Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	Diameter of needle bearing contact area	At stator shaft	22.984−23.000 mm (0.9049−0.9055 in.)	When worn or damaged
		At 5th gear collar	32.975−32.991 mm (1.2982−1.2989 in.)	When worn or damaged
		At 3rd gear	46.986−46.999 mm (1.8498−1.8503 in.)	When worn or damaged
	I.D. of gears	5th gear	37.000−37.016 mm (1.4567−1.4573 in.)	When worn or damaged
		3rd gear	52.000−52.013 mm (2.0472−2.0478 in.)	When worn or damaged
	End play	5th gear	0.15−0.27 mm (0.006−0.106 in.)	———
		3rd gear	0.04−0.10 mm (0.002−0.004 in.)	———
	40 x 63 mm thrust washer thickness	No. 1	3.750 mm (0.1476 in.)	When worn or damaged
		No. 2	3.775 mm (0.1486 in.)	When worn or damaged
		No. 3	3.800 mm (0.1496 in.)	When worn or damaged
		No. 4	3.825 mm (0.1506 in.)	When worn or damaged
		No. 5	3.850 mm (0.1516 in.)	When worn or damaged
		No. 6	3.875 mm (0.1526 in.)	When worn or damaged
		No. 7	3.900 mm (0.1535 in.)	When worn or damaged
		No. 8	3.925 mm (0.1545 in.)	When worn or damaged
		No. 9	3.950 mm (0.1555 in.)	When worn or damaged
		No. 10	3.975 mm (0.1565 in.)	When worn or damaged
		No. 11	4.000 mm (0.1575 in.)	When worn or damaged
	5th gear collar length		60.4−60.5 mm (2.380−2.381 in.)	———
	5th gear collar flange thickness		3.70−3.85 mm (0.146−0.152 in.)	When worn or damaged
	Sealing ring thickness		1.91−1.97 mm (0.0752−0.0776 in.)	1.86 mm (0.0732 in.)
	Width of sealing ring groove		2.025−2.060 mm (0.0797−0.0811 in.)	2.080 mm (0.0819 in.)
	3rd clutch feed pipe O.D.		7.97−7.98 mm (0.3138−0.3142 in.)	7.95 mm (0.313 in.)
	Feed pipe bushing I.D.		8.000−8.015 mm (0.3150−0.3156 in.)	8.030 mm (0.3161 in.)

Secondary shaft - 1/2

Item	Measurement	Qualification	Standard or New	Service Limit
Secondary shaft - 1/2	Diameter of needle bearing contact area	1st gear	30.986−30.999 mm (1.2199−1.2204 in.)	When worn or damaged
		2nd gear	42.986−42.999 mm (1.6924−1.6929 in.)	When worn or damaged
		4th gear collar	34.975−34.991 mm (1.3770−1.3776 in.)	When worn or damaged
	I.D. of gears	1st gear	38.000−38.016 mm (1.4961−1.4967 in.)	When worn or damaged
		2nd gear	49.000−49.016 mm (1.9291−1.9298 in.)	When worn or damaged
		4th gear	41.000−41.016 mm (1.6142−1.6148 in.)	When worn or damaged
	End play	1st gear	0.04−0.12 mm (0.002−0.005 in.)	———
		2nd gear	0.04−0.12 mm (0.002−0.005 in.)	———
		4th gear	0.10−0.22 mm (0.004−0.009 in.)	———
	31 x 50 mm thrust washer thickness	No. 1	3.925 mm (0.1545 in.)	When worn or damaged
		No. 2	3.950 mm (0.1555 in.)	When worn or damaged
		No. 3	3.975 mm (0.1565 in.)	When worn or damaged
		No. 4	4.000 mm (0.1575 in.)	When worn or damaged
		No. 5	4.025 mm (0.1585 in.)	When worn or damaged
		No. 6	4.050 mm (0.1594 in.)	When worn or damaged
		No. 7	4.075 mm (0.1604 in.)	When worn or damaged
		No. 8	4.100 mm (0.1614 in.)	When worn or damaged
		No. 9	4.125 mm (0.1624 in.)	When worn or damaged

