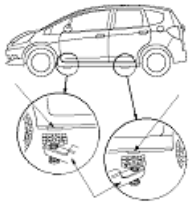
Lift and Support Points

NOTE: If you are going to remove heavy components such as suspension from the rear of the vehicle, first support the front of the vehicle with tall safety stands. When substantial weight is removed from the rear of the vehicle, the center of gravity can change, causing the vehicle to tip forward on the lift.



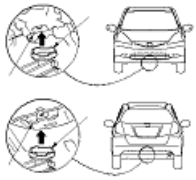
Vehicle Lift

1. Position the lift blocks (A), under the vehicle's front support points (B) and rear support points (C).
2. Raise the lift a few inches, and rock the vehicle gently to be sure it is firmly supported.
3. Raise the lift to its full height, and inspect the vehicle support points for solid contact with the lift blocks.

Safety Stands

To support the vehicle on safety stands, use the same support points (B and C) as for a vehicle lift. Always use safety stands when working on or under any vehicle that is supported only by a jack.

Floor Jack



1. When lifting the front of the vehicle, set the parking brake. When lifting the rear of the vehicle, put the shift lever in reverse for manual transmission, or P for automatic transmission.
2. Block the wheels that are not being lifted.
3. Position the floor jack under the front jacking bracket (A) or the rear jacking bracket (B). Center the jacking bracket on the jack lift platform (C), and jack up the vehicle high enough to fit the safety stands under it.
4. Position the safety stands under the support points, and adjust them so the vehicle is level.
5. Lower the vehicle onto the stands.

Towing

If the vehicle needs to be towed, call a professional towing service. Never tow the vehicle behind another vehicle with just a rope or chain. It is very dangerous.

Emergency Towing

There are three popular methods of towing a vehicle.

Flat-bed Equipment − The operator loads the vehicle on the back of a truck. **This is the best way of transporting the vehicle.**

To accommodate flat-bed equipment, the vehicle is equipped with front towing hook (A), front tie down hook slots (B), rear towing hook (C), and the rear tie down hook slots (D).

The towing hook can be used with a winch to pull the vehicle onto the truck, and the tie down hook slots can be used to secure the vehicle to the truck.

NOTE: The tie down hook slots use rubber plugs (E) to cover the openings.

Towing Hook Installation

The detachable towing hook is for towing very short distance, such as freeing the car. The hook mounts to the anchor in the front and rear bumper.

NOTICE

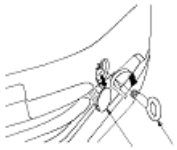
- To avoid damage to the vehicle, use the towing hook for straight flat ground towing only. Do not tow on an angle.
- The tow hook should not be used to tow the vehicle onto a flat-bed. Do not use it as a tie down.

Front:

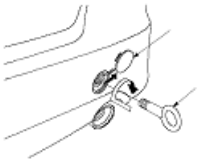
Rear:

1. Remove the cover (A) from the bumper.
2. Remove the towing hook placed behind a cover under the cargo area.
3. Screw in the towing hook (B), and tighten it securely by hand.

Front bumper:



Rear bumper:



Wheel Lift Equipment − The tow truck uses two pivoting arms that go under the tyres (front or rear) and lifts them off the ground. The other two wheels remain on the ground. **This is an acceptable way of towing the vehicle.**

Sling-type Equipment − The tow truck uses metal cables with hooks on the ends. These hooks go around parts of the frame or suspension, and the cables lift that end of the vehicle off the ground. The vehicle's suspension and body can be seriously damaged if this method of towing is attempted. **This method of towing the vehicle is unacceptable.**

If the vehicle cannot be transported by a flat-bed, it should be towed with the front wheels off the ground. If the vehicle is damaged, and must be towed with the front wheels on the ground, or with all four wheels on the ground, do this:

Manual Transmission

- Release the parking brake.
- Shift the transmission in Neutral.
- Leave the ignition switch in ACCESSORY (I) so the steering wheel does not lock.
- Make sure all accessories are turned off to minimize battery current draw.

Automatic Transmission

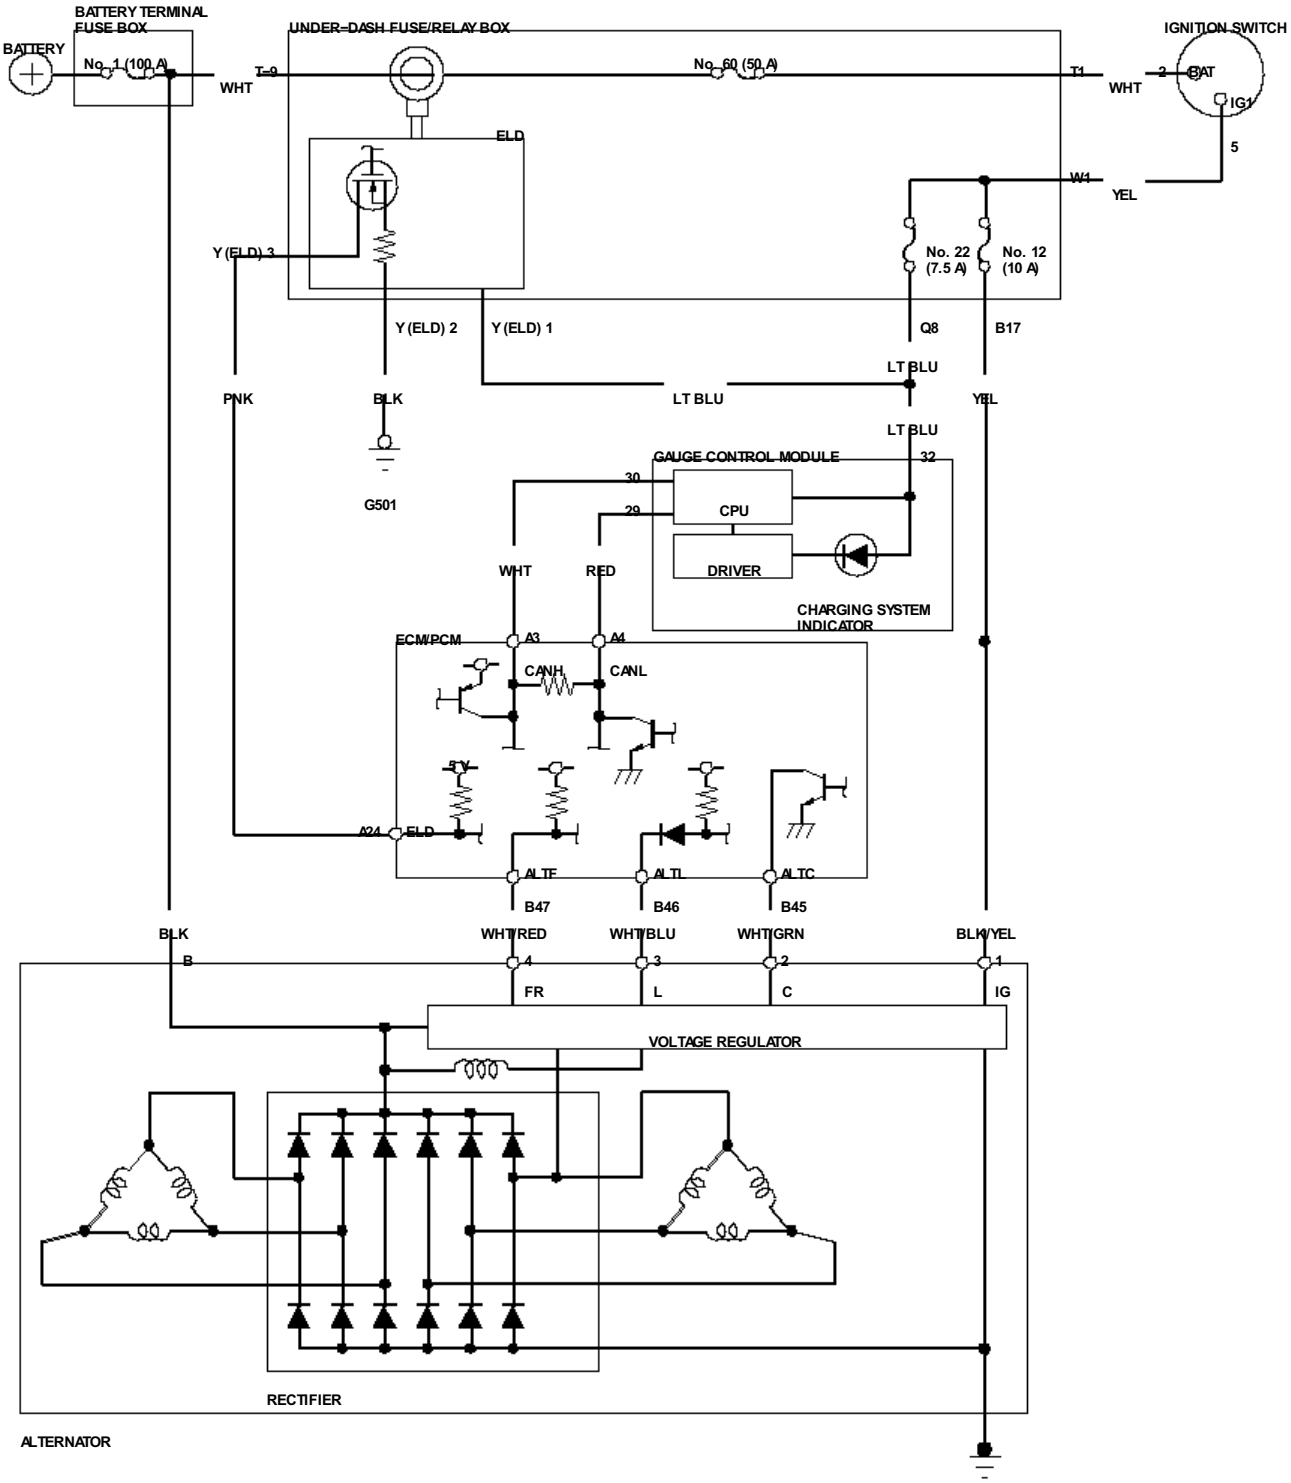
- Release the parking brake.
- Start the engine.
- Shift to D, then N.
- Turn off the engine.
- Leave the ignition switch in ACCESSORY (I) so the steering wheel does not lock.
- Make sure all accessories are turned off to minimize battery current draw.

It is best to tow the vehicle no farther than 80 km (50 miles), and keep the vehicle speed below 55 km/h (35 mph).

NOTICE

- Improper towing preparation will damage the transmission. Follow the above procedure exactly. If you cannot shift the transmission or start the engine (automatic transmission), the vehicle must be transported on a flat-bed.
- Trying to lift or tow the vehicle by the bumpers will cause serious damage. The bumpers are not designed to support the vehicle's weight.

Charging System Circuit Diagram



Charging system indicator does not come on with the ignition switch in ON (II)

Diagnostic procedure

1. Troubleshoot the charging system indicator circuit.

Charging system indicator stays on

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the drive belt auto-tensioner.
3. Check for a broken drive belt.
4. Troubleshoot the charging system indicator circuit.

Battery discharged

Diagnostic procedure

1. Check for a poor connection at the battery terminal.
2. Test the battery.
3. Check the drive belt auto-tensioner.
4. Check for a broken drive belt.
5. Check for excessive parasitic electrical current draw.
6. Troubleshoot the alternator and regulator circuit.

Battery overcharged

Diagnostic procedure

1. Test the battery.
2. Troubleshoot the alternator and regulator circuit.

Charging System Symptom Troubleshooting Index

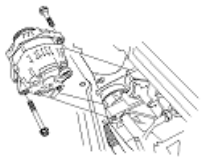
Symptom	Diagnostic procedure	Also check for
Charging system indicator does not come on with the ignition switch in ON (II)	Troubleshoot the charging system indicator circuit.	
Charging system indicator stays on	1. Check for PGM-FI DTCs. 2. Check the drive belt auto-tensioner. 3. Check for a broken drive belt. 4. Troubleshoot the charging system indicator circuit.	
Battery discharged	1. Check for a poor connection at the battery terminal. 2. Test the battery. 3. Check the drive belt auto-tensioner. 4. Check for a broken drive belt. 5. Check for excessive parasitic electrical current draw. 6. Troubleshoot the alternator and regulator circuit.	
Battery overcharged	1. Test the battery. 2. Troubleshoot the alternator and regulator circuit.	

Alternator Removal and Installation

Removal

1. Do the battery terminal disconnection procedure.
2. Remove the drive belt.
3. Remove the intake manifold.
4. Disconnect the alternator connector (A) and BLK wire (B), then remove the harness clamp (C) from the alternator.

5. Remove the alternator.



Installation

1. Install the alternator.

2. Connect the alternator connector (A) and BLK wire (B), then install the harness clamp (C) to the alternator.
3. Install the intake manifold.
4. Install the drive belt.
5. Do the battery terminal reconnection procedure.

Alternator Overhaul

Exploded View

Special Tools Required

Driver handle, 15 x 135L
07749-0010000

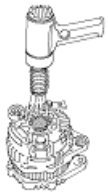
Bearing driver attachment, 42 x 47 mm
07746-0010300

NOTE: Refer to the Exploded View as needed during this procedure.

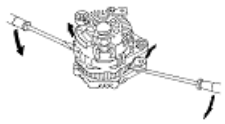
Alternator Disassembly

1. Test the alternator and regulator before you remove them.
2. Remove the alternator.
3. Remove the four through bolts.

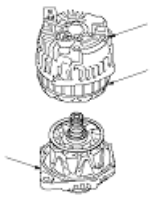
4. Heat the rear bearing seat with a heat gun for about 5 minutes (50−60 °C, 129−140 °F).



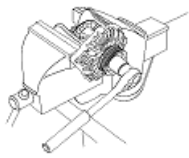
5. Separate the rear housing from the drive end housing by inserting a flat-tip screwdriver into the openings and prying them apart.
   NOTE: Be careful not to damage the stator with the tip of the screwdriver.



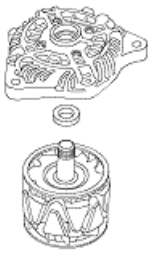
6. Separate the rear housing (A) and drive end housing (B) with the stator (C) attached to the rear housing.



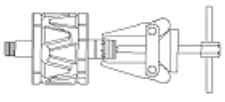
7. If you are not replacing the front bearing and/or rear bearing, go to Step 15 . Clamp the rotor in a soft-jawed vise, then remove the pulley locknut.



8. Remove the rotor.
9. Inspect the rotor shaft for scoring, and inspect the bearing journal surface in the drive end housing for seizure marks.
   - If either the rotor or drive end housing is damaged, replace the alternator.
   - If both the rotor and the drive end housing are OK, go to Step 10 .

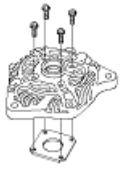


10. Remove the rear bearing using the puller as shown.



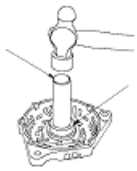
11. Use a hand press to install the new rear bearing. Apply pressure only on the inner race to avoid damaging the bearing.

12. Remove the front bearing retainer plate.



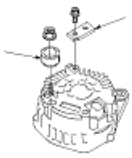
13. Support the drive end housing in a vise, and drive out the front bearing with a brass drift and hammer.

14. With a hammer and the special tools, install a new front bearing in the drive end housing.

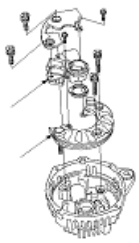


15. Remove the stator.

16. Remove the terminal insulator (A) and harness bracket (B).



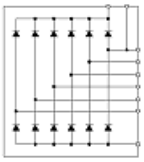
17. Remove the voltage regulator/brush holder assembly (A) and the rectifier (B).



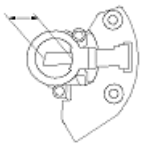
18. Check for continuity in each direction, between the B terminal (A) and P terminals (B), and between the E terminal (C) and P terminals (B) of each diode pair. All diodes should have continuity in only one direction. Because the rectifier diodes are designed to allow current to pass in one direction, and the rectifier is made up of six diodes (six pairs), you must test each diode in both directions for continuity with an ohmmeter that has diode checking capability: a total of 24 checks.
    - If any diode failed, replace the rectifier assembly. (Diodes are not available separately.)
    - If all the diodes are OK, go to Step 19 .

Stator side

Rear housing side



Alternator Brush Inspection

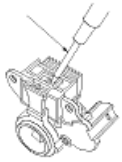


19. Measure the length of both brushes with a vernier caliper.
    - If either brush is shorter than the service limit, replace the rear housing assembly.
    - If brush length is OK, go to Step 20 .

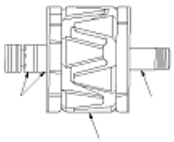
    Alternator Brush Length

Standard (New):	**23 mm (0.91 in.)**
Service Limit:	**18 mm (0.71 in.)**

20. Unsolder the brush leads from the voltage regulator/brush holder assembly with a 100 W soldering iron (A), then replace the brushes.



Rotor Slip Ring Test

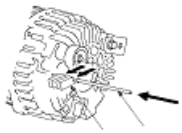


21. Check for continuity between the slip rings (A).
    - If there is continuity, go to Step 22 .
    - If there is no continuity, replace the rotor assembly.
22. Check for continuity between each slip ring (A) and the rotor (B) and the rotor shaft (C).
    - If there is no continuity, replace the rear housing assembly, go to Step 23 .
    - If there is continuity, replace the rotor assembly.

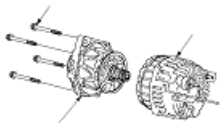
Stator Test

23. Check that there is continuity between each leads (A).
    - If there is continuity, go to Step 24 .
    - If there is no continuity, replace the stator.
24. Check for continuity between each lead and the coil core (B).
    - If there is no continuity, go to Step 25 .
    - If there is continuity, replace the stator.

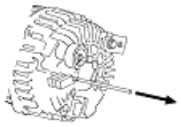
Alternator Reassembly



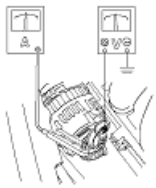
25. If you removed the pulley, put the rotor in the drive end housing, then tighten its locknut to 110 N·m (11.2 kgf·m, 81.0 lbf·ft).
26. Remove any grease or any oil from the slip rings.
27. Install the voltage regulator/brush holder assembly and rectifier on the rear housing.
28. Install the stator on the rear housing.
29. Push the brushes (A) in, then insert a pin or drill bit (B) (about 1.8 mm (0.07 in.) diameter) to hold them there.
30. Heat the rear bearing seat with a heat gun for about 5 minutes (50−60 °C, 129−140 °F).
31. Put the rear housing assembly (A) and drive end housing/rotor assembly (B) together, tighten the four through bolts (C).



32. Pull put the pin.
33. After assembling the alternator, turn the pulley by hand to make sure the rotor turns smoothly and without noise.
34. Install the alternator and drive belt.



Alternator and Regulator Circuit Troubleshooting



1. Be sure the battery connections are good, and that the battery is sufficiently charged and in good condition.
2. Hook up the following equipment:
   - Ammeter, 0−400 A
   - Voltmeter, 0−20 V (accurate within 0.1 V)
3. Start the engine. Hold the engine at 3,000 rpm (min $^{-1}$) with no load (in P or N (A/T model) or neutral (M/T model)), until the radiator fan comes on then let it idle.
4. Raise the engine speed to 2,000 rpm (min $^{-1}$) and hold it there.
5. Turn the headlights (high beam) on, and measure the voltage at the alternator terminal.

   Is the voltage within 13.9−15.1 V?
   YES - Go to Step 6 .
   NO - Replace the alternator, or repair the alternator. ■
6. Read the amperage at 13.5 V.
   NOTE: Adjust the voltage by turning the blower motor, rear window defogger, brake lights and etc. on.

   Is the amperage 60 A or more?
   YES - The charging system is OK. Go to alternator control circuit troubleshooting. ■
   NO - Replace the alternator, or repair the alternator. ■

Alternator Control Circuit Troubleshooting

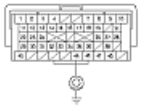
1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
4. Check for DTCs. If a DTC is present, diagnose and repair the cause before continuing with this test.
5. Disconnect the alternator 4P connector from the alternator.
6. Start the engine, and turn on the headlights to high beam.
7. Measure the voltage between alternator 4P connector terminal No. 2 and the positive terminal of the battery.

Is there 1 V or less?
YES - Go to Step 11 .
NO - Go to Step 8 .

8. Jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
NOTE: This step must be done to protect the ECM/PCM from damage.
9. Disconnect ECM/PCM connector B (49P).

---

10. Check for continuity between ECM/PCM connector terminal B45 and body ground.

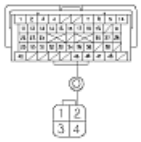


Is there continuity?
YES - Repair short in the wire between the alternator and the ECM/PCM.■
NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

11. Jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
NOTE: This step must be done to protect the ECM/PCM from damage.
12. Disconnect ECM/PCM connector B (49P).

---

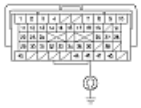
13. Check for continuity between ECM/PCM connector terminal B45 and alternator 4P connector terminal No. 2.



Is there continuity?
YES - Replace the alternator, or repair the alternator. ■
NO - Repair open in the wire between the alternator and the ECM/PCM.■

Charging System Indicator Circuit Troubleshooting

1. Turn the ignition switch to ON (II).



Does the charging system indicator come on?
YES - Go to Step 2 .
NO - Go to Step 14 .

2. Start the engine. Hold the engine speed at 2,000 rpm (min $^{-1}$) for 1 minute.

Does the charging system indicator go off?
YES - Charging system indicator circuit is OK. Go to the alternator and regulator circuit troubleshooting. ■
NO - Go to Step 3 .

3. Do the gauge control module self-diagnostic function procedure.

Does the charging system indicator flash?
YES - Go to Step 4 .
NO - Replace the gauge control module .■

4. Turn the ignition switch to LOCK (0).
5. Disconnect the alternator 4P connector.
6. Turn the ignition switch to ON (II).
NOTE: The charging system indicator may come on and then go off.

Does the charging system indicator go off?
YES - Replace the alternator, or repair the alternator. ■
NO - Go to Step 7 .

7. Turn the ignition switch to LOCK (0).
8. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
9. Turn the ignition switch to ON (II).
10. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
11. Jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
NOTE: This step must be done to protect the ECM/PCM from damage.
12. Disconnect ECM/PCM connector B (49P).
13. Check for continuity between ECM/PCM connector terminal B46 and body ground.

Is there continuity?
YES - Repair short in the wire between the alternator and the ECM/PCM (B46).■
NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

14. Do the gauge control module self-diagnostic function procedure.

Does the charging system indicator flash?
YES - Go to Step 15 .
NO - Replace the gauge control module. ■

15. Turn the ignition switch to LOCK (0).
16. Disconnect the alternator 4P connector.

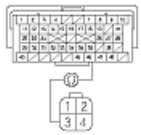
---

17. Connect alternator 4P connector terminal No. 3 to body ground with a jumper wire.
18. Turn the ignition switch to ON (II).

Does the charging system indicator come on?
YES - Replace the alternator, or repair the alternator. ■
NO - Disconnect the jumper wire, then go to Step 19 .

19. Connect the HDS to the DLC.
20. Turn the ignition switch to ON (II).
21. Make sure the HDS communicates with the vehicle and the ECM/PCM. If it doesn't communicate, troubleshoot the DLC circuit.
22. Jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
NOTE: This step must be done to protect the ECM/PCM from damage.
23. Disconnect ECM/PCM connector B (49P).

24. Check for continuity between ECM/PCM connector terminal B46 and alternator 4P connector terminal No. 3.



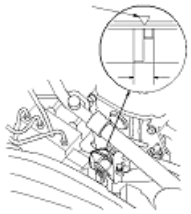
Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

NO - Repair open in the wire between the alternator and the ECM/PCM.■

Drive Belt Inspection

1. Inspect the belt for cracks or damage. If the belt is cracked or damaged, replace it.
2. Check the position of the auto-tensioner indicator's pointer (A) is within the standard range (B) as shown. If it is out of the standard range, replace the drive belt.

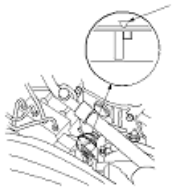


Drive Belt Auto-tensioner Removal/Installation

1. Remove the drive belt.
2. Remove the auto-tensioner
3. Install the auto-tensioner in the reverse order of removal.

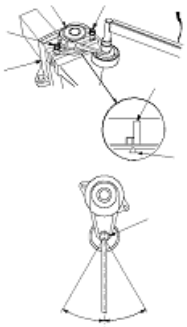
Drive Belt Auto-tensioner Inspection

1. Turn the ignition switch to ON (II), and make sure to turn the A/C switch off. Turn the ignition switch to LOCK (0).
2. Check the position of the auto-tensioner indicator's pointer (A). Start the engine then check the position again with the engine idling. If the position of the indicator moves or fluctuates very much, replace the auto-tensioner.
3. Check for abnormal noise from the tensioner pulley. If you hear abnormal noise, replace the tensioner pulley.
4. Remove the drive belt.



5. Move the auto-tensioner within its limit with a wrench in the direction shown. Check that the tensioner moves smoothly and without any abnormal noise. If the tensioner does not move smoothly or if you hear abnormal noise, replace the auto-tensioner.
6. Remove the auto-tensioner.

7. Clamp the auto-tensioner (A) by using two 8 mm bolts (B) and a vise (C) as shown. Do not clamp the auto-tensioner itself.
8. Set the torque wrench (D) on the pulley bolt, and align it as shown.
9. Align the indicator (E) on the tensioner base with Max. belt position mark (F) on the tensioner arm by using the torque wrench, and measure the torque. If the torque value is out of specification, replace the auto-tensioner.
   NOTE: If the indicator exceeds the Max. belt position mark, recheck the torque.
   Auto-tensioner Spring Torque:
   20.6–25.2 N·m (2.10–2.25 kgf·m, 15.2–18.6 lbf·ft)



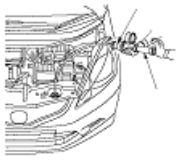
Drive Belt Auto-tensioner Pulley Replacement

1. Remove the auto-tensioner.
2. Remove the tensioner pulley.
3. Install the auto-tensioner in the reverse order of removal.

Coolant Check

1. Look at the coolant level in the coolant reservoir. Make sure it is between the MAX mark (A) and MIN mark (B).
2. If the coolant level in the coolant reservoir is at or below the MIN mark, add coolant to bring it up to the MAX mark, then inspect the cooling system for leaks.

Radiator Test



1. Wait until the engine is cool, then carefully remove the radiator cap and fill the radiator with engine coolant to the top of the filler neck.
2. Attach the pressure tester (A) (commercially available) to the radiator. Use a small adapter H-901122-09 (B) (commercially available) to attach the pressure tester.
3. Apply a pressure of 93−123 kPa (0.95−1.25 kgf/cm ^{2} , 14−18 psi).
4. Inspect for engine coolant leaks and a drop in pressure.
5. Remove the tester, and reinstall the radiator cap.
6. Check for engine oil in the coolant and/or coolant in the engine oil.

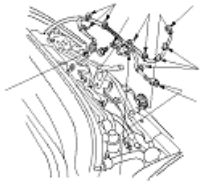
Radiator Replacement

1. Drain the engine coolant.
2. Remove the right side splash shield.
3. Remove the front bumper.

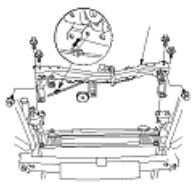
4. Disconnect the fan motor connectors (A), the hood latch switch connector (B), and the horn connector (C), then remove the ground cable (D) and the harness clamps (E).

RHD model

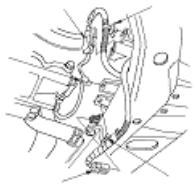
LHD model



5. Remove the bulkhead mounting bolts, and remove the hood opener cable clamp (A), then remove the bulkhead (B).
6. Raise the vehicle on the lift to full height.

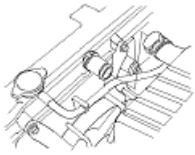


7. Disconnect the engine coolant temperature (ECT) sensor 2 connector (A), and remove the A/C compressor clutch connector (B) from the clamp.
8. Remove the harness clamps (C).

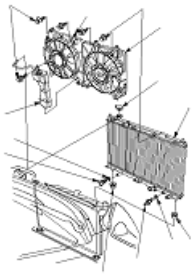


9. Disconnect the lower radiator hose (A).
10. With A/T model: Remove the automatic transmission fluid (ATF) cooler hoses (B), then plug the hose and line.
11. Lower the vehicle on the lift.

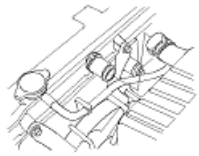
12. Remove the upper radiator hose.



13. Pull up the radiator (A), then remove the coolant reservoir (B), the radiator fan shroud assembly (C), the A/C condenser fan shroud assembly (D), the radiator cap (E), the ETC sensor 2 (F), and the drain plug (G).
14. Reassemble the radiator with new O-rings (H).
15. Install the radiator. Make sure the lower cushions (I) are set securely.



16. Install the upper radiator hose.
17. Raise the vehicle on the lift to full height.



18. Install the lower radiator hose (A).
19. With A/T model: Install the ATF cooler hoses (B).

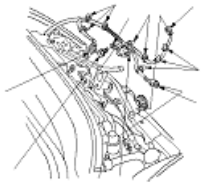
20. Connect the ECT sensor 2 connector (A), and install the A/C compressor clutch connector (B) to the clamp.
21. Install the harness clamps (C).
22. Lower the vehicle on the lift.

23. Install the hood opener cable clamp (A), then install the bulkhead (B).
24. Apply body paint to the bulkhead mounting bolts.

25. Connect the fan motor connectors (A), the hood latch switch connector (B), and the horn connector (C), then install the ground cable (D) and the harness clamps (E).
26. Install the front bumper.

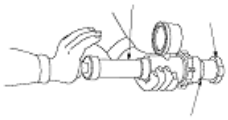
RHD model

LHD model



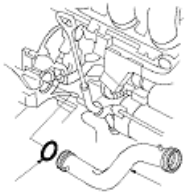
27. Install the right side splash shield.
28. Refill the radiator with engine coolant, and bleed the air from the cooling system with the heater valve open.
29. Clean up any spilled engine coolant.

Radiator Cap Test



1. Remove the radiator cap (A), wet the seal with engine coolant, then install it on the pressure tester (B) (commercially available). Use a small adapter H-901122-09 (C) (commercially available) to install the radiator cap.
2. Apply a pressure of 93−123 kPa (0.95−1.25 kgf/cm ^{2} , 14−18 psi).
3. Check for a drop in pressure.
4. If the pressure drops, replace the cap.

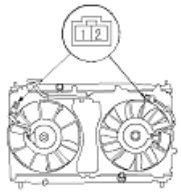
Connecting Pipe Replacement



1. Drain the engine coolant.
2. Remove the thermostat housing.
3. Remove the connecting pipe (A).
4. Install the connecting pipe with a new O-ring (B).
5. Install the thermostat housing.
6. Refill the radiator with engine coolant, and bleed the air from the cooling system with the heater valve open.
7. Clean up any spilled engine coolant.

Radiator and A/C Condenser Fan Motor Test

1. Disconnect the 2P connectors from the radiator fan motor and condenser fan motor.
2. Test the motor by connecting battery power to No. 2 terminal and ground to No. 1 terminal.
3. If the motor fails to run, or does not run smoothly, replace it.

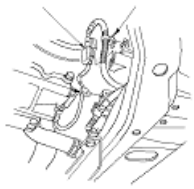


Radiator and A/C Condenser Fan, Motor, and Shroud Removal and Installation

Removal

1. Remove the right side splash shield.
2. Remove the front bumper.
3. Raise the vehicle on the lift to full height.

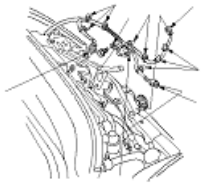
4. Remove the A/C compressor clutch connector (A) from the clamp, then remove the harness clamps (B).
5. Lower the vehicle on the lift.



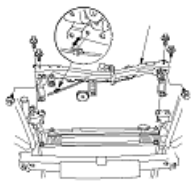
6. Disconnect the fan motor connectors (A), the hood latch switch connector (B), and the horn connector (C), then remove the ground cable (D) and the harness clamps (E).

RHD model

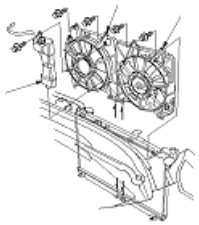
LHD model



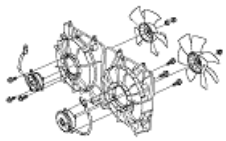
7. Remove the bulkhead mounting bolts, and remove the hood opener cable clamp (A), then remove the bulkhead (B).



8. Remove the coolant reservoir (A).
9. Remove the condenser fan shroud assembly (B), then remove the radiator fan shroud assembly (C) from condenser fan shroud side.

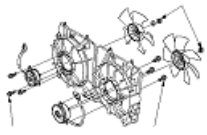


10. Disassemble the fan shrouds.

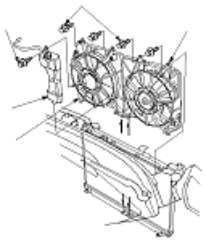


Installation

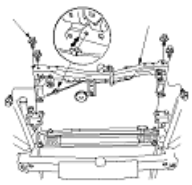
1. Assemble the fan shrouds.



2. Install the radiator fan shroud assembly (A), then install the condenser fan shroud assembly (B).
3. Install the coolant reservoir (C).



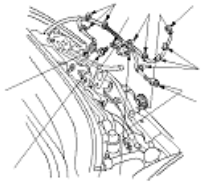
4. Install the hood opener cable clamp (A), then install the bulkhead (B).
5. Apply body paint to the bulkhead mounting bolts.



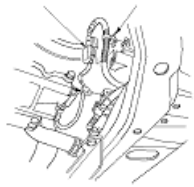
6. Connect the fan motor connectors (A), the hood latch switch connector (B), and the horn connector (C), then install the ground cable (D) and the harness clamps (E).
7. Raise the vehicle on the lift to full height.

RHD model

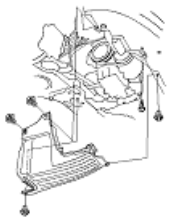
LHD model



8. Install the A/C compressor clutch connector (A) to the clamp, then install the harness clamps (B).
9. Lower the vehicle on the lift.
10. Install the front bumper.



11. Install the right side splash shield.



Thermostat Test

Replace the thermostat if it is open at room temperature.
To test a closed thermostat:

1. Suspend the thermostat (A) in a container of water. Do not let the thermometer (B) touch the bottom of the hot container.
2. Heat the water, and check the temperature with a thermometer. Check the temperature where the thermostat first opens, and where it is fully open.
3. Measure the lift height of the thermostat when it is fully open.

Standard Thermostat

Lift Height:	**Above 8.0 mm (0.31 in.)**
Starts Opening:	**76−80 °C (169−176 °F)**
Fully Open:	**90 °C (194 °F)**

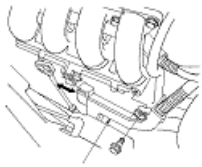
Thermostat Replacement

1. Drain the engine coolant.
2. Remove the thermostat cover (A), then remove the thermostat (B).
3. Install the new rubber seal (C) onto the thermostat, then install the thermostat with the pin (D) up, and install the thermostat cover.
4. Refill the radiator with engine coolant, then bleed the air from the cooling system.
5. Clean up any spilled engine coolant.

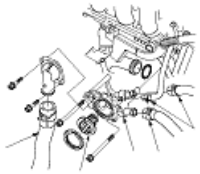
Thermostat Housing Removal and Installation

Removal

1. Drain the engine coolant.
2. Remove the coolant reservoir.

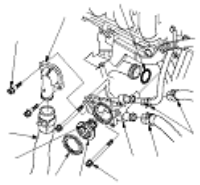


3. Remove the harness holder mounting bolt, then remove the harness holder (A) from the bracket.

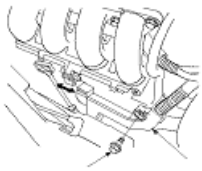


4. Disconnect the lower radiator hose (A), the heater hose (B), and the water bypass hoses (C).
5. Remove the thermostat housing assembly (D), then remove the thermostat (E).

Installation



1. Install the new rubber seal (A) onto the thermostat, then install the thermostat (B) with pin (C) up, and install the thermostat cover (D).
2. Install the thermostat housing Assembly (E) with new O-ring (F).
3. Install the lower radiator hose (G), the heater hose (H), and the water bypass hoses (I).

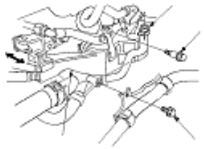


4. Install the harness holder (A).

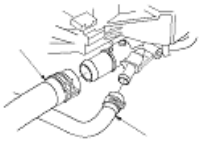
5. Install the coolant reservoir.
6. Refill the radiator with engine coolant, then bleed the air from the cooling system.
7. Clean up any spilled engine coolant.

Water Outlet Removal and Installation

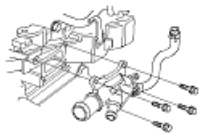
Removal



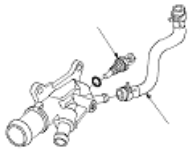
1. Drain the engine coolant.
2. Remove the air cleaner housing assembly.
3. Remove the heater hose clamp bracket mounting bolt (A) and the harness holder mounting bolt (B).
4. Disconnect the water bypass hose (C), then remove the harness holder (D) from the bracket.



5. Disconnect the upper radiator hose (A) and the water bypass hose (B).

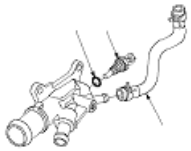


6. Disconnect the engine coolant temperature (ECT) sensor 1 connector, then remove the water outlet.

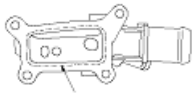


7. Remove the ECT sensor 1 (A) and the water bypass hose (B).

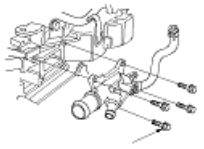
Installation



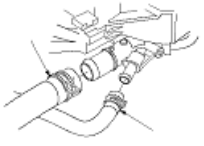
1. Install the ECT sensor 1 (A) with new O-ring (B).
2. Install the water bypass hose (C).
3. Remove the all of the old liquid gasket from the water outlet mating surfaces, the bolts, and the bolt holes.
4. Clean and dry the water outlet mating surfaces.



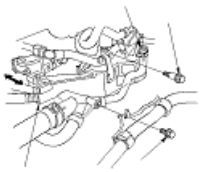
5. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the cylinder head mating surface of the water outlet and to the inner threads of the bolt holes.
   NOTE:
   - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).
   - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



6. Install the water outlet.
   NOTE:
   - Wait at least 30 minutes before filling the engine with oil.
   - Do not run the engine for at least 3 hours after installing the chain case.



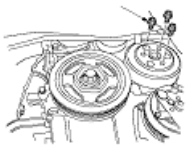
7. Install the upper radiator hose (A) and the heater hose (B).



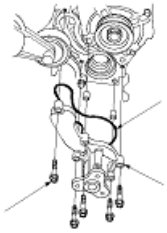
8. Install the harness holder (A), then tighten the harness holder mounting bolt (B) and the heater hose clamp bracket mounting bolt (C).
9. Install the water bypass hose (D).
10. Clean up any spilled engine coolant.
11. Install the air cleaner housing assembly.
12. Refill the radiator with engine coolant, and bleed the air from the cooling system with the heater valve open.

Water Pump Replacement

1. Drain the engine coolant.
2. Remove the right front wheel.
3. Remove the right side splash shield.
4. Loosen the water pump pulley mounting bolts.
5. Remove the drive belt.
6. Remove the water pump pulley.

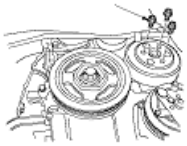


7. Remove the water pump (A) by removing the five bolts.
8. Inspect, and clean the O-ring groove and the mating surface of the engine block.
9. Install the water pump with a new O-ring (B) in the reverse order of removal.
10. Clean up any spilled engine coolant.
11. Install the water pump pulley.
12. Install the drive belt.
13. Tighten the water pump pulley mounting bolts.
14. Install the right side splash shield.
15. Install the right front wheel.
16. Refill the radiator with engine coolant, and bleed the air from the cooling system with the heater valve open.



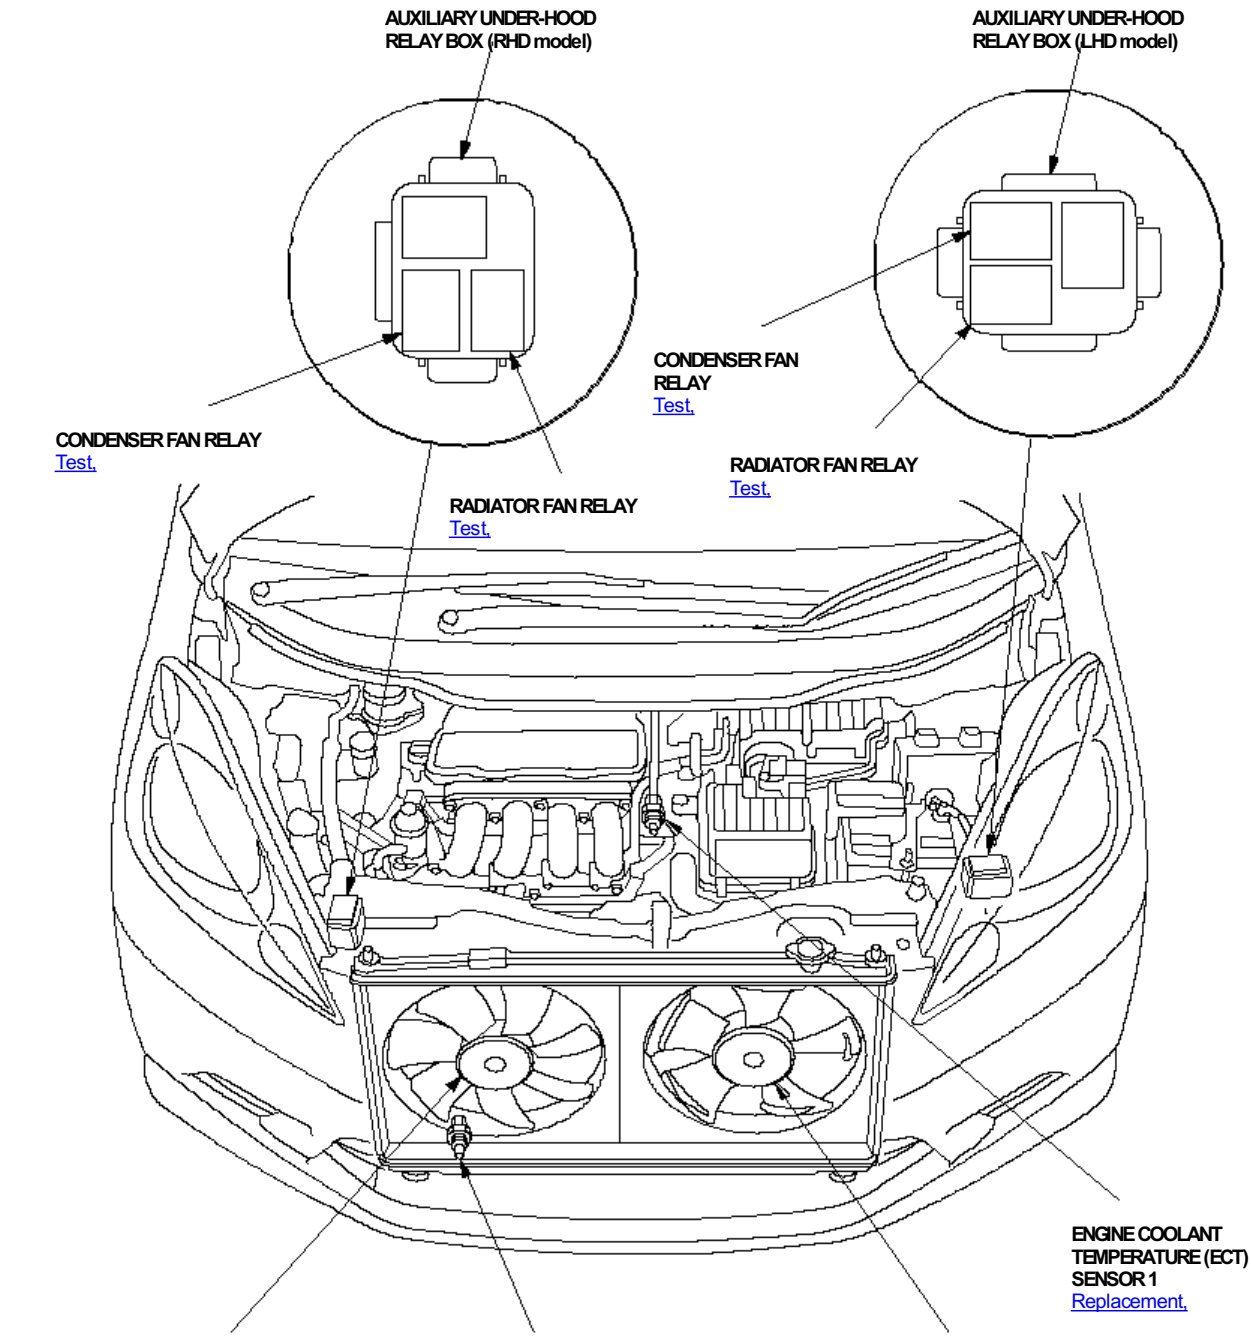
Water Pump Inspection

1. Remove the right front wheel.
2. Remove the right side splash shield.
3. Loosen the water pump pulley mounting bolts.
4. Remove the drive belt.
5. Remove the water pump pulley.

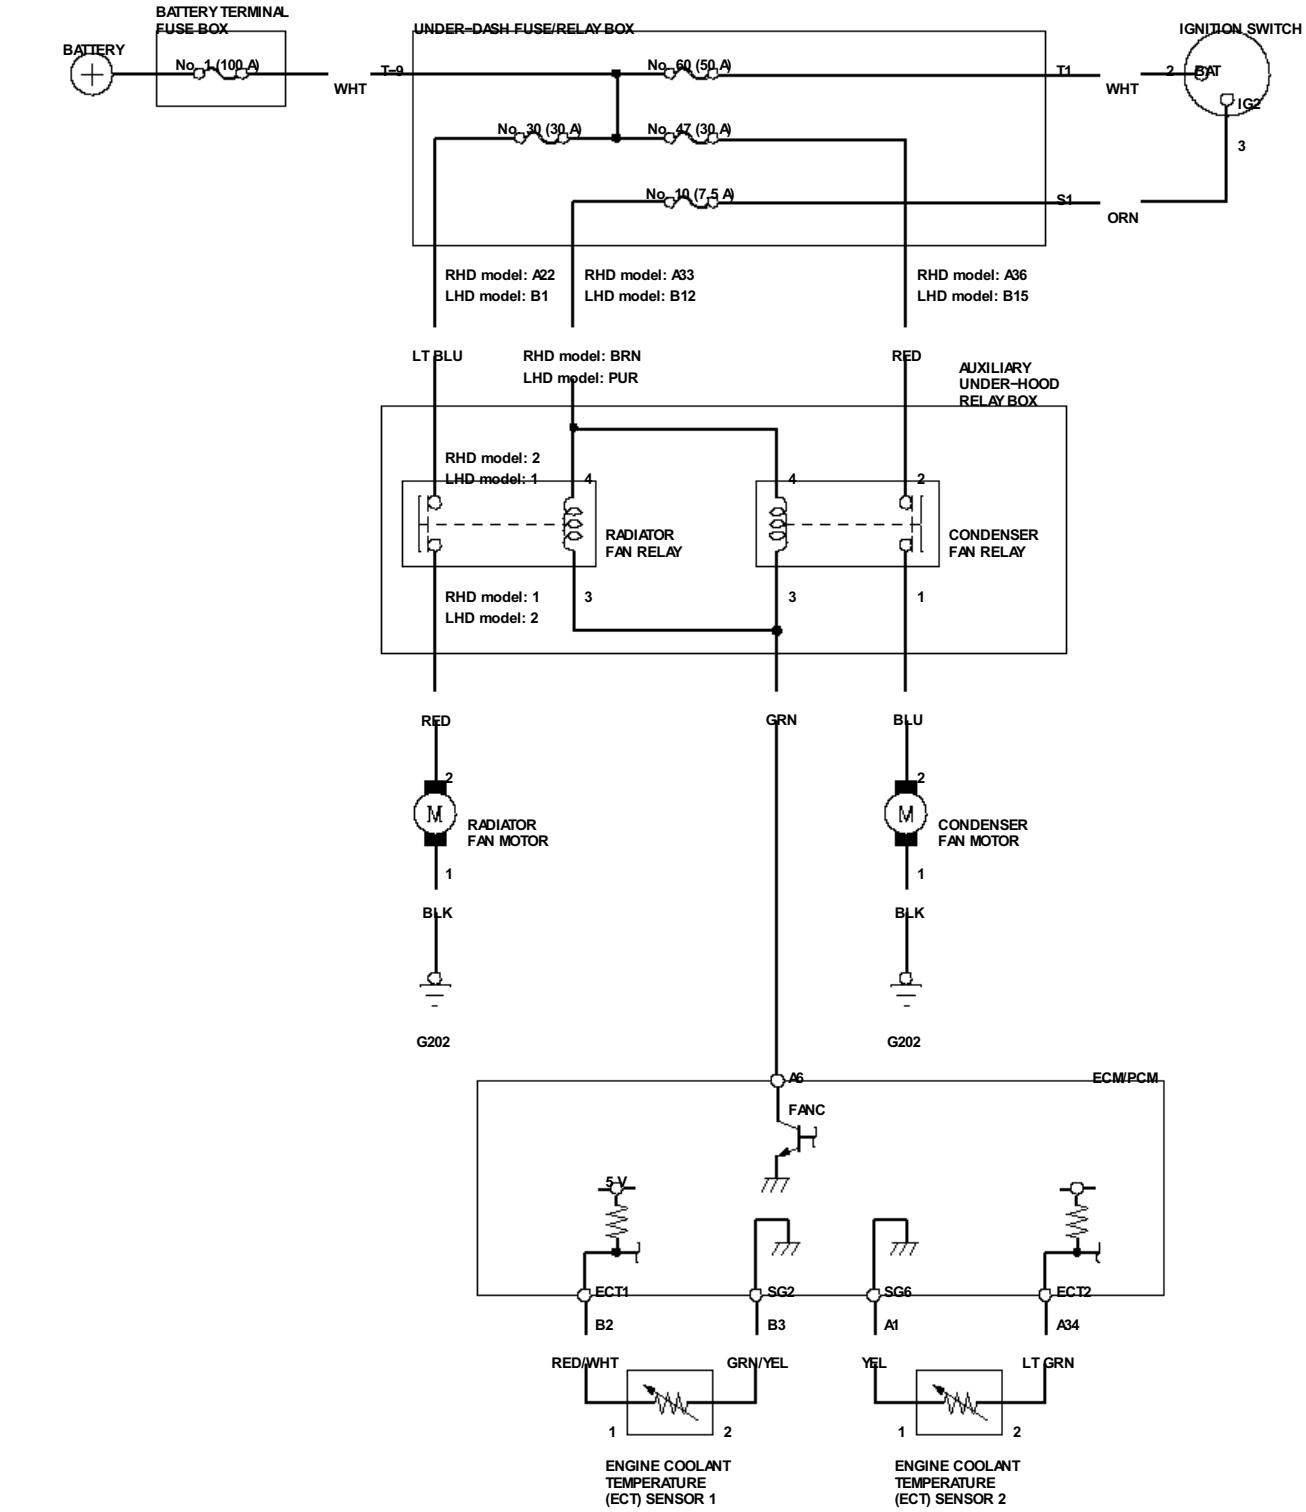


6. Turn the water pump counterclockwise, and make sure that it turns freely. If it doesn't, replace the water pump.
   NOTE: When you check the water pump, you may see a small amount of “weeping" from the bleed holes (A). This is normal.
7. Install the water pump pulley.
8. Install the drive belt.
9. Tighten the water pump pulley mounting bolts.
10. Install the right side splash shield.
11. Install the right front wheel.

Cooling Fan Controls Component Location Index



Cooling Fan Controls Circuit Diagram



Engine overheats

Diagnostic Procedure

1. Check the coolant level.
2. Check for the coolant leakage (from gaskets, hoses, O-rings, etc.).
3. Check for dirt, leaves, or insects on radiator and condenser.
4. Check for a broken drive belt.
5. Check the drive belt auto-tensioner.
6. Check for deteriorated coolant.
7. Check for damaged or deformed fan shroud.
8. Inspect the fan motors or fan relays.
9. Check the radiator cap.
10. Check the thermostat.
11. Inspect the water pump.
12. Check for plugged or deteriorated radiator hoses.
13. Check for plugged heater core of hoses.
14. Check for a damaged cylinder head gasket.

The radiator fan does not run when the engine coolant temperature is above 93 °C (199 °F)

Diagnostic Procedure

1. Radiator fan circuit troubleshooting.

Also check for

- Cleanliness and tightness of all connectors

The A/C condenser fan does not run when the engine coolant temperature is above 93 °C (199 °F)

Diagnostic Procedure

1. A/C condenser fan circuit troubleshooting.

Also check for

- Cleanliness and tightness of all connectors

Both the radiator fan and the A/C condenser fan does not run when the engine coolant temperature is above 93 °C (199 °F)

Diagnostic Procedure

1. Radiator fan and A/C condenser fan circuit troubleshooting.

Also check for

- Cleanliness and tightness of all connectors

The radiator fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)

Diagnostic Procedure

1. Remove the radiator fan relay.

Also check for

- Cleanliness and tightness of all connectors

The A/C condenser fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)

Diagnostic Procedure

1. Remove the condenser fan relay.

Also check for

- Cleanliness and tightness of all connectors

Both the radiator fan and the A/C condenser fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)

Diagnostic Procedure

1. Check for a short in the wire between the radiator fan 4P socket terminal No. 3 and ECM/PCM connector terminal A6.

Also check for

- Cleanliness and tightness of all connectors

Cooling Fan Controls Symptom Troubleshooting Index

Symptom	Diagnostic Procedure	Also check for
Engine overheats	1. Check the coolant level. 2. Check for the coolant leakage (from gaskets, hoses, O-rings, etc.). 3. Check for dirt, leaves, or insects on radiator and condenser. 4. Check for a broken drive belt. 5. Check the drive belt auto-tensioner. 6. Check for deteriorated coolant. 7. Check for damaged or deformed fan shroud. 8. Inspect the fan motors or fan relays. 9. Check the radiator cap. 10. Check the thermostat. 11. Inspect the water pump. 12. Check for plugged or deteriorated radiator hoses. 13. Check for plugged heater core of hoses. 14. Check for a damaged cylinder head gasket.	
The radiator fan does not run when the engine coolant temperature is above 93 °C (199 °F)	Radiator fan circuit troubleshooting.	Cleanliness and tightness of all connectors
The A/C condenser fan does not run when the engine coolant temperature is above 93 °C (199 °F)	A/C condenser fan circuit troubleshooting.	Cleanliness and tightness of all connectors
Both the radiator fan and the A/C condenser fan does not run when the engine coolant temperature is above 93 °C (199 °F)	Radiator fan and A/C condenser fan circuit troubleshooting.	Cleanliness and tightness of all connectors
The radiator fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)	Remove the radiator fan relay.	Cleanliness and tightness of all connectors
The A/C condenser fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)	Remove the condenser fan relay.	Cleanliness and tightness of all connectors
Both the radiator fan and the A/C condenser fan run with the ignition switch to ON (II), and the engine coolant temperature below 90 °C (194 °F)	Check for a short in the wire between the radiator fan 4P socket terminal No. 3 and ECM/PCM connector terminal A6.	Cleanliness and tightness of all connectors

Radiator and A/C Condenser Fan Circuit Troubleshooting

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.

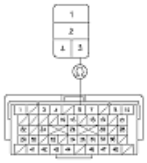
Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse and recheck.■

2. Remove the radiator fan relay.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the radiator fan relay 4P socket terminal No. 4 and body ground.

Is there battery voltage?
YES - Go to Step 5 .
NO - Repair open in the wire between the under-dash fuse/relay box and the radiator fan relay 4P socket terminal No. 4.■

5. Turn the ignition switch to LOCK (0).
6. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
7. Turn the ignition switch to ON (II).
8. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
9. Jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
NOTE: This step must be done to protect the ECM/PCM from damage.
10. Disconnect ECM/PCM connector A (49P).

11. Check for continuity between the radiator fan relay 4P socket terminal No. 3 and ECM/PCM connector terminal A6.



Is there continuity?
YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom goes away with a known good ECM/PCM, replace the original ECM/PCM. ■
NO - Repair open in the wire between the radiator fan relay 4P socket terminal No. 3 and ECM/PCM connector terminal A6.■

Radiator Fan Circuit Troubleshooting

1. Check the No. 30 (30 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse and recheck.■

2. Remove the radiator fan relay, and test the radiator fan relay.

Is the relay OK?
YES -
- RHD model: Go to Step 3 .
- LHD model: Go to Step 6 .

NO - Replace the radiator fan relay and recheck.■

3. Measure the voltage between the radiator fan relay 4P socket terminal No. 2 and body ground.

Is there battery voltage?
YES - Go to Step 4 .
NO - Repair open in the wire between the under-dash fuse/relay box and the radiator fan relay 4P socket terminal No. 2.■

4. Disconnect the radiator fan motor 2P connector.

5. Check for continuity between the radiator fan relay 4P socket terminal No. 1 and the radiator fan motor 2P connector terminal No. 2.

Is there continuity?
YES - Go to Step 9 .
NO - Repair open in the wire between the radiator fan relay 4P socket terminal No. 1 and the radiator fan motor 2P connector terminal No. 2.■

6. Measure the voltage between the radiator fan relay 4P socket terminal No. 1 and body ground.

Is there battery voltage?
YES - Go to Step 7 .
NO - Repair open in the wire between the under-dash fuse/relay box and the radiator fan relay 4P socket terminal No. 1.■

7. Disconnect the radiator fan motor 2P connector.

8. Check for continuity between the radiator fan relay 4P socket terminal No. 2 and the radiator fan motor 2P connector terminal No. 2.

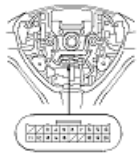
Is there continuity?
YES - Go to Step 9 .
NO - Repair open in the wire between the radiator fan relay 4P socket terminal No. 2 and the radiator fan motor 2P connector terminal No. 2.■

9. Check for continuity between the radiator fan motor 2P connector terminal No. 1 and body ground.

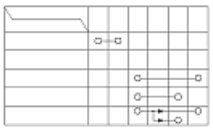
Is there continuity?
YES - Replace the radiator fan motor. ■
NO - Repair open in the wire between the radiator fan motor 2P connector terminal No. 1 and body ground. If the wire is OK, check for a poor ground at G202.■

Cruise Control Combination Switch Test

SRS components are located in this area. Review the SRS component locations, and the precautions and procedures, in the SRS before doing repairs or service.



1. Remove the driver's airbag.
2. Disconnect the 20P connector from the cable reel.



3. Check for continuity between the terminals in each switch position according to the table.
   - If there is continuity, and it matches the table, but switch failure occurred on the cruise control input test, check and repair the wire harness on the switch circuit.
   - If there is no continuity in one or more positions, replace the switch.

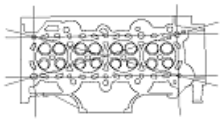
4. Check for continuity between the terminals in according to the table.
   - If there is continuity, and it matches the table, check and repair the wire harness on the switch circuit.
   - If there is no continuity in one or more positions, replace the switch.

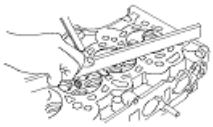
Engine Compression Inspection

NOTE: After this inspection, you must reset the engine control module (ECM)/powertrain control module (PCM), otherwise the ECM/PCM will continue to stop the injectors from functioning. Select ECM/PCM reset using the Honda Diagnostic System (HDS).

1. Warm up the engine to normal operating temperature (cooling fan comes on).
2. Turn the ignition switch to LOCK (0).
3. Connect the HDS to the data link connector (DLC).
4. Turn the ignition switch to ON (II).
5. Make sure the HDS communicates with the vehicle and the ECM/PCM. If it doesn't, troubleshoot the DLC circuit.
6. Select PGM-FI, INSPECTION, then ALL INJECTORS STOP function on the HDS.
7. Remove the four ignition coils.
8. Remove the four spark plugs.
9. Attach the compression gauge to the spark plug hole.
10. Open the throttle fully, then crank the engine with the starter motor and measure the compression.
    Compression Pressure:
    Above 980 kPa (10.0 kgf/cm ^{2}, 142 psi)
11. Measure the compression on the remaining cylinders.
    Maximum Variation:
    Within 200 kPa (2.0 kgf/cm ^{2}, 28 psi)
12. If the compression is not within specifications, check the following items, then remeasure the compression.
    - Damaged or worn valves and seats
    - Damaged cylinder head gasket
    - Damaged or worn piston rings
    - Damaged or worn piston and cylinder bore
13. Select ECM/PCM reset to cancel the ALL INJECTORS STOP function on the HDS.

Cylinder Head Inspection for Warpage





1. Remove the cylinder head.
2. Inspect the camshaft.
3. Check the cylinder head for warpage. Measure along the edges, and three ways across the center.
   Warpage

Standard (New):	**0.07 mm (0.0028 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**

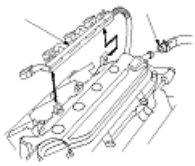
   - If warpage is less than 0.08 mm (0.003 in.) cylinder head resurfacing is not required.
   - If warpage is between 0.08 mm (0.003 in.) and 0.2 mm (0.008 in.), resurface the cylinder head.
   - Maximum resurface limit is 0.2 mm (0.008 in.) based on a height of 120 mm (4.72 in.).

   Cylinder Head Height

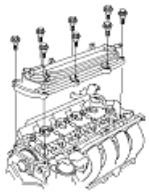
Standard (New):	**119.9−120.1 mm (4.720−4.728 in.)**

Cylinder Head Cover Removal

1. Remove the intake manifold chamber.
2. Disconnect the four ignition coil connectors.
3. Remove the harness holder (A) and the breather hose (B).

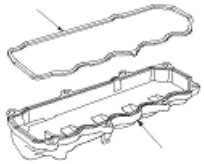


4. Remove the cylinder head cover.

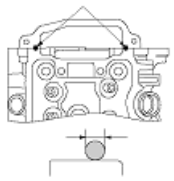


Cylinder Head Cover Installation

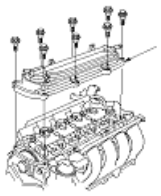
1. Thoroughly clean the head cover gasket and the groove.
2. Install the head cover gasket (A) in the groove of the cylinder head cover (B).
3. Check that the mating surfaces are clean and dry.



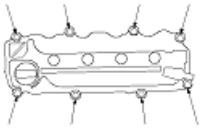
4. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the chain case contact areas (A).
   NOTE:
   - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead to the chain case contact areas.
   - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



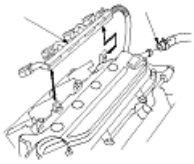
5. Place the cylinder head cover (A) on the cylinder head, then slide the cover slightly back and forth to seat the head cover gasket.



6. Tighten the bolts in three steps. In the final step tighten all bolts, in sequence, to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft).
   NOTE:
   - Wait at least 30 minutes before filling the engine with oil.
   - Do not run the engine for at least 3 hours after installing the head cover.

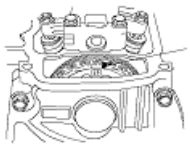


7. Install the harness holder (A) and the breather hose (B).
8. Connect the four ignition coil connectors.
9. Install the intake manifold chamber.

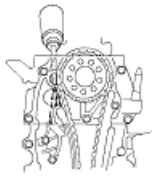


Camshaft Sprocket Removal

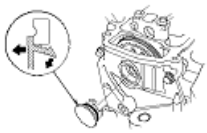
NOTE: Keep the cam chain away from magnetic fields.



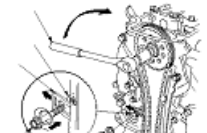
1. Remove the cylinder head cover.
2. Make a reference mark (A) across the camshaft sprocket and cam chain.



3. Apply new engine oil to the slider surface of the cam chain tensioner slider through the oil return hole in the cylinder head.



4. Remove the cylinder head plug.



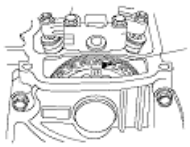
5. Hold the crankshaft pulley and set the socket wrench (A) on the camshaft sprocket bolt.
6. Remove the maintenance bolt (B), and turn the camshaft clockwise to compress the cam chain tensioner, then install the 6 x 1.0 mm bolt (C) in the bolt hole (D) on the engine block through the maintenance hole and cam chain tensioner (E).
   NOTE:
   - Turning torque should not exceed 56 N·m (5.7 kgf·m, 41 lbf·ft), when turning the camshaft.
   - Do not turn the camshaft counterclockwise.

7. Hold the camshaft with a 27 mm open-end wrench, then remove the camshaft sprocket.
   NOTE: Hang the cam chain with a wire.

Camshaft Sprocket Installation

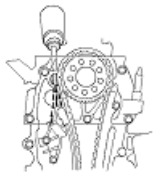
NOTE: Keep the cam chain away from magnetic fields.

1. Install the cam chain to the camshaft sprocket by alignment the reference mark (A), then install the camshaft sprocket on the camshaft.

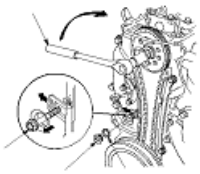


2. Hold the camshaft with a 27 mm open-end wrench, then tighten the bolt.
   Specified torque:
   56 N·m (5.7 kgf·m, 41 lbf·ft)

3. Apply new engine oil to the slider surface of the cam chain tensioner slider through the oil return hole in the cylinder head.



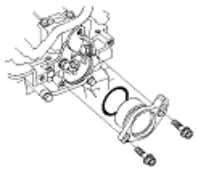
4. Hold the crankshaft pulley and set the socket wrench (A) on the camshaft sprocket bolt.
5. Turn the camshaft clockwise to compress the cam chain tensioner, then remove the 6 x 1.0 mm bolt (B).
   NOTE:
   - Turning torque should not exceed 56 N·m (5.7 kgf·m, 41 lbf·ft), when turning the camshaft.
   - Do not turn the camshaft counterclockwise.
6. Install the maintenance bolt (C) with a new washer (D).



7. Install the new cylinder head plug.
8. Install the cylinder head cover.

CMP Pulse Plate Removal and Installation

Removal

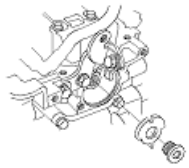


1. Remove the air cleaner housing assembly.
2. Remove the intake manifold chamber.
3. Remove the following engine wire harness connectors and wire harness clamps from the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - Camshaft position (CMP) sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
4. Remove the harness holder mounting bolt and the ground cable, then remove the harness holder from the bracket.
5. Remove the cylinder head cover.
6. Remove the camshaft thrust cover.

7. Hold the camshaft with an open-end wrench, then loosen the bolt.

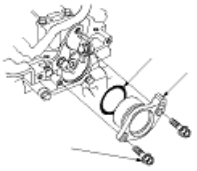
8. Remove the camshaft position (CMP) pulse plate.

Installation



1. Install the CMP pulse plate.

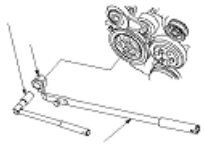
2. Hold the camshaft with an open-end wrench, then tighten the bolt.
   Specified Torque
   14 x 1.5 mm 34 N·m (3.5 kgf·m, 25 lbf·ft)



3. Install the camshaft thrust cover (A) with new O-ring (B).
4. Install the cylinder head cover.
5. Install the harness holder, then install the ground cable.
6. Install the following engine wire harness connectors and wire harness clamps from the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - Camshaft position (CMP) sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
7. Install the intake manifold chamber.
8. Install the air cleaner housing assembly.

Crankshaft Pulley Removal and Installation

Special Tools Required



Handle, 6-25-660L
07JAB-001020B

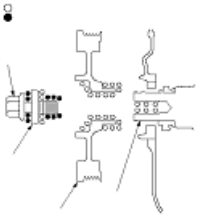
Crankshaft pulley holder, 50 offset 65
070AB-RJA0100

Socket wrench, 19 x 90L
07JAA-001020A

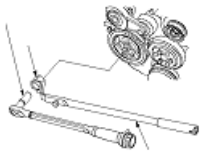
Removal

1. Remove the drive belt.
2. Hold the pulley with the handle (A) and the crankshaft pulley holder (B).
3. Remove the bolt with a 19 x 90L socket (C) and a breaker bar, then remove the crankshaft pulley.

Installation



1. Clean the crankshaft pulley (A), the crankshaft (B), the bolt (C), and the washer (D). Lubricate with new engine oil as shown.
2. Install the crankshaft pulley.



3. Tighten the crankshaft pulley bolt. Do not use an impact wrench.
   -1. Hold the pulley with the handle (A) and crankshaft pulley holder (B), then tighten the bolt to 37 N·m (3.8 kgf·m, 27 lbf·ft) with a torque wrench and a 19 x 90L socket (C). If the pulley bolt or crankshaft are new, tighten the bolt to 177 N·m (18.0 kgf·m, 130 lbf·ft), then remove the bolt and tighten it to 37 N·m (3.8 kgf·m, 27 lbf·ft).
   -2. Mark the embossed mark (D) on the bolt flange and the crankshaft pulley (E) as shown, then tighten the bolt an additional 90 ° (The mark on the bolt head should line up with the next embossed mark (F) on the bolt flange).

4. Install the drive belt.

Cam Chain Case Oil Seal Installation

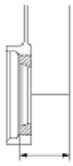
Special Tools Required

Driver handle, 15 x 135L
07749-0010000

Bearing driver attachment, 52 x 55 mm
07746-0010400

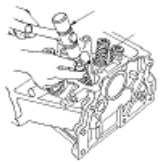
1. Use the driver handle and the bearing driver attachment to drive a new oil seal squarely into the chain case to the specified installed height.

2. Measure the distance between the chain case surface and the oil seal.
   Oil Seal Installed Height:
   30.3–31.0 mm (1.19–1.22 in.)



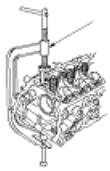
Cylinder Head Valve, Spring, and Valve Seal Removal

Special Tools Required



Valve spring compressor
07757-0010000
Identify the valves and the valve springs as they are removed so that each item can be reinstalled in its original position.

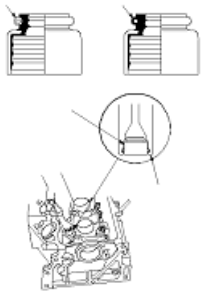
1. Remove the cylinder head.
2. Using an appropriate-sized socket (A), and a plastic mallet (B), lightly tap the spring retainer to loosen the valve cotters.



3. Install valve the spring compressor. Compress the spring, and remove the valve cotters.
4. Remove the valve spring compressor, then remove the spring retainer, the valve spring, the valve seal, and the valve spring seat.

Cylinder Head Valve, Spring, and Valve Seal Installation

Special Tools Required



Stem seal driver
07PAD-0010000

Valve spring compressor
07757-0010000

1. Coat the valve stems with new engine oil. Install the valves in the valve guides.
2. Check that the valves move up and down smoothly.
3. Install the spring seats on the cylinder head.
4. Install the new valve seals (A) using the valve guide seal installer (B).
   NOTE: The exhaust valve seal (C) has a black spring (D), and the intake valve seal (E) has a white spring (F). They are not interchangeable.
5. Install the valve spring. Place the end of the valve spring with closely wound coils toward the cylinder head.
6. Install the valve retainer.

---

7. Install the valve spring compressor. Compress the spring, and install the valve cotters.

---

8. Lightly tap the end of each valve stem three times with a plastic mallet (A) to ensure proper seating of the valve and valve cotters. Tap the valve stem only along its axis so you do not bend the stem.

Cylinder Head Valve Inspection

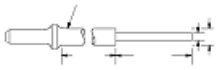
1. Remove the valves.

2. Measure the valve in these areas.

Intake Valve Dimensions	
A Standard (New):	**27.85–28.15 mm (1.096–1.108 in.)**
B Standard (New):	**118.55–119.15 mm (4.667–4.691 in.)**
C Standard (New):	**5.48–5.49 mm (0.2157–0.2161 in.)**
C Service Limit:	**5.45 mm (0.215 in.)**
Exhaust Valve Dimensions	
A Standard (New):	**22.85–23.15 mm (0.900–0.911 in.)**
B Standard (New):	**117.25–117.85 mm (4.616–4.640 in.)**
C Standard (New):	**5.45–5.46 mm (0.2146–0.2150 in.)**
C Service Limit:	**5.42 mm (0.213 in.)**

Cylinder Head Valve Guide Replacement

Special Tools Required



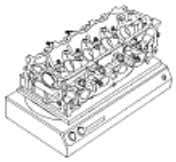
Valve guide driver, 5.35 x 9.7
07742-0010100

Valve guide reamer, 5.525 mm
07HAH-PJ70100

1. Inspect valve stem-to-guide clearance.
2. As illustrated below, use a commercially available air-impact valve guide driver (A) modified to fit the diameter of the valve guides. In most cases, the same procedure can be done using the valve guide driver and a conventional hammer.
3. Select the proper replacement guides, and chill them in the freezer section of a refrigerator for about an hour.

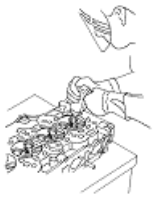
---

4. Use a hot plate or oven to evenly heat the cylinder head to 150 °C (300 °F). Monitor the temperature with a cooking thermometer. Do not get the head hotter than 150 °C (300 °F); excessive heat may loosen the valve seats.
5. Working from the camshaft side, use the valve guide driver and an air hammer to drive the guide about 2 mm (0.1 in.) towards the combustion chamber. This will knock off some of the carbon and make removal easier. Hold the air hammer directly in line with the valve guide to prevent damaging the driver.



---

6. Turn the head over, and drive the guide out toward the camshaft side of the head.
7. If a valve guide won't move, drill it out with a 8 mm (5/16 in.) bit, then try again. Drill guides only in extreme cases; you could damage the cylinder head if the guide breaks.
8. Remove the new guide(s) from the freezer, one at a time, as you need them.



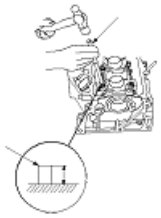
---

9. Apply a thin coat of new engine oil to the outside of the new valve guide. Install the guide from the camshaft side of the head; use the valve guide driver to drive the guide in to the specified installed height (A) of the guide (B). If you have all 16 guides to do, you may have to reheat the head.

   Valve Guide Installed Height:

   15.85–16.35 mm (0.624–0.644 in.)

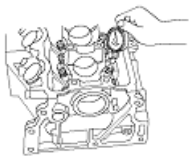
10. Coat both reamer and valve guide with cutting oil.



---

11. Rotate the reamer clockwise the full length of the valve guide bore.
12. Continue to rotate the reamer clockwise while removing it from the bore.
13. Thoroughly wash the guide in detergent and water to remove any cutting residue.
14. Check the clearances with a valve. Verify that a valve slides in the intake and exhaust valve guides without sticking.
15. Inspect the valve seat. If necessary renew the valve seat using a valve seat cutter.

Cylinder Head Valve Stem-to-Guide Clearance Inspection



1. Remove the valves.
2. Subtract the O.D. of the valve stem, measured with a micrometer, from the I.D. of the valve guide, measured with an inside micrometer or ball gauge.
   Take the measurements in three places along the valve stem and three places inside the valve guide.
   The difference between the largest guide measurement and the smallest stem measurement should not exceed the service limit.

Intake Valve Stem-to-Guide Clearance

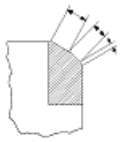
Standard (New):	**0.020−0.050 mm (0.0008−0.0020 in.)**
Service Limit:	**0.08 mm (0.003 in.)**

Exhaust Valve Stem-to-Guide Clearance

Standard (New):	**0.050−0.080 mm (0.0020−0.0031 in.)**
Service Limit:	**0.11 mm (0.004 in.)**

Cylinder Head Valve Seat Reconditioning

1. Inspect valve stem-to-guide clearance. If the valve guides are worn, replace them before cutting the valve seats.
2. Renew the valve seats in the cylinder head using a valve seat cutter.
3. Carefully cut a 45 ° seat, removing only enough material to ensure a smooth and concentric seat.

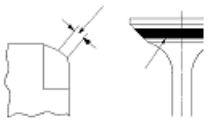


4. Bevel the upper and lower edges at the angles shown in the illustration.Check the width of the seat and adjust accordingly.
5. Make one more very light pass with the 45 ° cutter to remove any possible burrs caused by the other cutters.

Valve Seat Width

Intake:

Standard (New):	**0.850–1.150 mm (0.0335–0.0453 in.)**
Service Limit:	**1.60 mm (0.063 in.)**
Standard (New):	**1.250–1.550 mm (0.0492–0.0610 in.)**
Service Limit:	**2.00 mm (0.079 in.)**



6. After resurfacing the seat, inspect for even valve seating: Apply Prussian Blue compound (A) to the valve face. Insert the valve in its original location in the head, then lift it and snap it closed against the seat several times.
7. The actual valve seating surface (B), as shown by the blue compound, should be centered on the seat.
   - If it is too high (closer to the valve stem), you must make a second cut with the 67.5 ° cutter (intake) or 60 ° cutter (exhaust) to move it down, then one more cut with the 45 ° cutter to restore seat width.
   - If it is too low (close to the valve edge), you must make a second cut with the 30 ° cutter to move it up, then make one more cut with the 45 ° cutter to restore seat width.

   NOTE: The final cut should always be made with the 45 ° cutter.

8. Insert the intake and exhaust valves in the head, and measure valve stem installed height (A).

Intake Valve Stem Installed Height

Standard (New):	**46.1–46.5 mm (1.815–1.831 in.)**
Service Limit:	**46.8 mm (1.843 in.)**

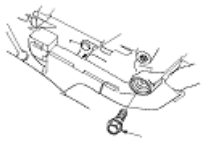
Exhaust Valve Stem Installed Height

Standard (New):	**46.2–46.6 mm (1.819–1.835 in.)**
Service Limit:	**46.9 mm (1.846 in.)**

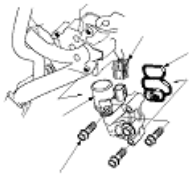
9. If valve stem installed height is over the service limit, replace the valve and recheck. If it is still over the service limit, replace the cylinder head; the valve seat in the head is too deep.

VTEC Rocker Arm Oil Control Valve Removal/Installation

1. Remove the harness holder (A).



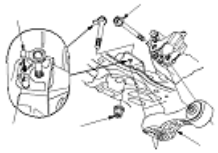
2. Disconnect the rocker arm oil control solenoid connector (A).
3. Remove the rocker arm oil control valve (B) and the rocker arm oil control valve filter (C).
4. Install the parts in the reverse order of removal with a new rocker arm oil control valve filter.



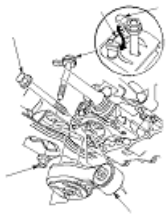
Engine Mount Torque Rod Replacement

1. Raise the vehicle on the lift to full height.
2. Support the transmission with a jack and wood block under the transmission.
3. Remove the torque rod (A).
4. Install the torque rod. Install the new bolt with the tab (B) on the bolt head aligned with the guide (C) on the front subframe, then tighten the new torque rod mounting bolt and nut in the numbered sequence shown.

M/T model

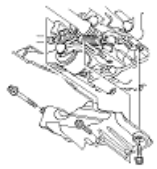


A/T model



Engine Mount Torque Rod Bracket Replacement

1. Raise the vehicle on the lift to full height.
2. A/T model: Remove the shift cable cover.
3. Support the transmission with a jack and wood block under the transmission.



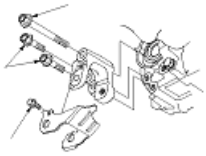
4. Remove the torque rod.

M/T model

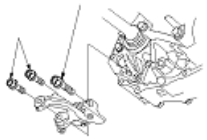
A/T model

5. Remove the torque rod bracket.
6. Install the torque rod bracket.

M/T model



A/T model

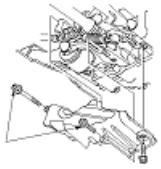


7. Install the torque rod (A). Install the new bolt with the tab (B) on the bolt head aligned with the guide (C) on the front subframe, then tighten the new torque rod mounting bolt and nut in the numbered sequence shown.

M/T model

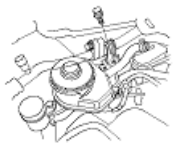
A/T model

8. A/T model: Install the shift cable cover.

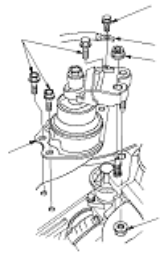


Side Engine Mount Replacement

1. Remove the A/C line bracket mounting bolt.
2. Support the engine with a jack and wood block under the oil pan.

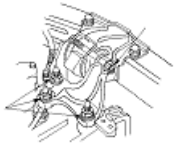


3. Remove the ground cable (A), then remove the side engine mount/bracket assembly (B).
4. Install the side engine mount/bracket assembly, then tighten the new side engine mount/bracket assembly mounting bolts (C).
5. Loosely tighten the new side engine mount/bracket assembly mounting nuts (D) and install the ground cable.
6. Remove the air cleaner housing assembly.



7. Loosen the transmission mount bracket mounting bolts and nuts (A).
8. Raise the vehicle on the lift to full height.

M/T model



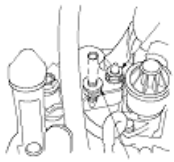
A/T model

9. Loosen the torque rod mounting bolt and nut (A).
10. Lower the vehicle on the lift.

M/T model

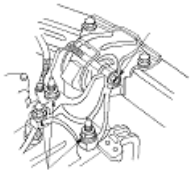
A/T model

11. Tighten the side engine mount/bracket assembly mounting nuts in the numbered sequence shown.



12. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
13. Raise the vehicle on the lift to full height.

M/T model

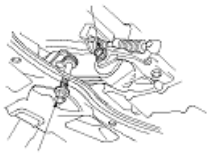


A/T model

14. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.
15. Lower the vehicle on the lift.

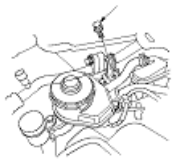
M/T model

A/T model



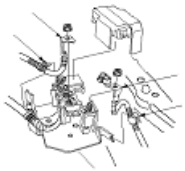
---

16. Install the A/C line bracket mounting bolt.
17. Install the air cleaner housing assembly.

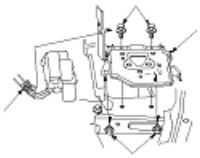


Transmission Mount Bracket Replacement

1. Remove the battery.
2. Remove the air cleaner housing assembly.
3. With M/T model: Remove the battery cables (A) from the battery terminal fuse box.
4. With M/T model: Remove the harness clamps (B).

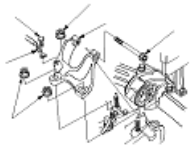


5. With M/T model: Remove the harness clamp (A). Remove the two bolts (B) and loosen the two bolts (C), then remove the battery base (D).
6. Support the transmission with a jack and wood block under the transmission.

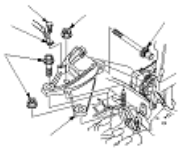


7. Remove the ground cable (A), then remove the transmission mount bracket (B).
8. Install the transmission mount bracket, and loosely tighten the new transmission mount bracket mounting bolts and nuts (C).
9. Install the ground cable.
10. Raise the vehicle on the lift to full height.

M/T model



A/T model



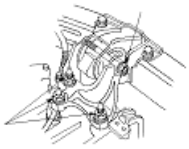
11. Loosen the torque rod mounting bolt and nut (A).

M/T model

A/T model

12. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
13. Raise the vehicle on the lift to full height.

M/T model

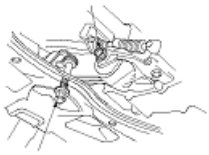


A/T model

14. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.

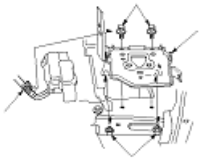
M/T model

A/T model



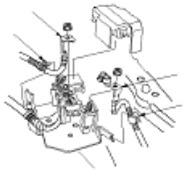
---

15. With M/T model: Install the battery base (A), then install the harness clamp (B).



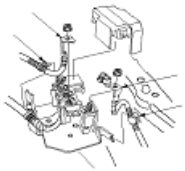
---

16. With M/T model: Install the battery cables (A) to the battery terminal fuse box.
17. With M/T model: Install the harness clamps (B).
18. Do the battery installation procedure.
19. Install the air cleaner housing assembly.

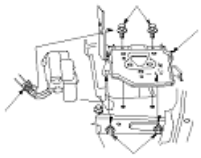


Transmission Mount Replacement

1. Remove the battery.
2. Remove the air cleaner housing assembly.
3. With M/T model: Remove the battery cables (A) from the battery terminal fuse box.
4. With M/T model: Remove the harness clamps (B).

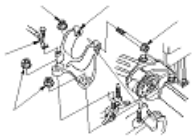


5. With M/T model: Remove the harness clamp (A). Remove the two bolts (B) and loosen the two bolts (C), then remove the battery base (D).
6. Support the transmission with a jack and wood block under the transmission.

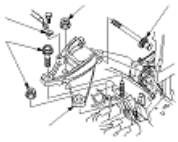


7. Remove the ground cable (A), then remove the transmission mount bracket (B).

M/T model

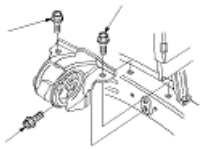


A/T model

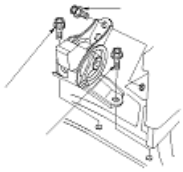


8. Remove the transmission mount.
9. Install the transmission mount and loosely tighten the new transmission mount mounting bolts, then tighten the transmission mount mounting bolts in the numbered sequence shown.

M/T model

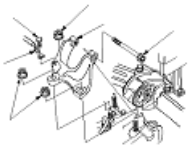


A/T model

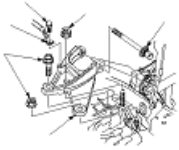


10. Install the transmission mount bracket (A), and loosely tighten the new transmission mount bracket mounting bolts and nuts (B).
11. Install the ground cable (C).
12. Raise the vehicle on the lift to full height.

M/T model



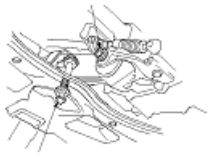
A/T model



13. Loosen the torque rod mounting bolt and nut (A).

M/T model

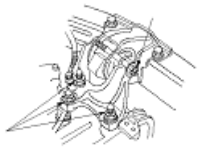
A/T model



---

14. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
15. Raise the vehicle on the lift to full height.

M/T model



A/T model

---

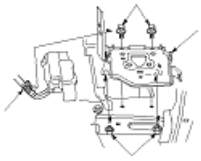
16. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.

M/T model

A/T model

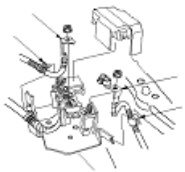
---

17. With M/T model: Install the battery base (A), then install the harness clamp (B).

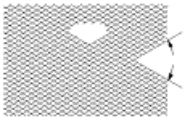


---

18. With M/T model: Install the battery cables (A) to the battery terminal fuse box.
19. With M/T model: Install the harness clamps (B).
20. Install the battery.
21. Install the air cleaner housing assembly.



Engine Block Cylinder Bore Honing

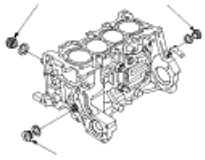


Only a scored or scratched cylinder bore must be honed.

1. Measure the cylinder bores.
   If the engine block is to be reused, hone the cylinders and remeasure the bores.
2. Hone the cylinder bores with honing oil and a fine (400 grit) stone in a 60 degree cross-hatch pattern (A). Use only a rigid hone with 400 grit or finer stone such as Sunnen, Ammco, or equivalent. Do not use stones that are worn or broken.
3. When honing is complete, thoroughly clean the engine block of all metal particles. Wash the cylinder bores with hot soapy water, then dry and oil them immediately to prevent rusting. Never use solvent, it will only redistribute the grit on the cylinder walls.
4. If scoring or scratches are still present in the cylinder bores after honing the engine block to the service limit, rebore the engine block. Some light vertical scoring and scratching is acceptable if it is not deep enough to catch your fingernail and does not run the full length of the bore.

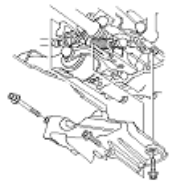
Engine Block Drain Bolt/Sealing Bolt Installation

NOTE: When installing the drain bolt and/or sealing bolt, always use new washer.



Engine Oil Pan Removal

1. If the engine is already out of the vehicle, go to Step 7 .
2. Drain the engine oil.
3. Remove the drive belt.
4. Remove the driveshaft heat shield.
5. Remove the A/C compressor without disconnecting the A/C hoses.
6. A/T model: Remove the shift cable cover.
7. M/T model: Remove the torque rod bracket.

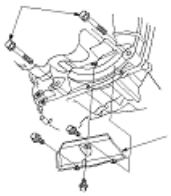


8. Remove the dipstick, then remove the dipstick tube.

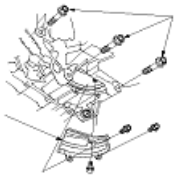
9. Remove the crankshaft position (CKP) sensor cover (A), then disconnect the CKP sensor connector (B).

10. Remove the clutch cover/torque converter cover (A), and transmission mounting bolts (B).
11. Remove the bolts securing the oil pan.

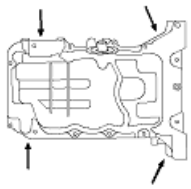
M/T model



A/T model

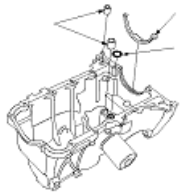


12. Using a flat blade screwdriver, separate the oil pan from the block in the places shown.
13. Remove the oil pan.

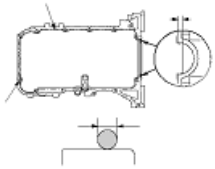


Engine Oil Pan Installation

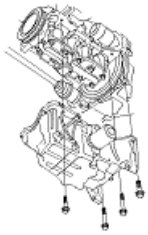
1. Remove any old liquid gasket from the oil pan mating surfaces, bolts and bolt holes.
2. Clean and dry the oil pan mating surfaces.
3. Install the new oil pan gasket (A), new O-ring (B), and dowel pins (C) on the oil pan.



4. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the engine block mating surface of the oil pan and to the inner threads of the bolt holes.
   NOTE:
   - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).
   - Apply liquid gasket about 5.0 mm (0.20 in.) diameter bead to the shaded area (B).
   - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



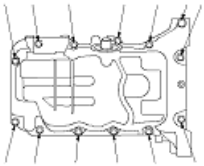
5. Install the oil pan.
   NOTE:
   - Wait at least 30 minutes before filling the engine with oil.
   - Do not run the engine for at least 3 hours after installing the oil pan.



6. Tighten the bolts in three steps. Wipe off the excess liquid gasket on the each side of crankshaft pulley and the flywheel/drive plate.

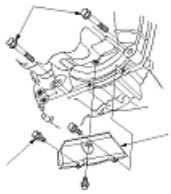
   Specified torque

   (1): 24 N·m (2.4 kgf·m, 17 lbf·ft)
   (2)–(13): 12 N·m (1.2 kgf·m, 8.8 lbf·ft)

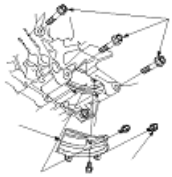


7. Install the clutch cover/torque converter cover (A), and install the transmission mounting bolts (B).

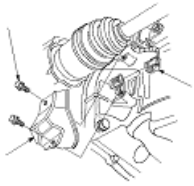
M/T model



A/T model

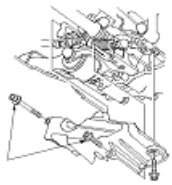


8. Connect the CKP sensor connector (A), then install the CKP sensor cover (B).



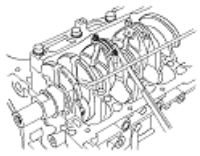
9. Install the dipstick tube (A) with new O-ring (B), then install the dipstick.
10. M/T model: Install the torque rod bracket.
11. If the engine is still in the vehicle, do Step 12 through 16.

12. A/T model: Install the shift cable cover.
13. Install the A/C compressor.
14. Install the driveshaft heat shield.
15. Install the drive belt.
16. Refill the engine with engine oil.



Connecting Rod and Crankshaft End Play Inspection

1. Remove the oil pump.



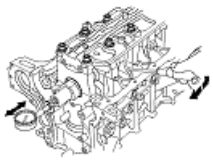
2. Measure the connecting rod end play with a feeler gauge between the connecting rod and the crankshaft.

Connecting Rod End Play

Standard (New):	**0.15–0.35 mm (0.006–0.014 in.)**
Service Limit:	**0.40 mm (0.016 in.)**

3. If the connecting rod end play is beyond the service limit, install a new connecting rod, and recheck. If it is still beyond the service limit, replace the crankshaft.

4. Push the crankshaft firmly away from the dial indicator, and zero the dial against the end of the crankshaft. Then pull the crankshaft firmly back toward the indicator; the dial reading should not exceed the service limit.

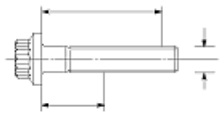


Crankshaft End Play

Standard (New):	**0.10–0.35 mm (0.004–0.014 in.)**
Service Limit:	**0.45 mm (0.018 in.)**

5. If the end play is beyond the service limit, replace the thrust washers and recheck, if it is still beyond the service limit, replace the crankshaft.

Connecting Rod Bolt Inspection



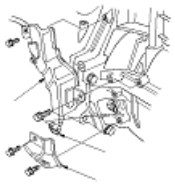
1. Measure the diameter of each connecting rod bolt at point A and point B with a micrometer.
2. Calculate the difference in diameter between point A and point B.
   Point A−Point B = Difference in Diameter

   Difference in Diameter:

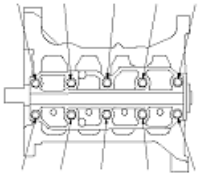
   Specification: **0−0.05 mm (0−0.002 in.)**

3. If the difference in diameter is out of specification, replace the connecting rod bolt.

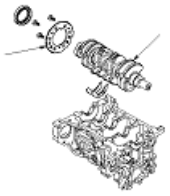
Crankshaft and Piston Removal



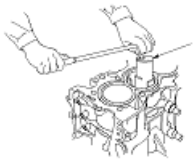
1. Remove the engine/transmission.
2. Remove the transmission:
   - Manual transmission
   - Automatic transmission
3. M/T model: Remove the pressure plate, clutch disc, and flywheel.
4. A/T model: Remove the drive plate.
5. Remove the crankshaft position (CKP) sensor cover (A), then disconnect the CKP sensor connector (B).
6. Remove the harness cover (C).
7. Remove the oil pan.
8. Remove the oil pump.
9. Remove the cylinder head.



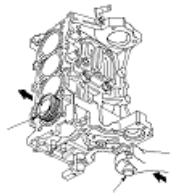
10. Remove the bearing cap bolts. To prevent warpage, unscrew the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.
11. Remove the bearing cap bridge.
12. Remove the rod caps/bearings. Keep all caps/ bearings in order.



13. Lift crankshaft (A) out of the engine. Be careful not to damage the journals and the CKP pulse plate (B).
14. Remove the CKP pulse plate.
15. Remove the upper bearing halves from the connecting rods, and set them aside with their respective caps.



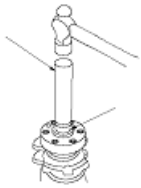
16. If you can feel a ridge of metal or hard carbon around the top of each cylinder, remove it with a ridge reamer (A). Follow the reamer manufacturer's instructions. If the ridge is not removed, it may damage the pistons as they are pushed out.



17. Use the wooden handle of a hammer (A) to drive out the piston/connecting rod assembly (B). Take care not to damage the cylinder with the connecting rod.
18. Reinstall the bearing cap bridge and bearings on the engine in the proper order.
19. Reinstall the connecting rod bearings and caps after removing each piston/connecting rod assembly.
20. Mark each piston/connecting rod assembly with its cylinder number to make sure they are reused in original order. NOTE: The existing number on the connecting rod does not indicate its position in the engine, it indicates the rod bore size.

Crankshaft/Oil Seal (Transmission End) Installation

Special Tools Required

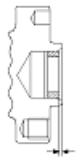


Driver handle, 15 x 135L
07749-0010000

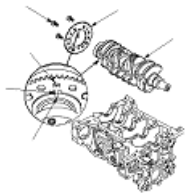
Bearing driver attachment, 28 x 30 mm
07946-1870100

Oil seal driver attachment, 96 mm
07ZAD-PNA0100

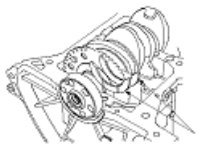
1. M/T model: Install the pilot bearing when replacing the crankshaft.
2. A/T model: Install the crankshaft end bushing when replacing the crankshaft. Using the driver handle and the bearing driver attachment, drive in the crankshaft end bushing to the specified installed height.



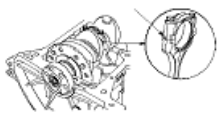
3. Measure the distance between the crankshaft surface and crankshaft end bushing.
   Oil Seal Installed Height:
   0.9–1.1 mm (0.035–0.043 in.)
4. Check the connecting rod bearing clearance with plastigage.
5. Check the main bearing clearance with plastigage.
6. Install the bearing halves in the engine block and the connecting rods.
7. Apply a coat of new engine oil to the main bearings and the rod bearings.



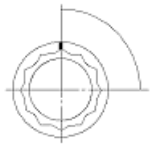
8. Install the crankshaft position (CKP) pulse plate (A) on the crankshaft (B); face the marked side (C) opposite the crankshaft, and align the tab (D) on the CKP pulse plate with the groove (E) on the crankshaft.
9. Hold the crankshaft so that rod journal No. 2 and rod journal No. 3 are straight up, and lower the crankshaft into the engine block.



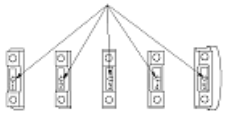
10. Apply new engine oil to the thrust washer surfaces. Install the thrust washers (A) in the No. 4 journal of the engine block.
11. Inspect the connecting rod bolts.
12. Apply new engine oil to the threads and flange of the connecting rod bolts.



13. Seat the rod journals into connecting rod No. 1 and connecting rod No. 4. Line up the mark (A) on the connecting rod and the cap, then install the caps and the bolts finger-tight.
14. Rotate the crankshaft clockwise, and seat the journals into connecting rod No. 2 and connecting rod No. 3. Line up the mark on the connecting rod and the cap, then install the caps and the bolts finger-tight.
15. Tighten the connecting rod bolts to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft).



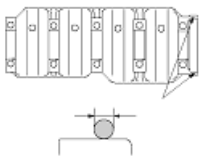
16. Tighten the connecting rod bolts an additional 90 °.
    NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to step 11 of the procedure. Do not loosen it back to the specified angle.



17. With L15A7 engine: Install the bearing caps with facing the arrows (A) to the cam chain side on the bearing cap bridge.
18. Remove old liquid gasket from the bearing cap bridge/No. 5 bearing cap mating surfaces.
19. Clean and dry the bearing cap bridge/No. 5 bearing cap mating surfaces.

---

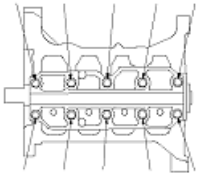
20. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the engine block mating surface of the bearing cap bridge/No. 5 bearing cap.
    NOTE:
    - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).
    - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



21. Put the bearing cap bridge on the engine block.
22. Apply engine oil to the threads and flange of the bearing cap bolts.

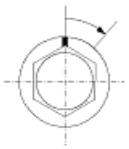
---

23. Tighten the bearing cap bolts is sequence to 25 N·m (2.5 kgf·m, 18 lbf·ft).



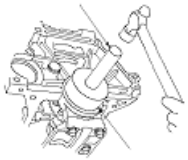
---

24. Tighten the bearing cap bolts an additional 40 °.
25. Clean the excess liquid gasket off the engine block.



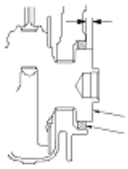
---

26. Use the special tools to drive a new oil seal squarely into the block to the specified installed height.



---

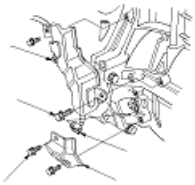
27. Measure the distance between the crankshaft (A) and oil seal (B).
    Oil Seal Installed Height:
    7–8 mm (0.28–0.31 in.)



28. Install the cylinder head.
29. Install the oil pump.
30. Install the oil pan.

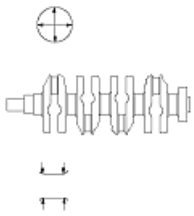
---

31. Connect the CKP sensor connector (A), then install the CKP sensor cover (B).
32. Install the harness cover (C).
33. M/T model: Install the flywheel, clutch disc, and pressure plate.
34. A/T model: Install the drive plate.
35. Install the transmission:
    - Manual transmission
    - Automatic transmission
36. Install the engine/transmission.
    NOTE: Whenever any crankshaft or connecting rod bearing is replaced, run the engine at idle speed until it reaches normal operating temperature, then continue to running it for about 15 minutes.



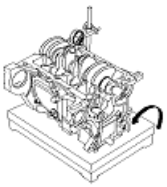
Crankshaft Inspection

Out-of-Round and Taper



1. Remove the crankshaft from the engine block.
2. Clean the crankshaft oil passages with pipe cleaners or a suitable brush.
3. Clean the keyway and threads.
4. Measure the out-of-round at the middle of each rod and the main journal in two places. The difference between measurements on each journal must not be more than the service limit.
   Journal Out-of-Round
   Standard (New): **0.005 mm (0.0002 in.) max.**
   Service Limit: **0.010 mm (0.0004 in.)**
5. Measure the taper at the edges of each rod and the main journal. The difference between measurements on each journal must not be more than the service limit.
   Journal Taper
   Standard (New): **0.005 mm (0.0002 in.) max.**
   Service Limit: **0.010 mm (0.0004 in.)**

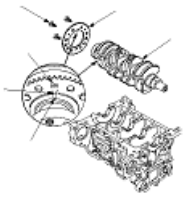
Straightness



6. Place the engine block on a flat surface, crankshaft side up.
7. Clean and install the bearings on the No. 1 and No. 5 journals of the engine block.
8. Lower the crankshaft into the engine block.
9. Measure the runout on all main journals. Rotate the crankshaft two complete revolutions. The difference between measurements on each journal must not be more than the service limit.
   Crankshaft Total Runout
   Standard (New): **0.03 mm (0.0012 in.) max.**
   Service Limit: **0.04 mm (0.0016 in.)**

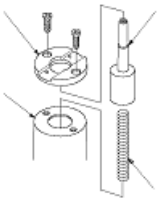
CKP Pulse Plate Replacement

1. Remove the crankshaft.
2. Remove the crankshaft position (CKP) pulse plate (A).
3. Install the CKP pulse plate on the crankshaft (B); face the marked side (C) opposite the crankshaft, and align the tab (D) on the CKP pulse plate with the groove (E) on the crankshaft.
4. Install the crankshaft.



Piston, Pin, and Connecting Rod Replacement

Special Tools Required



Piston base head
07PAF-0010400

Piston base head attachment
07PAF-0010500

Insert pin
07PAF-0010700

Piston pin pilot
070AF-PWC0110

Insert adjuster
070AF-PWC0120

Pilot collar, 18 mm
070AF-PWC0130

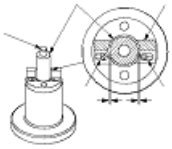
Piston base
07973-6570500

Spring
07973-6570600

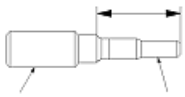
Disassembly

1. Assemble the special tool as shown.

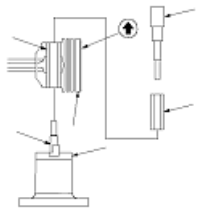
2. Temporarily install the pilot collar over the piston pin base insert (A), and adjust the piston base head inserts as shown, then tighten the screws (B). Remove the pilot collar.



3. Assemble and adjust the length of the piston pin driver head and shaft to 57 mm (2.2 in.).

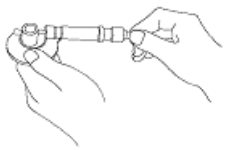


4. With the arrow on top of the piston pointing up, place the piston assembly (A) on the special tool (B).
   Be sure you position the recessed flat area of the piston against the piston base head inserts (C) as shown.
5. Press the pin (D) out with the pin driver (E), the pilot collar (F), and a hydraulic press.



Inspection

1. Measure the diameter of the piston pin.



Piston Pin Diameter

Standard (New):	**17.996–18.000 mm (0.7085–0.7087 in.)**

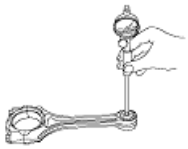
2. Zero the dial indicator to the piston pin diameter.

3. Measure the piston pin-to-piston clearance.

Piston Pin-to-Piston Clearance

Standard (New):	**0.010–0.017 mm (0.0004–0.0007 in.)**

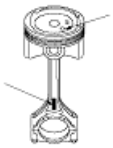
4. Check the difference between the piston pin diameter and connecting rod small end diameter.



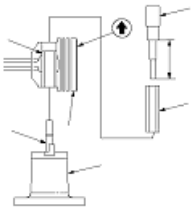
Piston Pin-to-Connecting Rod Interference

Standard (New): **0.019−0.036 mm (0.0007−0.0014 in.)**

Reassembly



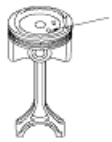
1. Assemble the piston and connecting rod with the arrow (A) and the embossed mark (B) on the same side.



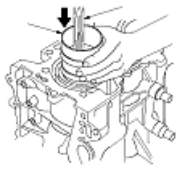
2. Insert the pilot collar (A) into the piston and the connecting rod.
3. With the arrow on top of the piston and the embossed mark on the connecting rod facing up, place the piston assembly (B) on the special tool (C). Be sure you position the recessed flat area of the piston against the piston base head inserts (D) as shown.
4. Press the pin (E) in with the pin driver (F) and a hydraulic press.

Piston Installation

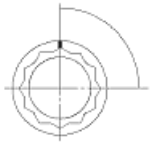
If the Crankshaft is Already Installed



1. Set the crankshaft to bottom dead center (BDC) for each cylinder as its piston is installed.
2. Remove the connecting rod caps, then install the ring compressor. Check that the bearing is securely in place.
3. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
4. Position the arrow (A) to face the cam chain side of the engine.



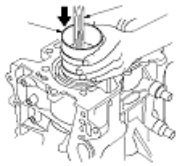
5. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A).
   Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.
6. Stop after the ring compressor pops free, and check the connecting rod-to-crank journal alignment before pushing the piston into place.
7. Check the connecting rod bearing clearance with plastigage.
8. Inspect the connecting rod bolts.
9. Apply new engine oil to the bolt threads, then install the rod caps with bearings. Torque the bolts to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft).



10. Tighten the connecting rod bolts an additional 90 °.
    NOTE: Remove the connecting rod bolt if you tightened it beyond the specified angle, and go back to Step 8 of the procedure. Do not loosen it back to the specified angle.

If the Crankshaft is Not Installed

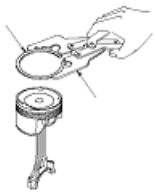
1. Remove the connecting rod caps, then install the ring compressor, and check that the bearing is securely in place.
2. Apply new engine oil to the piston, inside of the ring compressor, and the cylinder bore, then attach the ring compressor to the piston/connecting rod assembly.
3. Position the arrow (A) to face the cam chain side of the engine.



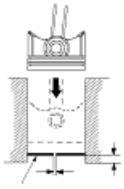
4. Position the piston in the cylinder, and tap it in using the wooden handle of a hammer (A).
   Push down on the ring compressor (B) to prevent the rings from expanding before entering the cylinder bore.
5. Position all pistons at top dead center (TDC).

Piston Ring Replacement

1. Remove the piston from the engine block.
2. Using a ring expander (A), remove the old piston rings (B).
3. Clean all the ring grooves thoroughly with a squared-off broken ring, or a ring groove cleaner with a blade to fit the piston grooves. File down the blade, if necessary. The top and second ring grooves are 1.0 mm (0.04 in.) wide, and the oil ring groove is 2.0 mm (0.08 in.) wide. Do not use a wire brush to clean the ring grooves, or cut the ring grooves deeper with the cleaning tool.
   NOTE: If the piston is to be separated from the connecting rod, do not install new rings yet.



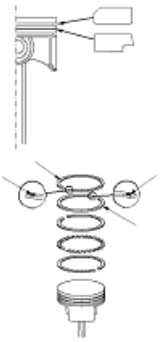
4. Using a piston, push a new ring (A) into the cylinder bore 15–20 mm (0.6–0.8 in.) from the bottom.
5. Measure the piston ring end-gap (B) with a feeler gauge:
   - If the gap is too small, check to see if you have the proper rings for your engine.
   - If the gap is too large, recheck the cylinder bore diameter against the wear limits.
     If the bore is over the service limit, the engine block must be rebored.



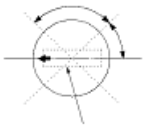
Piston Ring End-Gap

Top Ring:	
Standard (New):	**0.15–0.30 mm (0.006–0.012 in.)**
Service Limit:	**0.60 mm (0.024 in.)**
Second Ring:	
Standard (New):	**0.30–0.42 mm (0.012–0.017 in.)**
Service Limit:	**0.65 mm (0.026 in.)**
Oil Ring:	
Standard (New):	**0.20–0.70 mm (0.008–0.028 in.)**
Service Limit:	**0.80 mm (0.031 in.)**

6. Install the top ring and the second ring as shown. The top ring (A) has a R mark, and the second ring (B) has a 2R mark. The manufacturing marks (C) must be face upward.
7. Rotate the rings in their grooves to make sure they do not bind.



8. Position the ring end gaps as shown:



9. After installing a new set of rings, measure the ring-to-groove clearances:

Top Ring Clearance

Standard (New):	**0.065–0.090 mm (0.0026–0.0035 in.)**
Service Limit:	**0.15 mm (0.006 in.)**

Second Ring Clearance

Standard (New):	**0.030–0.055 mm (0.0012–0.0022 in.)**
Service Limit:	**0.12 mm (0.005 in.)**

Fuel and Emissions System Description - Electronic Control System

Electronic Control System

Fuel and Emissions System Description - Catalytic Converter System

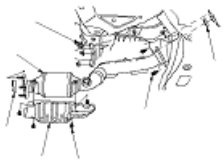
Catalytic Converter System

Tailpipe Emissions Test

1. Connect a tachometer.
2. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
3. Check the idle speed.
4. Warm up and calibrate the CO meter according to the meter manufacturer's instructions.
5. Check idle CO with the headlights, heater blower, rear window defogger, cooling fan, and air conditioner off.
   Specified CO: 0.1 % maximum

   - If unable to obtain this reading; see DTC troubleshooting.
   - If unable to obtain a CO reading of specified % by this procedure, check the tune-up condition.

TWC (Under-floor) Removal/Installation



1. Lift the vehicle, and support it with jackstands.
2. Remove the secondary HO2S (Sensor 2).
3. Remove the nuts (A) and the bolts (B).
4. Remove the under-floor TWC (C).
5. Remove the cover (D).
6. Install the parts in the reverse order of removal with new gaskets (E).

Catalytic Converter Inspection

If excessive exhaust system back-pressure is suspected, remove the TWC from the vehicle.
Using a flashlight (A) and plugs (B) make a visual check for plugging, melting or cracking of the catalyst.
Replace the TWC if any of the visible area is damaged or plugged.

WU-TWC

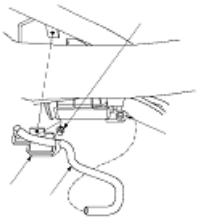
UNDER-FLOOR TWC

Fuel and Emissions System Description - EVAP Control System

[Exhaust Gas Recirculation (EGR) System]
[Evaporative Emission (EVAP) Control System]

EVAP Canister Filter Replacement

LHD model



1. Lift the vehicle, and support it with jackstands.
2. Disconnect the hose from the EVAP canister (A).
3. Remove the EVAP canister filter (B).
4. Disconnect the hose (C).
5. Install the parts in the reverse order of removal.

EVAP Canister Purge Valve Replacement

1. Disconnect the EVAP canister purge valve connector (A).
2. Disconnect the hose (B), the harness clamp (C), and the then remove the EVAP canister purge guard (D), and the canister purge valve (E).
3. Install the parts in the reverse order of removal with a new O-ring (F).

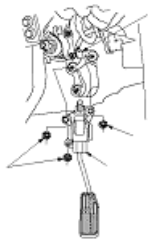
Fuel and Emissions System Description - Electronic Throttle Control System

Electronic Throttle Control System

Fuel and Emissions System Description - Electronic Throttle Control System Diagram

Electronic Throttle Control System Diagram

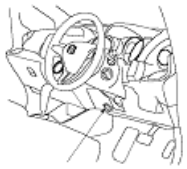
Accelerator Pedal Module Removal/Installation



1. Remove the driver's dashboard lower cover.
2. Disconnect the APP sensor 6P connector (A).
3. Remove the accelerator pedal module (B).
   NOTE: APP sensor is not available separately. Do not disassemble the accelerator pedal module.
4. Install the parts in the reverse order of removal.

Fuel Pressure Relieving

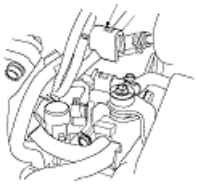
Before disconnecting fuel lines or hoses, relieve pressure from the system by disabling the fuel pump and then disconnecting the fuel tube/quick connect fitting in the engine compartment.



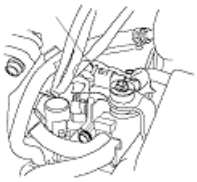
With the HDS

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Turn the ignition switch to LOCK (0).
5. Remove the fuel fill cap to relieve the pressure in the fuel tank.
6. Turn the ignition switch to ON (II).
7. From the INSPECTION MENU of the HDS, select Fuel Pump OFF, then start the engine, and let it idle until it stalls.
   NOTE:
   - Do not allow the engine to idle above 1,000 rpm (min $^{-1}$) or the ECM/PCM will continue to operate the fuel pump.
   - A DTC or a Temporary DTC may be set during this procedure. Check for DTCs, and clear them as needed.
8. Turn the ignition switch to LOCK (0).
9. Do the battery terminal disconnection procedure.

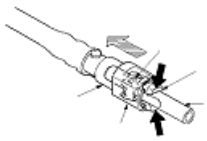
10. Remove the quick-connect fitting cover (A).
11. Check the fuel quick-connect fitting for dirt, and clean it if needed.



12. Place a rag or shop towel over the quick-connect fitting (A).



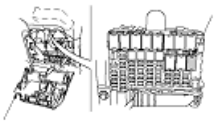
13. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.
    NOTE:
    - Be careful not to damage the line (E) or other parts.
    - Do not use tools.
    - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
    - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



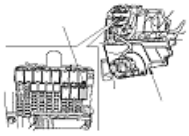
14. After disconnecting the quick-connect fitting, check it for dirt or damage.
15. Do the battery terminal reconnection procedure.

Without the HDS

RHD model

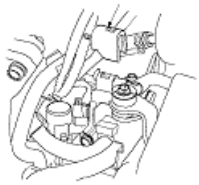


LHD model

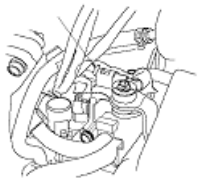


1. Open the fuse lid (A).
2. Remove the PGM-FI main relay 2 (B) from the under-dash fuse/relay box.
3. Start the engine, and let it idle until it stalls.
   NOTE: If any DTCs are stored, clear and ignore them.
4. Turn the ignition switch to LOCK (0).
5. Remove the fuel fill cap to relieve the pressure in the fuel tank.
6. Do the battery terminal disconnection procedure.

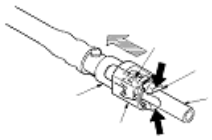
7. Remove the quick-connect fitting cover (A).
8. Check the fuel quick-connect fitting for dirt, and clean it if needed.



9. Place a rag or shop towel over the quick-connect fitting (A).



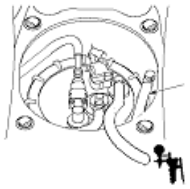
10. Disconnect the quick-connect fitting (A): Hold the connector (B) with one hand, and squeeze the retainer tabs (C) with the other hand to release them from the locking tabs (D). Pull the connector off.
    NOTE:
    - Be careful not to damage the line (E) or other parts.
    - Do not use tools.
    - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
    - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



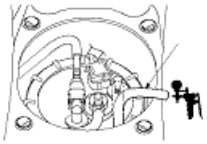
11. After disconnecting the quick-connect fitting, check it for dirt or damage.
12. Do the battery terminal reconnection procedure.

Fuel Breather Line and Suction Line Inspection

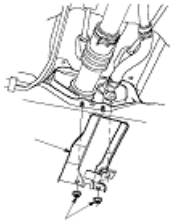
1. Remove the center console.
2. Remove the parking brake lever, then remove the access panel from the floor.
3. Disconnect the suction line (A) from the fuel tank unit, and connect a vacuum pump/gauge, 0−30 in.Hg (B) to the hose as shown.
4. Start the engine, and check the vacuum.
   - If there is vacuum, go to Step 5 .
   - If there is no vacuum, replace the fuel filter.
5. Turn the ignition switch to LOCK (0).



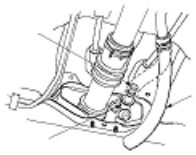
6. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply vacuum to the line.
   - If the line holds vacuum, check for blockage in the suction line. If there is blockage, replace the suction line.
   - If the line does not hold vacuum, go to Step 6 .
7. Lift the vehicle, and support it with jackstands.



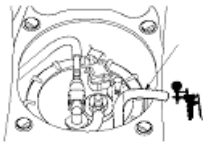
8. Remove the fill neck tube cover (A).



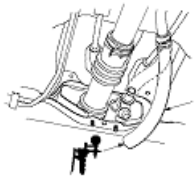
9. Disconnect the breather line (A), then plug the suction joint (B) with a rubber cap (C).



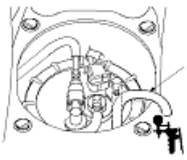
10. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply vacuum to the line.
    - If the line holds vacuum, check for blockage in the breather line between the fuel tank and the suction joint. If there is blockage, replace the fuel tank.
    - If the line does not hold vacuum, go to Step 12 .
11. Lift the vehicle, and support it with jackstands.



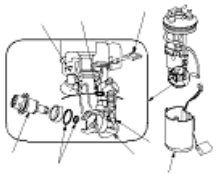
12. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the filler side of the breather line (B), and apply air pressure to the line.
    - If the air pressure holds, check for blockage between the suction line and the filler neck on the breather pipe, and replace the part that is causing the blockage.
    - If the air pressure does not hold, go to Step 13 .
13. Remove the rubber cap from the suction line, and reconnect the breather pipe to the suction line.



14. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply pressure to the line.
    - If the air pressure holds, the breather line and the suction line are OK.
    - If the air pressure does not hold, check for a vacuum leak in the suction line, and replace the suction line if necessary.



Fuel Pressure Regulator Replacement



1. Remove the fuel tank unit.
2. Remove the reservoir (A).
3. Remove the clip (B), ground wire (C), then remove the bracket (D).
4. Remove the clip (E), then remove the fuel pressure regulator (F).
5. Install the parts in the reverse order of removal with new O-rings (G) and a new bracket. When installing the fuel tank unit, align the marks on the unit and the fuel tank.
   NOTE:
   - Coat the O-rings with clean engine oil; do not use any other oils or fluids.
   - Do not pinch the O-rings during installation.
   - Use all the new parts supplied in the pressure regulator replacement kit.

Low Fuel Indicator Test

1. Do the gauge self-diagnostic test.
   - If the low fuel indicator flashes, go to Step 2 .
   - If the low fuel indicator does not flash, replace the gauge control module.
2. Check for body electrical system DTCs.
   - If any DTCs are indicated, do the indicated DTC's troubleshooting.
   - If no DTCs are indicated, go to Step 3 .
3. Do the fuel gauge sending unit test.

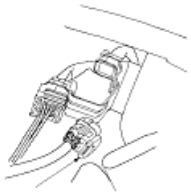
Fuel and Emissions System Description - PGM-FI System

PGM-FI System

A/F Sensor Replacement

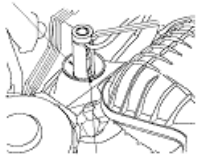
Special Tools Required

O2 sensor wrench 22 x 90
07LAA-PT50101

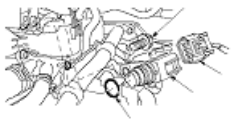


1. Remove the cowl cover and under cowl-cover panel.
2. Disconnect the A/F sensor connector (A).

3. Remove the A/F sensor (A).
4. Install the parts in the reverse order of removal.



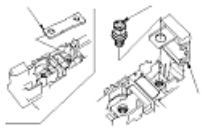
CMP Sensor Replacement



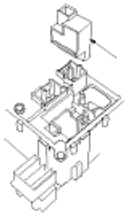
1. Remove the cowl cover and under cowl-cover panel.
2. Remove the air cleaner.
3. Disconnect the CMP sensor connector (A).
4. Remove the CMP sensor (B).
5. Install the parts in the reverse order of removal with a new O-ring (C).

ELD Replacement

1. Remove the under-dash fuse/relay box.
2. Remove the fuse (A).
3. Remove the joint bar (B).

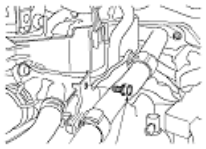


4. Turn the under-dash fuse/relay box, then remove the ELD (A).
5. Install the parts in the reverse order of removal.

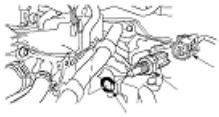


ECT Sensor 1 Replacement

1. Drain the engine coolant.
2. Remove the air cleaner.
3. Remove the hose clamp stay bolt (A).

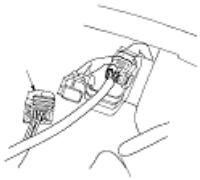


4. Disconnect the ECT sensor 1 connector (A).
5. Remove ECT sensor 1 (B).
6. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant.



Secondary HO2S Replacement

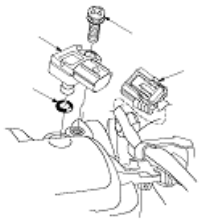
1. Remove the air cleaner.
2. Disconnect the secondary HO2S connector (A).
3. Lift the vehicle, and support it with jackstands.



4. Remove the supporters (A), then secondary HO2S (B).
5. Install the parts in the reverse order of removal.

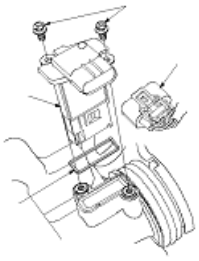
MAP Sensor Replacement

1. Disconnect the MAP sensor 3P connector (A).
2. Remove the MAP sensor (B).
3. Install the parts in the reverse order of removal with a new O-ring (C).



MAF Sensor/IAT Sensor Replacement

1. Disconnect the MAF sensor/IAT sensor 5P connector (A).
2. Remove the screws (B).
3. Remove the MAF sensor/IAT sensor (C).
4. Install the parts in the reverse order of removal with a new gasket (D).

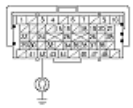


Fuel and Emissions System Description - Idle Control System/Fuel Supply System

[Idle Control System](#)
[Fuel Supply System](#)

Brake Pedal Position Switch Signal Circuit Troubleshooting

1. Turn the ignition switch to ON (II).
2. Check the BRAKE SWITCH in the DATA LIST with the HDS.



Does it indicate OFF?
YES - Go to Step 3 .
NO - Inspect the brake pedal position switch. ■

3. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

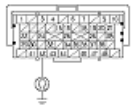
Does it change to ON?
YES - The brake pedal position switch signal circuit (BKSW line) is OK.■
NO - Go to Step 4 .

4. Turn the ignition switch to LOCK (0).
5. Jump the SCS line with the HDS.
6. Disconnect the brake pedal position switch 4P connector.
7. Disconnect ECM/PCM connector A (49P).
8. Check for continuity between ECM/PCM connector terminal A42 and body ground.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (A42) and the brake pedal position switch. Replace the No. 24 STOP, HORN (15 A) fuse.■
NO - Go to Step 9 .

9. Connect brake pedal position switch 4P connector terminal No. 2 to body ground with a jumper wire.

10. Check for continuity between ECM/PCM connector terminal A42 and body ground.

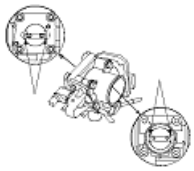


Is there continuity?
YES - Repair open in the wire between the brake pedal position switch and the No. 24 STOP, HORN (15 A) fuse. Inspect the brake pedal position switch. ■
NO - Repair open in the wire between the ECM/PCM (A42) and the brake pedal position switch.■

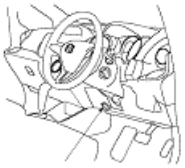
Throttle Body Cleaning

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.

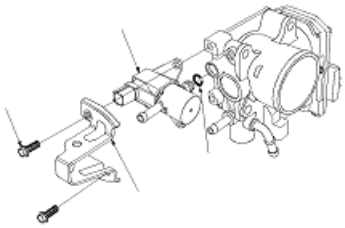


1. Make sure the ignition switch is turned OFF.
2. Check for damage to the air cleaner. If the air cleaner is damaged, replace it.
3. Remove the throttle body.
4. Clean off the carbon from the throttle valve and inside the throttle body with a paper towel soaked carburetor cleaner.
   NOTE:
   - Always remove the throttle body to clean it.
   - Be careful not to pinch your fingers.
   - To avoid removing the molybdenum coating, do not clean the bearing area of the throttle shaft (A).
   - Do not spray carburetor cleaner directly on the throttle body.
   - Use Honda genuine carburetor cleaner.
5. Install the throttle body.



6. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
7. Turn the ignition switch to ON (II).
8. Reset the ECM/PCM with the HDS.
9. Select the ETCS TEST in the INSPECTION MENU with the HDS.
10. Select TP POSITION CHECK and clear the throttle position (TP) learned value.
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II), and wait 2 seconds without pressing the accelerator pedal.
13. Do the ECM/PCM idle learn procedure.

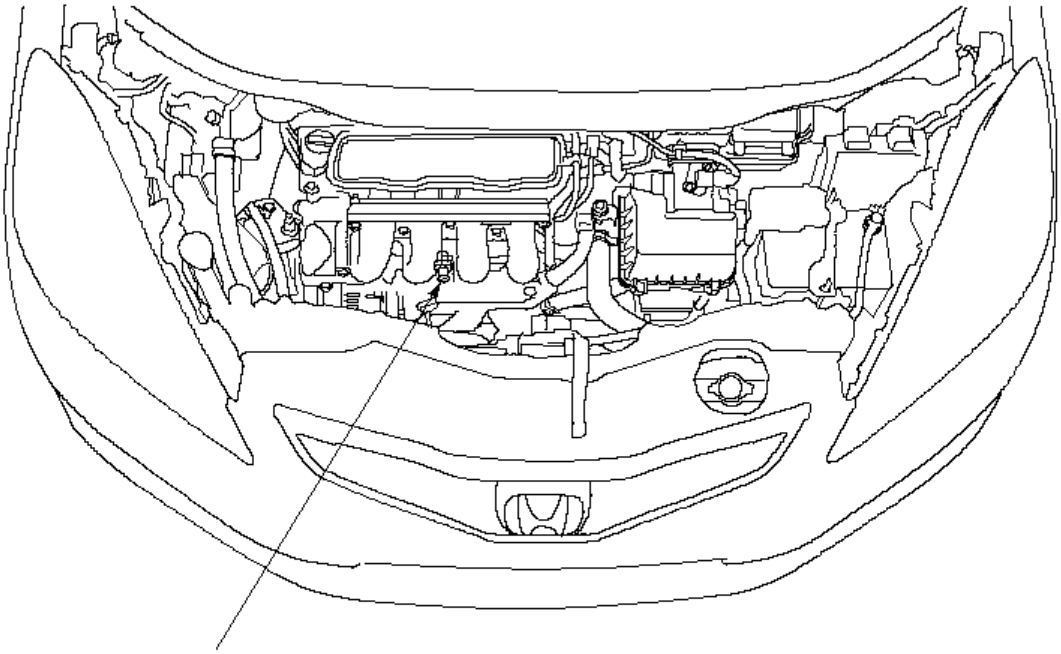
Throttle Body Disassembly/Reassembly



Fuel and Emissions System Description - PCV System

Positive Crankcase Ventilation (PCV) System

PCV System Component Location Index

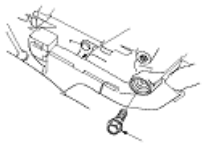


PCV VALVE
Inspection,
Replacement,

*: This illustration shows RHD model.

PCV Valve Replacement

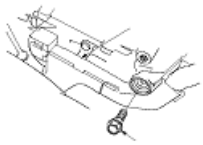
1. Remove the harness holder (A).



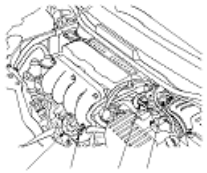
2. Remove the PCV valve (A).
3. Disconnenct the hose (B).
4. Install the parts in the reverse order of removal.
   NOTE: Make sure the clamp (C) is positioned as shown.

PCV Valve Inspection

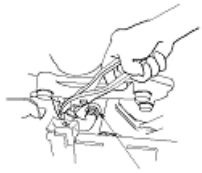
1. Remove the harness holder (A).



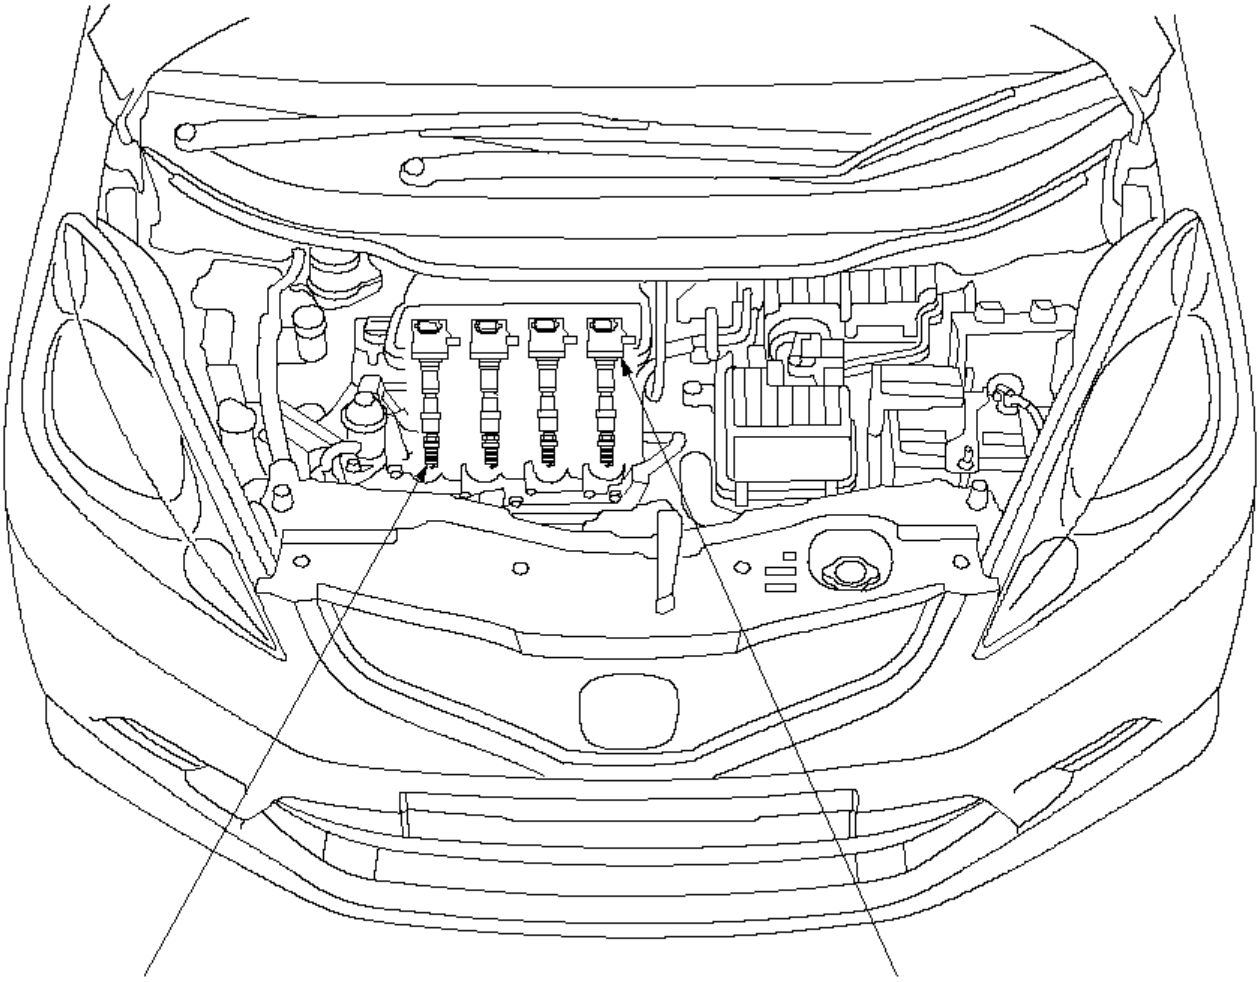
2. Check the PCV valve (A), hoses (B), pipe (C), and connections for leaks or restrictions.



3. At idle, make sure there is a clicking sound from the PCV valve when the hose between the PCV valve and intake manifold is lightly pinched (A) with your fingers or pliers.
   If there is no clicking sound, check the PCV valve washer for cracks or damage. If the washer is OK, replace the PCV valve and recheck.



Ignition System Component Location Index

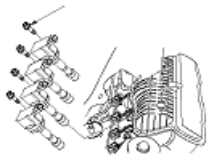


SPARK PLUG
Inspection.

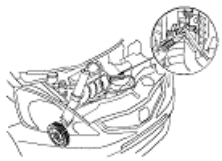
IGNITION COIL
Ignition Timing Inspection.
Removal/Installation.

Ignition Coil Replacement

1. Remove the under-cowl panel.
2. Disconnect the ignition coil connectors, then remove the ignition coils.
3. Install the ignition coils in the reverse order of removal.



Ignition Timing Inspection



1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
4. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) with no load (in the P or N) (A/T model) or neutral (M/T model) until the radiator fan comes on, then let it idle.
5. Check the idle speed.
6. Jump the SCS line with the HDS.
7. Connect the timing light to the service loop (white tape).

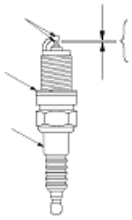
8. Aim the light toward the pointer (A) on the cam chain case. Check the ignition timing under a no load condition (headlights, blower fan, rear window defogger, and air conditioner are turned off).
   Ignition Timing

M/T model:	**0 °±2 ° BTDC (WHITE mark (B)) at idle in neutral**
A/T model:	**0 °±2 ° BTDC (WHITE mark (B)) at idle in N or P**

9. If the ignition timing differs from the specification, check the cam timing. If the cam timing is OK, update the ECM/PCM, if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the system works properly, and the ECM/PCM was substituted, replace the original ECM/PCM.
10. Disconnect the HDS and the timing light.

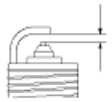
Spark Plug Inspection

1. Remove the spark plugs and inspect the electrodes and ceramic insulator.
   - Burned or worn electrodes may be caused by these conditions:
     - Advanced ignition timing
     - Loose spark plug
     - Plug heat range too hot
     - Insufficient cooling
   - Fouled plugs may be caused by these conditions:
     - Retarded ignition timing
     - Oil in combustion chamber
     - Incorrect spark plug gap
     - Plug heat range too cold
     - Excessive idling/low speed running
     - Clogged air cleaner element
     - Deteriorated ignition coils



2. If the spark plug electrode is dirty or contaminated, clean the electrode with a plug cleaner.
   NOTE:
   - Do not use a wire brush or scrape the iridium electrode since this will damage the electrode.
   - When using a sand blaster spark plug cleaner, do not clean for more than 20 seconds to avoid damaging the electrode.

3. Do not adjust the gap (A) of iridium tip plugs; replace the spark plug if the gap is out of specification.
   Electrode Gap
   Standard (New): 1.2−1.3 mm (0.047−0.051 in.)



4. Replace the plug at the specified interval or when the center electrode is rounded (A). Use only the listed spark plugs.
   Spark Plugs
   NGK: IZFR6K13
   DENSO: SKJ20DR-M13

5. Apply a small amount of anti-seize compound to the plug threads, and screw the plugs into the cylinder head, finger-tight. Then torque them to 18 N·m (1.8 kgf·m, 13 lbf·ft).

Engine Oil Pressure Test

Special Tools Required

Oil pressure gauge attachment PT 1/8
07406-0030000

Oil pressure gauge set
07506-3000001

NOTE: If the low oil pressure indicator stays on with the engine running, check the engine oil level. If the oil level is correct:

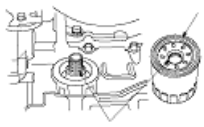
1. Remove the engine oil pressure switch, then install the special tools.
2. Start the engine. Shut it off immediately if the gauge registers no oil pressure. Repair the problem before continuing.
3. Allow the engine to reach operating temperature (fan comes on at least twice). The pressure should be:

Engine Oil Temperature:	**80 °C (176 °F)**
Engine Oil Pressure:	
At Idle:	**70 kPa (0.7 kgf/cm ^{2}, 10 psi) min.**
At 3,000 rpm (min $^{-1}$):	**340 kPa (3.5 kgf/cm ^{2}, 50 psi) min.**

4. If oil pressure is out of specifications, inspect these items:
   - Replace the oil filter.
   - Inspect the oil pressure relief valve.
   - Check the oil screen for clogging.
   - Inspect the oil pump.

Engine Oil Filter Replacement

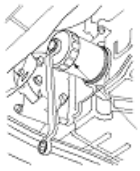
Special Tools Required



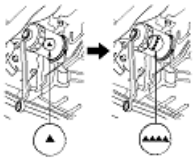
Oil filter wrench
07HAA-PJ70101

1. Drain the engine oil.
2. Remove the oil filter with the oil filter wrench.
3. Inspect the filter to make sure the rubber seal is not stuck to the oil filter seating surface of the engine.
4. Inspect the threads (A) and the rubber seal (B) on the new filter. Clean the seat on the oil pan, then apply a light coat of new engine oil to the filter rubber seal. Use only filters with a built-in bypass system.
5. Install the oil filter by hand.

6. After the rubber seal seats, tighten the oil filter clockwise with the oil filter wrench.
   Tighten: 3/4 Turn Clockwise
   Tightening Torque: 12 N·m (1.2 kgf·m, 8.8 lbf·ft)



7. If four numbers or marks (1 to 4 or ▼ to ▼▼▼▼) are printed around the outside of the filter, you can use the following procedure to tighten the filter.
   - Spin the filter on until its seal lightly seats against the oil pan, and note which number or mark is at the bottom.
   - Tighten the filter by turning it clockwise three numbers or marks from the one you noted. For example, if mark ▼ is at the bottom when the seal is lightly seated, tighten the filter until the mark ▼▼▼▼ comes around to the bottom.

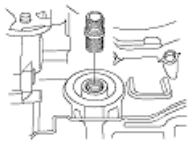


Number or Mark when rubber seal is seated	1 or ▼	2 or ▼▼	3 or ▼▼▼	4 or ▼▼▼▼
Number or Mark after tightening	4 or ▼▼▼▼	1 or ▼	2 or ▼▼	3 or ▼▼▼

8. Refill the new engine oil, run the engine for more than 3 minutes, then check for oil leakage.

Engine Oil Filter Feed Pipe Replacement

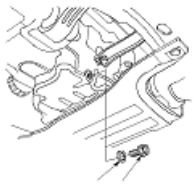
1. Remove the filter.
2. Remove the oil filter feed pipe.



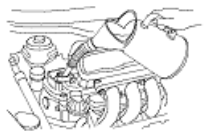
3. Install two 20 x 1.5 mm nuts (A) onto the new oil filter feed pipe. Hold one nut with a wrench, then use a second wrench to tighten the other nut.
4. Tighten the oil filter feed pipe to 39 N·m (4.0 kgf·m, 29 lbf·ft), then remove the nuts from the oil filter feed pipe.
5. Install the oil filter.

Engine Oil Replacement

1. Warm up the engine.
2. Remove the drain bolt (A), and drain the engine oil.
3. Reinstall the drain bolt with a new washer (B).



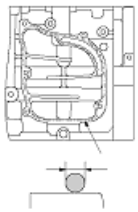
4. Refill the engine with the recommended oil.
   Capacity
   At Oil Change:
   3.4 L (3.6 US qt, 3.0 Imp qt)
   At Oil Change Including Filter:
   3.6 L (3.8 US qt, 3.2 Imp qt)
   After Engine Overhaul:
   4.2 L (4.4 US qt, 3.7 Imp qt)



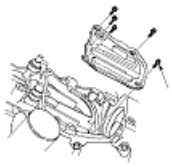
5. Run the engine for more than 3 minutes, then check oil level and oil leakage.

Engine Oil/Air Separator Installation

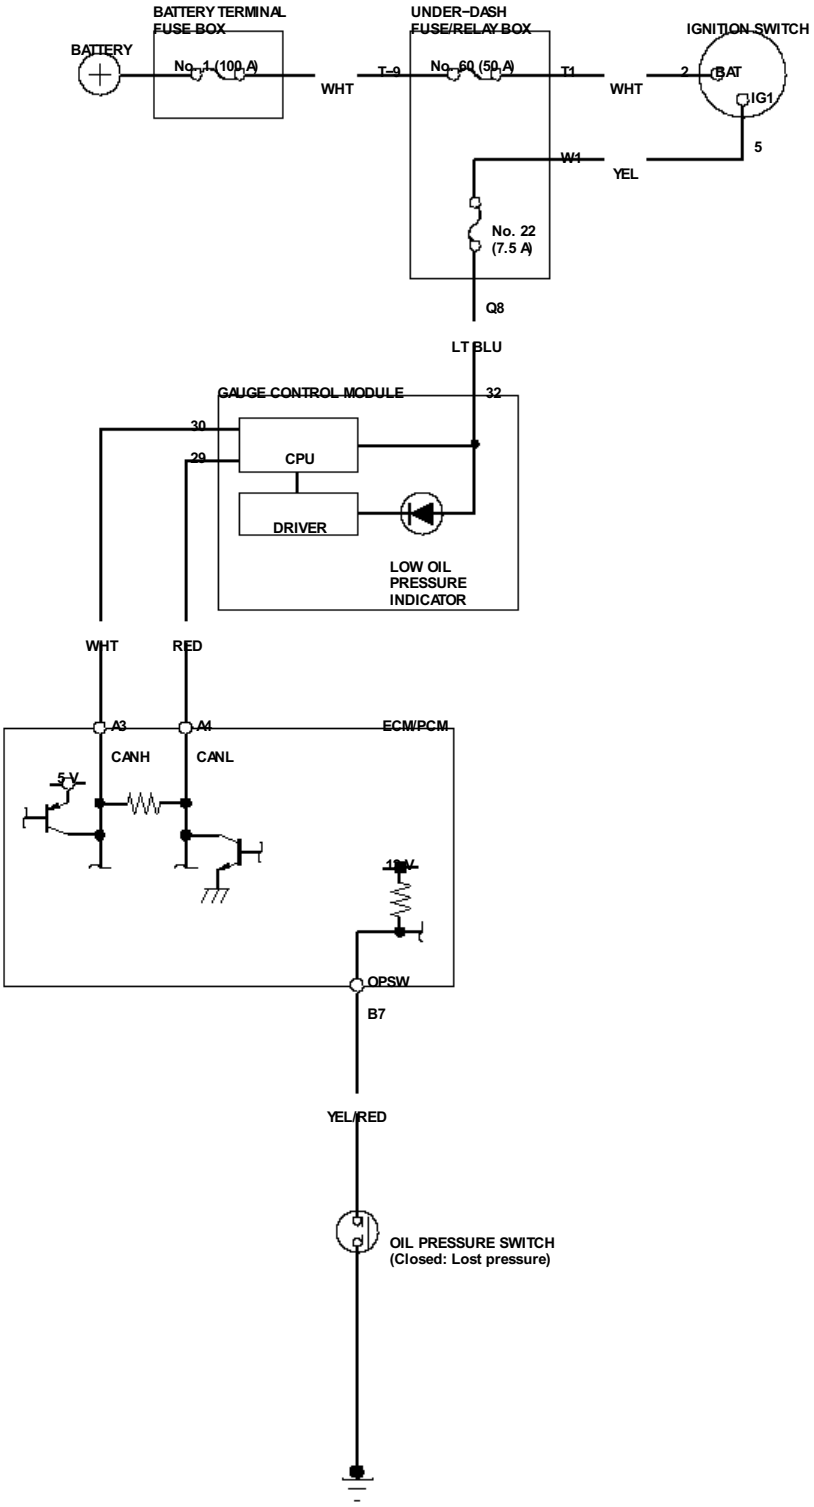
1. Remove the all of the old liquid gasket from the oil/air separator mating surfaces, the bolts, and the bolt holes.
2. Clean and dry the oil/air separator mating surfaces.
3. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the engine block mating surface of the oil/air separator and to the inner threads of the bolt holes.
   NOTE:
   - Apply liquid gasket about 1.5 mm (0.06 in.) diameter bead along the broken line (A).
   - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



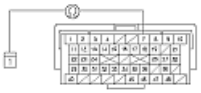
4. Install the oil/air separator.
   NOTE:
   - Wait at least 30 minutes before filling the engine with oil.
   - Do not run the engine for at least 3 hours after installing the chain case.



Low Oil Pressure Indicator Circuit Diagram



Low Oil Pressure Indicator Circuit Troubleshooting (Open)



1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't, troubleshoot the DLC circuit.
4. Check for DTCs. If a DTC is present, diagnose, and repair the cause before continuing with this test.
5. Turn the ignition switch to ON (II), select PGM-FI, and check the OIL PRESSURE SWITCH in the DATA LIST with the HDS.

   Is ON indicated?
   YES - Replace the gauge control module. ■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Check the oil pressure switch.

   Is the oil pressure switch OK?
   YES - Go to Step 8 .
   NO - Replace the oil pressure switch. ■
8. Turn the ignition switch to ON (II), and jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
   NOTE: This step must be done to protect the ECM/PCM from damage.
9. Disconnect ECM/PCM connector B (49P) and the oil pressure switch connector.
10. Check for continuity between ECM/PCM connector terminal B7 and the oil pressure switch connector.

    Is there continuity?
    YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
    NO - Repair open in the wire between the oil pressure switch and the ECM/PCM.■

Low Oil Pressure Indicator Circuit Troubleshooting (Short)

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).

3. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't, troubleshoot the DLC circuit.
4. Check for DTCs. If a DTC is present, diagnose, and repair the cause before continuing with this test.
5. Start the engine, select PGM-FI, and check the OIL PRESSURE SWITCH in the DATA LIST with the HDS.

   Is OFF indicated?
   YES - Replace the gauge control module. ■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the oil pressure switch connector.
8. Start the engine, and check the OIL PRESSURE SWITCH in the DATA LIST with the HDS.

   Is OFF indicated?
   YES - Go to Step 9 .
   NO - Go to Step 10 .
9. Check the oil pressure switch.

   Is the oil pressure switch OK?
   YES - Do the oil pressure test.
   NO - Replace the oil pressure switch. ■
10. Turn the ignition switch to ON (II), and jump the SCS line with the HDS, then turn the ignition switch to LOCK (0).
    NOTE: This step must be done to protect the ECM/PCM from damage.
11. Disconnect ECM/PCM connector B (49P) and the oil pressure switch connector.
12. Check for continuity between the oil pressure switch connector and body ground.

    Is there continuity?
    YES - Repair short in the wire between the oil pressure switch and the ECM/PCM.■
    NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM . ■

Engine Oil Pressure Switch Test

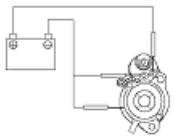
1. Disconnect the oil pressure switch connector (A) from the engine oil pressure switch (B).
2. Check for continuity between the oil pressure switch terminal and the engine (ground). There should be continuity with the engine stopped. There should be no continuity with the engine running.

Engine Oil Pressure Switch Replacement

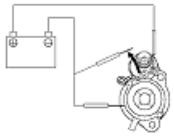
1. Disconnect the oil pressure switch connector (A), then remove the oil pressure switch (B).
2. Remove any old liquid gasket from the switch and switch mounting hole.
3. Apply a very small amount of liquid gasket to the oil pressure switch threads, then install the oil pressure switch. NOTE: Using too much liquid gasket may cause liquid gasket to enter the oil passage or the end of the new oil pressure switch.

Starter Performance Test

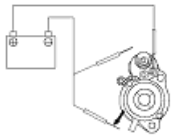
1. Remove the starter.
2. Disconnect the wires from the M terminal.
3. Make a connection for this test using the thickest (gauge) wire possible (preferably the same gauge as used on the vehicle).
   NOTE: To avoid damaging the starter, never leave the battery connected for more than 10 seconds.
4. Connect the battery as shown. Make sure you disconnect the starter motor wire from the solenoid. If the starter pinion moves out, it is working properly.



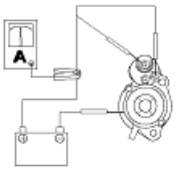
5. Disconnect the battery from the M terminal. If the pinion does not retract, the hold-in coil of the solenoid is working properly.



6. Disconnect the battery from the starter body. If the pinion retracts immediately, it is working properly.
7. Firmly clamp the starter in a vise.
8. Reconnect the wire to the M terminal.



9. Connect the starter to the battery as shown, and confirm that the motor runs.
10. If the electric current meets the specification when the battery voltage is at 11.5 V, the starter is working properly.
    Specification
    Electric Current: **50 A or less**

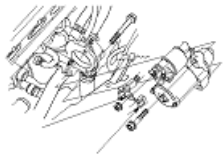


Starter Removal and Installation

Removal

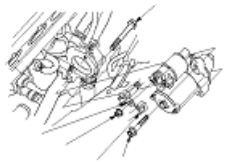
1. Do the battery terminal disconnection procedure.
2. Remove the coolant reservoir.
3. Remove the intake manifold.

4. Remove the dipstick, then remove the dipstick tube (A).
5. Disconnect the oil pressure switch connector (B).



6. Disconnect the starter cable (A) from the B terminal and disconnect the connector (B) from the S terminal, then remove the starter.
7. Remove the two bolts securing the starter, then remove the starter.

Installation



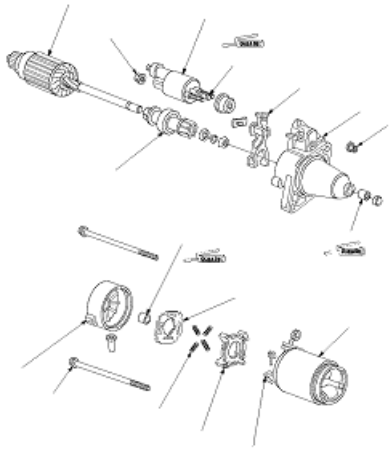
1. Install the starter to the engine. Connect the starter cable (A) and connector (B). Make sure the starter cable crimped side of the ring terminal faces away from the starter when you connect it.

2. Install the dipstick tube (A) with new O-ring (B).
3. Connect the oil pressure switch connector (C).

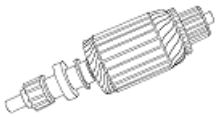
4. Install the coolant reservoir.
5. Installation the intake manifold.
6. Do the battery terminal reconnection procedure.
7. Start the engine to make sure the starter works properly.

Starter Overhaul

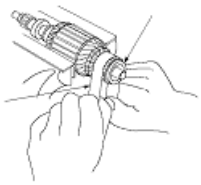
Disassembly/Reassembly



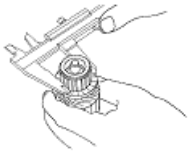
Armature Inspection and Test



1. Remove the starter.
2. Disassemble the starter as shown in the Exploded View.
3. Inspect the armature for wear or damage from contact with the magnet. If there is wear or damage, replace the armature.



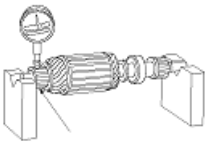
4. Check the commutator (A) surface. If the surface is dirty or burnt, resurface it with an emery cloth or a lathe to the specifications in Step 5 , or recondition with #500 or #600 sandpaper (B).



5. Check the commutator diameter. If the diameter is below the service limit, replace the armature.

Commutator Diameter

Standard (New):	**27.9–28.0 mm (1.098–1.102 in.)**
Service Limit:	**27.0 mm (1.06 in.)**



6. Measure the commutator (A) runout.
   - If the commutator runout is within the service limit, check the commutator for carbon dust or brass chips between the segments.
   - If the commutator runout is not within the service limit, replace the armature.

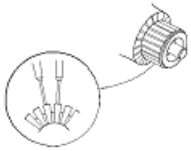
Commutator Runout

Standard (New):	**0.05 mm (0.002 in.) max.**
Service Limit:	**0.4 mm (0.02 in.)**

7. Check the mica depth (A). If the mica is too high (B), undercut the mica with a hacksaw blade to the proper depth. Cut away all the mica (C) between the commutator segments. The undercut should not be too shallow, too narrow, or V-shaped (D).

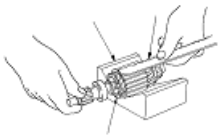
Commutator Mica Depth

Standard (New):	**0.45–0.75 mm (0.018–0.030 in.)**
Service Limit:	**0.2 mm (0.008 in.)**

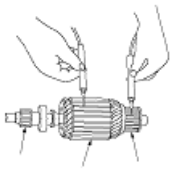


8. Check for continuity between the segments of the commutator. If there is an open circuit between any of the segments, replace the armature.

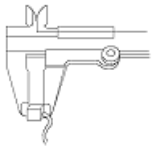
9. Place the armature (A) on an armature tester (B). Hold a hacksaw blade (C) on the armature core. If the blade is attracted to the core or vibrates while the core is turned, the armature is shorted. Replace the armature.



10. Use an ohmmeter to check for continuity between the commutator (A) and the armature coil core (B), and between the commutator and the armature shaft (C). If there is continuity, replace the armature.



Starter Brush Inspection



11. Measure the brush length. If it is not within the service limit, replace the armature housing assembly.

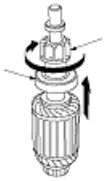
Brush Length

Standard (New):	**9.7−10.3 mm (0.38−0.41 in.)**
Service Limit:	**6 mm (0.2 in.)**

Starter Field Winding Test

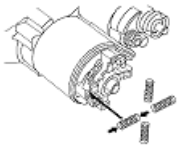
12. Check for continuity between the (+) brushes (A) and motor wire (B), and between the (−) brushes (C) and armature housing (D). If there is no continuity, replace the armature housing.
13. Check for continuity between the (+) brushes and (−) brushes, and between the (+) brushes and armature housing. If there is continuity, replace the armature housing.

Overrunning Clutch Inspection

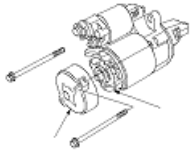


14. Slide the overrunning clutch (A) along the shaft.
Replace it, if it does not slide smoothly.
15. Hold the drive gear (B), and turn the overrunning clutch in the direction shown to make sure it turns freely. Also make sure the overrunning clutch locks in the opposite direction. If it does not lock in either direction or it locks in both directions, replace it.
16. If the starter drive gear is worn or damaged, replace the overrunning clutch assembly; the gear is not available separately. Check the condition of the flywheel or torque converter ring gear. Replace it if the starter drive gear teeth are damaged
17. Install the armature in the housing, and install the brush holder, then install the each brush in the holder.
NOTE: To seat new brushes, slip a strip of #500 or #600 sandpaper, with the grit side up, between the commutator and each brush, and smoothly rotate the armature. The contact surface of the brushes will be sanded to the same contour as the commutator.

18. Compress the spring, and install it in the brush holder.



19. Install the brush holder insulator (A) and end cover (B).



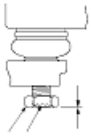
20. Do the starter performance test.

Starter Solenoid Test

1. Do the battery terminal disconnection procedure.
2. Remove the starter cable (A) and motor cable (B), then disconnect the connector (C).
3. Check the hold-in coil for continuity between the S terminal and the armature housing (ground). There should be continuity.
   - If there is continuity, go to Step 4 .
   - If there is no continuity, replace the solenoid.
4. Check the pull-in coil for continuity between the S terminal and M terminal. There should be continuity.
   - If there is continuity, the solenoid is OK.
   - If there is no continuity, replace the solenoid.
5. Install in the reverse order of removal.
6. Do the battery terminal reconnecting procedure.

Ball Joint Removal

Special Tools Required



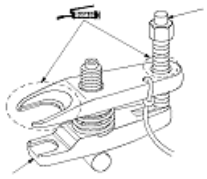
Ball joint remover, 28 mm
07MAC-SL00201

NOTICE

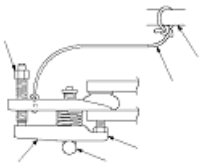
Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

1. Install a hex nut (A) onto the threads of the ball joint (B). Make sure the nut is flush with the ball joint pin end to prevent damage to the threaded end of the ball joint pin.

2. Apply grease to the ball joint remover on the areas shown (A). This will ease installation of the tool and prevent damage to the pressure bolt (B) threads.



3. Loosen the pressure bolt (A), and install the ball joint remover as shown. Insert the jaws carefully, making sure not to damage the ball joint boot. Adjust the jaw spacing by turning the adjusting bolt (B).
   NOTE: Fasten the safety tie (C) securely to a suspension arm or the subframe (D). Do not fasten it to a brake line or wire harness.



4. After adjusting the adjusting bolt, make sure the head of the adjusting bolt is in the position shown to allow the jaw (E) to pivot.

5. With a wrench, tighten the pressure bolt until the ball joint pin pops loose from the ball joint connecting hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin.
   NOTE: Do not use pneumatic or electric tools on the pressure bolt.

6. Remove the ball joint remover, then remove the nut from the end of the ball joint pin, and pull the ball joint out of the ball joint connecting hole. Inspect the ball joint boot, and replace it if damaged.

Front Lower Arm Ball Joint Inspection

NOTICE

When inspecting the ball joint, the vehicle will be shake strongly. Make sure support the front jacking bracket correctly with the suitable jack.

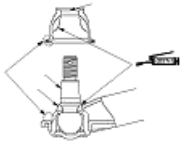
1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Check all bolts, nuts, and bushings on the suspension components, and make sure that there are not looseness, deterioration, and damage.
4. Hold the outside of lower arm (A) with your hands, and move it up and down to check for abnormal noise or wobbling.
   NOTE:
   - If the ball joint is abnormal, replace the lower arm.
   - A problem on the ball joint may be caused by an abnormal clearance (B).

5. Check the ball joint boot (A) for weakness, damage, cracks, and inner boot grease leaks.
   NOTE:
   - If the ball joint boot is damaged with grease leaks, replace the lower arm.
   - If the ball joint boot is weakness and cracks without grease leaks, replace the ball joint boot.

6. Install the front wheel.
   NOTE: Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.

Ball Joint Boot Inspection/Replacement

Special Tools Required

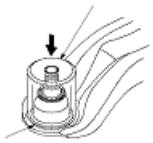


Inner bearing driver attachment, 40 mm
07GAF-SE00200

1. Check the ball joint boot for weakness, damage, cracks, and inner boot grease leaks.
   NOTE:
   - If the ball joint boot is damaged with grease leaks, replace the lower arm.
   - If the ball joint boot is weakness and cracks without grease leaks, go to Step 2 . Replace the ball joint boot.
2. Remove the lower arm.
3. Remove the boot.
4. Pack the interior and lip (A) of a new boot with grease. Keep the grease off of the boot-to-lower arm mating surfaces (B).
5. Wipe the grease off the tapered portion of the ball joint pin (C), and pack fresh grease into the base (D). Do not let dirt or other foreign materials get into the boot.
6. Install the boot on the ball joint, then squeeze it gently to force out any air.

---

7. Press the boot with the inner bearing driver attachment until the bottom seats (A) on the lower arm all the way around.



8. After installing a boot, wipe any grease off the exposed portion of the ball joint pin.
9. Install the lower arm.

Damper Disposal

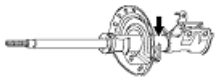
⚠WARNING

The dampers contain nitrogen gas and oil under pressure.
The pressure must be relieved before disposal to prevent explosion and possible injury when scrapping.

⚠WARNING

Always wear eye protection to avoid getting metal shavings in your eyes when the damper pressure is relieved.

Front damper



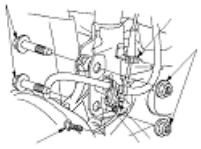
Rear damper

Place the damper on a level surface with its shaft extended and drill a hole of 2−3 mm (0.078−0.118 in.) diameter in the body to release the gas.

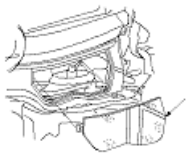
Front Damper/Spring Removal/Installation

1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Remove the wheel speed sensor (A) from the knuckle. Do not disconnect the wheel speed sensor connector.
4. Disconnect the stabilizer link from the damper.

5. Remove the wheel speed sensor clip (A), the wheel speed sensor stay (B), and the brake hose bracket (C) form the damper. Do not disconnect the wheel speed sensor connector.
6. Remove the damper pinch bolts (D) and the self-locking nuts (E) from the damper.
   NOTE:
   - Do not allow the knuckle to rotate too far outward. This may allow the driveshaft inboard joint come apart.
   - During installation, install new damper pinch bolts and new self-locking nuts, then tighten the damper pinch bolts to the specified torque value.

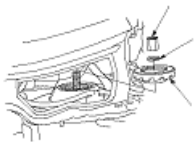


7. Remove the lid (A).

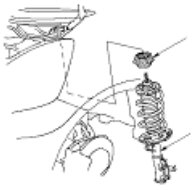


8. Remove the damper cap (A) from the top of the damper.
9. Hold the damper shaft (B) using a hex wrench (C), and loosen the damper mounting nut (D).

10. Remove the damper mounting nut (A) and the wave washer (B), then remove the damper mounting base (C) from the top of the damper.

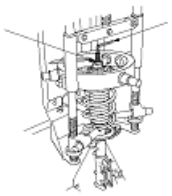


11. Remove the damper/spring (A) and the damper mounting rubber (B).
    NOTE: Be careful not to damage the body.
12. Install all of the removed parts in the reverse order of removal, and note these items:
    - First install all the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint of the lower arm.
    - Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.
13. Check the wheel alignment, and adjust it if necessary.



Front Damper/Spring Disassembly, Inspection, and Reassembly

Exploded View

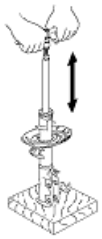


NOTE: When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent) according to the manufacturer's instructions.

Disassembly

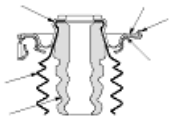
1. Compress the damper spring, then remove the nut (A) while holding the damper shaft with a hex wrench (B). Do not compress the damper spring more than necessary to remove the nut.
2. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.

Inspection

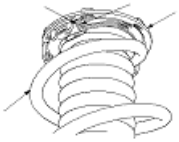


1. Install the nut on the damper shaft end, and set the socket wrench and T-handle on the nut.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.
3. Check for oil leaks, abnormal noises, and binding during these tests.

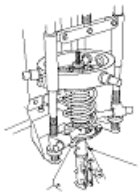
Reassembly



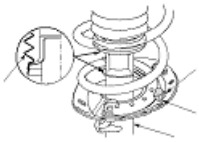
1. Install the upper spring seat (A) to the upper spring seat clip (B).
   NOTE: Make sure to securely set the upper spring seat to the hook (C) on the spring seat clip.
2. Install the bump stop rubber (D) and the dust cover (E) to the upper spring seat.
   NOTE: Push the bump stop rubber and the dust cover into the dent (F) of the upper spring seat securely.



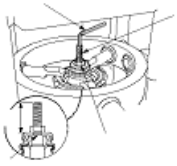
3. Install the damper spring (A) on the upper spring seat clip (B) by aligning the upper end (C) of the damper spring with the ledge portion (D) of the upper spring seat clip.
4. Install the spring seat rubber on the damper spring.
5. Compress the damper spring.



6. Install all the parts except the nut and the damper bearing onto the damper unit (A) by referring to the Exploded View.

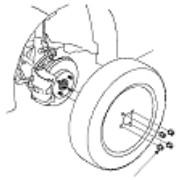


7. Align the raised portion (A) of the spring seat rubber and the hole (B) of the lower spring seat on the damper unit (C).
   NOTE: After reassemble the damper/spring, install the dust cover (D) into the damper unit as shown.
8. Install the damper bearing onto the damper shaft.



9. Compress the damper spring until the position (A) of the damper shaft (B) comes in contact with the damper bearing. Do not excessively compress the damper spring.
   NOTE: Make sure the distance of the rod is 44 mm (1.73 in.) from the upper surface of the bearing.
10. Install the nut (C).
11. Hold the damper shaft with a hex wench (D), and tighten the nut to the specified torque value.
12. Remove the damper/spring from the strut spring compressor.

Front Knuckle/Hub/Wheel Bearing Replacement



Exploded View

Special Tools Required

Ball joint remover, 28 mm
07MAC-SL00201

Hub dis/assembly tool, 34 mm
07965-SA70100

Driver handle, 15 x 135L
07749-0010000

Bearing driver attachment, 52 x 55 mm
07746-0010400

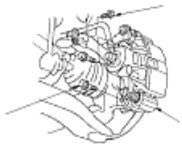
Support base, 73 x 78/82.6 mm
07965-SD90100

Knuckle/Hub Replacement

1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the wheel nuts (A) and the front wheel.

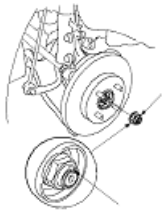
---

3. Remove the brake hose mounting bolt (A) from the damper bracket.
4. Remove the brake caliper bracket mounting bolts (B), and remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or the brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.



---

5. Raise the stake (A), then remove the spindle nut (B).
6. Remove the front brake disc.
7. Check the front hub for damage and cracks.

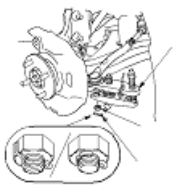


---

8. Remove the wheel speed sensor (A) from the knuckle (B). Do not disconnect the wheel speed sensor connector.

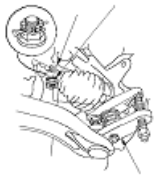
---

9. Remove the cotter pin (A) from the tie-rod end ball joint, then remove the nut (B).
   NOTE: During installation, install the new cotter pin after tightening the nut, and bend its end as shown.
10. Disconnect the tie-rod end ball joint from the knuckle using the ball joint remover.



---

11. Remove the lock pin (A) from the lower arm ball joint, then remove the castle nut (B).
    NOTE: During installation, install the lock pin as shown after tightening the new castle nut.
12. Disconnect the lower ball joint from the knuckle using the ball joint remover.
    NOTE:
    - Be careful not to damage the ball joint boot when installing the remover.
    - Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.



---

13. Remove the damper pinch bolts (A) and the self-locking nuts (B) from the damper.
NOTE: Use new damper pinch bolts and new self-locking nuts during reassembly.

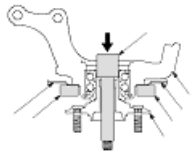
14. Remove the driveshaft outboard joint (C) from the knuckle (D) by tapping the driveshaft end (E) with a soft face hammer while drawing the hub outward, then remove the knuckle/hub.
NOTE:
    - Do not pull the driveshaft end outward. The driveshaft inboard joint may come apart.
    - During installation, apply grease to the mating surfaces of the wheel bearing and the driveshaft outboard joint.

15. Install the knuckle/hub in the reverse order of removal, and note these items:
    - First install all the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint of the lower arm.
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, and the threaded section and the mating surfaces of the castle nut.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Use a new spindle nut on reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the brake disc, clean the mating surfaces of the front hub and the inside of the brake disc.
    - Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.

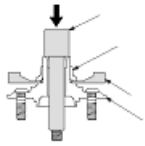
16. Check the wheel alignment, and adjust it if necessary.

Wheel Bearing Replacement

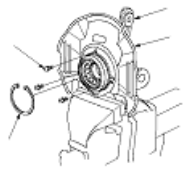
1. Separate the hub (A) from the knuckle (B) using the hub dis/assembly tool and a hydraulic press. Hold the knuckle with the attachment (C) of the hydraulic press or equivalent tool. Be careful not to damage or deform the splash guard (D). Hold onto the hub to keep it from falling when pressed clear.



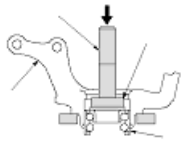
2. Press the wheel bearing inner race (A) off of the hub (B) using the hub dis/assembly tool, a commercially available bearing separator (C), and a press.



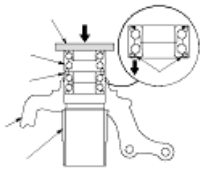
3. Remove the splash guard (A) and the snap ring (B) from the knuckle (C).



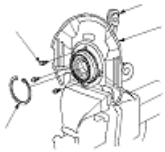
4. Press the wheel bearing (A) out of the knuckle (B) using the bearing driver attachment, the driver handle, and a press.
5. Wash the knuckle and the hub thoroughly in high flash point solvent before reassembly.



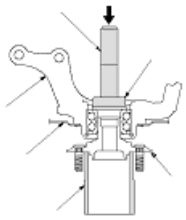
6. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the support base, and a press.
NOTE:
    - Install the wheel bearing with the wheel speed sensor magnetic encoder (E) (brown color), toward the inside of the knuckle.
    - Remove any oil, grease, dust, metal debris, and other foreign material from the encoder surface.
    - Keep any magnetic tools away from the encoder surface.
    - Be careful not to damage the encoder surface when you insert the wheel bearing.



7. Install the snap ring (A) securely in the knuckle (B).
8. Install the splash guard (C), and tighten the screws (D) to the specified torque value.

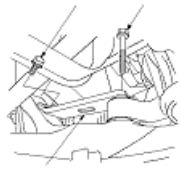


9. Install the hub (A) onto the knuckle (B) using the bearing driver attachment, the driver handle, the support base, and a hydraulic press. Be careful not to damage the splash guard (C).



Front Stabilizer Bar Replacement

NOTE: The illustrations show only the LHD model of the vehicle except where the procedure is different for the RHD model.



