.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

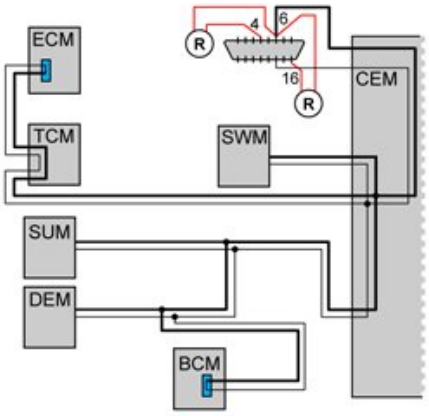
Volvo XC70 L5-2.5L Turbo VIN 59 B5254T2

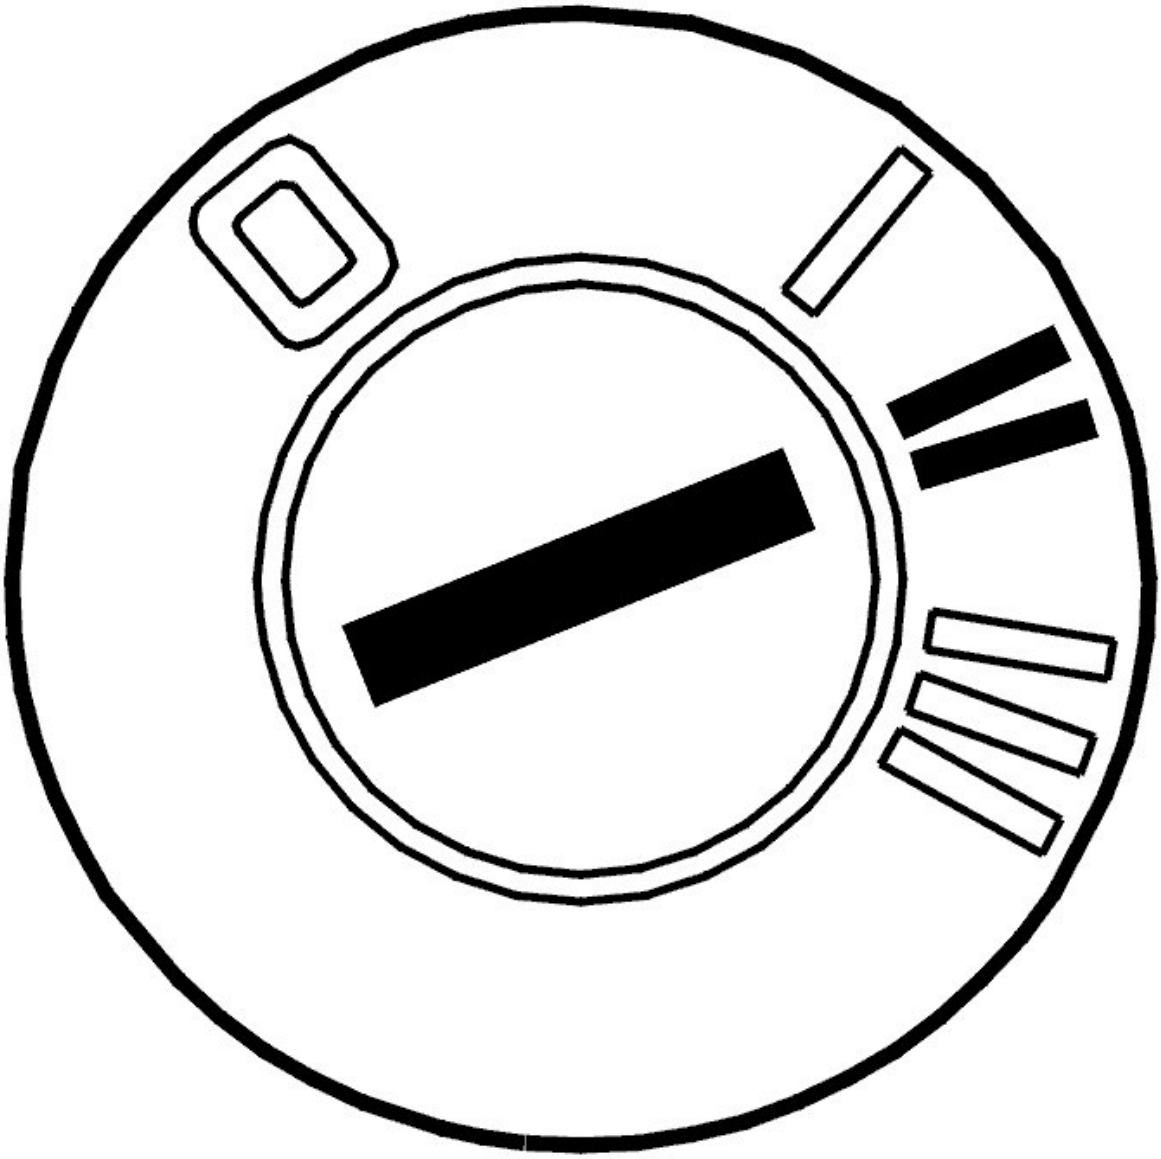


Was a fault detected?

Yes - Verification

No - Checking the traffic load on the CAN cables

Checking voltage-drop in cable for CAN-H and CAN-L, respectively



- Connect the battery.
- Ignition on.
- Connect OBDII-Box **(951 3015)** to the diagnostics socket.

Hint: Use the wiring diagram to provide support when taking readings.

For general information about CAN-troubleshooting, see:
- INFORMATION/PRODUCTSPECIFICATIONS/Design and function/37/CAN-net.
- General information about fault-tracing in the CAN network See: Information Bus/Description and Operation/General Information About Fault-tracing In the CAN Network

In principle, the voltage measured in each cable in the CAN-net shall be the same at each control module in the network. This means that the voltage-drop in the cable for CAN-H and CAN-L, respectively, between the control modules should be very low. If there is a voltage-difference in the CAN-lines between the diagnostics socket/Central electronic module (CEM) and a control module due to, e.g., contact resistance in a connector or branching, communication may be lost/interfered with.
Check if there is voltage-drop in the cable for CAN-H and CAN-L between the diagnostics socket/Central electronic module (CEM) and the control module where there is problem with communication.
Carry out the following:
Measure voltage between the following connections on the OBDII-box/diagnostics socket.
- #6 and corresponding connection on relevant control module for CAN-H. The voltage shall be lower than 50 mV.
- #14 and corresponding connection on relevant control module for CAN-L. The voltage shall be lower than 50 mV.

If voltage is too high, this indicates too high contact resistance in cable, connector, or branching. Check the circuit between the diagnostics socket and control module in question for contact resistance and oxidation.

Note! After fault with control modules that interfere with communication, other control modules may remain in Limp-Home (that is, they work with reduced functionality) even when the ignition has been turned off and on a few times. For certain faults in the CAN-net where control modules have stopped communicating, it may help to disconnect/reconnect the battery to "restart" the control module/CAN-net.

Remedy wiring as necessary.