		No. 13	4.225 mm (0.1663 in.)	When worn or damaged
		No. 14	4.250 mm (0.1673 in.)	When worn or damaged
		No. 15	4.275 mm (0.1683 in.)	When worn or damaged
		No. 16	4.300 mm (0.1693 in.)	When worn or damaged
		No. 17	4.325 mm (0.1703 in.)	When worn or damaged
	43 x 54.5 mm thrust washer thickness	No. 1	2.900 mm (0.114 in.)	When worn or damaged
		No. 2	2.925 mm (0.115 in.)	When worn or damaged
		No. 3	2.950 mm (0.116 in.)	When worn or damaged
		No. 4	2.975 mm (0.117 in.)	When worn or damaged
		No. 5	3.000 mm (0.118 in.)	When worn or damaged
		No. 6	3.025 mm (0.119 in.)	When worn or damaged
		No. 7	3.050 mm (0.120 in.)	When worn or damaged
		No. 8	3.075 mm (0.121 in.)	When worn or damaged
		No. 9	3.100 mm (0.122 in.)	When worn or damaged
		No. 10	3.125 mm (0.123 in.)	When worn or damaged
		No. 11	3.150 mm (0.124 in.)	When worn or damaged
		No. 12	3.175 mm (0.125 in.)	When worn or damaged
		No. 13	3.200 mm (0.126 in.)	When worn or damaged

Secondary shaft - 2/2

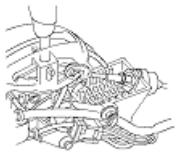
Item	Measurement	Qualification	Standard or New	Service Limit
Secondary shaft - 2/2	4th gear collar length		32.9−33.0 mm (1.295−1.299 in.)	———
	4th gear collar flange thickness		3.75−3.90 mm (0.148−0.154 in.)	When worn or damaged
	Sealing ring thickness		1.87−1.97 mm (0.074−0.078 in.)	1.82 mm (0.072 in.)
	Width of sealing ring groove		2.025−2.060 mm (0.0797−0.0811 in.)	2.080 mm (0.0819 in.)
	Clutch feed pipe O.D.	2nd clutch	6.97−6.98 mm (0.2744−0.2748 in.)	6.95 mm (0.2736 in.)
		4th clutch	11.47−11.48 mm (0.4516−0.4520 in.)	11.45 mm (0.4508 in.)
	Clutch feed pipe bushing O.D.	2nd clutch	7.018−7.030 mm (0.2763−0.2768 in.)	7.045 mm (0.2774 in.)
		4th clutch	11.500−11.518 mm (0.4528−0.4553 in.)	11.530 mm (0.4539 in.)
	ATF guide collar I.D. at sealing ring contact area		21.200−21.221 mm (0.8346−0.8355 in.)	21.25 mm (0.8366 in.)