Removal

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Remove the steering wheel.
4. Disconnect the steering joint from the pinion shaft.
5. Disconnect the tie-rod end ball joint from the knuckle.
6. Disconnect both sides of the stabilizer link from the stabilizer bar.
7. LHD model: Remove the secondary HO2S wire clamp on the steering gearbox.
8. Remove the steering gearbox mounting bolt (A) and the stiffener mounting bolt (B), and remove the gearbox stay (C) of the driver's side.

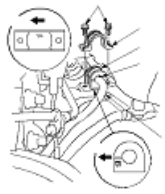
9. Remove the steering gearbox mounting bolt (A) and the stiffener mounting bolt (B), and remove the gearbox stay (C) of the passenger's side.

10. Remove the steering gearbox mounting bolt (A) and the washer (B) from the rear side of the steering gearbox.

11. Remove the flange bolts (A) and the bushing holders (B), then remove the bushings (C).
12. Move the steering gearbox toward the upper side, and remove the stabilizer bar (D) from the driver's side.
    NOTE: Be careful not to damage the steering gearbox.

Installation

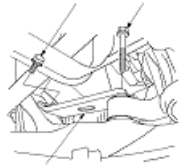
1. Move the steering gearbox toward the upper side, and install the stabilizer bar (A) from the driver's side.
   NOTE:
   - Be careful not no damage the steering gearbox.
   - Note the right and left direction of the stabilizer bar.
   - Note the direction of installation for the bushings (B) and the bushing holders (C).
   - Align the stabilizer band or the paint marks (D) on the stabilizer bar with the side of the bushings.



2. Loosely tighten the new steering gearbox mounting bolt (A) and the washer (B) from the rear side of the steering gearbox.

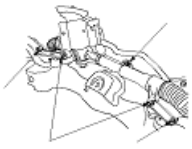
3. Loosely tighten the new steering gearbox mounting bolt (A) and the new stiffener mounting bolt (B) to the gearbox stay (C) of the passenger's side.

4. Loosely tighten the new steering gearbox mounting bolt (A) and the new stiffener mounting bolt (B) to the gearbox stay (C) of the driver's side.

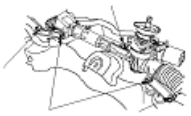


5. Tighten the steering gearbox mounting bolts (A) and the stiffener mounting bolts (B) to the specified torque values as shown order.
6. LHD model: Install the secondary HO2S wire clamp to the steering gearbox.
7. Connect both sides of the stabilizer link to the stabilizer bar.
8. Connect the tie-rod end ball joint to the knuckle.
9. Connect the steering joint.
10. Install the steering wheel.
11. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
12. Check the wheel alignment, and adjust it if necessary.

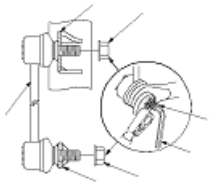
RHD model



LHD model



Front Stabilizer Link Removal/Installation

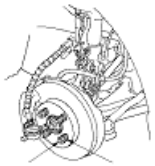


1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Remove the self-locking nut (A) and the flange nut (B) while holding the respective joint pin (C) with a hex wrench (D), then remove the stabilizer link (E).
4. Install the stabilizer link on the stabilizer bar (F) and the damper (G) with the joint pins set at the center of their range of movement.
5. Install the new self-locking nut and the new flange nut, and tighten them to the specified torque values while holding the respective joint pin with a hex wrench.
6. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheel.
7. Test-drive the vehicle.
8. After 5 minutes of driving, tighten the self-locking nut again to the specified torque value.

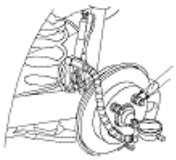
Wheel Bearing End Play Inspection

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the wheels.
3. Install suitable flat washers (A) and the wheel nuts. Tighten the nuts to the specified torque to hold the brake disc securely against the hub.
4. Attach the dial gauge. Place the dial gauge against the hub flange.
5. Measure the bearing end play while moving the brake disc inward and outward.
   Wheel bearing end play:
   Front/Rear: 0−0.05 mm (0−0.002 in.)
6. If the bearing end play measurement is more than the standard, replace the wheel bearing or the hub bearing unit.

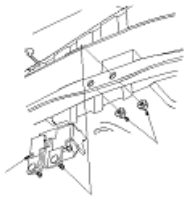
Front



Rear



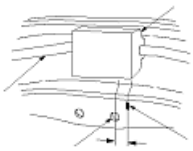
Rear Suspension Dynamic Damper Replacement



1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the dynamic damper (A) from the axle beam.
   NOTE: Use new self-looking nuts (B) during reassembly.
3. Install the new dynamic damper in the reverse order of removal.

Rear Stabilizer Rubber Replacement

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the dynamic damper from the axle beam.
3. Remove the stabilizer rubber (A) from the axle beam.
4. Apply osmosis preservation lubricant to the new stabilizer rubber. This will ease installation of the rubber into the stabilizer and the axle beam.

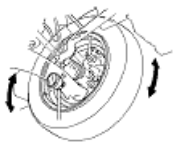


5. Make a mark (A) near the hole (B) of the axle beam as shown. Install the stabilizer rubber (C) into the axle beam by aligning the end face of the stabilizer rubber to the plant mark.
   NOTE: Make sure the stabilizer rubber is installed into the stabilizer (D).
6. Install the dynamic damper to the axle beam.

Wheel Runout Inspection

NOTE: When measuring the front wheel runout, turn the back side of the wheel slowly by hand.

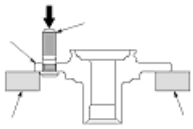
1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Check for bent or deformed wheel.
3. Set up the dial gauge as shown, and measure the axial runout by turning the wheel.
   Front and rear wheel axial runout:
   Standard:
   Steel wheel: **0–1.0 mm (0–0.04 in.)**
   Aluminum wheel: **0–0.7 mm (0–0.03 in.)**
   Service limit: **2.0 mm (0.08 in.)**



4. Reset the dial gauge to the position shown, and measure the radial runout.
   Front and rear wheel radial runout:
   Standard:
   Steel wheel: **0–1.0 mm (0–0.04 in.)**
   Aluminum wheel: **0–0.7 mm (0–0.03 in.)**
   Service limit: **1.5 mm (0.06 in.)**
5. If the wheel runout is not within the specification, check the wheel bearing end play, and make sure the mating surfaces on the brake disc and the inside of the wheel are clean.
6. If the bearing end play is within the specification but the wheel runout is more than the service limit, replace the wheel.

Wheel Bolt Replacement

NOTICE



- Do not use a hammer or air or electric impact tools to remove and install the wheel bolts.
- Be careful not to damage the threads of the wheel bolts.

1. Remove the front hub or the rear hub bearing unit: front , rear.
2. Separate the wheel bolt (A) from the hub (B) using a hydraulic press. Support the hub with hydraulic press attachments (C) or equivalent tools.
   NOTE:
   - Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub.
   - The illustration shows a front hub.
3. Insert the new wheel bolt into the hub while aligning the splined surfaces on the hub hole with the wheel bolt.
   NOTE:
   - Degrease all around the wheel bolt.
   - Make sure the wheel bolt is installed vertically in relation to the hub disc surface.
4. Install the wheel bolt using a hydraulic press until the wheel bolt shoulder is fully seated.
5. Install the front hub or the rear hub bearing unit: front , rear.
   NOTE: If you cannot tighten the wheel nut to the specified torque value when installing the wheel, replace the front hub or the rear hub bearing unit as an assembly.

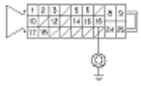
ABS indicator and brake system indicator do not go off at the same time

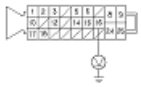


1. Turn the ignition switch to LOCK (0).
2. Check the No. 11 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 3 .
   NO - Reinstall the checked fuse, then go to Step 8 .
3. Disconnect the ABS modulator-control unit 25P connector.
4. Check for continuity between ABS modulator-control unit 25P connector terminal No. 16 and body ground.

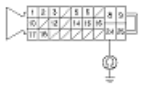
   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 11 (7.5 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■
   NO - Install the new No. 11 (7.5 A) fuse in the under-dash fuse/relay box, then go to Step 5 .
5. Reconnect the ABS modulator-control unit 25P connector.
6. Turn the ignition switch to ON (II).
7. Check the ABS indicator and brake system indicator for several seconds when the ignition switch is turned to ON (II).

   Do the indicators come on then go off?
   YES - Replace the ABS modulator-control unit. ■
   NO - The system is OK at this time.■
8. Disconnect the ABS modulator-control unit 25P connector.
9. Turn the ignition switch to ON (II).



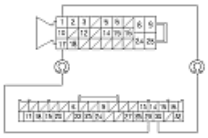
10. Measure the voltage between ABS modulator-control unit 25P connector terminal No. 16 and body ground.

    Is there battery voltage?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the No. 11 (7.5 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■
11. Turn the ignition switch to LOCK (0).



12. Check for continuity between ABS modulator-control unit 25P connector terminal No. 24 and body ground.

    Is there continuity?
    YES - Go to Step 13 .
    NO -
    - RHD model: Repair open in the wire between the ABS modulator-control unit and body ground (G203).■
    - LHD model: Repair open in the wire between the ABS modulator-control unit and body ground (G402).■
13. Disconnect the gauge control module 32P connector.



14. Check for continuity between the ABS modulator-control unit 25P connector terminal and gauge control module 32P connector terminal (see table).

Sign	ABS Modulator-control Unit 25P Connector Terminal	Gauge Control Module 32P Connector Terminal
CAN-L	No. 17	No. 29
CAN-H	No. 1	No. 30

    Is there continuity?
    YES - Check for loose terminals in the ABS modulator-control unit 25P connector. Clean terminal: G203 (RHD model), G402 (LHD model) and recheck. If necessary, substitute a known-good ABS modulator-control unit, and reset.■
    NO - Repair open in the wire between the gauge control module and the ABS modulator-control unit.■

HDS does not communicate with the ABS modulator-control unit or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

ABS indicator and brake system indicator do not come on at the same time

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Substitute a known-good ABS modulator-control unit, then retest. If it is OK, replace the original ABS modulator-control unit.

ABS indicator and brake system indicator do not go off at the same time

Diagnostic procedure

1. Check for F-CAN DTCs, and troubleshoot and repair those first.
2. Symptom Troubleshooting.
3. Do the gauge control module troubleshooting.

ABS Symptom Troubleshooting Index

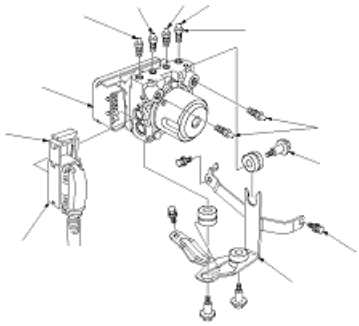
When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure
HDS does not communicate with the ABS modulator-control unit or the vehicle	Troubleshoot the DLC circuit.
ABS indicator and brake system indicator do not come on at the same time	1.Do the gauge control module troubleshooting. 2.Substitute a known-good ABS modulator-control unit, then retest. If it is OK, replace the original ABS modulator-control unit.
ABS indicator and brake system indicator do not go off at the same time	1.Check for F-CAN DTCs, and troubleshoot and repair those first. 2.Symptom Troubleshooting. 3.Do the gauge control module troubleshooting.

ABS Modulator-control Unit Removal and Installation

NOTE:

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- To prevent the brake fluid from dripping, plug and cover the hose ends and joints with a shop towel.



Removal

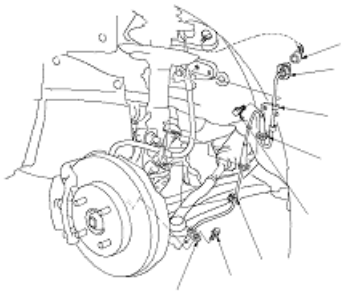
1. Turn the ignition switch to LOCK (0).
2. Disconnect the ABS modulator-control unit 25P connector (A) by pulling up the lock (B); the connector disconnects itself.
3. Disconnect the six brake lines from the ABS modulator-control unit.
   NOTE: Brake lines are connected to the master cylinder (C) and to the right-front (D), the left-rear (E), the right-rear (F), and the left-front (G) brake systems.
4. Remove the ABS modulator-control unit (H) with the bracket (I) from the body.
5. Remove the ABS modulator-control unit from the bracket.

Installation

1. Install the ABS modulator-control unit on the bracket.
2. Install the bracket with the ABS modulator-control unit to the body.
3. Reconnect the six brake lines, then tighten the flare nuts to the specified torque.
4. Align the connecting surface of the ABS modulator-control unit 25P connector to the ABS modulator-control unit.
5. Lower the lock of the ABS modulator-control unit 25P connector, then confirm the connector is fully seated.
6. Bleed the brake system.
7. Start the engine, and check that the ABS indicator goes off.
8. Test-drive the vehicle, and make sure the ABS indicator does not come on.
   NOTE: If the brake pedal is spongy, there may be air trapped in the modulator which could then be induced into the normal brake system during modulation. Bleed the brake system again.

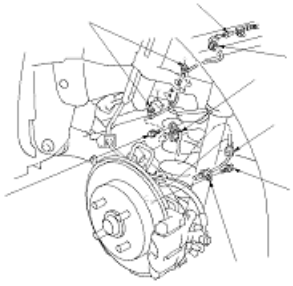
Wheel Speed Sensor Replacement

Front



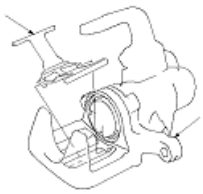
1. Turn the ignition switch to LOCK (0).
2. Remove the grommet (A), then disconnect the wheel speed sensor connector (B).
3. Remove the bracket (C), the clip (D), and the stay (E).
4. Remove the bolt and the wheel speed sensor (F).
5. Install the wheel speed sensor in the reverse order of removal, and note these items:
   - Install the sensor carefully to avoid twisting the wires.
   - If the wheel speed sensor comes in contact with the wheel bearing, it is faulty.
   - Make sure the grommet is installed properly.
6. Start the engine, and make sure the ABS indicator go off.
7. Test-drive the vehicle, and make sure the ABS indicator do not come on.

Rear



1. Turn the ignition switch to LOCK (0).
2. Pull back the carpet under the rear seat, then disconnect the wheel speed sensor connector (A).
3. Remove the grommet (B), the bracket (C), the clips (D), and the stay (E).
4. Remove the bolt and the wheel speed sensor (F).
5. Install the wheel speed sensor in the reverse order of removal, and note these items:
   - Install the sensor carefully to avoid twisting the wires.
   - If the wheel speed sensor comes in contact with the hub bearing unit, it is faulty.
   - Make sure the grommet is installed properly.
6. Start the engine, and make sure the ABS indicator go off.
7. Test-drive the vehicle, and make sure the ABS indicator do not come on.

Rear Brake Caliper Overhaul



Exploded View

Special Tools Required

Locknut wrench, 5.5 x 30 mm
07916-6390001

Rear caliper spring compressor
07HAE-SG00100

Snap ring pliers
07914-SA50001

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

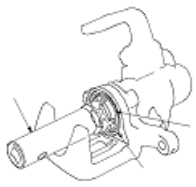
NOTE: Make sure that the caliper pins are installed correctly. Upper caliper pin B and lower caliper pin A are different. If these caliper pins are installed in the wrong location, it will cause vibration, uneven or rapid pad wear, and possibly uneven tyre wear.

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets in the brake fluid.
- Make sure no grease or oil gets on the brake discs or the brake pads.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Coat the piston, the piston seal groove, and the caliper bore with clean brake fluid.
- Use recommended greases in the rear caliper set.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.
- When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.

Disassembly

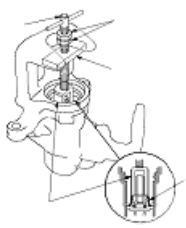
1. Remove the caliper body.
2. Remove the pad spring (A) from the caliper body (B).

3. Rotate the piston (A) counterclockwise by using the locknut wrench (B), and remove the piston and piston boot (C).
   NOTE: Be careful not to damage the piston.

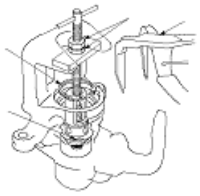


4. Remove the piston seal (A) from the caliper body (B).
   NOTE: Be careful not to damage the inner surface of the cylinder wall with the tool.

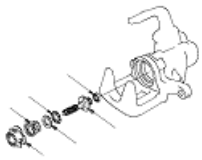
5. Install the rear caliper spring compressor (A) on the spring guide (B) inside of the caliper body.
6. Locate a locknut (C) on the top of the shaft (D) and turn the shaft clockwise until a plate (E) touches the caliper body.



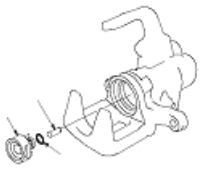
7. Turn the locknut (A) and put it on the plate. Turn the shaft for 1/4 to 1/2 clockwise and compress the adjusting spring B.
8. Remove the circlip (C) with the snap ring pliers (D).
9. Depress the lower side of the locknut, tighten the upper side of the locknut and fix the position.
   NOTE: Do not displace the position of the locknut until reassembling the circlip.



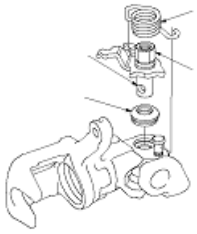
10. Remove the rear caliper spring compressor, then remove the spring guide (C), adjusting spring B, spacer (D), bearing A, adjusting bolt (E) and the cup (F).



11. Remove the sleeve piston (A), then remove the rod (B) and the O-ring (C) from the shaft.

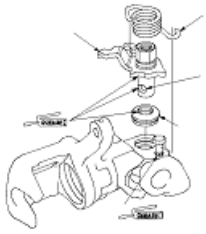


12. Remove the return spring (A), then remove the lever/shaft (B) from the caliper.
    NOTE: Do not loosen a parking nut (C), with the shaft attached to the caliper. When disassembling the lever and the shaft, fix the lever to the vice and loosen the nut.
13. Remove the shaft cover (D).



Reassembly

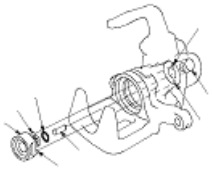
NOTE: When disassembling the lever and the shaft, assemble them according to the following procedure, referring to the exploded view beforehand, then install them to the caliper.



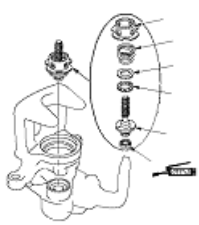
- Install the lever and a spring washer to the shaft.
- Apply new sealant (Loctite 569) to the threads of the parking nut and install it.
- Fix the lever to the vice and tighten the nut.

1. Apply silicone grease to a needle roller bearing (A) of the caliper body.
   NOTE: Check if notch of the needle roller bearing faces to the cylinder.
2. Apply silicone grease to the seal of a new shaft cover (B), then install it to the caliper body.
3. Apply silicone grease to the hole (C) of the shaft. Turn the hole toward the caliper, then install the lever/shaft (D) to the caliper body.
   NOTE:
   - Rotate the shaft slowly when inserting so as not to damage the seal of the shaft cover.
   - Fix the lip of the shaft cover to the groove portion of the shaft completely.
4. Install the return spring (E).

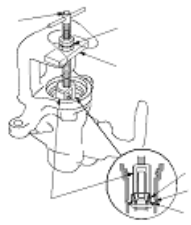
5. Install the rod (A) to the shaft (B) so that it turns toward the center.
6. Install the new O-ring (C) to the sleeve piston (D).
7. Install two pins (E) of the sleeve piston to the two holes (F) of the caliper body, so that the rod is inserted in the hole of the bottom side of the sleeve piston.



8. Apply rubber grease to the new cup (C) and assemble to the adjusting bolt (D). Assemble the bearing A, spacer (E), adjusting spring B, and the spring guide (F), then install them into the caliper body.
   NOTE: Install the cup with the groove facing toward the bearing A.



9. Install the rear caliper spring compressor (A) on the spring guide (B) in the caliper body and turn the shaft (C) clockwise until the plate (D) touches the locknut (E).
10. Check that the bottom (F) of the spring guide is lower than the circlip installation groove (G) of the caliper body.

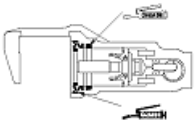


---

11. Install the circlip (A) with the snap ring pliers (B).
    NOTE: Make sure the circlip securely fits in the groove of the caliper body.

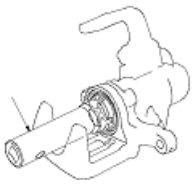
---

12. Apply a thin coat of silicone grease to the new piston seal (A), then install it into the groove in the caliper body.
13. Apply a thin coat of rubber grease to the new piston boot (B), then install it into the groove in the caliper body.
14. Apply brake fluid to the outer surface of the piston, then set the piston in place on the caliper body.



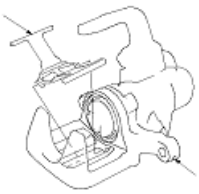
---

15. Rotate the piston clockwise by using the locknut wrench (A) to install it. Make sure that the piston boot is properly positioned into the groove of the piston.
    NOTE: Be careful not to damage the piston boot when rotate the piston.



---

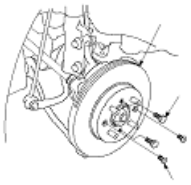
16. Install the pad spring (A) to the caliper body (B).
17. Install the caliper body.
18. Bleed the brake system.



Front Brake Disc Replacement

NOTE: Keep any grease off the brake disc and brake pads.

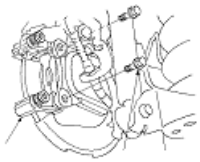
1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Remove the brake hose mounting bolts (A).
4. Remove the brake caliper bracket mounting bolts (B), then remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.



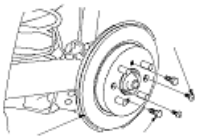
5. Remove the brake disc flat screws (A).
6. Remove the brake disc (B) from the front hub.
   NOTE: If the brake disc is stuck to the front hub, thread two 8 x 1.25 mm bolts (C) into the brake disc to push it away from the front hub. Turn each bolt 90 degrees at a time to prevent the brake disc from binding.
7. Install the brake disc in the reverse order of removal.
   NOTE: Before installing the brake disc, clean the mating surfaces of the front hub and the inside of the brake disc.
8. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheel.

Rear Brake Disc Replacement

NOTE: Keep any grease off the brake disc and brake pads.



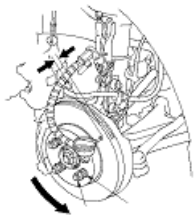
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheel.
3. Release the parking brake lever fully.
4. Remove the caliper body and the brake pads from the caliper bracket.
5. Remove the caliper bracket (A) from the knuckle.



6. Remove the brake disc flat screws (A).
7. Remove the brake disc (B) from the hub bearing unit.
   NOTE: If the brake disc is stuck to the hub bearing unit, thread two 8 x 1.25 mm bolts (C) into the brake disc to push it away from the hub bearing unit. Turn each bolt 90 degrees at a time to prevent the brake disc from binding.
8. Install the brake disc in the reverse order of removal, and note these items:
   - Adjust the parking brake.
   - Before installing the brake disc, clean the mating surfaces of the hub bearing unit and the inside of the brake disc.
9. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheel.

Front Brake Disc Inspection

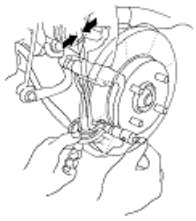
Runout



1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Remove the brake pads.
4. Inspect the brake disc surface for damage and cracks. Clean the brake disc thoroughly, and remove all rust.
5. Install suitable flat washers (A) and the wheel nuts (B), and tighten the wheel nuts to the specified torque to hold the brake disc securely against the hub.
6. Set up the dial gauge against the brake disc as shown, and measure the runout at 10 mm (0.39 in.) from the outer edge of the brake disc.
   Brake disc runout:
   Service limit: 0.04 mm (0.0016 in.)
7. If the brake disc is beyond the service limit, refinish the brake disc with a commercially available on-car brake lathe.
   Max. refinishing limit: 19.0 mm (0.75 in.)

   NOTE:
   - If the brake disc is beyond the service limit for refinishing, replace it.
   - A new brake disc should be refinished if its runout is greater than 0.04 mm (0.0016 in.).
8. Install the brake pads.
9. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.

Thickness and Parallelism

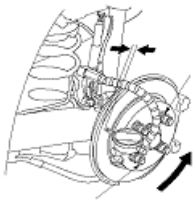


1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Remove the brake pads.
4. Using a micrometer, measure the brake disc thickness at eight points, about 45 ° apart and 10 mm (0.39 in.) in from the outer edge of the brake disc. Replace the brake disc if the smallest measurement is less than the max. refinishing limit.
   Brake disc thickness:
   Standard: 20.9–21.1 mm (0.82–0.83 in.)
   Max. refinishing limit: 19.0 mm (0.75 in.)
   Brake disc parallelism: 0.015 mm (0.0006 in.) max.

   NOTE: This is the maximum allowable difference between the thickness measurements.
5. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with a commercially available on-car brake lathe.
   NOTE: If the brake disc is beyond the service limit for refinishing, replace it.
6. Install the brake pads.
7. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.

Rear Brake Disc Inspection

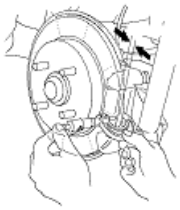
Runout



1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the brake pads.
4. Inspect the brake disc surface for damage and cracks. Clean the brake disc thoroughly, and remove all rust.
5. Install suitable flat washers (A) and the wheel nuts (B), and tighten the wheel nuts to the specified torque to hold the brake disc securely against the hub.
6. Set up the dial gauge against the brake disc as shown, and measure the runout at 10 mm (0.39 in.) from the outer edge of the brake disc.
   Brake disc runout:
   Service limit: 0.04 mm (0.0016 in.)
7. If the brake disc is beyond the service limit, refinish the brake disc with a commercially available on-car brake lathe.
   Max. refinishing limit: 8.0 mm (0.31 in.)

   NOTE:
   - If the brake disc is beyond the service limit for refinishing, replace it.
   - A new brake disc should be refinished if its runout is greater than 0.04 mm (0.0016 in.).
8. Install the brake pads.
9. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.

Thickness and Parallelism



1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the brake pads.
4. Using a micrometer, measure the brake disc thickness at eight points, about 45 ° apart and 10 mm (0.39 in.) in from the outer edge of the brake disc. Replace the brake disc if the smallest measurement is less than the max. refinishing limit.
   Brake disc thickness:
   Standard: 8.9–9.1 mm (0.35–0.36 in.)
   Max. refinishing limit: 8.0 mm (0.31 in.)
   Brake disc parallelism: 0.015 mm (0.0006 in.) max.

   NOTE: This is the maximum allowable difference between the thickness measurements.
5. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with a commercially available on-car brake lathe.
   NOTE: If the brake disc is beyond the service limit for refinishing, replace it.
6. Install the brake pads.
7. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.

Brake Hose Replacement

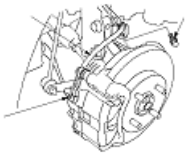
NOTE:

- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones whenever specified to do so.
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Plug the end of a hose and joints to prevent spilling brake fluid.

Front

1. Remove the front wheel.
2. Disconnect the brake line (A) from the brake hose (B), then remove the brake hose bracket (C).

3. Remove the banjo bolt (A), and disconnect the brake hose (B) from the caliper.
4. Remove the brake hose mounting bolt (C), then remove the brake hose.



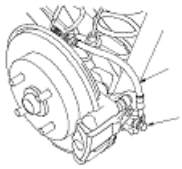
5. Install the brake hose (A) with the mounting bolt (B).
6. Connect the brake hose to the caliper with the banjo bolt (C) and new sealing washers (D).

7. Install the brake hose bracket (A) to the body, then connect the brake line (B). Do not twist the brake hose.
8. After installing the brake hose, bleed the brake system.
9. Do the following checks:
   - Check the brake hose and line joint for leaks, and tighten if necessary.
   - Check the brake hoses for interference and twisting.
10. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheel.

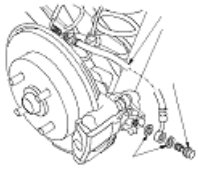
Rear

1. Remove the rear wheel.
2. Disconnect the brake line (A) from the brake hose (B), then remove the brake hose clip (C).

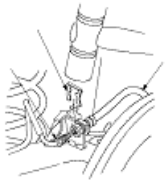
3. Remove the banjo bolt (A), and disconnect the brake hose (B) from the caliper.



4. Connect the brake hose (A) to the caliper with the banjo bolt (B) and new sealing washers (C).

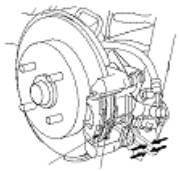


5. Install a new brake hose clip (A) to the brake hose (B) on the bracket, then connect the brake line (C). Do not twist the brake hose.
6. After installing the brake hoses, bleed the brake system.
7. Do the following checks:
   - Check the brake hose and line joint for leaks, and tighten if necessary.
   - Check the brake hose for interference and twisting.
8. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheel.



Rear Brake Pad Inspection and Replacement

Special Tools Required



Locknut wrench, 5.5 x 30 mm
07916-6390001

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

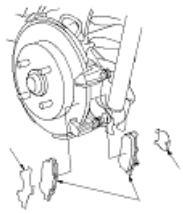
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

Inspection

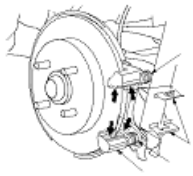
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Check the thickness (A) of the inner pad (B) and outer pad (C). Do not include the thickness of the backing plate.
   Brake pad thickness:
   Standard: **6.8–7.5 mm (0.27–0.30 in.)**
   Service limit: **1.6 mm (0.06 in.)**
4. If the brake pad thickness of any of the pads is less than the service limit, replace the rear brake pads as a set.
5. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.

Replacement

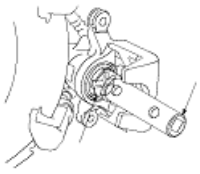
1. Remove some brake fluid from the master cylinder.
2. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
3. Remove the rear wheels.
4. Remove the parking brake cable mounting nut (A).
5. Remove the flange bolts (B) while holding respective caliper pins (C) with a wrench. Be careful not to damage the pin boot, and remove the caliper (D). Check the hose, the pin boots, and the parking brake cable boots for damage and deterioration.
   NOTE: Do not twist the brake hose and the parking brake cable to prevent damage.



6. Remove the pad shims (A) and the brake pads (B).



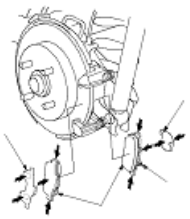
7. Remove the pad retainers (A).
8. Clean the caliper bracket (B) thoroughly; remove any rust, and check for grooves and cracks.
   Verify that the caliper pins (C) move in and out smoothly. Clean and lube if needed.
9. Inspect the brake disc, and check for damage and cracks.
10. Apply Molykote M77 grease to the retainers on their mating surfaces (indicated by the arrows) against the caliper bracket.
11. Install the pad retainers. Wipe excess grease off the retainers. Keep the grease off the brake disc and the brake pads.



12. Rotate the caliper piston (A) clockwise into the cylinder by using the locknut wrench.
    NOTE: Be careful when moving the piston back in the caliper; brake fluid might overflow from the master cylinder's reservoir.

13. Apply Molykote M77 grease to the pad side of the shims (A), the back of the brake pads (B), and the other areas indicated by the arrows. Wipe excess grease off the pad shims and the brake pads. Keep grease off the brake discs and the brake pads. Contaminated brake discs or brake pads reduce stopping ability.

14. Install the brake pads and pad shims correctly. Install the brake pad with the wear indicator (C) on the bottom inside. If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.



---

15. Align the cutout (A) in the piston (B) with the tab (C) on the inner pad. Lubricate the boot with rubber grease to avoid twisting the piston boot. If the piston boot is twisted, back it out so it is positioned properly.

16. Install the caliper. Install the flange bolts (D), and tighten it to the specified torque while holding the respective caliper pins (E) with a wrench, being careful not to damage the pin boots and parking brake cable boots.

17. Install the parking brake cable mounting nut (F).

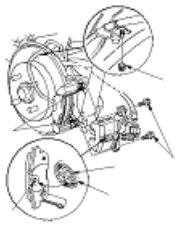
18. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.

19. Press the brake pedal several times to make sure the brakes work.
NOTE: Engagement may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.

20. Add brake fluid as needed.

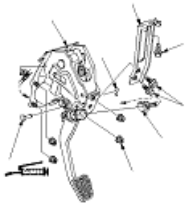
21. After installation, check for leaks at hose and line joints or connections, and retighten if necessary. Test-drive the vehicle, then recheck for leaks.

22. Adjust the parking brake.



Brake Pedal Replacement

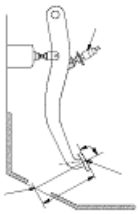
NOTE: The illustration shows RHD model.



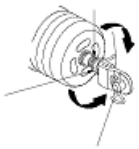
1. Remove the driver's dashboard undercover.
2. Disconnect the brake pedal position switch connector (A).
3. Remove the lock pin (B) and joint pin (C).
4. RHD model: Remove the brake pedal support member (D).
5. Remove the brake booster mounting nuts (E).
6. Remove the brake pedal with bracket (F).
7. Install the brake pedal in the reverse order of removal.
8. Adjust the brake pedal and the brake pedal position switch.

Brake Pedal and Brake Pedal Position Switch Adjustment

Pedal Height

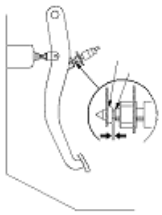


1. Remove the driver's dashboard undercover.
2. Turn the brake pedal position switch (A) counterclockwise, and pull it back until it is no longer touching the brake pedal.
3. Pull back the carpet and find the cutout (B) in the insulation. Measure the pedal height (C) at the center of the pedal pad (D) to the floor without the insulation.
   Standard pedal height (with carpet removed):
   M/T: 139 mm (5.5 in.)
   A/T: 138 mm (5.4 in.)



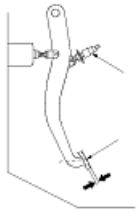
4. Loosen the pushrod locknut (A), and screw the pushrod (B) in or out with pliers until the standard pedal height from the floor is reached. After adjustment, tighten the locknut firmly. Do not adjust the pedal height with the pushrod pressed.

Brake Pedal Position Switch Clearance



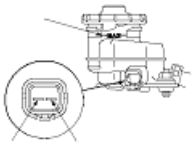
5. Lift up on the brake pedal by hand. Push in the brake pedal position switch until its plunger is fully pressed (threaded end (A) touching the pad (B) on the pedal arm). Turn the switch 45 ° clockwise to lock it. The gap between the brake pedal position switch and the pad is automatically adjusted to 0.7 mm (0.028 in.) by locking the switch. Make sure the brake lights go off when the pedal is released.
6. Install the all removed parts in the reverse order of removal.
7. Check the brake pedal free play.

Pedal Free Play



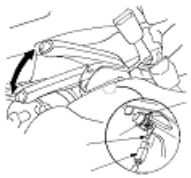
1. With the ignition switch in LOCK (0), inspect the play (A) at the brake pedal pad (B) by pushing the brake pedal by hand. If the brake pedal free play is out of specification, adjust the brake pedal position switch (C). If the brake pedal free play is insufficient, it may result in brake drag.
   Free play: 1−5 mm (0.04−0.20 in.)

Brake Fluid Level Switch Test



1. Disconnect the brake fluid level switch connector.
2. Check for continuity between the terminals (1) and (2) with the float in the down position and in the up position.
   NOTE:
   - Remove the brake fluid completely from the reservoir. With the float down, there should be continuity.
   - Fill the reservoir with brake fluid to the MAX (upper) level (A). With the float up, there should be no continuity.
   - If both the ABS indicator and the brake system indicator come on at the same time, check the ABS system first.
   - If the parking brake switch and brake fluid level switch are OK, but the brake system indicator does not function, do the gauge control module self-diagnostic function.
3. Reconnect the brake fluid level switch connector.

Parking Brake Switch Test



NOTE: If both the ABS indicator and the brake system indicator come on at the same time, check the ABS system first.

1. Remove the center console.
2. Disconnect the parking brake switch connector (A) from the parking brake switch (B).
3. Check for continuity between the switch terminal (C) and body ground.
   - With the parking brake lever pulled, there should be continuity.
   - With the parking brake lever released, there should be no continuity.

   NOTE: If the parking brake switch and the brake fluid level switch are OK, but the brake system indicator does not function, do the gauge control module self-diagnostic function.
4. Reconnect the parking brake switch connector.
5. Install the center console.

VSA System Description

VSA Modulator-control Unit Inputs and Outputs for 36P Connector
System Outline

VSA activation indicator does not go off, and no DTCs are stored

1. Turn the ignition switch to ON (II).
2. Check the VSA activation indicator for several seconds when the ignition switch is turned to ON (II).

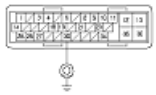
   Does the indicator come on then go off?
   YES - The system is OK at this time.■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the VSA OFF switch 5P connector.
5. Check the VSA OFF switch.

   Is the VSA OFF switch OK?
   YES - Go to Step 6 .
   NO - Replace the VSA OFF switch. ■
6. Disconnect the gauge control module 32P connector.
7. Check for continuity between VSA OFF switch 5P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Repair short to body ground between the gauge control module and the VSA OFF switch.■
   NO - Substitute a known-good gauge control module, then go to Step 1 and recheck. If it is OK, replace the original gauge control module. ■

VSA System Symptom Troubleshooting - ABS indicator, brake system indicator, and VSA indicator do not go off at the same time

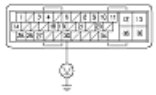
ABS indicator, brake system indicator, and VSA indicator do not go off at the same time



1. Turn the ignition switch to LOCK (0).
2. Check the No. 11 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 3 .
   NO - Reinstall the checked fuse, then go to Step 6 .
3. Disconnect the VSA modulator-control unit 36P connector.
4. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector.
5. Check for continuity between VSA modulator-control unit 36P connector terminal No. 30 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 11 (7.5 A) fuse in the driver's under-dash fuse/relay box and the VSA modulator-control unit or the yaw rate-lateral/longitudinal acceleration sensor.■
   NO - Install the new No. 11 (7.5 A) fuse in the driver's under-dash fuse/relay box, then go to Step 7 .
6. Disconnect the VSA modulator-control unit 36P connector.
7. Turn the ignition switch to ON (II).



8. Measure the voltage between VSA modulator-control unit 36P connector terminal No. 30 and body ground.

   Is there battery voltage?
   YES - Go to Step 9 .
   NO - Repair open in the wire between the No. 11 (7.5 A) fuse in the driver's under-dash fuse/relay box and the VSA modulator-control unit.■
9. Turn the ignition switch to LOCK (0).

---

10. Check for continuity between VSA modulator-control unit 36P connector terminal No. 35 and body ground.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the VSA modulator-control unit and body ground (G402 *1 , G203 *2).■
    *1: LHD model
    *2: RHD model

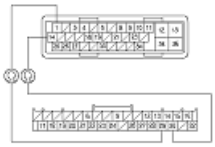
---

11. Measure the voltage between VSA modulator-control unit 36P connector terminal No. 12 and body ground.

    Is there battery voltage?
    YES - Go to Step 12 .
    NO - Repair open in the wire between the No. 37 (30 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.■
12. Disconnect the gauge control module 32P connector.

---

13. Check for continuity between the VSA modulator-control unit 36P connector terminal and gauge control module 32P connector terminal (see table).



Sign	VSA Modulator-control Unit 36P Connector Terminal	Gauge Control Module 32P Connector Terminal
CAN-L	No. 1	No. 29
CAN-H	No. 14	No. 30

Is there continuity?

YES - Go to Step 14 .

NO - Repair open in the wire between the gauge control module and the VSA modulator-control unit.■

14. Reconnect all connectors.

15. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.

16. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.

17. Check the ABS indicator, brake system indicator and the VSA indicator for several seconds when the ignition switch is turned to ON (II).

Do the indicators come on then go off?

YES - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. ■

NO - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .

HDS does not communicate with the VSA modulator-control unit or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

VSA activation indicator does not come on at start-up (bulb check)

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.

VSA activation indicator does not go off, and no DTCs are stored

Diagnostic procedure

1. Symptom troubleshooting.
2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.

ABS indicator, brake system indicator, and VSA indicator do not come on at the same time

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.

ABS indicator, brake system indicator, and VSA indicator do not go off at the same time

Diagnostic procedure

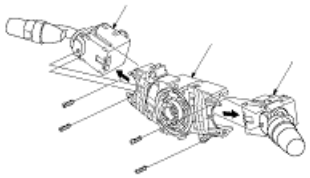
1. Check for F-CAN DTCs, and troubleshoot and repair those first.
2. Symptom troubleshooting.
3. Do the gauge control module troubleshooting.

VSA System Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure
HDS does not communicate with the VSA modulator-control unit or the vehicle	Troubleshoot the DLC circuit.
VSA activation indicator does not come on at start-up (bulb check)	1. Do the gauge control module troubleshooting. 2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.
VSA activation indicator does not go off, and no DTCs are stored	1. Symptom troubleshooting. 2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.
ABS indicator, brake system indicator, and VSA indicator do not come on at the same time	1. Do the gauge control module troubleshooting. 2. Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then retest. If it is OK, the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit.
ABS indicator, brake system indicator, and VSA indicator do not go off at the same time	1. Check for F-CAN DTCs, and troubleshoot and repair those first. 2. Symptom troubleshooting. 3. Do the gauge control module troubleshooting.

Steering Angle Sensor Replacement



NOTE:

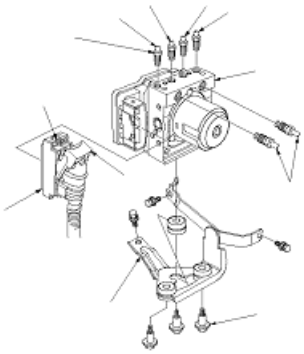
- Do not damage or drop the combination switch as the steering angle sensor is sensitive to shock and vibration.
- The illustration shows LHD model, RHD model is symmetrical.

1. Remove the steering wheel.
2. Remove the steering column covers and the cable reel.
3. Remove the combination switch assembly.
4. Remove the combination light switch (A) and the wiper/washer switch (B) from the combination switch body assembly (C).
5. Install the combination switch body assembly in the reverse order of removal.
   NOTE:
   - Do not remove the steering angle sensor from the combination switch body.
   - When installing the cable reel, set the turn signal canceling sleeve position.
   - Note that the tightening order is specified for combination switch mounting screws.

VSA Modulator-control Unit Removal and Installation

NOTE:

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- Plug the end of a hose and joints to prevent spilling brake fluid.



Removal

1. Turn the ignition switch to LOCK (0).
2. Disconnect the VSA modulator-control unit 36P connector (A) by pushing the lock (B) and pulling down the lever (C); the connector disconnects itself.
3. Disconnect the six brake lines from the VSA modulator-control unit.
   NOTE: Brake lines are connected to the master cylinder (D) and to the left-front (E), the right-front (F), the left-rear (G), and the right-rear (H) brake systems.
4. Remove the VSA modulator-control unit (I) with the bracket (J) from the body.
5. Remove the VSA modulator-control unit from the bracket.

Installation

1. Install the VSA modulator-control unit onto the bracket.
2. Install the bracket with the VSA modulator-control unit to the body.
3. Reconnect the six brake lines, then tighten the flare nuts to the specified torque.
4. Align the connecting surface of the VSA modulator-control unit 36P connector to the VSA modulator-control unit.
5. Pull up the lever of the VSA modulator-control unit 36P connector, then confirm the connector is fully seated.
6. Bleed the brake system.
7. Do the VSA sensor neutral position memorization procedure.
8. Start the engine, and check that the ABS and the VSA indicators go off.
9. Test-drive the vehicle, and make sure that the ABS and the VSA indicators do not come on.
   NOTE: If the brake pedal is spongy, there may be air trapped in the modulator which could then be induced into the normal brake system during modulation. Bleed the brake system again.

VSA Modulator-Control Unit Update

Special Tools Required

- Honda diagnostic system (HDS)
- Honda interface module (HIM)
- HDS pocket tester

NOTE:

- Use this procedure when you need to update the VSA modulator-control unit during troubleshooting procedures.
- Make sure the HDS/HIM has the latest software version.
- Before you update the VSA modulator-control unit, make sure the battery in the vehicle is fully charged, and connect a jumper battery (not a battery charger) to maintain system voltage.
- Never turn the ignition switch to LOCK (0) during the update. If there is a problem with the update, leave the ignition switch to ON (II).
- To prevent VSA modulator-control unit damage, do not operate anything electrical (headlights, audio system, brakes, A/C, power windows, door locks, etc.) during the update.
- To ensure the latest program is installed, do a VSA modulator-control unit update whenever the VSA modulator-control unit is substituted or replaced.
- You cannot update a VSA modulator-control unit with a program it already has. It will only accept a new program.
- If you need to diagnose the Honda interface module (HIM) because the HIM's red (#3) light came on or was flashed during the update, leave the ignition switch in ON (II) when you disconnect the HIM from the data link connector (DLC). This will prevent VSA modulator-control unit damage.
- DTCs stored in memory are cleared when the VSA modulator-control unit is updated.

1. Turn the ignition switch to ON (II), but do not start the engine.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshooting the DLC circuit.
4. Select the update mode, and follow the screen prompts to update the VSA modulator-control unit.
5. If the software in the VSA modulator-control unit is the latest, disconnect the HDS/HIM from the DLC. If the software in the VSA modulator-control unit is not the latest, follow the instructions on the screen.
6. Do the VSA sensor neutral position memorization procedure.

VSA Sensor Neutral Position Memorization

NOTE: Make sure to connect and disconnect the HDS to the 16P data link connector (DLC) with the ignition switch in LOCK (0).

1. Start the engine, let it idle.
2. Slowly drive the vehicle straight without operating the steering wheel for 3 m (10 ft) or more, then park the vehicle on a flat surface while holding the steering wheel in the straight ahead position.
3. With the ignition switch in LOCK (0), connect the HDS to the 16P data link connector (DLC) (A) under the driver's side of the dashboard.
4. Turn the ignition switch to ON (II).
5. Do the VSA sensor neutral position memorization with the HDS.
   NOTE:
   - Do not press the brake pedal during this procedure.
   - Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't troubleshoot the DLC circuit.
6. Turn the ignition switch to LOCK (0).

VSA OFF Switch Test

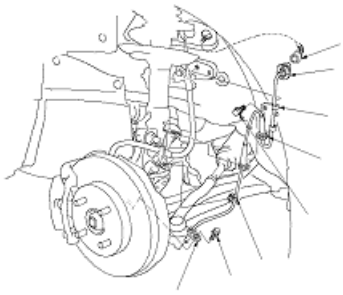
1. Turn the ignition switch to LOCK (0).
2. Pull the fuse lid panel (A).
3. Push out the VSA OFF switch (A) from the back of the fuse lid panel.
4. Disconnect the VSA OFF switch 5P connector (B).

5. Check for continuity between the VSA OFF switch 5P connector terminals No. 1 and No. 2. There should be continuity when the switch is pressed, and no continuity when the switch is released.

6. Check for continuity between VSA OFF switch 5P connector terminals No. 4 and No. 5. There should be continuity at all times.
7. Install the VSA OFF switch in the reverse order of removal.

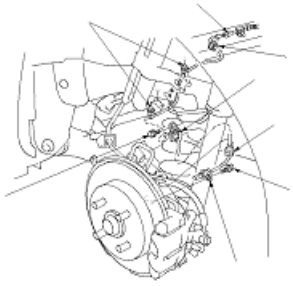
Wheel Speed Sensor Replacement

Front



1. Turn the ignition switch to LOCK (0).
2. Remove the grommet (A), then disconnect the wheel speed sensor connector (B).
3. Remove the bracket (C), the clip (D), and the stay (E).
4. Remove the bolt and the wheel speed sensor (F).
5. Install the wheel speed sensor in the reverse order of removal, and note these items:
   - Install the sensor carefully to avoid twisting the wires.
   - If the wheel speed sensor comes in contact with the wheel bearing, it is faulty.
   - Make sure the grommet is installed properly.
6. Start the engine, and make sure the ABS and the VSA indicator go off.
7. Test-drive the vehicle, and make sure the ABS and the VSA indicator do not come on.

Rear

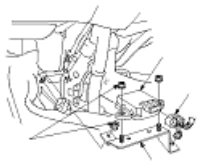


1. Turn the ignition switch to LOCK (0).
2. Pull back the carpet under the rear seat, then disconnect the wheel speed sensor connector (A).
3. Remove the grommet (B), the bracket (C), the clips (D), and the stay (E).
4. Remove the bolt and the wheel speed sensor (F).
5. Install the wheel speed sensor in the reverse order of removal, and note these items:
   - Install the sensor carefully to avoid twisting the wires.
   - If the wheel speed sensor comes in contact with the hub bearing unit, it is faulty.
   - Make sure the grommet is installed properly.
6. Start the engine, and make sure the ABS and the VSA indicator go off.
7. Test-drive the vehicle, and make sure the ABS and the VSA indicator do not come on.

Yaw Rate-Lateral/Longitudinal Acceleration Sensor Replacement

NOTE:

- Do not damage or drop the sensor as it is sensitive.
- Do not use power tools.



1. Turn the ignition switch to LOCK (0).
2. Remove the center console.
3. Remove the yaw rate-lateral/longitudinal acceleration sensor (A) mounting nuts.
4. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 4P connector (B).
5. Check for deformation in the bracket (C). If necessary replace it.
6. Install the yaw rate-lateral/longitudinal acceleration sensor in the reverse order of removal.
7. Do the VSA sensor neutral position memorization.

Driveshaft Disassembly

Special Tools Required

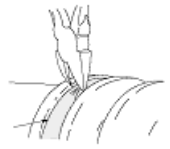
Threaded adapter, 22 x 1.5 mm
07XAC-0010100

Sliding hammer set
07936-5790002

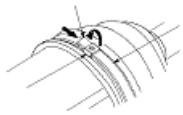
Boot band pincers
, commercially available

Puller
, commercially available

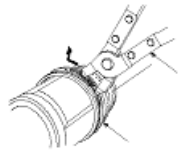
Welded type



Double loop type



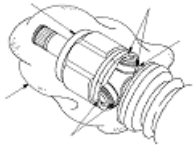
Low profile type



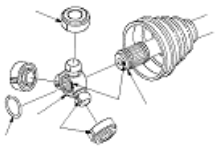
Inboard Joint Side

1. Remove the boot bands. Be careful not to damage the boot.
   - If the boot band is welded type (A), cut the boot band.
   - If the boot band is a double loop type (B), lift up the band end (C), and push it into the clip (D).
   - If the boot band is a low profile type (E), pinch the boot band using the commercially available boot band pincers (F).

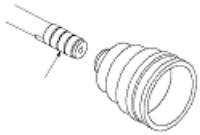
2. Make marks (A) on each roller (B) and the inboard joint (C) to identify the locations of rollers to the grooves in the inboard joint. Then remove the inboard joint on a clean shop towel (D). Be careful not to drop the rollers when separating them from the inboard joint.
   NOTE: Do not engrave or scribe any marks on the rolling surface.



3. Make marks (A) on the rollers (B) and spider (C) to identify the locations of the rollers on the spider, then remove the rollers.
   NOTE: Do not engrave or scribe any marks on the rolling surface.
4. Remove the circlip (D).
5. Make marks (E) on the spider and driveshaft (F) to identify the position of the spider on the shaft.
6. Remove the spider.
   NOTE: If necessary, use a commercially available puller.

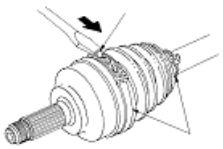


7. Wrap the splines on the driveshaft with vinyl tape (A) to prevent damaging the boot.
8. Remove the inboard boot. Be careful not to damage the boot.
9. Remove the vinyl tape.

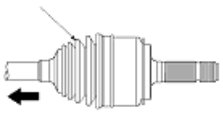


Outboard Joint Side

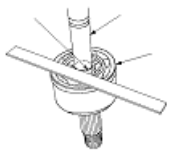
1. Remove the boot bands (A). Lift up the three tabs (B) with a screwdriver. Be careful not to damage the boot.



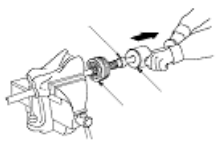
2. Slide the outboard boot (A) partially to the inboard joint side. Be careful not to damage the boot.
3. Wipe off the grease to expose the driveshaft and the outboard joint inner race.



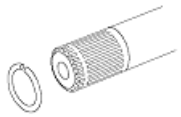
4. Make a mark (A) on the driveshaft (B) at the same level as the outboard joint rim (C).
5. Securely clamp the driveshaft in a bench vise with a shop towel.



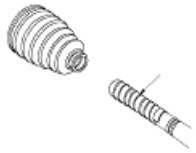
6. Remove the outboard joint (A) using the 22 x 1.5 mm threaded adapter (B) and the sliding hammer set (C).
7. Remove the driveshaft from the bench vise.



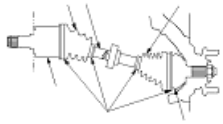
8. Remove the stop ring from the driveshaft.



9. Wrap the splines on the driveshaft with vinyl tape (A) to prevent damaging the boot.
10. Remove the outboard boot. Be careful not to damage the boot.
11. Remove the vinyl tape.



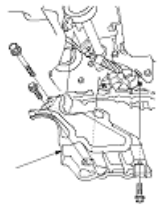
Driveshaft Inspection



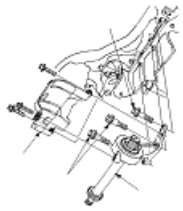
1. Check the inboard boot (A) and the outboard boot (B) on the driveshaft (C) for cracks, damage, leaking grease, and loose boot bands (D). If any damage is found, replace the boot and boot bands.
2. Check the driveshaft for cracks and damage. If any damage is found, replace the driveshaft.
3. Check the inboard joint (E) and the outboard joint (F) for cracks and damage. If any damage is found, replace the inboard joint or the outboard joint as an assembly.
4. Hold the inboard joint and turn the front wheel by hand, then make sure the joint is not excessively loose. If necessary, replace the inboard joint or the outboard joint as an assembly.

Intermediate Shaft Removal

1. Drain the transmission fluid. Reinstall the drain using a new sealing washer.
2. Remove the right driveshaft.
3. Remove the control cable cover (A).

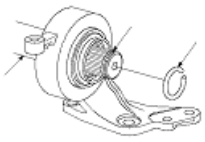


4. Remove the heat cover (A).
5. Remove the two dowel bolts (B) and the flange bolt (C).
6. Remove the intermediate shaft (D) from the differential. Hold the intermediate shaft horizontal until it is clear of the differential to prevent damaging the oil seal.

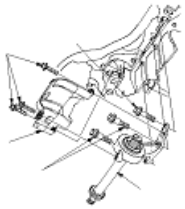


Intermediate Shaft Installation

1. Clean the areas where the intermediate shaft contacts the differential thoroughly with solvent or brake cleaner, and dry with compressed air.
   NOTE: Do not wash the rubber parts with solvent.
2. Install a new set ring (A) onto the set ring groove (B) of the intermediate shaft (C).



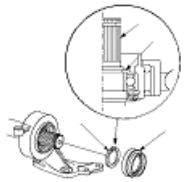
3. Insert the intermediate shaft (A) into the differential correctly.
   NOTE: Insert the intermediate shaft carefully to prevent damaging the oil seal.
4. Install the flange bolt (B) and the two dowel bolts (C).
5. Install the heat cover (D).



6. Install the control cable cover (A).
7. Install the right driveshaft.
8. Refill the transmission with the recommended transmission fluid.
9. Check the wheel alignment, and adjust it if necessary.
10. Test-drive the vehicle.

Intermediate Shaft Disassembly

Special Tools Required

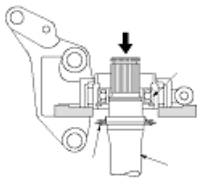


Half shaft base
07NAF-SR30101

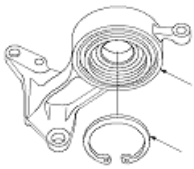
Oil seal driver, 44.5 mm
07947-SB00100

1. Remove the outer seal (A), and the external snap ring (B) from the intermediate shaft (C).

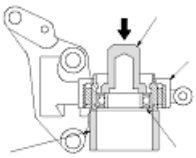
2. Press the intermediate shaft (A) out of the intermediate shaft bearing (B) using a press. Be careful not to damage the bearing support ring (C) on the intermediate shaft during disassembly.



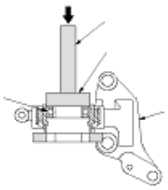
3. Remove the internal snap ring (A) from the bearing support (B).



4. Press intermediate shaft bearing (A) out of the bearing support (B) using the 44.5 mm oil seal driver (C), the half shaft base (D) and a press.



Intermediate Shaft Reassembly



Exploded View

Special Tools Required

Oil seal driver, 65 mm
07JAD-PL90100

Bearing driver attachment, 52 x 55 mm
07746-0010400

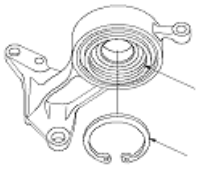
Inner bearing driver attachment, 35 mm
07746-0030400

Driver handle, 15 x 135L
07749-0010000

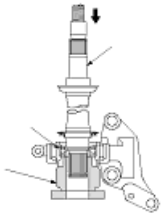
NOTE: Refer to the Exploded View, as needed, during this procedure.

1. Clean the disassembled parts with solvent, and dry them with compressed air.
   NOTE: Do not wash the rubber parts with solvent.
2. Press a new intermediate shaft bearing (A) into the bearing support (B) using the 52 x 55 mm bearing driver attachment (C), the 15 x 135L driver handle (D), and a press.

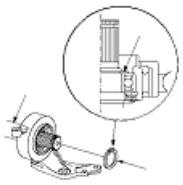
3. Install the internal snap ring (A) into the groove (B) of the bearing support.



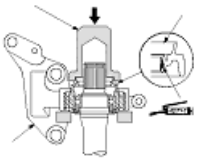
4. Press the intermediate shaft (A) into the new shaft bearing (B) using the 35 mm inner bearing driver attachment (C) and a press.



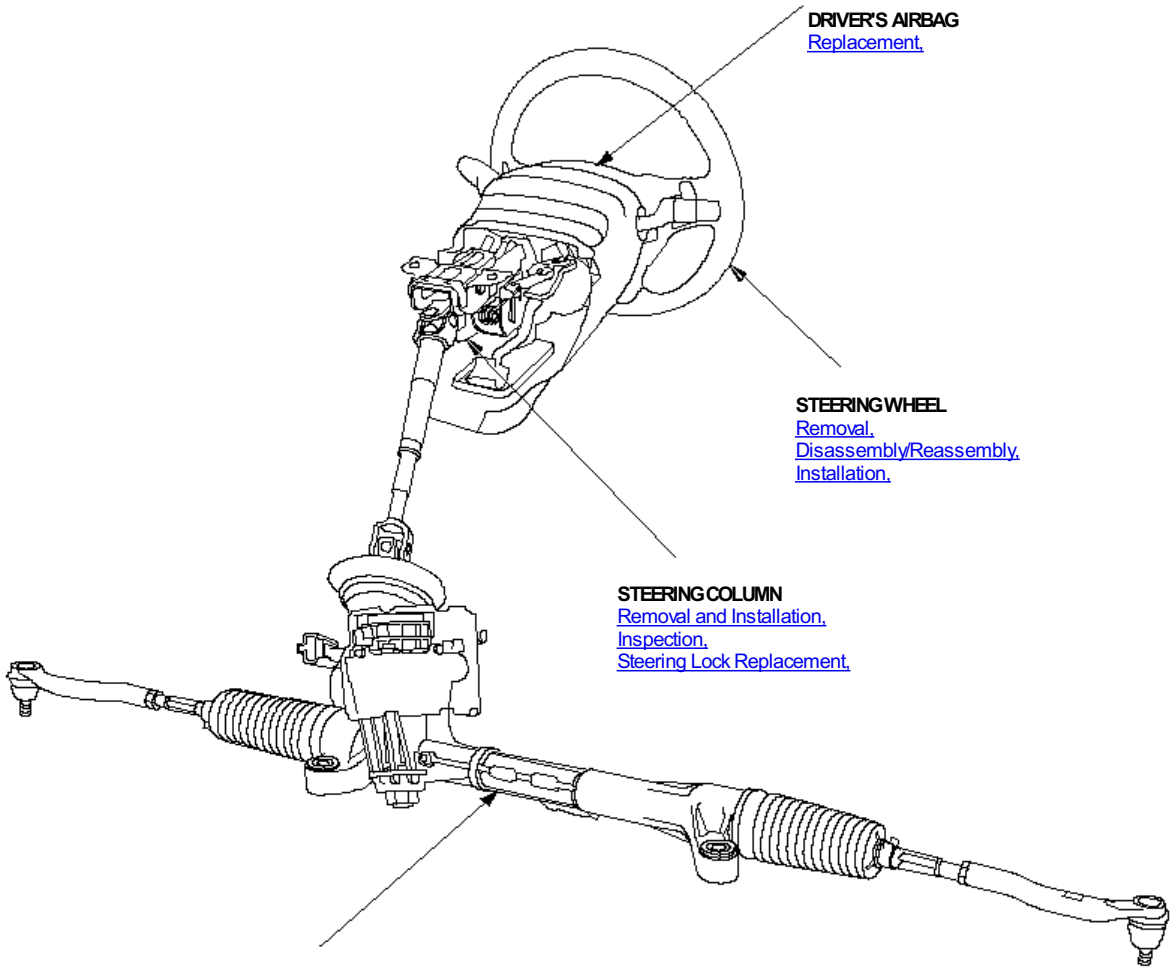
5. Install the external snap ring (A) in the groove of the intermediate shaft (B).



6. Install a new outer seal (A) into the bearing support (B) using the 65 mm oil seal driver (C), and a press. Press the seal until it is 0±0.2 mm (0±0.08 in.) below the surface of the bearing support end.



Steering Component Location Index

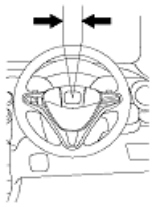


The illustration shows RHD model, LHD model is similar.

Steering Wheel Rotational Play Check

1. Turn the front wheels to the straight ahead position.
2. Measure how far you can turn the steering wheel left and right without moving the front wheels.
   - If the play is within the limit, the steering gearbox and the linkage are OK.
   - If the play exceeds the limit, adjust the rack guide. If the play is still excessive after rack guide adjustment, inspect the steering linkage and steering gearbox.

   Rotational play: **0–10 mm (0–0.39 in.)**



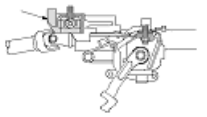
Power Steering Assist Check

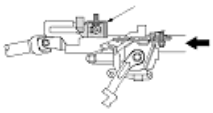
NOTE: This test should be done with original equipment tyres and wheels at the correct tyre pressure.

1. Start the engine, and let it idle.
2. Attach a commercially available spring scale to the steering wheel. With the engine idling and the vehicle on a clean, dry floor, pull the scale as shown, and read it as soon as the tyres begin to turn.
3. If the scale reads no more than 29 N (3.0 kgf, 6.6 lbf), the power assist is OK. If it reads more, check these items:
   - Steering linkage
   - Rack guide adjustment
   - EPS system

Steering Column Removal and Installation

SRS components are located in this area. Review the SRS component locations, and the precautions and procedures before doing repairs or service.



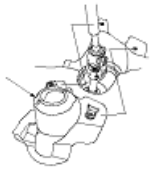


Removal

NOTICE

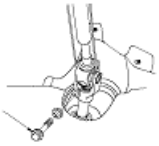
Be careful not to pull the bracket (A) on the front side of steering column out of its normal position.
If the bracket accidentally comes out, replace the steering column as an assembly.

1. Do the battery terminal disconnection procedure.
2. Release the lock lever, and adjust the steering column to the full tilt up position, and to the full telescopic in position.
3. Tighten the lock lever.
4. Remove the driver's airbag and the steering wheel.
5. Remove the driver's dashboard undercover.
6. Remove the steering joint cover (A).

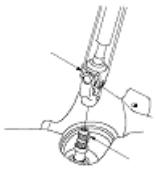


7. Hold the lower slide shaft (A) on the column with a piece of wire (B) between the joint yoke (C) of the lower slide shaft and joint yoke (D) of the upper shaft to prevent the lower slide shaft from pulling out.
8. Release the lock lever, and adjust the steering column to the full telescopic out position, then tighten the lock lever.
   NOTE: Do not release lock lever when removing the steering column from the frame.

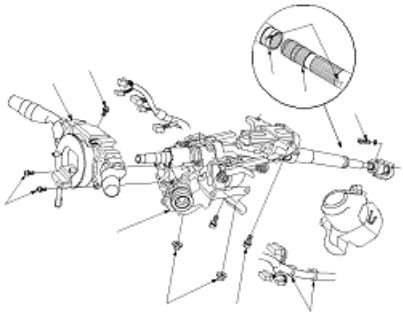
9. Remove the steering joint bolt (A).



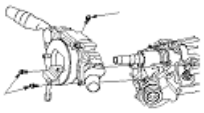
10. Disconnect the steering joint (A) by moving the steering joint toward the column.
    NOTE:
    - If the center guide (B) is in place and has not moved, leave it in place.
    - If the center guide has moved or been removed, discard it.
11. Remove the column covers.



12. Disconnect the connectors from the ignition switch, and release the wire harness clips (A) from the steering column.
13. Disconnect the wire harness connectors from the combination switch assembly/cable reel (B).
14. Remove the combination switch assembly from the steering column shaft by removing the three screws (C).
15. Remove the steering column (D) by removing the attaching nuts and bolts. If the lower slide shaft (E) is removed, slip it into the upper shaft (F) by aligning the paint or stamped marks (G).

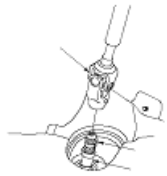


Installation



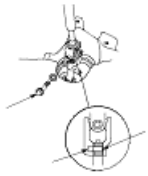
1. Install the steering column in the reverse order of removal, and note these items:
   - Tighten the steering column mounting nuts and bolts to the specified torque in the following order; bolts, then nuts.
   - Make sure the wires are not caught or pinched by any parts.
   - Take care not to let the sliding capsules fall out of position during column installation.
   - Tighten the three screws (A) to the sequence shown.
2. Center the steering rack within its stroke.
3. With the rack in the straight ahead driving position, then cut the wire.

4. Slip the lower end of the steering joint (A) onto the pinion shaft (B).
   NOTE:
   - Pinion shaft with center guide; install the steering joint by aligning the center guide (C).
   - Pinion shaft without center guide; position the steering column by aligning the gap (D) with the angle.
5. Release the lock lever, and adjust the steering column to the full tilt down position, and to the full telescopic out position, then tighten the lock lever.



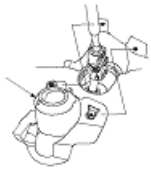
---

6. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, then loosely install the lower steering joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft.
7. Pull on the steering joint to make sure that the steering joint is fully seated, then tighten the lower joint bolt to the specified torque.



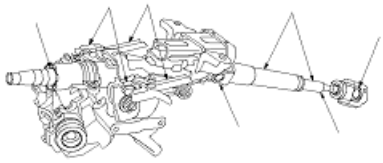
---

8. Install the steering joint cover (A).
9. Install the steering wheel and the driver's airbag.
10. Do the battery terminal reconnection procedure, and do these tasks:
    - Turn the ignition switch to ON (II) and check that the SRS indicator should come on for about 6 seconds and then go off.
    - Make sure the horn and turn signal switches work properly.
    - Make sure the steering wheel switches work properly.
11. After installation, do these checks:
    - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft splines.
    - Set the steering column to the center tilt position, and to the center telescopic position, then do the front toe inspection.



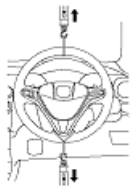
Steering Column Inspection

Inspection



1. Remove the steering column.
2. Do these checks:
   - Check the steering column ball bearing (A) and the steering joint bearings (B) for play and proper movement. If any bearing is noisy or has excessive play, replace the steering column as an assembly.
   - Check the absorbing plates (C) and sliding capsules (D) for distortion or breakage. If there is distortion or breakage, replace the steering column as an assembly.
   - Check the tilt mechanism and telescopic mechanism for movement and damage.
   - Check the lower slide shaft (E) for smooth movement in and out. If the lower slide shaft is removed, slip it into the upper shaft by aligning the paint or stamped marks (F). If it sticks or binds, replace the steering column as an assembly.
3. Install the steering column.

Check of Tilting Force



1. Set the steering wheel in the straight driving position, and loosen the lock lever fully.
2. Attach the spring scale to the highest point of the steering wheel, and tilt the steering column to the lowest position.
3. Pull the spring scale straight up, and read the force required to move the steering column.
4. Attach the spring scale to the lowest point of the steering wheel.
5. Pull the spring scale straight down, and read the force required to move the steering column.
   Tilting force (upward/downward):
   Standard: 69 N (7.0 kgf, 15 lbf) max.
6. If the measurement is higher than the specified, replace the steering column as an assembly.

Check of Telescoping Force

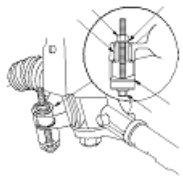
1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully.
2. Attach the spring scale to the center point of the steering wheel.
3. Pull the spring scale, and read the force required to move the steering column during telescopic.
   Telescoping force:
   Standard: 140 N (14.3 kgf, 31.5 lbf) max.
4. If the measurement is higher than the specified, replace the steering column as an assembly.

Check of Lock Lever Force

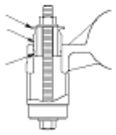
1. Move the lock lever (A) from the loosened position to the locked position three to five times, then release the lock lever. Adjust the steering column to the center tilt position and also to the full telescopic out position, and hold the steering wheel.
2. Using a push gauge, push the lock lever at 10 mm (0.39 in.) from its end, and measure the force required to move lock lever.
   Lock lever force:
   82 N (8.4 kgf, 18.2 lbf) min.
3. If the measurement is higher than the specified, replace the steering column as an assembly.

Steering Gearbox Mount Cushion Replacement

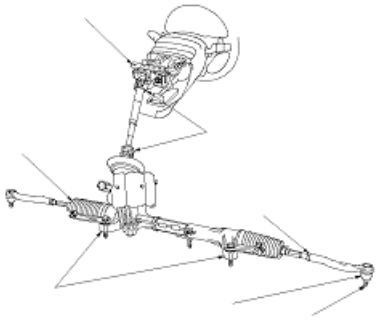
1. Remove the steering gearbox.
2. Position a 34 mm socket wrench (A) on the flange part of the gearbox housing with a washer (B), a 10 x 105 mm flange bolt (C) and a 10 mm nut (D) as shown.
3. Hold the flange bolt with a wrench, and tighten the nut with a wrench. Remove the gearbox mount cushion (E).



4. Apply a mild soap and water solution to the new gearbox mount cushion surface (A), then place it on the gearbox mounting cushion hole.
5. Position the 34 mm socket wrench on the flange part of the gearbox housing with a washer, a flange bolt, and a nut as shown.
6. Install the gearbox mount cushion by tightening the nut until the mount cushion edges (B) contact the gearbox flange surface.
7. Install the steering gearbox.



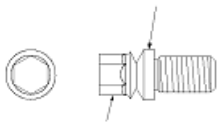
Steering Linkage and Gearbox Inspection



Steering Lock Replacement

1. Remove the steering column.
2. Center-punch each of the two shear bolts, and drill their heads off with a 5.0 mm (0.20 in.) drill bit. Be careful not to damage the switch body when removing the shear bolts.
3. Remove the shear bolts from the switch body.
4. Install the switch body without the key inserted.
5. Loosely tighten the new shear bolts.
6. Insert the ignition key, and check for proper operation of the steering wheel lock and that the ignition key turns freely.

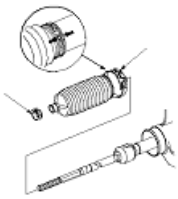
7. Tighten the shear bolts (A) until the hex heads (B) twist off.
8. Rewrite the new immobilizer control unit-receiver , and make sure the immobilizer system works properly.



Steering Rack End Removal and Installation

RHD model

LHD model



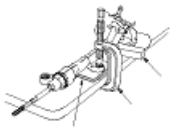
Removal

NOTE:

- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- The illustrations show RHD model, LHD model is similar for items not shown in this section.

1. Remove the boot bands (A) and discard them. Remove the tie-rod clips (B), and pull the boots away from the ends of the steering gearbox.

2. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) as shown. Do not clamp the cylinder part of the gearbox housing in the vise.

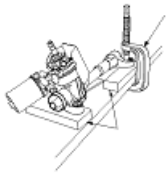


3. Unbend the lock washer (A).

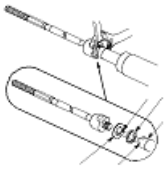
4. Hold the flat surface sections (A) of the steering rack (B) with one wrench, and unscrew both rack ends (C) with another wrench. Be careful not to damage the rack shaft surface with the wrench.
5. Remove the lock washer (D) and rubber stop (E).

Installation

1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) as shown. Do not clamp the cylinder part of the gearbox housing in the vise.

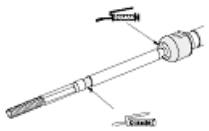


2. Install the new rubber stop (A) and a new lock washer (B). Align the lock washer tabs (C) with the slots (D) on the rack end (E) while holding the lock washer in place. Repeat this step for the other side of the rack.
3. Hold the flat surface sections of the steering rack with one wrench, and tighten both rack ends with another wrench. Be careful not to damage the rack surface with the wrench.

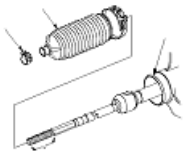


4. Bend the lock washer (A) back against the flat spots on the rack end joint housing.

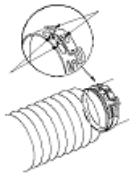
5. Apply multipurpose grease to the circumference of the rack end joint housing (A).
6. Apply a light coat of silicone grease to the boot grooves (B) on the rack end.



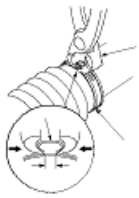
7. Clean off any grease or contamination from the boot installation grooves (A) around on the gearbox housing. Install the boots (B) on the rack ends with the tie-rod clips (C), and fit the boot end in the installation grooves in the housing properly.
8. After installing the boots, wipe the grease off the thread section (D) of the rack end.



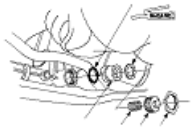
9. Install the new boot bands by aligning the tabs (A) with the holes (B) of the band.



10. Close the ear portion (A) of the boot band (B) with commercially available pincers, Oetiker 1098 or equivalent (C).
11. Slide the rack right and left to be certain that the boots are not deformed or twisted.
12. Install the tie-rod end to the rack end.
13. Install the steering gearbox.



Steering Rack Guide Removal/Installation



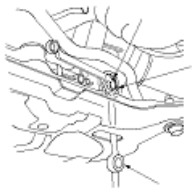
NOTE:

- During removal/installation, do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- The illustrations show RHD model, LHD model is similar for items not shown in this section.

1. Remove the steering gearbox.
2. Loosen the locknut (A), then remove the rack guide screw (B), the spring (C), disc washer (D), and rack guide (E).
3. Replace the O-ring (F) from the rack guide. Wipe the grease off the sliding surface of the rack guide.
4. Apply multipurpose grease to the new O-ring, then install it to the rack guide.
5. Apply multipurpose grease to the sliding surface and the circumference of the rack guide, and install it onto the gearbox housing. Wipe the grease off the threaded section of the gearbox housing.
6. Install the disc washer onto the gearbox housing.
7. Install the spring onto the gearbox housing.
8. Remove the old sealant from the rack guide screw and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads. Loosely install the rack guide screw on the steering gearbox.
   NOTE: If more than 5 minutes has passed after applying the sealant, remove the old sealant and residue, and reapply new sealant.
9. Loosely install the locknut.
10. Adjust the rack guide screw. After adjusting, check that the rack moves smoothly by sliding the rack right and left.

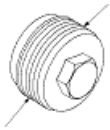
Steering Rack Guide Adjustment

Special Tools Required

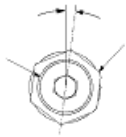


Locknut eye wrench, 40 mm
07MAA-SL00100

1. Set the wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the locknut wrench, then remove the rack guide screw (B).



3. Remove the old sealant from the rack guide screw (A), and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads (B). Loosely install the rack guide screw on the steering gearbox.
   NOTE: If more than 5 minutes has passed after applying the sealant, remove the old sealant and residue, and reapply new sealant.

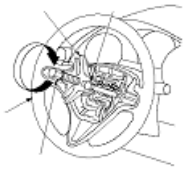


4. Tighten the rack guide screw (A) to 25 N·m (2.5 kgf·m, 18 lbf·ft), then loosen it.
5. Retighten the rack guide screw to 3.9 N·m (0.4 kgf·m, 4 lbf·ft), then back it off to the specified angle.
   Specified return angle: 10±3 °
6. Hold the rack guide screw stationary with a wrench, and tighten the locknut by hand until it's fully seated.
7. Install the locknut wrench on the locknut (B), and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque.
8. Check for unusual steering effort through the complete turning range.
9. Check the steering wheel rotation play and the power assist.

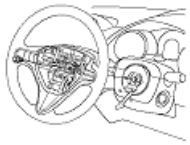
Steering Wheel Removal

SRS components are located in this area. Review the SRS component locations, and the precautions and procedures before doing repairs or service.

1. Do the battery terminal disconnection procedure.
2. Align the front wheels straight ahead, then remove the driver's airbag from the steering wheel.
3. Disconnect the cable reel subharness connector (A).
4. Loosen the steering wheel bolt (B).



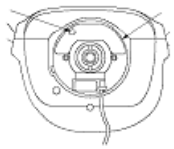
5. Install a commercially available steering wheel puller (A) on the steering wheel (B). Free the steering wheel from the steering column shaft by turning the pressure bolt (C) of the puller.
   Note these items when removing the steering wheel:
   - Do not tap on the steering wheel or the steering column shaft when removing the steering wheel.
   - If you thread the puller bolts (D) into the wheel hub more than five threads, the bolts will hit the cable reel and damage it. To prevent this, install a pair of jam nuts five threads up on each puller bolt.



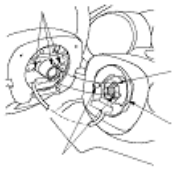
6. Remove the steering wheel puller, then remove the steering wheel bolt and steering wheel from the steering column.

Steering Wheel Installation

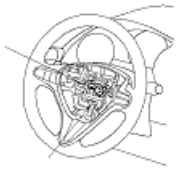
1. Before installing the steering wheel, make sure the front wheels are pointing straight ahead, then center the cable reel (A). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise about three full turns. The arrow mark (B) on the cable reel label should point straight up.



2. Position the two tabs (A) of the turn signal canceling sleeve (B) as shown. Install the steering wheel on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.



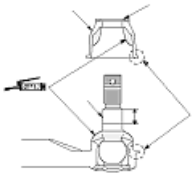
3. Install the steering wheel bolt (A), and tighten it to the specified torque. Connect the cable reel subharness connector (B). Make sure the wire harness is routed and fastened properly.



4. Install the driver's airbag.
5. Do the battery terminal reconnection procedure, and do these tasks:
   - Turn the ignition switch to ON (II) and check that the SRS indicator should come on for about 6 seconds and then go off.
   - Make sure the horn and turn signal switches work properly.
   - Make sure the steering wheel switches work properly.
6. After installation, do these checks:
   - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel is not centered), correct the engagement of the wheel/column shaft splines.
   - Set the steering column to the center tilt position, and to the center telescopic position, then do the front toe inspection.

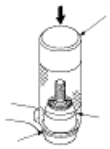
Steering Tie-rod Ball Joint Boot Replacement

Special Tools Required



Driver, 32.5 mm
070AD-SAA0100

1. Disconnect the tie-rod ball joint from the knuckle.
2. Remove the tie-rod end from the rack end.
3. Remove the tie-rod ball joint boot from the tie-rod end, and wipe the old grease off the ball pin.
4. Pack the lower area of the ball pin (A) with fresh multipurpose grease.
5. Pack the interior of the new tie-rod ball joint boot (B) and lip (C) with fresh multipurpose grease.
   Note these items when installing new grease:
   - Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
   - Do not allow dust, dirt, or other foreign materials to enter the boot.



6. Install the new tie-rod ball joint boot (A) using the inner bearing driver attachment. The boot must not have a gap at the boot installation sections (B). After installing the boot, check the ball pin tapered section for grease contamination, and wipe it if necessary.
7. Install the tie-rod end to the rack end.
8. Connect the tie-rod ball joint to the knuckle.
9. Check the wheel alignment, and adjust it if necessary.

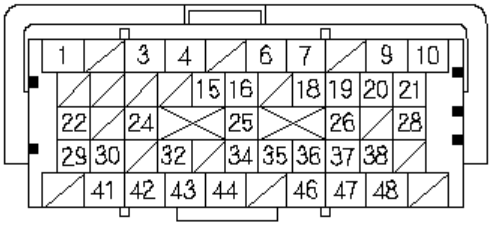
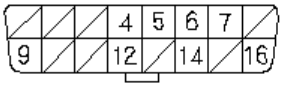
STEERING GEARBOX 1P CONNECTOR (RHD model)

Wire side of female tarminals

ECM/PCM CONNECTOR A (49P)

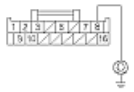


DATA LINK CONNECTOR (DLC)



Terminal side of female tarminals

EPS indicator does not go off, and no DTCs are stored



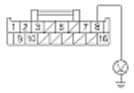
1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

   Are any DTCs indicated?
   YES - Troubleshoot the indicated DTC.■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Check the No. 11 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Reinstall the No. 11 (7.5 A) fuse, then go to Step 13 .
   NO - Go to Step 5 .
5. Disconnect the EPS control unit connector C (16P).
6. Check for continuity between EPS control unit connector C (16P) terminal No. 8 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the EPS control unit and No. 11 (7.5 A) fuse in the under-dash fuse/relay box.■
   NO - Install a new No. 11 (7.5 A) fuse in the under-dash fuse/relay box, then go to Step 7 .
7. Reconnect the EPS control unit connector C (16P).
8. Start the engine, and watch the EPS indicator.

   Does the EPS indicator go off?
   YES - Troubleshooting is complete. If any other DTCs are indicated, go to the indicated DTC's troubleshooting.■
   NO - Replace the EPS control unit. ■
9. Disconnect the EPS control unit connector C (16P).
10. Turn the ignition switch to ON (II).



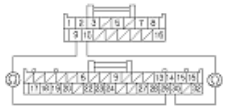
11. Measure the voltage between EPS control unit connector C (16P) terminal No. 8 and body ground.

    Is there battery voltage?
    YES - Go to Step 12 .
    NO - Repair open in the wire between the EPS control unit and No. 11 (7.5 A) fuse in the under-dash fuse/relay box.■
12. Turn the ignition switch to LOCK (0).
13. Disconnect the EPS control unit connector A (2P).

---

14. Check for continuity between EPS control unit connector A (2P) terminal No. 1 and body ground.

    Is there continuity?
    YES - Go to Step 15 .
    NO -
    - LHD model: Repair open in the wire between the EPS control unit and body ground (G301).■
    - RHD model: Repair open in the wire between the EPS control unit and body ground (G402).■
15. Turn the ignition switch to LOCK (0).
16. Disconnect the gauge control module 32P connector.



17. Check for continuity between EPS control unit connector C (16P) terminal and gauge control module 32P connector terminal individually.

Sign	EPS Control Unit Connector C (16P) Terminal	Gauge Control Module 32P Connector Terminal
CAN-L	9	29
CAN-H	10	30

    Is there continuity?
    YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
    NO - Repair open in the wire between the EPS control unit and gauge control module.■

HDS does not communicate with the EPS control unit or the vehicle

Procedure(s)

1. Troubleshoot the DLC circuit

EPS indicator does not come on

Procedure(s)

1. Do the gauge control module troubleshooting

EPS indicator does not go off, and no DTCs are stored

Procedure(s)

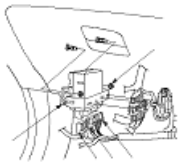
1. Symptom Troubleshooting
2. Do the gauge control module troubleshooting

EPS Symptom Troubleshooting Index

Symptom	Procedure(s)	Also check for
HDS does not communicate with the EPS control unit or the vehicle	Troubleshoot the DLC circuit	
EPS indicator does not come on	Do the gauge control module troubleshooting	
EPS indicator does not go off, and no DTCs are stored	1. Symptom Troubleshooting 2. Do the gauge control module troubleshooting	

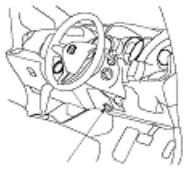
EPS Control Unit Removal/Installation

NOTE: The illustrations shows RHD model, LHD model is similar.



1. Do the battery terminal disconnection procedure.
2. Disconnect EPS control unit connector A (2P), connector B (2P), and connector C (16P).
3. Remove the connector clips from EPS control unit bracket (D).
4. Remove the nuts (E) from the EPS control unit bracket.
5. Remove the EPS control unit.
6. Install the EPS control unit in the reverse order of removal.
7. Do the battery terminal reconnection procedure.
8. Do the memorizing the torque sensor neutral position.
9. After installation, start the engine, allow it to idle, and turn the steering wheel from lock-to-lock several times. Check that the EPS indicator does not come on.

EPS Torque Sensor Neutral Position Memorization



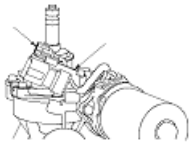
The torque sensor neutral position must be memorized whenever the steering gearbox, the EPS motor, or the EPS control unit is replaced. Note that the torque sensor neutral position is not affected when erasing the DTC.
NOTE: The torque sensor is temperature sensitive. When memorizing the torque sensor neutral position, the ambient temperature must be above 20 °C (68 °F).

1. With the ignition switch in LOCK (0), connect the HDS to the DLC (data link connector) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit.
4. From the EPS MENU, select MISCELLANEOUS TEST then TORQUE SENSOR LEARN and follow the screen prompts on the HDS.
   NOTE: See the HDS Help menu for specific instructions.
5. Turn the ignition switch to LOCK (0).

EPS Motor Removal and Installation

NOTE:

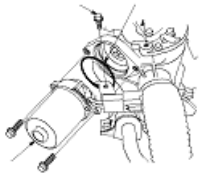
- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- The illustrations show RHD model, LHD model is similar for items not shown in this section.



Removal

1. Remove the steering gearbox.
2. LHD model: Remove the torque sensor 4P connector (A) from the connector bracket (B).

3. Remove the connector bracket mount bolt (A), then remove the EPS motor (B) and the O-ring (C).



Installation

1. Clean the mating surfaces of the EPS motor (A) and the steering gearbox.
2. Apply steering grease to the new O-ring (B), and carefully fit it on the EPS motor.
   NOTE: When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.
3. Apply steering grease to the EPS motor shaft (C).
4. Install the EPS motor on the steering gearbox by engaging the EPS motor shaft and the worm shaft (D).
5. Turn the EPS motor two or three times to the right and left about 45 degrees. Make sure the EPS motor is evenly seated on the steering gearbox, and that the O-ring is not pinched between the mating surfaces.
6. Loosely install the EPS motor mounting bolts (E), then turn the steering wheel two or three times to the right and left about 45 degrees.
7. Tighten the EPS motor mounting bolts to the specified torque.
8. LHD model: Install the torque sensor 4P connector to the connector bracket.
9. Install the steering gearbox.

A/C Service Tips and Precautions

⚠WARNING

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The air conditioning system uses HFC-134a (R-134a) refrigerant and polyalkyleneglycol (PAG) refrigerant oil, which are not compatible with CFC-12 (R-12) refrigerant and mineral oil. Do not use R-12 refrigerant or mineral oil in this system, and do not attempt to use R-12 servicing equipment; damage to the air conditioning system or your servicing equipment will result.
Separate the manifold gauge sets (pressure gauges, hoses, joints) for refrigerants R-12 and R-134a. Do not confuse them.
If accidental system discharge occurs, ventilate the work area before resuming service.
R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- Always disconnect the negative cable from the battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; don't remove the caps or plugs until just before you reconnect each line.
- Before connecting any hose or line, apply a few drops of refrigerant oil to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, don't let refrigerant escape too fast; it will draw the A/C compressor oil out of the system.

A/C System Test

Performance Test

⚠WARNING

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

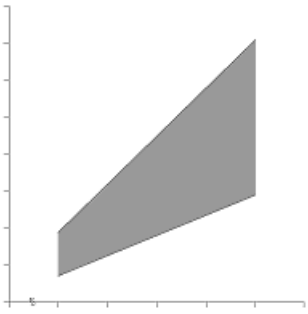
The performance test will help determine if the air conditioner system is operating within specifications.
Use only service equipment for refrigerant HFC-134a (R-134a).
If accidental system discharge occurs, ventilate the work area before resuming service.
R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect an R-134a refrigerant recovery/recycling/charging station to the high-pressure service port and the low-pressure service port, following the equipment manufacturer's instructions.
2. Determine the relative humidity and air temperature.
3. Open the globe box. Release the glove box stop on each side, then let the glove box hang down.
4. Insert a thermometer (A) in the center vent.
5. Place another thermometer (B) near the blower unit's recirculation inlet duct.
6. Test conditions:
   - Avoid direct sunlight.
   - Open hood.
   - Open front doors.
   - Set the temperature control dial to Max Cool, the mode control switch to Vent, and the recirculation control knob to Recirculate.
   - Turn the A/C switch ON and the fan switch to Max.
   - Run the engine at 1,500 rpm (min $^{-1}$).
   - No driver or passengers in vehicle.
7. After running the air conditioning for 10 minutes under the above test conditions, read the delivery temperature from the thermometer in the center vent, the intake temperature near the blower unit, and the high and low system pressure from the A/C gauges.

---

8. To complete the vent (delivery)/ambient air (intake) temperature chart:
   - Mark the vent (delivery) temperature on the vertical line.
   - Mark the ambient air (intake) temperature on the bottom line.
   - Draw a vertical line from the ambient air (intake) temperature mark.
   - Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

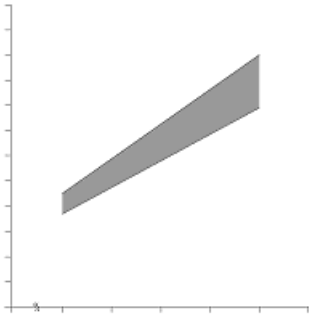
   NOTE: The low side and intake temperatures should intersect in the shaded area within about 10 % of the measured humidity level. Any measurements outside the line may indicate the need for further inspection.



---

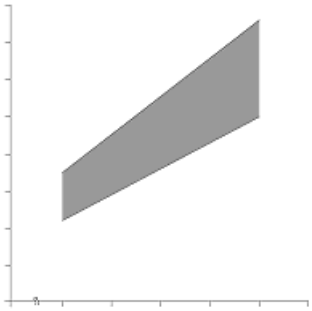
9. To complete the high side (discharge pressure)/ambient air (intake) temperature chart:
   - Mark the high side (discharge pressure) temperature on the vertical line.
   - Mark the ambient air (intake) temperature on the bottom line.
   - Draw a vertical line from the high side (discharge pressure) temperature mark.
   - Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

   NOTE: The low side and intake temperatures should intersect in the shaded area within about 10 % of the measured humidity level. Any measurements outside the line may indicate the need for further inspection.



10. To complete the low side (suction pressure)/ambient air (intake) temperature chart:
    - Mark the low side (suction pressure) temperature along the vertical line.
    - Mark the ambient air (intake) temperature along the bottom line.
    - Draw a vertical line from the ambient air (intake) temperature mark.
    - Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

    NOTE: The low side and intake temperatures should intersect in the shaded area within about 10 % of the measured humidity level. Any measurements outside the line may indicate the need for further inspection.



Pressure Test

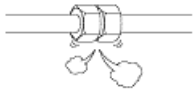
Test results	Related symptoms	Probable cause	Remedy
Driver's and passenger's side vent temperatures vary by more than 11 °C	Poor A/C performance. Discharge (high) and suction (low) pressures are low.	Low refrigerant charge	Recover, evacuate, and recharge with specified amount.
		Air mix door inoperable	Repair or replace.
Discharge (high) pressure abnormally high	After stopping A/C compressor, pressure drops about 196 kPa (2.0 kgf/cm ^{2}, 28 psi) quickly, and then falls gradually.	Air in system	Recover, evacuate, and recharge with specified amount.
	Reduced or no airflow through A/C condenser.	• Clogged condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean. • Check voltage and fan rpm. • Check fan direction.
	Line to A/C condenser is excessively hot.	Restricted flow of refrigerant in system	Restricted lines.
Discharge pressure abnormally low	High and low-pressures are balanced soon after stopping A/C compressor. Low side is higher than normal.	• Faulty A/C compressor discharge valve • Faulty A/C compressor seal	Replace the A/C compressor.

Test results	Related symptoms	Probable cause	Remedy
	Outlet of expansion valve is not frosted, low-pressure gauge indicates vacuum.	• Faulty expansion valve • Moisture in system	• Replace. • Recover, evacuate, and recharge with specified amount.
Suction (low) pressure abnormally low	Expansion valve is not frosted, and low-pressure line is not cold. Low-pressure gauge indicates vacuum.	• Frozen expansion valve (Moisture in system) • Faulty expansion valve	• Recover, evacuate, and recharge with specified amount. • Replace the expansion valve.
	Discharge temperature is low, and the airflow from vents is restricted.	Frozen evaporator	Run the fan with A/C compressor off, then check evaporator temperature sensor.
	Expansion valve is frosted.	Clogged expansion valve	Clean or replace.
	Receiver/dryer outlet is cool, and inlet is warm (should be warm during operation).	Clogged receiver/dryer	Replace.
Suction pressure abnormally high	Low-pressure hose and service port are cooler than the temperature around evaporator.	Expansion valve open too long	Repair or replace.
	Suction pressure is lowered when A/C condenser is cooled by water.	Excessive refrigerant in system	Recover, evacuate, and recharge with specified amount.
	High and low-pressures are equalized as soon as the A/C compressor is stopped, and both gauges fluctuate while running.	• Faulty gasket • Faulty high-pressure valve • Foreign particle stuck in high-pressure valve	Replace the A/C compressor.
Suction and discharge pressures abnormally high	Reduced airflow through A/C condenser.	• Clogged A/C condenser or radiator fins • A/C condenser or radiator fan not working properly	• Clean. • Check voltage and fan rpm. • Check fan direction.
Suction and discharge pressures abnormally low	Low-pressure hose and metal fittings are cooler than evaporator.	Clogged or kinked low-pressure hose parts	Repair or replace.
	Temperature around expansion valve is too low compared with that around receiver/dryer.	Clogged high-pressure line	Repair or replace.
Refrigerant leaks	A/C compressor clutch is dirty.	A/C compressor shaft seal leaking	Replace the A/C compressor.
	A/C compressor bolt(s) are dirty.	Leaking around bolt(s)	Tighten bolt(s) or replace A/C compressor.
	A/C compressor gasket is wet with oil.	Gasket leaking	Replace the A/C compressor.
	A/C fitting is dirty.	Leaking O-ring	Clean the A/C fitting and replace the O-ring.

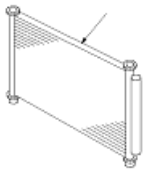
A/C System Inspection

Before troubleshooting any problem with the air conditioning system, do the following:

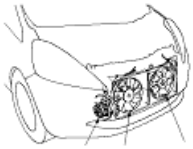
1. With the ignition switch in LOCK (0), inspect the A/C components, pressure lines and hoses for stains that may indicate a refrigerant or a compressor oil leak.



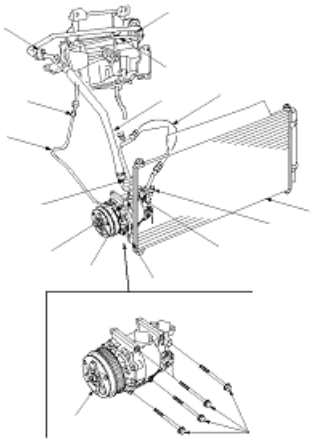
2. Check the A/C condenser (A) for material clogging the fins or for damage to the fins:
   - Carefully clean any material from the A/C condenser fins with water and detergent.
   - Be sure to dry the A/C condenser completely.
3. Inspect the drive belt.
4. Make sure no material is blocking the airflow to the A/C condenser.
5. Check the dust and pollen filter, and replace it if it is clogged.
6. Start the engine, turn the air conditioning system on, and allow it to normalize for a few minutes.
7. Check that the A/C operates at each position of the blower fan switch (except OFF).



8. Check that the A/C compressor clutch (A) is engaged. The pressure plate should be rotating at the same speed as the pulley.
9. Check that the A/C condenser fan (B) and radiator fan (C) operate when the A/C compressor clutch is engaged.
10. Check that the engine idle speed is correct when the A/C is switched on and off, and when the A/C compressor clutch is engaged and disengaged.

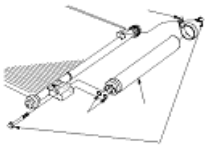


A/C Line Replacement



A/C Receiver/Dryer Desiccant Replacement

NOTE: Install the receiver/dryer as quickly as possible to prevent the system from absorbing moisture from the air.



1. Remove the A/C condenser.
2. Remove the bolts from the A/C condenser, then remove the receiver/dryer (A), the bracket (B), and the O-rings (C).
3. Install the receiver/dryer in the reverse order of removal. Replace the O-rings with new ones, and apply a thin coat of refrigerant oil (SP-10) before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.

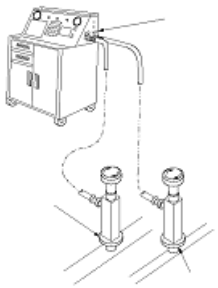
A/C Refrigerant Leak Test

⚠WARNING

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.



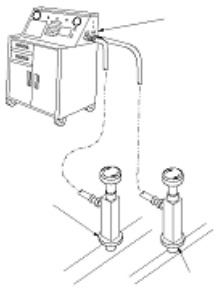
Use only service equipment for refrigerant HFC-134a (R-134a).
If accidental system discharge occurs, ventilate the work area before resuming service.
R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.
2. Open the high pressure valve to charge the system to the specified capacity, then close the supply valve, and disconnect the charging station fittings.
   Select the appropriate units of measurement for your refrigerant charging station.
   Refrigerant Capacity:
   370 to 420 g
   0.37 to 0.42 kg
   0.82 to 0.93 lbs
   13.1 to 14.8 oz
3. Check the system for leaks using an R-134a refrigerant leak detector with an accuracy of 14 g (0.5 oz) per year or better.
4. If you find leaks that require the system to be opened (to repair or replace hoses, fittings, etc.), do a recovery of the system.
5. After checking and repairing leaks, the system must be evacuated.

A/C Refrigerant Recovery

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.



Use only service equipment for refrigerant HFC-134a (R-134a).
If accidental system discharge occurs, ventilate the work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

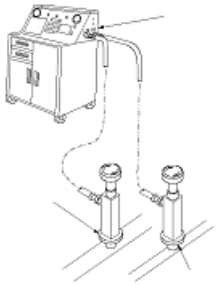
1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacture's instructions.

2. Measure the amount of refrigerant oil removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new refrigerant oil back into the A/C system before charging.

A/C System Evacuation

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.



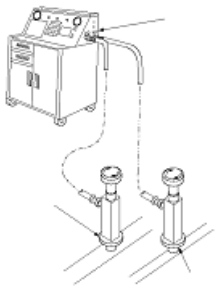
Use only service equipment for refrigerant HFC-134a (R-134a).
If accidental system discharge occurs, ventilate the work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. When an A/C system has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an R-134a refrigerant recovery/recycling/charging station. If the system has been open for several days, the receiver/dryer should be replaced, and the system should be evacuated for several hours.
2. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions. Evacuate the system.
3. If the low-pressure does not reach more than 93.3 kPa (700 mmHg, 27.6 in.Hg) in 15 minutes, there is probably a leak in the system. Partially charge the system, and check for leaks.

A/C System Charging

⚠CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.



Use only service equipment for refrigerant HFC-134a (R-134a).
If accidental system discharge occurs, ventilate the work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect an R-134a refrigerant recovery/recycling/charging station (A) to the high-pressure service port (B) and the low-pressure service port (C), as shown, following the equipment manufacturer's instructions.
2. Evacuate the system.
3. Add the same amount of new refrigerant oil to the system that was removed during recovery. Use only SP-10 refrigerant oil.
4. Charge the system with the specified amount of R-134a refrigerant. Do not overcharge the system; the compressor will be damaged.
   Select the appropriate units of measure for your refrigerant charging station.
   Refrigerant Capacity:
   370 to 420 g
   0.37 to 0.42 kg
   0.82 to 0.93 lbs
   13.1 to 14.8 oz
5. Check for refrigerant leaks.
6. Check for system performance.

A/C Refrigerant Oil Replacement

Recommended PAG oil: SP-10

- P/N 38897-P13-003: 120 mL (4 fl·oz, 4.2 Imp·oz)
- P/N 38898-P13-003: 250 mL (8 1/3 fl·oz, 8.8 Imp·oz)
- P/N 38899-P13-A01: 40 mL (1 1/3 fl·oz, 1.4 Imp·oz)

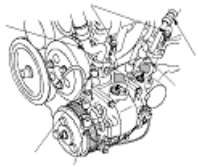
Add the recommended refrigerant oil in the amount listed if you replace any of the following parts.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle; it may damage the paint; if it gets on the paint, wash it off immediately.

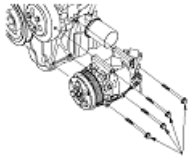
A/C condenser (including Dryer Desiccant) .	25 mL (5/6 fl·oz, 0.9 Imp·oz)
Evaporator .	35 mL (1 1/5 fl·oz, 1.2 Imp·oz)
Line or hose .	10 mL (1/3 fl·oz, 0.4 Imp·oz)
Receiver/Dryer Desiccant .	10 mL (1/3 fl·oz, 0.4 Imp·oz)
Leakage repair .	25 mL (5/6 fl·oz, 0.9 Imp·oz)
A/C compressor .	Since the oil separator is equipped inside the compressor for this vehicle, oil drainage is unnecessary at the time of compressor replacement.

A/C Compressor Replacement

NOTE: Do not install an A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the A/C compressor into a contaminated system can result in premature A/C compressor failure.



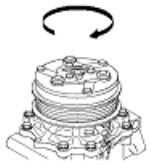
1. If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Recover the refrigerant with a recovery/recycling/charging station.
3. Remove the splash shield.
4. Remove the drive belt.
5. Remove the compressor clutch connector (A) from the condenser fan shroud, then disconnect the connector. Remove the nuts, then disconnect the suction line (B) and the discharge line (C) from the compressor, and remove the O-rings (D). Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



6. Remove the mounting bolts and the A/C compressor (A). Be careful not to damage the radiator fins when removing the A/C compressor.
7. Install the compressor in the reverse order of removal, and note these items:
   - Inspect the A/C lines for any signs of contamination.
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Use refrigerant oil (SP-10) for HFC-134a SANDEN spiral type A/C compressor only.
   - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Charge the system.

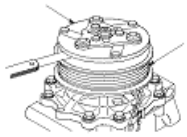
A/C Compressor Clutch Check

1. Check the armature plate for discoloration, peeling, or other damage. If there is damage, replace the clutch set.
2. Check the rotor pulley bearing play and drag by rotating the rotor pulley by hand. Replace the clutch set with a new one if it is noisy or has excessive play/drag.

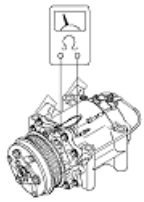


3. Measure the clearance between the rotor pulley (A) and the armature plate (B) all the way around. If the clearance is not within specified limits, remove the armature plate and add or remove shims as needed to increase or decrease clearance.
   Clearance: **0.35−0.65 mm (0.014−0.026 in.)**

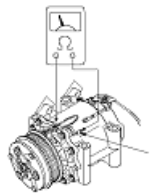
   NOTE: The shims are available in four thicknesses: 0.1 mm, 0.2 mm, 0.4 mm, and 0.5 mm.



4. Release the field coil connector from the holder, then disconnect it. Check the thermal protector for continuity. If there is no continuity, replace the thermal protector.
   NOTE: The thermal protector will have no continuity above 122 to 128 °C. When the temperature drops below 116 to 104 °C, the thermal protector will have continuity.

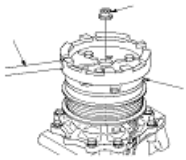


5. Disconnect the field coil connector (A). Check resistance of the field coil. If resistance is not within specifications, replace the field coil.
   Field Coil Resistance: **3.15−3.45 Ω 20 °C**

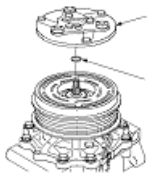


A/C Compressor Clutch Overhaul

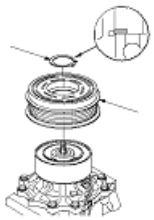
1. Remove the center nut while holding the armature plate (A) with a commercially available A/C clutch holder (B).



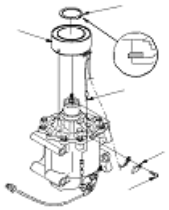
2. Remove the armature plate (A) and shim(s) (B), taking care not to lose the shim(s). If the clutch needs adjustment, increase or decrease the number and thickness of shims as necessary, then reinstall the armature plate, and recheck its clearance.
   NOTE: The shims are available in four thicknesses: 0.1 mm, 0.2 mm, 0.4 mm, and 0.5 mm.



3. If you are replacing the field coil, remove the snap ring (A) with snap ring pliers, then remove the rotor pulley (B). Be careful not to damage the rotor pulley and A/C compressor.



4. Remove the bolt and holder (A), then disconnect the field coil connector (B). Remove the snap ring (C) with snap ring pliers, then remove the field coil (D). Be careful not to damage the field coil and A/C compressor.



5. Reassemble the clutch in the reverse order of disassembly, and note these items:
   - Install the field coil with the wire side facing down, and align the boss on the field coil with the hole in the A/C compressor.
   - Clean the rotor pulley and A/C compressor sliding surfaces with contact cleaner or other non-petroleum solvent.
   - Install new snap rings, note the installation direction, and make sure they are fully seated in the groove.
   - Make sure that the rotor pulley turns smoothly after it's reassembled.
   - Route and clamp the wires properly or they can be damaged by the rotor pulley.

A/C Compressor Clutch Circuit Troubleshooting

NOTE:

- It is normal for the A/C compressor to turn off under certain conditions, such as low idle, high engine coolant temperature, or hard acceleration.
- Do not use this troubleshooting procedure if the fans are also inoperative with the A/C on. Refer to the symptom troubleshooting index.

1. Check the No. 43 (7.5 A) and the No. 10 (7.5 A) fuses in the under-dash fuse/relay box.

   Are the fuses OK?
   YES - Go to Step 2 .
   NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 43 (7.5 A) and No. 10 (7.5 A) fuses circuit.■

2. Connect the HDS to the DLC.
3. Start the engine.
4. Turn on the A/C.
5. Check the A/C switch in the PGM-FI Data List with the HDS.

   Is the A/C switch on?
   YES - Go to Step 6 .
   NO - Go to A/C pressure switch circuit troubleshooting. ■

6. Using the HDS, confirm the following values in the PGM-FI Data List at idle.

TP sensor	About 0.5 V	
RPM	A/T	740−840
	M/T	700−800
ECT SENSOR 2	80−100 °C	
A/C SWITCH	ON	
A/C CLUTCH	ON	
A/C PRESSURE SENSOR	196−3,138 kPa (2−32 kgf/cm ^{2}) 28−455 psi	
A/C TEMPERATURE	3.0 °C or more	

   Are all the values within specifications?
   YES - Go to Step 7 .
   NO - Troubleshoot the value that is not within the specifications.■

7. Turn the ignition switch to LOCK (0).
8. Remove the A/C compressor clutch relay from the auxiliary under-hood relay box, and test it.

   Is the relay OK?
   YES - Go to Step 9 .
   NO - Replace the A/C compressor clutch relay .■

9. Measure the voltage between the No. 1 terminal of the A/C compressor clutch relay 4P socket and body ground.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the No. 43 (7.5 A) fuse in the under-dash fuse/relay box and the A/C compressor clutch relay.■

10. Connect the No. 1 and No. 2 terminals of the A/C compressor clutch relay 4P socket with a jumper wire.

    Does the A/C compressor clutch click?
    YES - Go to Step 11 .
    NO - Go to Step 21 .

11. Disconnect the jumper wire.
12. Turn the ignition switch to ON (II).

13. Measure the voltage between the No. 4 terminal of the A/C compressor clutch relay 4P socket and body ground.

Is there battery voltage?

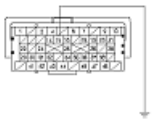
YES - Go to Step 14 .

NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the A/C compressor clutch relay.■

14. Turn the ignition switch to LOCK (0).
15. Reinstall the A/C compressor clutch relay.
16. Make sure the A/C switch is OFF.
17. Jump the SCS line with the HDS.
NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
18. Disconnect ECM/PCM connector A (49P).

---

19. Connect the ECM/PCM connector A (49P) No. 15 terminal to body ground with a jumper wire.



20. Turn the ignition switch to ON (II).

Does the A/C compressor click?

YES - Check for loose wires or poor connections at ECM/PCM connector A (49P). If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM. ■

NO - Repair open in the wire between the A/C compressor clutch relay and the ECM/PCM.■

21. Disconnect the jumper wire.
22. Disconnect the A/C compressor clutch 1P connector.

---

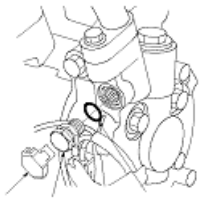
23. Check for continuity between the A/C compressor clutch relay 4P socket No. 2 terminal and the A/C compressor clutch 1P connector No. 1 terminal.

Is there continuity?

YES - Check the A/C compressor clutch clearance, the thermal protector circuit, and the A/C compressor clutch field coil. ■

NO - Repair open in the wire between the A/C compressor clutch relay and the A/C compressor clutch.■

A/C Compressor Relief Valve Replacement

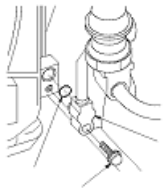


1. Recover the refrigerant with a recovery/recycling/charging station.
2. Remove the relief valve cover (A), the relief valve (B), and the O-ring (C). Plug the opening to keep foreign matter from entering the system and the A/C compressor oil from running out.
3. Clean the mating surfaces.
4. Replace the O-ring with a new one at the relief valve, and apply a thin coat of refrigerant oil before installing it.
5. Remove the plug, and install and tighten the relief valve.
6. Charge the system.

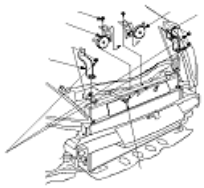
A/C Condenser Replacement

1. Recover the refrigerant with a recovery/recycling/charging station.
2. Remove the front bumper.
3. Remove the nut, then disconnect the discharge hose (A) from the A/C condenser. From the discharge hose, remove the O-ring (B).

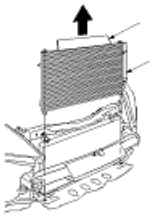
4. Remove the bolt, then disconnect the receiver line (A) from the A/C condenser. From the receiver line, remove the O-ring (B).



5. Remove the bolts (A), disconnect the connector (B), and remove the horn (C). If equipped with the high horn (D), remove it.
6. Remove the bolts (E) and the brackets (F).

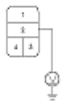


7. Remove the A/C condenser (A) by lifting it up.
   - Do not grab the upper seal (B).
   - Be careful not to damage the radiator and A/C condenser fins when removing the A/C condenser.
8. Install the A/C condenser in the reverse order of removal, and note these items:
   - If you're installing a new A/C condenser, add refrigerant oil (SP-10).
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Charge the system.



A/C Condenser Fan Circuit Troubleshooting

NOTE: Do not use this troubleshooting procedure if the fans are also inoperative with the A/C on. Refer to the symptom troubleshooting index.



1. Check the No. 47 (30 A) and the No. 10 (7.5 A) fuses in the under-dash fuse/relay box.

   Are the fuses OK?
   YES - Go to Step 2 .
   NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 47 (30 A) and No. 10 (7.5 A) fuses circuit.■

2. Remove the A/C condenser fan relay from the auxiliary under-hood relay box, and test it.

   Is the relay OK?
   YES - Go to Step 3 .
   NO - Replace the A/C condenser fan relay .■

3. Measure the voltage between the No. 2 terminal of the A/C condenser fan relay 4P socket and body ground.

   Is there battery voltage?
   YES - Go to Step 4 .
   NO - Repair open in the wire between the No. 47 (30 A) fuse in the under-dash fuse/relay box and the A/C condenser fan relay.■

---

4. Connect the No. 1 and No. 2 terminals of the A/C condenser fan relay 4P socket with a jumper wire.

   Does the A/C condenser fan run?
   YES - Go to Step 5 .
   NO - Go to Step 8 .

5. Disconnect the jumper wire.

6. Turn the ignition switch to ON (II).

---

7. Measure the voltage between the No. 4 terminal of the A/C condenser fan relay 4P socket and body ground.

   Is there battery voltage?
   YES - Repair open in the GRN wire between the A/C condenser fan relay and the ECM/PCM.■
   NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the A/C condenser fan relay.■

8. Disconnect the jumper wire.

9. Disconnect the A/C condenser fan 2P connector.

---

10. Check for continuity between the No. 1 terminal of the A/C condenser fan relay 4P socket and the No. 2 terminal of the A/C condenser fan 2P connector.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the A/C condenser fan relay and the A/C condenser fan.■

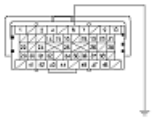
---

11. Check for continuity between the No. 1 terminal of the A/C condenser fan 2P connector and body ground.

    Is there continuity?
    YES - Replace the A/C condenser fan motor.■
    NO - Check for an open in the wire between the A/C condenser fan and body ground. If the wire is OK, check for poor ground at G202. ■

Radiator and A/C Condenser Fan Common Circuit Troubleshooting

NOTE: Do not use this troubleshooting procedure if the A/C compressor is inoperative. Refer to the symptom troubleshooting index.



1. Remove the radiator fan relay and A/C condenser fan relay from the auxiliary under-hood relay box, and test them.

   Are the relays OK?
   YES - Go to Step 2 .
   NO - Replace the relays.■

2. Reinstall the relays.
3. Jump the SCS line with the HDS.
   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
4. Disconnect ECM/PCM connector A (49P).
5. Connect the ECM/PCM connector A (49P) No. 6 terminal to body ground with a jumper wire.
6. Turn the ignition switch to ON (II).

   Do the fans run?
   YES - Check for loose wires or poor connections at ECM/PCM connector A (49P). If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM .■
   NO - Repair open in the wire between the radiator fan relay, the A/C condenser fan relay and the ECM/PCM.■

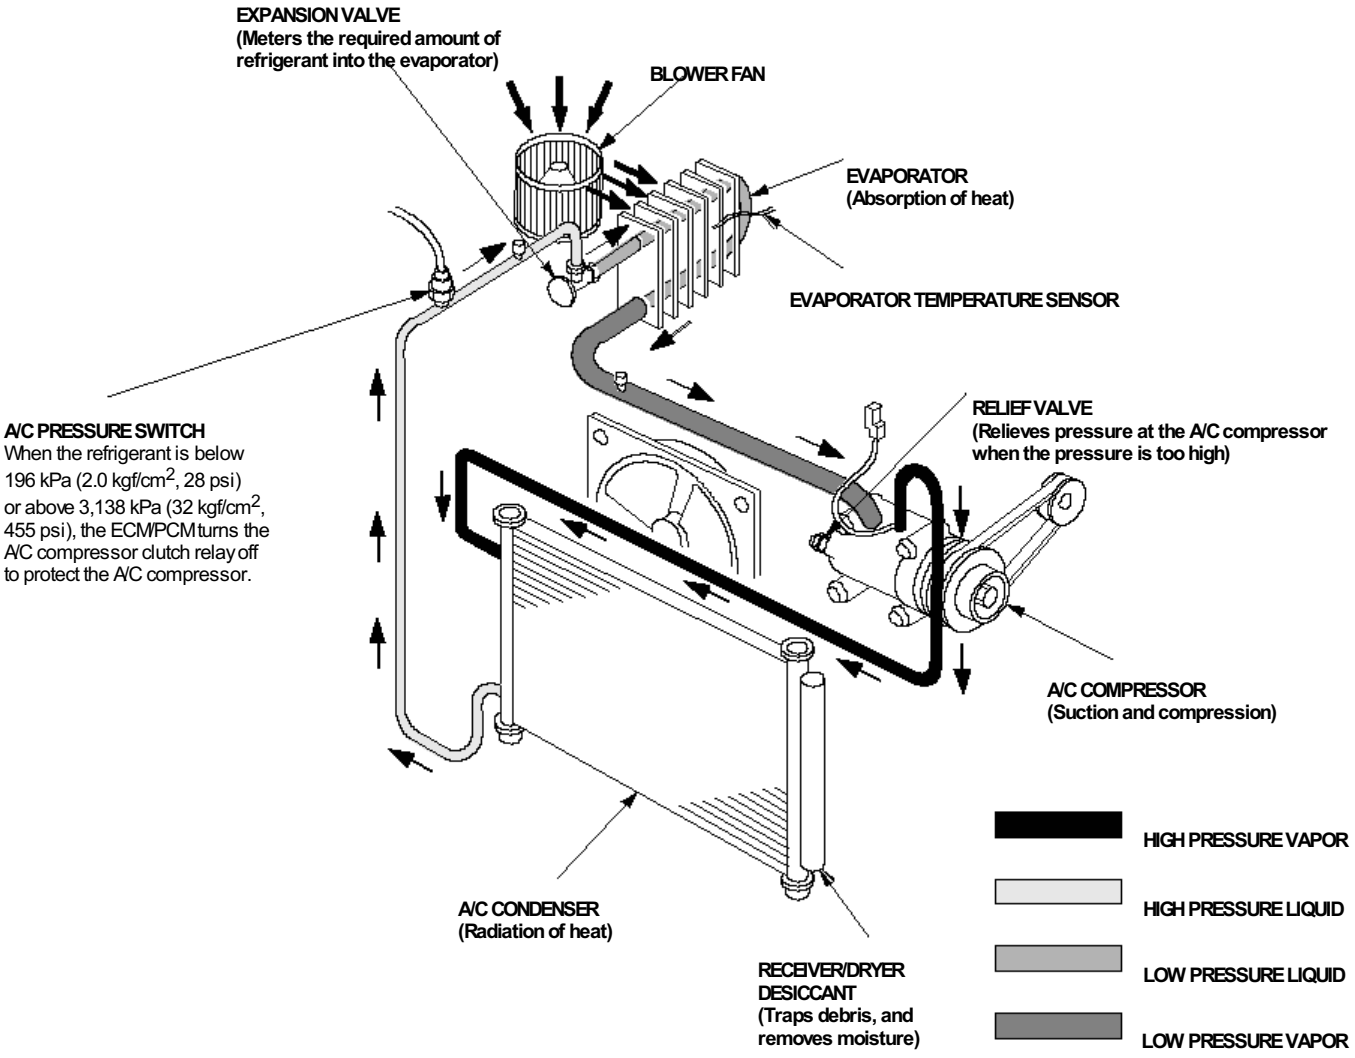
A/C Evaporator Temperature Sensor Test

1. Remove the evaporator core and the evaporator temperature sensor.
2. Dip the sensor in ice water, and measure the resistance between its terminals.
3. Then pour warm water on the sensor, and check for a change in resistance.

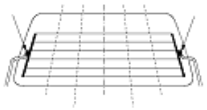
4. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications.
5. If the resistance is not as specified, replace the evaporator temperature sensor.

Heating and A/C System Description

The air conditioning system removes heat from the passenger compartment by transferring heat from the ambient air to the evaporator. The evaporator cools the air with the refrigerant that is circulating through the evaporator. The refrigerant expands in the evaporator, and the evaporator becomes very cold and absorbs the heat from the ambient air. The blower fan pushes air across the evaporator where the heat is absorbed, and then it blows the cool air into the passenger compartment.



Rear Window Defogger Function Test



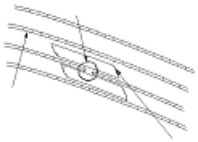
NOTE:

- Before testing, check the No. 10 (7.5 A), No. 59 (20 A), and No. 60 (IGN) (50 A) fuse in the under-dash fuse/relay box.
- Be careful not to scratch or damage the defogger wires with the tester probe.

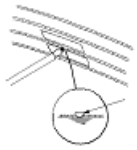
1. Turn the ignition switch to ON (II), then turn the rear window defogger switch ON.
2. Measure the voltage between the positive terminal (A) and body ground. There should be battery voltage.
   - If there is no voltage, check for:
     - Faulty rear window defogger relay.
     - Faulty rear window defogger switch.
     - An open in the BLU wire to the positive terminal.
   - If there is battery voltage, go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the negative terminal (B) from the rear window defogger.
5. Check for continuity between the negative terminal and body ground. There should be continuity.
   If there is no continuity, check for an open in the BLK wire or poor ground (G602). If there is continuity, go to Step 6 .
6. Reconnect the negative terminal to the rear window defogger.
7. Turn the ignition switch to ON (II), then turn the rear window defogger switch ON.
8. Touch the voltmeter positive probe to each point on each defogger wire, and the negative probe to the negative terminal.
   - If the voltage is as specified, the defogger wire up to that point is OK.
   - If the voltage is not as specified, repair the defogger wire.
     - If it is more than specified at one of the points, there is a break in the negative half of the wire.
     - If it is less than specified at one of the points, there is a break in the positive half of the wire.

Rear Window Defogger Wire Repair

NOTE: To make an effective repair, the broken section must be no longer than 25 mm (1 inch).

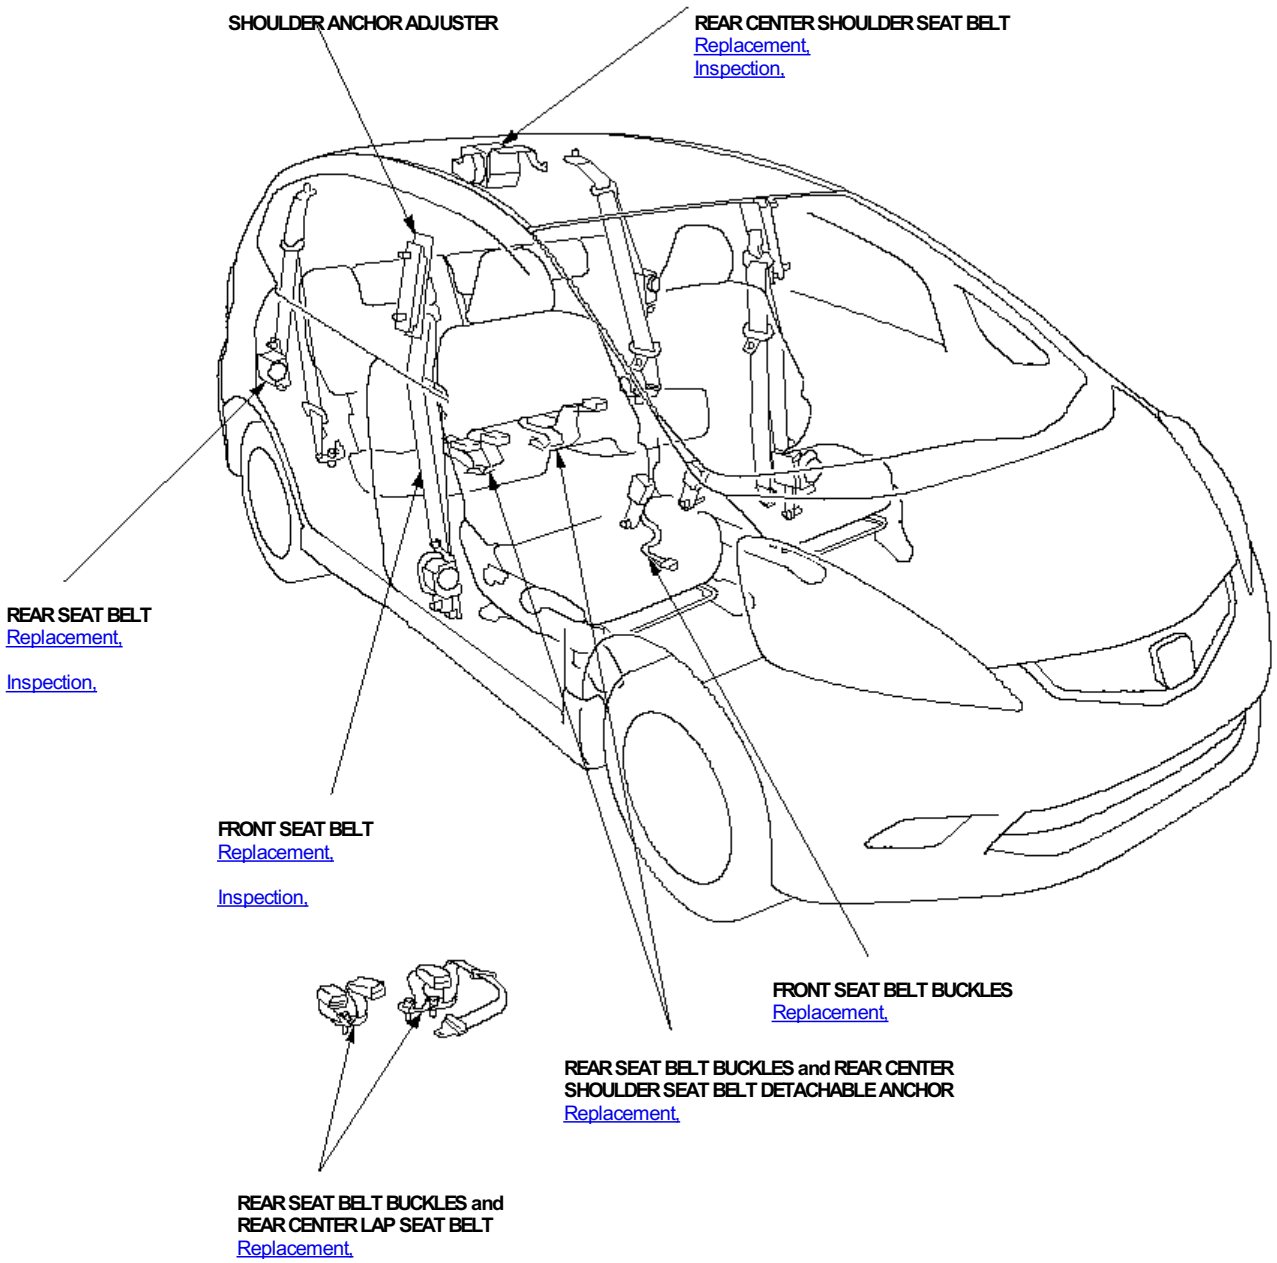


1. Lightly rub the area around the broken section (A) with fine steel wool, then clean it with isopropyl alcohol.
2. Carefully mask above and below the broken portion of the defogger wire (B) with cellophane tape (C).



3. Using a small brush, apply a heavy coat of silver conductive paint (commercially available) (A) extending about 3 mm (1/8") on both sides of the break. Allow 25 minutes to dry.
4. Do the function test to confirm that the wire is repaired.
5. Apply a second coat of paint in the same way. Let it dry 3 hours before removing the tape.

Seat Belts Component Location Index



Seat Belt Inspection

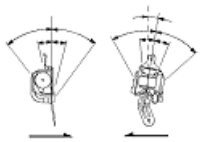
Out of Vehicle

For front seat belt retractors with seat belt tensioners, review the SRS component locations, and the precautions and procedures before doing repairs or service.

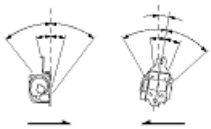
Retractor

1. Before installing the retractor, check that the seat belt can be pulled out freely.
2. Make sure that the seat belt does not lock when the retractor (A) is leaned slowly up to 15 ° from the mounted position. The seat belt should lock when the retractor is leaned over 40 °. Do not attempt to disassemble the retractor.
3. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

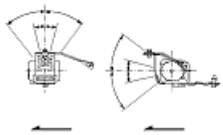
Front



Rear



Rear center shoulder



In-vehicle

1. Check that the seat belt is not twisted or caught on anything.
2. After installing the anchors, check for free movement on the anchor bolts. If necessary, remove the anchor bolts and check that the washers and other parts are not damaged or improperly installed.
3. Check the seat belts for damage or discoloration.
   Clean with a shop towel if necessary. Use only soap and water to clean.
   NOTE: Dirt build-up in the loops of the upper anchors can cause the seat belts to retract slowly. Wipe the inside of the loops with a clean cloth dampened in isopropyl alcohol.
4. Check that the seat belt does not lock when pulled out slowly. The seat belt is designed to lock only during a sudden stop or impact.
5. Make sure that the seat belt will retract automatically when released.
6. For each rear passenger's seat belt, check the seat belt retractor locking mechanism ALR (automatic locking retractor). This function is for securing child seats.
   -1. Pull the seat belt all the way out to engage the ALR. The seat belt should retract, but not extend. This is normal.
   -2. To disengage the ALR, release the seat belt and allow it to fully retract, then pull the seat belt out part-way. The seat belt should retract and extend normally.
7. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

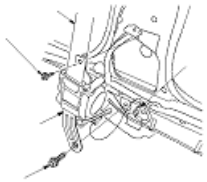
Front Seat Belt Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tool or equivalent.
- Check the front seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.

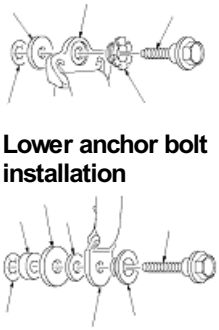
Front Seat Belt

1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Slide the front seat forward fully.
3. Remove the center pillar lower trim:
   - Without side curtain airbags
   - With side curtain airbags
4. Remove the upper anchor cover (A), and remove the upper anchor bolt (B).



5. Disconnect the seat belt tensioner connector (A).
6. Remove the self-tapping ET screw (B) and the lower retractor bolt (C), then remove the front seat belt (D) and retractor (E).
7. Remove the center pillar lower trim:
   - Without side curtain airbags
   - With side curtain airbags

8. Remove the shoulder anchor adjuster (A).



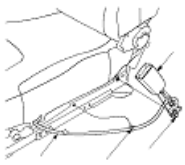
9. Install the seat belt and retractor in the reverse order of removal, and note these items:
   - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
   - Tighten the bolts by hand first, then tighten to specified torque.
   - Check that the retractor locking mechanism functions as described.
   - Assemble the washers, the collars, and the bushings on the upper anchor bolt and lower anchor bolt as shown.
   - Before installing the anchor bolts, make sure there are no twists or kinks in the seat belt.
   - Make sure the seat belt tensioner connector is plugged in properly.
   - Do the battery terminal reconnection procedure.
   - Check for any DTCs, and clear them using the HDS. If the DTCs will not clear, do the necessary troubleshooting.

Upper anchor bolt installation

Lower anchor bolt installation

Front Seat Belt Buckle

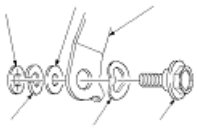
1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Remove the front seat.
3. Lift up the front driver's seat, then detach the seat belt switch connector (A), and detach the harness clip (B). RHD model is shown, LHD model is similar.



4. Detach the harness clip (A), and pull the seat belt switch harness (B) through the hole in the seat track. Remove the center anchor bolt (C), then remove the seat belt buckle (D).

5. Install the buckle in the reverse order of removal, and note these items:
    - Assemble the washers and collar on the center anchor bolt as shown.
    - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
    - Tighten the bolt by hand first, then tighten to specified torque.
    - Make sure the seat belt switch connector is plugged in properly.
    - Do the battery terminal reconnection procedure.
    - Check for any DTCs, and clear them using the HDS. If the DTCs will not clear, do the necessary troubleshooting.

Center anchor bolt installation



Rear Seat Belt Replacement

NOTE: Check the rear seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.

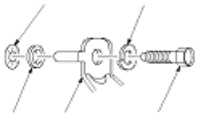
Rear Seat Belt

1. Remove the cargo side trim panel.
2. Pull the carpet back as necessary, and remove the lower anchor bolt (A).

3. Remove the upper anchor cap (A), and remove the upper anchor bolt (B).

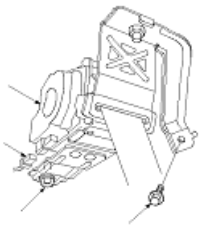
4. Disconnect the seat belt tensioner connector (A) if equipped, and remove the self-tapping ET screw (B) and the lower retractor mounting bolt (C). Remove the rear seat belt (D) and retractor (E). The right seat belt is shown, the left seat belt is similar.

Upper anchor bolt installation



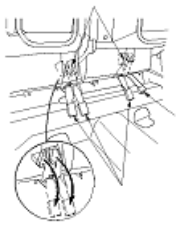
5. Install the seat belt in the reverse order of removal, and note these items:
   - Apply medium strength type liquid thread lock to the anchor bolts before reinstallation.
   - Tighten the bolts by hand first, then tighten to specification torque.
   - Check that the retractor locking mechanism functions as described.
   - Assemble the washers and the collar on the upper anchor bolt as shown.
   - Before installing the anchor bolts, make sure there are no twists or kinks in the seat belt.
   - Make sure the seat belt tensioner connector is properly plugged in.

Rear Center Shoulder Seat Belt

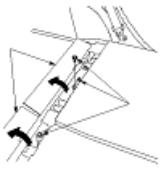


1. Remove the headliner.
2. Disconnect the seat belt tensioner connector (A) if equipped, and remove the retractor mounting bolts (B, C), then remove the center seat belt and retractor (D).
3. Install the center seat belt and retractor in the reverse order of removal, and note these items:
   - Tighten the bolts by hand first, then tighten to specification torque.
   - Check that the retractor locking mechanism functions as described.
   - Before installing the anchor mounting bolt, make sure there are no twists or kinks in the center seat belt.
   - Make sure the seat belt tensioner connector is properly plugged in if equipped.

Rear Seat Belt Buckles and Center Shoulder Seat Belt Detachable Anchor/Center Lap Seat Belt



1. Pull the rear seat belt buckles (A) and rear center seat belt detachable anchor or rear center lap seat belt (B) out through each elastic straps (C) on both seat cushions.
2. Lift both rear seat cushions up, and slip the seat belt buckles and seat belt detachable anchor or seat belt.
3. Fold both rear seat-backs.

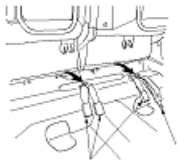


4. Opening the cargo floor lids (A) and remove the anchor bolts (B).
5. Lift both rear seat cushions up.

6. Remove the seat belt buckles (A) and center seat belt detachable anchor (B) or rear center lap seat belt (C).

With center seat belt and seat belt buckles

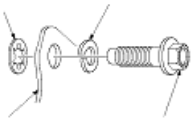
With center lap seat belt and seat belt buckles



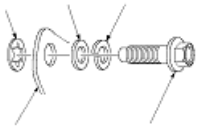
---

7. Install the anchor and buckle in the reverse order of removal, and note these items:
   - Tighten the bolts by hand first, then tighten to specification torque.
   - Assemble the washers, and the collar on the anchor bolt as shown.

Right side anchor bolt installation



Left side anchor bolt installation



Airbag and Tensioner Disposal

Deploying Airbags in the Vehicle

Special Tools Required

Deployment tool
07HAZ-SG00500

Before scrapping any airbags, side airbags, side curtain airbags, or seat belt tensioners (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Honda District Parts and Service Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped. If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.
If an SRS equipped vehicle is to be entirely scrapped, its airbags, side airbags, side curtain airbags, and seat belt tensioners, should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the ignition switch to LOCK (0). Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Confirm that each airbag, side airbag, side curtain airbag, or seat belt tensioner is securely mounted.
3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

Driver's Airbag

1. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.

Front Passenger's Airbag

1. Lower the glove box, then remove the connector clip. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Side Airbag

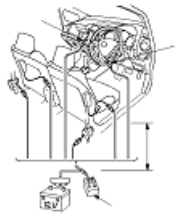
1. Disconnect the side airbag 2P connector (A) from the floor wire harness.

Side Curtain Airbag

1. Disconnect the floor wire harness 2P connector (A) from the side curtain airbag.

Seat Belt Tensioner

1. Disconnect the floor wire harness 4P connector (A) from the seat belt tensioner. Pull the seat belt out all the way and cut it.

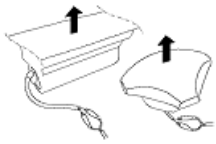


2. Cut off each connector, and strip the ends of the wires. Twist each pair of unlike colored wires together, and clip an alligator clip (A) from the deployment tool to each pair. Place the deployment tool at least 10 m (30 ft) away from the vehicle.
   NOTE: The driver's and front passenger's airbags have dual inflators. Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.
3. Connect a 12 volt battery to the tool.
   - If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
   - If the red light on the tool comes on, the component is ready to be deployed.

4. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).
   - If the components deploy and the green light on the tool comes on, continue with this procedure.
   - If a component does not deploy, and the green light comes ON, its igniter is defective. Go to Disposal of Damaged Components.
   - During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.

5. Dispose of the complete airbag. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

Deploying Components Out of the Vehicle



If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:

1. Confirm that the deployment tool is functioning properly by following the check procedure Deploying Airbags in the Vehicle on the tool label.
2. Position the airbag face up, outdoors, on flat ground, at least 10 m (30 ft) from any obstacles or people.
3. Follow Step 2 through 12 of the in-vehicle deployment procedure.
   NOTE: The driver's and front passenger's airbags have dual inflators. Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.

Disposal of Damaged Components

1. If installed in a vehicle, follow the removal procedure for the driver's airbag, front passenger's airbag, side airbag, side curtain airbag, seat belt tensioner.
2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.
   NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators. Twist the like colored wires together.
3. Package the component in exactly the same packaging that the new replacement part came in.
4. Mark the outside of the box ‘‘DAMAGED AIRBAG NOT DEPLOYED,'' ‘‘DAMAGED SIDE AIRBAG NOT DEPLOYED,'' ‘‘DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED,'' ‘‘DAMAGED SEAT BELT TENSIONER NOT DEPLOYED'' so it does not get confused with your parts stock.
5. Contact your Honda District Parts and Service Manager for instructions on how and where to return it for disposal.

Deployment Tool Check

1. Connect the yellow clips to both switch protector handles on the tool.
2. Then connect the red lead to the positive battery post and the black lead to the negative battery post.
3. Push the operation switch: The green light should come on, indicating that the tool is operating properly and is ready for use. If the red light stays on, the tool is faulty, and another one must be used for the procedure.
4. Disconnect the tool clips and connectors from the protector handles and the battery.

SRS Symptom Troubleshooting - SRS indicator does not come on

SRS indicator does not come on

NOTE: Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
2. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator come on?
   YES - Intermittent failure, the system is OK at this time.
   NO - Go to Step 3 .
3. Connect the HDS to the data link connector (DLC).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
5. Do the gauge control module self diagnostic function.

   Does the SRS indicator come on?
   YES - Faulty SRS unit; replace the SRS unit. ■
   NO - Faulty gauge control module; replace the gauge control module. ■

SRS Symptom Troubleshooting - SRS indicator stays on, but no DTCs are stored

SRS indicator stays on, but no DTCs are stored

NOTE: Before doing this troubleshooting procedure, check the battery is sufficiently charged. If the battery voltage is low, SRS indicator stays on.

1. Start the engine, and see if the malfunction indicator lamp (MIL) stays on.

   Does the MIL come on?
   YES - Go to the MIL Circuit Troubleshooting.
   NO - Go to Step 2 .

2. Connect the HDS to the data link connector (DLC).

3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.

4. Read the DTC.

   Are any SRS DTCs indicated?
   YES - Do the SRS DTC troubleshooting.
   NO - Go to Step 5 .

5. Select Body Electrical status with the HDS.

6. Check for DTCs in the Gauge Menu with the HDS.

   Is DTC B1187 indicated?
   YES - Go to the DTC B1187 troubleshooting.
   NO - Go to Step 7 .

7. Do the gauge control module self diagnostic function.

   Does the SRS indicator come on?
   YES - Faulty SRS unit; replace the SRS unit.
   NO - Faulty gauge control module; replace the gauge control module.

Side airbag cutoff indicator stays on

1. Make sure nothing is on the front passenger's seat.
2. Make sure the seat-back is dry.
3. Turn the ignition switch to ON (II), and see if the SRS indicator comes on.

   Does the SRS indicator come on and stay on?
   YES - Go to the Symptom Troubleshooting ‘‘SRS indicator stay on, but no DTCs are stored".
   NO - Go to Step 4 .
4. Connect the HDS to the data link connector (DLC).
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
6. Select Body Electrical status with the HDS.
7. Check for DTCs in the Gauge Menu with the HDS.

   Is DTC B1187 indicated?
   YES - Go to the DTC B1187 troubleshooting.
   NO - Go to Step 8 .
8. Do the gauge control module self-diagnostic function.

   Does the side airbag cutoff indicator flash?
   YES - Initialize the OPDS unit. If problem is still present, replace the OPDS sensor/seat-back cover/pad. ■
   NO - Faulty gauge control module; replace the gauge control module. ■

Side airbag cutoff indicator does not come on

NOTE:

- If the SRS indicator also stays on, go to SRS indicator stays on, but no DTCs are stored.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
2. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the side airbag cutoff indicator come on?
   YES - Intermittent failure, the system is OK at this time.
   NO - Go to Step 3 .
3. Connect the HDS to the data link connector (DLC).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
5. Do the gauge control module self diagnostic function.

   Does the side airbag cutoff indicator come on?
   YES - Faulty SRS unit; replace the SRS unit. ■
   NO - Faulty gauge control module; replace the gauge control module. ■

SRS Symptom Troubleshooting - Faulty front seat belt reminder indicator

Faulty Front Seat Belt Reminder Indicator

NOTE: Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not latest, update the SRS unit software.

1. Observe these precautions:
   - Unbuckle the right seat belt.
   - Unbuckle the left seat belt.
   - Make sure nothing is on or under the seat.
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it dose not communicate, troubleshoot the DLC circuit.
5. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the PARAMETER INFORMATION Menu, select "SRS PSS", and read the HDS indicated.

   Is OFF indicated on the HDS?
   YES - Go to Step 8 .
   NO - Go to Step 6 .
6. Disconnect the floor wire harness 3P connector (A) from the front passenger's seat sitting switch.
7. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the PARAMETER INFORMATION Menu, select "SRS PSS", and read the HDS indicated.

   Is ON indicated on the HDS?
   YES - Short to ground in the floor wire harness; replace the faulty harness.■
   NO - Faulty front passenger's seat sitting switch.■
8. Observe these precautions:
   - Unbuckle the right seat belt.
   - Unbuckle the left seat belt.
   - I make it the state that people more than 45 kg in weight sit down on in front passenger's seat.
9. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the PARAMETER INFORMATION Menu, select "SRS PSS", and read the HDS indicated.

   Is ON indicated on the HDS?
   YES - Go to Step 10 .
   NO - Go to Step 11 .
10. Check the front seat belt reminder indicator.

    Does the front seat belt reminder indicator stay on?
    YES - Faulty gauge control module.■
    NO - Faulty SRS unit or poor connection at SRS unit connector B (39P) and SRS unit or poor connection at front passenger's seat belt sitting switch 3P connector and front passenger's seat sitting switch. Check the connection; if connection is OK and DTC is not indicated, replace the SRS unit. ■

11. Disconnect the floor wire harness 3P connector (A) from the front passenger's seat sitting switch.
12. Install a jumper wire between the No. 1 terminal and the No. 2 terminal of the floor wire harness 3P connector.
13. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the PARAMETER INFORMATION Menu, select "SRS PSS", and read the HDS indicated.

    Is ON indicated on the HDS?
    YES - Faulty front passenger's seat sitting switch; replace the front seat cushion cover/pad.
    NO - Open in the floor wire harness; replace the faulty wire harness.■

SRS Component Replacement/Inspection After Deployment

NOTE:

- Before doing any SRS repairs, check the DTCs, for the less obvious deployed components (seat belt tensioners, front impact sensors, side airbag sensors, etc.).
- Do not replace the OPDS unit unless it is physically damaged or a specific fault was found during DTC troubleshooting.

After a collision where the seat belt tensioners deployed, replace these items:

- SRS unit
- Seat belt tensioners
- Front impact sensors

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed airbag(s)
- Seat belt tensioners
- Front impact sensors

After a collision where the side airbag(s) deployed, replace these items:

- SRS unit
- Deployed side airbag(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Center pillar lower trim
- Complete seat frame

After a collision where a side curtain airbag has deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Seat belt tensioner(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Front pillar trim
- Center pillar upper trim
- Quarter pillar trim
- Headliner
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor

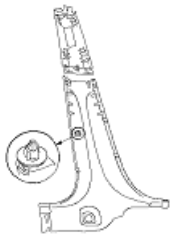
After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. Replace the components as needed.
During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel.

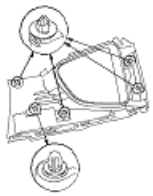
After the vehicle is completely repaired, turn the ignition switch to ON (II). If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS to read the DTC. If you cannot retrieve a code, do the SRS Symptom Troubleshooting.

Front pillar trim

Center pillar trim



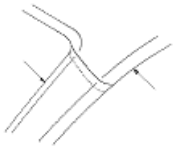
Quarter pillar trim



Checking and Adjusting the Headliner/Pillar Trim Overlap

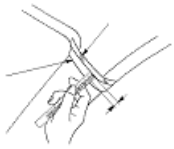
To prevent the side curtain airbag from deploying and damaging the pillar trim, the overlap between the headliner and pillar trim must be less then 8 mm (0.3 in.). To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).

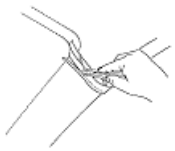


2. Using masking tape on the headliner, mark the upper edge of each pillar trim.

3. Remove the pillar trim, and measure the headliner overlap.
   - If the overlap is less than 8 mm (0.3 in.), remove the tape, and install the pillar trim.
   - If the overlap is more than 8 mm (0.3 in.), go to Step 4 .



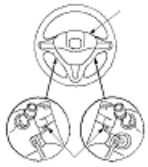
4. Carefully trim the headliner with a utility knife, reducing the overlap to less than 8 mm (0.3 in.).
5. Remove the tape, and install the pillar trim.



Driver's Airbag Replacement

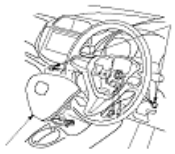
Removal

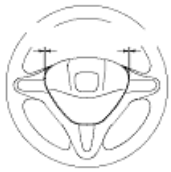
1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) and horn switch 1P connector (C) from the cable reel.



3. Using a TORX T30 bit, remove the two TORX bolts (A).
4. Remove the driver's airbag (B).

Installation





1. Place the driver's airbag (A) in the steering wheel, and secure it with new TORX bolts (B).
   NOTE: Make sure the clearance (C) between the steering wheel and horn pad is the specified value.

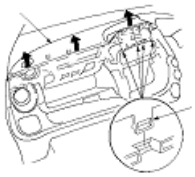
2. Connect the driver's airbag 4P connector (A) and horn switch 1P connector (B) of the cable reel, then install the access panel (C) on the steering wheel.
3. Do the battery terminal reconnection procedure.
4. Connect the HDS, and clear the DTCs.
5. After installing the airbag, confirm proper system operation:
   - Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.
   - Make sure the horn and turn signal switches work properly.
   - Make sure the steering wheel switches work properly.

Front Passenger's Airbag Replacement

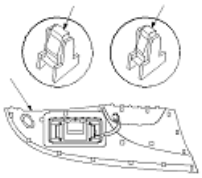
Removal

1. Do the battery terminal disconnection procedure, then wait for 3minutes before starting work.
2. Remove these items:
   - The glove box is lowered
   - Passenger's tray lid
   - Passenger's side vent
   - Center vent
   - Audio unit
3. Remove the connector clip, then disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness (B).

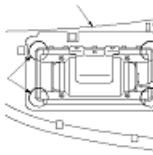
4. Remove the screw (A) from the passenger's lid.
5. Remove the three mounting bolts (B) from the bracket.



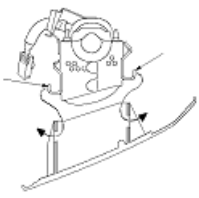
6. Release the hooks (A), of the front passenger's lid (B) from the Audio panel.
7. Pull up the front edges of the front passenger's lid to release the hooks (C).



8. Remove the front passenger's airbag assembly (A) out of the dashboard. If you are replacing only the front passenger's lid, go to Step 8 .
   NOTE: The front passenger's lid has pawls (B, C) on each side which attach it to the dashboard.



9. Cut the four parts (A) of the front passenger's lid (B) as shown, and remove the front passenger's airbag.
   NOTE:
   - Always replace the front passenger's lid whenever you remove the airbag from the panel.
   - Replace the airbag if the airbag mounting hooks or its housing is damaged.



10. Insert the hooks (A) of the front passenger's airbag housing into the new front passenger's lid, then insert the other hooks (B) into the panel.
    NOTE:
    - Make sure there are no objects between the airbag and the front passenger's lid.
    - Make sure the airbag is fully seated, and make sure the front passenger's lid is not deformed or damaged after the airbag is in place.
    - Do not use tools when detaching the front passenger's airbag in order to protect it.

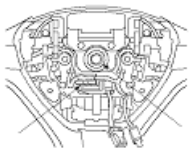
Installation

1. Place the front passenger's airbag assembly (A) into the dashboard. Torque the front passenger's airbag mounting bolts (B).
2. Install the screws (C) from the front passenger's lid.

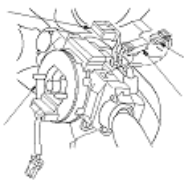
3. Connect the front passenger's airbag 4P connector (A) to the dashboard wire harness (B), then connect the connector clip. Reinstall the glove box.
4. Do the battery terminal reconnection procedure.
5. Connect the HDS and clear the DTCs.
6. After installing the airbag, confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.

Cable Reel Replacement

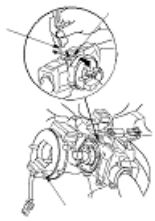
Removal



1. Make sure the front wheels are aligned straight ahead.
2. Do the battery terminal disconnection procedure, then wait for 3 minutes.
3. Remove the driver's airbag.
4. Disconnect the connector (A) from the cable reel, then remove the steering wheel bolt (B).
5. Confirm that the front wheels point straight ahead, then remove the steering wheel with a steering wheel puller. Do not tap on the steering wheel or steering column shaft when removing the steering wheel.
6. Remove the column cover.

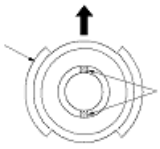


7. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector (B), then disconnect the dashboard wire harness 20P connector (C) from the cable reel (D).

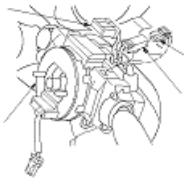


8. Release the lock tab (A) under the cable reel connector with a 90 ° hook shaped tool (B). Slide the tool below the cable reel connector just above the lock tab. Release the lower lock tab (C), and slide the cable reel off the column.

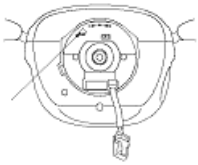
Installation



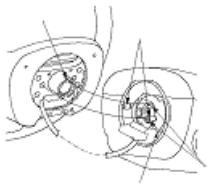
1. Before installing the steering wheel, align the front wheels straight ahead.
2. If not already done, disconnect the negative cable from the battery, then wait for 3 minutes.
3. Set the turn signal canceling sleeve (A) so that the projections (B) are aligned vertically.



4. Carefully install the cable reel (A) on the steering column shaft. Then connect 20P connector (B) to the cable reel, and connect the cable reel 4P connector (C) to the dashboard wire harness 4P connector (D).
5. Install the column covers.

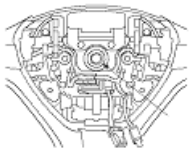


6. If necessary, center the cable reel (New replacement cable reels come centered.). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise (about three turns) until the arrow mark (A) on the cable reel label points straight up.



7. Position the two tabs (A) of the turn signal canceling sleeve (B) as shown, and install the steering wheel on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.

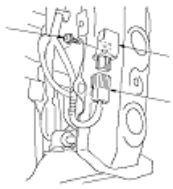
8. Install and torque a new steering wheel bolt (A), then reconnect the connectors.



9. Install the driver's airbag.
10. Do the battery terminal reconnection procedure.
11. Connect the HDS and clear any DTCs.
12. After installing the cable reel, confirm proper system operation:
    - Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds, and then go off.
    - After the SRS indicator has turned off, turn the steering wheel fully left and right to confirm the SRS indicator does not come on.
    - Make sure the horn and turn signal switches work properly.
    - Make sure the steering wheel switches work properly.

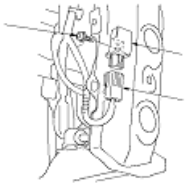
Front Impact Sensor Replacement

Removal



1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Disconnect the driver's airbag 4P connector, the front passenger's airbag 4P connector, and both seat belt tensioner 4P connectors.
3. Remove the front bumper.
4. Disconnect the engine compartment wire harness 2P connector (A). Using a TORX T30 bit, remove the TORX bolt (B), then remove the front impact sensor (C).

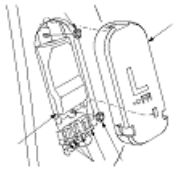
Installation



1. Install the front impact sensor with a new TORX bolt (A), then connect the engine compartment wire harness 2P connector (B) to the front impact sensor (C).
2. Reconnect the driver's airbag 4P connector, the front passenger's airbag 4P connector, and both seat belt tensioner 4P connectors.
3. Do the battery terminal reconnection procedure.
4. Confirm proper SRS operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.
5. Reinstall all removed parts.

OPDS Unit Replacement

Removal



1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Disconnect the front passenger's side airbag harness 2P connector.
3. Remove the front passenger's seat assembly.
4. Remove the seat-back cover/pad.
5. Remove the cover (A), then disconnect the OPDS unit 18P connector (B) and sensor connectors (C) from the OPDS unit (D).
6. Remove the two nuts (E) and the OPDS unit.

Installation

1. Place the OPDS unit (A) on the seat-back frame. Tighten the new nuts (B), and connect the OPDS unit harness 18P connector (C) and sensor connectors (D) to the OPDS unit. Reinstall the cover (E).
2. Install the seat-back cover/pad.
3. Install the front seat assembly, then connect the front passenger's side airbag harness 2P connector.
4. Do the battery terminal reconnection procedure.
5. Set the seat-back in the normal position, and make sure there is nothing on the front passenger's seat.
6. Initialize the OPDS unit.
7. Confirm proper SRS operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.

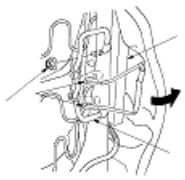
OPDS Unit Initialization

When a seat-back cover/pad and/or OPDS unit is replaced, initialize the OPDS by doing this procedure.
NOTE: A new (uninitialized) OPDS unit installed with a faulty OPDS sensor can cause DTC 85-71 or 85-78.

1. Clear the DTC memory.
2. Make sure the front passenger's seat is dry. Set the seat-back in a normal position, and make sure there is nothing on the seat.
3. Make sure the ignition switch is in LOCK (0).
4. Connect the HDS to the data link connector (DLC) (A).
5. Turn the ignition switch to ON (II).
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
7. From the HDS Main Menu, select SRS, then SRS, then Calibration. In the Calibration Menu, select OPDS UNIT INITIALIZATION. Follow the screen prompts to initialize the OPDS unit.
8. Turn the ignition switch to LOCK (0).
9. Disconnect the HDS from the DLC.
   NOTE: If the OPDS unit fails to initialize after several attempts, replace the OPDS sensor/seat-back and retry. If the OPDS unit continues to fail to initialize, replace the OPDS unit.

Side Airbag Replacement

Removal



1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the front seat assembly.
3. Pull out the seat-back cover/pad as needed.
4. Release the rear hooks (A) from seat-back frame (B).
5. Remove the mounting nut (C) and the side airbag (D).

Installation

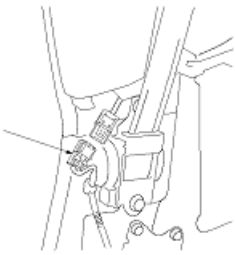
NOTE:

- If the side airbag lid is secured with tape, remove the tape.
- Do not open the lid on the side airbag cover.
- Use new mounting nut tightened to the specified torque.
- Make sure that the seat-back cover/pad is installed properly. Improper installation may prevent proper deployment.
- Be sure to install the harness so that they are not pinched or interfering with other parts.

1. Place the side airbag (A) on the seat-back frame. Torque the new side airbag mounting nut (B).
2. Install the rear hooks (C) in the seat-back frame (D).
3. Install the seat-back cover/pad.
4. Install the front seat assembly. then connect the floor wire harness 2P connector.
5. Move the front seat and the seat-back through their full ranges of movement, making sure the harness are not pinched or interfering with other parts.
6. Do the battery terminal reconnection procedure.
7. Connect the HDS, and clear the DTCs.
8. After installing the side airbag, confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.

Side Curtain Airbag Replacement

Removal

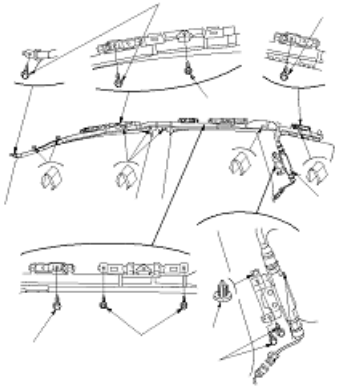


NOTE:

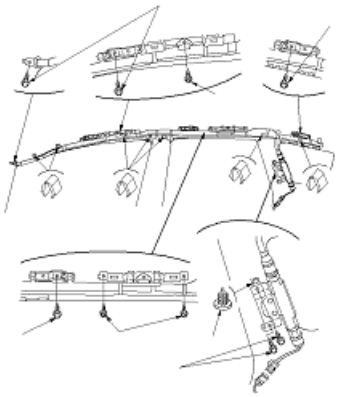
- Review the interior trim replacement procedure before doing repair or service.
- Removal of the side curtain airbag must be done according to Precaution and Procedures.
- The side curtain airbag system consists of many components. When the side curtain airbag has been deployed, go to Component Replacement/Inspection After Deployment, and replace all of the parts listed.

1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the cargo area side trim panel.
3. Disconnect the floor wire harness 2P connectors (A) from the side curtain airbags.
4. Remove the headliner.

5. Remove the side airbag mounting bolts (A) and mounting screws (B) from the bracket. Detach the clip (C), then remove the side curtain airbag (D).



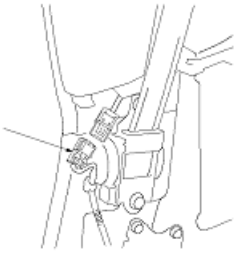
Installation



NOTE:

- Installation of the side curtain airbag must be done according to the Precautions and Procedures.
- If the airbag is frayed, or has any other visible damage, replace it. Do not attempt to repair an airbag.
- When you install the airbag, make sure it is not twisted, and that it is not caught between the inflator bracket by the bracket bolts.
- Make sure that the side curtain airbag inflator retainer is installed properly. Otherwise the airbag could incorrectly deploy and cause damage or injuries.
- Make sure you have the slack or no cutting and peeling. If tape has slack or cutting, and peeling side curtain airbag should be replacement.

1. Place the side curtain airbag assembly on the side of the roof, and fit its clip (A) into the holes in the body. Tighten the new side curtain airbag mounting bolts (B) and mounting screws (C).



2. Connect the floor wire harness 2P connectors (A) to the side curtain airbags.
3. Do the battery terminal reconnection procedure.
4. Connect the HDS, and clear the DTCs.
5. After installing the side curtain airbag, confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.
6. Install all removed parts.
7. Confirm proper headliner/pillar trim overlap.

Side Impact Sensor (Second) Replacement

Removal

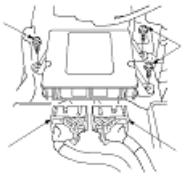
1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the cargo area side trim panel.
3. Disconnect the floor wire harness 2P connector (A) from the side impact sensor (second) (B).
4. Using a TORX T30 bit, remove the TORX bolt (C) then remove the side impact sensor (second).

Installation

1. Install the side impact sensor (second) with a new TORX bolt (A), then connect the floor wire harness 2P connector (B) to the side impact sensor (second) (C).
2. Do the battery terminal reconnection procedure.
3. Confirm proper SRS operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds, and then go off.
4. Reinstall all removed parts.

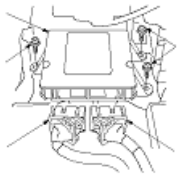
SRS Unit Replacement

Removal



1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the center console.
3. Remove the rear heater joint duct.
4. Disconnect SRS unit connectors A (39P) and B (39P) from the SRS unit.
5. Remove the TORX bolts (C) using a TORX T30 bit, then pull out the SRS unit.

Installation



1. Install the SRS unit (A) with a new TORX bolts (B), then connect the connectors (C) to the SRS unit; push them into position until they click.
   NOTE: Be sure the SRS unit is sitting squarely against it's bracket before torquing the TORX bolts.
2. Do the battery terminal reconnection procedure.
3. Confirm proper SRS operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.
4. Reinstall all removed parts.

SRS Unit Update

Special Tools Required

- Honda diagnostic system (HDS) table tester
- Honda interface module (HIM) and an iN workstation with HDS and CM update software
- HDS pocket tester
- GNA600 and an iN workstation with HDS and CM update soft ware (Any one of the update tools above will work)

NOTE:

- Use this procedure when you need to update the SRS unit at anytime.
- Make sure the HDS/HIM has the latest software version.
- Before you update the SRS unit, make sure the battery in the vehicle is fully charged.
- Never turn the ignition switch to LOCK (0) or ACC (I) during the update. If there is a problem with the update, leave the ignition switch in the ON (II).
- To prevent SRS unit damage, do not operate anything electrical (headlights, audio system, brakes, A/C, power windows, moonroof (if equipped), door locks, etc.) during the update.
- To ensure the latest program is installed, do an SRS unit update whenever the SRS unit is replaced.
- You cannot update an SRS unit with a program it already has. It will only accept a new program.
- If you need to diagnose the HIM because the HIM's red (#3) light came on or was flashed during the update, leave the ignition switch in the ON (II) position when you disconnect the HIM from the data link connector (DLC). This will prevent SRS unit damage.

1. Connect the HDS to the DLC (A).
2. Turn the ignition switch to ON (II), but do not start the engine.
3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
4. Select the update program, and follow the screen prompts to update the SRS unit.
5. If the software in the SRS unit is the latest, disconnect the HDS/HIM from the DLC, and go back to the procedure that you were doing. If the software in the SRS unit is not the latest, follow the instructions on the screen.
   NOTE: If you run into a problem during the update procedure (programming takes over 15 minutes, status bar goes over 100 %, D or immobilizer light flashes, HDS tablet freezes, etc.), follow these steps to minimize the chance of damaging the SRS unit :
   - Leave the ignition switch in the ON (II) position.
   - Connect a jumper battery (do not connect a battery charger).
   - Shut down the HDS.
   - Disconnect the HDS from the DLC.
   - Reboot the HDS.
   - Reconnect the HDS to the DLC, and try the update procedure again.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the HDS from the DLC.

Audio System Description

[Overview](#)
[Audio Unit Connector for Inputs and Outputs](#)
[USB Adapter Connector for Inputs and Outputs](#)

Poor AM or FM radio reception or interference

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.
- Check the radio reception in an open area.
- Compare it to a known-good vehicle of the same model, year, and trim level whenever possible.
- If necessary, have the customer demonstrate the symptom.
- Poor reception/interference can be caused by the following:
  - The radio station is far away.
  - Atmospheric conditions are unfavorable.
  - Tall buildings, mountains, or high-voltage power lines are nearby.
  - Non-standard antenna element.

1. Check if the radio reception/interference is the same as the known-good vehicle in several locations.

   Is the reception/interference the same?
   YES - Go to Step 2 .
   NO - Multipath interference or weak station. Operation is normal.■

2. Check the reception/interference while the engine is running, and compare it to the known-good vehicle.

   Is there noise (static or whine) only with the engine running?
   YES - Check the antenna and radio grounds. If OK, check the charging system, fuel injection system (fuel pump), HVAC (blower motor), and the ignition system.■
   NO - Go to Step 3 .

3. Make sure turn the ignition switch to LOCK (0).

4. Check the AM/FM antenna element for cracks, or other damage. Make sure that the AM/FM antenna element isn't loose.
   NOTE: Do not use any tools to tighten the AM/FM antenna element.

   Is there any damage?
   YES - Replace the AM/FM antenna element. ■
   NO - Go to Step 5 .

5. Disconnect AM/FM antenna 3P connector.

6. Turn the ignition switch to ON (II).

7. Turn on the audio unit.

8. Measure the voltage between the AM/FM antenna 3P connector No. 3 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 14 .
   NO - Go to Step 9 .

9. Turn the ignition switch to LOCK (0).

10. Remove the audio unit.

11. Turn the ignition switch to ON (II).

12. Turn on the audio unit.

---

13. Measure the voltage between audio unit connector D (3P) No. 3 terminal and body ground with the audio unit connectors connected.

    Is there battery voltage?
    YES - Repair open or short in the wire between audio unit and AM/FM antenna. Also check the AM/FM antenna lead/sublead connector.■
    NO - Replace the audio unit. ■

14. Turn the ignition switch to LOCK (0).

15. Remove the audio unit, and disconnect audio unit connector D (3P).

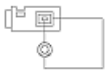
---

16. Check for continuity between audio unit connector D (3P) terminal No. 1 and body ground.

    Is there continuity?
    YES - Replace the AM/FM antenna lead and/or sublead.■
    NO - Go to Step 17 .

---

17. Check for continuity between audio unit connector D (3P) No. 1 and No. 2 terminals.



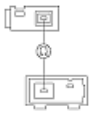
Is there continuity?

YES - Replace the AM/FM antenna lead and/or sublead.■

NO - Go to Step 18 .

---

18. Check for continuity between audio unit connector D (3P) No. 1 terminal and the AM/FM antenna 3P connector No. 1 terminal.



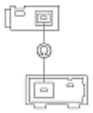
Is there continuity?

YES - Go to Step 19 .

NO - Replace the AM/FM antenna lead and/or sublead.■

---

19. Check for continuity between audio unit connector D (3P) No. 2 terminal and the AM/FM antenna 3P connector No. 2 terminal.



Is there continuity?

YES - Substitute a known-good AM/FM antenna and recheck. If the reception is still poor, replace the audio unit. ■

NO - Replace the AM/FM antenna lead and/or sublead.■

Audio System Symptom Troubleshooting - Volume does not change

Volume does not change

NOTE: Set the fader and balance positions to the center.

1. Turn on the audio unit, and listen for sound from the speakers.

   Is the sound normal?
   YES - Go to Step 2 .
   NO - Go to audio system sound is weak or distorted, or no sound is heard from speakers. ■

2. Operate the volume knob to see if the volume changes.

   Does the volume change?
   YES - Operation is normal at this time.■
   NO - Replace audio unit. ■

Audio disc does not load

NOTE:

- CD labels should not be used in the audio unit. They may damage the player mechanism.
- Make sure the CD is compatible with the system (see the owner's manual for more information).

1. Insert a known-good CD to see if the symptom can be duplicated.

   Does the CD load?
   YES - Operation is normal. If the disc loads normally, but will not play, go to audio disc does not play. ■
   NO - Go to Step 2 .

2. Insert another CD.

   Does the CD load?
   YES - The original CD is faulty.■
   NO - Replace audio unit. ■

Audio disc does not play

1. Try loading a known-good CD.

   Does the CD load?
   YES - Go to Step 2 .
   NO - Go to audio disc does not load. ■

2. Insert another known-good CD to see if the symptom can be duplicated.

   Does the CD play?
   YES - Operation is normal.■
   NO - Replace the audio unit. ■

Audio System Symptom Troubleshooting - Audio disc skips

Audio disc skips

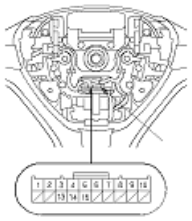
1. Confirm the vehicle's tyres are properly inflated with no cupping or flat spots.
2. Check the customers CD for scratches, fingerprints, and marks.
   NOTE: The following test should be done with audio unit bass and treble set to customers listening performance.
   When comparing to known-good vehicles, the comparison should be done on same model and trim level.
3. Compare the customer's CD that is skipping in a known-good vehicle under the same conditions.

   Does the CD skip in the known-good vehicle under the same conditions?
   YES - Operation is normal.■
   NO - Replace the audio unit. ■

AM/FM Antenna Replacement

1. Remove the AM/FM antenna element (A).
2. Remove the AM/FM antenna base (B).
   -1. Remove the quarter pillar trim and disconnect the connector (C).
   -2. Remove the headliner and detach the clip (D).
   -3. Remove the nut (E) from the AM/FM antenna base and remove it.
3. Install the antenna in the reverse order of removal.

Audio Remote Switch Test



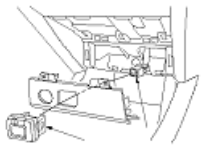
1. Remove the driver's airbag assembly.
2. Disconnect the cable reel 20P connector (A).
3. Measure the resistance between the No. 3 and No. 7 terminals in each switch position according to the table.

Position	Resistance
No button pressed	About 10 kΩ
MODE	About 3.7 kΩ
CH (+)	About 1.7 kΩ
CH (−)	About 775 Ω
▲ (VOL.UP)	About 357 Ω
▼ (VOL.DOWN)	About 100 Ω

4. If the resistance is not as specified, replace the audio remote switch.

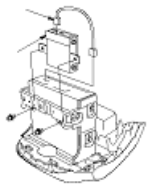
USB Adapter Holder Replacement

1. Remove the center lower trim.
2. Remove the 5P connector (A) from the USB adapter holder (B).
3. Push out the USB adapter holder from the center lower trim.
4. Install the holder in the reverse order of removal.



USB Adapter Unit Replacement

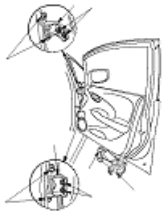
1. Remove the audio unit.
2. Disconnect the connector (A) from the USB adapter unit (B).
3. Remove the bolts and the USB adapter unit.
4. Install the unit in the reverse order of removal.



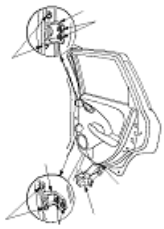
Door Position Adjustment

NOTE: Check for a flush fit with the body, then check for equal gaps between the front, rear, and bottom door edges and the body. Check that the door and body edges are parallel.