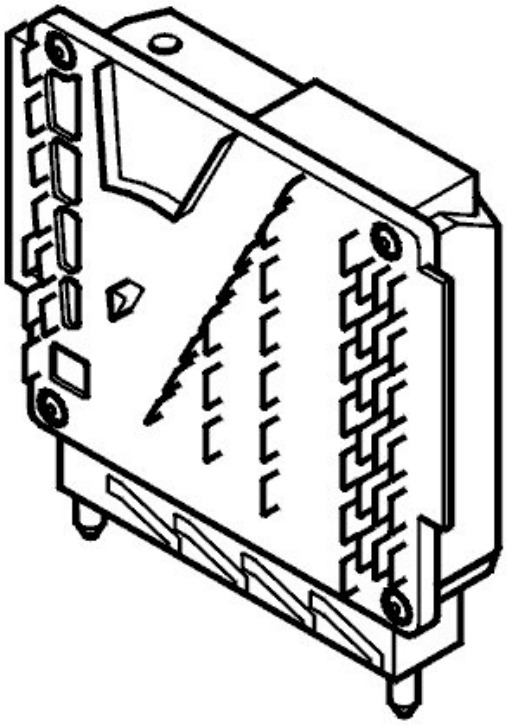
Diagnostic Trouble Code (DTC) Information

Diagnostic trouble code (DTC) information

Condition



Shift solenoids S1, S2, S3, S4 and S5 operate in tandem to control gear-shifting. The solenoids are controlled by power stages in the transmission control module (TCM). The transmission control module (TCM) opens the power stages to activate the solenoids and sends a voltage through the circuit. Diagnostic trouble codes (DTCs) TCM-0001, TCM-0007, TCM-0101 TCM-0107 or TCM-010A are stored (depending on the solenoid)if the transmission control module (TCM) registers that the signal in circuits S1, S2, S3, S4 or S5 is too high when the solenoid should not be activated.

Substitute value

- The transmission control module (TCM) "Emergency mode I" program has been initiated.

Possible source

- Short-circuit to supply voltage in the signal cable.
- Internal fault in the control module.

Fault symptom[s]

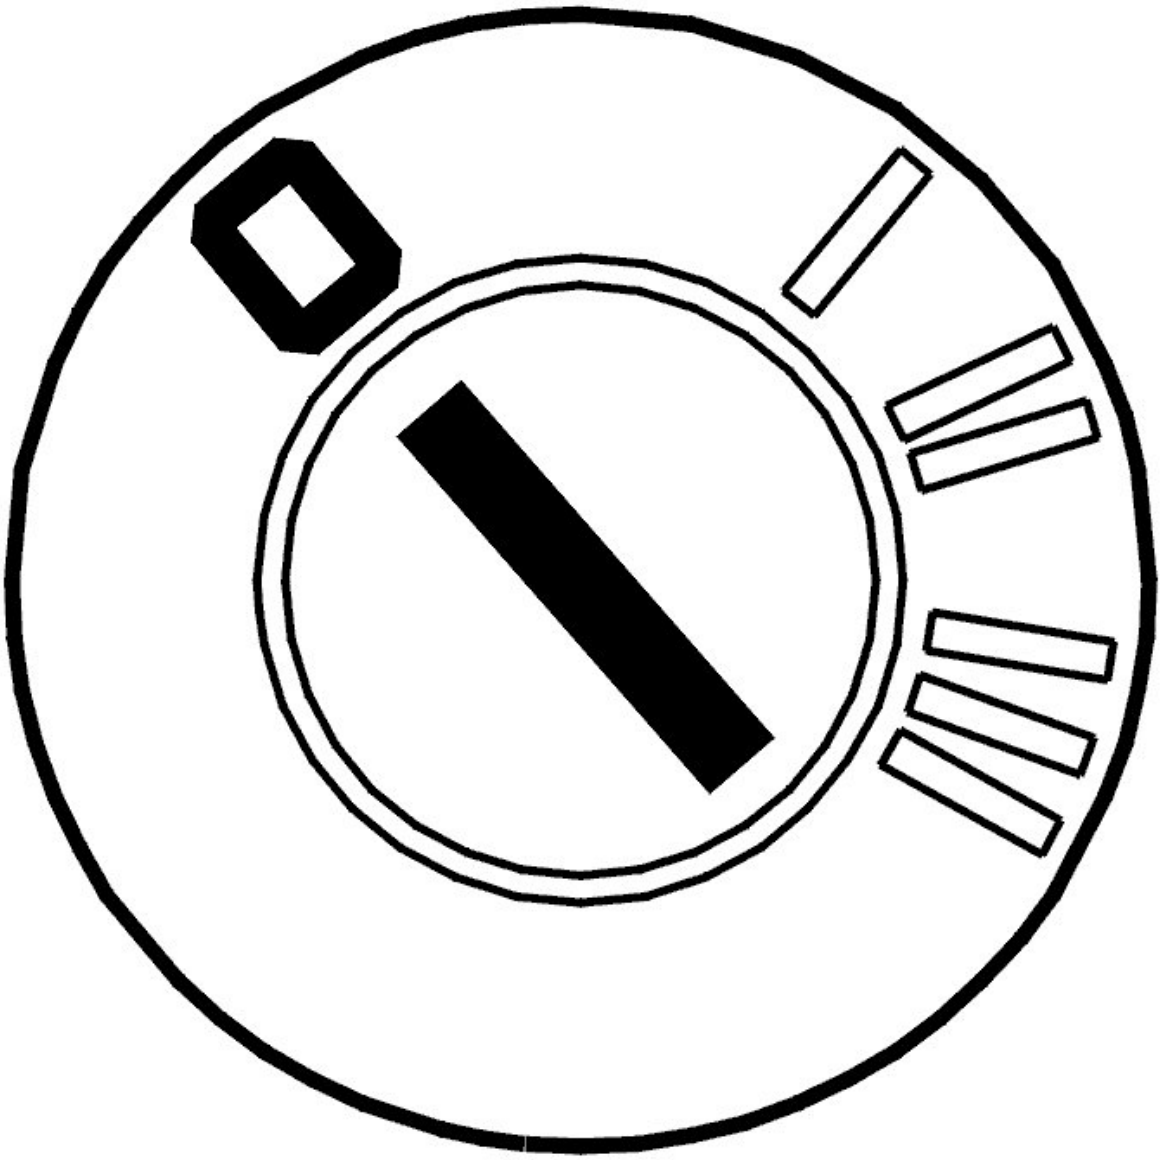
- General orange warning lamp lit.
- Malfunction indicator lamp (MIL) lit.
- Harsh gear shifting.
- No shifting.
- No lock-up function.

Signal Too High

Signal too high

Checking the temperature sensor

Hint: In some cases, the diagnostic trouble code (DTC) may be caused by a defective oil temperature sensor. Check the function of the oil temperature sensor first.



- Ignition off
- Read off the oil temperature.

Check that the function of the temperature sensor is OK. Test drive the car to increase the temperature of the transmission fluid. Read off the temperature again. Check that the temperature has increased.