Clutch

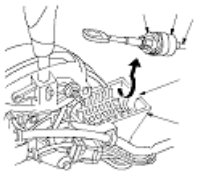
Item	Measurement	Qualification	Standard or New	Service Limit
Clutch	Clutch between clutch end-plate and top disc	1st	———	1.62−1.82 mm (0.064−0.072 in.)
		2nd	———	0.5−0.7 mm (0.020−0.028 in.)
		3rd	———	0.73−0.93 mm (0.029−0.037 in.)
		4th	———	0.7−0.9 mm (0.028−0.035 in.)
		5th	———	0.73−0.93 mm (0.029−0.037 in.)
	Clutch return spring free length	1st	35.2 mm (1.39 in.)	34.5 mm (1.36 in.)
		2nd	39.5 mm (1.56 in.)	37.4 mm (1.47 in.)
		3rd	45.15 mm (1.778 in.)	43.0 mm (1.69 in.)
		4th	39.5 mm (1.56 in.)	37.4 mm (1.47 in.)
		5th	45.15 mm (1.778 in.)	43.0 mm (1.69 in.)
	Clutch disc thickness	1st	1.94 mm (0.076 in.)	———
		2nd	1.96 mm (0.077 in.)	———
		3rd	1.94 mm (0.076 in.)	———
		4th	1.96 mm (0.077 in.)	———
		5th	1.94 mm (0.076 in.)	———
	Clutch plate thickness	1st	1.6 mm (0.063 in.)	When discolored
		2nd	2.3 mm (0.091 in.)	When discolored
		3rd	2.0 mm (0.079 in.)	When discolored
		4th	1.6 mm (0.063 in.)	When discolored
		5th	2.0 mm (0.079 in.)	When discolored
	Clutch waved-plate height 1st, 3rd, and 5th clutches		0.07−0.20 mm (0.003−0.008 in.)	0.05 mm (0.002 in.)
	1st, 3rd, and 5th clutch end-plate thickness	Mark 1	2.1 mm (0.083 in.)	When discolored
		Mark 2	2.2 mm (0.087 in.)	When discolored
		Mark 3	2.3 mm (0.091 in.)	When discolored
		Mark 4	2.4 mm (0.094 in.)	When discolored
		Mark 5	2.5 mm (0.098 in.)	When discolored
		Mark 6	2.6 mm (0.102 in.)	When discolored
		Mark 7	2.7 mm (0.106 in.)	When discolored
		Mark 8	2.8 mm (0.110 in.)	When discolored
		Mark 9	2.9 mm (0.114 in.)	When discolored
	2nd and 4th clutch end-plate thickness	Mark AC or AM	2.1 mm (0.083 in.)	When discolored
		Mark AD or AN	2.2 mm (0.087 in.)	When discolored
		Mark AE or AP	2.3 mm (0.091 in.)	When discolored
		Mark AF or AQ	2.4 mm (0.094 in.)	When discolored
		Mark AG or AR	2.5 mm (0.098 in.)	When discolored
		Mark AH or AS	2.6 mm (0.102 in.)	When discolored
		Mark AJ or AT	2.7 mm (0.106 in.)	When discolored
		Mark AK or AU	2.8 mm (0.110 in.)	When discolored
		Mark AL or AV	2.9 mm (0.114 in.)	When discolored

A/T Shift Cable Replacement

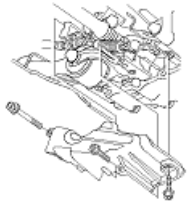
1. Raise the vehicle on a lift, or apply the parking brake, block rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the splash shield.
3. Remove the center console.
4. Shift the transmission to N.
5. Remove the nut securing the shift cable end.



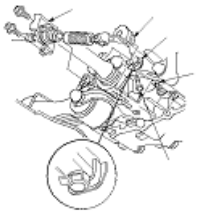
6. Rotate the socket holder (A) on the shift cable (B) a quarter turn; the corner (C) on the socket holder will be in the opening (D) of the shift lever bracket base (E). Then slide the holder to remove the shift cable from the bracket.



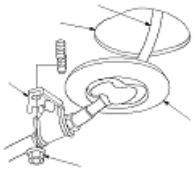
7. Remove the shift cable cover.



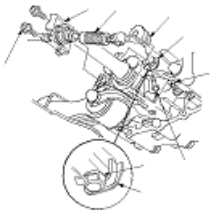
8. Pry up the lock tab of the lock washer (A), and remove the lock bolt (B) and lock washer.
9. Remove the bolts securing the shift cable holder (C), and separate the shift cable (D) from the selector control shaft end (E).
10. Remove the heat shield under the body.



11. Remove the nut securing the shift cable bracket (A).
12. Remove the shift cable grommet (B), and pull out the shift cable (C).
13. Insert the new shift cable through the grommet hole (D), and install the grommet in its hole. Do not bend the shift cable excessively.
14. Secure the shift cable bracket with the nut.
15. Install the heat shield.

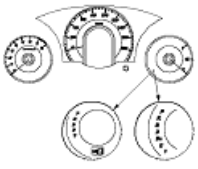


16. Install the control lever (A) over the control shaft (B). Do not twist the boot (C).
17. Secure the shift cable bracket (D) with the bolts.
18. Secure the control lever with the new lock washer (E) and the lock bolt (F); install the flange (G) of the lock washer with facing to the transmission housing, then bend the lock tab (H) of the lock washer against the bolt head securely.