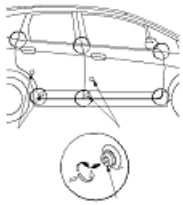
Front door



Rear door

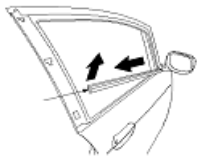


1. Place the vehicle on a firm, level surface when adjusting the doors.
2. Adjust at the hinges (A):
   - Pad a floor jack (B) with shop towels (C), then use the jack to support the door to prevent damage to the door while adjusting it.
   - On the front door: Remove the front inner fender. Loosen the hinge mounting bolts (D) slightly, and move the door backward or forward, up or down as necessary to equalize the gaps.
   - On the rear door: Loosen the hinge mounting bolts (E) slightly, and move the door backward or forward, up or down as necessary to equalize the gaps.
3. If necessary, replace the door mounting bolts with the adjusting bolts (P/N 90102-SFA-305) made specifically for door adjustment, then adjust at the door: Loosen the door mounting bolts (F) slightly, and move the door up or down as necessary to equalize the gaps, and move it in or out until it's flush with the body.



4. Check that the door and body edges are parallel. If necessary, adjust the door cushions (A) to make the rear of the doors flush with the body.
5. Apply touch-up paint to the hinge mounting bolts, and around the hinges.
6. Check for water leaks.

Front Door Glass Outer Weatherstrip Replacement



NOTE:

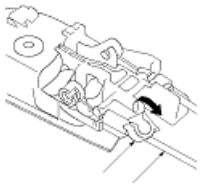
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

1. Lower the glass fully.
2. Remove the door sash outer trim.
3. While lifting the rear of the door glass outer weatherstrip (A), slide the weatherstrip rearward, then remove the weatherstrip.
4. Install the weatherstrip in the reverse order of removal, and note these items:
   - Push the weatherstrip into place securely.
   - Make sure that there is no clearance between the rear edge of the weatherstrip and door sash outer trim.

Front Door Latch Replacement - Without Super Locking

NOTE:

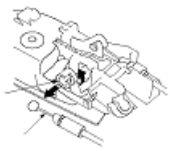
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.



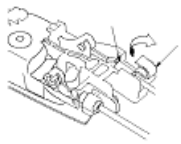
Latch Replacement

1. Raise the glass fully.
2. Remove the door panel.
3. Disconnect the power door lock actuator connector.
4. Remove the plastic cover, as needed.
5. Detach the latch cable fastener (A) from the latch cable (B).

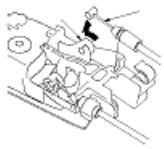
6. Disconnect the latch cable (A) from the lock knob (B).



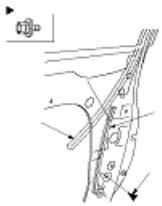
7. Detach the inner handle cable fastener (A) from the inner handle cable (B).



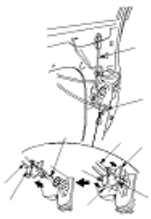
8. Disconnect the inner handle cable (A) from the lock knob (B).



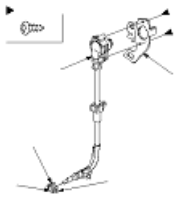
9. Pull the glass run channel (A) away as needed, and remove the bolt, then remove the center lower channel (B).



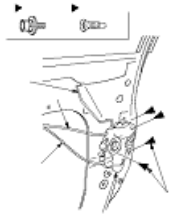
10. Driver's door. Pull both side flanges (A) of the retainer (B) outward, and pull the middle flange portion (C) of the outer casing cover (D) out, then disconnect the cylinder cable (E) from the latch.



11. If necessary, remove the front door outer handle and the special screws, then separate the door cylinder (A) and outer handle protector (B). If the retainer (C) is damaged, release the hooks (D), and replace it.
NOTE: If removed, the special screws must be replaced.



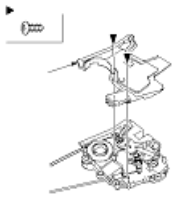
12. Disconnect the outer handle rod (A).
13. Remove the bolt (B) and the screws (C) securing the latch (D), then remove the latch through the hole in the door.
NOTE: Take care not to bend the outer handle rod, the latch cable (E), and the inner handle cable (F).
14. Install the latch in the reverse order of removal, and note these items:
    - Make sure the actuator connector is plugged in properly, and each rod is connected securely.
    - Make sure the door locks and opens properly.
    - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
    - Check for water leaks.



Cable Replacement

1. Remove the door latch.
2. Remove the screw(s), then remove the latch protector (A).

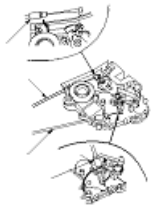
Indonesia-produced models



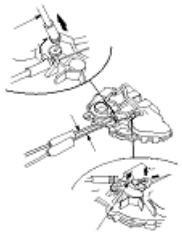
Thailand-produced models

3. Disconnect the latch cable (A) and inner handle cable (B).
4. Install the cables in the reverse order of removal, and note these items:
   - Make sure the latch cable and inner handle cable are connected securely.
   - Make sure the door locks and opens properly.
   - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
   - Check for water leaks.

Indonesia-produced models



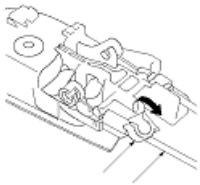
Thailand-produced models



Front Door Latch Replacement - With Super Locking

NOTE:

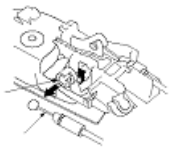
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.



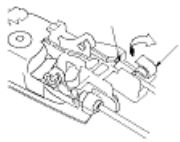
Latch Replacement (with Super Locking)

1. Raise the glass fully.
2. Remove the door panel.
3. Disconnect the power door lock actuator connector.
4. Remove the plastic cover, as needed.
5. Detach the latch cable fastener (A) from the latch cable (B).

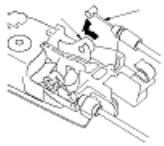
6. Disconnect the latch cable (A) from the lock knob (B).



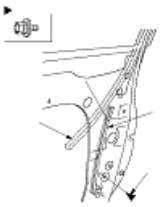
7. Detach the inner handle cable fastener (A) from the inner handle cable (B).



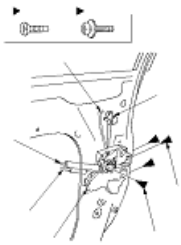
8. Disconnect the inner handle cable (A) from the lock knob (B).



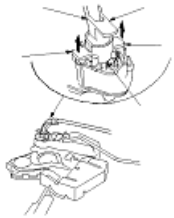
9. Pull the glass run channel (A) away as needed, and remove the bolt, then remove the center lower channel (B) by pulling it downward.



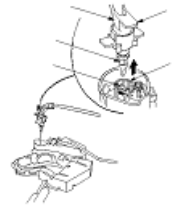
10. Remove the screws (A, B) securing the latch (C), then remove the latch through the hole in the door. Take care not to bend the outer handle rod (D), the cylinder cable (E) (driver's door), the latch cable (F), and the inner handle cable (G).



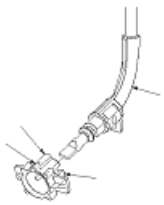
11. Driver's door: While pressing a middle flange portion (A) of the outer casing cover (B) against the latch, pull both outside flanges (C) of the retainer (D) upward.



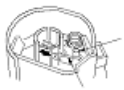
12. Driver's door: Pull the middle flange portion (A) of the outer casing cover (B) up, then disconnect the cylinder cable (C) from the latch.
NOTE: As soon as the cable comes off the latch, the shutter (D) goes down into the connector (E).

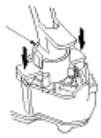


13. Driver's door: If the retainer (A) of the lock cylinder cable (B) is damaged, release the hooks (C), then replace it.



14. Install the latch in the reverse order of removal, and note these items:
    - Make sure the actuator connector is plugged in properly and each rod is connected securely.
    - Make sure the door locks and opens properly.
    - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
    - Cylinder cable installation: Before installing the cylinder cable (A) to the latch, hang the elbow of the shutter (B) on the boss (C) as shown. Next install the cylinder cable fully into the connector (D), then push the retainer (E) until it snaps to engage the latch and the door cylinder securely. Make sure the elbow of the shutter is on the boss.

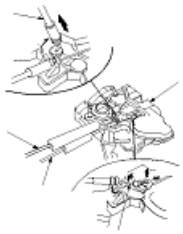




Cable Replacement

1. Remove the screw, then remove the latch protector (A) by releasing the hook (B).

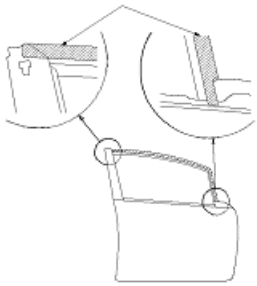
2. Detach the latch cable (A) and the inner handle cable (B) from the latch (C).

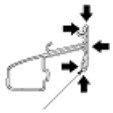


3. Install the cable in the reverse order of removal.
    - Make sure the latch cable and inner handle cable are connected securely.
    - Make sure the door locks and opens properly.
    - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.

Front Door Channel Tape Replacement

NOTE:





- Keep dust away from the working area.
- When working at lower temperatures, heat the door channel and door channel tape with a hair dryer.
  Door channel: about 15 °C (59 °F).
  Door channel tape: about 30 °C (86 °F).
- When heating the door channel tape, heat it evenly and gradually to prevent deformation.
- When pressing the door channel tape, slowly press it from the corner to prevent air bubbles and wrinkles.
- If there are air bubbles in the door channel tape, release the air with your finger or a plastic squeegee.
- If the air bubble is more than 10 mm (0.4 in.) in diameter, peel up the door channel tape, then reapply it.
- RHD model is shown; LHD model is symmetrical.

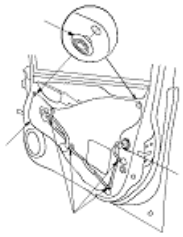
1. The following tools are required to replace the door channel tape:
   - Plastic squeegee
   - Isopropyl alcohol
   - Sponge or shop towel
   - Hair dryer
2. Remove these items:
   - Power mirror
   - Front door glass outer weatherstrip
   - Front door weatherstrip, as needed
   - Glass run channel, as needed
   - Front door sash outer trim
3. Slowly peel up the old door channel tape while heating it with a hair dryer.
4. Clean the door channel bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
5. Attach the door channel tape.
   -1. Peel the edge of the adhesive backing from the channel tape.
   -2. Fit the door channel tape to the door channel.
   -3. Apply the door channel tape to the door channel while peeling the adhesive backing from it a little at a time. Check that the channel tape is parallel with the door channel.
   -4. Push firmly on the door channel tape with a plastic squeegee (felt side).
   NOTE: To prevent air bubbles, slowly press the door channel tape around the door frame corner.
6. As necessary, repeat the preceding steps.
7. Reinstall all remaining removed parts.
8. Check that the body color on the door channel is covered by the door channel tape.
9. Check for water leaks.

Attachment Point (Reference)

Front Door Outer Handle Replacement

NOTE:

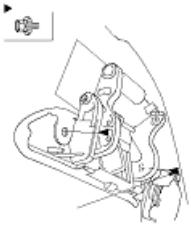
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- When removing components, use the trim tools or equivalent.



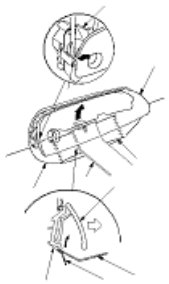
1. Remove the door panel.
2. Raise the glass fully.
3. Disconnect the power door lock actuator connector (A), and detach the harness clips (B).
4. Remove the plug caps (C), then remove the plastic cover (D) as needed.

5. Detach the rod fastener (A), then disconnect the outer handle rod (B) with a clip remover.

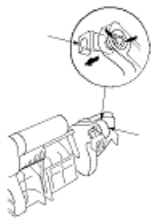
6. Remove the bolts.



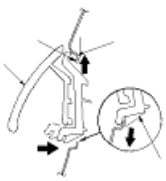
7. Remove the outer handle (A).
   -1. Release the hook (B) of the outer handle protector (C).
   -2. Apply protective tape (D) to the door panel (E) as shown.
   -3. Pry out the outer handle with the appropriate trim tool (F) to release the hook (G), then remove it.
   NOTE: Take care not to scratch the door.



8. Remove the rod fastener (A) from the outer handle base (B), then replace it with a new one.



9. Install the handle (A) in the following order.
   -1. Set the upper portion (B) of the handle to the edge (C) of the door panel.
   -2. While pulling up the handle, push the lower hook (D) into place.
   NOTE: Push the hook into place securely.



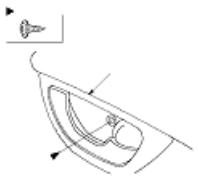
10. Install the removed parts in the reverse order of removal, and note these items:
    - Make sure that the actuator connector is plugged in properly, and that the outer handle rod are connected securely.
    - Make sure the door handle works properly.

Front Door Panel Removal/Installation

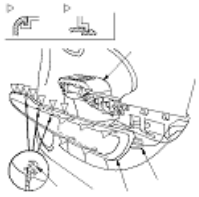
NOTE:

- RHD model is shown; LHD model is symmetrical.
- Take care not to scratch the door and related parts.
- When removing components, use the trim tools or equivalent.

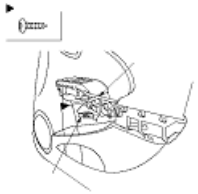
1. Remove the screw securing the inner handle (A).



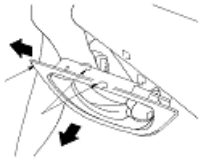
2. Remove the grip cover (A).
   -1. Using a flat-tip screwdriver wrapped with protective tape, pry out the front bottom edge of the cover while pushing up the hooks (B).
   -2. From front to rear, pry out along the edge of the cover to release the hooks (C, D) from the power window switch panel (E).
   -3. Release the rear hook (F), while pulling the cover forward.



3. Disconnect the power window switch connector (A). Remove the screw from the grip base (B).

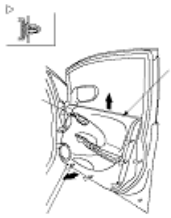


4. Pull the inner handle (A) forward and out half-way to release the hooks (B).



5. Apply protective tape (A) to the door panel (B) as shown.

6. Remove the door panel (A) with as little bending as possible to avoid creasing or breaking it.
   -1. Start at the bottom edge of the door panel, release the clips with a commercially available trim pad remover.
   -2. Detach the upper clips.
   -3. Starting at the rear, pull the door panel upward.
   NOTE: Do not pull the door panel up too far, or the door panel will be damaged by the inner handle (B).



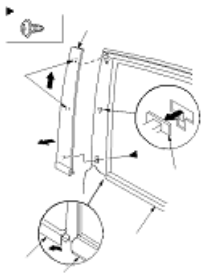
7. Remove the door panel (A) while pulling the inner handle (B) out through the hole in the door panel.

8. Install the door panel in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the connector is plugged in properly.

Front Door Sash Outer Trim Replacement

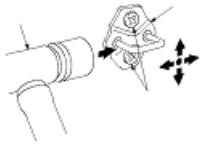
NOTE:

- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.



1. Remove the door sash outer trim (A).
   -1. Remove the screw from inside the door.
   -2. Release the lower edge of the trim from the door glass outer weatherstrip (B).
   -3. Pull the trim up to release the hooks (C) from the door, then remove the trim.
2. Install the trim in the reverse order of removal.

Door Striker Adjustment



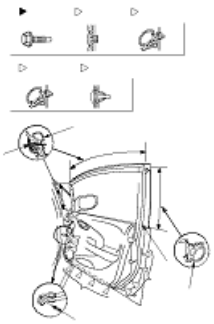
Make sure the door latches securely without slamming it. If necessary, adjust the striker (A): The striker nuts are fixed, but the striker can be adjusted slightly up or down, and in or out.

1. Loosen the screws (B).
2. Wrap the striker with a shop towel, then adjust the striker by tapping it with a plastic hammer (C). Do not tap the striker too hard.
3. Lightly tighten the screws.
4. Hold the outer handle out, and push the door against the body to be sure the striker allows a flush fit. If the door latches properly, tighten the screws and recheck.

Front Door Weatherstrip Replacement

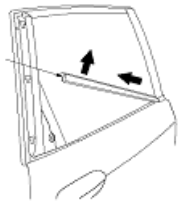
NOTE:

- Take care not to scratch the door and related parts.
- Use a clip remover to remove the clips.
- RHD model is shown; LHD model is symmetrical.



1. At the front pillar, remove the door checker mounting bolt (A).
2. Detach the clips (B, C, D, E), then remove the door weatherstrip (F).
3. Install the weatherstrip in the reverse order of removal and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Make sure the weatherstrip is installed in the holder (G) securely.
   - Apply medium strength type liquid thread lock to door stop mounting bolt before installation.
   - Check for water leaks.

Rear Door Glass Outer Weatherstrip Replacement



NOTE:

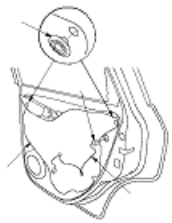
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

1. Lower the glass fully.
2. Remove the rear door rear sash trim.
3. While lifting the rear of the door glass outer weatherstrip (A), slide the weatherstrip rearward, then remove the weatherstrip.
4. Install the weatherstrip in the reverse order of removal, and note these items:
   - Push the weatherstrip into place securely.
   - Make sure that there is no clearance between the front edge of the weatherstrip and door sash outer trim.

Rear Door Latch Replacement

NOTE:

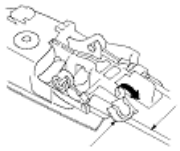
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.



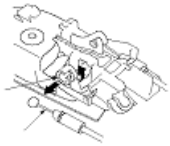
Latch Replacement

1. Raise the glass fully.
2. Remove the door panel.
3. Detach the harness clip (A), then disconnect the power door lock actuator connector (B).
4. Remove the plug caps (C), then remove the plastic cover (D), as needed.

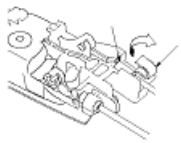
5. Detach the latch cable fastener (A) from the latch cable (B).



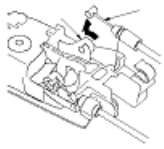
6. Disconnect the latch cable (A) from the lock knob (B).



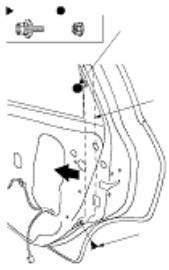
7. Detach the inner handle cable fastener (A) from the inner handle cable (B).



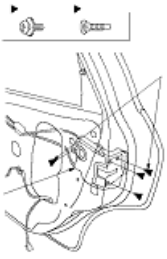
8. Disconnect the inner handle cable (A) from the lock knob (B).



9. Remove the bolt, and loosen the nut, then pull the rear lower channel (A) forward.



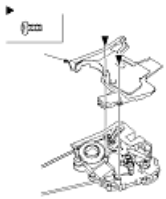
10. Remove the screws (A, B), then remove the latch (C) through the gap between the rear lower channel and door.
    NOTE: Take care not to bend the latch cable, the inner handle cable.
11. Install the latch in the reverse order of removal, and note these items:
    - Make sure the actuator connector is plugged in properly.
    - Make sure the door locks and opens properly.
    - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
    - Check for water leaks.



Cable Replacement

1. Remove the door latch.
2. Remove the screws, then remove the latch protector (A).

Indonesia-produced models



Thailand-produced models

---

3. Disconnect the latch cable (A) and the inner handle cable (B).
4. Install the cable in the reverse order of removal, and note these items:
   - Make sure the latch cable and inner handle cable are connected securely.
   - Make sure the door locks and opens properly.
   - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
   - Check for water leaks.

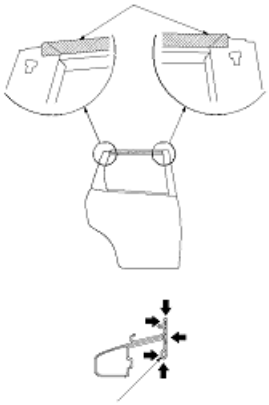
Thailand-produced models

Rear Door Channel Tape Replacement

NOTE:



- Keep dust away from the working area.
- When working at lower temperatures, heat the door channel and door channel tape with a hair dryer.
  Door channel: about 15 °C (59 °F).
  Door channel tape: about 30 °C (86 °F).
- When heating the door channel tape, heat it evenly and gradually to prevent deformation.
- When pressing the door channel tape, slowly press it from the corner to prevent air bubbles and wrinkles.
- If there are air bubbles in the door channel tape, release the air with your finger or a plastic squeegee.
- If the air bubble is more than 10 mm (0.4 in.) in diameter, peel up the door channel tape, then reapply it.

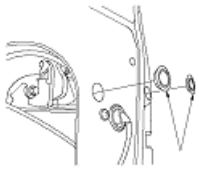
1. The following tools are required to replace the door channel tape:
   - Plastic squeegee
   - Isopropyl alcohol
   - Sponge or shop towel
   - Hair dryer
2. Remove these items:
   - Rear door sash outer trim
   - Rear door rear sash trim
   - Rear door glass outer weatherstrip
   - Glass run channel, as needed
   - Rear door weatherstrip, as needed
3. Slowly peel up the old door channel tape while heating it with a hair dryer.
4. Clean the door channel bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
5. Attach the door channel tape.
   -1. Peel the edge of the adhesive backing from the channel tape.
   -2. Fit the door channel tape to the door channel.
   -3. Apply the door channel tape to the door channel while peeling the adhesive backing from it a little at a time. Check that the channel tape is parallel with the door channel.
   -4. Push firmly on the door channel tape with a plastic squeegee (felt side).
   NOTE: To prevent air bubbles, slowly press the door channel tape around the door frame corner.
6. As necessary, repeat the preceding steps.
7. Reinstall all remaining removed parts.
8. Check that the body color on the door channel is covered by the door channel tape.
9. Check for water leaks.

Attachment Point (Reference)

Rear Door Outer Handle Replacement

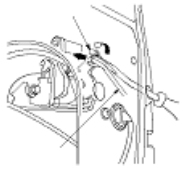
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

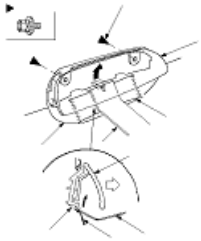


1. Remove the door panel.
2. Raise the glass fully.
3. Remove the plastic cover, as needed.
4. Remove the maintenance caps (A).

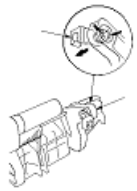
5. Detach the rod fastener (A), then disconnect the outer handle rod (B) with a clip remover.



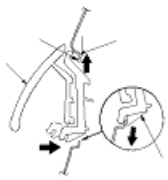
6. Remove the outer handle (A).
   -1. Remove the bolts.
   -2. Apply protective tape (B) to the door panel (C) as shown.
   -3. Pry out the outer handle with the appropriate trim tool (D) to release the hook (E), then remove it.
   NOTE: Take care not to scratch the door.



7. Remove the rod fastener (A) from the outer handle base (B), then replace it with a new one.



8. Install the handle (A) in the following order.
   -1. Set the upper portion (B) of the handle to the edge (C) of the door panel.
   -2. While pulling up the handle, push the lower hook (D) into place.
   NOTE: Push the hook into place securely.

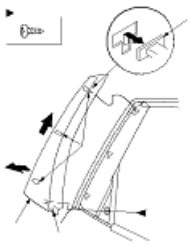


9. Install the removed parts in the reverse order of removal, and note these items:
   - Make sure that the outer handle rod are connected securely.
   - Make sure the door handle works properly.
   - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
   - Check for water leaks.

Rear Door Rear Sash Trim Replacement

NOTE:

- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

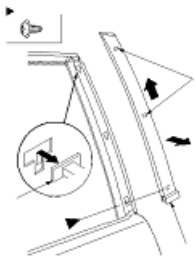


1. Remove the door quarter inner trim.
2. From inside the door, remove the screw.
3. Pull up the door rear sash trim (A) to release the hooks (B, C), then remove it from the door.
4. Install the trim in the reverse order of removal.

Rear Door Sash Outer Trim Replacement

NOTE:

- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

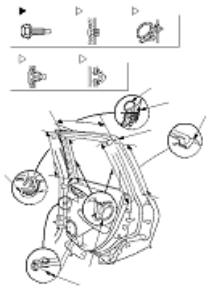


1. Remove these items:
   - Rear door rear sash trim
   - Rear door glass outer weatherstrip
2. Remove the screw from inside the door.
3. Pull the rear door sash outer trim (A) up to release the hooks (B) from the door, then remove the trim.
4. Install the trim in the reverse order of removal.

Rear Door Weatherstrip Replacement

NOTE:

- Take care not to scratch the door and related parts.
- Use a clip remover to remove the clips.
- RHD model is shown; LHD model is symmetrical.

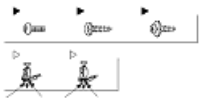


1. Remove these items:
   - Rear door rear sash trim
   - Rear door glass outer weatherstrip
   - Rear door sash outer trim
2. At the center pillar, remove the door checker mounting bolt (A).
3. Detach the clips (B, C, D, E), then remove the door weatherstrip (F).
4. Install the weatherstrip in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Make sure the weatherstrip is installed in the holder (G) securely.
   - Apply medium strength type liquid thread lock to the door stop mounting bolt before installation.
   - Check for water leaks.

Front Bumper Removal/Installation

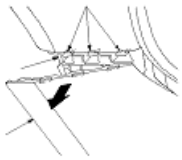
NOTE:

- Put on gloves to protect your hands.
- Have an assistant help you when removing and installing the front bumper.
- Take care not to scratch the front bumper and the body.

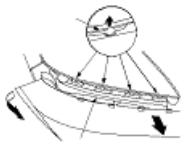


1. Remove the screws (A, B, C) and clips (D, E) securing the front bumper (F).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (G) on its head.

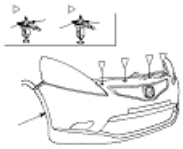
2. Pull on the front bumper (A) at the wheel arch areas to release it from the hooks (B) on the side spacers (C).



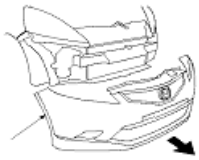
3. With the help of an assistant, release the bumper from the hooks (A) on the upper beam (B).



4. Remove the clips (A, B) securing the front bumper (C).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (D) on its head.



5. Remove the front bumper (A).



6. Install the bumper in the reverse order of removal, and note these items:
   - Make sure the front bumper engages the hooks (of both upper beams and side spacers) on each side securely.
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

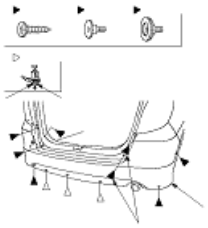
Rear Bumper Removal/Installation

NOTE:

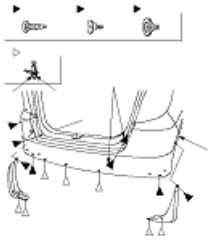
- Put on gloves to protect your hands.
- Have an assistant help you when removing and installing the rear bumper.
- Take care not to scratch the rear bumper and the body.

1. Remove the clips (A), screws (B), and bolts (C, D) securing the rear bumper (E).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (F) on its head.

Without rear splash guard

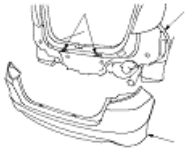


With rear splash guard



2. Pull on the rear bumper (A) at the wheel arch areas to release it from the hooks (B, C) on the side spacers (D).

3. With the help of an assistant, while pulling the wheel arch portion away from the side spacer (A), pull the rear bumper (B) to release the bumper from the hooks (C) on the body.



4. Install the bumper in the reverse order of removal, and note these items:
   - Make sure the rear bumper engages the hooks (of both the side spacers) on each side securely.
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

Rear Bumper Lower Trim Replacement

For Some Models

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the rear bumper.

1. Remove the rear bumper (A).
2. Remove the clips and the hooks (B, C), then remove the rear bumper lower trim (D) from the rear bumper.
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (E) on its head.
3. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

Front Air Spoiler Replacement

For Some Models

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front bumper.

1. Remove the clips securing the air spoiler (A) from under the front bumper (B).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (C) on its head.
2. Pull the front air spoiler back to detach the hooks (D) and remove the spoiler.
3. Install the spoiler in the reverse order of removal:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

Bulkhead Under Spoiler Replacement

For Some Models

NOTE: Take care not to scratch the body.

1. Detach the clips, then remove the bulkhead under spoiler (A) from the front bulkhead.
   NOTE: To remove the clips, pry the inner pin up at the edge near the line (B) on its head.
2. Install the spoiler in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

Rear Fender Cover Replacement

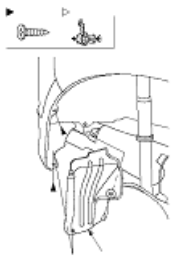
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.

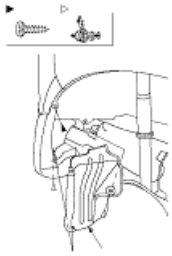
1. Remove the screws and the clips, then remove the rear fender cover (A).

2. Install the cover in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

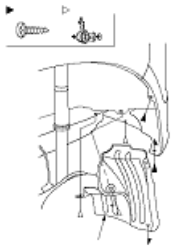
Driver's side without rear splash guard



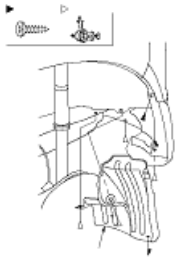
Driver's side with rear splash guard



Passenger's side without rear splash guard



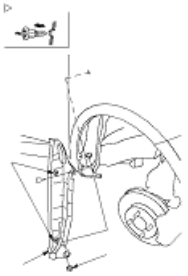
Passenger's side with rear splash guard



Front Fender Fairing Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.



1. Remove the front inner fender as needed.
2. From the wheel arch, remove the clip and the maintenance plug (A).
3. Release the hooks (B) of the front fender enclosure (C) from the holes in the front fender, and pull the fender enclosure out, then remove it.

4. Install the fender enclosure in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Before installing the clips, make sure the hooks (A) of the front fender enclosure (B) is installed into the holes (C) in the front fender securely.
   - Push the clip into place securely.

Rear Air Outlet Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.

1. Remove the rear bumper.
2. Detach the hooks (A), then remove the rear air outlet (B).
3. Install the air outlet by pushing on the hook portions until the hooks snap into place.

Rear Spring Seat Lower Cover Replacement

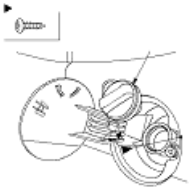
NOTE: Take care not to scratch the body.

1. Remove the clip and detach the hooks (A), then remove the rear spring seat lower cover (B).
2. Install the cover in the reverse order of removal, and note these items:
   - Checki if the clip is dameged or stress-whitened, and if necessary, replace it with a new one.
   - Push the hook portions into place securely.

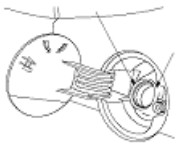
Fuel Fill Door/Adapter Replacement

NOTE: Take care not to scratch the body.

1. Remove the fuel cap (A) by turning it counterclockwise, and remove the screw.

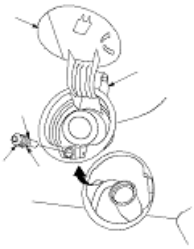


2. Pull the fuel fill door/adapter lip (A) out from the fuel fill pipe (B).



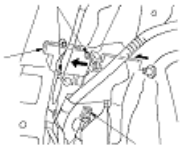
3. While pulling the fuel fill door/adapter (A), turn the fuel fill door/adapter 90 ° clockwise with the fuel fill door partly opened.

4. Remove the fuel fill door/adapter (A).
   -1. Pull the lower portion of the fuel fill door/adapter out.
   -2. Pull the portion (B) of the hinge out from inside the body.
   -3. If necessary, release the hooks (C), then remove the fuel fill door push lifter (D) from the fuel fill door/adapter.

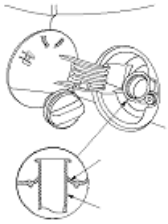


5. If necessary, pull out the fuel fill adapter grommet (A) and the fuel fill adapter packing (B) from the rod (C).
   NOTE: When reinstalling the packing, be sure the arrow mark (D) on the packing is the upper side of the packing.

6. If necessary, remove the fuel fill door actuator (A).
   -1. Remove the left cargo area side trim panel.
   -2. Disconnect the actuator connector (B), and loosen the screws (C), then remove the actuator.



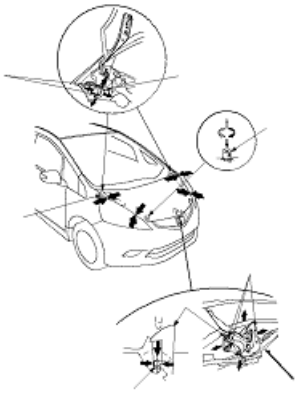
7. Install the fuel fill door/adapter in the reverse order of removal, and note these items:
   - Apply multipurpose grease to the sliding surfaces (A) of the fuel fill adapter grommet (B) where shown.
   - Make sure the adapter lip (C) is fully seated on the fuel fill pipe (D).



Hood Adjustment

NOTE:

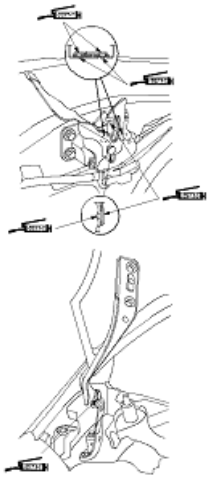
- Put on gloves to protect your hands.
- Take care not to scratch the hood, body and other related parts.



1. Remove the cowl covers.
2. Slightly loosen each bolt (A).
3. Adjust the hood (B) alignment in this sequence:
   - Adjust the hood right and left, as well as forward and rearward, by using the elongated holes in the hood hinges (C).
   - Turn the hood edge cushions (D), as necessary, to make the hood fit flush with the body at the front and side edges.
4. Adjust the hood latch (E) to obtain the proper height at the forward edge, and move the hood latch right or left until the striker (F) is centered in the hood latch.
5. Tighten the bolts to the specified torque.
6. Check that the hood opens properly and closes securely.
7. Apply touch-up paint to the hinge mounting bolts and around the hinges, and let the paint dry.

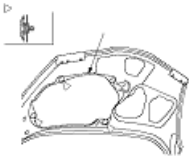
---

8. Apply multipurpose grease to the hood latch and the hood hinges as indicated by the arrows.
9. Reinstall all of the removed parts.



Hood Insulator Replacement

1. Using a clip remover, detach the clips, then remove the hood insulator (A). Take care not to scratch the hood.



2. Install the insulator in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

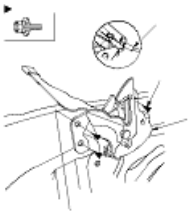
Hood Latch Replacement

NOTE:

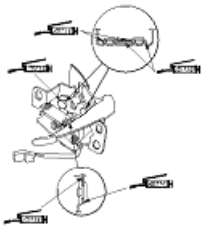
- Put on gloves to protect your hands.
- Take care not to scratch the body and related parts.

1. For some models: Remove the clip (A), then disconnect and detach the hood switch connector (B).

2. Remove the bolts, then remove the hood latch (A) from the body.
3. Disconnect the hood opener cable (B) from the hood latch. Take care not to kink the cable.



4. Install the latch in the reverse order of removal, and note these items:
   - Apply multipurpose grease to each location of the hood latch indicated by the arrows.
   - Make sure the hood opener cable is connected properly and hood latch switch connector is plugged in properly (for some models).
   - Adjust the hood latch alignment.
   - Make sure the hood opens properly and locks securely.



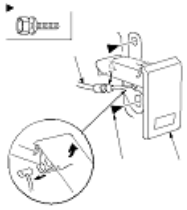
Hood Seal Replacement

1. Using a clip remover, detach the clips, then remove the hood seals (A). Take care not to scratch the hood.

2. Install the seal in the reverse order of removal, and note these items:
    - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
    - Push the clips into place securely.

Hood Release Handle Replacement

NOTE:



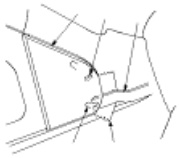
- Put on gloves to protect your hands.
- Take care not to scratch the body.
- RHD model is shown; LHD model is symmetrical.

1. Remove these items:
   - Kick panel, driver's side
   - Driver's dashboard undercover
2. Remove the bolts, then remove the hood release handle (A).
3. Disconnect the hood opener cable (B) from the hood release handle. Take care not to kink the cable.
4. Install the hood release handle in the reverse order of removal, and note there items:
   - Make sure the hood opener cable is connected properly.
   - Make sure the hood opens properly.

Front Pillar Corner Trim Replacement

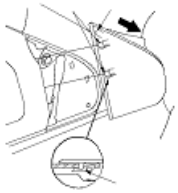
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the corner trim and the body.
- When removing components, use the trim tools or equivalent.



1. Carefully insert the trim tool (A) next to the grommet (B), and detach the grommet by prying on the front pillar corner trim (C), then detach the tab (D).
   NOTE: Apply protective tape (E) to the body as shown.

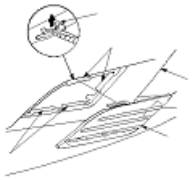
2. While sliding the front pillar corner trim forward in the direction shown, detach the clips (A) and the tab (B) from the body, then remove the trim.



3. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

Front Bumper Lid Replacement

For Some Models



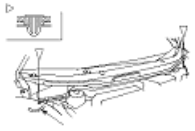
NOTE: Take care not to scratch the front bumper.

1. Release the hooks (A) by using a flat-tip screwdriver wrapped with the protective tape, then remove the front bumper lid (B) from the front bumper (C).
2. Install the front bumper lid by pushing on the hook portions until the hooks snap into place.

Cowl Cover Replacement

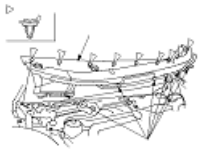
NOTE:

- Put on gloves to protect your hands.
- When removing components, use the trim tools or equivalent.
- Take care not to damage the body.
- RHD model is shown, LHD model is symmetrical.



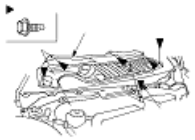
1. Remove the windshield wiper arms.
2. Using a clip remover, detach the clips from the cowl cover, then disconnect the windshield washer tube (A).

3. Detach the clips by carefully pulling the windshield side edge of the cowl cover (A) upward, and release the forward hooks (B) by pulling the cowl cover forward, then remove the cover.



4. Remove the hood hinge covers (A) on both sides.
   -1. Detach the clips(B) from the under-cowl panel.
   -2. Release the hook (C) from the front fender, then detach the clips (D).

5. If necessary, remove the under-cowl panel (A).
   -1. Remove the wiper motor.
   -2. Remove the bolts.



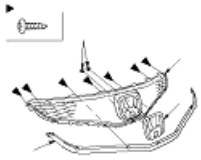
6. Install the covers in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.
   - Make sure the washer tube is connected securely.

Upper Front Grille Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front bumper.

1. Remove the front bumper.
2. Remove the screws, and release the hooks (A), then remove the upper front grille (B) from the front bumper (C).



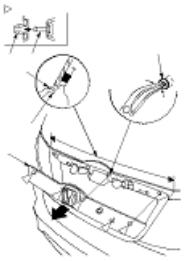
3. For some models: If necessary, remove the screws and the push nuts (A), then remove the upper front grille molding (B) and the front "H" emblem (C) from the grille base (D).
4. Install the grille in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

Rear License Trim Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.

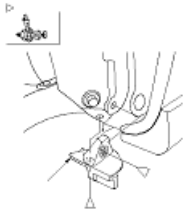
1. Remove these items:
   - Tailgate lower trim panel
   - Rear window wiper motor
   - Rear window wiper arm
2. From inside the tailgate, remove the bolt securing the rear license trim.



3. Pull out the rear license trim (A) to detach the pins (B) of the clips from the grommets (C), then remove the trim from the tailgate.
4. Using snap ring pliers, remove the grommets from the tailgate.
5. Check if the grommets and pins are damaged or stress-whitened, and if necessary, replace grommets and pins as an assembly with new ones.
6. Install the grommets on the pins by pushing them into place.
7. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Do not roll up the lip (D) of the rear window rubber dam. If necessary for proper attachment, set a plastic plate between the lip and the trim. Install the top edge of the trim while sliding a plastic plate sideward. Be careful not to cut the lip.
   - Push the clips into place securely.

Rear Strake Replacement

For Some Models



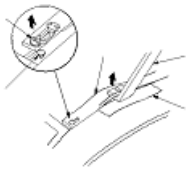
NOTE: Take care not to scratch the body.

1. Remove the clips, then remove he rear strake (A) from the body.
2. Install the strake in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

Roof Molding Replacement

NOTE:

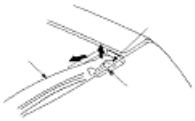
- Take care not to scratch the body.
- Take care not to bend the roof molding.
- When removing components, use the trim tools or equivalent.



1. Apply protective tape (A) to the body. Using a trim tool (B), pry up on the roof molding (C).
2. Pull up and slide the roof molding to release the front bracket (D) from the pin (E).

3. Pull up the front portion of the roof molding.

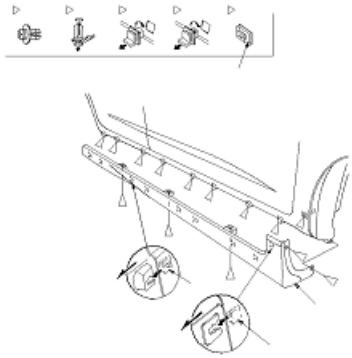
4. Pull up and release the rear bracket (A) from the pin (B), then remove the roof molding (C).



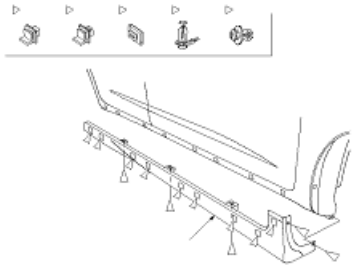
5. Install the molding in the reverse order of removal, and note these items:
    - Take care not to damage the windshield molding.
    - Make sure the roof molding is installed securely.

Side Sill Panel Replacement

For Some Models



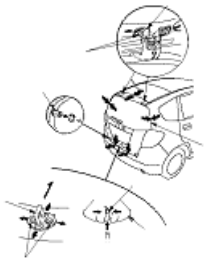
1. Remove the side sill panel (A).
   -1. On the back of the front wheel arch, remove the clips (B).
   -2. Remove the expansion clips (C).
   -3. Slide the side sill panel forward, and remove it. The side clips (D, E, F) will stay in the body.
   -4. Remove the side clips (D, E) from the body by turning them 45 °.
   -5. If necessary, use a utility knife to cut the double-sided adhesive tape (G) that holds the side clips (F) to the body. Take care not to scratch the body.
2. Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
3. If the side clips (F) will be reinstalled, remove any remaining double-sided adhesive tape from the side clips, then clean the side clip surfaces with a sponge dampened in isopropyl alcohol where new double-sided will be attached. Apply primer to the side clips, then attach new double-sided adhesive tape.
4. Clean the body surface with a sponge dampened in isopropyl alcohol where adhesive tape will be attached.



5. Install the side clips (A, B, C) on the side sill panel (D).
6. Hold the panel up, and fit all the side clips into the holes in the body. Push on the panel until the clips snap into place, and press the adhesive tape into place.
7. Install the expansion clips (E).
8. Install the clips (F) on the back of the front wheel arch.

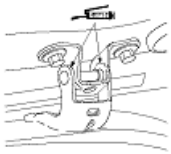
Tailgate Adjustment

NOTE:



- Have an assistant help you when adjusting the tailgate.
- Take care not to scratch the tailgate, the body and other related parts.
- Put on gloves to protect your hands.

1. Remove the tailgate support strut from each side.
2. Slightly loosen each bolt.
3. Adjust the tailgate (A) alignment in the following sequence:
   - Adjust the tailgate hinges (B) right and left, using the elongated holes.
   - Turn the tailgate edge cushions (C), in or out as necessary, to make the tailgate fit flush with the body at the side edges.
   - Adjust the fit between the tailgate and tailgate opening by moving the striker (D), and adjust the striker right or left until it is centered in the tailgate latch (E).
4. Tighten each bolt securely.
5. Check that the tailgate opens properly and locks securely.
6. Reinstall the support struts securely.
7. Apply touch-up paint to the hinge mounting bolts and around the hinges.



8. Apply multipurpose grease to the pivot portion of the tailgate hinges as indicated by the arrows.
9. Reinstall all of the removed parts.

Tailgate Latch Replacement - Without Super Locking

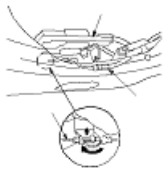
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the tailgate and the related parts.
- If the tailgate latch doesn't be unlocked by using the keyless entry transmitter or unlocking the driver's door lock, remove the maintenance lid (A) from the tailgate lower trim panel, then unlock the tailgate latch by turning the lock lever counterclockwise as shown. Open the tailgate by pulling the tailgate handle.

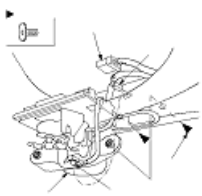
Without tailgate key cylinder

With tailgate key cylinder

1. Remove the tailgate lower trim panel.
2. Disconnect the tailgate opener cable (A) from the tailgate latch (B). Take care not to kink the cable.
3. For some models: Disconnect the cylinder rod from the tailgate lock cylinder.



4. Disconnet the tailgate latch actuator connector (A) and the tailgate lock switch connector (B), and detach the clip (C), then remove the tailgate latch.
5. Using a 6 mm socket wrench, remove the bolts, then pull out the tailgate latch (D) from the tailgate.
6. Install the tailgate latch in the reverse order of removal, and note these items:
   - Make sure the connectors are plugged in properly and the handle cable is connected properly.
   - Make sure the tailgate opens properly and locks securely.



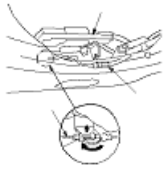
Tailgate Latch Replacement - With Super Locking

With Super Locking

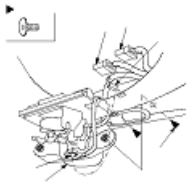
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the tailgate and the related parts.
- If the tailgate latch doesn't be unlocked by using the keyless entry transmitter or unlocking the driver's door lock, remove the maintenance lid (A) from the tailgate lower trim panel, then unlock the tailgate latch by turning the lock lever counterclockwise as shown. Open the tailgate by pulling the tailgate handle.

1. Remove the tailgate lower trim panel.
2. Disconnect the tailgate opener cable (A) from the tailgate latch (B). Take care not to kink the cable.

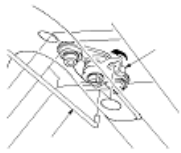


3. Disconnect the tailgate latch actuator connector (A) and the tailgate lock switch connector (B), and the trunk knob switch connector (C) and detach the clip (D), then remove the tailgate latch.
4. Using a 6 mm socket wrench, remove the bolts, then pull out the tailgate latch (E) from the tailgate.
5. Install the tailgate latch in the reverse order of removal, and note these items:
   - Make sure the connectors are plugged in properly and the handle cable is connected properly.
   - Make sure the tailgate opens properly and locks securely.



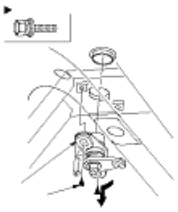
Tailgate Lock Cylinder Replacement

For Some Models



NOTE: Put on gloves to protect your hands.

1. Remove the tailgate lower trim panel.
2. Disconnect the tailgate cylinder rod (A).
   NOTE: Check for damaged or stress-whitened rod fastener (B).

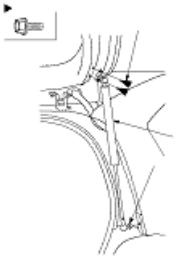


3. Remove the bolt securing the lock cylinder (A), then remove the lock cylinder by turning it.
4. Install the lock cylinder in the reverse order of removal, and note these items:
   - Make sure the cylinder rod is connected properly.
   - Make sure the tailgate opens properly and locks securely.

Tailgate Support Strut Replacement

NOTE:

- Have an assistant help you when removing and installing the support strut.
- Take care not to scratch the body and tailgate.



1. Remove the pivot bolt (A) from the body.
2. Remove the bolts, then remove the support strut (B) from the tailgate.
3. Install the tailgate side bolts first, next install the body side pivot bolt, and fix the support strut correctly.

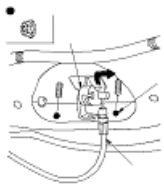
Tailgate Weatherstrip Replacement

1. Remove the tailgate weatherstrip (A) by pulling out on it.
2. Locate the painted alignment mark (B) on the tailgate weatherstrip. Align the painted mark with the alignment tab in the center of the tailgate opening, and install the weatherstrip. Make sure it's seated completely and facing in the direction shown. Make sure there are no wrinkles in the weatherstrip.
3. Check for water leaks.

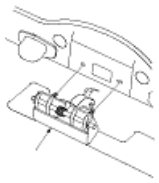
Tailgate Handle Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the tailgate and the related parts.



1. Remove these items:
   - Tailgate lower trim panel
   - Rear license trim
2. Disconnect the tailgate opener cable (A) from the tailgate handle (B), and remove the nuts. Take care not to kink the cable.



3. From outside of the tailgate, pull out the tailgate handle (A), then remove it.
4. Install the handle in the reverse order of removal, and note these items:
   - Make sure the tailgate opener cable is connected securely.
   - Make sure the tailgate opens properly.

j2 R	Floor frame locating hole φ15 (0.59) rear
j2 L	Floor frame locating hole φ15 (0.59) rear
k	Front floor center locating hole φ15 (0.59)

Unit: mm (in.)

φ: Inner diameter

a1	For engine side mount φ15 (0.59) front
a2	For engine side mount φ13 (0.51) outer
a3	For engine side mount φ15 (0.59) rear
b1	For transmission mount φ15 (0.59) front
b2	For transmission mount φ15 (0.59) wheelhouse side
b3	For transmission mount φ15 (0.59) rear
b4	For transmission mount φ13 (0.51) [Manual transmission model]
c	Front side frame locating hole φ16 (0.63)
d	Front damper center hole φ48 (1.89)
e1	For front subframe mount φ15 (0.59) front
e2	For front subframe mount φ16 (0.63) middle
e3 R	Outrigger locating hole φ11 (0.43)
e3 L	Outrigger locating hole φ11 (0.43) x 15 (0.59) slot
e4	For front subframe mount φ15 (0.59) rear
f	Outrigger locating hole φ25 (0.98)
g	Floor center stiffener locating hole φ15 (0.59)
h1	Front floor locating hole φ50 (1.97) front
i1	Inside sill locating hole φ25 (0.98) front
j1 R	Floor frame locating hole φ15 (0.59) front
j1 L	Floor frame locating hole φ15 (0.59) front
j2 R	Floor frame locating hole φ15 (0.59) rear
j2 L	Floor frame locating hole φ15 (0.59) rear
k	Front floor center locating hole φ15 (0.59)

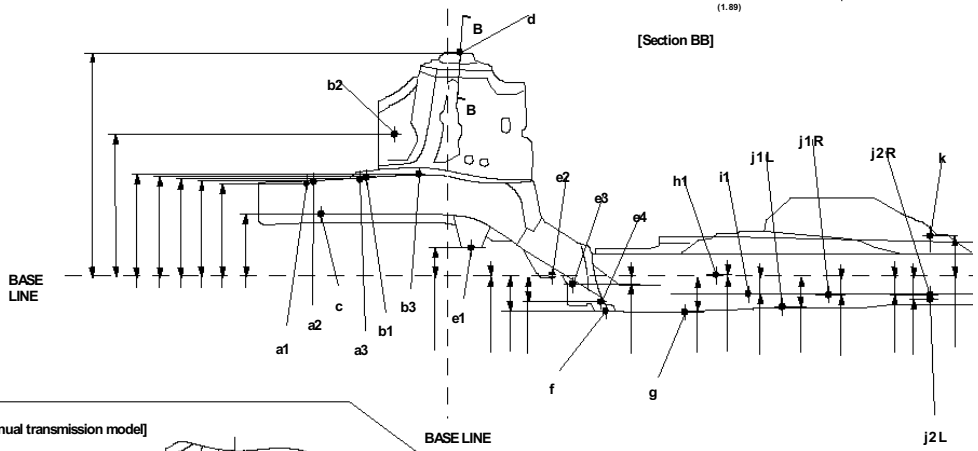
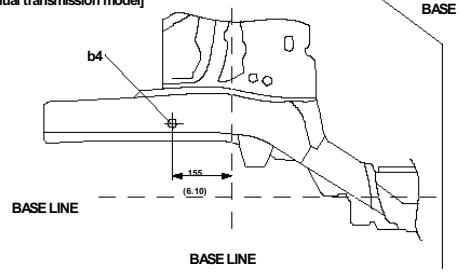
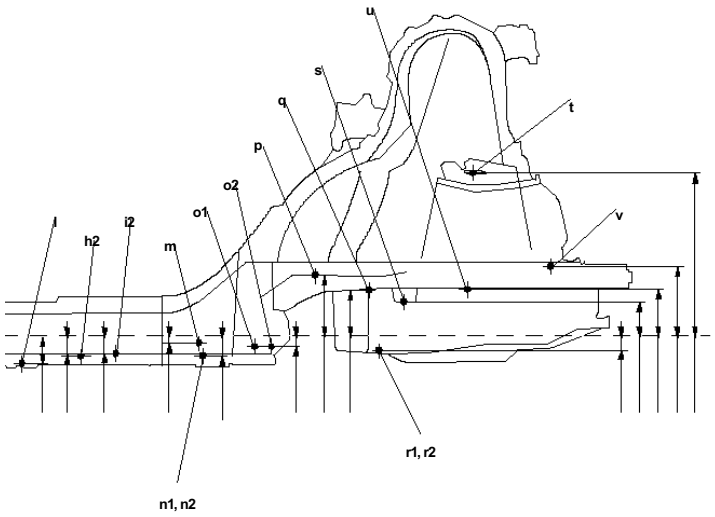
[Section BB]



[Manual transmission model]

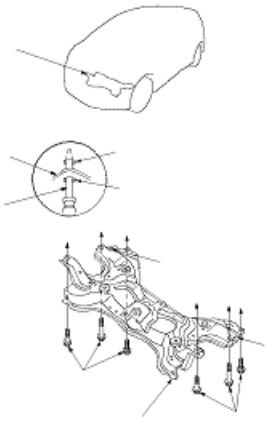


l	Front floor cross-member locating hole φ25 (0.98)
h2	Front floor locating hole φ25 (0.98) rear
i2	Inside sill locating hole φ25 (0.98) rear
m	Trailing arm gusset locating hole φ20 (0.79)
n1	Rear seat guide bracket locating hole φ9 (0.35) right
n2	Rear seat guide bracket locating hole φ9 (0.35) left
o1	For trailing arm mount φ15 (0.59) inner
o2	For trailing arm mount φ17 (0.67) outer
p	Middle floor cross-member locating hole φ20 (0.79)
q	Rear frame A locating hole φ15 (0.59)
r1	Rear floor locating hole φ25 (0.98) right
r2	Rear floor locating hole φ25 (0.98) left
s	For spring base mount hole 15 (0.59) x 15 (0.59) square
t	Rear damper center hole φ24 (0.94)
u	Rear frame B locating hole φ20 (0.79)
v	Rear floor side panel locating hole φ20 (0.79)



Subframe Replacement

Front Subframe Torque



NOTE:

- After loosening the subframe mounting bolts, be sure to replace them with new ones.
- When installing, align both installation reference holes in the subframe with both reference holes in the body using a screwdriver or tapered punch as a guide.

Gauge Control Module Self-diagnostic Function

NOTE: Before doing the self-diagnostic function, make sure the No. 1 (10 A) and the No. 22 (7.5 A) fuse in the under-dash fuse/relay box are OK.
The gauge control module has a self-diagnostic function which consists of the following checks:

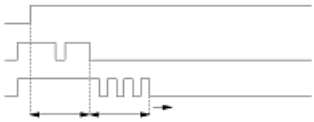
- The beeper drive circuit check.
- The indicator drive circuit check.
- The switch input test.
- The LCD segment check.
- The gauges drive circuit check (Tachometer, Fuel gauge, Speedometer).
- The communication line check (of the body-controller area network (B-CAN) communication line and the fast-controller area network (F-CAN) communication line between the gauges).

NOTE:
Indicators are also controlled via the communication line.

Entering the self-diagnostic function with the HDS

Using the HDS, select Body Electrical, Gauges, then Function Test and do the self-diagnostic function.

Entering the self-diagnostic function (manual method)



1. Push and hold the SELECT/RESET switch button.
2. Turn the combination light switch ( ) ON.
3. Turn the ignition switch to ON (II).
4. Within 2−5 sec., turn the combination light switch ( ) OFF, then ON and OFF again.
5. Within 5 sec., release the SELECT/RESET switch button, and then push and release the button three times repeatedly.

NOTE:

- While in the self-diagnostic mode, the dash lights brightness controller operates normally.
- While in the self-diagnostic mode, the SELECT/RESET button is used to start the Beeper Drive Circuit Test and the Gauge Drive Circuit Check.
- If the vehicle speed exceeds 2 km/h (1.2 mph) or the ignition switch is turned to LOCK (0), the self-diagnostic mode ends.

The Indicator Drive Circuit Check

When entering the self-diagnostic mode, the following indicators blink:
ABS indicator, brake system indicator, A/T gear position indicator, charging system indicator, cruise control indicator, cruise main indicator, EPS indicator, high beam indicator, high temperature indicator, immobilizer indicator, lights-on indicator, low temperature indicator, low oil pressure indicator, low fuel indicator, malfunction indicator lamp (MIL), seat belt indicator, security indicator, side airbag cutoff indicator, sequential sportshift mode shift indicator, safety indicators, SRS indicator.

The Beeper Drive Circuit Check

When entering the self-diagnostic mode, the beeper sounds five times.

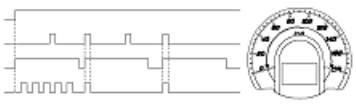
Switch Input Check

After the beeper drive circuit check, you can check the switch input. The beeper sounds continuously when the ODO/TRIP button or the parking brake switch inputs are switched from OFF to ON: ODO/TRIP button, parking brake switch.

The LCD Segment Check

With ODO/TRIP display: When entering the self-diagnostic mode, all the segments blink five times.With multi-information display (MID): When entering the self-diagnostic mode, "…" shows on the MID, and blink five times.

The Gauge Drive Circuit Check



When entering the self-diagnostic mode, the speedometer, the tachometer, the fuel gauge needles sweep from the minimum position to maximum position, then return to the minimum position.
NOTE:
After the beeper stops sounding and the gauge needles return to the minimum position, pressing the ODO/TRIP button starts the Beeper Drive Circuit Check (one beep) and the Gauge Drive Circuit Check again.
The check cannot be started again until the gauge needles return to the minimum position.
If the needles fail to sweep, or the beeper does not sound, replace the gauge control module.

The Communication Line Check - With ODO/TRIP display

Example Indication

While in the self-diagnostic mode, the Communication Line Check starts after the LCD Segments Check.
If all segments come on, the communication line is OK. If faulty, the word ‘‘Err" will be indicated on the odometer display followed by number(s).

Error Code List

Error code	Type of communication line(s) error
Error 1	F-CAN communication
Error 2	B-CAN communication
Error 12	F-CAN and B-CAN communication

- Err 1: there is a malfunction in the communication line between the gauge control module and F-CAN. Check for DTCs in the ECM/PCM, and troubleshoot the indicated DTCs.
- Err 2: there is a malfunction in the communication line between the gauge control module and B-CAN. Check for DTCs in the body electrical system and troubleshoot the indicated DTCs.
- Err 12: there is a malfunction in the communication line between the gauge control module and F-CAN or B-CAN. Check for DTCs in the ECM/PCM first and troubleshoot the indicated DTCs. If there is no DTCs in the ECM/PCM, check for the body electrical system DTCs and troubleshoot the indicated DTCs.

The Communication Line Check - With multi-information display (MID)

Example Indication

While in the self-diagnostic mode, the Communication Line Check starts after the LCD Segments Check.
If ‘‘···" come on, the communication line is OK. If faulty, the word ‘‘Error" will be indicated on the MID followed by number(s).

Error Code List

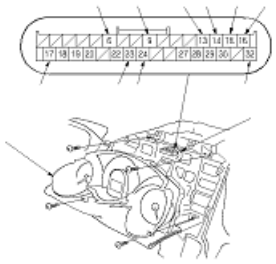
Error code	Type of communication line(s) error
Error 1	F-CAN communication
Error 2	B-CAN communication
Error 12	F-CAN and B-CAN communication

- Error 1: there is a malfunction in the communication line between the gauge control module and F-CAN. Check for DTCs in the ECM/PCM, and troubleshoot the indicated DTCs.
- Error 2: there is a malfunction in the communication line between the gauge control module and B-CAN. Check for DTCs in the body electrical system and troubleshoot the indicated DTCs.
- Error 12: there is a malfunction in the communication line between the gauge control module and F-CAN or B-CAN. Check for DTCs in the ECM/PCM first and troubleshoot the indicated DTCs. If there is no DTCs in the ECM/PCM, check for the body electrical system DTCs and troubleshoot the indicated DTCs.

Ending the self-diagnostic function

Turn the ignition switch OFF.
NOTE: If the vehicle speed exceeds 2 km/h (1.2 mph), the self-diagnostic function ends.

Gauge Control Module Input Test



NOTE: Before testing, do the gauge control module self-diagnostic function, and make sure the B-CAN communication line is OK.

1. Turn the ignition switch to LOCK (0).
2. Remove the gauge control module (A), and disconnect the 32P connector (B) from it.
3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to Step 4 .
4. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the gauge control module must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
17	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
16	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
32	LT BLU	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
6	WHT	Ignition switch ON (II), and turn signal switch in RIGHT position	Measure the voltage to ground: There should be battery voltage when the lights are flashing.	• Faulty under-dash fuse/relay box • Faulty combination light switch • An open in the wire
9	BLU	Ignition switch ON (II), and turn signal switch in LEFT position	Measure the voltage to ground: There should be battery voltage when the lights are flashing.	• Faulty under-dash fuse/relay box • Faulty combination light switch • An open in the wire
23	ORN	Parking brake lever pulled	Check for continuity to ground: There should be continuity.	• Faulty parking brake switch • An open in the wire
		Parking brake lever released	Check for continuity to ground: There should be continuity.	• Faulty parking brake switch • A short to ground in the wire
24	GRY	Brake fluid is lower level in the reservoir	Check for continuity to ground: There should be continuity.	• Poor ground (G301) [G302] • Faulty brake fluid level switch • A short to ground in the wire
		Brake fluid is full level in the reservoir	Check for continuity to ground: There should be continuity.	• Poor ground (G301) [G302] • Faulty brake fluid level switch • An open in the wire
14*	GRN	Ignition switch ON (II), information button pressed	Measure the voltage to ground: There should be battery voltage.	• Blown No. 24 (10 A) fuse in the under-dash fuse/relay box • Faulty select/reset/information switch • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
		Ignition switch ON (II), information button released	Measure the voltage to ground: There should be less than 1 V.	• Faulty select/reset/information switch • A short to power in the wire • An open in the wire
15*	PUR	Ignition switch ON (II), select/reset button pressed	Measure the voltage to ground: There should be battery voltage.	• Faulty select/reset/information switch • An open in the wire
		Ignition switch ON (II), select/reset button released	Measure the voltage to ground: There should be less than 1 V.	• Blown No. 24 (10 A) fuse in the under-dash fuse/relay box • Faulty select/reset/information switch • A short to power in the wire • An open in the wire

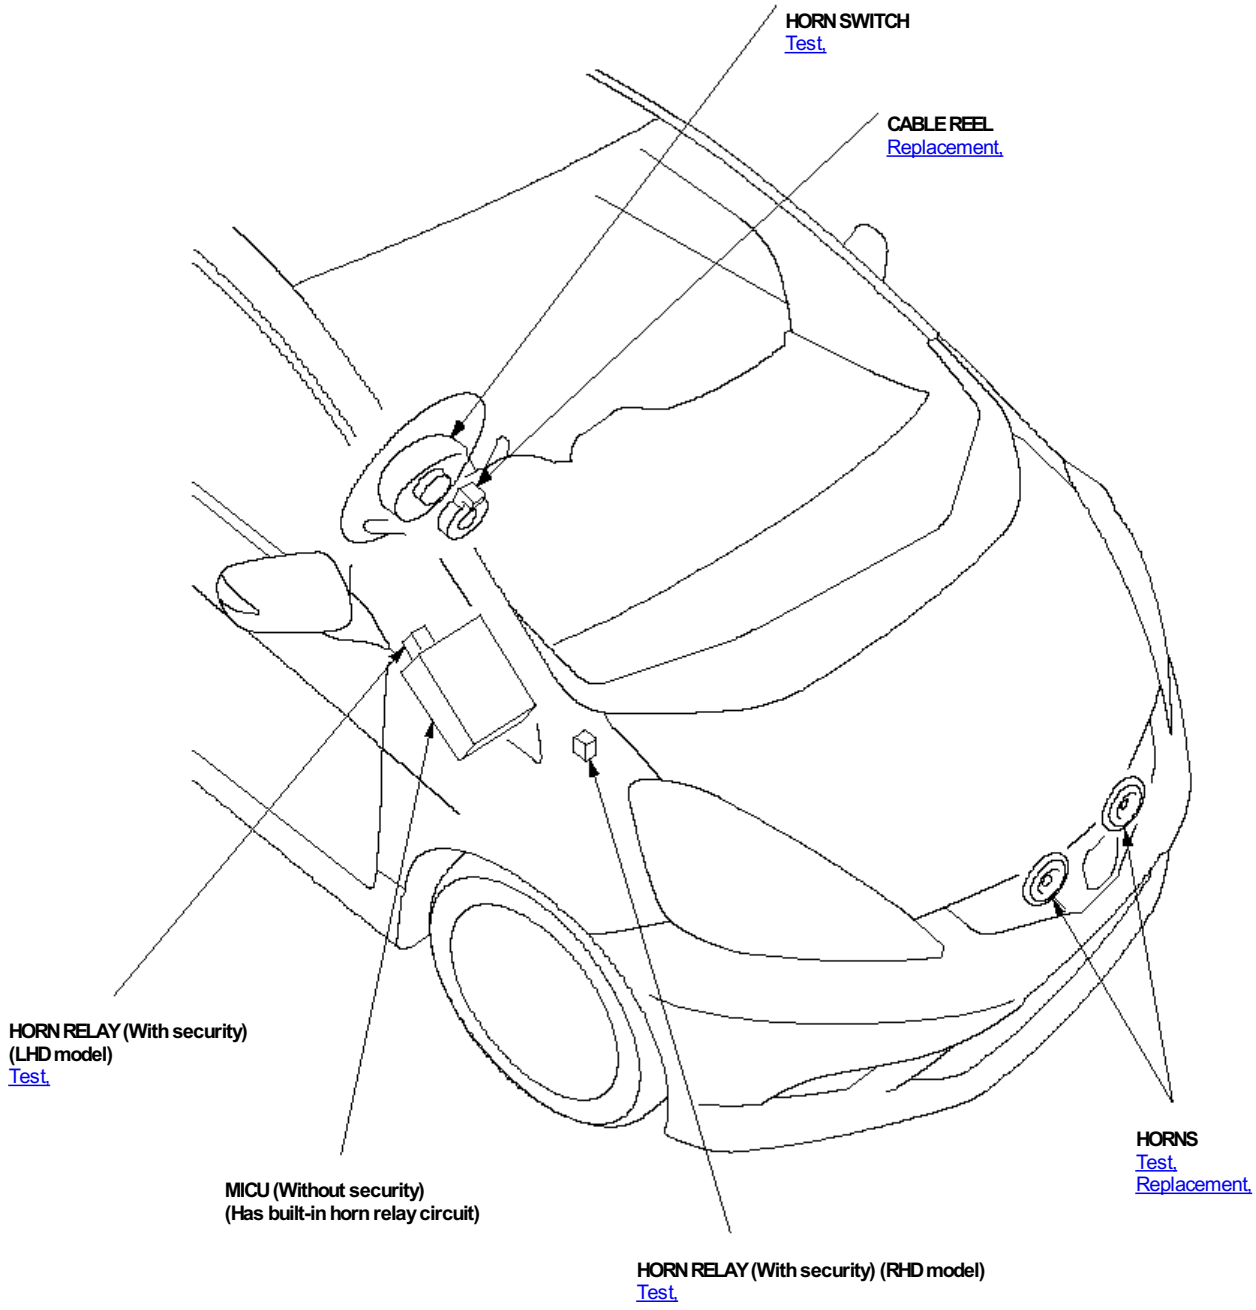
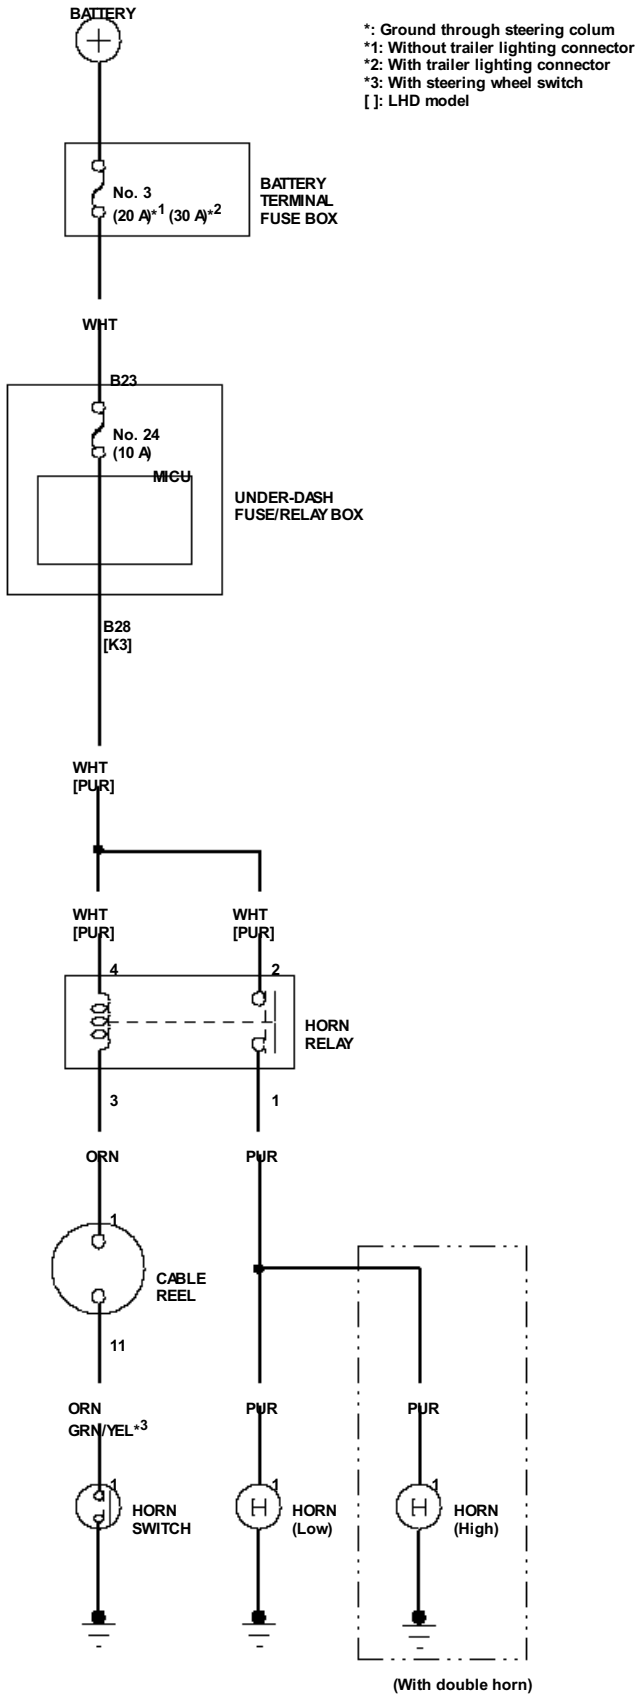
Horns Component Location Index

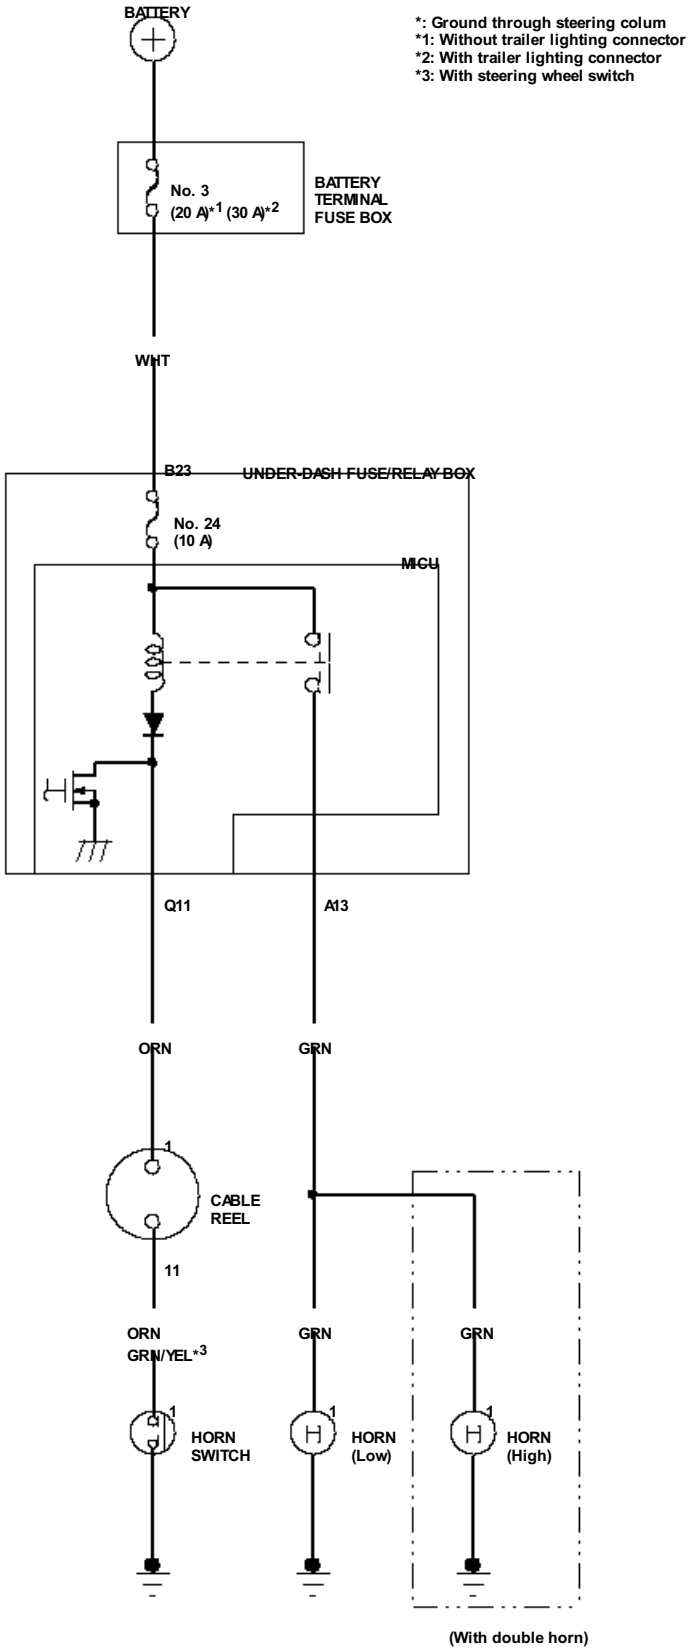


RHD model is shown, LHD model is similar.

Horns Circuit Diagram - With Security

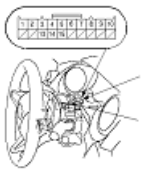


Horns Circuit Diagram - Without Security

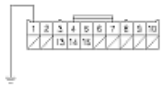


Horn Switch Test

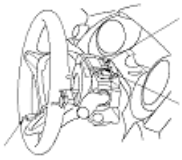
1. Remove the steering column covers.
2. Disconnect the dashboard wire harness 20P connector (A) from the cable reel (B).



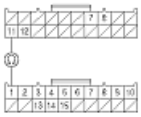
3. Using a jumper wire, connect the dashboard wire harness 20P connector No. 1 terminal to body ground. The horns should sound.
   - If the horn sounds, go to Step 4 .
   - If the horn do not sound, check these items:
     - No. 24 (10 A) fuse in the under-dash fuse/relay box.
     - Horn.
     - Horn relay (with security).
     - MICU (without security).
     - An open in the wire.



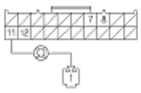
4. Reconnect the dashboard wire harness 20P connector (A) to the cable reel (B).
5. Remove the driver's airbag assembly, and disconnect the horn switch 1P positive terminal (C) from the driver's airbag.



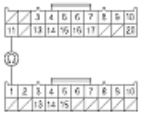
6. Without steering wheel switch:
   Check for continuity between the dashboard wire harness 20P connector No. 1 terminal and the cable reel subharness 20P connector No. 11 terminal.
   - If there is continuity, go to Step 7 .
   - If there is no continuity, replace the cable reel.



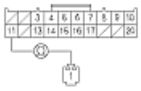
7. Check for continuity between the cable reel subharness 20P connector No. 11 terminal and the horn switch 1P positive terminal.
   - If there is continuity, check the installation of the driver's airbag assembly and the steering wheel. If OK, replace the driver's airbag assembly.
   - If there is no continuity, repair an open in the wire.



8. With steering wheel switch:
   Check for continuity between the dashboard wire harness 20P connector No. 1 terminal and the steering wheel switch 20P connector No. 11 terminal.
   - If there is continuity, go to Step 9 .
   - If there is no continuity, replace the cable reel.

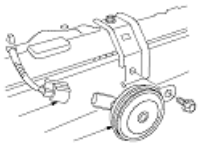


9. Check for continuity between the steering wheel switch 20P connector No. 11 terminal and the horn switch 1P positive terminal.
   - If there is continuity, check the installation of the driver's airbag assembly and the steering wheel. If OK, replace the driver's airbag assembly.
   - If there is no continuity, repair an open in the wire.

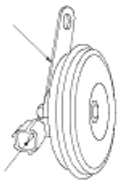


Horn Test/Replacement

1. Remove the front bumper.
2. Disconnect the 1P connector (A) from each horn (B).

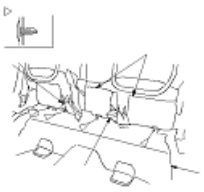


3. Connect the terminal (A) to the battery power, and the bracket (B) to body ground.
4. If the horn does not sound, replace it.



Carpet Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:



- Put on gloves to protect your hands.
- Take care not to damage, wrinkle or twist the carpet.
- Be careful not to damage the dashboard and other interior trim pieces.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

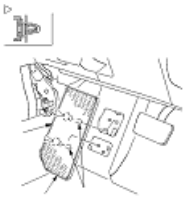
1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.

2. Remove these items:
   - Center console
   - Front seats, both sides
   - Kick panels, both sides
   - Front door sill trim, both sides
   - Center pillar lower trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Rear door sill trim, both sides
   - Rear seat leg guide cover, both sides

3. From the bottom of the both rear seat-backs (A), detach the clips and release the Velcro fasteners (B) in the rear of the carpet (C). Pull the rear seat belt buckles (D) out through a slit, then pull the carpet out from both cargo area side trim panels.

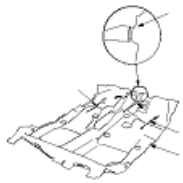
---

4. Pry up the gap (A) detach the clips and pins (B), then remove the footrest (C). RHD model is shown, LHD model is similar.



---

5. Remove the front portion of the carpet (A).
   -1. Cut the carpet in the area (B) shown, then remove the carpet.
   -2. Pull the seat harnesses (C) out through the holes in the carpet.
   RHD model is shown; LHD model is similar.



6. Install the carpet in the reverse order of removal, and note these items:
   - Take care not to damage, wrinkle or twist the carpet.
   - Make sure the seat harnesses are routed correctly.
   - If the clips are damaged or stress-whitened and if necessary, replace them with new ones.
   - Push the Velcro fastener and the clips into place securely.
   - Do the battery terminal reconnection procedure.

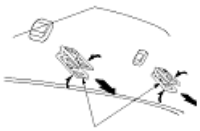
Grab Handle Removal/Installation

NOTE: When removing components, use the trim tools or equivalent.

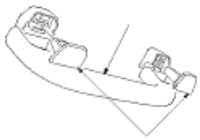
1. Lower the grab handle (A), then pull out the covers (B).

2. While pinching the clips (A), release the hooks (B), then remove the grab handle (C).

3. Using a pair of pliers, remove the clips (A) by pinching the hooks.
4. If the side curtain airbag has deployed, replace the grab handle with a new one.

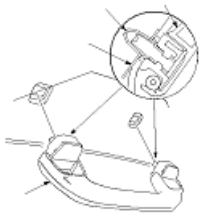


5. If the side curtain airbag has not deployed, to prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect removed pieces and replace them if they have any of these types of damage:
   - Any cracks or damages in the grab handle (A).
   - Any cracks or stress-whitenings in the caps (B).



6. Install the clips (A) to the grab handle (B), then install the caps (C) fully into the clips.

7. Position the grab handle (A) on the bracket (B), and push on the grab handle until the clips (C) snap into place securely.

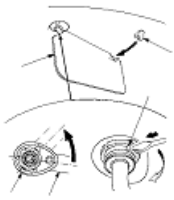


Sunvisor Removal/Installation

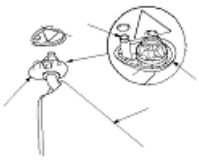
NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the headliner.
- RHD model is shown; LHD model is symmetrical.

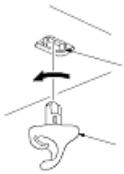
1. Insert a flat-tip screwdriver wrapped with protective tape through the hole in the front side of the bracket cover (A), and push the hook (B). Then make sure the hook is unlocked certainly.



2. While pushing the hook (A) with a flat-tip screwdriver wrapped with protective tape, release the sunvisor (B) from the holder (C), and rotate the sunvisor backward 45 °. Then make sure the hook slides into the bracket cover (D) as the rotating the sunvisor.

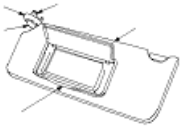


3. Pull the sunvisor (A) down, then release the pin (B) of the bracket cover (C) from the hole in the body.

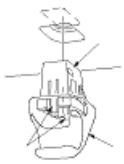


4. Turn the holder (A) 45 ° counterclockwise, and remove it from the holder grommet (B) by pulling the holder down.

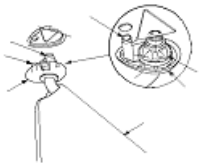
5. Pry out the holder grommet (A) from the body by pinching its hooks (B).
6. If the side curtain airbag has deployed, replace the sunvisor with a new one.



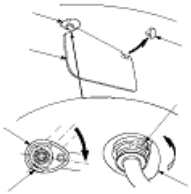
7. If the side curtain airbag has not deployed, to prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect removed sunvisor and replace it, if it has any cracks or breakages:
    - Any cracks in the sunvisor bracket (A)
    - Any cracks in the sunvisor bracket cover (B)
    - Any bends or cracks in the sunvisor stay shaft (C)
    - Any cracks in the sunvisor base (D)
    - Any cracks in the vanity mirror base (E)
8. If the holder grommet is damaged or stress-whitened, replace it with a new one.



9. Install the holder (A) to the holder grommet (B) by turning it 45 ° clockwise, and install them to the body as an assembly by pushing it until the hooks (C) snap into place securely.



10. Set the sunvisor (A) by inserting the bracket (B) and the pin (C) of the bracket cover (D) to the hole in the body.



11. While holding the bracket cover (A), rotate the sunvisor (B) forward until the hook (C) snaps into place. Then make sure the sunvisor does not come off the body by pulling it down. Set the sunvisor to the holder (D).

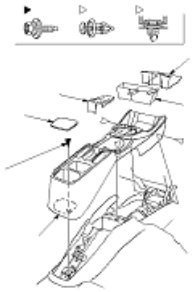
Center Console Removal/Installation - Without Seat Heater

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to scratch the front seat, dashboard, and related parts.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- RHD model is shown; LHD model is symmetrical.

1. M/T model: Remove the shift knob (A).

2. Remove the center console (A).
   -1. Remove the parking brake cover lid (B), separation box (C), and center console lid (D).
   -2. Remove the console box mat (E), then remove the bolt (F) and the clips (G).
   -3. Lift the rear of the console up to detach the clip (H).



3. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.
   - Make sure the wire harness is not pinched.

Center Console Removal/Installation - With Seat Heater

With Seat Heater

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to scratch the front seat, dashboard, and related parts.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- LHD model is shown; RHD model is symmetrical.

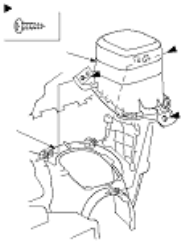
1. M/T model: Remove the shift knob (A).

2. Remove the center console (A).
   -1. Remove the parking brake cover lid (B).
   -2. Remove the switch panel (C), then disconnect the seat heater connector (D).
   -3. Detach the harness clip (E), then remove the switch panel base (F).
   -4. Remove the console box mat (G), then remove the bolt (H) and the clips (I).
   -5. Lift the rear of the console up to detach the clip (J).
3. Install the trim in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.
   - Make sure the wire harness is not pinched.

Dashboard Beverage Holder Removal/Installation

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.



1. Remove the dashboard/steering hanger beam.
2. Remove the screws, then remove each side beverage holders (A) from the dashboard (B).
3. Install the beverage holder in the reverse order of removal.

Dashboard Vent Removal/Installation

Side Vent

NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Pull the fin (A) of the side vent (B) toward you and release the hooks (C) and remove the side vent.
2. Install the side outlet in the reverse order of removal and push the hooks into place securely.

Driver's side

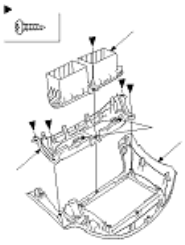
Passenger's side

Center Vent

NOTE:

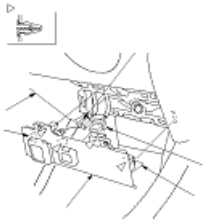
- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is similar.

1. Remove the center panel:
   - Without audio system
   - With audio system
2. Remove the screws, then remove the center vent panel (A) from the center panel (B).
3. Release the hooks (C), then remove the center vent (D) from the center vent panel.
4. Install the center vent in the reverse order of removal and push the hooks into place securely.



Dashboard Center Lower Trim Removal/Installation

NOTE:



- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. Remove the center lower cover.
2. Remove the center lower trim (A).
   -1. Use the trim tool to pry the gap between the dashboard (B) and the upper side of the center lower trim partially out and release the clips and hooks (C).
   -2. Pull out the center lower trim slightly toward you and disconnect the accessory power socket connector (D) and USB connector (E) (if equipped).
3. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.
   - Make sure the connectors are plugged in properly.

Dashboard Center Lower Cover Removal/Installation

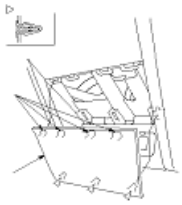
NOTE:

- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. While holding the glove box (A), release the glove box stops (B) on each side from the dashboard by pushing them in, then lower the glove box.

---

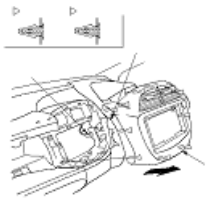
2. Remove the center lower cover (A).
   -1. Insert a hand through the opening of the glove box and push the back side of the cover, and release the clips.
   -2. Release the panel from the hooks (B) and remove it.



3. Install the cover in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

Dashboard Center Panel Removal/Installation

Without Audio System



NOTE:

- When removing components, use the trim tool or equivalent.
- Take care not to scratch the dashboard and related parts.

1. Open the passenger's tray lid.
2. Remove the center panel (A).
   -1. While carefully lifting the panel with the appropriate trim tool, insert the trim tool into the gap (B) between the dashboard and the panel.
   -2. Use the trim tool to gently pry the panel up partially to release the clips (C, D), then pull the panel up to remove the panel.
   -3. Disconnect the hazard warning switch connector (E).
3. Install the panel in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.
   - Make sure each connector is plugged in properly.

Dashboard Passenger's Tray Lid Removal/Installation

NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Open the lid.
2. Remove the screws, then remove the passenger's upper tray lid (A).
3. Install the lid in the reverse order of removal.

Dashboard Driver's Undercover Removal/Installation - Without HFT unit

NOTE:

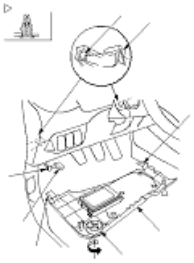
- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Remove the driver's dashboard undercover (A).
   -1. Turn the lock knob (B) 90 °.
   -2. Gently pull down the rear edge to detach the clip.
   -3. Pull the undercover away to release the pins (C) from the kick panel (D).

2. Install the undercover in the reverse order of removal, and note these items:
   - Check if the clip is damaged or stress-whitened, and if necessary, replace it with a new one.
   - Push the clip and pins into place securely.

Dashboard Driver's Undercover Removal/Installation - With HFT unit

With HFT Unit



NOTE:

- Take care not to scratch the dashboard and its related parts.
- LHD model is shown; RHD model is symmetrical.

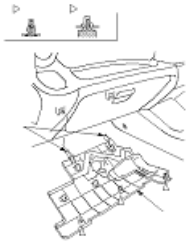
1. Remove the driver's dashboard undercover (A).
   -1. Turn the lock knob (B) 90 °.
   -2. Gently pull down the rear edge to detach the clip.
   -3. Pull the undercover away to release the pins (C) from the kick panel (D).
   -4. Detach the clip (E) and disconnect the HFT unit connector (F), then remove the undercover.

2. Install the undercover in the reverse order of removal, and note these items:
   - If the clip is damaged or stress-whitened, replace it with a new one.
   - Push the clip and pins into place securely.

Dashboard Passenger's Undercover Removal/Installation

NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.



1. Remove the passenger's dashboard undercover (A).
   -1. Gently pull down the front edge to detach the clips (B, C).
   -2. Pull the cover away to release the pins (D).

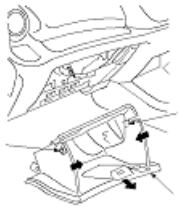
2. Install the cover in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the pins into place securely.

Glove Box Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Remove the passenger's dashboard undercover.
2. Remove the bolts.



3. While holding the glove box (A), release the glove box stops (B) on both sides from the dashboard by pushing them inside, then remove the glove box.
4. Install the glove box in the reverse order of removal.

Dashboard Glove Box Cover Removal/Installation

NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Remove the dashboard/steering hanger beam.
2. Remove the screws, then remove the dashboard glove box center cover (A) and the dashboard glove box outer cover (B).
3. Install the cover in the reverse order of removal.

Center

Outer

Glove Box Striker Replacement

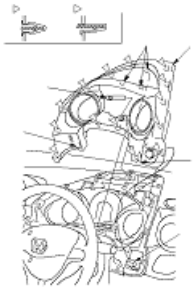
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Pull down the glove box.
2. Remove the screws, then remove the glove box striker (A).
3. Install the glove box striker in the reverse order of removal.

Instrument Panel Removal/Installation

NOTE:



- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. Tilt the steering column down.
2. Remove the instrument panel (A).
   -1. Pull out the select/reset knob (B).
   -2. While carefully lifting the panel with the appropriate trim tool, insert the trim tool into the gap (C) between the dashboard and the panel.
   -3. Use the trim tool to gently pry the panel up partially to release the clips (D, E) and the hooks (F), then pull the panel up to release the panel.
   -4. Disconnect the power mirror switch connector (G).
3. Install the panel in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.
   - Make sure each connector is plugged in properly.
   - Make sure the select/reset knob operate properly.

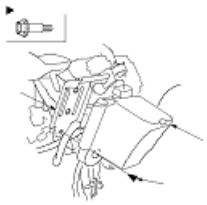
Dashboard Driver's Knee Pad Removal/Installation

NOTE:

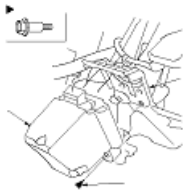
- Take care not to scratch the dashboard and its related parts.
- RHD model is shown; LHD model is symmetrical.

1. Remove the dashboard/steering hanger beam.
2. Remove the bolt, then remove the right driver's knee pad (A) and the left driver's knee pad (B) from the steering hanger beam (C).
3. Install the pad in the reverse order of removal.

Right



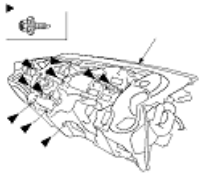
Left



Dashboard/Steering Hanger Beam Disassembly/Reassembly

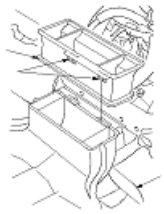
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the dashboard, the body and the other related parts.
- Take care not to bend the brackets.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

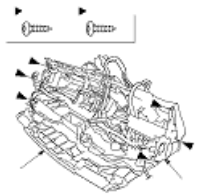


1. Remove the dashboard/steering hanger beam.
2. Remove these items from the dashboard:
   - Instrument panel
   - Gauge control module
   - Driver's dashboard undercover
   - Center panel (without audio system)
   - Audio unit (with audio system)
   - Center lower cover
   - Center lower trim
   - Passenger's tray lid
   - Side vent
   - Passenger's airbag
3. From the front of the dashboard (A), remove the screws.

4. From the back of the dashboard (A), release the hooks (B), and remove the center joint duct (C).

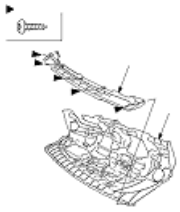


5. From the back of the dashboard (A), remove the screws (B, C), then separate the dashboard from the steering hanger beam (D).



6. Remove the screws, then remove the dashboard duct (A) from the dashboard (B).

7. If necessary, remove the screws, then remove the front def trim (A) from the dashboard (B).
8. Assemble the dashboard and steering hanger beam in the reverse order of removal. Make sure the dashboard wire harness is not pinched.



Interior Trim Removal/Installation - Door Areas

Front Door Sill Area

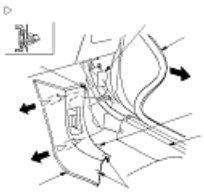
NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

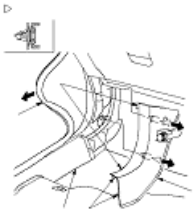
1. Remove the driver's dashboard undercover.

2. Remove the driver's kick panel (A) or the passenger's side kick panel (B).
   -1. Pull out the front door inner seal (C) from the kick panel hooks (D) and the front door opening flange.
   -2. Pull the kick panel back by hand to detach the clips, and to release the hooks (E) from the front door sill trim (F), then remove the panel. On the driver's side, pull the hood opener knob (G) and hold it while removing the panel.

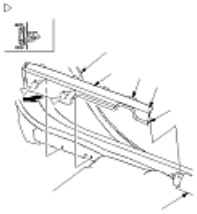
Driver's side



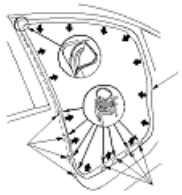
Passenger's side



3. Remove the front door sill trim (A).
   -1. Pull out the front door inner seal (B) from the front door sill trim hooks (C) and the front door opening flange.
   -2. Detach the hook (D) and tab (E) from center pillar lower trim (F), and pull the front door sill trim up by hand to detach the clips.



4. Pull out the front door inner seal (A) from the trim hooks (B) and around the front door opening flange, then remove the seal.

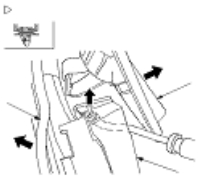


5. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and hooks into place securely.

Rear Door Sill Area

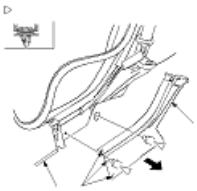
NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

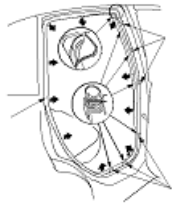


1. Tip-up the rear seat, and pull out the rear door inner seal (A), then carefully slide the luggage area side trim (B), and detach the clip from the rear side sill trim (C) using with a clip remover.

2. Remove the hooks (A) from the center lower trim (B), then detach the lower clips pulling the bottom of the rear side sill trim (C) back by hand and remove it.



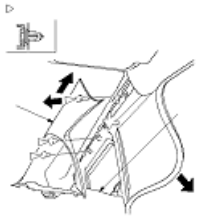
3. Pull out the rear door opening seal (A) from the trim hooks (B) and around the front door opening flange, then remove the seal.



4. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and hooks into place securely.

Interior Trim Removal/Installation - Pillar Areas - Without Side Curtain Airbags

Front Pillar Trim



NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. Pull the front door opening seal away from the front pillar, as needed.
2. Pull the upper portion of the front pillar trim (A) back by hand to detach the clips and pull the trim up, then remove it from the dashboard (B).
3. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.

Center Pillar Upper/Lower Trim

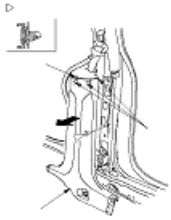
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

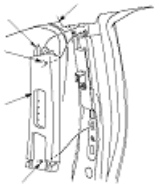
1. Remove these items:
   - Front door sill trim
   - Rear door sill trim
   - Front door opening seal, as needed
   - Rear door opening seal, as needed
2. Slide the front seat forward fully, and put the rear seat in the normal upright position.
3. Remove the seat belt lower anchor bolt (A).

4. Remove the center pillar lower trim (A).
   -1. Pull the upper portion of the trim back to release the upper hooks (B).
   -2. Detach the clip by pulling the trim back by hand.



5. Remove the upper anchor cover (A), and remove the upper anchor bolt (B).

6. Remove the center pillar upper trim (A).
   -1. Pull the bottom of the trim back by hand to detach the lower clip (B).
   -2. Pull the upper of the trim back by hand to detach the upper clip (C).
   -3. Release the upper pin (D) by pulling the top of the center pillar trim and remove it from the headliner (E).



7. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.
   - Apply medium strength type liquid thread lock to the front seat belt upper anchor bolt before reinstallation.
   - Before installing the anchor bolt, make sure there are no twists or kinks in the seat belt.

Quarter Pillar Trim

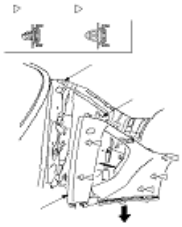
NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. Remove these items:
   - Rear door opening seal, as needed
   - Tailgate weatherstrip, as needed
   - Cargo area side trim panel, as needed
2. Remove the upper anchor cover (A) by releasing the hooks (B), then remove the rear seat belt upper anchor bolt (C).

---

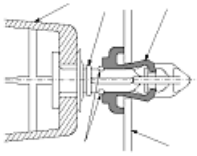
3. Remove the quarter pillar trim (A).
   -1. Pull the bottom of the trim back by hand to detach the clips (B, C).
   -2. Pull the trim down to release the upper hook (D) from the body hole (E).



4. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips and hooks are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and hooks into place securely.
   - Before installing the anchor bolt, make sure there are no twists or kinks in the seat belt.

Interior Trim Removal/Installation - Pillar Areas - With Side Curtain Airbags

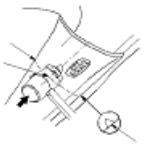
Front Pillar Trim

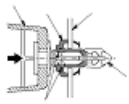


SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

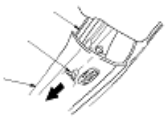
- Follow the front pillar trim installation procedure carefully; improper installation could cause the side curtain airbags to deploy improperly and possibly cause injury.
- Put on gloves to protect your hands.
- When removing components, use the trim tools or equivalent.
- Take care not to scratch the trim and panels.
- The upper clip in the front pillar trim (A) consists of a grommet (B) and a pin (C). The grommet expanded with the pin secures it to the body panel (D). The projections (E) on the pin is broken during removal, so the clip must be replaced with a new one when the trim is reinstalled.

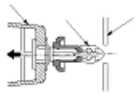
1. Pull the front door opening seal away from the front pillar as needed.
2. Hit the upper clip in the front pillar trim (A) with a rubber mallet. The clip is under the point (B) where the triangle mark (C) on the edge of the trim indicates. Hitting the clip breaks the projections (D) on the pin (E) and pushes it into the grommet (F) and against the body (G).
   NOTE: The clip must be replaced with a new one when the front pillar trim is reinstalled.



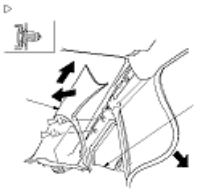


3. Pull the top of the front pillar trim (A) back by hand to remove the upper clip (B) from the body (C).

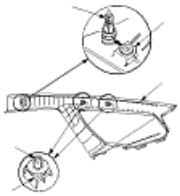




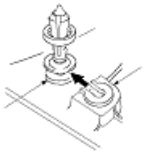
4. Pull the front pillar trim (A) by hand to detach the clips. Pull the trim up from the dashboard (B), then remove it.
5. If the side curtain airbag has deployed, replace the front pillar trim with a new one.



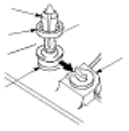
6. If the side curtain airbag has not been deployed, check the front pillar trim (A) and note the following:
   - To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the front pillar trim and replace it if it has any of these types of damage:
     - Any cracks, deformations, or stress-whitened areas in the front pillar trim
     - Any cracks or stress-whitening in the clip seating surfaces (B, C)
   - Replace the upper clip (D) with a new one.
   - Check if the clips (E) are damaged or stress-whitened, replace them with new ones.

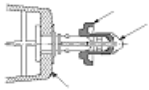


7. Before installing the front pillar trim (A), carefully remove a new upper clip (B).
8. Check the overlap between the headliner and front pillar trim, and if necessary, adjust it.

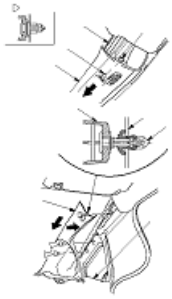


9. Carefully install a new upper clip (A) to the front pillar trim (B). Be sure that the grommet (C) is nearest to the top of the pin (D) as shown.





10. Reinstall the front pillar trim (A).
    -1. Insert the bottom of the trim into the dashboard (B).
    -2. Place the trim over the front pillar (C), and fit its upper clip (D) and lower clips (E) into the holes (F) in the front pillar, then lightly push the trim into place.
    NOTE:
        - Make sure the side curtain airbag isn't tucked down under the clips and the ribs.
        - Push lightly on the upper clip. If you push too hard, the clip will be damaged, and it will not hold the trim properly.



11. Reinstall the front door opening seal.

Center Pillar Upper/Lower Trim

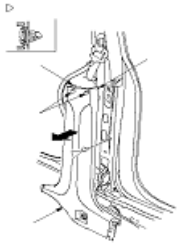
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.

1. Remove these items:
    - Front door sill trim
    - Rear door sill trim
    - Front door opening seal, as needed
    - Rear door opening seal, as needed
2. Slide the front seat forward fully, and put the rear seat in the normal upright position.
3. Remove the seat belt lower anchor bolt (A).

---

4. Remove the center pillar lower trim (A).
    -1. Pull the upper portion of the trim back to release the upper hooks (B).
    -2. Detach the clip by pulling the trim back by hand.

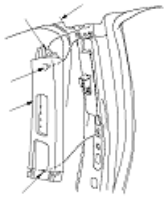


---

5. Remove the upper anchor cover (A), and remove the upper anchor bolt (B).

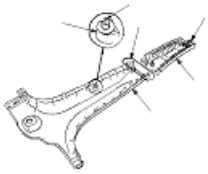
---

6. Remove the center pillar upper trim (A).
    -1. Pull the bottom of the trim back by hand to detach the lower clip (B).
    -2. Pull the upper of the trim back by hand to detach the upper clip (C).
    -3. Release the upper pin (D) by pulling the top of the center pillar trim and remove it from the headliner (E).



---

7. Install the trim in the reverse order of removal, and note these items:
   - Check if the clip (A) is damaged or stress-whitened, and if necessary, replace it with a new one.
   - If the side curtain airbag has deployed, replace the center pillar upper and lower trim and all clips on the trim with new ones.
   - To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the trim and replace it, if it has any of these types of damage:
     - Any cracks or deformations in the center pillar upper trim (B) and the upper hook (C)
     - Any cracks or deformation in the center pillar lower trim (D), and any breakage in the part (E) fitted with the center pillar upper trim
     - Any cracks or stress-whitened areas seating surfaces (F)
   - Replace any damaged parts with new ones.
   - Make sure the top of the trim overlaps with the headliner correctly.
   - Make sure the trim hook is installed into the body hole securely.
   - Push the clip and hooks into place securely.
   - Before installing the anchor bolt, make sure there are no twists or kinks in the seat belt.



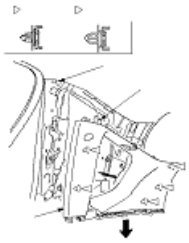
Quarter Pillar Trim

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

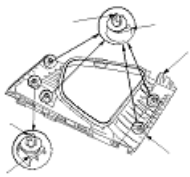
- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

1. Remove these items:
   - Rear door opening seal, as needed
   - Tailgate weatherstrip, as needed
   - Cargo area side trim panel, as needed
2. Remove the upper anchor cover (A) by releasing the hooks (B), then remove the rear seat belt upper anchor bolt (C).

3. Remove the quarter pillar trim (A).
   -1. Pull the bottom of the trim back by hand to detach the clips (B, C).
   -2. Pull the trim down to release the upper hook (D) from the body hole (E).

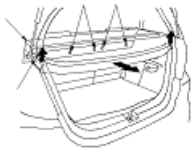


4. Install the trim in the reverse order of removal, and note these items:
   - Replace any stress-whitened or damaged clips (A) with new ones.
   - If the side curtain airbag has deployed, replace the quarter pillar glass trim and all clips on the trim with new ones.
   - To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect the trim and replace it, if it has any of these types of damage:
     - Any cracks or deformation in the quarter pillar trim (B) and the upper hook (C), and any stress-whitened areas in the upper part of the trim
     - Any cracks or stress-whitened areas in the clips seating surfaces (D)
   - Replace any damaged parts with new ones.
   - Make sure the top of the trim overlaps with the headliner correctly.
   - Make sure the trim hook is installed into the body holes.
   - Push the clip and hooks into place securely.
   - Before installing the seat belt anchor bolt, make sure there are no twists or kinks in the seat belt.



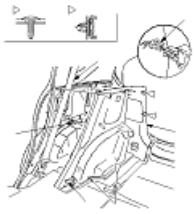
Interior Trim Removal/Installation - Rear Side Areas

NOTE:



- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is symmetrical.

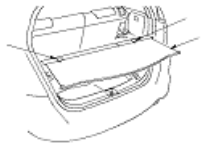
1. Remove these items:
   - Rear door opening seal, as needed
   - Tailgate weatherstrip, as needed
   - Cargo floor
   - Rear trim panel
2. For some models: Release the buttons (A), then remove the rear shelf (B).



3. Remove the cargo area side trim panel (A).
   -1. Release the rear seat belt (B) from the guide (C) of the cargo area side trim panel.
   -2. Detach the clips (D, E), then pull the panel back to remove it from the rear seat back striker (F).
   -3. Left side: Disconnect the cargo area light connector (G).
4. Install the panel in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips into place securely.
   - Make sure the cargo area light connector is plugged in properly.
   - When installing the panel, make sure there are no pinches in the seat belt.

Interior Trim Removal/Installation - Cargo Areas

NOTE:



- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When removing components, use the trim tools or equivalent.

Rear Trim Panel

1. Release the hooks (A), then pull up the cargo floor (B) and remove it.
2. Remove the tailgate weatherstrip, as needed.

---

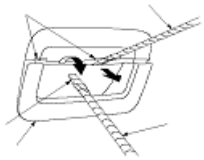
3. Remove the rear trim panel (A).
   -1. Disengage the tabs (B) and hooks (C) on both sides from both cargo area side trim panel (D).
   -2. Detach the clips by pulling the panel up.

4. Install the trim in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips, hooks, and tabs into place securely.

Interior Trim Removal/Installation - Tailgate Areas

NOTE:

- Put on gloves to protect your hands.
- Take care not to bend or scratch the trim and panels.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.



1. Insert a flat-tip screwdriver (A) to the slit (B), the other flat-tip screwdriver (C) into the groove (D), then rotate the flat-tip screwdriver C and remove the pull pocket (E).

---

2. Pull the tailgate lower trim panel (A) back by hand, and detach the clips (B, C, D), then remove it.

3. Install the trim in the reverse order of removal, and note these items:
    - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
    - Push the clips into place securely.

Steering Column Cover Removal/Installation

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the column cover.
- Do not pry the cover surface with any tools.
- RHD model is shown; LHD model is symmetrical.

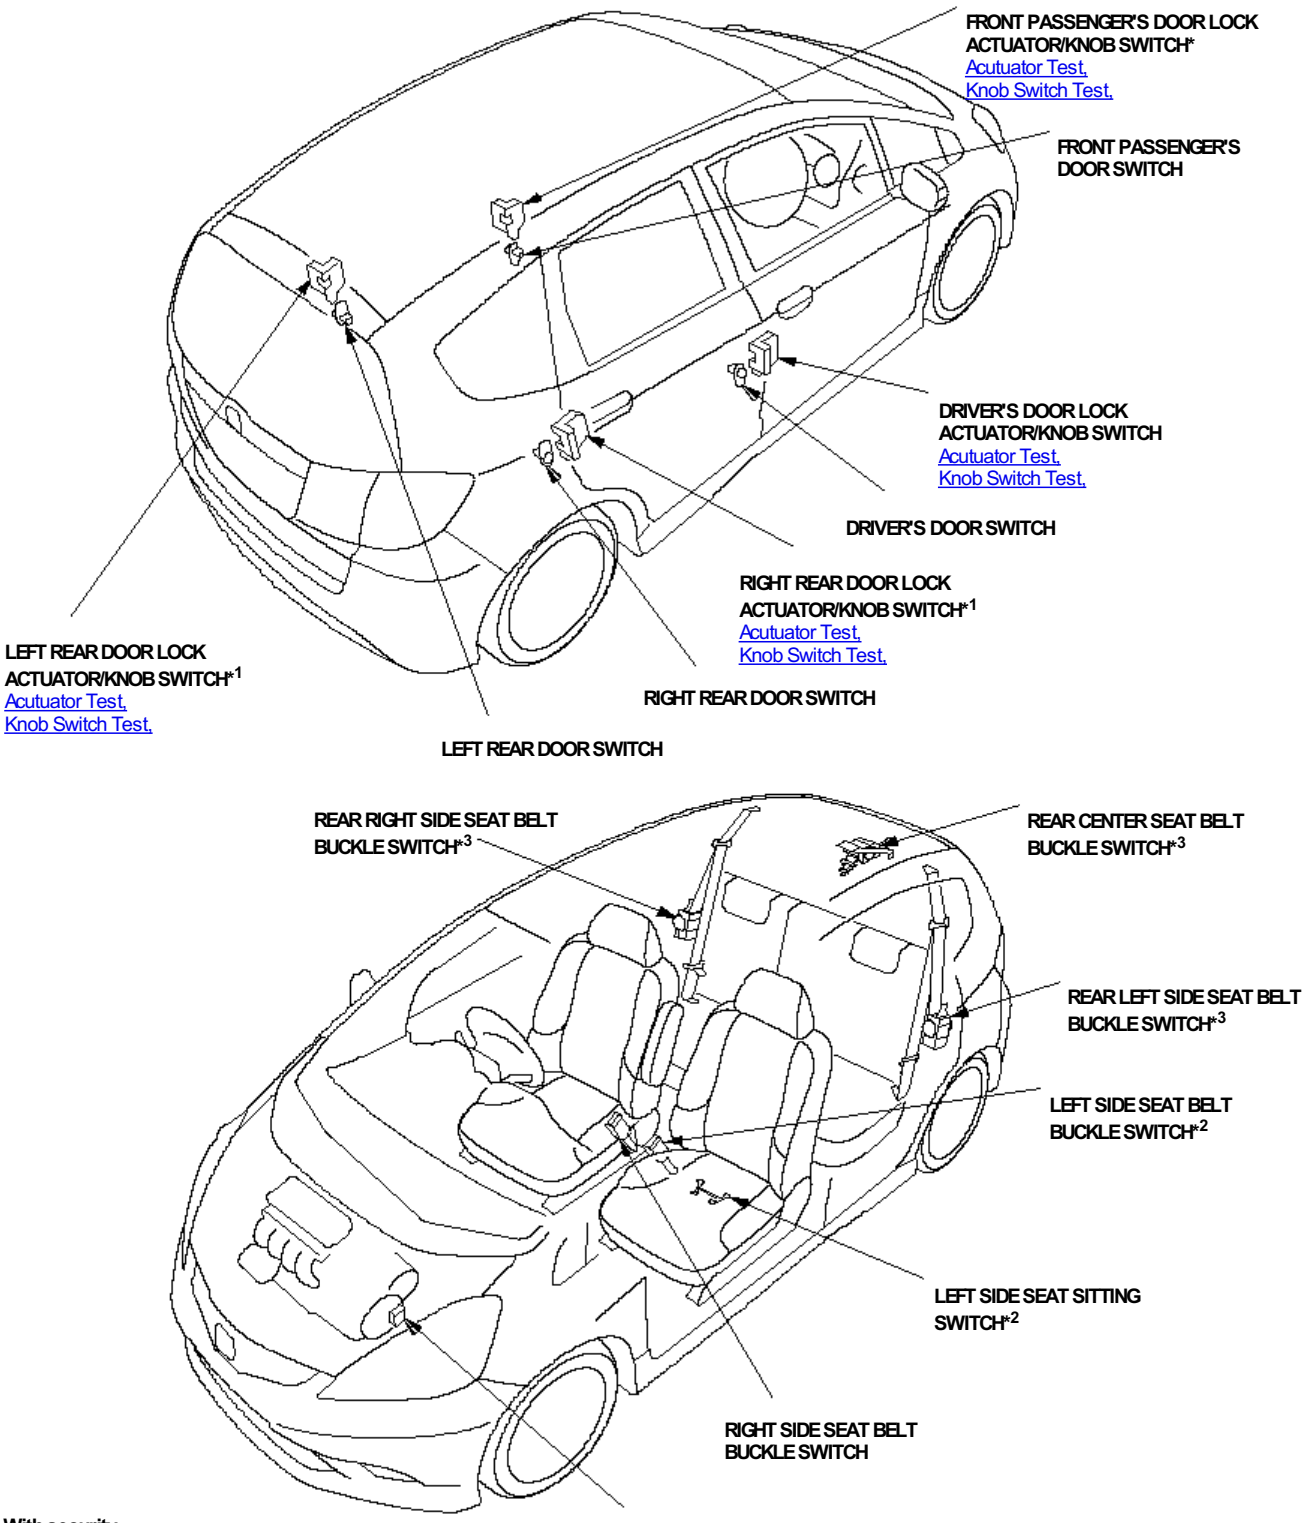
1. Release the tilt/telescopic lever (A), adjust the steering column to full tilt down position and to the full telescopic pull position.
2. Release the tabs (B) of the upper column cover (C) while pushing the lower column cover (D) from the front side.
   NOTICE
   Carefully release the tabs, and note the hooks (E) may break when the upper column cover is pulled up too hard.
3. Insert a suitable sized screwdriver or equivalent tool (F) into the lever hole (G) in the lower column cover D along the guide rib (H).
4. Release the hook (I) locating on the left side of the upper column cover C. The right side hook (J) of the upper column cover C can't be released from the inside.
5. Remove the upper column cover C by lightly pulling it up by releasing the right side hook J of the cover.

---

6. Remove the screws, then remove the lower column cover (A).

7. Install the upper and lower column covers in the reverse order of removal, and push the hooks into place securely.

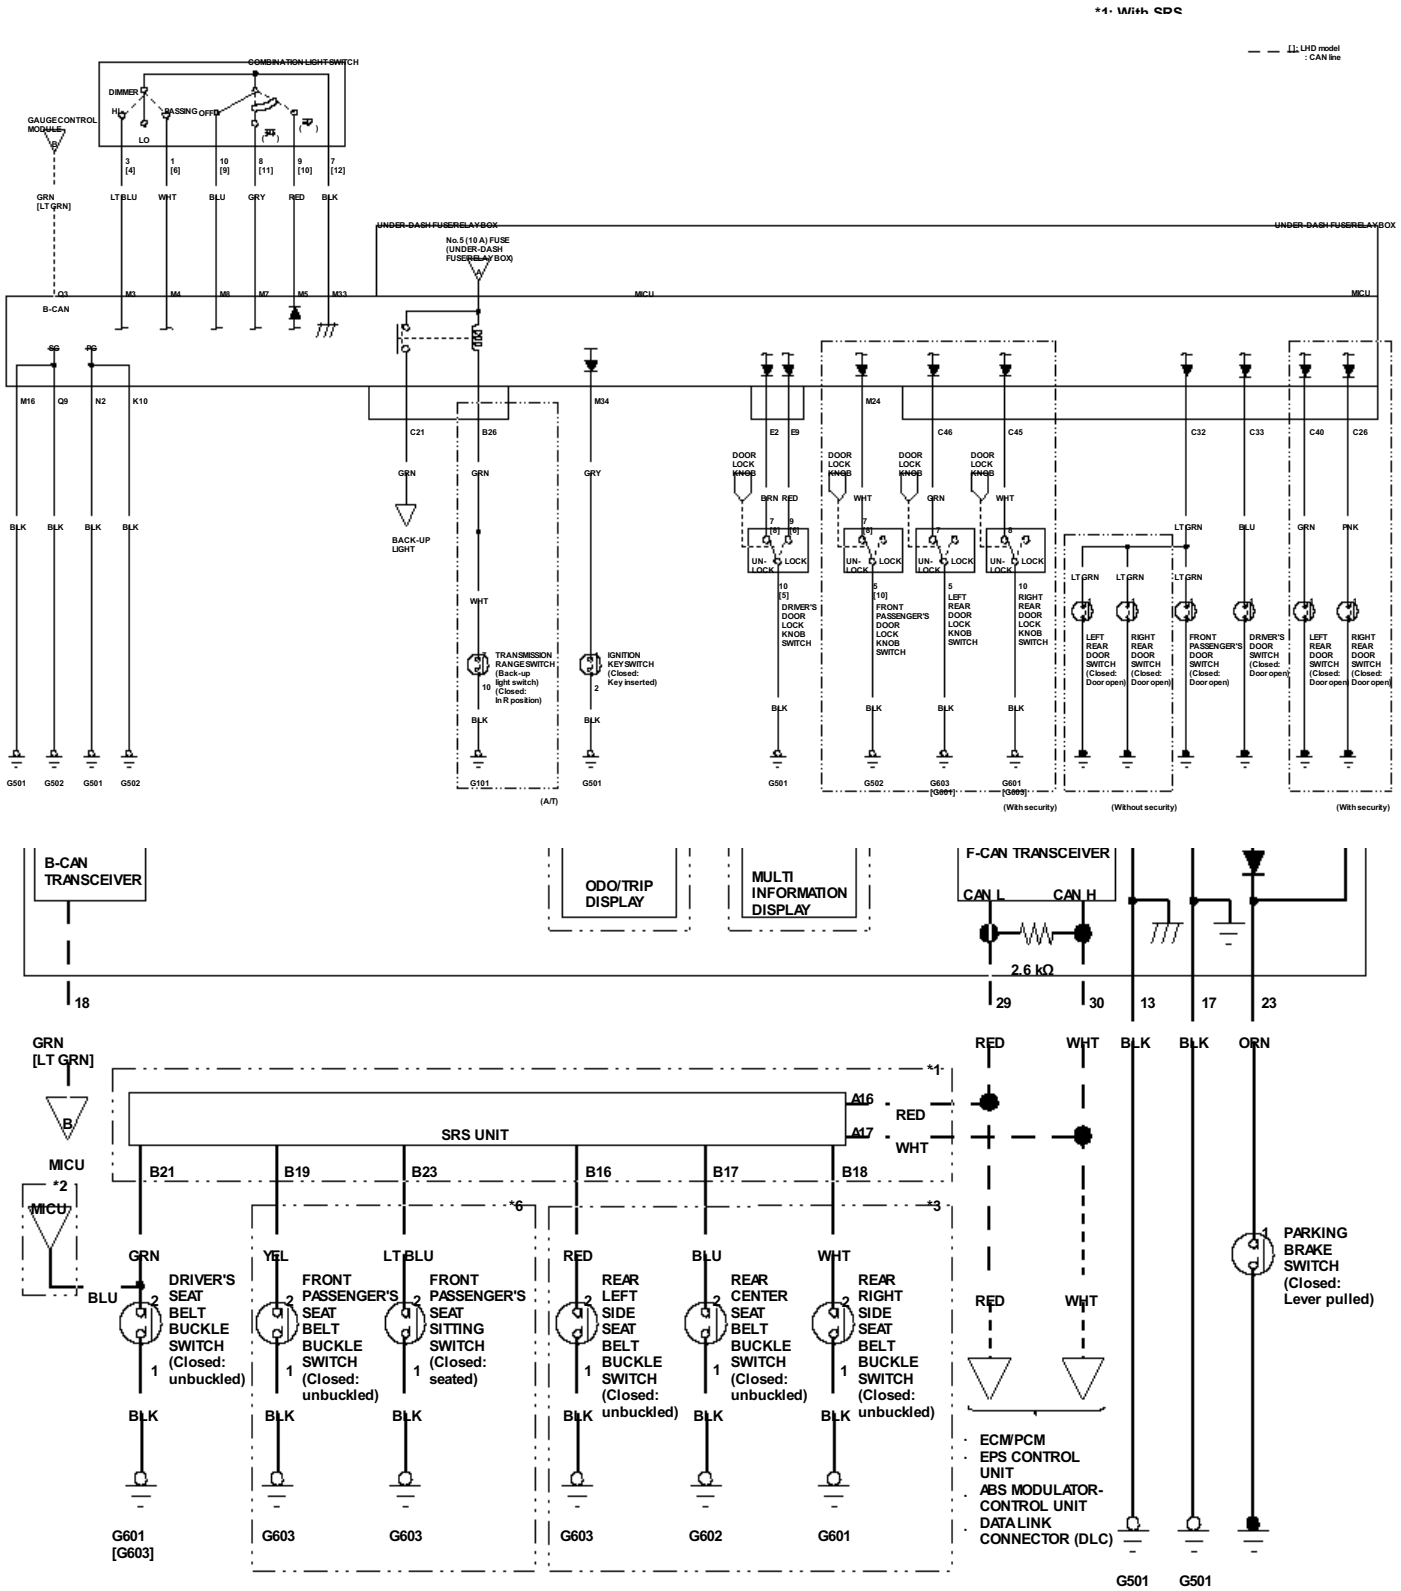
Reminder Systems Component Location Index



***1: With security**
***2: With passenger's seat belt reminder**
***3: With rear seat belt reminder**

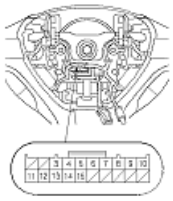
RHD model is shown, LHD model is similar.

Reminder System Circuit Diagram

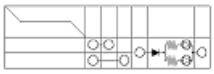


Multi-information Display Select/Reset/Information/Switch Test/Replacement

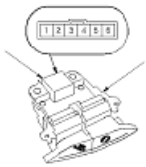
1. Remove the driver's airbag assembly.
2. Disconnect the 20P connector (A) from the cable reel.



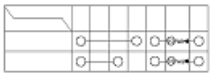
3. Check for continuity between the terminals in each switch position according to the table.
4. Without cruise control: if the check is not as specified, replace the switch. If the switch is OK, but the system does not operate, check for the cable reel.
   With cruise control: if the check is not as specified, go to Step 5 . If the check is OK, but the system does not operate, check for the cable reel.



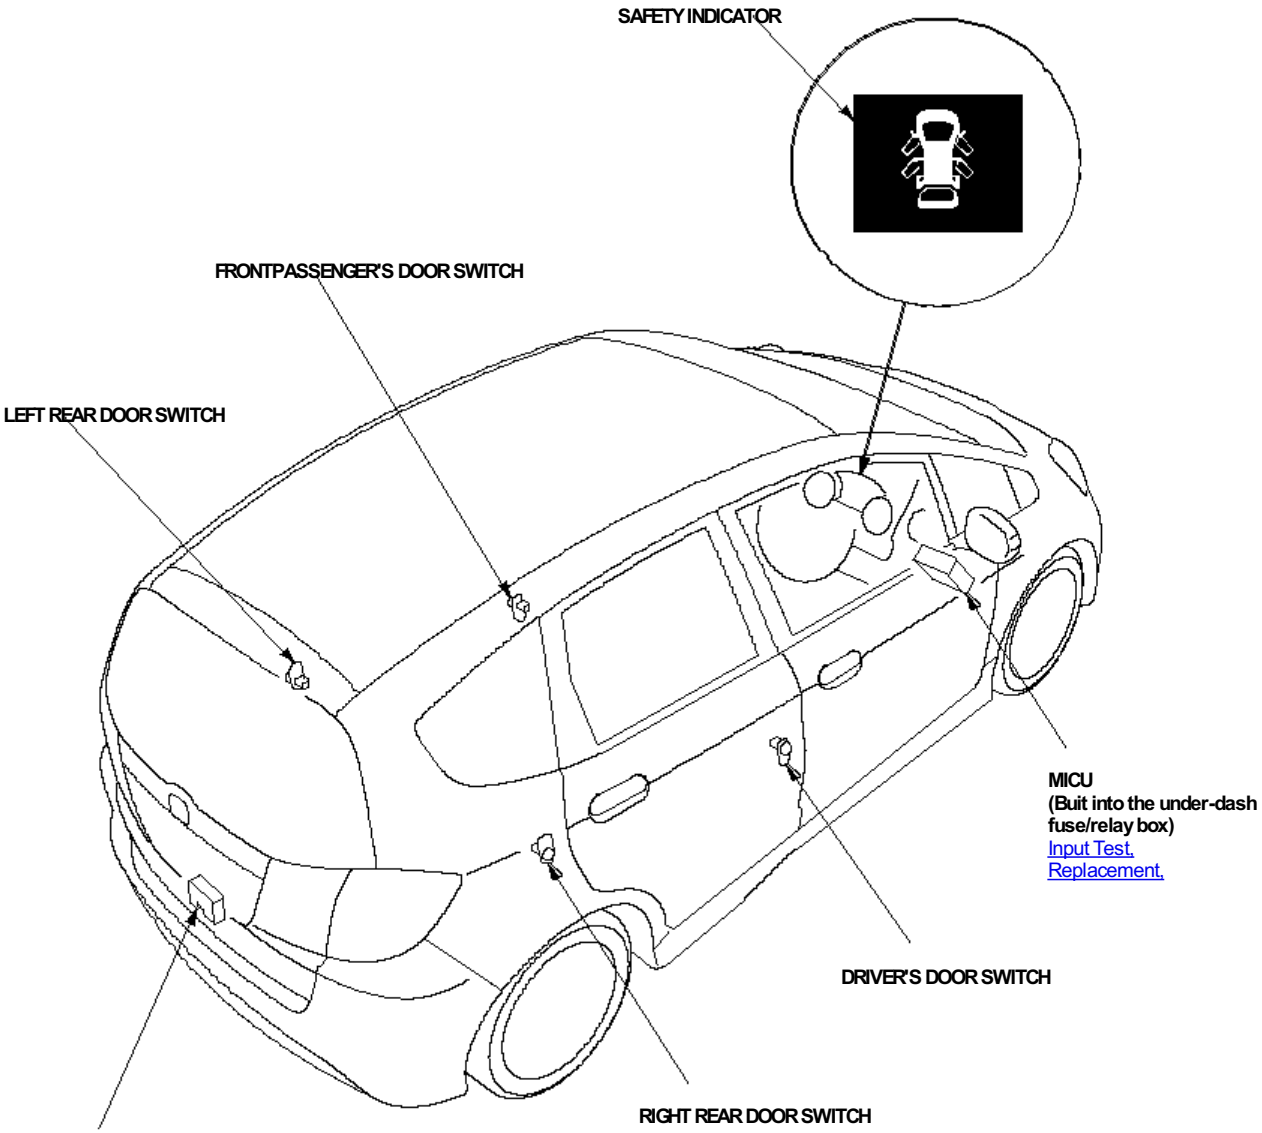
5. Remove the select/reset/information switch (A).



6. Check for continuity between the terminal (B) in each switch position according to the table.
7. If the continuity is not as specified, replace the switch. If the switch is OK, but the system does not operate, check for an open in the wire between the switch and the cable reel.

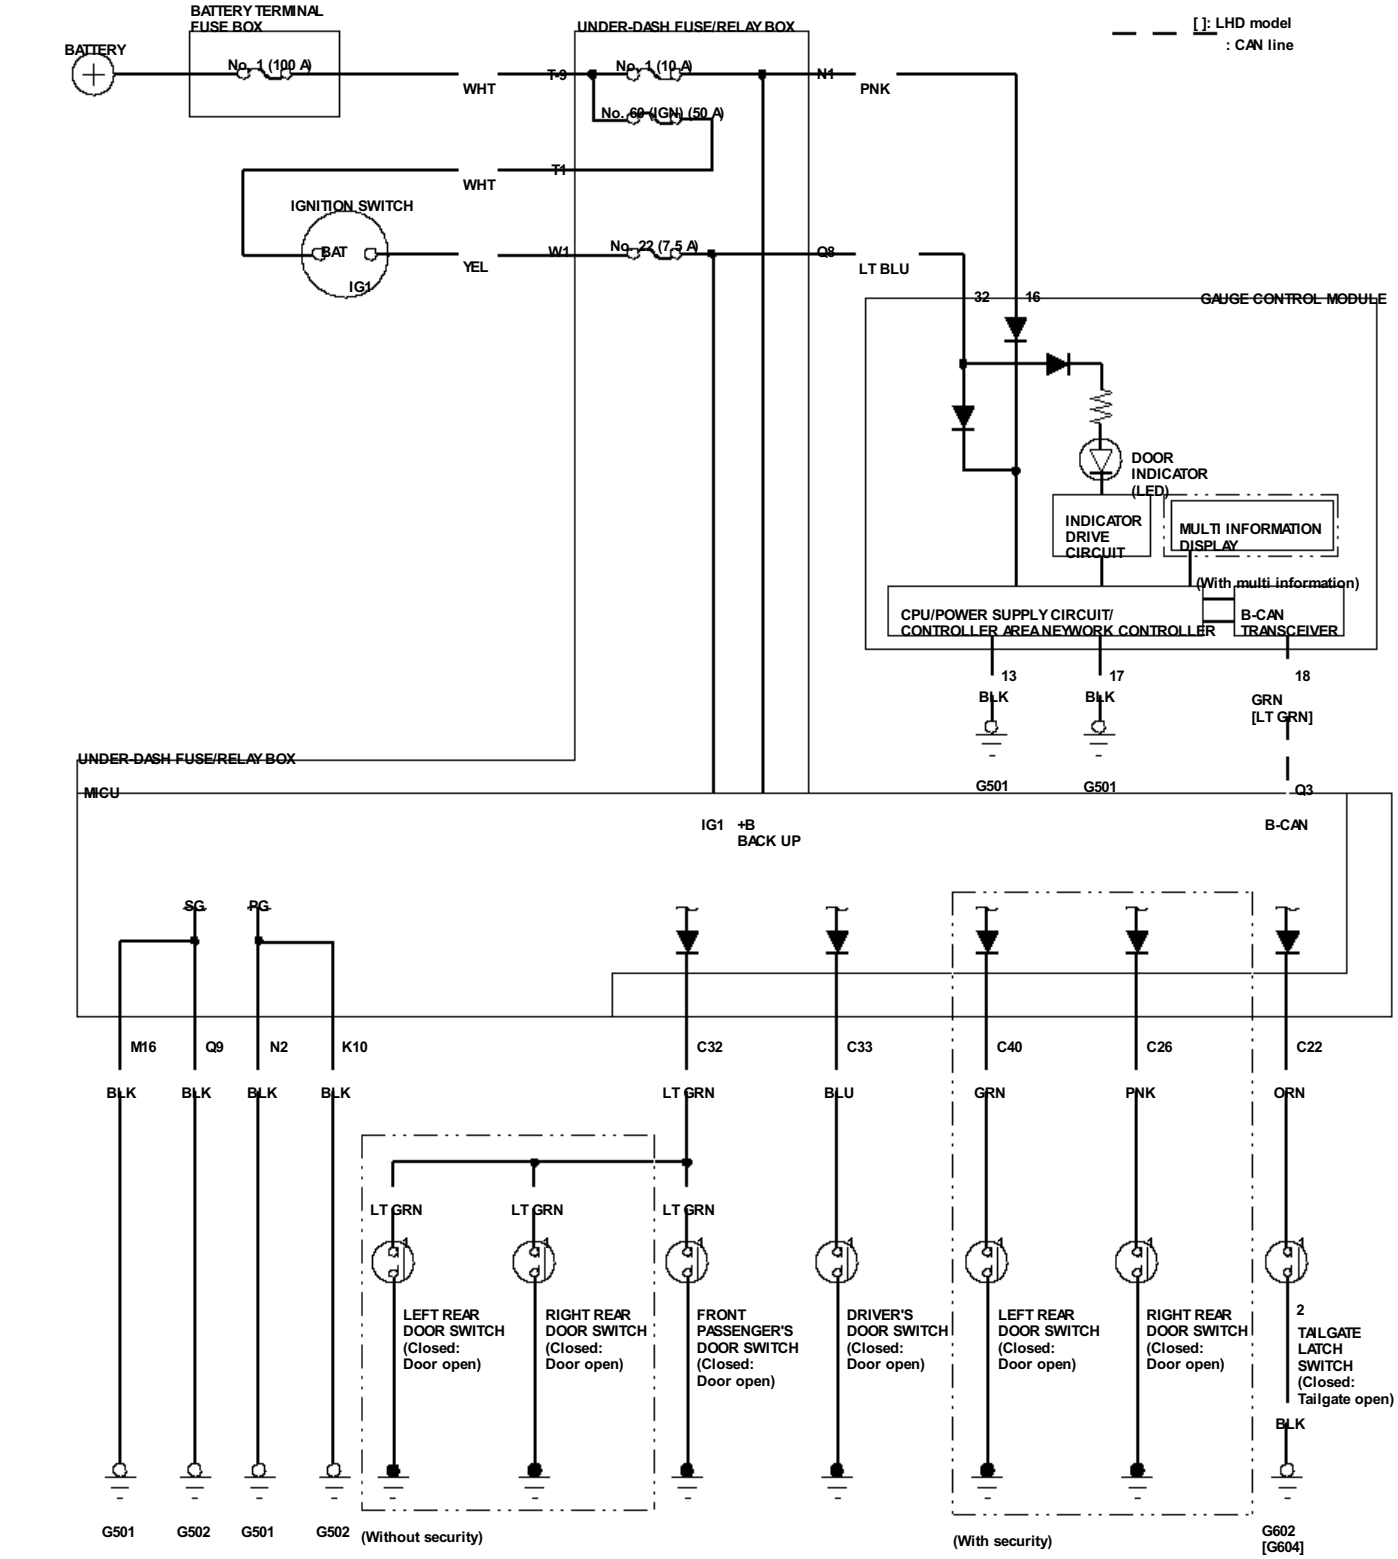


Safety Indicator System Component Location Index



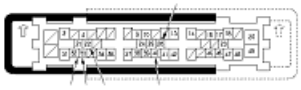
RHD model is shown, LHD model is similar.

Safety Indicator System Circuit Diagram



Safety Indicator System (MICU and Gauge Control Module) Input Test

NOTE: Before testing, do the gauge control module self-diagnostic function to make sure the door indicator LED and B-CAN communication line are OK.



MICU

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors C, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
W1	YEL	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 60 (50 A) fuse in the under-dash fuse/relay box • Faulty ignition switch • An open in the wire
Q3	GRN[LT GRN]	Disconnect the gauge control module 32P connector	Check for continuity between Q3 terminal and the gauge control module 32P connector No. 18 terminal: There should be continuity.	An open in the wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
C33	BLU	Driver's door open	Check for continuity to ground: There should be continuity.	• Faulty driver's door switch • An open in the wire
		Driver's door closed	Check for continuity to ground: There should be no continuity.	• Faulty driver's door switch • A short to ground in the wire
C32	LT GRN	Front passenger's door open	Check for continuity to ground: There should be continuity.	• Faulty front passenger's door switch • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
		Front passenger's door closed	Check for continuity to ground: There should be no continuity.	• Faulty front passenger's door switch • A short to ground in the wire
C32 *2	LT GRN	Left rear door or right rear door open	Check for continuity to ground: There should be continuity.	• Faulty left rear door switch • Faulty right rear door switch • An open in the wire
		Left rear door and right rear door closed	Check for continuity to ground: There should be no continuity.	• Faulty left rear door switch • Faulty right rear door switch • A short to ground in the wire
C40 *1	GRN	Left rear door open	Check for continuity to ground: There should be continuity.	• Faulty left rear door switch • An open in the wire
		Left rear door closed	Check for continuity to ground: There should be no continuity.	• Faulty left rear door switch • A short to ground in the wire
C26 *1	PNK	Right rear door open	Check for continuity to ground: There should be continuity.	• Faulty right rear door switch • An open in the wire
		Right rear door closed	Check for continuity to ground: There should be no continuity.	• Faulty right rear door switch • A short to ground in the wire
C22	ORN	Tailgate open	Check for continuity to ground: There should be continuity.	• Faulty tailgate latch switch • An open in the wire
		Tailgate closed	Check for continuity to ground: There should be no continuity.	• Faulty tailgate latch switch • A short to ground in the wire

*1: With security
*2: Without security

Gauge

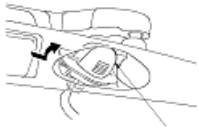
6. Turn the ignition switch to LOCK (0), and remove the instrument panel.
7. Disconnect the gauge control module 32P connector.
8. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 9 .
9. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If al the input tests prove OK, go to Step 10 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
17	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
16	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
32	LT BLU	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

10. Substitute a known-good gauge control module, and recheck the system.
    - If the symptom is gone, the gauge control module is faulty: replace it.
    - If the symptom is still present, the MICU is faulty; replace the under-dash fuse/relay box.

License Plate Light Replacement

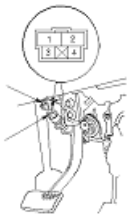
1. Push the retaining spring, and pry out the license plate light (A).
   NOTE: Be careful not to damage the tailgate.



2. Disconnect the 2P connector (A) from the light.
   License Plate Light: 5 W

3. Separate the license plate light lens (B) and the housing (C), then remove the bulb (D).
4. Install the light in the reverse order of removal.

Brake Pedal Position Switch Test



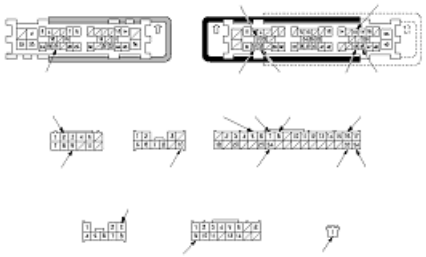
1. Disconnect the 4P connector (A) from the brake pedal position switch (B).
2. Check for continuity between the No. 1 and No. 2 terminals.
   - There should be continuity when the brake pedal is pressed.
   - There should be no continuity when the brake pedal is released.
3. Check for continuity between the No. 3 and No. 4 terminals.
   - There should be no continuity when the brake pedal is pressed.
   - There should be continuity when the brake pedal is released.
4. If necessary, adjust or replace the switch, or adjust the pedal height.

Headlight Replacement

1. Remove the front bumper.
2. Disconnect the connectors (A) from the headlight (B).
   Headlight: 60/55 W
   Front Position Light: 5 W
   Front Turn Signal Light: 21 W
3. Remove the four mounting bolts from the headlight.
4. Remove the bolt and the corner upper beam (C).
5. Install in the reverse order of removal.
6. After replacement, adjust the headlights to local requirements.

Reminder System (MICU and Gauge Control Module) Input Test

NOTE: Before testing, do the gauge control module self-diagnostic function to make sure the beeper and the indicators in the gauge control module work properly, and the B-CAN and F-CAN lines are OK.



MICU

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors B, C, E, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals are OK, go to Step 5 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire

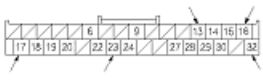
*: Without security

Gauge Control Module



5. Turn the ignition switch to LOCK (0).
6. Remove the gauge control module, and disconnect the 32P connector from it.
7. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to Step 8 .
8. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 9 .

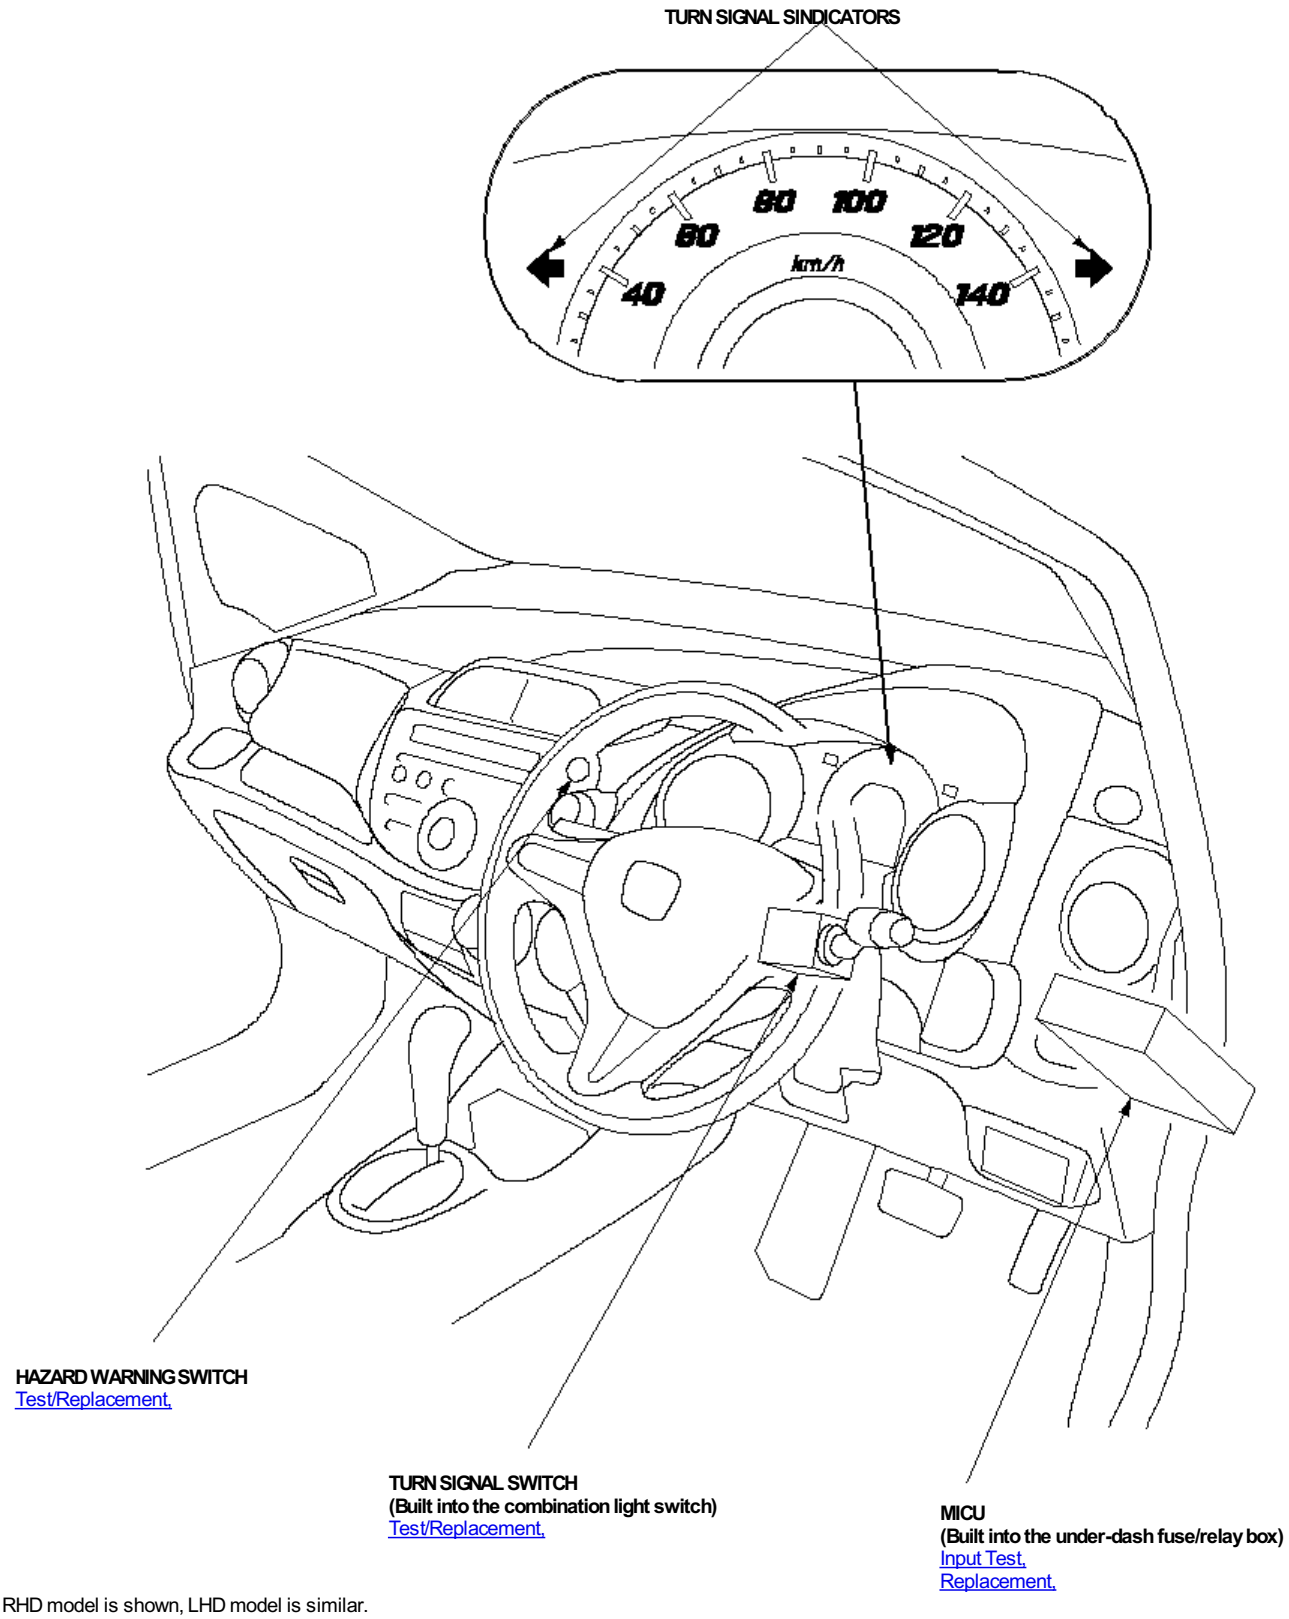
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
16	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
17	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
23	ORN	Parking brake switch ON (Lever pulled)	Measure the voltage to ground: There should be less than 1 V.	• Faulty parking brake switch • An open in the wire
		Parking brake switch OFF (Lever released)	Measure the voltage to ground: There should be 5 V or more.	• Faulty parking brake switch • A short to ground in the wire
29	RED	Disconnect SRS unit connector A (39P)	Check for continuity between the No. 29 terminal and SRS unit connector A (39P) No. 16 terminal: There should be continuity.	An open in the wire
			Check for continuity between the No. 29 terminal and ground: There should be no continuity.	A short to ground in the wire
30	WHT	Disconnect SRS unit connector A (39P)	Check for continuity between the No. 30 terminal and SRS unit connector A (39P) No. 17 terminal: There should be continuity.	An open in the wire
			Check for continuity between the No. 30 terminal and ground: There should be no continuity.	A short to ground in the wire
32	LT BLU	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty ignition switch • An open in the wire

9. If the lights-on reminder has a problem, substitute a known-good under-dash fuse/relay box, and recheck the system. If the seat belt reminder has a problem, check for SRS DTCs and check the seat belt buckle switch. If all the tests prove OK, go to Step 10 .

10. Substitute a known-good gauge control module, and recheck the system.
    - If the symptom is gone, the gauge control module is faulty; replace it.
    - If the symptom is still present, the MICU is faulty; replace the under-dash fuse/relay box.

Turn Signal/Hazard Warning Lights Component Location Index



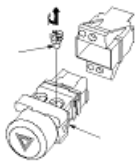
RHD model is shown, LHD model is similar.

Hazard Warning Switch Test/Replacement

1. Remove the audio panel.
   - With audio unit.
   - Without audio unit.
2. Remove the two screws and the hazard warning switch (A).

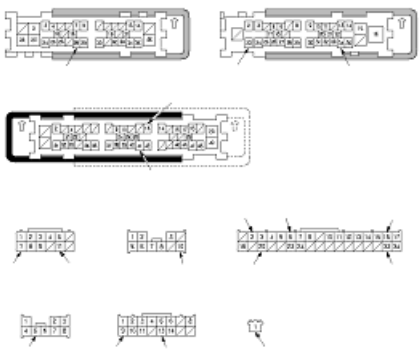
3. Check for continuity between the terminals in each switch position according to the table.

4. If the continuity is not as specified, replace the switch (A) or bulb (B).
5. Install the switch in the reverse order of removal.



Turn Signal/Hazard Warning Lights (MICU) Input Test

NOTE: Before testing, check the No. 1 (10 A), No. 22 (7.5 A), and No. 23 (10 A) fuse in the under-dash fuse/relay box.



1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect the under-dash fuse/relay box connectors A, B, C, E, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. With the connectors still disconnected, make these input tests at the appropriate connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained

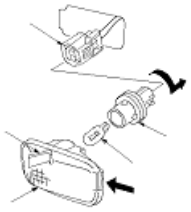
Side Turn Signal Light Replacement

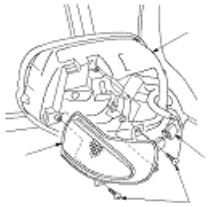
Fender type



NOTE: Be careful not to damage the fender.

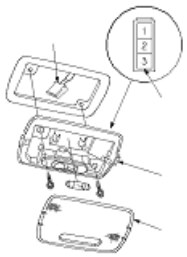
1. Push the retaining spring (A), and pry out the side turn signal light (B).
   Side Turn Signal Light: 5 W
2. Disconnect the 2P connector (C) from the side turn signal light.
3. Turn the bulb socket (D) counterclockwise to remove it from the bulb (E).
4. Install a new bulb in the reverse order of removal.

Mirror Type



1. Remove the mirror holder.
2. Remove the skullcap.
3. Remove the two screws (A) and remove the side turn signal light (B) from the housing (C).
4. Disconnect the 2P connector (D) from the side turn signal light.
5. Install the light in the reverse order of removal.

Ceiling Light Test/Replacement



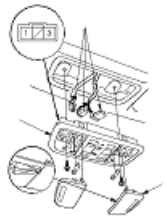
1. Turn the ceiling light switch OFF.
2. Carefully pry the lens (A) off with a small screwdriver.
   Ceiling Light: 8 W
3. Remove the screws, then remove the ceiling light (B).
4. Disconnect the 3P connector (C) from the ceiling light.
5. Check for continuity between the terminals.
   - There should be continuity between the No. 1 and No. 2 terminals with the switch in the MIDDLE position.
   - There should be continuity between the No. 2 and No. 3 (Body ground) terminals with the switch in the ON position.
   - There should be no continuity between the No. 1 and No. 2 terminals, and between the No. 2 and No. 3 (Body ground) terminals with the switch in the OFF position.
6. If the continuity is not as specified, check the bulb. If the bulb is OK, replace the ceiling light.
7. Install the light in the reverse order of removal.

Individual Map Light Test/Replacement - Without Sunshade

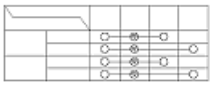
1. Turn the individual map light switch OFF.
2. Carefully pry the lens (A) off with a small screwdriver.
   Individual Map Light: 8 W x 2
3. Remove the screws, then remove the individual map light (B).
4. Disconnect the connector (C) from the individual map light.
5. Check for continuity between the terminals.
   - There should be continuity between the No. 1 terminal and ground terminal with the switch in the ON position.
   - There should be no continuity between the No. 1 terminal and ground terminal with the switch in the OFF position.
6. If the continuity is not as specified, check the bulb. If the bulb is OK, replace the individual map light.
7. Install the light in the reverse order of removal.

Front Individual Map Light Test/Replacement - With Sunshade

With sunshade



1. Turn the map light switch OFF.
2. Carefully pry the lens (A) off with a small screwdriver.
   Front Map Light: 8 W x 2
3. Remove the screws, then remove the map lights (B).
4. Disconnect the connectors (C) from the map lights.

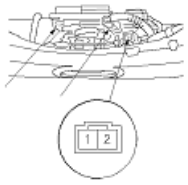


5. Check for continuity between the terminals.
6. If the continuity is not as specified, check the bulb(s). If the bulb(s) are OK, replace the map light.
7. Install the light in the reverse order of removal.

Cargo Area Light Test/Replacement

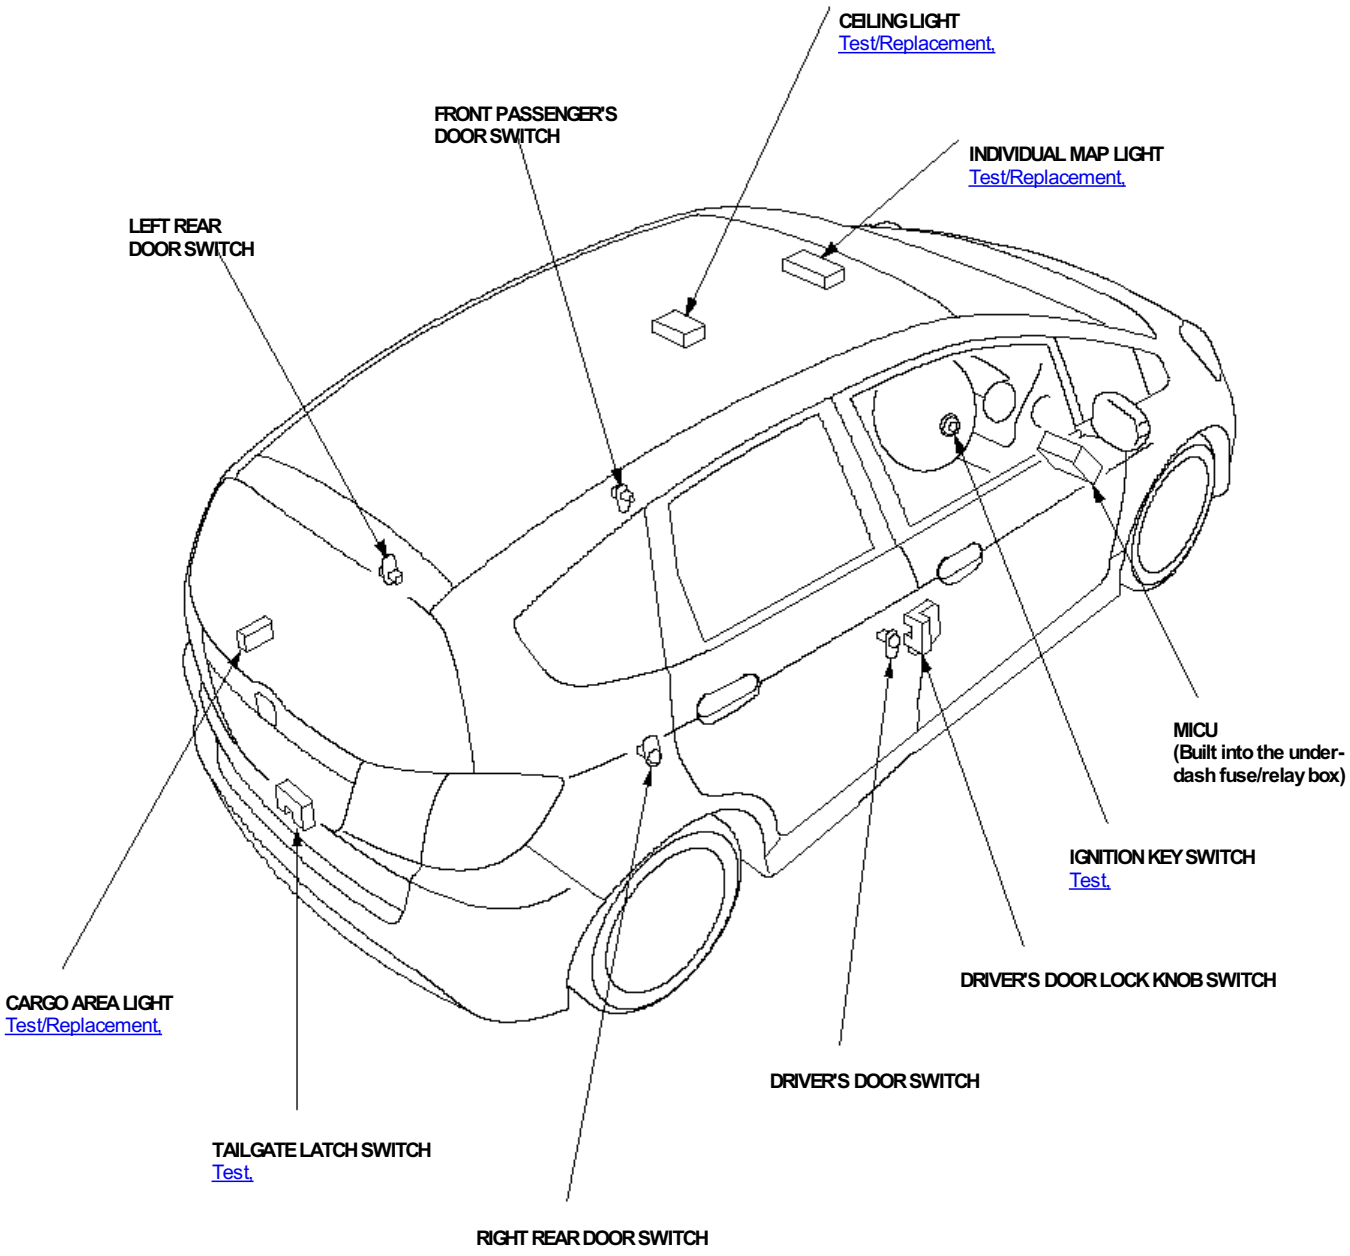
1. Open the tailgate.
2. Carefully pry out the cargo area light (A).
   Cargo Area Light: 5 W
3. Disconnect the 2P connector (B) from the light.
4. Check for continuity between the No. 1 (+) and No. 2 (−) terminals. There should be continuity. If there is no continuity, check the bulb. If the bulb is OK, replace the cargo area light assembly.
5. Install the light in the reverse order of removal.

Tailgate Latch Switch Test



1. Open the tailgate.
2. Remove the tailgate lower trim panel.
3. Disconnect the 2P connector (A) from the tailgate latch assembly (B).
4. Check for continuity between the No. 1 and No. 2 terminals.
   - There should be continuity with the trunk lid open.
   - There should be no continuity with the trunk lid closed.
5. If the continuity is not as specified, replace the trunk lid latch assembly.

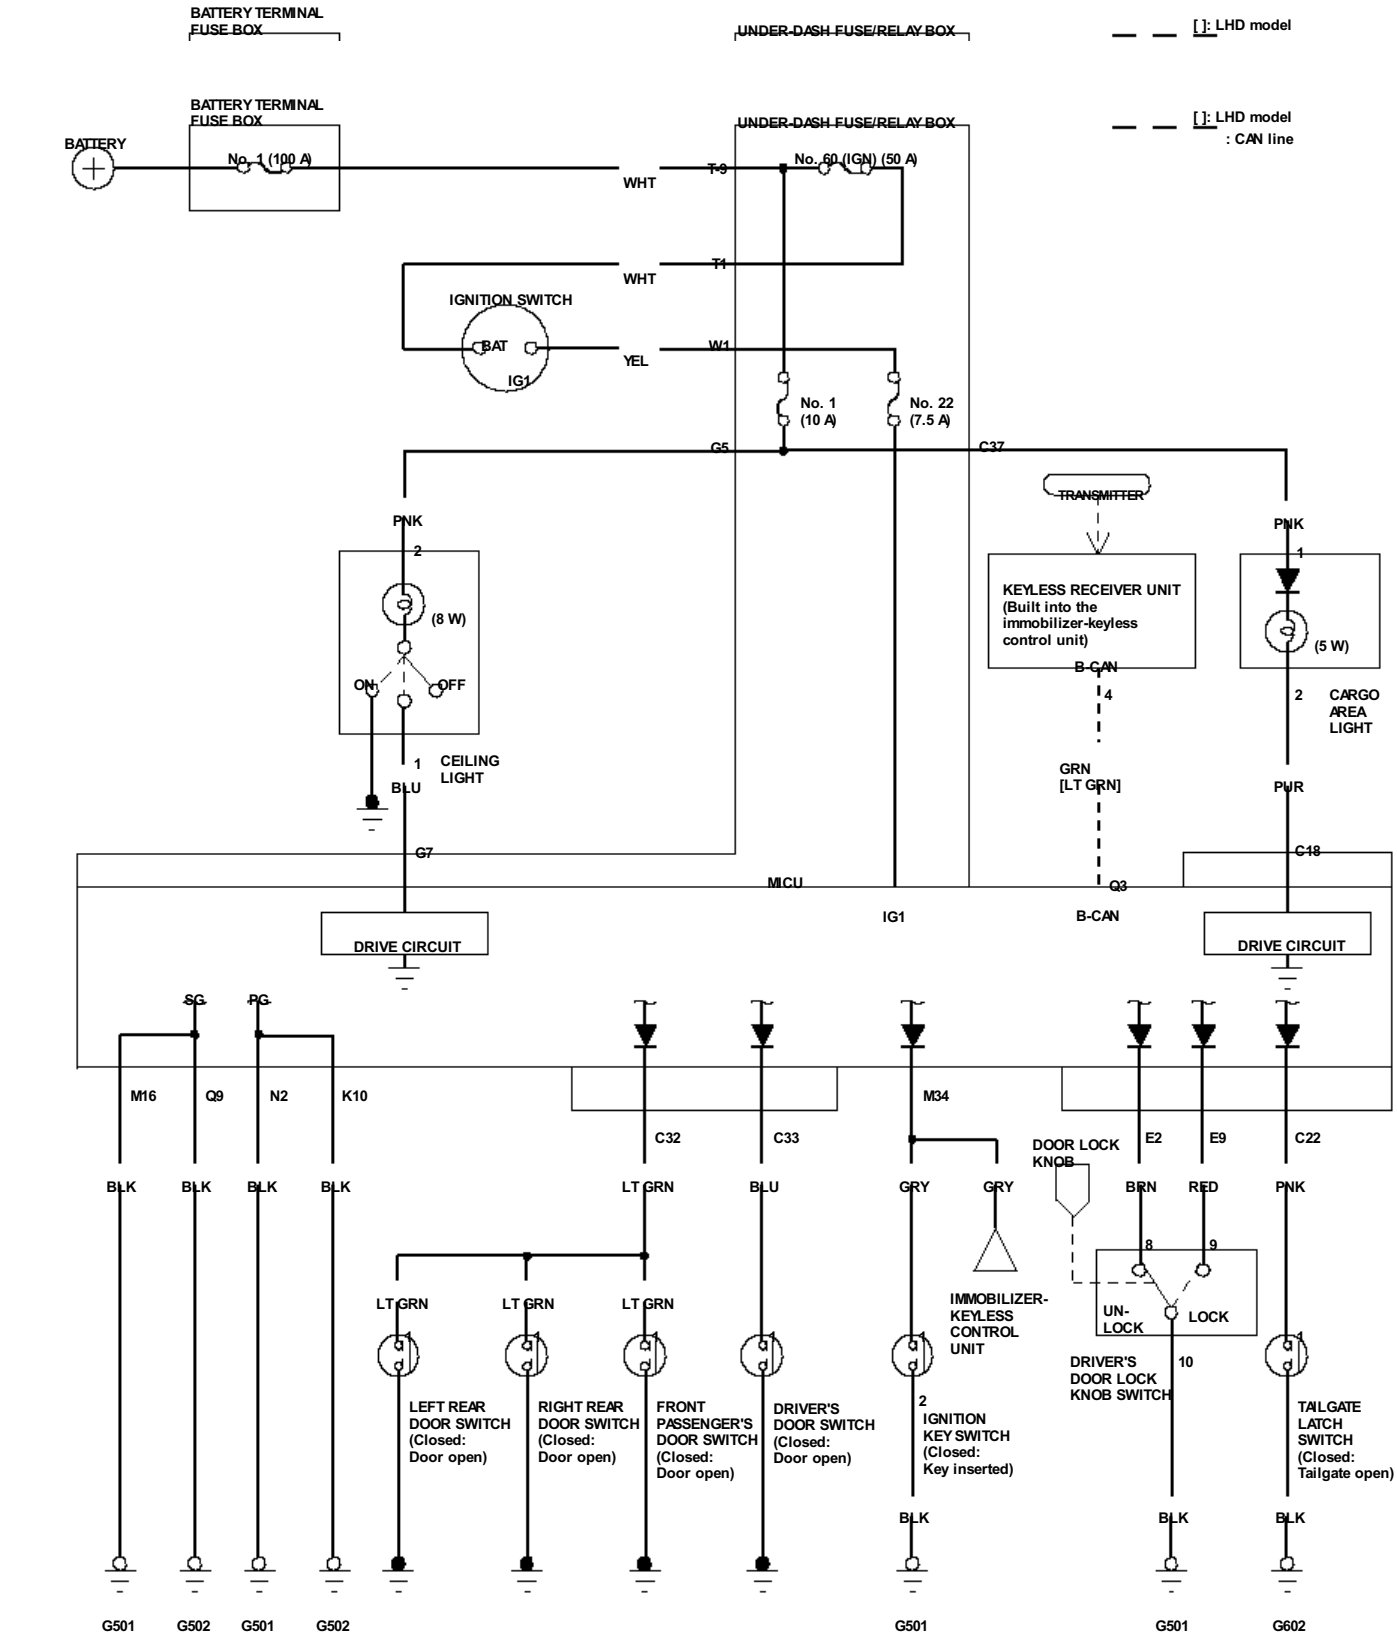
Entry Lights Control System Component Location Index



RHD model is shown, LHD model is similar.

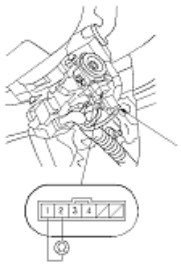
Entry Lights Control System Circuit Diagram

With security



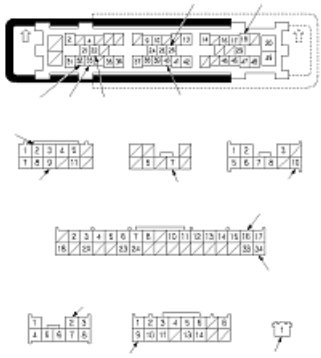
Ignition Key Switch Test

1. Remove the steering column upper and lower covers.
2. Disconnect the 6P connector (A).
3. Check for continuity between the No. 1 and No. 2 terminals.
   - There should be continuity with the key in the ignition switch.
   - There should be no continuity with the key removed.
4. If the continuity is not as specified, replace the ignition switch.



Entry Lights Control System (MICU) Input Test

NOTE: Before testing, check for No. 22 (7.5 A) fuse in the under-dash fuse/relay box.



1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect the under-dash fuse/relay box connectors C, E, G, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD models and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire

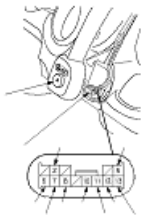
		Driver's door lock knob switch in neutral or UNLOCK	Check for continuity to ground: There should be no continuity	• Faulty driver's door lock knob switch • A short to ground in the wire

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the under dash fuse relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
G7	BLU	Ceiling light switch in middle position	Connect G7 terminal and body ground with a jumper wire: The ceiling light should come on.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty ceiling light • Blown bulb • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C18	PUR	Under all conditions	Connect C18 terminal and body ground with a jumper wire: The cargo area light should come on.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty cargo area light • Blown bulb • An open in the wire

Power Mirrors Function Test



1. Remove the instrument panel.
2. Disconnect the 13P connector (A) from the power mirror switch (B).
3. Choose the appropriate test based on the symptom:
   - Both mirrors don't work, go to Step 4 .
   - Right mirror doesn't work, go to Step 6 .
   - Left mirror doesn't work, go to Step 7 .
   - Retractable mirrors don't work, go to Step 8 .

Both mirrors

4. Measure the voltage between the No. 2 terminal and body ground with the ignition switch ON (II). There should be battery voltage.
   - If there is no battery voltage, check for:
     - Blown No. 10 (7.5 A) fuse in the under-dash fuse/relay box.
     - An open in the BRN wire.
   - If there is battery voltage, go to Step 5 .
5. Check for continuity between the No. 6 terminal and body ground.
   There should be continuity.
   - If there is no continuity, check for:
     - An open in the BLK wire.
     - Poor ground (G501).
   - If there is continuity, check the power mirror switch.

Right mirror

6. Connect the No. 2 terminal to the No. 11 terminal, and the No. 5 (then No. 13) terminal to the No. 6 terminal with jumper wires, and turn the ignition switch to ON (II). The right mirror should tilt down (then swing left).
   - If the mirror does not tilt down (or does not swing left), check for an open in the GRN (or BLU) wire between the right mirror and the power mirror switch 13P connector. If the wire is OK, check the right mirror actuator.
   - If the mirror neither tilts down nor swings left, repair an open in the LT GRN wire.
   - If the mirror works properly, check the power mirror switch.

Left mirror

7. Connect the No. 2 terminal to the No. 10 terminal, and the No. 5 (then No. 12) terminal to the No. 6 terminal with jumper wires, and turn the ignition switch to ON (II). The left mirror should tilt down (then swing left).
   - If the mirror does not tilt down (or does not swing left), check for an open in the GRN (or PNK) wire between the left mirror and the power mirror switch 13P connector. If the wire is OK, check the left mirror actuator.
   - If the mirror neither tilts down nor swings left, repair an open in the ORN wire.
   - If the mirror works properly, check the power mirror switch.