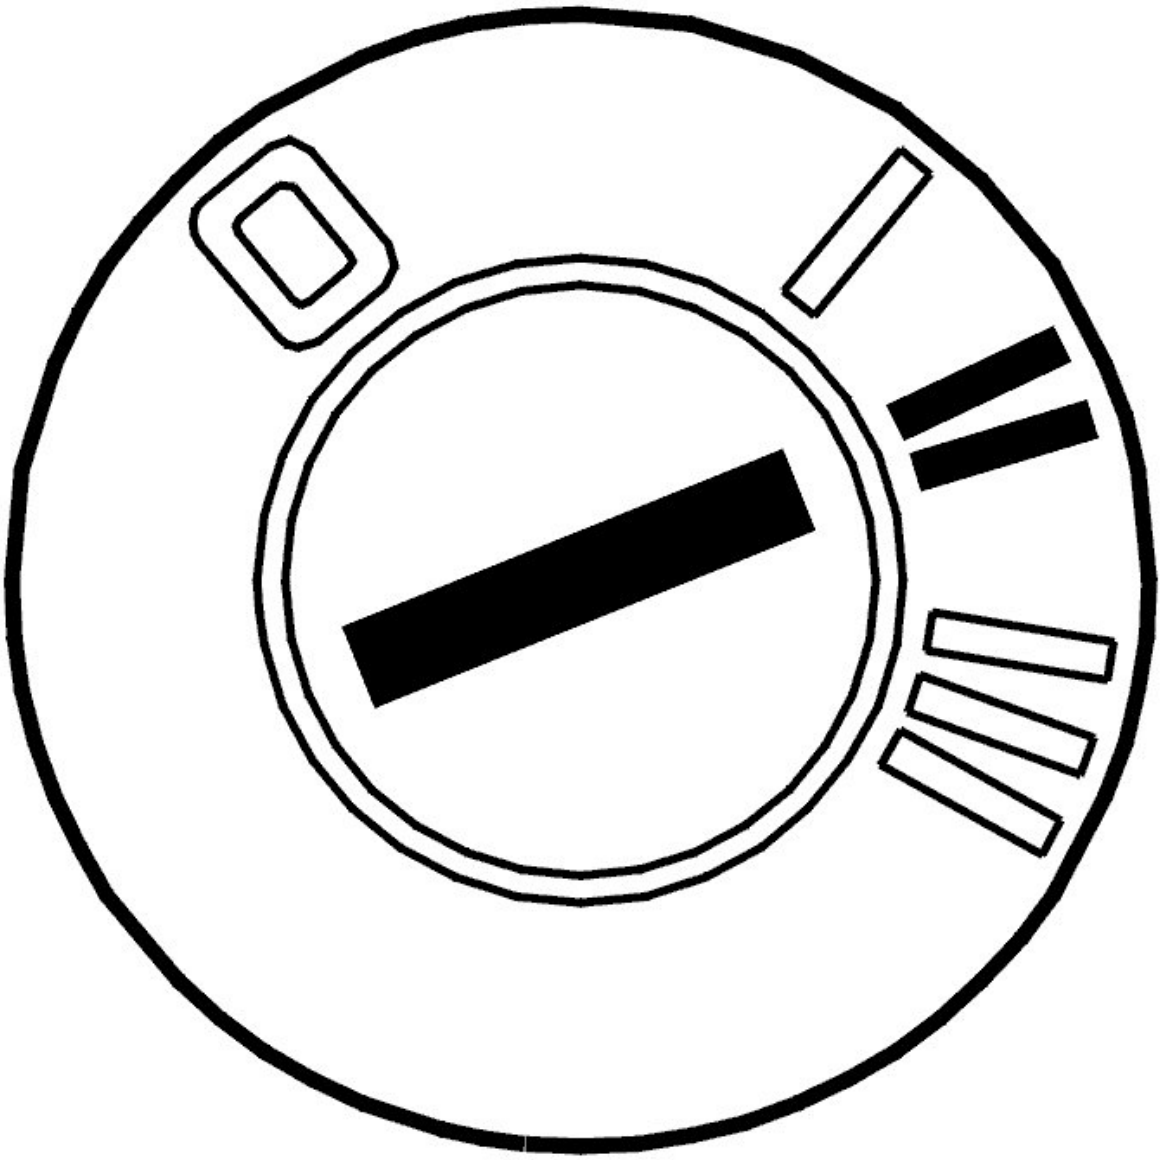
Note! If the temperature is outside its permitted range, fault-trace the temperature sensor.

Is the oil temperature within its permitted range?

Yes - Checking shift solenoid S1

No - Checking transmission fluid temperature sensor

Checking shift solenoid S1



- Ignition on
- Gear selector in position P
- Activate solenoid S1.

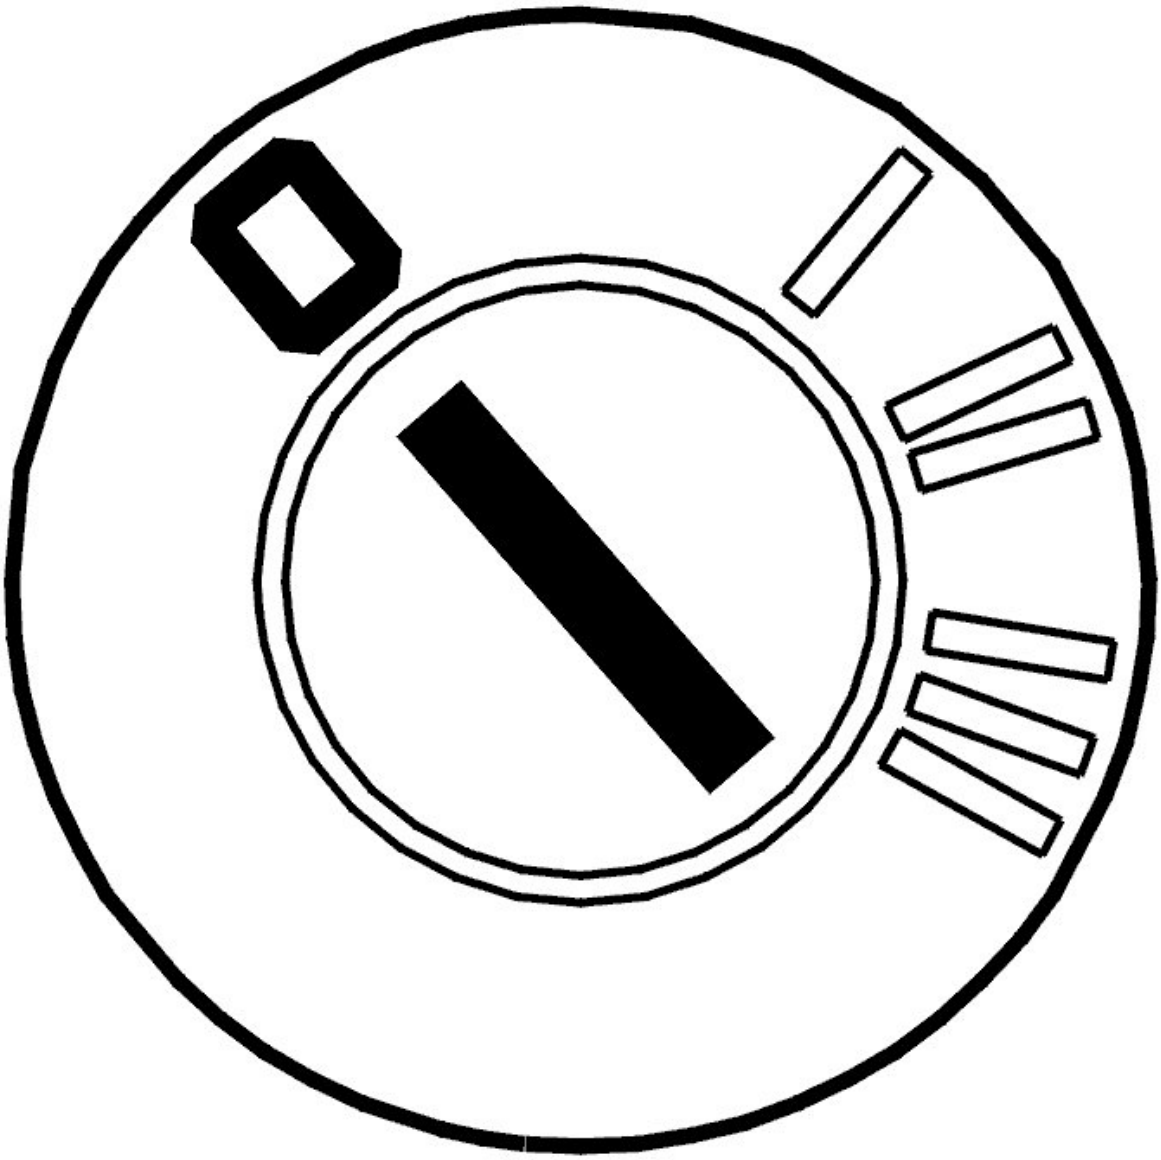
The value must change between OFF and ON.