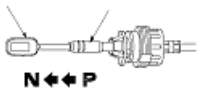


19. Install the shift cable cover.

20. Turn the ignition switch to ON (II), and check that the N indicator comes on.

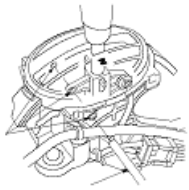


21. If necessary, push the shift cable (A) until it stops, then release it. Pull the shift cable back two steps so that the shift position is in N. Do not hold the shift cable guide (B) to adjust the shift cable.
22. Turn the ignition switch to LOCK (0).



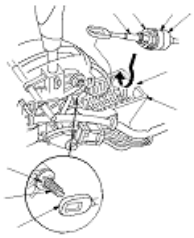
---

23. Insert a 6.0 mm (0.24 in.) pin (A) through the positioning holes (B) on the shift lever bracket base and into the positioning hole on the shift lever. Use only the 6.0 mm pin.
24. Check that the shift lever is secured in N.



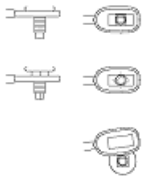
---

25. Rotate the socket holder (A) on the shift cable (B) to place the corner (C) on the holder opposite the opening (D) in the shift lever bracket base (E). Align the holder with the opening in the bracket, then slide the holder into the bracket. Install the shift cable end (F) over the mounting stud (G) by aligning its square hole with the square fitting (H) at the bottom of the stud. Rotate the holder a quarter turn until the holder stops to secure the shift cable. Do not install the shift cable by twisting the shift cable guide (I).



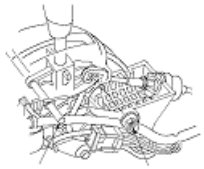
---

26. Check that the shift cable end is properly installed on the mounting stud.
27. If the cable end is out of position on the mounting stud, remove the shift cable from the bracket, and reinstall the shift cable. Do not install the shift cable end on the mounting stud while the shift cable in on the bracket. If the cable end rides on the bottom of the mounting stud, rotate the stud and align the square fitting with the hole.



---

28. Secure the shift cable end with the nut (A).
29. Remove the 6.0 mm (0.24 in.) pin (B) that was installed to hold the shift lever.
30. Turn the ignition switch to ON (II). Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
31. Shift to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back into P.
32. Reinstall the center console.



A/T differential carrier

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential carrier	Pinion shaft contact area I.D.		18.010−18.028 mm (0.709−0.710 in.)	———
	Clearance between carrier and pinion shaft		0.023−0.057 mm (0.001−0.002 in.)	0.1 mm (0.004 in.)
	Driveshaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and driveshaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Intermediate shaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and Intermediate shaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Tapered roller bearing starting torque (preload)	For new bearing	2.7−3.9 N·m(28−40 kgf·cm, 24−35 lbf·in.)	Adjust
		For reused bearing	2.5−3.6 N·m(25−37 kgf·cm, 22−32 lbf·in.)	Adjust
	Final driven gear backlash	Reference	0.085−0.144 mm (0.003−0.006 in.)	0.2 mm (0.008 in.)

A/T differential pinion gear

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———
	I.D.		18.042−18.066 mm (0.7103−0.7113 in.)	———
	Clearance between pinion gear and pinion shaft		0.055−0.095 mm (0.002−0.004 in.)	0.12 mm (0.005 in.)

Idler gear shaft

Item	Measurement	Qualification	Standard or New	Service Limit
Idler gear shaft	End cover bearing contact area		30.003−30.013 mm (1.1812−1.1816 in.)	When worn or damaged
	Cotters thickness		1.39−1.42 mm (0.055−0.056 in.)	———

Torque converter

Item	Measurement	Qualification	Standard or New	Service Limit
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min $^{-1}$)	2,050−2,350 rpm (min $^{-1}$)

ATF pump

Item	Measurement	Qualification	Standard or New	Service Limit
ATF pump	ATF pump thrust clearance		0.03−0.06 mm (0.001−0.002 in.)	0.07 mm (0.003 in.)
	Clearance between ATF pump gear and body	Drive gear	0.210−0.265 mm (0.0083−0.0104 in.)	———
		Driven gear	0.070−0.125 mm (0.0028−0.0049 in.)	———
	ATF pump driven gear I.D.		14.016−14.034 mm (0.5518−0.5525 in.)	When worn or damaged
	ATF pump driven gear shaft O.D.		13.980−13.990 mm (0.5504−0.5508 in.)	When worn or damaged