Retractable Power Mirror

8. Connect the No. 2 and No. 7 (or No. 8) terminals and the No. 8 (or No. 7) and the No. 6 terminals with jumper wires, and turn the ignition switch to ON (II). The both mirror should retract (or extend).
   - If both mirrors do not work, check for:
     - Blown No. 10 (7.5 A) fuse in the under-dash fuse/relay box.
     - An open in the GRY or YEL wire.
     - Poor ground (G501).
   - If only one fails to work, check its retractable mirror actuator.
   - If both work, check the power mirror switch.

Power Mirror Replacement

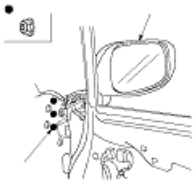
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

1. Carefully pull the bottom edge of the mirror mount cover (A) out to release the hooks (B), and remove the cover by lifting it upward to release the hooks (C, D).
2. Remove the front door panel.

3. Remove the plastic cover as needed, then disconnect the connector (A).

4. While holding the mirror (A), remove the nuts.

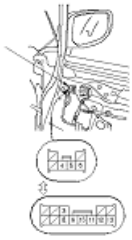


5. While holding the mirror (A), detach the clip (B) and pull the harness (C) out through the hole in the door. Take care not to scratch the door.

6. Install the mirror in the reverse order of removal, and note these items:
   - Make sure the connector is plugged in properly.
   - Check if the clip is damaged or stress-whitened, and if necessary, replace it with a new one.
   - Push the clip and hooks into place securely.

Power Mirror Actuator Test

1. Remove the door panel.
2. Disconnect the power mirror 13P (or 6P) connector (A) .



3. Check actuator operation by connecting power and ground according to the table.
4. If the mirror fails to work properly, replace the power mirror actuator.

Power Mirror Actuator

	⊕ ⊖	⊖ ⊕	
	⊖	⊕	
		⊕ ⊖	⊖ ⊕

Retract Actuator

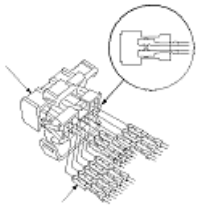
	⊕ ⊖	⊖ ⊕

Power Mirror Actuator Replacement

Removal

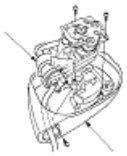
1. Remove the power mirror holder, and the power mirror.
2. Remove the two screws (A) and the side turn signal light (B) from the housing (C).
3. Disconnect the 2P connector (D) from the side turn signal light.
4. Record the power mirror connector terminals location and the wire harness colors.

5. Disassemble the power mirror connector (A), and remove the terminals (B) from the connector.



6. Remove the gasket (A) and cover (B).
7. Remove the three screws, and separate the mirror housing (C) from the bracket (D).

8. Remove the three screws and the power mirror actuator (A) from the housing (B).



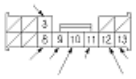
9. Remove the four screws, and separate the power mirror actuator (A) and the retract actuator (B).

Installation

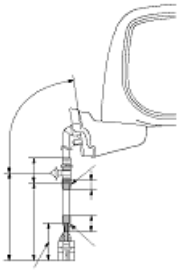
6P CONNECTOR

10. Route the wire harness of the new actuator through the hole in the bracket and gasket, then install the parts in the reverse order of removal.
11. Insert the new actuator terminals into the connector in the original arrangement.

13P CONNECTOR

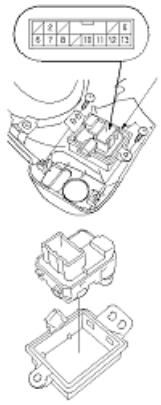


12. Apply tapes (A), (B) to seal the wire harness.
13. Reassemble in the reverse order of disassembly. Be careful not to break the mirror holder when reinstalling it to the actuator.
14. Reinstall the mirror assembly on the door.
15. Operate the power mirror to ensure smooth operation.



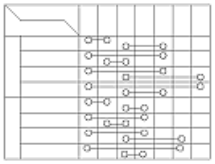
Power Mirror Switch Test/Replacement

1. Remove the instrument panel.
2. Disconnect the 13P connector from the power mirror switch (A).

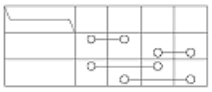


3. Check for continuity between the terminals in each switch position according to the table.
4. If the continuity is not as specified, remove the screws and the covers and replacement the switch.
5. Install in the reverse order of removal.

Power Mirror Switch



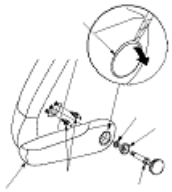
Retract Switch



Front Seat Armrest Replacement

NOTE:

- Take care not to tear the seams or damage the seat covers.
- When removing components, use the trim tools or equivalent.



1. Using a trim tool, remove the cap (A).
2. Remove the center pin (B), bushing (C) and washer (D), then remove the armrest (E).
3. If necessary, remove the pins (F) from the seat-back.
4. Install the armrest in the reverse order of removal.

Front Seat Frame Replacement

Passenger's Seat

NOTE

- Put on gloves to protect your hands.
- Apply oil to the pivot portions of the slide locks.
- Apply multipurpose grease to the sliding portions of the seat tracks.
- RHD model is shown; LHD model is similar.
- If the side airbag has deployed, replace the seat frame and related parts with new ones.

1. Remove the front seat.
2. Remove these items:
   - Front seat recline covers
   - Front seat belt buckle
   - Front seat-back cover/pad
   - Front seat cushion cover/pad
   - Recline inner covers
   - For some models: OPDS unit
   - For some models: Side airbag module
3. Install the new seat frame in the reverse order of removal.

Driver's Seat

NOTE

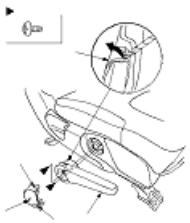
- Put on gloves to protect your hands.
- Apply oil to the pivot portions of the slide locks.
- Apply multipurpose grease to the sliding portions of the seat tracks.
- RHD model is shown; LHD model is similar.
- If the side airbag has deployed, replace the seat frame and related parts with new ones.

1. Remove the front seat.
2. Remove these items:
   - Front seat recline covers
   - Front seat belt buckle
   - Front seat-back cover/pad
   - Front seat cushion cover/pad
   - Recline inner covers
   - For some models: Side airbag module
3. Install the new seat frame in the reverse order of removal.

Front Seat Recline Cover Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

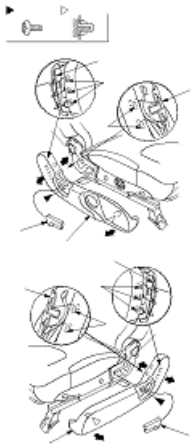
- Put on gloves to protect your hands.
- Take care not to tear the seams or damage the seat covers.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is similar.



Outer recline cover

1. Remove the front seat.
2. Manual height adjustable seat: Pull back the cap (A) to release the hooks (B), and remove the screws, then remove the height handle (C).

3. Remove the recline outer cover (A).
   -1. Fold back the seat to fully.
   -2. Remove the recline knob (B), and remove the screw.
   -3. Using a trim tool, and release the hooks (C) of the outer cover from the recline inner cover (D).
   -4. Detach the clip by pulling the outer cover back by hand.
   -5. Gently pull out the outer cover and remove it.

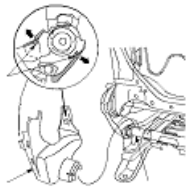


Inner recline cover

4. Remove the front seat cushion cover/pad.
5. Remove the recline inner cover (A).
   -1. Release the hooks (B) of the recline inner cover from the seat cushion frame.
   -2. Pull out the cover by removing the holder of the cover from the seat cushion frame pipe (C).
6. When installing the inner cover; securely fit the hooks on the seat cushion frame first, next fit the holder of the cover on the cushion pipe.

Driver's seat

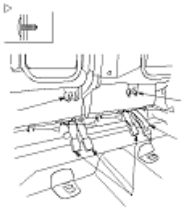
Passenger's seat



Rear Seat Removal/Installation

NOTE:

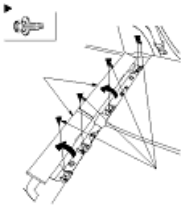
- Put on gloves to protect your hands.
- Take care not to scratch the trim and panels.
- Have an assistant help you when removing and installing the rear seat.



1. Pull the rear seat belt buckles (A) and rear center seat belt detachable anchor or rear center lap seat belt (B) out through each elastic straps (C) on both seat cushions.
2. Lift both rear seat cushions up.
3. Detach the clips from the seat-back hinge. Slip the sea belt buckles and seat belt detachable anchor or seat belt.
4. Fold both rear seat-backs.

---

5. Open the cargo floor lids (A) and remove the bolts securing both rear seats.



---

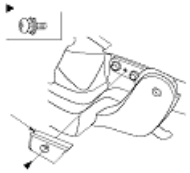
6. Remove the right rear seat (A) and the left rear seat (B) through both rear door opening.

7. Install the seats in the reverse order of removal, and note these items:
   - Apply medium strength type liquid thread lock to the seat mounting bolts before reinstallation.
   - Push the clips into place securely.
   - After installing, fix the seat belt buckles and the detachable anchor with elastic bands on both seat cushions.
   - If the clips are damage or stress-whitened, replace them with new ones.

Rear Seat Disassembly/Reassembly

NOTE:

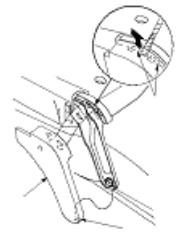
- When removing components, use the trim tools or equivalent.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- The left rear seat is shown, the right rear seat is similar.

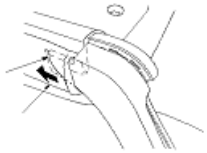


Seat-back cover removal

1. Remove the rear seat assembly.
2. Remove the head restraints.
3. Remove the screw, then remove the recline upper cover (A).

4. Remove the center cover (A).
   -1. Using a trim tool, and release the upper hooks (B) of the cover.
   -2. Release the lower hook (C) of the cover, then remove the center cover.
   NOTE: When installing the center cover, insert the upper portion (D) of the cover into the seat cushion cover (E) securely.

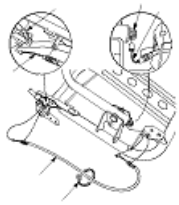




5. Remove the bolts and nut, then separate the rear seat-back (A) and the rear seat cushion (B).
6. If necessary, remove the bushing (C) and pivot washer (D).
7. Reassemble the seat-back and seat cushion in reverse order of disassembly, and note these items:
   - Apply medium strength type liquid thread lock to the bolts before reinstallation.
   - Apply multipurpose grease to the moving portions of the recline adjusters.
   - Replace any damaged or stress-whitened bushing and pivot washer with new ones.
   - Make sure the bushing and pivot washer are installed correctly.

Rear Seat Control Cable Replacement

NOTE:



- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- Take care not to kink the cable.
- The left rear seat cushion is shown, the right rear seat cushion is similar.

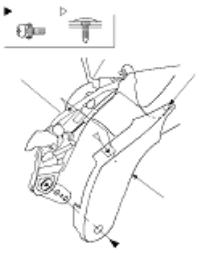
1. Remove the rear seat assembly.
2. Remove the rear seat cushion.
3. Remove the rear seat cushion cover/pad and the silencer.
4. Fold the leg, and remove the wire tie (A).
5. Disconnect the control cable (B) from the leg end (C) and cable bracket (D) of the seat cushion frame.
6. Install the cable in the reverse order of removal, and note these items:
   - Replace the wire tie you removed with new ones.
   - Make sure the control cable is routed properly and connected securely.
   - Fix at the original position in the end of the cable on the cable bracket securely. And check the rear seat tip-up operation:
     Make sure the rear seat cushion unlocks by lifting the leg. If necessary, adjust the position of the cable end.

Rear Seat Cushion Cover/Pad Replacement

NOTE:

- When removing components, use the trim tools or equivalent.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- The left rear seat cushion is shown, the right rear seat cushion is similar.

1. Remove the rear seat.
2. Remove the rear seat cushion.
3. Remove the screw and clip, then release the lib (A) and remove the recline cover (B).



4. Lift the leg (A), and remove the rear seat under cover cap (B).

Left rear seat cushion

Right rear seat cushion

5. Remove the screws and knobs (A). Release the hook strip (B) of the seat cushion cover (C) from the edge of the rear seat under cover (D) all the way around.

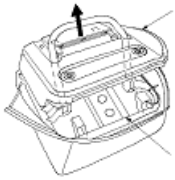
Left rear seat cushion

Right rear seat cushion

6. Remove the rear seat under cover (A) from the seat cushion frame (B).

Left rear seat cushion

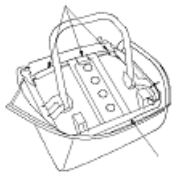
Right rear seat cushion



7. Release the hooks (A) from the seat-back frame (B).

Left rear seat cushion

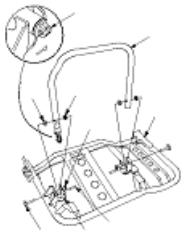
Right rear seat cushion



---

8. Remove the rear seat cushion cover/pad (A) and the silencer (B) from the rear seat cushion frame (C).
9. Install the rear seat cushion cover/pad in the reverse order of removal. To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the hooks.

Rear Seat Cushion Leg Replacement



NOTE:

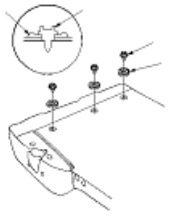
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- Take care not to kink the cable.
- The left rear seat cushion is shown, the right rear seat cushion is similar.

1. Remove the rear seat assembly.
2. Remove the rear seat cushion.
3. Remove the rear seat cushion cover/pad and the silencer.
4. Remove the leg (A) from the seat cushion frame (B):
   -1. Disconnect the control cable.
   -2. Release the push nuts (C), then remove the set pins (D).
   -3. Remove the leg.
   -4. If necessary, remove the bushings (E), the cable hook (F), and the spring pins (G).
5. Install the leg in the reverse order of removal, and note these items:
   - Replace the push nuts and spring pins you removed with new ones.
   - Make sure the control cable is connected securely.
   - Apply multipurpose grease to the inside surfaces of the brackets (H).

Rear Seat-back Cover/Pad Replacement

NOTE:

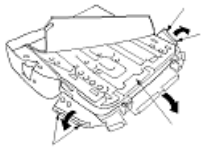
- When removing components, use the trim tools or equivalent.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- The left rear seat is shown, the right rear seat is similar.



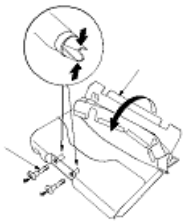
1. Remove the rear seat assembly.
2. Remove the seat-back.
3. Remove the these items:
   - Latch cover
   - Striker hole cover
4. If equipped, remove the shelf hooks (A) and shelf holder covers (B) from the back of the seat-back.

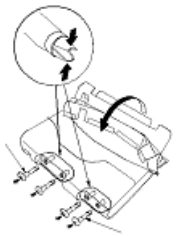
5. Release the hook strip (A), and unzip the seat-back cover and pull back the cover (B).

6. Release the hooks (A) from the seat-back frame (B).

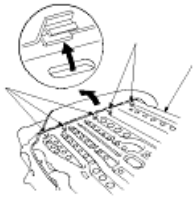


7. Pull out the seat-back cover/pad (A) from the frame, then pull out the head restraint guides (B) and center head restraint guides (C) (for some model) while pinching the end of the guides, and remove them.

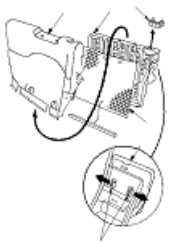




8. Release the hooks (A) from the seat-back frame (B).



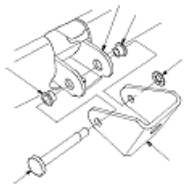
9. Remove the seat-back cover/pad (A) and the silencer (B) from the seat-back frame (C). If necessary, release the hooks (D) and remove the latch lever inner cover (E).
10. Install the seat-back cover/pad in the reverse order of removal. To prevent wrinkles when installing a seat-back cover, make sure the material is stretched evenly over the pad before securing the hooks.



Rear Seat-back Hinge Replacement

NOTE:

- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.

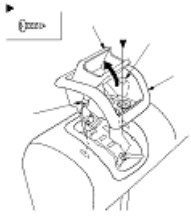


1. Remove the rear seat assembly.
2. Release the push nut (A) from the pivot pin (B).
3. Remove the pivot pin, pivot collars (C), and hinge (D) from the seat-back frame (E). The inside hinge of each seat-back frame is shown. The outside hinges of them are symmetrical.
4. Reassemble the hinge in the reverse order of disassembly, and note these items:
   - Apply multipurpose grease to the moving portions of the hinge.
   - Replace any push nuts you removed with new ones.

Rear Seat-back Latch Replacement

NOTE:

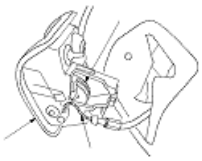
- When removing components, use the trim tools or equivalent.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- The left rear seat is shown, the right rear seat is similar.



1. While pulling the latch lever (A), and remove the screw.
2. Release the hooks (B), and pull up the latch cover (C) from the rear seat-back.

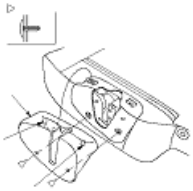
---

3. Disconnect the control cable (A) from the latch lever (B), and remove the latch cover (C). Take care not to bend the cable.



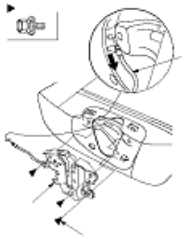
---

4. Detach the clips and hooks (A), then remove the striker hole cover (B).



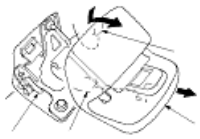
---

5. Remove the bolts securing the seat-back latch (A).
6. Carefully pull out the seat-back latch and cable (B) out through the striker hole in the seat-back cover.
7. Reassemble the seat-back latch and cable in reverse order of disassembly, and not these items:
   - If the clips are damage or stress-whitened, replace them with new ones.
   - Make sure the seat-back cable is routed properly.
   - Make sure the seat-back cable is connected securely.
   - Make sure the rear seat locks and unlocks properly.

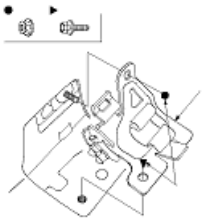


Rear Seat Leg Guide Replacement

1. Push the leg guide cover (A) to release the hook (B), then pull out the cover from the attaching plate (C) of the foot guide (D).



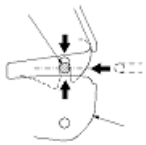
2. Remove the nut and bolt, then remove the foot guide (A).
3. Install the foot guide in the reverse order of removal.



Rear Seat-back Striker Replacement

1. Remove the cargo area side trim panel.
2. Remove the bolts, then remove the rear seat-back striker (A).

3. Install the striker in the reverse order of removal, and more the striker (A) up or down until it is centered in the seat-back latch (B).



Immobilizer System Symptom Troubleshooting Index

1. Troubleshoot the immobilizer system by the order of the priority shown:

Order of Priority	Symptom	Possible cause
1	Immobilizer indicator blinks after the ignition switch turned to LOCK (0).	Symptom troubleshooting.
2	Engine does not start with the immobilizer key.	Symptom troubleshooting.
3	Immobilizer indicator does not come on.	Check the MIL indication. • If the MIL comes on, go to the Fuel and Emission MIL circuit troubleshooting. • If the MIL does not come on, go to the gauge control module self-diagnostic function.
4	Immobilizer indicator does not go off.	Symptom troubleshooting.

How to Troubleshoot the Immobilizer System

General Check before Troubleshooting

Before troubleshooting the immobilizer system, check the following general items and solve any if applicable:

- The battery is low; charge the battery fully, then troubleshoot the immobilizer system.
- The ignition key is not a genuine Honda part; use the Honda-approved key blank, register the key, then troubleshoot the immobilizer system.
- A key ring, or keys, or a key case is used; remove the key from it, and troubleshoot the immobilizer system with a key only.
- An aftermarket electrical part is attached; remove it, then troubleshoot the immobilizer system.

Symptom Troubleshooting by the Immobilizer Indicator Lighting Pattern

The pattern of the immobilizer indicator can help troubleshoot the condition of the immobilizer system. Following are descriptions of the four possible patterns:

Normal operation

If the immobilizer code is identified, the immobilizer indicator comes on for 2 seconds, then goes off after turning the ignition switch to ON (II).
The immobilizer indicator does not come on when the ignition switch is turned to LOCK (0).

Immobilizer code is not identified

If the immobilizer code is not identified, the immobilizer indicator comes on for 2 seconds, then blinks after turning the ignition switch to ON (II).
The immobilizer indicator blinks ten times, then goes off when the ignition switch is turned to LOCK (0).

Immobilizer indicator does not come on

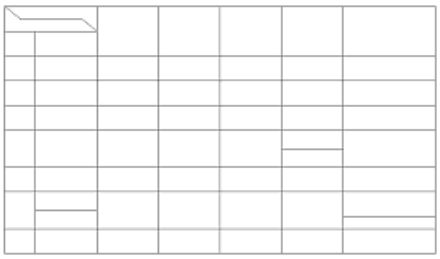
If the immobilizer indicator does not come on after turning the ignition switch to ON (II), an open or short in the F-CAN lines between the ECM/PCM and the gauge control module. Watch the malfunction indicator lamp (MIL). If the MIL stays on, go to the PGM-FI system troubleshooting.

Immobilizer indicator does not go off

If the immobilizer indicator does not go off after turning the ignition switch to ON (II), do the gauge control module self-diagnostic function. If the indicator drive circuit is OK, do the SYSTEM CHECK with the HDS. Before troubleshooting the immobilizer system, check the following general points and solve any if applicable.

Symptom Troubleshooting Using Malfunctioning Circuit Functions

If a malfunction occurs in the immobilizer circuit, use the table to cross-reference the malfunctioning function to the line(s) that should be checked:



System Check

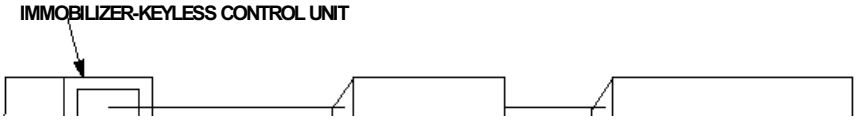
NOTE: The HDS can be used to:

- Check the state of the immobilizer key registration and the S-NET line by doing a SYSTEM CHECK.
- Check the number of times the immobilizer-keyless control unit doesn't permit the engine to run by checking the STATUS LOG.

1. Connect the HDS to the data link connector, then turn the ignition switch to ON (II) and follow the prompts to the MAIN MENU.
   NOTE: If the HDS does not communicate with the vehicle, go to the DLC circuit troubleshooting.
2. At the MAIN MENU, enter IMMOBILIZER, then select the IMMOBILIZER SETUP.
3. Do the SYSTEM CHECK. If there is a system check number, do the troubleshooting for the item indicated.
4. Check the status log using the HDS. Troubleshooting the line with the highest counts first. If all the lines are “0" zero, the problem may not be caused by the immobilizer system, check for ignition or fuel problems.
   NOTE: Once repaired, clear the status log by removing the No. 1 (10 A) fuse in the under-dash fuse/relay box or disconnecting the immobilizer-keyless control unit.

Immobilizer System Description

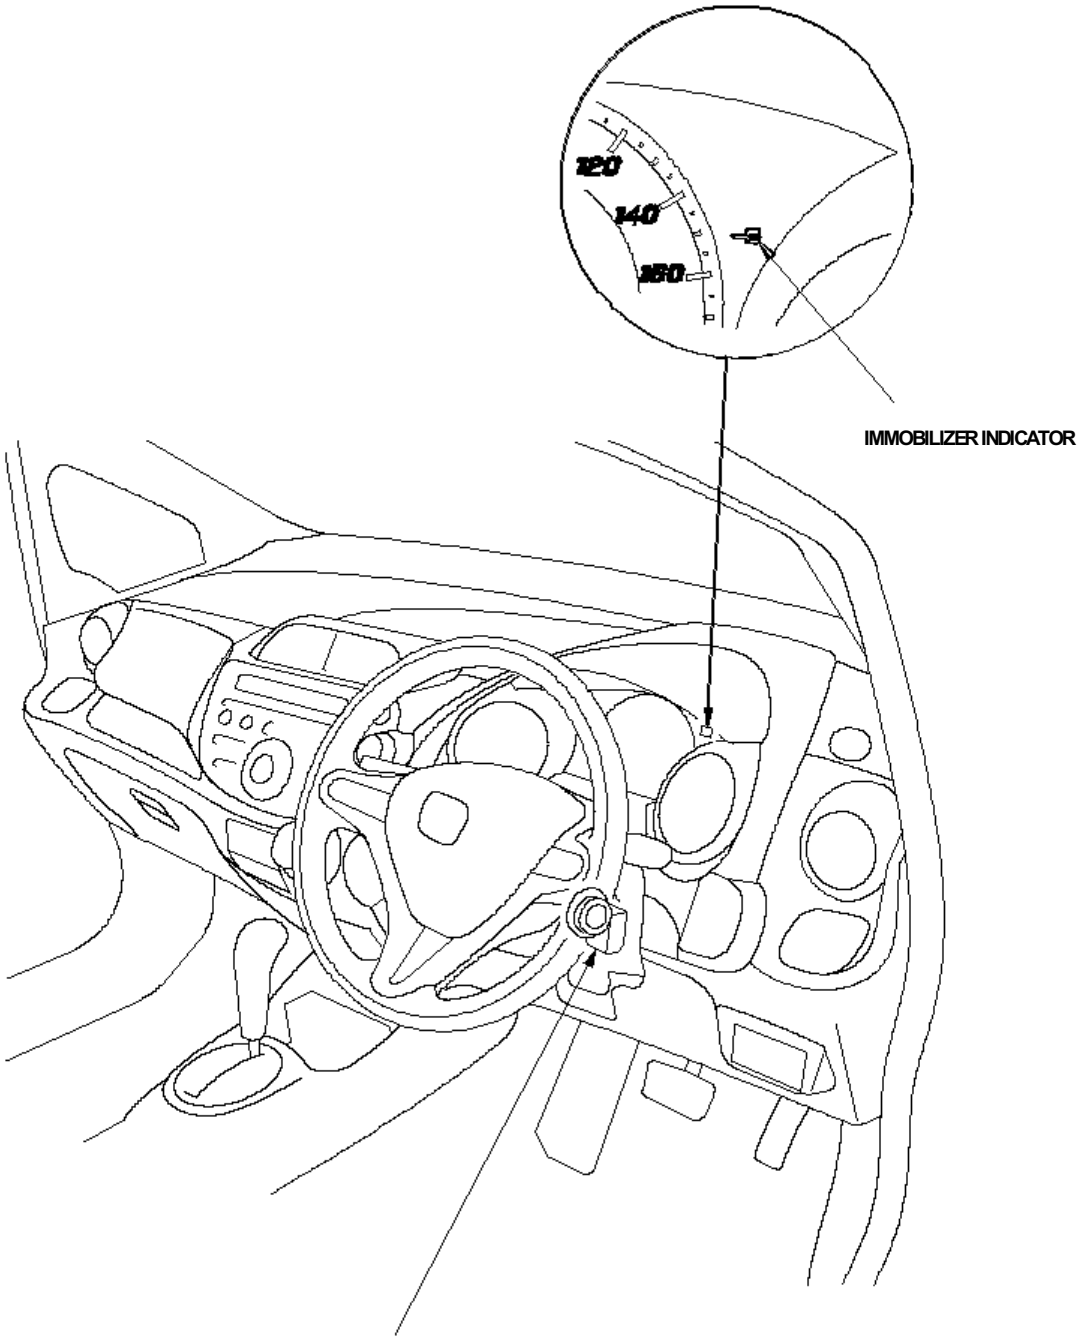
The vehicle is equipped with an immobilizer system that will disable the vehicle unless a programmed ignition key is used.
This system consists of a transponder located in the ignition key, an immobilizer-keyless control unit, an indicator, and the ECM/PCM.
When the key is inserted in the ignition switch and turned to the ON (II) position, the immobilizer-keyless control unit sends power to the transponder in the ignition key. The transponder then sends a coded signal back through the immobilizer control unit-receiver to the ECM/PCM. The code is a rolling type embedded in the receiver instead of the ECM/PCM.
A communication agreement with the HDS is required at the ECM/PCM after repair or replacement. When replacing the immobilizer-keyless control unit, all keys are required to be registered into the new control unit. Any keys that were not registered in the control unit will not start the vehicle.



IMMOBILIZER INDICATOR BLINKING PATTERN

IGNITION SWITCH		ON (II) / LOCK (0)
PROGRAMMED KEY INSERTED	INDICATOR	ON / OFF — 2 sec., 5 sec., 1 Hz
WRONG KEY INSERTED	INDICATOR	ON / OFF — 1 sec.

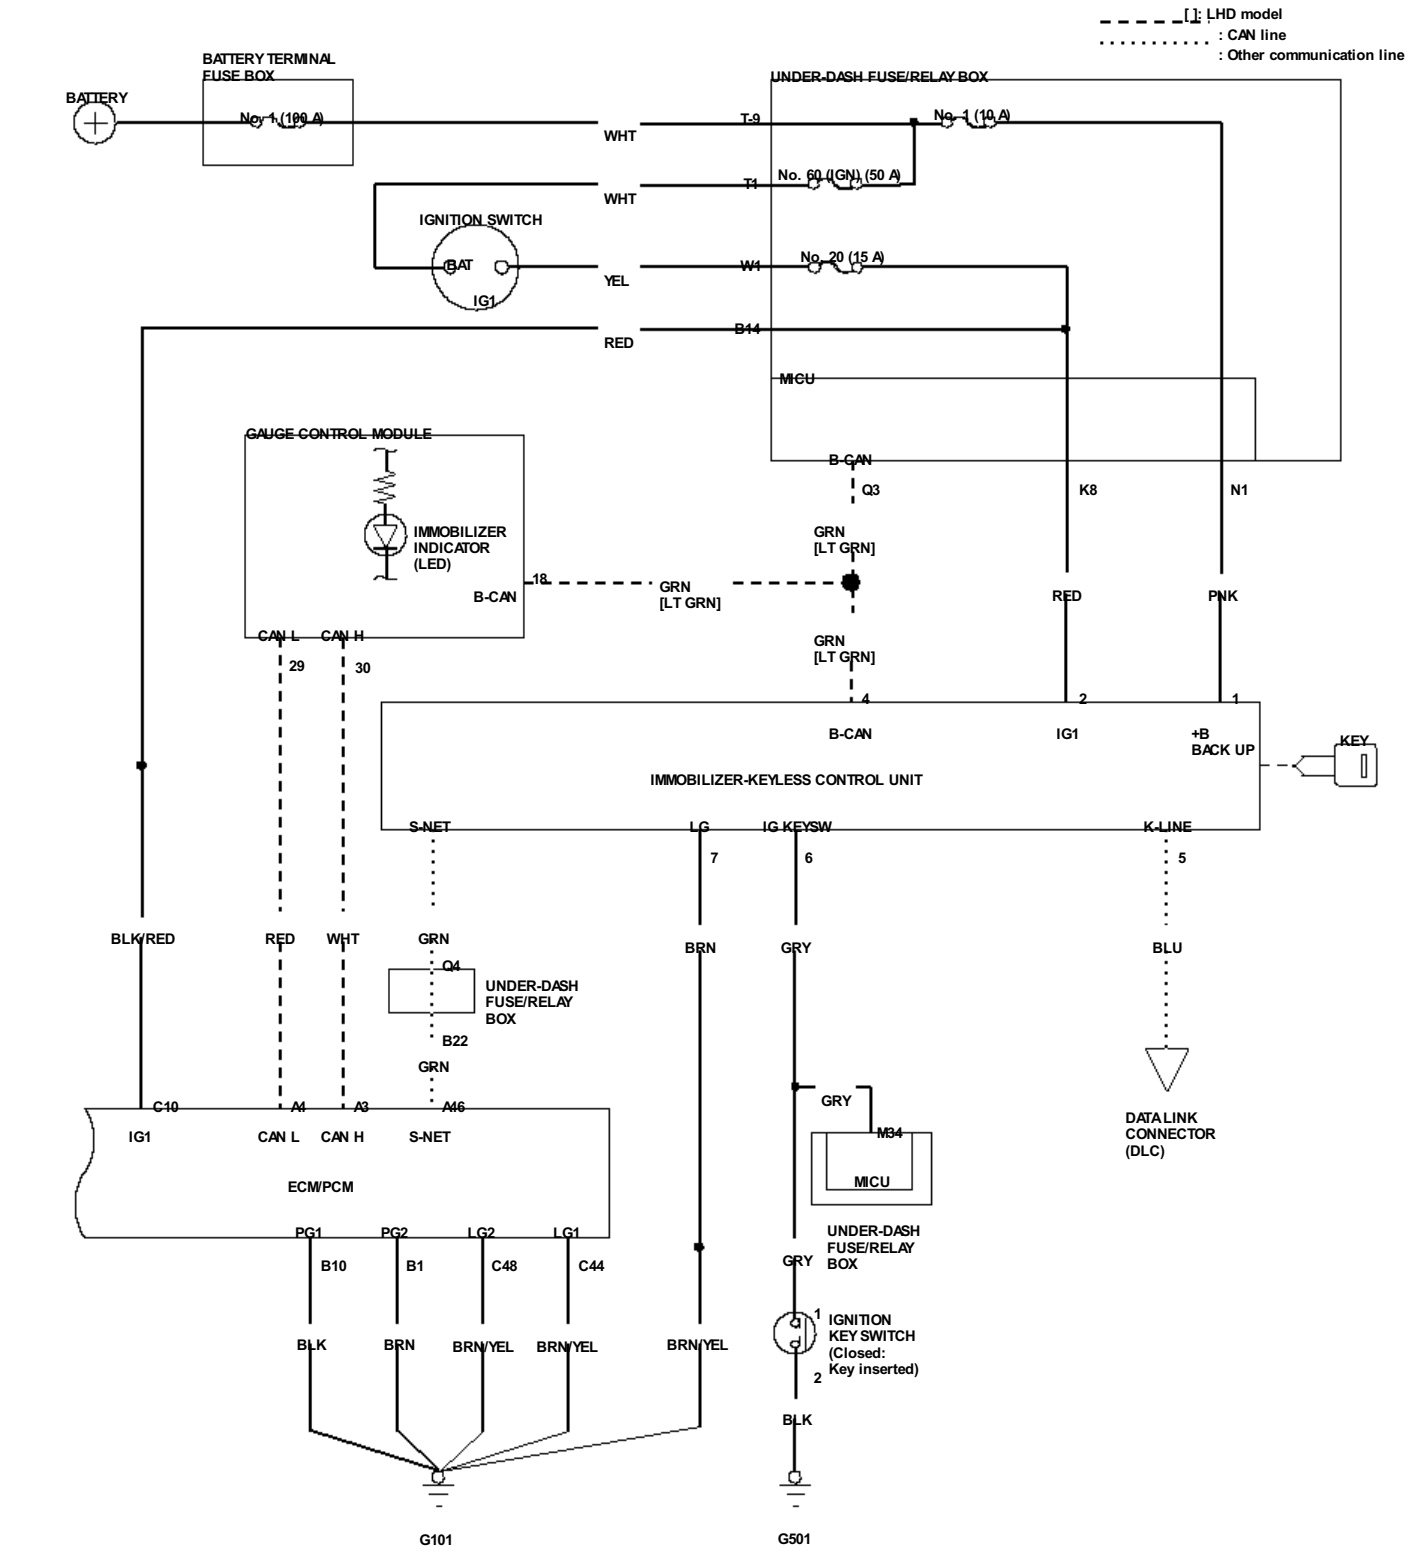
Immobilizer System Component Location Index



IMMOBILIZER-KEYLESS CONTROL UNIT
Symptom Troubleshooting,

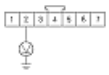
Replacement,
Registration for Immobilizer System,

Immobilizer System Circuit Diagram



Immobilizer indicator blinks

NOTE: Before troubleshooting, check the items listed in ‘‘General Check before Troubleshooting".



1. Turn the ignition switch to LOCK (0).
2. Connect the HDS, then turn the ignition switch to ON (II).
3. Enter the IMMOBILIZER, then select the IMMOBILIZER SETUP.
4. Select the SYSTEM CHECK.

   Is the SYSTEM CHECK indicated?
   YES - Troubleshoot the immobilizer system according to the result of the SYSTEM CHECK.■
   NO - Go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Enter the vehicle, and remove the ignition key from the ignition switch, then close all the doors.
7. Operate the keyless transmitter LOCK and UNLOCK several times in the vehicle.

   Do the door lock actuators work normally?
   YES - Go to Step 8 .
   NO - Check for a poor ground (G101) and/or an open in the wire between the immobilizer-keyless control unit 7P connector No. 7 terminal and body ground (G101).■
8. Turn the ignition switch to ON (II).
9. Measure the voltage between the immobilizer-keyless control unit 7P connector No. 2 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair an open in the RED wire between the under-dash fuse/relay box and the immobilizer-keyless control unit.■

---

10. Measure the voltage between the immobilizer-keyless control unit 7P connector No. 7 terminal and body ground.

    Is there 0.5 V or more?
    YES - Repair an open or poor connection between the immobilizer-keyless control unit 7P connector No. 7 terminal and G101.■
    NO - Replace the immobilizer-keyless control unit .■

Engine does not start with the immobilizer key

NOTE: Before troubleshooting, check the items listed in "General Check before Troubleshooting".

1. Turn the ignition switch to LOCK (0).
2. Turn the ignition switch to ON (II), and check the immobilizer indicator indication.

   Does the indicator come on for 2 seconds, then go off?
   YES - Go to the immobilizer indicator blinks troubleshooting. ■
   NO - Go to Step 3 .
3. Turn the ignition switch to START (III).

   Does the starter motor run?
   YES - Go to Step 4 .
   NO - Go to Starting System and check the starter motor.■
4. Try to start the engine with the immobilizer key.

   Does the engine start?
   YES - Go to Step 5 .
   NO - Go to the Fuel and Emissions System Symptom Troubleshooting.■
5. Wait for a few minutes with the engine running.

   Does the engine stop?
   YES - Go to the Fuel and Emissions System Symptom Troubleshooting.■
   NO - The system is OK at this time.■

Immobilizer indicator does not go off

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector.
3. Turn the ignition switch to ON (II).
4. Enter the IMMOBILIZER, then select the IMMOBILIZER INFORMATION.
5. Do the SYSTEM CHECK with the HDS.

Is N-1 OK indicated?

YES - Replace the gauge control module. ■

NO - Substitute a known-good immobilizer-keyless control unit , then register it and recheck. If the symptom goes away, replace the original immobilizer-keyless control unit .■

Immobilizer System Check

1. Connect the HDS to the data link connector.
2. Turn the ignition switch to ON (II).
3. Monitor the System Check in the Immobilizer Info with the HDS.
4. If the HDS displays the ‘‘Immobilizer system is normal", the immobilizer system is OK. If the HDS displays any other messages, check as follows:

System Check No.	System Check	Possible Failures
N-1	Normal	———
A-1	The key is not registered	• This key is not registered in the immobilizer-keyless control unit. Try to register keys by using ‘‘KEYS". • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-2	Communication error between the key and immobilizer-keyless control unit	• Intermittent interruption between transponder and immobilizer-keyless control unit. • The immobilizer key type is different. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low.
A-3	No communication between the key and immobilizer-keyless control unit	• The ignition switch was turned to ON (II) with a non-immobilizer key. • The immobilizer key type is different. It is not for this vehicle but for another one or for other company's one. • Key failure (transponder failure) • The communication was not good between the antenna and the immobilizer key by influence of metal such as key chains. • The communication was not good between the antenna and the immobilizer key by battery voltage low. • Immobilizer-keyless control unit failure
B-1	The ECM/PCM is not registered	• The ECM/PCM was not registered. Try to register the ECM/PCM by using ‘‘REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer-keyless control unit by battery voltage low. • The communication was not good between the immobilizer-keyless control unit and the ECM/PCM by influence of some noise.
B-2	Error of communication format in ECM/PCM	• The ECM/PCM was not registered. Try to register the ECM/PCM by using ‘‘REPLACE ECM/PCM". • The communication was not good between the ECM/PCM and the immobilizer-keyless control unit by battery voltage low. • The communication was not good between the immobilizer-keyless control unit and the ECM/PCM by influence of some noise.
D-1	S-net line short	• Harness short from the ECM/PCM to the immobilizer-keyless control unit. (IMOCD/S-NET line short) • The communication was not good between the ECM/PCM and the immobilizer-keyless control unit by battery voltage low. • The communication was not good between the immobilizer-keyless control unit and the ECM/PCM by influence of some noise. • Immobilizer-keyless control unit failure • ECM/PCM failure
D-3	No communication between the ECM/PCM and immobilizer-keyless control unit	• Blown fuse • Harness open from the ECM/PCM to the immobilizer-keyless control unit. • The communication was not good between the ECM/PCM and the immobilizer-keyless control unit by battery voltage low. • The communication was not good between the immobilizer-keyless control unit and the ECM/PCM by influence of some noise. • Immobilizer-keyless control unit failure • ECM/PCM failure
E-1	Initial registration of immobilizer-keyless control unit is not completed	The key was not registered. Try to register keys by using ‘‘REPLACE IMMOBILIZER-KEYLESS CONTROL UNIT".
E-2		The ECM/PCM was not registered. Try to register the ECM/PCM by using ‘‘REPLACE ECM/PCM".
E-3		The MICU was not registered. Try to register the MICU by using ‘‘REPLACE MICU".

System Check No.	System Check	Possible Failures
E-4		The immobilizer-keyless control unit was not registered. Try to register the IMMOBILIZER-KEYLESS CONTROL UNIT by using ‘‘REPLACE IMMOBILIZER-KEYLESS CONTROL UNIT".
E-5		• The MICU was not registered. Try to register the MICU by using ‘‘REPLACE MICU". • MICU failure
F-1	Special mode	Immobilizer system is under registration mode. Turn the ignition switch to lock (0) and ON (II) so as to change normal mode.
F-2		
F-3		
F-4		
F-5		
F-6		

Immobilizer Key Registration

NOTE:

- The HDS is required for registration of the immobilizer keys.
- Check for aftermarket electrical equipment that can cause problems with transponder operation.
- The immobilizer control unit-receiver can store up to six immobilizer Keys.

Replace any of the keys

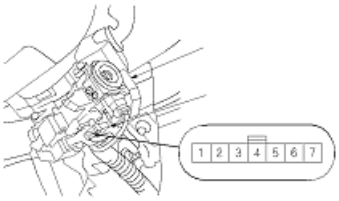
NOTE: If any of the registered keys were lost, do the following procedure to delete the lost registered key.

1. Have at least one original key, all other keys to be registered and the immobilizer ECM/PCM code.
2. Connect the HDS to the data link connector.
3. Turn the ignition switch to ON (II).
4. Select ‘‘IMMOBILIZER" from the ‘‘SYSTEM SELECTION MENU".
5. Select ‘‘KEYS" from the ‘‘IMMOBILIZER MENU", then select ‘‘REWRITE KEYS".
6. Select ‘‘REWRITE KEYS" from the ‘‘KEYS".
7. Do the registration according to the instruction of HDS screen.
8. Check if the engine can be started by all the registered keys.

All keys are lost

1. Prepare all new keys and have the immobilizer ECM/PCM code.
2. Connect the HDS to the data link connector.
3. Turn the ignition switch to ON (II).
4. Select ‘‘IMMOBILIZER" from the ‘‘SYSTEM SELECTION MENU".
5. Select ‘‘KEYS" from the ‘‘IMMOBILIZER MENU", then select ‘‘REWRITE KEYS".
6. Select ‘‘ALL KEYS LOST" from the ‘‘KEYS".
7. Do the registration according to the instruction of HDS screen.
8. Check if the engine can be started by all the registered keys.

Immobilizer-Keyless Control Unit Input Test



1. Remove the steering column covers.
2. Disconnect the 7P connector (A) from the immobilizer-keyless control unit (B).
3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the immobilizer-keyless control unit must be faulty; replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	PNK	Under all conditions	Measure the voltage between the immobilizer-keyless control unit 7P connector No. 1 terminal and body ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
2	RED	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 20 (15 A) fuse in the under-dash fuse/relay box • An open in the wire
7	BRN	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G101) • An open in the wire
6	GRY	Ignition key inserted into the ignition switch	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • Faulty ignition key switch • An open in the wire
		Ignition key removed form the ignition switch	Check for continuity: There should be no continuity.	• Faulty ignition key switch • A short to ground in the wire

Immobilizer-Keyless Control Unit Replacement

1. Remove the steering column covers.
2. Disconnect the 7P connector (A) from the immobilizer-keyless control unit (B).
3. Remove the two screws and the immobilizer-keyless control unit.
4. Install the immobilizer-keyless control unit in the reverse order of removal.
5. After replacement, register the immobilizer-keyless control unit, and make sure the immobilizer system works properly.

Keyless/Power Door Locks/Security System Symptom Troubleshooting Index

Power Door Locks/Keyless

1. Check for B-CAN DTCs. If any B-CAN DTCs are indicated, troubleshoot and resolve them first.
2. If the door lock system and the keyless operation do not work, troubleshoot the door locks first.
   NOTE: The system does not function when the ignition switch is ON (II).

No.	Symptom	Check Items
1	All the doors will not lock or unlock. *	• Poor ground (G501, G502) • Driver's door key cylinder switch test • Door switch test (check the door switch ON/OFF information with the HDS) • Door lock switch test (check the door switch ON/OFF information with the HDS)
2	Driver's and right[left] rear doors, and fuel lid will not lock or unlock.	• Poor ground (G501, G502) • Blown No. 27 (30 A) fuse in the under-dash fuse/relay box • Blown No. 36 (15 A) and/or No. 50 (15A) fuse in the under-dash fuse/relay box • MICU input test
3	Front passenger's and left[right] rear doors, and tailgate will not lock or unlock.	• Poor ground (G501, G502) • Blown No. 27 (30 A) fuse in the under-dash fuse/relay box • Blown No. 35 (15 A) and or No. 49 (15 A) fuse in the under-dash fuse/relay box • MICU input test
4	Keyless operation does not work (LOCK, UNLOCK).	Symptom troubleshooting
5	Doors will not unlock with the transmitter, but will unlock with the door lock switch and the door key cylinder switch.	• Symptom troubleshooting • Door lock switch test (check the door switch ON/OFF information with the HDS)
6	Doors will not lock with the transmitter, but will lock with the door lock switch and the door key cylinder switch.	• Symptom troubleshooting • Door lock switch test (check the door switch ON/OFF information with the HDS)
7	Doors automatically relock 30 seconds after being unlocked with the transmitter even though a door has been opened.	Symptom troubleshooting
8	Only driver's door will unlock or door locks relock immediately after unlocking with the remote.	Driver's door lock knob switch test
9	Keyless operation will work even though the ignition key is in the ignition switch.	Ignition key switch test

[ ]: LHD model

*: If only one door is not working properly, check that door's lock actuator first, then check the other items listed in this table.

Keyless/Power Door Locks/Security System Description

Security Alarm System
Keyless Entry System
Ultrasonic System
Door Lock System

Keyless/Power Door Locks/Security System Symptom Troubleshooting - Doors will not unlock (or lock) with the transmitter, but will unlock (lock) with the door switch

Doors will not unlock (or lock) with the transmitter, but will unlock (lock) with the door switch

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, troubleshoot the indicated DTC first.

1. Turn the ignition switch to LOCK (0).
2. Remove the ignition key from the ignition switch.
3. Close and lock the doors.
4. Try to lock/unlock the doors with the keyless transmitter.

   Do the door lock actuators work normally?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 5 .
5. Open the driver's door.

   Does the key-in reminder chime sound?
   YES - Faulty ignition key switch , or short to ground on the ignition switch wire. Repair as necessary.■
   NO - Go to Step 6 .
6. Do the transmitter test.

   Is the transmitter OK?
   YES - Substitute a known-good under-dash fuse/relay box and recheck. If there is still a problem, substitute a known-good immobilizer-keyless control unit and recheck.■
   NO - Replace the transmitter.■

Keyless/Power Door Locks/Security System Symptom Troubleshooting - Doors automatically relock 30 second after being unlocked with the transmitter even though a door has been opened

Doors automatically relock 30 seconds after being unlocked with the transmitter even though a door has been opened

NOTE: Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, troubleshoot the indicated DTC first.

1. Place the ceiling light switch in the DOOR position.
2. Turn the ignition switch to ON (II).
3. Watch the ceiling light and the door indicators on the gauge control module.

Do the ceiling light and door indicators come on when the door is open, and go off when the door is closed?

YES - Substitute a known-good under-dash fuse/relay box and recheck. If the symptom goes away, replace the original under-dash fuse/relay box.■

NO - Repair an open in the wire between the MICU and each door switch. If the wire is OK, replace the door switch.■

Keyless/Power Door Locks/Security System Symptom Troubleshooting - Keyless operation does not work (LOCK, UNLOCK)

Keyless operation does not work (LOCK, UNLOCK)

NOTE:

- Before troubleshooting, check the B-CAN DTCs. If any DTC is indicated, troubleshoot the indicated DTC first.
- Before troubleshooting, do the keyless transmitter test.

1. Turn the ignition switch to ON (II).
2. Try to start the engine.

   Does the engine start?
   YES - The immobilizer system is OK, go to Step 3 .
   NO - Go to the immobilizer symptom troubleshooting. ■
3. Turn the ignition switch to LOCK (0).
4. Test the transmitter.

   Is the transmitter OK?
   YES - Replace the immobilizer-keyless control unit .■
   NO - Replace the transmitter.■

Security Alarm Function Test

Ultrasonic sensor

1. Open the driver's window.
2. Close all doors.
3. Lock the doors with the transmitter or the key cylinder.
4. Wait 25 seconds for activate the security system.
   The hazard warning lights and the security indicator blink when the security system is armed.
5. Put your hand into the cabin.
   - If the siren sounds and hazard warning lights blink, go to Step 6 .
   - If the system siren doesn't sound and the hazard warning lights don't blink, replace the ultrasonic sensor.

Internal battery of alarm control siren

6. Open the hood.
7. Disconnect the terminals from the battery.
   - If the siren sounds continuously, internal battery is OK.
   - If the siren turns off, replace the alarm control siren.

   NOTE:
   - The alarm control siren is self-powered system with internal Ni-MH battery back-up. Even if the voltage of vehicle's battery drops, the alarm control siren works properly.
   - If the lock knob is pushed before the door is closed, the buzzer sounds 1 time and ultrasonic system doesn't work.

Security Alarm Tripped Sensor Recall

The security system stores information on the last tripped sensor if the security system has been violated. The information can be retrieved using the HDS.
To retrieve the last tripped sensor data:

1. Select HISTORY DATA from the security system test mode menu.
2. Select CURRENT DATA.
3. Confirm that MaRIS matches the Vehicle then press the enter button.
4. Scroll through the data list.
    - Sensors that were violated will indicate DETECT.
    - Sensors that were not violated will indicate NONE.
5. Inspect the DETECT circuit for:
    - Misadjusted or damaged switch.
    - Loose or corroded connections.
    - Intermittent shot to ground.

Security Alarm Control Siren Input Test

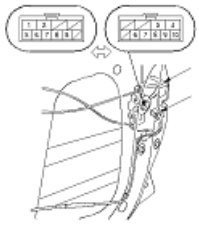
1. Remove the right cargo area side trim panel.
2. Disconnect the 6P connector (A) from the alarm control siren (B).
3. Inspect connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bend, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. Make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 5 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
5	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G604) • An open in the wire
4	GRN	Ultrasonic sensor 3P connector disconnected	Check for continuity between the No. 4 terminal and No. 2 terminal of the ultrasonic sensor: There should be continuity.	An open in the wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
3	LT GRN	Under-dash fuse/relay box connector C (49P) disconnected	Check for continuity between the No. 3 terminal and C25 terminal of the under-dash fuse/relay box: There should be continuity.	An open in the wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
2	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • An open in the wire

5. Substitute a known-good alarm control siren and recheck the system.
   - If the symptom goes away, the alarm control siren is faulty; replace it.
   - If the symptom is still present, the MICU is faulty; replace the under-dash fuse/relay box.

Door Key Cylinder Switch Test

With security

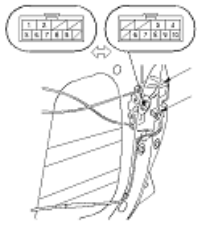


1. Remove the driver's door panel.
2. Disconnect the 10P connector (A) from the key cylinder switch (B).
3. Check for continuity between the terminals.
   - There should be continuity between the No. 8 [No. 7] and No. 10 [No. 5] terminals when the door key cylinder switch is in UNLOCK position.
   - There should be no continuity between the No. 8 [No. 7] and No. 10 [No. 5] terminals when the door key cylinder switch is in the neutral or LOCK position.
   - There should be continuity between the No. 9 [No. 6] and No. 10 [No. 5] terminals when the door key cylinder switch is in LOCK position.
   - There should be no continuity between the No. 9 [No. 6] and No. 10 [No. 5] terminals when the door key cylinder switch is in the neutral or UNLOCK position.

   [ ]: LHD model
4. If the continuity is not as specified, replace the door lock actuator assembly.

Door Lock Actuator Test - Without Super Locking

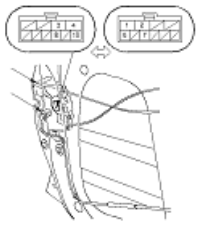
Driver's Door



1. Remove the driver's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

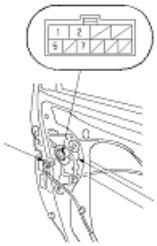
Front Passenger's Door



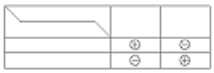
1. Remove the front passenger's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Left Rear Door

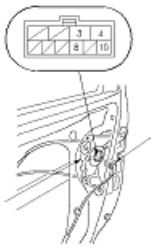


1. Remove the left rear door panel.
2. Disconnect the 10P connector (A) from the actuator (B).



3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Right Rear Door

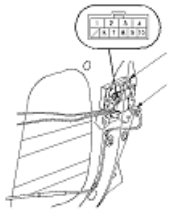


1. Remove the right rear door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Door Lock Actuator Test - With Super Locking

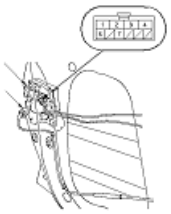
Driver's Door with Super Locking



1. Remove the driver's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

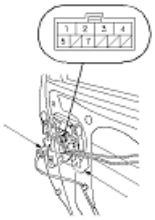
Front Passenger's Door with Super Locking



1. Remove the front passenger's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

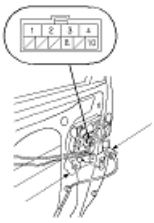
Left Rear Door with Super Locking



1. Remove the left rear door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Right Rear Door with Super Locking

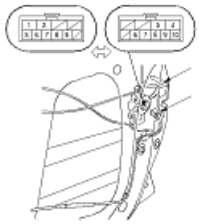


1. Remove the right rear door panel.
2. Disconnect the 10P connector (A) from the actuator (B).

3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Door Lock Knob Switch Test

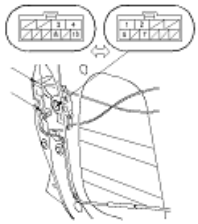
Driver's Door



1. Remove the driver's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).
3. Check for continuity between the terminals.
   - There should be continuity between the No. 9 [No. 6] and No. 10 [No. 5] terminals when the door lock knob switch is in the LOCK position and no continuity when the switch is in the UNLOCK position.
   - There should be continuity between the No. 8 [No. 7] and No. 10 [No. 5] terminals when the door lock knob switch is in the UNLOCK position and no continuity when the switch is in the LOCK position.

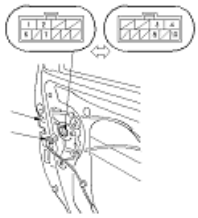
   [ ]: LHD model
4. If the continuity is not as specified, replace the door lock actuator.

Front Passenger's Door (With security)



1. Remove the passenger's door panel.
2. Disconnect the 10P connector (A) from the actuator (B).
3. Check for continuity between the terminals.
   There should be continuity between the No. 7 [No. 8] and No. 5 [No. 10] terminals when the door lock knob switch in the UNLOCK position and no continuity when the switch is in the LOCK position.
   [ ]: LHD model
4. If the continuity is not specified, replace the door lock actuator.

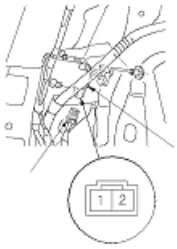
Rear Door (With security)



1. Remove the left or right rear door panel.
2. Disconnect the 10P connector (A) from the actuator (B).
   NOTE: The illustration shows the left rear door.
3. Check for continuity between the terminals.
   There should be continuity between the No. 7 [No. 8] and No. 5 [No. 10] terminals when the door lock knob switch is UNLOCK position and no continuity when the switch is in the LOCK position.
   [ ]: Right rear door
4. If the continuity is not as specified, replace the door lock actuator.

Fuel Lid Lock Actuator Test

1. Open the tailgate, then remove the lid cover from the left cargo area side trim panel.
2. Disconnect the 2P connector (A) from the actuator (B).



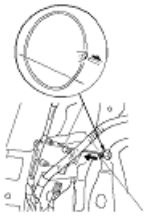
3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
4. If the actuator does not operate as specified, replace it.

Fuel Lid Lock Actuator Replacement

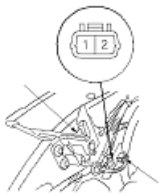
1. Open the tailgate, then remove the lid cover from the left cargo area side trim panel.
2. Disconnect the 2P connector (A) from the actuator (B).
3. Loosen the mounting screws (C).
4. Move an actuator at the back, and remove the actuator.
5. Install in the reverse order or removal.

Fuel Lid Lock Actuator How to Cope in the Trouble

1. Open the tailgate, then remove the lid cover from the left cargo area side trim panel.
2. Move the rod (A) by hand in the direction that the arrow shows, and release the lock.



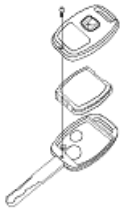
Security Alarm Hood Switch Test



1. Open the hood.
2. Disconnect the 2P connector (A) from the hood switch (B).
3. Check for continuity between the terminals.
   - There should be continuity between the No. 1 and No. 2 terminals when the hood is opened (lever released).
   - There should be no continuity between the No. 1 and No. 2 terminals when the hood is closed (lever pushed down).
4. If the continuity is not as specified, replace the hood latch assembly.

Keyless Entry Transmitter Test

Special Tools Required

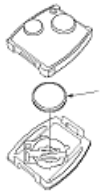


Keyless entry checker
07MAJ-SP00400
NOTE:

- If the doors unlock or lock with the transmitter, but the LED on the transmitter does not come on, the LED is faulty; replace the transmitter.
- If any door is open, you cannot lock the doors with the transmitter.
- If you unlocked the doors with the transmitter, but do not open any of the doors within 30 seconds, the doors relock automatically.
- The doors do not lock or unlock with the transmitter if the ignition key is inserted in the ignition switch.

With HDS

1. Press the lock or unlock button five or six times to reset the transmitter.
   - If the locks work, the transmitter is OK.
   - If any of the transmitter buttons do not work, replace the transmitter, then register the transmitter programming.
   - If the locks don't work, go to Step 2 .
2. Connect the HDS to the data link connector.
3. Select the KEYLESS from the BODY ELECTRICAL menu, then enter the KEYLESS CHECK.
4. Press lock, unlock, trunk, or panic button and check the response on the screen of the HDS.
   NOTE: The door lock actuators may or may not cycle when receiving input from the transmitter.
   - If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the transmitter is OK.
   - If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the transmitter is not registered to the vehicle. If necessary, reprogram and register the transmitter.
   - If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to Step 5 .
5. Open the transmitter and check for water damage.
   - If you find any water damage, replace the transmitter, then register it.
   - If there is no water damage, go to Step 6 .

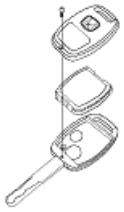


6. Replace the transmitter battery (A) with a new one, and press lock or unlock button and check the receive condition on the screen of the HDS.
   - If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the transmitter is OK.
   - If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to Step 7 .
7. Use a different known-good keyless transmitter assembly and repeat Step 3 and 4.
   NOTE: The keyless transmitter does not need to be programmed to the vehicle for this test.
   - If (DIFFERENT) KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, replace the keyless transmitter and do the immobilizer system registration.
   - If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, the immobilizer-keyless control unit is faulty, replace it and do the immobilizer system registration.

   NOTE: As the keyless transmitter is combined with the immobilizer transponder, so when the transponder is registered by the HDS, the keyless transmitter is also registered automatically.

Without HDS

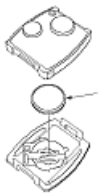
1. Put on the transmitter (A) behind the keyless entry checker (B).
2. Press the door lock button.
   - If the indicator light (C) comes on, the transmitter is OK.
   - If the indicator light does not come on, check for;
     -A dead or low battery, go to Step 3 .
     -Faulty transmitter.



3. Open the transmitter and check for water damage.
   - If you find any water damage, replace the transmitter.
   - If there is no water damage, go to Step 4 .

---

4. Replace the transmitter battery (A) with a new one, and try to lock and unlock the doors with the transmitter by pressing the lock or unlock button five or six times.
    - If the doors lock and unlock, the transmitter is OK.
    - If the doors don't lock and unlock, go to Step 5 .

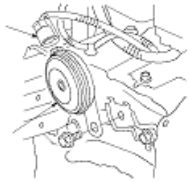


5. Reprogram and register the transmitter, then try to lock and unlock the doors.
    - If the doors lock and unlock, the transmitter is OK.
    - If the doors don't lock and unlock, substitute a known-good transmitter and recheck. If still not operating, replace the immobilizer-keyless control unit.

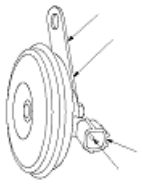
    NOTE: As the keyless transmitter is combined with the immobilizer transponder, so when the transponder is registered by the HDS, the keyless transmitter is also registered automatically.

Security Horn Test/Replacement

1. Remove the front bumper.
2. Disconnect the 1P connector (A) from horn (B).

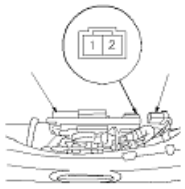


3. Test the horn by connecting battery power to the terminal (A) and grounding the bracket (B). The horn should sound.
4. If it fails to sound, replace it.

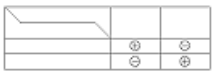


Tailgate Lock Actuator Test

With Keyless Entry

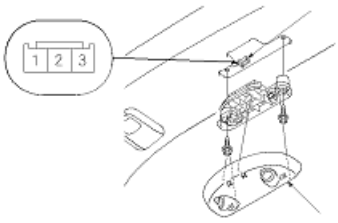


1. Open the tailgate.
2. Remove the tailgate lower trim panel.
3. Disconnect the 2P connector (A) from the tailgate lock actuator (B).



4. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.
5. If the actuator does not operate as specified, replace it.

Ultrasonic Sensor Input Test



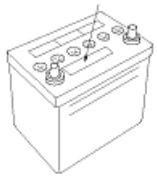
1. Carefully pry off the ultrasonic sensor cover (A) with a small screwdriver.
2. Remove the mounting screws.
3. Disconnect the 3P connector (B) from the ultrasonic sensor.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bend, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the ultrasonic sensor must be faulty, replace it.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • An open in the wire
2	GRN	Alarm control siren 6P connector disconnected	Check for continuity between the No. 2 terminal and No. 4 terminal of the alarm control siren: There should be continuity.	An open in the wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
3	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G602) • An open in the wire

Battery Test

⚠WARNING

A battery can explode if you do not follow the proper procedure, causing serious injury to anyone nearby.
Follow all procedures carefully and keep sparks and open flames away from the battery.
The battery contains sulfuric acid (electrical) which is highly corrosive and poisonous.
Getting electrolyte in your eyes or on your skin can cause serious burns.
Wear protective clothing and eye protection when working on or near battery.
Swallowing electrolyte can cause fatal poisoning if immediate action is not taken.



NOTE: To get accurate results, the temperature of the electrolyte must be between 21 and 38 °C (70 and 100 °F) before testing.

Test Equipment Required

- Battery Tester with:
  Voltmeter with 0−18 V scale, ammeter with 0−100 A and 0−500 A scales, and a carbon pile with 0−300 W
- 12 V Battery Charger:
  Fast charge capability of 50 A and slow charge capability of 5 A

Test Procedure

⚠CAUTION

Regarding the battery check and battery charge method.

- If battery has description, follow it.
- When you charge the battery, you must remove the battery from vehicle.

1. Check for damage: If the case is cracked or the terminals are loose, replace the battery.
2. Check the test indicator window:
   If the test indicator window indicates the shortage of battery liquid, go to Step 3 .
   If the test indicator window indicates a low, go to Step 4 .
3. Remove the tape and caps, and add distilled water. After refill the distilled water, apply the tape and caps.
4. Test battery load capacity by connecting a battery tester, and applying a load of three times the battery ampere hour rating.
   When the load has been applied for exactly 15 seconds, the battery voltage reading should stay above 9.6 V.
   - If the reading stays above 9.6 V, the battery is OK; clean its terminals and case, and reinstall it.
   - If the reading is between 6.5 and 9.6 V, connect a battery charger and charge the battery for 3 minutes at an initial rate of 40 amps.

   ⚠WARNING

   Since the main body of the battery is transformed or might be exploded by gas generated when charging it, loosen the cap of each cell of the battery completely when you charged battery.

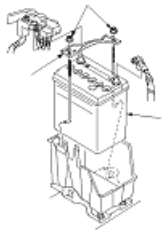
   ⚠CAUTION

   Amperage will drop as voltage increases; do not increase the amperage to compensate or you may damage the battery.

   - Watch the battery voltage during the entire 3 minutes; the highest reading should stay below 15.5 V.
     - If the reading stays below 15.5 V, the battery is OK; clean its terminals and case, and reinstall it.
     - If the reading exceeds 15.5 V any time during the 3 minutes of fast charge, the battery is not good; replace it.
   - If the reading drops below 6.5 V, slow-charge the battery by connecting a battery, and charge at 5 amps for no more than 24 hours (or until the indicator shows full charge, or the specific gravity of the electrolyte is at least 1.270).
     Then test load capacity again.
     - If the voltage stays above 9.6 V, the battery is OK; clean its terminals and case, and reinstall it.
     - If the voltage still drops below 6.5 V, the battery is not good; replace it.

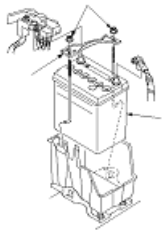
Battery Removal/Installation

NOTE: The battery terminal disconnection/reconnection procedure must be done before and after doing this procedure. Some systems store data in memory that is lost when the battery is disconnected.



Removal

1. Do the battery terminal disconnection procedure.
2. Remove the two nuts (A) securing the battery setting plate (B), then remove the battery setting plate and the battery (C).



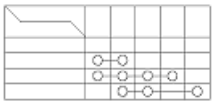
Installation

1. Install the battery (A), then install the battery setting plate (B).
2. Tighten the two nuts (C) equally until the battery is stable.
   NOTE: Do not deform the battery setting plate by tightening the nuts too much.
3. Do the battery terminal reconnection procedure.
   NOTE: Make sure the positive terminal and the negative terminal are not reverse-connected.

Ignition Switch Test

SRS components are located in the area. Review the SRS component locations, and precautions and procedures before performing repairs or servicing.

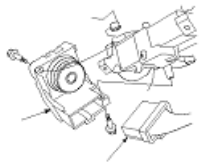
1. Do the battery terminal disconnection procedure.
2. Remove the steering column covers.
3. Disconnect the 7P connector (A) from the ignition switch (B).



4. Check for continuity between the terminals in each switch position according to the table.
5. If the continuity does not agree with the table, replace the ignition switch.
6. Do the battery terminal reconnection procedure.

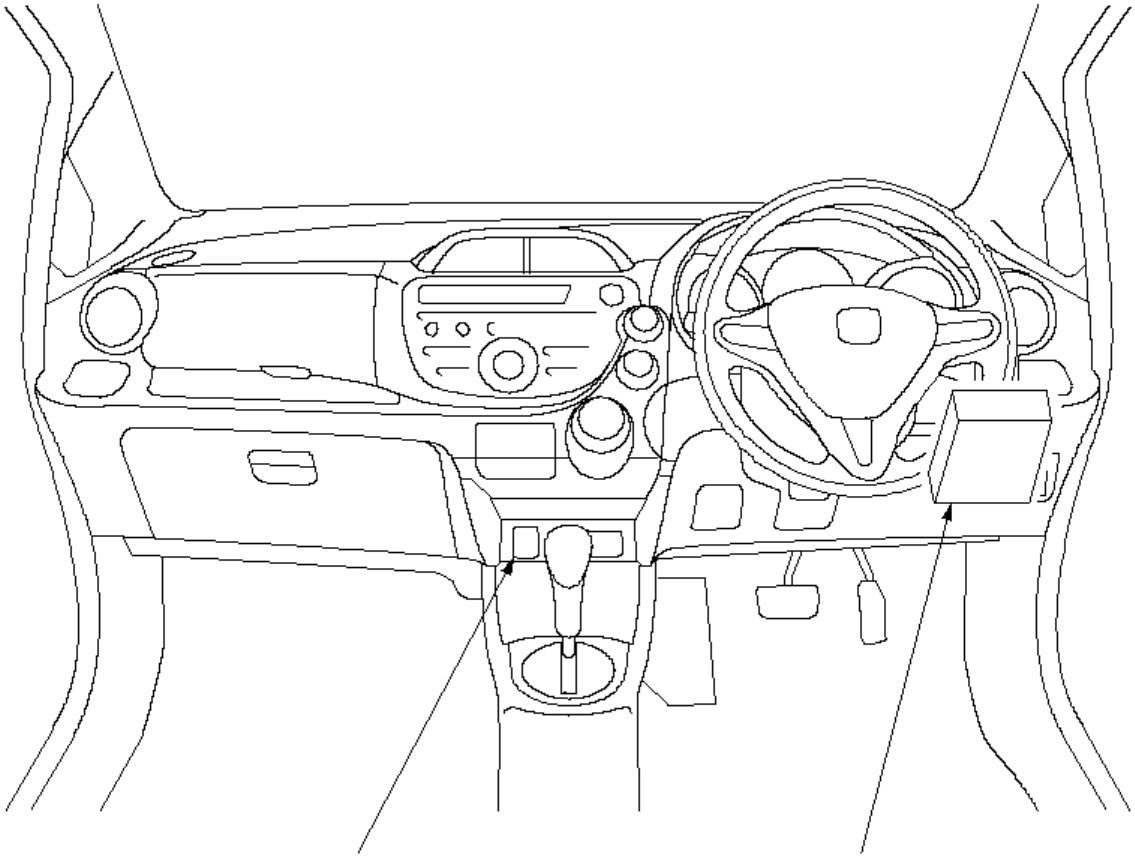
Ignition Switch Replacement

SRS components are located in the area. Review the SRS component locations, and precautions and procedures before performing repairs or servicing.



1. Do the battery terminal disconnection procedure.
2. Remove the steering column covers.
3. Disconnect the 7P connector (A) from the ignition switch (B).
4. Remove the two screws and the ignition switch.
5. Install in the reverse order of removal.
6. Do the battery terminal reconnection procedure.

Accessory Power Socket Component Location Index

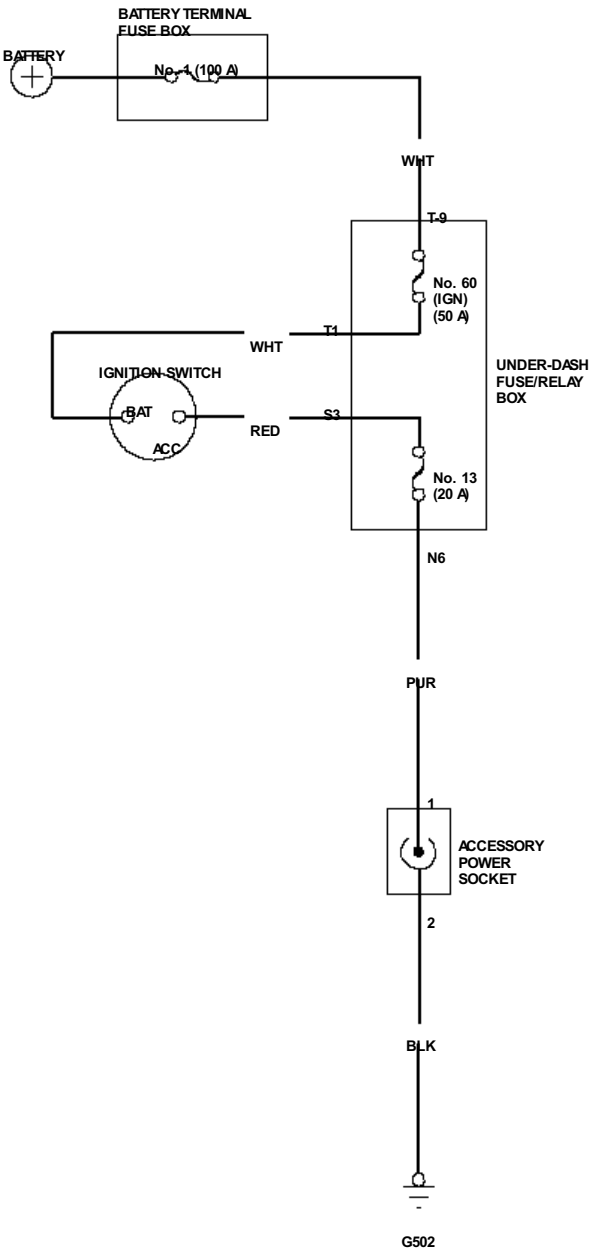


ACCESSORY POWER SOCKET
Test/Replacement,

UNDER-DASH FUSE/RELAY BOX

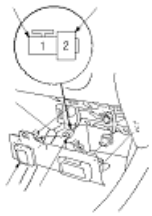
RHD model is shown, LHD model is similar.

Accessory Power Socket Circuit Diagram



Accessory Power Socket Test/Replacement

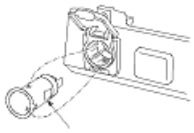
NOTE: If the accessory power socket does not work, check the No. 13 (20 A) fuse in the under-dash fuse/relay box and ground (G502) first.



1. Remove the center lower trim.
2. Disconnect the 2P connector (A) from the accessory power socket (B).
3. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. Turn the ignition switch to ACC (I).
5. Measure the voltage between the accessory power socket 2P connector No. 1 terminal and body ground. There should be battery voltage.
   - If there is battery voltage, go to Step 6 .
   - If there is no battery voltage, check for an open in the wire.
6. Check for continuity between the accessory power socket No. 2 terminal and body ground. There should be continuity.
   - If there is continuity, go to Step 7 .
   - If there is no continuity, check for an open in the wire.

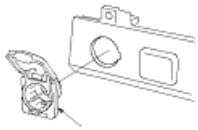
---

7. Remove the socket (A).



---

8. Remove the housing (A) from the panel.
9. Install the power socket in the reverse order of removal.



Under-dash Fuse/Relay Box Removal and Installation

SRS components are located in this area. Review the SRS component locations , and precautions and procedures before performing repairs or servicing.

Removal

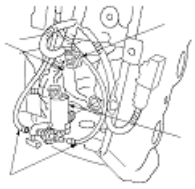
1. Make sure the ignition switch is in LOCK (0).
2. Disconnect the negative battery cable, then disconnect the positive cable, and wait at least 3 minutes.
3. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover. LHD model: Remove the fuse lid panel.
4. Disconnect the connectors from the front side of the under-dash fuse/relay box (A).
5. Remove the mounting bolts, and the terminal (B).
6. Release the lock (C) and pull the fuse/relay box away from the body.
7. Disconnect the connectors from the back side of the under-dash fuse/relay box, then remove the under-dash fuse/relay box.
8. Carefully remove the relays by prying under the base of the relay.
   NOTE: Do not use pliers. Pliers will damage the relays, which could cause the engine to stall or not start.

Installation

1. Install the relays and connect the connectors to the under-dash fuse/relay box, then install the under-dash fuse/relay box in the reverse order of removal.
2. Install the removed parts in the reverse order of removal.
3. Connect the positive cable to the battery, then connect the negative cable to the battery.
4. Set the clock (if equipped).
5. Make sure that all systems work properly.

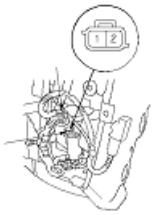
Washer Reservoir Replacement

1. Remove the right inner fender.
2. Disconnect the 2P connector (A) and tubes (B) from the washer motor (C).
   Washer Reservoir Capacity:
   2.5 L (2.6 US qt, 2.2 Imp qt)
3. Remove the washer motor from the washer reservoir (D).



4. Remove the two bolts (A) and clip (B), then remove the washer reservoir (C).
5. Install the reservoir in the reverse order of removal. Check the washer motor operation.

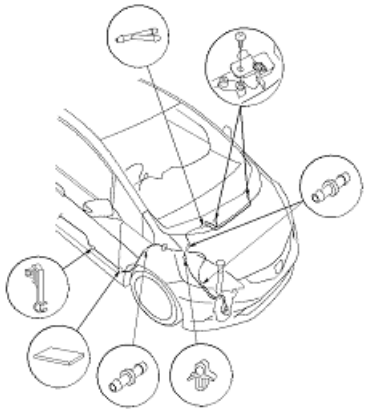
Washer Motor Test

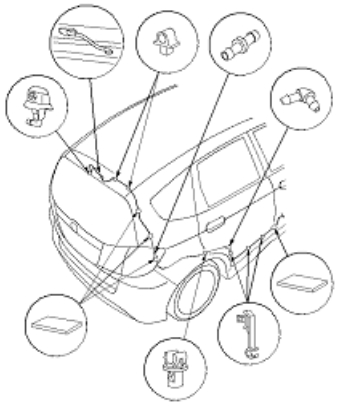


1. Remove the right inner fender.
2. Disconnect the 2P connector (A) from the washer motor (B).
3. Test the motor by connecting battery power to the No. 1 (or No. 2) terminal, and ground the No. 2 (or No. 1) terminal of the washer motor. The motor should run.
   - If the motor does not run, or fails to run smoothly, replace it.
   - If the motor runs smoothly, but little or no washer fluid is pumped, check for a disconnected or blocked washer hose, or a clogged washer motor outlet.

Washer Tube/Nozzle Replacement

1. Remove the right inner fender.
2. Remove the washer nozzles and clips, then remove the tubes.
3. Install in the reverse order of removal. Take care not to pinch the washer tubes. Check the washer operation.



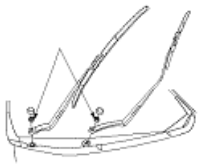


Wiper Arm Replacement

NOTE: Set the wiper arms to the auto-stop position before removal and installation.

Windshield

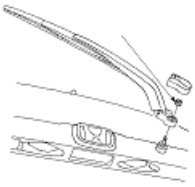
NOTE: Always pull up the driver's side wiper blade first.



1. Remove the caps, the nuts, and the wiper arms.

Rear Window

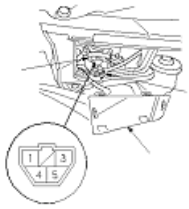
NOTE: Be careful not to damage the tailgate.



1. Remove the cover, the nut, and the wiper arm.

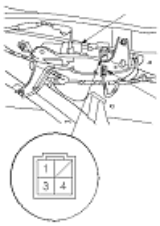
Wiper Motor Test

Windshield



1. Remove the wiper arms, and cowl lid (A).
2. Disconnect the 5P connector (B) from the wiper motor (C).
3. Test the motor by connecting battery power to the No. 4 [No. 3] terminal and ground the No. 5 [No. 4] terminal of the wiper motor 5P connector. The motor should run at low speed. If the motor does not run, or fails to run smoothly, replace the motor.
4. Test the motor by connecting battery power to the No. 1 [No. 5] terminal and ground the No. 5 [No. 4] terminal of the wiper motor 5P connector. The motor should run at high speed. If the motor does not run, or fails to run smoothly, replace the motor.
5. Connect an analog ohmmeter to the No. 3 [No. 1] and No. 5 [No. 4] terminals, and run the motor at low or high speed. The needle of the ohmmeter should pulse. If it does not, replace the motor.
   [ ]: LHD model

Rear Window



NOTE: If there is malfunction of the rear windshield wiper operation, and no DTCs are detected, check the rear windshield wiper motor and an open in the ground circuit of the rear windshield wiper.

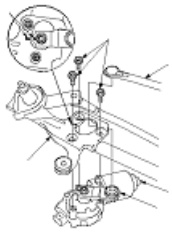
1. Open the tailgate, and remove the tailgate lower trim panel.
2. Disconnect the 4P connector (A) from the wiper motor (B).
3. Test the motor by connecting battery power to the No. 1 terminal and ground the No. 3 terminal of the wiper motor. The motor should run. If the motor does not run or fails to run smoothly, replace the motor.
4. Connect an analog ohmmeter between the rear window wiper motor 4P connector No. 3 and No. 4 terminals. The ohmmeter should indicate continuity and no continuity alternately. If it does not, replace the motor.

Wiper Motor Replacement

Windshield

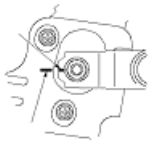
NOTE: Be careful not to scratch or damage the hood and the body.

1. Remove the windshield wiper arms.
2. Remove the under-cowl panel and hood hinge cover.
3. Disconnect the 5P connector (A) from the windshield wiper motor (B).
4. Remove the bolts and the wiper linkage assembly (C).



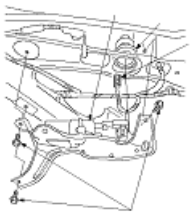
5. Mark lines (A) to show the original adjustment, then remove the connection rod (B) from the linkage (C).
6. Remove the three bolts and the separate the windshield wiper motor (D) from the linkage assembly (E) through the hole.

Installation



1. Before installing the motor, connect the 5P connector to the wiper motor, and turn the windshield wiper/washer switch ON to LO or HI position, then OFF to return the motor shaft to the park position.
   NOTE:
   - Do not use the windshield wiper/washer switch INT position in this step.
   - Apply multipurpose grease to the moving parts.
2. Install the wiper motor to the wiper linkage assembly in the reverse order of removal.
3. Install the linkage to the wiper motor shaft, then align the mark (A) of the linkage and the mark (B) of the wiper linkage assembly.
4. After installation, adjust the wiper arms.

Rear Window



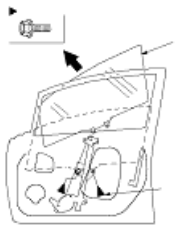
NOTE: Be careful not to scratch or damage the tailgate.

1. Remove the rear window wiper arm.
2. Open the tailgate, and remove the tailgate lower trim panel.
3. Remove the cap (A), and disconnect the 4P connector (B) from the rear window wiper motor (C).
4. Remove the three bolts and the rear window wiper motor.
5. Install in the reverse order of removal, and note these items:
   - Grease the moving parts.
   - Before reinstalling the wiper arm, turn the rear window wiper switch ON, then OFF to return the wiper shaft to the park position.
   - Check the wiper motor operation.

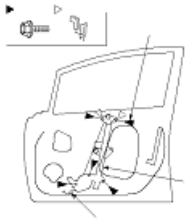
Front Door Glass and Regulator Replacement

NOTE:

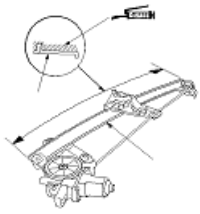
- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.



1. Remove the these items:
   - Door panel
   - Speaker
2. Disconnect the power door lock actuator connector.
3. Remove the plastic cover.
4. Carefully raise the glass (A) until you can see the bolts, then remove them. Carefully pull the glass out through the window slot.
   NOTE: Take care not to drop the glass inside the door.



5. Disconnect the connector (A) from the regulator (B).
6. Remove the bolts, and release the hooks, then remove the regulator through the hole in the door.



7. Apply multipurpose grease to all the sliding surfaces of the regulator (A) where shown.
8. Install the glass and regulator in the reverse order of removal, and note these items:
   - Raise and lower the glass to see if it moves freely without binding.
   - Make sure that there is no clearance between the glass and glass run channel when the glass is closed.
   - Adjust the position of the glass as necessary.
   - Do the power window control unit reset procedure.
   - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
   - Check for water leaks.
   - Test-drive and check for wind noise and rattles.
   - Make sure the power door locks, windows and power mirror operate properly.

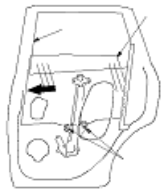
Door Glass Adjustment

NOTE: Check the weatherstrips and glass run channel for damage or deterioration, and replace them if necessary.

1. Place the vehicle on a firm, level surface.
2. Remove these items:
   - Door panel:
     - Front door
     - Rear door
   - Plastic cover:
     - Front door
     - Rear door
3. Carefully move the glass (A) until you can see the glass mounting bolts (B), then loosen them.
4. Push the glass against the channel (C), then tighten the glass mounting bolts.
5. Check that the glass moves smoothly.

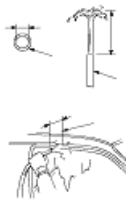
Front door

Rear door



6. Raise the glass fully, and check for gaps. Also check that the glass (A) contacts the glass run channel (B) evenly.
7. Attach the plastic cover making sure it is sealed around its outside perimeter to seal out water.

8. Check for water leaks. Run water over the roof and on the sealing area as shown, and note these items:
   - Use a 12 mm (0.47 in.) diameter hose (A).
   - Adjust the rate of water flow as shown (B).
   - Do not use a nozzle.
   - Hold the hose about 300 mm (12 in.) away from the door (C).
9. Reinstall the door panel:
   - Front door
   - Rear door



Front Corner Glass Replacement

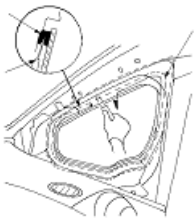
NOTE:

- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive.
- Use seat covers to avoid damaging any surfaces.
- The front corner trim and the front corner glass clips will need replacement because they will be damage during glass removal.

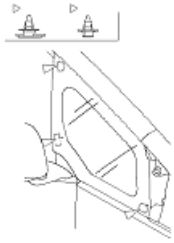
1. Remove these items:
   - Front pillar corner trim
   - Front pillar trim:
     -Without side curtain airbags
     -With side curtain airbags

2. Remove the front corner trim (A).
   -1. From inside the vehicle, use a utility knife to cut through the adhesive (B) of the front corner trim.
   -2. Pull out the upper edge of the front corner trim.
   -3. Pull out the lower edge of the front corner trim, then remove it.
   NOTE: Replace the front corner trim with a new one.

3. From inside the vehicle, use a utility knife (A) to cut through the front corner glass adhesive (B) all the way around. Apply protective tape along the edge of the entire front corner glass opening flange.



4. From inside the vehicle, cut through the clips (A, B) of the front corner glass with a utility knife.



5. Carefully remove the front corner glass.

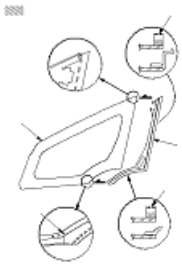
6. With a putty knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire front corner glass opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the clips and the rubber dams from the body

7. Clean the body bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease and water from getting on the surface.

8. If the old front corner glass is to be reinstalled, use a putty knife to scrape off all of the old adhesive and clips from the front corner glass. Clean the inside face of the front corner glass and the edge of the glass with isopropyl alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.

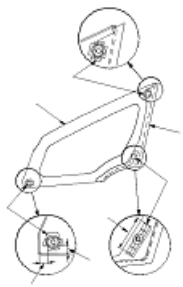
9. Attach the front corner trim (A) with adhesive tape to the inside face of the front corner glass (B) as shown. Before installing the front corner trim, apply primer to the inside face of the front corner glass:
   - Be careful not to touch the glass where adhesive will be applied.
   - The front corner trim must be replaced with a new one.
   - Be sure the bottom edge of the front corner trim lines up with the alignment mark (C).
   - Be sure the top edge of the front corner trim lines up with the top edge of the glass.

   Front corner trim adhesive tape:
   Thickness 0.8 mm (0.03 in.)
   Width 5 mm (0.197 in.)

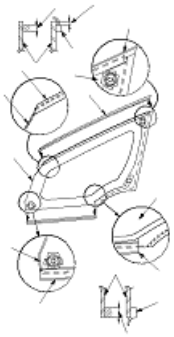


10. Attach the clip A (A), the clip B (B, C) with adhesive tape to the inside face of the front corner glass (D) as shown:
    - Be careful not to touch the glass where adhesive will be applied.
    - Be sure the clip B (B) lines up with the inner shape of the front corner trim (E).
    - Be sure the side portion (F) of the clip A lines up with the front corner trim.

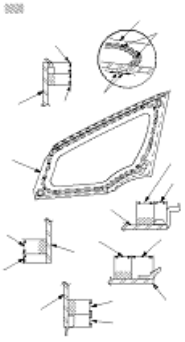
    Clip A adhesive tape:
    Thickness 1.2 mm (0.047 in.)
    Width 8 mm (0.315 in.)
    Clip B adhesive tape:
    Thickness 1.2 mm (0.047 in.)
    Width 16 mm (0.63 in.)



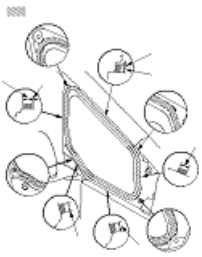
11. Attach the rubber dam (A, B) with adhesive tape to the inside face of the front corner glass (C) as shown.
    Before installing the rubber dam, apply primer to the inside face of the front corner glass.
    NOTE: Be careful not to touch the front corner glass where adhesive will be applied.
    Rubber dam adhesive tape:
    Thickness 0.2 mm (0.0079 in.)
    Width 3 mm (0.12 in.)



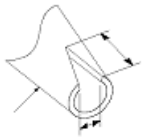
12. With a sponge, apply a light coat of glass primer to the inside face of the front corner glass (A) as shown, then lightly wipe it off with gauze or cheesecloth:
    - With the printed dots (B) on the front corner glass as a guide, apply the glass primer to the corner portions of the front corner glass.
    - Do not apply body primer to the front corner glass, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the front corner glass properly, causing a leak after the front corner glass is installed.
    - Keep water, dust, and abrasive materials away from the primed surface.



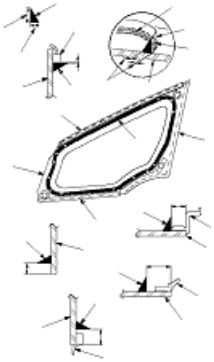
13. With a sponge, apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply glass primer to the body, and be careful not to mix up glass and body primer sponges.
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Never touch the primed surfaces with your hands.
    - Mask off the dashboard before painting the flange.



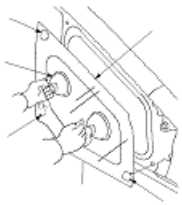
14. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



15. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the front corner glass (B) and along the rubber dam (C, D) and front corner trim (E) as shown:
    - With the printed dots (F) on the front corner glass as a guide, apply the adhesive to the corner portions of the front corner glass.
    - Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.



16. Use suction cups (A) to hold the front corner glass (B) over the opening, align it with the clips (C, D), and set it down on the adhesive. Lightly push on the front corner glass until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.



17. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the front corner glass, use a soft shop towel dampened with isopropyl alcohol.

18. After the adhesive has dried, spray water over the front corner glass and check for leaks. Mark the leaking areas and let the front corner glass dry, then seal with sealant. Let the vehicle stand for at least 4 hours after front corner glass installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.

19. Reinstall all remaining removed parts.
    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

Quarter Glass Replacement

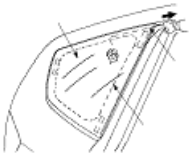
NOTE:

- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with a piano wire.
- Use seat covers to avoid damaging any surfaces.

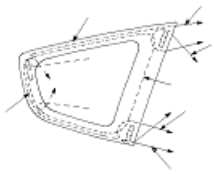
1. Remove the quarter pillar trim.
   - Without side curtain airbags
   - With side curtain airbags
2. Remove the rubber dam (A) from the front edge of the quarter glass (B). If necessary, cut the rubber dam with a utility knife.
3. Apply protective tape to along the inside and outside edges of the body. Using an awl, make a hole through the adhesive from inside the vehicle. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

---

4. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the quarter glass (B) as possible to prevent damage to the body, and carefully cut through the adhesive (C) around the entire quarter glass.
5. Carefully remove the quarter glass.
6. With a putty knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire quarter glass opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the clips and rubber dams from the body.
7. Clean the body bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease and water from getting on the surface.
8. If the old quarter glass is to be reinstalled, use a putty knife to scrape off all of the old adhesive, clips and the rubber dams from the quarter glass. Clean the inside face and the edge of the quarter glass with isopropyl alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.

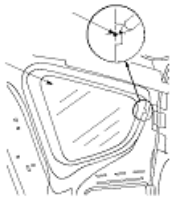


Cutting positions



---

9. Set the quarter glass (A) in the opening, and center it. From inside the vehicle, make alignment mark (B) to the quarter glass where the rear clip will be installed with a grease pencil. Be careful not to touch the glass where adhesive will be applied.
10. Remove the quarter glass.

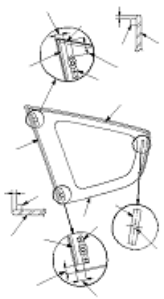


---

11. Attach the rubber dam A, rubber dam B, upper clip (C), lower clip (D), and rear clip (E) with adhesive tape to the inside face of the quarter glass (F) as shown:
    - Align the center of the rear clip with the alignment mark (G) you made in step 9.
    - Be careful not to touch the quarter glass where adhesive will be applied.
    - Be sure the rubber dam B contacts the rubber dam A.

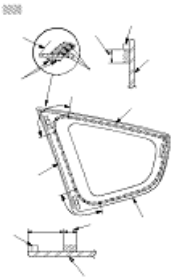
    Rubber dam A adhesive tape:
    Thickness 0.16 mm (0.006 in.)
    Width 3 mm (0.12 in.)
    Rubber dam B adhesive tape:
    Thickness 0.16 mm (0.006 in.)
    Width 3 mm (0.12 in.)
    Upper clip adhesive tape:
    Thickness 1.3 mm (0.051 in.)
    Width 10 mm (0.3937 in.)
    Lower clip adhesive tape:
    Thickness 1.3 mm (0.051 in.)
    Width 11 mm (0.433 in.)

    Rear clip adhesive tape:
    Thickness 0.4 mm (0.016 in.)
    Width 7.5 mm (0.30 in.)

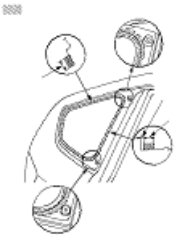


---

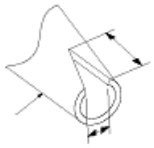
12. With a sponge, apply a light coat of glass primer along the edge of the quarter glass (A) and rubber dams (B) as shown, then lightly wipe it off with gauze or cheesecloth:
    - With the printed dots (C) on the quarter glass as a guide, apply the glass primer to the corner portions of the quarter glass.
    - Do not apply body primer to the quarter glass, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the quarter glass properly, causing a leak after the quarter glass is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.



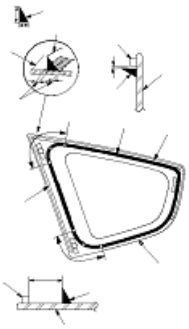
13. With a sponge, apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.



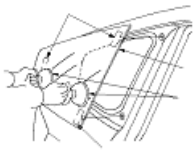
14. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



15. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the quarter glass (B) and along the rubber dams (C) as shown. With the printed dots on the quarter glass as a guide, apply the adhesive to the corner portions of the quarter glass. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.



16. Use suction cups (A) to hold the quarter glass (B) over the opening, align it with the clips (C) and set it down on the adhesive. Lightly push on the quarter glass until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.



17. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the quarter glass, use a soft shop towel dampened with isopropyl alcohol.

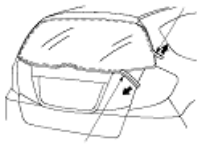
18. After the adhesive has dried, spray water over the quarter glass and check for leaks. Mark the leaking areas, let the quarter glass dry, then seal with sealant. Let the vehicle stand for at least 4 hours after quarter glass installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.

19. Reinstall all remaining removed parts.
    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

Rear Window Replacement

NOTE:

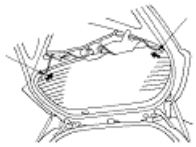
- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with a piano wire.
- Use seat covers to avoid damaging any surfaces.
- Do not damage the rear window defogger grid lines and terminals.



1. Remove these items:
   - Tailgate lower trim panel
   - High mount brake light
   - Rear window wiper arm
2. Remove the rubber dam (A, B) from the edge of the rear window. If necessary, cut the rubber dam with a utility knife.

---

3. Disconnect the rear window defogger connectors (A).



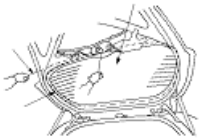
---

4. If the old rear window is to be reinstalled, make alignment marks (A) across the glass and body with a grease pencil.

5. Apply protective tape along the inside and outside edges of the tailgate. Using an awl, make a hole through the adhesive from inside the vehicle at the corner portion of the rear window. Push the piano wire through the hole, and wrap each end around a piece of wood.

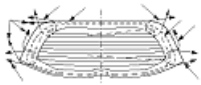
---

6. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the rear window (B) as possible to prevent damage to the tailgate, and carefully cut through the adhesive (C) around the entire rear window.



7. Carefully remove the rear window.
8. With a putty knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire rear window opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the fasteners from the tailgate.

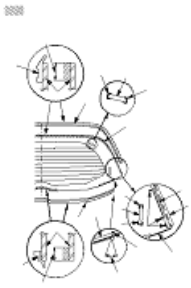
Cutting positions



9. Clean the tailgate bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease and water from getting on the surface.
10. If the old rear window is to be reinstalled, use a putty knife to scrape off all of the old adhesive, the fasteners and the rubber dams from the rear window. Clean the inside face and the edge of the rear window with isopropyl alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.

---

11. Attach the rubber dam A, the rubber dam B, the rubber dam D (C), fasteners A (D), and fasteners B (E) with adhesive tape to the inside face of the rear window (F) as shown. Before installing the rubber dam A, the rubber dam B, apply primer to the inside face of the rear window.
    - Be sure the rubber dams and fasteners line up with alignment marks (G).
    - Be careful not to touch the rear window where adhesive will be applied.
    - Before installing the rubber dam D, apply primer to the area where its adhesive tape will be stuck in the rubber dam A.
    - Cut both ends of the rubber dam B as shown.

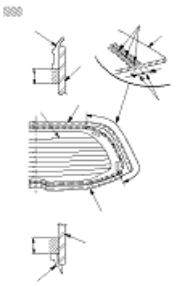


Fasteners adhesive tape:
Thickness 0.6 mm (0.024 in.)
Width 7.5 mm (0.30 in.)
Rubber dam A adhesive tape:
Thickness 0.4 mm (0.016 in.)
Width 7 mm (0.276 in.)
Rubber dam B adhesive tape:
Thickness 0.2 mm (0.008 in.)
Width 3 mm (0.12 in.)
Rubber dam D adhesive tape:
Thickness 0.2 mm (0.008 in.)
Width 3 mm (0.12 in.)

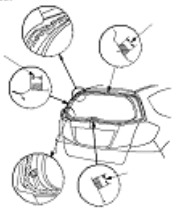
12. Attach the fasteners (A, B) with adhesive tape to the tailgate as shown.
    Fasteners adhesive tape:
    Thickness 0.6 mm (0.024 in.)
    Width 7.5 mm (0.30 in.)

13. Set the rear window (A) in the opening, and center it. Make alignment marks (B) across the rear window and body with a grease pencil at the four points shown. Make sure the fasteners B (C) contact with the holes of the tailgate corner. Be careful no to touch the rear window where adhesive will be applied.
14. Remove the rear window.

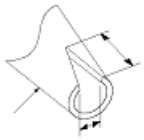
15. With a sponge, apply a light coat of glass primer around the edge of the rear window (A) and along the rubber dams (B) as shown, then lightly wipe it off with gauze or cheesecloth:
    - With the printed dots (C) on the rear window as a guide, apply the glass primer to both side portions of the rear window.
    - Do not apply body primer to the rear window, and do not get tailgate and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the rear window properly, causing a leak after the rear window is installed.
    - Keep water, dust, and abrasive materials away from the primed surfaces.



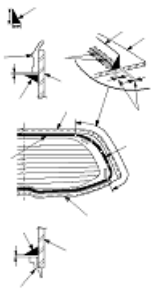
16. With a sponge, apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.



17. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



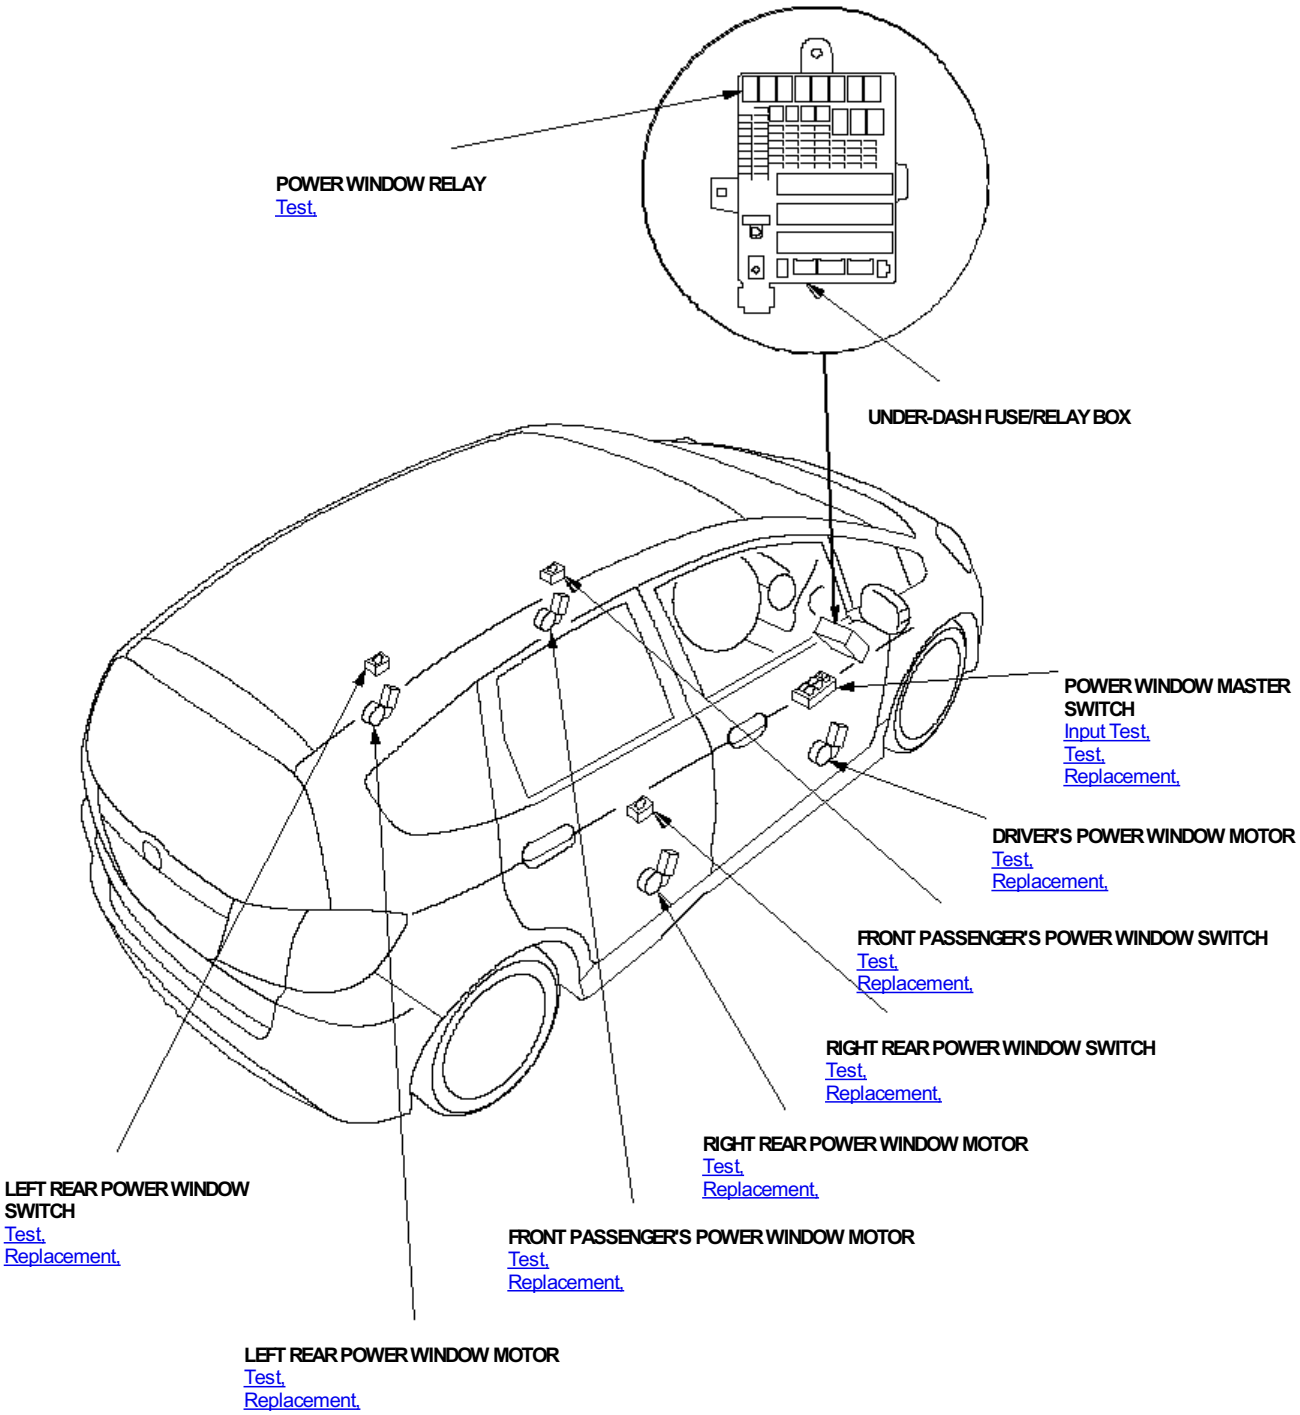
18. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the rear window (B) and along the rubber dams (C) as shown:
    - With the printed dots (D) on the rear window as a guide, apply the adhesive to both side portions of the rear window.
    - Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.
19. Use suction cups to hold the rear window over the opening, align it with the alignment marks you made in Step 14, and set it down on the adhesive. Lightly push on the rear window until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.
20. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the rear window, use a soft shop towel dampened with isopropyl alcohol.
21. After the adhesive has dried, spray water over the rear window and check for leaks. Mark the leaking areas, let the rear window dry, then seal with sealant. Let the vehicle stand for at least 4 hours after rear window installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
22. Reinstall all remaining removed parts.
    NOTE: Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).



Power Windows System Description

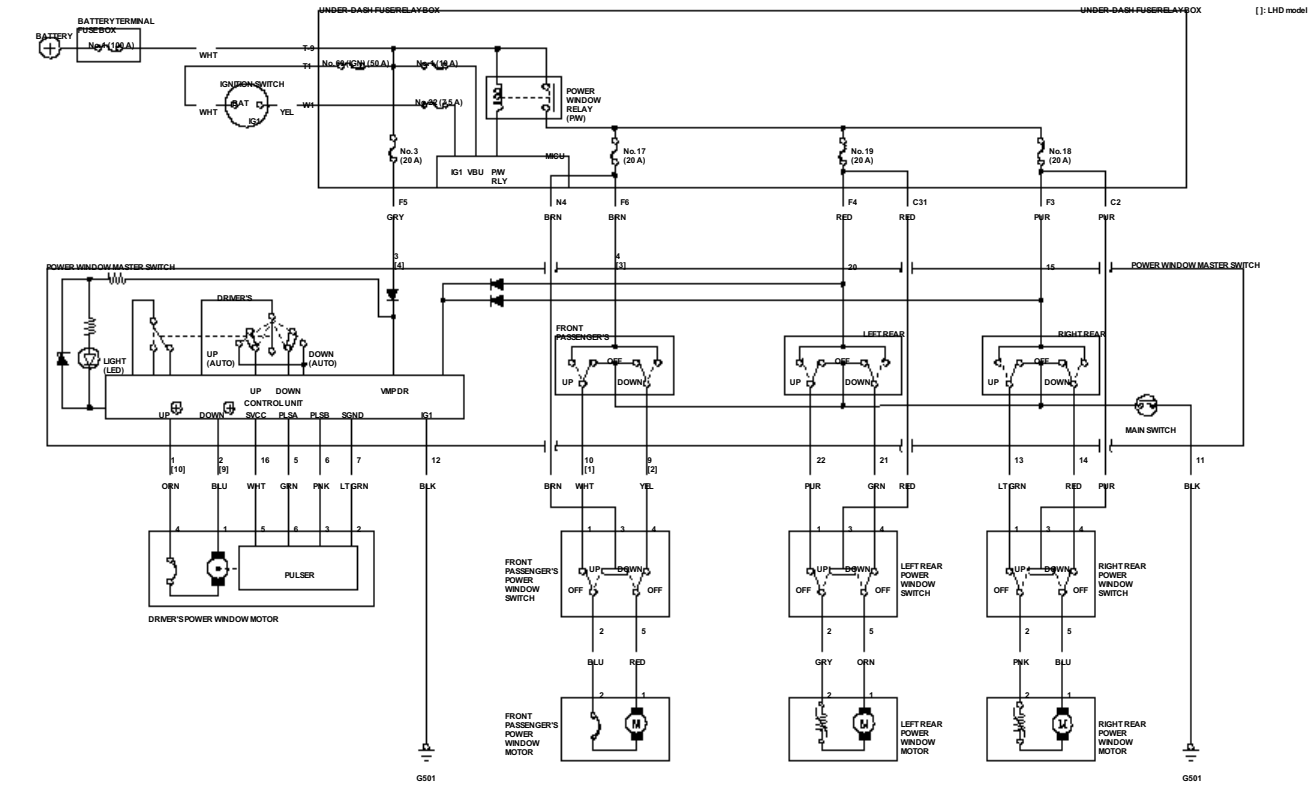
[Auto Reverse Operation]

Power Windows Component Location Index



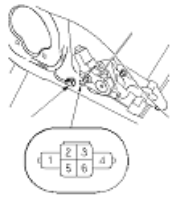
RHD model is shown, LHD model is similar.

Power Windows Circuit Diagram



Power Window Driver's Motor Test

1. Remove the door panel.
2. Disconnect the 6P (A) connector from the driver's power window motor.



Motor Test

3. Test the motor in each direction by connecting battery power and ground according to the table. When the motor stops running, disconnect one lead immediately.
4. If the motor does not run or fails to run smoothly, replace it.

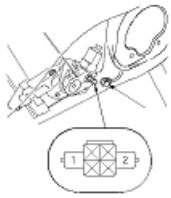
Pulser Test

5. Reconnect the 6P connector to the driver's power window motor.
6. Turn the ignition switch to ON (II).
7. Measure the voltage between the terminals.
   - There should be battery voltage between the No. 5 (+) and No. 2 (−) terminals.
   - Connect an analog voltmeter between the No. 6 (+) and No. 2 (−) terminals, and run the window motor down or up. The voltmeter needle should move back and forth alternately (a digital voltmeter reads about 2.5 V).
   - Connect an analog voltmeter between the No. 3 (+) and No. 2 (−) terminals, and run the window motor down or up. The voltmeter needle should move back and forth alternately (a digital voltmeter reads about 2.5 V).
8. If the voltage is not as specified, do the power window master switch input test for terminals No. 5, 6, 7, and 16.
9. If the switch is OK, replace the power window motor.
10. Reset the power window control unit.

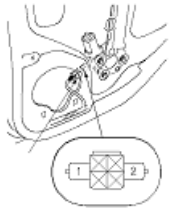
Power Window Passenger's Motor Test

1. Remove the door panel:
   - Front passenger's
   - Rear
2. Disconnect the 2P connector (A) from the power window motor.

Front passenger's



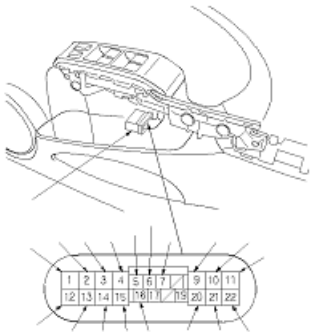
Rear



3. Test the motor by connecting battery power and ground according to the table. When the motor stops running, disconnect one lead immediately.
4. If the motor does not run or fails to run smoothly, replace it.

Power Window Master Switch Input Test

NOTE: The power window control unit is built into the power window master switch.



1. Remove the grip cover.
2. Disconnect the 22P connector (A) from the power window master switch.
3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 5 .

   NOTE: Before testing, make sure the No. 1 (10 A), No. 22 (7.5 A), and No. 60 (50 A) fuse in the under-dash fuse/relay.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3 [4]	GRY	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 3 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
4 [3]	BRN	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 17 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty power window relay (P/W) • Faulty MICU • An open in the wire
15	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 18 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty power window relay (P/W) • Faulty MICU • An open in the wire
20	RED	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 19 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty power window relay (P/W) • Faulty MICU • An open in the wire
11	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
12	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
9 [2]	YEL	Ignition switch ON (II)	Connect the No. 4 [No. 3] and the No. 9 [No. 2] terminals, and No. 10 [No. 1] and No. 11 terminals momentarily with jumper wires: The front passenger's window should go down.	• Blown No. 17 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty front passenger's power window motor • Faulty front passenger's power window switch • Poor ground (G501) • An open in the wire
10 [1]	WHT	Ignition switch ON (II)	Connect the No. 4 [No. 3] and the No. 10 [No. 1] terminals, and No. 9 [No. 2] and No. 11 terminals momentarily with jumper wires: The front passenger's window should go up.	

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
13	LT GRN	Ignition switch ON (II)	Connect the No. 15 and the No. 13 terminals, and No. 14 and No. 11 terminals momentarily with jumper wires: The right rear window should go up.	• Blown No. 18 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty right rear power window motor • Faulty right rear power window switch • Poor ground (G501) • An open in the wire
14	RED	Ignition switch ON (II)	Connect the No. 15 and the No. 14 terminals, and No. 13 and No. 11 terminals momentarily with jumper wires: The right rear window should go down.	

[ ]: LHD model

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
21	GRN	Ignition switch ON (II)	Connect the No. 20 and the No. 21 terminals, and No. 22 and No. 11 terminals momentarily with jumper wires: The left rear window should go down.	• Blown No. 19 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty left rear power window motor • Faulty left rear power window switch • Poor ground (G501) • An open in the wire
22	PUR	Ignition switch ON (II)	Connect the No. 20 and the No. 22 terminals, and No. 21 and No. 11 terminals momentarily with jumper wires: The left rear window should go up.	
1 [10]	ORN	Connect the No. 3 [No. 4] and the No. 1 [No. 10] terminals, and No. 2 [No. 9] and No. 12 terminals momentarily with jumper wires	Check driver's power window motor operation: The driver's window should go up.	• Blown No. 3 (20 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty driver's power window motor • Poor ground (G501) • An open in the wire
2 [9]	BLU	Connect the No. 3 [No. 4] and the No. 2 [No. 9] terminals, and No. 1 [No. 10] and No. 12 terminals momentarily with jumper wires	Check driver's power window motor operation: The driver's window should go down.	

5. Reconnect the 22P connector to the power window master switch. Turn the ignition switch to ON (II), and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the control unit must be faulty; replace the power window master switch.

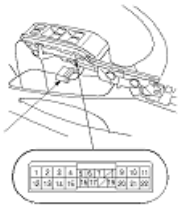
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
7	LT GRN	Ignition switch ON (II)	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • Faulty power window master switch • An open in the wire
16	WHT	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Faulty power window master switch • A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
5	GRN	Ignition switch ON (II), and driver's window switch moving up or down	Measure the voltage between the No. 5 and No. 7 terminals: There should be 0 V−about 5 V−0 V−about 5 V repeatedly (a digital voltmeter should reads about 2.5 V while the window moves).	• Faulty power window master switch • Faulty driver's power window motor • An open in the wire • A short to ground in the wire
6	PNK	Ignition switch ON (II), and driver's power window switch moving up or down	Measure the voltage between the No. 6 and No. 7 terminals: There should be 0 V−about 5 V−0 V−about 5 V repeatedly (a digital voltmeter should reads about 2.5 V while the window moves).	

[ ]: LHD model

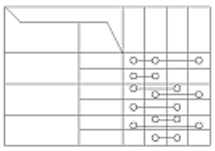
Power Window Master Switch Test

1. Remove the grip cover.
2. Disconnect the 22P connector (A) from the power window master switch.

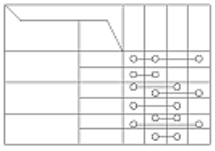


3. Check for continuity between the terminals in each switch position according to the tables.
   Driver's Switch
   The driver's switch is combined with the control unit so you cannot isolate the switch to test it. Instead, run the master switch input test procedures. If the tests are normal, the driver's switch must be faulty. Replace the switch.
4. If the continuity is not as specified, replace the switch.

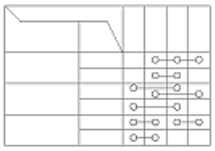
Front Passenger's Switch



Right Rear Switch

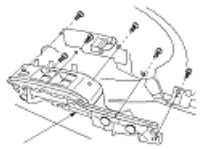


Left Rear Switch

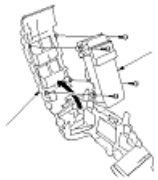


Power Window Master Switch Replacement

1. Remove the door panel.
2. Remove the screws and the grip base (A).



3. Open the switch panel (A) from the grip base.
4. Remove the screws and replace the power window master switch (B).
5. Install in the reverse order of removal.



Resetting the Power Window Control Unit (Master Switch)

Driver's Window Resetting and Learning

Resetting and learning the driver's window is required when any of the following have occurred:

- Power window master switch replacement

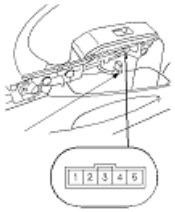
- Power window regulator replacement or repair
- Power window motor replacement or repair
- Window run channel replacement or repair
- Driver's door glass replacement or repair
- Power is removed from the power window control unit while the power window key-off operation timer is ON.

1. Turn the ignition switch to LOCK (0).
2. Press and hold the driver's window DOWN switch.
3. Turn the ignition switch to ON (II).
4. Release the driver's window DOWN switch.
5. Repeat Step 1 −4 three more times.
6. Check if the AUTO UP and AUTO DOWN functions still work.
   - If they still work, AUTO UP and AUTO DOWN functions have not been cleared; go back to Step 1 .
   - If they do not, go to Step 7 .
7. Turn the ignition switch to ON (II).
8. Move the driver's window all the way down by using the driver's window DOWN switch.
9. Pull up and hold the driver's window UP switch until the window reaches the fully closed position, then continue to hold the switch for 1 second.
10. Make sure that the power window control unit is reset and learned by using the driver's window AUTO UP and AUTO DOWN functions.

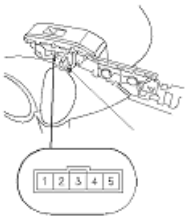
Power Window Passenger's Switch Test

1. Remove the grip cover:
   - Front passenger's
   - Rear
2. Disconnect the 5P connector (A) from the passenger's window switch.

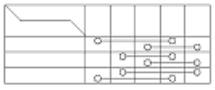
Front passenger's



Rear

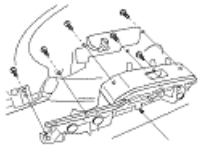


3. Check for continuity between the terminals in each switch position according to the table.
4. If the continuity is not as specified, replace switch.



Power Window Passenger's Switch Replacement

NOTE: The illustration shows front passenger's power window switch.

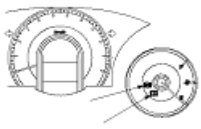


1. Remove the door panel:
   - Front passenger's
   - Rear
2. Remove the screws and the grip base (A).

3. Open the switch panel (A) from the grip base.
4. Remove the screws and replace the passenger's power window switch (B).
5. Install in the reverse order of removal.

How to Troubleshoot the ABS

System Indicator



This system has two indicators:

- ABS indicator (A)
- Brake system indicator (B)

When the system is OK, each indicator comes on for about 2 seconds after turning the ignition switch to ON (II), then goes off.
When the system detects a problem, a DTC will be set and, depending upon the failure, the ABS modulator-control unit will determine which indicator(s) will be turned on. If the problem goes away (system returns to normal), the indicator(s) will be controlled in the following way depending upon the DTC that was set:

- The indicator(s) will come on and stay on when the ignition switch is ON (II).
- The indicator(s) will automatically go off.
- The indicator(s) will go off after the vehicle is driven.

ABS Indicator

The ABS indicator comes on when the ABS function is lost. The brakes still work like a conventional system.

Brake System Indicator

The brake system indicator comes on when the EBD function is lost, the parking brake is applied, and/or the brake fluid level is low.
NOTE: If two or more wheel speed sensors fail, the brake system indicator will come on.

Diagnostic Trouble Code (DTC)

- The memory can hold all DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in the order they occur.
- The DTCs are memorized in the EEPROM. Therefore, the memorized DTCs cannot be erased by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
  - Initial diagnosis: Done right after the ignition switch is turned to ON (II) and until the ABS indicator goes off.
  - Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned to LOCK (0).
- When the system detects a problem, the ABS modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the ABS modulator-control unit is functioning, and the fluid in the reservoir is forced out to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the ABS modulator-control unit is functioning.
- The ABS modulator-control unit checks the pump motor operation one time after completing initial diagnosis during regular diagnosis when the vehicle is driven over 15 km/h (10 mph).

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles without the ABS.

How to Troubleshoot DTCs

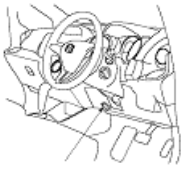
The troubleshooting procedures assume that the cause of the problem is still present and the ABS indicator is still on. Following a troubleshooting procedure for a code that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS indicator came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.
2. When the ABS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. before you start troubleshooting.
3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the ABS indicator does not come on.
4. Check for DTCs from other systems which connected via F-CAN. If there are DTCs that are related to F-CAN, the most likely cause was that the ignition switch was turned to ON (II) with the ABS modulator-control unit connector disconnected. Clear the DTCs. Check for fuel and emissions, and ABS codes, first. Be sure to troubleshoot those first.

Intermittent Failures

The term ‘‘intermittent failure" means a system may have had a failure, but it checks OK now. If the indicator(s) of the system does not come on, check for loose connectors or poor contacts in the terminals related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)



1. If the system indicators stay on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the ABS modulator-control unit. If it doesn't, troubleshoot the DLC circuit.
4. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.
   NOTE:
   - The HDS communication will be stopped when the vehicle speed is at 50 km/h (31 mph) or more.
   - The HDS can read the DTC, the current data, and other system data.
   - For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

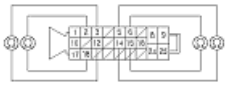
1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the ABS modulator-control unit. If it doesn't, troubleshoot the DLC circuit.
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting.
5. Turn the ignition switch to LOCK (0).

How to Clear DTCs

1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the ABS modulator-control unit. If it doesn't, troubleshoot the DLC circuit.
4. Clear the DTC(s) by following the screen prompts on the HDS.
5. Turn the ignition switch to LOCK (0).

ABS DTC Troubleshooting: 11-13, 13-13, 15-13, 17-13

DTC 11-13:
Right-front Wheel Speed Sensor Circuit Malfunction
DTC 13-13:
Left-front Wheel Speed Sensor Circuit Malfunction
DTC 15-13:
Right-rear Wheel Speed Sensor Circuit Malfunction
DTC 17-13:
Left-rear Wheel Speed Sensor Circuit Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 11-13, 13-13, 15-13, and/or 17-13 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the ABS modulator-control unit 25P connector.
7. Disconnect the wheel speed sensor 2P connector.
8. Check for continuity between the appropriate ABS modulator-control unit 25P connector wheel speed sensor +B and GND terminals (see table).

DTC	ABS Modulator-control Unit 25P Connector Terminal	
11-13	No. 2	No. 18
13-13	No. 12	No. 3
15-13	No. 6	No. 15
17-13	No. 14	No. 5

   Is there continuity?
   YES - Repair short in the wires between the appropriate wheel speed sensor and the ABS modulator-control unit.■
   NO - Go to Step 9 .

9. Check for continuity between the appropriate ABS modulator-control unit 25P connector terminal and the wheel speed sensor 2P connector terminal.

DTC	ABS Modulator-control Unit 25P Connector	Appropriate Wheel Speed Sensor
11-13	No. 2	Right-front
13-13	No. 12	Left-front
15-13	No. 6	Right-rear
17-13	No. 14	Left-rear

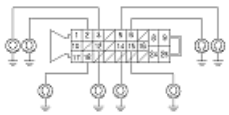
   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the appropriate wheel speed sensor and the ABS modulator-control unit.■

10. Check for continuity between the appropriate ABS modulator-control unit 25P connector terminal and the wheel speed sensor 2P connector terminal.

DTC	ABS Modulator-control Unit 25P Connector	Appropriate Wheel Speed Sensor
11-13	No. 18	Right-front
13-13	No. 3	Left-front
15-13	No. 15	Right-rear
17-13	No. 5	Left-rear

   Is there continuity?
   YES - Go to Step 11 .
   NO - Repair open in the wire between the appropriate wheel speed sensor and the ABS modulator-control unit.■

11. Check for continuity between body ground and the appropriate ABS modulator-control unit 25P connector terminal (see table).



DTC	ABS Modulator-control Unit 25P Connector Terminal	
11-13	No. 2	No. 18
13-13	No. 12	No. 3
15-13	No. 6	No. 15
17-13	No. 14	No. 5

Is there continuity?

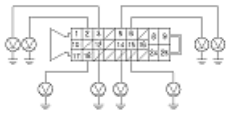
YES - Repair short to body ground in the wire between the appropriate wheel speed sensor and the ABS modulator-control unit.■

NO - Go to Step 12 .

12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between body ground and the appropriate ABS modulator-control unit 25P connector terminal (see table).



DTC	ABS Modulator-control Unit 25P Connector Terminal	
11-13	No. 2	No. 18
13-13	No. 12	No. 3
15-13	No. 6	No. 15
17-13	No. 14	No. 5

Is there 0.1 V or more?

YES - Repair short to power in the wire between the appropriate wheel speed sensor and the ABS modulator-control unit.■

NO - Go to Step 14 .

14. Turn the ignition switch to LOCK (0).
15. Substitute the appropriate sensor with oppsite wheel speed sensor, or with a known-good wheel speed sensor.
16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Clear the DTC with the HDS.
19. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
20. Check for DTCs with the HDS.

Is DTC indicated that is indicated in Step 4 ?

YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■

NO - Replace the original wheel speed sensor. ■

ABS DTC Troubleshooting: 12-11, 14-11, 16-11, 18-11

DTC 12-11:
Right-front Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 14-11:
Left-front Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 16-11:
Right-rear Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 18-11:
Left-rear Wheel Speed Sensor Electrical Noise or Intermittent Interruption
NOTE: These DTCs may be caused by electrical interference. Check for aftermarket devices installed in the vehicle when these DTCs are indicated.

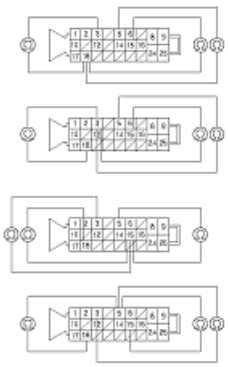
1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 12-11, 14-11, 16-11, and/or 18-11 indicated?
   YES - If the DTC 12-12, 14-12, 16-12, or 18-12 is indicated at the same time, do the DTC 12-12, 14-12, 16-12, or 18-12 troubleshooting. If DTC 12-12, 14-12, 16-12, or 18-12 is not indicated, go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting.
5. Turn the ignition switch to LOCK (0).
6. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-11	Right-front
14-11	Left-front
16-11	Right-rear
18-11	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

ABS DTC Troubleshooting: 12-12, 14-12, 16-12, 18-12



DTC 12-12:
Right-front Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 14-12:
Left-front Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 16-12:
Right-rear Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 18-12:
Left-rear Wheel Speed Sensor Short to the Other Sensor Circuit

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 20 km/h (13 mph) or more, and go a distance of 100 m (328 ft) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 12-12, 14-12, 16-12, and/or 18-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the ABS modulator-control unit 25P connector.
7. Check for continuity between the appropriate ABS modulator-control unit 25P connector wheel speed sensor GND terminals (see table).

DTC	ABS Modulator-control Unit 25PConnector Terminal			
	AppropriateTerminal	Other Terminals		
12-12	No. 18	No. 3	No. 15	No. 5
14-12	No. 3	No. 18	No. 15	No. 5
16-12	No. 15	No. 18	No. 3	No. 5
18-12	No. 5	No. 18	No. 3	No. 15

   Is there continuity?
   YES - Repair short in the wires between the appropriate wheel speed sensor and the ABS modulator-control unit.■
   NO - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■

ABS DTC Troubleshooting: 12-21, 14-21, 16-21, 18-21

DTC 12-21:
Right-front Wheel Speed Sensor Installation Error
DTC 14-21:
Left-front Wheel Speed Sensor Installation Error
DTC 16-21:
Right-rear Wheel Speed Sensor Installation Error
DTC 18-21:
Left-rear Wheel Speed Sensor Installation Error

1. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RF, LF, RR, LR WHEEL SPD in the ABS DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-21	Right-front
14-21	Left-front
16-21	Right-rear
18-21	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

ABS DTC Troubleshooting: 12-22, 14-22, 16-22, 18-22

DTC 12-22:
Right-front Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 14-22:
Left-front Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 16-22:
Right-rear Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 18-22:
Left-rear Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)

1. Test-drive the vehicle. Drive the vehicle between 30 km/h (19 mph) and 50 km/h (31 mph) for 70 seconds or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RF, LF, RR, LR WHEEL SPD in the ABS DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-22	Right-front
14-22	Left-front
16-22	Right-rear
18-22	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

ABS DTC Troubleshooting: 12-23, 14-23, 16-23, 18-23

DTC 12-23:
Right-front Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 14-23:
Left-front Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 16-23:
Right-rear Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 18-23:
Left-rear Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))

1. Test-drive the vehicle. Drive the vehicle between 1 km/h (1 mph) and 15 km/h (9 mph).
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RF, LF, RR, LR WHEEL SPD in the ABS DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-23	Right-front
14-23	Left-front
16-23	Right-rear
18-23	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

ABS DTC Troubleshooting: 21-11, 22-11, 23-11, 24-11

DTC 21-11:
Right-front Magnetic Encoder Malfunction (Pulse Missing)
DTC 22-11:
Left-front Magnetic Encoder Malfunction (Pulse Missing)
DTC 23-11:
Right-rear Magnetic Encoder Malfunction (Pulse Missing)
DTC 24-11:
Left-rear Magnetic Encoder Malfunction (Pulse Missing)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 20 km/h (13 mph) or more, and go a distance of 100 m (328 ft) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 21-11, 22-11, 23-11, and/or 24-11 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Inspect the appropriate magnetic encoder for dirt or debris.

DTC	AppropriateMagneticEncoder	Note
21-11	Right-front	Remove the driveshaft outboard joint from the appropriate wheel hub.
22-11	Left-front	
23-11	Right-rear	Remove the hub bearing unit.
24-11	Left-rear	

   Is the magnetic encoder surface OK?
   YES - Replace the wheel bearing (front) or the hub bearing unit (rear):■

   - Front: Replace the front wheel bearing.
   - Rear: Replace the hub bearing unit.

   NO - Clean off dust or dirt from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit, then go to Step 1 and recheck. If the DTC is still present, replace the appropriate wheel bearing or hub bearing unit.

ABS DTC Troubleshooting: 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, 38-xx

DTC 31-xx *:
ABS Right-front Inlet Solenoid Valve Malfunction
DTC 32-xx *:
ABS Right-front Outlet Solenoid Valve Malfunction
DTC 33-xx *:
ABS Left-front Inlet Solenoid Valve Malfunction
DTC 34-xx *:
ABS Left-front Outlet Solenoid Valve Malfunction
DTC 35-xx *:
ABS Right-rear Inlet Solenoid Valve Malfunction
DTC 36-xx *:
ABS Right-rear Outlet Solenoid Valve Malfunction
DTC 37-xx *:
ABS Left-rear Inlet Solenoid Valve Malfunction
DTC 38-xx *:
ABS Left-rear Outlet Solenoid Valve Malfunction
*: Any two-character subcode (see table).

Subcode	Malfunction	Note (DTC)
01	Solenoid Initial Pulse	31-01, 32-01, 33-01, 34-01, 35-01, 36-01, 37-01, 38-01
21	Solenoid Pulse	31-21, 32-21, 33-21, 34-21, 35-21, 36-21, 37-21, 38-21
22	Solenoid Speculative	31-22, 32-22, 33-22, 34-22, 35-22, 36-22, 37-22, 38-22
23	Solenoid Stuck ON	31-23, 32-23, 33-23, 34-23, 35-23, 36-23, 37-23, 38-23

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, or 38-xx indicated?
YES - Replace the ABS modulator-control unit. ■
NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 41-21, 42-21, 43-21, 44-21

DTC 41-21:
Right-front Wheel Lock
DTC 42-21:
Left-front Wheel Lock
DTC 43-21:
Right-rear Wheel Lock
DTC 44-21:
Left-rear Wheel Lock
The DTCs may be indicated under these conditions:

- The vehicle goes into a spin.
- The ABS continues to operate for a long time.
- Snow, dirt, or debris build-up on the wheel speed sensor or magnetic encoder.
- Misadjusted brake switch.
- Contaminated brake fluid.

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Turn the appropriate wheel by hand.

DTC	Appropriate Wheel
41-21	Right-front
42-21	Left-front
43-21	Right-rear
44-21	Left-rear

Is there brake drag?
YES - Repair the brake drag.■
NO - Go to Step 3 .

3. Check that the appropriate wheel speed sensor is properly mounted.

Is the wheel speed sensor installation OK?
YES - Go to Step 4 .
NO - Reinstall the wheel speed sensor, and check the mounting position. ■

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Turn the ignition switch to LOCK (0).
7. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) for 20 seconds or more.
NOTE: Drive the vehicle on a straight section of road, not on a lift.
8. Check for DTCs with the HDS.

Is DTC 41-21, 42-21, 43-21, or 44-21 indicated?
YES - Check for loose terminals between the wheel speed sensor 2P connector and the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 51-11, 51-13

DTC 51-11:
Motor Lock
DTC 51-13:
Motor Drive Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Wait 5 seconds.
5. Operate any one of the four solenoids, as listed, in the ABS FUNCTION TEST five times with the HDS.

-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

6. Check for DTCs with the HDS.

Is DTC 51-11 or 51-13 indicated?
YES - Replace the ABS modulator-control unit. ■
NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 51-12

DTC 51-12:
Motor Drive Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 51-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Check the No. 58 (30 A) fuse in the under-dash fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 7 .
   NO - Reinstall the checked fuse, then go to Step 14 .
7. Disconnect the ABS modulator-control unit 25P connector.
8. Check for continuity between ABS modulator-control unit 25P connector terminal No. 9 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 58 (30 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■
   NO - Install a new No. 58 (30 A) fuse in the under-dash fuse/relay box, then go to Step 9 .
9. Reconnect the ABS modulator-control unit 25P connector.
10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
13. Check for DTCs with the HDS.

    Is DTC 51-12 indicated?
    YES - Replace the ABS modulator-control unit. ■
    NO - The system is OK at this time.■
14. Disconnect the ABS modulator-control unit 25P connector.

---

15. Measure the voltage between ABS modulator-control unit 25P connector terminal No. 9 and body ground.

    Is there battery voltage?
    YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
    NO - Repair open in the wire between the No. 58 (30 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■

ABS DTC Troubleshooting: 52-12

DTC 52-12:
Motor Stuck OFF

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Operate any one of the four solenoids, as listed, in the ABS FUNCTION TEST five times with the HDS.

-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

5. Check for DTCs with the HDS.

Is DTC 52-12 indicated?
YES - Replace the ABS modulator-control unit. ■
NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 53-01, 53-12

DTC 53-01:
Motor Relay Stuck ON 1
DTC 53-12:
Motor Relay Stuck ON 2

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 53-01 or 53-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the ABS modulator-control unit 25P connector.
7. Check for continuity between ABS modulator-control unit 25P connector terminal No. 25 and body ground.

   Is there continuity?
   YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
   NO -
   - RHD model: Repair open in the wire between the ABS modulator-control unit and body ground (G203).■
   - LHD model: Repair open in the wire between the ABS modulator-control unit and body ground (G402).■

ABS DTC Troubleshooting: 54-03

DTC 54-03:
Fail-safe Relay 1 Stuck ON

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 54-03 indicated?
YES - Replace the ABS modulator-control unit. ■
NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 54-04, 54-21

DTC 54-04:
Fail-safe Relay 1 Stuck OFF (Initial)
DTC 54-21:
Fail-safe Relay 1 Stuck OFF (Main)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 54-04 or 54-21 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Check the No. 37 (30 A) fuse in the under-dash fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 7 .
   NO - Reinstall the checked fuse, then go to Step 14 .
7. Disconnect the ABS modulator-control unit 25P connector.
8. Check for continuity between ABS modulator-control unit 25P connector terminal No. 8 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 37 (30 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■
   NO - Install a new No. 37 (30 A) fuse in the under-dash fuse/relay box, then go to Step 9 .
9. Reconnect the ABS modulator-control unit 25P connector.
10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
13. Check for DTCs with the HDS.

    Is DTC 54-04 or 54-21 indicated?
    YES - Replace the ABS modulator-control unit. ■
    NO - The system is OK at this time.■
14. Disconnect the ABS modulator-control unit 25P connector.

---

15. Measure the voltage between ABS modulator-control unit 25P connector terminal No. 8 and body ground.

    Is there battery voltage?
    YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
    NO - Repair open in the wire between the No. 37 (30 A) fuse in the under-dash fuse/relay box and the ABS modulator-control unit.■

ABS DTC Troubleshooting: 61-01, 61-21, 61-22, 61-23

DTC 61-01:
ABS Modulator-control Unit Initial IG Low Voltage
DTC 61-21:
ABS Modulator-control Unit Power Source Low Voltage 1
DTC 61-22:
ABS Modulator-control Unit Power Source Low Voltage 2
DTC 61-23:
ABS Modulator-control Unit Power Source Low Voltage 3

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then start the engine.
4. Check for DTCs with the HDS.

   Is DTC 61-01, 61-21, 61-22, or 61-23 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Check and note BATTERY voltage in the ABS DATA LIST with the HDS.
6. Using a voltmeter, measure and note the voltage between the battery terminals.
   NOTE: If the voltage is below 9.5 V, check the battery, and troubleshoot the alternator regulator circuit.
7. Compare the voltage noted in Step 5 to the voltage in Step 6 .

   Is the difference between the two voltage readings less then 3 V?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. If the code resets after clearing, replace the ABS modulator-control unit. ■
   NO - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■

ABS DTC Troubleshooting: 62-21

DTC 62-21:
ABS Modulator-control Unit IG High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then start the engine.
4. Check for DTCs with the HDS.

   Is DTC 62-21 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Check and note BATTERY voltage in the ABS DATA LIST with the HDS.
6. Using a voltmeter, measure and note the voltage between the battery terminals.
   NOTE: If the voltage is beyond 15.1 V, troubleshoot the alternator regulator circuit.
7. Compare the voltage noted in Step 5 to the voltage in Step 6 .

   Is the difference between the two voltage readings less than 3 V?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals at the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. If the code resets after clearing, replace the ABS modulator-control unit. ■
   NO - Replace the ABS modulator-control unit, and retest.■

ABS DTC Troubleshooting: 71-21, 71-22, 71-23, 71-24, 71-25, 71-26

DTC 71-21:
Right-front or Left-rear Different Diameter Tyre Malfunction
DTC 71-22:
Left-front or Right-rear Different Diameter Tyre Malfunction
DTC 71-23:
Right-front and Right-rear Different Diameter Tyre Malfunction
DTC 71-24:
Left-front and Left-rear Different Diameter Tyre Malfunction
DTC 71-25:
Right-front and Left-front Different Diameter Tyre Malfunction
DTC 71-26:
Right-rear and Left-rear Different Diameter Tyre Malfunction
NOTE: The DTC will be indicated when the vehicle has a different diameter tyre(s) compared to the other tyre(s).

DTC	Sectional	Note
71-21	Right-front or left-rear	
71-22	Left-front or right-rear	
71-23	Right-front and right-rear	
71-24	Left-front and left-rear	
71-25	Right-front and left-front	
71-26	Right-rear and left-rear	

1. Check the tyres for proper inflation.
2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Turn the ignition switch to LOCK (0).
5. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
6. Check for DTCs with the HDS.

   Is DTC 71-21, 71-22, 71-23, 71-24, 71-25, or 71-26 indicated?
   YES - Replace tyres as needed until all their diameters much.■
   NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 81-11, 81-51, 81-52

DTC 81-11:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-51:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-52:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
5. Check for DTCs with the HDS.

   Is DTC 81-11, 81-51, or 81-52 indicated?
   YES - Replace the ABS modulator-control unit. ■
   NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 81-xx

DTC 81-xx * :
Central Processing Unit (CPU) Internal Circuit Malfunction
*: Any two-character subcode (Except these combinations: DTC 81-11, 81-51, and 81-52).

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

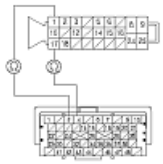
Is DTC 81-xx indicated?

YES - If the DTC 81-11, 81-51, or 81-52 is indicated at the same time, do the DTC 81-11, 81-51, or 81-52 troubleshooting. If DTC 81-11, 81-51, or 81-52 is not indicated, replace the ABS modulator-control unit, and retest.■

NO - Intermittent failure, the system is OK at this time.■

ABS DTC Troubleshooting: 86-01

DTC 86-01:
F-CAN Bus-off Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

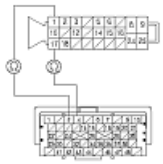
   Is DTC 86-01 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between ECM/PCM connector A (49P) and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Disconnect the ABS modulator-control unit 25P connector.
9. Check for continuity between the ABS modulator-control unit 25P connector terminal and ECM/PCM connector A (49P) terminal (see table).

Sign	ABS Modulator-control Unit 25P Connector Terminal	ECM/PCM Connector A (49P) Terminal
CAN-L	No. 17	No. 4
CAN-H	No. 1	No. 3

   Is there continuity?
   YES - Check for loose terminals in the ABS modulator-control unit 25P connector. If necessary, substitute a known-good ABS modulator-control unit, and retest.■
   NO - Repair open in the wire between the ECM/PCM and the ABS modulator-control unit.■

ABS DTC Troubleshooting: 86-24, 86-25

DTC 86-24:
F-CAN Communication with Engine Malfunction
DTC 86-25:
F-CAN Communication with Engine Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 86-24 and/or 86-25 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between ECM/PCM connector A (49P) and the ABS modulator-control unit 25P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Disconnect the ABS modulator-control unit 25P connector.
9. Check for continuity between the ABS modulator-control unit 25P connector terminal and ECM/PCM connector A (49P) terminal (see table).

Sign	ABS Modulator-control Unit 25P Connector Terminal	ECM/PCM Connector A (49P) Terminal
CAN-L	17	4
CAN-H	1	3

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the ECM/PCM and the ABS modulator-control unit.■
10. Reconnect all connectors.
11. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM.
12. Clear the DTC with the HDS.
13. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
14. Check for DTCs with the HDS.

    Is DTC 86-24 and/or 86-25 indicated?
    YES - Replace the ABS modulator-control unit. ■
    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM. ■

ABS DTC Troubleshooting: 86-FF

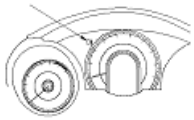
DTC 86-FF:
F-CAN Communication with ABS Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 86-FF indicated?
YES - Replace the ABS modulator-control unit. ■
NO - Intermittent failure, the system is OK at this time.■

How to Troubleshoot the EPS

EPS Indicator



Under normal conditions, the EPS indicator (A) comes on when the ignition switch is turned to ON (II) position, then goes off after the engine is started. This indicates that the LED and its circuit are operating correctly.
If there is a failure in the system after the engine is started, the EPS indicator will stay on, and the power assist is turned off or restricted.
When the EPS indicator comes on, the control unit memorizes the DTC. In this case, the control unit will not activate the EPS system after the engine starts again, but it keeps the EPS indicator on.
When DTC 51-01, 51-02, 51-03 or 51-05 is stored in the control unit, the EPS indicator will stay on until the DTC is erased. When a problem is detected and the EPS indicator comes on, there are cases when the indicator stays on until the ignition switch is turned to LOCK (0), and cases when the indicator goes off automatically when the system returns to normal. Even though the system is operating normally, the EPS indicator will come on under the following conditions:

- The vehicle speed is above 15 km/h (10 mph) for more than 3 seconds. When the vehicle speed decreases abruptly (by applying the brakes) from above 20 km/h (12 mph) to less than 1 km/h (1 mph), and stay for 5 seconds, and after abrupt deceleration, when the engine speed is above 1,840 rpm (min^{-1}) (after the engine starts within 5 minutes: 4,000 rpm (min^{-1})) for 5 seconds (continuously).
- When the steering wheel is turned, and the engine speed is above 1,840 rpm (min^{-1}) (after the engine starts within 5 minutes: 4,000 rpm (min^{-1})) for 20 seconds, then the engine speed is above 2,500 rpm (min^{-1}) for 10 seconds continuously.

To determine the actual cause of the problem, question the customer about the conditions during which the problem occurred, taking the above conditions into consideration.

Diagnostic Trouble Code (DTC)

- If the CPU cannot be activated, or it fails, the EPS indicator comes on, but the DTC is not memorized.
- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the most recent DTC is written over the prior DTC, therefore only one occurrence is memorized.
- The lowest DTC is indicated first. The DTCs are indicated in ascending order, not in the order that they occurred.
- The DTCs are memorized in the EEPROM (non-volatile memory) therefore the memorized DTCs cannot be erased by disconnecting the battery. Perform the specified procedures to clear DTCs.

Self-diagnosis

Self-diagnosis can be classified into two categories:

- Initial diagnosis: Done right after the engine starts and until the EPS indicator goes off.
- Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned to LOCK (0).

The EPS control unit performs the following functions when a problem is detected by self-diagnosis:

1. Turns on the EPS indicator.
2. Memorizes the DTC.
3. Stops or restricts the power assist and manual steering operation resumes.
   NOTE: For DTCs 11-01, 11-02, 12-01, 21-01, 21-02, 22-01, 35-04, 36-02, 37-01, and 37-02 the EPS indicator will go off automatically, and the system returns to normal.

Restriction on Power Assist Operation

Repeated extreme steering force, such as turning the steering wheel continuously back-and-forth with the vehicle stopped, causes an increase of power consumption in the EPS motor. The increase of electric current causes the EPS motor to heat up. Because this heat adversely affects the system, the control unit monitors the electric current of the EPS motor. When the control unit detects heat build-up in the EPS motor, it reduces the electric current to the EPS motor gradually to protect the system, and it restricts the power assist operation. The EPS indicator does not come on during this function.
When steering torque is not applied to the steering wheel, or when the ignition is turned off and the EPS motor cools, the control unit will restore the power assist gradually until it's fully restored (after about 20 minutes).

Torque Sensor Neutral Position

The EPS control unit stores the torque sensor neutral position in the EEPROM. The torque sensor neutral position must be memorized whenever the steering gearbox, or the EPS control unit is replaced.
NOTE: The torque sensor neutral position is not affected when erasing the DTCs.

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the EPS indicator is still on. Following the procedure when the EPS indicator does not come on can result in an incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the EPS indicator came on, such as while turning, after turning, when the vehicle was at a certain speed, etc.
2. When the EPS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., in the affected circuit before you start troubleshooting.
3. After troubleshooting, clear the DTC and test-drive the vehicle. Be sure the EPS indicator does not come on.

How to Use the HDS (Honda Diagnostic System)

1. If the system indicators stay on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit.
4. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.
   NOTE:
   - The HDS can read the DTC, the current data, and other system data.
   - For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

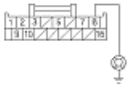
1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit.
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting.
5. Turn the ignition switch to LOCK (0).

How to Clear DTCs

1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it doesn't, troubleshoot the DLC circuit.
4. Clear the DTC(s) by following the screen prompts on the HDS.
5. Turn the ignition switch to LOCK (0).

EPS DTC Troubleshooting: 11-01, 11-02

DTC 11-01:
Low/High IG1-terminal Voltage (Initial Diagnosis)
DTC 11-02:
Low/High IG1-terminal Voltage (Regular Diagnosis)



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Wait at least 60 seconds.
6. Check for DTCs with the HDS.

   Is DTC 11-01 or 11-02 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.■
7. Turn the ignition switch to LOCK (0).
8. Check and note BATTERY voltage in the EPS DATA LIST with the HDS.

   Is the battery OK?
   YES - Go to Step 9 .
   NO - Check the battery, and troubleshoot the alternator regulator circuit. ■
9. Check the No. 11 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Reinstall the No. 11 (7.5 A) fuse, then go to Step 18 .
   NO - Go to Step 10 .
10. Disconnect the EPS control unit connector C (16P).
11. Check for continuity between EPS control unit connector C (16P) terminal No. 8 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the EPS control unit and No. 11 (7.5 A) fuse in the under-dash fuse/relay box.■
    NO - Install a new No. 11 (7.5 A) fuse in the under-dash fuse/relay box, then go to Step 12 .
12. Reconnect the EPS control unit connector C (16P).
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Turn the ignition switch to LOCK (0).
16. Start the engine.
17. Check for DTCs with the HDS.

    Is DTC 11-01 or 11-02 indicated?
    YES - Replace the EPS control unit. ■
    NO - Troubleshooting is complete. If any other DTCs are indicated, go to the indicated DTC's troubleshooting.■
18. Disconnect the EPS control unit connector C (16P).
19. Turn the ignition switch to ON (II).

---

20. Measure the voltage between EPS control unit connector C (16P) terminal No. 8 and body ground.

    
    Is there battery voltage?
    YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
    NO - Repair open in the wire between the No. 11 (7.5 A) fuse in the under-dash fuse/relay box and the EPS control unit.■

EPS DTC Troubleshooting: 12-01

DTC 12-01:
Low/High VBU Voltage (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC 12-01 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.■
6. Turn the ignition switch to LOCK (0).
7. Check and note BATTERY voltage in the EPS DATA LIST with the HDS.

   Is the battery OK?
   YES - Go to Step 8 .
   NO - Check the battery, and troubleshoot the alternator regulator circuit. ■
8. Check the No. 2 (60 A) fuse in the battery terminal fuse box.

   Is the fuse OK?
   YES - Reinstall the No. 2 (60 A) fuse, then go to Step 17 .
   NO - Go to Step 9 .
9. Disconnect the EPS control unit connector A (2P).
10. Check for continuity between EPS control unit connector A (2P) terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the EPS control unit and No. 2 (60 A) fuse in the battery terminal fuse box.■
    NO - Install a new No. 2 (60 A) fuse in the battery terminal fuse box, then go to Step 11 .
11. Reconnect the EPS control unit connector C (16P).
12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Turn the ignition switch to LOCK (0).
15. Start the engine.
16. Check for DTCs with the HDS.

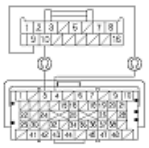
    Is DTC 12-01 indicated?
    YES - Replace the EPS control unit. ■
    NO - Troubleshooting is complete. If any other DTCs are indicated, go to the indicated DTC's troubleshooting.■
17. Disconnect the EPS control unit connector A (2P).
18. Turn the ignition switch to ON (II).

---

19. Measure the voltage between EPS control unit connector A (2P) terminal No. 2 and body ground.

    Is there battery voltage?
    YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
    NO - Repair open in the wire between the No. 2 (60 A) fuse in the battery terminal fuse box and the EPS control unit.■

EPS DTC Troubleshooting: 21-01, 21-02



DTC 21-01:
Excessive Change of the Vehicle Speed Signal (Regular Diagnosis)
DTC 21-02:
Comparison Between the Vehicle Speed and the Engine Speed Signal (Regular Diagnosis)
NOTE:

- If the MIL stays on, or the D indicator blinks at the same time as DTC 21-01 or DTC 21-02 is indicated, troubleshoot the PGM-FI system or A/T model: automatic transmission system, then recheck for DTC 21-01 or DTC 21-02.
- Even though the system is operating normally, the EPS indicator will come on caused by the detecting condition of DTC 21-01 or DTC 21-02.
- The ABS indicator may come on during this troubleshoot. If so, clear the DTC related to the ABS.

1. Turn the ignition switch to LOCK (0).
2. Raise the vehicle, and support it with safety stands in the proper locations, and allow all four wheels to rotate freely.
3. Connect the HDS to the data link connector (DLC).
4. Start the engine, then run the vehicle in the 4th gear (M/T), or D position (A/T).
5. Check the VEHICLE SPEED in the EPS DATA LIST with the HDS.

   Is 0 km/h (0 mph) indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ECM/PCM and the EPS control unit.■
6. Turn the ignition switch to LOCK (0).
7. Start the engine and check the tachometer.

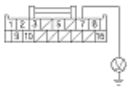
   Is the tachometer working correctly?
   YES - Go to Step 8 .
   NO - Troubleshoot the gauge control module. ■
8. Turn the ignition switch to LOCK (0).
9. Short the SCS line with the HDS.
10. Disconnect the ECM/PCM connector A (49P) and EPS control unit connector C (16P).
11. Check for continuity between EPS control unit connector C (16P) terminal and ECM/PCM connector A (49P) terminal individually.

Sign	EPS Control Unit Connector C (16P) Terminal	ECM/PCM Connector A (49P) Terminal
CAN-L	9	4
CAN-H	10	3

   Is there continuity?
   YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
   NO - Repair open in the wire between the EPS control unit and the ECM/PCM.■

EPS DTC Troubleshooting: 22-01

DTC 22-01:
Engine Speed Signal (Regular Diagnosis)



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) for 3 seconds or more.
4. Check the ENGINE SPEED in the EPS DATA LIST with the HDS.

   Is there 440 rpm (min^{-1}) or less at idle?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the EPS control unit connector C (16P).
7. Start the engine.
8. Measure the voltage between EPS control unit connector C (16P) terminal No. 7 and body ground.

   Is there any voltage?
   YES - Go to Step 9 .
   NO - Go to Step 14 .
9. Turn the ignition switch to LOCK (0).
10. Short the SCS line with the HDS.
11. Disconnect the ECM/PCM connector A (49P).
12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between EPS control unit connector C (16P) terminal No. 7 and body ground.

    Is there any voltage?
    YES - Repair short to power in the wire between the EPS control unit and ECM/PCM.■
    NO - Check for loose terminal in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
14. Turn the ignition switch to LOCK (0).
15. Short the SCS line with the HDS.
16. Disconnect the ECM/PCM connector A (49P).

---

17. Check for continuity between EPS control unit connector C (16P) terminal No. 7 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the EPS control unit and the ECM/PCM.■
    NO - Go to Step 18 .

---

18. Check for continuity between EPS control unit connector C (16P) terminal No. 7 and ECM/PCM connector A (49P) terminal No. 29.

    Is there continuity?
    YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then go to Step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs are not indicated, replace the original ECM/PCM. ■
    NO - Repair open in the wire between the EPS control unit and the ECM/PCM.■

EPS DTC Troubleshooting: 31-01

DTC 31-01:
No Writing the Torque Sensor Neutral Position (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Do the memorizing of the torque sensor neutral position.
5. Turn the ignition switch to ON (II).
6. Check for DTCs with the HDS.

Is DTC 31-01 indicated?
YES - Replace the EPS control unit. ■
NO - Intermittent failure, the system is OK at this time.■

EPS DTC Troubleshooting: 32-01, 32-02, 32-03, 32-04, 32-05, 32-06, 34-01, 35-01, 35-02, 35-03, 35-04, 36-01, 36-02, 37-01, 37-02

DTC 32-01:
EPS Control Unit Internal Circuit (Current Sensor) (Regular Diagnosis)
DTC 32-02:
EPS Control Unit Internal Circuit Offset (Current Sensor) (Regular Diagnosis)
DTC 32-03:
Lower Current Sensor Stuck ON (Initial Diagnosis)
DTC 32-04:
Lower Current Sensor Stuck ON (Regular Diagnosis)
DTC 32-05:
Motor Power Supply Voltage (Regular Diagnosis)
DTC 32-06:
EPS Control Unit Internal Circuit (Sub-CPU) (Regular Diagnosis)
DTC 34-01:
Power Relay Stuck ON (IG Switch is in LOCK (0))
DTC 35-01:
EPS Control Unit Internal Circuit (CPU) (Initial Diagnosis/Regular Diagnosis)
DTC 35-02:
EPS Control Unit Internal Circuit (EEPROM) (Initial Diagnosis)
DTC 35-03:
EPS Control Unit Internal Circuit (CPU Communication) (Initial Diagnosis)
DTC 35-04:
EPS Control Unit Internal Circuit (CPU Communication) (Regular Diagnosis)
DTC 36-01:
EPS Control Unit Internal Circuit (Direction Distinction) (Initial Diagnosis)
DTC 36-02:
EPS Control Unit Internal Circuit (INH Output Circuit) (Initial Diagnosis)
DTC 37-01:
EPS Control Unit Internal Circuit (Step-Up Circuit) (Initial Diagnosis)
DTC 37-02:
EPS Control Unit Internal Circuit (Step-Up Circuit) (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 32-01, 32-02, 32-03, 32-04, 32-05, 32-06, 34-01, 35-01, 35-02, 35-03, 35-04, 36-01, 36-02, 37-01, or 37-02 indicated?

   YES - Replace the EPS control unit. ■
   NO - Intermittent failure, the system is OK at this time.■

EPS DTC Troubleshooting: 33-01

DTC 33-01:
Lower FET Stuck ON (Initial Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 33-01 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector B (2P).
9. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, and No. 2 terminal.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Check for loose terminal in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
10. Disconnect the EPS motor 2P connector.

---

11. On the EPS motor side, check for continuity between body ground and EPS motor 2P connector No. 1 terminal, and No. 2 terminal.

    Is there continuity?
    YES - Replace the EPS motor. ■
    NO - Repair short to body ground in the wire between the EPS control unit and EPS motor.■

EPS DTC Troubleshooting: 33-02, 34-02

DTC 33-02:
Upper FET Stuck ON (Initial Diagnosis)
DTC 33-07:
Fail-safe Relay Stuck ON (Initial Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 33-02 or 34-02 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector B (2P).
9. Turn the ignition switch to ON (II).
10. Measure the voltage between body ground and EPS control unit connector B (2P) No. 1 terminal, and No. 2 terminal.

    Is there battery voltage?
    YES - Repair short to power in the wire between the EPS control unit and the EPS motor.■
    NO - Check for loose terminal in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit. ■

EPS DTC Troubleshooting: 33-03, 33-04, 33-05

DTC 33-03:
FET Stuck ON (Overcurrent) (Regular Diagnosis)
DTC 33-04:
FET Stuck ON (Failure) (Regular Diagnosis)
DTC 33-05:
FET Stuck ON (Overcurrent Addition) (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 33-03, 33-04, or 33-05 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector B (2P).
9. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, and No. 2 terminal.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Go to Step 12 .
10. Disconnect the EPS motor 2P connector.

---

11. On the EPS motor side, check for continuity between body ground and EPS motor 2P connector No. 1 terminal, and No. 2 terminal.

    Is there continuity?
    YES - Replace the EPS motor. ■
    NO - Repair short to body ground in the wire between the EPS control unit and EPS motor.■
12. Disconnect the EPS motor 2P connector.
13. Turn the ignition switch to ON (II).

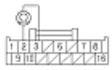
---

14. Measure the voltage between body ground and EPS control unit connector B (2P) No. 1 terminal, and No. 2 terminal.

    Is there battery voltage?
    YES - Repair short to power in the wire between the EPS control unit and the EPS motor.■
    NO - Check for loose terminal in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit. ■

EPS DTC Troubleshooting: 51-01, 51-02, 51-03, 51-04, 51-05

DTC 51-01:
Torque Sensor (VT1 and VT2) (Regular Diagnosis)
DTC 51-02:
Torque Sensor VT3 Differential-amplification Function (Regular Diagnosis)
DTC 51-03:
Torque Sensor (VT1, VT2 Rapid-change) (Regular Diagnosis)
DTC 51-04:
Torque Sensor (Temperature) (Regular Diagnosis)
DTC 51-05:
Torque Sensor (Coil) (Regular Diagnosis)



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 51-01, 51-02, 51-03, 51-04, or 51-05 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS motor and the EPS control unit.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector C (16P).
9. Measure the resistance between EPS control unit connector C (16P) terminals No. 2 and No. 3.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Go to Step 10 .
   NO - Go to Step 12 .
10. Disconnect the torque sensor 3P connector.

---

11. On the torque sensor side, measure the resistance between torque sensor 3P connector terminals No. 1 and No. 2.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Replace the steering gearbox. ■
   NO - Repair short in the wires between the EPS control unit and torque sensor.■

---

12. Measure the resistance between EPS control unit connector C (16P) terminals No. 1 and No. 2.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Go to Step 13 .
   NO - Go to Step 15 .
13. Disconnect the torque sensor 3P connector.

---

14. On the torque sensor side, measure the resistance between torque sensor 3P connector terminals No. 2 and No. 3.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Replace the steering gearbox. ■
   NO - Repair short in the wires between the EPS control unit and torque sensor.■

---

15. Measure the resistance between EPS control unit connector C (16P) terminals No. 1 and No. 3.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Go to Step 16 .
   NO - Go to Step 18 .
16. Disconnect the torque sensor 3P connector.

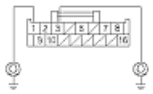
---

17. On the torque sensor side, measure the resistance between torque sensor 3P connector terminals No. 1 and No. 3.

   Is there resistance 10 Ω or less at 20 °C (68 °F)?
   YES - Replace the steering gearbox. ■
   NO - Repair short in the wires between the EPS control unit and torque sensor.■

---

18. Check for continuity between body ground and EPS control unit connector C (16P) No. 1 terminal, and No. 3 terminal.



Is there continuity?
YES - Go to Step 17 .
NO - Go to Step 19 .

19. Disconnect the torque sensor 3P connector.

---

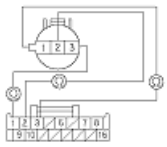
20. On the torque sensor side, check for continuity between body ground and torque sensor 3P connector No. 1 terminal, and No. 3 terminal.

Is there continuity?
YES - Replace the steering gearbox. ■
NO - Repair short to body ground in the wire between the EPS control unit and torque sensor.■

21. Disconnect the torque sensor 3P connector.

---

22. Check for continuity between EPS control unit connector C (16P) terminal and the torque sensor 3P connector terminal individually.



Sign	Torque Sensor 3P Connector	EPS Control Unit Connector C (16P) Terminal
VS1	1	3
T/S GND	2	2
VS2	3	1

Is there continuity?
YES - Go to Step 21 .
NO - Repair open in the wire between the EPS control unit and torque sensor.■

---

23. On the torque sensor side, measure the resistance between torque sensor 3P connector terminals No. 1 and No. 2, and No. 2 and No. 3 individually.

Is there resistance 10–40 Ω at 20 °C (68 °F)?
YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
NO - Replace the steering gearbox. ■

EPS DTC Troubleshooting: 61-01, 61-02

DTC 61-01:
EPS Motor Voltage (Initial Diagnosis)
DTC 61-02:
EPS Motor Voltage (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 61-01 or 61-02 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS motor and the EPS control unit.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector B (2P).
9. Check for continuity between torque sensor 3P connector terminals No. 1 and No. 2.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Go to Step 12 .
10. Disconnect the EPS motor 2P connector.

---

11. On the EPS motor side, check for continuity between EPS motor 2P connector terminals No. 1 and No. 2.

    Is there continuity?
    YES - Repair open in the wire between the EPS control unit and EPS motor.■
    NO - Replace the EPS motor. ■

12. Disconnect the EPS motor 2P connector.

---

13. Check for continuity between body ground and EPS control unit connector B (2P) No. 1 terminal, and No. 2 terminal.

    Is there continuity?
    YES - Repair short to body ground in the wire between the EPS control unit and EPS motor.■
    NO - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■

EPS DTC Troubleshooting: 61-03

DTC 61-03:
Open the EPS Motor Harness (Regular Diagnosis)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock to lock several times, and hold the steering wheel for 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 61-03 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS motor and the EPS control unit.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the EPS control unit connector B (2P) and the EPS motor 2P connector.
9. Check for continuity between EPS control unit connector B (2P) terminal No. 2 and EPS motor 2P connector terminal No. 1.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the EPS control unit and EPS motor.■

---

10. Check for continuity between EPS control unit connector B (2P) terminal No. 1 and EPS motor 2P connector terminal No. 2.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the EPS control unit and EPS motor.■

---

11. On the EPS motor side, check for continuity between EPS motor 2P connector terminals No. 1 and No. 2.

    Is there continuity?
    YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit. ■
    NO - Replace the EPS motor. ■

DTC Troubleshooting: B1152

DTC B1152:
Gauge Control Module Internal Error (EEPROM error)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Is DTC B1152 indicated?
YES - Replace the gauge control module. ■
NO - Intermittent failure, the gauge control module is OK at this time.■

DTC Troubleshooting: B1155

DTC B1155:
Gauge Control Module Lost Communication with the MICU (Headlight Switch Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1155 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1155 and B1905 indicated?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1156

DTC B1156:
Gauge Control Module Lost Communication with the MICU (Wiper Switch Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1156 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1156 and B1905 indicated?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1157

DTC B1157:
Gauge Control Module Lost Communication with the MICU (MICU Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1157 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1157 and B1905 indicated?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1159

DTC B1159:
Gauge Control Module Lost Communication with the MICU (Door Switch Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1159 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1159 and B1905 indicated?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1160

DTC B1160:
Gauge Control Module Lost Communication with the MICU (Door Lock Switch)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1160 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1160 and B1905 indicated?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1168

DTC B1168:
Gauge Control Module Lost Communication with ECM/PCM (Engine Messages)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1168 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for Fuel and Emission system DTCs with the HDS.

   Is any DTCs indicated?
   YES - Go to the indicated DTCs, then recheck.
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Jump the SCS with the HDS.
9. Disconnect the ECM/PCM connector A (49P).
10. Connect the gauge control module 32P connector No. 29 and No. 30 terminals and body ground with jumper wires.

---

11. Check for continuity between ECM/PCM connector A (49P) No. 3 and No. 4 terminals and body ground individually.

    Is there continuity?
    YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, and recheck. If the indication goes away, replace the original ECM/PCM. If the DTC is still present, replace the gauge control module. ■
    NO - Repair an open in the wire.■

DTC Troubleshooting: B1169

DTC B1169:
Gauge Control Module Lost Communication with the PCM (A/T Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1169 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for Fuel and Emission system DTCs with the HDS.

   Is any DTCs indicated?
   YES - Go to the indicated DTCs, then recheck.
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Jump the SCS with the HDS.
9. Disconnect PCM connector A (49P).
10. Connect the gauge control module 32P connector No. 29 and No. 30 terminals and body ground with jumper wires.

---

11. Check for continuity between PCM connector A (49P) No. 3 and No. 4 terminals and body ground individually.

   Is there continuity?
   YES - Update the PCM if it does not have the latest software, or substitute a known-good PCM, and recheck. If the indication goes away, replace the original PCM. If the DTC is still present, replace the gauge control module. ■
   NO - Repair an open in the wire.■

DTC Troubleshooting: B1175

DTC B1175:
Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 30 seconds.
4. Check for DTCs with the HDS.

   Is DTC B1175 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the fuel level sensor circuit is OK at this time. Check for loose or poor connections.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the fuel tank unit 4P connector and the gauge control module 32P connector.
7. Connect the fuel tank unit 4P connector No. 1 and No. 3 terminals and body ground with jumper wires.

---

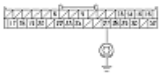
8. Check for continuity between gauge control module 32P connector No. 27 and No. 28 terminals and body ground individually.

   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair an open in the wire between the gauge control module and the fuel tank unit.■
9. Do the fuel gauge sending unit test.

   Is the fuel gauge sending unit OK?
   YES - Replace the gauge control module. ■
   NO - Replace the fuel tank unit.■

DTC Troubleshooting: B1176

DTC B1176:
Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 30 seconds.
4. Check for DTCs with the HDS.

   Is DTC B1176 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the fuel level sensor circuit is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the fuel tank unit 4P connector.
7. Clear the DTCs with the HDS.
8. Turn the ignition switch to LOCK (0), and then back to ON (II).
9. Wait for 30 seconds.
10. Check for DTCs with the HDS.

    Is DTC B1176 indicated?
    YES - Go to Step 11 .
    NO - Replace the fuel gauge sending unit. ■
11. Disconnect the gauge control module 32P connector.
12. Check for continuity between the gauge control module 32P connector No. 27 terminal and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire between the gauge control module and the fuel tank unit.■
    NO - Replace the gauge control module. ■

DTC Troubleshooting: B1178

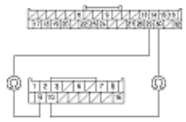
DTC B1178:
F-CAN Communication Circuit Error

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Check for DTCs with the HDS.

Are DTCs B1168, B1169, B1170, B1178, B1183 and/or B1187 indicated?
YES - Go to the indicated DTCs troubleshooting.■
NO - Intermittent failure, the F-CAN communication line is OK at this time. Check for worn or shorted wires.■

DTC Troubleshooting: B1183

DTC B1183:
Gauge Control Module Lost Communication with EPS Control Unit (EPS Message)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

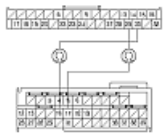
   Is DTC B1183 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for EPS system DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTCs, then recheck.
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Disconnect EPS control unit connector C (16P).
9. Check for continuity between the gauge control module 32P connector No. 29 and No. 30 terminals and EPS control unit connector C (16P) No. 9 and No. 10 terminals and body ground individually.

   Is there continuity?
   YES - Substitute a known-good EPS control unit, and recheck. If the indication goes away, replace the original EPS control unit. If the DTC is still present, replace the gauge control module. ■
   NO - Repair an open in the wire.■

DTC Troubleshooting: B1187

DTC B1187:
Gauge Control Module Lost Communication with SRS Unit (SRS Message)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1187 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for SRS DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTCs troubleshooting, then recheck.■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Disconnect SRS unit connector A (39P).
9. Check for continuity between the gauge control module 32P connector No. 29 and No. 30 terminals and SRS unit connector A (39P) No. 17 and No. 16 terminals individually.