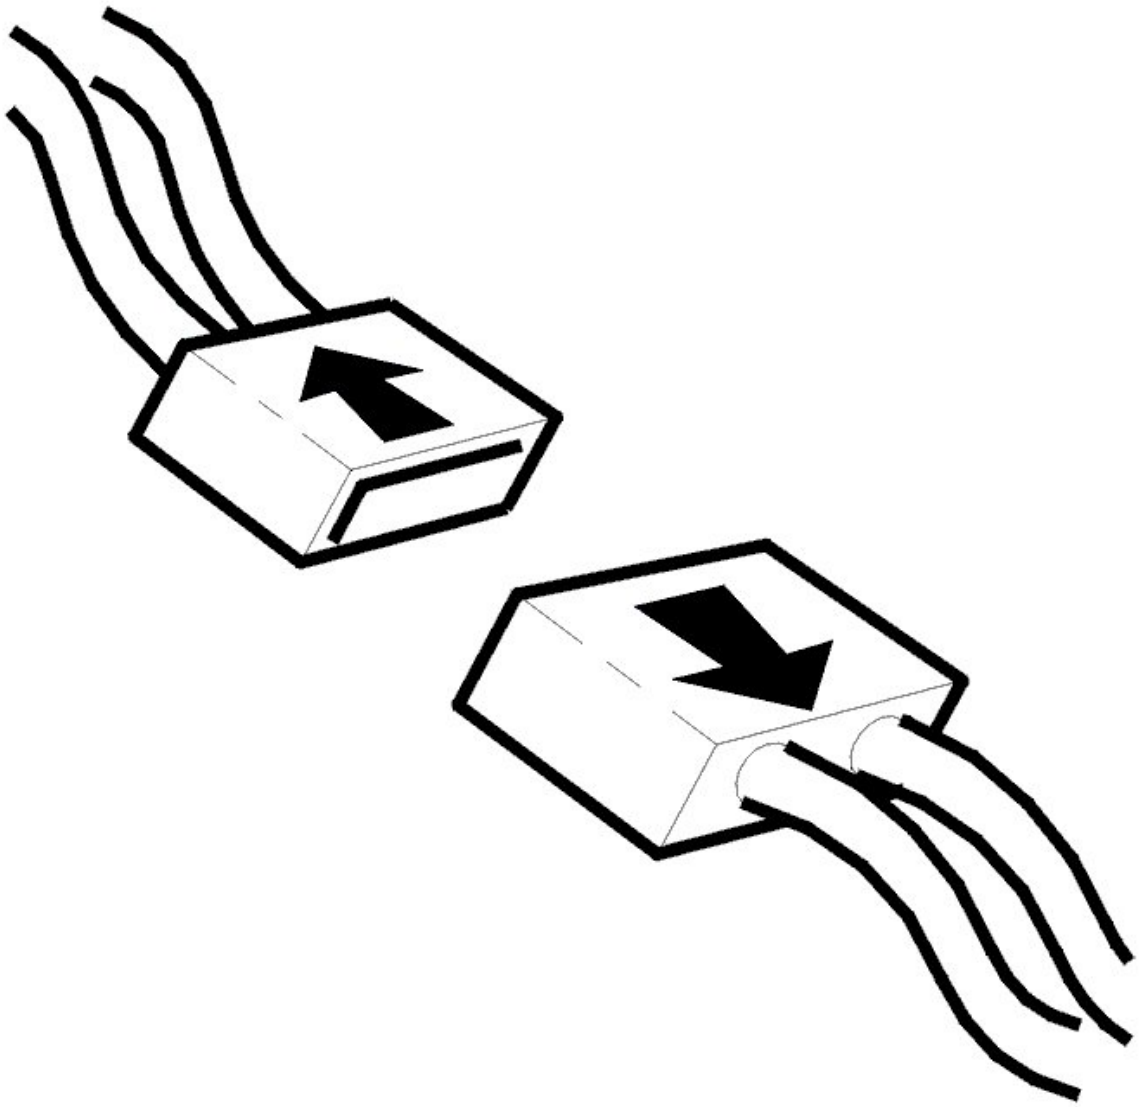
Does the value change?

Yes - Intermittent fault

No - Checking the wiring

Checking the wiring





- Ignition off
- Disconnect transmission connector C.

Check the cable between control module terminal #A50 (#A50) and transmission connector terminal #C1 (control module side). Check for a short-circuit to supply voltage according to Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault. Also check against the other cables in the circuit. Use the relevant wiring diagram.