Main valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Main valve body spring	Cut valve B spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0
	Shift valve A spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Shift valve C spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Relief valve spring		1.0 mm (0.039 in.)	9.6 mm (0.378 in.)	34.1 mm (1.343 in.)	10.2
	Lock-up control valve spring		0.6 mm (0.024 in.)	7.1 mm (0.280 in.)	29.6 mm (1.165 in.)	11.2
	Cooler check valve spring		0.85 mm (0.033 in.)	6.6 mm (0.260 in.)	27.0 mm (1.063 in.)	11.3
	Shift valve D spring		0.8 mm (0.031 in.)	5.6 mm (0.220 in.)	28.1 mm (1.106 in.)	15.9
	Servo control valve spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0

Regulator valve body

Item	Measurement	Qualification	Standard or New	Service Limit
Regulator valve body	Sealing ring contact I.D.		29.000−29.021 mm (1.1417−1.1426 in.)	29.05 mm (1.144 in.)

Regulator valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Regulator valve body spring	Stator reaction spring		4.5 mm (0.177 in.)	35.4 mm (1.394 in.)	30.3 mm (1.193 in.)	1.92
	Regulator valve spring A		1.9 mm (0.075 in.)	14.7 mm (0.579 in.)	80.6 mm (3.173 in.)	16.1
	Regulator valve spring B		1.6 mm (0.063 in.)	9.2 mm (0.362 in.)	44.0 mm (1.732 in.)	12.5
	Torque converter check valve spring		1.2 mm (0.047 in.)	8.6 mm (0.339 in.)	33.8 mm (1.331 in.)	12.2
	Lock-up shift valve spring		1.0 mm (0.039 in.)	6.6 mm (0.260 in.)	35.5 mm (1.398 in.)	18.2
	1st accumulator spring B		2.4 mm (0.094 in.)	12.2 mm (0.480 in.)	35.0 mm (1.378 in.)	7.7
	1st accumulator spring A		2.4 mm (0.094 in.)	18.6 mm (0.732 in.)	50.1 mm (1.972 in.)	6.7
	4th accumulator spring		2.5 mm (0.098 in.)	14.6 mm (0.575 in.)	29.9 mm (1.177 in.)	4.9

Servo body

Item	Measurement	Qualification	Standard or New	Service Limit
Servo body	Shift fork shaft bore I.D.		14.000−14.010 mm (0.5512−0.5526 in.)	When worn or damaged
	Shift fork shaft valve bore I.D.		37.000−37.039 mm (1.4567−1.4582 in.)	37.045 mm (1.4585 in.)