   Is there continuity?
   YES - Substitute a known-good SRS unit, and recheck. If the indication goes away, replace the original SRS unit. If the DTC is still present, replace the gauge control module. ■
   NO - Repair an open in the wire.■

DTC Troubleshooting: B1188

DTC B1188:
Gauge Control Module Lost Communication with MICU (RM Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1188 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1188 and B1905 indicated?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Replace the gauge control module. ■

DTC Troubleshooting: B1905

DTC B1905:
Immobilizer-Keyless Control Unit Lost Communication with MICU (DRLOCKSW Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs witch the HDS.

   Is DTC B1905 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the immobilizer-keyless control unit is OK at this time. Check for loose or poor connections between the immobilizer-keyless control unit and the MICU.■
5. Check for DTCs with the HDS.

   Are DTCs B1155, B1156, B1157, B1159, B1160, and B1188 all indicated with DTC B1905 at the same time?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the immobilizer-keyless control unit .■

DTC Troubleshooting: B1906

DTC B1906:
Immobilizer-Keyless Control Unit Lost Communication with Gauge Control Module (A/T Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1906 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the immobilizer-keyless control unit.■
5. Turn the ignition switch to LOCK (0).
6. Connect the HDS to the data link connector, then turn the ignition switch to ON (II).
7. Select the BODY ELECTRICAL menu, then enter the UNIT INFORMATION.
8. Check the condition of the gauge control module from the CONNECTED UNIT list.

   Is NOT AVAILABLE indicated?
   YES - Go to Step 9 .
   NO - Go to Step 10 .
9. Do the gauge control module input test.

   Are all inputs OK?
   YES - Replace the gauge control module.
   NO - Repair the faulty input, then recheck the DTCs.■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the gauge control module 32P connector.
12. Turn the ignition switch to ON (II).
13. Measure the voltage between the gauge control module 32P connector No. 16 and No. 32 terminals and body ground.

    Is there battery voltage?
    YES - Go to Step 14 .
    NO - Check the No. 1 (10 A) and the No. 20 (15 A) fuses in the under-dash fuse/relay box. If the fuse is blown, replace the fuse and recheck the DTCs. If the fuses are OK, repair an open in the wire between the under-dash fuse/relay box and the gauge control module.■
14. Turn the ignition switch to LOCK (0).

---

15. Check for continuity between the gauge control module 32P connector No. 13 and No. 17 terminals and body ground.

    Is there continuity?
    YES - Go to Step 16 .
    NO - Repair an open in the wire or poor ground (G501).■
16. Disconnect under-dash fuse/relay box connector Q (16P).

---

17. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and the gauge control module 32P connector No. 18 terminal.

    Is there continuity?
    YES - Replace the gauge control module. ■
    NO - Repair an open in the wire.■

DTC Troubleshooting: B1002

DTC B1002:
MICU Internal Error (EEPROM Error)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Is DTC B1002 indicated?

YES - Faulty MICU; replace the under-dash fuse/relay box.■

NO - Intermittent failure, the MICU is OK at this time. Check for loose or poor connections. If the connections are good, check the battery condition and the charging system.■

DTC Troubleshooting: B1011

DTC B1011:
MICU Lost Communication with Gauge Control Module (VSP/NE Message)
NOTE: Before troubleshooting, check the No. 1 (10 A) fuse in the under-dash fuse/relay box and No. 22 (7.5 A) fuse in the under-dash fuse/relay box.

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTCs B1011 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the gauge control module is OK at this time. Check for loose or poor connections between the gauge control module and under-dash fuse/relay box connector Q (16P). If the connections are good, check the battery condition and the charging system.■
5. Check for DTCs with the HDS.

   Are DTCs B1000 and B1011 all indicated?
   YES - Go to DTC troubleshooting B1000.
   NO - Go to Step 6 .
6. Select the BODY ELECTRICAL system select menu, then enter the UNIT INFORMATION menu.
7. Check the condition of the gauge control module from the CONNECTED UNIT.

   Is NOT AVAILABLE indicated?
   YES - Go to Step 8 .
   NO - Replace the gauge control module. ■
8. Turn the ignition switch to LOCK (0).
9. Disconnect the gauge control module 32P connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the gauge control module 32P connector No. 16 and No. 32 terminals and body ground individually.

    Is there battery voltage?
    YES - Go to Step 12 .
    NO - Repair an open in the wire.■
12. Turn the ignition switch to LOCK (0).

---

13. Check for continuity between the gauge control module 32P connector No. 13 and No. 17 terminals and body ground individually.

    Is there battery voltage?
    YES - Go to Step 14 .
    NO - Repair an open in the wire poor ground (G501).■
14. Disconnect under-dash fuse/relay box connector Q (16P).
15. Disconnect the gauge control module 32P connector.

---

16. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and gauge control module 32P connector No. 18 terminal.

    Is there continuity?
    YES - Replace the gauge control module. ■
    NO - An open in the wire between the MICU and the gauge control module.■

DTC Troubleshooting: B1028

DTC B1028:
Rear Wiper Auto Stop Switch Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Operate the rear window wiper for 15 seconds or more, then turn the rear window wiper switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1028 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check the No. 16 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 6 .
   NO - Replace the fuse and recheck the system.■
6. Disconnect the rear window wiper motor 4P connector.
7. Turn the ignition switch to ON (II).
8. Measure the voltage between the rear window wiper motor 4P connector No. 1 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 9 .
   NO - Repair an open in the wire between the under-dash fuse/relay box and rear window wiper motor.■

---

9. Check for continuity between the rear window wiper motor 4P connector No. 4 terminal and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair an open in the wire between the No. 4 terminal of the rear window wiper motor 4P connector and body ground (G602) [G604].■
   [ ]: LHD model
10. Do the rear window wiper motor test.

    Is the rear window wiper motor OK?
    YES - Go to Step 11 .
    NO - Replace the rear window wiper motor.■
11. Disconnect under-dash fuse/relay box connector C.

---

12. Measure the voltage between the rear window wiper motor 4P connector No. 3 terminal and body ground.

    Is there battery voltage?
    YES - Repair a short to power in the wire between the rear window wiper motor and under-dash fuse/relay box.■
    NO - Go to Step 13 .

---

13. Check for continuity between the rear window wiper motor 4P connector No. 3 terminal and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire between the rear window wiper motor and under-dash fuse/relay box.■
    NO - Go to Step 14 .

---

14. Check for continuity between under-dash fuse/relay box connector C (49P) No. 29 terminal and the rear window wiper rear window wiper motor 4P connector No. 3 terminal.
    NOTE: The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

    Is there continuity?
    YES - Faulty MICU, replace the under-dash fuse/relay box. ■
    NO - Repair an open in the wire between the rear window wiper motor and under-dash fuse/relay box.■

DTC Troubleshooting: B1036

DTC B1036:
IG1 Power Supply Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1036 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connection at the gauge control module 32P connector, and at under-dash fuse/relay box connector Q (16P). If the connections are good, check the battery condition and the charging system.■

5. Measure the voltage between the gauge control module 32P connector No. 32 terminal and body ground.

   Is there battery voltage?
   YES - Faulty MICU or an open in the under-dash fuse/relay box internal circuit. Substitute a known-good under-dash fuse/relay box and recheck.■
   NO - Check for No. 22 (7.5 A) in the under-dash fuse/relay box. If the fuse is OK, check for an open in the wire between the under-dash fuse/relay box and the gauge control module, or repair a short in the wire between the under-dash fuse/relay box and the gauge control module.■

DTC Troubleshooting: B1077

DTC B1077:
Windshield Wiper (As) Signal Error

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Turn the windshield wiper switch to LOW or HIGH for 15 seconds or more, then turn the switch OFF.

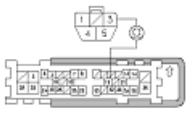
   Does the wiper motor work?
   YES - Go to Step 4 .
   NO - Go to Step 13 .
4. Check for DTCs with the HDS.

   Is DTC B1077 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the windshield wiper system is OK at this time. Check for loose or poor connections.■
5. Turn the ignition switch to LOCK (0).
6. Do the wiper motor test.

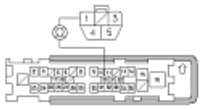
   Does the wiper motor run and does it pulse normally?
   YES - Go to Step 7 .
   NO - Replace the windshield wiper motor and recheck.■
7. Disconnect the windshield wiper motor 5P connector.
8. Disconnect the under-dash fuse/relay box connector A (36P) [B (36P)].
   [ ]: LHD model
9. Check for continuity between the windshield wiper motor 5P connector No. 3 [No. 1] terminal and under-dash fuse/relay box connector A (36P) No. 19 terminal or under-dash fuse/relay box connector B (36P) No. 20 terminal.
   [ ]: LHD model

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair an open in the PNK wire.■

RHD model



LHD model



10. Check for continuity between the windshield wiper motor 5P connector No. 3 [No. 1] terminal and body ground.
    [ ]: LHD model

    Is there continuity?
    YES - Repair a short to ground in the PNK wire.■
    NO - Go to Step 11 .
11. Turn the ignition switch to ON (II).

RHD model

LHD model

12. Measure the voltage between the windshield wiper motor 5P connector No. 3 [No. 1] terminal and body ground.
    [ ]: LHD model

    Is there voltage?
    YES - Repair a short to ground in the PNK wire.■
    NO - Faulty MICU; replace the under-dash fuse/relay box.■
13. Turn the ignition switch to LOCK (0).
14. Check the No. 56 (30 A) fuse in the under-dash fuse/relay box.

    Is the fuse OK?
    YES - Go to Step 15 .
    NO - Replace the fuse and recheck the system.■
15. Do the wiper motor test.

    Does the wiper motor run normally?
    YES - Go to Step 16 .
    NO - Replace the windshield wiper motor and recheck.■
16. Disconnect under-dash fuse/relay box connector A (36P) and the windshield wiper motor 5P connector.

RHD model

LHD model

17. Check for continuity between under-dash fuse/relay box connector A (36P) terminals and the windshield wiper motor 5P connector terminals as shown:

Under-dash fuse/relay box connector A (36P)	Windshield wiper motor 5P connector
7	1 [5]
14	4 [3]

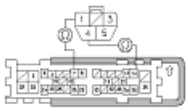
[ ]: LHD model

Is there continuity?

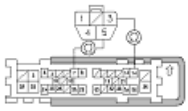
YES - Go to Step 18 .

NO - Repair an open in the BLU (LOW) or GRN (HIGH) wire.■

RHD model



LHD model



---

18. Check for continuity between the windshield wiper motor 5P connector No. 5 [No. 4] terminal and body ground.
[ ]: LHD model

Is there continuity?

YES - Faulty MICU; replace the under-dash fuse/relay box. ■

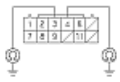
NO - Repair an open in the BLK wire or poor ground (G202).■

RHD model

LHD model

DTC Troubleshooting: B1127

DTC B1127:
Driver's Door Key Cylinder Switch Input Circuit Malfunction (Simultaneous input of lock and unlock signal)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Insert the ignition key into the driver's door key cylinder switch, and turn the key to the LOCK and UNLOCK positions 10 times.
4. Check for DTCs with the HDS.

   Is DTC B1127 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the driver's door key cylinder switch system is OK at this time. Check for loose or poor connections.■
5. With the driver's door key cylinder in the neutral position, select KEYLESS with the HDS, and enter the DATA LIST.
6. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) and DRIVER'S DOOR KEY CYLINDER SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?
   YES - Check the wires for continuity between the under-dash fuse/relay box and driver's door key cylinder switch. If there is continuity, the MICU is faulty. Replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Disconnect the driver's door lock actuator 10P connector.
8. Check the ON/OFF information of the DRIVER'S DOOR KEY CYLINDER SWITCH (LOCK) and DRIVER'S DOOR KEY CYLINDER SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?
   YES - Faulty driver's door key cylinder switch; replace the driver's door lock actuator.■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Disconnect under-dash fuse/relay box connector E (12P).
11. Check for continuity between the No. 4 (UNLOCK) and No. 3 (LOCK) terminals of under-dash fuse/relay box connector E (12P) and body ground individually.

    Is there continuity?
    YES - Repair a short to ground in the LOCK or UNLOCK wire.■
    NO - Go to Step 12 .

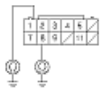
---

12. Check for continuity between the No. 4 (UNLOCK) and No. 3 (LOCK) terminals of under-dash fuse/relay box connector E (12P).

    Is there continuity?
    YES - Repair a short in the wire between the LOCK and UNLOCK wires.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■

DTC Troubleshooting: B1128

DTC B1128:
Driver's Door Remote Switch Input Circuit Malfunction (Simultaneous input of lock and unlock signal)



1. Clear the DTCs with the HDS.
2. Lock and unlock the driver's door with the driver'sdoor lock switch.
3. Check for DTCs with the HDS.

   Is DTC B1128 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the driver's door lock switch system is OK at this time. Check for loose or poor connections.■
4. With the driver's door lock switch in the neutral position, select KEYLESS from the HDS and enter the DATA LIST.
5. Check the ON/OFF information of the DRIVER'S DOOR LOCK SWITCH (LOCK) and DRIVER'S DOOR LOCK SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?
   YES - Check the wires for continuity between the under-dash fuse/relay box and driver's door key cylinder switch. If there is continuity, the MICU is faulty. Replace the under-dash fuse/relay box.■
   NO - Go to Step 6 .
6. Disconnect the power window master switch connector.
7. Check the ON/OFF information of the DRIVER'S DOOR LOCK SWITCH (LOCK) and DRIVER'S DOOR LOCK SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?
   YES - Faulty door lock switch; replace the power window master switch.■
   NO - Go to Step 8 .
8. Turn the ignition switch to LOCK (0).
9. Disconnect under-dash fuse/relay box connector E (12P).
10. Check for continuity between the No. 8 (LOCK) and No. 1 (UNLOCK) terminals of under-dash fuse/relay box connector E (12P) and body ground individually.

    Is there continuity?
    YES - Repair a short to ground in the LOCK or UNLOCK wire.■
    NO - Go to Step 11 .

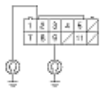
---

11. Check for continuity between the No. 8 (LOCK) and No. 1 (UNLOCK) terminals of under-dash fuse/relay box connector E (12P).

    Is there continuity?
    YES - Repair a short in the wire between the LOCK and UNLOCK wires.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■

DTC Troubleshooting: B1129

DTC B1129:
Driver's Door Lock Knob Switch Input Circuit Malfunction (Simultaneous input of lock and unlock signal)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate the driver's door lock knob switch several times.
4. Check for DTCs with the HDS.

   Is DTC B1129 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the driver's door lock knob switch is OK at this time. Check for loose or poor connections.■
5. Select KEYLESS from the BODY ELECTRICAL menu, and enter the DATA LIST.
6. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK).

   Are the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) information indicator ON and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator OFF with the driver's door lock knob switch in LOCK position, and are the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) information indicator OFF and the DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) information indicator ON with the driver's door lock knob switch in UNLOCK position?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Disconnect the driver's door lock actuator 10P connector.
8. Check the ON/OFF information of the DRIVER'S DOOR LOCK KNOB SWITCH (LOCK) and DRIVER'S DOOR LOCK KNOB SWITCH (UNLOCK) in the DATA LIST.

   Are both information indicators OFF?
   YES - Check for an open in the driver's door lock knob switch (LOCK) wire or the driver's door lock knob switch (UNLOCK) wire between the MICU and the driver's door lock knob switch. If OK, replace the driver's door lock actuator.■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Disconnect under-dash fuse/relay box connector E (12P).
11. Check for continuity between the No. 2 (UNLOCK) and No. 9 (LOCK) terminals of under-dash fuse/relay box connector E (12P) and body ground individually.

    Is there continuity?
    YES - Repair a short to ground in the LOCK or UNLOCK wire.■
    NO - Go to Step 12 .

---

12. Check for continuity between the No. 2 (UNLOCK) and No. 9 (LOCK) terminals of under-dash fuse/relay box connector E (12P).

    Is there continuity?
    YES - Repair a short in the wire between the LOCK wire and UNLOCK wire.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■

DTC Troubleshooting: B1275

DTC B1275:
Headlight OFF Position Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each combination light switch position, then turn the combination light switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1275 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select LIGHTING from the BODY ELECTRICAL system select menu.
6. Check each combination light switch position value with the DATA LIST menu.

   When the combination light switch turns OFF:

Data List	Value
Headlight Switch (OFF)	ON
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns SMALL:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns ON (headlight):

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	ON

   Are all data list values correct?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch ON (II).
10. Select LIGHTING from the BODY ELECTRICAL system select menu.
11. Check each combination light switch position value with the DATA LIST menu.

    When the combination light switch is OFF:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

    Are all data list values indicated OFF?
    YES - Go to Step 15 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 5, No. 7, and No. 8 terminals and body ground individually.

    Is there continuity?

YES - Repair a short to ground in the wire.■
NO - Faulty MICU, replace the under-dash fuse/relay box. ■

15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

Is the combination light switch OK?
YES - Go to Step 17 .
NO - Replace the combination light switch.■

17. Disconnect under-dash fuse/relay box connector M (34P).

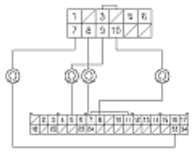
---

18. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the combination light switch 12P connector terminals as shown:

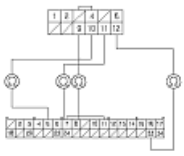
Under-dash fuse/relay box connector M (34P)	Combination light switch 12P connector
5	9 [10]
7	8 [11]
8	10[9]
33	7[12]

[ ]: LHD model

RHD model



LHD model



Is there continuity?
YES - Faulty MICU, replace the under-dash fuse/relay box. ■
NO - Repair an open in the wire.■

DTC Troubleshooting: B1276

DTC B1276:
Headlight SMALL Position Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each combination light switch position, then turn the combination light switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1276 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select LIGHTING from the BODY ELECTRICAL system select menu.
6. Check each combination light switch position value with the DATA LIST menu.

   When the combination light switch turns OFF:

Data List	Value
Headlight Switch (OFF)	ON
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns SMALL:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns ON (headlight):

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	ON

   Are all data list values correct?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II).
10. Select LIGHTING from the BODY ELECTRICAL system select menu.
11. Check each combination light switch position value with the DATA LIST menu.

    When the combination light switch is OFF:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

    Are all data list values indicated OFF?
    YES - Go to Step 15 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 5, No. 7, and No. 8 terminals and body ground individually.

    Is there continuity?

YES - Repair a short to ground in the wire.■
NO - Faulty MICU, replace the under-dash fuse/relay box. ■

15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

Is the combination light switch OK?
YES - Go to Step 17 .
NO - Replace the combination light switch.■

17. Disconnect under-dash fuse/relay box connector M (34P).

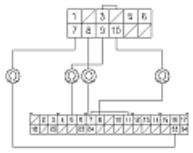
---

18. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the combination light switch 12P connector terminals as shown:

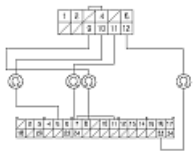
Under-dash fuse/relay box connector M (34P)	Combination light switch 12P connector
5	9 [10]
7	8 [11]
8	10[9]
33	7[12]

[ ]: LHD model

RHD model



LHD model



Is there continuity?
YES - Faulty MICU, replace the under-dash fuse/relay box. ■
NO - Repair an open in the wire.■

DTC Troubleshooting: B1278

DTC B1278:
Headlight ON Position Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each combination light switch position, then turn the combination light switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1278 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select LIGHTING from the BODY ELECTRICAL system select menu.
6. Check each combination light switch position value with the DATA LIST menu.

   When the combination light switch turns OFF:

Data List	Value
Headlight Switch (OFF)	ON
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns SMALL:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	OFF

   When the combination light switch turns ON (headlight):

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	ON
Headlight Switch (HEADLIGHT)	ON

   Are all data list values correct?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II).
10. Select LIGHTING from the BODY ELECTRICAL system select menu.
11. Check each combination light switch position value with the DATA LIST menu.

    When the combination light switch is OFF:

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (PARKING)	OFF
Headlight Switch (HEADLIGHT)	OFF

    Are all data list values indicated OFF?
    YES - Go to Step 15 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 5, No. 7, and No. 8 terminals and body ground individually.

    Is there continuity?

YES - Repair a short to ground in the wire.■
NO - Faulty MICU, replace the under-dash fuse/relay box. ■

15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

Is the combination light switch OK?
YES - Go to Step 17 .
NO - Replace the combination light switch.■

17. Disconnect under-dash fuse/relay box connector M (34P).

---

18. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the combination light switch 12P connector terminals as shown:

Under-dash fuse/relay box connector M (34P)	Combination light switch 12P connector
5	9 [10]
7	8 [11]
8	10[9]
33	7[12]

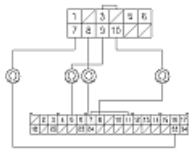
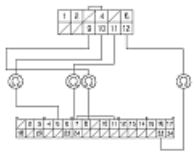
RHD model



LHD model



Is there continuity?
YES - Faulty MICU, replace the under-dash fuse/relay box. ■
NO - Repair an open in the wire.■

DTC Troubleshooting: B1279

DTC B1279:
Dimmer Switch Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Turn the combination light (headlight) switch ON.
4. Change the dimmer switch from low beam to high beam.
5. Turn the combination light switch OFF and then to the passing position.
6. Check for DTCs with the HDS.

   Is DTC B1279 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
7. Select LIGHTING from the BODY ELECTRICAL system select menu, then enter the DATA LIST.
8. Check each combination light switch position value with the DATA LIST menu.

   When the passing switch is operated

Data List	Value
Headlight Switch (PASSING)	ON
Headlight Switch (High beam)	OFF

   When the headlight switch is turned ON, and the dimmer switch changed from low beam to high beam

Data List	Value
Headlight Switch (PASSING)	OFF
Headlight Switch (High beam)	ON
Headlight Switch (HEADLIGHT)	ON

   Are all data list values correct?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Disconnect the combination light switch 12P connector.
11. Turn the ignition switch to ON (II).
12. Select LIGHTING from the BODY ELECTRICAL system select menu, then enter the DATA LIST.
13. Check each combination light switch position value with the DATA LIST menu.

    When the combination light switch is turned OFF

Data List	Value
Headlight Switch (PASSING)	OFF
Headlight Switch (High beam)	OFF
Headlight Switch (HEADLIGHT)	OFF

    Are all data list values indicated OFF?
    YES - Go to Step 17 .
    NO - Go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Disconnect under-dash fuse/relay box connector M (34P).
16. Check for continuity between under-dash fuse/relay box connector M (34P) No. 3, No. 4, and No. 5 terminals and body ground individually.

    Is there continuity?
    YES - Repair a short to ground in the wire.■
    NO - Faulty MICU; replace the under-dash fuse/relay box. ■
17. Turn the ignition switch to LOCK (0).

18. Do the combination light switch test.

Is the combination light switch OK?
YES - Go to Step 19 .
NO - Replace the combination light switch.■

19. Disconnect under-dash fuse/relay box connector M (34P).

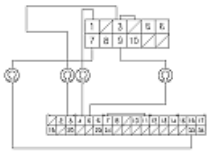
---

20. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the combination light switch 12P connector terminals as shown:

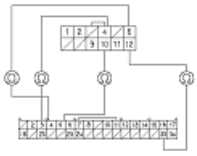
Under-dash fuse/relay box connector M (34P)	Combination light switch 12P connector
3	3 [4]
4	1 [6]
5	9 [10]
33	7 [12]

[ ]: LHD model

RHD model



LHD model



Is there continuity?
YES - Go to Step 21 .
NO - Repair an open in the wire.■

21. Check for continuity between under-dash fuse/relay box connector M (34P) terminals as shown:

From terminal	To terminal
5	3, 4, 7, 8
7	3, 4, 8
8	3, 4

Is there continuity?
YES - Repair a short between the wires.■
NO - Faulty MICU; replace the under-dash fuse/relay box. ■

DTC Troubleshooting: B1280

DTC B1280:
Turn Signal Switch Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Operate the turn signal switch in left and right positions.
4. Check for DTCs with the HDS.

   Is DTC B1280 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select LIGHTING from the BODY ELECTRICAL system select menu, then enter the DATE LIST.
6. Check each combination light switch position value with the DATA LIST menu.

   When the turn signal switch is in left position:

Data List	Value
Turn Signal Switch (LEFT)	ON
Turn Signal Switch (RIGHT)	OFF

   When the turn signal switch is in right position:

Data List	Value
Turn Signal Switch (LEFT)	OFF
Turn Signal Switch (RIGHT)	ON

   Are all data list values correct?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II).
10. Select the BODY ELECTRICAL system select menu, then enter the LIGHTING SYSTEM.
11. Check each combination light switch position value with the DATA LIST menu.

    When the turn signal switch is in neutral position:

Data List	Value
Turn Signal Switch (LEFT)	OFF
Turn Signal Switch (RIGHT)	OFF

    Are both data list values indicated OFF?
    YES - Go to Step 15 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 2 and No. 6 terminals and body ground individually.

    Is there continuity?
    YES - Repair a short to ground in the wire.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■
15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

    Is the combination light switch OK?
    YES - Go to Step 17 .
    NO - Replace the combination light switch.■
17. Disconnect under-dash fuse/relay box connector M (34P).

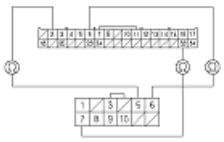
18. Check for continuity between under-dash fuse/relay box connector M (34P) No. 2, No. 6, and No. 33 terminals and the combination light switch 12P connector No. 5 [No. 2], No. 6 [No. 1], and No. 7 [No. 12] terminals.
[ ]: LHD model

Is there continuity?

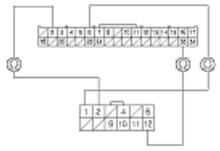
YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Repair an open in the wire.■

RHD model

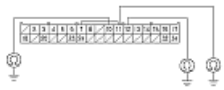


LHD model



DTC Troubleshooting: B1281

DTC B1281:
Front Wiper MIST Position Circuit Malfunction



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each windshield wiper switch position, then turn the wiper/washer switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1281 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select WIPERS from the BODY ELECTRICAL menu.
6. Check each windshield wiper switch position value with the DATA LIST menu.

   When the windshield wiper switch is OFF:

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

   Are all data list values indicated OFF?
   YES - Go to Step 15 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the wiper/washer switch 8P connector.
9. Turn the ignition switch to ON (II).
10. Select WIPERS from the BODY ELECTRICAL menu.
11. Check each windshield wiper switch position value with the DATA LIST menu.

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

    Are all data list values indicated OFF?
    YES - Replace the wiper/washer switch.■
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (24P) No. 10, No. 11, and No. 12 terminals and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■
15. Check each windshield wiper switch position value with the DATA LIST menu.

    When the windshield wiper switch is ON (LOW):

Data List	Value
Windshield Wiper Switch (LOW)	ON

    When the windshield wiper switch is ON (HIGH):

Data List	Value
Windshield Wiper Switch (HIGH)	ON

When the windshield wiper switch is MIST:

Data List	Value
Windshield Wiper Switch (MIST)	ON

When the windshield wiper switch is INT:

Data List	Value
Windshield Wiper Switch (INT)	ON

Are all data list values correct?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Go to Step 16 .

16. Turn the ignition switch to LOCK (0).
17. Do the wiper/washer switch test.

Is the wiper/washer switch OK?

YES - Go to Step 18 .

NO - Replace the wiper/washer switch.■

18. Disconnect under-dash fuse/relay box connectors M (34P) and Q (16P).

---

19. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the windshield wiper/wash switch 8P connector terminals as shown:

Under-dash fuse/relay box connector M (34P)	Windshield wiper/wash switch 8P connector
10	3 [4]

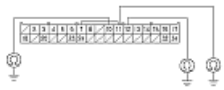
Is there continuity?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Repair an open in the wire.■

DTC Troubleshooting: B1282

DTC B1282:
Front Wiper INT Position Circuit Malfunction



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each windshield wiper switch position, then turn the wiper/washer switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1282 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select WIPERS from the BODY ELECTRICAL menu.
6. Check each windshield wiper switch position value with the DATA LIST menu.

   When the windshield wiper switch is OFF:

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

   Are all data list values indicated OFF?
   YES - Go to Step 15 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the wiper/washer switch 8P connector.
9. Turn the ignition switch to ON (II).
10. Select the BODY ELECTRICAL system select menu, then enter the WIPERS.
11. Check each windshield wiper switch position value with the DATA LIST menu.

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

   Are all data list values indicated OFF?
   YES - Replace the wiper/washer switch.■
   NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 10, No. 11, and No. 12 terminals and body ground.

   Is there continuity?
   YES - Repair a short to ground in the wire.■
   NO - Faulty MICU, replace the under-dash fuse/relay box. ■
15. Check each windshield wiper switch position value with the DATA LIST menu.

   When the windshield wiper switch is ON (LOW):

Data List	Value
Windshield Wiper Switch (LOW)	ON

   When the windshield wiper switch is ON (HIGH):

Data List	Value
Windshield Wiper Switch (HIGH)	ON

When the windshield wiper switch is MIST:

Data List	Value
Windshield Wiper Switch (MIST)	ON

When the windshield wiper switch is INT:

Data List	Value
Windshield Wiper Switch (INT)	ON

Are all data list values correct?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Go to Step 16 .

16. Turn the ignition switch to LOCK (0).
17. Do the wiper/washer switch test.

Is the wiper/washer switch OK?

YES - Go to Step 18 .

NO - Replace the wiper/washer switch.■

18. Disconnect under-dash fuse/relay box connectors M (34P) and Q (16P).

---

19. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the windshield wiper/washer switch 8P connector terminals as shown:

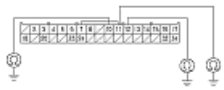
Is there continuity?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Repair an open in the wire.■

DTC Troubleshooting: B1283

DTC B1283:
Front Wiper LOW Position Circuit Malfunction



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each windshield wiper switch position, then turn the wiper/washer switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1283 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select WIPER from the BODY ELECTRICAL menu.
6. Check each windshield wiper switch position value with the DATA LIST menu.

   When the windshield wiper switch is OFF:

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

   Are all data list values indicated OFF?
   YES - Go to Step 15 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the wiper/washer switch 8P connector.
9. Turn the ignition switch to ON (II).
10. Select WIPER from the BODY ELECTRICAL menu.
11. Check each windshield wiper switch position value with the DATA LIST menu.

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

    Are all data list values indicated OFF?
    YES - Replace the wiper/washer switch.■
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 10, No. 11, and No. 12 terminals and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■
15. Check each windshield wiper switch position value with the DATA LIST menu.

    When the windshield wiper switch is ON (LOW):

Data List	Value
Windshield Wiper Switch (LOW)	ON

    When the windshield wiper switch is ON (HIGH):

Data List	Value
Windshield Wiper Switch (HIGH)	ON

When the windshield wiper switch is MIST:

Data List	Value
Windshield Wiper Switch (MIST)	ON

When the windshield wiper switch is INT:

Data List	Value
Windshield Wiper Switch (INT)	ON

Are all data list values correct?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Go to Step 16 .

16. Turn the ignition switch to LOCK (0).
17. Do the wiper/washer switch test.

Is the wiper/washer switch OK?

YES - Go to Step 18 .

NO - Replace the wiper/washer switch.■

18. Disconnect under-dash fuse/relay box connectors M (34P) and Q (16P).

---

19. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the windshield wiper/washer switch 8P connector terminals as shown:

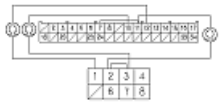
Under-dash fuse/relay box connector M (34P)	Windshield wiper/washer switch 8P connector
10	3 [4]
11	2
12	1 [3]

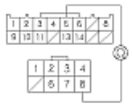
[ ]: LHD model

Under-dash fuse/relay box connector Q (16P)	Windshield wiper/washer switch 8P connector
5	8 [5]

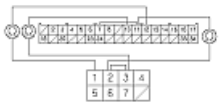
[ ]: LHD model

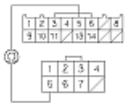
RHD model





LHD model





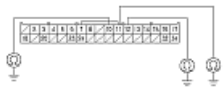
Is there continuity?

YES - Faulty MICU, replace the under-dash fuse/relay box. ■

NO - Repair an open in the wire.■

DTC Troubleshooting: B1284

DTC B1284:
Front Wiper HIGH Position Circuit Malfunction



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Operate each windshield wiper switch position, then turn the wiper/washer switch OFF.
4. Check for DTCs with the HDS.

   Is DTC B1284 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select WIPERS from the BODY ELECTRICAL menu.
6. Check each windshield wiper switch position value with the DATA LIST menu.

   When the windshield wiper switch is OFF:

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

   Are all data list values indicated OFF?
   YES - Go to Step 15 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the wiper/washer switch 8P connector.
9. Turn the ignition switch to ON (II).
10. Select WIPERS from the BODY ELECTRICAL menu.
11. Check each windshield wiper switch position value with the DATA LIST menu.

Data List	Value
Windshield Wiper Switch (LOW)	OFF
Windshield Wiper Switch (HIGH)	OFF
Windshield Wiper Switch (MIST)	OFF
Windshield Wiper Switch (INT)	OFF

    Are all data list values indicated OFF?
    YES - Replace the wiper/washer switch.■
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between under-dash fuse/relay box connector M (34P) No. 10, No. 11, and No. 12 terminals and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■
15. Check each windshield wiper switch position value with the DATA LIST menu.

    When the windshield wiper switch is ON (LOW):

Data List	Value
Windshield Wiper Switch (LOW)	ON

    When the windshield wiper switch is ON (HIGH):

Data List	Value
Windshield Wiper Switch (HIGH)	ON

When the windshield wiper switch is MIST:

Data List	Value
Windshield Wiper Switch (MIST)	ON

When the windshield wiper switch is INT:

Data List	Value
Windshield Wiper Switch (INT)	ON

Are all data list values correct?
YES - Faulty MICU, replace the under-dash fuse/relay box. ■
NO - Go to Step 16 .

16. Turn the ignition switch to LOCK (0).
17. Do the wiper/washer switch test.

Is the wiper/washer switch OK?
YES - Go to Step 18 .
NO - Replace the wiper/washer switch.■

18. Disconnect under-dash fuse/relay box connectors M (34P) and Q (16P).

---

19. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the windshield wiper/washer switch 8P connector terminals as shown:

Under-dash fuse/relay box connector M (34P)	Windshield wiper/washer switch 8P connector
10	3 [4]
11	2
12	1 [3]

[ ]: LHD model

Under-dash fuse/relay box connector Q (16P)	Windshield wiper/washer switch 8P connector
5	8 [5]

[ ]: LHD model

Is there continuity?
YES - Faulty MICU, replace the under-dash fuse/relay box. ■
NO - Repair an open in the wire.■

How to Troubleshoot the SRS

DTC (Diagnostic Trouble Codes)

The self-diagnostic function of the SRS system allows it to locate the causes of system problems and then store this information in memory. For easier troubleshooting, this data can be retrieved via a data link circuit.

- When you turn the ignition switch to ON (II), the SRS indicator should come on. If it goes off after 6 seconds, the system is normal, and is not currently detecting any abnormality.
- If there is an abnormality, the system locates and defines the problem, stores this information in memory, and turns the SRS indicator on. The data remains in the memory even when the ignition switch is turned to LOCK (0) or if the battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator goes off the next time the ignition switch is turned to ON (II) and the system is normal, but the DTC is still stored. With latching DTCs, the SRS indicator does not turn OFF until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the 16P data link connector (DLC), you can retrieve a more detailed DTC in the Honda Systems ‘‘SRS" menu.
- After reading and recording the DTC, proceed with the troubleshooting procedure for that code.

Precautions

- Use only a digital multimeter to check the system. Make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the ignition switch is in ON (II), or has been turned to LOCK (0) for less than 3 minutes, be careful not to bump the SRS unit; the airbags could accidentally deploy and cause damage or injuries.
- Before you remove the dashboard wire harness or floor wire harness, disconnect the driver's airbag connector, the front passenger's airbag connector, both side airbag connectors, both side curtain airbag connectors, and both seat belt tensioner connectors.
- Make sure the battery is fully charged. If the battery is dead or low, measuring values may not be correct.
- Do not touch a tester probe to the terminals in the SRS unit or harness connectors, and do not connect the SRS unit terminals or the sensor terminals or the sensor terminals with a jumper wire. Use only the backprobe set and the multimeter. Backprobe spring-loaded lock type connectors correctly.

Reading the DTC

1. Make sure the ignition switch is to LOCK (0).
2. Connect the HDS to the data link connector (DLC) (A).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
5. Use the HDS to check for SRS DTCs.
6. Read and record the DTC.
7. Turn the ignition switch to LOCK (0).
8. Disconnect the HDS from the DLC.
9. Do the troubleshooting procedure for the DTC.

Clear the DTC Memory With the HDS

NOTE: Make sure the battery is fully charged before you begin.

1. Make sure the ignition switch is to LOCK (0).
2. Connect the HDS to the data link connector (DLC) (A).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit.
5. In the SRS MENU of the HDS, select SRS, then DTC to clear DTC(s).
6. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
7. Disconnect the HDS from the DLC.

Troubleshooting Intermittent Failures

If there was a malfunction that sets a DTC, but it does not recur, it will be stored in the memory as an intermittent failure, and the SRS indicator may come on depending on the malfunction detected.
NOTE:

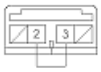
- Check the condition of the battery, and the charging system. Low battery voltage may cause some intermittent failures.
- A faulty cable reel can cause intermittent connections related to the driver's airbag inflator DTCs.

After checking the DTC, troubleshoot as follows:

1. Read the DTC (see Reading the DTC).
2. Clear the DTC memory (see Clear the DTC Memory).
3. Set the parking brake, then start the engine, and let it idle.
4. The SRS indicator comes on for about 6 seconds and then goes off.
5. Shake the related wire harnesses and the connectors, then look for loose connections, and poor grounds.
6. Take a test-drive (quick acceleration, quick braking, and cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.
7. If you cannot duplicate the concern, ask the customer about the conditions when it occurred, or ask the customer to demonstrate the concern.
8. If you cannot duplicate the intermittent failure, the system is OK at this time.

SRS DTC Troubleshooting: 21-1x, 21-2x

DTC 21-1x ("x" can be 0 thru 9 or A thru F):
Open in the Left Side Seat Belt Tensioner
DTC 21-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Left Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

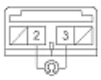
   Is DTC 21-1x or 21-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 4P connector from the left side seat belt tensioner.
7. Install a jumper wire between the No. 2 and the No. 3 terminals of the floor wire harness 4P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 21-1x or 21-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty left side seat belt tensioner; replace the left side seat belt tensioner. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 4P connector.
15. Disconnect SRS unit connector B (39P) from the SRS unit.

16. Install a jumper wire between the No. 12 and the No. 13 terminals of SRS unit connector B (39P).

17. Check for continuity between the No. 2 and the No. 3 terminals of floor wire harness 4P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.■



SRS DTC Troubleshooting: 21-3x

DTC 21-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Left Side Seat Belt Tensioner
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

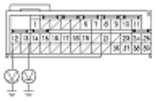
   Is DTC 21-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 4P connector from the left side seat belt tensioner.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 21-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty left side seat belt tensioner; replace the left side seat belt tensioner. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect SRS unit connector B (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to No. 12 and No. 13 terminals of the SRS unit connector B (39P).
15. Measure the resistance between the No. 12 and No. 13 terminals of SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 21-8x

DTC 21-8x (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Left Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 21-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 12 and the No. 13 terminals of SRS unit connector A (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 12 and the No. 13 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the floor wire harness 4P connector from the left side seat belt tensioner.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

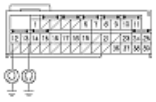
---

16. Measure the voltage between the No. 12 and the No. 13 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty left side seat belt tensioner; replace the left side seat belt tensioner. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 21-9x

DTC 21-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Left Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 21-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 12 and the No. 13 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the floor wire harness 4P connector from the left side seat belt tensioner.

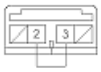
---

9. Check for continuity between the No. 12 and the No. 13 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty left side seat belt tensioner; replace the left side seat belt tensioner. ■

SRS DTC Troubleshooting: 22-1x, 22-2x

DTC 22-1x ("x" can be 0 thru 9 or A thru F):
Open in the Right Side Seat Belt Tensioner
DTC 22-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Right Side Seat Belt Tensioner
NOTE:



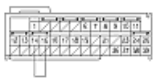
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 22-1x or 22-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 4P connector from the right side seat belt tensioner.
7. Install a jumper wire between the No. 2 and the No. 3 terminals of the floor wire harness 4P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

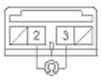
    Is DTC 22-1x or 22-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty right side seat belt tensioner; replace the right side seat belt tensioner. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 4P connector.
15. Disconnect SRS unit connector B (39P) from the SRS unit.

16. Install a jumper wire between the No. 14 and the No. 15 terminals of SRS unit connector B (39P).



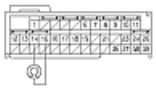
17. Check for continuity between the No. 2 and the No. 3 terminals of floor wire harness 4P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.■



SRS DTC Troubleshooting: 22-3x

DTC 22-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Right Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

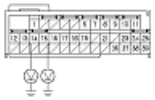
   Is DTC 22-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 4P connector from the right side seat belt tensioner.
7. Read the DTC.

   Is DTC 22-3x indicated?
   YES - Go to Step 8 .
   NO - Faulty right side seat belt tensioner; replace the right side seat belt tensioner. ■
8. Turn the ignition switch to LOCK (0).
9. Do the battery terminal disconnection procedure , then wait for 3 minutes.
10. Disconnect SRS unit connector B (39P) from the SRS unit.
11. Connect an SRS short canceller (070AZ-SAA0100) to No. 14 and No. 15 terminals of the SRS unit connector B (39P).
12. Measure the resistance between the No. 14 and No. 15 terminals of SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 22-8x

DTC 22-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Right Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 22-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 14 and the No. 15 terminals of SRS unit connector B (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 14 and the No. 15 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the floor wire harness 4P connector from the right side seat belt tensioner.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

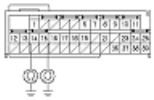
---

16. Measure the voltage between the No. 14 and the No. 15 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty right side seat belt tensioner; replace the right side seat belt tensioner. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 22-9x

DTC 22-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Right Side Seat Belt Tensioner
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 22-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 14 and the No. 15 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the floor wire harness 4P connector from the right side seat belt tensioner.

---

9. Check for continuity between the No. 14 and the No. 15 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty right side seat belt tensioner; replace the right side seat belt tensioner. ■

SRS DTC Troubleshooting: 31-1x, 31-2x

DTC 31-1x ("x" can be 0 thru 9 or A thru F):
Open in the Left Side Airbag Inflator
DTC 31-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Left Side Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 31-1x or 31-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the left side airbag.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of floor wire harness 2P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 31-1x or 31-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty left side airbag; replace the left side airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 2P connector.
15. Disconnect SRS unit connector B (39P) from the SRS unit.

---

16. Install a jumper wire between the No. 6 and the No. 7 terminals of SRS unit connector B (39P).

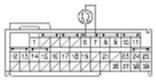
---

17. Check for continuity between the No. 1 and the No. 2 terminals of floor wire harness 2P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 31-3x

DTC 31-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Left Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

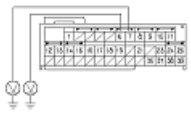
   Is DTC 31-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the left side airbag.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 31-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty left side airbag; replace the left side airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect SRS unit connector B (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to No. 6 and No. 7 terminals of the SRS unit connector B (39P).
15. Measure the resistance between the No. 6 and No. 7 terminals of SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 31-8x

DTC 31-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Left Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 31-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 6 and the No. 7 terminals of SRS unit connector B (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 6 and the No. 7 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the floor wire harness 2P connector from the left side airbag.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

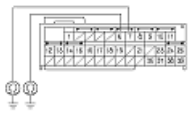
---

16. Measure the voltage between the No. 6 and the No. 7 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty left side airbag; replace the left side airbag. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 31-9x

DTC 31-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Left Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 31-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 6 and the No. 7 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the floor wire harness 2P connector from the left side airbag.

---

9. Check for continuity between the No. 6 and the No. 7 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty left side airbag; replace the left side airbag. ■

SRS DTC Troubleshooting: 32-1x, 32-2x

DTC 32-1x ("x" can be 0 thru 9 or A thru F):
Open in the Right Side Airbag Inflator
DTC 32-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Right Side Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

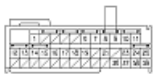
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 32-1x or 32-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the right side airbag.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of the floor wire harness 2P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 32-1x or 32-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty right side airbag; replace the right side airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 2P connector.
15. Disconnect SRS unit connector B (39P) from the SRS unit.

---

16. Install a jumper wire between the No. 8 and the No. 9 terminals of SRS unit connector B (39P).



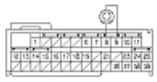
---

17. Check for continuity between the No. 1 and the No. 2 terminals of floor wire harness 2P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or inscreased resistance in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 32-3x

DTC 32-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Right Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

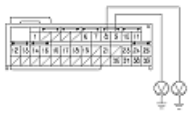
   Is DTC 32-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the right side airbag.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 32-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty right side airbag; replace the right side airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect SRS unit connector B (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to No. 8 and No. 9 terminals of the SRS unit connector B (39P).
15. Measure the resistance between the No. 8 and the No. 9 terminals of SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 32-8x

DTC 32-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Right Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 32-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 8 and the No. 9 terminals of SRS unit connector B (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 8 and the No. 9 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the floor wire harness 2P connector from the right side airbag.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

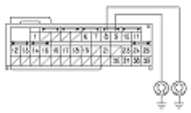
---

16. Measure the voltage between the No. 8 and the No. 9 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty right side airbag; replace the right side airbag. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 32-9x

DTC 32-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Right Side Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 32-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 8 and the No. 9 terminals of floor wire harness 2P connector and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the floor wire harness 2P connector from the right side airbag.

---

9. Check for continuity between the No. 8 and the No. 9 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty right side airbag; replace the right side airbag. ■

SRS DTC Troubleshooting: 33-1x, 33-2x

DTC 33-1x ("x" can be 0 thru 9 or A thru F):
Open in the Left Side Curtain Airbag Inflator
DTC 33-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Left Side Curtain Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 33-1x or 33-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the left side curtain airbag.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of floor wire harness 2P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 33-1x or 33-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty left side curtain airbag; replace the left side curtain airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 2P connector.
15. Disconnect SRS unit connector B (32P) from the SRS unit.

---

16. Install a jumper wire between the No. 10 and the No. 11 terminals of SRS unit connector B (39P).

---

17. Check for continuity between the No. 1 and the No. 2 terminals of floor wire harness 2P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 33-3x

DTC 33-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Left Side Curtain Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

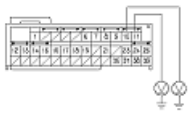
   Is DTC 33-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the left side curtain airbag.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 33-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty left side curtain airbag; replace the left side curtain airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect SRS unit connector B (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to No. 10 and No. 11 terminals of the SRS unit connector B (39P).
15. Measure the resistance between the No. 10 and No. 11 terminals of the SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 33-8x

DTC 33-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Left Side Curtain Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 33-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 10 and the No. 11 terminals of SRS unit connector B (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 10 and the No. 11 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the floor wire harness 2P connector from the left side curtain airbag.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

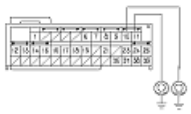
---

16. Measure the voltage between the No. 10 and the No. 11 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty left side curtain airbag; replace the left side curtain airbag. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 33-9x

DTC 33-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Left Side Curtain Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 33-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 10 and the No. 11 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the floor wire harness 2P connector from the left side curtain airbag.

---

9. Check for continuity between the No. 10 and the No. 11 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty left side curtain airbag; replace the left side curtain airbag. ■

SRS DTC Troubleshooting: 34-1x, 34-2x

DTC 34-1x ("x" can be 0 thru 9 or A thru F):
Open in the Right Side Curtain Airbag Inflator
DTC 34-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Right Side Curtain Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 34-1x or 34-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the right side curtain airbag.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of the floor wire harness 2P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 34-1x or 34-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty right side curtain airbag, replace the right side curtain airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure, then wait for 3 minutes.
14. Remove a jumper wire from the floor wire harness 2P connector.
15. Disconnect SRS unit connector B (39P) from the SRS unit.

16. Install a jumper wire between the No. 24 and the No. 25 terminals of SRS unit connector B (39P).

17. Check for continuity between the No. 1 and the No. 2 terminals of the floor wire harness 2P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit . ■
    NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 34-3x

DTC 34-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Right Side Curtain Airbag Inflator
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

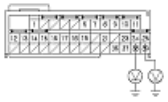
   Is DTC 34-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Disconnect the floor wire harness 2P connector from the right side curtain airbag.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 34-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty right side curtain airbag; replace the right side curtain airbag.
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure, then wait for 3 minutes.
13. Disconnect SRS unit connector B (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to No. 24 and No. 25 terminals of the SRS unit connector B (39P).
15. Measure the resistance between the No. 24 and No. 25 terminals of the SRS unit connector B (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the floor wire harness; replace the floor wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 34-8x

DTC 34-8x (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Right Side Curtain Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 34-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to No. 24 and No. 25 terminals of the SRS unit connector B (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 24 and the No. 25 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure, then wait for 3 minutes.
13. Disconnect the floor wire harness 2P connector from the right side curtain airbag.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

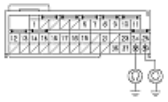
---

16. Measure the voltage between the No. 24 and the No. 25 terminals of SRS unit connector B (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty right side curtain airbag; replace the right side curtain airbag. ■
    NO - Short to power in the floor wire harness; replace the floor wire harness.■

SRS DTC Troubleshooting: 34-9x

DTC 34-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Right Side Curtain Airbag Inflator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 34-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Disconnect SRS unit connector B (39P) from the SRS unit.
7. Check for continuity between the No. 24 and the No. 25 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect floor wire harness 2P connector from the right side curtain airbag.

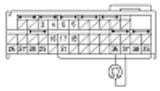
---

9. Check for continuity between the No. 24 and the No. 25 terminals of SRS unit connector B (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the floor wire harness; replace the floor wire harness.■
   NO - Faulty right side curtain airbag; replace the right side curtain airbag. ■

SRS DTC Troubleshooting: 41-1x

DTC 41-1x (“x" can be 0 thru 9 or A thru F):
No Signal From the Left Front Impact Sensor
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 41-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Check the connections between SRS unit connector A (39P) and the SRS unit, between the left engine compartment wire harness 2P connector and the left front impact sensor, and at left engine compartment wire harness 4P connector.

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Connect an SRS short canceller (070AZ-SAA0100) to the No. 36 and the No. 37 terminals of SRS unit connector A (39P).
9. Disconnect the left engine compartment wire harness 2P connector from the left front impact sensor.
10. Measure the resistance between the No. 36 and the No. 37 terminals of SRS unit connector A (39P). There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short in the left engine compartment wire harness or dashboard wire harness; replace the faulty harness.■

---

11. Measure the resistance between the No. 36 terminal of SRS unit connector A (39P) and body ground, and between the No. 37 terminal and body ground. There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 12 .
    NO - Short to ground in the left engine compartment wire harness or dashboard wire harness; replace the faulty harness.■
12. Do the battery terminal reconnection procedure.
13. Turn the ignition switch to ON (II).

---

14. Measure the voltage between the No. 36 terminal of SRS unit connector A (39P) and body ground, and between the No. 37 terminal and body ground. There should be less than 1 V.

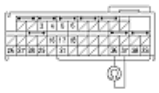
    Is the voltage as specified?
    YES - Go to Step 15 .
    NO - Short to power in the left engine compartment wire harness or dashboard wire harness; replace the faulty harness.■
15. Turn the ignition switch to LOCK (0).
16. Do the battery terminal disconnection procedure.

---

17. Install a jumper wire between the No. 1 and the No. 2 terminals of left engine compartment wire harness 2P connector.

---

18. Measure the resistance between the No. 36 and the No. 37 terminals of SRS unit connector A (39P). There should be less than 1 Ω.



Is the resistance as specified?

YES - Go to Step 19 .

NO - Open in the left engine compartment wire harness or dashboard wire harness; replace the faulty harness.■

19. Substitute a known-good left front impact sensor and recheck.

20. Connect SRS unit connector A (39P) to the SRS unit.

21. Clear the DTC memory.

22. Turn the ignition switch to ON (II), then wait for 10 seconds.

23. Read the DTC.

Is DTC 41-1x indicated?

YES - Faulty SRS unit; replace the SRS unit. ■

NO - Faulty left front impact sensor; replace the left front impact sensor. ■

SRS DTC Troubleshooting: 41-3x, 41-8x, 41-9x, 41-Ax, 41-Bx

DTC 41-3x, 41-8x, 41-9x, 41-Ax, 41-Bx (‘‘x" can be 0 thru 9 or A thru F):
Internal Failure of the Left Front Impact Sensor
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 41-3x, 41-8x, 41-9x, 41-Ax or 41-Bx indicated?

YES - Faulty left font impact sensor; replace the left front impact sensor. ■
NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 42-1x

DTC 42-1x (‘‘x" can be 0 thru 9 or A thru F):
No Signal From the Right Front Impact Sensor
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 42-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Check the connections between SRS unit connector A (39P) and the SRS unit, between the right engine compartment wire harness 2P connector and the right front impact sensor, and at right engine compartment wire harness 4P connector.

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Connect an SRS short canceller (070AZ-SAA0100) to the No. 38 and the No. 39 terminals of SRS unit connector A (39P).
9. Disconnect the right engine compartment wire harness 2P connector from the right front impact sensor.
10. Measure the resistance between the No. 38 and the No. 39 terminals of SRS unit connector A (39P). There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.■

---

11. Measure the resistance between the No. 38 terminal of SRS unit connector A (39P) and body ground, and between the No. 39 terminal and body ground. There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 12 .
    NO - Short to ground in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.■
12. Do the battery terminal reconnection procedure.
13. Turn the ignition switch to ON (II).

---

14. Measure the voltage between the No. 38 terminal of SRS unit connector A (39P) and body ground, and between the No. 39 terminal and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Go to Step 15 .
    NO - Short to power in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.■
15. Turn the ignition switch to LOCK (0).
16. Do the battery terminal disconnection procedure.

---

17. Install a jumper wire between the No. 1 and the No. 2 terminals of right engine compartment wire harness 2P connector.

18. Measure the resistance between the No. 38 and the No. 39 terminals of SRS unit connector A (39P). There should be less than 1 Ω.

Is the resistance as specified?

YES - Go to Step 19 .

NO - Open in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.■

19. Substitute a known-good right front impact sensor and recheck.

20. Connect SRS unit connector A (39P) to the SRS unit.

21. Clear the DTC memory.

22. Turn the ignition switch to ON (II), then wait for 10 seconds.

23. Read the DTC.

Is DTC 42-1x indicated?

YES - Faulty SRS unit; replace the SRS unit. ■

NO - Faulty right front impact sensor, replace the right front impact sensor. ■

SRS DTC Troubleshooting: 42-3x, 42-8x, 42-9x, 42-Ax, 42-Bx

DTC 42-3x, 42-8x, 42-9x, 42-Ax, 42-Bx ("x" can be 0 thru 9 or A thru F):
Internal Failure of the Right Front Impact Sensor
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 42-3x, 42-8x, 42-9x, 42-Ax, or 42-Bx indicated?

YES - Faulty right front impact sensor; replace the right front impact sensor. ■

NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 43-3x, 43-8x, 43-9x, 43-Ax, 43-Bx

DTC 43-3x, 43-8x, 43-9x, 43-Ax, 43-Bx ("x" can be 0 thru 9 or A thru F):
Internal Failure of the Left Side Impact Sensor (first)
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 43-3x, 43-8x, 43-9x, 43-Ax, or 43-Bx indicated?

YES - Faulty left side impact sensor (first); replace the left side front impact sensor (first). ■

NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 44-3x, 44-8x, 44-9x, 44-Ax, 44-Bx

DTC 44-3x, 44-8x, 44-9x, 44-Ax, 44-Bx ("x" can be 0 thru 9 or A thru F):
Internal Failure of the Right Side Impact Sensor (first)
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 44-3x, 44-8x, 44-9x, 44-Ax, or 44-Bx indicated?

YES - Faulty right side impact sensor (first); replace the right side front impact sensor (first). ■

NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 45-11

DTC 45-11:
No Signal From the Left Side Impact Sensor (second)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 45-1x indicated?
   YES -
   - If DTC 45-11 is indicated alone, go to Step 4 .
   - If DTC except 45-11 is indicated, faulty left side impact sensor (second); replace the left side impact sensor (second). ■
   - If DTC 43-11 and 45-11 are indicated, faulty left side impact sensor (first); replace the left side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Check the connections between the floor wire harness 2P connector and the left side impact sensor (second), and at floor wire harness 2P connector.

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect the floor wire harness 4P connector from the left side impact sensor (first).
8. Disconnect the floor wire harness 2P connector from the left side impact sensor (second).
9. Measure the resistance between No. 1 and No. 2 terminals of floor wire harness 2P connector. There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■

---

10. Measure the resistance between No. 1 terminal of floor wire harness 2P connector and body ground, and between the No. 2 terminal and body ground. There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Do the battery terminal reconnection procedure.
12. Turn the ignition switch to ON (II).

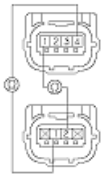
---

13. Measure the voltage between No. 1 terminal of floor wire harness 2P connector and body ground, and between the No. 2 terminal and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

---

15. Measure the resistance between the No. 4 terminal of the floor wire harness 4P connector and the No. 1 terminal of the floor wire harness 2P connector, and between the No. 1 terminal of the floor wire harness 4P connector and the No. 2 terminal of the floor wire harness 2P connector. There should be 0−1.0 Ω.



Is the resistance as specified?
YES - Go to Step 16 .
NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good left side impact sensor (second) and recheck.

17. Connect SRS unit connector B (39P) to the SRS unit.

18. Clear the DTC memory.

19. Turn the ignition switch to ON (II), then wait for 10 seconds.

20. Read the DTC.

Is DTC 45-11 indicated?
YES - Faulty SRS unit; replace the SRS unit. ■
NO - Faulty left side impact sensor (second); replace the left side impact sensor (second). ■

SRS DTC Troubleshooting: 45-3x, 45-8x, 45-9x, 45-Ax, 45-Bx

DTC 45-3x, 45-8x, 45-9x, 45-Ax, 45-Bx (‘‘x" can be 0 thru 9 or A thru F):
Internal Failure of the Left Side Impact Sensor (second)
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 45-3x, 45-8x, 45-9x, 45-Ax, or 45-Bx indicated?

YES - Faulty left side impact sensor (second); replace the left side impact sensor (second). ■
NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 46-11

DTC 46-11:
No Signal From the Right Side Impact Sensor (second)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 46-11 indicated?
   YES -
   - If DTC 46-11 is indicated alone, go to Step 4 .
   - If DTC except 46-11 is indicated, faulty right side impact sensor (second); replace the right side impact sensor (second). ■
   - If DTC 44-11 and 46-11 are indicated, faulty right side impact sensor (first); replace the right side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Check the connections between the floor wire harness 2P connector and the right side impact sensor (second), and at floor wire harness 2P connector.

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect the floor wire harness 4P connector from the right side impact sensor (first).
8. Disconnect the floor wire harness 2P connector from the right side impact sensor (second).
9. Measure the resistance between the No. 1 and No. 2 terminals of floor wire harness 2P connector. There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■

---

10. Measure the resistance between No. 1 terminal of floor wire harness 2P connector and body ground, and between the No. 2 terminal and body ground. There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Do the battery terminal reconnection procedure.
12. Turn the ignition switch to ON (II).

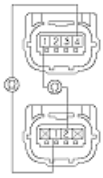
---

13. Measure the voltage between No. 1 terminal of floor wire harness 2P connector and body ground, and between the No. 2 terminal and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

---

15. Measure the resistance between the No. 1 terminal of the floor wire harness 4P connector and the No. 2 terminal of the floor wire harness 2P connector, and between the No. 4 terminal of the floor wire harness 4P connector and the No. 1 terminal of the floor wire harness 2P connector. There should be 0−1.0 Ω.



Is the resistance as specified?
YES - Go to Step 16 .
NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good right side impact sensor (second) and recheck.

17. Connect SRS unit connector B (39P) to the SRS unit.

18. Clear the DTC memory.

19. Turn the ignition switch to ON (II), then wait for 10 seconds.

20. Read the DTC.

Is DTC 46-11 indicated?
YES - Faulty SRS unit; replace the SRS unit. ■
NO - Faulty right side impact sensor (second); replace the right side impact sensor (second). ■

SRS DTC Troubleshooting: 46-3x, 46-8x, 46-9x, 46-Ax, 46-Bx

DTC 46-3x, 46-8x, 46-9x, 46-Ax, 46-Bx ("x" can be 0 thru 9 or A thru F):
Internal Failure of the Right Side Impact Sensor (second)
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC 46-3x, 46-8x, 46-9x, 46-Ax, or 46-Bx indicated?

YES - Faulty right side impact sensor (second); replace the right side impact sensor (second). ■

NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 51-xx, 52-xx, 53-xx, 54-xx, 55-xx

DTC 51-xx, 52-xx, 53-xx, 54-xx, 55-xx (“x" can be 0 thru 9 or A thru F):
Internal Failure of the SRS Unit
NOTE:

- Before troubleshooting any of these DTCs, check the battery/system voltage and battery cable connections. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the customer if the battery ever went dead or if the engine was started and run with the battery in a low state of charge. A dead battery may trigger one or more of these DTCs.
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Check that the SRS indicator goes off.

Does the SRS indicator go off?

YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
NO - Replace the SRS unit. ■

SRS DTC Troubleshooting: 53-FF

DTC 53-FF:
SRS Unit Programming Error
NOTE:

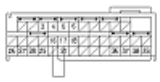
- This DTC is indicated when a SRS unit update is not completed properly.
- Do not turn the ignition switch to ACC (I) or to LOCK (0) while updating the SRS unit. If you turn the ignition switch to ACC (I) or to LOCK (0) before you complete the SRS unit update procedure, the SRS unit can be damaged.
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Do the SRS unit update procedure.
2. Read the DTC.

   Is DTC 53-FF indicated?
   YES - Replace the original SRS unit. ■
   NO - Update is complete.■

SRS DTC Troubleshooting: 56-31

DTC 56-31:
Lost Communication with the ECM/PCM (PGM-FI system)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Check for any F-CAN and B-CAN communication DTCs, and troubleshoot those DTCs before doing this troubleshooting procedure.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 56-31 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to ON (II), and see if the malfunction indicator lamp (MIL) comes on.

   Does the MIL come on?
   YES - Go to the MIL Circuit Troubleshooting.
   NO - Go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Do the battery terminal disconnection procedure , then wait for 3 minutes.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Install a jumper wire between the No. 16 and the No. 17 terminal of SRS unit connector A (39P).
9. Disconnect ECM/PCM connector A (49P) from the ECM/PCM.

---

10. Check for continuity between the No. 3 and the No. 4 terminals of the ECM/PCM connector A (49P).

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open in the left engine compartment wire harness or the floor wire harness; replace the faulty harness.■

SRS DTC Troubleshooting: 56-32, 56-33

DTC 56-32, 56-33:
Undefined Data Received From the ECM/PCM (PGM-FI system)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Check for any F-CAN and B-CAN communication DTCs, and troubleshoot those DTCs before doing this troubleshooting procedure.

1. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Check that the malfunction indicator lamp (MIL) comes on.

   Does the MIL come on?
   YES - Go to Step 4 .
   NO - Go to the PGM-FI system troubleshooting.
4. Clear the DTC memory.
5. Turn the ignition switch to LOCK (0), and wait for 10 seconds.
6. Turn the ignition switch to ON (II), then wait for 10 seconds.
7. Read the DTC.

   Is DTC 56-32 or 56-33 indicated?
   YES - Faulty ECM/PCM; replace the ECM/PCM.
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 85-4x, 85-63, 85-64

DTC 85-4x, 85-63, 85-64 (‘‘x" can be 0 thru 9 or A thru F):
Internal Failure of the OPDS Unit
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?
   YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Initialize the OPDS unit.
5. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?
   YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. ■
   NO - Replace the OPDS unit and retest. If the problem is still present, replace the OPDS sensor/seat-back cover/pad. ■

SRS DTC Troubleshooting: 85-61, 85-62

DTC 85-61:
No Signal From the OPDS Unit
DTC 85-62:
Non-stipulated Data From the OPDS Unit
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Read the DTC.

   Is DTC 85-61 or 85-62 indicated?
   YES - Go to Step 3 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
3. Check the No. 8 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 4 .
   NO - Replace the fuse, then turn the ignition switch to ON (II). If the fuse blows again, check for a short in the No. 8 (7.5 A) fuse circuit (floor wire harness, or OPDS unit harness).
4. Turn the ignition switch to LOCK (0).
5. Disconnect the OPDS unit harness 18P connector (A) from the OPDS unit.
6. Turn the ignition switch to ON (II).

---

7. Measure the voltage between the No. 1 terminal of the OPDS unit harness 18P connector and body ground. There should be battery voltage.

   
   Is there battery voltage?
   YES - Go to Step 8 .
   NO - Open between the No. 8 (7.5 A) fuse in the under-dash fuse/relay box and the No. 1 terminal of the OPDS unit 18P connector (floor wire harness or OPDS unit harness); replace the faulty harness.■
8. Turn the ignition switch to LOCK (0).

---

9. Measure the resistance between the No. 12 terminal of the OPDS unit harness 18P connector and body ground. There should be 0−1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Open between the No. 12 terminal of the OPDS unit harness 18P connector and body ground (G603) or poor connection at G603. ■
10. Do the battery terminal disconnection procedure , then wait for 3 minutes.
11. Disconnect SRS unit connector B (39P) from the SRS unit.

---

12. Measure the resistance between No. 1 terminal of SRS unit connector B (39P) and body ground. There should be 1 MΩ.

    
    Is the resistance as specified?
    YES - Go to Step 13 .
    NO - Short to ground between the No. 1 terminal of the SRS unit connector B (39P) and the No. 7 terminal of the OPDS unit harness 18P connector (floor wire harness or OPDS unit harness); replace the faulty harness.■

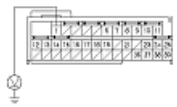
---

13. Measure the resistance between the No. 1 terminal of SRS unit connector B (39P) and the No. 7 terminal of the OPDS unit harness 18P connector. There should be 0−1.0 Ω.

    
    Is the resistance as specified?
    YES - Go to Step 14 .
    NO - Open between the No. 1 terminal of the SRS unit connector B (39P) and the No. 7 terminal of the OPDS unit harness 18P connector (floor wire harness or OPDS unit harness); replace the faulty harness.■
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between the No. 1 terminal of the SRS unit connector B (39P) and body ground. There should be 1 V.



Is there battery voltage?

YES - Go to Step 17 .

NO - Short to power between the No. 1 terminal of the SRS unit connector B (39P) and the No. 7 terminal of the OPDS unit harness 18P connector (floor wire harness or OPDS unit harness); replace the faulty harness.■

17. Replace the OPDS unit.

18. Initialize the OPDS unit.

19. Clear the DTC.

20. Read the DTC.

Is the DTC 85-61 or 85-62 indicated?

YES - Replace the SRS unit. ■

NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 85-71, 85-78

DTC 85-71, 85-78:
OPDS Unit Does Not Initialized
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 85-71 or 85-78 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Initialize the OPDS unit.
5. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
6. Turn the ignition switch to ON (II), then wait for 10 seconds.
7. Read the DTC.

   Is SRS DTC indicated?
   YES - Replace the OPDS unit. ■
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: 85-79

DTC 85-79:
OPDS Initial Check Failure
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?
   YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Make sure nothing is on the front passenger's seat.
5. Clear the DTC memory.
6. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?
   YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures.
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Initialize the OPDS unit.
9. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator go off?
   YES - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures.
   NO - Replace the OPDS unit and retest. If the problem is still present, replace the OPDS sensor/seat-back cover/pad. ■

SRS DTC Troubleshooting: 86-1x, 86-2x

DTC 86-1x ("x" can be 0 thru 9 or A thru F):
Faulty OPDS Seat-Back Sensor
DTC 86-2x ("x" can be 0 thru 9 or A thru F):
Faulty OPDS Seat Support Sensor
NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. Clear the DTC memory.
2. Read the DTC.

   Is DTC 86-1x or 86-2x indicated?
   YES - Go to Step 3 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
3. Check the connection at the OPDS sensor harness connectors (A) and the OPDS unit harness 18P connector (B).

   Is the connection OK?
   YES - Go to Step 4 .
   NO - Repair the poor connection, and clear the DTC. ■
4. Replace the front passenger's seat-back cover/pad, and initialize the OPDS.
5. Clear the DTC memory.
6. Read the DTC.

   Is DTC 86-1x or 86-2x indicated?
   YES - Replace the OPDS unit. ■
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

SRS DTC Troubleshooting: A1-1x

DTC A1-1x (‘‘x" can be 0 thru 9 or A thru F):
Faulty Power Supply (VA line)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC A1-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Check the No. 8 (7.5 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 6 .
   NO - Replace the fuse, then turn the ignition switch to ON (II). If the fuse blows again, check for a short to ground in the dashboard wire harness or in the under-dash fuse/relay box No. 8 (7.5 A) fuse circuit; replace the dashboard wire harness. If the problem is still there, replace the under-dash fuse/relay box. ■
6. Turn the ignition switch to LOCK (0).
7. Do the battery terminal disconnection procedure , then wait for 3 minutes.
8. Disconnect SRS unit connector A (39P) from the SRS unit.
9. Do the battery terminal reconnection procedure.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the No. 26 terminal of SRS unit connector A (39P) and body ground. There should be battery voltage.

    Is the voltage as specified?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit. ■
    NO - Open in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: A2-1x

DTC A2-1x (‘‘x" can be 0 thru 9 or A thru F):
Faulty Power Supply (VB line)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC A2-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Check the No. 6 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 6 .
   NO - Replace the fuse, then turn the ignition switch to ON (II). If the fuse blows again, check for a Short to ground in the dashboard wire harness or in the under-dash fuse/relay box No. 6 (10 A) fuse circuit; replace the dashboard wire harness. If the problem is still there, replace the under-dash fuse/relay box. ■
6. Turn the ignition switch to LOCK (0).
7. Do the battery terminal disconnection procedure , then wait for 3 minutes.
8. Disconnect SRS unit connector A (39P) from the SRS unit.
9. Do the battery terminal reconnection procedure.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the No. 27 terminal of SRS unit connector A (39P) and body ground. There should be battery voltage.

    Is the voltage as specified?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit. ■
    NO - Open in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: A3-1x

DTC A3-1x (‘‘x" can be 0 thru 9 or A thru F):
SRS Unit Connector A Not Properly Installed
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC A3-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Check the connection between the SRS unit connector A (39P) and the SRS unit.

   Is the connection OK?
   YES - Go to Step 5 .
   NO - Repair the poor connection and retest.
5. Turn the ignition switch to LOCK (0).
6. Do the battery terminal disconnection procedure , then wait for 3 minutes.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Check for bent or damaged terminals on the SRS unit.

   Are any terminals bent or damaged?
   YES - Replace the dashboard wire harness.■
   NO - Replace the SRS unit. ■

SRS DTC Troubleshooting: A4-1x

DTC A4-1x (‘‘x" can be 0 thru 9 or A thru F):
SRS Unit Connector B Not Properly Installed
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC A4-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Check the connection between the SRS unit connector B (39P) and the SRS unit.

   Is the connection OK?
   YES - Go to Step 5 .
   NO - Repair the poor connection and retest.
5. Turn the ignition switch to LOCK (0).
6. Do the battery terminal disconnection procedure , then wait for 3 minutes.
7. Disconnect SRS unit connector B (39P) from the SRS unit.
8. Check for bent or damaged terminals on the SRS unit.

   Are any terminals bent or damaged?
   YES - Replace the floor wire harness.■
   NO - Replace the SRS unit. ■

SRS DTC Troubleshooting: Ex-11

DTC Ex-11 ("x" can be 0 thru 9 or A thru F):
Control Operation Recorded
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

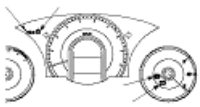
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

Is DTC Ex-11 indicated?

YES - Faulty SRS unit; replace the SRS unit. ■
NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

How to Troubleshoot the VSA System

System Indicator



This system has four indicators:

- ABS indicator (A)
- Brake system indicator (B)
- VSA indicator (C)
- VSA activation indicator (D)

When the system is OK, each indicator comes on for about 2 seconds after turning the ignition switch to ON (II), then goes off.
When the system detects a problem, a DTC will be set and, depending upon the failure, the VSA modulator-control unit will determine which indicator(s) will be turned on. If the problem goes away (system returns to normal), the indicator(s) will be controlled in the following way depending upon the DTC that was set:

- The indicator(s) will come on and stay on when the ignition switch is ON (II).
- The indicator(s) will automatically go off.
- The indicator(s) will go off after the vehicle is driven.

ABS Indicator

The ABS indicator comes on when the ABS function is lost. The brakes still work like a conventional system.

Brake System Indicator

The brake system indicator comes on when the EBD function is lost, the parking brake is applied, and/or the brake fluid level is low.
NOTE: If two or more wheel speed sensors fail, the brake system indicator will come on.

VSA Indicator

The VSA indicator comes on when the VSA function is lost.

VSA Activation Indicator

The VSA activation indicator blinks when the VSA function is activating. The VSA activation indicator comes on, when the VSA is turned OFF by using the VSA OFF switch, or the VSA function is lost.

Diagnostic Trouble Code (DTC)

- The memory can hold all DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in ascending number order, not in the order they occur.
- The DTCs are memorized in the EEPROM. Therefore, the memorized DTCs cannot be erased by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
  - Initial diagnosis: Done right after the ignition switch is turned to ON (II) and until the ABS and VSA indicators go off.
  - Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned to LOCK (0).
- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the VSA modulator-control unit is functioning, and the fluid in the reservoir is forced out to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the VSA modulator-control unit is functioning.
- The VSA modulator-control unit checks the pump motor operation one time after completing initial diagnosis during regular diagnosis when the vehicle is driven over 15 km/h (10 mph).

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles without the VSA system.

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the ABS and/or VSA indicator is still on. Following a troubleshooting procedure for a code that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS and/or VSA indicator came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.
2. When the ABS or VSA indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. before you start troubleshooting.
3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the ABS and VSA indicators do not come on.
4. Check for DTCs from other systems which are connected via F-CAN. If there are DTCs that are related to F-CAN, the most likely cause was that the ignition switch was turned to ON (II) with the VSA modulator-control unit connector disconnected. Clear the DTCs. Check for fuel and emissions, and VSA codes, first. Be sure to troubleshoot those first.

Intermittent Failures

The term ‘‘intermittent failure" means a system may have had a failure, but it checks OK now. If the indicator(s) of the system does not come on, check for loose connectors or poor contacts in the terminals related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

1. If the system indicators stay on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshoot the DLC circuit.
4. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.
   NOTE:
   - The HDS communication will be stopped when the vehicle speed is at 50 km/h (31 mph) or more.
   - The HDS can read the DTC, the current data, and other system data.
   - For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

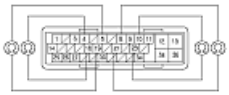
1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't troubleshoot the DLC circuit.
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting.
5. Turn the ignition switch to LOCK (0).

How to Clear DTCs

1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't troubleshoot the DLC circuit.
4. Clear the DTC(s) by following the screen prompts on the HDS.
5. Turn the ignition switch to LOCK (0).

VSA DTC Troubleshooting: 11-13, 13-13, 15-13, 17-13

DTC 11-13:
Right-front Wheel Speed Sensor Circuit Malfunction
DTC 13-13:
Left-front Wheel Speed Sensor Circuit Malfunction
DTC 15-13:
Right-rear Wheel Speed Sensor Circuit Malfunction
DTC 17-13:
Left-rear Wheel Speed Sensor Circuit Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 11-13, 13-13, 15-13, and/or 17-13 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the VSA modulator-control unit 36P connector.
7. Disconnect the appropriate wheel speed sensor 2P connector.
8. Check for continuity between the appropriate VSA modulator-control unit 36P connector wheel speed sensor +B and GND terminals (see table).

DTC	VSA Modulator-control Unit 36P Connector Terminal	
11-13	No. 23	No. 10
13-13	No. 19	No. 6
15-13	No. 18	No. 4
17-13	No. 21	No. 8

   Is there continuity?
   YES - Repair short in the wires between the appropriate wheel speed sensor and the VSA modulator-control unit.■
   NO - Go to Step 9 .

9. Check for continuity between the appropriate VSA modulator-control unit 36P connector terminal and the wheel speed sensor 2P connector terminal.

DTC	VSA Modulator-control Unit 36P Connector Terminal	Appropriate Wheel Speed Sensor 2P Connector Terminal
11-13	No. 23	Right-front
13-13	No. 19	Left-front
15-13	No. 18	Right-rear
17-13	No. 21	Left-rear

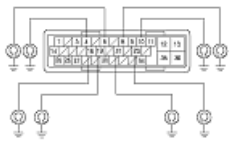
   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the appropriate wheel speed sensor and the VSA modulator-control unit.■

10. Check for continuity between the appropriate VSA modulator-control unit 36P connector terminal and the wheel speed sensor 2P connector terminal.

DTC	VSA Modulator-control Unit 36P Connector Terminal	Appropriate Wheel Speed Sensor 2P Connector Terminal
11-13	No. 10	Right-front
13-13	No. 6	Left-front
15-13	No. 4	Right-rear
17-13	No. 8	Left-rear

   Is there continuity?
   YES - Go to Step 11 .
   NO - Repair open in the wire between the appropriate wheel speed sensor and the VSA modulator-control unit.■

11. Check for continuity between the appropriate VSA modulator-control unit 36P connector terminal and the wheel speed sensor 2P connector terminal (see table).



DTC	VSA Modulator-control Unit 36P Connector Terminal	
11-13	No. 23	No. 10
13-13	No. 19	No. 6
15-13	No. 18	No. 4
17-13	No. 21	No. 8

Is there continuity?

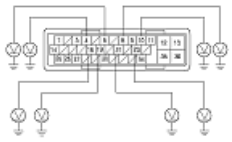
YES - Repair short to body ground in the wire between the appropriate wheel speed sensor and the VSA modulator-control unit.■

NO - Go to Step 12 .

12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between body ground and the appropriate VSA modulator-control unit 36P connector terminal (see table).



DTC	VSA Modulator-control Unit 36P Connector Terminal	
11-13	No. 23	No. 10
13-13	No. 19	No. 6
15-13	No. 18	No. 4
17-13	No. 21	No. 8

Is there 0.1 V or more?

YES - Repair short to power in the wire between the appropriate wheel speed sensor and the VSA modulator-control unit.■

NO - Go to Step 14 .

14. Turn the ignition switch to LOCK (0).
15. Substitute a known-good wheel speed sensor.
16. Reconnect all connectors.
17. Turn the ignition switch to ON (II).
18. Check for DTCs with the HDS.
19. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
20. Check for DTCs with the HDS.

Is DTC 11-13, 13-13, 15-13, and/or 17-13 indicated?

YES - Go to Step 21 .

NO - Replace the original wheel speed sensor. ■

21. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
22. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
23. Check for DTCs with the HDS.

Is DTC 11-13, 13-13, 15-13, and/or 17-13 indicated?

YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .

NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 11-14, 13-14, 15-14, 17-14

DTC 11-14:
Right-front Wheel Speed Sensor Power Source Malfunction
DTC 13-14:
Left-front Wheel Speed Sensor Power Source Malfunction
DTC 15-14:
Right-rear Wheel Speed Sensor Power Source Malfunction
DTC 17-14:
Left-rear Wheel Speed Sensor Power Source Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 11-14, 13-14, 15-14, and/or 17-14 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to ON (II).
7. Check for DTCs with the HDS.

   Is DTC 11-14, 13-14, 15-14, and/or 17-14 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 12-11, 14-11, 16-11, 18-11

DTC 12-11:
Right-front Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 14-11:
Left-front Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 16-11:
Right-rear Wheel Speed Sensor Electrical Noise or Intermittent Interruption
DTC 18-11:
Left-rear Wheel Speed Sensor Electrical Noise or Intermittent Interruption
NOTE: These DTCs may be caused by electrical interference. Check for aftermarket devices installed in the vehicle when these DTC are indicated.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

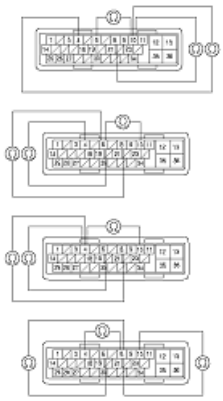
   Is DTC 12-11, 14-11, 16-11, and/or 18-11 indicated?
   YES - If the DTC 12-12, 14-12, 16-12, or 18-12 is indicated at the same time, do the DTC 12-12, 14-12, 16-12, or 18-12 troubleshooting. If DTC 12-12, 14-12, 16-12, or 18-12 is not indicated, go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-11	Right-front
14-11	Left-front
16-11	Right-rear
18-11	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Go to Step 7 .
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■
7. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
8. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
9. Check for DTCs with the HDS.

   Is DTC 12-11, 14-11, 16-11, and/or 18-11 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 12-12, 14-12, 16-12, 18-12



DTC 12-12:
Right-front Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 14-12:
Left-front Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 16-12:
Right-rear Wheel Speed Sensor Short to the Other Sensor Circuit
DTC 18-12:
Left-rear Wheel Speed Sensor Short to the Other Sensor Circuit

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 20 km/h (13 mph) or more, and go a distance of 100 m (328 ft) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 12-12, 14-12, 16-12, and/or 18-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the VSA modulator-control unit 36P connector.
7. Check for continuity between the appropriate VSA modulator-control unit 36P connector wheel speed sensor GND terminals (see table).

DTC	VSA Modulator-control Unit 36P Connector Terminal			
	Appropriate Terminal	Other Terminals		
12-12	No. 10	No. 6	No. 4	No. 8
14-12	No. 6	No. 10	No. 4	No. 8
16-12	No. 4	No. 10	No. 6	No. 8
18-12	No. 8	No. 10	No. 6	No. 4

   Is there continuity?
   YES - Repair short in the wires between the appropriate wheel speed sensor and the VSA modulator-control unit.■
   NO - Go to Step 8 .
8. Reconnect the VSA modulator-control unit 36P connector.
9. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
10. Test-drive the vehicle. Drive the vehicle at 20 km/h (13 mph) or more, and go a distance of 100 m (328 ft) or more.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
11. Check for DTCs with the HDS.

    Is DTC 12-12, 14-12, 16-12, and/or 18-12 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 12-21, 14-21, 16-21, 18-21

DTC 12-21:
Right-front Wheel Speed Sensor Installation Error
DTC 14-21:
Left-front Wheel Speed Sensor Installation Error
DTC 16-21:
Right-rear Wheel Speed Sensor Installation Error
DTC 18-21:
Left-rear Wheel Speed Sensor Installation Error

1. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RIGHT-FRONT, LEFT-FRONT, RIGHT-REAR, LEFT-REAR WHEEL SPEED in the VSA DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-21	Right-front
14-21	Left-front
16-21	Right-rear
18-21	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

VSA DTC Troubleshooting: 12-22, 14-22, 16-22, 18-22

DTC 12-22:
Right-front Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 14-22:
Left-front Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 16-22:
Right-rear Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)
DTC 18-22:
Left-rear Wheel Speed Sensor Installation Error (30 km/h (19 mph) or More)

1. Test-drive the vehicle. Drive the vehicle between 30 km/h (19 mph) and 50 km/h (31 mph) for 70 seconds or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RIGHT-FRONT, LEFT-FRONT, RIGHT-REAR, LEFT-REAR WHEEL SPEED in the VSA DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-22	Right-front
14-22	Left-front
16-22	Right-rear
18-22	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

VSA DTC Troubleshooting: 12-23, 14-23, 16-23, 18-23

DTC 12-23:
Right-front Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 14-23:
Left-front Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 16-23:
Right-rear Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))
DTC 18-23:
Left-rear Wheel Speed Sensor Installation Error (0 to 15 km/h (0 to 9 mph))

1. Test-drive the vehicle. Drive the vehicle between 1 km/h (1 mph) and 15 km/h (9 mph).
   NOTE: Drive the vehicle on a straight section of road, not on a lift.

2. Check the RIGHT-FRONT, LEFT-FRONT, RIGHT-REAR, LEFT-REAR WHEEL SPEED in the VSA DATA LIST with the HDS.

   Are all four values the same?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Check that the appropriate wheel speed sensor is properly mounted.

DTC	Appropriate Wheel Speed Sensor
12-23	Right-front
14-23	Left-front
16-23	Right-rear
18-23	Left-rear

   Is the wheel speed sensor installation OK?
   YES - Replace the appropriate wheel speed sensor. ■
   NO - Reinstall the wheel speed sensor, and check the mounting position. ■

VSA DTC Troubleshooting: 21-11, 22-11, 23-11, 24-11

DTC 21-11:
Right-front Magnetic Encoder Malfunction (Pulse Missing)
DTC 22-11:
Left-front Magnetic Encoder Malfunction (Pulse Missing)
DTC 23-11:
Right-rear Magnetic Encoder Malfunction (Pulse Missing)
DTC 24-11:
Left-rear Magnetic Encoder Malfunction (Pulse Missing)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 20 km/h (13 mph) or more, and go a distance of 100 m (328 ft) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 21-11, 22-11, 23-11, and/or 24-11 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Inspect the appropriate magnetic encoder for dirt or debris.

DTC	Appropriate Magnetic Encoder	Note
21-11	Right-front	Remove the driveshaft outboard joint from the appropriate wheel hub.
22-11	Left-front	
23-11	Right-rear	Remove the hub bearing unit.
24-11	Left-rear	

   Is the magnetic encoder surface OK?
   YES - Replace the wheel bearing (front) or the hub bearing unit (rear):■

   - Front: Replace the front wheel bearing.
   - Rear: Replace the rear hub bearing unit.

   NO - Clean off dust or dirt from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit, then go to Step 1 and recheck. If the DTC is still present, replace the appropriate wheel bearing or hub bearing unit.

VSA DTC Troubleshooting: 25-12, 25-13, 26-12, 26-13, 28-12, 28-13

DTC 25-12:
Yaw Rate Sensor Internal Circuit Malfunction (Open, Short)
DTC 25-13:
Yaw Rate Sensor Internal Circuit Malfunction
DTC 26-12:
Lateral Acceleration Sensor Internal Circuit Malfunction (Open, Short)
DTC 26-13:
Lateral Acceleration Sensor Internal Circuit Malfunction
DTC 28-12:
Longitudinal Acceleration Sensor Internal Circuit Malfunction (Open, Short)
DTC 28-13:
Longitudinal Acceleration Sensor Communication Error

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 25-12, 25-13, 26-12, 26-13, 28-12, or 28-13 indicated?
YES - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■
NO - Intermittent failure, the system is OK at this time.■

VSA DTC Troubleshooting: 25-17, 25-18, 25-19

DTC 25-17:
Yaw Rate-Lateral/Longitudinal Acceleration Sensor Power Source Voltage Malfunction
DTC 25-18:
Yaw Rate-Lateral/Longitudinal Acceleration Sensor Internal Circuit Malfunction
DTC 25-19:
Yaw Rate-Lateral/Longitudinal Acceleration Sensor Startup Time Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 25-17 or 25-18 indicated?

YES - If the DTC 61-01, 61-21, 61-22, 61-23, and/or 62-21 is indicated at the same time, check the battery performance, and do the alternator and regulator circuit troubleshooting. If the DTC 61-01, 61-21, 61-22, 61-23, and/or 62-21 is not indicated at the same time, replace the yaw rate-lateral/longitudinal acceleration sensor. ■

NO - Intermittent failure, the system is OK at this time.■

VSA DTC Troubleshooting: 25-21, 25-23, 26-21, 26-23, 28-21, 28-23

DTC 25-21:
Yaw Rate Sensor Neutral Position Malfunction
DTC 25-23:
Yaw Rate Sensor Circuit Intermittent Interruption
DTC 26-21:
Lateral Acceleration Sensor Neutral Position Malfunction
DTC 26-23:
Lateral Acceleration Sensor Circuit Intermittent Interruption
DTC 28-21:
Longitudinal Acceleration Sensor Neutral Position Malfunction
DTC 28-23:
Longitudinal Acceleration Sensor Circuit Intermittent Interruption

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Wait 60 seconds or more.
5. Check for DTCs with the HDS.

Is DTC 25-21, 25-23, 26-21, 26-23, 28-21, or 28-23 indicated?
YES - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■
NO - Intermittent failure, the system is OK at this time.■

VSA DTC Troubleshooting: 25-22

DTC 25-22:
Yaw Rate Sensor Stuck

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 25-22 indicated?
   YES - Go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time.■
5. Test-drive the vehicle. Check the YAW RATE S in the VSA DATA LIST with the HDS while driving in corners.

   Does the indicated value change?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■

VSA DTC Troubleshooting: 25-24, 25-25, 26-24, 26-25, 28-24, 28-25

DTC 25-24:
Yaw Rate Sensor Gain Low
DTC 25-25:
Yaw Rate Sensor Gain High
DTC 26-24:
Lateral Acceleration Sensor Gain Low
DTC 26-25:
Lateral Acceleration Sensor Gain High
DTC 28-24:
Longitudinal Acceleration Sensor Gain Low
DTC 28-25:
Longitudinal Acceleration Sensor Gain High
NOTE: When the vehicle is listed and driven on up speed and down speed repeatedly, it can cause this DTC.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 15 km/h (10 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 25-24, 25-25, 26-24, 26-25, 28-24, or 28-25 indicated?
   YES - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■
   NO - Intermittent failure, the system is OK at this time.■

VSA DTC Troubleshooting: 26-22

DTC 26-22:
Lateral Acceleration Sensor Stuck

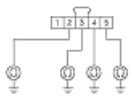
1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 26-22 indicated?
   YES - Go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time.■
5. Test-drive the vehicle. Check the LATERAL ACCELERATION SENSOR in the VSA DATA LIST with the HDS while driving in corners.

   Does the indicated value change?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■

VSA DTC Troubleshooting: 27-11, 27-26

DTC 27-11:
Steering Angle Sensor DIAG Signal Error (Initial)
DTC 27-26:
Steering Angle Sensor DIAG Signal Error (Main)

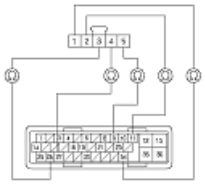


1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 27-11 or 27-26 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the steering angle sensor 5P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 36P connector.
8. Check for continuity between body ground and steering angle sensor 5P connector terminals No. 2, No. 3, No. 4, and No. 5 individually.

   Is there continuity?
   YES - Repair short to body ground in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Go to Step 9 .

9. Check for continuity between the VSA modulator-control unit 36P connector terminal and the steering angle sensor 5P connector terminal individually.



Sign	VSA Modulator-control Unit 36P Connector Terminal	Steering Angle Sensor 5P Connector Terminal
SVCC	No. 9	No. 5
STR-A	No. 11	No. 2
STR-D	No. 26	No. 3
STR-B	No. 27	No. 4
SGND	No. 34	No. 1

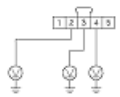
   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the steering angle sensor and the VSA modulator-control unit.■
10. Substitute a known-good steering angle sensor.
11. Reconnect all connectors.
12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
15. Check for DTCs with the HDS.

    Is DTC 27-11 or 27-26 indicated?
    YES - Go to Step 16 .
    NO - Replace the original steering angle sensor. ■
16. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
17. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
18. Check for DTCs with the HDS.

    Is DTC 27-11 or 27-26 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 27-21, 27-22

DTC 27-21:
Steering Angle Sensor Stuck Neutral Position
DTC 27-22:
Steering Angle Sensor Stuck Offset Position



1. Turn the ignition switch to ON (II).
2. Turn the steering wheel left and right 90 degrees or more. Check the STEERING ANGLE in the VSA DATA LIST with the HDS.

   Is there +90 ° or more, and −90 ° or less?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the steering angle sensor 5P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the steering angle sensor 5P connector.
5. Disconnect the VSA modulator-control unit 36P connector.
6. Turn the ignition switch to ON (II).
7. Measure the voltage between body ground and steering angle sensor 5P connector terminals No. 2, No. 3, and No. 4 individually.

   Is there 0.1 V or more?
   YES - Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Replace the steering angle sensor. ■

VSA DTC Troubleshooting: 27-23

DTC 27-23:
Steering Angle Sensor Counter Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Start the engine.
5. Turn the steering wheel from lock-to-lock several times.
6. Check for DTCs with the HDS.

   Is DTC 27-23 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the steering angle sensor 5P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the steering angle sensor 5P connector.
9. Disconnect the VSA modulator-control unit 36P connector.
10. Check for continuity between steering angle sensor 5P connector terminals No. 2 and No. 4.

    Is there continuity?
    YES - Repair short in the wires between the steering angle sensor and the VSA modulator-control unit.■
    NO - Go to Step 11 .

11. Check for continuity between steering angle sensor 5P connector terminals No. 5 and No. 2, and No. 5 and No. 4 individually.

    Is there continuity?
    YES - Repair short in the wires between the steering angle sensor and the VSA modulator-control unit.■
    NO - Go to Step 12 .

12. Check for continuity between steering angle sensor 5P connector terminals No. 1 and No. 2, and No. 1 and No. 4 individually.

    Is there continuity?
    YES - Repair short in the wires between the steering angle sensor and the VSA modulator-control unit.■
    NO - Replace the steering angle sensor. ■

VSA DTC Troubleshooting: 27-24

DTC 27-24:
Steering Angle Sensor Exchange Malfunction

1. Turn the ignition switch to ON (II).
2. Turn the steering wheel one turn. Check the STEERING ANGLE in the VSA DATA LIST with the HDS.

Is there about 288−432 °?
YES - Intermittent failure, the system is OK at this time.■
NO - Replace the steering angle sensor. ■

VSA DTC Troubleshooting: 28-22

DTC 28-22:
Longitudinal Acceleration Sensor Stuck

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 28-22 indicated?
   YES - Go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time.■
5. Test-drive the vehicle. Check the LONGITUDINAL ACCELERATION SENSOR in the VSA DATA LIST with the HDS while driving in corners.

   Does the indicated value change?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■

VSA DTC Troubleshooting: 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, 38-xx

DTC 31-xx *:
ABS Right-front Inlet Solenoid Valve Malfunction
DTC 32-xx *:
ABS Right-front Outlet Solenoid Valve Malfunction
DTC 33-xx *:
ABS Left-front Inlet Solenoid Valve Malfunction
DTC 34-xx *:
ABS Left-front Outlet Solenoid Valve Malfunction
DTC 35-xx *:
ABS Right-rear Inlet Solenoid Valve Malfunction
DTC 36-xx *:
ABS Right-rear Outlet Solenoid Valve Malfunction
DTC 37-xx *:
ABS Left-rear Inlet Solenoid Valve Malfunction
DTC 38-xx *:
ABS Left-rear Outlet Solenoid Valve Malfunction
*: Any two-character subcode (see table).

Subcode	Malfunction	Note (DTC)
01	Solenoid Initial Pulse	31-01, 32-01, 33-01, 34-01, 35-01, 36-01, 37-01, 38-01
02	Initial Feedback Signal	31-02, 33-02, 35-02, 37-02
11	Feedback Signal	31-11, 33-11, 35-11, 37-11
21	Solenoid Pulse	31-21, 32-21, 33-21, 34-21, 35-21, 36-21, 37-21, 38-21
22	Solenoid Speculative	31-22, 32-22, 33-22, 34-22, 35-22, 36-22, 37-22, 38-22
23	Solenoid Stuck ON	31-23, 32-23, 33-23, 34-23, 35-23, 36-23, 37-23, 38-23
24	Feedback Signal/Solenoid Stuck ON	31-24, 33-24, 35-24, 37-24

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, or 38-xx indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
7. Check for DTCs with the HDS.

   Is DTC 31-xx, 32-xx, 33-xx, 34-xx, 35-xx, 36-xx, 37-xx, or 38-xx indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 41-21, 42-21, 43-21, 44-21

DTC 41-21:
Right-front Wheel Lock
DTC 42-21:
Left-front Wheel Lock
DTC 43-21:
Right-rear Wheel Lock
DTC 44-21:
Left-rear Wheel Lock
The DTCs may be indicated under these conditions:

- The vehicle goes into a spin.
- The ABS or VSA continues to operate for a long time.
- Snow, dirt, or debris build-up on the wheel speed sensor or magnetic encoder.
- Misadjusted brake pedal position switch.
- Contaminated brake fluid.

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Turn the appropriate wheel by hand.

DTC	Appropriate Wheel
41-21	Right-front
42-21	Left-front
43-21	Right-rear
44-21	Left-rear

Is there brake drag?
YES - Repair the brake drag.■
NO - Go to Step 3 .

3. Check that the appropriate wheel speed sensor is properly mounted.

Is the wheel speed sensor installation OK?
YES - Go to Step 4 .
NO - Reinstall the wheel speed sensor, and check the mounting position. ■

4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) for 20 seconds or more.
NOTE: Drive the vehicle on a straight section of road, not on a lift.
7. Check for DTCs with the HDS.

Is DTC 41-21, 42-21, 43-21, and/or 44-21 indicated?
YES - Go to Step 8 .
NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time.■

8. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
9. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) for 20 seconds or more.
NOTE: Drive the vehicle on a straight section of road, not on a lift.
10. Check for DTCs with the HDS.

Is DTC 41-21, 42-21, 43-21, and/or 44-21 indicated?
YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 51-11, 51-13

DTC 51-11:
Motor Lock
DTC 51-13:
Motor Drive Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Wait 5 seconds.
5. Operate any one of the four solenoids, as listed, in the VSA FUNCTION TEST five times with the HDS.

-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

6. Check for DTCs with the HDS.

   Is DTC 51-11 or 51-13 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■

7. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
8. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
9. Wait 5 seconds.
10. Operate any one of the four solenoids, as listed, in the VSA FUNCTION TEST five times with the HDS.

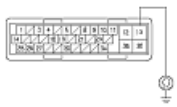
-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

11. Check for DTCs with the HDS.

    Is DTC 51-11 or 51-13 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 51-12

DTC 51-12:
Motor Drive Circuit Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check the DTCs with the HDS.

   Is DTC 51-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Check the No. 58 (30 A) fuse in the under-hood fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 7 .
   NO - Reinstall the checked fuse, then go to Step 9 .
7. Disconnect the VSA modulator-control unit 36P connector.
8. Check for continuity between VSA modulator-control unit 36P connector terminal No. 13 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 58 (30 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.■
   NO - Install a new No. 58 (30 A) fuse in the under-hood fuse/relay box, then go to Step 10 .
9. Disconnect the VSA modulator-control unit 36P connector.

---

10. Measure the voltage between VSA modulator-control unit 36P connector terminal No. 13 and body ground.

    Is there battery voltage?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the No. 58 (30 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.■
11. Reconnect the VSA modulator-control unit 36P connector.
12. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
13. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
14. Check for DTCs with the HDS.

    Is DTC 51-12 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 52-12

DTC 52-12:
Motor Stuck OFF

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Operate any one of the four solenoids, as listed, in the VSA FUNCTION TEST five times with the HDS.

-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

5. Check for DTCs with the HDS.

   Is DTC 52-12 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■

6. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
7. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
8. Operate any one of the four solenoids, as listed, in the VSA FUNCTION TEST five times with the HDS.

-LFT FT SOLENOID
-RT FT SOLENOID
-LFT REAR SOLENOID
-RT REAR SOLENOID

9. Check for DTCs with the HDS.

   Is DTC 52-12 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 53-01, 53-12

DTC 53-01:
Motor Relay Stuck ON 1
DTC 53-12:
Motor Relay Stuck ON 2

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 53-01 or 53-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the VSA modulator-control unit 36P connector.
7. Check for continuity between VSA modulator-control unit 36P connector terminal No. 36 and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Repair open in the wire between the VSA modulator-control unit and body ground (G402 *1 , G203 *2).■
   *1: LHD model
   *2: RHD model
8. Reconnect the VSA modulator-control unit 36P connector.
9. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
10. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
11. Check for DTCs with the HDS.

    Is DTC 53-01 or 53-12 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 54-03, 54-04, 54-21

DTC 54-03:
Fail-safe Relay 1 Stuck ON
DTC 54-04:
Fail-safe Relay 1 Stuck OFF (Initial)
DTC 54-21:
Fail-safe Relay 1 Stuck OFF (Main)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 54-03, 54-04, or 54-21 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Check the No. 37 (30 A) fuse in the under-hood fuse/relay box.

   Is the fuse blown?
   YES - Go to Step 7 .
   NO - Reinstall the checked fuse, then go to Step 10 .
7. Disconnect the VSA modulator-control unit 36P connector.
8. Check for continuity between VSA modulator-control unit 36P connector terminal No. 12 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the No. 37 (30 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.■
   NO - Install a new No. 37 (30 A) fuse in the under-hood fuse/relay box, then go to Step 9 .
9. Reconnect the VSA modulator-control unit 36P connector.
10. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
11. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
12. Check for DTCs with the HDS.

    Is DTC 54-03, 54-04, or 54-21 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 56-01, 56-02, 56-11

DTC 56-01:
Initial VIG FET Stuck OFF (Initial)
DTC 56-02:
Initial VIG FET Stuck ON
DTC 56-11:
VIG FET Stuck OFF (Main)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 56-01, 56-02, or 56-11 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
7. Check for DTCs with the HDS.

   Is DTC 56-01, 56-02, or 56-11 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 61-01, 61-21, 61-22, 61-23

DTC 61-01:
VSA Modulator-control Unit Initial IG Low Voltage
DTC 61-21:
VSA Modulator-control Unit Power Source Low Voltage 1
DTC 61-22:
VSA Modulator-control Unit Power Source Low Voltage 2
DTC 61-23:
VSA Modulator-control Unit Power Source Low Voltage 3

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then start the engine.
4. Check for DTCs with the HDS.

   Is DTC 61-01, 61-21, 61-22, or 61-23 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Check and note BATTERY voltage in the VSA DATA LIST with the HDS.
6. Using a voltmeter, measure and note the voltage between the battery terminals.
   NOTE: If the voltage is below 9.5 V, check the battery, and troubleshoot the alternator regulator circuit.
7. Compare the voltage noted in Step 5 to the voltage in Step 6 .

   Is the difference between the two voltage readings less then 3 V?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. If the code resets after clearing, go to Step 8 .
   NO - Go to Step 8 .
8. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
9. Turn the ignition switch to LOCK (0), then start the engine.
10. Check for DTCs with the HDS.

    Is DTC 61-01, 61-21, 61-22, or 61-23 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 62-21

DTC 62-21:
VSA Modulator-control Unit IG High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then start the engine.
4. Check for DTCs with the HDS.

   Is DTC 62-21 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Check and note BATTERY voltage in the VSA DATA LIST with the HDS.
6. Using a voltmeter, measure and note the voltage between the battery terminals.
   NOTE: If the voltage is beyond 15.1 V, troubleshoot the alternator regulator circuit.
7. Compare the voltage noted in Step 5 to the voltage in Step 6 .

   Is the difference between the two voltage readings less than 3 V?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. If the code resets after clearing, go to Step 8 .
   NO - Go to Step 8 .
8. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
9. Turn the ignition switch to LOCK (0), then start the engine.
10. Check for DTCs with the HDS.

    Is DTC 62-21 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 64-11

DTC 64-11:
Steering Angle Sensor Power Circuit Low Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 64-11 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 36P connector.
8. Check for continuity between steering angle sensor 5P connector terminal No. 5 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Go to Step 9 .
9. Reconnect all connectors.
10. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
11. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
12. Check for DTCs with the HDS.

    Is DTC 64-11 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 64-12

DTC 64-12:
Steering Angle Sensor Power Circuit High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 64-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between the steering angle sensor 5P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 36P connector.
8. Turn the ignition switch to ON (II).
9. Measure the voltage between steering angle sensor 5P connector terminal No. 5 and body ground.

   Is there 0.1 V or more?
   YES - Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Reconnect all connectors.
12. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
13. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
14. Check for DTCs with the HDS.

    Is DTC 64-12 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 65-21

DTC 65-21:
Brake Fluid Level Stuck ON
NOTE: Bleeding the brake system while the ignition switch is ON can cause this DTC.

1. Check the brake fluid level in the master cylinder reservoir.

   Is the brake fluid level OK?
   YES - Go to Step 2 .
   NO - Do the brake pad inspection: Front, rear, check for brake fluid leaks or replace worn pads. Fill the fluid reservoir to the correct level or replace the pads, then go to Step 2 and recheck.

2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
5. Check for DTCs with the HDS.

   Is DTC 65-21 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■

6. Release the parking brake.
7. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
8. Check the brake system indicator in the gauge control module.

   Does the indicator come on then go off?
   YES - Go to Step 13 .
   NO - Go to Step 9 .

9. Check the BRAKE FLUID LEVEL SWITCH in the VSA DATA LIST with the HDS.

   Does the HDS indicate the BRAKE FLUID LEVEL SWITCH as OFF?
   YES - Substitute a known-good gauge control module, then go to Step 1 and recheck. If no DTCs are indicated, replace the original gauge control module.
   NO - Go to Step 10 .

10. Disconnect the brake fluid level switch 2P connector, then check the BRAKE FLUID LEVEL SWITCH in the VSA DATA LIST.

    Does the HDS indicate OFF?
    YES - Replace the brake fluid reservoir tank (the brake fluid level switch is included).
    NO - Go to Step 11 .

11. Disconnect the gauge control module 32P connector.
12. Check for continuity between brake fluid level switch 2P connector terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the gauge control module and the brake fluid level switch.■
    NO - Substitute a known-good gauge control module, then go to Step 1 and recheck. If no DTCs are indicated, replace the original gauge control module.

13. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
14. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
15. Check for DTCs with the HDS.

    Is DTC 65-21 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 2 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 66-11, 66-14, 66-16, 66-17, 66-18, 66-19

DTC 66-11:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
DTC 66-14:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
DTC 66-16:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
DTC 66-17:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
DTC 66-18:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
DTC 66-19:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 66-11, 66-14, 66-16, 66-17, 66-18, or 66-19 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
7. Check for DTCs with the HDS.

   Is DTC 66-11, 66-14, 66-16, 66-17, 66-18, or 66-19 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 66-12

DTC 66-12:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 66-12 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 36P connector.
8. Check for continuity between steering angle sensor 5P connector terminal No. 5 and body ground.

   Is there continuity?
   YES - Repair short to body ground in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Go to Step 9 .
9. Turn the ignition switch to ON (II).

---

10. Measure the voltage between steering angle sensor 5P connector terminal No. 5 and body ground.

    Is there 0.1 V or more?
    YES - Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit.■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).

---

12. Check for continuity between VSA modulator-control unit 36P connector terminal No. 9 and steering angle sensor 5P connector terminal No. 5.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between the steering angle sensor and the VSA modulator-control unit.■
13. Reconnect all connectors.
14. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
15. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
16. Check for DTCs with the HDS.

    Is DTC 66-12 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 66-15

DTC 66-15:
Pressure Sensor (Inside of VSA Modulator-control Unit) Malfunction
NOTE: Brake fluid leaks from brake system can cause this DTC. Check for brake fluid leaks first.

1. Test-drive the vehicle.
2. Turn the ignition switch to LOCK (0).
3. Raise the vehicle, and support it with safety stands in the proper locations.
4. Turn all four wheels by hand.

   Is there brake drag?
   YES - Repair the brake drag.■
   NO - Go to Step 5 .
5. Turn the ignition switch to ON (II).
6. Check the BRAKE PRESS in the VSA DATA LIST with the HDS while moving the brake pedal.

   Does the indicated value change?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 7 .
7. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
8. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
9. Check for DTCs with the HDS.

   Is DTC 66-15 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 68-21

DTC 68-21:
Brake Pedal Position Switch Stuck OFF

1. Turn the ignition switch to ON (II).
2. Check the BRAKE PRESS in the VSA DATA LIST with the HDS. Do not press the brake pedal.

   Is there 10 MPa or less?
   YES - Go to Step 3 .
   NO - Check for brake drag or a misadjusted brake pedal position switch. If they are normal, go to Step 20 .
3. Check the BRAKE SWITCH in the VSA DATA LIST with the HDS while moving the brake pedal.

   Does it indicate ON when the pedal is pressed, and OFF when the pedal is released?
   YES - Intermittent failure, the system is OK at this time. Check for loose terminals between the brake pedal position switch 4P connector, ECM/PCM connector A (49P), and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
   NO - Go to Step 4 .
4. Turn the ignition switch to LOCK (0).
5. Disconnect the brake pedal position switch 4P connector.
6. Connect brake pedal position switch 4P connector terminals No. 1 and No. 2 with a jumper wire.
7. Turn the ignition switch to ON (II).
8. Check the BRAKE SWITCH in the VSA DATA LIST with the HDS.

   Does it indicate ON?
   YES - Check the brake pedal position switch adjustment. If it is OK, replace the brake pedal position switch .■
   NO - Go to Step 9 .
9. Disconnect the jumper wire.
10. Turn the ignition switch to LOCK (0).
11. Check the No. 24 (15 A) fuse in the under-hood fuse/relay box.

    Is the fuse blown?
    YES - Go to Step 12 .
    NO - Reinstall the checked fuse, then go to Step 16 .

---

12. Check for continuity between brake pedal position switch 4P connector terminal No. 1 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the No. 24 (15 A) fuse in the under-hood fuse/relay box and the brake pedal position switch.■
    NO - Go to Step 13 .
13. Short the SCS line with the HDS.
14. Disconnect ECM/PCM connector A (49P).

---

15. Check for continuity between brake pedal position switch 4P connector terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the brake pedal position switch and the ECM/PCM.■
    NO - Install a new No. 24 (15 A) fuse in the under-hood fuse/relay box, then go to Step 18 .
16. Short the SCS line with the HDS.
17. Disconnect ECM/PCM connector A (49P).

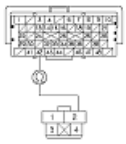
---

18. Measure the voltage between brake pedal position switch 4P connector terminal No. 1 and body ground.

    Is there battery voltage?
    YES - Go to Step 19 .
    NO - Repair open in the wire between the No. 24 (15 A) fuse in the under-hood fuse/relay box and the brake pedal position switch.■

---

19. Check for continuity between brake pedal position switch 4P connector terminal No. 2 and ECM/PCM connector A (49P) terminal No. 42.



Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then go to Step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs are not indicated, replace the original ECM/PCM.

NO - Repair open in the wire between the ECM/PCM and the brake pedal position switch.■

20. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.

21. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
NOTE: Drive the vehicle on a straight section of road, not on a lift.

22. Check for DTCs with the HDS.

Is DTC 68-21 indicated?

YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .

NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 68-22

DTC 68-22:
Brake Pedal Position Switch Stuck ON

1. Turn the ignition switch to ON (II).
2. Check the BRAKE PRESS in the VSA DATA LIST with the HDS. Do not press the brake pedal.

   Is there 10 MPa or more?
   YES - Check the brake pedal height. If the brake pedal height is OK, go to Step 10 .
   NO - Go to Step 3 .
3. Check the BRAKE SWITCH in the VSA DATA LIST with the HDS while moving the brake pedal.

   Does it indicate ON when the pedal is pressed, and OFF when the pedal is released?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 4 .
4. Check the BRAKE SWITCH in the VSA DATA LIST with the HDS, and disconnect the brake pedal position switch 4P connector.

   Does the indicator change from ON to OFF?
   YES - Replace the brake pedal position switch. ■
   NO - Go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Turn the ignition switch to ON (II).
9. Measure the voltage between brake pedal position switch 4P connector terminal No. 2 and body ground.

   Is there 0.1 V or more?
   YES - Repair short to power in the wire between the ECM/PCM and the brake pedal position switch.■
   NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then go to Step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs are not indicated, replace the original ECM/PCM.
10. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
11. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
12. Check for DTCs with the HDS.

    Is DTC 68-22 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 71-21, 71-22, 71-23, 71-24, 71-25, 71-26, 71-27, 71-28, 71-29, 71-2A, 71-2B, 71-2C

DTC 71-21:
Right-front or Left-rear Different Diameter Tyre Malfunction
DTC 71-22:
Left-front or Right-rear Different Diameter Tyre Malfunction
DTC 71-23:
Right-front and Right-rear Different Diameter Tyre Malfunction
DTC 71-24:
Left-front and Left-rear Different Diameter Tyre Malfunction
DTC 71-25:
Right-front and Left-front Different Diameter Tyre Malfunction
DTC 71-26:
Right-rear and Left-rear Different Diameter Tyre Malfunction
DTC 71-27:
Right-front or Left-rear Different Diameter Tyre Malfunction
DTC 71-28:
Left-front or Right-rear Different Diameter Tyre Malfunction
DTC 71-29:
Right-front and Right-rear Different Diameter Tyre Malfunction
DTC 71-2A:
Left-front and Left-rear Different Diameter Tyre Malfunction
DTC 71-2B:
Right-front and Left-front Different Diameter Tyre Malfunction
DTC 71-2C:
Right-rear and Left-rear Different Diameter Tyre Malfunction
NOTE: The DTC will be indicated when the vehicle has a different diameter tyre(s) compared to the other tyres.

DTC	Sectional	Note
71-21	Right-front or left-rear	
71-22	Left-front or right-rear	
71-23	Right-front and right-rear	
71-24	Left-front and left-rear	
71-25	Right-front and left-front	
71-26	Right-rear and left-rear	
71-27	Right-front or left-rear	
71-28	Left-front or right-rear	
71-29	Right-front and right-rear	
71-2A	Left-front and left-rear	
71-2B	Right-front and left-front	
71-2C	Right-rear and left-rear	

1. Check the tyres for proper inflation and the correct size.
2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
5. Check for DTCs with the HDS.

Is DTC 71-21, 71-22, 71-23, 71-24, 71-25, 71-26, 71-27, 71-28, 71-29, 71-2A, 71-2B, or 71-2C indicated?
YES - Replace tyres as needed until all their diameters match.■
NO - Intermittent failure, the system is OK at this time.■

VSA DTC Troubleshooting: 81-07

DTC 81-07:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 81-07 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the steering angle sensor 5P connector.
7. Disconnect the VSA modulator-control unit 36P connector.
8. Turn the ignition switch to ON (II).
9. Measure the voltage between steering angle sensor 5P connector terminal No. 5 and body ground.

   Is there 0.1 V or more?
   YES - Repair short to power in the wire between the steering angle sensor and the VSA modulator-control unit.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Reconnect all connectors.
12. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software substitute a known-good VSA modulator-control unit.
13. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
14. Check for DTCs with the HDS.

    Is DTC 81-07 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 81-11, 81-52, 81-54, 81-56, 81-58

DTC 81-11:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-52:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-54:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-56:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-58:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 81-11, 81-52, 81-54, 81-56, or 81-58 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
7. Check for DTCs with the HDS.

   Is DTC 81-11, 81-52, 81-54, 81-56, or 81-58 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 81-3D, 81-3E, 81-59

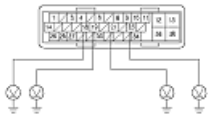
DTC 81-3D:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-3E:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-59:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Turn the steering wheel from lock-to-lock several times.
5. Check for DTCs with the HDS.

   Is DTC 81-3D, 81-3E, or 81-59 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
7. Start the engine.
8. Turn the steering wheel from lock-to-lock several times.
9. Check for DTCs with the HDS.

   Is DTC 81-3D, 81-3E, or 81-59 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 81-51, 81-53, 81-55, 81-57



DTC 81-51:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-53:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-55:
Central Processing Unit (CPU) Internal Circuit Malfunction
DTC 81-57:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 81-51, 81-53, 81-55, or 81-57 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the VSA modulator-control unit 36P connector.
7. Turn the ignition switch to ON (II).
8. Measure the voltage between body ground and the appropriate VSA modulator-control unit 36P connector terminals (see table).

DTC	VSA Modulator-control Unit 36P Connector Terminal
81-51	No. 23
81-53	No. 19
81-55	No. 18
81-57	No. 21

   Is there 0.1 V or more?
   YES - Repair short to power in the wire between the appropriate wheel speed sensor and the VSA modulator-control unit.■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Reconnect the VSA modulator-control unit 36P connector.
11. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
12. Test-drive the vehicle.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
13. Check for DTCs with the HDS.

    Is DTC 81-51, 81-53, 81-55, or 81-57 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 81-xx

DTC 81-xx *:
Central Processing Unit (CPU) Internal Circuit Malfunction
*: Any two-character subcode (Except these combinations: DTC 81-07, 81-11, 81-3D, 81-3E, 81-51, 81-52, 81-53, 81-54, 81-55, 81-56, 81-57, 81-58, and 81-59)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 81-xx indicated?
   YES - If the DTC 81-07, 81-11, 81-3D, 81-3E, 81-51, 81-52, 81-53, 81-54, 81-55, 81-56, 81-57, 81-58, or 81-59 is indicated at the same time, do the appropriate troubleshooting. If DTC 81-07, 81-11, 81-3D, 81-3E, 81-51, 81-52, 81-53, 81-54, 81-55, 81-56, 81-57, 81-58, or 81-59 is not indicated. Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
7. Check for DTCs with the HDS.

   Is DTC 81-xx indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 83-13, 83-14

DTC 83-13:
ECM/PCM Communication Error (Engine Malfunction)
DTC 83-14:
ECM/PCM Communication Error (A/T Malfunction)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 83-13 or 83-14 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between ECM/PCM connector A (49P) and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM.
6. Clear the DTC with the HDS.
7. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
8. Check for DTCs with the HDS.

   Is DTC 83-13 or 83-14 indicated?
   YES - Go to Step 9 .
   NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM. ■
9. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
10. Test-drive the vehicle.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
11. Check for DTCs with the HDS.

    Is DTC 83-13 or 83-14 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 84-21

DTC 84-21:
VSA Sensor Neutral Position not Writing

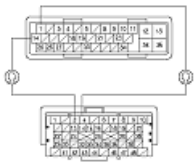
1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Do the VSA sensor neutral position memorization.
4. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
5. Check for DTCs with the HDS.

   Is DTC 84-21 indicated?
   YES - Go to Step 6 .
   NO - The system is OK at this time.■
6. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
7. Do the VSA sensor neutral position memorization.
8. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
9. Check for DTCs with the HDS.

   Is DTC 84-21 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 86-01

DTC 86-01:
F-CAN Bus-off Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

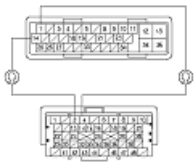
   Is DTC 86-01 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals between ECM/PCM connector A (49P) and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Disconnect the VSA modulator-control unit 36P connector.
9. Check for continuity between VSA modulator-control unit 36P connector terminal and ECM/PCM connector A (49P) terminal (see table).

Sign	VSA Modulator-control Unit 36P Connector Terminal	ECM/PCM Connector A (49P) Terminal
CAN-L	No. 1	No. 4
CAN-H	No. 14	No. 3

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the ECM/PCM and the VSA modulator-control unit.■
10. Reconnect all connectors.
11. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
12. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
13. Check for DTCs with the HDS.

    Is DTC 86-01 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 86-11, 86-21, 86-22, 86-23, 86-24, 86-25, 84-41



DTC 86-11:
F-CAN Communication with ECM/PCM Malfunction
DTC 86-21:
F-CAN Communication with Engine Malfunction
DTC 86-22:
F-CAN Communication with Engine Malfunction
DTC 86-23:
F-CAN Communication with Engine Malfunction
DTC 86-24:
F-CAN Communication with Engine Malfunction
DTC 86-25:
F-CAN Communication with Engine Malfunction
DTC 86-41:
F-CAN Communication with EAT/TCM Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 86-11, 86-21, 86-22, 86-23, 86-24, 86-25, and/or 86-41 indicated?
   YES - If the DTC 86-01 is indicated at the same time, do the DTC 86-01 troubleshooting. If the DTC 86-01 is not indicated, go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals between ECM/PCM connector A (49P) and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect ECM/PCM connector A (49P).
8. Disconnect the VSA modulator-control unit 36P connector.
9. Check for continuity between the VSA modulator-control unit 36P connector terminal and ECM/PCM connector A (49P) terminal (see table).

Sign	VSA Modulator-control Unit 36P Connector Terminal	ECM/PCM Connector A (49P) Terminal
CAN-L	No. 1	No. 4
CAN-H	No. 14	No. 3

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the ECM/PCM and the VSA modulator-control unit.■
10. Reconnect all connectors.
11. Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM.
12. Clear the DTC with the HDS.
13. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
14. Check for DTCs with the HDS.

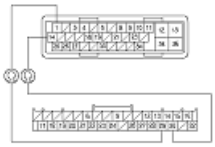
    Is DTC 86-11, 86-21, 86-22, 86-23, 86-24, 86-25, and/or 86-41 indicated?
    YES - Go to Step 15 .
    NO - If the ECM/PCM was updated, troubleshooting is complete. If the ECM/PCM was substituted, replace the original ECM/PCM. ■
15. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
16. Test-drive the vehicle. Drive the vehicle at 10 km/h (7 mph) or more.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
17. Check for DTCs with the HDS.

    Is DTC 86-11, 86-21, 86-22, 86-23, 86-24, 86-25, and/or 86-41 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .

NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 86-31

DTC 86-31:
F-CAN Communication with Gauge Control Module Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 86-31 indicated?
   YES - If the DTC 86-01 is indicated at the same time, do the DTC 86-01 troubleshooting. If the DTC 86-01 is not indicated, go to Step 5 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals between the gauge control module 32P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
5. Turn the ignition switch to ON (II).

   Do the gauge indicators come on?
   YES - Go to Step 6 .
   NO - Do the gauge control module troubleshooting. ■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Disconnect the VSA modulator-control unit 36P connector.
9. Check for continuity between the VSA modulator-control unit 36P connector terminal and gauge control module 32P connector terminal (see table).

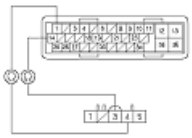
Sign	VSA Modulator-control Unit 36P Connector Terminal	Gauge Control Module 32P Connector Terminal
CAN-L	No. 1	No. 29
CAN-H	No. 14	No. 30

   Is there continuity?
   YES - Check for loose terminals in the gauge control module 32P connector. If necessary, substitute a known-good gauge control module, then go to Step 1 and recheck. If no DTCs are indicated, replace the original gauge control module. If DTC 86-31 resets, go to Step 10 .
   NO - Repair open in the wire between the gauge control module and the VSA modulator-control unit.■
10. Reconnect all connectors.
11. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
12. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
13. Check for DTCs with the HDS.

    Is DTC 86-31 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 86-71

DTC 86-71:
F-CAN Communication with Yaw Rate-Lateral/Longitudinal Acceleration Sensor Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for DTCs with the HDS.

   Is DTC 86-71 indicated?
   YES - If the DTC 86-01 is indicated at the same time, do the DTC 86-01 troubleshooting. If the DTC 86-01 is not indicated, go to Step 4 .
   NO - If any other DTCs are indicated, go to the indicated DTCs troubleshooting. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals at the yaw rate-lateral/longitudinal acceleration sensor 5P connector and the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting. ■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector.
6. Disconnect the VSA modulator-control unit 36P connector.
7. Check for continuity between the VSA modulator-control unit 36P connector terminal and the yaw rate-lateral/longitudinal acceleration sensor 5P connector terminal (see table).

Sign	VSA Modulator-control Unit 36P Connector Terminal	Yaw Rate-lateral/Longitudinal Acceleration Sensor 5P Connector Terminal
CAN-L	No. 1	No. 4
CAN-H	No. 14	No. 3

   Is there continuity?
   YES - Go to Step 8 .
   NO - Repair open in the wire between the yaw rate-lateral acceleration sensor and the VSA modulator-control unit.■
8. Turn the ignition switch to ON (II).

---

9. Measure the voltage between yaw rate-lateral/longitudinal acceleration sensor 5P connector terminal No. 1 and body ground.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the No. 11 (7.5 A) fuse in the driver's under-dash fuse/relay box and the yaw rate-lateral/longitudinal acceleration sensor.■
10. Turn the ignition switch to LOCK (0).
11. Reconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector.
12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between yaw rate-lateral/longitudinal acceleration sensor 5P connector terminal No. 5 and body ground.

   Is there 0.1 V or less?
   YES - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■
   NO - Repair open in the wire between the yaw rate-lateral/longitudinal acceleration sensor and body ground (G503).■

VSA DTC Troubleshooting: 107-22

DTC 107-22:
Central Processing Unit (CPU) Internal Circuit Malfunction

1. Turn the ignition switch to LOCK (0) to cool the VSA modulator-control unit, and wait 1 hour or more.
2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
5. Check for DTCs with the HDS.

   Is DTC 107-22 indicated?
   YES - Go to Step 6 .
   NO - The system is OK at this time.■
6. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
7. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
8. Check for DTCs with the HDS.

   Is DTC 107-22 indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 108-21

DTC 108-21:
Steering Angle Sensor Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
4. Check for DTCs with the HDS.

   Is DTC 108-21 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Substitute a known-good steering angle sensor.
7. Turn the ignition switch to ON (II).
8. Clear the DTC with the HDS.
9. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
10. Check for DTCs with the HDS.

    Is DTC 108-21 indicated?
    YES - Go to Step 11 .
    NO - Replace the original steering angle sensor. ■
11. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
12. Test-drive the vehicle.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
13. Check for DTCs with the HDS.

    Is DTC 108-21 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 116-11

DTC 116-11:
The Functional Abnormalities of i-SHIFT System

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not a lift.
4. Check for DTCs with the HDS.

   Is DTC 116-11 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose terminals in the VSA modulator-control unit 36P connector. Refer to intermittent failures troubleshooting.
5. Check for i-SHIFT system DTCs with the HDS.

   Are any i-SHIFT system DTCs indicated?
   YES - Do the applicable troubleshooting for the i-SHIFT system, then go to Step 6 .
   NO - Go to Step 9 .
6. Clear the DTC with the HDS.
7. Test-drive the vehicle.
   NOTE: Drive the vehicle on a straight section of road, not on a lift.
8. Check for DTCs with the HDS.

   Is DTC 116-11 indicated?
   YES - Go to Step 9 .
   NO - Troubleshooting is complete.■
9. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
10. Test-drive the vehicle.
    NOTE: Drive the vehicle on a straight section of road, not on a lift.
11. Check for DTCs with the HDS.

    Is DTC 116-11 indicated?
    YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
    NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

VSA DTC Troubleshooting: 121-xx, 122-xx, 123-xx, 124-xx

DTC 121-xx *:
VSA Solenoid Valve Malfunction
DTC 122-xx *:
VSA Solenoid Valve Malfunction
DTC 123-xx *:
VSA Solenoid Valve Malfunction
DTC 124-xx *:
VSA Solenoid Valve Malfunction
*: Any two-character subcode (see table).

DTC		Sectional	Valve
121	-01	Right-front and left-rear	Regulator
	-02		
	-11		
	-21		
	-24		
122	-01		Suction
	-21		
	-22		
	-23		
123	-01	Left-front and right-rear	Regulator
	-02		
	-11		
	-21		
	-24		
124	-01		Suction
	-21		
	-22		
	-23		

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

   Is DTC 121-xx, 122-xx, 123-xx, or 124-xx indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the VSA modulator-control unit if it does not have the latest software. If the unit already has the latest software, substitute a known-good VSA modulator-control unit.
6. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
7. Check for DTCs with the HDS.

   Is DTC 121-xx, 122-xx, 123-xx, or 124-xx indicated?
   YES - Check for loose terminals in the VSA modulator-control unit 36P connector. If the VSA modulator-control unit was updated, substitute a known-good VSA modulator-control unit, then retest. If the VSA modulator-control unit was substituted, go to Step 1 .
   NO - If the VSA modulator-control unit was updated, troubleshooting is complete. If the VSA modulator-control unit was substituted, replace the original VSA modulator-control unit. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.■

Symbols

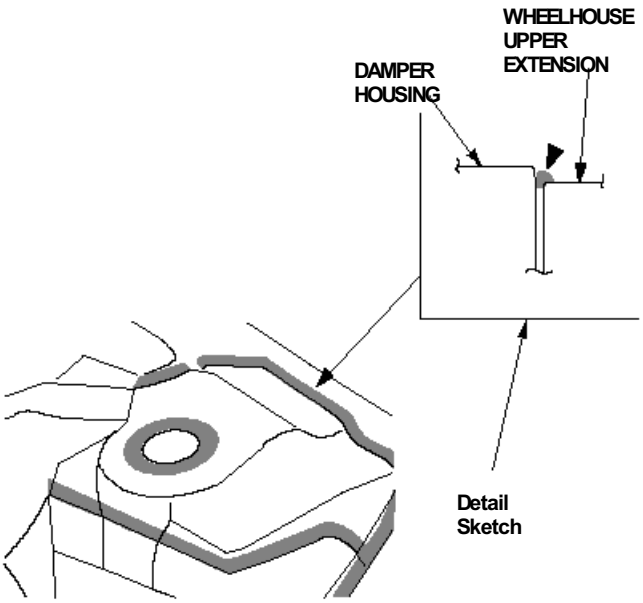
Replacement

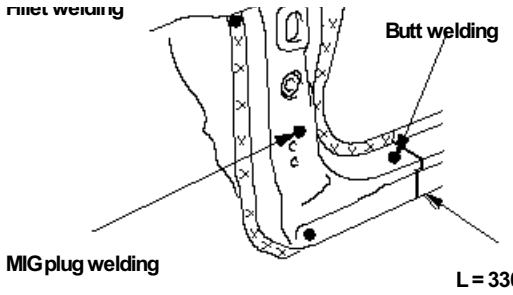
The welding symbols in the removal/installation have these meanings.
× : 2-Plate spot welding
⊗ : 3-Plate spot welding
⊠ : 4-Plate spot welding
● : MIG plug welding
⬬ : MIG welding
L= Welding length Unit: mm (in.)
( ): The number of welds

of positioning bosses and/or holes shown in the detail sketches.
ne holes.

Black dots: Measuring point

▶ **: Sealing locations**



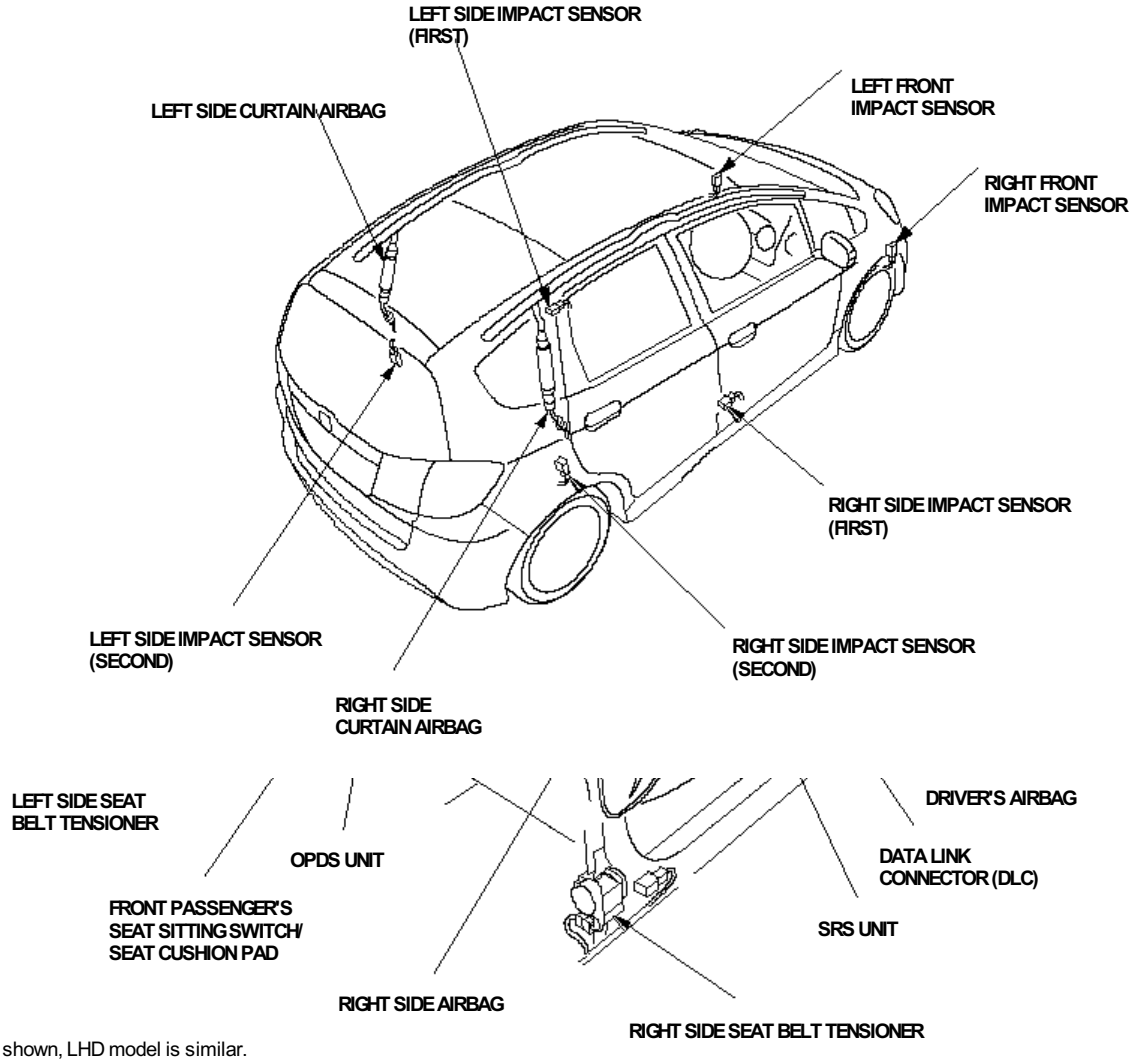


SRS Information

This model has an SRS which includes a driver's airbag in the steering wheel hub, a passenger's airbag in the dashboard above the glove box, the seat belt tensioners in the front seat belt retractors, the side airbags in the front seat-backs, and the side curtain airbags in the sides of the roof. The SRS unit is separate from the airbag assembly and has built-in sensors. The following precautions should be observed when doing sheet metal work, paint work, and repair work around the locations of the SRS components.

- The SRS unit (including the safing sensor and the impact sensor) is located under the dashboard and the side impact sensors are located in each side sill and rear wheel arch. The front impact sensors are located behind the right and left ends of the front bumper. Avoid any strong impact with a hammer or other tools when repairing the front side frame, the lower part of the dashboard, the side sill, and rear wheel arch. Do not apply heat to these areas with a torch, etc.
- Take extra care when painting or doing body work in the area below the center pillar. Do not expose the seat belt retractor and tensioner to heat guns, welding, or spraying equipment.
- SRS electrical wiring harnesses and connectors are identified with yellow color coding. Take care when repairing this area. Prevent damage to the harness.
- Do not apply heat of more than 100 °C (212 °F) when drying painted surfaces anywhere around the SRS components locations.
- If strong impact or high temperature need to be applied to the areas around the locations of SRS components, remove the components before performing the repair work.
- If any of the SRS related components are damaged or deformed, be sure to replace them.

NOTE: For after-deployment procedures, and removal and replacement of SRS related components, refer to the Fit/Jazz Shop Manual.



RHD model is shown, LHD model is similar.

SRS Component Replacement/Inspection After Deployment

NOTE:

- Before doing any SRS repairs, check the DTCs, refer to the appropriate Fit/Jazz Shop Manual, for the less obvious deployed components (seat belt tensioners, front impact sensors, side airbag sensors, etc.)
- Do not replace the OPDS unit unless it is physically damaged or a specific fault was found during DTC troubleshooting in the appropriate Fit/Jazz Shop Manual.

After a collision where the seat belt tensioners deployed, replace these items:

- SRS unit
- Seat belt tensioners
- Front impact sensors

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed airbag(s)
- Seat belt tensioners
- Front impact sensors

After a collision where the side airbag(s) deployed, replace these items:

- SRS unit
- Deployed side airbag(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Center pillar lower trim
- Complete seat frame

After a collision where a side curtain airbag has deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Seat belt tensioner(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Front pillar trim
- Center pillar upper trim
- Quarter pillar trim
- Headliner
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor

After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. Replace the components as needed.
After a collision, where a side curtain airbag has deployed, replace all trim clips on that side, even if they appear to be undamaged. Replace the clips on these parts:

- Front pillar trim
- Center pillar lower trim
- Quarter pillar trim

During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel.

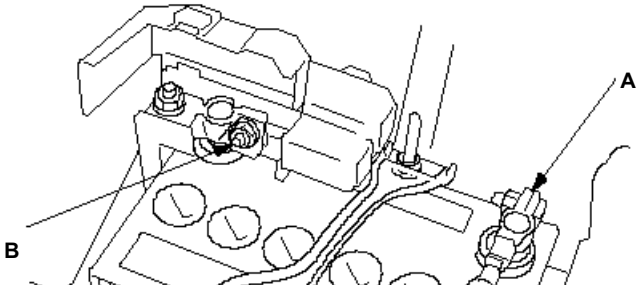
After the vehicle is completely repaired, turn the ignition switch to ON (II). If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS to read the DTC, refer to the appropriate Fit/Jazz Shop Manual. If you cannot retrieve a code, do the SRS Symptom Troubleshooting in the appropriate Fit/Jazz Shop Manual.

Battery Terminal Disconnection/Reconnection

Disconnection

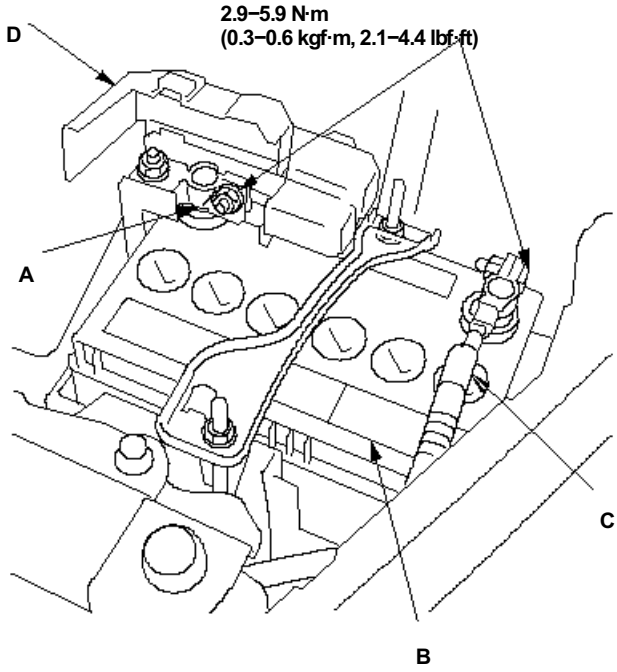
NOTE: Some system store data in memory is lost when the battery is disconnected. Do the following procedures before disconnecting the battery.

1. Make sure you have the anti-theft code(s) for the audio and/or the navigation system (if equipped).
   NOTE: For some models, it maybe necessary to write down the audio presets (AM and FM), because the audio unit does not retain the presets after the battery is disconnected.
2. Make sure the ignition switch is in LOCK (0).
3. Disconnect and isolate the negative cable (A) from the battery.
   NOTE: Always disconnect the negative cable from the battery first.



d. Do the following procedures to restore the systems back to normal

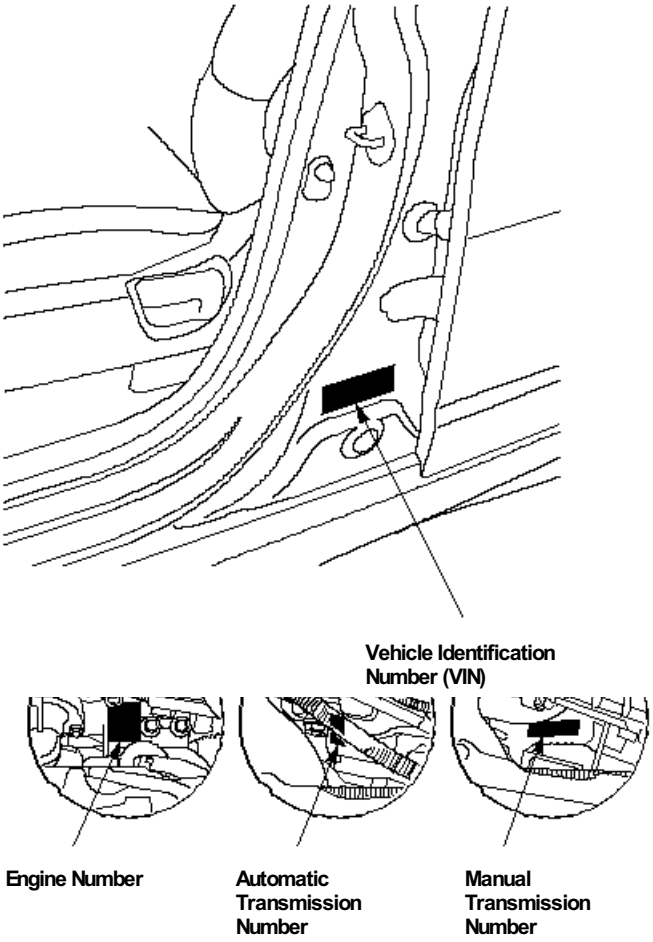
negative cable (C) to the battery.



n (if equipped).

Identification Number Locations

NOTE: The illustration shows the RHD model, LHD model is similar.

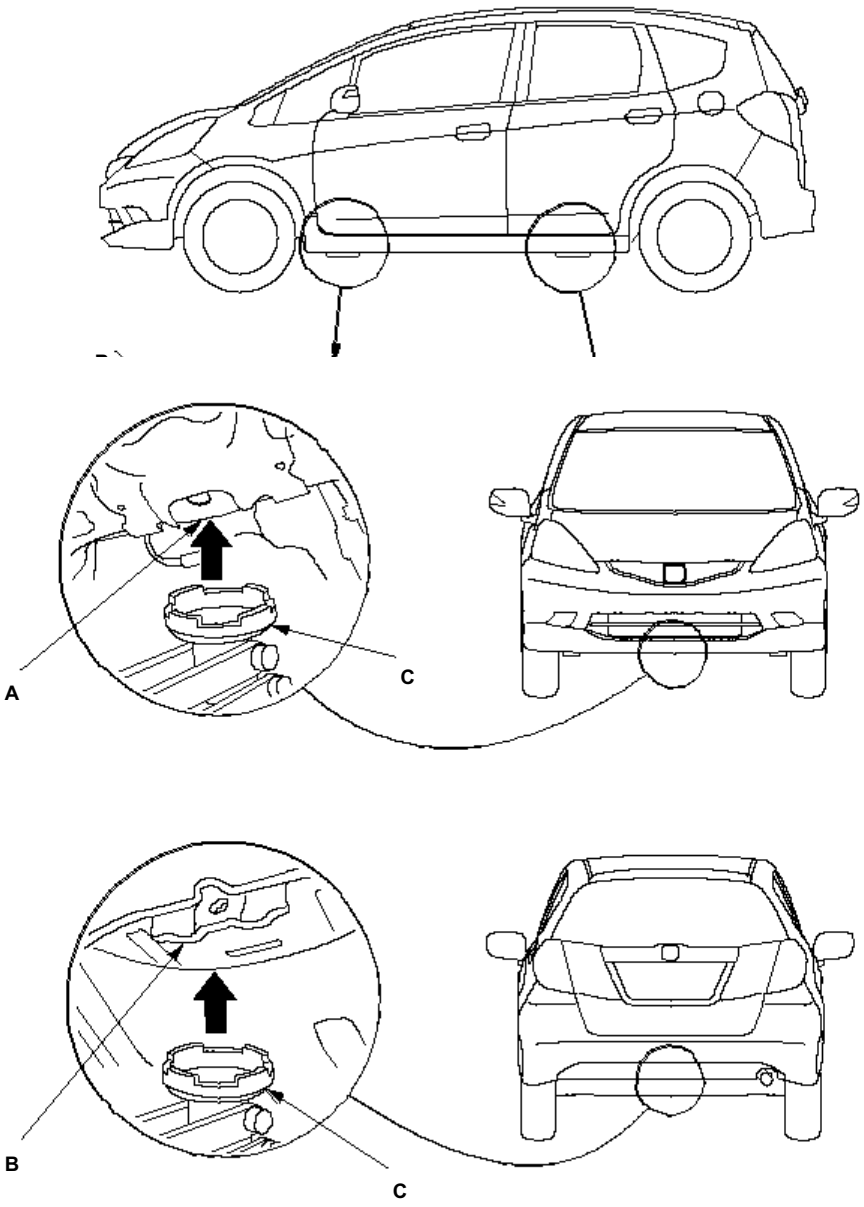


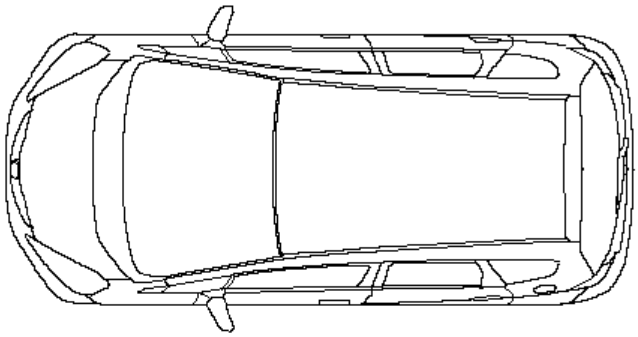
Lift and Support Points

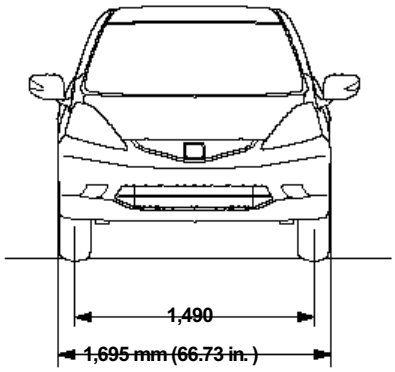
NOTE: If you are going to remove heavy components such as the suspension from the rear of the vehicle, first support the front of the vehicle with tall safety stands. When substantial weight is removed from the rear of the vehicle, the center of gravity can change causing the vehicle to tip forward on the lift.

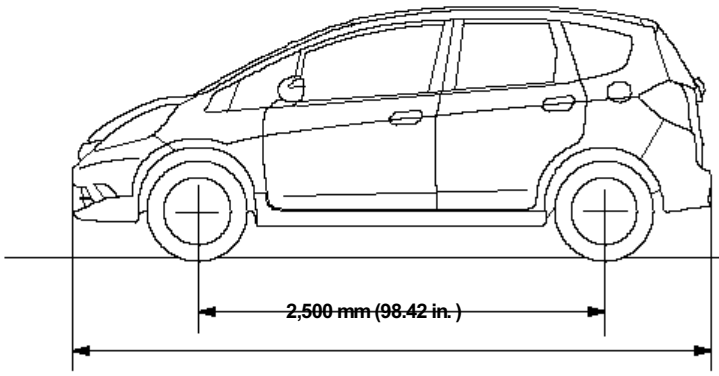
Vehicle Lift

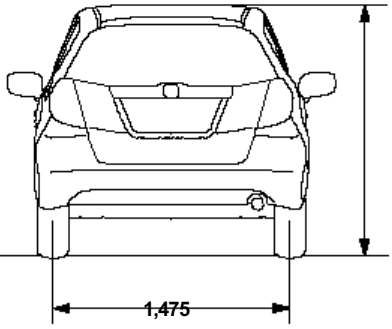
1. Position the hoist lift blocks (A) under the vehicle's front support points (B) and rear support points (C).









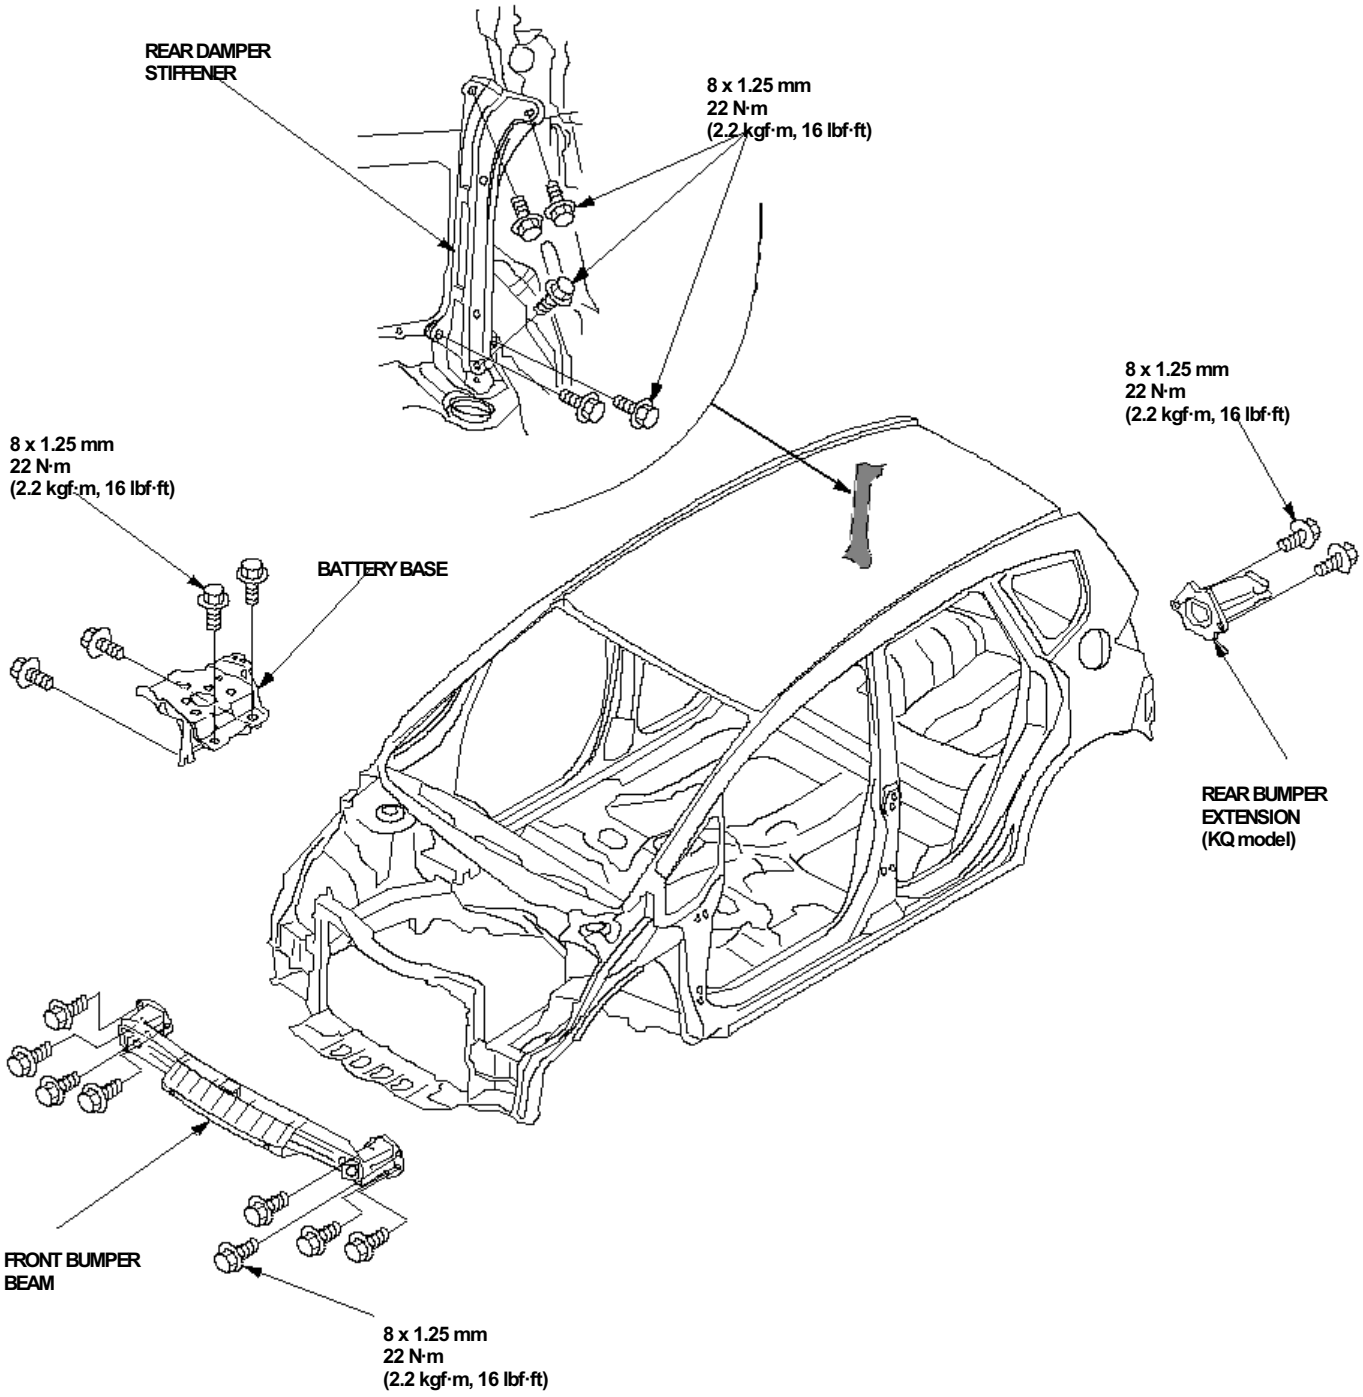


L13Z1 Engine models: 3,900 mm (153.5 in.)
L15A7 Engine models: 3,920 mm (154.3 in.)

Exterior Parts Removal/Installation

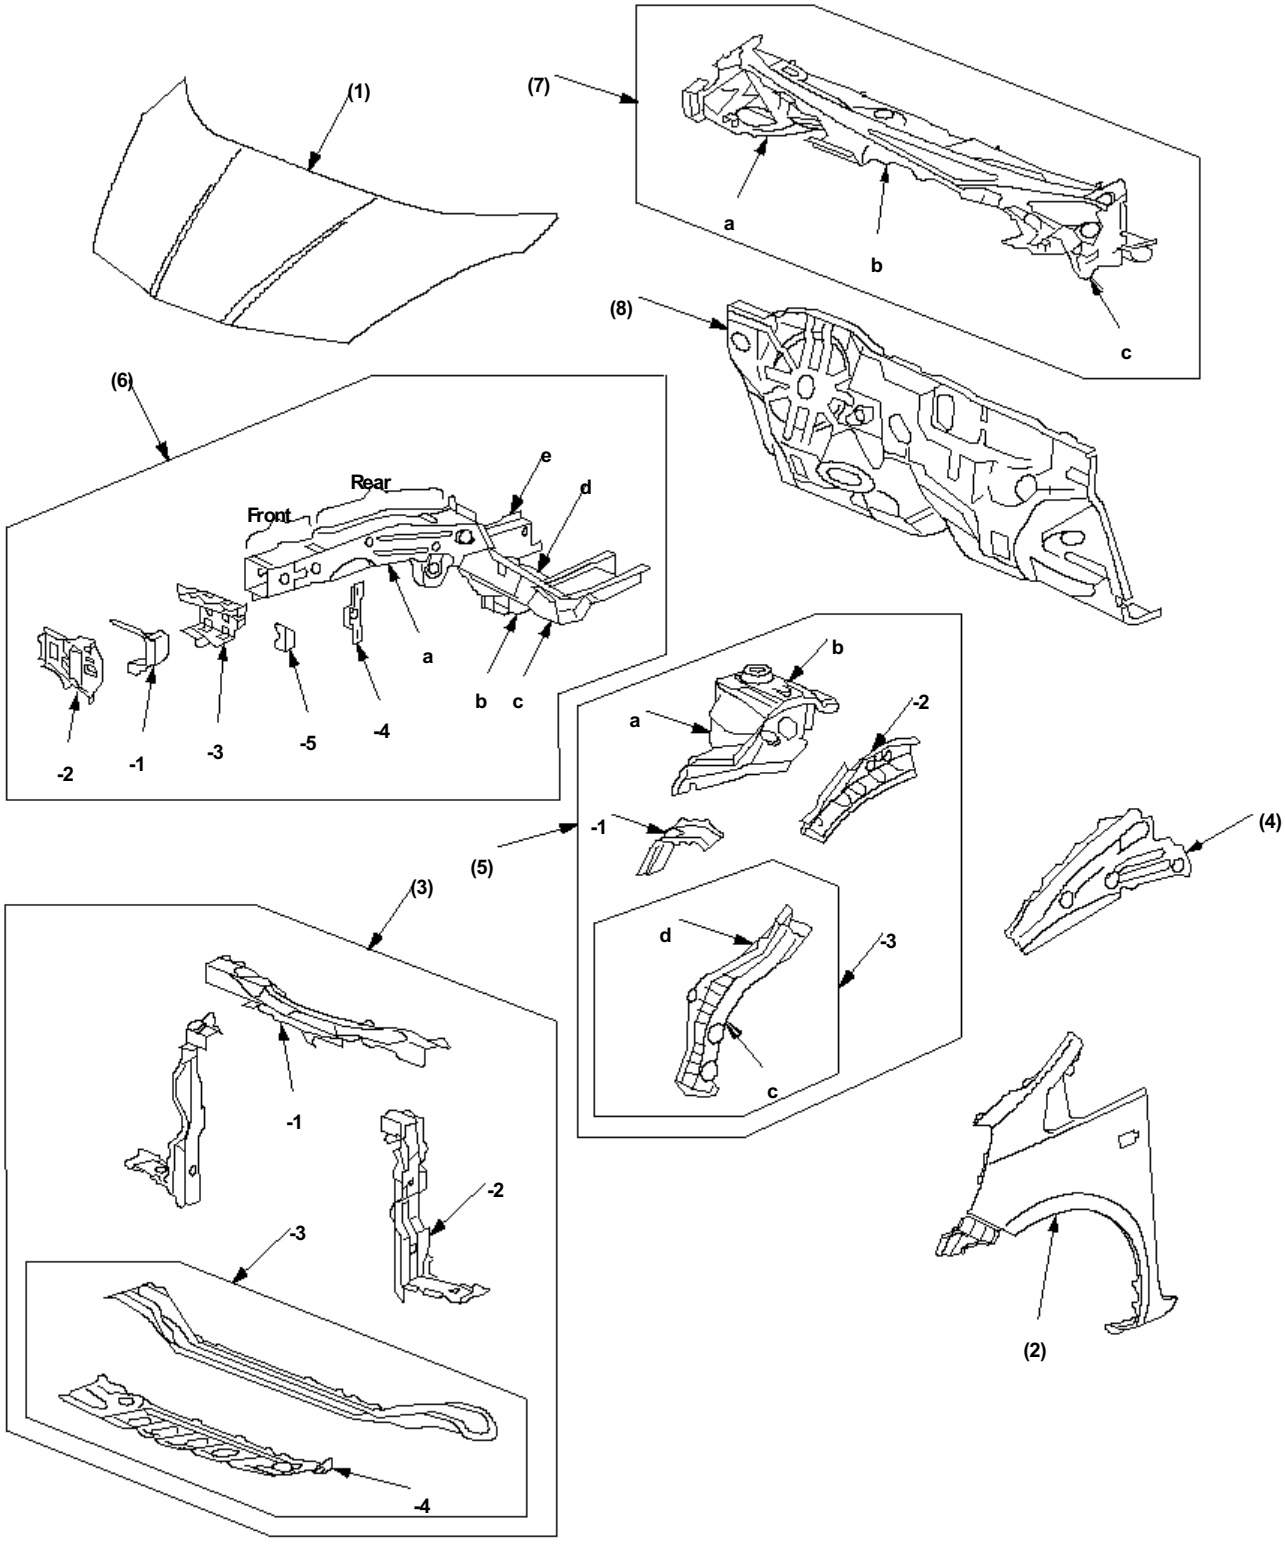
NOTE:

- When removing the front fender, do not deform the upper portion (A) of the front fender.
- When adjusting the door in or out, replace the mounting bolts (B) (90102-SFA-305).
- Apply spot sealer to the mating surface, then install the front fender, the hood, the doors, the tailgate, and the hinges.
- Before attaching the front fender, apply sealer to the mating surface of the front fender and front pillar outer panel.



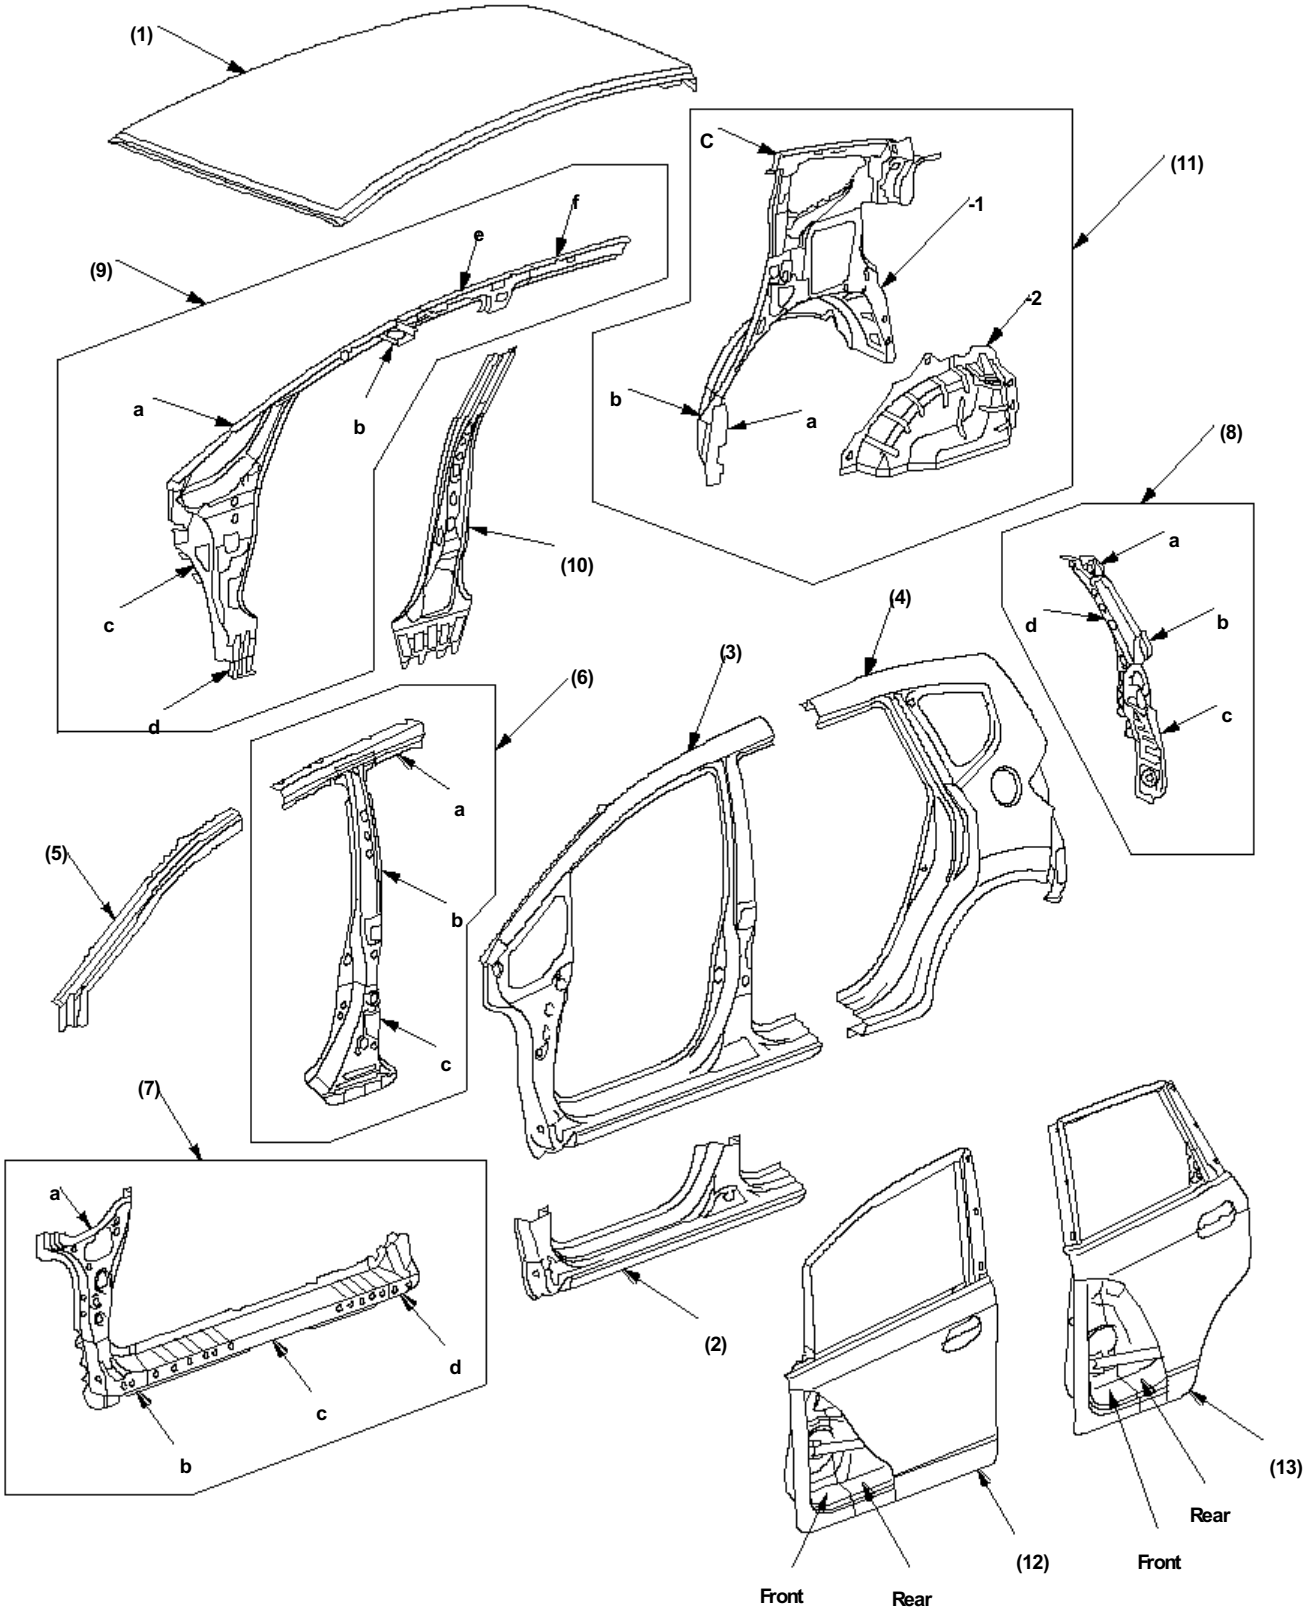
Front Body Construction

NOTE: Confirm that the sold as repair parts, refer to the appropriate Parts Catalog.



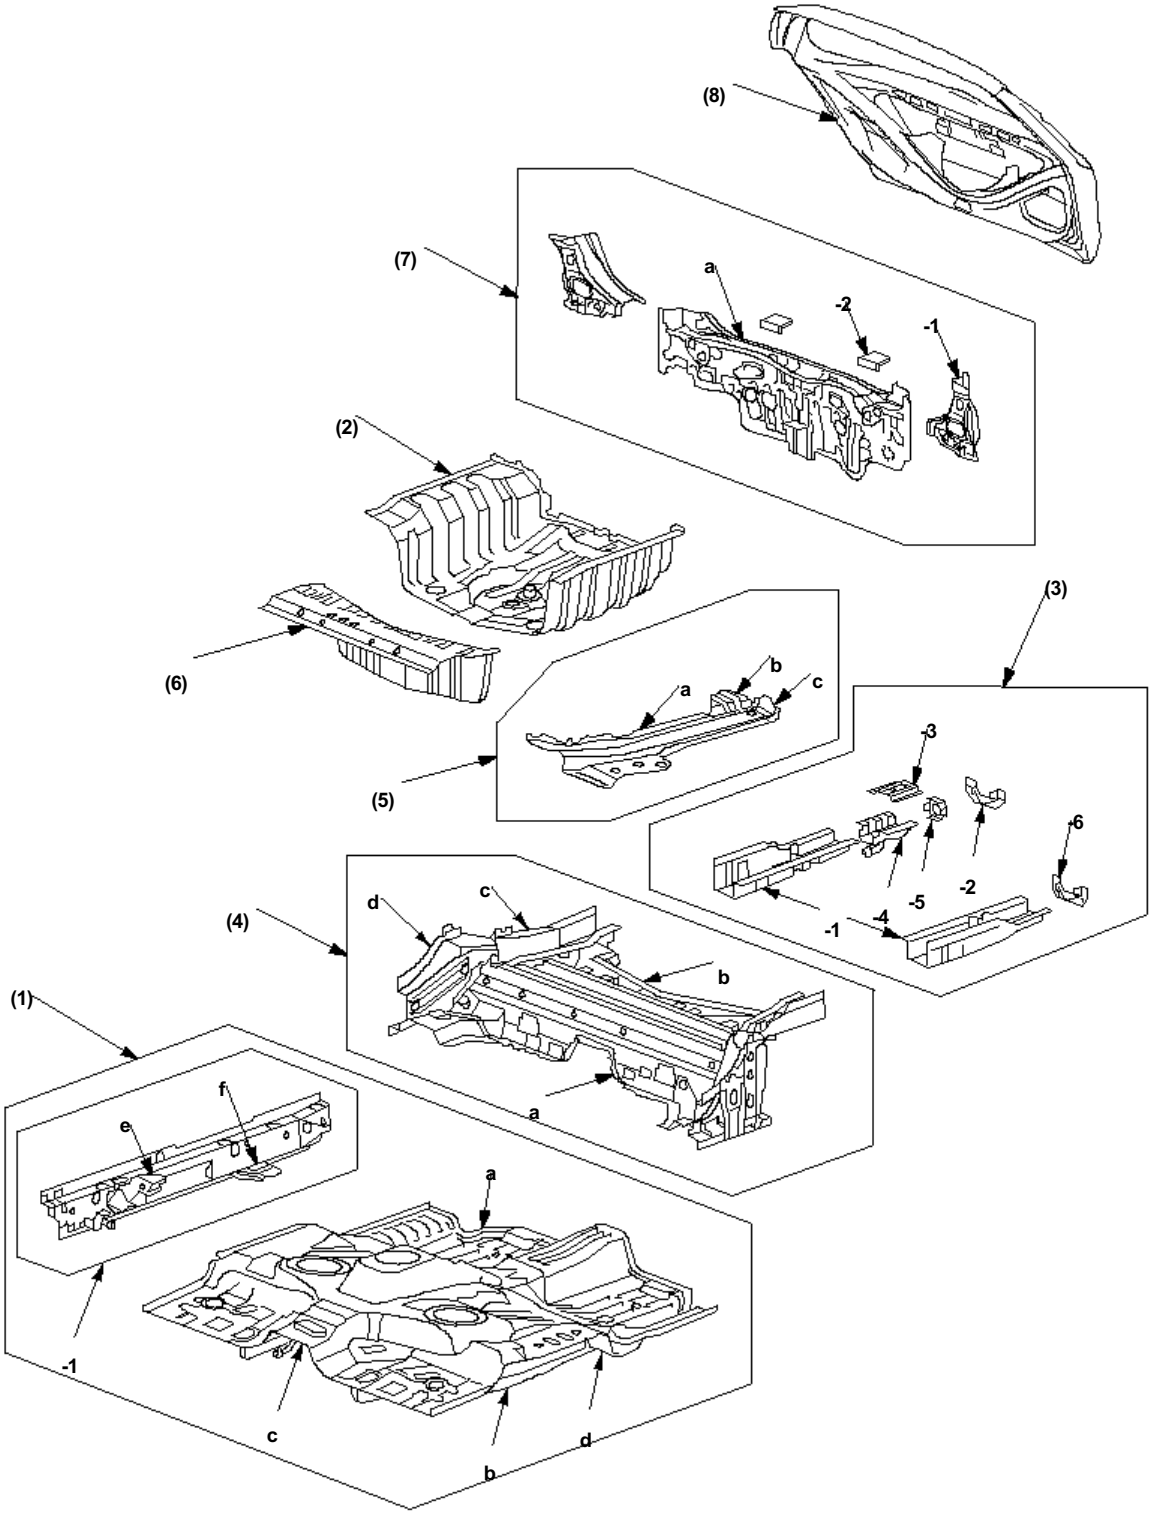
Roof and Side Panel Construction

NOTE: Confirm that the sold as repair parts, refer to the appropriate Parts Catalog.