Continue - Resetting the adaptation and oil quality counter

Resetting the adaptation and oil quality counter

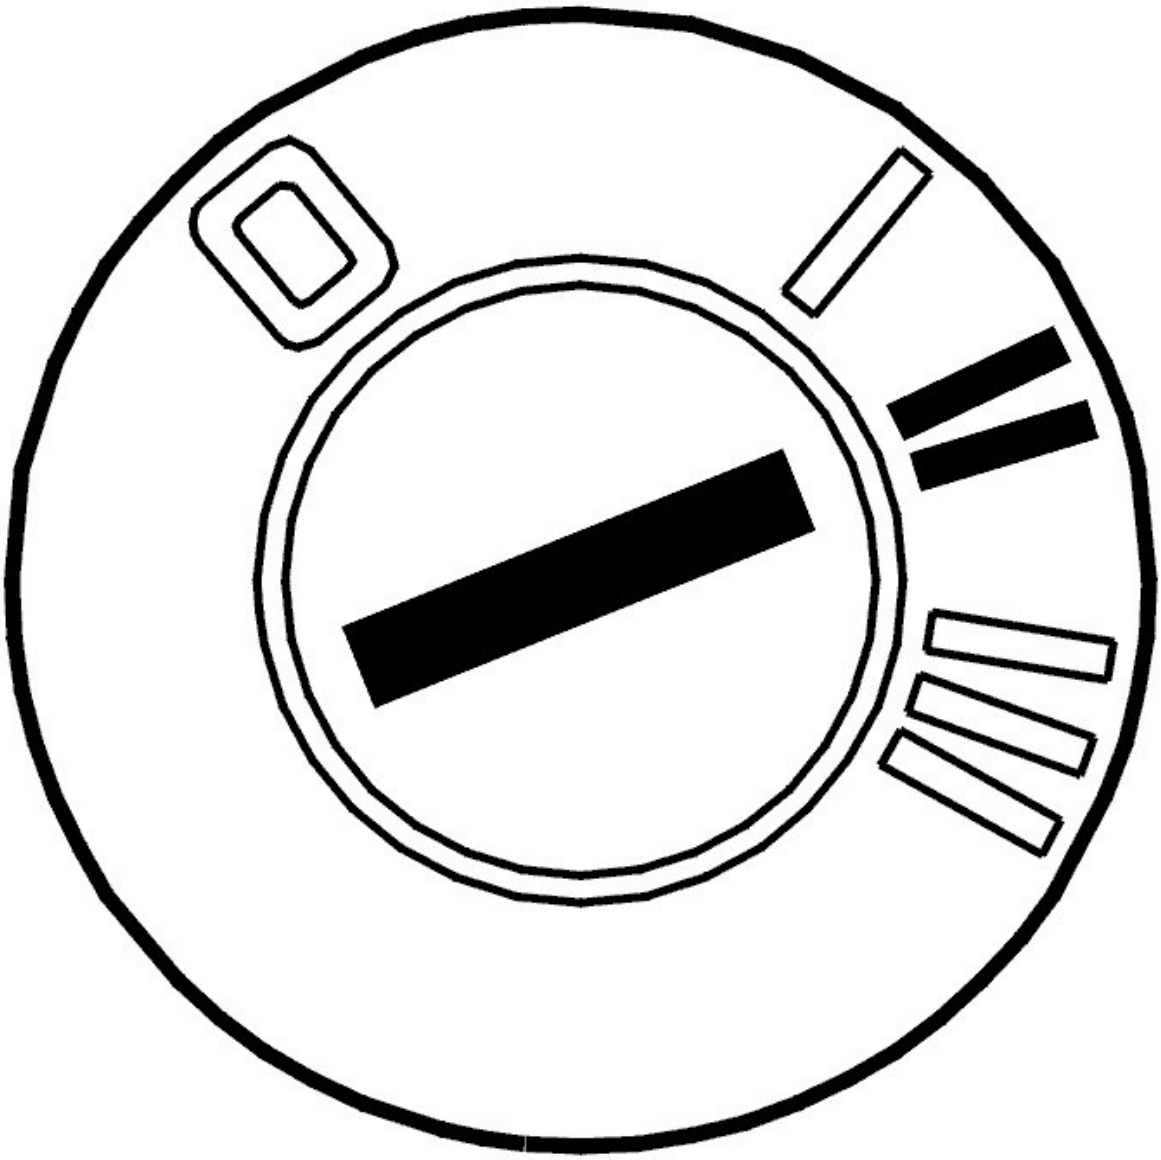
Resetting the adaptation

Resetting adaptation and the counter for "Transmission oil change"

Hint: The transmission has torque controlled adaptive pressure control. Pressure control means that the transmission regulates the pressure itself

during each gear shift. This avoids harsh gear shifting. Each gear shift is evaluated by the control module and stored in the memory. This allows for compensation for wear and tear in the transmission and clutch. It is important that the adaptation in the memory is reset after the transmission has been repaired. This is to ensure normal operation. The oil is replaced during repair; the "Transmission oil change" counter must be reset. If the counter is not reset when the fluid is drained and replaced, there is a risk that a diagnostic trouble code (DTC) will be stored in incorrect circumstances.

Note! This applies only if the transmission or one of the components in the transmission have been replaced.