Servo body spring

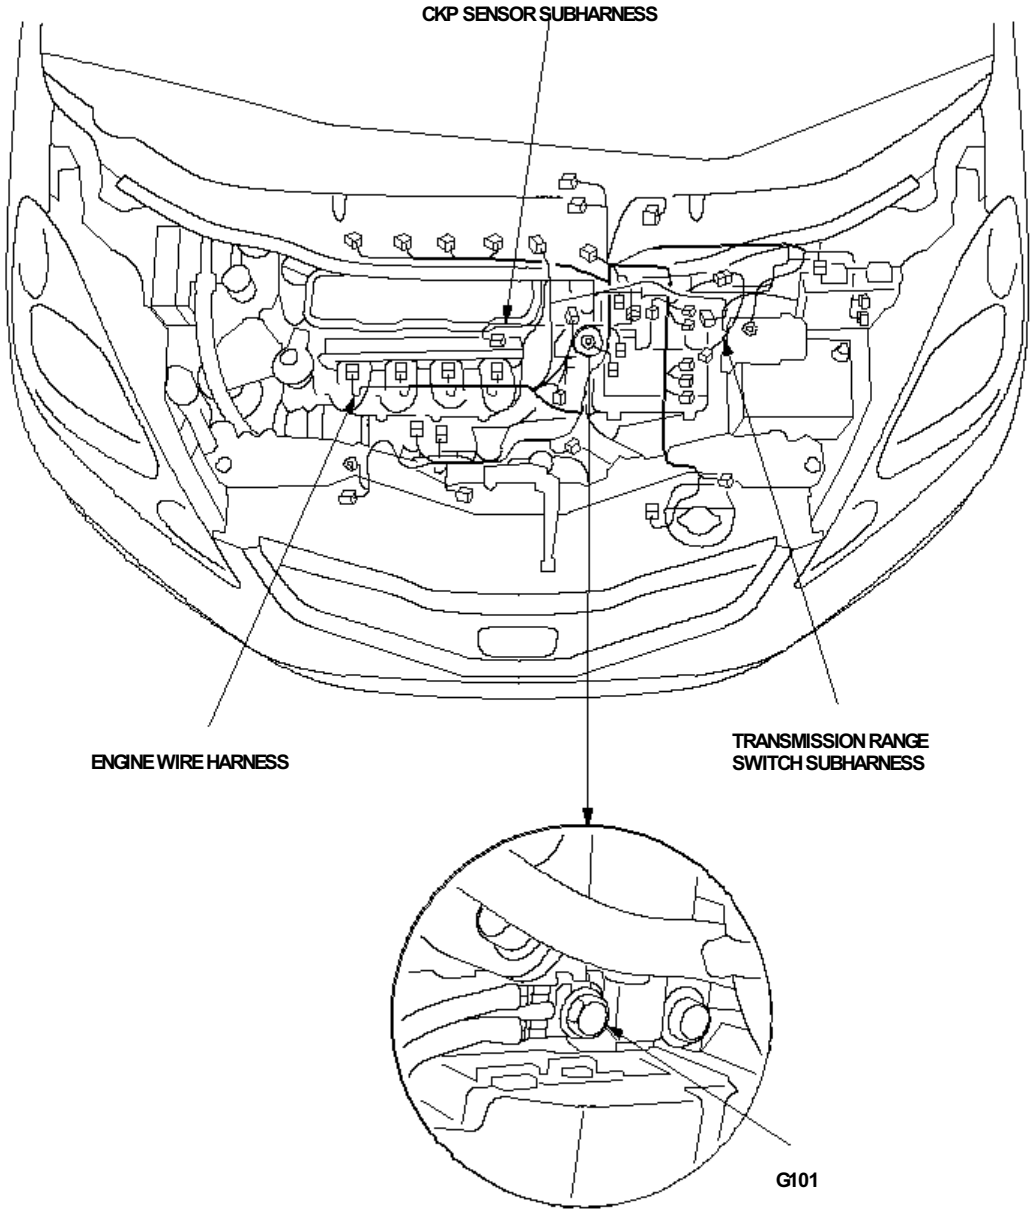
Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Servo body spring	Cut valve A spring		0.9 mm (0.035 in.)	9.9 mm (0.390 in.)	22.3 mm (0.878 in.)	6.9
	Shift valve B spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	5th accumulator spring A		2.5 mm (0.098 in.)	16.6 mm (0.654 in.)	46.9 mm (1.846 in.)	7.8
	5th accumulator spring B		1.9 mm (0.075 in.)	10.0 mm (0.394 in.)	38.5 mm (1.516 in.)	10.6
	2nd accumulator spring A		1.8 mm (0.071 in.)	14.6 mm (0.575 in.)	43.8 mm (1.724 in.)	7.9
	2nd accumulator spring B		1.85 mm (0.073 in.)	9.4 mm (0.370 in.)	32.5 mm(1.280 in.)	8.7
	3rd accumulator spring A		1.8 mm (0.071 in.)	14.6 mm (0.575 in.)	43.8 mm (1.724 in.)	7.9
	3rd accumulator spring B		1.85 mm (0.073 in.)	9.4 mm (0.370 in.)	32.5 mm (1.280 in.)	8.7

Stator shaft

Item	Measurement	Qualification	Standard or New	Service Limit
Stator shaft	Needle bearing contact I.D.	Torque converter side	27.000−27.021 mm (1.063−1.064 in.)	When worn or damaged
		ATF pump side	29.000−29.021 mm (1.1417−1.1426 in.)	———
	Sealing ring contact area I.D.		29.000−29.021 mm (1.1417−1.1426 in.)	29.05 mm (1.144 in.)