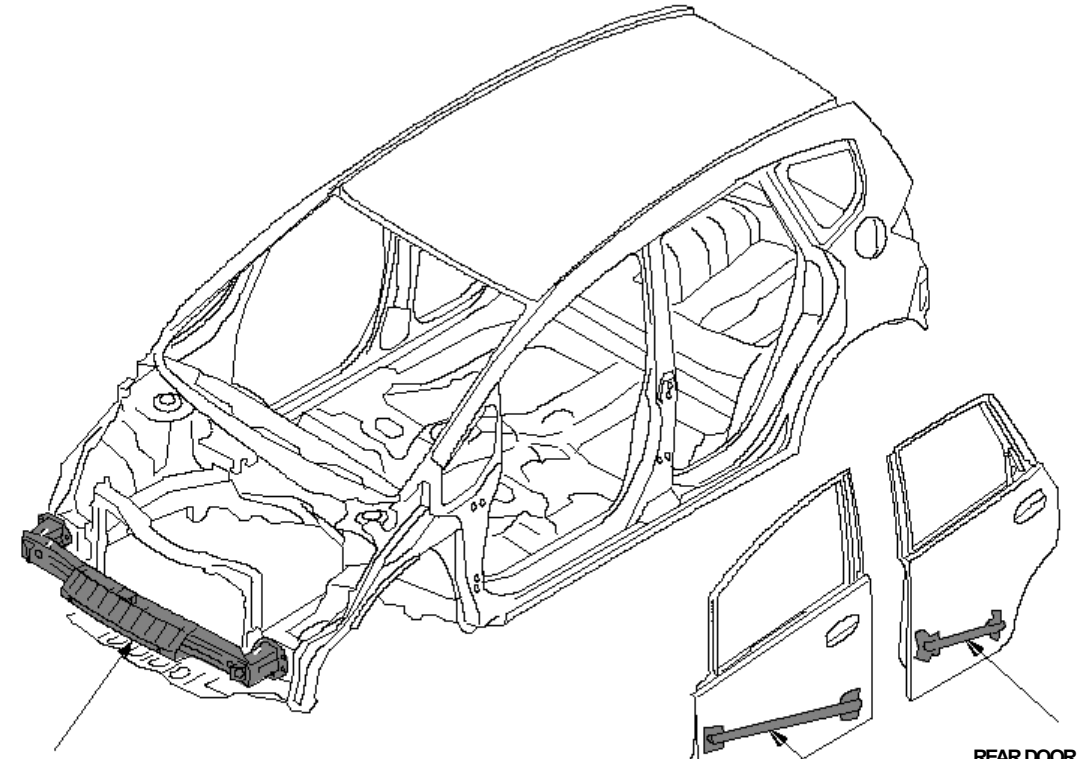
Floor and Rear Body Construction

NOTE: Confirm that the sold as repair parts, refer to the appropriate Parts Catalog.



Door and Bumper Reinforcement Beams

The door and bumper reinforcement beams used on Fit/Jazz vehicles are made from a metal equivalent to high-strength steel.
If high-strength steel is heated, the strength of the steel will be reduced. If high-strength steel is damaged, for example. In an accident, and the door and bumper reinforcement beams are bent, the beams may crack when attempting to straighten them. If a door beam is damaged, the whole door panel assembly should be replaced.
For this reason, the door and bumper reinforcement beams should NEVER be replaced; they should be replaced if they are damaged.



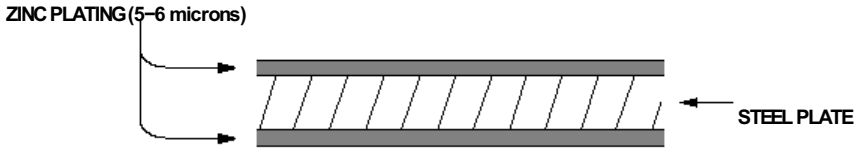
FRONT BUMPER REINFORCEMENT BEAM
Do not repair.

REAR DOOR REINFORCEMENT BEAM
Do not repair.

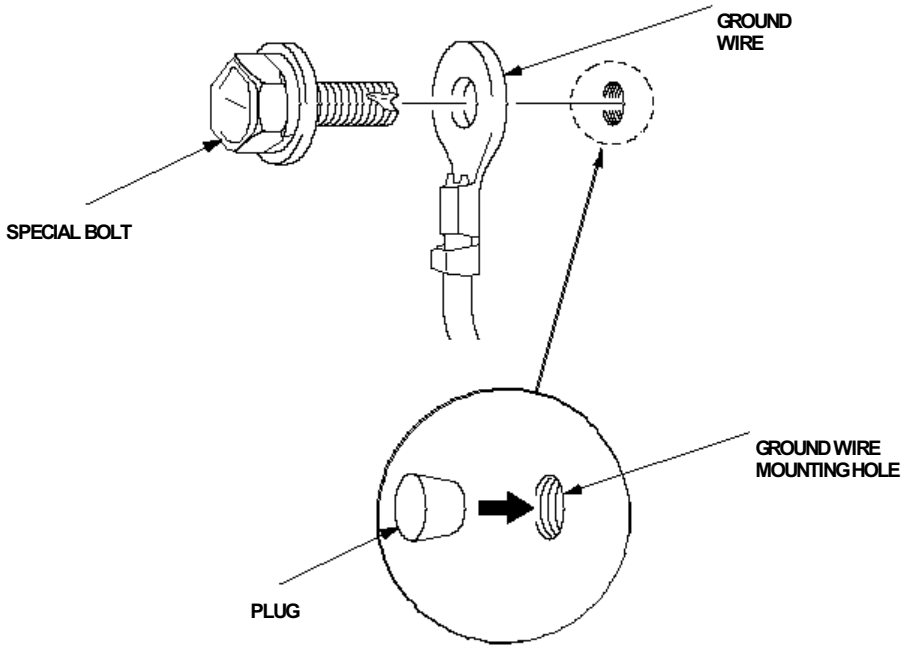
FRONT DOOR REINFORCEMENT BEAM
Do not repair.

Zinc-plated Steel Plate Repair

The zinc-plated steel plate used in some panels of the Fit/Jazz require different repair techniques than ordinary steel plate. Refer to "Front Body Construction" , "Roof and Side Panel Construction" , "Floor and Rear Body Construction" for the location of the zinc-plated panels.



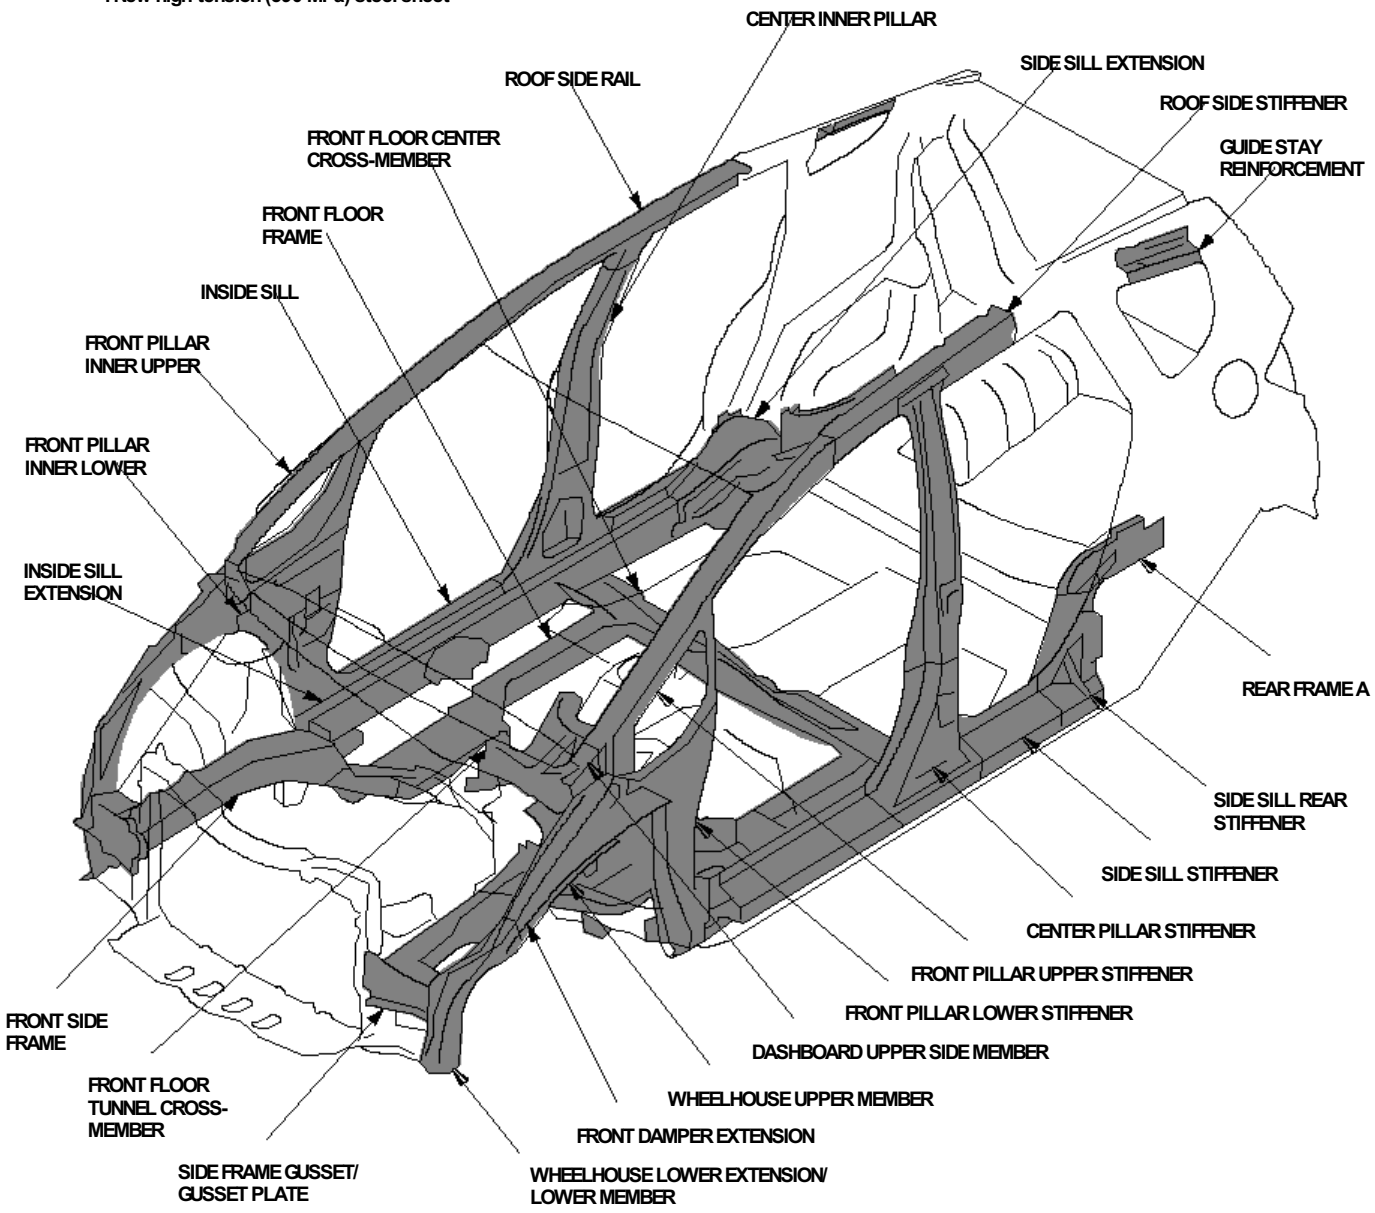
4. When doing paint work, protect the ground wire and the ground wire mounting hole threads with a bolt or a plug.



High-tension Steel Sheet Framed Area

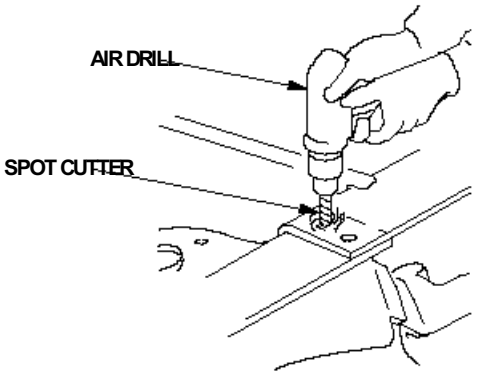
The new high-tension steel sheet has greater tensioner strength than the conventional high-tension steel sheet. Although it's a thinner sheet, it maintains the same strength capacity as the previous thicker ones. Because the manufacturing press process has improved, the usage area has expanded. For this vehicle, the new high-tension steel sheet is used for its main frame and its cabin construction part to make the new model lightweight and to strengthen the safety capacity of the high-crush absorption frame.

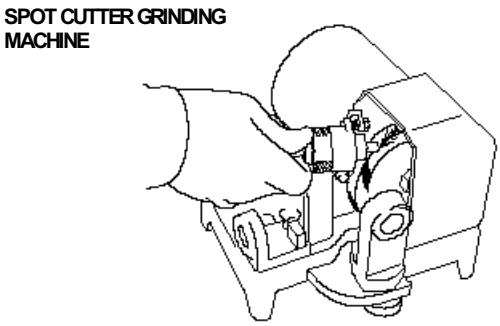
: New high-tension (590 MPa) steel sheet

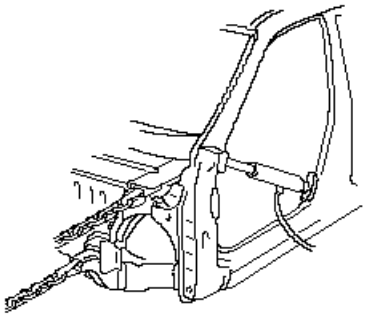


Precautions for High-tension Steel Parts Area Repair

- The new high-tension steel parts of the frame are all spot welded together. In order to disassemble, drill a hole in the sections that are spot welded together with a very sharp spot weld bit.
- The new high-tension steel sheet is more rigid than previous steel sheets, making it difficult to strengthen. When an automobile's frame is partially constructed with the new high-tension steel sheet, it should be strengthened using an accurate frame straightening system. Inspect the body and frame once the repair is complete for stress-related damage to the sections that are not made from the new high-tension steel.
- High-tension steel has more memory than normal steel, and it is necessary to monitor the body dimensions closely during the straightening process.
- Spot welding is a acceptable for replacement parts as long as the proper number of welds is used in the repair. For replacement part welding locations, refer to ‘‘Replacement" in this manual. If spot welding does not provide acceptable repairs, plug the welds using an MIG welder.



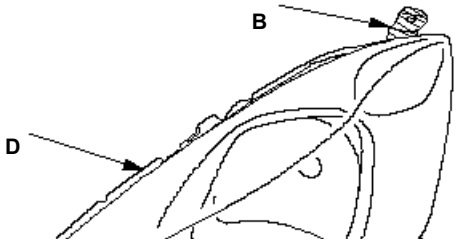




Headlight Bracket Replacement

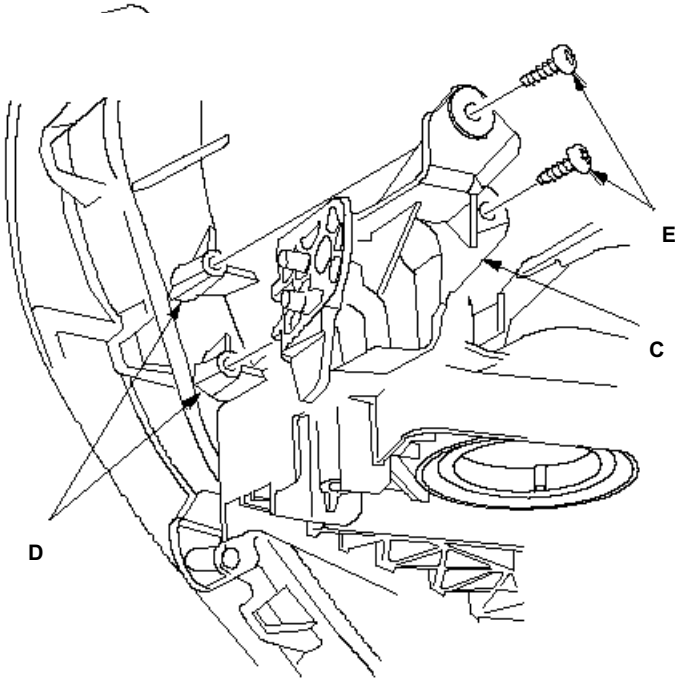
NOTE: Put on gloves to protect your hands.
When the Front bracket (A), the upper bracket (B) and/or the lower bracket (C) of the headlight assembly (D) are broken, it can be reinstalled using the repair brackets if it meets this criteria;

- There is no damage to the headlight assembly.
- The sealing of the headlight lens and headlight housing is maintained.



he lower bracket (C) so that the bosses (D) of the headlight housing
a with 400 grit sandpaper. Take care not to scratch the headlight

ver repair bracket (C) on the bosses of the headlight housing (D), then



Paint Safety Precautions

⚠WARNING

Most paints contain substances that are harmful if inhaled or swallowed. Read the paint label before opening the container.

Observe the following precautions to maintain a safe painting work area.

- Wear an approved respirator and eye protection when painting.
- Wear approved gloves and appropriate clothing when painting. Avoid contact with skin.
- Spray paint only in a well ventilated area.
- Cover spilled paint with sand, or wipe it up at once.
- If paint gets in your mouth or on your skin, rinse and wash thoroughly with water. If paint gets in your eyes, flush with water and get prompt medical attention.
- After the painting work is finished, wash your face and gargle with water.
- Paint is flammable. Store it in a safe place, and keep it away from sparks, flames, or cigarettes.

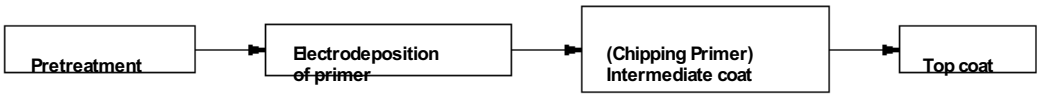
Paint General Information

The 3-coat·3-bake (3C·3B) paint finish gives the Fit/Jazz a deep gloss and stunning finish. This manual provides information on paint defects, repair, and refinishing. Throughout, the objective is to explain in a simple yet comprehensive manner the basic items you should know about paint repairs. Select the correct material for the defect and repaint or refinish in the correct manner as described in this manual.

Basic Rules for Repairing a Paint Finish

To repair paint damage, always use the 2-part acrylic urethane paints designated; polish and bake each of the three coats, as in production, to maintain the original film thickness, and to assure the same quality as the original finish.

Outline of factory painting process



After the body has been cleaned with pure water, it is placed in an electrolytic bath of soluble primer (cationic electrodeposition). This produces a thorough corrosion inhibiting coating on the inner surface and corners of the body, pillars, sills, and panel joints. Chipping primer is then applied to the most susceptible areas.

Intermediate coat

The intermediate coat is applied to the prepared surface to further protect against damage.

Top coat

Enamel paint and either polyester or acrylic resin paint are used in the top coat for higher solidity, smoothness, brightness, and weather resistance.

Sectional view of paint coats

Features of Plastic Materials

- Check each of the plastic parts for solvent resistance and heat resistance before you do any repair work.
- Select the repair material according to materials of the plastic parts.
- Alcohol can be used for degreasing in small amounts, and for short periods of time. Do not soak.
- Contact your paint and material supplier for other recommended cleaners for the type of plastic you are working on.

Standard Symbol	Name	Heat Resistance Temperature °F (°C)	Note
AAS	Acrylonitrile acrylic styrene	176 (80)	
ABS	Acrylonitrile butadiene styrene	176 (80)

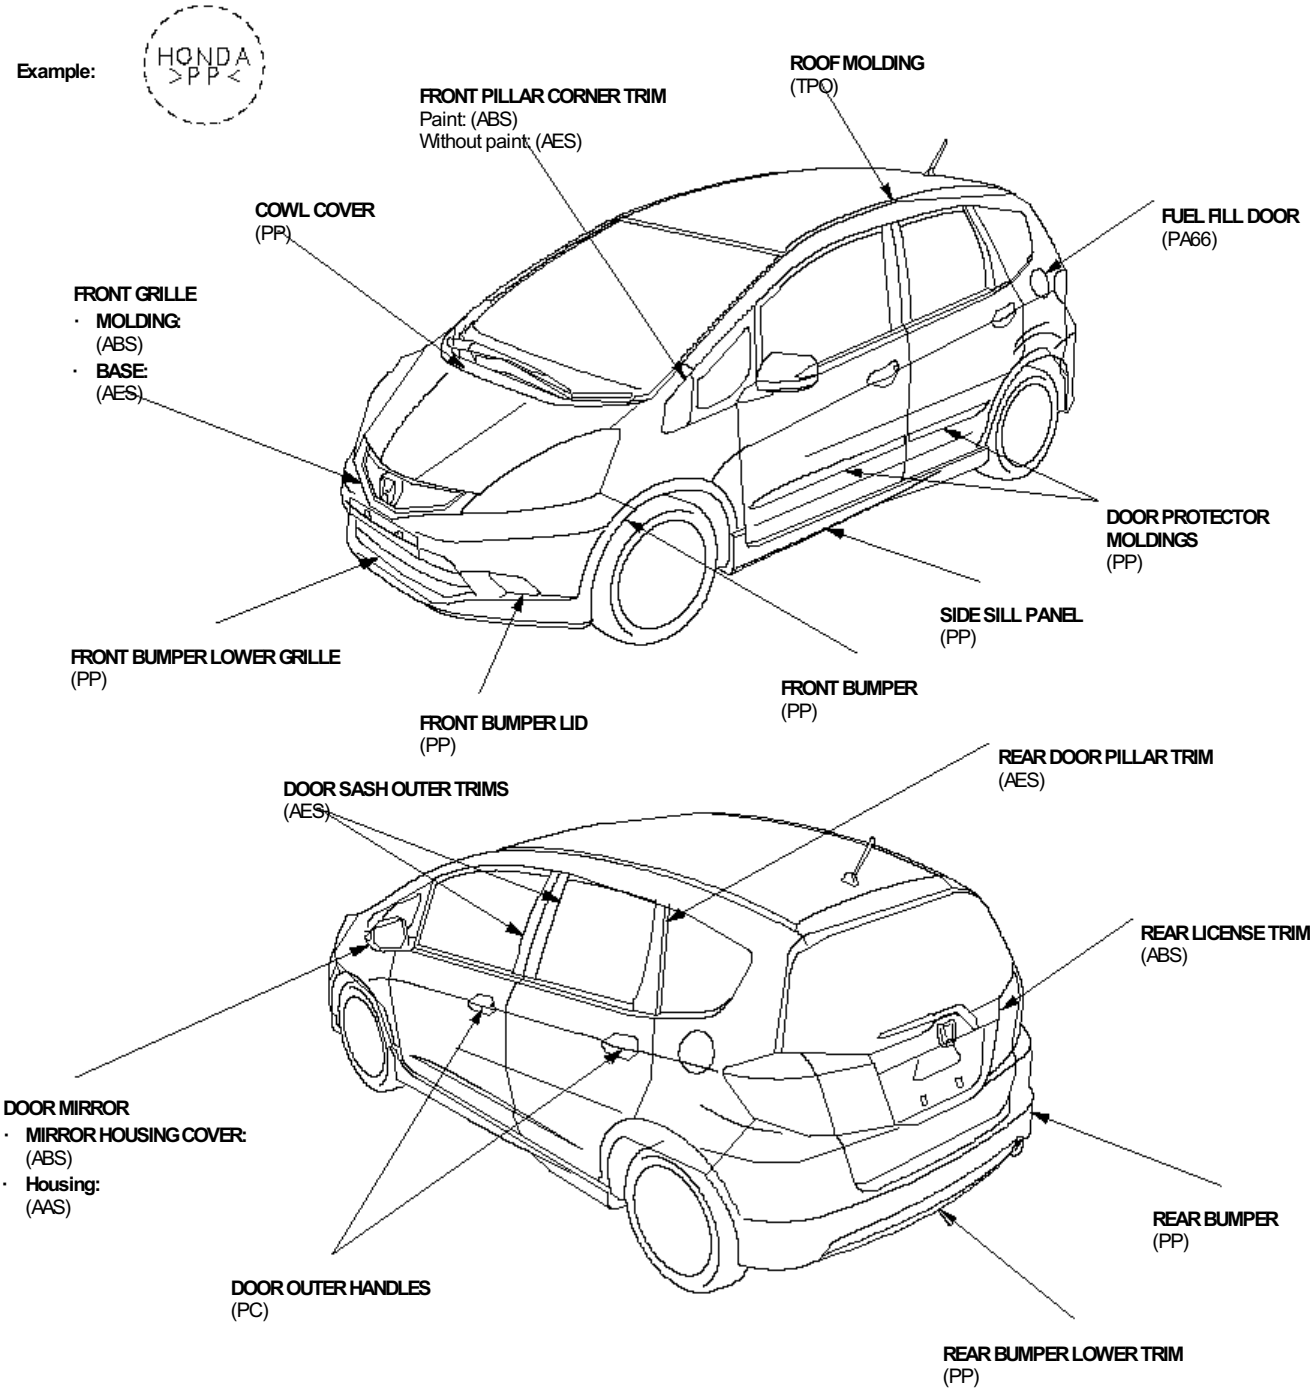
UP	Polyester	230 (110)	Alkali can damage the material.

Types and Materials of Exterior Plastic Parts

NOTE:

- For the full plastic name, refer to the features of plastic materials.
- A standard symbol is stamped on the underside of each resin part to show the type of material used.



Soft Chipping Guard Primer Coat - General Safety Precautions

The removal of paint and undercoating by stone chips immediately exposes metal to the atmosphere, causing it to oxidize. The thickness of this oxidation increases if the process continues unchecked. The soft chipping guard primer protects against damage due to the impact of such objects.

- The soft chipping guard primer coat is applied over the E. D. (electorostatically deposited) primer. It is followed by guide coating and top coating.
- The soft chipping guard primer produces a smooth surface when dry. It should be sprayed so the thickness of the protective film is 20 microns.

Sectional view of paint coats:

Top coat
Intermediate coat + Chipping guard primer
Electrodeposition
Base metal

- A soft chipping guard primer coat is then applied to the most susceptible area.
- Spray the primer surface (2-part urethane primer surfacer) on the soft chipping guard primer coating areas when you replace parts using soft chipping guard primer coat.

Coating Procedures

⚠WARNING

- Wear goggles or safety glasses to prevent eye injury.
- Ventilate when spraying undercoat.

1. Sanding the replacement part.
   Use a double action sander and 400 grit sandpaper.
   NOTE:
   - Do not oversand the edges or corners of the part.
   - Do not expose base metal.

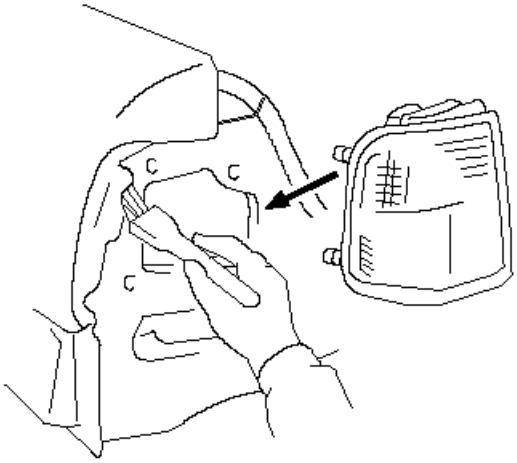
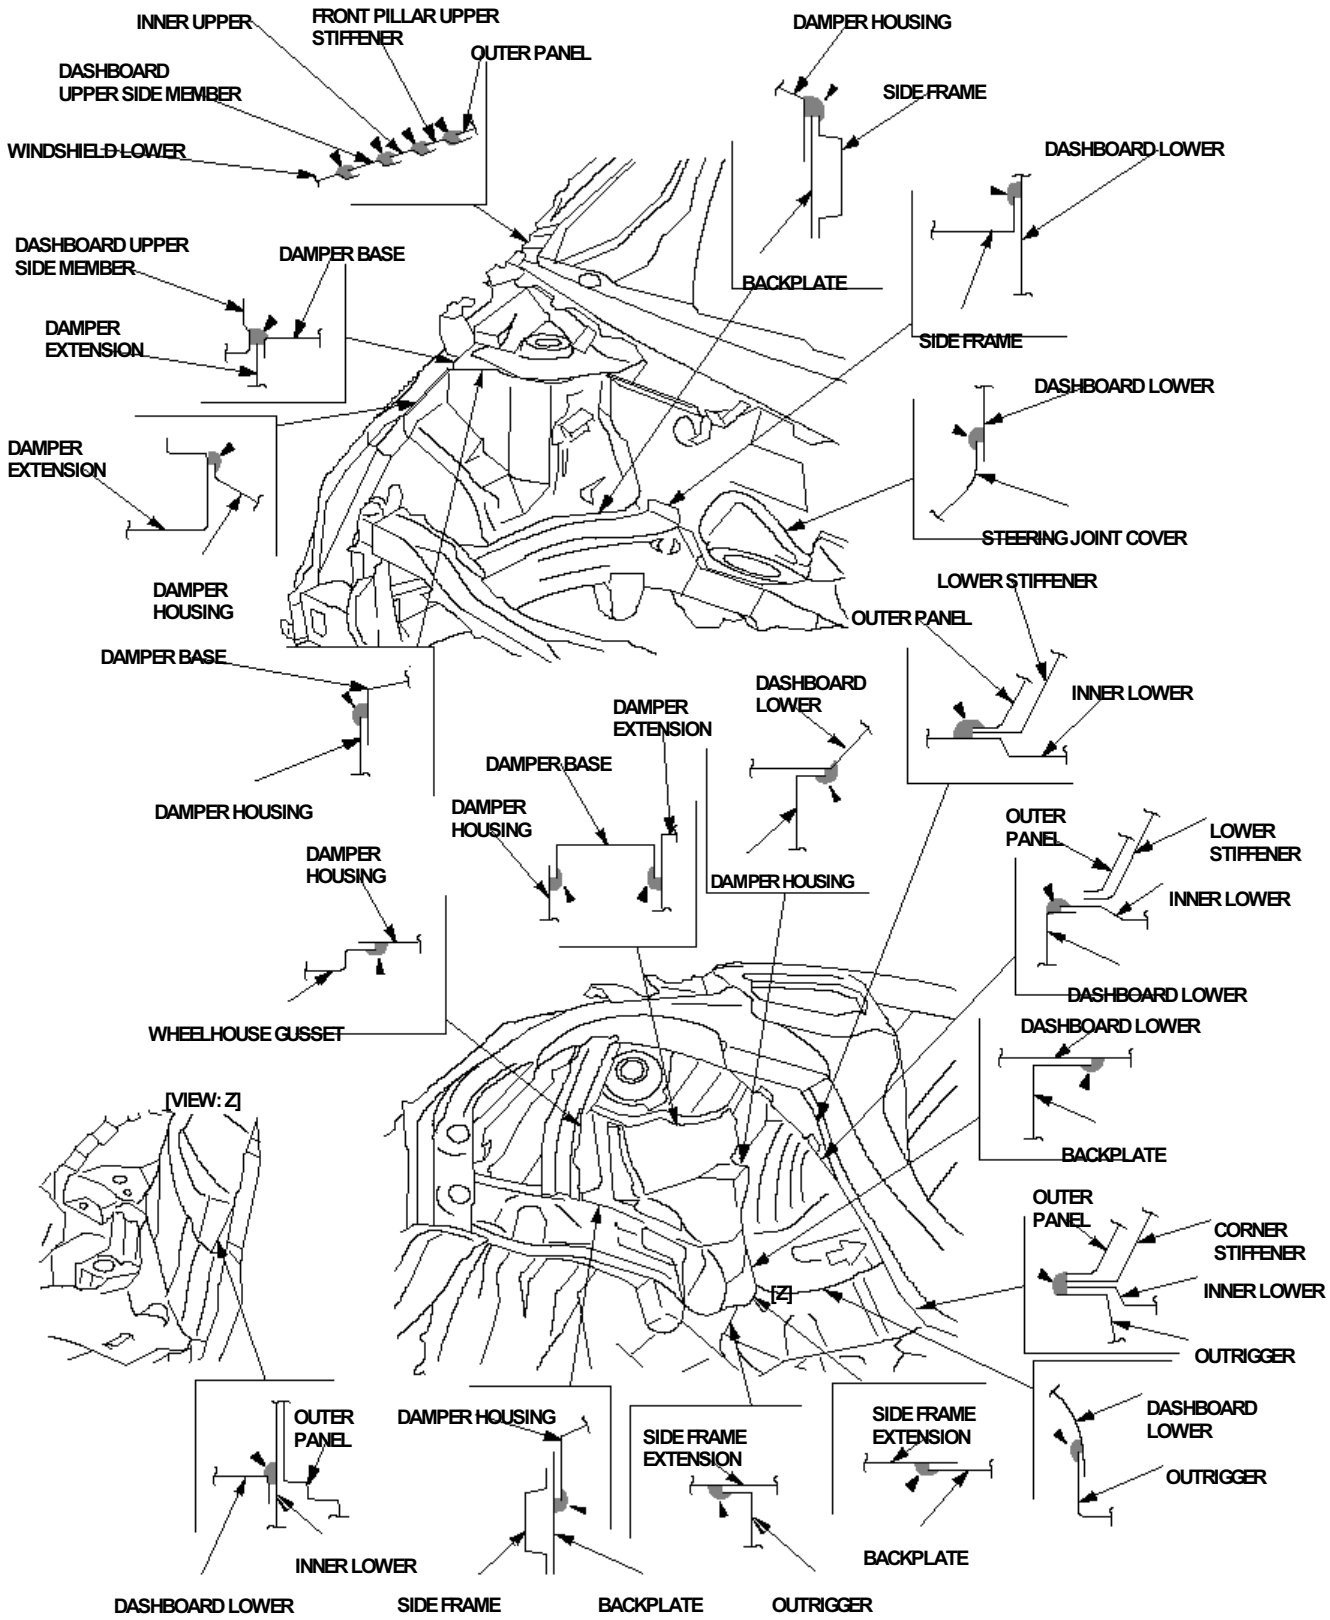
Cross Section of Body and Sealants - General

NOTE: Follow the sealer manufacturer's instructions, and apply the sealer. Note the following items:

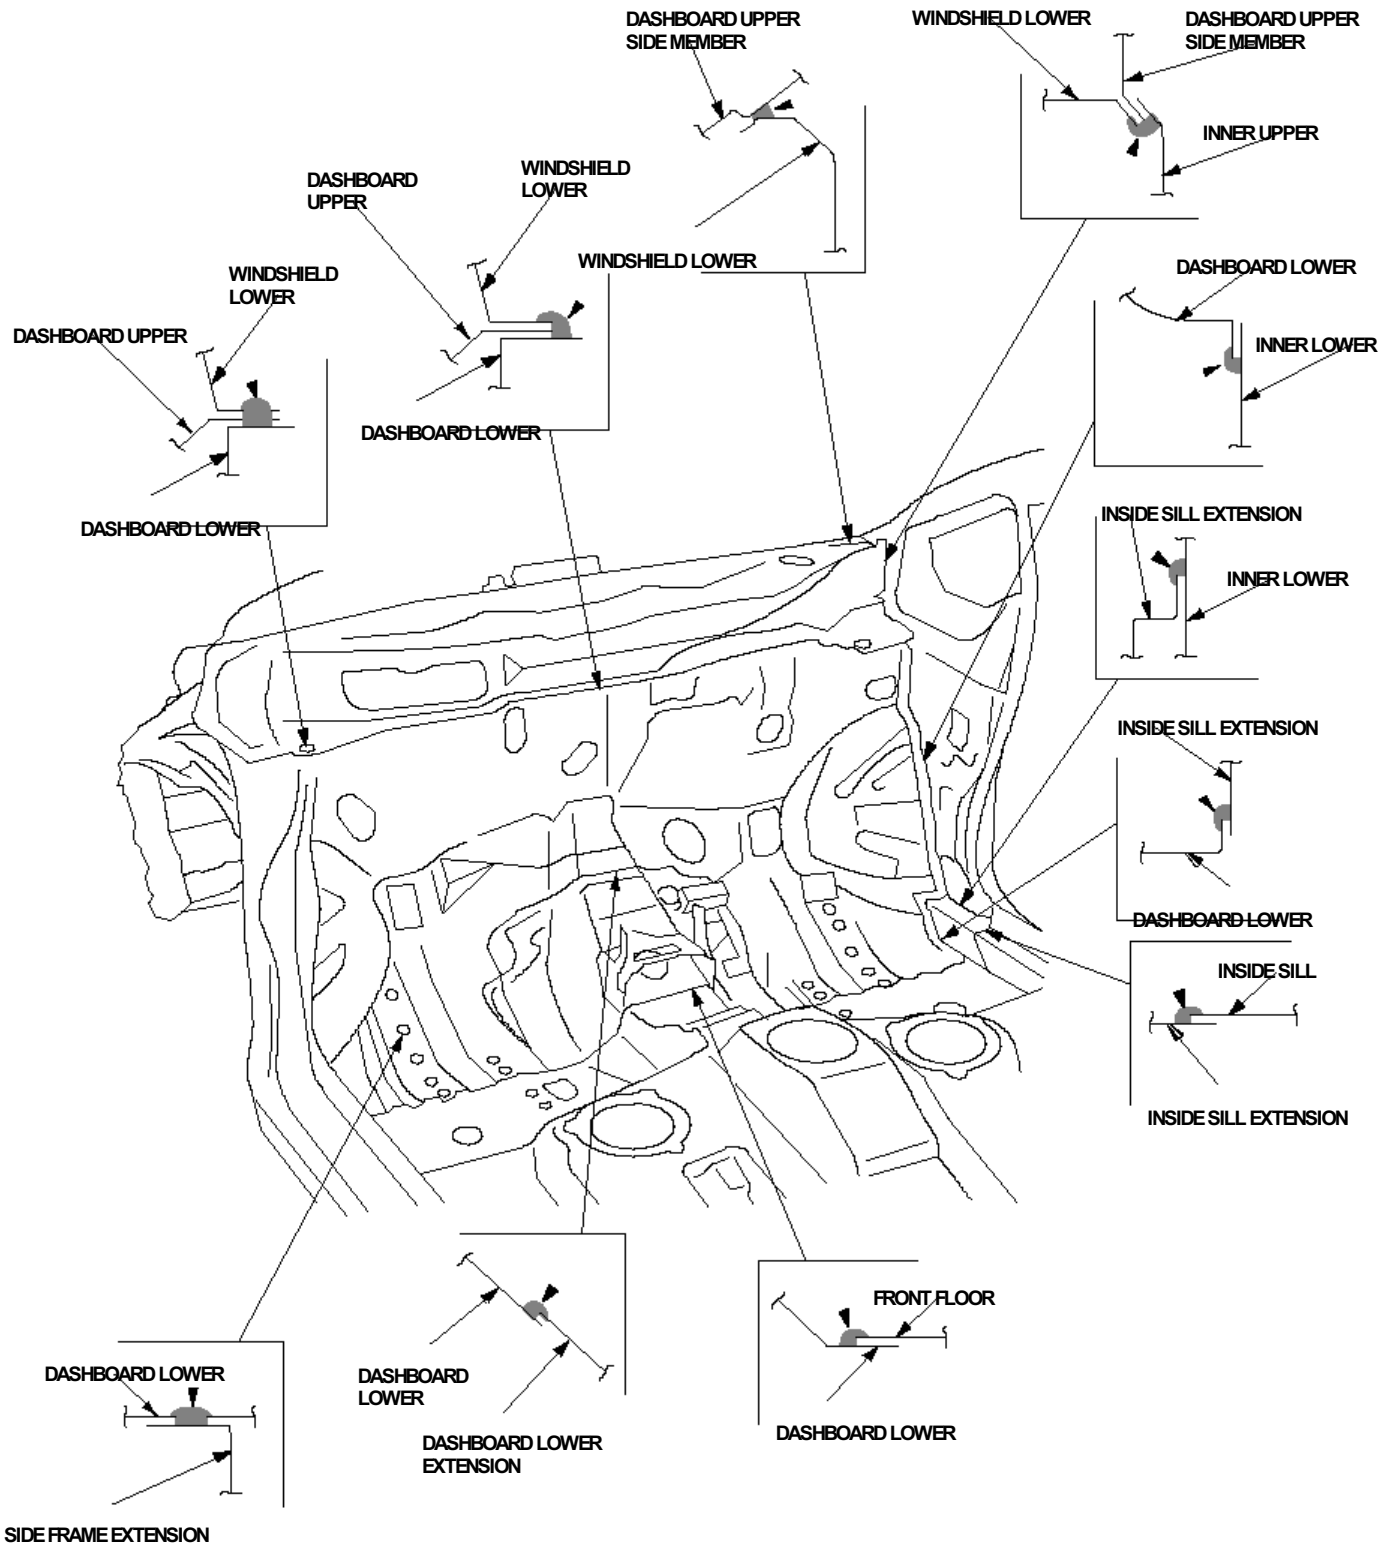
- Clean the areas to be sealed with wax and grease remover.
- Wipe off any excess spot sealer with thinner. After the primer is sprayed, sealer will fill the area where the spot sealer was wiped.
- Make sure you can see the sealant when the sealed part is in its proper location. For the details, refer to engine compartment and damper housing, dashboard upper and dashboard lower, front floor, rear floor, roof panel/rear pillar gutter and rear panel, and rear wheelhouse.
- When applying sealant to the engine compartment, the door opening, and the trunk lid gutter, try to match the appearance of the factory sealer. Wipe off any excess sealer.
- Apply sealer to any area that a replacement part will cover. Smooth the sealer with a brush if necessary.



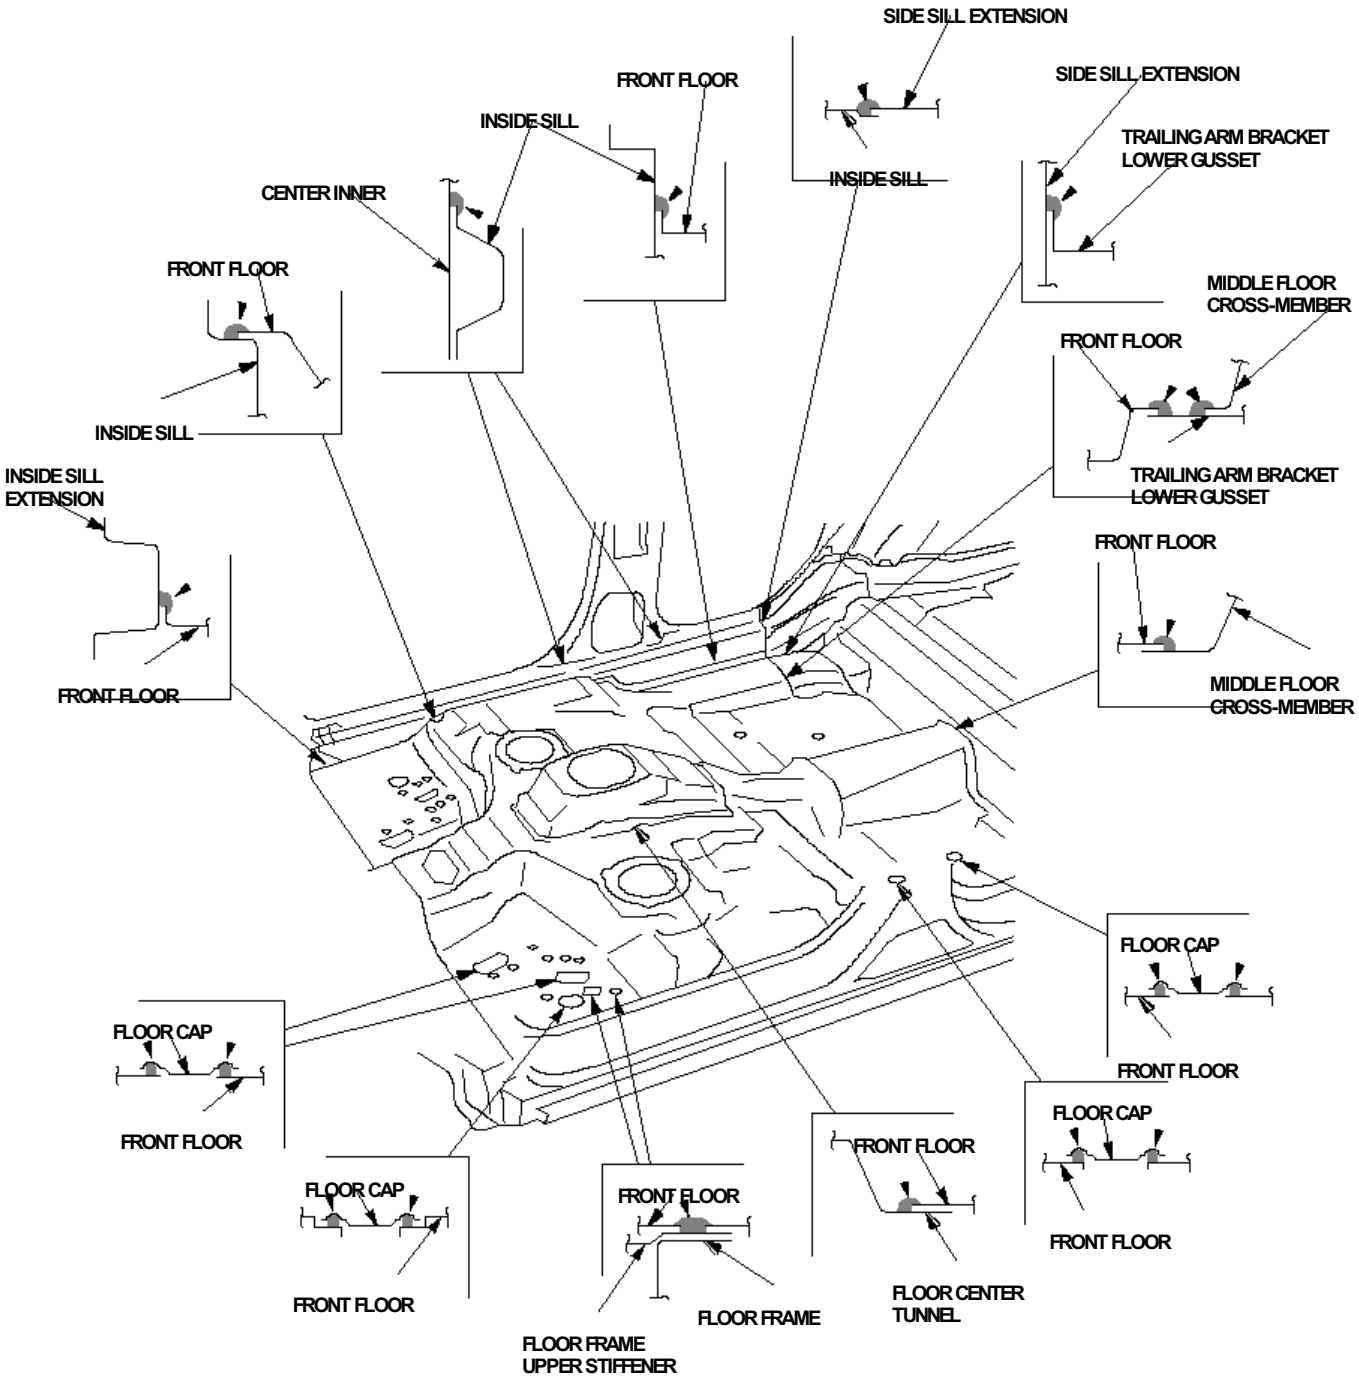
Cross Section of Body and Sealants - Engine Compartment and Damper Housing



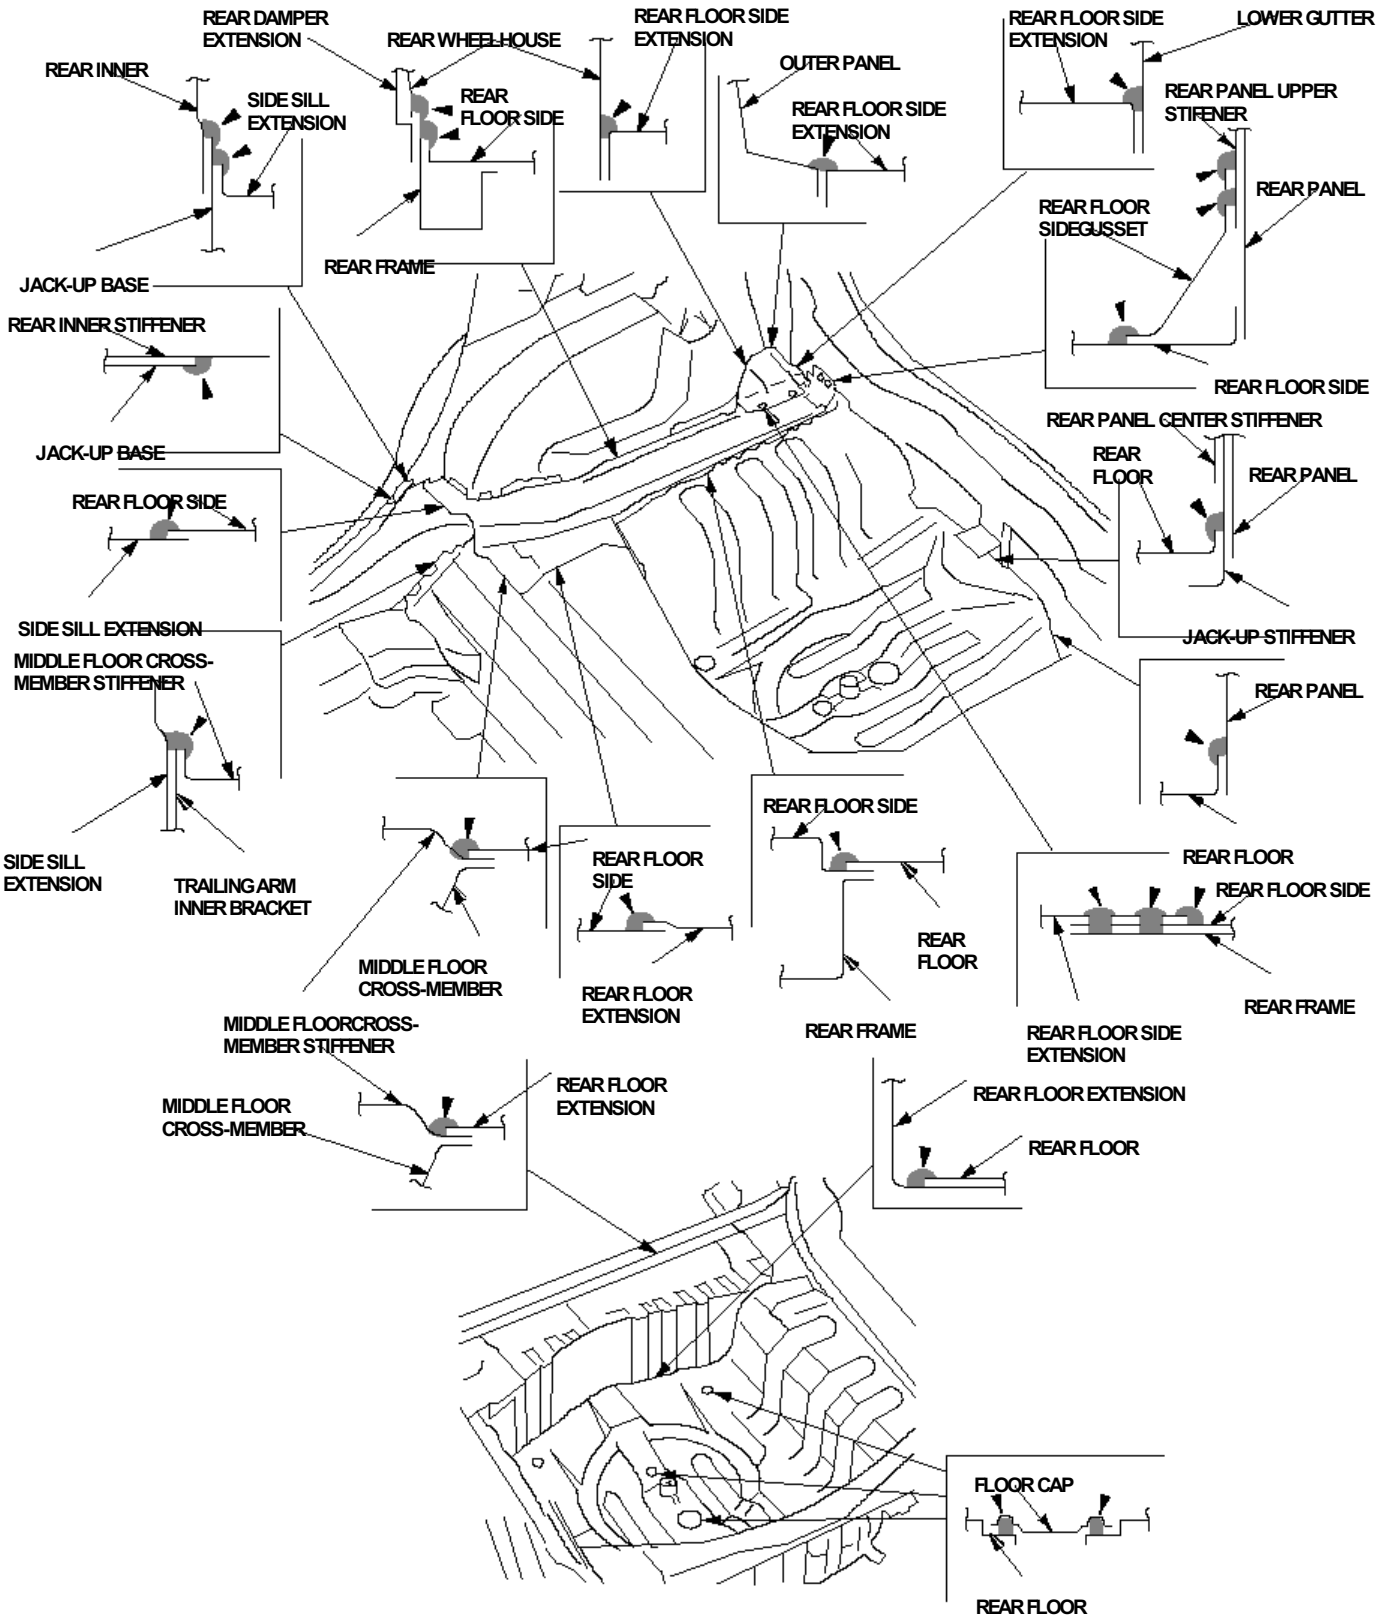
Cross Section of Body and Sealants - Dashboard Upper and Dashboard Lower



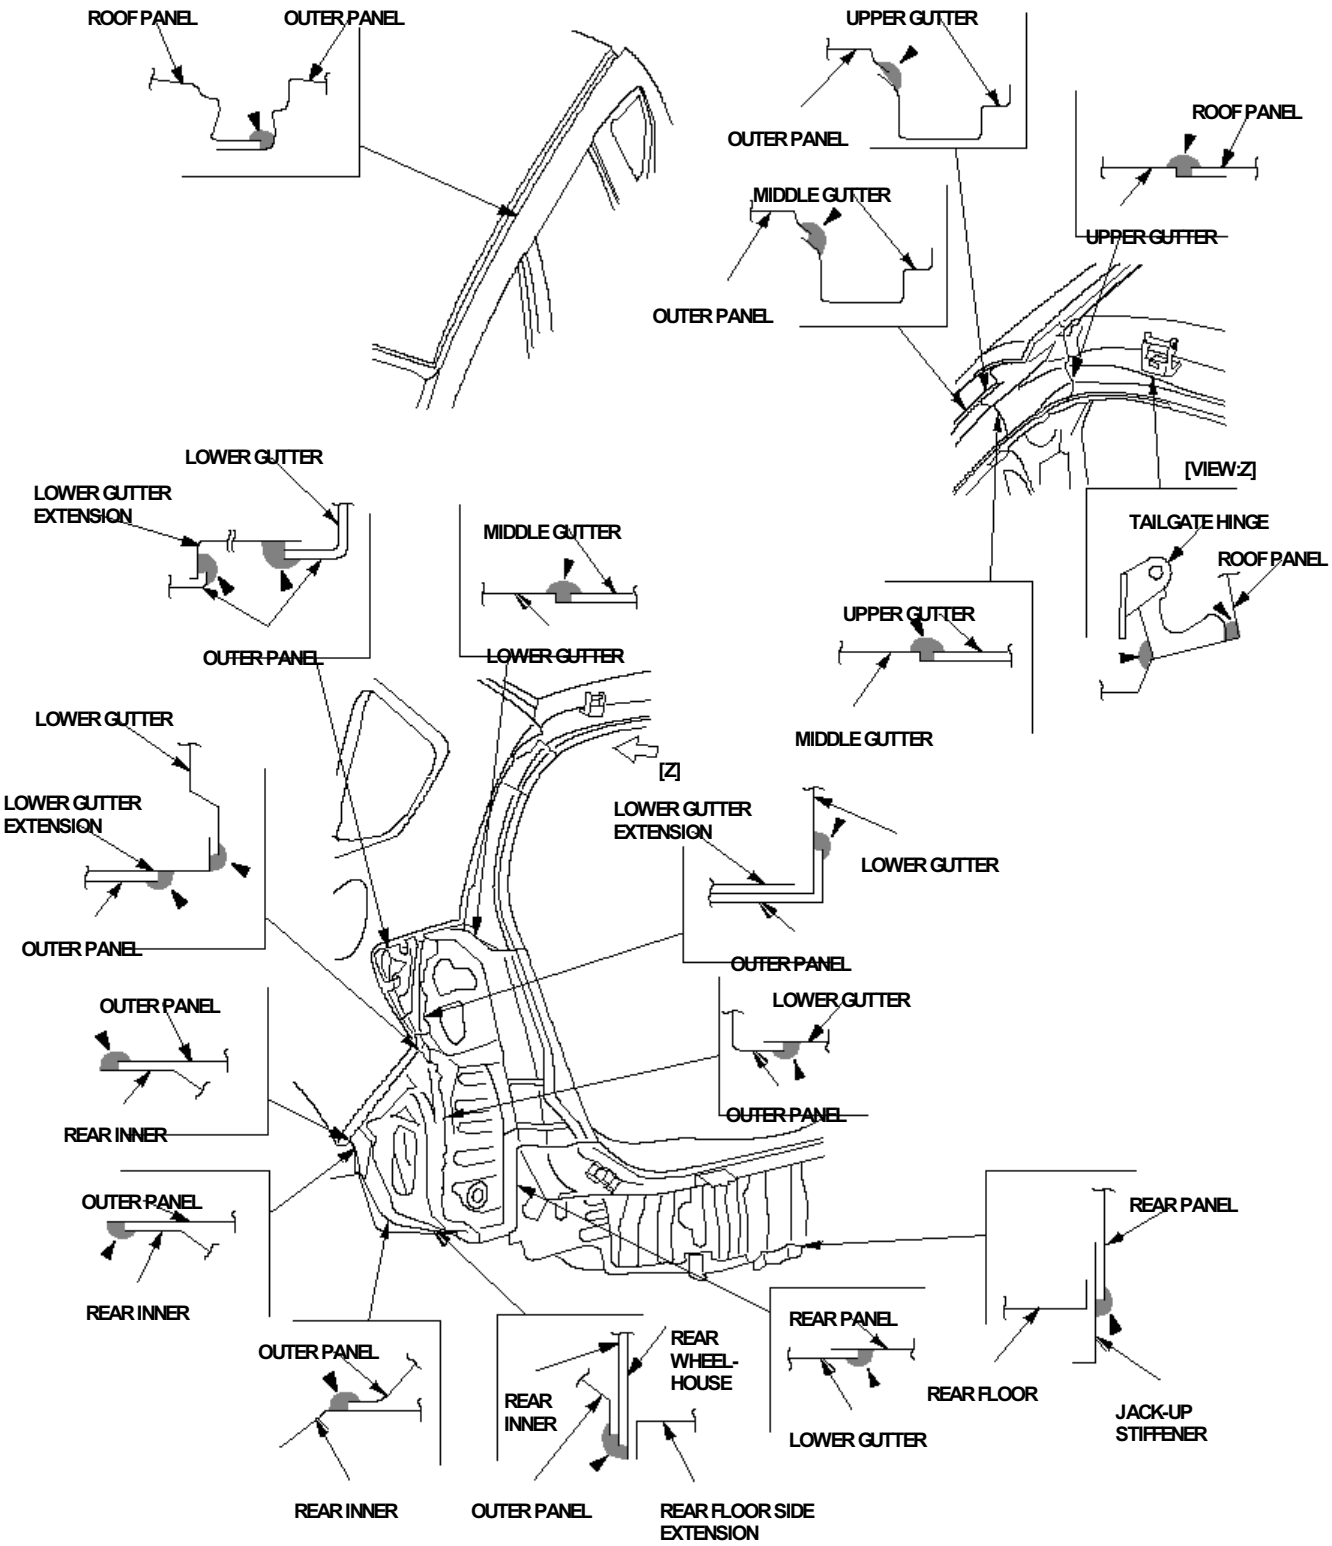
Cross Section of Body and Sealants - Front Floor



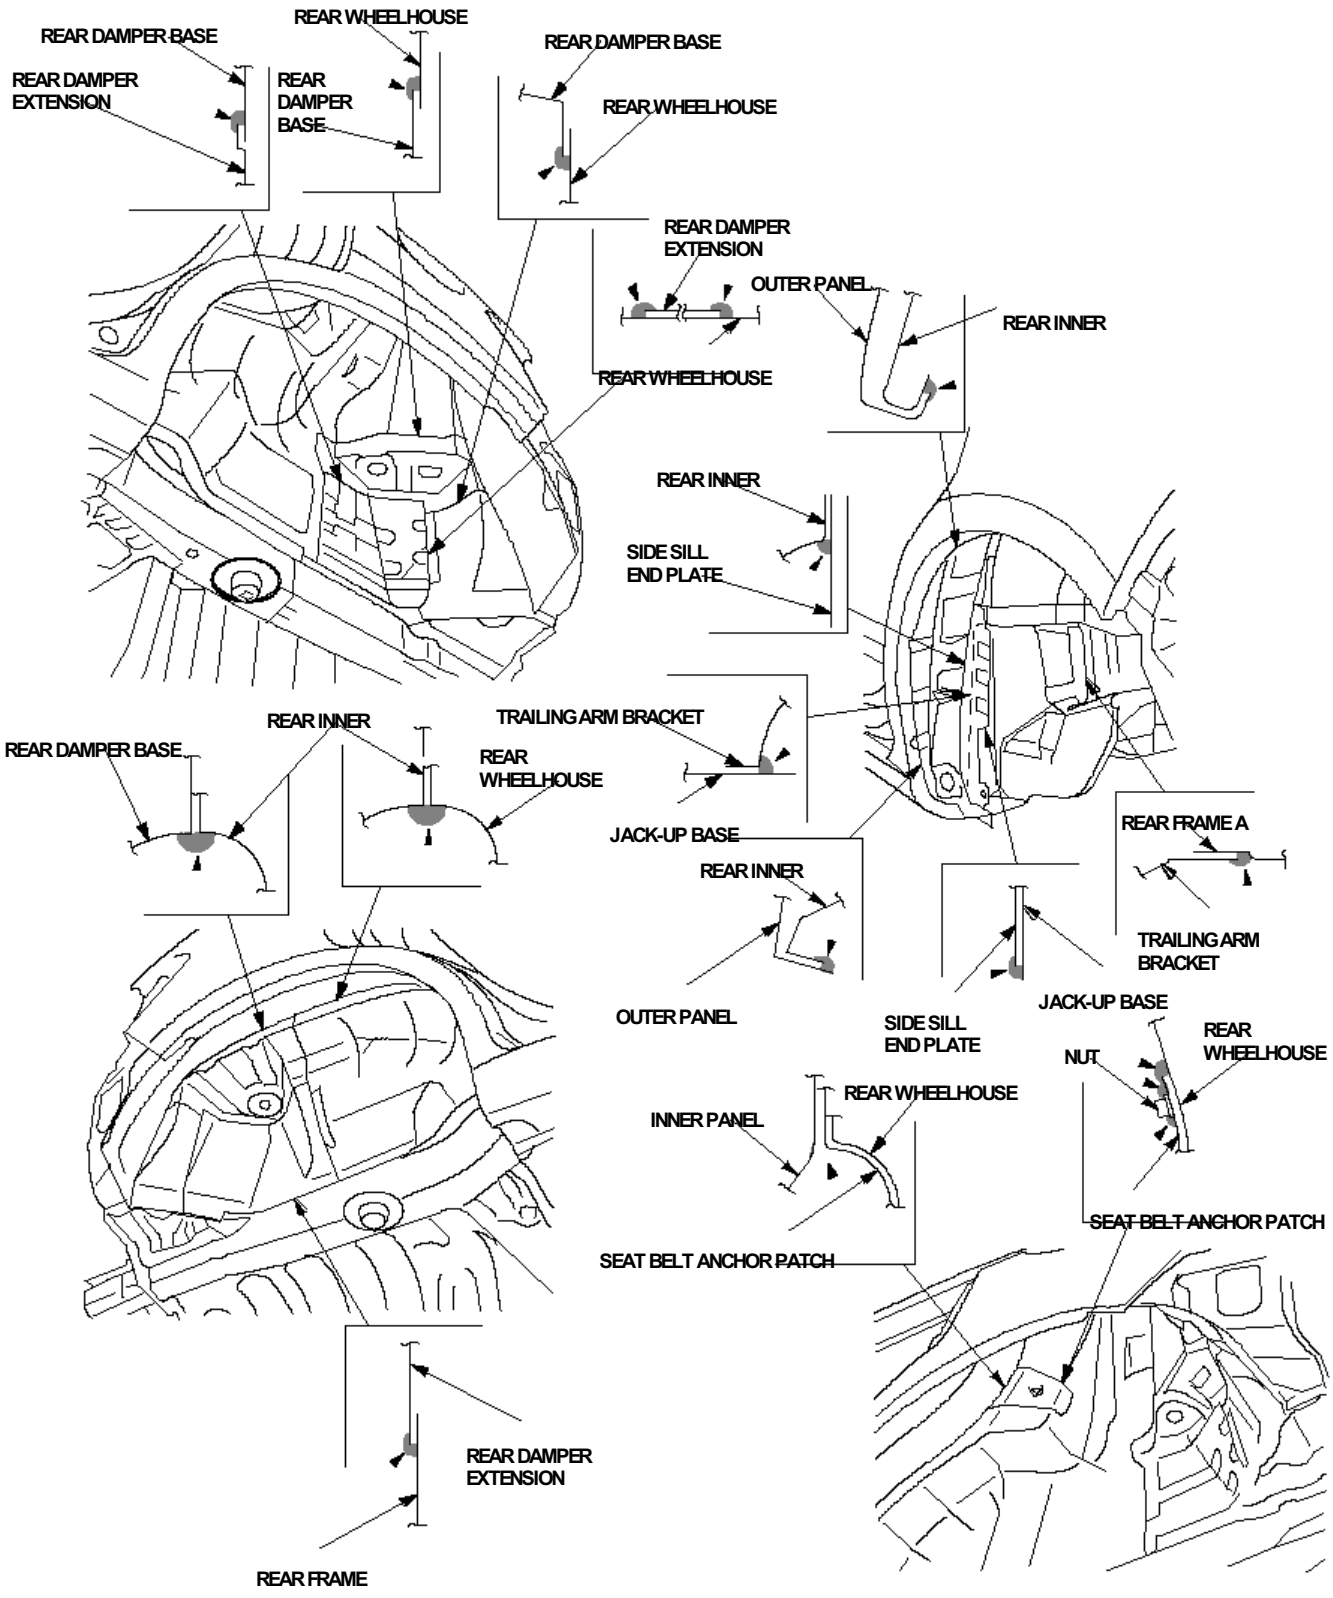
Cross Section of Body and Sealants - Rear Floor



Cross Section of Body and Sealants - Roof Panel/Rear Pillar Gutter and Rear Panel



Cross Section of Body and Sealants - Rear Wheelhouse



Rust-preventive Treatments - General

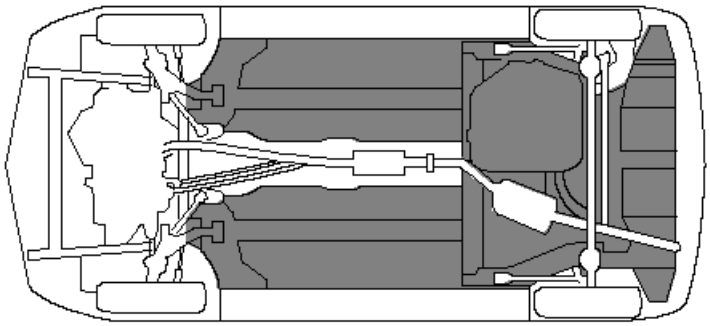
Undercoat

⚠WARNING

- Wear goggles or safety glasses to prevent eye injury.
- Ventilate when spraying undercoat.

NOTE:

- Mask the exhaust system, oxygen sensors, and suspension mount areas to protect them from undercoat overspray.
- Follow the undercoating manufacturer's instructions.
- Clean the body with wax and grease remover before the undercoat is sprayed.
- Apply the undercoat to the front wheelhouse, rear wheelhouse, and undersides of the front floor and rear floor, refer to undercoating diagram.
- Coat the bottom of the fuel tank.



ING

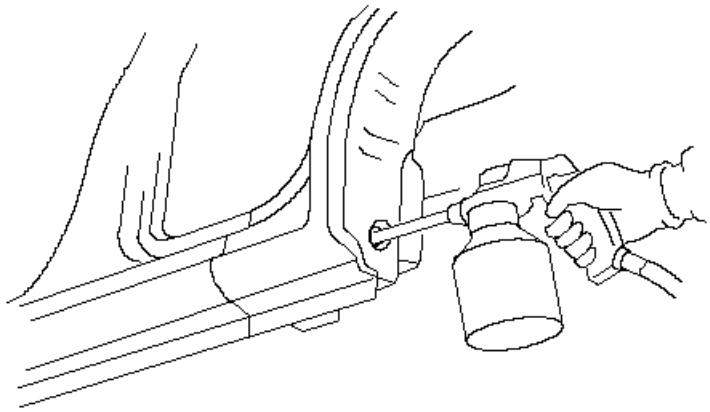
ow them, or get them on your skin. Wear coveralls, gloves, eye

organic solvent. Keep sparks, flames and cigarettes away.

system components and related parts, emission control devices in the
or parts.

ith a steam cleaner, etc., and let it dry. Waxoyl may be applied to a

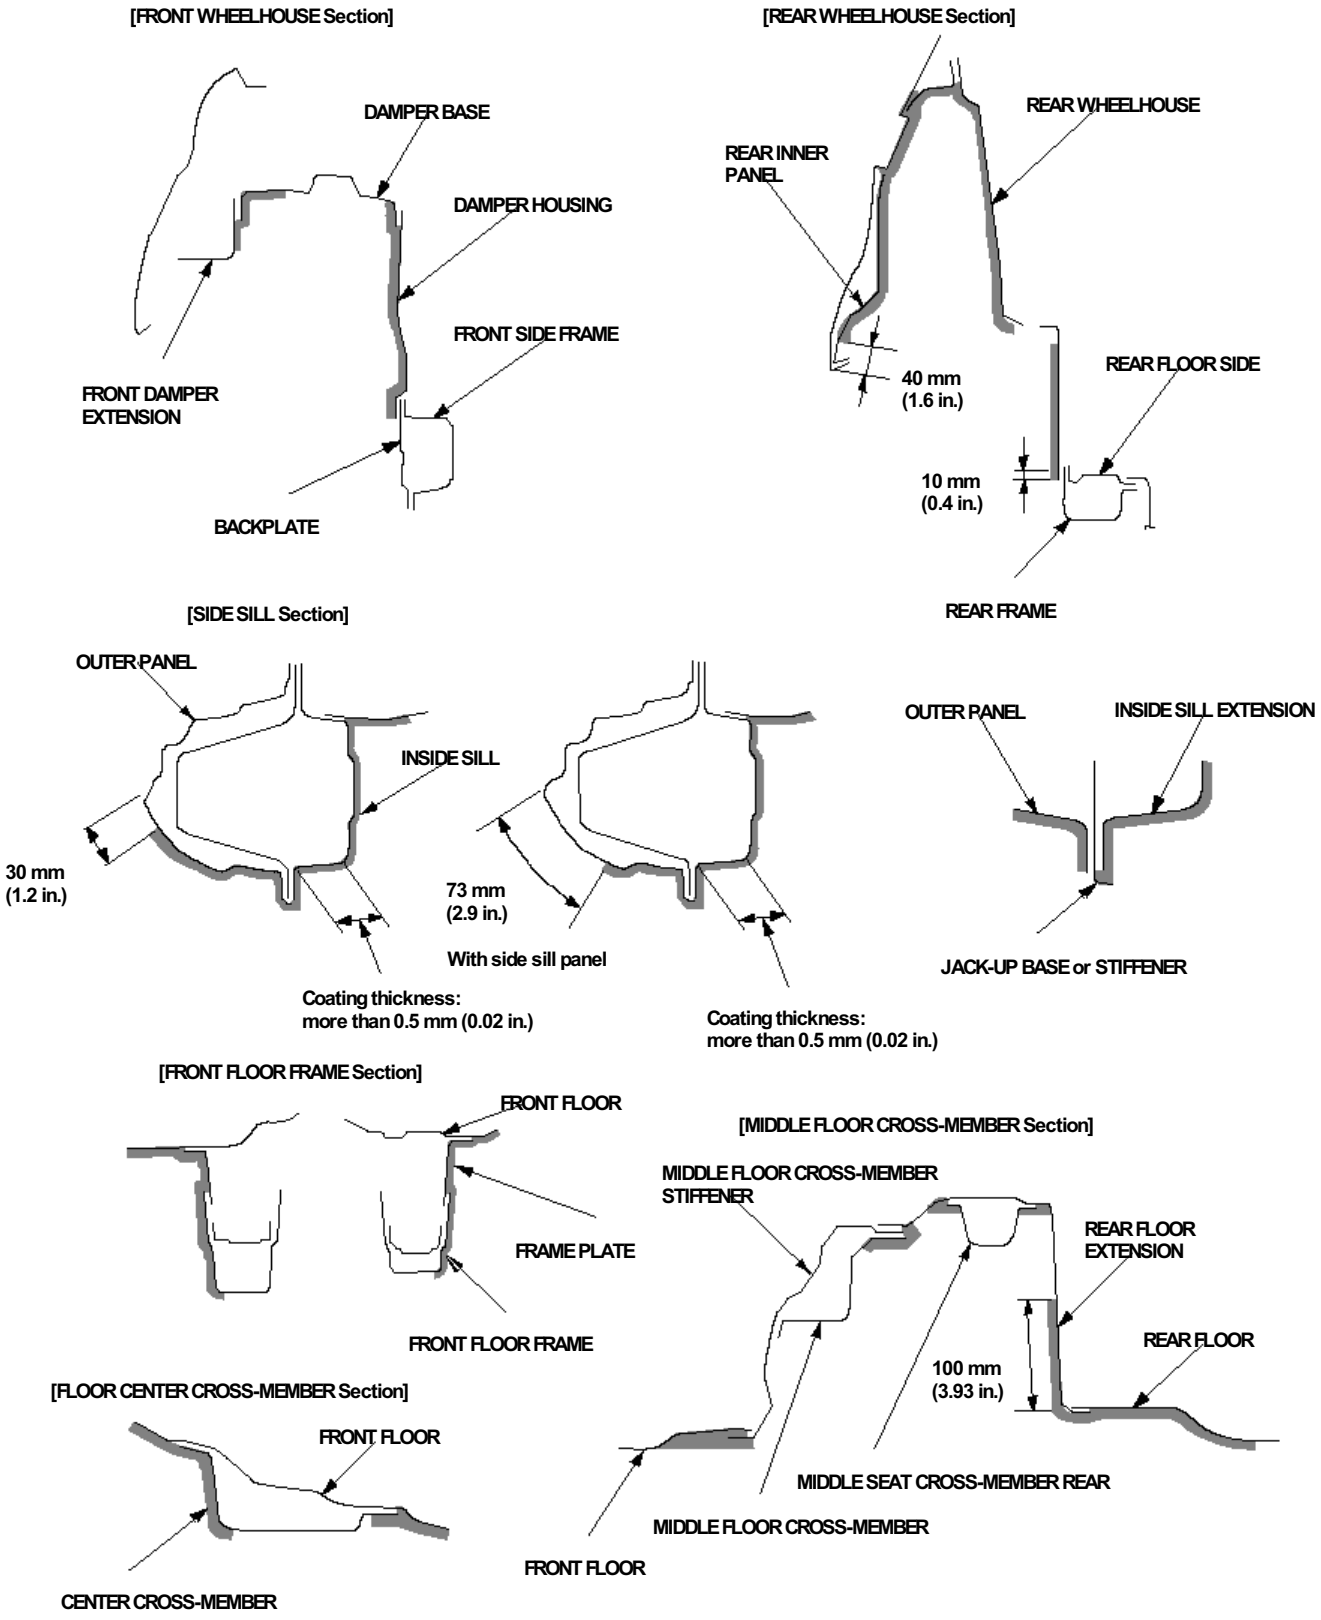
arts in the outer panel and the frame. Spray the anti-rust agent



Rust-preventive Treatments - Undercoating Area

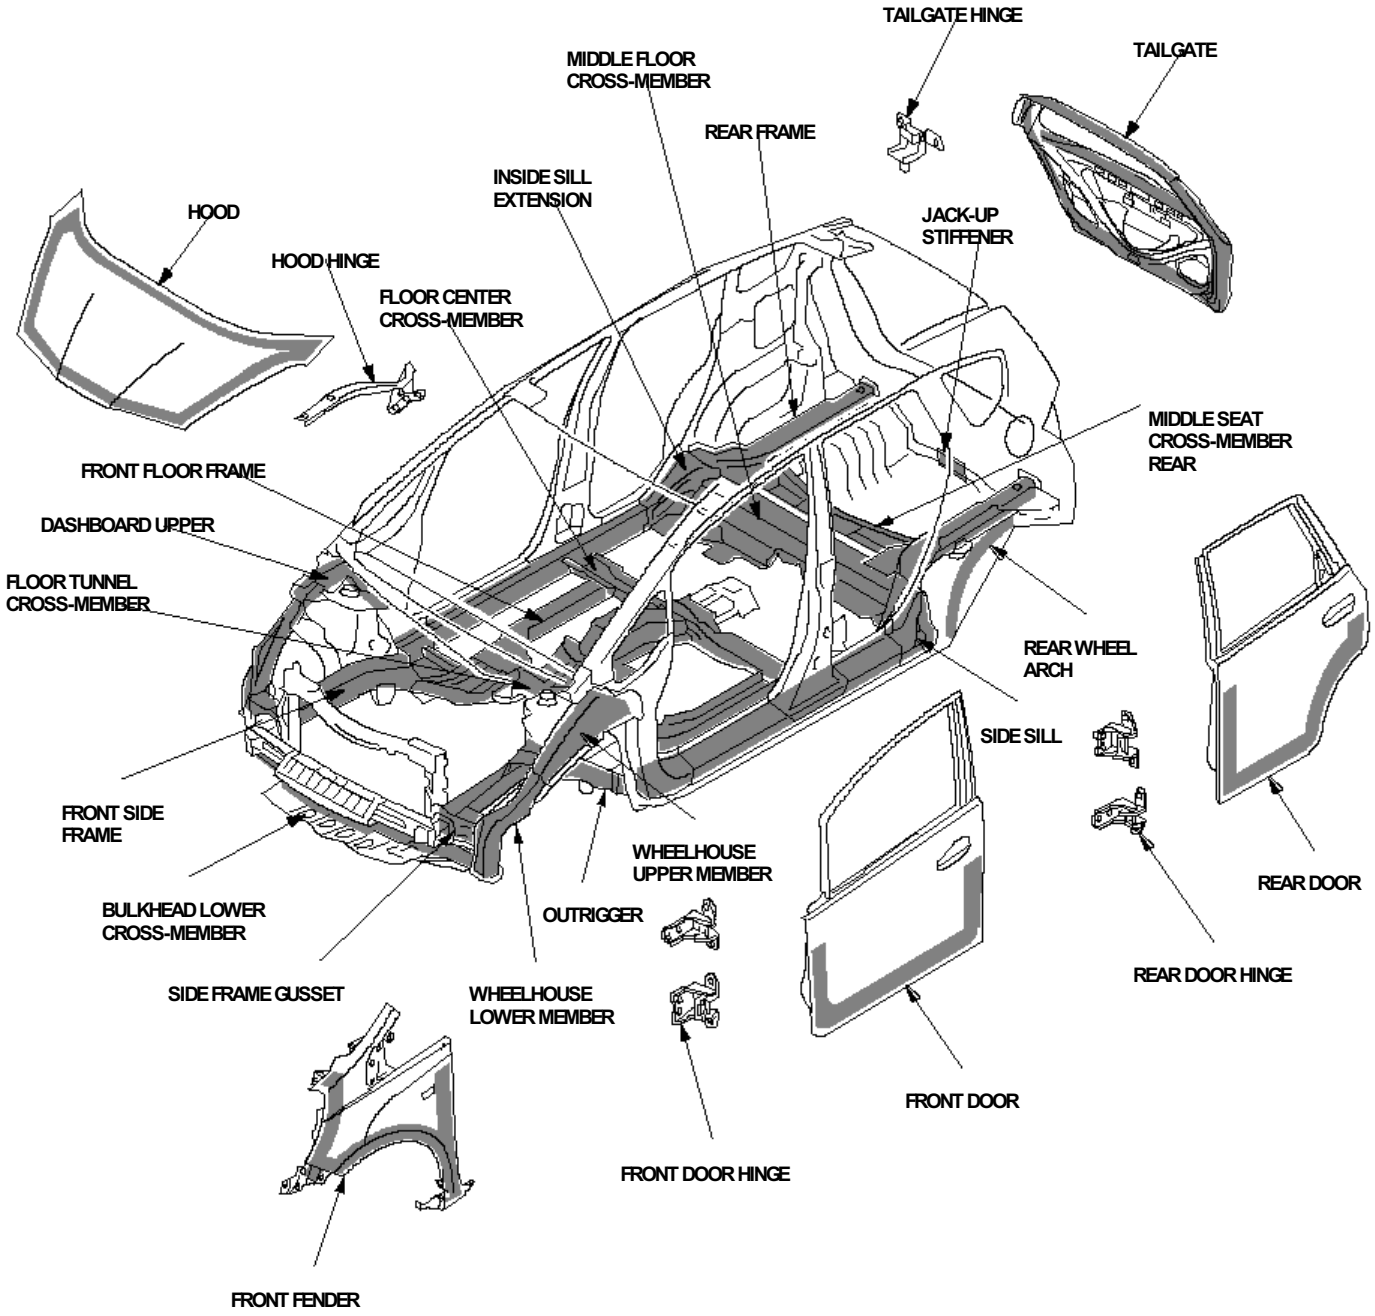
Apply undercoat to the areas shown.
NOTE:

- Coating thickness: 0.4 mm (0.016 in.) MIN.
- Front wheelhouse, rear wheelhouse, and dashboard lower coating thickness 0.5 mm (0.02 in.).
- Apply the undercoat 10 mm (0.4 in.) from the edge of the welded flanges.



Rust-preventive Treatments - Areas to be Covered by Internal Anti-rust Agents

: indicates anti-rust agents.



Service Precautions

General

⚠CAUTION

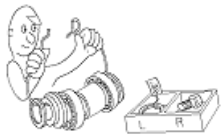
Observe all safety precautions and notes while working.

- Protect all painted surfaces and seats against dirt and scratches with a clean cloth or vinyl cover.

- Work safety and give your work your undivided attention. When either the front or rear wheels are to be raised, block the remaining wheels securely. Communicate at frequently as possible when work involves two or more workers. Do not run the engine unless the shop or working area is well ventilated.

- Before removing or disassembling parts, they must be inspected carefully to isolate the cause for which service is necessary. Observe all safety notes and precautions and follow the proper procedures as described in this manual.

- Mark or place all removed parts in order in a parts rack so they can be reassembled in their original places.



- Use the special tool when use of such a tool is specified.

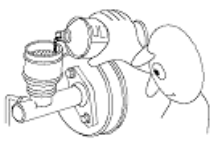
- Parts must be assembled with the proper torque according to the maintenance standards established.
- When tightening a series of bolts or nuts, begin with the center or large diameter bolts and tighten them in crisscross pattern in two or more steps.

- Use new packings, gaskets, O-rings, and cotter pins whenever reassembling.
- Do not reuse parts that must be required to replace. Always replace them.

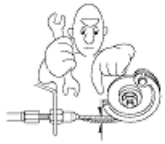
- Use Honda parts and lubricants or those equivalent. When parts are to be reused, they must be inspected carefully to make sure they are not damaged or deteriorated and are in good usable condition.

- Coat or fill parts with specified grease as specified. Clean all removed parts with solvent upon disassembly.

- Brake fluid and hydraulic components
  - When replenishing the system, use extreme care to prevent dust and dirt from entering the system.
  - Do not mix different brands of fluid as they may not be compatible.
  - Do not reuse drained brake fluid.
  - Because brake fluid can cause damage to painted and resin surfaces, care should be taken not to spill it on such materials. If spilled accidentally, quickly rinse it with water or warm water from painted or resin surfaces.
  - After disconnecting brake hoses or pipes, be sure to plug the openings to prevent loss of brake fluid.
  - Clean all disassembled parts only in clean BRAKE FLUID. Blow open all holes and passages with compressed air.
  - Keep disassembled parts from air-borne dust and abrasives.
  - Check that parts are clean before assembly.



- Avoid oil or grease getting on rubber parts and tubes, unless specified.
- Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.
- When spraying any agents that contain silicone, cover all the connectors, terminals, and switches in area with a protective cloth or plastic sheet.
- Upon assembling, check every part for proper installation and operation.

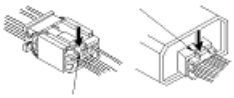


Electrical Troubleshooting Information

Before Troubleshooting

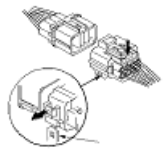
1. Check applicable fuses in the appropriate fuse/relay box.
2. Check the battery for damage, state of charge, and clean and tighten the connections.
   NOTICE
   - Do not quick-charge a battery unless the battery ground cable has been disconnected, otherwise you will damage the alternator diodes.
   - Do not attempt to crank the engine with the battery ground cable loosely connected or you will severely damage the wiring.
3. Check the drive belt tension.

Handling Connectors



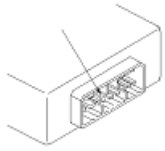
- Make sure the connectors are clean and have no loose wire terminals.
- Make sure multiple cavity connectors are packed with grease (except watertight connectors).
- All connectors have push-down release type locks (A).

- Some connectors have a clip on their side used to attach them to a mounting bracket on the body or on another component. This clip has a pull type lock.
- Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).

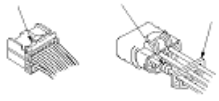


- Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
- Always reinstall plastic covers.

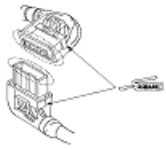
- Before connecting connectors, make sure the terminals (A) are in place and not bent.



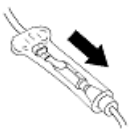
- Check for loose retainer (A) and rubber seals (B).



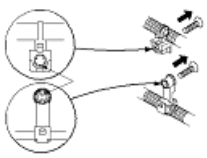
- The backs of some connectors are packed with grease. Add grease if necessary. If the grease is contaminated, replace it.



- Insert the connector all the way and make sure it is securely locked.
- Position wires so that the open end of the cover faces down.

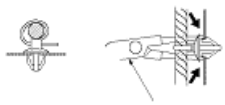


Handling Wires and Harnesses



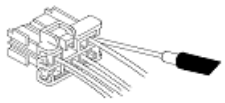
- Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
- Remove clips carefully; don't damage their locks (A).

- Slip pliers (A) under the clip base and through the hole at an angle, then squeeze the expansion tabs to release the clip.



- After installing harness clips, make sure the harness doesn't interfere with any moving parts.
- Keep wire harnesses away from exhaust pipes and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
- Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).

Testing and Repairs



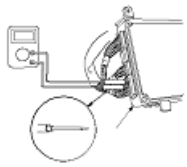
- Do not use wires or harnesses with broken insulation. Replace them or repair them by wrapping the break with electrical tape.
- After installing parts, make sure that no wires are pinched under them.
- When using electrical test equipment, follow the manufacturer's instructions and those described in this manual.
- If possible, insert the probe of the tester from the wire side (except waterproof connector).

- Use a probe with a tapered tip.
- Refer to the instructions in the Honda Terminal Kit for identification and replacement of connector terminals.

⚠CAUTION

- Puncturing the insulation on a wire can cause poor or intermittent electrical connections.
- For testing at connectors, bring the tester probe into contact with the terminal from the connector side of wire harness connectors in the engine compartment.
  For female connectors, just tough lightly with the tester probe and do not insert the probe.

When checking any control module(s) or unit(s) connector terminals, gently slide the sharp tester probe from the wire side into the connector until it comes in contact with the terminal end of the wire.



Five-step Troubleshooting

1. Verify The Complaint
   Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.

2. Analyze The Schematic
   Look up the schematic for the problem circuit. Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or ground is a likely cause.
   Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.

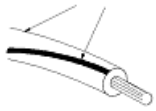
3. Isolate The Problem By Testing The Circuit
   Make circuit tests to check the diagnosis you made in Step 2 . Keep in mind that a logical, simple procedure is the key to efficient troubleshooting. Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.

4. Fix The Problem
   Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.

5. Make Sure The Circuit Works
   Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

Wire Color Codes

The following abbreviations are used to identify wire colors in the circuit schematics:



WHT.	White
YEL.	Yellow
BLK.	Black
BLU.	Blue
GRN.	Green
RED.	Red
ORN.	Orange
PNK.	Pink
BRN.	Brown
GRY.	Gray
PUR.	Purple
LT BLU.	Light Blue
LT GRN.	Light Green

The wire insulation has one color or one color with another color stripe. The second color is the stripe.

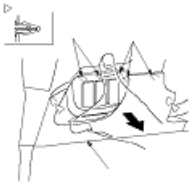
Dashboard Fuse Lid Panel Removal/Installation

LHD Model

NOTE:

- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.

1. Pull the fuse lid panel (A) back by hand to release the hooks (B) and the clips.



2. Pull the fuse lid panel (A) rearward to remove it.

3. Install the panel in the reverse order of removal, and note these items:
    - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
    - Push the clips and the hooks into place securely.

Dashboard Driver's Lower Cover Removal/Installation

LHD Model

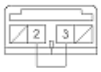
NOTE:

- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.

1. Remove the fuse lid panel.
2. Remove the driver's dashboard lower cover (A).
   -1. Use the trim tool to pry the bottom side of the panel partially out.
   -2. Pry the front bottom of the panel slightly toward you and release the clips and the hooks (B).
3. Install the lower cover in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

SRS DTC Troubleshooting: 12-1x, 12-2x

DTC 12-1x ("x" can be 0 thru 9 or A thru F):
Open in the Front Passenger's Airbag Inflator (LHD model)
DTC 12-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Front Passenger's Airbag Inflator (LHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

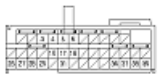
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-1x or 12-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.
7. Install a jumper wire between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 12-1x or 12-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the dashboard wire harness 4P connector.
15. Disconnect SRS unit connector A (39P) from the SRS unit.

---

16. Install a jumper wire between the No. 5 and the No. 6 terminals of SRS unit connector A (39P).



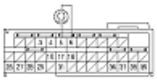
---

17. Check for continuity between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-3x

DTC 12-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Passenger's Airbag Inflator (LHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 12-3x indicated?
    YES - Go to Step 10 .
    NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect SRS unit connector A (39P) from the SRS unit.
14. Connect an SRS short canceller (070AZ-SAA0100) to the No. 5 and the No. 6 terminals of the SRS unit connector A (39P).
15. Measure the resistance between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 12-8x

DTC 12-8x (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Front Passenger's Airbag Inflator (LHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 5 and the No. 6 terminals of the SRS unit connector A (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

---

16. Measure the voltage between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty front passenger's airbag; replace the front passenger's airbag. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-9x

DTC 12-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Front Passenger's Airbag Inflator (LHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Check for continuity between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.

---

9. Check for continuity between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the dashboard wire harness: replace the dashboard wire harness.■
   NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■

Brake Booster Replacement

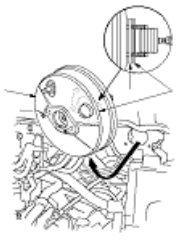
LHD Model

1. Remove the air cleaner cover, and the air cleaner case.
2. Remove the master cylinder.
3. Disconnect the brake booster vacuum hose (A) from the brake booster.

4. Remove the brake lines (A) from the clamp (B).

5. Remove the engine wire harness clamp (A).
6. Remove the driver's dashboard undercover.

7. Remove the lock pin (A) and the joint pin (B), then disconnect the yoke from the brake pedal.
8. Remove the brake booster mounting nuts (C).



9. Remove the brake booster (A) from the engine compartment.
   NOTICE
   - Be careful not to damage the booster surfaces and threads of the booster stud bolts.
   - Be careful not to bend or damage the brake lines or other components hoses and lines.

   NOTE:
   - Use new booster gasket (B) reassembly.
   - KG ABS model: Install the brake booster bracket (C) between brake booster and new gasket reassembly.
10. Install the brake booster in the reverse order of removal, and note these items:
    - Install the master cylinder after installing the brake booster.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
    - Bleed the brake system.
    - KG ABS model: Check the brake assist.

SRS DTC Troubleshooting: 11-1x, 11-2x

DTC 11-1x ("x" can be 0 thru 9 or A thru F):
Open in the Driver's Airbag First Inflator (LHD model)
DTC 11-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Driver's Airbag First Inflator (LHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

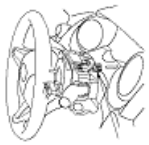
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-1x or 11-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Install a jumper wire between the No. 2 [No. 4] and the No. 3 terminals of the cable reel 4P connector.
   [ ]: KG model
8. Reconnect the negative cable to the battery.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 11-1x or 11-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

14. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

15. Install a jumper wire between the No. 2 [No. 4] and the No. 3 terminals of the dashboard wire harness 4P connector.
    [ ]: KG model

16. Reconnect the negative cable to the battery.
17. Read the DTC.

    Is DTC 11-1x or 11-2x indicated?
    YES - Go to Step 18 .
    NO - Open or increased resistance in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Disconnect the negative cable from the battery, then wait at least 3 minutes.
20. Remove a jumper wire from the dashboard wire harness 4P connector.
21. Disconnect SRS unit connector A (39P) from the SRS unit.

---

22. Install a jumper wire between the No. 3 and the No. 4 terminals of SRS unit connector A (39P).

---

23. Measure the resistance between the No. 2 [No. 4] and the No. 3 terminals of the dashboard wire harness 4P connector. There should be less than 1.0 Ω.
[ ]: KG model

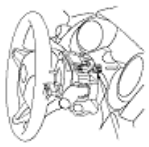
Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-3x

DTC 11-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Driver's Airbag First Inflator (LHD model)



Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Reconnect the negative cable to the battery.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 11-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.
14. Reconnect the negative cable to the battery.
15. Clear the DTC memory.
16. Turn the ignition switch to ON (II), then wait for 10 seconds.
17. Read the DTC.

    Is DTC 11-3x indicated?
    YES - Go to Step 18 .
    NO - Short in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Disconnect the negative cable from the battery, then wait at least 3 minutes.
20. Disconnect SRS unit connector A (39P) from the SRS unit.
21. Connect an SRS short canceller (070AZ-SAA0100) to the No. 3 and the No. 4 terminals of the SRS unit connector A (39P).

---

22. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector A (39P). There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 11-4x, 11-5x

DTC 11-4x ("x" can be 0, 2 thru 9 or A thru F):
Open in the Driver's Airbag Second Inflator (LHD model)
DTC 11-5x ("x" can be 0, 2 thru 9 or A thru F):
Increased Resistance in the Driver's Airbag Second Inflator (LHD model)
NOTE:

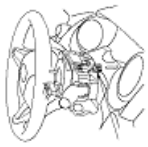
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-4x or 11-5x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of the cable reel 4P connector.
8. Reconnect the negative cable to the battery.
9. Read the DTC.

   Is DTC 11-4x or 11-5x indicated?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the negative cable from the battery, then wait at least 3 minutes.

12. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



13. Install a jumper wire between the No. 1 and the No. 2 terminals of the dashboard wire harness 4P connector.
14. Reconnect the negative cable to the battery.

15. Read the DTC.

    Is DTC 11-4x or 11-5x indicated?
    YES - Go to Step 16 .
    NO - Open in the cable reel; replace the cable reel. ■
16. Turn the ignition switch to LOCK (0).
17. Remove the jumper wire from the dashboard wire harness 4P connector.
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.
19. Disconnect SRS unit connector A (39P) from the SRS unit.

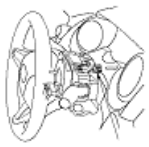
20. Install a jumper wire between the No. 7 and the No. 8 terminals of SRS unit connector A (39P).

21. Check for continuity between the No. 1 and the No. 2 terminals of the dashboard wire harness 4P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-6x

DTC 11-6x ("x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Driver's Airbag Second Inflator (LHD model)



Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-6x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Read the DTC.

   Is DTC 11-6x indicated?
   YES - Go to Step 8 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■
8. Turn the ignition switch to LOCK (0).
9. Disconnect the negative cable from the battery, then wait at least 3 minutes.
10. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.
11. Read the DTC.

    Is DTC 11-6x indicated?
    YES - Go to Step 12 .
    NO - Short in the cable reel; replace the cable reel. ■
12. Turn the ignition switch to LOCK (0).
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector A (39P) from the SRS unit.
15. Connect an SRS short canceller (070AZ-SAA0100) to No. 7 and the No. 8 terminals of the SRS unit connector A (39P).

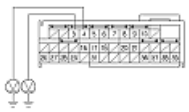
---

16. Measure the resistance between the No. 7 and the No. 8 terminals of the SRS unit connector A (39P). There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 11-8x

DTC 11-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Driver's Airbag First Inflator (LHD model)



Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 3 and the No. 4 terminals of SRS unit connector A (39P).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Disconnect the driver's airbag 4P connector from the cable reel.
14. Reconnect the negative cable to the battery.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

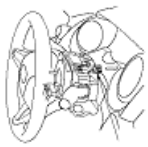
---

16. Measure the voltage between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty driver's airbag; replace the driver's airbag. ■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

19. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



20. Reconnect the negative cable to the battery.
21. Turn the ignition switch to ON (II), then wait for 10 seconds.

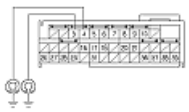
---

22. Measure the voltage between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Short to power in the cable reel; replace the cable reel. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-9x

DTC 11-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Driver's Airbag First Inflator (LHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the driver's airbag 4P connector from the cable reel.

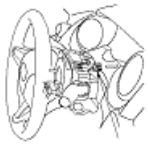
---

9. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■

---

10. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

11. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short to ground in the dashboard wire harness: replace the dashboard wire harness.■
    NO - Short to ground in the cable reel; replace the cable reel. ■

SRS DTC Troubleshooting: 11-Ax

DTC 11-Ax (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Driver's Airbag Second Inflator (LHD model)

Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-Ax indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 7 and the No. 8 terminals of SRS unit connector A (39P).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 7 and the No. 8 terminals of the SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Disconnect the driver's airbag 4P connector from the cable reel.
14. Reconnect the negative cable to the battery.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

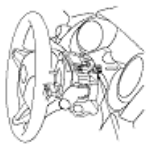
---

16. Measure the voltage between the No. 7 and the No. 8 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty driver's airbag; replace the driver's airbag. ■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

19. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



20. Reconnect the negative cable to the battery.
21. Turn the ignition switch to ON (II), then wait for 10 seconds.

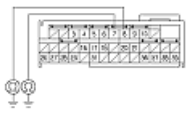
---

22. Measure the voltage between the No. 7 and the No. 8 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Short to power in the cable reel; replace the cable reel. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-Bx

DTC 11-Bx (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Driver's Airbag Second Inflator (LHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-Bx indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Check for continuity between the No. 7 and the No. 8 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the driver's airbag 4P connector from the cable reel.

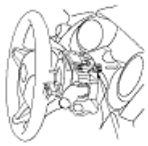
---

9. Check for continuity between the No. 7 and the No. 8 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■

---

10. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

11. Check for continuity between the No. 7 and the No. 8 terminals of SRS unit connector A (39P) and body ground.

    Is there continuity?
    YES - Short to ground in the dashboard wire harness: replace the dashboard wire harness.■
    NO - Short to ground in the cable reel; replace the cable reel. ■

Left Engine Compartment Wire Harness Locations

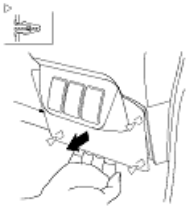
Dashboard Fuse Lid Panel Removal/Installation

RHD Model

NOTE:

- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.

1. Pull out the fuse lid panel (A) to detach the clips.



2. Gently pull down the bottom edge of the fuse lid panel (A) to detach the hooks (B).

3. Install the panel in the reverse order of removal, and note these items:
    - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
    - Push the clips and the hooks into place securely.

Dashboard Driver's Lower Cover Removal/Installation

RHD Model

NOTE:

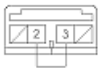
- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.

1. Remove the driver's dashboard lower cover (A).
   -1. Use the trim tool to pry the bottom side of the panel partially out.
   -2. Pry the front bottom of the panel slightly toward you and release the clips and the hooks (B).

2. Install the lower cover in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

SRS DTC Troubleshooting: 11-1x, 11-2x

DTC 11-1x ("x" can be 0 thru 9 or A thru F):
Open in the Front Passenger's Airbag Inflator (RHD model)
DTC 11-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Front Passenger's Airbag Inflator (RHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-1x or 11-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.
7. Install a jumper wire between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Is DTC 11-1x or 11-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.
14. Remove a jumper wire from the dashboard wire harness 4P connector.
15. Disconnect SRS unit connector A (39P) from the SRS unit.

---

16. Install a jumper wire between the No. 3 and the No. 4 terminals of SRS unit connector A (39P).

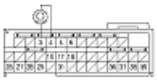
---

17. Check for continuity between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-3x

DTC 11-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Front Passenger's Airbag Inflator (RHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.
7. Clear the DTC memory.
8. Turn the ignition switch to ON (II), then wait for 10 seconds.
9. Read the DTC.

   Is DTC 11-3x indicated?
   YES - Go to Step 10 .
   NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■
10. Turn the ignition switch to LOCK (0).
11. Do the battery terminal disconnection procedure , then wait for 3 minutes.
12. Disconnect SRS unit connector A (39P) from the SRS unit.
13. Connect an SRS short canceller (070AZ-SAA0100) to No. 3 and No. 4 terminals of the SRS unit connector A (39P).
14. Measure the resistance between the No. 3 and No. 4 terminal of the SRS unit connector A (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 11-8x

DTC 11-8x (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Front Passenger's Airbag Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 3 and the No. 4 terminals of the SRS unit connector A (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 3 and the No. 4 terminals of the SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the dashboard wire harness 4P connector from the cable reel.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

---

16. Measure the voltage between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty front passenger's airbag; replace the front passenger's airbag. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 11-9x

DTC 11-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Front Passenger's Airbag Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 11-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Check for continuity between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the dashboard wire harness 4P connector from the front passenger's airbag.

---

9. Check for continuity between the No. 3 and the No. 4 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Short to ground in the dashboard wire harness; replace the dashboard wire harness.■
   NO - Faulty front passenger's airbag; replace the front passenger's airbag. ■

SRS DTC Troubleshooting: Fx-11

DTC Fx-11 ("x" can be 0 thru 9 or A thru F):
Airbags and/or Tensioners Deployment Recorded
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Refer to the DTCs shown:
  - DTC F1-11: Driver's airbag and/or driver's seat belt tensioner deployed.
  - DTC F2-11: Front passenger's airbag and/or front passenger's seat belt tensioner deployed.
  - DTC F3-11: Driver's side airbag, left side curtain airbag, and/or driver's seat belt tensioner deployed.
  - DTC F4-11: Front passenger's side airbag, right side curtain airbag, and/or front seat belt tensioner deployed.

When any airbags or tensioners have deployed, go to Component Replacement/Inspection After Deployment. ■

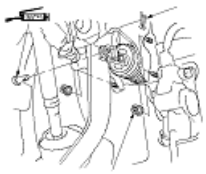
Brake Booster Replacement

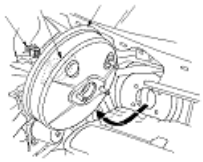
RHD Model

1. Remove the front wiper arms.
2. Remove the cowl cover and hood hinge covers.
3. Remove the wiper linkage assembly.
4. Remove the under cowl panel.
5. Remove the master cylinder.
6. Disconnect the brake booster vacuum hose (A) from the brake booster.

7. Disconnect the brake lines (A) from the ABS modulator-control unit (B).
8. Remove the driver's dashboard undercover.



9. Remove the lock pin (A) and the joint pin (B), then disconnect the yoke from the brake pedal.
10. Remove the brake booster mounting nuts (C).



11. Pull the brake booster (A) forward, then rotate it so the yoke (B) toward the driver's side.

NOTICE

- Be careful not to damage the booster surfaces and threads of the booster stud bolts.
- Be careful not to bend or damage the brake lines or other components hoses and lines.

12. Remove the brake booster from the engine compartment.
    NOTE: Use new booster gasket (C) reassembly.
13. Install the brake booster in the reverse order of removal, and note these items:
    - Install the master cylinder after installing the brake booster.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
    - Bleed the brake system.

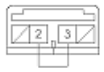
SRS DTC Troubleshooting: 12-1x, 12-2x

DTC 12-1x ("x" can be 0 thru 9 or A thru F):
Open in the Driver's Airbag Inflator (RHD model)
DTC 12-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Driver's Airbag Inflator (RHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

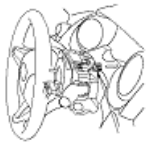
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-1x or 12-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Install a jumper wire between the No. 2 and No. 3 terminals of the cable reel 4P connector.
8. Do the battery terminal reconnection procedure.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Are DTC 12-1x or 12-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Do the battery terminal disconnection procedure , then wait for 3 minutes.

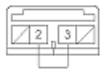
---

14. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

15. Install a jumper wire between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector.
16. Do the battery terminal reconnection procedure.

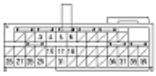


17. Read the DTC.

    Is DTC 12-1x or 12-2x indicated?
    YES - Go to Step 18 .
    NO - Open or increased resistance in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Do the battery terminal disconnection procedure , then wait for 3 minutes.
20. Remove a jumper wire from the dashboard wire harness 4P connector.
21. Disconnect SRS unit connector A (39P) from the SRS unit.

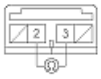
---

22. Install a jumper wire between the No. 5 and the No. 6 terminals of SRS unit connector A (39P).



---

23. Measure the resistance between the No. 2 and the No. 3 terminals of the dashboard wire harness 4P connector. There should be 0−1.0 Ω.



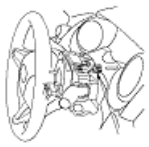
Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-3x

DTC 12-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Driver's Airbag Inflator (RHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Do the battery terminal reconnection procedure.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 12-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.
14. Do the battery terminal reconnection procedure.
15. Clear the DTC memory.
16. Turn the ignition switch to ON (II), then wait for 10 seconds.
17. Read the DTC.

    Is DTC 12-3x indicated?
    YES - Go to Step 18 .
    NO - Short in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Do the battery terminal disconnection procedure , then wait for 3 minutes.
20. Disconnect SRS unit connector A (39P) from the SRS unit.
21. Connect an SRS short canceller (070AZ-SAA0100) to No. 5 and the No. 6 terminals of the SRS unit connector A (39P).

---

22. Measure the resistance between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P). There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 12-8x

DTC 12-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Driver's Airbag Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal reconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 5 and the No. 6 terminals of the SRS unit connector A (39P).
8. Do the battery terminal reconnection procedure.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Do the battery terminal disconnection procedure , then wait for 3 minutes.
13. Disconnect the driver's airbag 4P connector from the cable reel.
14. Do the battery terminal reconnection procedure.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

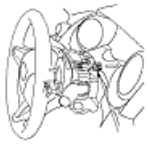
---

16. Measure the voltage between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Faulty driver's airbag; replace the driver's airbag. ■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Do the battery terminal disconnection procedure , then wait for 3 minutes.

---

19. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



20. Do the battery terminal reconnection procedure.
21. Turn the ignition switch to ON (II), then wait for 10 seconds.

---

22. Measure the voltage between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1 V.

    Is the voltage as specified?
    YES - Short to power in the cable reel; replace the cable reel. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-9x

DTC 12-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Driver's Airbag Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be 0−1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the driver's airbag 4P connector from the cable reel.

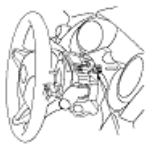
---

9. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be 0−1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■

---

10. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

11. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be 0−1.0 Ω.

    Is the resistance as specified?
    YES - Short to ground in the dashboard wire harness: replace the dashboard wire harness.■
    NO - Short to ground in the cable reel; replace the cable reel. ■

SRS DTC Troubleshooting: 12-1x, 12-2x

DTC 12-1x ("x" can be 0 thru 9 or A thru F):
Open in the Driver's Airbag First Inflator (RHD model)
DTC 12-2x ("x" can be 0 thru 9 or A thru F):
Increased Resistance in the Driver's Airbag First Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

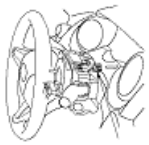
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-1x or 12-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Install a jumper wire between the No. 2 [No. 4] and No. 3 terminals of the cable reel 4P connector.
   [ ]: KE model
8. Reconnect the negative cable to the battery.
9. Clear the DTC memory.
10. Turn the ignition switch to ON (II), then wait for 10 seconds.
11. Read the DTC.

    Are DTC 12-1x or 12-2x indicated?
    YES - Go to Step 12 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
12. Turn the ignition switch to LOCK (0).
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

14. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

15. Install a jumper wire between the No. 2 [No. 4] and the No. 3 terminals of the dashboard wire harness 4P connector.
    [ ]: KE model

16. Reconnect the negative cable to the battery.
17. Read the DTC.

    Is DTC 12-1x or 12-2x indicated?
    YES - Go to Step 18 .
    NO - Open or increased resistance in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Disconnect the negative cable from the battery, then wait at least 3 minutes.
20. Remove a jumper wire from the dashboard wire harness 4P connector.
21. Disconnect SRS unit connector A (39P) from the SRS unit.

---

22. Install a jumper wire between the No. 5 and the No. 6 terminals of SRS unit connector A (39P).

---

23. Measure the resistance between the No. 2 [No. 4] and the No. 3 terminals of the dashboard wire harness 4P connector. There should be less than 1.0 Ω.
[ ]: KE model

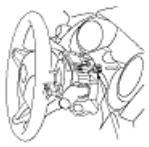
Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-3x

DTC 12-3x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Driver's Airbag First Inflator (RHD model)



Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-3x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Reconnect the negative cable to the battery.
8. Clear the DTC memory.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Read the DTC.

    Is DTC 12-3x indicated?
    YES - Go to Step 11 .
    NO - Faulty driver's airbag; replace the driver's airbag. ■
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.
14. Reconnect the negative cable to the battery.
15. Clear the DTC memory.
16. Turn the ignition switch to ON (II), then wait for 10 seconds.
17. Read the DTC.

    Is DTC 12-3x indicated?
    YES - Go to Step 18 .
    NO - Short in the cable reel; replace the cable reel. ■
18. Turn the ignition switch to LOCK (0).
19. Disconnect the negative cable from the battery, then wait at least 3 minutes.
20. Disconnect SRS unit connector A (39P) from the SRS unit.
21. Connect an SRS short canceller (070AZ-SAA0100) to No. 5 and the No. 6 terminals of the SRS unit connector A (39P).

---

22. Measure the resistance between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P). There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 12-4x, 12-5x

DTC 12-4x ("x" can be 0 thru 9 or A thru F):
Open in the Driver's Airbag Second Inflator (RHD model)
DTC 12-5x ("x" can be 0, 2 thru 9 or A thru F):
Increased Resistance in the Driver's Airbag Second Inflator (RHD model)
NOTE:

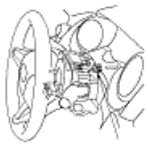
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-4x or 12-5x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Install a jumper wire between the No. 1 and the No. 2 terminals of the cable reel 4P connector.
8. Reconnect the negative cable to the battery.
9. Read the DTC.

   Is DTC 12-4x or 12-5x indicated?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the negative cable from the battery, then wait at least 3 minutes.

12. Remove the column cover, then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



13. Install a jumper wire between the No. 1 and No. 2 terminals of dashboard wire harness 4P connector.
14. Reconnect the negative cable to the battery.

15. Read the DTC.

    Is DTC 12-4x or 12-5x indicated?
    YES - Go to Step 16 .
    NO - Open in the cable reel; replace the cable reel. ■
16. Turn the ignition switch to LOCK (0).
17. Remove the jumper wire from the dashboard wire harness 4P connector.
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.
19. Disconnect SRS unit connector A (39P) from the SRS unit.

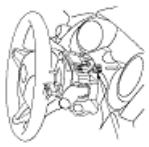
20. Install a jumper wire between the No. 9 and the No. 10 terminals of SRS unit connector A (39P).

21. Check for continuity between the No. 1 and the No. 2 terminals of dashboard wire harness 4P connector.

    Is the continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-6x

DTC 12-6x (‘‘x" can be 0 thru 9 or A thru F):
Short to Another Wire or Decreased Resistance in the Driver's Airbag Second Inflator (RHD model)



Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-6x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the driver's airbag 4P connector from the cable reel.
7. Read the DTC.

   Is DTC 12-6x indicated?
   YES - Go to Step 8 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■
8. Turn the ignition switch to LOCK (0).
9. Disconnect the negative cable from the battery, then wait at least 3 minutes.
10. Remove the column cover, then disconnect the dashboard wire harness 4P connector (A) from the cable reel.
11. Read the DTC.

    Is DTC 12-6x indicated?
    YES - Go to Step 12 .
    NO - Short in the cable reel; replace the cable reel. ■
12. Turn the ignition switch to LOCK (0).
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector A (39P) from the SRS unit.
15. Connect an SRS short canceller (070AZ-SAA0100) to No. 7 and No. 8 terminals of the SRS unit connector A (39P).

---

16. Measure the resistance between the No. 9 and the No.10 terminal of the SRS unit connector A (39P). There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit: replace the SRS unit. ■

SRS DTC Troubleshooting: 12-8x

DTC 12-8x (“x" can be 0 thru 9 or A thru F):
Short to Power in the Driver's Airbag First Inflator (RHD model)

Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-8x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Reconnect the negative cable to the battery.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to the No. 5 and the No. 6 terminals of the SRS unit connector A (39P).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 5 and the No. 6 terminals of the SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Disconnect the driver's airbag 4P connector from the cable reel.
14. Reconnect the negative cable to the battery.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

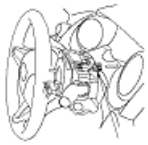
---

16. Measure the voltage between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty driver's airbag; replace the driver's airbag. ■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

19. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



20. Reconnect the negative cable to the battery.
21. Turn the ignition switch to ON (II), then wait for 10 seconds.

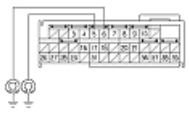
---

22. Measure the voltage between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Short to power in the cable reel; replace the cable reel. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-9x

DTC 12-9x (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Driver's Airbag First Inflator (RHD model)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the driver's airbag 4P connector from the cable reel.

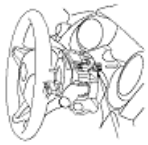
---

9. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■

---

10. Remove the column cover , then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

11. Measure the resistance between the No. 5 and the No. 6 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 Ω.

    Is the resistance as specified?
    YES - Short to ground in the dashboard wire harness: replace the dashboard wire harness.■
    NO - Short to ground in the cable reel; replace the cable reel. ■

SRS DTC Troubleshooting: 12-Ax

DTC 12-Ax (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Driver's Airbag Second Inflator (RHD model)

Special Tools Required

SRS short canceller
070AZ-SAA0100
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-Ax indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Connect an SRS short canceller (070AZ-SAA0100) to No. 9 and No. 10 terminals of the SRS unit connector A (39P).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), then wait for 10 seconds.
10. Measure the voltage between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty SRS unit; replace the SRS unit. ■
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect the negative cable from the battery, then wait at least 3 minutes.
13. Disconnect the driver's airbag 4P connector from the cable reel.
14. Reconnect the negative cable to the battery.
15. Turn the ignition switch to ON (II), then wait for 10 seconds.

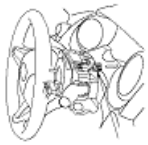
---

16. Measure the voltage between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Faulty driver's airbag: replace driver's airbag. ■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Disconnect the negative cable from the battery, then wait at least 3 minutes.

---

19. Remove the column cover, then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



20. Reconnect the negative cable to the battery.
21. Turn the ignition switch to ON (II), then wait for 10 seconds.

---

22. Measure the voltage between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Short to power in the cable reel; replace the cable reel. ■
    NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.■

SRS DTC Troubleshooting: 12-Bx

DTC 12-Bx (‘‘x" can be 0 thru 9 or A thru F):
Short to Ground in the Driver's Airbag Second Inflator (RHD model)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 12-9x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect SRS unit connector A (39P) from the SRS unit.
7. Check for continuity between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 8 .
   NO - Faulty SRS unit; replace the SRS unit. ■
8. Disconnect the driver's airbag 4P connector from the cable reel.

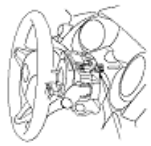
---

9. Check for continuity between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Faulty driver's airbag; replace the driver's airbag. ■

---

10. Remove the column cover, then disconnect the dashboard wire harness 4P connector (A) from the cable reel.



---

11. Check for continuity between the No. 9 and the No. 10 terminals of SRS unit connector A (39P) and body ground.

    Is there continuity?
    YES - Short to ground in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Short to ground in the cable reel; replace the cable reel. ■

ECM/PCM Idle Learn Procedure

The idle learn procedure must be done so the ECM/PCM can learn the engine idle characteristics.
Do the idle learn procedure whenever you do any of these actions:

- Replace the ECM/PCM.
- Reset the ECM/PCM.
- Update the ECM/PCM.
- Replace or clean the throttle body.
- When the engine or transmission is disassembled.

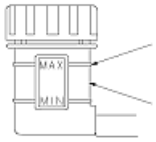
NOTE: Clearing the DTCs with the HDS does not require you to do the idle learn procedure.

Procedure

1. Make sure all electrical items (A/C, audio, lights, etc.) are off.
2. Reset the ECM/PCM with the HDS.
3. Turn the ignition switch to ON (II), and wait 2 seconds.
4. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, or until the engine coolant temperature reaches 90 °C (194 °F).
5. Let the engine idle for about 5 minutes with the throttle fully closed.
   NOTE: If the radiator fan comes on, do not include its running time in the 5 minutes.
6. Verify on the HDS data list that the idle learn procedure is complete.

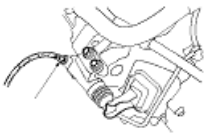
Clutch Hydraulic System Bleeding

NOTE:



- Do not reuse the drained fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.
- If may be necessary to limit the movement of the release fork with a block of wood to remove all the air from the system.
- Use fender covers to avoid damaging painted surfaces.

1. Make sure the brake fluid level in the clutch reservoir (A) is at the MAX (upper) level line (B).



2. Attach one end of a clear tube to the bleeder screw (A), and put the other end into a container. Loosen the bleeder screw to allow air to escape from the system.
3. Make sure there is an adequate supply of fluid in the reservoir, then slowly push the clutch pedal all the way down. Before releasing the pedal, have an assistant temporarily tighten the bleeder screw. Loosen the bleeder screw and push the clutch pedal down again. Repeat this step until no more bubbles appear at the clear tube.
   NOTE: Make sure the fluid level on the reservoir does not go below MIN.
4. Tighten the bleeder screw securely.
5. Refill the brake fluid in the reservoir to the MAX (upper) level line.

Clutch Hose Replacement

NOTE:

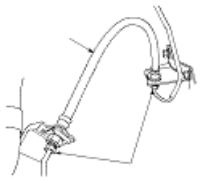
- Replace the clutch hose it is twisted, cracked, or if it leaks.
- Use fender covers to avoid damaging painted surfaces.
- Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately water.

1. Do the battery removal procedure.
2. Remove the air cleaner housing.
3. Disconnect the clutch hose (A) from the clutch lines (B).

4. Remove and discard the clutch hose clips (A) from the clutch hose (B).

5. Install the clutch hose (A) with the new clutch hose clips (B).

6. Connect the clutch lines (A) to the clutch hose (B).
7. Bleed the clutch hydraulic system.
8. Do the following checks:
   - Check the clutch hose and line joint for leaks, and tighten if necessary.
   - Check the clutch hose for interference and twisting.
9. Install the air cleaner housing.
10. Do the battery installation procedure.
11. Test-drive the vehicle.



Clutch Master Cylinder Overhaul

Exploded View

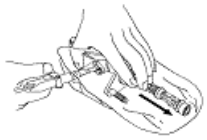
NOTE:

- Refer to the Exploded View, as needed during this procedure.
- Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all part are free of dust and other foreign particles.
- Replace parts with new ones whenever specified to do so.
- Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not reuse the drained fluid. Use only clean genuine Honda DOT 3 or DOT 4 brake fluid.

1. Remove the clutch master cylinder, then disconnect the reservoir hose and clutch line connector from the master cylinder.
2. Pry the circlip off the clutch master cylinder.
3. Remove the pushrod with the stopper plate and the york.

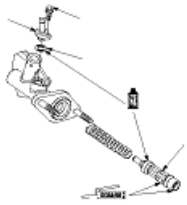
---

4. Carefully remove the piston by applying air pressure through the clutch line hole.



---

5. Remove the piston assembly (A), the connector (B), and the O-ring (C).
6. Apply the rubber grease to the piston, and slide the piston assembly into the clutch master cylinder, then install the pushrod with the stopper plate, and the circlip in the groove of the clutch master cylinder while pushing the piston.
7. Install the connector with a new O-ring.
8. Connect the clutch line connector and the reservoir hose to the master cylinder, then install the clutch master cylinder.



Clutch Slave Cylinder Replacement

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.

1. Do the battery removal procedure.
2. Remove the air cleaner housing.
3. Remove the mounting bolts (A), clutch line bracket (B), and clutch line clip (C), then remove the slave cylinder (D).

---

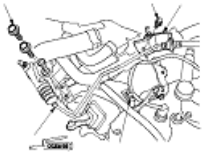
4. Disconnect the clutch line (A). Plug the end of the clutch line with a shop towel to prevent brake fluid from coming out.
   NOTE: Loosen the flare nut (B) while holding the clutch line connector (C) with a wrench.

---

5. Connect the clutch line (A).
   NOTE: Tighten the flare nut (B) while holding the clutch line connector (C) with a wrench.

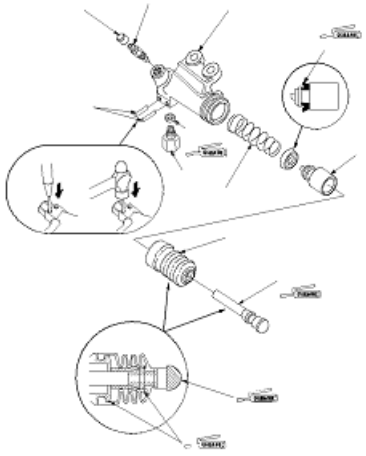
---

6. Apply a light coat of molybdenum to the push rod (A) of the slave cylinder.
7. Install the clutch line clip (B), clutch line bracket (C), and mounting bolts (D).



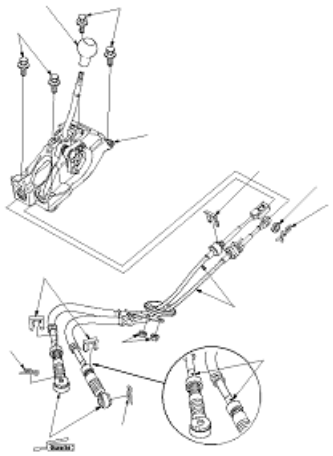
8. Bleed the clutch hydraulic system.
9. Check the clutch operation, and check for leaks.
10. Install the air cleaner housing.
11. Do the battery installation procedure.
12. Test-drive the vehicle.

Clutch Slave Cylinder Overhaul



M/T Gearshift Mechanism Replacement

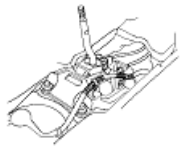
NOTE: When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.



M/T Shift Lever Housing Replacement

NOTE:

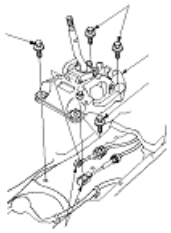
- When removing components, use the trim tool or equivalent.
- Take care not to scratch the center console, dashboard, and related parts.



1. Remove the center console.
2. Remove the harness clamps.

3. Remove the lock pin (A), washer (B), and shift cable clip (C), shift cables (D) from the shift lever housing assembly (E).

4. Remove the shift lever assembly (A) from bolts (B) and the shift cables (C).
5. Install the shift lever housing in the reverse order of removal.



DTC Troubleshooting: P0134 (41)

DTC P0134:
A/F Sensor (Sensor 1) Heater System Malfunction
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel and clear the DTC with the HDS.
- If DTC P0135 is stored at the same time as DTC P0134, troubleshoot DTC P0135 first, then recheck for DTC P0134.

1. Turn the ignition switch ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0134 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM.■
5. Turn the ignition switch to LOCK (0).
6. Replace the A/F sensor (Sensor 1).
7. Turn the ignition switch to ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure.
10. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0134 indicated?
    YES - Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM, then go to Step 1 .
    NO - Go to Step 11 .
11. Monitor the OBD STATUS for DTC P0134 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?
    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in Step 10 , go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the A/F sensor (Sensor 1), the A/F sensor relay, and the ECM/PCM, then go to Step 1 . If the screen indicates NOT COMPLETED, go to Step 8 .

DTC Troubleshooting: P0339 (4)

DTC P0339:
CKP Sensor Intermittent Interruption
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CKP NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?
   YES - Go to Step 7 .
   NO - Go to Step 5 .
5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CKP NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM.■
7. Check for poor or loose connections and terminals at these locations:
   - CKP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?
   YES - Go to Step 8 .
   NO - Repair the connectors or terminals, then go to Step 11 .
8. Check for damage on the CKP sensor pulser plate.

   Is the pulser plate damaged?
   YES - Replace the CKP sensor pulser plate, then go to Step 11 .
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Replace the CKP sensor.
11. Turn the ignition switch to ON (II).
12. Reset the ECM/PCM with the HDS.
13. Clear the CKP pattern with the HDS.
14. Do the ECM/PCM idle learn procedure.
15. Do the CKP pattern learn procedure.
16. Start the engine, and let it idle for 10 seconds.
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0339 indicated?
    YES - Check for poor connections or loose terminals at the CKP sensor and the ECM/PCM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P0369 (8)

DTC P0369:
CMP Sensor Intermittent Interruption
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 10 seconds.
4. Check the CMP B NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?
   YES - Go to Step 7 .
   NO - Go to Step 5 .
5. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
6. Check the CMP B NOISE in the DATA LIST with the HDS.

   Are 0 counts indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM.■
7. Check for poor or loose connections and terminals at these locations:
   - CMP sensor
   - ECM/PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?
   YES - Go to Step 8 .
   NO - Repair the connectors or terminals, then go to Step 11 .
8. Check for damage on the CMP sensor pulser plate.

   Is the pulser plate damaged?
   YES - Replace the CMP sensor pulser plate, then go to Step 11 .
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Replace the CMP sensor.
11. Turn the ignition switch to ON (II).
12. Reset the ECM/PCM with the HDS.
13. Do the ECM/PCM idle learn procedure.
14. Start the engine, and let it idle for 10 seconds.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0369 indicated?
    YES - Check for poor connections or loose terminals at the CMP sensor and the ECM/PCM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P0562

DTC P0562:
Charging System Low Voltage
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- If any high current load accessories are installed, this DTC can be set.
- If DTC P16BB and/or P16BC is stored at the same time as DTC P0562, troubleshoot DTC P16BB and/or P16BC first, then recheck for DTC P0562.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (min^{-1}) (A/T in P or N, M/T in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0562 indicated?

   YES -
   - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to Step 7.
   - Replace the alternator, then go to Step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, and check the battery performance. ■
7. Turn the ignition switch to ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure.
10. Start the engine.
11. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
12. Hold the engine speed at 2,000 rpm (min^{-1}) (A/T in P or N, M/T in neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0562 indicated?

    YES - Check for poor connections or loose terminals at the alternator and the under-hood fuse/relay box, then go to Step 1.

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P1549

DTC P1549:
Charging System High Voltage
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C off
   - Headlights off
   - Rear window defogger off
5. Hold the engine speed at 2,000 rpm (min $^{-1}$) (A/T in P or N, M/T in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1549 indicated?
   YES - Replace the alternator, then go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the battery terminal fuse box.■
7. Turn the ignition switch to ON (II).
8. Reset the ECM/PCM with the HDS.
9. Do the ECM/PCM idle learn procedure.
10. Start the engine.
11. Check under these conditions:
    - A/C off
    - Headlights off
    - Rear window defogger off
12. Hold the engine speed at 2,000 rpm (min $^{-1}$) (A/T in P or N, M/T in neutral) for 1 minute.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P1549 indicated?
    YES - Check for poor connections or loose terminals at the alternator and the battery terminal fuse box, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P16BB

DTC P16BB:
Alternator B Terminal Circuit Low Voltage
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with HDS.
3. Start the engine.
4. Check under these conditions:
   - A/C on
   - Temperature control at maximum cool
   - Blower fan at maximum speed
   - Rear window defogger on
   - Headlights on high beam
5. Hold the engine speed at 2,000 rpm (min $^{-1}$) (A/T in P or N, M/T in neutral) for 1 minute.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P16BB indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the alternator and the battery terminal fuse box, and check the battery performance. ■
7. Check for poor connections or loose terminals at the alternator and the battery terminal fuse box (+B line).

   Are the connections and terminals OK?
   YES - Go to Step 8 .
   NO - Repair the connectors or terminals, then go to Step 9 .
8. Check for an open in the wire between the alternator and battery terminal fuse box at the engine wire harness.

   Is the harness OK?
   YES - Replace the alternator, then go to Step 9 .
   NO - Repair open in the wire between the alternator and the battery terminal fuse box, then go to Step 9 .
9. Turn the ignition switch to ON (II).
10. Reset the ECM/PCM with the HDS.
11. Do the ECM/PCM idle learn procedure.
12. Start the engine.
13. Check under these conditions:
    - A/C on
    - Temperature control at maximum cool
    - Blower fan at maximum speed
    - Rear window defogger on
    - Headlights on high beam
14. Hold the engine speed at 2,000 rpm (min $^{-1}$) (A/T in P or N, M/T in neutral) for 1 minute.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BB indicated?
    YES - Check for poor connections or loose terminals at the alternator and the battery terminal fuse box, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: U0155 (126)

DTC U0155:
F-CAN Malfunction (ECM/PCM-Gauge Control Module)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0155 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the ECM/PCM.■
4. Check for body electrical DTCs in the DTCs MENU with the HDS.

   Is DTC B1168, B1169, and/or B1178 indicated?
   YES - Go to Step 5 .
   NO - Do the gauge control module input test. ■
5. Turn the ignition switch to LOCK (0).
6. Jump the SCS line with the HDS.
7. Remove the gauge control module.
8. Disconnect the gauge control module 32P connector.
9. Disconnect ECM/PCM connector A (49P).
10. Connect gauge control module 32P connector terminal No. 30 to body ground with a jumper wire.

---

11. Check for continuity between ECM/PCM connector terminal A3 and body ground.

    Is there continuity?
    YES - Go to Step 12 .
    NO - Repair open in the wire between the ECM/PCM (A3) and the gauge control module, then go to Step 14 .

---

12. Connect gauge control module 32P connector terminal No. 29 to body ground with a jumper wire.

---

13. Check for continuity between ECM/PCM connector terminal A4 and body ground.

    Is there continuity?
    YES - Substitute a known-good gauge control module, then go to Step 14 and recheck. If DTC U0155 is not indicated after substitution, replace the original gauge control module, then go to Step 14 .
    NO - Repair open in the wire between the ECM/PCM (A4) and the gauge control module, then go to Step 14 .
14. Reconnect all connectors.
15. Turn the ignition switch to ON (II).
16. Reset the ECM/PCM with the HDS.
17. Do the ECM/PCM idle learn procedure.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0155 indicated?
    YES - Check for poor connections or loose terminals at the gauge control module and the ECM/PCM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

Manual Transmission and M/T Differential

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	
Mainshaft	End play		0.11–0.18 mm (0.004–0.007 in.)	Adjust

Manual transmission fluid

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	

Clutch disc

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch disc	Rivet head depth		1.00−1.50 mm (0.039−0.059 in.)	0.2 mm (0.008 in.)
	Thickness		7.25−7.95 mm (0.285−0.313 in.)	5.0 mm (0.20 in.)

Clutch pedal

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor	RHD	145 mm (5.71 in.)	———
		LHD	150 mm (5.91 in.)	———
	Stroke		120−130 mm (4.72−5.12 in.)	———

Pressure plate

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height difference of diaphragm spring fingers measured with dial indicator		0.6 mm (0.02 in.) max.	1.0 mm (0.04 in.)

Flywheel

Item	Measurement	Qualification	Standard or New	Service Limit
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	0.15 mm (0.006 in.)

Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	I.D.		15.016−15.043 mm (0.5912−0.5922 in.)	15.08 mm (0.594 in.)
	Gear-to-reverse idler gear shaft clearance		0.032−0.077 mm (0.0012−0.0030 in.)	0.14 mm (0.006 in.)

Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of needle bearing contact area (transmission housing side)		34.000−34.015 mm (1.3386−1.3392 in.)	33.95 mm (1.337 in.)
	Diameter of ball bearing contact area (clutch housing side)		24.980−24.993 mm (0.9835−0.9840 in.)	24.93 mm (0.981 in.)
	Diameter of distance collar contact area		36.487−36.500 mm (1.4365−1.4370 in.)	36.440 mm (1.435 in.)
	Runout		0.02 mm (0.0008 in.) max.	0.05 mm (0.002 in.)

Countershaft 1st gear

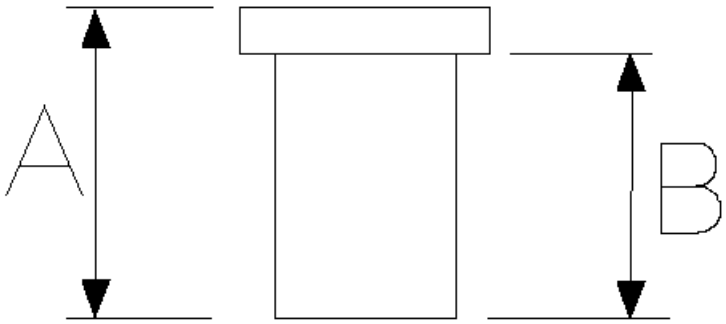
Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear	I.D.		48.509−48.525 mm (1.9098−1.9104 in.)	48.580 mm (1.9126 in.)
	End play		0.03−0.12 mm (0.001−0.005 in.)	0.24 mm (0.009 in.)
	Thickness		27.42−27.47 mm (1.080−1.081 in.)	27.39 mm (1.078 in.)

Countershaft 2nd gear

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear	I.D.		45.009−45.025 mm (1.7720−1.7726 in.)	45.07 mm (1.774 in.)
	End play		0.04−0.12 mm (0.002−0.005 in.)	0.24 mm (0.009 in.)
	Thickness		27.41−27.46 mm (1.079−1.081 in.)	27.36 mm (1.077 in.)

Countershaft 1st gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear distance collar	I.D.		36.50−36.51 mm (1.4370−1.4373 in.)	36.52 mm (1.4378 in.)
	O.D.		44.489−45.000 mm (1.7515−1.7717 in.)	44.44 mm (1.7500 in.)
	Length	A	30.50−30.54 mm (1.2007−1.2023 in.)	———
			0445−1.0464 in.)	———



Countershaft 2nd gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear distance collar	I.D.		34.000−34.010 mm (1.3386−1.3390 in.)	34.04 mm (1.340 in.)
	O.D.		39.989−40.000 mm (1.5744−1.5748 in.)	39.93 mm (1.572 in.)
	Length		27.53−27.56 mm (1.084−1.085 in.)	27.51 mm (1.083 in.)

Change lever

Item	Measurement	Qualification	Standard or New	Service Limit
Change lever	Shaft-to-select lever clearance		0.05−0.35 mm (0.002−0.014 in.)	0.55 mm (0.022 in.)
	Groove width		13.00−13.15 mm (0.512−0.518 in.)	———
	Shaft-to-shift arm clearance		0.013−0.070 mm (0.0005−0.0028 in.)	0.1 mm (0.004 in.)

Select lever

Item	Measurement	Qualification	Standard or New	Service Limit
Select lever	Finger width		12.80−12.95 mm (0.504−0.510 in.)	———

Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Finger width		13.5−13.8 mm (0.53−0.54 in.)	———
	Fork-to-reverse idler gear clearance		1.30−1.90 mm (0.051−0.075 in.)	2.5 mm (0.098 in.)

Shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Shift fork	Finger thickness	1st-2nd and 3rd-4th forks	7.4−7.6 mm (0.29−0.30 in.)	———
		5th fork	6.7−6.9 mm (0.26−0.27 in.)	———
	Fork-to-synchro sleeve clearance		0.35−0.65 mm (0.014−0.026 in.)	1.0 mm (0.04 in.)

Shift arm

Item	Measurement	Qualification	Standard or New	Service Limit
Shift arm	I.D.		13.973−14.000 mm (0.5501−0.5512 in.)	———
	Finger width		12.9−13.0 mm (0.508−0.512 in.)	———
	Shift arm-to-shift fork clearance		0.2−0.5 mm (0.008−0.020 in.)	0.62 mm (0.024 in.)

Mainshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	End play		0.11−0.18 mm (0.004−0.007 in.)	Adjust
	Diameter of ball bearing contact area (transmission housing side)		25.987−26.000 mm (1.0231−1.0236 in.)	25.93 mm (1.020 in.)

Item	Measurement	Qualification	Standard or New	Service Limit
M/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———

Synchro ring

Item	Measurement	Qualification	Standard or New	Service Limit
Synchro ring	Ring-to-gear clearance	Ring pushed against gear	0.85−1.10 mm (0.033−0.043 in.)	0.4 mm (0.02 in.)

Set speed does not cancel (engine rpm stays high) when the clutch pedal is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the clutch pedal position switch B test.
3. Do the cruise control input test. Test the clutch pedal position switch B signal input.

Also check for

- Short to ground on the WHT wire
- Faulty clutch pedal position switch B

Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the clutch pedal)

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the clutch pedal position switch B adjustment.
3. Do the cruise control combination switch test.
4. Do the cruise control input test. Test the cruise control resume/accel switch B signal input. Test the clutch pedal position switch B signal input.

Also check for

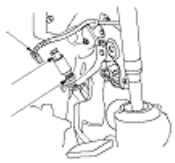
- Faulty clutch pedal position switch B
- Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire

Clutch Pedal Position Switch B Test

1. Disconnect the clutch pedal position switch B connector.

2. Check for continuity between the terminals according to the table.
   - If the continuity is not as specified, replace the clutch pedal position switch B.
   - If OK, install the clutch pedal position switch B, and adjust the pedal height.

Clutch Pedal Position Switch B Replacement



1. Disconnect the clutch pedal position switch B connector (A).
2. Loosen the locknut (B), then remove the clutch pedal position switch B (C).
3. Install the clutch pedal position switch B, and adjust the pedal height.

Cruise Control (ECM/PCM) Input Test

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it does not communicate, troubleshoot the DLC circuit.
4. Go to PGM-FI, and check for DTCs.
5. Do the following tests while monitoring parameters in the PGM-FI DATA LIST with the HDS.
   NOTE: Intermittent failures are often caused by loose circuit connections. While monitoring cruise control inputs, flex their circuits, and note if any of the test results change.

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Brake pedal position switch signal	Brake pedal pressed, then released	CRUISE BRAKE SW should indicate OFF when the brake pedal is pressed and ON when the brake pedal is released.	• Faulty brake pedal position switch • Blown No. 24 (10 A) fuse in the under-dash fuse/relay box • An open in the wire between the ECM/PCM and the brake pedal position switch • A wire shorted to ground between the ECM/PCM and the brake pedal position switch
Clutch pedal position switch B signal (M/T model)	Clutch pedal pressed, then released	SHIFT/CLUTCH SW should indicate OFF when the clutch pedal is pressed and ON when the clutch pedal is released.	• Faulty clutch pedal position switch B • An open in the wire between the ECM and the clutch pedal position switch B • A wire shorted to ground between the ECM and the clutch pedal position switch B • Poor ground G401
Transmission range switch signal (A/T model)	Shift lever in D and S	SHIFT/CLUTCH SW should indicate ON in P, R, and N and OFF in D and S.	• Faulty transmission range switch • An open in the wire between the PCM and the transmission range switch • A wire shorted to ground between the PCM and the transmission range switch • Poor ground G101
Set switch signal	Set/decel switch pressed and released	CRUISE CONTROL SET SW should indicate ON when the set/decel switch is pressed and OFF when the set/decel switch is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
Resume switch signal	Resume/accel switch pressed and released	CRUISE CONTROL RESUME SW should indicate ON when the resume/accel switch is pressed and OFF when the resume/accel switch is released.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch
Cancel switch signal	Cancel switch pressed and released	CRUISE CONTROL CANCEL SW should indicate ON when the cancel switch is pressed and OFF when the cancel switch is released.	Faulty cruise control combination switch
Cruise control main switch signal	Cruise control main switch ON and OFF	CRUISE CONTROL MAIN SW should indicate ON when the cruise control main switch is turned ON and OFF when the cruise control main switch is turned OFF.	• Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and the cruise control combination switch • An open in the wire between the cruise control combination switch and ground

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Cruise control indicator signal	Start the engine, turn the cruise control main switch on, and drive the vehicle above 40 km/h (25 mph). Set and cancel the cruise control.	CRUISE INDICATOR should indicate ON when the cruise control is set and OFF when the cruise control is canceled.	Faulty gauge control module

SIL never comes on

Diagnostic procedure

1. Troubleshoot shift indicator lamp.

When the clutch pedal pressed, light out of SIL is slow

Diagnostic procedure

1. Troubleshoot shift indicator lamp.

SIL does not work once in a while

Diagnostic procedure

1. Troubleshoot shift indicator lamp.

Shift up indicator lamp does not come on, or shift down indicator lamp does not come on

Diagnostic procedure

1. Check for body electrical system DTCs.

SIL stays on

Diagnostic procedure

1. Check for body electrical system DTCs.

Fuel and Emissions System Description - ECM/PCM Inputs and Outputs

ECM/PCM Inputs and Outputs at Connector A (□) (49P)
ECM/PCM Inputs and Outputs at Connector A (□) (49P)
ECM/PCM Inputs and Outputs at Connector A (□) (49P)
ECM/PCM Inputs and Outputs at Connector B (△) (49P)
ECM/PCM Inputs and Outputs at Connector B (△) (49P)
ECM/PCM Inputs and Outputs at Connector B (△) (49P)
ECM/PCM Inputs and Outputs at Connector C (○) (49P)
ECM/PCM Inputs and Outputs at Connector C (○) (49P)

Clutch Pedal Position Switch A Replacement

KE, KG models (M/T)

1. Remove the driver's dashboard undercover.
2. Disconnect clutch pedal position switch A connector (A).
3. Remove clutch pedal position switch A (B).
4. Install the parts in the reverse order of removal.
   NOTE: Adjust clutch pedal position switch A.

How to Troubleshoot the Fuel and Emissions Systems

Intermittent Failures

The term ‘‘intermittent failure" means a system may have had a failure, but it checks OK now. If the malfunction indicator lamp (MIL) on the dash does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the MIL was on but then went out, the original problem may have been intermittent.

Service Information

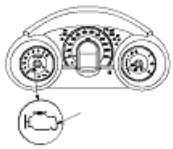
Periodically, new ECM/PCM software or new service procedures may become available. Always check online for the latest software or service information related to the DTCs or symptoms you are troubleshooting.

Opens and Shorts

‘‘Open" and ‘‘short" are common electrical terms. An open is a break in a wire or at a connection. A short is an accidental connection of a wire to ground or to another wire. In simple electronics, this usually means something won't work at all. With complex electronics (such as ECMs or PCMs) this can sometimes mean something works, but not the way it's supposed to.

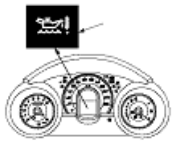
MIL indication

If you turn the ignition switch to the ON (II) position, without starting the engine, the malfunction indicator lamp (MIL) (A) will come on for about 20 seconds. It then goes off or brinks 5 times under various conditions. This is normal: it shows the self-testing condition of the diagnostics for the emissions control systems.
If the MIL in the gauge assembly will come on, go to how to use the HDS.



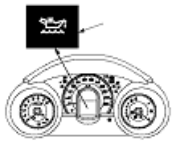
CHECK SYSTEM display (A) Indication (CHECK OIL LEVEL SENSOR)

If display is on, engine oil level sensor may have had a failure. Connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.



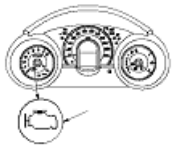
CHECK ENGINE OIL LEVEL display (A) Indication

If display is on, engine oil level may have had a failure. Check the engine oil level sensor.



How to Use the HDS (Honda Diagnostic System)

If the MIL (malfunction indicator lamp) has come on



1. Start the engine, and check the MIL (A).

2. If the MIL stays on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting.
5. Check the diagnostic trouble code (DTC) and note it. Also check the freeze data and/or on-board snapshot data, and download any data found. Then refer to the indicated DTC's troubleshooting, and begin the appropriate troubleshooting procedure.
   NOTE:
   - Freeze data indicates the engine conditions when the first system malfunction, misfire, or fuel trim malfunction that activated the MIL was detected.
   - The HDS can read the DTC, freeze data, on-board snapshot, current data, and other engine control module (ECM) or powertrain control module (PCM) data.
   - For specific operations, refer to the user's manual that came with the HDS.
6. If no DTCs are found, go to MIL troubleshooting.

If the MIL did not stay on

If the MIL did not stay on but there is a driveability problem, do the symptom troubleshooting.

If you can't duplicate the DTC

Some of the troubleshooting requires you to reset the ECM/PCM and try to duplicate the DTC. If the problem is intermittent and you can't duplicate the code, do not continue through the procedure. To do so will only result in confusion and possibly, a needlessly replaced ECM/PCM.

HDS Clear Command

The ECM/PCM stores various specific data to correct the system even if there is no electrical power such as when the battery negative terminal is disconnected. Stored data based on failed parts should be cleared by using the "CLEAR COMMAND" of the HDS, if parts are replaced.
The HDS has three kinds of clear commands to meet this purpose. They are clear DTCs, ECM/PCM reset, and CKP pattern clear. DTC clear command erases all stored DTC codes, freeze data, and on-board snapshot. This must be done with the HDS after reproducing the DTC during troubleshooting.
The ECM/PCM reset command erases all stored DTC codes, freeze data, on-board snapshot, and all specific data to correct the system except CKP pattern. If the CKP pattern data in the ECM/PCM was cleared, you must do the CKP pattern learn procedure. The CKP pattern clear command erases only CKP pattern data. This command is for repair of a misfire or the CKP sensor.

Scan Tool Clear Command

If you are using a generic scan tool to clear commands, be aware that there is only one setting for clearing the ECM/PCM, and it clears all commands at the same time (CKP pattern learn, idle learn, freeze data, on-board snapshot, and DTCs). After you clear all commands, you then need to do these procedures, in this order: ECM/PCM idle learn procedure; CKP pattern learn procedure.

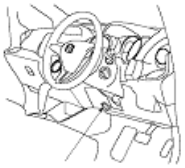
DTC Clear

1. Clear the DTC with the HDS while the engine is stopped.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch to ON (II), and wait 30 seconds.
4. Turn the ignition switch to LOCK (0), and disconnect the HDS from the DLC.

ECM/PCM Reset

1. Reset the ECM/PCM with the HDS while the engine is stopped.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch to ON (II), and wait 30 seconds.
4. Turn the ignition switch to LOCK (0), and disconnect the HDS from the DLC.
5. Do the ECM/PCM idle learn procedure.

CKP Pattern Clear/CKP Pattern Learn Clear/Learn Procedure (with the HDS)



1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting.
4. Select CRANK PATTERN in the ADJUSTMENT MENU with the HDS.
5. Select CRANK PATTERN LEARNING with the HDS, and follow the screen prompts.
6. The CKP pattern learn procedure is complete.

Learn Procedure (without the HDS)

1. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
2. Test-drive the vehicle on a level road: Decelerate (with the throttle fully closed) from an engine speed of 2,500 rpm (min^{-1}) down to 1,000 rpm (min^{-1}) with the A/T in 2 position, or the M/T in 1st gear.
3. Repeat Step 2 several times.
4. Turn the ignition switch to LOCK (0).
5. Turn the ignition switch to ON (II), and wait 30 seconds. The CKP pattern learn procedure is complete.

How to End a Troubleshooting Session (required after any troubleshooting)

1. Reset the ECM/PCM with the HDS.
2. Do the ECM/PCM idle learn procedure.
3. Turn the ignition switch to LOCK (0).
4. Disconnect the HDS from the DLC.
   NOTE: The ECM/PCM is part of the immobilizer system. If you replace the ECM/PCM, it will have a different immobilizer code. In order for the engine to start, you must rewrite the immobilizer code with the HDS (immobilizer system section).

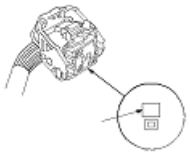
How to Troubleshoot Circuits at the ECM/PCM Connectors

NOTE: The ECM/PCM stays on up to about 15 minutes after the ignition switch is turned to LOCK (0). Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the ECM/PCM during this function, without jumping the SCS line first, can damage the ECM/PCM.

1. Jump the SCS line with the HDS.
2. Disconnect ECM/PCM connectors A, B, and C.
   NOTE: ECM/PCM connectors A, B, and C have symbols (A=□, B=△, C=○) embossed on them for identification.

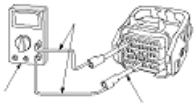
---

3. When diagnosis/troubleshooting is done at the ECM/PCM connector, use the terminal test port (A) above the terminal you need to check.



---

4. Connect one side of the patch cord (A) terminals to a commercially available digital multimeter (B), and connect the other side of the patch cord terminals to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).



5. Gently contact the pin probe (male) at test port from the terminal side. Do not force the tips into the terminals.

NOTICE

- For accurate results, always use the pin probe (male).
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

Substituting the ECM/PCM

Special Tools Required

- Honda diagnostic system (HDS)
- Honda interface module (HIM)
- HDS pocket tester

NOTE: Use this procedure when you have to substitute a known-good ECM/PCM during troubleshooting procedure.

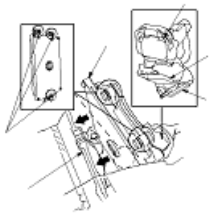
1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM and other vehicle systems. If it doesn't, go to the DLC circuit troubleshooting.
4. Jump the SCS line with the HDS.
5. Turn the ignition switch to LOCK (0).

---

6. Remove the ECM/PCM cover (A).

---

7. Remove the battery setting plate, and reposition the battery (D) away from the ECM/PCM.
   NOTE: Do not disconnect the battery terminals.
8. Remove the bolts (E).
9. Disconnect ECM/PCM connectors A, B, and C, then remove the ECM/PCM (F).
   NOTE: ECM/PCM connectors A, B, and C have symbols (A=□, B=△, C=○) embossed on them for identification.
10. Install a known-good ECM/PCM in the reverse order of removal.
11. Turn the ignition switch to ON (II).
    NOTE: DTC P0630 ‘‘VIN Not Programmed or Mismatch" may be stored because the VIN has not been programmed into the ECM/PCM; ignore it, and continue this procedure.
12. Manually input the VIN to the ECM/PCM with the HDS.
13. Select the IMMOBI SYSTEM with the HDS.
14. Enter the immobilizer code using the ECM/PCM replacement procedure in the HDS; it allows you to start the engine.
15. Reset the ECM/PCM with the HDS.
16. Update the ECM/PCM if it does not have the latest software.
17. Do the ECM/PCM idle learn procedure.
18. Do the CKP pattern learn procedure.



OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on board diagnosis is successfully finished.
- FAILED: The on board diagnosis has finished but failed.
- EXECUTING: The vehicle is in enable criteria conditions for the DTC and the on board diagnosis is running.
- NOT COMPLETED: The on board diagnosis was running but is out for the enable conditions for the DTC.
- OUT OF CONDITION: The vehicle has stayed out of the enable conditions for the DTC.

DTC Troubleshooting: P0171 (45), P0172 (45)

DTC P0171:
Fuel System Too Lean
DTC P0172:
Fuel System Too Rich
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- If some of the DTCs listed below are indicated at the same time as DTC P0171 and/or P0172, troubleshoot those DTCs first, then recheck for P0171 and/or P0172.
  P0102, P0103: Mass air flow (MAF) sensor
  P0107, P0108: Manifold absolute pressure (MAP) sensor
  P0133, P1157, P2238, P2252, P2A00: Air fuel ratio (A/F) sensor (Sensor 1)
  P0134, P0135: Air fuel ratio (A/F) sensor (Sensor 1) heater
  P0137, P0138, P0139: Secondary HO2S (Sensor 2)
  P0141: Secondary HO2S (Sensor 2) heater
  P2648, P2649: VTEC system
  P0443: EVAP canister purge valve

1. Check the fuel pressure.

   Is the fuel pressure OK?
   YES - Go to Step 2.
   NO -
   - If the pressure is too high, replace the fuel pressure regulator, then go to Step 10.
   - If the pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator, then go to Step 10.

2. Check for vacuum leaks at these parts:
   - PCV valve
   - PCV hose
   - EVAP canister purge valve
   - Throttle body
   - Intake manifold
   - Brake booster hose
   - Brake booster
   - Intake air duct

   Are the parts OK?
   YES - Go to Step 3.
   NO - Repair or replace parts with leaks, then go to Step 10.

3. Turn the ignition switch to LOCK (0).

4. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B), and connect a vacuum pump/gauge to the EVAP canister purge valve.

5. Apply vacuum to the hose.

   Does the hold vacuum?
   YES - Go to Step 6.
   NO - Replace the EVAP canister purge valve, then go to Step 10.

6. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.

7. Check for these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 70 °C (158 °F)
   - A/T in P or N (M/T in neutral)
   - All electrical loads off

8. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm (min $^{-1}$). Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

   Did the engine speed vary more than 100 rpm (min $^{-1}$) from 2,500 rpm (min $^{-1}$)?
   YES - Repeat Step 8.
   NO - Go to Step 9.

9. While holding the engine speed at 2,500 rpm (min $^{-1}$), check the MAF SENSOR in the DATA LIST with the HDS.

   Is there about 4.3−5.3 gm/s (L12B1 engine) or 4.5−5.5 gm/s (L13Z1 engine) or 4.6−5.7 gm/s (L15A7 engine)?
   YES - Check the engine valve clearances and adjust them if needed. If the valve clearances are OK, replace the injectors, then go to Step 10.
   NO - Replace the MAF sensor/IAT sensor, then go to Step 10.

10. Turn the ignition switch to ON (II).

11. Reset the ECM/PCM with the HDS.

12. Do the ECM/PCM idle learn procedure.

13. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.

14. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 70 °C (158 °F)
    - A/T in D, M/T in 4th
    - Drive at a steady speed between 24−120 km/h (15−75 mph) for 15 minutes

    NOTE: DTC P0171 and/or P0172 may take up to 80 minutes of test driving to set. Using the HDS, monitor the long term fuel trim (LT FUEL TRIM) or the air fuel feed back average (AF FB AVE). If the long term fuel trim/air fuel feed back average stays within 0.80−1.25, there is no problem at this time.

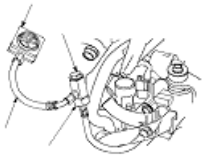
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0171 or P0172 indicated?

    YES - Check for poor connections or loose terminals at the MAF sensor/IAT sensor, the injectors, the EVAP canister purge valve, and the ECM/PCM, then go to Step 1 .

    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P0300 (75) and any combination of P0301 (71), P0302 (72), P0303 (73), P0304 (74)



DTC P0300:
Random Misfire and Any Combination of the Following:
DTC P0301:
No. 1 Cylinder Misfire Detected
DTC P0302:
No. 2 Cylinder Misfire Detected
DTC P0303:
No. 3 Cylinder Misfire Detected
DTC P0304:
No. 4 Cylinder Misfire Detected

Special Tools Required

Oil pressure gauge attachment
07NAJ-P070100

Low pressure gauge assy. 1,000 kpa
07406-0070002

Oil pressure hose
07ZAJ-S5A0200

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- If the misfire is frequent enough to trigger detection of increased emissions during two consecutive driving cycles, the MIL will come on, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored.
- If the misfire is frequent enough to damage the catalyst, the MIL will flash whenever the misfire occurs, and DTC P0300 (and some of the combination of P0301 through P0304) will be stored. When the misfire stops, the MIL will remain on.
- If any of the DTCs listed below are indicated at the same time as the random misfire DTCs, troubleshoot those DTCs first, then recheck for random misfire DTCs:
  P0102, P0103: Mass air flow (MAF) sensor
  P0107, P0108: Manifold absolute pressure (MAP) sensor
  P0171, P0172: Fuel system
  P0335, P0339: Crankshaft position (CKP) sensor
  P0365, P0369: Camshaft position (CMP) sensor
  P2648, P2649: VTEC system

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle without load (A/T in P or N, M/T in neutral).
4. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?
   YES - Go to Step 9.
   NO - If the screen indicates PASSED, go to Step 5. If the screen indicates EXECUTING, keep idling until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, wait for several minutes, then recheck.
5. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?
   YES - Go to Step 9.
   NO - Go to Step 6.
6. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
   - ENGINE SPEED
   - VSS
   - REL TP SENSOR
   - CLV (calculated load value)
   - APP SENSOR
7. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?
   YES - Go to Step 9.
   NO - If the screen indicates PASSED, go to Step 8. If the screen indicates EXECUTING, keep driving until a result comes on. if the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 6 and recheck.
8. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

   Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?
   YES - Go to Step 9.
   NO - Intermittent failure, the system is OK at this time.■

9. Turn the ignition switch to LOCK (0).
10. Check the fuel quality.

    Is the quality good?
    YES - Go to Step 11 .
    NO - Drain the tank and fill with a known-good fuel, then go to Step 24 .
11. Inspect the spark plugs. If the spark plugs are fouled or worn, replace them.
12. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS
    - REL TP SENSOR
    - CLV (calculated load value)
    - APP SENSOR
13. Check the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE in the DATA LIST for 10 minutes with the HDS.

    Does the CYL1 MISFIRE, CYL2 MISFIRE, CYL3 MISFIRE, and/or CYL4 MISFIRE show misfire counts?
    YES - Go to Step 14 .
    NO - Go to Step 24 .
14. Check the fuel pressure.

    Is the fuel pressure OK?
    YES - Go to Step 15 .
    NO -
    - If the fuel pressure is too high, replace the fuel pressure regulator, then go to Step 24 .
    - If the fuel pressure is too low, check the fuel pump, the fuel feed pipe, and the fuel filter. If they are OK, replace the fuel pressure regulator, then go to Step 24 .
15. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
16. Check for these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 80 °C (176 °F)
    - A/T in P or N, M/T in neutral
    - All electrical loads off
17. Monitor the ENGINE SPEED in the DATA LIST with the HDS, and hold the engine speed at 2,500 rpm (min $^{-1}$). Once the engine speed is met, hold the accelerator pedal steady for more than 10 seconds.

    Did the engine speed vary more than 100 rpm (min $^{-1}$) from 2,500 rpm (min $^{-1}$)?
    YES - Repeat Step 17 .
    NO - Go to Step 18 .
18. While holding the engine speed at 2,500 rpm (min $^{-1}$), check the MAF SENSOR in the DATA LIST with the HDS.

    Is there about 4.3−5.3 gm/s (L12B1 engine), 4.5−5.5 gm/s (L13Z1 engine), 4.6−5.7 gm/s (L15A7 engine)?
    YES - Go to Step 19 .
    NO - Replace the MAF sensor/IAT sensor, then go to Step 24 .
19. Turn the ignition switch to LOCK (0).
20. Remove rocker arm oil pressure switch.
21. Attach the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt that was removed to the pressure gauge joint attachment.
22. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
23. Check the oil pressure at engine speeds of 1,000 rpm (min $^{-1}$) and 2,000 rpm (min $^{-1}$).

    Is the oil pressure below 49 kPa (0.5 kgf/cm ^{2} , 7 psi)?
    YES - Check for air in the fuel line, then go to Step 24 .
    NO - Inspect the VTEC system, then go to Step 24 .
24. Turn the ignition switch to ON (II).
25. Reset the ECM/PCM with the HDS.
26. Clear the CKP pattern with the HDS.
27. Do the ECM/PCM idle learn procedure.
28. Do the CKP pattern learn procedure.
29. Test-drive the vehicle for several minutes in the range of these recorded freeze data parameters:
    - ENGINE SPEED
    - VSS

- REL TP SENSOR
- CLV (calculated load value)
- APP SENSOR

30. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0300, P0301, P0302, P0303, or P0304 indicated?

YES - Check for a poor connections or loose terminals at the ignition coils, the injectors, and the ECM/PCM, then go to the troubleshooting for DTC P0301, P0302, P0303, or P0304.

NO - Go to Step 31 .

31. Monitor the OBD STATUS for DTC P0301, P0302, P0303, or P0304 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in Step 30 , go to the indicated DTC's troubleshooting.■

NO - If the screen indicates FAILED, go to Step 1 and recheck. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 29 .

DTC Troubleshooting: P0401 (80)

DTC P0401:
EGR Insufficient Flow
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?
   YES - Go to Step 5.
   NO - Go to Step 7.
5. Test-drive under these conditions:
   - Engine coolant temperature (ECT SENSOR 1) above 70 °C (158 °F)
   - M/T in 4th
   - Drive the vehicle at a steady speed between 24–60 km/h (15–38 mph)
   - During the drive, decelerate (with the throttle fully closed) for 4 seconds
6. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

   Does the screen indicate FAILED?
   YES - Clean the intake manifold EGR port and EGR pipe with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner, then go to Step 9.
   NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 5 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Replace the EGR valve.
9. Turn the ignition switch to ON (II).
10. Reset the ECM with the HDS.
11. Do the ECM idle learn procedure.
12. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 70 °C (158 °F)
    - M/T in 4th
    - Drive the vehicle at a steady speed between 24–60 km/h (15–38 mph)
    - During the drive, decelerate (with the throttle fully closed) for 4 seconds
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0401 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM. If the connections are OK, go to Step 15.
    NO - Go to Step 14.
14. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?
    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in Step 13, go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1. If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 12.
15. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
16. Test-drive under these conditions:
    - Engine coolant temperature (ECT SENSOR 1) above 70 °C (158 °F)
    - M/T in 4th
    - Drive the vehicle at a steady speed between 24–60 km/h (15–38 mph)
    - During the drive, decelerate (with the throttle fully closed) for 4 seconds
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0401 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 16. If the ECM was substituted, go to Step 1.
    NO - Go to Step 18.

18. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs were indicated in Step 17 , go to the indicated DTC's troubleshooting.■

NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 16 . If the ECM was substituted, go to Step 1 . If the screen indicates EXECUTING, keep driving until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 16 .

DTC Troubleshooting: P0404 (12)

DTC P0404:
EGR Control Circuit Range/Performance Problem
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?
   YES - Intermittent failure, the system is OK at this time. Clean any carbon build-up on the EGR valve with throttle plate and induction cleaner.■
   NO - Go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Disconnect the EGR valve 5P connector.
7. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 3.

   Is there 100 kΩ or more?
   YES - Go to Step 25 .
   NO - Go to Step 8 .

---

8. Measure the resistance between EGR valve 5P connector terminals No. 2 and No. 4.

   Is there 100 kΩ or more?
   YES - Go to Step 25 .
   NO - Go to Step 9 .

---

9. Check for continuity between EGR valve 5P connector terminal No. 5 and body ground.

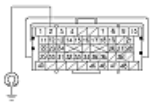
   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the EGR valve and G101, then go to Step 26 .

10. Jump the SCS line with the HDS.
11. Disconnect ECM connector B (49P).

---

12. Check for continuity between ECM connector terminal B2 and body ground.

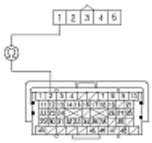
    Is there continuity?
    YES - Repair short in the wire between the ECM (B2) and the EGR valve, then go to Step 26 .
    NO - Go to Step 13 .



---

13. Check for continuity between ECM connector terminal B2 and EGR valve 5P connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 14 .
    NO - Repair open in the wire between the ECM (B2) and the EGR valve, then go to Step 26 .



14. Remove the EGR valve.
15. Clean the intake manifold EGR port and the EGR pipe with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.
16. Install the EGR valve.
17. Reconnect the EGR valve 5P connector.
18. Reconnect ECM connector B (49P).
19. Turn the ignition switch to ON (II).
20. Reset the ECM with the HDS.
21. Do the ECM idle learn procedure.
22. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (in neutral) until the radiator fan comes on, then let it idle.
23. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?

YES - Go to Step 32 .
NO - Go to Step 24 .

24. Turn the ignition switch to LOCK (0).
25. Replace the EGR valve.
26. Reconnect all connectors.
27. Turn the ignition switch to ON (II).
28. Reset the ECM with the HDS.
29. Do the ECM idle learn procedure.
30. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (in neutral) until the radiator fan comes on, then let it idle.
31. Do the EGR TEST in the INSPECTION MENU with the HDS.
32. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1 . If the connections and terminals are OK, go to Step 34 .
    NO - Go to Step 33 .

33. Monitor the OBD STATUS for DTC P0404 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in Step 32 , go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1 . If the screen indicates EXECUTING, keep testing until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 30 .

34. Reconnect all connectors.
35. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
36. Do the EGR TEST in the INSPECTION MENU with the HDS.
37. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0404 indicated?

    YES - Check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 36 . If the ECM was substituted, go to Step 1 .
    NO - Go to Step 38 .

38. Monitor the OBD STATUS for DTC P0404 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?

    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs were indicated in Step 37 , go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 36 . If the ECM was substituted, go to Step 1 . If the screen indicates EXECUTING, keep testing until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 36 .

DTC Troubleshooting: P0406 (12)

DTC P0406:
EGR Valve Position Sensor Circuit High Voltage
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Check the EGR VLS in the DATA LIST with the HDS.

   Is 4.88 V or more indicated?
   YES - Go to Step 3 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM.■
3. Turn the ignition switch to LOCK (0).
4. Disconnect the EGR valve 5P connector.
5. Turn the ignition switch to ON (II).
6. Measure the voltage between EGR valve 5P connector terminals No. 3 and No. 4.

   Is there about 5 V?
   YES - Go to Step 11 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector B (49P).

---

10. Check for continuity between ECM connector terminal B34 and EGR valve 5P connector terminal No. 3.

    Is there continuity?
    YES - Go to Step 18 .
    NO - Repair open in the wire between the EGR valve and the ECM (B34), then go to Step 13 .
11. Turn the ignition switch to LOCK (0).
12. Replace the EGR valve.
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II).
15. Reset the ECM with the HDS.
16. Do the ECM idle learn procedure.
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0406 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
18. Reconnect all connectors.
19. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
20. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0406 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P2413 (12)

DTC P2413:
EGR System Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (in neutral) until the radiator fan comes on, then let it idle.
4. Do the EGR TEST in the INSPECTION MENU with the HDS.

   Is the result OK?
   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the ECM.■
   NO - Go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Turn the ignition switch to ON (II).
7. Check the EGR VLS in the DATA LIST with the HDS.

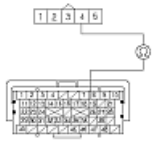
   Is about 0 V indicated?
   YES - Go to Step 8 .
   NO - Go to Step 21 .
8. Turn the ignition switch to LOCK (0).
9. Disconnect the EGR valve 5P connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between EGR valve 5P connector terminal No. 4 and body ground.