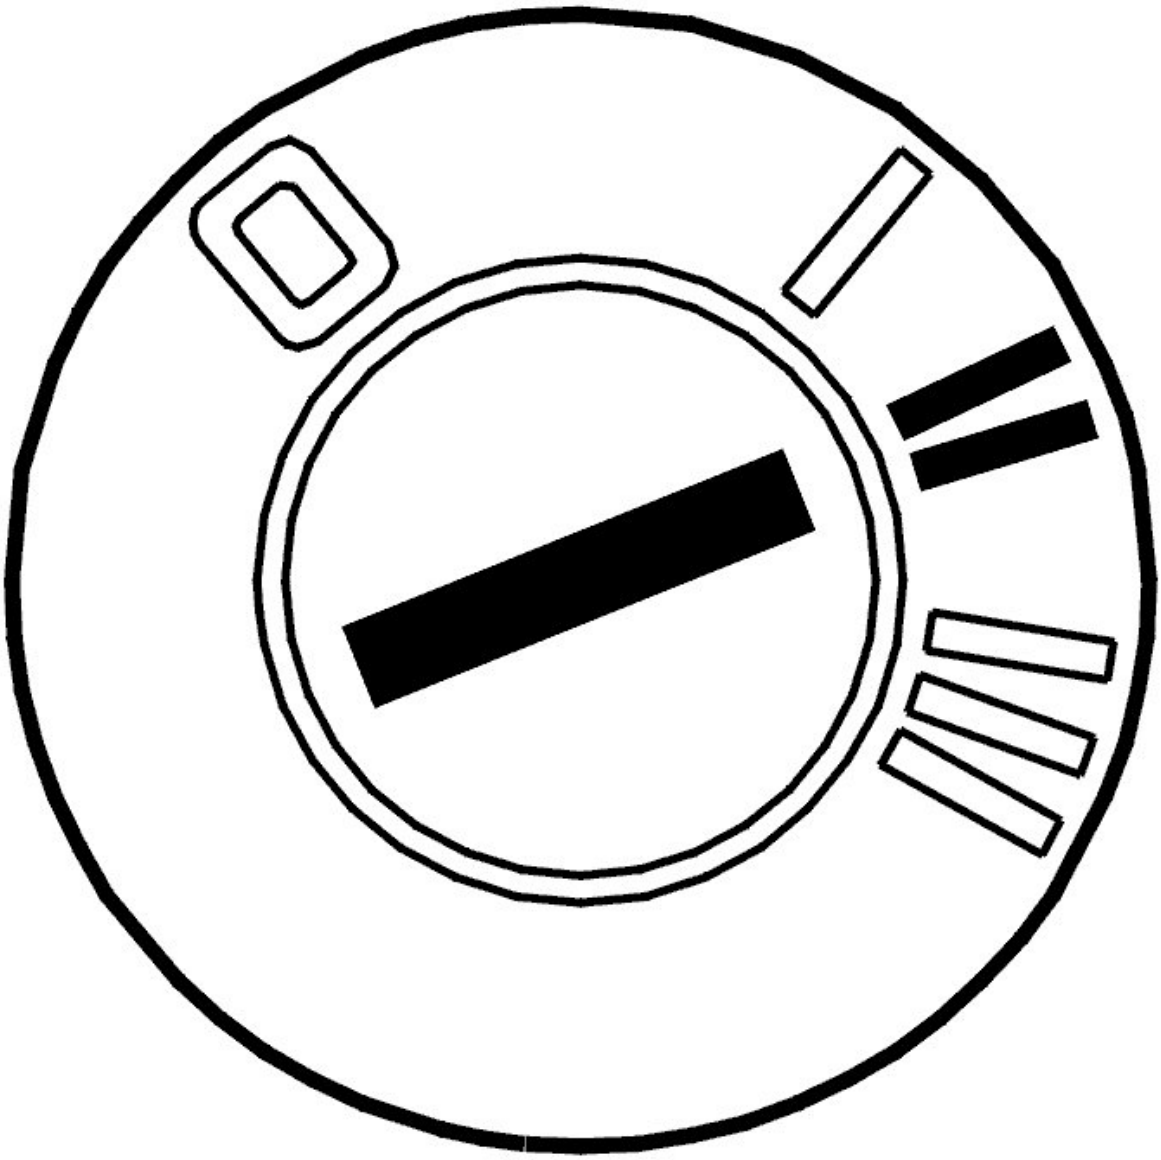
- Ignition on.

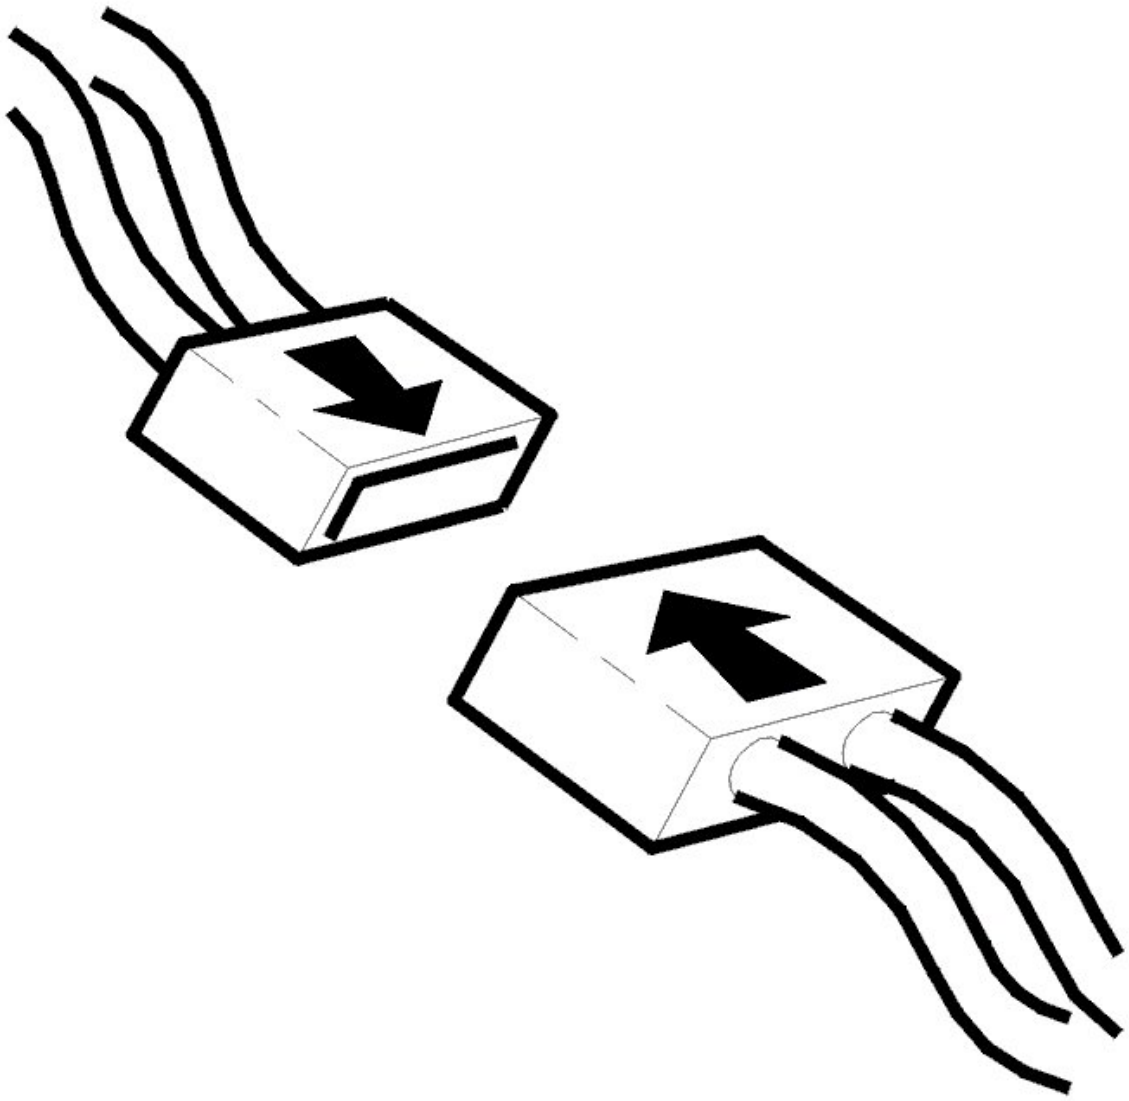
Click on the VCT2000 symbol to reset the adaptation and counter.

Continue - Verification

Verification

Hint: After the repair it is necessary to check that the fault has been rectified.





- Ignition off.
- Wait for at least 90 seconds.
- Connect the connectors, install the components etc.
- Ignition on.

- Connect the control module.
- Transmission connector disconnected
- Gear selector in position P.

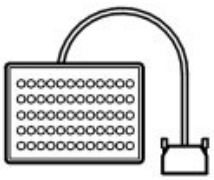
Check the transmission control module (TCM) by measuring the resistance between terminals #A50 (#A50) and #A53 (#A53) on the breakout box. The resistance must be approximately 9 kohms.

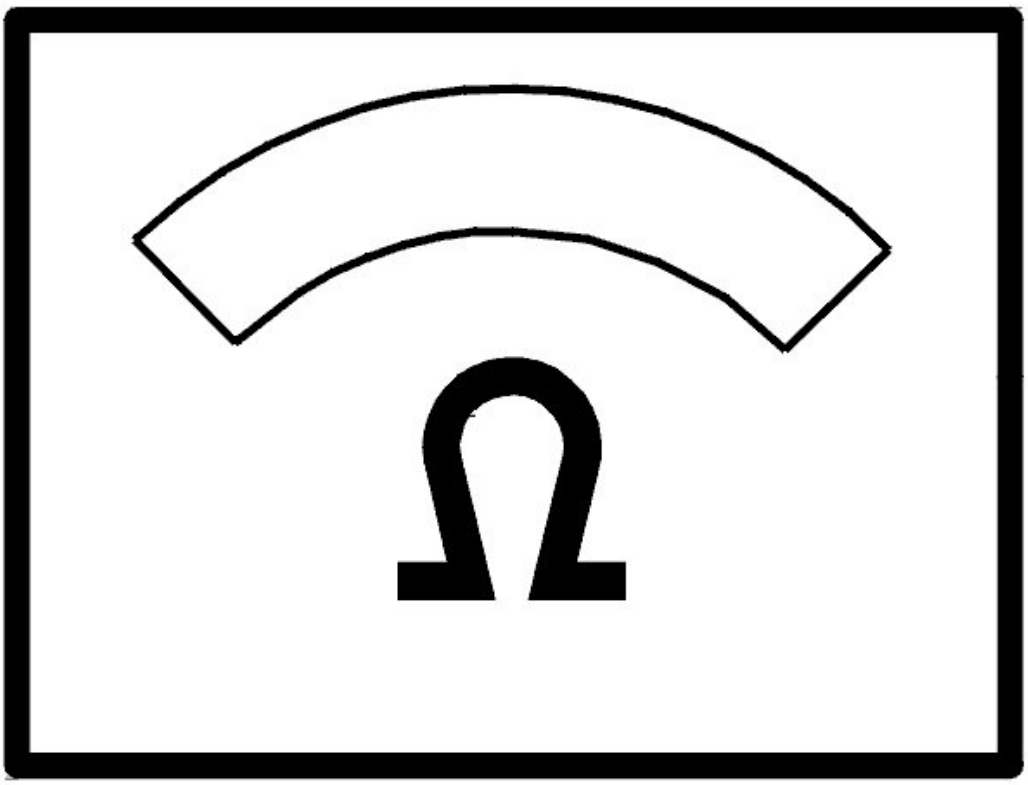
Note! When removing the transmission connector, the control module may store diagnostic trouble codes (DTCs) for the gear-shift position sensor, the shift solenoids, the temperature sensor etc.

Try a new control module if the resistance is infinite.

Other information:

- To disconnect the transmission connectors, see Connectors transmission, disconnecting / connecting See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Wiring Harness/Service and Repair/Procedures
- To replace the control module, see Transmission control module (TCM), replacing, B5244T5, AW55-50/51SN, B5254T2, AW55-50/51SN, B5254T2, AW50/51 AWD See: Transmission Control Systems/Relays and Modules - Transmission and Drivetrain/Relays and Modules - A/T/Control Module/Service and Repair
- For information about signals, see Signal description. Transmission control module (TCM), AW50/51 AWD, AW55-50/51SN See: Transmission Control Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Description. Transmission Control Module (TCM).



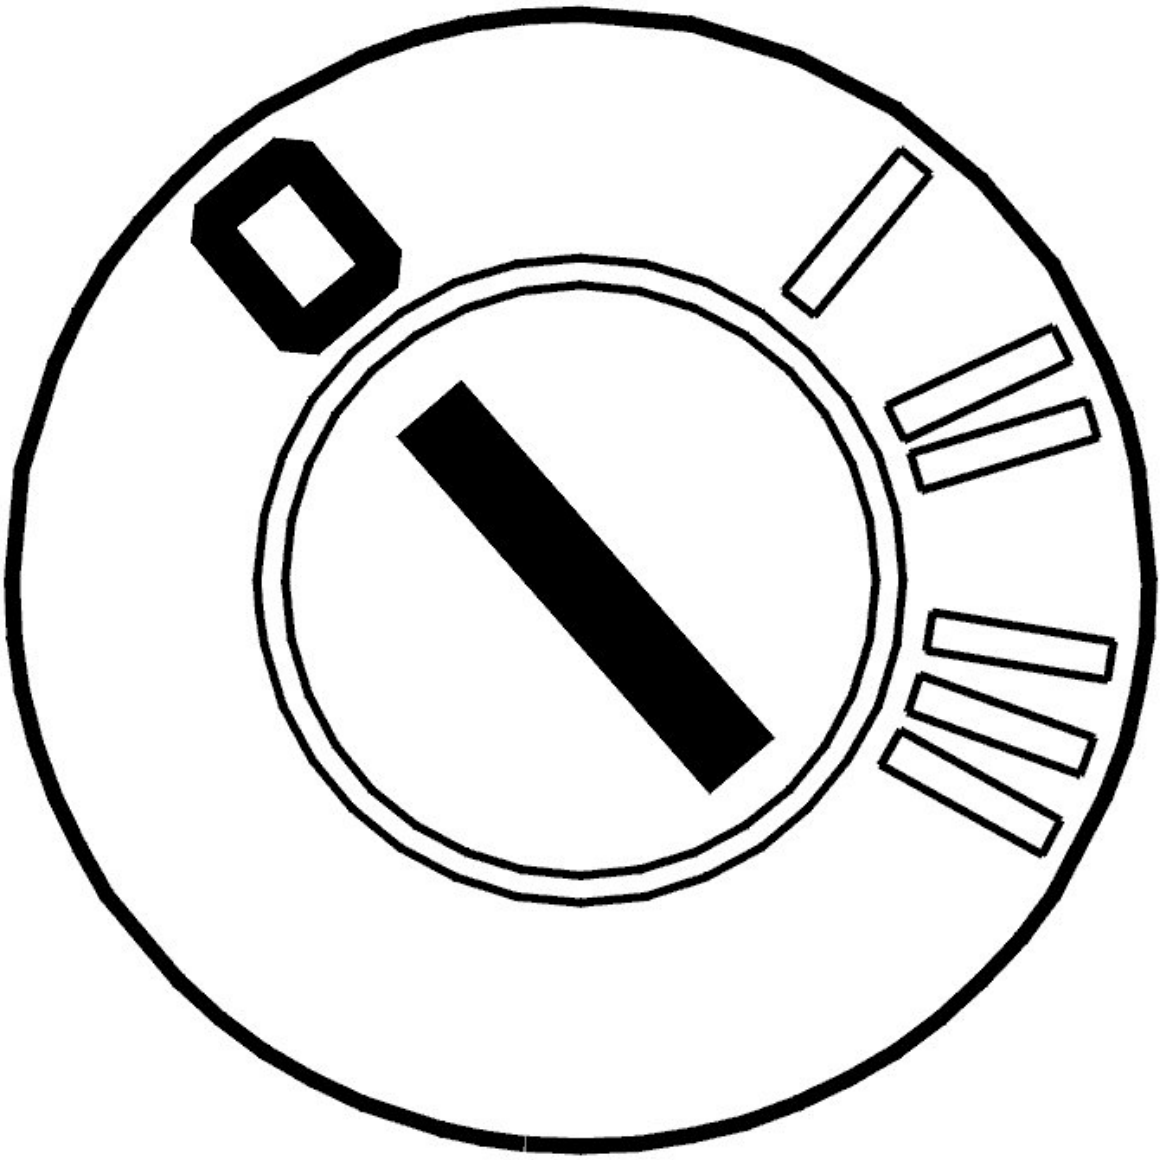


Was the resistance OK?