    Is there about 5 V?
    YES - Go to Step 16 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect ECM connector B (49P).

---

15. Check for continuity between ECM connector terminal B19 and EGR valve 5P connector terminal No. 4.

    Is there continuity?
    YES - Go to Step 51 .
    NO - Repair open in the wire between the EGR valve and the ECM (B19), then go to Step 44 .

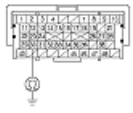


16. Turn the ignition switch to LOCK (0).
17. Jump the SCS line with the HDS.
18. Disconnect ECM connector B (49P).

---

19. Check for continuity between ECM connector terminal B30 and body ground.

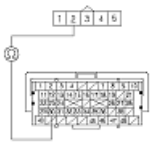
    Is there continuity?
    YES - Repair short in the wire between the ECM (B30) and the EGR valve, then go to Step 44 .
    NO - Go to Step 20 .



---

20. Check for continuity between ECM connector terminal B30 and EGR valve 5P connector terminal No. 2.

    Is there continuity?
    YES - Go to Step 21 .
    NO - Repair open in the wire between the ECM (B30) and the EGR valve, then go to Step 44 .



21. Turn the ignition switch to LOCK (0).
22. If not already done, disconnect the EGR valve 5P connector.

---

23. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 3.

Is there 100 kΩ or more?
YES - Go to Step 43 .
NO - Go to Step 24 .

---

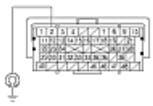
24. At the EGR valve side, measure the resistance between EGR valve 5P connector terminals No. 2 and No. 4.

Is there 100 kΩ or more?
YES - Go to Step 43 .
NO - Go to Step 25 .

25. If not already done, jump the SCS line with the HDS.
26. If not already done, disconnect ECM connector B (49P).

---

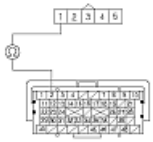
27. Check for continuity between ECM connector terminal B2 and body ground.



Is there continuity?
YES - Repair short in the wire between the ECM (B2) and the EGR valve, then go to Step 44 .
NO - Go to Step 28 .

---

28. Check for continuity between ECM connector terminal B2 and EGR valve 5P connector terminal No. 1.



Is there continuity?
YES - Go to Step 29 .
NO - Repair open in the wire between the ECM (B2) and the EGR valve, then go to Step 44 .

---

29. Check for continuity between EGR valve 5P connector terminal No. 5 and body ground.

Is there continuity?
YES - Go to Step 30 .
NO - Repair open in the wire between the EGR valve and G101, then go to Step 44 .

30. Reconnect ECM connector B (49P).

---

31. At the EGR valve side, connect the battery positive terminal to EGR valve 5P connector terminal No. 1 with a jumper wire.

32. Start the engine, and let it idle. Then connect the battery negative terminal to EGR valve 5P connector terminal No. 5 with a jumper wire.

Does the engine stall or run roughly?
YES - Go to Step 51 .
NO - Go to Step 33 .

33. Turn the ignition switch to LOCK (0).
34. Remove the EGR valve.
35. Clean the intake manifold EGR port and the EGR pipe with throttle plate and induction cleaner. Also, clean the passage inside the EGR valve with throttle plate and induction cleaner.
36. Install the EGR valve.
37. Reconnect all connectors.
38. Turn the ignition switch to ON (II).
39. Reset the ECM with the HDS.
40. Do the ECM idle learn procedure.
41. Do the EGR TEST in the INSPECTION MENU with the HDS.

Is the result OK?
YES - Go to Step 49 .
NO - Go to Step 42 .

42. Turn the ignition switch to LOCK (0).
43. Replace the EGR valve.
44. Reconnect all connectors.

45. Turn the ignition switch to ON (II).
46. Reset the ECM with the HDS.
47. Do the ECM idle learn procedure.
48. Do the EGR TEST in the INSPECTION MENU with the HDS.
49. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2413 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1 .
    NO - Go to Step 50 .

50. Monitor the OBD STATUS for DTC P2413 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?
    YES - Troubleshooting is complete. If any other Temporary DTCs or DTCs were indicated in Step 49 , go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM, then go to Step 1 . If the screen indicates EXECUTING, keep testing until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 47 .

51. Reconnect all connectors.
52. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
53. Do the EGR TEST in the INSPECTION MENU with the HDS.
54. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P2413 indicated?
    YES - Check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 52 . If the ECM was substituted, go to Step 1 .
    NO - Go to Step 55 .

55. Monitor the OBD STATUS for DTC P2413 in the DTCs MENU with the HDS.

    Does the screen indicate PASSED?
    YES - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs were indicated in Step 54 , go to the indicated DTC's troubleshooting.■
    NO - If the screen indicates FAILED, check for poor connections or loose terminals at the EGR valve and the ECM. If the ECM was updated, substitute a known-good ECM, then go to Step 53 . If the ECM was substituted, go to Step 1 . If the screen indicates EXECUTING, keep testing until a result comes on. If the screen indicates OUT OF CONDITION or NOT COMPLETED, go to Step 53 .

DTC Troubleshooting: P250A

DTC P250A:
Engine Oil Level Sensor Circuit Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Wait 5 seconds.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P250A indicated?
   YES - Go to Step 5.
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the engine oil level sensor and the ECM.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the engine oil level sensor 3P connector.
7. Turn the ignition switch to ON (II).
8. Measure the voltage between engine oil level sensor 3P connector terminal No. 3 and body ground.

   Is there battery voltage?
   YES - Go to Step 9.
   NO - Repair open in the wire between the engine oil level sensor and the No. 31 OIL LVL (7.5 A) fuse then go to Step 19.

---

9. Check for continuity between engine oil level sensor 3P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 10.
   NO - Repair open in the wire between the engine oil level sensor and G101, then go to Step 19.

---

10. Measure the voltage between engine oil level sensor 3P connector terminal No. 1 and body ground.

    Is there battery voltage?
    YES - Go to Step 17.
    NO - Go to Step 11.
11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect ECM connector C (49P).

---

14. Check for continuity between ECM connector terminal C41 and body ground.

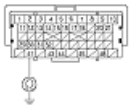
    Is there continuity?
    YES - Repair short in the wire between the ECM (C41) and the engine oil level sensor, then go to Step 19.
    NO - Go to Step 15.

---

15. Connect engine oil level sensor 3P connector terminal No. 1 to body ground with a jumper wire.

---

16. Check for continuity between ECM connector terminal C41 and body ground.



Is there continuity?
YES - Go to Step 24 .
NO - Repair open in the wire between the ECM (C41) and the engine oil level sensor, then go to Step 19 .

17. Turn the ignition switch to LOCK (0).
18. Replace the engine oil level sensor.
19. Reconnect all connectors.
20. Turn the ignition switch to ON (II).
21. Reset the ECM with the HDS.
22. Do the ECM idle learn procedure.
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P250A indicated?
YES - Check for poor connections or loose terminals at the engine oil level sensor and the ECM, then go to Step 1 .
NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

24. Reconnect all connectors.
25. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P250A indicated?
YES - Check for poor connections or loose terminals at the engine oil level sensor and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P250B

DTC P250B:
Engine Oil Level Sensor Range/Performance Problem
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.
- When you check this DTC troubleshooting, carry out in a flat place.
- Check the engine oil level and condition, before checking this DTC troubleshooting.

1. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (in neutral) until the radiator fan comes on, then let it idle.
2. Check the ENGINE OIL TEMPERATURE in the DATA LIST with the HDS.

   Is 50 °C (122 °F) or more indicated?
   YES - Go to Step 3.
   NO - Keep idling until the value of ENGINE OIL TEMPERATURE becomes 50 °C (122 °F) or more, then go to Step 3.
3. Check the ENGINE OIL LEVEL MONITOR CONDITION in the DATA LIST with the HDS.

   Is it OK?
   YES - Go to Step 4.
   NO - Keep idling until the screen indicates "OK", then go to Step 4.
4. Maintain idling for 2 minutes.
5. Note the value of ENGINE OIL LEVEL in the DATA LIST with the HDS.
6. Stop the engine, but stop the ignition switch with ON (II) position.
7. Wait 5 minutes.
8. Check the ENGINE OIL LEVEL in the DATA LIST with the HDS.
9. Compare the value of ENGINE OIL LEVEL and the recorded value of ENGINE OIL LEVEL.

   Does the value of ENGINE OIL LEVEL differ 2 mm (0.08 in.) or more?
   YES - Intermittent failure, the system is OK at this time. Check the engine oil level and condition.■
   NO - Go to Step 10.
10. Replace the engine oil level sensor.
11. Turn the ignition switch to ON (II).
12. Reset the ECM with the HDS.
13. Do the ECM idle learn procedure.
14. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P250B indicated?
    YES - Check for poor connections or loose terminals at the engine oil level sensor and the ECM, then go to Step 1.
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P250E

DTC P250E:
Engine Oil Level Sensor Intermittent Interruption
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine, and let it idle for 1 minute.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P250E indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the engine oil level sensor and the ECM.■
5. Turn the ignition switch to LOCK (0).
6. Check for poor or loose connections and terminals at these locations:
   - Oil level sensor
   - ECM
   - Engine ground (G101)
   - Body ground

   Are the connections and terminals OK?
   YES - Go to Step 7 .
   NO - Repair the connectors or terminals, then go to Step 12 .
7. Substitute a known-good engine oil level sensor.
8. Turn the ignition switch to ON (II).
9. Clear the DTC with the HDS.
10. Start the engine, and let it idle for 1 minute.
11. Check for Temporary DTCs or DTCs with the HDS.

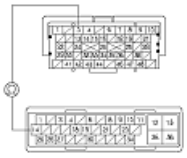
    Is DTC P250E indicated?
    YES - Go to Step 16 .
    NO - Replace the original engine oil level sensor, then go to Step 12 .
12. Turn the ignition switch to ON (II).
13. Reset the ECM with the HDS.
14. Do the ECM idle learn procedure.
15. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P250E indicated?
    YES - Check for poor connections or loose terminals at the engine oil level sensor and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
16. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
17. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P250E indicated?
    YES - Check for poor connections or loose terminals at the engine oil level sensor and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: U0122

DTC U0122:
F-CAN Malfunction (ECM-VSA Modulator-Control Unit)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.



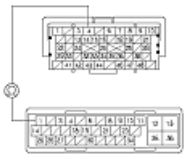
1. Turn the ignition switch to ON (II).
2. Check for Temporary DTCs or DTCs with the HDS.

   Are DTC U0029 and U0122 indicated at the same time?
   YES - Go to troubleshooting for DTC U0029. ■
   NO - Go to Step 3 .
3. Clear the DTC with the HDS.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0122 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the VSA modulator-control unit, and the ECM.■
5. Check for communication to the VSA system with the HDS.

   Does the HDS communicate with the VSA modulator-control unit?
   YES - Go to Step 6 .
   NO - Go to the DLC circuit troubleshooting. ■
6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect the VSA modulator-control unit 36P connector.
9. Disconnect ECM connector A (49P).
10. Check for continuity between ECM connector terminal A3 and VSA modulator-control unit 36P connector terminal No. 14.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the ECM (A3) and the VSA modulator-control unit, then go to Step 12 .



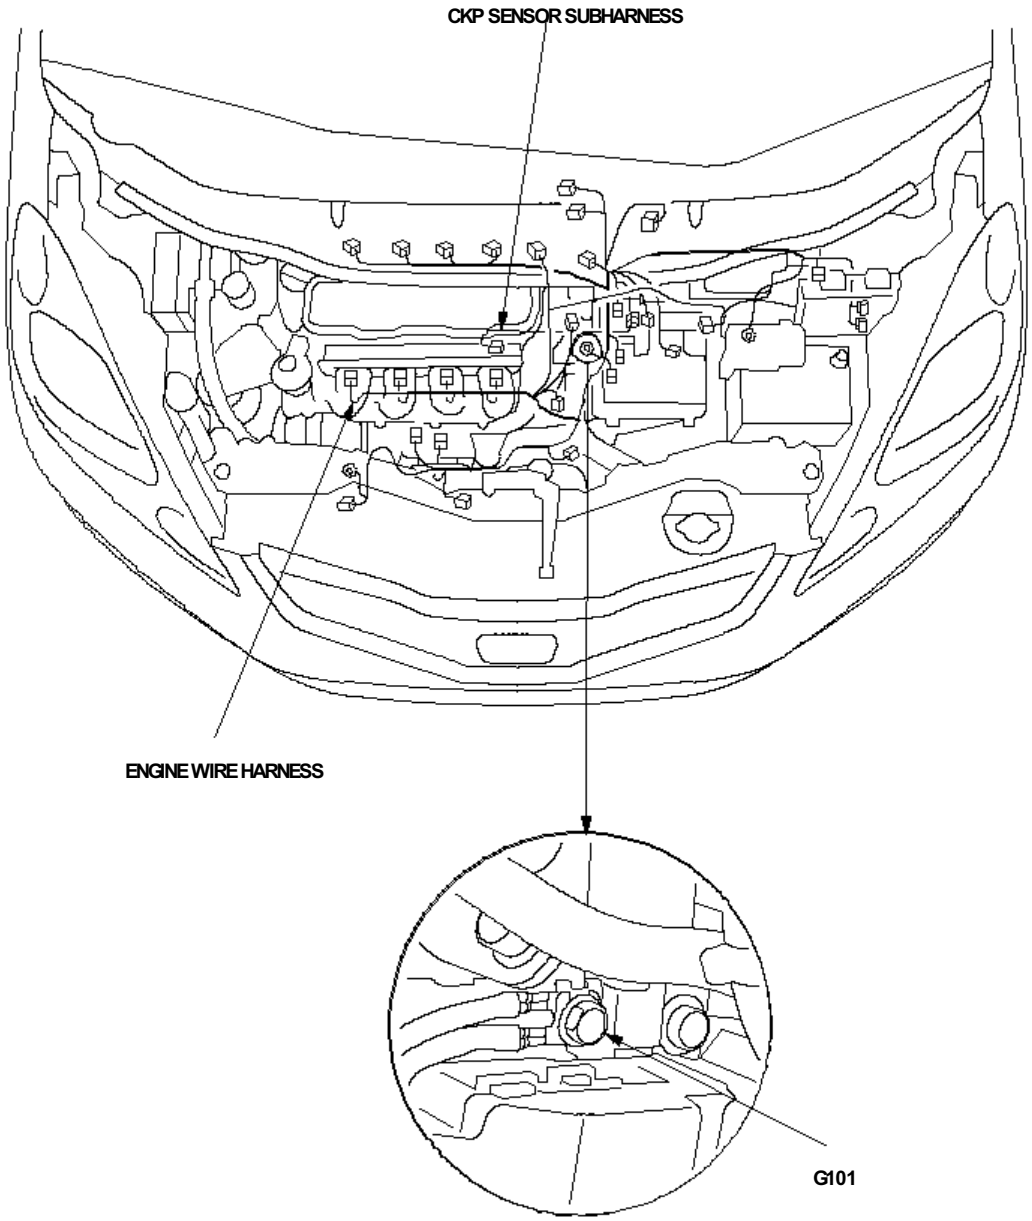
11. Check for continuity between ECM connector terminal A4 and VSA modulator-control unit 36P connector terminal No. 1.

    Is there continuity?
    YES - Update the VSA modulator-control unit if it does not have the latest software, or substitute a known-good VSA modulator-control unit, then go to Step 12 and recheck. If DTC U0122 is not indicated after substitution, replace the original VSA modulator-control unit, then go to Step 12 .
    NO - Repair open in the wire between the ECM (A4) and the VSA modulator-control unit, then go to Step 12 .
12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC U0122 indicated?
    YES - Check for poor connections or loose terminals at the gauge control module, the VSA modulator unit, and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

Engine Wire Harness and CKP Sensor Subharness Locations

M/T



RHD model is shown, LHD model is similar.

Manual Transmission and M/T Differential

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	
Mainshaft	End play		0.11–0.18 mm (0.004–0.007 in.)	Adjust
	Diameter of ball bearing contact area (transmission housing side)		25.987–26.000 mm (1.0231–1.0236 in.)	25.93 mm (1.020 in.)
	Diameter of distance collar contact area		28.992–29.005 mm (1.1414–1.1419 in.)	28.93 mm (1.139 in.)

Manual transmission fluid

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	

Clutch disc

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch disc	Rivet head depth		1.00−1.50 mm (0.039−0.059 in.)	0.2 mm (0.008 in.)
	Thickness		7.25−7.95 mm (0.285−0.313 in.)	5.0 mm (0.20 in.)

Clutch pedal

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor		150 mm (5.91 in.)	———
	Stroke		120−130 mm (4.72−5.12 in.)	———

Pressure plate

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height difference of diaphragm spring fingers measured with dial indicator		0.6 mm (0.02 in.) max.	1.0 mm (0.04 in.)

Flywheel

Item	Measurement	Qualification	Standard or New	Service Limit
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	0.15 mm (0.006 in.)

Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	I.D.		15.016−15.043 mm (0.5912−0.5922 in.)	15.08 mm (0.594 in.)
	Gear-to-reverse gear shaft clearance		0.032−0.077 mm (0.0012−0.0030 in.)	0.14 mm (0.006 in.)

Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of needle bearing contact area (transmission housing side)		34.000−34.015 mm (1.3386−1.3392 in.)	33.95 mm (1.337 in.)
	Diameter of ball bearing contact area (clutch housing side)		24.980−24.993 mm (0.9835−0.9840 in.)	24.93 mm (0.981 in.)
	Diameter of distance collar contact area		36.487−36.500 mm (1.4365−1.4370 in.)	36.44 mm (1.4346 in.)
	Runout		0.02 mm (0.001 in.) max.	0.05 mm (0.002 in.)

Countershaft 1st gear

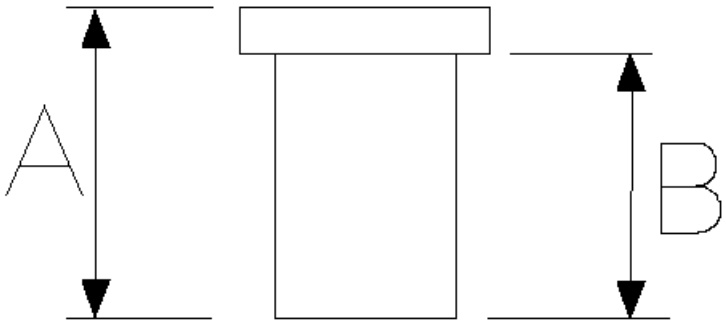
Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear	I.D.		48.509−48.525 mm (1.9098−1.9104 in.)	48.580 mm (1.9126 in.)
	End play		0.03−0.12 mm (0.001−0.005 in.)	0.24 mm (0.009 in.)
	Thickness		27.42−27.47 mm (1.080−1.081 in.)	27.39 mm (1.078 in.)

Countershaft 2nd gear

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear	I.D.		45.009−45.025 mm (1.7720−1.7726 in.)	45.07 mm (1.774 in.)
	End play		0.04−0.12 mm (0.002−0.005 in.)	0.24 mm (0.009 in.)
	Thickness		27.41−27.46 mm (1.079−1.081 in.)	27.36 mm (1.077 in.)

Countershaft 1st gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear distance collar	I.D.		36.50−36.51 mm (1.4370−1.4373 in.)	36.52 mm (1.4378 in.)
	O.D.		44.489−45.000 mm (1.7515−1.7717 in.)	44.44 mm (1.7500 in.)
	Length	A	30.50−30.54 mm (1.2007−1.2023 in.)	———
			044−1.046 in.)	———



Countershaft 2nd gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear distance collar	I.D.		34.000−34.010 mm (1.3386−1.3390 in.)	34.04 mm (1.340 in.)
	O.D.		39.989−40.000 mm (1.5744−1.5748 in.)	39.93 mm (1.572 in.)
	Length		27.53−27.56 mm (1.084−1.085 in.)	27.51 mm (1.083 in.)

Change lever

Item	Measurement	Qualification	Standard or New	Service Limit
Change lever	Shaft-to-select lever clearance		0.05−0.35 mm (0.002−0.014 in.)	0.55 mm (0.022 in.)
	Groove width		13.00−13.15 mm (0.512−0.518 in.)	———
	Shaft-to-shift arm clearance		0.013−0.070 mm (0.0005−0.0028 in.)	0.1 mm (0.004 in.)

Select lever

Item	Measurement	Qualification	Standard or New	Service Limit
Select lever	Finger width		12.80−12.95 mm (0.504−0.510 in.)	———

Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Finger width		13.5−13.8 mm (0.53−0.54 in.)	———
	Fork-to-reverse idler gear clearance		1.30−1.90 mm (0.051−0.075 in.)	2.5 mm (0.098 in.)

Shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Shift fork	Finger thickness	1st-2nd and 3rd-4th forks	7.4−7.6 mm (0.29−0.30 in.)	———
		5th fork	6.7−6.9 mm (0.26−0.27 in.)	———
	Fork-to-synchro sleeve clearance		0.35−0.65 mm (0.014−0.026 in.)	1.0 mm (0.04 in.)

Shift arm

Item	Measurement	Qualification	Standard or New	Service Limit
Shift arm	I.D.		13.973−14.000 mm (0.5501−0.5512 in.)	———
	Finger width		12.9−13.0 mm (0.508−0.512 in.)	———
	Shift arm-to-shift fork clearance		0.2−0.5 mm (0.008−0.020 in.)	0.62 mm (0.024 in.)

Mainshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	End play		0.11−0.18 mm (0.004−0.007 in.)	Adjust
	Diameter of ball bearing contact area (transmission housing side)		25.987−26.000 mm (1.0231−1.0236 in.)	25.93 mm (1.020 in.)
	Diameter of distance collar contact area		28.992−29.005 mm (1.1414−1.1419 in.)	28.93 mm (1.139 in.)
	Diameter of needle bearing contact area		34.984−35.000 mm (1.3773−1.3780 in.)	34.93 mm (1.375 in.)
	Diameter of ball bearing contact area (clutch housing side)		25.977−25.990 mm (1.0227−1.0232 in.)	25.92 mm (1.020 in.)
	Diameter of pilot bearing contact area		14.870−14.890 mm (0.5854−0.5862 in.)	———
	Runout		0.02 mm (0.001 in.) max.	0.05 mm (0.002 in.)

Mainshaft 4th and 5th gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 4th and 5th gear distance collar	I.D.		29.014−29.024 mm (1.1423−1.1427 in.)	29.06 mm (1.144 in.)

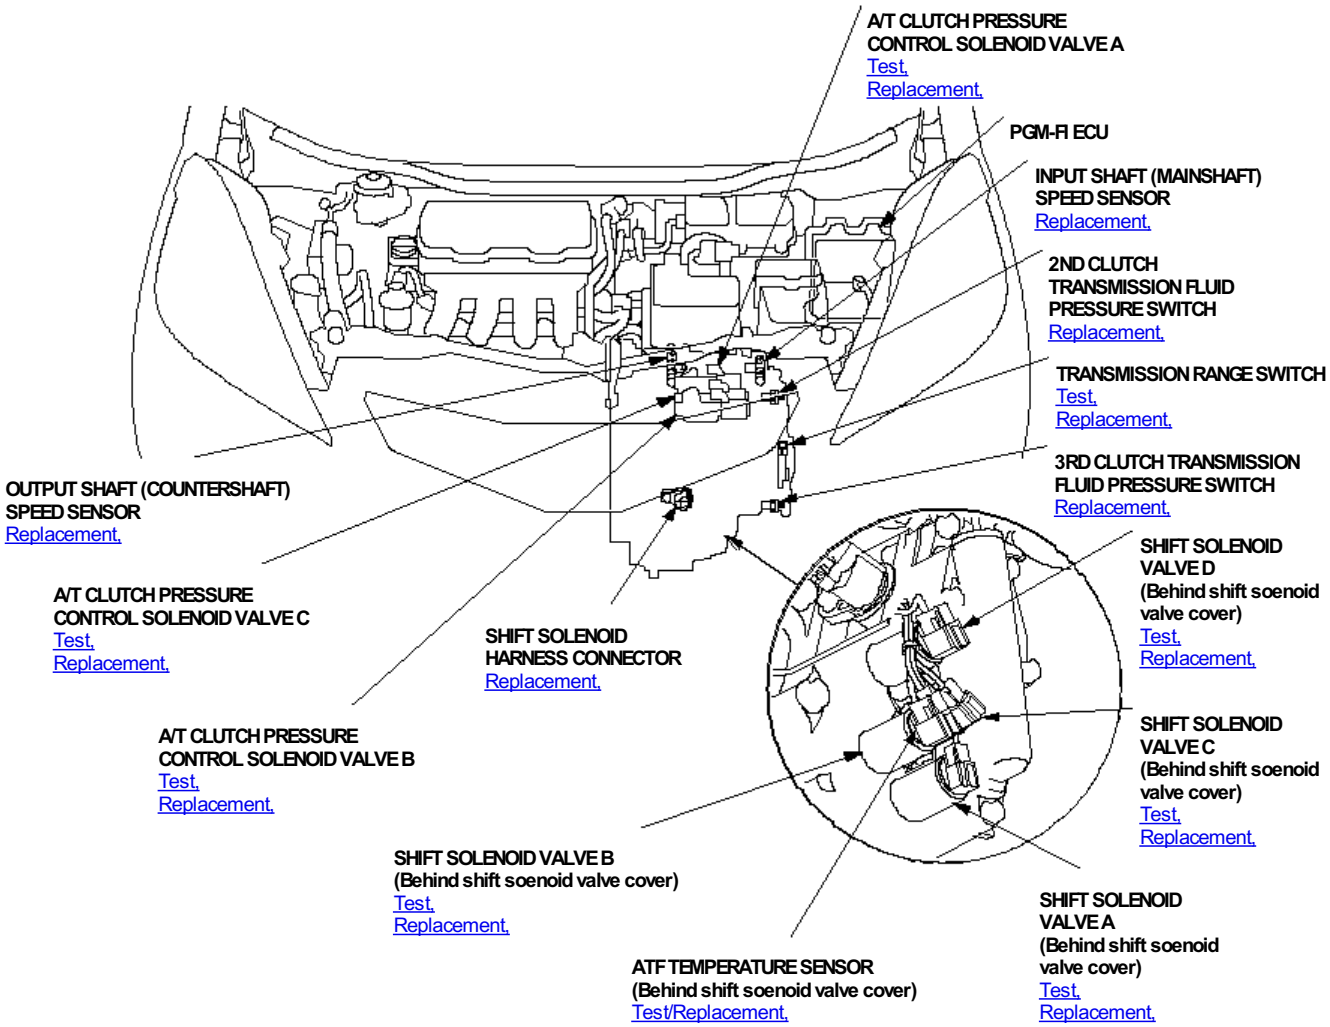
A/T System Description - General Operation

General Operation
General Operation (cont'd)

A/T System Component Location Index

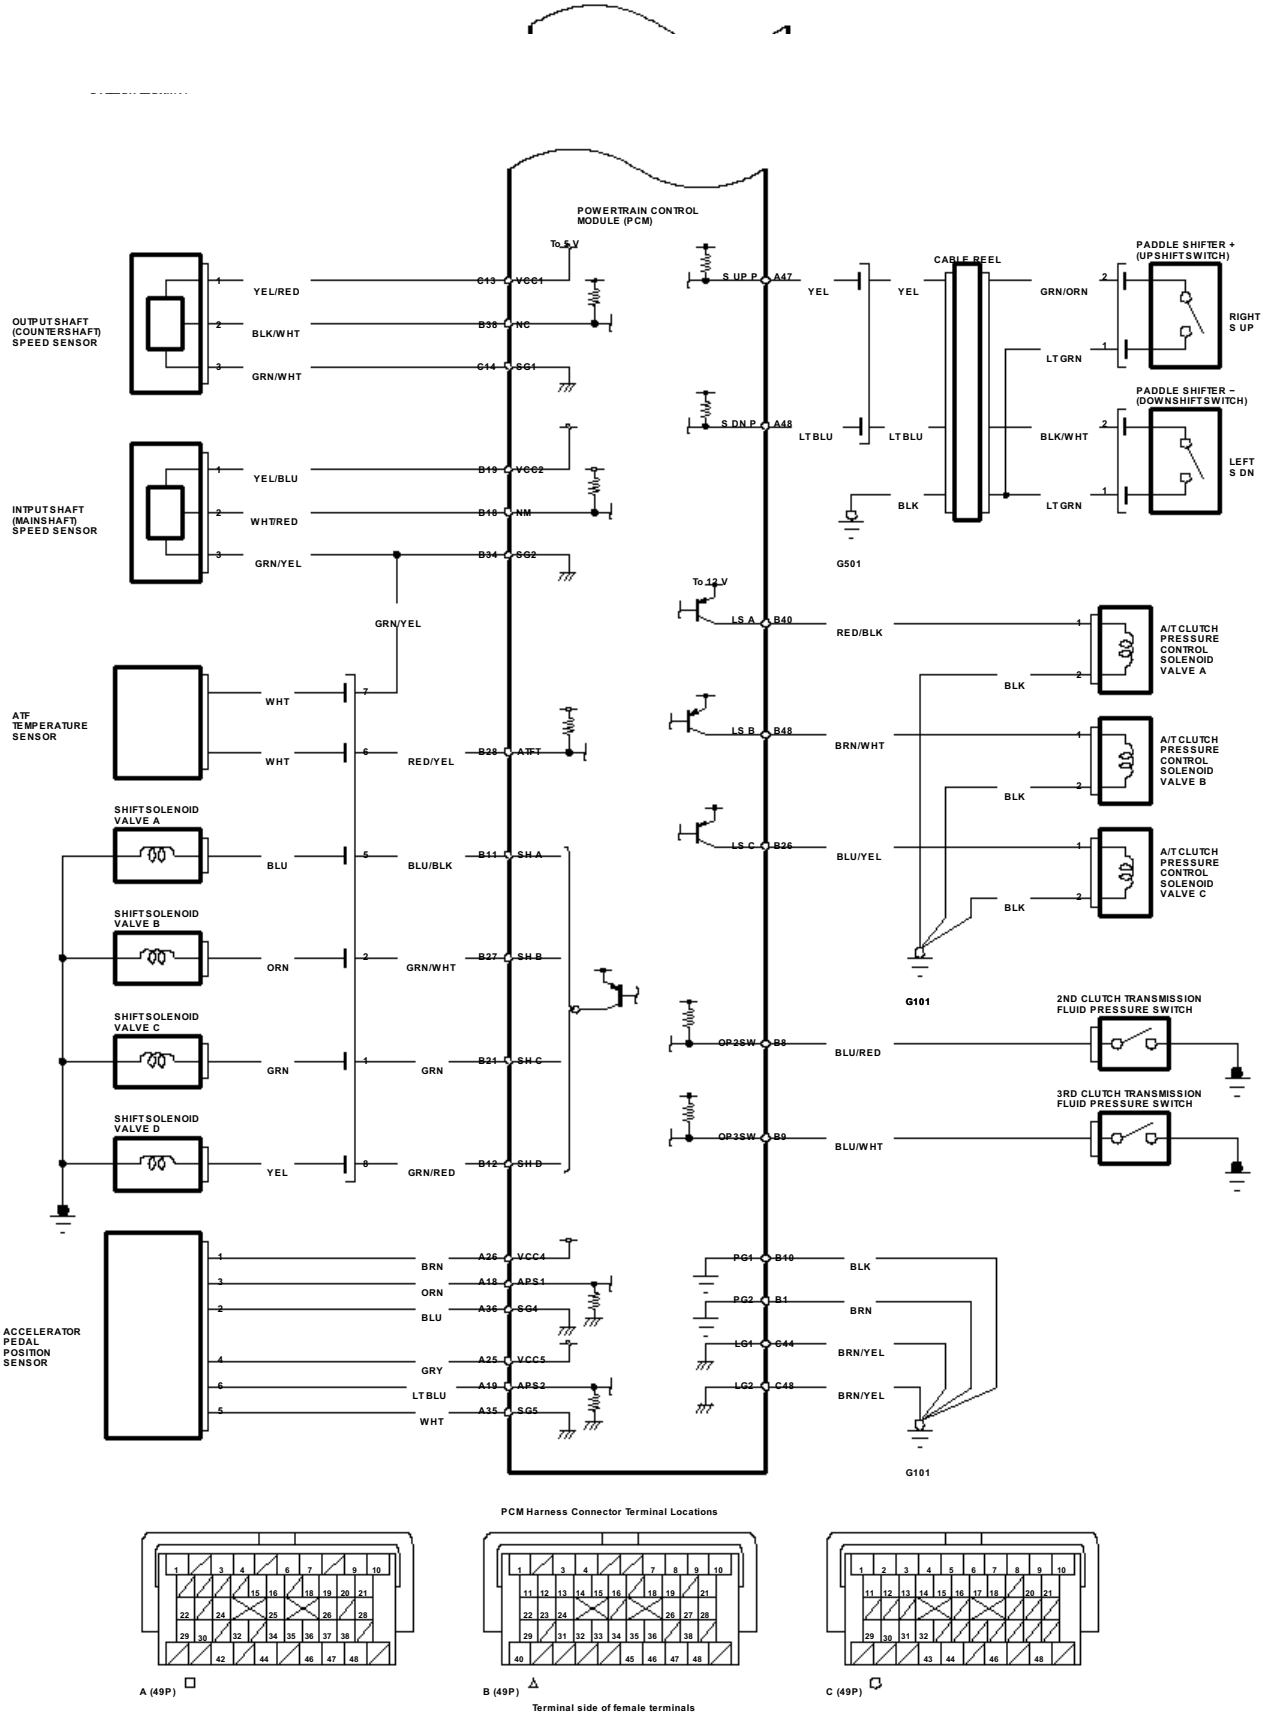
Seven-position Transmission



*: This illustration shows RHD model.

A/T System Circuit Diagram - PCM A/T Control System

Circuit Diagram - PCM A/T Control System - Seven-position Transmission



A/T Road Test

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Apply the parking brake, and block all four wheels.
3. Start the engine, then shift to D while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.
4. Repeat step 3 in all shift lever positions.
5. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
6. Prepare the HDS to take a HIGH SPEED SNAPSHOT (refer to the HDS user's guide for more details if needed):
   - Select High Speed icon.
   - Select these parameters:
     - Vehicle Speed
     - Output Shaft (Countershaft) Speed (rpm)
     - Input Shaft (Mainshaft) Speed (rpm)
     - Engine Speed
     - TP Sensor (1)
     - APP Sensor A (V)
     - ATF Temp Sensor (V)
     - Battery Voltage
     - Shift Control
     - Brake Switch
   - Set the Trigger Type to Parameter.
   - Adjust the Parameter setting to APP Sensor A above 1.26 V.
   - Set the recording time to 60 seconds.
   - Set the trigger point to −30 seconds.
7. Find a suitable level road. When you are ready to do the test, press OK on the HDS.
8. Monitor the HDS, and accelerate quickly until the APP Sensor A reads 1.26 V. Maintain a steady throttle until the transmission shifts to 5th gear, then slow the vehicle and come to a stop.
9. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary and repeat Step 8 .
10. Adjust the parameter setting to 2.53 V. Test-drive the vehicle again. While monitoring the HDS, accelerate quickly until the APP Sensor A reads 2.53 V. Maintain a steady throttle until the transmission shifts to 5th gear (or reasonable speed), then slow the vehicle and come to a stop.
11. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary and repeat Step 10 .
12. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the transmission shifts to 4th gear, then slow to a stop, and save the snapshot.
13. Review each snapshot individually, and compare the Shift Command, the APP Sensor A voltage, and the Vehicle Speed to the table below.

L13A1 Engine model: Upshifting in D

Accelerator pedal position sensor A voltage: 1.26 V	
1st → 2nd	13−15 km/h (8−9 mph)
2nd → 3rd	25−28 km/h (16−17 mph)
3rd → 4th	36−41 km/h (22−25 mph)
4th → 5th	45−51 km/h (28−32 mph)
Lock-up ON	42−46 km/h (26−29 mph)
Accelerator pedal position sensor A voltage: 2.53 V	
1st → 2nd	28−31 km/h (17−19 mph)
2nd → 3rd	52−58 km/h (32−36 mph)
3rd → 4th	84−90 km/h (52−56 mph)
4th → 5th	119−125 km/h (74−78 mph)
Lock-up ON	123−129 km/h (76−80 mph)
Fully-opened throttle **Accelerator pedal position sensor A voltage: 4.50 V**	
1st → 2nd	46−52 km/h (29−32 mph)
2nd → 3rd	84−90 km/h (52−56 mph)
3rd → 4th	141−147 km/h (88−91 mph)

Downshifting in D (Reference)

Accelerator pedal position sensor A voltage: 1.26 V	
Lock-up OFF	41−45 km/h (25−28 mph)

5th → 4th	39–45 km/h (24–28 mph)
4th → 3rd	32–36 km/h (20–22 mph)
3rd → 1st	8–12 km/h (5–7 mph)
Accelerator pedal position sensor A voltage: 2.53 V	
Lock-up OFF	116–122 km/h (72–76 mph)
Fully-opened throttle Accelerator pedal position sensor A voltage: 4.50 V	
Lock-up OFF	170–176 km/h (106–109 mph)
5th → 4th	178–184 km/h (111–114 mph)
4th → 3rd	118–124 km/h (73–77 mph)
3rd → 2nd	72–78 km/h (45–48 mph)
2nd → 1st	29–35 km/h (18–22 mph)

L15A1 Engine Model: Upshifting in D

Accelerator pedal position sensor A voltage: 1.26 V	
1st → 2nd	13–15 km/h (8–9 mph)
2nd → 3rd	25–28 km/h (16–17 mph)
3rd → 4th	36–41 km/h (22–25 mph)
4th → 5th	45–51 km/h (28–32 mph)
Lock-up ON	42–46 km/h (26–29 mph)
Accelerator pedal position sensor A voltage: 2.53 V	
1st → 2nd	28–31 km/h (17–19 mph)
2nd → 3rd	52–58 km/h (32–36 mph)
3rd → 4th	84–90 km/h (52–56 mph)
4th → 5th	119–125 km/h (74–78 mph)
Lock-up ON	123–129 km/h (76–80 mph)
Fully-opened throttle Accelerator pedal position sensor A voltage: 4.50 V	
1st → 2nd	48–54 km/h (30–34 mph)
2nd → 3rd	88–94 km/h (55–58 mph)
3rd → 4th	148–154 km/h (92–96 mph)

Downshifting in D (Reference)

Accelerator pedal position sensor A voltage: 1.26 V	
Lock-up OFF	41–45 km/h (25–28 mph)
5th → 4th	41–47 km/h (25–29 mph)
4th → 3rd	32–36 km/h (20–22 mph)
3rd → 1st	8–12 km/h (5–7 mph)
Accelerator pedal position sensor A voltage: 2.53 V	
Lock-up OFF	116–122 km/h (72–76 mph)
Fully-opened throttle Accelerator pedal position sensor A voltage: 4.50 V	
Lock-up OFF	170–176 km/h (106–109 mph)
5th → 4th	178–184 km/h (111–114 mph)
4th → 3rd	124–130 km/h (77–81 mph)
3rd → 2nd	79–85 km/h (49–53 mph)
2nd → 1st	36–42 km/h (22–26 mph)

14. Check for engine braking under these conditions:
    - Seven-position transmission: Drive the vehicle in 4th or 5th gear in D, then shift to 2. The vehicle should immediately begin to slow down from engine braking.
    - Five-position transmission: Drive the vehicle in 4th or 5th gear in S with sequential shift mode, then downshift to 2nd gear by pulling the paddle shifter − (downshift switch). The vehicle should immediately begin to slow down from engine braking.
15. For seven-position transmission: Shift to 1, accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage. Upshifts should not occur in this position.
16. For seven-position transmission: Shift to 2, accelerate from a stop at full throttle, and check for abnormal noise and clutch slippage. Upshifts and downshifts should not occur in this position.
17. Shift to R. Then, from a full stop, accelerate at full throttle, and check for abnormal noise and clutch slippage.
18. Park the vehicle on a slope (about 16 degrees), apply the brake, and shift into P. Release the brake; the vehicle should not move.
    NOTE: Always use the brake to hold the vehicle, when stopped on an incline in gear. Depending on the grade of the incline, the vehicle could roll backwards if the brake is released.

When you turn the ignition switch to ON (II), the D indicator comes on and stays on in all shift lever positions, or it never comes on at all

Probable cause(s)

1. F-CAN communication line error
2. Gauge control module defective
3. PCM defective

Notes

- Check the F-CAN communication line for a DTC.
- Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function.

A/T gear position indicator does not come on while the shift lever is in that position

Probable cause(s)

1. F-CAN communication line error
2. Gauge control module defective
3. PCM defective
4. Transmission range switch defective

Notes

- Check the F-CAN communication line for a DTC.
- Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function.
- Inspect the transmission range switch.

Shift lever cannot be moved from P while you are pressing on the brake pedal

Probable cause(s)

1. Accelerator pedal position sensor circuit
2. Accelerator pedal position sensor defective
3. Brake pedal position switch circuit
4. Brake pedal position switch defective
5. Shift lock solenoid defective
6. Shift lock solenoid control circuit
7. Shift lock mechanism defective
8. Throttle body defective
9. Transmission range switch ATP P switch stuck OFF
10. Transmission range switch ATP P switch line opened

Notes

- Inspect the APP sensor signal.
- Troubleshoot the shift lock system circuit.
- Test the shift lock solenoid.
- Inspect the transmission range switch.

Ignition switch cannot be moved from ACCESSORY (I) to LOCK (0) (key is pushed in, the shift lever in P)

Probable cause(s)

1. Interlock control system circuit
2. Key interlock solenoid stuck ON
3. Park pin switch stuck ON
4. Transmission range switch

Notes

- Troubleshoot the key interlock system circuit.
- Inspect the transmission range switch.

HDS does not communicate with the PCM or the vehicle

Probable cause(s)

1. DLC circuit error

Notes

- Troubleshoot the DLC circuit.

Shift indicator does not work on five-position transmission

Probable cause(s)

1. F-CAN communication line error
2. Gauge control module defective
3. PCM defective
4. Transmission range switch defective

Notes

- Check the F-CAN communication line for a DTC.
- Check the F-CAN communication line by using the gauge control module self-diagnostic function.
- Check the indicator drive circuit in the gauge control module by gauge control module self-diagnostic function.

When you press the paddle shifter + (upshift switch) in D and S, the transmission does not upshift on five-position transmission

Probable cause(s)

1. A problem in the paddle shifter + (upshift switch) circuit

Notes

- Check the paddle shifter + (upshift switch) circuit.

When you press the paddle shifter − (downshift switch) in D and S, the transmission does not downshift on five-position transmission

Probable cause(s)

1. A problem in the paddle shifter − (downshift switch) circuit

Notes

- Check the paddle shifter − (downshift switch) circuit.

M indicator does not come on even though the paddle shifter + (upshift switch) or paddle shifter − (downshift switch) is operated in sequential shift mode on five-position transmission

Probable cause(s)

1. F-CAN communication line error
2. Gauge control module defective
3. PCM defective

Notes

- Check the F-CAN communication line for a DTC.
- Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function.

Engine runs, but vehicle does not move in any gear

Probable cause(s)

1. Low ATF level
2. Shift cable broken or out of adjustment
3. Connection between shift cable and transmission or body is worn
4. ATF pump worn or binding
5. Regulator valve stuck or spring worn
6. ATF strainer clogged
7. Mainshaft worn or damaged
8. Final gears worn or damaged
9. Transmission-to-engine assembly error
10. Axle disengaged

Notes

- Check the ATF level, and check the ATF cooler lines for leakage and loose connections. If necessary, clean the ATF cooler lines.
- Check for a loose shift cable at the shift lever and the transmission control lever.
- Check the stall speed.
- Check the line pressure.
- Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak.
- Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause the ATF pump seize.
- Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage.
- Check the regulator valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter.
- Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler and cooler lines.
- Replace the torque converter.
- Inspect the countershaft and secondary shaft for wear and damage.
- Check for a misinstalled transmission.

Vehicle moves in 2 and R, but not in 1st in D, D3, S, or 1

Probable cause(s)

1. 1st accumulator defective
2. 1st gears worn or damaged
3. 1st clutch defective

Notes

- Check the 1st clutch pressure.
- Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the servo body.
- Inspect the countershaft, secondary shaft, and 1st clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

Vehicle moves in D, D3, S, 1, and R, but not in 2, or in 2nd in S

Probable cause(s)

1. 2nd accumulator defective
2. 2nd gears worn or damaged
3. 2nd clutch defective

Notes

- Check the 2nd clutch pressure.
- Inspect the 2nd accumulator piston, O-ring, and spring for wear and damaged in the servo body.
- Inspect the countershaft, secondary shaft, and 2nd clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover.
- Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.

Vehicle moves in D, D3, S, 2, and 1, but not in R

Probable cause(s)

1. Shift solenoid valve D defective
2. Shift fork shaft stuck
3. Shift valve D defective
4. 5th/reverse accumulator defective
5. 5th clutch defective
6. Reverse gears worn or damaged

Notes

- Check for a stored DTC, and check for loose connections.
- Test the shift solenoid valve function with the HDS.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Check the 5th clutch pressure.
- Check for a missing shift fork bolt on the shift fork shaft.
- Inspect the servo valve O-ring.
- Check the shift fork shaft detent for wear and damage.
- Inspect the 5th accumulator piston, O-ring, and spring for wear and damage in the servo body.
- Inspect the mainshaft and 5th clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the countershaft 5th gear and reverse gear. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes a clicking, grinding, or whirring noise, also replace the mainshaft 5th gear, reverse idler gear, and countershaft 5th gear.

Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed high in D, D3, S, 2, and 1

Probable cause(s)

1. Low ATF level
2. Shift cable broken or out of adjustment
3. ATF pump worn or binding
4. Regulator valve stuck or spring worn
5. ATF strainer clogged
6. Torque converter check valve defective

Notes

- Check the line pressure.
- Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines.
- Check for a loose shift cable at the shift lever and the transmission control lever.
- Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter.
- Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler and ATF lines.
- Check the torque converter check valve in the main valve body for free movement, and check the valve spring for wear and damage.

Poor acceleration; flares when starting off in D, D3, S, 2, and R; stall speed high

Probable cause(s)

1. 2nd clutch defective

Notes

- Check the 2nd clutch pressure.
- Inspect the secondary shaft and 2nd clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover.
- Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.

Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed high in R

Probable cause(s)

1. Shift cable broken or out of adjustment
2. 5th clutch defective

Notes

- Check for a loose shift cable at the shift lever and the transmission control lever.
- Check the 5th clutch pressure.
- Inspect the mainshaft and 5th clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed low in D, 2, and 1

Probable cause(s)

1. Shift solenoid valve D defective
2. Torque converter one-way clutch defective
3. Engine output low
4. Torque converter clutch piston defective
5. Lock-up shift valve defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the shift solenoid valve function with the HDS.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Replace the torque converter assembly.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the engine control system.

Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed low in R

Probable cause(s)

1. Torque converter one-way clutch defective
2. Engine output low
3. Torque converter clutch piston defective
4. Lock-up shift valve defective

Notes

- Check the engine control system.
- Replace the torque converter assembly.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.

Engine idle vibration

Probable cause(s)

1. Low ATF level
2. Shift solenoid valve D defective
3. Drive plate defective or transmission misassembled
4. Engine output low
5. Torque converter clutch piston defective
6. ATF pump worn or damaged
7. Lock-up shift valve defective
8. Misassembled engine or transmission mount

Notes

- Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines.
- Check for a stored DTC, and check for loose connections.
- Test the shift solenoid valve function with the HDS.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Check for a misinstalled/damaged drive plate, replace the drive plate if it is worn or damaged.
- Check the engine control system.
- Replace the torque converter assembly.
- Check the line pressure.
- Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Adjust the transmission and engine mounts.

Vehicle moves in N

Probable cause(s)

1. Excessive ATF
2. Foreign material in separator plate orifice
3. Relief valve defective
4. 1st clutch defective
5. 2nd clutch defective
6. 3rd clutch defective
7. 4th clutch defective
8. 5th clutch defective
9. Clearance between the clutch end-plate and the top disc is incorrect
10. Needle bearing seized, worn, or damaged
11. Thrust washer seized, worn, or damaged

Notes

- Check the ATF level, and drain the ATF if it is over-filled.
- Check the 1st, 2nd, 3rd, 4th, and 5th clutch pressures.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the ATF strainer for debris. If the strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter.
- Check the relief valve in the main valve body for free movement, and check the valve spring for wear and damage.
- Inspect the mainshaft, secondary shaft, 1st, 2nd, 3rd, 4th, and 5th clutches for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 2nd, 3rd, and 4th clutch feed pipes.
- If the 2nd clutch feed pipe is scored, replace the end cover.
- If the 3rd or 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.
- Replace the secondary shaft if the bushing for the 2nd clutch feed pipe or 4th clutch feed pipe is loose or damaged.
- Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

Late shift after shifting from N to D, D3, and S, or excessive shock when shifted into D, D3, and S

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. A/T clutch pressure control solenoid valve B defective
4. A/T clutch pressure control solenoid valve C defective
5. Shift cable broken or out of adjustment
6. Connection between shift cable and transmission or body is worn
7. Input shaft (mainshaft) speed sensor defective
8. Output shaft (countershaft) speed sensor defective
9. ATF temperature sensor defective
10. Foreign material in separator plate orifice
11. Servo control valve defective
12. 1st accumulator defective
13. 1st check ball stuck
14. Lock-up shift valve defective
15. 1st clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings, for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve seizure.
- Check for a loose shift cable at the shift lever and the transmission control lever.
- Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring for wear and damage.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 1st clutch pressure.
- Check the servo control valve in the main valve body for free movement, and check the valve spring for wear and damage.
- Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the regulator valve body.
- Check the 1st check ball for stuck in the main valve body.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Inspect the secondary shaft and 1st clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

Late shift after shifting from N to R, or excessive shock when shifted into R

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. Shift cable broken or out of adjustment
4. Connection between shift cable and transmission or body is worn
5. Input shaft (mainshaft) speed sensor defective
6. Output shaft (countershaft) speed sensor defective
7. ATF temperature sensor defective
8. Shift fork shaft stuck
9. Foreign material in separator plate orifice
10. Shift valve D defective
11. 5th/reverse accumulator defective
12. Lock-up shift valve defective
13. 5th clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings, for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Check for a loose shift cable at the shift lever and the transmission control lever.
- Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring for wear and damage.
- Check for a missing shift fork bolt on the shift fork shaft.
- Inspect the servo valve O-ring.
- Check the shift fork shaft detent for wear and damage.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 5th clutch pressure.
- Check the shift valve D in the main valve body for free movement, and check the valve spring for wear and damage.
- Inspect the 5th accumulator piston, O-ring, and spring for wear and damage in the servo body.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Inspect the mainshaft and 5th clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

Transmission does not shift

Probable cause(s)

1. Input shaft (mainshaft) speed sensor defective
2. Output shaft (countershaft) speed sensor defective

Notes

- Check for a stored DTC, and check for loose connections.
- Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring for wear and damage.

Excessive shock or flares on all upshifts and downshifts

Probable cause(s)

1. A/T clutch pressure control solenoid valve B defective
2. A/T clutch pressure control solenoid valve C defective
3. Input shaft (mainshaft) speed sensor defective
4. Output shaft (countershaft) speed sensor defective
5. ATF temperature sensor defective
6. Foreign material in separator plate orifice

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring for wear and damage.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.

Excessive shock or flares on 1-2 upshift or 2-1 downshift

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. A/T clutch pressure control solenoid valve B defective
4. A/T clutch pressure control solenoid valve C defective
5. 2nd clutch transmission fluid pressure switch defective
6. Foreign material in separator plate orifice
7. 1st accumulator defective
8. 2nd accumulator defective
9. 1st check ball stuck
10. 2nd check ball stuck
11. Lock-up shift valve defective
12. 1st clutch defective
13. 2nd clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 1st and 2nd clutch pressures.
- Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the servo body.
- Inspect the 2nd accumulator piston, O-ring, and spring for wear and damage in the servo body.
- Check the 1st check ball and 2nd check ball for stick in the main valve body.
- Inspect the secondary shaft, 1st clutch, and 2nd clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover.
- Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.

Excessive shock or flares on 2-3 upshift or 3-2 downshift

Probable cause(s)

1. A/T clutch pressure control solenoid valve B defective
2. A/T clutch pressure control solenoid valve C defective
3. 3rd clutch transmission fluid pressure switch defective
4. Foreign material in separator plate orifice
5. 2nd accumulator defective
6. 3rd accumulator defective
7. 2nd check ball stuck
8. 2nd clutch defective
9. 3rd clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 2nd and 3rd clutch pressures.
- Inspect the 2nd and 3rd accumulator pistons, O-rings, and springs for wear and damage in the servo body.
- Check the 2nd check ball for stick in the main valve body.
- Inspect the secondary shaft, mainshaft, 2nd clutch, and 3rd clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 2nd and 3rd clutch feed pipes.
- If the 2nd clutch feed pipe is scored, replace the end cover.
- If the 3rd clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.
- Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.
- Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

Excessive shock or flares on 3-4 upshift or 4-3 downshift

Probable cause(s)

1. A/T clutch pressure control solenoid valve B defective
2. A/T clutch pressure control solenoid valve C defective
3. Foreign material in separator plate orifice
4. 3rd accumulator defective
5. 4th accumulator defective
6. 3rd clutch defective
7. 4th clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 3rd and 4th clutch pressures.
- Inspect the 3rd and 4th accumulator pistons, O-rings, and springs for wear and damage in the servo body.
- Inspect the mainshaft, secondary shaft, 3rd clutch, and 4th clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 3rd and 4th clutch feed pipes.
- If the 3rd clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.
- If the 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.
- Replace the secondary shaft if the bushing for the 4th clutch feed pipe is loose or damaged.
- Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

Excessive shock or flares on 4-5 upshift or 5-4 downshift

Probable cause(s)

1. A/T clutch pressure control solenoid valve B defective
2. A/T clutch pressure control solenoid valve C defective
3. Foreign material in separator plate orifice
4. 4th accumulator defective
5. 5th accumulator defective
6. 4th clutch defective
7. 5th clutch defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the 4th and 5th clutch pressures.
- Inspect the 4th and 5th accumulator pistons, O-rings, and springs for wear and damage in the servo body.
- Inspect the mainshaft, secondary shaft, 4th clutch, and 5th clutch for wear and damage.
- Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
- Inspect the 4th clutch feed pipes. If the 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange.
- Replace the secondary shaft if the bushing for the 4th clutch feed pipe is loose or damaged.

Noise from transmission in all shift lever positions

Probable cause(s)

1. ATF pump worn or damaged
2. Mainshaft bearing, countershaft bearing, or secondary shaft bearing defective

Notes

- Check the line pressure.
- Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak.
- Be careful not to damage the torque converter housing when replacing the main ball bearing. Not torquing the valve body to specification could also damage the ATF pump. This could cause the pump to seize.
- Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage.
- Inspect the mainshaft, countershaft, and secondary shaft bearing for wear and damage.

Vehicle does not accelerate above 50 km/h (31 mph)

Probable cause(s)

1. Torque converter one-way clutch defective

Notes

- Replace the torque converter assembly.

Vibration in all shift lever positions

Probable cause(s)

1. Drive plate defective or transmission misassembled

Notes

- Check for a misinstalled/damaged drive plate, replace the drive plate if it is worn or damaged.
- Check the engine control system.

Shift lever does not operate smoothly

Probable cause(s)

1. Transmission range switch defective or out of adjustment
2. Shift cable broken or out of adjustment
3. Connection between shift cable and transmission or body is worn

Notes

- Check for a stored DTC, and check for loose connections.
- Inspect the transmission range switch. If the transmission range switch is faulty, replace it. If the transmission range switch is out of adjustment, adjust it and shift cable.
- Check for a loose shift cable at the shift lever and the transmission control lever.

Transmission does not shift into P

Probable cause(s)

1. Shift cable broken or out of adjustment
2. Connection between shift cable and transmission or body is worn
3. Park mechanism defective

Notes

- Check for a loose shift cable at the shift lever and the transmission control lever.
- Check the park pawl spring installation and the park lever spring installation. If installation is incorrect, install the spring correctly. Make sure that the park lever stop is not installed upside down. Check the distance between the park pawl shaft and park lever pin. If the distance is out of tolerance, adjust the distance with the park lever stop.

Torque converter clutch does not disengage

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. Torque converter clutch piston defective
4. Lock-up shift valve defective
5. Lock-up control valve defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Replace the torque converter assembly.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.

Torque converter clutch does not operate smoothly

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. Torque converter clutch piston defective
4. Torque converter check valve defective
5. Lock-up shift valve defective
6. Lock-up control valve defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Replace the torque converter assembly.
- Check the torque converter check valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.

Torque converter clutch does not engage

Probable cause(s)

1. Shift solenoid valve D defective
2. A/T clutch pressure control solenoid valve A defective
3. Input shaft (mainshaft) speed sensor defective
4. Output shaft (countershaft) speed sensor defective
5. Torque converter clutch piston defective
6. Torque converter check valve defective
7. Lock-up shift valve defective
8. Lock-up control valve defective

Notes

- Check for a stored DTC, and check for loose connections.
- Test the solenoid valve function with the HDS.
- Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage.
- Inspect the O-rings, and check the shift solenoid valve for seizure.
- Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring for wear and damage.
- Replace the torque converter assembly.
- Check the torque converter check valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
- Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.

A/T gear position indicator does not indicate shift lever positions

Probable cause(s)

1. Transmission range switch defective or out of adjustment
2. Shift cable broken or out of adjustment
3. Connection between shift cable and transmission or body worn

Notes

- Check for a stored DTC, and check for loose connections.
- Inspect the transmission range switch. If the transmission range switch is faulty, replace it. If the transmission range switch is out of adjustment, adjust it and shift cable.
- Check for a loose shift cable at the shift lever and the transmission control lever.

Speedometer and odometer do not work

Probable cause(s)

1. Output shaft (countershaft) speed sensor defective

Notes

- Check for a stored DTC, and check for loose connections.
- Check the output shaft (countershaft) speed sensor installation.
- Inspect the sensor O-ring.

Engine does not rev to high rpm, and the transmission upshifts at low rpm (engine at normal operating temperature)

Probable cause(s)

1. Engine rocker arm defective

Notes

- Check the engine rocker arms.
- Check for a restricted or damaged exhaust system.

A/T System Symptom Troubleshooting Index

Symptom	Probable cause(s)	Notes
When you turn the ignition switch to ON (II), the D indicator comes on and stays on in all shift lever positions, or it never comes on at all	• F-CAN communication line error • Gauge control module defective • PCM defective	• Check the F-CAN communication line for a DTC. • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function.
A/T gear position indicator does not come on while the shift lever is in that position	• F-CAN communication line error • Gauge control module defective • PCM defective • Transmission range switch defective	• Check the F-CAN communication line for a DTC. • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function. • Inspect the transmission range switch.
Shift lever cannot be moved from P while you are pressing on the brake pedal	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor defective • Brake pedal position switch circuit • Brake pedal position switch defective • Shift lock solenoid defective • Shift lock solenoid control circuit • Shift lock mechanism defective • Throttle body defective • Transmission range switch ATP P switch stuck OFF • Transmission range switch ATP P switch line opened	• Inspect the APP sensor signal. • Troubleshoot the shift lock system circuit. • Test the shift lock solenoid. • Inspect the transmission range switch.
Ignition switch cannot be moved from ACCESSORY (I) to LOCK (0) (key is pushed in, the shift lever in P)	• Interlock control system circuit • Key interlock solenoid stuck ON • Park pin switch stuck ON • Transmission range switch	• Troubleshoot the key interlock system circuit. • Inspect the transmission range switch.
HDS does not communicate with the PCM or the vehicle	DLC circuit error	Troubleshoot the DLC circuit.
Shift indicator does not work on five-position transmission	• F-CAN communication line error • Gauge control module defective • PCM defective • Transmission range switch defective	• Check the F-CAN communication line for a DTC. • Check the F-CAN communication line by using the gauge control module self-diagnostic function. • Check the indicator drive circuit in the gauge control module by gauge control module self-diagnostic function.
When you press the paddle shifter + (upshift switch) in D and S, the transmission does not upshift on five-position transmission	A problem in the paddle shifter + (upshift switch) circuit	Check the paddle shifter + (upshift switch) circuit.
When you press the paddle shifter − (downshift switch) in D and S, the transmission does not downshift on five-position transmission	A problem in the paddle shifter − (downshift switch) circuit	Check the paddle shifter − (downshift switch) circuit.
M indicator does not come on even though the paddle shifter + (upshift switch) or paddle shifter − (downshift switch) is operated in sequential shift mode on five-position transmission	• F-CAN communication line error • Gauge control module defective • PCM defective	• Check the F-CAN communication line for a DTC. • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function.

Symptom	Probable cause(s)	Notes
Engine runs, but vehicle does not move in any gear	1. Low ATF level 2. Shift cable broken or out of adjustment 3. Connection between shift cable and transmission or body is worn 4. ATF pump worn or binding 5. Regulator valve stuck or spring worn 6. ATF strainer clogged 7. Mainshaft worn or damaged 8. Final gears worn or damaged 9. Transmission-to-engine assembly error 10. Axle disengaged	• Check the ATF level, and check the ATF cooler lines for leakage and loose connections. If necessary, clean the ATF cooler lines. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the stall speed. • Check the line pressure. • Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause the ATF pump seize. • Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Check the regulator valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler and cooler lines. • Replace the torque converter. • Inspect the countershaft and secondary shaft for wear and damage. • Check for a misinstalled transmission.

Symptom	Probable cause(s)	Notes
Vehicle moves in 2 and R, but not in 1st in D, D3, S, or 1	1. 1st accumulator defective 2. 1st gears worn or damaged 3. 1st clutch defective	• Check the 1st clutch pressure. • Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the servo body. • Inspect the countershaft, secondary shaft, and 1st clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in D, D3, S, 1, and R, but not in 2, or in 2nd in S	1. 2nd accumulator defective 2. 2nd gears worn or damaged 3. 2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the 2nd accumulator piston, O-ring, and spring for wear and damaged in the servo body. • Inspect the countershaft, secondary shaft, and 2nd clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.

Symptom	Probable cause(s)	Notes
Vehicle moves in D, D3, S, 2, and 1, but not in R	1. Shift solenoid valve D defective 2. Shift fork shaft stuck 3. Shift valve D defective 4. 5th/reverse accumulator defective 5. 5th clutch defective 6. Reverse gears worn or damaged	• Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check the 5th clutch pressure. • Check for a missing shift fork bolt on the shift fork shaft. • Inspect the servo valve O-ring. • Check the shift fork shaft detent for wear and damage. • Inspect the 5th accumulator piston, O-ring, and spring for wear and damage in the servo body. • Inspect the mainshaft and 5th clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the countershaft 5th gear and reverse gear. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes a clicking, grinding, or whirring noise, also replace the mainshaft 5th gear, reverse idler gear, and countershaft 5th gear.
Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed high in D, D3, S, 2, and 1	1. Low ATF level 2. Shift cable broken or out of adjustment 3. ATF pump worn or binding 4. Regulator valve stuck or spring worn 5. ATF strainer clogged 6. Torque converter check valve defective	• Check the line pressure. • Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines. • Check for a loose shift cable at the shift lever and the transmission control lever. • Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler and ATF lines. • Check the torque converter check valve in the main valve body for free movement, and check the valve spring for wear and damage.
Poor acceleration; flares when starting off in D, D3, S, 2, and R; stall speed high	2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the secondary shaft and 2nd clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged.
Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed high in R	1. Shift cable broken or out of adjustment 2. 5th clutch defective	• Check for a loose shift cable at the shift lever and the transmission control lever. • Check the 5th clutch pressure. • Inspect the mainshaft and 5th clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed low in D, 2, and 1	1. Shift solenoid valve D defective 2. Torque converter one-way clutch defective 3. Engine output low 4. Torque converter clutch piston defective 5. Lock-up shift valve defective	• Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Replace the torque converter assembly. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the engine control system.

Symptom	Probable cause(s)	Notes
Poor acceleration; flares when starting off in D, D3, S, 2, 1, and R; stall speed low in R	1. Torque converter one-way clutch defective 2. Engine output low 3. Torque converter clutch piston defective 4. Lock-up shift valve defective	• Check the engine control system. • Replace the torque converter assembly. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.
Engine idle vibration	1. Low ATF level 2. Shift solenoid valve D defective 3. Drive plate defective or transmission 4. misassembled 5. Engine output low 6. Torque converter clutch piston defective 7. ATF pump worn or damaged 8. Lock-up shift valve defective Misassembled engine or transmission mount	• Check the ATF level and check the ATF lines for leakage and loose connections. If necessary, clean the ATF lines. • Check for a stored DTC, and check for loose connections. • Test the shift solenoid valve function with the HDS. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check for a misinstalled/damaged drive plate, replace the drive plate if it is worn or damaged. • Check the engine control system. • Replace the torque converter assembly. • Check the line pressure. • Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Adjust the transmission and engine mounts.

Symptom	Probable cause(s)	Notes
Vehicle moves in N	1. Excessive ATF 2. Foreign material in separator plate orifice 3. Relief valve defective 4. 1st clutch defective 5. 2nd clutch defective 6. 3rd clutch defective 7. 4th clutch defective 8. 5th clutch defective 9. Clearance between the clutch end-plate and 10. the top disc is incorrect 11. Needle bearing seized, worn, or damaged Thrust washer seized, worn, or damaged	• Check the ATF level, and drain the ATF if it is over-filled. • Check the 1st, 2nd, 3rd, 4th, and 5th clutch pressures. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the ATF strainer for debris. If the strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the relief valve in the main valve body for free movement, and check the valve spring for wear and damage. • Inspect the mainshaft, secondary shaft, 1st, 2nd, 3rd, 4th, and 5th clutches for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd, 3rd, and 4th clutch feed pipes. • If the 2nd clutch feed pipe is scored, replace the end cover. • If the 3rd or 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe or 4th clutch feed pipe is loose or damaged. • Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

Symptom	Probable cause(s)	Notes
Late shift after shifting from N to D, D3, and S, or excessive shock when shifted into D, D3, and S	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. A/T clutch pressure control solenoid valve B 5. defective 6. A/T clutch pressure control solenoid valve C 7. defective 8. Shift cable broken or out of adjustment 9. Connection between shift cable and 10. transmission or body is worn 11. Input shaft (mainshaft) speed sensor 12. defective 13. Output shaft (countershaft) speed sensor 14. defective 15. ATF temperature sensor defective Foreign material in separator plate orifice Servo control valve defective 1st accumulator defective 1st check ball stuck Lock-up shift valve defective 1st clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings, for wear and damage. • Inspect the O-rings, and check the shift solenoid valve seizure. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring for wear and damage. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 1st clutch pressure. • Check the servo control valve in the main valve body for free movement, and check the valve spring for wear and damage. • Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the regulator valve body. • Check the 1st check ball for stuck in the main valve body. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Inspect the secondary shaft and 1st clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.
Late shift after shifting from N to R, or excessive shock when shifted into R	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. Shift cable broken or out of adjustment 5. Connection between shift cable and 6. transmission or body is worn 7. Input shaft (mainshaft) speed sensor 8. defective 9. Output shaft (countershaft) speed sensor 10. defective 11. ATF temperature sensor defective 12. Shift fork shaft stuck 13. Foreign material in separator plate orifice Shift valve D defective 5th/reverse accumulator defective Lock-up shift valve defective 5th clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings, for wear and damage. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring for wear and damage. • Check for a missing shift fork bolt on the shift fork shaft. • Inspect the servo valve O-ring. • Check the shift fork shaft detent for wear and damage. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 5th clutch pressure. • Check the shift valve D in the main valve body for free movement, and check the valve spring for wear and damage. • Inspect the 5th accumulator piston, O-ring, and spring for wear and damage in the servo body. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Inspect the mainshaft and 5th clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate.

Symptom	Probable cause(s)	Notes
Transmission does not shift	1. Input shaft (mainshaft) speed sensor defective 2. Output shaft (countershaft) speed sensor defective	• Check for a stored DTC, and check for loose connections. • Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring for wear and damage.

Symptom	Probable cause(s)	Notes
Excessive shock or flares on all upshifts and downshifts	1. A/T clutch pressure control solenoid valve B 2. defective 3. A/T clutch pressure control solenoid valve C 4. defective 5. Input shaft (mainshaft) speed sensor defective 6. Output shaft (countershaft) speed sensor defective ATF temperature sensor defective Foreign material in separator plate orifice	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring for wear and damage. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.

Symptom	Probable cause(s)	Notes
Excessive shock or flares on 1-2 upshift or 2-1 downshift	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. A/T clutch pressure control solenoid valve B 5. defective 6. A/T clutch pressure control solenoid valve C 7. defective 8. 2nd clutch transmission fluid pressure switch 9. defective 10. Foreign material in separator plate orifice 11. 1st accumulator defective 12. 2nd accumulator defective 13. 1st check ball stuck 2nd check ball stuck Lock-up shift valve defective 1st clutch defective 2nd clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 1st and 2nd clutch pressures. • Inspect the 1st accumulator piston, O-ring, and spring for wear and damage in the servo body. • Inspect the 2nd accumulator piston, O-ring, and spring for wear and damage in the servo body. • Check the 1st check ball and 2nd check ball for stick in the main valve body. • Inspect the secondary shaft, 1st clutch, and 2nd clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd clutch feed pipe. If the 2nd clutch feed pipe is scored, replace the end cover. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage.

Symptom	Probable cause(s)	Notes

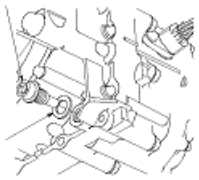
Symptom	Probable cause(s)	Notes
Excessive shock or flares on 2-3 upshift or 3-2 downshift	1. A/T clutch pressure control solenoid valve B 2. defective 3. A/T clutch pressure control solenoid valve C 4. defective 5. 3rd clutch transmission fluid pressure switch 6. defective 7. Foreign material in separator plate orifice 8. 2nd accumulator defective 9. 3rd accumulator defective 2nd check ball stuck 2nd clutch defective 3rd clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 2nd and 3rd clutch pressures. • Inspect the 2nd and 3rd accumulator pistons, O-rings, and springs for wear and damage in the servo body. • Check the 2nd check ball for stick in the main valve body. • Inspect the secondary shaft, mainshaft, 2nd clutch, and 3rd clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 2nd and 3rd clutch feed pipes. • If the 2nd clutch feed pipe is scored, replace the end cover. • If the 3rd clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange. • Replace the secondary shaft if the bushing for the 2nd clutch feed pipe is loose or damaged. • Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.
Excessive shock or flares on 3-4 upshift or 4-3 downshift	1. A/T clutch pressure control solenoid valve B 2. defective 3. A/T clutch pressure control solenoid valve C 4. defective 5. Foreign material in separator plate orifice 6. 3rd accumulator defective 7. 4th accumulator defective 3rd clutch defective 4th clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 3rd and 4th clutch pressures. • Inspect the 3rd and 4th accumulator pistons, O-rings, and springs for wear and damage in the servo body. • Inspect the mainshaft, secondary shaft, 3rd clutch, and 4th clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 3rd and 4th clutch feed pipes. • If the 3rd clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange. • If the 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange. • Replace the secondary shaft if the bushing for the 4th clutch feed pipe is loose or damaged. • Replace the mainshaft if the bushing for the 3rd clutch feed pipe is loose or damaged.

Symptom	Probable cause(s)	Notes
Excessive shock or flares on 4-5 upshift or 5-4 downshift	1. A/T clutch pressure control solenoid valve B 2. defective 3. A/T clutch pressure control solenoid valve C 4. defective 5. Foreign material in separator plate orifice 6. 4th accumulator defective 7. 5th accumulator defective 4th clutch defective 5th clutch defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Check for clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 4th and 5th clutch pressures. • Inspect the 4th and 5th accumulator pistons, O-rings, and springs for wear and damage in the servo body. • Inspect the mainshaft, secondary shaft, 4th clutch, and 5th clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace them as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If they are OK, adjust the clearance with the clutch end-plate. • Inspect the 4th clutch feed pipes. If the 4th clutch feed pipe is scored, replace it and the O-rings under the feed pipe flange. • Replace the secondary shaft if the bushing for the 4th clutch feed pipe is loose or damaged.
Noise from transmission in all shift lever positions	1. ATF pump worn or damaged 2. Mainshaft bearing, countershaft bearing, or secondary shaft bearing defective	• Check the line pressure. • Improper alignment of ATF pump and torque converter housing may cause the ATF pump to seize. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. Not torquing the valve body to specification could also damage the ATF pump. This could cause the pump to seize. • Install the main seal flush with the torque converter housing when replacing the main seal. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Inspect the mainshaft, countershaft, and secondary shaft bearing for wear and damage.
Vehicle does not accelerate above 50 km/h (31 mph)	Torque converter one-way clutch defective	Replace the torque converter assembly.
Vibration in all shift lever positions	Drive plate defective or transmission misassembled	• Check for a misinstalled/damaged drive plate, replace the drive plate if it is worn or damaged. • Check the engine control system.
Shift lever does not operate smoothly	1. Transmission range switch defective or out of 2. adjustment 3. Shift cable broken or out of adjustment Connection between shift cable and transmission or body is worn	• Check for a stored DTC, and check for loose connections. • Inspect the transmission range switch. If the transmission range switch is faulty, replace it. If the transmission range switch is out of adjustment, adjust it and shift cable. • Check for a loose shift cable at the shift lever and the transmission control lever.
Transmission does not shift into P	1. Shift cable broken or out of adjustment 2. Connection between shift cable and 3. transmission or body is worn Park mechanism defective	• Check for a loose shift cable at the shift lever and the transmission control lever. • Check the park pawl spring installation and the park lever spring installation. If installation is incorrect, install the spring correctly. Make sure that the park lever stop is not installed upside down. Check the distance between the park pawl shaft and park lever pin. If the distance is out of tolerance, adjust the distance with the park lever stop.
Torque converter clutch does not disengage	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. Torque converter clutch piston defective 5. Lock-up shift valve defective Lock-up control valve defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Replace the torque converter assembly. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.

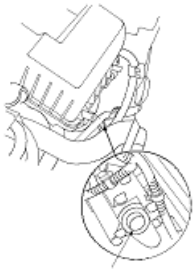
Symptom	Probable cause(s)	Notes
Torque converter clutch does not operate smoothly	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. Torque converter clutch piston defective 5. Torque converter check valve defective 6. Lock-up shift valve defective Lock-up control valve defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Replace the torque converter assembly. • Check the torque converter check valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.
Torque converter clutch does not engage	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A 3. defective 4. Input shaft (mainshaft) speed sensor defective 5. Output shaft (countershaft) speed sensor 6. defective 7. Torque converter clutch piston defective 8. Torque converter check valve defective Lock-up shift valve defective Lock-up control valve defective	• Check for a stored DTC, and check for loose connections. • Test the solenoid valve function with the HDS. • Inspect the A/T clutch pressure control solenoid valve body gasket, ATF feed pipes, and O-rings for wear and damage. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Check the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring for wear and damage. • Replace the torque converter assembly. • Check the torque converter check valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the lock-up shift valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Check the lock-up control valve in the main valve body for free movement, and check the valve spring for wear and damage.
A/T gear position indicator does not indicate shift lever positions	1. Transmission range switch defective or out of 2. adjustment 3. Shift cable broken or out of adjustment Connection between shift cable and transmission or body worn	• Check for a stored DTC, and check for loose connections. • Inspect the transmission range switch. If the transmission range switch is faulty, replace it. If the transmission range switch is out of adjustment, adjust it and shift cable. • Check for a loose shift cable at the shift lever and the transmission control lever.
Speedometer and odometer do not work	Output shaft (countershaft) speed sensor defective	• Check for a stored DTC, and check for loose connections. • Check the output shaft (countershaft) speed sensor installation. • Inspect the sensor O-ring.
Engine does not rev to high rpm, and the transmission upshifts at low rpm (engine at normal operating temperature)	Engine rocker arm defective	• Check the engine rocker arms. • Check for a restricted or damaged exhaust system.

ATF Replacement

NOTE: Keep all foreign particles out of the transmission.



1. Warm up the engine to normal operating temperature (the radiator fan comes on), and turn the engine off.
2. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
3. Remove the splash shield.
4. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).
5. Reinstall the drain plug with a new sealing washer (B).

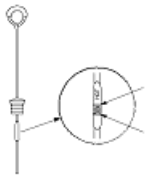


6. Remove the dipstick, and refill the transmission with the recommended fluid into the dipstick guide opening (A). Always use genuine Honda ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Honda ATF can affect shift quality.
   Automatic Transmission Fluid Capacity:
   2.5 L (2.6 US qt, 2.2 Imp qt) at change
   5.85 L (6.18 US qt, 5.15 Imp qt) at overhaul
7. Insert the dipstick back into the transmission.
8. Check the ATF level.
9. Install the splash shield.

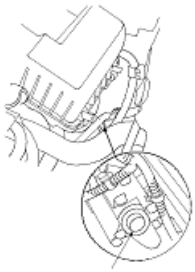
ATF Level Check

NOTE: Keep all foreign particles out of the transmission.

1. Park the vehicle on the level ground.
2. Warm up the engine to normal operating temperature (the radiator fan comes on), then turn the engine off. Do not allow the engine to warm up longer than the time it takes for the radiator fan to come on twice.
   NOTE: Check the fluid level within 60−90 seconds after turning the engine off. Higher fluid level may be indicated if the radiator fan comes on twice or more.
3. Remove the dipstick (yellow loop) (A), and wipe it with a clean cloth.
4. Insert the dipstick into the transmission.

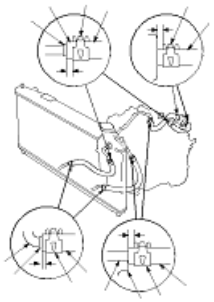


5. Remove the dipstick and check the fluid level. It should be between the upper mark (A) and lower mark (B).
6. If the level is below the lower mark, check for fluid leaks at the transmission, and hose and line joints. If a problem is found, fix it before filling the transmission.
   NOTE: If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:
   - Transmission damage.
   - Vehicle does not move in any gear.
   - Vehicle accelerates poorly, and flares when starting off in the forward and reverse positions.
   - The engine vibrates at idle.
7. If the level is above the upper mark, drain the ATF to proper level.
   NOTE: If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.



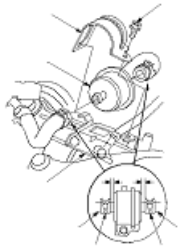
8. If necessary, fill the transmission with the ATF through the dipstick guide opening (A) to bring the fluid level midway between the upper mark and lower mark of the dipstick. Do not fill past the upper mark. Always use genuine Honda ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Honda ATF can affect shift quality.
9. Insert the dipstick back into the transmission.

ATF Cooler Hose Replacement



1. Slide the ATF cooler hose (A) on the ATF filter (B) until the hose end contacts the filter housing, and secure the hose with the clip (C) at 6−8 mm (0.24−0.31 in.) (D) from the filter housing. Install the cooler hose on the other side of the ATF filter in the same manner.
2. Slide the ATF cooler hoses (E) over the ATF lines (F) until the hose ends contact the bulge (G), and secure the hoses with the clip (H) at 6−8 mm (0.24−0.31 in.) (I) from the hose end.
3. Slide the ATF cooler hose (J) over the ATF line (K) until the hose end contacts the line bracket (L), and secure the hose with the clip (M) at 6−8 mm (0.24−0.31 in.) (N) from the hose end.
4. Slide the ATF cooler hose (O) over the ATF cooler line (P) until the hose end contacts the bulge (Q), and secure the hose with the clip (R) at 2−4 mm (0.08−0.16 in.) (S) from the hose end.

ATF Filter Replacement



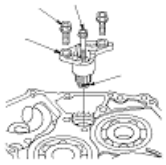
1. Remove the air cleaner assembly.
2. Disconnect the ATF cooler hoses (A) from the ATF filter (B).
3. Remove the ATF filter holder (C).
4. Remove the ATF filter, and replace it.
5. Install the new ATF filter on the filter mounting bracket (D), and secure it with its holder and bolt.
6. Slide the ATF cooler hose on the ATF filter until the hose end contacts the filter housing, and secure the hose with the clip (E) at 6−8 mm (0.24−0.31 in.) (F) from the filter housing. Install the cooler hose on the other side of the ATF filter in the same manner.
7. Install the air cleaner assembly.

A/T Drive Plate Removal and Installation

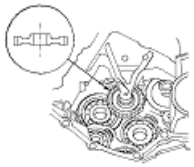
1. Remove the transmission assembly.
2. Remove the drive plate (A) and washer (B) from the engine crankshaft.
3. Install the drive plate and washer on the engine crankshaft, and tighten the six bolts in a crisscross pattern in at least two steps.
4. Install the transmission assembly.

A/T Housing Reverse Idler Gear Removal

1. Remove the bolts (A) securing the reverse idler gear shaft holder (B).
2. Install a 5 x 0.8 mm bolt (C) in the reverse gear shaft, and pull it to remove the reverse idler gear shaft (D) and the gear shaft holder together.

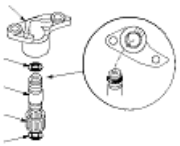


3. Remove the reverse idler gear.

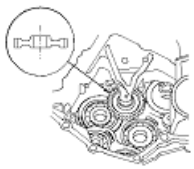


A/T Housing Reverse Idler Gear Installation

1. Lightly coat the reverse idler gear shaft (A), the needle bearing (B), and the new O-rings (C) with lithium grease.
2. Assemble the new O-rings and the needle bearing on the reverse idler gear shaft, then install the reverse idler gear shaft in the reverse idler gear shaft holder (E). Align the D-shaped cut out of the shaft with the D-shaped area of the holder.



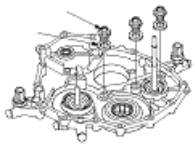
3. Install the reverse idler gear in the transmission housing in the direction shown.



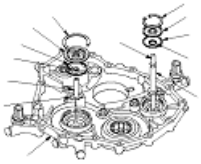
4. Install the reverse idler gear shaft/holder assembly in the reverse idler gear.
5. Secure the holder with the bolts.

A/T End Cover Air Check Valve Inspection and Replacement

1. Check the air check valve filter for clogging. If the filter is clogged, remove the air check valve (A), and clean the filter thoroughly by pouring clean ATF. Do not blow out the filter with compressed air. Replace the air check valve, if the filter or check valve (ball) is clogged or damaged.
2. Install the air check valve and a new sealing washer (B).



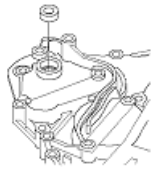
A/T End Cover ATF Feed Pipe Replacement



1. Remove the snap ring (A), 3rd clutch feed pipe (B), and feed pipe flange (C) from the end cover (D).
2. Install the new O-ring (E) over the 3rd clutch feed pipe.
3. Install the 3rd clutch feed pipe in the end cover by aligning the feed pipe tabs (F) with the indentations in the end cover.
4. Install the new O-ring (G) in the end cover, then install the feed pipe flange over the 3rd clutch feed pipe.
5. Secure the 3rd clutch feed pipe and feed pipe flange with the snap ring.
6. Remove the snap ring (H) and feed pipe flange (I).
7. Check the 4th clutch feed pipe (J) and 2nd clutch feed pipe (K) for scoring and damage. Replace the end cover, if the feed pipe is scored or damaged.
8. Install the new O-ring (L) over the 4th clutch feed pipe.
9. Install the new O-ring (M) in the end cover, then install the feed pipe flange over the 4th clutch feed pipe.
10. Secure the 4th clutch feed pipe and feed pipe flange with the snap ring.

A/T End Cover Selector Control Shaft Bearing Replacement

Special Tools Required



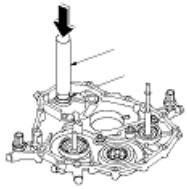
Driver handle 15 x 135L
07749-0010000

Driver attachment, 22 x 24 mm
07746-0010800

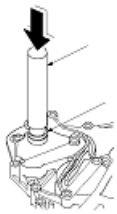
1. Remove the oil seal from the end cover.

2. Remove the control shaft bearing from the end cover.

3. Install the new bearing flush to the end cover with the special tools.

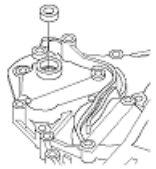


4. Install the new oil seal flush to the end cover with the special tools.



A/T End Cover Selector Control Shaft Oil Seal Replacement

Special Tools Required

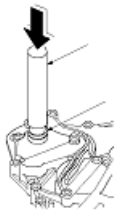


Driver handle 15 x 135L
07749-0010000

Driver attachment, 22 x 24 mm
07746-0010800

1. Remove the oil seal from the end cover.

2. Install the new oil seal flush to the end cover with the special tools.



Torque Converter Housing Selector Control Shaft Oil Seal Replacement

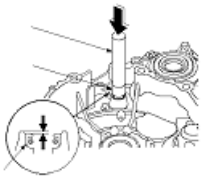
Special Tools Required

Driver handle 15 x 135L
07749-0010000

Oil seal driver attachment
07947-ZV00100

1. Remove the oil seal from the torque converter housing.

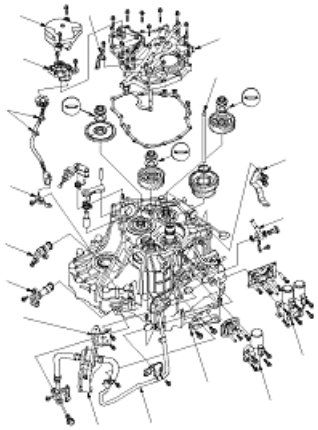
2. Install the new oil seal (A) in the torque converter housing in depth (B) of 0.5−1.5 mm (0.02−0.06 in.) below the housing surface with the special tools.



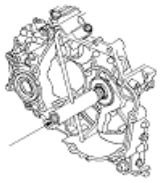
A/T End Cover Removal

Special Tools Required

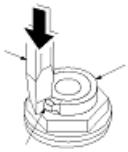
Mainshaft holder set
07PAB-0010001



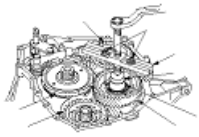
1. Remove the bolts securing the ATF inlet line (A) and ATF filter holder (B), line bolt and sealing washers, and remove the ATF inlet line, ATF hose, and ATF filter. Remove the ATF filter bracket (C).
2. Remove the ATF outlet line bolt, line mounting bolt, sealing washers, and ATF outlet line (D).
3. Remove the transmission hanger (E) and breather hose clamp bracket (F).
4. Remove the A/T clutch pressure control solenoid valve A (G), ATF joint pipes, O-rings, ATF pipe, and gasket.
5. Remove the A/T clutch pressure control solenoid valve B and C (H), O-rings, ATF pipe, ATF joint pipes, and gasket.
6. Remove the input shaft (mainshaft) speed sensor (I) and output shaft (countershaft) speed sensor (J).
7. Remove the transmission range switch cover (K).
8. Remove the transmission range switch harness clamps (L) from the clamp bracket (M), then remove the transmission range switch (N).
9. Remove the clamp bracket from the end cover (O).
10. Remove the connector bracket (P) from the transmission housing.
11. Remove the end cover, dowel pins, O-rings, and end cover gasket.
12. Remove the ATF lubrication pipe (Q) from the idler gear shaft.



13. Slip the special tool onto the mainshaft.
14. Engage the park pawl with the park gear.



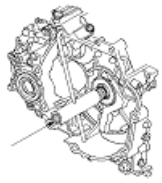
15. Cut the lock tab (A) of the each shaft locknut (B) using a chisel (C). Then remove the locknuts and conical spring washers from each shaft.
    NOTE:
    - Countershaft and secondary shaft locknuts have left-hand threads.
    - Keep all of the chiseled particles out of the transmission.
    - Clean the old locknuts; they are used to install the press fit idler gears and park gear.
16. Remove the snap ring securing the idler gear to the idler gear shaft.



17. Install 6 x 1.0 mm bolts (A) on the idler gear shaft idler gear (B). Set a puller (C) on the idler gear shaft (D) with putting a spacer (E) between the puller and idler gear shaft, then remove idler gear shaft idler gear.
18. Set the puller, 6 x 1.0 mm bolts, and spacer on the secondary shaft idler gear (F), and remove the secondary shaft idler gear from the secondary shaft in the same manner as the removal of idler gear shaft idler gear.
19. Set the puller, 6 x 1.0 mm bolts, and spacer on the mainshaft idler gear (G), and remove the mainshaft idler gear from the mainshaft in the same manner as the removal of idler gear shaft idler gear.
20. Set the puller, 6 x 1.0 mm bolts, and spacer on the park gear (H), and remove the park gear from the countershaft in the same manner as the removal of idler gear shaft idler gear.
21. Remove the park pawl, park pawl spring, park pawl shaft, and stop shaft.
22. Remove the park lever from the selector control shaft.

A/T End Cover Installation

Special Tools Required

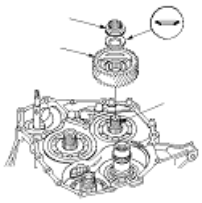


Mainshaft holder set
07PAB-0010001

Gear installer set
070AC-XFD0100

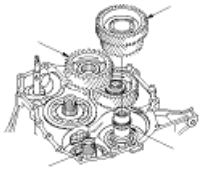
1. Install the special tool onto the mainshaft.
2. Lubricate the following parts with ATF:
   - Splines and threads of the mainshaft.
   - Splines of the mainshaft idler gear.
   - Old conical spring washer and old locknut.

3. Install the mainshaft idler gear (A), old conical spring washer (B), and old locknut (C) on the mainshaft (D), and tighten the locknut to 216 N·m (22.0 kgf·m, 159 lbf·ft).
   NOTE:
   - Do not tap the idler gear to install.
   - Use a torque wrench to tighten the locknut. Do not use an impact wrench.

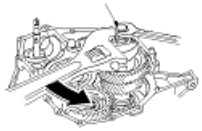


4. Lubricate the following parts with ATF:
   - Splines and threads of the secondary shaft and idler gear shaft.
   - Splines of the secondary shaft idler gear.
   - Old conical spring washer and old locknut.

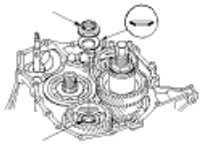
5. Install the secondary shaft idler gear (A) on the secondary shaft (B), and install the idler gear shaft idler gear (C) on the idler gear shaft (D).



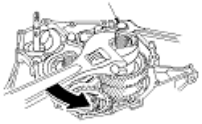
6. Set the special tool on the idler gear shaft and idler gear, and tighten the installer nut to install the idler gear part-way.
   NOTE: The installer nut has left-hand threads.



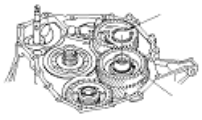
7. Install the old conical spring washer (A) and old locknut (B) on the secondary shaft (C), and tighten the locknut to 226 N·m (23.0 kgf·m, 166 lbf·ft).
   NOTE:
   - Do not tap the idler gear to install.
   - Use a torque wrench to tighten the locknut. Do not use an impact wrench.
   - Secondary shaft locknut has left-hand threads.



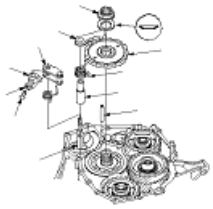
8. Retighten the installer nut to seat the idler gear in the idler gear shaft until it stops. Remove the special tool from the idler gear shaft.



9. Install the new snap ring (A) on the idler gear shaft (B), and verify that the snap ring is seated securely into the groove.



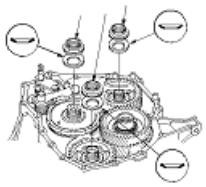
10. Install the park lever (A) and the park lever stop (B) on the selector control shaft (C), then install the lock bolt and the new lock washer (D). Do not bend the lock tab of the lock washer until Step 23 .



11. Install the park pawl shaft (E), the park pawl spring (F), the park pawl (G), and the stop shaft (H) on the transmission housing.
12. Lubricate the following parts with ATF:
    - Threads and splines of the countershaft.
    - Old conical spring washer and old locknut.
    - Areas where the park gear contacts the conical spring washer.
13. Install the park gear (I), the old conical spring washer (J), and the old locknut (K) on the countershaft.
14. Lift the park pawl up, and engage it with the park gear, then tighten the locknut to 226 N·m (23.0 kgf·m, 166 lbf·ft).
    NOTE:
    - Do not tap the park gear to install.
    - Use a torque wrench to tighten the locknut. Do not use an impact wrench.
    - Countershaft locknut has left-hand threads.
15. Remove the locknuts and the conical spring washers from the mainshaft, the countershaft, and the secondary shaft.
16. Lubricate the threads of the shafts, the new locknuts and the new conical spring washers with ATF.

---

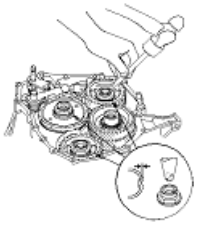
17. Install the new conical spring washers (A) (B) with facing stamped mark side up in the direction shown, and install the new mainshaft locknut (C), the new countershaft locknut (D), and the new secondary shaft locknut (E).



18. Tighten the countershaft locknut and the secondary shaft locknut to 167 N·m (17.0 kgf·m, 23 lbf·ft), and tighten the mainshaft locknut to 155 N·m (15.8 kgf·m, 114 lbf·ft).
    NOTE:
    - Be sure to install the conical spring washers in the direction shown.
    - Use a torque wrench to tighten the locknut. Do not use an impact wrench.
    - Countershaft and secondary shaft locknuts have left-hand threads.
19. Remove the special tool from the mainshaft.

---

20. Stake the locknuts into the shafts in depth (A) of 0.7–1.3 mm (0.03–0.05 in.) using a 3.5 mm punch (B).

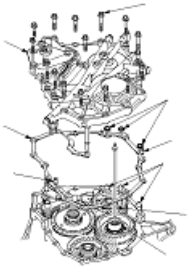


---

21. Set the park pawl (A) in the P position, then verify that the park pawl engages with the park gear (B).
22. If the park pawl does not engage fully, check the distance (C) between the pawl shaft and the extension line connected centers of the park lever roller pin and the selector control shaft.
23. Tighten the lock bolt (D), and bend the lock tab of the lock washer (E) against the bolt head.

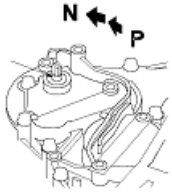
---

24. Install the ATF lubrication pipe (A) into the idler gear shaft (B).
25. Install the new gasket (C) on the transmission housing, and install the two dowel pins (D) and new O-rings (E) over the top of the ATF feed pipes (F).
26. Install the end cover (G), and tighten the 17 bolts.



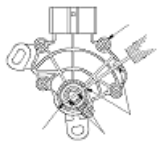
---

27. Using the selector control shaft end on the torque converter housing side, turn the control shaft (A) fully clockwise (view from end cover) to the P position. Turn the control shaft back two click-stopped positions so that it is in the N position.
    NOTE: Do not squeeze the end of the selector control shaft tips together when turning the shaft. If the control shaft tips are squeezed together it will cause a faulty signal or position due to play between the selector control shaft and the switch.

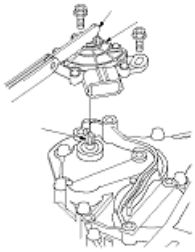


---

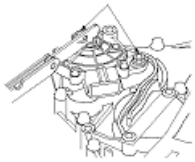
28. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.
NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.



29. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).



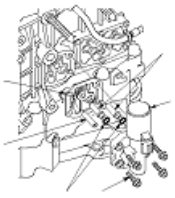
30. Tighten the bolts on the transmission range switch while you continue to hold it in the N position. Do not move the transmission range switch while tightening the bolts. Remove the feeler gauge.



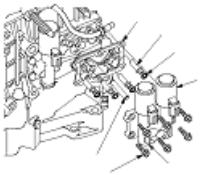
31. Install the harness clamp bracket (A) on the end cover (B).
32. Install the connector bracket (C) on the transmission housing.
33. Connect the transmission range switch connector (D) securely, then install the harness clamps (E) on the clamp bracket.
34. Install the transmission range switch cover (F).

35. Install the new O-ring (A) on the input shaft (mainshaft) speed sensor (B), then install the input shaft (mainshaft) speed sensor.
36. Install the new O-ring (C) on the output shaft (countershaft) speed sensor (D), then install the output shaft (countershaft) speed sensor.

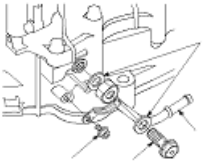
37. Install the new gasket (B) on the transmission housing, and install the ATF pipe (C) and the ATF joint pipes (D).
38. Install the new O-rings (E) over the ATF joint pipes, and install the A/T clutch pressure control solenoid valve A.



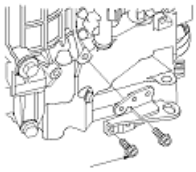
39. Install the new gasket (A) with the blue side facing the transmission housing and the white side facing the A/T clutch pressure control solenoid valve body.
40. Install the ATF pipe (D) and the ATF joint pipes (E), and install the new O-rings (F) over the ATF joint pipes.
41. Install A/T clutch pressure control solenoid valve B and C.



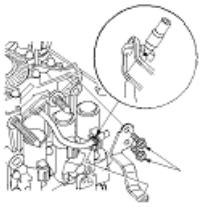
42. Install the ATF outlet line (A) on the torque converter housing, and secure it with the line bolt (B) and new sealing washers (C).
43. Secure the ATF outlet line with the bracket bolt.



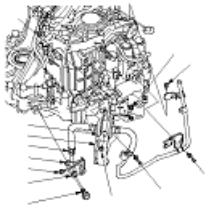
44. Install the transmission hanger.



45. Install the breather hose clamp bracket, and install the clamp on the bracket.

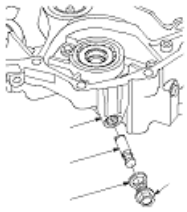


46. Install the ATF filter bracket (A).
47. Install the ATF inlet line and hose (B) on the torque converter housing, and secure it with the line bolt (C) and new sealing washers (D).
48. Put the ATF filter (E) on its bracket, and secure with the holder (F) and the bolt.
49. Secure the inlet line with the bolts (G) on the transmission.



Torque Converter Housing Lubrication Check Valve Replacement

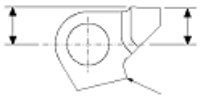
1. Remove the sealing bolt (A) and sealing washer (B).
2. Remove the lubrication check valve (C) from the torque converter housing (D).
3. Install the lubrication check valve, new sealing washer, and the sealing bolt.



A/T End Cover Park Lever Stop Inspection and Adjustment

1. Set the park lever in the P position.
2. Measure the distance (A) between the park pawl shaft center (B) and the extension line (C) connected centers of the park lever roller pin (D) and control shaft (E) in the vertical direction from the extension line.
   Standard: 46.8−47.8 mm (1.84−1.88 in.)

3. If the measurement is out of standard, select and install the appropriate park lever stop (A) from the table.

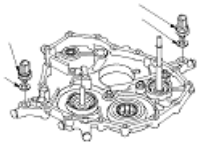


PARK LEVER STOP

Mark	Part Number	A	B
1	24537-PA9-003	11.00 mm (0.433 in.)	11.00 mm (0.433 in.)
2	24538-PA9-003	10.80 mm (0.425 in.)	10.65 mm (0.419 in.)
3	24539-PA9-003	10.60 mm (0.417 in.)	10.30 mm (0.406 in.)

4. After replacing the park lever stop, make sure the distance is within tolerance.

A/T End Cover Transmission Fluid Pressure Switch Replacement

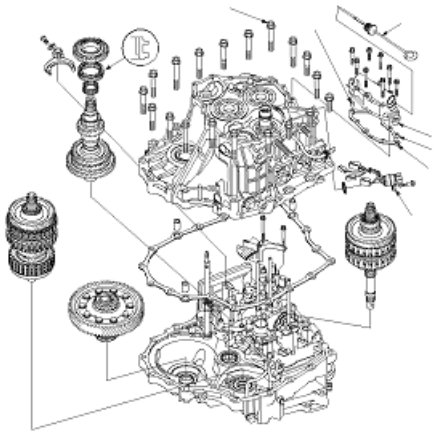


1. Remove the 2nd clutch transmission fluid pressure switch (A).
2. Make sure there is no water, oil, dust, or foreign particles inside the connector.
3. Install the new 2nd clutch transmission fluid pressure switch and a new sealing washer (B), and tighten the metal part of the switch.
4. Remove the 3rd clutch transmission fluid pressure switch (C).
5. Make sure there is no water, oil, dust, or foreign particles inside the connector.
6. Install the new 3rd clutch transmission fluid pressure switch and a new sealing washer (D), and tighten the metal part of the switch.

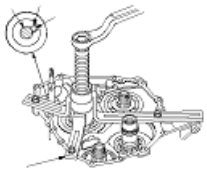
A/T Housing and Shaft Assembly Removal

Special Tools Required

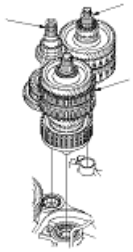
Housing puller
07HAC-PK40102



1. Remove the Dipstick (A).
2. Remove the shift solenoid valve cover (B), dowel pins (C), and gasket (D).
3. Disconnect the connectors from the shift solenoid valves, and remove the solenoid harness connector (E).
4. Remove the transmission housing mounting bolts (F) (19).



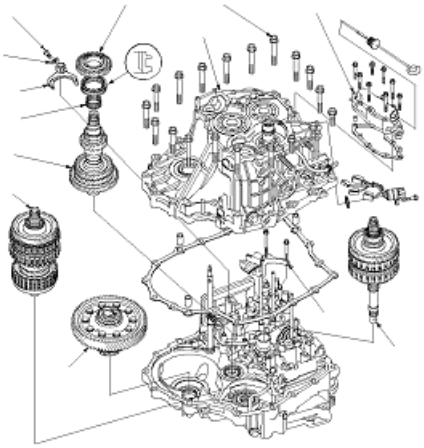
5. Align the spring pin (A) on the selector control shaft (B) with the transmission housing groove (C) by turning the control shaft with the detent plate.
   NOTE: Do not squeeze the end of the selector control shaft tips together when turning the control shaft.
6. Install the special tool over the mainshaft, then remove the transmission housing, dowel pins, and gasket.
   NOTE: If the top arm of your housing puller is too short, replace it with housing puller arm, 205 mm 07SAC-P0Z0101.
7. Remove the countershaft reverse gear and needle bearing.
8. Remove the lock bolt securing the shift fork, then remove the shift fork with the reverse selector together.



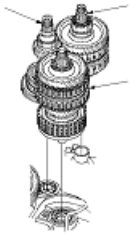
9. Remove the mainshaft subassembly (A), the countershaft subassembly (B), and the secondary shaft subassembly (C) together.
   If the reverse selector hub is removed by hand, remove the 4th-5th gear and needle bearings, and remove the mainshaft subassembly, then the countershaft subassembly and secondary shaft subassembly together.
10. Remove the baffle plate.
11. Remove the differential assembly.

A/T Shaft Assembly and Housing Installation

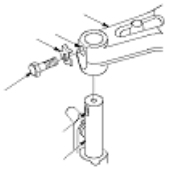
1. Install the differential assembly in the torque converter housing.
2. Install the baffle plate.
3. Assemble the mainshaft, countershaft, and secondary shaft.
   - Countershaft reverse selector hub is press-fitted type, go to Step 4 .
   - Countershaft reverse selector hub is not press-fitted type, go to Step 5 .



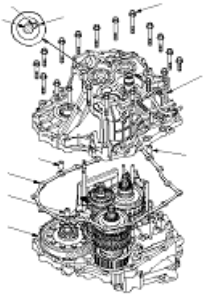
4. Join the mainshaft subassembly (A), countershaft subassembly (B), and secondary shaft subassembly (C) together, and install them in the torque converter housing.
5. Join the countershaft subassembly and secondary shaft subassembly together, then install them in the torque converter housing, and install the mainshaft subassembly. Install the needle bearings, 4th-5th gear, and reverse selector hub over the countershaft.



6. Turn the shift fork shaft (A) so the large chamfered hole (B) is facing the fork bolt hole (C) of the shift fork (D).
7. Install the shift fork and reverse selector together on the shift fork shaft and countershaft. Secure the shift fork to the shift fork shaft with the lock bolt and a new lock washer (E), then bend the lock tab of the lock washer against the bolt head.
8. Install the needle bearing and countershaft reverse gear on the countershaft.
9. Install the reverse idler gear in the transmission housing.

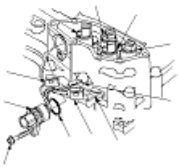


10. Install the three dowel pins (A) and a new gasket (B) on the torque converter housing (C).
11. Align the spring pin (D) of the control shaft (E) with the transmission housing groove (F) by turning the control shaft detent plate. Do not squeeze the end of the control shaft tips together when turning the shaft. If the tips are squeezed together, it will causes a faulty shift position signal or position due to the play between the control shaft and the switch.
12. Place the transmission housing (G) on the torque converter housing. Do not install the input shaft (mainshaft) speed sensor and output shaft (countershaft) speed sensor before installing the transmission housing on the torque converter housing.



13. Wrap a screwdriver tip with tape to prevent damage to the reverse idler gear teeth. Engage the reverse idler gear with reverse gears by rotating the idler gear using the screwdriver.
14. Install the transmission housing mounting bolts, and tighten the bolts to 44 N·m (4.5 kgf·m, 33 lbf·ft) in at least two steps in a crisscross pattern.

15. Install the shift solenoid harness connector (E) in the transmission housing with the new O-ring (F).
16. Connect the WHT and ORN wires connector to shift solenoid valve B. The ATF temperature sensor is assembled in the WHT wires connector.
17. Connect the harness terminals to the solenoids:
    - BLU wire connector to shift solenoid valve A.
    - GRN wire connector to shift solenoid valve C.
    - YEL wire connector to shift solenoid valve D.



18. Install the shift solenoid valve cover (A), two dowel pins (B), and a new gasket (C).
19. Install the ATF dipstick.

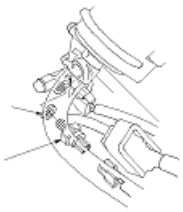
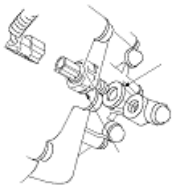
A/T 2nd Clutch Transmission Fluid Pressure Switch Replacement



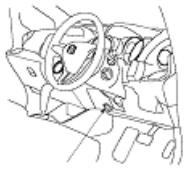
1. Remove the air cleaner assembly.
2. Disconnect the 2nd clutch transmission fluid pressure switch connector, and remove the 2nd clutch transmission fluid pressure switch (A).
3. Install the new 2nd clutch transmission fluid pressure switch with a new sealing washer (B), and tighten the metal part of the switch.
4. Make sure there is no water, oil, dust, or foreign particles inside the connectors.
5. Connect the connector securely.
6. Install the air cleaner assembly.

A/T 3rd Clutch Transmission Fluid Pressure Switch Replacement



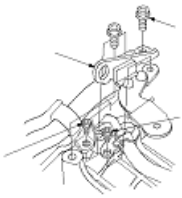
1. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the 3rd clutch transmission fluid pressure switch connector, then remove the 3rd clutch transmission fluid pressure switch (A).
4. Install the new 3rd clutch transmission fluid pressure switch with a new sealing washer (B), and tighten the metal part of the switch.
5. Make sure there is no water, oil, dust, or foreign particles inside the connector.
6. Connect the connector securely.
7. Install the splash shield.

A/T Clutch Pressure Control Solenoid Valve A Test

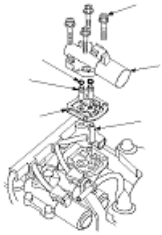


1. Connect the HDS to the DLC (A).
2. Select Clutch Pressure Control (Linear) Solenoid A in Miscellaneous Test Menu on the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Test A/T clutch pressure control solenoid valve A with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to Step 4 .
4. Remove the air cleaner assembly.

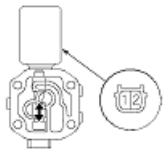
5. Disconnect the A/T clutch pressure control solenoid valve A connector.
6. Measure the A/T clutch pressure control solenoid valve A resistance at the connector terminals.
   Standard: 3–10 Ω
   - If the resistance is out of standard, replace A/T clutch pressure control solenoid valve A.
   - If the resistance is within the standard, go to Step 7 .
7. Connect a jumper wire from the negative battery terminal to the solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to Step 8 .



8. Remove the bolt (A) securing the harness cover.
9. Remove the bolt (B) securing the ATF cooler line/hose bracket.
10. Remove the transmission hanger/air cleaner housing bracket (C).

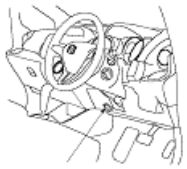


11. Remove the mounting bolts and A/T clutch pressure control solenoid valve A.
12. Remove the ATF pipe (B), ATF joint pipes (C), O-rings (D), and gasket (E).
13. Check the fluid passage of the solenoid valve for contamination.

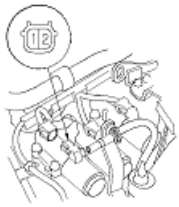


14. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve A moves.
15. Disconnect one of the jumper wires, and check valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valve A.
16. Clean the mounting surfaces and fluid passages of the solenoid valve body and transmission housing.
17. Install the new gasket with blue side down; white side up on the transmission housing.
18. Install the ATF pipe and ATF joint pipes, and install the new O-rings over the ATF joint pipes.
19. Install A/T clutch pressure control solenoid valve A.
20. Install the transmission hanger/air cleaner housing bracket, and secure the ATF cooler line/hose bracket and harness cover with the bolts.
21. Check the connector for rust, dirt, or oil, clean or repair if necessary, then connect the connector securely.
22. Install the air cleaner assembly.

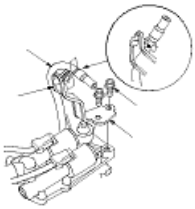
A/T Clutch Pressure Control Solenoid Valve B Test



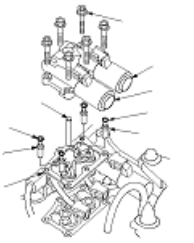
1. Connect the HDS to the DLC (A).
2. Select Clutch Pressure Control (Linear) Solenoid B in Miscellaneous Test Menu on the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Test A/T clutch pressure control solenoid valve B with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to Step 4 .
4. Remove the air cleaner assembly.



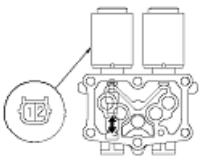
5. Disconnect the A/T clutch pressure control solenoid valve B connector.
6. Measure the A/T clutch pressure control solenoid valve B resistance at the connector terminals.
   Standard: 3−10 Ω
   - If the resistance is out of standard, replace A/T clutch pressure control solenoid valve B.
   - If the resistance is within the standard, go to Step 7 .
7. Connect a jumper wire from the negative battery terminal to the solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to Step 8 .



8. Remove the breather hose (A) from its clamp (B), and remove the breather hose clamp bracket (C).

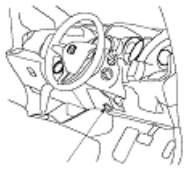


9. Remove A/T clutch pressure control solenoid valve B and C.
10. Remove the ATF pipe (A), ATF joint pipes (D), O-rings (E), and gasket (F).
11. Check the fluid passage of the solenoid valve for contamination.



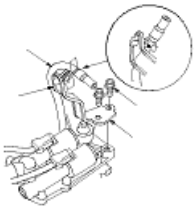
12. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve B moves.
13. Disconnect one of the jumper wires, and check valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valve B and C.
14. Clean the mounting surfaces and fluid passages of the solenoid valve body and transmission housing.
15. Install the new gasket with blue side down; white side up on the transmission housing.
16. Install the ATF pipe and ATF joint pipes, and install the new O-rings over the ATF joint pipes.
17. Install A/T clutch pressure control solenoid valve B and C.
18. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connectors securely.
19. Install the breather hose clamp bracket, and install the breather hose on its clamp at the dot.
20. Install the air cleaner assembly.

A/T Clutch Pressure Control Solenoid Valve C Test

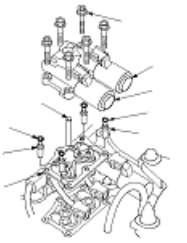


1. Connect the HDS to the DLC (A).
2. Select Clutch Pressure Control (Linear) Solenoid valve C in Miscellaneous Test Menu on the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Test A/T clutch pressure control solenoid valve C with the HDS.
   - If the valve tests OK, the test is complete. Disconnect the HDS.
   - If the valve does not test OK, follow the instructions on the HDS.
   - If the valve does not test OK, and the HDS does not determine the cause, go to Step 4 .
4. Remove the air cleaner assembly.

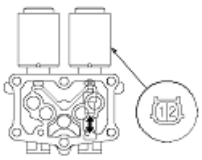
5. Disconnect the A/T clutch pressure control solenoid valve C connector.
6. Measure the A/T clutch pressure control solenoid valve C resistance at the connector terminals.
   Standard: 3−10 Ω
   - If the resistance is out of standard, replace A/T clutch pressure control solenoid valve C.
   - If the resistance is within the standard, go to Step 7 .
7. Connect a jumper wire from the negative battery terminal to the solenoid valve C connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
   - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
   - If no clicking sound is heard, go to Step 8 .



8. Remove the breather hose (A) from its clamp (B), and remove the breather hose clamp bracket (C).



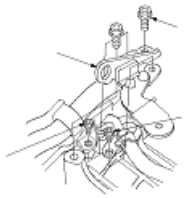
9. Remove A/T clutch pressure control solenoid valve B and C.
10. Remove the ATF pipe (A), ATF joint pipes (D), O-rings (E), and gasket (F).
11. Check the fluid passage of the solenoid valve for contamination.



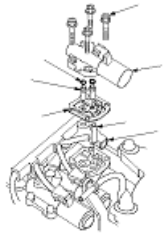
12. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve C connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve C moves.
13. Disconnect one of the jumper wires, and check valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valve B and C.
14. Clean the mounting surfaces and fluid passages of the solenoid valve body and transmission housing.
15. Install the new gasket with blue side down; white side up on the transmission housing.
16. Install the ATF pipe and ATF joint pipes, and install the new O-rings over the ATF joint pipes.
17. Install A/T clutch pressure control solenoid valve B and C.
18. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connectors securely.
19. Install the breather hose clamp bracket, and install the breather hose on its clamp at the dot.
20. Install the air cleaner assembly.

A/T Clutch Pressure Control Solenoid Valve A Replacement

1. Remove the air cleaner assembly.
2. Remove the bolt (A) securing the harness cover.
3. Remove the bolt (B) securing the ATF cooler line/hose bracket.
4. Remove the transmission hanger/air cleaner housing bracket (C).

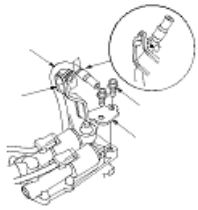


5. Disconnect A/T clutch pressure control solenoid valve connector (A).
6. Remove the mounting bolts and A/T clutch pressure control solenoid valve A (B).
7. Remove the ATF pipe (C), ATF joint pipes (D), O-rings (E), and gasket (F).
8. Clean the mounting surface and fluid passages of the transmission housing.
9. Install the new gasket with blue side down; white side up on the transmission housing.
10. Install the ATF pipe and ATF joint pipes, and install the new O-rings over the ATF joint pipes.
11. Install A/T clutch pressure control solenoid valve A.
12. Install the transmission hanger/air cleaner housing bracket, and secure the ATF cooler line/hose bracket and harness cover with the bolts.
13. Check the connector for rust, dirt, or oil, clean or repair if necessary, then connect the connector securely.
14. Install the air cleaner assembly.

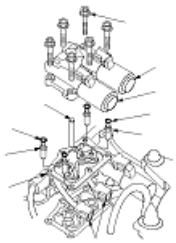


A/T Clutch Pressure Control Solenoid Valve B and C Replacement

1. Remove the air cleaner assembly.
2. Remove the breather hose (A) from its clamp (B), and remove the breather hose clamp bracket (C).

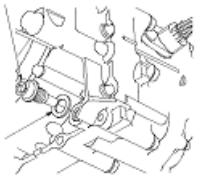


3. Disconnect the connectors (A) from A/T clutch pressure control solenoid valve B and C.
4. Remove A/T clutch pressure control solenoid valve B and C.
5. Remove the ATF pipe (D), ATF joint pipes (E), O-rings (F), and gasket (G).
6. Clean the mounting surface and fluid passages of the transmission housing.
7. Install the new gasket with blue side down; white side up on the transmission housing.
8. Install the ATF pipe and ATF joint pipes, and install the new O-rings over the ATF joint pipes.
9. Install A/T clutch pressure control solenoid valve B and C.
10. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connectors securely.
11. Install the breather hose clamp bracket, and install the breather hose on its clamp at the dot.
12. Install the air cleaner assembly.

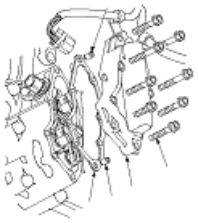


ATF Temperature Sensor Test/Replacement

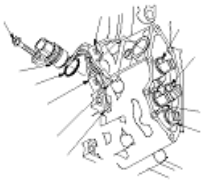
1. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the shift solenoid harness connector.
4. Measure the ATF temperature sensor resistance between shift solenoid harness connector terminals No. 6 and No. 7.
   Standard: **50 Ω−25 kΩ**
5. If the resistance is out of standard, replace the ATF temperature sensor and the solenoid harness; go to Step 6 . The ATF temperature sensor is not available separately from the shift solenoid harness. If the resistance is within the standard, connect the connector securely, and install the splash shield.



6. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).
7. Reinstall the drain plug with a new sealing washer (B).

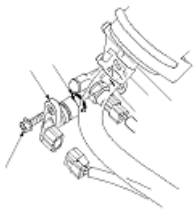


8. Remove the shift solenoid valve cover (A), dowel pins (B), and gasket (C).



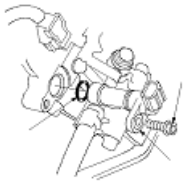
9. Disconnect the connectors, remove the shift solenoid harness connector (E), and replace it.
10. Install the new O-ring (F) on the new shift solenoid harness connector, and install the connector in the transmission housing.
11. Connect the WHT and ORN wires connector to shift solenoid valve B. The ATF temperature sensor is assembled in the WHT wires connector.
12. Connect the harness terminals to the solenoids:
    - BLU wire connector to shift solenoid valve A.
    - GRN wire connector to shift solenoid valve C.
    - YEL wire connector to shift solenoid valve D.
13. Install the shift solenoid valve cover, dowel pins, and a new gasket.
14. Check the connector for rust, dirt, or oil, then connect it securely.
15. Refill the transmission with ATF.
16. Install the splash shield.

A/T Input Shaft (Mainshaft) Speed Sensor Replacement



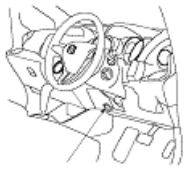
1. Remove the air cleaner assembly.
2. Disconnect the input shaft (mainshaft) speed sensor connector, and remove the input shaft (mainshaft) speed sensor (A).
3. Install the new O-ring (B) on the new input shaft (mainshaft) speed sensor, then install the input shaft (mainshaft) speed sensor.
4. Check the connector for rust, dirt, or oil, then connect the connector securely.
5. Install the air cleaner assembly.

A/T Output Shaft (Countershaft) Speed Sensor Replacement



1. Remove the air cleaner assembly.
2. Disconnect the output shaft (countershaft) speed sensor connector, and remove the output shaft (countershaft) speed sensor (A).
3. Install the new O-ring (B) on the new output shaft (countershaft) speed sensor, then install the output shaft (countershaft) speed sensor.
4. Check the connector for rust, dirt, or oil, then connect the connector securely.
5. Install the air cleaner assembly.

A/T Shift Solenoid Valve Test

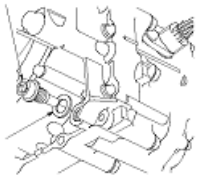


1. Connect the HDS to the DLC (A).
2. Select Shift Solenoid A, B, C, and D Test in Miscellaneous Test Menu on the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Check that the shift solenoid valve A, B, C, and D operate with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the valves are OK. The test is complete, disconnect the HDS.
   - If no clicking sound is heard, go to Step 4 , and test the solenoid valve.
4. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
5. Remove the splash shield.

6. Disconnect the shift solenoid harness connector.
7. Measure shift solenoid valve resistance between shift solenoid harness connector terminals below and body ground:
   - No. 1: Shift solenoid valve C
   - No. 2: Shift solenoid valve B
   - No. 5: Shift solenoid valve A
   - No. 8: Shift solenoid valve D

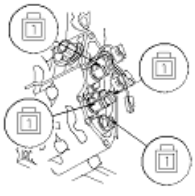
   Standard: 12−25 Ω

   - If the resistance is within the standard, go to Step 8 and check solenoid valve for a clicking sound.
   - If the resistance is out of standard, go to Step 9 .
8. Connect a jumper wire from the negative battery terminal to the body ground, and connect another jumper wire from the positive battery terminal to each shift solenoid harness connector terminal individually. A clicking sound should be heard.
   - If a clicking sound is heard, the valves are OK. The test is complete, connect the connector.
   - If no clicking sound is heard, go to Step 9 and test shift solenoid valves.



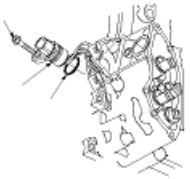
9. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).
10. Reinstall the drain plug with a new sealing washer (B).

11. Remove the shift solenoid valve cover (A), dowel pins (B), and gasket (C).



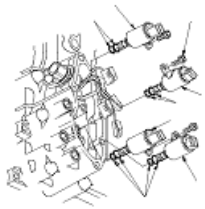
12. Disconnect the connectors from shift solenoid valve A, shift solenoid valve B, shift solenoid valve C, and shift solenoid valve D.
13. Measure the resistance of each solenoid valve between the connector terminal and body ground.
    Standard: 12−25 Ω

    - If the resistance is out of standard, go to Step 16 and replace shift solenoid valve.
    - If the resistance is within the standard, go to Step 14 and check solenoid valve for a clicking sound.
14. Connect a jumper wire from the negative battery terminal to the body ground, and connect another jumper wire from the positive battery terminal to each solenoid valve terminal individually.
    - If a clicking sound is heard, go to Step 15 and replace the shift solenoid harness.
    - If no clicking sound is heard, go to Step 16 and replace shift solenoid valve.



15. Remove the shift solenoid harness connector (A), and replace it. Install the new O-ring (B) on the shift solenoid harness connector, and install the connector in the transmission housing, then go to Step 21 .

16. Remove the mounting bolts, then hold the solenoid valve body and remove the solenoid valves. Do not hold the connector to remove the solenoid valve.



17. Install new O-rings (two O-rings per solenoid valve) (E) on the reused solenoid valve.
    NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided on it.

18. Install shift solenoid valve D (black connector) and shift solenoid valve C (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.
    NOTE: Do not hold the solenoid valve connector to install the solenoid valve. Be sure to hold the solenoid valve body.

19. Install shift solenoid valve B (black connector) by holding the solenoid valve body; make sure the mounting bracket contacts the servo body.

20. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the bracket of shift solenoid valve B.
    NOTE: Do not install shift solenoid valve A before installing shift solenoid valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage to hydraulic control system.

21. Connect the harness terminals to the solenoids:
    - BLU wire connector to shift solenoid valve A.
    - ORN wire connector to shift solenoid valve B.
    - GRN wire connector to shift solenoid valve C.
    - YEL wire connector to shift solenoid valve D.

22. Install the shift solenoid valve cover, dowel pins, and a new gasket.

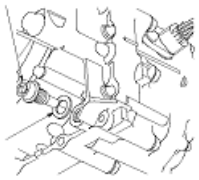
23. Check the connector for rust, dirt, or oil, then connect the connector securely.

24. Refill the transmission with ATF.

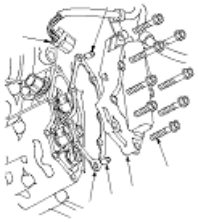
25. Install the splash shield.

A/T Shift Solenoid Valve Replacement, and Shift Solenoid Harness Replacement

1. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).
4. Reinstall the drain plug with a new sealing washer (B).

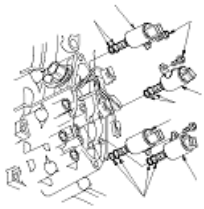


5. Disconnect the shift solenoid harness connector (A).
6. Remove the shift solenoid valve cover (B), dowel pins (C), and gasket (D).



7. Disconnect the shift solenoid valve connectors.
   - If replacing shift solenoid valve(s), go to Step 8 .
   - If replacing the shift solenoid harness, remove the shift solenoid harness connector (A), and replace it. Install the new O-ring (B) on the new shift solenoid harness connector, and install it in the transmission housing, then go to Step 13 .

8. Remove the mounting bolts, then hold the solenoid valve body and remove the solenoid valves. Do not hold the connector to remove the solenoid valve.
9. Install new O-rings (two O-rings per solenoid valve) (E) on the reused solenoid valve.
   NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided on it.
10. Install shift solenoid valve D (black connector) and shift solenoid valve C (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the servo body.
    NOTE: Do not hold the solenoid valve connector to install the solenoid valve. Be sure to hold the solenoid valve body.
11. Install shift solenoid valve B (black connector) by holding the solenoid valve body; make sure the mounting bracket contacts the servo body.
12. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the bracket of shift solenoid valve B.
    NOTE: Do not install shift solenoid valve A before installing shift solenoid valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage to hydraulic control system.
13. Connect the harness terminals to the solenoids:
    - BLU wire connector to shift solenoid valve A.
    - ORN wire connector to shift solenoid valve B.
    - GRN wire connector to shift solenoid valve C.
    - YEL wire connector to shift solenoid valve D.
14. Install the shift solenoid valve cover, dowel pins, and a new gasket.
15. Check the connector for rust, dirt, or oil, then connect the connector
16. Refill the transmission with ATF.
17. Install the splash shield.



A/T Gear Position Indicator Component Location Index

Seven-position Transmission

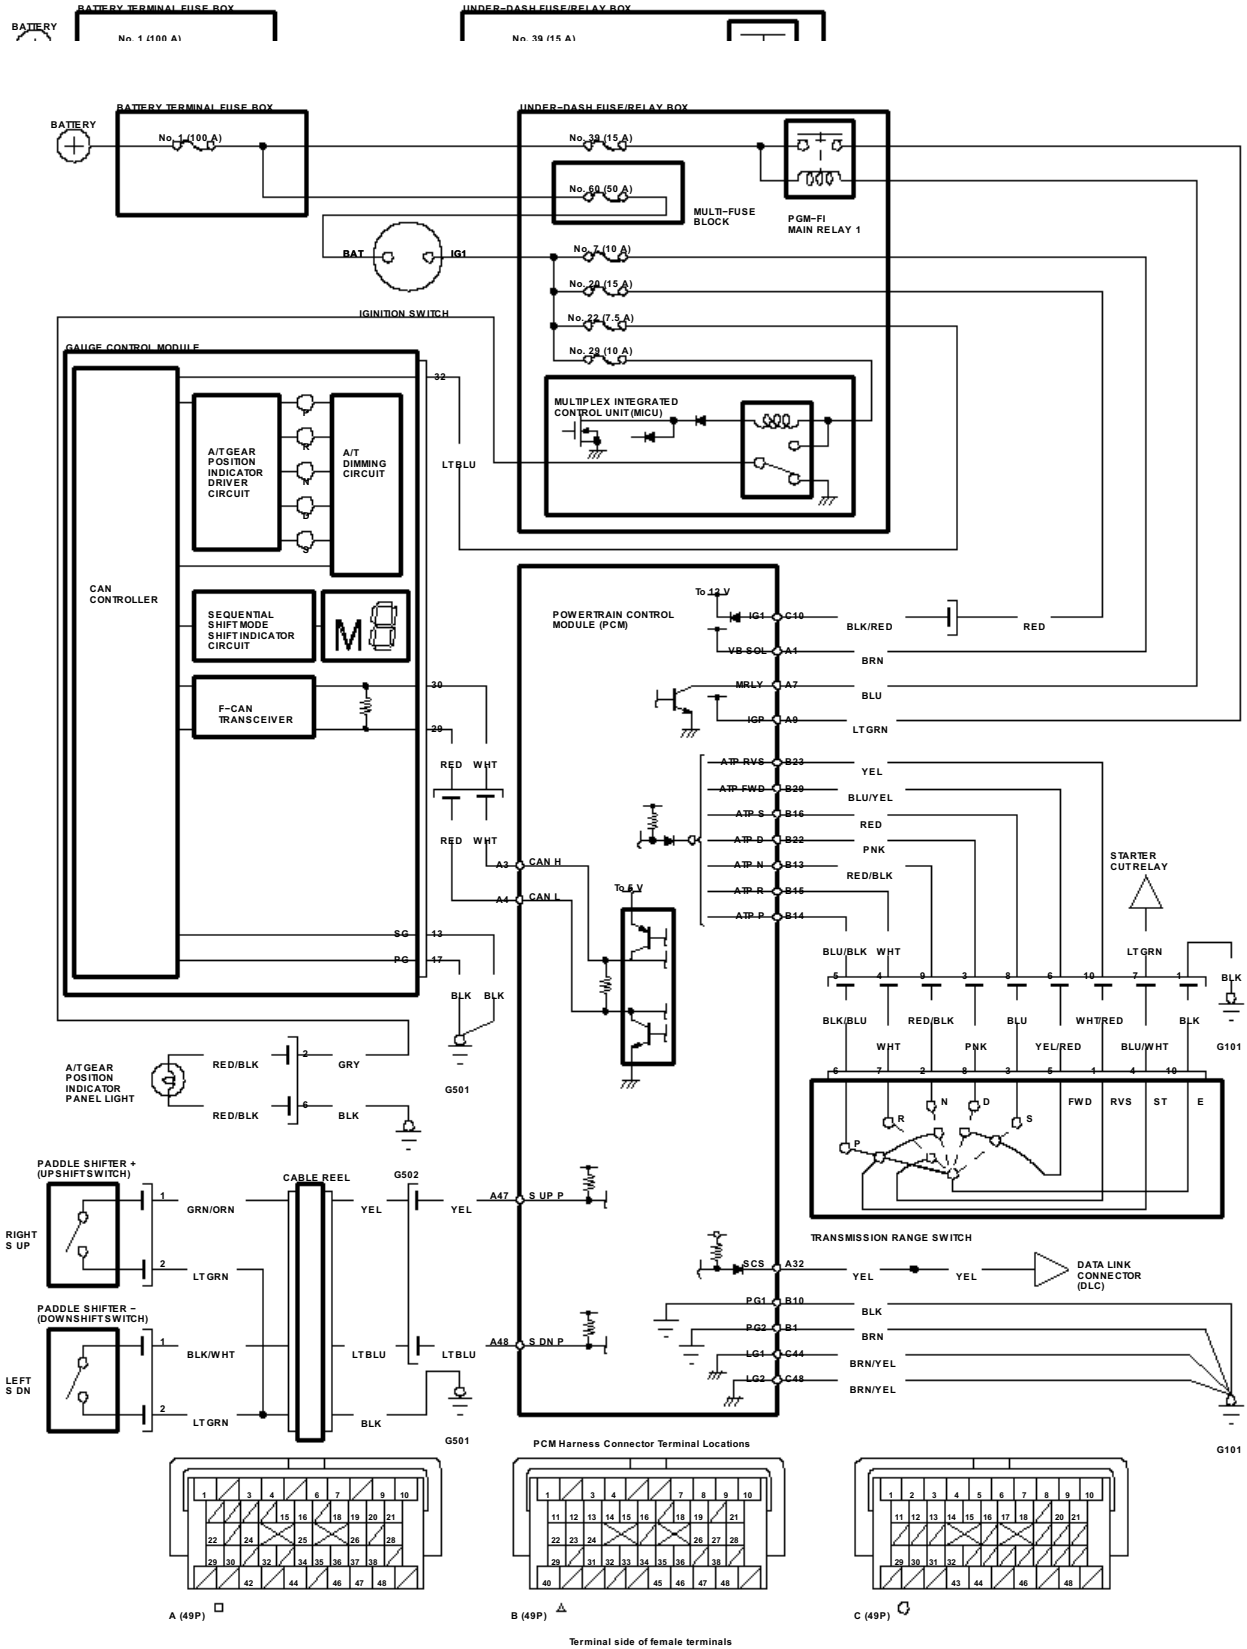
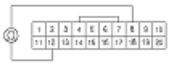
A/T Gear Position Indicator Circuit Diagram

Seven-position Transmission



Paddle Shifter - (Downshift Switch) Circuit Troubleshooting

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



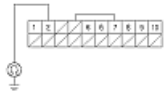
1. Remove the steering wheel.
2. Check for continuity between steering switch harness 20P connector terminals No. 8 and No. 12 while pressing the paddle shifter − (downshift switch) and when the paddle shifter − is released.

   Is there continuity while pressing the paddle shifter − and no continuity when the paddle shifter − is released?
   YES - Go to Step 5 .
   NO - Go to Step 3 .
3. Disconnect the paddle shifter − (downshift switch) connector.

---

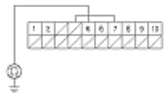
4. Check for continuity between paddle shifter − (downshift switch) connector terminals while pressing the paddle shifter − and when the paddle shifter − is released.

   Is there continuity while pressing the paddle shifter − and no continuity when the paddle shifter − is released?
   YES - Replace the steering switch harness.■
   NO - Replace the paddle shifter −. ■
5. Remove the cable reel.



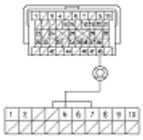
6. Check for continuity between cable reel 20P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 7 .
   NO - Repair open in the wire between cable reel 20P connector terminal No. 2 and ground (G501), or repair poor ground (G501).■
7. Jump the SCS line with the HDS.
8. Disconnect PCM connector A (49P).



9. Check for continuity between cable reel 20P connector terminal No. 5 and body ground.

   Is there continuity?
   YES - Repair short in the wire between cable reel 20P connector terminal No. 5 and PCM connector terminal A48.■
   NO - Go to Step 10 .

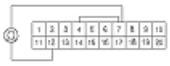


10. Check for continuity between PCM connector terminal A48 and cable reel 20P connector terminal No. 5.

    Is there continuity?
    YES - Replace the cable reel. ■
    NO - Repair open in the wire between PCM connector terminal A48 and the cable reel 20P connector.■

Paddle Shifter + (Upshift Switch) Circuit Troubleshooting

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



1. Remove the steering wheel.
2. Check for continuity between steering switch harness 20P connector terminals No. 7 and No. 12 while pressing the paddle shifter + (upshift switch) and when the paddle shifter + is released.

   Is there continuity while pressing the paddle shifter + and no continuity when the paddle shifter + is released?
   YES - Go to Step 5 .
   NO - Go to Step 3 .
3. Disconnect the paddle shifter + (upshift switch) connector.

---

4. Check for continuity between paddle shifter + (upshift switch) connector terminals while pressing the paddle shifter + and when the paddle shifter + is released.

   Is there continuity while pressing the paddle shifter + and no continuity when the paddle shifter + is released?
   YES - Replace the steering switch harness.■
   NO - Replace the paddle shifter +. ■
5. Remove the cable reel.

---

6. Check for continuity between cable reel 20P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 7 .
   NO - Repair open in the wire between cable reel 20P connector terminal No. 2 and ground (G501), or repair poor ground (G501).■
7. Jump the SCS line with the HDS.
8. Disconnect PCM connector A (49P).

---

9. Check for continuity between cable reel 20P connector terminal No. 6 and body ground.

   Is there continuity?
   YES - Repair short in the wire between cable reel 20P connector terminal No. 6 and PCM connector terminal A47.■
   NO - Go to Step 10 .

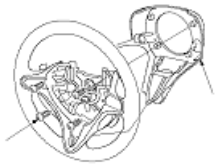
---

10. Check for continuity between PCM connector terminal A47 and cable reel 20P connector terminal No. 6.

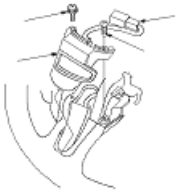
    Is there continuity?
    YES - Replace the cable reel. ■
    NO - Repair open in the wire between PCM connector terminal A47 and the cable reel 20P connector.■

Paddle Shifter - (Downshift Switch) Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



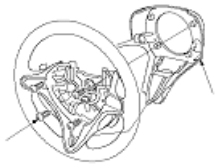
1. Remove the steering wheel.
2. Remove the four screws (A) securing the steering wheel rear cover (B), then remove the steering wheel rear cover.



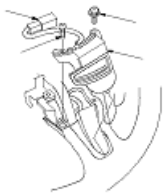
3. Remove the paddle shifter − (downshift switch) connector (A) from its holder, and disconnect the connector.
4. Remove the screws (B) securing the paddle shifter − (C), remove the paddle shifter −, and replace it with a new one.
5. Install the new paddle shifter − on the steering wheel, and secure it with the screws.
6. Connect the paddle shifter − connector securely, and install the connector in the connector holder.
7. Install the steering wheel rear cover, and secure the rear cover with the four screws.
8. Install the steering wheel.

Paddle Shifter + (Upshift Switch) Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



1. Remove the steering wheel.
2. Remove the four screws (A) securing the steering wheel rear cover (B), then remove the steering wheel rear cover.



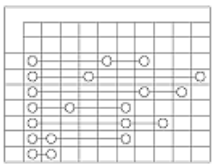
3. Remove the paddle shifter + (upshift switch) connector (A) from its holder, and disconnect the connector.
4. Remove the screws (B) securing the paddle shifter + (C), remove the paddle shifter +, and replace it with a new one.
5. Install the new paddle shifter + on the steering wheel, and secure it with the screws.
6. Connect the paddle shifter + connector securely, and install the connector in the connector holder.
7. Install the steering wheel rear cover, and secure the rear cover with the four screws.
8. Install the steering wheel.

Transmission Range Switch Test

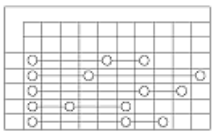
1. Remove the air cleaner assembly.
2. Disconnect the transmission range switch harness connector (A).

3. Check for continuity between terminals at the harness connector. There should be continuity between the terminals in the following table for each switch position.
4. Transmission range switch test has finished if the test results are OK.
   If there is no continuity between any terminals, go to Step 5 .
5. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.

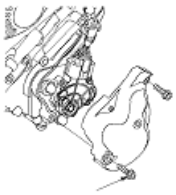
Transmission Range Switch Harness Connector Seven-position Transmission



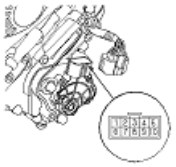
Transmission Range Switch Harness Connector Five-position Transmission



6. Remove the transmission range switch cover.

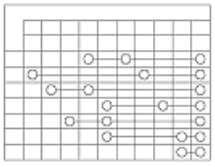


7. Disconnect the transmission range switch connector.

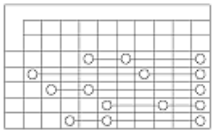


8. Check for continuity between terminals at the switch connector. There should be continuity between the terminals in the following table for each switch position.

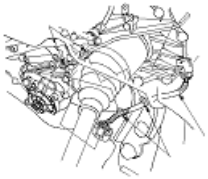
Transmission Range Switch Connector Seven-position Transmission



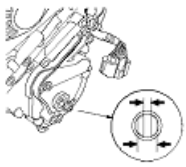
Transmission Range Switch Connector Five-position Transmission



9. If the transmission range switch continuity check is OK, replace the faulty transmission range switch harness; remove the harness clamps (A) from the clamp bracket (B), remove the transmission range switch harness (C).



10. If there is no continuity between any terminals, remove the transmission range switch, and check the end of the selector control shaft (A).
    Selector Control Shaft Specifications:
    Width (B): 6.1−6.2 mm (0.240−0.244 in.)
    End Gap (C): 1.8−2.0 mm (0.07−0.08 in.)

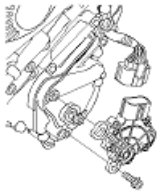


11. The measurement of the selector control shaft end is within the standard, replace the transmission range switch. If the measurement is out of the standard, repair the selector control shaft end, and recheck the transmission range switch continuity.

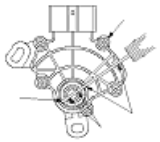
Transmission Range Switch Replacement

1. Raise the vehicle on a lift, or apply the parking brake, block the rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Shift to N.
3. Remove the transmission range switch cover.

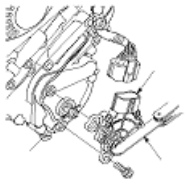
4. Remove the transmission range switch.
5. Make sure the shift position is in N. If necessary, put the shift lever into N.
   NOTE: Do not use the selector control shaft to adjust the shift position. If the control shaft tips are squeezed together it will cause a faulty signal or position due to play between the selector control shaft and switch.



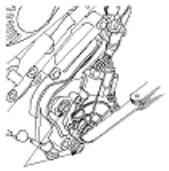
6. Align the cutouts (A) on the rotary-frame with the neutral positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.08 in.) feeler gauge blade (D) in the cutouts to hold the switch in the N position.
   NOTE: Be sure to use a 2.0 mm (0.08 in.) blade or equivalent to hold the switch in the N position.



7. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.08 in.) blade (C).



8. Tighten the bolts on the transmission range switch while you continue to hold the N position. Do not move the transmission range switch when tightening the bolts. Remove the feeler gauge.
9. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connector securely.
10. Turn the ignition switch to ON (II). Move the shift lever through all positions, and check the transmission range switch synchronization with the A/T gear position indicator.
11. Check that the engine starts in P and N, and does not start in any other shift lever position.
12. Check that the back-up lights come on when the shift lever is in R.
13. Allow the front wheels to rotate freely, then start the engine, and check the shift lever operation.



14. Install the transmission range switch cover.

A/T Pressure Test

Special Tools Required

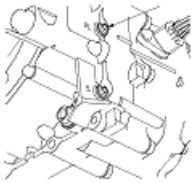
A/T oil pressure gauge set
07406-0020005

1. Make sure the transmission fluid is filled to the proper level.
2. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
3. Allow the front wheels to rotate freely.
4. Remove the splash shield.
5. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.

---

6. Connect the oil pressure gauge to the line pressure inspection port (A). Do not allow dust or other foreign particles to enter the hole while connecting the gauge.

7. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
8. Measure the line pressure at the line pressure inspection port in P or N while holding the engine speed at 2,000 rpm (min $^{-1}$).
   NOTE: Higher pressure may be indicated if measurements are made in the shift lever position other than P or N.

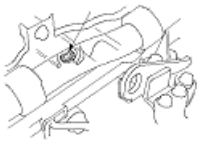


Pressure	Fluid Pressure	
	Standard	Service Limit
Line (A)	900–960 kPa (9.2–9.8 kgf/cm ^{2} , 130–140 psi)	850 kPa (8.7 kgf/cm ^{2} , 120 psi)

9. Turn the engine off, then disconnect the oil pressure gauge from the line pressure inspection port.
10. Install the sealing bolt to the line pressure inspection port with a new sealing washer, and tighten the bolt to 18 N·m (1.8 kgf·m, 13 lbf·ft). Do not reuse the old sealing washer.
11. Remove the air cleaner assembly.

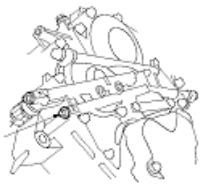
---

12. Connect the oil pressure gauge to the 1st clutch pressure inspection port (B), then temporarily install the air cleaner assembly.



---

13. Connect the oil pressure gauge to the 2nd clutch pressure inspection port (C).



14. For seven-position transmission: Measure the 1st and 2nd clutch pressure.
    -1. Start the engine, and shift to 1.
    -2. Measure the 1st clutch pressure at the 1st clutch pressure inspection port while holding the engine speed at 2,000 rpm (min $^{-1}$).
    -3. Shift to 2, and measure the 2nd clutch pressure at the 2nd clutch pressure inspection port while holding the engine speed at 2,000 rpm (min $^{-1}$).
15. For five-position transmission: Measure the 1st and 2nd clutch pressure.
    -1. Start the engine, and shift to S.
    -2. Pull the paddle shifter + (upshift switch), make sure the transmission is in 1st gear, and measure the 1st clutch pressure at the 1st clutch pressure inspection port while holding the engine speed at 2,000 rpm (min $^{-1}$).
    -3. Upshift to 2nd gear by pulling the paddle shifter +, and measure the 2nd clutch pressure at the 2nd clutch pressure inspection port while holding the engine speed at 2,000 rpm (min $^{-1}$).

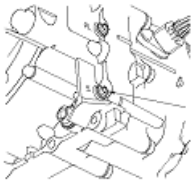
Pressure	Fluid Pressure	
	Standard	Service Limit
1st clutch (B) 2nd clutch (C)	890–970 kPa (9.1–9.9 kgf/cm ^{2} , 130–140 psi)	840 kPa (8.6 kgf/cm ^{2} , 120 psi)

16. Turn the engine off, remove the air cleaner assembly, then disconnect the oil pressure gauges from the 1st clutch pressure and 2nd clutch pressure inspection ports.
17. Install the sealing bolts to the 1st clutch pressure and 2nd clutch pressure inspection ports with the new sealing washers, and tighten the bolts to 18 N·m (1.8 kgf·m, 13 lbf·ft). Do not reuse old sealing washer.
18. Install the air cleaner assembly.

---

19. Connect the oil pressure gauge to the 3rd clutch pressure inspection port (D) and the 4th clutch pressure inspection port (E).

20. Connect the oil pressure gauge to the 5th clutch pressure inspection port (F).



21. For seven-position transmission: Measure the 3rd, 4th, and 5th clutch pressures.
    -1. Start the engine, and shift to D3, then press the accelerator pedal slowly until reaching 3rd gear.
    -2. Measure the 3rd clutch pressure at the 3rd clutch pressure inspection port while holding the engine speed at 2,000 rpm (min^{-1}).
    -3. Shift to D, and measure the 4th clutch pressure at the 4th clutch pressure inspection port.
    -4. Measure the 5th clutch pressure at the 5th clutch pressure inspection port while holding the engine speed at 2,000 rpm (min^{-1}).

22. For five-position transmission: Measure the 3rd, 4th, and 5th clutch pressures.
    -1. Start the engine, and shift to S.
    -2. Upshift to 3rd gear by pulling the paddle shifter +, and measure the 3rd clutch pressure at the 3rd clutch pressure inspection port while holding the engine speed at 2,000 rpm (min^{-1}).
    -3. Upshift to 4th gear by pulling the paddle shifter +, and measure the 4th clutch pressure at the 4th clutch pressure inspection port while holding the engine speed at 2,000 rpm (min^{-1}).
    -4. Upshift to 5th gear by pulling the paddle shifter +, and measure the 5th clutch pressure at the 5th clutch pressure inspection port while holding the engine speed at 2,000 rpm (min^{-1}).

Pressure	Fluid Pressure	
	Standard	Service Limit
3rd clutch (D) 4th clutch (E) 5th clutch (F)	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

23. Bring the engine back to an idle, then press the brake pedal to stop the wheels from rotating.

24. Shift to R, then release the brake pedal. Raise the engine speed to 2,000 rpm (min^{-1}), and measure the 5th clutch pressure at the 5th clutch pressure inspection port.

Pressure	Fluid Pressure	
	Standard	Service Limit
5th clutch (F) in R	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

25. Turn the engine off, then disconnect the oil pressure gauges from the 3rd, 4th, and 5th clutch pressure inspection ports.

26. Install the sealing bolts in the 3rd, 4th, and 5th clutch pressure inspection ports with the new sealing washers, and tighten the bolts to 18 N·m (1.8 kgf·m, 13 lbf·ft). Do not reuse the old sealing washer.

27. If any of the pressures are out of the service limit, refer to the problems and probable causes listed in the table.

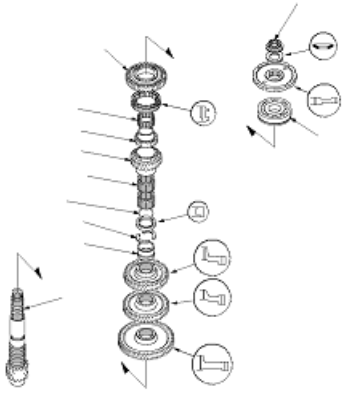
Problem	Probable causes
No or low line pressure	• Torque converter • ATF pump • Regulator valve • Torque converter check valve • Clogged ATF strainer
No or low 1st clutch pressure	• 1st clutch • O-rings
No or low 2nd clutch pressure	• 2nd clutch • O-rings
No or low 3rd clutch pressure	• 3rd clutch • O-rings
No or low 4th clutch pressure	• 4th clutch • O-rings
No or low 5th clutch pressure	• 5th clutch • O-rings
No or low 5th clutch pressure in R	• Servo valve • 5th clutch • O-rings

28. Install the splash shield.

29. Retrieve an ABS DTC with the HDS. If there is an ABS DTC, clear the DTC with the HDS.
    NOTE: When rotating the front wheels off the ground by the engine, it may cause an ABS system problem.

A/T Countershaft Disassembly, Inspection, and Reassembly

1. Inspect the thrust needle bearing and the needle bearing for galling and rough movement.
2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Lubricate all parts with ATF during assembly.
5. Install the conical spring washer, the park gear, the reverse selector, the 33 x 45 x 7.8 mm collar, and the gears in the direction shown.
6. Replace the locknut and the conical spring washer with new ones when assembling the transmission. The countershaft locknut has left-hand threads.
7. Some reverse selector hubs are press-fitted to the countershaft; remove the hubs with a press, and install them with the special tool and a press.



Torque Converter Housing Countershaft Bearing and Oil Seal Replacement

Special Tools Required

Adjustable bearing remover set
07JAC-PH80000

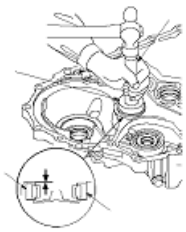
Driver handle 15 x 135L
07749-0010000

Oil seal driver attachment, 58 mm
07JAD-PH80101

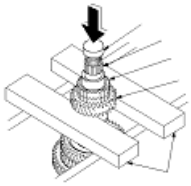
1. Remove the countershaft bearing with the special tool.

---

2. Install the ATF guide plate (A).
3. Install the new countershaft bearing (B) in the housing with the special tools; install the bearing outer race surface in height (C) of 0−0.03 mm (0−0.001 in.) above the housing surface (D). Do not install the bearing exceeding 0.03 mm (0.001 in.) high from housing surface.



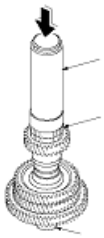
A/T Countershaft Reverse Selector Hub Removal



1. Remove the reverse selector hub from the countershaft by hand. If the reverse selector hub (A) cannot be removed by hand, it is press-fitted to the countershaft (B), and removed from the countershaft with a press. Place the 4th-5th gear (C) on press bases (D), and place a shaft protector (E) between the countershaft and press to prevent damaging the countershaft.
   NOTE: Some reverse selector hubs are not press-fitted, and can be removed without using a press.
2. Press the countershaft out of the press-fitted reverse selector hub, and remove the countershaft while holding the underside the countershaft. The countershaft falls down when pressing the countershaft out of the press-fitted reverse selector hub.
3. Remove the remaining parts from the countershaft, if necessary.

A/T Countershaft Reverse Selector Hub Installation

Special Tools Required



Driver, 40 mm I.D.
07746-0030100

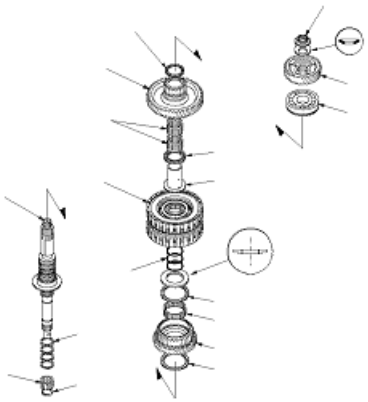
1. Install the 1st gear, the 2nd gear, the 3rd gear, the 33.2 x 40 x 26 mm collar, the 29 mm cotters, and the 33 x 45 x 7.8 mm collar on the countershaft, and secure them with the snap ring.
2. Install the needle bearings and the 4th-5th gear.
3. Slide the reverse selector hub (A) over the countershaft (B), then press it in place using the driver (40 mm I.D.) and a press.
   NOTE: Some reverse selector hubs are not press-fitted, and can be installed without using the a press.

A/T System Description - Power Flow

Power Flow
Power Flow (cont'd)
Power Flow (cont'd)
Power Flow (cont'd)

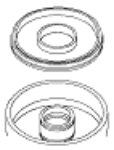
A/T Mainshaft Disassembly, Inspection, and Reassembly

1. Inspect the thrust needle bearing and the needle bearing for galling and rough movement.
2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Before installing the O-rings, wrap the shaft splines with tape to prevent O-ring damage.
5. Lubricate all parts with ATF during assembly.
6. Install the conical spring washer, the 40 x 63 mm thrust washer in the direction shown.
7. Replace the locknut and the conical spring washer with new ones when assembling the transmission.
8. Check the axial clearance of the 3rd gear.



A/T Clutch Clearance Inspection

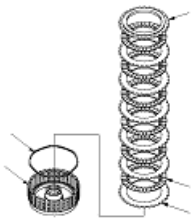
Special Tools Required



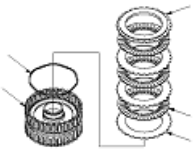
Clutch compressor attachment
07ZAE-PRP0100

1. Inspect the clutch piston, the discs, the plates, and the end-plate for wear and damage, and inspect the clutch wave-plate phase difference, if necessary.
2. Install the clutch piston in the clutch drum. Do not install the O-rings on the clutch piston during inspection.

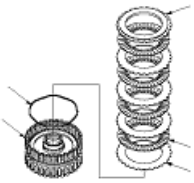
3. Install the wave spring (A) in the 1st clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (6) and discs (D) (6). Install the clutch end-plate (E) with the flat side down on the top disc.



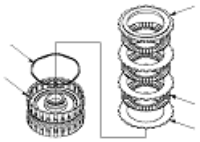
4. Install the wave spring (A) in the 2nd clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.



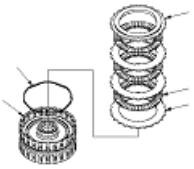
5. Install the wave spring (A) in the 4th clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.



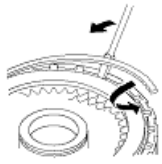
6. Install the wave spring (A) in the 3rd clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.



7. Install the wave spring (A) in the 5th clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

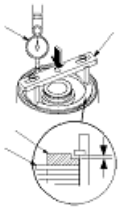


8. Install the snap ring with a screwdriver to secure the clutch end-plate.



9. Set a dial indicator (A) on the clutch end-plate (B).
10. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C).

11. Release the clutch end-plate to lower it, then put the clutch compressor attachment on the end-plate (A).



12. For the 1st, 3rd, and 5th clutches:
    Press the clutch compressor attachment down with 150−160 N (15−16 kgf, 33−35 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

13. For 2nd and 4th clutches:
    Press the clutch compressor attachment down with 39 N (4 kgf, 9 lbf) (B) using a force gauge, and read the dial indicator (C). The dial indicator reads the clearance (D) between the clutch end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.
    Clearance between Clutch End-Plate and Top Disc
    Service Limit

1st clutch:	**1.62−1.82 mm (0.064−0.072 in.)**
2nd clutch:	**0.5−0.7 mm (0.020−0.028 in.)**
3rd clutch:	**0.73−0.93 mm (0.029−0.037 in.)**
4th clutch:	**0.7−0.9 mm (0.028−0.035 in.)**
5th clutch:	**0.73−0.93 mm (0.029−0.037 in.)**

14. If the clearance of the 1st, 3rd, or 5th clutch is out of the service limit, select a new clutch end-plate from the following table.

1ST CLUTCH END-PLATES

Mark	Part Number	Thickness
1	22551-RPC-003	2.1 mm (0.083 in.)
2	22552-RPC-003	2.2 mm (0.087 in.)
3	22553-RPC-003	2.3 mm (0.091 in.)
4	22554-RPC-003	2.4 mm (0.094 in.)
5	22555-RPC-003	2.5 mm (0.098 in.)
6	22556-RPC-003	2.6 mm (0.102 in.)
7	22557-RPC-003	2.7 mm (0.106 in.)
8	22558-RPC-003	2.8 mm (0.110 in.)
9	22559-RPC-003	2.9 mm (0.114 in.)

3RD and 5TH CLUTCH END-PLATES

Mark	Part Number	Thickness
1	22561-RPC-003	2.1 mm (0.083 in.)
2	22562-RPC-003	2.2 mm (0.087 in.)
3	22563-RPC-003	2.3 mm (0.091 in.)
4	22564-RPC-003	2.4 mm (0.094 in.)
5	22565-RPC-003	2.5 mm (0.098 in.)
6	22566-RPC-003	2.6 mm (0.102 in.)
7	22567-RPC-003	2.7 mm (0.106 in.)
8	22568-RPC-003	2.8 mm (0.110 in.)
9	22569-RPC-003	2.9 mm (0.114 in.)

15. If the clearance of the 2nd or 4th clutch is out of the service limit, remove the clutch end-plate and check the clutch end-plate mark. Select a new clutch end-plate from the following tables by the mark on the old clutch end-plate. Use the AC-AL Plates table when the old clutch end-plate is marked with between AC and AL. Use the AM-AV Plates table when the old clutch end-plate is marked with between AM and AV.

2ND and 4TH CLUTCH END-PLATES AC-AL Plates

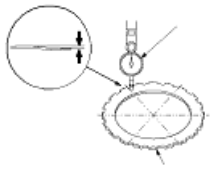
Mark	Part Number	Thickness
AC	22551-RPC-004	2.1 mm (0.083 in.)
AD	22552-RPC-004	2.2 mm (0.087 in.)
AE	22553-RPC-004	2.3 mm (0.091 in.)
AF	22554-RPC-004	2.4 mm (0.094 in.)
AG	22555-RPC-004	2.5 mm (0.098 in.)
AH	22556-RPC-004	2.6 mm (0.102 in.)
AJ	22557-RPC-004	2.7 mm (0.106 in.)
AK	22558-RPC-004	2.8 mm (0.110 in.)
AL	22559-RPC-004	2.9 mm (0.114 in.)

AM-AV Plates

Mark	Part Number	Thickness
AM	22561-RPC-004	2.1 mm (0.083 in.)
AN	22562-RPC-004	2.2 mm (0.087 in.)
AP	22563-RPC-004	2.3 mm (0.091 in.)
AQ	22564-RPC-004	2.4 mm (0.094 in.)
AR	22565-RPC-004	2.5 mm (0.098 in.)
AS	22566-RPC-004	2.6 mm (0.102 in.)
AT	22567-RPC-004	2.7 mm (0.106 in.)
AU	22568-RPC-004	2.8 mm (0.110 in.)
AV	22569-RPC-004	2.9 mm (0.114 in.)

16. Install the new clutch end-plate and recheck the clearance. If the thickest clutch end-plate is installed but the clearance is still over the service limit, replace the clutch discs and plates.

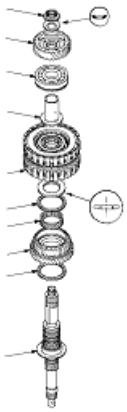
A/T Clutch Wave-plate Phase Difference Inspection



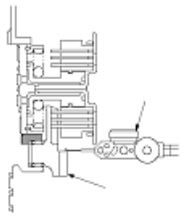
1. Place the clutch wave-plate (A) on a surface plate, and set a dial indicator (B) on the wave-plate.
2. Find the bottom (C) of a phase difference of the wave-plate, zero the dial indicator, and make a reference mark on the bottom of the wave-plate.
3. Rotate the 1st clutch wave-plate 5 or 6 tooth of angles apart from the bottom while holding the wave-plate by its circumference, and rotate the 3rd and 5th clutch wave-plate about 60-degrees apart from the bottom while holding the wave-plate by its circumference. The dial indicator should be at the top (D) of a phase difference. Do not rotate the wave-plate while holding its surface, always rotate it by holding its circumference.
4. Read the dial indicator. The dial indicator reads the phase difference (E) of the wave-plate between the bottom and top.
   Standard: 0.07−0.20 mm (0.003−0.008 in.)
5. Rotate the 1st clutch wave-plate 5 or 6 tooth of angles from the top, and rotate the 3rd and 5th clutch wave-plate about 60-degrees. The dial indicator should be at the bottom of a phase difference (F and G). Zero the dial indicator.
6. Measure the phase difference at the other two tops (H and I) of the wave-plate by following Step 3 thru 5.
7. If two of the three measurements are within the standard, the wave-plate is OK. If two of the three measurements are out of the standard, replace the wave-plate.

A/T Mainshaft 3rd Gear Axial Clearance Inspection

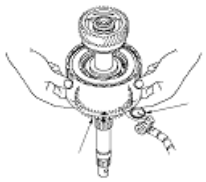
1. Remove the mainshaft transmission housing bearing.
2. Install the thrust needle bearing (A), the 3rd gear (B), the needle bearing (C), the thrust needle bearing (D), the 40 x 63 mm thrust washer (E), the 3rd/5th clutch (F), the 5th gear collar (G), and the transmission housing bearing (H) on the mainshaft (I). Do not install the O-rings during inspection.
3. Install the idler gear (J) on the mainshaft by a press, then install the conical spring washer (K) and the locknut (L).
4. Tighten the locknut to 29 N·m (3.0 kgf·m, 22 lbf·ft).



5. Set the dial indicator (A) on the 3rd gear (B).



6. Lift 3rd gear (A) up while holding the mainshaft, and use the dial indicator (B) to read the 3rd gear axial clearance.
7. Measure the 3rd gear axial clearance in at least three places while moving 3rd gear. Use the average as the actual clearance.
   Standard: **0.04–0.10 mm (0.002–0.004 in.)**



8. If the clearance is out of standard, remove the 40 x 63 mm thrust washer and measure its thickness (A).
9. Select and install a new thrust washer, then recheck.

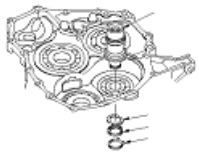
THRUST WASHER, 40 x 63 mm

No.	Part Number	Thickness
1	90414-RPC-000	3.750 mm (0.1476 in.)
2	90415-RPC-000	3.775 mm (0.1486 in.)
3	90416-RPC-000	3.800 mm (0.1496 in.)
4	90417-RPC-000	3.825 mm (0.1506 in.)
5	90418-RPC-000	3.850 mm (0.1516 in.)
6	90419-RPC-000	3.875 mm (0.1526 in.)
7	90420-RPC-000	3.900 mm (0.1535 in.)
8	90421-RPC-000	3.925 mm (0.1545 in.)
9	90422-RPC-000	3.950 mm (0.1555 in.)
10	90423-RPC-000	3.975 mm (0.1565 in.)
11	90424-RPC-000	4.000 mm (0.1575 in.)

10. After replacing the thrust washer, make sure the clearance is within standard.
11. Disassemble the installed parts from the mainshaft.
12. Reinstall the bearing in the transmission housing.

A/T Housing Bearing Removal

Special Tools Required



Driver attachment, 72 x 75 mm
07746-0010600

Driver attachment, 78 x 80 mm
07NAD-PX40100

Driver attachment, 62 x 68 mm
07746-0010500

Driver handle 15 x 135L
07749-0010000

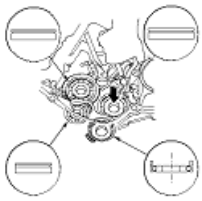
Snap ring pliers
07LGC-0010100

1. Remove the snap ring (A), cotter retainer (B), and cotters (C) from the idler gear shaft (D), then remove the idler gear shaft. Do not distort the snap ring.
   NOTE: If you are not removing the idler gear shaft bearing, idler gear shaft removal is not needed.

2. To remove the mainshaft bearing (A), countershaft bearing (B), secondary shaft bearing (C), and idler gear shaft bearing (D) from the transmission housing, expand each snap ring with the snap ring pliers, then push the bearing out.
   NOTE: Do not remove the snap ring unless it's necessary to clean the grooves in the housing.

A/T Housing Bearing Installation

Special Tools Required



Driver attachment, 72 x 75 mm
07746-0010600

Driver attachment, 78 x 80 mm
07NAD-PX40100

Driver attachment, 62 x 68 mm
07746-0010500

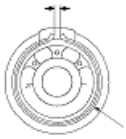
Driver handle 15 x 135L
07749-0010000

Snap ring pliers
07LGC-0010100

1. Install the mainshaft bearing (A), countershaft bearing (B), secondary shaft bearing (C), and idler gear shaft bearing (D) in the transmission housing in the direction shown.
2. Expand each snap ring with the snap ring pliers, and install the bearing part-way into the housing.
3. Release the pliers, then push the bearing down into the housing until the snap ring snaps in place around it.

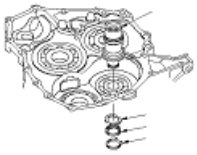
---

4. After installing the bearings verify that the snap rings (A) are seated in the bearing and housing grooves, and that the ring end gaps (B) are 0−7 mm (0−0.28 in.)



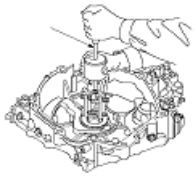
---

5. Install the idler gear shaft (A) in the idler gear shaft bearing.
6. Install the cotters (B) and cotter retainer (C), and secure the idler gear shaft with the snap ring (D).



Torque Converter Housing Mainshaft Bearing and Oil Seal Replacement

Special Tools Required



Adjustable bearing remover set
07JAC-PH80000

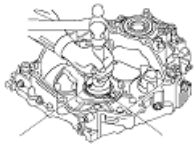
Driver handle 15 x 135L
07749-0010000

Driver attachment, 62 x 68 mm
07746-0010500

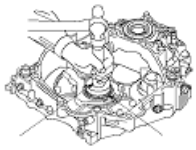
Driver attachment, 72 x 75 mm
07746-0010600

1. Remove the mainshaft bearing and oil seal with the special tool.

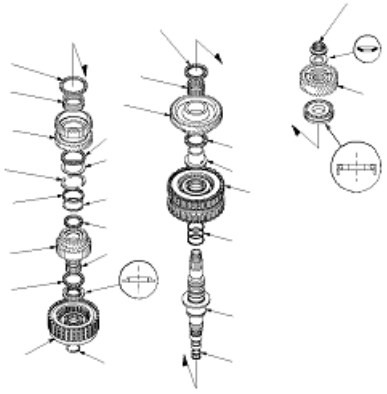
2. Install the new mainshaft bearing until it bottoms in the torque converter housing with the special tools.



3. Install the new oil seal flush with the housing with the special tools.



A/T Secondary Shaft Disassembly, Inspection, and Reassembly



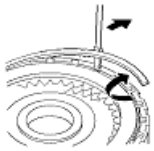
1. Inspect the thrust needle bearing and the needle bearing for galling and rough movement.
2. Inspect the splines for excessive wear and damage.
3. Check the shaft bearing surface for scoring and excessive wear.
4. Before installing the O-rings, wrap the shaft splines with tape to prevent O-ring damage.
5. Lubricate all parts with ATF during assembly.
6. Install the conical spring washer, idler gear, and 31 x 50 mm thrust washer in the direction shown.
7. Replace the locknut and conical spring washer with new ones when assembling the transmission. The locknut has left-hand threads.
8. Check the axial clearance of the 1st gear and 2nd gear.
9. Inspect the condition of the sealing rings. If the sealing rings are worn, distorted, or damaged, replace them.

A/T System Description - Clutches and Gears

Clutches and Gears
Clutches and Gears (cont'd)

A/T Clutch Disassembly

Special Tools Required



Clutch spring compressor set
07LAE-PX40000

Clutch spring compressor attachment
07LAE-PX40100

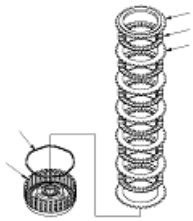
Clutch spring compressor attachment
07HAE-PL50100

Clutch spring compressor bolt assembly
07GAE-PG40200

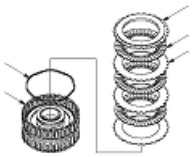
Snap ring pliers
07LGC-0010100

1. Remove the snap ring with a screwdriver.

2. Remove the clutch end-plate (A), the clutch discs (B) (6), the clutch wave-plates (C) (6), and the wave spring (D) from the 1st clutch drum (E).

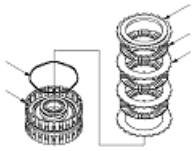


3. Remove the clutch end-plate (A), the clutch discs (B) (3), the clutch flat-plates (C) (3), and the wave spring (D) from the 2nd clutch drum (E).

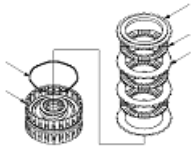


4. Remove the clutch end-plate (A), the clutch discs (B) (4), the clutch flat-plates (C) (4), and the wave spring (D) from the 4th clutch drum (E).

5. Remove the clutch end-plate (A), the clutch discs (B) (3), the clutch wave-plates (C) (3), and the wave spring (D) from the 3rd clutch drum (E).



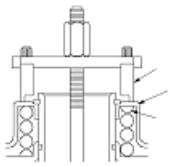
6. Remove the clutch end-plate (A), the clutch discs (B) (3), the clutch wave-plates (C) (3), and the wave spring (D) from the 5th clutch drum (E).



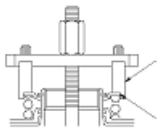
7. Install the clutch spring compressor attachments and the clutch spring compressor bolt assembly.

8. Set the clutch spring compressor attachment (A) on the 1st clutch spring retainer (B) so the clutch spring compressor attachment works on the clutch return spring (C).

9. If either end of the clutch spring compressor attachment is not set over the clutch return spring end, the spring retainer may be tilted and damaged. If the retainer is tilted when compressing the return spring, reset the clutch spring compressor attachment on the retainer at another angle.

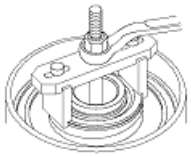


10. Be sure the clutch spring compressor attachment (A) is adjusted to have full contact with the spring retainer (B) on the 2nd, 3rd, 4th, and 5th clutches.

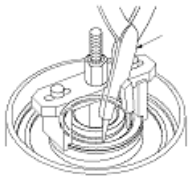


11. If either end of the clutch spring compressor attachment is set over an area of the spring retainer that is unsupported by the return spring, reset the clutch spring compressor attachment over the proper position.

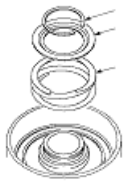
12. Compress the return spring until the snap ring can be removed.



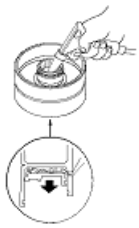
13. Remove the snap ring with snap ring pliers.
14. Remove the clutch spring compressor attachments and the clutch spring compressor bolt assembly.



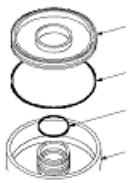
15. Remove the snap ring (A), the spring retainer (B), and the return spring (C).



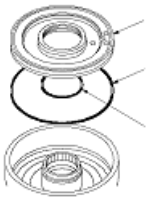
16. Wrap a shop rag around the clutch drum, and apply air pressure to the fluid passage to remove the piston. Place a finger tip on the other passage while applying air pressure.



17. Remove the clutch piston (A) from the clutch drum (B) of the 1st, 2nd, and 4th clutches. Remove the O-ring (C) from the clutch piston, and O-ring (D) from the drum.

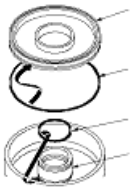


18. Remove the clutch piston (A) from the clutch drum of the 3rd and 5th clutches, and remove the outer O-ring (B) and inner O-ring (C) from the piston.



A/T 1st Clutch Reassembly

Special Tools Required



Clutch spring compressor set
07LAE-PX40000

Clutch spring compressor attachment
07LAE-PX40100

Clutch spring compressor attachment
07HAE-PL50100

Clutch spring compressor bolt assembly
07GAE-PG40200

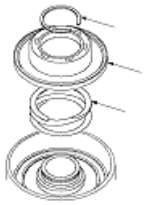
Snap ring pliers
07LGC-0010100

NOTE: Coat all parts with ATF during reassembly.

1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.
2. Install the new O-ring (A) on the clutch piston (B), and install the O-ring (C) on the clutch drum (D).

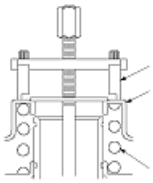
3. Coat the piston O-ring with ATF, and install the clutch piston (A) in the clutch drum (B) while applying pressure and rotating to ensure proper seating. Do not pinch the O-ring.

4. Install the return spring (A), and install the spring retainer (B) can be adjusted (center of tolerance) to prevent damaging the retainer oil seal.
5. Position the snap ring (C) on the spring retainer.

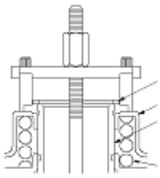


6. Install the clutch spring compressor attachments and the clutch spring compressor bolt assembly.

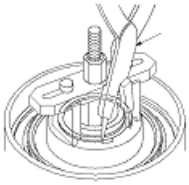
7. Set the clutch spring compressor attachment (A) on the spring retainer (B), and over the clutch return spring end, so the clutch spring compressor attachment works on the clutch return spring (C).
8. If either end of the clutch spring compressor attachment is not set over the clutch return spring end, reset the clutch spring compressor attachment over the return spring end.



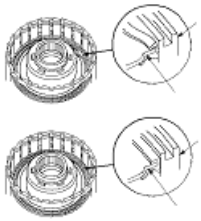
9. Coat between the mating areas of the spring retainer oil seal and the clutch piston with ATF. Compress the return spring (A) carefully until the snap ring (B) can be installed, and install the spring retainer (C) to ensure proper seating in the clutch piston, and over the clutch hub (D). Do not pinch the spring retainer oil seal.



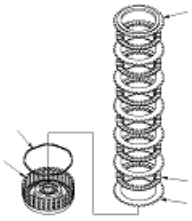
10. Install the snap ring with the snap ring pliers.
11. Remove the clutch spring compressor attachments and the clutch spring compressor bolt assembly.



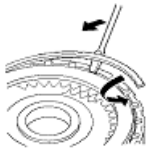
12. Check that the spring retainer oil seal (A) is properly seated in the clutch piston (B).
13. If improperly seated, remove the spring retainer, and check the oil seal. If the oil seal is worn, damaged, or peeling, replace the spring retainer, and reinstall the new retainer in the clutch piston.



14. Install the wave spring (A) in the 1st clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (6) and discs (D) (6). Install the clutch end-plate (E) with the flat side down on the top disc.



15. Install the snap ring with a screwdriver to secure the clutch end-plate.
16. Check that the clutch piston moves by applying air pressure into the fluid passage.



A/T Clutch Inspection

1. Inspect the clutch pistons and the clutch piston check valves (A).
2. If the clutch piston check valve is loose or damaged, replace the clutch piston.
3. Check the spring retainer for wear and damage.
4. If the spring retainer is worn or damaged, replace it.
5. Check the oil seal (A) on the 1st clutch spring retainer for wear, damage, and peeling.

6. If the oil seal is worn, damaged, or peeling, replace the spring retainer.
7. Inspect the clutch discs, the clutch plates, and the clutch end-plate for wear, damage, and discoloration.

Clutch Discs Standard Thickness

1st clutch:	**1.94 mm (0.076 in.)**
2nd clutch:	**1.96 mm (0.077 in.)**
3rd clutch:	**1.94 mm (0.076 in.)**
4th clutch:	**1.96 mm (0.077 in.)**
5th clutch:	**1.94 mm (0.076 in.)**

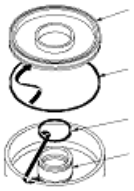
Clutch Plates Standard Thickness

1st clutch	**(wave-plates):**	**1.6 mm (0.063 in.)**
2nd clutch	**(flat-plates):**	**2.3 mm (0.091 in.)**
3rd clutch	**(wave-plates):**	**2.0 mm (0.079 in.)**
4th clutch	**(flat-plates):**	**1.6 mm (0.063 in.)**
5th clutch	**(wave-plate):**	**2.0 mm (0.079 in.)**

8. If the clutch discs are worn or damaged, replace them as a set. If the clutch discs are replaced, inspect the clearance between the clutch end-plate and the top disc.
9. If any flat-plate is worn, damaged, or discolored, replace them as a set. If the clutch flat-plates are replaced, inspect the clearance between the clutch end-plate and the top disc.
10. If any wave-plate is worn, damaged, or discolored, replace the damaged plate with a new plate, and inspect the other wave-plates for a phase difference. If the clutch wave-plate is replaced, inspect the clearance between the clutch end-plate and the top disc.
11. If the clutch end-plate is worn, damaged, or discolored, inspect the clearance between the clutch end-plate and the top disc, then replace the clutch end-plate.

A/T 2nd, 3rd, 4th, and 5th Clutch Reassembly

Special Tools Required



Clutch spring compressor set
07LAE-PX40000

Clutch spring compressor attachment
07LAE-PX40100

Clutch spring compressor attachment
07HAE-PL50100

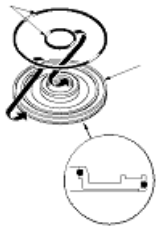
Clutch spring compressor bolt assembly
07GAE-PG40200

Snap ring pliers
07LGC-0010100

NOTE: Coat all parts with ATF during reassembly.

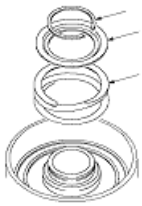
1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.
2. Install the new O-ring (A) on the clutch piston (B) of the 2nd, and 4th clutches, and install the O-ring (C) on each clutch drum (D).

3. Install the new O-rings (A) on the piston (B) of the 3rd and 5th clutches.



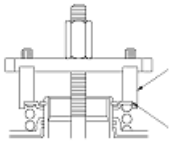
4. Install the clutch piston (A) in the clutch drum (B) while applying pressure and rotating to ensure proper seating. Do not pinch the O-ring.

5. Install the return spring (A) and the spring retainer (B), and position the snap ring (C) on the spring retainer.



6. Install the clutch spring compressor attachments and the clutch spring compressor bolt assembly.

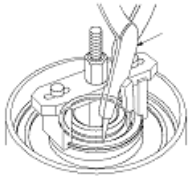
7. Be sure the clutch spring compressor attachment (A) is adjusted to have full contact with the spring retainer (B).



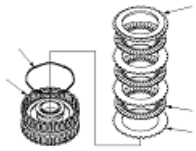
8. If either end of the clutch spring compressor attachment is set over an area of the spring retainer that is unsupported by the return spring, reset the clutch spring compressor attachment over the proper position.

9. Compress the return spring until the snap ring can be installed.

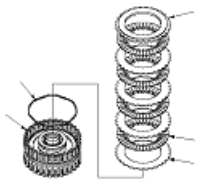
10. Install the snap ring with the snap ring pliers.
11. Remove the clutch spring compressor attachments and the clutch spring compressor bolt assembly.



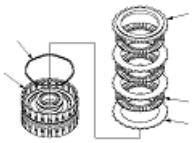
12. Install the wave spring (A) in the 2nd clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.



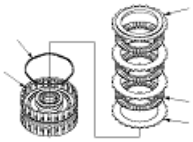
13. Install the wave spring (A) in the 4th clutch drum (B). Starting with the clutch flat-plate, alternately install the flat-plates (C) (4) and the discs (D) (4). Install the clutch end-plate (E) with the flat side down on the top disc.



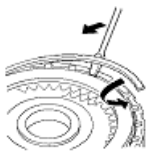
14. Install the wave spring (A) in the 3rd clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.



15. Install the wave spring (A) in the 5th clutch drum (B). Starting with the clutch wave-plate, alternately install the wave-plates (C) (3) and the discs (D) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

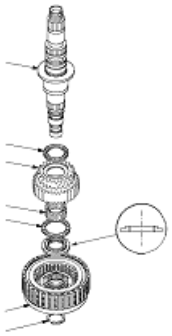


16. Install the snap ring with a screwdriver to secure the clutch end-plate.
17. Check that the clutch piston moves by applying air pressure into the fluid passage.

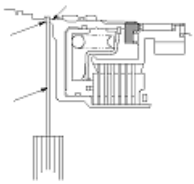


A/T Secondary Shaft 1st Gear Axial Clearance Inspection

1. Install the thrust needle bearing (A), 1st gear (B), needle bearing (C), thrust needle bearing (D), 31 x 50 mm thrust washer (E), and 1st clutch (F) on the secondary shaft (G), then secure them with the snap ring (H).



2. Measure the clearance between the snap ring (A) and the 1st clutch guide (B) with a feeler gauge (C), in at least three places. Use the average as the actual clearance.
   Standard: 0.04−0.12 mm (0.002−0.005 in.)



3. If the clearance is out of standard, remove the 31 x 50 mm thrust washer and measure its thickness (A).
4. Select and install a new thrust washer, then recheck.

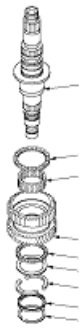
THRUST WASHER, 31 x 50 mm

No.	Part Number	Thickness
1	90521-RG5-000	3.925 mm (0.1545 in.)
2	90522-RG5-000	3.950 mm (0.1555 in.)
3	90523-RG5-000	3.975 mm (0.1565 in.)
4	90524-RG5-000	4.000 mm (0.1575 in.)
5	90525-RG5-000	4.025 mm (0.1585 in.)
6	90526-RG5-000	4.050 mm (0.1594 in.)
7	90527-RG5-000	4.075 mm (0.1604 in.)
8	90528-RG5-000	4.100 mm (0.1614 in.)
9	90529-RG5-000	4.125 mm (0.1624 in.)
10	90530-RG5-000	4.150 mm (0.1634 in.)
11	90531-RG5-000	4.175 mm (0.1644 in.)
12	90532-RG5-000	4.200 mm (0.1654 in.)
13	90533-RG5-000	4.225 mm (0.1663 in.)
14	90534-RG5-000	4.250 mm (0.1673 in.)
15	90535-RG5-000	4.275 mm (0.1683 in.)
16	90536-RG5-000	4.300 mm (0.1693 in.)
17	90537-RG5-000	4.325 mm (0.1703 in.)

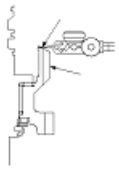
5. After replacing the thrust washer, make sure the clearance is within standard.
6. Disassemble the installed parts from the secondary shaft.

A/T Secondary Shaft 2nd Gear Axial Clearance Inspection

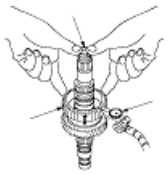
1. Install the thrust needle bearing (A), the needle bearing (B), the 2nd gear (C), the thrust needle bearing (D), the 43 x 54.5 mm thrust washer (E), the 39 mm cotters (F), and the cotter retainer (G) on the secondary shaft (H), then secure them with the snap ring (I).



2. Set the dial indicator (A) on the 2nd gear (B).



3. Lift the 2nd gear (A) up while holding the secondary shaft (B), and use the dial indicator (C) to read the 2nd gear axial clearance.
4. Measure the 2nd gear axial clearance in at least three places while moving the 2nd gear. Use the average as the actual clearance.
   Standard: 0.04−0.12 mm (0.002−0.005 in.)



5. If the clearance is out of standard, remove the 43 x 54.5 mm thrust washer and measure its thickness.
6. Select and install a new thrust washer, then recheck.

THRUST WASHER, 43 x 54.5 mm

No.	Part Number	Thickness
1	90502-RPC-000	2.900 mm (0.114 in.)
2	90503-RPC-000	2.925 mm (0.115 in.)
3	90504-RPC-000	2.950 mm (0.116 in.)
4	90505-RPC-000	2.975 mm (0.117 in.)
5	90506-RPC-000	3.000 mm (0.118 in.)
6	90507-RPC-000	3.025 mm (0.119 in.)
7	90508-RPC-000	3.050 mm (0.120 in.)
8	90509-RPC-000	3.075 mm (0.121 in.)
9	90510-RPC-000	3.100 mm (0.122 in.)
10	90511-RPC-000	3.125 mm (0.123 in.)
11	90512-RPC-000	3.150 mm (0.124 in.)

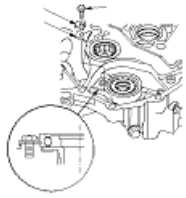
13	90514-RPC-000	3.200 mm (0.126 in.)

7. After replacing the thrust washer, make sure the clearance is within standard.
8. Disassemble the installed parts from the secondary shaft.

Torque Converter Housing Secondary Shaft Bearing Replacement

Special Tools Required

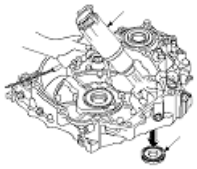


Driver handle 15 x 135L
07749-0010000

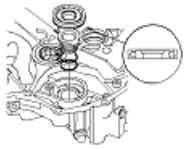
Driver attachment, 62 x 68 mm
07746-0010500

1. Remove the bolt, then remove the lock washer (A) and bearing set plate (B).

2. Remove the secondary shaft bearing (A) by heating the housing to about 100 °C (212 °F) with a heat gun (B). Do not heat the housing in excess 100 °C (212 °F).
   NOTE: Let the housing cool to normal temperature before installing the bearing.



3. Install the new O-rings (A) on the ATF guide collar (B), then install the ATF guide collar in the housing.
4. Install the new secondary shaft bearing (C) in the direction shown.



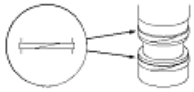
5. Drive the secondary shaft bearing with the special tools, and install it securely in the housing.
6. Check that the bearing groove aligns with the housing surface, then install the bearing set plate with aligning the bearing groove.
7. Install the new lock washer and bolt, then bend the lock tab of the lock washer against the bolt head.

A/T Secondary Shaft Sealing Ring Replacement

The sealing rings are synthetic resin with chamfered ends. Check the condition of the sealing rings, and replace them only if they are worn, distorted, or damaged.

1. For a better fit, squeeze sealing rings together slightly before installing them.

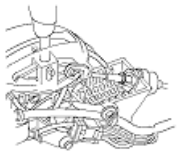
2. Apply ATF to the new sealing rings, then install them on the mainshaft.



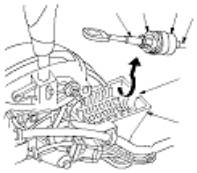
3. After installing the sealing rings, verify the following:
   - The rings are fully seated in the groove.
   - The rings are not twisted.
   - The chamfered ends of the rings are properly joined.

A/T Shift Cable Adjustment

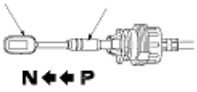
1. Remove the center console.
2. Shift the transmission to N.
3. Remove the nut securing the shift cable end.



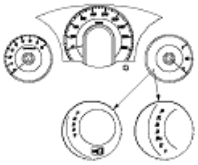
4. Rotate the socket holder (A) on the shift cable (B) a quarter turn; the corner (C) on the socket holder will be in the opening (D) of the shift lever bracket base (E). Then slide the holder to remove the shift cable from the bracket. Do not remove the shift cable by twisting the shift cable guide (F).



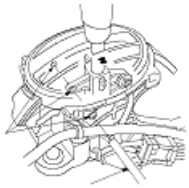
5. Push the shift cable (A) until it stops, then release it. Pull the shift cable back two steps so that the shift position is in N. Do not hold the shift cable guide (B) to adjust the shift cable.



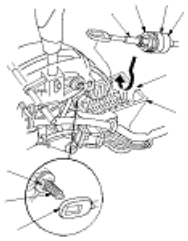
6. Turn the ignition switch to ON (II), and check that the N indicator comes on.
7. Turn the ignition switch to LOCK (0).



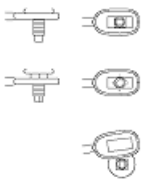
8. Insert a 6.0 mm (0.24 in.) pin (A) through the positioning holes (B) on the shift lever bracket base and into the positioning hole on the shift lever. Use only the 6.0 mm pin.
9. Check that the shift lever is secured in N.



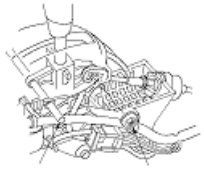
10. Rotate the socket holder (A) on the shift cable (B) to place the corner (C) on the holder opposite the opening (D) in the shift lever bracket base (E). Align the holder with the opening in the bracket, then slide the holder into the bracket. Install the shift cable end (F) over the mounting stud (G) by aligning its square hole with the square fitting (H) at the bottom of the stud. Rotate the holder a quarter turn until the holder stops to secure the shift cable. Do not install the shift cable by twisting the shift cable guide (I).



11. Check that the shift cable end is properly installed on the mounting stud.
12. If the cable end is out of position on the mounting stud, remove the shift cable from the bracket, and reinstall the shift cable. Do not install the shift cable end on the mounting stud while the shift cable in on the bracket. If the cable end rides on the bottom of the mounting stud, rotate the stud and align the square fitting with the hole.

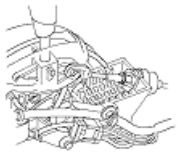


13. Secure the shift cable end with the nut (A).
14. Remove the 6.0 mm (0.24 in.) pin (B) that was installed to hold the shift lever.
15. Turn the ignition switch to ON (II). Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
16. Shift to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back into P.
17. Reinstall the center console.

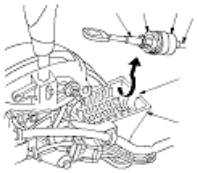


A/T Shift Lever Removal

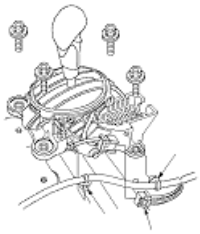
1. Remove the center console.
2. Shift the transmission to N.
3. Remove the nut securing the shift cable end.



4. Rotate the socket holder (A) on the shift cable (B) a quarter turn; the corner (C) on the socket holder will be in the opening (D) of the shift lever bracket base (E). Then slide the holder to remove the shift cable from the bracket. Do not remove the shift cable by twisting the shift cable guide (F).

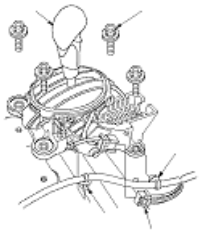


5. Disconnect the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector (A), and remove the harness clamps (B) from the shift lever bracket base.
6. Remove the mounting bolts, then remove the shift lever assembly.

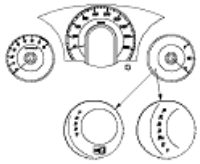


A/T Shift Lever Installation

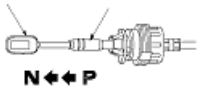
1. Install the shift lever assembly (A).
2. Connect the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector (B), and install the harness clamps (C) on the shift lever bracket base.



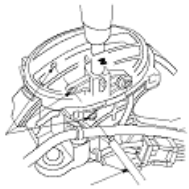
3. Turn the ignition switch to ON (II), and check that the N indicator comes on.



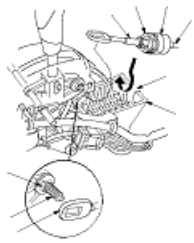
4. If necessary, push the shift cable (A) until it stops, then release it. Pull the shift cable back two steps so that the shift position is in N. Do not hold the shift cable guide (B) to adjust the shift cable.
5. Turn the ignition switch to LOCK (0).



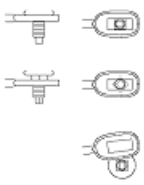
6. Insert a 6.0 mm (0.24 in.) pin (A) through the positioning holes (B) on the shift lever bracket base and into the positioning hole on the shift lever. Use only the 6.0 mm pin.
7. Check that the shift lever is secured in N.



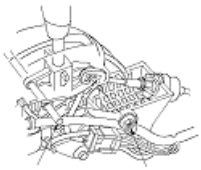
8. Rotate the socket holder (A) on the shift cable (B) to place the corner (C) on the holder opposite the opening (D) in the shift lever bracket base (E). Align the holder with the opening in the bracket, then slide the holder into the bracket. Install the shift cable end (F) over the mounting stud (G) by aligning its square hole with the square fitting (H) at the bottom of the stud. Rotate the holder a quarter turn until the holder stops to secure the shift cable. Do not install the shift cable by twisting the shift cable guide (I).



9. Check that the shift cable end is properly installed on the mounting stud.
10. If the cable end is out of position on the mounting stud, remove the shift cable from the bracket, and reinstall the shift cable. Do not install the shift cable end on the mounting stud while the shift cable in on the bracket. If the cable end rides on the bottom of the mounting stud, rotate the stud and align the square fitting with the hole.

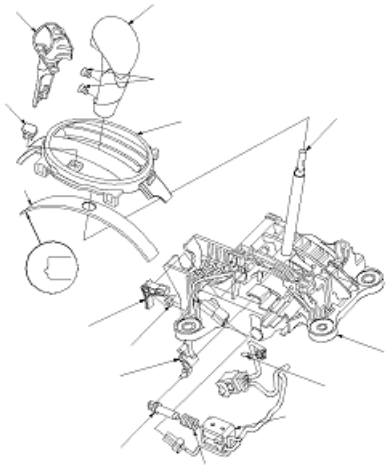


11. Secure the shift cable end with the nut (A).
12. Remove the 6.0 mm (0.24 in.) pin (B) that was installed to hold the shift lever.
13. Turn the ignition switch to ON (II). Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
14. Shift to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back into P.
15. Reinstall the center console.

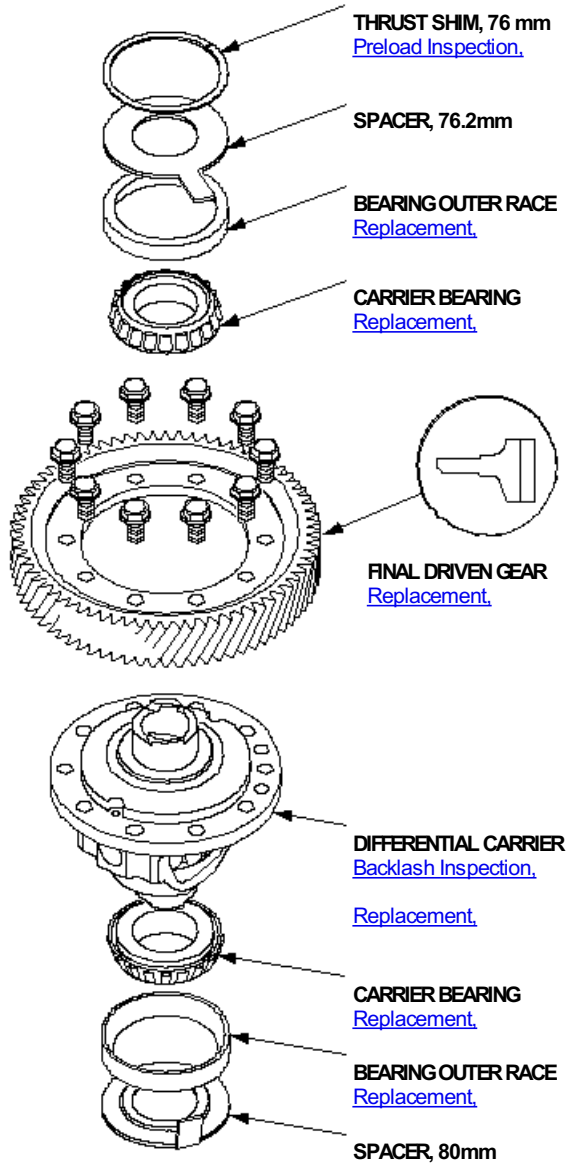


A/T Shift Lever Disassembly/Reassembly

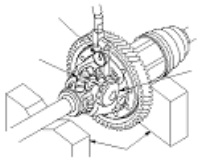
Apply silicone grease to movable joints of the shift lock mechanism, shift lever, and lock pin rod. Keep the connector terminals free of silicone grease.



A/T Differential Component Location Index



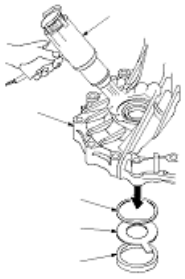
A/T Differential Backlash Inspection



1. Install the driveshaft and intermediate shaft into the differential assembly, and place the axles on V-blocks (A).
2. Measure the backlash of the pinion gears (B) with a dial indicator (C).
   Standard: 0.05−0.15 mm (0.002−0.006 in.)
3. If the backlash is out of standard, replace the differential carrier.

A/T Differential Carrier Bearing Outer Race Replacement

Special Tools Required



Driver handle 15 x 135L
07749-0010000

Driver attachment, 78 x 90 mm
07GAD-SD40101

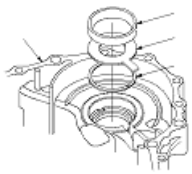
Driver attachment, 72 x 75 mm
07746-0010600

NOTE:

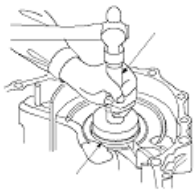
- Replace the bearing with a new one whenever the outer race is replaced.
- Do not use shim(s) on the toque converter housing side.
- Adjust the preload after replacing the bearing and the outer race.
- Coat all parts with ATF during installation.

1. Remove the bearing outer race (A), 76.2 mm spacer (B), and 76 mm thrust shim (C) from the transmission housing (D) by heating the housing to about 100 °C (212 °F) with a heat gun (E). Do not heat the housing more than 100 °C (212 °F).

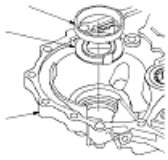
2. Install the 76 mm thrust shim (A), 76.2 mm spacer (B), and outer race (C) in the transmission housing (D).



3. Using the special tools, drive the outer race securely in the housing so there is no clearance between the outer race, spacer, shim, and housing.



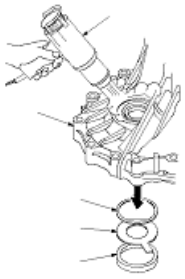
4. Remove the bearing outer race (A) and 80 mm spacer (B) from the torque converter housing (C).
5. Install the spacer and the new outer race in the torque converter housing.



6. Drive the bearing outer race securely in the housing with the special tools.

A/T Differential Carrier Bearing Preload Inspection

Special Tools Required



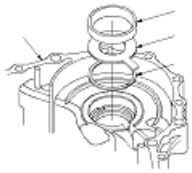
Driver handle 15 x 135L
07749-0010000

Driver attachment, 72 x 75 mm
07746-0010600

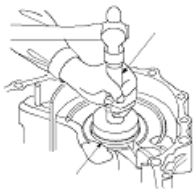
Diff preload inspection attachment
07HAJ-PK40201

NOTE: If the transmission housing, torque converter housing, differential carrier, tapered roller bearing, bearing outer race, or thrust shim were replaced, the bearing preload must be adjusted.

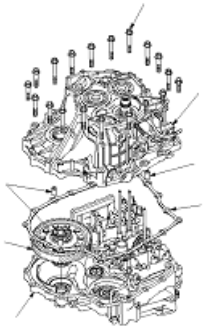
1. Remove the bearing outer race (A), 76.2 mm spacer (B), and 76 mm thrust shim (C) from the transmission housing (D) by heating the housing to about 100 °C (212 °F) with a heat gun (E). Do not heat the housing more than 100 °C (212 °F).
   NOTE: Let the transmission housing cool to room temperature before adjusting the bearing preload.
2. Replace the tapered roller bearing when the outer race is to be replaced.
3. Do not use a shim on the torque converter housing side.



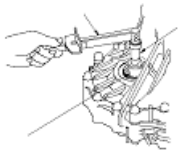
4. Install the 76 mm thrust shim (A) in the transmission housing (B). If you replace the 76 mm thrust shim with a new one, use the same thickness shim as the old one.
5. Install the 76.2 mm spacer (C) and the bearing outer race (D) in the transmission housing.



6. Drive the outer race securely in the housing with the special tools so there is no clearance between the outer race, spacer, shim, and housing.



7. Install the differential assembly (A) in the torque converter housing (B), and install the gasket (C) and the three dowel pins (D) on the housing.
8. Install the transmission housing (E), and install the transmission housing mounting bolts. Tighten the 19 bolts to 44 N·m (4.5 kgf·m, 33 lbf·ft) in at least two steps in a crisscross pattern.
9. Rotate the differential assembly in both directions to seat the bearings.



10. Measure the starting torque of the differential assembly with the special tool, a torque wrench (A), and a socket (B). Measure the staring torque at normal room temperature in both directions.
    Standard
    New Bearing:
    2.7−3.9 N·m (28−40 kgf·cm, 24−35 lbf·in.)
    Reused Bearing:
    2.5−3.6 N·m (25−37 kgf·cm, 22−32 lbf·in.)
11. If the starting torque is out of the standard, remove the thrust shim and measure its thickness.
12. Select a new thrust shim. To increase the starting torque, increase thickness of the thrust shim. To decrease the starting torque, decrease the thickness of the thrust shim.
    Changing the shim to the next size will increase or decrease the starting torque about 0.5−0.6 N·m (5−6 kgf·m, 5−5 lbf·in.)

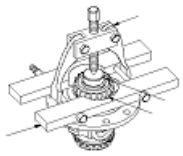
0C	41456-PAX-000	2.975 mm (0.1171 in.)
0D	41457-PAX-000	3.025 mm (0.1191 in.)

13. Install the new thrust shim, then recheck the staring torque.

A/T Differential Carrier Bearing Replacement

Special Tools Required



Bearing Separator
07KAF-PS30200

Attachment, 40
07LAD-PW50601

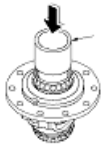
NOTE:

- The bearing and outer race should be replaced as a set.
- Inspect and adjust the carrier bearing preload whenever the bearing is replaced.
- Check the bearing for wear and rough rotation. If the bearing is OK, removal is not necessary.

1. Remove the final driven gear from the differential carrier when replacing the carrier bearing on the final driven gear side. When only replacing the carrier bearing on opposite side of the final driven gear, final driven gear removal is no needed.
2. Set a commercially available bearing separator (A) or the special tool (07KAF-PS30200) under the carrier bearing (B).
3. Place a collar (C) on the differential carrier, and set a commercially available bearing puller (D), then remove the carrier bearing.

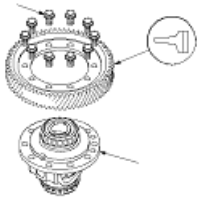
---

4. Install the new bearing with the special tool and a press. Press the bearing on securely until it bottoms so there is no clearance between the bearing and the differential carrier.
5. Install the final driven gear if the gear was removed.



A/T Differential Carrier, Final Driven Gear Replacement

1. Remove the final driven gear (A) from the differential carrier (B). The final driven gear bolts have left-hand threads.
2. Install the final driven gear on the differential carrier in the direction shown.
3. Tighten the bolts to 101 N·m (10.3 kgf·m, 74.5 lbf·ft) in a crisscross pattern in at least two steps.



A/T Differential Oil Seal Replacement

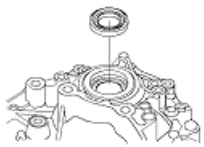
Special Tools Required

Driver handle 15 x 135L
07749-0010000

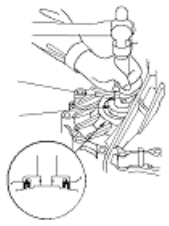
Oil seal driver attachment
07JAD-PH80101

1. Remove the oil seal from the transmission housing.

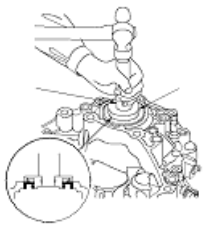
2. Remove the oil seal from the torque converter housing.



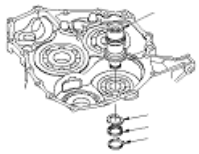
3. Install the new oil seal in the transmission housing in between 0.2 mm-deep and 0.5 mm-high from the housing surface with the special tools.



4. Install the new oil seal in the torque converter housing in between 0.2 mm-deep and 0.5 mm-high from the housing surface with the special tools.



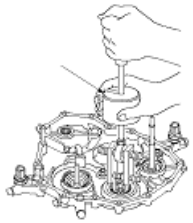
A/T Idler Gear Shaft Removal and Installation



1. Remove the snap ring (A), cotter retainer (B), and cotters (C) from the idler gear shaft (D), then remove the idler gear shaft. Do not distort the snap ring.
2. Check the snap ring and cotter retainer for wear and damage. Replace the snap ring and/or cotter retainer if the snap ring or cotter retainer is worn, distorted, or damaged.
3. Install the idler gear shaft in the idler gear shaft bearing.
4. Install the cotters and cotter retainer, and secure the idler gear shaft with the snap ring.

A/T End Cover Idler Gear Shaft Bearing Replacement

Special Tools Required



Adjustable bearing remover set
07JAC-PH80000

Driver handle 15 x 135L
07749-0010000

Driver attachment, 52 x 55 mm
07746-0010400

1. Remove the idler gear shaft bearing from the end cover with the special tool.

2. Install the new bearing in the end cover with the special tools.

A/T Interlock System - Key Interlock System Circuit Troubleshooting

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Turn the ignition switch to ACCESSORY (I). The shift lever must be in P.
2. Disconnect the steering lock assembly connector.
3. Check if the ignition switch can be turned to LOCK (0).

   Can the ignition switch be turned to LOCK (0)?
   YES - Go to Step 4 .
   NO - Replace the ignition key cylinder/steering lock assembly. ■
4. Turn the ignition switch to LOCK (0).
5. Move the shift lever out of P.
6. Check for continuity between steering lock assembly connector terminal No. 3 and body ground.

   Is there continuity?
   YES - Repair short in the wire between key interlock solenoid and the MICU.■
   NO - Go to Step 7 .
7. Connect the HDS to the DLC.
8. Check the Park Pin Switch signal with the HDS in the A/T data list while the shift lever is in P, and when the shift lever is shifted to any position other than P.

   Is the park pin switch signal OFF while the shift lever is in P, and ON when the shift lever is shifted out of P?
   YES - Go to Step 15 .
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Remove the center console.
11. Disconnect the park pin switch 2P connector, and remove it from the shift lever bracket base.

---

12. Check for continuity between park pin switch 2P connector terminal No. 1 and No. 2.

    Is there no continuity while the shift lever is in P, and continuity when the shift lever is shifted out of P?
    YES - Go to Step 13 .
    NO - Replace the park pin switch. ■

13. Disconnect the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector.

---

14. Check for continuity between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 4 and body ground.

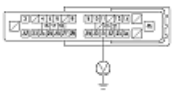
    Is there continuity?
    YES - Repair short in the wire between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 4 and the MICU.■
    NO - There is short in the wires between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector and the 2P connector. Replace the shift lock solenoid; the shift lock solenoid is combined with the park pin switch harness and the indicator panel light harness/socket, and supplied as an assembly.■

15. Turn the ignition switch to LOCK (0).
16. Disconnect under-dash fuse/relay box connector B (36P).
17. Turn the ignition switch to ON (II).

---

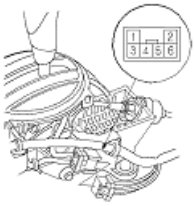
18. Measure the voltage between under-dash fuse/relay box connector B (36P) terminal No. 31 and body ground.

    Is there voltage?
    YES - Substitute a known-good MICU and recheck.■
    NO - Repair open or short in the wire between under-dash fuse/relay box connector B (36P) and the transmission range switch.■

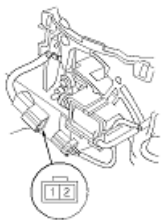


A/T Interlock System - Park Pin Switch Test

1. Connect the HDS to the DLC (A).
2. Check the Park Pin Switch signal with the HDS in the A/T data list while the shift lever is in P, and when the shift lever is shifted to any position other than P.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Check that the park pin switch signal is OFF while the shift lever is in P, and signal is ON when the shift lever is shifted out of P.
4. If the park pin switch signal is OK, test is complete, disconnect the HDS. If the signal is incorrect, go to Step 5 .
5. Turn the ignition switch to LOCK (0).
6. Remove the center console.



7. Remove the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector from the shift lever bracket base, then disconnect the connector.
8. Shift into P, and check for continuity between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminals No. 4 and No. 5. Do not press the shift lever button. There should be no continuity.
9. Shift out of P, and check for continuity between connector terminals No. 4 and No. 5. There should be continuity.
10. If the park pin switch tests OK, repair open or short in the wire between the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 4 and the MICU.
11. If the park pin switch tests incorrectly, test the park pin switch at the park pin switch 2P connector.



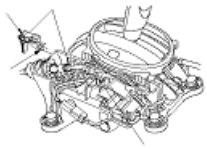
12. Disconnect the park pin switch 2P connector, and remove it from the bracket base.
13. Shift into P, and check for continuity between park pin switch 2P connector terminals No. 1 and No. 2. Do not press the shift lever button. There should be no continuity.
14. Shift out of P, and check for continuity between connector terminals No. 1 and No. 2. There should be continuity.
15. If the park pin switch tests OK at the 2P connector, there is a break or short in the wire between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector and the 2P connector. Replace the shift lock solenoid; the shift lock solenoid is combined with the park pin switch harness and the indicator panel light harness/socket, and supplied as an assembly.
16. If the park pin switch fails the test, replace the park pin switch.
17. Install the center console.

A/T Interlock System - Park Pin Switch Replacement

NOTE: The park pin switch is installed in the shift lever bracket base, and not available separately from the shift lever bracket base; replace the park pin switch and the shift lever bracket base as an assembly.

1. Remove the shift lever.
2. Disassemble the shift lever.
3. Replace the park pin switch and shift lever bracket base assembly.
4. Assemble the shift lever.
5. Install the shift lever.

A/T Interlock System - Shift Lock Release and Release Spring Replacement

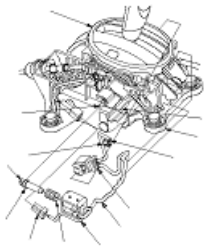


1. Remove the center console.
2. Release the lock tab retaining the A/T gear position indicator panel, and move the indicator panel up.
3. Remove the shift lock release (A) and release spring (B).
4. Apply silicone grease to the pin (C) on the shift lever bracket base, and install the shift lock release and release spring over the pin. Keep the connector terminals free of silicone grease.
5. Install the indicator panel on the shift lever bracket base.
6. Install the center console.

A/T Interlock System - Shift Lock Solenoid Test

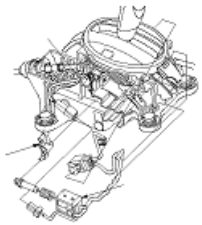
1. Connect the HDS to the DLC (A).
2. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
3. Make sure that the shift lever can be moved out of P when Shift Lock Solenoid: ON. Move the shift lever back in P, and make sure it locks with Shift Lock Solenoid: OFF.
4. Make sure that the shift lock releases when the shift lock release is pushed, and make sure it locks when the shift lock release is released.
5. If the shift lock solenoid does not work properly, troubleshoot shift lock system.

A/T Interlock System - Shift Lock Solenoid Replacement



1. Remove the center console.
2. Remove the A/T gear position indicator panel light socket (A) from the indicator panel (B), then remove the bulb (C) from the socket.
3. Remove the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector (D) from the shift lever bracket base (E), then disconnect the connector.
4. Disconnect the park pin switch 2P connector (F).
5. Release the lock tab (G) retaining the shift lock solenoid using thin blade screwdriver, and remove the shift lock solenoid (H).
6. Replace the shift lock solenoid, solenoid plunger (I), and plunger spring (J) assembly.
7. Apply silicone grease to the tip of the shift lock stop and solenoid plunger. Keep the connector terminals free of silicone grease.
8. Install the shift lock solenoid by aligning the joint (K) of the shift lock solenoid plunger with the tip of the shift lock stop (L), then push the shift lock solenoid into the shift lever bracket base securely.
9. Install the A/T gear position indicator panel light bulb in the panel light socket, then install the socket in the A/T gear position indicator panel.
10. Route the harness (M) through the harness clamp, and connect the park pin switch 2P connector.
11. Install the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector on the bracket base, and connect the connector.
12. Test the shift lock solenoid.
13. Install the center console.

A/T Interlock System - Shift Lock Stop/Shift Lock Stop Cushion Replacement



1. Remove the center console.
2. Remove the shift lock solenoid assembly (A).
3. Remove the shift lock stop/stop cushion (B), and replace them as an assembly.
4. Apply silicone grease to the pin (C) on the shift lever bracket base, and install the shift lock stop over the pin. Keep the connector terminals free of silicone grease.
5. Install the shift lock solenoid assembly.
6. Install the center console.

A/T Interlock System - Shift Lock System Circuit Troubleshooting

1. Connect the HDS to the DLC.
2. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.

   Does the shift lock solenoid work properly?
   YES - Go to Step 3 .
   NO - Go to Step 6 .
3. Check the Brake Switch signal with the HDS in the A/T data list while pressing the brake pedal, and when the brake pedal is released.

   Does the brake pedal position switch work properly?
   YES - Go to Step 4 .
   NO - Troubleshoot the brake pedal position switch signal circuit. ■
4. Check the ATP Switch signal with the HDS in the A/T data list. The shift lever must be in P.

   Is the ATP Switch ON?
   YES - Go to Step 5 .
   NO - Go to Step 19 .
5. Check the accelerator pedal position (APP) sensor A with the HDS in the A/T data list. Do not press the accelerator.

   Is the APP sensor A opening 5 % or more, or the APP sensor A voltage 1.16 V or higher?
   YES - Check the APP Sensor. ■
   NO - Update the PCM if it does not have the latest software, or substitute a known-good PCM, and recheck. If the symptom goes away with a known-good PCM, replace the original PCM. ■
6. Turn the ignition switch to LOCK (0).
7. Remove the center console.
8. Disconnect the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector.
9. Turn the ignition switch to ON (II).
10. Measure the voltage between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 1 and body ground.

    Is there battery voltage?
    YES - Go to Step 11 .
    NO - Check for a blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short in the wire between the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector and the under-dash fuse/relay box.■
11. Shift to P, and press the brake pedal. Do not press the accelerator.

---

12. Measure the voltage between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminals No. 1 and No. 3 while pressing the brake pedal.

    Is there battery voltage?
    YES - Go to Step 13 .
    NO - Go to Step 15 .

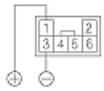
---

13. Release the brake pedal, and measure the voltage between shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminals No. 1 and No. 3. The shift lever must be in P.

    Is there battery voltage?
    YES - Repair short in the wire between PCM connector terminal A28 and the shift lock solenoid/park pin switch/A/T gear position indicator panel light connector.■
    NO - Go to Step 14 .

---

14. Connect a jumper wire from the negative battery terminal to shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 3, and connect another jumper wire from the positive battery terminal to connector terminal No. 1, then check that the shift lock solenoid operates.
NOTE: Do not connect the positive battery terminal to the connector terminal No. 3 or you will damage the diode inside the shift lock solenoid.

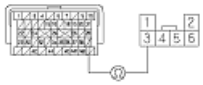


Does the shift lock solenoid operate properly?
YES - Check the shift lock mechanism. Replace the shift lock stop and stop cushion, if the shift lock stop is worn or stuck.■
NO - Replace the shift lock solenoid. ■

15. Turn the ignition switch to LOCK (0).
16. Jump the SCS line with the HDS.
17. Disconnect PCM connector A (49P).

---

18. Check for continuity between PCM connector terminal A28 and shift lock solenoid/park pin switch/A/T gear position indicator panel light connector terminal No. 3.



Is there continuity?
YES - Update the PCM if it does not have the latest software, or substitute a known-good PCM, and recheck. If the symptom goes away with a known-good PCM, replace the original PCM. ■
NO - Repair open in the wire between PCM connector terminal A28 and shift lock solenoid connector.■

19. Turn the ignition switch to LOCK (0).
20. Disconnect the transmission range switch connector.

---

21. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

Is there continuity?
YES - Go to Step 22 .
NO - Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101), or repair poor ground (G101).■

22. Turn the ignition switch to ON (II).

---

23. Measure the voltage between transmission range switch connector terminals No. 6 and No. 10.

Is there battery voltage?
YES - Go to Step 24 .
NO - Repair open in the wire between PCM connector terminal B14 and the transmission range switch.■

---

24. Check for continuity between transmission range switch connector terminals No. 6 and No. 10.

Is there continuity while the shift lever is in P, and no continuity when the shift lever is shifted to any position other than P?
YES - Update the PCM if it does not have the latest software, or substitute a known-good PCM, and recheck. If the symptom goes away with a known-good PCM, replace the original PCM. ■
NO - Replace the transmission range switch. ■

A/T System Description - Lock-up System

[Lock-up System](#)
[Lock-up System (cont'd)](#)

A/T Stall Speed Test

1. Make sure the transmission fluid is filled to the proper level.
2. Apply the parking brake, and block all four wheels.
3. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.
4. Make sure the A/C switch OFF.
5. After the engine has warmed up to normal operating temperature (the radiator fan comes on), shift to D.
6. Firmly press and hold the brake pedal then, while still holding the brake pedal, press the accelerator pedal for six to eight seconds, and note maximum engine speed. Do not move the shift lever while raising engine speed.
7. Allow 2 minutes for cooling, repeat the test for the seven-position transmission in 2, and allow 2 minutes, then repeat test in 1.
8. Allow 2 minutes for cooling, then repeat the test in R.
   NOTE:
   - Do not test stall speed for more than 10 seconds at a time.
   - Stall speed tests should be used for diagnostic purposes only.
   - The stall speed should be the same in D, 2, 1, and R.
   - Do not test stall speed with the A/T pressure gauges installed.

   Stall Speed rpm

   Specification: **2,200 rpm (min $^{-1}$)**

   Service Limit: **2,050–2,350 rpm (min $^{-1}$)**
9. If any of the stall speeds are out of the service limit, refer to the problems and probable causes listed in the table.

Seven-position Transmission

Problem	Probable Causes
Stall speed rpm high in D, 2, 1, and R	• ATF pump output low • Clogged ATF strainer • Regulator valve stuck • Slipping clutch
Stall speed rpm high in 2	Slippage of 2nd clutch
Stall speed rpm high in 1	Slippage of 1st clutch
Stall speed rpm high in R	Slippage of 5th clutch
Stall speed rpm low in D, 2, 1, and R	• Engine output low • Engine throttle valve closed • Torque converter one-way clutch slipping

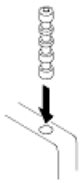
Five-position Transmission

Problem	Probable Causes
Stall speed rpm high in D and R	• ATF pump output low • Clogged ATF strainer • Regulator valve stuck • Slipping clutch
Stall speed rpm high in R	Slippage of 5th clutch
Stall speed rpm low in D and R	• Engine output low • Engine throttle valve closed • Torque converter one-way clutch slipping

A/T Valve Body Repair

NOTE: Valve body repair is only necessary if one or more of the valves in a valve body do not slide smoothly in their bores. Use this procedure to free the valves.

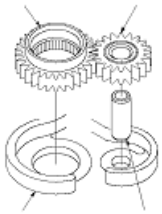
1. Soak a sheet of #600 abrasive paper in ATF for about 30 minutes.
2. Carefully tap the valve body so the sticking valve drops out of its bore. It may be necessary to use a small screwdriver to pry the valve free. Be careful not to scratch the bore with the screwdriver.
3. Inspect the valve for any scuff marks. Use the ATF-soaked #600 paper to polish off any burrs that are on the valve, then wash the valve in solvent and dry it with compressed air.
4. Roll up half of the ATF-soaked #600 paper and insert it in the valve bore of the sticking valve. Twist the paper slightly, so that it unrolls and fits the bore tightly, then polish the bore by twisting the paper as you push it in and out.
   NOTE: The valve body is aluminum and doesn't require much polishing to remove any burrs.
5. Remove the #600 paper. Thoroughly wash the entire valve body in solvent, then dry it with compressed air.



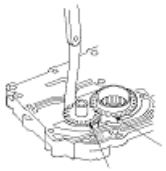
6. Coat the valve with ATF, then drop it into its bore. It should drop to the bottom of the bore under its own weight. If not, repeat steps 4 and 5, then retest. If the valve still sticks, replace the valve body.
7. Remove the valve, and thoroughly clean it and the valve body with solvent. Dry all parts with compressed air, then reassemble using ATF as a lubricant.

ATF Pump Inspection

1. Install the ATF pump drive gear (A), the driven gear (B), and the ATF pump driven gear shaft (C) in the main valve body (D). Lubricate all parts with ATF, and install the ATF pump driven gear with its grooved and chamfered side facing up.



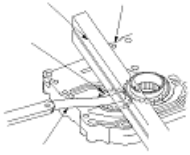
2. Measure the side clearance of the ATF pump drive gear (A) and the driven gear (B).



ATF Pump Gears Side (Radial) Clearance

Standard (New)
ATF Pump Drive Gear:
0.210−0.265 mm (0.0083−0.0104 in.)
ATF Pump Driven Gear:
0.070−0.125 mm (0.0028−0.0049 in.)

3. Remove the ATF pump driven gear shaft. Measure the thrust clearance between the ATF pump driven gear (A) and the valve body (B) with a straight edge (C) and a feeler gauge (D).

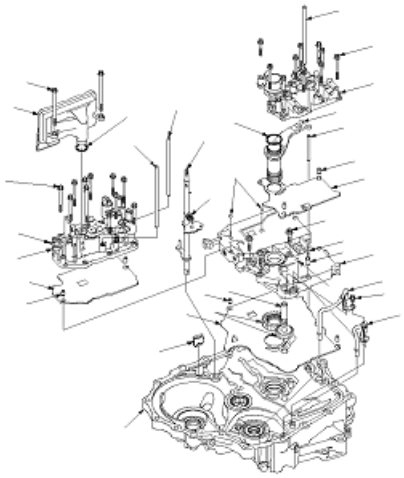


ATF Pump Drive/Driven Gear Thrust (Axial) Clearance

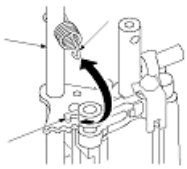
Standard (New):	**0.03−0.06 mm (0.001−0.002 in.)**
Service Limit:	**0.07 mm (0.003 in.)**

A/T Valve Body and ATF Strainer Removal

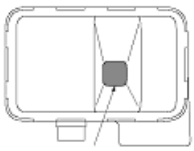
1. Remove the ATF feed pipe (A) from the regulator valve body (B).
2. Remove the ATF feed pipes (C) (D) from the servo body (E).
3. Remove the ATF strainer (F) (two bolts).



4. Unhook the detent spring (G) from the detent arm (H), and remove the control shaft (I).
5. Remove the regulator valve body (10 bolts).
6. Remove the stator shaft (J) and stator shaft stop (K), then remove the regulator separator plate (L) and two dowel pins (M).
7. Remove the servo body (11 bolts), then remove the separator plate (N) and two dowel pins (O).
8. Remove the ATF joint pipes (P) (Q).
9. Remove the cooler check valve spring (R) and cooler check valve (S), then remove the main valve body (T) (three bolts). Do not let the check balls (U) fall out.
10. Remove the ATF pump driven gear shaft (V), then remove the ATF pump gears (W).
11. Remove the main separator plate (X) and two dowel pins (Y).
12. Remove the ATF magnet (Z), clean and reinstall it in the torque converter housing (AA).
13. Remove the O-ring (BB) from the stator shaft, and remove the O-ring (CC) from the ATF strainer. Install the new ones when installing the valve bodies.

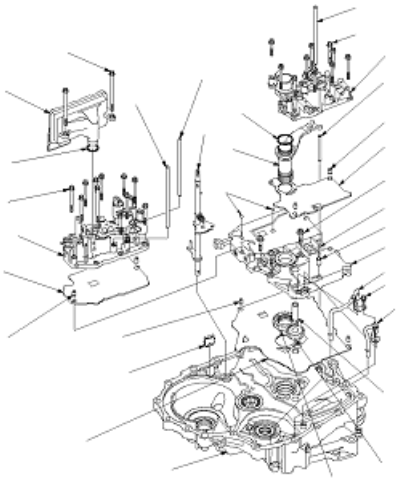


14. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it is in good condition and that the inlet opening is not clogged.
15. Test the ATF strainer by pouring clean ATF through the inlet opening, and replace it if it is clogged or damaged.

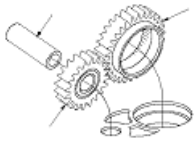


A/T Valve Body and ATF Strainer Installation

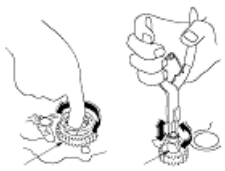
1. Make sure that the ATF magnet is cleaned and installed in the torque converter housing.
   Torque Specifications;
   6 x 1.0 mm: 12 N·m (1.2 kgf·m, 8.7 lbf·ft)
   8 x 1.25 mm: 18 N·m (1.8 kgf·m, 13 lbf·ft)
2. Install the main separator plate and two dowel pins on the torque converter housing.



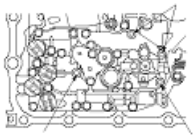
3. Install the ATF pump drive gear (A), ATF pump driven gear (B), and ATF pump driven gear shaft (C). Install the ATF pump driven gear with its grooved and chamfered side facing down.
4. Install the main valve body.



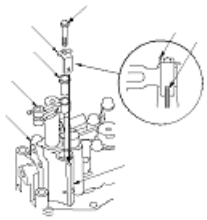
5. Make sure the ATF pump drive gear (A) rotates smoothly in the normal operating direction, and the ATF pump driven gear shaft (B) moves smoothly in the axial and normal operating direction.
6. If the ATF pump drive gear and ATF pump driven gear shaft do not move smoothly, loosen the main valve body bolts. Realign the ATF pump driven gear shaft, and retighten the bolts to the specified torque, then recheck. Failure to align the ATF pump driven gear shaft correctly will result in a seized ATF pump drive gear or ATF pump driven gear shaft.
7. Make sure that the three check balls and the cooler check valve are in the main valve body, then install the cooler check valve spring in the cooler check valve.
8. Install the ATF joint pipes between the main valve body and the torque converter housing.
9. Install the regulator separator plate and two dowel pins on the main valve body.
10. Install the new O-ring on the stator shaft, and install the stator shaft and stator shaft stop.
11. Install the regulator valve body (10 bolts).
12. Install the servo separator plate and two dowel pins on the main valve body.



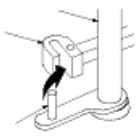
13. Install the servo body (11 bolts). Install the ATF strainer with the two bolts in the bolt holes (A) in step 17, and install the baffle plate with the two bolts in the bolt holes (B) in step 4 in shaft assembly and housing installation.



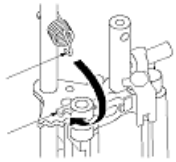
14. If the detent arm was removed, install the detent arm (A) with arm collar (B) on the servo body (C), and install the new lock washer (D) by aligning its cutout (E) with the projection (F) of the servo body. Install and tighten the bolt, then bend the lock tab (G) of the lock washer against the bolt head.



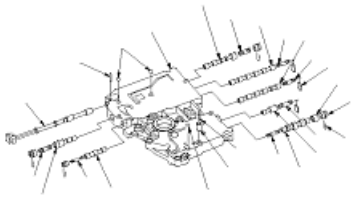
15. Install the control shaft (A) in the torque converter housing while aligning the manual valve lever pin (B) on the control shaft with the guide of the manual valve (C).



16. Hook the detent arm spring (A) to the detent arm (B).
17. Install the new O-ring on the ATF strainer, and install the ATF strainer (two bolts).
18. Install the 8 x 180.5 mm ATF feed pipe in the regulator valve body.
19. Install the 8 x 192.5 mm ATF feed pipe and 8 x 180.5 mm ATF feed pipe in the servo body.



A/T Main Valve Body Disassembly, Inspection, and Reassembly

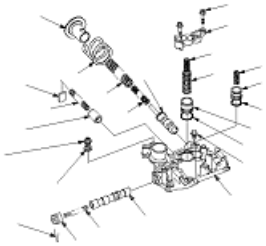


1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages.
2. Do not use a magnet to remove the check balls, it may magnetize the check balls.
3. Inspect the main valve body for scoring and damage.
4. Check all valves for free movement. If any fail to slide freely, refer to valve body repair.
5. Coat all parts with ATF during assembly.

VALVE SPRING SPECIFICATIONS

Valve Springs		Standard (New)-Unit: mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	Cut valve B spring	0.8 (0.031)	9.9 (0.290)	27.3 (1.075)	8.0
B	Shift valve A spring	0.8 (0.031)	7.1 (0.280)	23.7 (0.933)	9.7
C	Shift valve C spring	0.8 (0.031)	7.1 (0.280)	23.7 (0.933)	9.7
D	Relief valve spring	1.0 (0.039)	9.6 (0.378)	34.1 (1.343)	10.2
E	Lock-up control valve spring	0.6 (0.024)	7.1 (0.280)	29.6 (1.165)	11.2
F	Cooler check valve spring	0.85 (0.033)	6.6 (0.260)	27.0 (1.063)	11.3
G	Shift valve D spring	0.8 (0.031)	5.6 (0.220)	28.1 (1.106)	15.9
H	Servo control valve spring	0.8 (0.031)	9.9 (0.290)	27.3 (1.075)	8.0

A/T Regulator Valve Body Disassembly, Inspection, and Reassembly

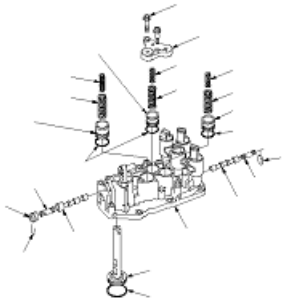


1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages except the air check valve filter.
2. Inspect the regulator valve body for scoring and damage.
3. Hold the regulator spring cap in place while removing the stop bolt. The regulator spring cap is spring loaded. Once the stop bolt is removed, release the spring cap slowly so it does not pop out.
4. Check all valves for free movement. If any fail to slide freely, refer to valve body repair.
5. Check the air check valve filter for clogging. If the filter is clogged, remove the air check valve, and clean the filter thoroughly by pouring clean ATF. Do not blow out the filter with compressed air. Replace the air check valve, if the filter or the check valve (ball) is clogged or damaged.
6. Coat all parts with ATF during assembly.
7. Align the hole in the regulator spring cap with the stop bolt hole, then press the spring cap into the valve body, and tighten the stop bolt.

VALVE SPRING SPECIFICATIONS

Valve Springs		Standard (New)-Unit: mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	Stator reaction spring	4.5 (0.177)	35.4 (1.394)	30.3 (1.193)	1.92
B	Regulator valve spring A	1.9 (0.075)	14.7 (0.579)	80.6 (3.173)	16.1
C	Regulator valve spring B	1.6 (0.063)	9.2 (0.362)	44.0 (1.732)	12.5
D	Torque converter check valve spring	1.2 (0.047)	8.6 (0.339)	33.8 (1.331)	12.2
E	Lock-up shift valve spring	1.0 (0.039)	6.6 (0.260)	35.5 (1.398)	18.2
F	1st accumulator spring B	2.4 (0.094)	12.2 (0.480)	35.0 (1.378)	7.7
G	1st accumulator spring A	2.4 (0.094)	18.6 (0.732)	50.1 (1.972)	6.7
H	4th accumulator spring	2.5 (0.098)	14.6 (0.575)	29.9 (1.177)	4.9

A/T Servo Body Disassembly, Inspection, and Reassembly



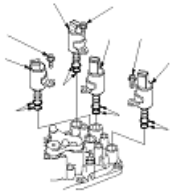
1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages.
2. Inspect the servo body for scoring and damage.
3. Check all valves for free movement. If any fail to slide freely, refer to valve body repair.
4. Coat all parts with ATF during assembly.

VALVE SPRINGS SPECIFICATIONS

Valve Springs		Standard (New)-Unit: mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	Cut valve A spring	0.9 (0.035)	9.9 (0.390)	22.3 (0.878)	6.9
B	Shift valve B spring	0.8 (0.031)	7.1 (0.280)	23.7 (0.933)	9.7
C	5th accumulator spring A	2.5 (0.098)	16.6 (0.654)	46.9 (1.846)	7.8
D	5th accumulator spring B	1.9 (0.075)	10.0 (0.394)	38.5 (1.516)	10.6
E	2nd accumulator spring A	1.8 (0.071)	14.6 (0.575)	43.8 (1.724)	7.9
F	2nd accumulator spring B	1.85 (0.073)	9.4 (0.370)	32.5 (1.280)	8.7
G	3rd accumulator spring A	1.8 (0.071)	14.6 (0.575)	43.8 (1.724)	7.9
H	3rd accumulator spring B	1.85 (0.073)	9.4 (0.370)	32.5 (1.280)	8.7

A/T Valve Body Shift Solenoid Valve Removal and Installation

NOTE: Do not hold the solenoid valve connector to remove and install the solenoid valve. Be sure to hold the solenoid valve body.

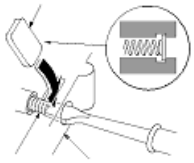


1. Remove the mounting bolts, then remove the solenoid valves by holding the solenoid valve body.
2. Install the new O-rings (E) on each solenoid valve.
   NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided with it.
3. Install shift solenoid valve D (black connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts to the servo body.
4. Install shift solenoid valve C (brown connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts to the servo body.
5. Install shift solenoid valve B (black connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts to the servo body.
6. Install shift solenoid valve A (brown connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts to the bracket of shift solenoid valve B.
   NOTE: Do not install shift solenoid valve A before installing shift solenoid valve B. If shift solenoid valve A is installed before installing shift solenoid valve B, it may damage the hydraulic control system.

A/T Valve Body Valve Installation

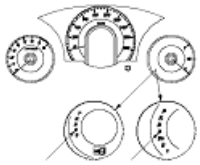
1. Coat all parts with ATF before assembly.
2. Install the valves and springs in the sequence shown for the main valve body, the regulator valve body, and the servo body. Refer to the following valve cap illustrations, and install each valve cap so the end shown facing up will be facing the outside of the valve body, then secure the valve cap with the valve cap clip.

3. Install the valve and the valve spring (A) in the valve body (B). Push the valve spring in with a screwdriver, then install the spring seat (C).

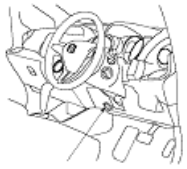


How to Troubleshoot the A/T System

How to Check for DTCs with the Honda Diagnostic System (HDS)



When the powertrain control module (PCM) senses an abnormality in the input or output system, the D indicator (A) in the gauge assembly (B) will usually blink.



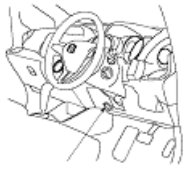
When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) (A) (located under the driver's dashboard lower cover), it will indicate the diagnostic trouble code (DTC) when the ignition switch is turned to ON (II) and the appropriate menu is selected.
If the D indicator or malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II), select A/T system, and observe the DTC in the DTCs MENU on the HDS screen.
   If the HDS does not communicate with the PCM, go to the DLC circuit troubleshooting.
3. Record the freeze data and the on-board snapshots for all fuel and emissions DTCs and A/T DTCs.
4. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
5. Clear the DTC and data.
6. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, and then recheck for a DTC. If the A/T DTC returns, go to the indicated DTC's troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

Symptom Troubleshooting Versus DTC Troubleshooting

Some symptoms will not trigger DTCs or cause the D indicator to blink. If the malfunction indicator lamp (MIL) was reported ON or the D indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause(s) for the symptom, in the sequence listed, until you find the problem.

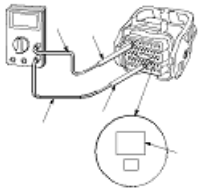
How to Troubleshoot Circuits at the PCM Connectors



NOTE: Monitoring the powertrain control system throughout the vehicle, the PCM stays on up to 60 minutes after the ignition switch is turned to LOCK (0). Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Connect the HDS to the DLC (A), and jump the SCS line with the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.

2. Disconnect PCM connectors A, B, and C.



3. Connect one side of the patch cord (A) terminal to a digital multimeter (B), and connect the other side of the patch cord terminals to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (C).
4. Gently slide the pin probe into the inspection port (D) at the connector terminal side. Always use the inspection port. Do not slide the probe into the connector terminals.

   NOTICE

   - For accurate result, always use the pin probe (male).
   - To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
   - Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

How to Clear A/T DTCs

1. Connect the HDS to the DLC (A).
2. Turn the ignition switch to ON (II).
3. Clear the DTC(s) with the HDS.
   NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the technician's repair was successfully finished. The results of diagnostic tests for the DTC are displayed as:

- PASSED: On board diagnosis is successfully finished.
- FAILED: On board diagnosis has finished but failed.
- NOT COMPLETED: The on board diagnosis was running but is out of the enable conditions of the DTC.

How to End a Troubleshooting Session (required after any troubleshooting)

1. Reset the PCM with the HDS while the engine is stopped.
2. Turn the ignition switch to LOCK (0).
3. Turn the ignition switch to ON (II), and wait for 30 seconds.
4. Turn the ignition switch to LOCK (0), and disconnect the HDS from the DLC.
5. Do the PCM idle learn procedure.
6. Start the engine in P or N, and warm it up to normal operating temperature (the radiator fan comes on).
7. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 50 km/h (30 mph) or under the same conditions as those indicated by the freeze data.

Updating the A/T software in the PCM

Refer to the PCM Update when the A/T software updating is needed in the DTC troubleshooting.

Replacing the PCM

Refer to the PCM Replacement when replacing the PCM is needed in the DTC troubleshooting.

How to Substitute the PCM

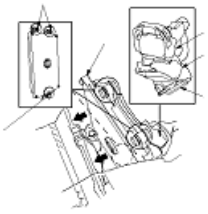
1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the DLC (A).
3. Turn the ignition switch to ON (II), and make sure the HDS communicates with the PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Turn the ignition switch to LOCK (0).
5. Do the battery removal procedure.

---

6. Remove the PCM cover (A).

---

7. Remove the mounting bolts (A) from the PCM (B).
8. Disconnect PCM connectors A (C), B (D), and C (E), and remove the PCM.
9. Install a known-good PCM in the reverse order of removal.
10. Do the battery installation procedure.
11. Open the SCS line with the HDS.
12. Turn the ignition switch to ON (II).
    NOTE: If DTC P0630 ‘‘VIN not Programmed or Mismatch" will be stored because the VIN has not been programmed into the PCM; ignore it, and continue this procedure.
13. Manually input the VIN to the PCM with the HDS.
14. Select the IMMOBI SYSTEM with the HDS.
15. Enter the immobilizer code using the PCM replacement procedure in the HDS; this allows you to start the engine.
16. Reset the PCM with the HDS.
17. Update the PCM if it does not have the latest software.
18. Do the CKP learn procedure.
19. Do the PCM idle learn procedure.



DTC Troubleshooting: P0705 (5)

DTC P0705:
Transmission Range Switch (Multiple Shift-position Input)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine.
3. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position, and monitor the OBD status for P0705 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for an intermittent short in the wire between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, return to Step 2 and recheck.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission range switch connector.
6. Turn the ignition switch to ON (II).
7. Check the A/T P Switch, A/T R Switch, A/T N Switch, A/T D Switch, A/T D3 Switch, A/T 2-1 Switch, A/T S Switch, Forward Switch (ATP FWD), and Reverse Switch (ATP RVS) inputs with the HDS in the A/T data list.

   Are there any ON-inputs?
   YES - Repair short in the ON-input circuit:

   - A/T P Switch circuit: between PCM connector terminal B14 and transmission range switch connector terminal No. 6.
   - A/T R Switch circuit: between PCM connector terminal B15 and transmission range switch connector terminal No. 7.
   - A/T N Switch circuit: between PCM connector terminal B13 and transmission range switch connector terminal No. 2.
   - A/T D Switch circuit: between PCM connector terminal B22 and transmission range switch connector terminal No. 8.
   - A/T D3 Switch circuit (seven-position transmission): between PCM connector terminal B16 and transmission range switch connector terminal No. 3.
   - A/T S Switch circuit (five-position transmission): between PCM connector terminal B16 and transmission range switch connector terminal No. 3.
   - A/T 2-1 Switch circuit (seven-position transmission): between PCM connector terminal B17 and transmission range switch connector terminal No. 9.
   - Forward Switch (ATP FWD) circuit: between PCM connector terminal B29 and transmission range switch connector terminal No. 5.
   - Reverse Switch (ATP RVS) circuit: between PCM connector terminal B23 and transmission range switch connector terminal No. 1.

   Go to Step 15 after repairing the circuit.
   NO - Go to Step 8 .
8. Turn the ignition switch to LOCK (0).
9. Inspect the transmission range switch.

   Is the test result OK?
   YES - Connect the transmission range switch connector, then go to Step 10 .
   NO - Replace the transmission range switch, then go to Step 15 .
10. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
11. Start the engine.
12. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0705 indicated?
    YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
    NO - Go to Step 14 .
14. Monitor the OBD status for P0705 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 13 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

15. Clear the DTC with the HDS.
16. Start the engine.
17. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0705 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then return to Step 16 and recheck.

NO - Go to Step 19 .

19. Monitor the OBD status for P0705 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 16 and recheck.

DTC Troubleshooting: P0706 (6)

DTC P0706:
Transmission Range Switch (Open)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0).
3. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
4. Start the engine. Run the engine in D until the vehicle speed reaches 40 km/h (25 mph), then slow down, and stop the wheels.
5. Monitor the OBD status for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.■
6. Turn the ignition switch to LOCK (0).
7. Inspect the transmission range switch.

   Is the test result OK?
   YES - Connect the transmission range switch connector, then go to Step 8 .
   NO - Replace the transmission range switch, then go to Step 38 .
8. Check the control wire adjustment.
9. Clear the DTC with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Start the engine. Run the engine in D until the vehicle speed reaches 40 km/h (25 mph), then slow down, and stop the wheels.
12. Monitor the OBD status for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate FAILED?
    YES - Go to Step 13 .
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.■
13. Shift to D, and verify the A/T D Switch and Forward Switch (ATP FWD) inputs with the HDS in the A/T data list.

    Are A/T D Switch and Forward Switch (ATP FWD) ON?
    YES -
    - Seven-position transmission: Go to Step 14 .
    - Five-position transmission: Go to Step 16 .

    NO - Go to Step 22 .
14. Shift to D3, and verify the A/T D3 Switch and Forward Switch (ATP FWD) inputs with the HDS in the A/T data list.

    Are A/T D3 Switch and Forward Switch (ATP FWD) ON?
    YES - Go to Step 15 .
    NO - Go to Step 22 .
15. Shift to 2, and verify the A/T 2-1 Switch and Forward Switch (ATP FWD) inputs with the HDS in the A/T data list.

    Are A/T 2-1 Switch and Forward Switch (ATP FWD) ON?
    YES - Go to Step 17 .
    NO - Go to Step 22 .
16. Shift to S, and verify the A/T S Switch and Forward Switch (ATP FWD) with the HDS in the A/T data list.

    Are A/T S Switch and Forward Switch (ATP FWD) ON?
    YES - Go to Step 17 .
    NO - Go to Step 22 .
17. Clear the DTC with the HDS.
18. Turn the ignition switch to LOCK (0).
19. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.

20. Start the engine. Run the engine in D until the vehicle speed reaches 40 km/h (25 mph), then slow down, and stop the wheels.
21. Monitor the OBD status for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

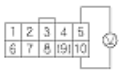
    Does the HDS indicate FAILED?
    YES - Go to Step 22 .
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 20 and recheck.
22. Turn the ignition switch to LOCK (0).
23. Disconnect the transmission range switch connector.
24. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

    Is there continuity?
    YES - Go to Step 25 .
    NO - Repair open in the wire between the transmission range switch and ground (G101), or repair poor ground (G101), then go to Step 37 .
25. Turn the ignition switch to ON (II).

---

26. Measure the voltage between transmission range switch connector terminals No. 5 and No. 10.

    Is there voltage?
    YES - Go to Step 27 .
    NO - Repair open in the wire between the transmission range switch and PCM connector terminal B29, then go to Step 37 .



---

27. Measure the voltage between transmission range switch connector terminals No. 8 and No. 10.

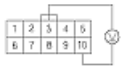
    Is there voltage?
    YES -
    - Seven-position transmission: Go to Step 28 .
    - Five-position transmission: Go to Step 30 .

    NO - Repair open in the wire between the transmission range switch and PCM connector terminal B22, then go to Step 37 .

---

28. Measure the voltage between transmission range switch connector terminals No. 3 and No. 10.

    Is there voltage?
    YES - Go to Step 29 .
    NO - Repair open in the wire between the transmission range switch and PCM connector terminal B16, then go to Step 37 .



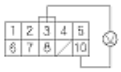
---

29. Measure the voltage between transmission range switch connector terminals No. 9 and No. 10.

    Is there voltage?
    YES - Go to Step 31 .
    NO - Repair open in the wire between the transmission range switch and PCM connector terminal B17, then go to Step 37 .

---

30. Measure the voltage between transmission range switch connector terminals No. 3 and No. 10.



Is there voltage?
YES - Go to Step 31 .
NO - Repair open in the wire between the transmission range switch and PCM connector terminal B16, then go to Step 37 .

31. Connect the transmission range switch connector.

32. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

33. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.

34. Start the engine, and run it in D until the vehicle speed reaches 48 km/h (30 mph). Slow down and stop the wheels.

35. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0706 indicated?
YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 36 .

36. Monitor the OBD status for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 35 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 34 and recheck.

37. Connect the transmission range switch connector.

38. Clear the DTC with the HDS.

39. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.

40. Start the engine, and run it in D until the vehicle speed reaches 48 km/h (30 mph). Slow down and stop the wheels.

41. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0706 indicated?
YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 .
NO - Go to Step 42 .

42. Monitor the OBD status for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 41 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 40 and recheck.

DTC Troubleshooting: P0711 (28)

DTC P0711:
ATF Temperature Sensor (Range/Performance)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II), and wait for 20 seconds.
2. Check the ATF temperature with the HDS in the A/T data list.

   Does the ATF temperature exceed the ambient air temperature?
   YES - Record the ATF temperature. Leave the engine off for at least 30 minutes, and go to Step 3 .
   NO - Record the ATF temperature. Test the stall speed RPM three times. Go to Step 3 after stall speed testing.
3. Check the ATF temperature with the HDS.

   Does the ATF temperature change?
   YES - Leave the engine off for at least 30 minutes, and go to Step 4 .
   NO - Replace the ATF temperature sensor, then go to Step 13 .
4. Check the ECT SENSOR with the HDS.

   Is the ECT SENSOR equal to the ambient air temperature?
   YES - Go to Step 5 .
   NO - Leave the engine off until the ECT SENSOR reads the same as ambient air temperature, then go to Step 5 .
5. Check the ATF TEMP SENSOR with the HDS.

   Does the ATF temperature read about the same as the ECT SENSOR?
   YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the connection is OK, go to Step 6 .
   NO - Replace the ATF temperature sensor, then go to Step 13 .
6. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
7. Turn the ignition switch to ON (II), and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on).
8. Turn the engine off, and leave it off until the engine coolant cools to the ambient air temperature (the ECT SENSOR reads the same as the ambient air temperature).
9. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
10. Turn the ignition switch to ON (II), and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on). Start off in D, accelerate with the throttle opened at least 4 degrees, and run the vehicle at speeds over 30 km/h (19 mph) for at least 5 minutes. Or test-drive the vehicle in D for at least 20 seconds while the ATF temperature reads −10 °C to 110 °C (14 °F to 230 °F) by monitoring with the HDS. Slow down and stop the wheels.
11. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0711 indicated?
    YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
    NO - Go to Step 12 .
12. Monitor the OBD status for P0711 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 11 , go to the indicated DTC's troubleshooting.■
    NO - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, go to Step 7 and recheck.
13. Clear the DTC with the HDS.
14. Turn the ignition switch to ON (II), and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on).
15. Turn the engine off, and leave it off until the engine coolant cools to the ambient air temperature (the ECT SENSOR reads the same as the ambient air temperature).
16. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or

raise the vehicle on a lift.

17. Turn the ignition switch to ON (II), and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on). Start off in D, accelerate with the throttle opened at least 4 degrees, and run the vehicle at speeds over 30 km/h (19 mph) for at least 5 minutes. Or test-drive the vehicle in D for at least 20 seconds while the ATF temperature reads −10 °C to 110 °C (14 °F to 230 °F) by monitoring with the HDS. Slow down and stop the wheels.

18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0711 indicated?

    YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to Step 1 .

    NO - Go to Step 19 .

19. Monitor the OBD status for P0711 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

    NO - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 14 and recheck.

DTC Troubleshooting: P0712 (28)

DTC P0712:
ATF Temperature Sensor (Short)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Check the ATF temperature sensor voltage with the HDS in the A/T data list.

   Is the ATF Temp Sensor (V) 0.07 V or less?
   YES - Go to Step 2 .
   NO - Intermittent failure, the system is OK at this time. Check for an intermittent short in the ATFT wire between the ATF temperature sensor and the PCM.■

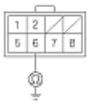
2. Turn the ignition switch to LOCK (0).
3. Disconnect the shift solenoid harness connector at the shift solenoid valve cover.
4. Turn the ignition switch to ON (II).
5. Check the ATF temperature sensor voltage with the HDS.

   Is the ATF Temp Sensor (V) 0.07 V or less?
   YES - Go to Step 6 .
   NO - Replace the ATF temperature sensor, then go to Step 16 .

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connector B (49P).
9. Check for continuity between shift solenoid harness connector terminal No. 6 and body ground.

   Is there continuity?
   YES - Repair short in the wire between PCM connector terminal B28 and shift solenoid harness connector terminal No. 6, then go to Step 16 .
   NO - Go to Step 10 .

10. Check for continuity between shift solenoid harness connector terminal No. 6 and body ground.



Is there continuity?
YES - Replace the ATF temperature sensor, then go to Step 16 .
NO - Go to Step 11 .

11. Reconnect all connectors.

12. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

13. Start the engine in P, and wait for at least 20 seconds.

14. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0712 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 15 .

15. Monitor the OBD status for P0712 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 14 , go to the indicated DTC's troubleshooting.■
NO - Check for an intermittent short in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, go to Step 13 and recheck.

16. Reconnect all connectors.

17. Clear the DTC with the HDS.

18. Start the engine in P, and wait for at least 20 seconds.

19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0712 indicated?
YES - Check for an intermittent short in the wire between the ATF temperature sensor and the PCM, then go to Step 1 .
NO - Go to Step 20 .

20. Monitor the OBD status for P0712 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 19 , go to the indicated DTC's troubleshooting.■
NO - Check for an intermittent short in the wire between the ATF temperature sensor and the PCM. If the HDS indicates NOT COMPLETED, return to Step 18 and recheck.

DTC Troubleshooting: P0713 (28)

DTC P0713:
ATF Temperature Sensor (Open)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Check the ATF temperature sensor voltage with the HDS in the A/T data list.

   Does the ATF Temp Sensor (V) exceed 4.93 V?
   YES - Go to Step 2 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ATF temperature sensor and the PCM.■

2. Turn the ignition switch to LOCK (0).
3. Disconnect the shift solenoid harness connector at the shift solenoid valve cover.
4. Turn the ignition switch to ON (II).
5. Measure the voltage between shift solenoid harness connector terminal No. 6 and body ground.

   Is there about 5 V?
   YES - Go to Step 6 .
   NO - Go to Step 7 .

---

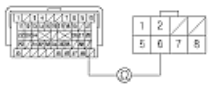
6. Measure the voltage between shift solenoid harness connector terminals No. 6 and No. 7.

   Is there about 5 V?
   YES - Replace the ATF temperature sensor, then go to Step 17 .
   NO - Repair open in the wire between PCM connector terminal B34 and the shift solenoid harness connector, then go to Step 17 .

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector B (49P).

---

10. Check for continuity between PCM connector terminal B28 and shift solenoid harness connector terminal No. 6.



Is there continuity?
YES - Go to Step 11 .
NO - Repair open in the wire between PCM connector terminal B28 and the shift solenoid harness connector, then go to Step 16 .

11. Reconnect all connectors.

12. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

13. Start the engine in P, and wait for at least 20 seconds.

14. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0713 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 15 .

15. Monitor the OBD status for P0713 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 14 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 13 and recheck.

16. Connect PCM connector B (49P).

17. Connect the ATF temperature sensor connector.

18. Clear the DTC with the HDS.

19. Start the engine in P, and wait for at least 20 seconds.

20. Check for Temporary DTCs or DTCs with the HDS.

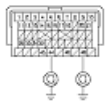
Is DTC P0713 indicated?
YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to Step 1 .
NO - Go to Step 21 .

21. Monitor the OBD status for P0713 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

DTC Troubleshooting: P0716 (15), P0717 (15)

DTC P0716:
Input Shaft (Mainshaft) Speed Sensor (Range/Performance)
DTC P0717:
Input Shaft (Mainshaft) Speed Sensor (No Signal Input)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check for proper input shaft (mainshaft) speed sensor installation. If the sensor is installed improperly, correct the problem, then go to Step 40 .
3. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
4. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.
5. Monitor the OBD status for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections at the PCM and input shaft (mainshaft) speed sensor connectors. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connector C (49P).
9. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 39 .
10. Connect PCM connector C (49P).
11. Disconnect the input shaft (mainshaft) speed sensor connector.
12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

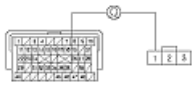
    Is there about 5 V?
    YES - Go to Step 18 .
    NO - Go to Step 14 .

14. Turn the ignition switch to LOCK (0).
15. Jump the SCS line with the HDS.
16. Disconnect PCM connector B (49P).

---

17. Check for continuity between PCM connector terminal B19 and input shaft (mainshaft) speed sensor connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 34 .
    NO - Repair open in the wire between PCM connector terminal B19 and the input shaft (mainshaft) speed sensor, then go to Step 39 .



18. Turn the ignition switch to LOCK (0).
19. Jump the SCS line with the HDS.
20. Disconnect PCM connector B (49P).

---

21. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

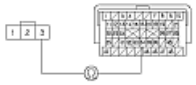
Is there continuity?

YES - Repair short in the wire between PCM connector terminal B18 and the input shaft (mainshaft) speed sensor connector, then go to Step 39 .

NO - Go to Step 22 .

---

22. Check for continuity between PCM connector terminal B34 and input shaft (mainshaft) speed sensor connector terminal No. 3.



Is there continuity?

YES - Go to Step 23 .

NO - Repair open in the wire between PCM connector terminal B34 and the input shaft (mainshaft) speed sensor connector, then go to Step 39 .

23. Connect PCM connector B (49P).

24. Turn the ignition switch to ON (II).

---

25. Measure the voltage between input shaft (mainshaft) speed sensor connector terminals No. 2 and No. 3.

Is there about 5 V?

YES - Go to Step 26 .

NO - Go to Step 30 .

26. Connect the input shaft (mainshaft) speed sensor connector.

27. Clear the DTC with the HDS.

28. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.

29. Monitor the OBD status for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Replace the input shaft (mainshaft) speed sensor, then go to Step 40 .

NO - Go to Step 35 .

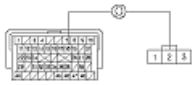
30. Turn the ignition switch to LOCK (0).

31. Jump the SCS line with the HDS.

32. Disconnect PCM connector B (49P).

---

33. Check for continuity between PCM connector terminal B18 and input shaft (mainshaft) speed sensor connector terminal No. 2.



Is there continuity?

YES - Go to Step 34 .

NO - Repair open in the wire between PCM connector terminal B18 and the input shaft (mainshaft) speed sensor, then go to Step 39 .

34. Reconnect all connectors.

35. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

36. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.

37. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0716 or P0717 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 38 .

38. Monitor the OBD status for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 37 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 36 and recheck.

39. Reconnect all connectors.

40. Clear the DTC with the HDS.

41. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.

42. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0716 or P0717 indicated?

YES - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to Step 1 .

NO - Go to Step 43 .

43. Monitor the OBD status for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

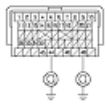
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 42 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, go to Step 41 and recheck.

DTC Troubleshooting: P0718 (15)

DTC P0718:
Input Shaft (Mainshaft) Speed Sensor (Intermittent Failure)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.
3. Monitor the OBD status for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, return to Step 2 and recheck.
4. Turn the ignition switch to LOCK (0).
5. Disconnect the input shaft (mainshaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?
   YES - Go to Step 6 .
   NO - Repair the connector terminals, then go to Step 6 .
6. Connect the input shaft (mainshaft) speed sensor connector.
7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.
8. Monitor the OBD status for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 9 .
   NO - Troubleshooting is complete. If the HDS indicates NOT COMPLETED, return to Step 7 and recheck.■
9. Turn the ignition switch to LOCK (0).
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector C (49P).
12. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 37 .
13. Connect PCM connector C (49P).
14. Disconnect the input shaft (mainshaft) speed sensor connector.
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

    Is there about 5 V?
    YES - Go to Step 17 .
    NO - Go to Step 28 .
17. Turn the ignition switch to LOCK (0).
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector B (49P).

---

20. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

Is there continuity?
YES - Repair short in the wire between PCM connector terminal B18 and the input shaft (mainshaft) speed sensor connector, then go to Step 37 .
NO - Go to Step 21 .

21. Connect PCM connector B (49P).
22. Turn the ignition switch to ON (II).

---

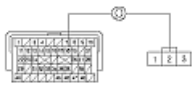
23. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

Is there about 5 V?
YES - Replace the input shaft (mainshaft) speed sensor, then go to Step 37 .
NO - Go to Step 24 .

24. Turn the ignition switch to LOCK (0).
25. Jump the SCS line with the HDS.
26. Disconnect PCM connector B (49P).

---

27. Check for continuity between PCM connector terminal B18 and input shaft (mainshaft) speed sensor connector terminal No. 2.

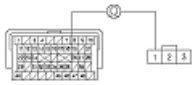


Is there continuity?
YES - Go to Step 32 .
NO - Repair open in the wire between PCM connector terminal B18 and the input shaft (mainshaft) speed sensor, then go to Step 37 .

28. Turn the ignition switch to LOCK (0).
29. Jump the SCS line with the HDS.
30. Disconnect PCM connector B (49P).

---

31. Check for continuity between PCM connector terminal B19 and input shaft (mainshaft) speed sensor connector terminal No. 1.



Is there continuity?

YES - Go to Step 32 .

NO - Repair open in the wire between PCM connector terminal B19 and the input shaft (mainshaft) speed sensor, then go to Step 37 .

32. Reconnect all connectors.

33. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

34. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.

35. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0718 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 36 .

36. Monitor the OBD status for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 35 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 34 and recheck.

37. Reconnect all connectors.

38. Clear the DTC with the HDS.

39. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.

40. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0718 indicated?

YES - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to Step 1 .

NO - Go to Step 41 .

41. Monitor the OBD status for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

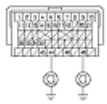
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 40 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 39 and recheck.

DTC Troubleshooting: P0721 (9), P0722 (9)

DTC P0721:
Output Shaft (Countershaft) Speed Sensor (Range/Performance)
DTC P0722:
Output Shaft (Countershaft) Speed Sensor (No Signal Input)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check for proper output shaft (countershaft) speed sensor installation. If the sensor is installed improperly, correct the problem, then go to Step 42 .
3. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.
4. Start the engine, and run the vehicle in D with the engine speed at 2,000 rpm (min $^{-1}$) or higher, for at least 10 seconds. Slow down and stop the wheels.
5. Monitor the OBD status for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections at the PCM and output shaft (countershaft) speed sensor connectors. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connector C (49P).
9. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 41 .
10. Connect PCM connector C (49P).
11. Disconnect the output shaft (countershaft) speed sensor connector.
12. Turn the ignition switch to ON (II).

---

13. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

    Is there about 5 V?
    YES - Go to Step 18 .
    NO - Go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Jump the SCS line with the HDS.
16. Disconnect PCM connector C (49P).

---

17. Check for continuity between PCM connector terminal C13 and output shaft (countershaft) speed sensor connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 36 .
    NO - Repair open in the wire between PCM connector terminal C13 and the output shaft (countershaft) speed sensor, then go to Step 41 .
18. Turn the ignition switch to LOCK (0).
19. Jump the SCS line with the HDS.
20. Disconnect PCM connector B (49P).

---

21. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

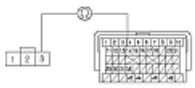
Is there continuity?
YES - Repair short in the wire between PCM connector terminal B38 and output shaft (countershaft) speed sensor connector, then go to Step 41 .

NO - Go to Step 22 .

22. Disconnect PCM connector C (49P).

---

23. Check for continuity between PCM connector terminal C14 and output shaft (countershaft) speed sensor connector terminal No. 3.



Is there continuity?
YES - Go to Step 24 .
NO - Repair open in the wire between PCM connector terminal C14 and output shaft (countershaft) speed sensor connector, then go to Step 41 .

24. Connect PCM connectors B (49P) and C (49P).

25. Turn the ignition switch to ON (II).

---

26. Measure the voltage between output shaft (countershaft) speed sensor connector terminals No. 2 and No. 3.

Is there about 5 V?
YES - Go to Step 27 .
NO - Go to Step 32 .

27. Connect the output shaft (countershaft) speed sensor connector.

28. Clear the DTC with the HDS.

29. Raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely. Or raise the vehicle on a lift.

30. Start the engine, and run the vehicle in D with the engine speed at 2,000 rpm (min^{-1}) or higher, for at least 10 seconds. Slow down and stop the wheels.

31. Monitor the OBD status for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?
YES - Replace the output shaft (countershaft) speed sensor , then go to Step 42 .
NO - Go to Step 37 .

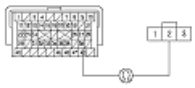
32. Turn the ignition switch to LOCK (0).

33. Jump the SCS line with the HDS.

34. Disconnect PCM connector B (49P).

---

35. Check for continuity between PCM connector terminal B38 and output shaft (countershaft) speed sensor connector terminal No. 2.



Is there continuity?

YES - Go to Step 36 .

NO - Repair open in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to Step 41 .

36. Reconnect all connectors.

37. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

38. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.

39. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0721 or P0722 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 40 .

40. Monitor the OBD status for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 39 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 38 and recheck.

41. Reconnect all connectors.

42. Clear the DTC with the HDS.

43. Start the engine, and run the vehicle in D at speeds over 20 km/h (12 mph) for at least 10 seconds. Slow down and stop the wheels.

44. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0721 or P0722 indicated?

YES - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to Step 1 .

NO - Go to Step 45 .

45. Monitor the OBD status for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

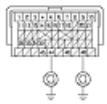
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 44 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, go to Step 43 and recheck.

DTC Troubleshooting: P0723 (9)

DTC P0723:
Output Shaft (Countershaft) Speed Sensor (Intermittent Failure)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears with the engine speed at 2,000 rpm (min $^{-1}$) or higher, for several minutes. Slow down and stop the wheels.
3. Monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 4.
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, return to Step 2 and recheck.
4. Turn the ignition switch to LOCK (0).
5. Disconnect the output shaft (countershaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

   Are the connector terminals OK?
   YES - Go to Step 6.
   NO - Repair the connector terminals, then go to Step 6.
6. Connect the output shaft (countershaft) speed sensor connector.
7. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears with the engine speed at 2,000 rpm (min $^{-1}$) or higher, for several minutes. Slow down and stop the wheels.
8. Monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 9.
   NO - Troubleshooting is complete. If the HDS indicates NOT COMPLETED, return to Step 7 and recheck.■
9. Turn the ignition switch to LOCK (0).
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector C (49P).
12. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.

    Is there continuity?
    YES - Go to Step 13.
    NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 37.
13. Connect PCM connector C (49P).
14. Disconnect the output shaft (countershaft) speed sensor connector.
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

    Is there about 5 V?
    YES - Go to Step 17.
    NO - Go to Step 28.
17. Turn the ignition switch to LOCK (0).
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector B (49P).

---

20. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor connector, then go to Step 37 .

NO - Go to Step 21 .

21. Connect PCM connector B (49P).
22. Turn the ignition switch to ON (II).

---

23. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

Is there about 5 V?

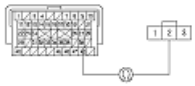
YES - Replace the output shaft (countershaft) speed sensor, then go to Step 37 .

NO - Go to Step 24 .

24. Turn the ignition switch to LOCK (0).
25. Jump the SCS line with the HDS.
26. Disconnect PCM connector B (49P).

---

27. Check for continuity between PCM connector terminal B38 and output shaft (countershaft) speed sensor connector terminal No. 2.



Is there continuity?

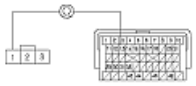
YES - Go to Step 32 .

NO - Repair open in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to Step 37 .

28. Turn the ignition switch to LOCK (0).
29. Jump the SCS line with the HDS.
30. Disconnect PCM connector C (49P).

---

31. Check for continuity between PCM connector terminal C13 and output shaft (countershaft) speed sensor connector terminal No. 1.



Is there continuity?

YES - Go to Step 32 .

NO - Repair open in the wire between PCM connector terminal C13 and the output shaft (countershaft) speed sensor, then go to Step 37 .

32. Reconnect all connectors.

33. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

34. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.

35. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0723 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 36 .

36. Monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 35 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 34 .

37. Reconnect all connectors.

38. Clear the DTC with the HDS.

39. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears at speeds over 20 km/h (12 mph). Slow down and stop the wheels.

40. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0723 indicated?

YES - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to Step 1 .

NO - Go to Step 41 .

41. Monitor the OBD status for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 40 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 39 and recheck.

DTC Troubleshooting: P0746 (76)

DTC P0776:
A/T Clutch Pressure Control Solenoid Valve A Stuck OFF
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 10 .
   NO - Replace the ATF, then go to Step 4 .
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears. Then slow down to a stop. Shift to N, wait for at least 3 seconds, then shift into R. Move the vehicle in reverse for at least 3 seconds, then slow down and stop the wheels.
6. Monitor the OBD status for P0746 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to Step 9 . If any part is replaced, go to Step 10 .
9. Inspect A/T clutch pressure control solenoid valve A.

   Does A/T clutch pressure control solenoid valve A work properly?
   YES - Repair the hydraulic system related with shift valve A, or replace the transmission, then go to Step 10 .
   NO - Replace A/T clutch pressure control solenoid valve A, then go to Step 10 .
10. Clear the DTC with the HDS.
11. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears. Then slow down to a stop. Shift to N, wait for at least 3 seconds, then shift into R. Move the vehicle in reverse for at least 3 seconds, then slow down and stop the wheels.
12. Monitor the OBD status for P0746 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 10 and recheck. If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

DTC Troubleshooting: P0747 (76)

DTC P0747:
A/T Clutch Pressure Control Solenoid Valve A Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 10 .
   NO - Replace the ATF, then go to Step 4 .
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0747 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.
7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to Step 9 . If any part is replaced, go to Step 10 .
9. Inspect A/T clutch pressure control solenoid valve A.

   Does A/T clutch pressure control solenoid valve A work properly?
   YES - Repair the hydraulic system related with shift valve A, or replace the transmission, then go to Step 10 .
   NO - Replace A/T clutch pressure control solenoid valve A, then go to Step 10 .
10. Clear the DTC with the HDS.
11. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
12. Monitor the OBD status for P0747 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 10 and recheck. If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

DTC Troubleshooting: P0751 (70), P0752 (70)

DTC P0751:
Shift Solenoid Valve A Stuck OFF
DTC P0752:
Shift Solenoid Valve A Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 11 .
   NO - Replace the ATF, then go to Step 4 .
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0751 or P0752 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Shift Solenoid A in the Miscellaneous Test Menu, and check that shift solenoid valve A operates with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 9 .
   NO - Replace shift solenoid valve A, then go to Step 11 .
9. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
10. Monitor the OBD status for P0751 or P0752 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate FAILED?
    YES - Repair the hydraulic system related with shift valve A, or replace the transmission, then go to Step 11 .
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 9 and recheck.■
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
13. Monitor the OBD status for P0751 or P0752 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 11 and recheck. If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

DTC Troubleshooting: P0756 (71), P0757 (71)

DTC P0756:
Shift Solenoid Valve B Stuck OFF
DTC P0757:
Shift Solenoid Valve B Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 11.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0756 or P0757 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Shift Solenoid B in the Miscellaneous Test Menu, and check that shift solenoid valve B operates with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 9.
   NO - Replace shift solenoid valve B, then go to Step 11.
9. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
10. Monitor the OBD status for P0756 or P0757 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate FAILED?
    YES - Repair the hydraulic system related with shift valve B, or replace the transmission, then go to Step 11.
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 9 and recheck.■
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
13. Monitor the OBD status for P0756 or P0757 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 11 and recheck. If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

DTC Troubleshooting: P0761 (72), P0762 (72)

DTC P0761:
Shift Solenoid Valve C Stuck OFF
DTC P0762:
Shift Solenoid Valve C Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 11.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0761 or P0762 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Shift Solenoid C in the Miscellaneous Test Menu, and check that shift solenoid valve C operates with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 9.
   NO - Replace shift solenoid valve C, then go to Step 11.
9. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
10. Monitor the OBD status for P0761 or P0762 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail

    Does the HDS indicate FAILED?
    YES - Repair the hydraulic system related with shift valve C, or replace the transmission, then go to Step 11.
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 9 and recheck.■
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D for at least 12 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
13. Monitor the OBD status for P0761 or P0762 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 11 and recheck. If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

DTC Troubleshooting: P0766 (73)

DTC P0766:
Shift Solenoid Valve D Stuck OFF
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 11.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Start the engine, shift to N, then into R. Move the vehicle in reverse for at least 2 seconds, and stop the wheels. Shift to D, and test-drive the vehicle for at least 2 seconds, and let the transmission shift through all five gears, then slow down to a stop.
6. Monitor the OBD status for P0766 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Shift Solenoid D in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 9.
   NO - Replace shift solenoid valve D, then go to Step 11.
9. Start the engine, shift to N, then into R. Move the vehicle in reverse for at least 2 seconds, and stop the wheels. Shift to D, and test-drive the vehicle for at least 2 seconds, and let the transmission shift through all five gears, then slow down to a stop.
10. Monitor the OBD status for P0766 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate FAILED?
    YES - Repair the hydraulic system related with shift valve D, or replace the transmission, then go to Step 11.
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 9 and recheck.■
11. Clear the DTC with the HDS.
12. Start the engine, shift to N, then into R. Move the vehicle in reverse for at least 2 seconds, and stop the wheels. Shift to D, and test-drive the vehicle for at least 2 seconds, and let the transmission shift through all five gears, then slow down to a stop.
13. Monitor the OBD status for P0766 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 11 and recheck. If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

DTC Troubleshooting: P0767 (73)

DTC P0767:
Shift Solenoid Valve D Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 11.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 2 seconds, and let the transmission shift through all five gears. Then slow down to a stop. With the brake pedal pressed, shift into to R, and wait for at least 3 seconds.
6. Monitor the OBD status for P0767 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Shift Solenoid D in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 9.
   NO - Replace shift solenoid valve D, then go to Step 11.
9. Test-drive the vehicle with the shift lever in D for at least 2 seconds, and let the transmission shift through all five gears. Then slow down to a stop. With the brake pedal pressed, shift into to R, and wait for at least 3 seconds.
10. Monitor the OBD status for P0767 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate FAILED?
    YES - Repair the hydraulic system related with shift valve D, or replace the transmission, then go to Step 11.
    NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 9 and recheck.■
11. Clear the DTC with the HDS.
12. Test-drive the vehicle with the shift lever in D for at least 2 seconds, and let the transmission shift through all five gears. Then slow down to a stop. With the brake pedal pressed, shift into to R, and wait for at least 3 seconds.
13. Monitor the OBD status for P0767 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 11 and recheck. If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

DTC Troubleshooting: P0776 (77), P0777 (77)

DTC P0776:
A/T Clutch Pressure Control Solenoid Valve B Stuck OFF
DTC P0777:
A/T Clutch Pressure Control Solenoid Valve B Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 10 .
   NO - Replace the ATF, then go to Step 4 .
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0776 or P0777 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.
7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

   Does the HDS indicate NORMAL?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to Step 9 . If any part is replaced, go to Step 10 .
9. Inspect A/T clutch pressure control solenoid valve A.

   Does A/T clutch pressure control solenoid valve B work properly?
   YES - Repair the hydraulic system related with shift valve B, or replace the transmission, then go to Step 11 .
   NO - Replace A/T clutch pressure control solenoid valve B, then go to Step 10 .
10. Clear the DTC with the HDS.
11. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
12. Monitor the OBD status for P0776 or P0777 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 10 and recheck. If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

DTC Troubleshooting: P0796 (78), P0797 (78)

DTC P0796:
A/T Clutch Pressure Control Solenoid Valve C Stuck OFF
DTC P0797:
A/T Clutch Pressure Control Solenoid Valve C Stuck ON
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 10 .
   NO - Replace the ATF, then go to Step 4 .
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P0796 or P0797 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

   Does the HDS indicate NORMAL?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to Step 9 . If any part is replaced, go to Step 10 .
9. Inspect A/T clutch pressure control solenoid valve C.

   Does A/T clutch pressure control solenoid valve C work properly?
   YES - Repair the hydraulic system related with shift valve C, or replace the transmission, then go to Step 10 .
   NO - Replace A/T clutch pressure control solenoid valve C, then go to Step 10 .
10. Clear the DTC with the HDS.
11. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
12. Monitor the OBD status for P0796 or P0797 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?
    YES - Troubleshooting is complete.■
    NO - Return to Step 10 and recheck. If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

DTC Troubleshooting: P0812 (65)

DTC P0812:
Transmission Range Switch ATP R Switch (Open)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to R, and verify the A/T R Switch signal with the HDS in the A/T data list.

   Is the A/T R Switch ON?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the transmission range switch connector.
5. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

   Is there continuity?
   YES - Go to Step 6
   NO - Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101), or repair poor ground (G101), then go to Step 14 .
6. Turn the ignition switch to ON (II).

---

7. Measure the voltage between transmission range switch connector terminals No. 7 and No. 10.

   Is there voltage?
   YES - Go to Step 8 .
   NO - Repair open in the wire between PCM connector terminal B15 and the transmission range switch, then go to Step 14 .

---

8. Check for continuity between transmission range switch connector terminals No. 7 and No. 10 while the shift lever is in R, and when the shift lever is shifted to any position other than R.

Is there continuity while the shift lever is in R, and no continuity when the shift lever is shifted to any position other than R?
   YES - Go to Step 9
   NO - Replace the transmission range switch, then go to Step 14 .

9. Connect the transmission range switch connector.

10. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

11. Start the engine, shift to R while pressing the brake pedal, and wait for at least 2 seconds. Move the vehicle in reverse at speeds below 5 km/h (3 mph) for at least 2 seconds, then increase the speed and move at speeds over 5 km/h (3 mph) for at least 2 seconds. Slow down and stop the wheels.

12. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0812 indicated?
   YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
   NO - Go to Step 13 .

13. Monitor the OBD status for P0812 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 12 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 11 and recheck.

14. Connect the transmission range switch connector.

15. Clear the DTC with the HDS.

16. Start the engine, shift to R while pressing the brake pedal, and wait for at least 2 seconds. Move the vehicle in reverse at speeds below 5 km/h (3 mph) for at least 2 seconds, then increase the speed and move at speeds over 5 km/h (3 mph) for at least 2 seconds. Slow down and stop the wheels.

17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0812 indicated?

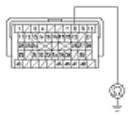
   YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 .
   NO - Go to Step 18 .

18. Monitor the OBD status for P0812 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
   YES - Troubleshooting is complete. If any other DTCs were indicated on Step 17 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 16 and recheck.

DTC Troubleshooting: P0842 (25)

DTC P0842:
2nd Clutch Transmission Fluid Pressure Switch (Short or Stuck ON)



NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check the 2nd Pressure Switch signal with the HDS in the A/T data list when not in 2nd gear.

   Is the 2nd Pressure Switch OFF?
   YES - Go to Step 3 .
   NO - Go to Step 6 .
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 3rd gear in D or D3 for at least 2 seconds, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, or in D, then slow down to a stop.
5. Monitor the OBD status for P0842 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check the OP2SW wire for an intermittent short to ground between the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the 2nd clutch transmission fluid pressure switch connector.
8. Turn the ignition switch to ON (II).
9. Check the 2nd Pressure Switch signal with the HDS in the A/T data list.

   Is the 2nd Pressure Switch OFF?
   YES - Replace the 2nd clutch transmission fluid pressure switch, then go to Step 20 .
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector B (49P).
13. Check for continuity between PCM connector terminal B8 and body ground.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch, then go to Step 20 .
    NO - Go to Step 14 .
14. Reconnect all connectors.
15. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
16. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
17. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0842 indicated?
    YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
    NO - Go to Step 19 .
19. Monitor the OBD status for P0842 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

20. Reconnect all connectors.

21. Clear the DTC with the HDS.

22. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

23. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0842 indicated?

    YES - Check for an intermittent short in the wire between the 2nd clutch transmission fluid pressure switch and the PCM, then go to Step 1 .

    NO - Go to Step 25 .

25. Monitor the OBD status for P0842 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other DTCs were indicated on Step 24 , go to the indicated DTC's troubleshooting.■

    NO - Check for an intermittent short in the wire between the 2nd clutch transmission fluid pressure switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 23 and recheck.

DTC Troubleshooting: P0843 (25)

DTC P0843:
2nd Clutch Transmission Fluid Pressure Switch (Open or Stuck OFF)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
3. Shift into 2nd gear, and verify Shift Control display in the HDS:
   - Seven-position transmission: Shift to 2 while pressing the brake pedal, and verify with the HDS in the A/T data list that the Shift Control indicates 2nd.
   - Five-position transmission: Shift to S while pressing the brake pedal, upshift to 2nd gear by pulling the paddle shifter + (upshift switch), and verify with the HDS in the A/T data list that the Shift Control indicates 2nd.
4. Check the 2nd Pressure Switch signal with the HDS in the A/T data list.

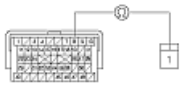
   Is the 2nd Pressure Switch ON?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 2 for at least 2 seconds, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 2 seconds, then slow down to a stop.
6. Monitor the OBD status for P0843 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 8 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.
7. Measure the 2nd clutch pressure.

   Is the 2nd clutch pressure within the service limits?
   YES - Go to Step 8 .
   NO - Repair shift valves A, B, and C, and related hydraulic circuit, or replace the transmission, then go to Step 22 .
8. Turn the ignition switch to LOCK (0).
9. Disconnect the 2nd clutch transmission fluid pressure switch connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the 2nd clutch transmission fluid pressure switch connector terminal and body ground.

    Is there about 5 V?
    YES - Replace the 2nd clutch transmission fluid pressure switch, then go to Step 22 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector B (49P).

15. Check for continuity between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch connector terminal.



Is there continuity?

YES - Go to Step 16 .

NO - Repair open in the wire between PCM connector terminal B8 and the 2nd clutch transmission fluid pressure switch, then go to Step 22 .

16. Reconnect all connectors.

17. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

18. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

19. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0843 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 21 .

21. Monitor the OBD status for P0843 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

22. Reconnect all connectors.

23. Clear the DTC with the HDS.

24. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

25. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0843 indicated?

YES - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to Step 1 .

NO - Go to Step 27 .

27. Monitor the OBD status for P0843 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

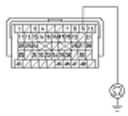
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 26 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 25 and recheck.

DTC Troubleshooting: P0847 (26)

DTC P0847:
3rd Clutch Transmission Fluid Pressure Switch (Short or Stuck ON)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check the 3rd Pressure Switch signal with the HDS in the A/T data list when not in 3rd gear.

   Is the 3rd Pressure Switch OFF?
   YES - Go to Step 3 .
   NO - Go to Step 6 .
3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 4th gear in D for at least 2 seconds, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 4th gear in the sequential shift mode in S for at least 2 seconds, then slow down to a stop.
5. Monitor the OBD status for P0847 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check the OP3SW wire for an intermittent short to ground between the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the 3rd clutch transmission fluid pressure switch connector.
8. Turn the ignition switch to ON (II).
9. Check the 3rd Pressure Switch signal with the HDS in the A/T data list.

   Is the 3rd Pressure Switch OFF?
   YES - Replace the 3rd clutch transmission fluid pressure switch, then go to Step 20 .
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector B (49P).
13. Check for continuity between PCM connector terminal B9 and body ground.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B9 and the 3rd clutch transmission fluid pressure switch, then go to Step 20 .
    NO - Go to Step 14 .
14. Reconnect all connectors.
15. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
16. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
17. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 3rd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
18. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0847 indicated?
    YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
    NO - Go to Step 19 .
19. Monitor the OBD status for P0847 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

20. Reconnect all connectors.

21. Clear the DTC with the HDS.

22. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

23. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 3rd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

24. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0847 indicated?

    YES - Check for an intermittent short in the wire between the 3rd clutch transmission fluid pressure switch and the PCM, then go to Step 1 .

    NO - Go to Step 25 .

25. Monitor the OBD status for P0847 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other DTCs were indicated on Step 24 , go to the indicated DTC's troubleshooting.■

    NO - Check for an intermittent short in the wire between the 3rd clutch transmission fluid pressure switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 23 and recheck.

DTC Troubleshooting: P0848 (26)

DTC P0848:
3rd Clutch Transmission Fluid Pressure Switch (Open or Stuck OFF)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
3. Verify Shift Control display in the HDS while driving in 3rd gear:
   - Seven-position transmission: Drive the vehicle in 3rd gear in D3, and verify with the HDS in the A/T data list that the Shift Control indicates 3rd.
   - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S, and verify with the HDS in the A/T data list that the Shift Control indicates 3rd.
4. Check the 3rd Pressure Switch signal with the HDS in the A/T data list.

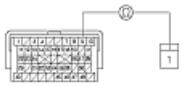
   Is the 3rd Pressure Switch ON?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 3rd gear in D3 for at least 2 seconds, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, then slow down to a stop.
6. Monitor the OBD status for P0848 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 8 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.
7. Measure the 3rd clutch pressure.

   Is the 3rd clutch pressure within the service limits?
   YES - Go to Step 8 .
   NO - Repair shift valves A, B, and C, and related hydraulic circuit, or replace the transmission, then go to Step 22 .
8. Turn the ignition switch to LOCK (0).
9. Disconnect the 3rd clutch transmission fluid pressure switch connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the 3rd clutch transmission fluid pressure switch connector terminal and body ground.

    Is there about 5 V?
    YES - Replace the 3rd clutch transmission fluid pressure switch, then go to Step 22 .
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector B (49P).

15. Check for continuity between PCM connector terminal B9 and the 3rd clutch transmission fluid pressure switch connector terminal.



Is there continuity?

YES - Go to Step 16 .

NO - Repair open in the wire between PCM connector terminal B9 and the 3rd clutch transmission fluid pressure switch, then go to Step 22 .

16. Reconnect all connectors.

17. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

18. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

19. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 3rd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0848 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 21 .

21. Monitor the OBD status for P0848 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

22. Reconnect all connectors.

23. Clear the DTC with the HDS.

24. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

25. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 3rd gear in D for at least 2 seconds, then press the accelerator pedal so that the transmission upshifts into 4th gear, and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 3rd gear in the sequential shift mode in S for at least 2 seconds, then upshift to 4th gear by pulling the paddle shifter + (upshift switch), and drive in 4th gear for at least 2 seconds. Slow down and stop the wheels.

26. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0848 indicated?

YES - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to Step 1 .

NO - Go to Step 27 .

27. Monitor the OBD status for P0848 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 26 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 25 and recheck.

DTC Troubleshooting: P0962 (16)

DTC P0962:
A/T Clutch Pressure Control Solenoid Valve A (Open or Short)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0962 recurs.

   Is DTC P0962 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve A at 1.0 A.
5. Monitor the OBD status for P0962 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve A connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve A, then go to Step 19 .

---

9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101), or repair poor ground (G101), then go to Step 19 .
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector B (49P).

---

12. Check for continuity between PCM connector terminal B40 and A/T clutch pressure control solenoid valve A connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B40 and A/T clutch pressure control solenoid valve A, then go to Step 19 .

---

13. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 1 and body ground.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B40 and A/T clutch pressure control solenoid valve A, then go to Step 19 .

NO - Go to Step 14 .

14. Reconnect all connectors.

15. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

16. Start the engine, and wait for at least 1 second.

17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0962 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 18 .

18. Monitor the OBD status for P0962 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 17 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 16 and recheck.

19. Reconnect all connectors.

20. Clear the DTC with the HDS.

21. Start the engine, and wait for at least 1 second.

22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0962 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to Step 1 .

NO - Go to Step 23 .

23. Monitor the OBD status for P0962 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 22 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 21 and recheck.

DTC Troubleshooting: P0963 (16)

DTC P0963:
A/T Clutch Pressure Control Solenoid Valve A
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0963 recurs.

   Is DTC P0963 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve A at 0.2 A.
5. Monitor the OBD status for P0963 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve A connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve A, then go to Step 15 .

9. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

Is there continuity?

YES - Go to Step 10 .

NO - Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101), or repair poor ground (G101), then go to Step 15 .

10. Connect the A/T clutch pressure control solenoid valve A connector.

11. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

12. Start the engine, and wait for at least 1 second.

13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0963 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 14 .

14. Monitor the OBD status for P0963 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 13 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

15. Connect the A/T clutch pressure control solenoid valve A connector.

16. Clear the DTC with the HDS.

17. Start the engine, and wait for at least 1 second.

18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0963 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to Step 1 .

NO - Go to Step 19 .

19. Monitor the OBD status for P0963 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

DTC Troubleshooting: P0966 (23)

DTC P0966:
A/T Clutch Pressure Control Solenoid Valve B (Open or Short)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0966 recurs.

   Is DTC P0966 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve B at 1.0 A.
5. Monitor the OBD status for P0966 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve B connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve B, then go to Step 19 .

---

9. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between A/T clutch pressure control solenoid valve B and ground (G101), or repair poor ground (G101), then go to Step 19 .
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector B (49P).

---

12. Check for continuity between PCM connector terminal B48 and A/T clutch pressure control solenoid valve B connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B48 and A/T clutch pressure control solenoid valve B, then go to Step 19 .

---

13. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 1 and body ground.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B48 and A/T clutch pressure control solenoid valve B, then go to Step 19 .

NO - Go to Step 14 .

14. Reconnect all connectors.

15. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

16. Start the engine, and wait for at least 1 second.

17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0966 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 18 .

18. Monitor the OBD status for P0966 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 17 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 16 and recheck.

19. Reconnect all connectors.

20. Clear the DTC with the HDS.

21. Start the engine, and wait for at least 1 second.

22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0966 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to Step 1 .

NO - Go to Step 23 .

23. Monitor the OBD status for P0966 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 22 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 21 and recheck.

DTC Troubleshooting: P0967 (23)

DTC P0967:
A/T Clutch Pressure Control Solenoid Valve B
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0967 recurs.

   Is DTC P0967 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve B at 0.2 A.
5. Monitor the OBD status for P0967 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve B connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve B, then go to Step 15 .

9. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

Is there continuity?

YES - Go to Step 10 .

NO - Repair open in the wire between A/T clutch pressure control solenoid valve B and ground (G101), or repair poor ground (G101), then go to Step 15 .

10. Connect the A/T clutch pressure control solenoid valve B connector.

11. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

12. Start the engine, and wait for at least 1 second.

13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0967 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 14 .

14. Monitor the OBD status for P0967 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 13 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

15. Connect the A/T clutch pressure control solenoid valve B connector.

16. Clear the DTC with the HDS.

17. Start the engine, and wait for at least 1 second.

18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0967 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to Step 1 .

NO - Go to Step 19 .

19. Monitor the OBD status for P0967 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

DTC Troubleshooting: P0970 (29)

DTC P0970:
A/T Clutch Pressure Control Solenoid Valve C (Open or Short)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0970 recurs.

   Is DTC P0970 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve C at 1.0 A.
5. Monitor the OBD status for P0970 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve C connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve C, then go to Step 19 .

---

9. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101), or repair poor ground (G101), then go to Step 19 .
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector B (49P).

---

12. Check for continuity between PCM connector terminal B26 and A/T clutch pressure control solenoid valve C connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B26 and A/T clutch pressure control solenoid valve C, then go to Step 19 .

---

13. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 1 and body ground.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B26 and A/T clutch pressure control solenoid valve C, then go to Step 19 .

NO - Go to Step 14 .

14. Reconnect all connectors.

15. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

16. Start the engine, and wait for at least 1 second.

17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0970 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 18 .

18. Monitor the OBD status for P0970 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 17 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, go to Step 16 and recheck.

19. Reconnect all connectors.

20. Clear the DTC with the HDS.

21. Start the engine, and wait for at least 1 second.

22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0970 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to Step 1 .

NO - Go to Step 23 .

23. Monitor the OBD status for P0970 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 22 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 21 and recheck.

DTC Troubleshooting: P0971 (29)

DTC P0971:
A/T Clutch Pressure Control Solenoid Valve C
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check that DTC P0971 recurs.

   Is DTC P0971 indicated?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

   Does the HDS indicate NORMAL?
   YES - Go to Step 4 .
   NO - Go to Step 6 .
4. In the Clutch Pressure Control Solenoid Control menu, select Clutch Pressure Control Solenoid Valve C at 0.2 A.
5. Monitor the OBD status for P0971 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to Step 3 and recheck.
6. Turn the ignition switch to LOCK (0).
7. Disconnect the A/T clutch pressure control solenoid valve C connector.
8. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

   Is there 3−10 Ω?
   YES - Go to Step 9 .
   NO - Replace A/T clutch pressure control solenoid valve C, then go to Step 15 .

9. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

Is there continuity?
YES - Go to Step 10 .
NO - Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101), or repair poor ground (G101), then go to Step 12 .

10. Connect the A/T clutch pressure control solenoid valve C connector.

11. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

12. Start the engine, and wait for at least 1 second.

13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0971 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 14 .

14. Monitor the OBD status for P0971 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 13 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

15. Connect the A/T clutch pressure control solenoid valve C connector.

16. Clear the DTC with the HDS.

17. Start the engine, and wait for at least 1 second.

18. Check for Temporary DTCs or DTCs with the HDS.

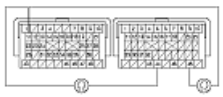
Is DTC P0971 indicated?
YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to Step 1 .
NO - Go to Step 19 .

19. Monitor the OBD status for P0971 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

DTC Troubleshooting: P0973 (7)

DTC P0973:
Shift Solenoid Valve A (Short)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D, then slow down to a stop.
3. Check that DTC P0973 recurs.

   Is DTC P0973 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid A in the Miscellaneous Test Menu, and test the shift solenoid valve A with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
   - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.
6. Monitor the OBD status for P0973 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check the SH A wire for an intermittent short to ground between shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B11 and C44 or C48.

    Is there less than 12 Ω?
    YES - Go to Step 11 .
    NO - Go to Step 17 .
11. Disconnect the shift solenoid harness connector.

---

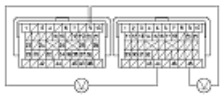
12. Check for continuity between PCM connector terminals B11 and C44 or C48.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B11 and the shift solenoid harness connector, then go to Step 22 .
    NO - Go to Step 13 .
13. Inspect shift solenoid valve A.

    Is shift solenoid valve A OK?
    YES - Go to Step 14 .
    NO - Replace shift solenoid valve A or the shift solenoid harness, then go to Step 22 .
14. Disconnect PCM connector A (49P).
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between PCM connector terminals A9 and C44 or C48.



Is there battery voltage?

YES - Go to Step 17 .

NO - Check for a blown No. 39 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, check the PGM-FI main relay, and repair open or short in the wire between PCM connector terminal A9 and the under-dash fuse/relay box, then go to Step 22 .

17. Reconnect all connectors.

18. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

19. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.

20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0973 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 21 .

21. Monitor the OBD status for P0973 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

22. Reconnect all connectors.

23. Clear the DTC with the HDS.

24. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
    - Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.

25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0973 indicated?

YES - Check for an intermittent short in the wire between shift solenoid valve A and the PCM, then go to Step 1 .

NO - Go to Step 26 .

26. Monitor the OBD status for P0973 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

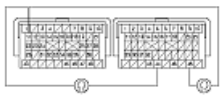
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 25 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve A and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 24 and recheck.

DTC Troubleshooting: P0974 (7)

DTC P0974:
Shift Solenoid Valve A (Open)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P, and wait for at least 1 second.
3. Check that DTC P0974 recurs.

   Is DTC P0974 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid A in the Miscellaneous Test Menu, and test shift solenoid valve A with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine in P, and wait for at least 1 second. Then:
   - Seven-position transmission: Test-drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
   - Five-position transmission: Test-drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.
6. Monitor the OBD status for P0974 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B11 and C44 or C48.

    Is there 12–25 Ω?
    YES - Go to Step 15 .
    NO - Go to Step 11 .
11. Disconnect the shift solenoid harness connector.

---

12. Check for continuity between PCM connector terminal B11 and shift solenoid harness connector terminal No. 5.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B11 and the shift solenoid harness connector, then go to Step 25 .
13. Remove the shift solenoid harness.

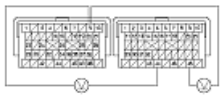
---

14. Check for continuity between shift solenoid harness connector terminal No. 5 and the shift solenoid valve A connector terminal.

    Is there continuity?
    YES - Replace shift solenoid valve A, then go to Step 25 .
    NO - Replace the shift solenoid harness, then go to Step 25 .
15. Disconnect PCM connector A (49P).
16. Turn the ignition switch to ON (II).

---

17. Measure the voltage between PCM connector terminals A9 and C44 or C48.

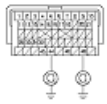


Is there battery voltage?
YES - Go to Step 20 .
NO - Go to Step 18 .

18. Turn the ignition switch to LOCK (0).

---

19. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.



Is there continuity?
YES - Check for a blown No. 39 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, check the PGM-FI main relay, and repair open or short in the wire between PCM connector terminal A9 and the under-dash fuse/relay box, then go to Step 25 .
NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 25 .

20. Connect PCM connectors.

21. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

22. Test-drive the vehicle:
- Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
- Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.

23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0974 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 24 .

24. Monitor the OBD status for P0974 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 23 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 22 and recheck.

25. Reconnect all connectors.

26. Clear the DTC with the HDS.

27. Test-drive the vehicle:
- Seven-position transmission: Drive the vehicle in 2nd gear in D, D3, or 2 for at least 1 second. Slow down to a stop, and wait for at least 1 second.
- Five-position transmission: Drive the vehicle in 2nd gear in the sequential shift mode in S for at least 1 second, or in D. Slow down to a stop, and wait for at least 1 second.

28. Check for Temporary DTCs or DTCs with the HDS.

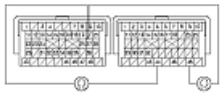
Is DTC P0974 indicated?
YES - Check for poor connections and loose terminals at shift solenoid valve A and the PCM, then go to Step 1 .
NO - Go to Step 29 .

29. Monitor the OBD status for P0974 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 28 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve A and the PCM, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 27 and recheck.

DTC Troubleshooting: P0976 (8)

DTC P0976:
Shift Solenoid Valve B (Short)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 1st gear in D, D3, or 1 for at least 1 second, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, or in D, then slow down to a stop.
3. Check that DTC P0976 recurs.

   Is DTC P0976 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
   - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
6. Monitor the OBD status for P0976 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check the SH B wire for an intermittent short to ground between shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B27 and C44 or C48.

    Is there less than 12 Ω?
    YES - Go to Step 11 .
    NO - Go to Step 17 .
11. Disconnect the shift solenoid harness connector.

---

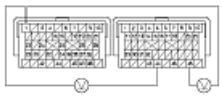
12. Check for continuity between PCM connector terminals B27 and C44 or C48.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B27 and the shift solenoid harness connector, then go to Step 22 .
    NO - Go to Step 13 .
13. Inspect shift solenoid valve B.

    Is shift solenoid valve B OK?
    YES - Go to Step 14 .
    NO - Replace shift solenoid valve B or the shift solenoid harness, then go to Step 22 .
14. Disconnect PCM connector A (49P).
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between PCM connector terminals A1 and C44 or C48.



Is there battery voltage?

YES - Go to Step 17 .

NO - Check for a blown No. 7 (10 A) fuse in the under-hood fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal A1 and the under-hood fuse/relay box, then go to Step 22 .

17. Reconnect all connectors.

18. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

19. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.

20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0976 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 21 .

21. Monitor the OBD status for P0976 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

22. Reconnect all connectors.

23. Clear the DTC with the HDS.

24. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.

25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0976 indicated?

YES - Check for an intermittent short in the wire between shift solenoid valve B and the PCM, then go to Step 1 .

NO - Go to Step 26 .

26. Monitor the OBD status for P0976 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

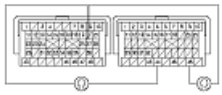
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 25 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve B and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 24 and recheck.

DTC Troubleshooting: P0977 (8)

DTC P0977:
Shift Solenoid Valve B (Open)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop.
3. Check that DTC P0977 recurs.

   Is DTC P0977 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
   - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
6. Monitor the OBD status for P0977 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B27 and C44 or C48.

    Is there 12–25 Ω?
    YES - Go to Step 15 .
    NO - Go to Step 11 .
11. Disconnect the shift solenoid harness connector.

---

12. Check for continuity between PCM connector terminal B27 and shift solenoid harness connector terminal No. 2.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B27 and the shift solenoid harness connector, then go to Step 25 .
13. Remove the shift solenoid harness.

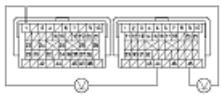
---

14. Check for continuity between shift solenoid harness connector terminal No. 2 and the shift solenoid valve B connector terminal.

    Is there continuity?
    YES - Replace shift solenoid valve B, then go to Step 25 .
    NO - Replace the shift solenoid harness, then go to Step 25 .
15. Disconnect PCM connector A (49P).
16. Turn the ignition switch to ON (II).

---

17. Measure the voltage between PCM connector terminals A1 and C44 or C48.

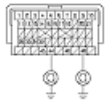


Is there battery voltage?
YES - Go to Step 20 .
NO - Go to Step 18 .

18. Turn the ignition switch to LOCK (0).

---

19. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.



Is there continuity?
YES - Check for a blown No. 7 (10 A) fuse in the under-hood fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal A1 and the under-hood fuse/relay box, then go to Step 25 .
NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 25 .

20. Connect PCM connectors.

21. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

22. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.

23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0977 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 24 .

24. Monitor the OBD status for P0977 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 23 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 22 and recheck.

25. Reconnect all connectors.

26. Clear the DTC with the HDS.

27. Test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in 1st gear in D3 for at least 1 second, then press the accelerator pedal so that the transmission upshifts into 3rd gear, and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.
    - Five-position transmission: Drive the vehicle in 1st gear in the sequential shift mode in S for at least 1 second, then upshift to 3rd gear by pulling the paddle shifter + (upshift switch), and drive in 3rd gear for at least 1 second. Slow down and stop the wheels.

28. Check for Temporary DTCs or DTCs with the HDS.

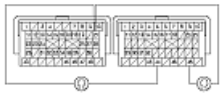
Is DTC P0977 indicated?
YES - Check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to Step 1 .
NO - Go to Step 29 .

29. Monitor the OBD status for P0977 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 28 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 27 and recheck.

DTC Troubleshooting: P0979 (22)

DTC P0979:
Shift Solenoid Valve C (Short)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop.
   - Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop.
3. Check that DTC P0979 recurs.

   Is DTC P0979 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine, and test-drive the vehicle:
   - Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears, then slow down to a stop. Shift into P, and wait for at least 1 second.
   - Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S, then slow down to a stop. Shift into P, and wait for at least 1 second.
6. Monitor the OBD status for P0979 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check the SH C wire for an intermittent short to ground between shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B21 and C44 or C48.

    Is there less than 12 Ω?
    YES - Go to Step 11 .
    NO - Go to Step 17 .
11. Disconnect the shift solenoid harness connector.

---

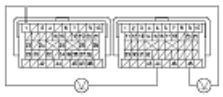
12. Check for continuity between PCM connector terminals B21 and C44 or C48.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B21 and the shift solenoid harness connector, then go to Step 22 .
    NO - Go to Step 13 .
13. Inspect shift solenoid valve C.

    Is shift solenoid valve C OK?
    YES - Go to Step 14 .
    NO - Replace shift solenoid valve C or the shift solenoid harness, then go to Step 22 .
14. Disconnect PCM connector A (49P).
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between PCM connector terminals A1 and C44 or C48.



Is there battery voltage?

YES - Go to Step 17 .

NO - Check for a blown No. 7 (10 A) fuse in the under-hood fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal A1 and the under-hood fuse/relay box, then go to Step 22 .

17. Connect PCM connectors.

18. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

19. Start the engine, and test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears, then slow down to a stop. Shift into P, and wait for at least 1 second.
    - Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S, then slow down to a stop. Shift into P, and wait for at least 1 second.

20. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0979 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 21 .

21. Monitor the OBD status for P0979 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 20 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 19 and recheck.

22. Reconnect all connectors.

23. Clear the DTC with the HDS.

24. Start the engine, and test-drive the vehicle:
    - Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears, then slow down to a stop. Shift into P, and wait for at least 1 second.
    - Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S, then slow down to a stop. Shift into P, and wait for at least 1 second.

25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0979 indicated?

YES - Check for an intermittent short in the wire between shift solenoid valve C and the PCM, then go to Step 1 .

NO - Go to Step 26 .

26. Monitor the OBD status for P0979 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

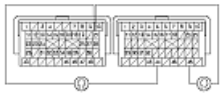
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 25 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve C and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 24 and recheck.

DTC Troubleshooting: P0980 (22)

DTC P0980:
Shift Solenoid Valve C (Open)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P, and wait for at least 1 second.
3. Check that DTC P0980 recurs.

   Is DTC P0980 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine in P, and wait for at least 1 second. Then:
   - Seven-position transmission: Test-drive the vehicle in D3, and let the transmission shift through all three gears. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.
   - Five-position transmission: Test-drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.
6. Monitor the OBD status for P0980 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B21 and C44 or C48.

    Is there 12−25 Ω?
    YES - Go to Step 15 .
    NO - Go to Step 11 .
11. Disconnect the shift solenoid harness connector.

---

12. Check for continuity between PCM connector terminal B21 and shift solenoid harness connector terminal No. 1.

    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B21 and the shift solenoid harness connector, then go to Step 25 .
13. Remove the shift solenoid harness.

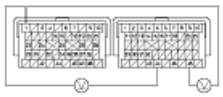
---

14. Check for continuity between shift solenoid harness connector terminal No. 1 and the shift solenoid valve C connector terminal.

    Is there continuity?
    YES - Replace shift solenoid valve C, then go to Step 25 .
    NO - Replace the shift solenoid harness, then go to Step 25 .
15. Disconnect PCM connector A (49P).
16. Turn the ignition switch to ON (II).

---

17. Measure the voltage between PCM connector terminals A1 and C44 or C48.

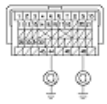


Is there battery voltage?
YES - Go to Step 20 .
NO - Go to Step 18 .

18. Turn the ignition switch to LOCK (0).

---

19. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.



Is there continuity?
YES - Check for a blown No. 7 (10 A) fuse in the under-hood fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal A1 and the under-hood fuse/relay box, then go to Step 25 .
NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 25 .

20. Connect PCM connectors.

21. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

22. Test-drive the vehicle:
- Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.
- Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.

23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0980 indicated?
YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
NO - Go to Step 24 .

24. Monitor the OBD status for P0980 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 23 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 22 and recheck.

25. Clear the DTC with the HDS.

26. Test-drive the vehicle:
- Seven-position transmission: Drive the vehicle in D3, and let the transmission shift through all three gears. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.
- Five-position transmission: Drive the vehicle in 1st thru 3rd gears in the sequential shift mode in S. Drive the vehicle in 3rd gear for at least 1 second, then slow down to a stop. Shift into P, and wait for at least 1 second.

27. Check for Temporary DTCs or DTCs with the HDS.

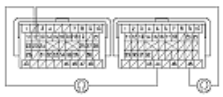
Is DTC P0980 indicated?
YES - Check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to Step 1 .
NO - Go to Step 28 .

28. Monitor the OBD status for P0980 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
YES - Troubleshooting is complete. If any other DTCs were indicated on Step 27 , go to the indicated DTC's troubleshooting.■
NO - Check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 26 and recheck.

DTC Troubleshooting: P0982 (60)

DTC P0982:
Shift Solenoid Valve D (Short)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P, and wait for at least 1 second.
3. Check that DTC P0982 recurs.

   Is DTC P0982 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.
6. Monitor the OBD status for P0982 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check the SH D wire for an intermittent short to ground between shift solenoid valve E and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B12 and C44 or C48.

    Is there less than 12 Ω?
    YES - Go to Step 11 .
    NO - Go to Step 16 .
11. Disconnect the shift solenoid harness connector.

---

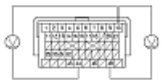
12. Check for continuity between PCM connector terminals B12 and C44 or C48.

    Is there continuity?
    YES - Repair short in the wire between PCM connector terminal B12 and the shift solenoid harness connector, then go to Step 21 .
    NO - Go to Step 13 .
13. Inspect shift solenoid valve D.

    Is shift solenoid valve D OK?
    YES - Go to Step 14 .
    NO - Replace shift solenoid valve D or the shift solenoid harness , then go to Step 21 .
14. Turn the ignition switch to ON (II).

---

15. Measure the voltage between PCM connector terminals C10 and C44 or C48.



Is there battery voltage?

YES - Go to Step 16 .

NO - Check for a blown No. 20 (15 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal C10 and the under-dash fuse/relay box, then go to Step 21 .

16. Reconnect all connectors.

17. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

18. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.

19. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0982 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 20 .

20. Monitor the OBD status for P0982 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 19 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 18 and recheck.

21. Reconnect all connectors.

22. Clear the DTC with the HDS.

23. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.

24. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0982 indicated?

YES - Check for an intermittent short in the wire between shift solenoid valve D and the PCM, then go to Step 1 .

NO - Go to Step 25 .

25. Monitor the OBD status for P0982 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

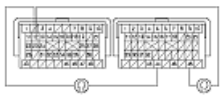
Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 24 , go to the indicated DTC's troubleshooting.■

NO - Check for an intermittent short in the wire between shift solenoid valve D and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 23 and recheck.

DTC Troubleshooting: P0983 (60)

DTC P0983:
Shift Solenoid Valve D (Open)
NOTE:



- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P. With the brake pedal pressed, shift to N, and wait for at least 1 second.
3. Check that DTC P0983 recurs.

   Is DTC P0983 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 4 .
4. Select Shift Solenoid D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

   Is a clicking sound heard?
   YES - Go to Step 5 .
   NO - Go to Step 7 .
5. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.
6. Monitor the OBD status for P0983 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve D and the PCM. If the HDS indicates NOT COMPLETED, return to Step 4 and recheck.
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals B12 and C44 or C48.

    Is there 12−25 Ω?
    YES - Go to Step 15 .
    NO - Go to Step 11 .
11. Disconnect the shift solenoid harness connector.

---

12. Check for continuity between PCM connector terminal B12 and shift solenoid harness connector terminal No. 8.

    
    Is there continuity?
    YES - Go to Step 13 .
    NO - Repair open in the wire between PCM connector terminal B12 and the shift solenoid harness connector, then go to Step 24 .
13. Remove the shift solenoid harness.

---

14. Check for continuity between shift solenoid harness connector terminal No. 8 and the shift solenoid valve D connector terminal.

    
    Is there continuity?
    YES - Replace shift solenoid valve D, then go to Step 24 .
    NO - Replace the shift solenoid harness, then go to Step 24 .
15. Turn the ignition switch to ON (II).

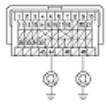
---

16. Measure the voltage between PCM connector terminals C10 and C44 or C48.

    
    Is there battery voltage?
    YES - Go to Step 19 .
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).

---

18. Check for continuity between PCM connector terminals C44 and body ground, and between C48 and body ground.



Is there continuity?

YES - Check for a blown No. 20 (15A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short in the wire between PCM connector terminal C10 and the under-dash fuse/relay box, then go to Step 24 .

NO - Repair open in the wires between PCM connector terminals C44, C48 and ground (G101), or repair poor ground (G101), then go to Step 24 .

19. Connect PCM connectors.

20. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

21. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.

22. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0983 indicated?

YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .

NO - Go to Step 23 .

23. Monitor the OBD status for P0983 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 22 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 21 and recheck.

24. Reconnect all connectors.

25. Clear the DTC with the HDS.

26. Start the engine in P, and wait for at least 1 second. With the brake pedal pressed, shift to N, and wait for at least 1 second.

27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0983 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to Step 1 .

NO - Go to Step 28 .

28. Monitor the OBD status for P0983 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on Step 27 , go to the indicated DTC's troubleshooting.■

NO - Check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 26 and recheck.

DTC Troubleshooting: P16C0

DTC P16C0:
PCM A/T Control System Incomplete Update
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is indicated when PCM updating is incomplete.

1. Update the A/T software in the PCM.
2. Check whether the DTC P16C0 is indicated in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

   Is DTC P16C0 indicated?
   YES - Replace the original PCM. ■
   NO - PCM updating is complete.■

DTC Troubleshooting: P1717 (62)

DTC P1717:
Transmission Range Switch ATP RVS Switch (Open)
NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to R, and verify the A/T R Switch signal with the HDS in the A/T data list.

   Is the A/T R Switch ON?
   YES - Go to Step 3 .
   NO - Check for proper transmission range switch installation, and adjust the shift cable, then recheck.■
3. Check the Reverse Switch (ATP RVS) signal with the HDS.

   Is the Reverse Switch (ATP RVS) ON?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 4 .
4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission range switch connector.
6. Check for continuity between transmission range switch connector terminal No. 10 and body ground.

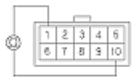
   Is there continuity?
   YES - Go to Step 7 .
   NO - Repair open in the wire between transmission range switch connector terminal No. 10 and ground (G101), or repair poor ground (G101), then go to Step 15 .
7. Turn the ignition switch to ON (II).

---

8. Measure the voltage between transmission range switch connector terminals No. 1 and No. 10.

   Is there voltage?
   YES - Go to Step 9 .
   NO - Repair open in the wire between PCM connector terminal B23 and the transmission range switch, then go to Step 15 .

9. Check for continuity between transmission range switch connector terminals No. 1 and No. 10 while the shift lever is in R, and when the shift lever is shifted to any position other than R.



Is there continuity while the shift lever is in R, and no continuity when the shift lever is shifted to any position other than R?
   YES - Go to Step 10 .
   NO - Replace the transmission range switch, then go to Step 15 .

10. Connect the transmission range switch connector.

11. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.

12. Start the engine, and shift to R. Move the vehicle in reverse at speeds below 5 km/h (3 mph) for at least 2 seconds, then increase the speed and move at speeds over 5 km/h (3 mph) for at least 2 seconds. Slow down and stop the wheels.

13. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1717 indicated?
   YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
   NO - Go to Step 14 .

14. Monitor the OBD status for P1717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 13 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 12 and recheck.

15. Connect the transmission range switch connector.

16. Clear the DTC with the HDS.

17. Start the engine, and shift to R. Move the vehicle in reverse at speeds below 5 km/h (3 mph) for at least 2 seconds, then increase the speed and move at speeds over 5 km/h (3 mph) for at least 2 seconds. Slow down and stop the wheels.

18. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P1717 indicated?
   YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 .
   NO - Go to Step 19 .

19. Monitor the OBD status for P1717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?
   YES - Troubleshooting is complete. If any other DTCs were indicated on Step 18 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 17 and recheck.

DTC Troubleshooting: P1746 (45)

DTC P1746:
Hydraulic Control System (Cut A Valve Stuck OFF or Cut B Valve Stuck ON)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 7.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P1746 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Repair cut A valve in the servo body, repair cut B valve in the main valve body, replace the main valve body or servo body, then go to Step 7, or replace the transmission.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
9. Monitor the OBD status for P1746 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate PASSED?
   YES - Troubleshooting is complete.■
   NO - Return to Step 7 and recheck. If the HDS indicates NOT COMPLETED, return to Step 8 and recheck.

DTC Troubleshooting: P1747 (45)

DTC P1747:
Hydraulic Control System (Cut A Valve Stuck ON or Cut B Valve Stuck OFF)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?
   YES - Replace the transmission, then go to Step 7.
   NO - Replace the ATF, then go to Step 4.
4. Clear the DTC with the HDS.
5. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
6. Monitor the OBD status for P1747 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate FAILED?
   YES - Repair cut A valve in the servo body, repair cut B valve in the main valve body, replace the main valve body or servo body, then go to Step 7, or replace the transmission.
   NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.■
7. Clear the DTC with the HDS.
8. Test-drive the vehicle with the shift lever in D for at least 3 seconds, and let the transmission shift through all five gears. Then slow down to a stop.
9. Monitor the OBD status for P1747 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate PASSED?
   YES - Troubleshooting is complete.■
   NO - Return to Step 7 and recheck. If the HDS indicates NOT COMPLETED, return to Step 8 and recheck.

DTC Troubleshooting: P1780 (49)

DTC P1780:
Shift Control System (Transmission Default Mode)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears. Then slow down to a stop.
3. Check for other DTCs indicated simultaneously with DTC P1780.
   NOTE: DTC P1780 means there is one or more A/T DTCs about the shift control system.

   Are there other DTCs?
   YES - Troubleshoot the problem indicated by the DTC.■
   NO - Go to Step 4 .
4. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
5. Test-drive the vehicle with the shift lever in D, and let the transmission shift through all five gears. Then slow down to a stop.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P1780 indicated?
   YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
   NO - Go to Step 7 .
7. Monitor the OBD status for P1780 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate PASSED?
   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 6 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 5 and recheck.

DTC Troubleshooting: U0029 (107) - A/T

DTC U0029:
F-CAN Malfunction (F-CAN bus OFF)
Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Clear the DTC with the HDS.
2. Start the engine, and run it at idle for at least 2 minutes.
3. Check whether DTC U0029 is indicated in the DTCs/Freeze Data in PGM-FI Mode Menu with the HDS.

   Is DTC U0029 indicated in the PGM-FI system?
   YES - Troubleshoot DTC U0029 in the PGM-FI system. ■
   NO - Go to Step 4 .
4. Check whether DTC U0029 is indicated in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

   Is DTC U0029 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0029 indicated?
   YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
   NO - Go to Step 7 .
7. Monitor the OBD status for U0029 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate PASSED?
   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 6 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 7 and recheck.

DTC Troubleshooting: U0121 (107) - A/T System

DTC U0121:
F-CAN Malfunction (PCM-ABS Modulator-Control Unit)
Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review General Troubleshooting Information.

1. Clear the DTC with the HDS.
2. Start the engine, and run it at idle for at least 2 minutes.
3. Check whether DTC U0121 is indicated in the DTCs/Freeze Data in PGM-FI Mode Menu with the HDS.

   Is DTC U0121 indicated in the PGM-FI system?
   YES - Troubleshoot DTC U0121 in the PGM-FI system. ■
   NO - Go to Step 4 .
4. Check whether DTC U0121 is indicated in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

   Is DTC U0121 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
6. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC U0121 indicated?
   YES - If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 .
   NO - Go to Step 7 .
7. Monitor the OBD status for U0121 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

   Does the HDS indicate PASSED?
   YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on Step 6 , go to the indicated DTC's troubleshooting.■
   NO - Check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to Step 1 . If the HDS indicates NOT COMPLETED, return to Step 7 and recheck.

Automatic Transmission and A/T Differential

Item	Measurement	Qualification	Standard or New	Service Limit
Automatic transmission fluid	Capacity Use genuine Honda ATF-Z1	Fluid change	2.5 L (2.6 US qt, 2.2 Imp qt)	
		Overhaul	5.85 L (6.18 US qt, 5.15 Imp qt)	
Pressure (Seven-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in D3	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Pressure (Five-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1st gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2nd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min^{-1})	2,050–2,350 rpm (min^{-1})

		Mark AK or AU	2.8 mm (0.110 in.)	When discolored
		Mark AL or AV	2.9 mm (0.114 in.)	When discolored

A/T differential carrier

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential carrier	Pinion shaft contact area I.D.		18.010−18.028 mm (0.709−0.710 in.)	———
	Clearance between carrier and pinion shaft		0.023−0.057 mm (0.001−0.002 in.)	0.1 mm (0.004 in.)
	Driveshaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and driveshaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Intermediate shaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and Intermediate shaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Tapered roller bearing starting torque (preload)	For new bearing	2.7−3.9 N·m(28−40 kgf·cm, 24−35 lbf·in.)	Adjust
		For reused bearing	2.5−3.5 N·m(25−37 kgf·cm, 21−32 lbf·in.)	Adjust
	Final driven gear backlash	(Reference)	0.085−0.144 mm (0.003−0.006 in.)	0.2 mm (0.008 in.)

A/T differential pinion gear

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———
	I.D.		18.042−18.066 mm (0.7103−0.7113 in.)	———
	Clearance between pinion gear and pinion shaft		0.055−0.095 mm (0.002−0.004 in.)	0.12 mm (0.005 in.)

Idler gear shaft

Item	Measurement	Qualification	Standard or New	Service Limit
Idler gear shaft	End cover bearing contact area		30.003−30.013 mm (1.1812−1.1816 in.)	When worn or damaged
	Cotters thickness		1.39−1.42 mm (0.055−0.056 in.)	———

Torque converter

Item	Measurement	Qualification	Standard or New	Service Limit
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min $^{-1}$)	2,050−2,350 rpm (min $^{-1}$)

ATF pump

Item	Measurement	Qualification	Standard or New	Service Limit
ATF pump	ATF pump thrust clearance		0.03−0.06 mm (0.001−0.002 in.)	0.07 mm (0.003 in.)
	Clearance between ATF pump gear and body	Drive gear	0.210−0.265 mm (0.008−0.010 in.)	———
		Driven gear	0.070−0.125 mm (0.003−0.005 in.)	———
	ATF pump driven gear I.D.		14.016−14.034 mm (0.5518−0.5525 in.)	When worn or damaged
	ATF pump driven gear shaft O.D.		13.980−13.990 mm (0.5504−0.5508 in.)	When worn or damaged

Main valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coil
Main valve body spring	Cut valve B spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0
	Shift valve A spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Shift valve C spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Relief valve spring		1.0 mm (0.039 in.)	9.6 mm (0.378 in.)	34.1 mm (1.343 in.)	10.2
	Lock-up control valve spring		0.6 mm (0.024 in.)	7.1 mm (0.280 in.)	29.6 mm (1.165 in.)	11.2
	Cooler check valve spring		0.85 mm (0.033 in.)	6.6 mm (0.260 in.)	27.0 mm (1.063 in.)	11.3
	Shift valve D spring		0.8 mm (0.031 in.)	5.6 mm (0.220 in.)	28.1 mm (1.106 in.)	15.9
	Servo control valve spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0

Regulator valve body

Item	Measurement	Qualification	Standard or New	Service Limit
Regulator valve body	Sealing ring contact I.D.		29.000−29.021 mm (1.1417−1.1426 in.)	29.05 mm (1.144 in.)

Regulator valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coil
Regulator valve body spring	Stator reaction spring		4.5 mm (0.177 in.)	35.4 mm (1.394 in.)	30.3 mm (1.193 in.)	1.92
	Regulator valve spring A		1.9 mm (0.075 in.)	14.7 mm (0.579 in.)	80.6 mm (3.173 in.)	16.1
	Regulator valve spring B		1.6 mm (0.063 in.)	9.2 mm (0.362 in.)	44.0 mm (1.732 in.)	12.5
	Torque converter check valve spring		1.2 mm (0.047 in.)	8.6 mm (0.339 in.)	33.8 mm (1.331 in.)	12.2
	Lock-up shift valve spring		1.0 mm (0.039 in.)	6.6 mm (0.260 in.)	35.5 mm (1.398 in.)	18.2
	1st accumulator spring B		2.4 mm (0.094 in.)	12.2 mm (0.480 in.)	35.0 mm (1.378 in.)	7.7
	1st accumulator spring A		2.4 mm (0.094 in.)	18.6 mm (0.732 in.)	50.1 mm (1.972 in.)	6.7
	4th accumulator spring		2.5 mm (0.098 in.)	14.6 mm (0.575 in.)	29.9 mm (1.177 in.)	4.9

Servo body

Item	Measurement	Qualification	Standard or New	Service Limit
Servo body	Shift fork shaft bore I.D.		14.000−14.010 mm (0.5512−0.5526 in.)	When worn or damaged
	Shift fork shaft valve bore I.D.		37.000−37.039 mm (1.4567−1.4582 in.)	37.045 mm (1.4585 in.)

Servo body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coil
Servo body spring	Cut valve A spring		0.9 mm (0.035 in.)	9.9 mm (0.390 in.)	22.3 mm (0.878 in.)	6.9
	Shift valve B spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	5th accumulator spring A		2.5 mm (0.098 in.)	16.6 mm (0.654 in.)	46.9 mm (1.846 in.)	7.8
	5th accumulator spring B		1.9 mm (0.075 in.)	10.0 mm (0.394 in.)	38.5 mm (1.516 in.)	10.6
	2nd accumulator spring A		1.8 mm (0.071 in.)	14.6 mm (0.575 in.)	43.8 mm (1.724 in.)	7.9
	2nd accumulator spring B		1.85 mm (0.073 in.)	9.4 mm (0.370 in.)	32.5 mm(1.280 in.)	8.7
	3rd accumulator spring A		1.8 mm (0.071 in.)	14.6 mm (0.575 in.)	43.8 mm (1.724 in.)	7.9
	3rd accumulator spring B		1.85 mm (0.073 in.)	9.4 mm (0.370 in.)	32.5 mm (1.280 in.)	8.7

Stator shaft

Item	Measurement	Qualification	Standard or New	Service Limit
Stator shaft	Needle bearing contact I.D.	Torque converter side	27.000−27.021 mm (1.063−1.064 in.)	When worn or damaged
		ATF pump side	29.000−29.021 mm (1.1417−1.1426 in.)	———
	Sealing ring contact area I.D.		29.000−29.021 mm (1.1417−1.1426 in.)	29.05 mm (1.144 in.)

Automatic Transmission and A/T Differential

Item	Measurement	Qualification	Standard or New	Service Limit
Automatic transmission fluid	Capacity Use genuine Honda ATF-Z1	Fluid change	2.5 L (2.6 US qt, 2.2 Imp qt)	
		Overhaul	5.85 L (6.18 US qt, 5.15 Imp qt)	
Pressure (Seven-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in D3	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Pressure (Five-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1st gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2nd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min^{-1})	2,050–2,350 rpm (min^{-1})

Automatic Transmission and A/T Differential (cont'd)

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch	Clutch between clutch end-plate and top disc	1st	———	1.62–1.82 mm (0.064–0.072 in.)

A/T Assembly Removal

Special Tools Required

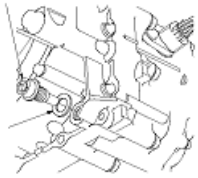
Hanger plate
07MAK-PY30100

Engine support hanger
AAR-T1256-J00
This special tool is available from Snap-on Tools International, LLC.
NOTE:

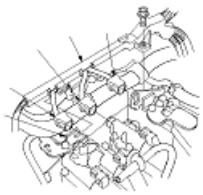
- Use fender covers to avoid damaging painted surfaces.
- Engine support hanger (AAR-T1256-J00) must be used with the side engine mount installed.

1. Remove the windshield wiper arms.
2. Do the battery terminal disconnect procedure.
3. Do the battery removal procedure.
4. Remove the battery base.
5. Remove the cowl cover.
6. Fix the hood in a vertical position.
7. Remove the cowl cover stiffener (A), and remove the windshield wiper motor and center-front cowl cover (B).
8. Remove the air cleaner assembly.
9. Raise the vehicle on a lift, and make sure it is securely supported.
10. Remove the wheels.
11. Remove the splash shield.

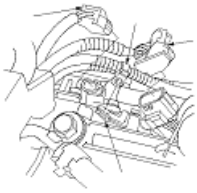
12. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).
13. Reinstall the drain plug with a new sealing washer (B).



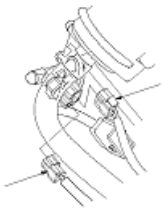
14. Disconnect the A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and A/T clutch pressure control solenoid valve C connector (C).
15. Remove the bolt securing the harness cover (D), and remove the harness cover from its bracket (E).



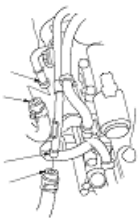
16. Disconnect the transmission range switch connector (A).
17. Disconnect the output shaft (countershaft) speed sensor connector (B), and remove the harness clamp (C) from its bracket (D).



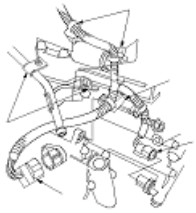
18. Disconnect the input shaft (mainshaft) speed sensor connector (A) and 2nd clutch transmission fluid pressure switch connector (B).



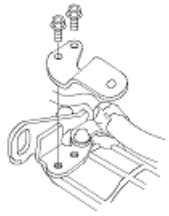
19. Remove the ATF cooler hoses (A) from the ATF cooler lines (B). Turn the ends of the cooler hoses up to prevent ATF from flowing out, then plug the cooler hoses and lines.
20. Check for any signs of leakage at the hose joints.



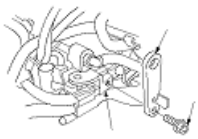
21. Remove the bolt securing the harness clamp bracket (A).
22. Disconnect the shift solenoid harness connector (B) and 3rd clutch transmission fluid pressure switch connector (C), and remove the harness clamps (D) from the clamp brackets (E).



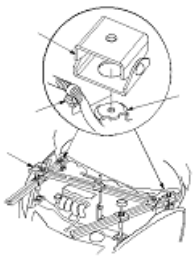
23. Remove the air cleaner housing mounting bracket from the transmission hanger.



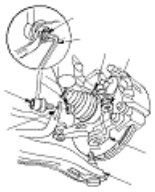
24. Install the hanger plate (07MAK-PY30100) (A) to the air cleaner housing mounting bracket (B) with the 8 x 1.25 mm bolt (C).



25. Remove the harness clamp (A) from its clamp bracket (B) located in front of the left damper top.
26. Set up the engine support hanger (AAR-T1256-J00). Carefully position the engine support hanger to the vehicle; position both cross-arm foot bases (C) over the harness clamp brackets on both sides, and position both front stands on the front bulkhead. Attach the hook to the hanger plate, tighten the wing nut by hand, and lift and support the engine.

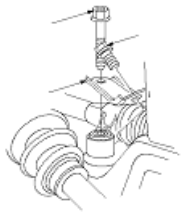


27. Insert a 5 mm Allen wrench (A) in the top of the ball joint pin (B), and remove the nuts (C), then separate the stabilizer link (D) from the stabilizer ends (E).
28. With HID lamp model: If removing the left side lower arm, disconnect the suspension stroke sensor, and the lower arm.
29. Remove the lock pin (F) and castle nuts (G), and separate the lower arms (H) from the knuckles (I).

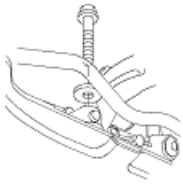


30. Remove the steering gearbox mounting bolt (A), bolt (B), and stiffener (C) on the right.

31. Remove the steering gearbox mounting bolt (A), bolt (B), and stiffener (C) on the left.

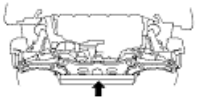


32. Remove the steering gearbox mounting bolt on the middle.

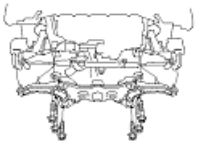


33. Place a jack under the transmission, raise it just enough to take it off of the lower torque rod, and remove the lower torque rod bolt (A) on the transmission.
34. Remove the lower torque rod nut (B) and bolt (C) on the front subframe, and remove the lower torque rod (D).
35. Remove the jack.

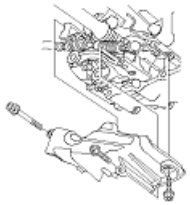
36. Support the front subframe with a wood piece and a jack.



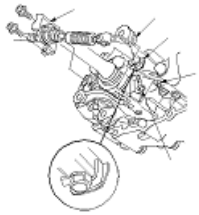
37. Remove the six bolts securing the front subframe.
38. Hang the steering gearbox to the body with a strap.



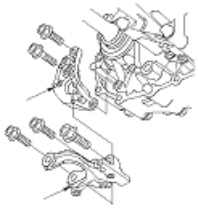
39. Remove the shift cable cover.



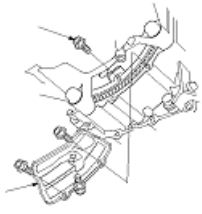
40. Pry up the lock tab of the lock washer (A), and remove the lock bolt (B) and lock washer.
41. Remove the bolts securing the shift cable holder (C), and separate the shift cable (D) from the selector control shaft end (E). Do not bend the shift cable excessively.



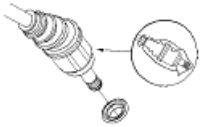
42. Remove the lower torque rod mounting bracket (A) and shift cable holder bracket (B).



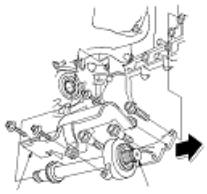
43. Remove the torque converter cover (A), and remove the drive plate bolts (B) (eight bolts) while rotating the crankshaft pulley.



44. Pry out the driveshafts from the differential and the intermediate shaft.
45. Coat all precision machined surfaces with clean engine oil, then put plastic bags over driveshaft ends.

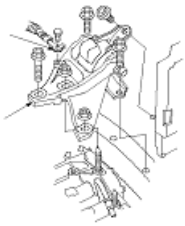


46. Remove the bolts securing the heat shield (A).
47. Remove the intermediate shaft (B) and heat shield.
48. Coat all precision finished surfaces with clean engine oil, then put plastic bags over intermediate shaft ends.

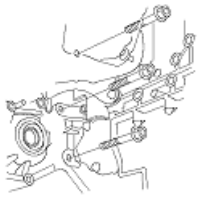


49. Remove the front and upper transmission housing mounting bolts.

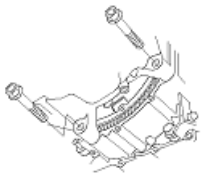
50. Remove the transmission ground cable terminal (A) from the transmission mount bracket (B).
51. Place a jack under the transmission, raise it just enough to take it off of the mount, and remove the transmission mount and mount bracket.
52. Remove the jack.



53. Remove the rear transmission housing mounting bolts.
54. Lower the transmission by loosening the wing nut on the engine support hanger, and tilt the engine just enough for the end of the transmission to clear the side frame.
55. Place a jack under the transmission.



56. Remove the lower transmission housing mounting bolts.
57. Slide the transmission away from the engine to remove it from the vehicle.



58. Remove the torque converter and dowel pins.
59. Inspect the drive plate, and replace it if it's damaged.

A/T Assembly Installation

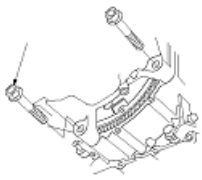
Special Tools Required

Hanger plate
07MAK-PY30100

Engine support hanger
AAR-T1256-J00
This special tool is available from Snap-on Tools International, LLC.
NOTE: Use fender covers to avoid damaging painted surfaces.

1. Install the torque converter (A) on the mainshaft (B) with the new O-ring (C).
2. Install the 14 mm dowel pins (D) in the torque converter housing.
3. Place the transmission on the jack, and raise the transmission to the engine level.

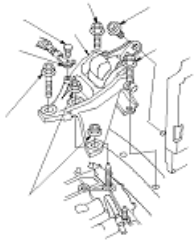
4. Attach the transmission to the engine, and install the lower transmission housing mounting bolts.



5. Install the rear transmission housing mounting bolt.

6. Install the front and upper transmission housing mounting bolts.

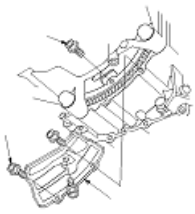
7. Place a jack under the transmission, raise it and secure the transmission mount and mount bracket (A) on the body and transmission housing with the new mounting bolts and new nuts loose.
8. Tighten the transmission mount bolts to the specified torque in the following order; on the middle (B), on the front (C), and on the rear (D).
9. Remove the jack, and tighten the bolt (E) and nuts (F) on the transmission mount bracket to the specified torque.
10. Install the transmission ground cable terminal (G).



11. Install the new set ring (A) on the intermediate shaft (B).
12. Clean the areas where the intermediate shaft contacts the transmission (differential) with solvent, and dry with compressed air. Apply ATF to the intermediate shaft splines, put the heat shield (C) on the intermediate shaft, then install the intermediate shaft; be sure not to allow dust or other foreign particles to enter the transmission.
13. Secure the heat shield with the mounting bolts.

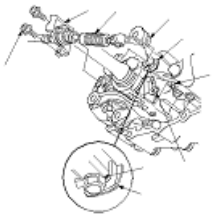
14. Install the new set ring (A) on the left driveshaft (B).
15. Clean the areas where the left driveshaft contacts the transmission (differential) with solvent, and dry with compressed air. Then install the left driveshaft; be sure not to allow dust or other foreign particles to enter the transmission. Turn the steering knuckle fully outward, and slide the driveshaft into the differential until you feel its set ring fully engage the side gear.
16. Apply right driveshaft inboard-joint splines with the recommended grease.
17. Slide the right driveshaft over the intermediate shaft splines until you feel the driveshaft fully engage the intermediate shaft set ring.

18. Attach the torque converter to the drive plate with eight bolts (A). Rotate the crankshaft pulley as necessary to tighten the bolts to 1/2 of the specified torque, then to the final torque, in a crisscross pattern. After tightening the last bolt, check that the crankshaft rotate freely.
19. Install the torque converter cover (B).

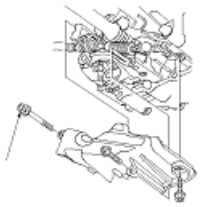


20. Install the shift cable holder bracket (A) and lower torque rod mounting bracket (B) on the transmission.

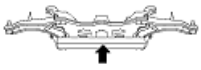
21. Install the control lever (A) over the control shaft (B). Do not twist the boot (C).
22. Secure the shift cable bracket (D) with the bolts.
23. Secure the control lever with the new lock washer (E) and the lock bolt (F); install the flange (G) of the lock washer with facing to transmission housing, then bend the lock tab (H) of the lock washer against the bolt head securely.



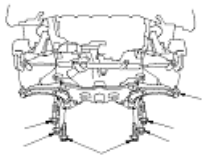
24. Install the shift cable cover.



25. Support the front subframe with a wood piece and a jack.

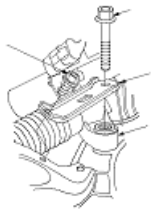


26. Lift the front subframe (A) up to body, and secure it with the new mounting bolts loose.
27. Tighten the right middle mounting bolt (B) first, then the left middle bolt (C), and the four remaining bolts (D) to the specified torque.

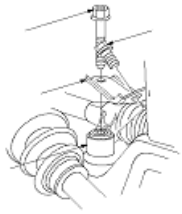


28. Place a jack under the transmission, raise it and attach the lower torque rod (A) in the mounting bracket and front subframe.
29. Install the new mounting bolt (B), and set the bolt tongue (C) into the stop (D) through the guide (E), then loosely install the new nut (F).
30. Loosely install the new mounting bolt (G).
31. Remove the jack, and tighten the bolt and nut to the specified torque.

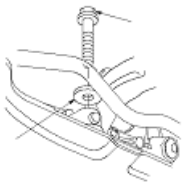
32. On the right side of the steering gearbox, secure the steering gear box (A) and stiffener (B) with the new mounting bolt (C) and the new bolt (D) loose.



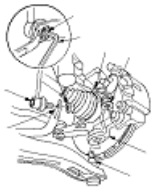
33. On the left side of the steering gearbox, secure the steering gear box (A) and stiffener (B) with the new mounting bolt (C) and the new bolt (D) loose.



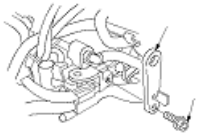
34. Loosely install the steering gearbox mounting bolt (A) and washer (B) on the middle.
35. Tighten the steering gearbox mounting bolts to the specified torque in the following order; on the right side, on the left side, and on the middle.
36. Tighten the bolts to the specified torque securing the right side stiffener, then left side stiffener.



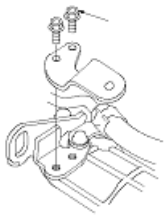
37. Connect the ball joints (A) to both knuckles (B), and install the new ball joint nuts (C). Tighten the nuts, then secure the nuts with the lock pin (D).
38. Connect the stabilizer links (E) to the stabilizer ends (F), and install the nuts (G). Insert a 5 mm Allen wrench (H) in the top of the ball joint pins (I), and tighten the nuts.
39. With HID lamp model: If the left side lower arm was removed, connect the suspension stroke sensor, to the lower arm.
40. Remove the engine support hanger, and install the harness clamp in its bracket located in front of the left damper top.



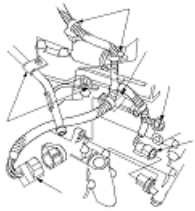
41. Remove the hanger plate (07MAK-PY30100) (A) and bolt (B).



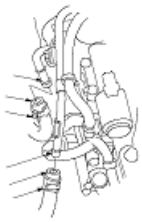
42. Install the air cleaner housing mounting bracket on the transmission hanger.



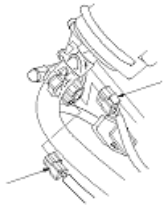
43. Secure the harness clamp bracket (A) with the bolt.
44. Connect the shift solenoid harness connector (B) and 3rd clutch transmission fluid pressure switch connector (C), and install the harness clamps (D) in the clamp brackets (E).



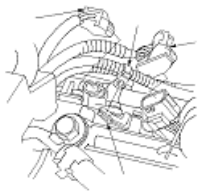
45. Connect the ATF cooler hoses (A) to the ATF cooler lines (B), and secure the hoses with the clips (C).



46. Connect the input shaft (mainshaft) speed sensor connector (A) and 2nd clutch transmission fluid pressure switch connector (B).

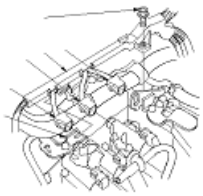


47. Connect the output shaft (countershaft) speed sensor connector (A), and install the harness clamp (B) on its bracket (C).
48. Connect the transmission range switch connector (D).



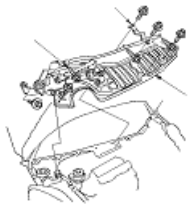
---

49. Install the harness cover (A) on its bracket (B), and secure the cover with the bolt.
50. Connect the A/T clutch pressure control solenoid valve A connector (C), A/T clutch pressure control solenoid valve C connector (D), and A/T clutch pressure control solenoid valve B connector (E).
51. Install the air cleaner assembly.



---

52. Install the windshield wiper motor and center-front cowl cover (A), and install the cowl cover stiffener (B).
53. Install the cowl cover.
54. Install the windshield wiper arms.
55. Refill the transmission with ATF.
56. Install the battery base.
57. Do the battery installation procedure.
58. Install the splash shield.
59. Install the wheels.
60. Set the parking brake. Start the engine, and shift the transmission through all positions three times. Check the shift lever operation, A/T gear position indicator operation, and shift cable adjustment.
61. Check and adjust the front wheel alignment.
62. Check the ATF level.
63. With HID lamp model: If the left side lower arm was removed, do the headlight initial position learning procedure.
64. Do the road test.



Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	Reverse idler gear shaft O.D. at needle bearing contact area		14.99−15.00 mm (0.590−0.591 in.)	When worn or damaged
	I.D.		20.001−20.014 mm (0.7874−0.7880 in.)	When worn or damaged
	I.D. of reverse idler gear shaft contact area on transmission housing		14.800−14.818 mm (0.5827−0.5834 in.)	———
	I.D. of reverse idler gear shaft holder		14.800−14.824 mm (0.5827−0.5836 in.)	When worn or damaged

Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Fork finger thickness		5.90−6.00 mm (0.232−0.236 in.)	5.40 mm (0.213 in.)

Park gear and pawl

Item	Measurement	Qualification	Standard or New	Service Limit
Park gear and pawl			———	When worn or damaged

Pressure (Seven-position transmission)

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure (Seven-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900−960 kPa (9.2−9.8 kgf/cm^2, 130−140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in D3	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in D	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in D	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

Pressure (Five-position transmission)

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure (Five-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900−960 kPa (9.2−9.8 kgf/cm^2, 130−140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1st gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2nd gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of needle bearing contact area	At torque converter housing	33.504−33.517 mm (1.3191−1.3196 in.)	When worn or damaged
		At 5th gear	32.986−32.999 mm (1.2987−1.2991 in.)	When worn or damaged
		Reverse selector hub	35.983−35.999 mm (1.4167−1.4173 in.)	When worn or damaged
	I.D. of gears	5th gear	39.000−39.016 mm (1.5354−1.5361 in.)	When worn or damaged
		Reverse gear	42.000−42.016 mm (1.6535−1.6542 in.)	When worn or damaged
	End play	5th gear	0.04−0.27 mm (0.002−0.011 in.)	———
		Reverse gear	0.10−0.25 mm (0.004−0.010 in.)	———
	Reverse selector hub width		29.25−29.45 mm (1.152−1.160 in.)	———
	Collar, 33.2 x 40 x 26 mm length		25.95−26.00 mm (1.022−1.024 in.)	———
	Reverse selector hub O.D.		51.87−51.90 mm (2.042−2.043 in.)	When worn or damaged

Mainshaft