Yes - No Fault Found

No - Verification

Checking the wiring and component



- Ignition off
- Open the control system.

Check the cable between transmission connector terminal #C1 (transmission side) and the connector for solenoid S1. Check for an open-circuit according to Checking wiring and terminals. Permanent fault See: Testing and Inspection/Component Tests and General Diagnostics/Checking Wiring and Terminals/Checking Wiring and Terminals. Permanent Fault.

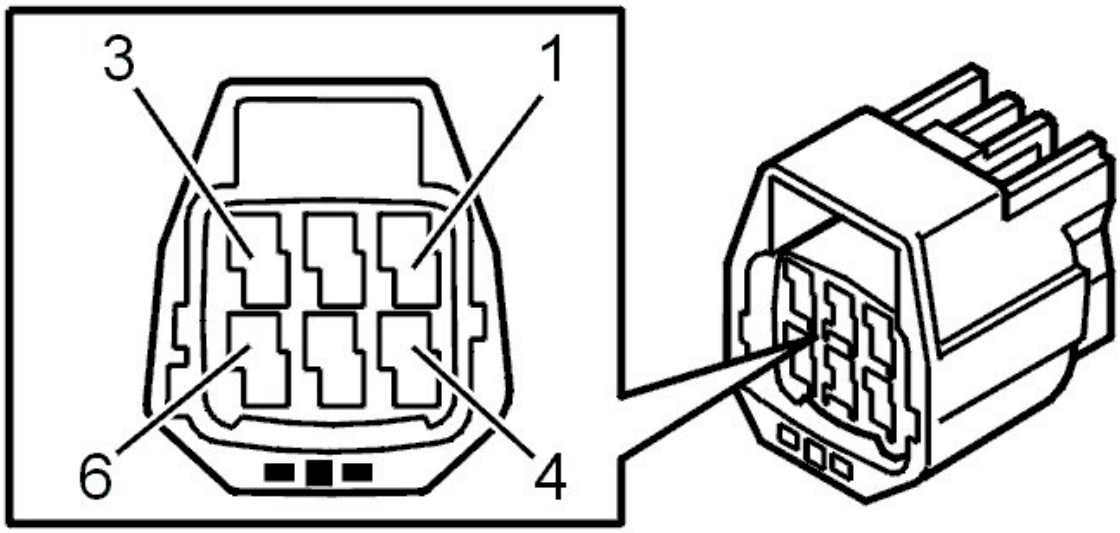
Hint:

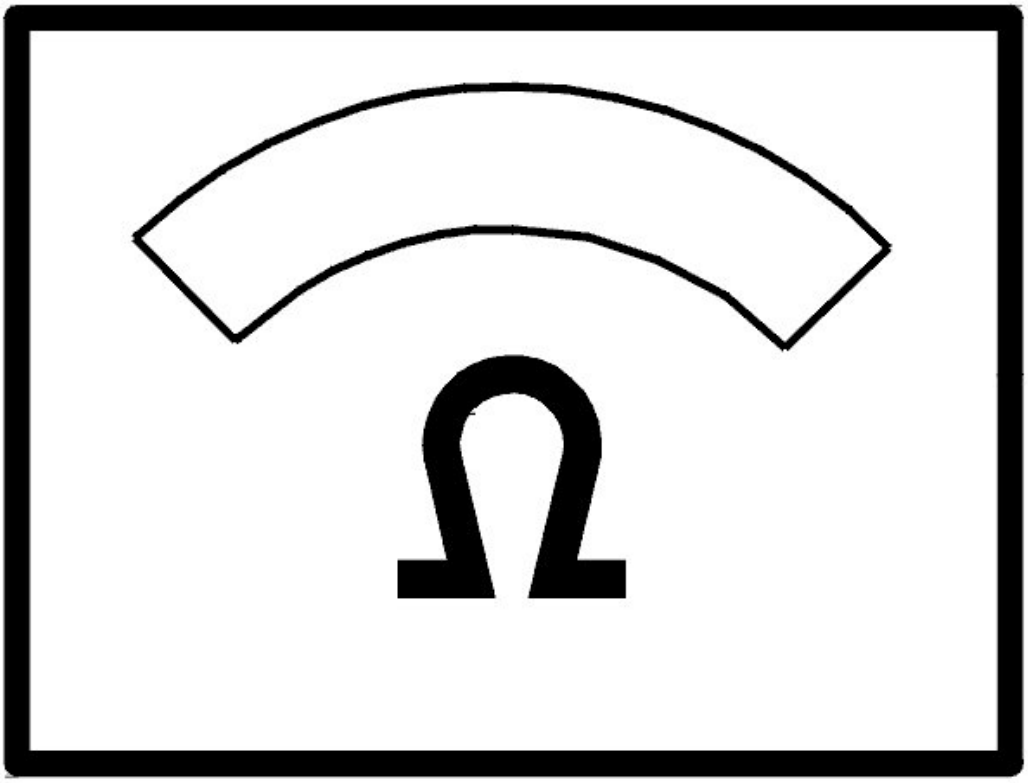
- Check solenoid S1. Measure the resistance between the terminal on solenoid S1 and the transmission housing. The resistance must be 12-16 ohms.

Remedy as necessary.

Other information:

- To disconnect the transmission connectors, see Connectors transmission, disconnecting / connecting See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Wiring Harness/Service and Repair/Procedures
- To replace the cable harness for the control system, see Wiring harness / oil temperature sensor, replacing See: Transmission and Drivetrain/Automatic Transmission/Transaxle/Wiring Harness/Service and Repair/Removal and Replacement
- To open the control system and to check or replace solenoid S1, see Solenoid control system, replacing See: Transmission Control Systems/Actuators and Solenoids - Transmission and Drivetrain/Actuators and Solenoids - A/T/Shift Solenoid/Service and Repair/Solenoid Control System, Replacing
- For information about signals, see Signal description. Transmission control module (TCM), AW50/51 AWD, AW55-50/51SN See: Transmission Control Systems/Testing and Inspection/Pinout Values and Diagnostic Parameters/Signal Description. Transmission Control Module (TCM).





Select Continue when the fault has been remedied.