Engine Wire Harness, CKP Sensor Subharness, Transmission Range Switch Subharness Locations

A/T



RHD model is shown, LHD model is similar.

Automatic Transmission and A/T Differential

Item	Measurement	Qualification	Standard or New	Service Limit
Automatic transmission fluid	Capacity Use genuine Honda ATF-Z1	Fluid change	2.5 L (2.6 US qt, 2.2 Imp qt)	
		Overhaul	5.85 L (6.18 US qt, 5.15 Imp qt)	
Pressure (Seven-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in D3	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in D	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Pressure (Five-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900–960 kPa (9.2–9.8 kgf/cm^2, 130–140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1st gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2nd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in S	890–970 kPa (9.1–9.9 kgf/cm^2, 130–140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min^{-1})	2,050–2,350 rpm (min^{-1})

Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	Reverse idler gear shaft O.D. at needle bearing contact area		14.99−15.00 mm (0.590−0.591 in.)	When worn or damaged
	I.D.		20.001−20.014 mm (0.7874−0.7880 in.)	When worn or damaged
	I.D. of reverse idler gear shaft contact area on transmission housing		14.800−14.818 mm (0.5827−0.5834 in.)	———
	I.D. of reverse idler gear shaft holder		14.800−14.824 mm (0.5827−0.5836 in.)	When worn or damaged

Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Fork finger thickness		5.90−6.00 mm (0.232−0.236 in.)	5.40 mm (0.213 in.)

Park gear and pawl

Item	Measurement	Qualification	Standard or New	Service Limit
Park gear and pawl			———	When worn or damaged

Pressure (Seven-position transmission)

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure (Seven-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900−960 kPa (9.2−9.8 kgf/cm^2, 130−140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in D3	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in D	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in D	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

Pressure (Five-position transmission)

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure (Five-position transmission)	Line pressure	At 2,000 rpm (min^{-1}) in P or N	900−960 kPa (9.2−9.8 kgf/cm^2, 130−140 psi)	850 kPa (8.7 kgf/cm^2, 120 psi)
	1st clutch pressure	At 2,000 rpm (min^{-1}) in 1st gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	2nd clutch pressure	At 2,000 rpm (min^{-1}) in 2nd gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	3rd clutch pressure	At 2,000 rpm (min^{-1}) in 3rd gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	4th clutch pressure	At 2,000 rpm (min^{-1}) in 4th gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)
	5th clutch pressure	At 2,000 rpm (min^{-1}) in 5th gear in S	890−970 kPa (9.1−9.9 kgf/cm^2, 130−140 psi)	840 kPa (8.6 kgf/cm^2, 120 psi)

Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of needle bearing contact area	At torque converter housing	33.504−33.517 mm (1.3191−1.3196 in.)	When worn or damaged
		At 5th gear	32.986−32.999 mm (1.2987−1.2991 in.)	When worn or damaged
		Reverse selector hub	35.983−35.999 mm (1.4167−1.4173 in.)	When worn or damaged
	I.D. of gears	5th gear	39.000−39.016 mm (1.5354−1.5361 in.)	When worn or damaged
		Reverse gear	42.000−42.016 mm (1.6535−1.6542 in.)	When worn or damaged
	End play	5th gear	0.04−0.27 mm (0.002−0.011 in.)	———
		Reverse gear	0.10−0.25 mm (0.004−0.010 in.)	———
	Reverse selector hub width		29.25−29.45 mm (1.152−1.160 in.)	———
	Collar, 33.2 x 40 x 26 mm length		25.95−26.00 mm (1.022−1.024 in.)	———
	Reverse selector hub O.D.		51.87−51.90 mm (2.042−2.043 in.)	When worn or damaged

Mainshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	Diameter of needle bearing contact area	At stator shaft	22.984−23.000 mm (0.9049−0.9055 in.)	When worn or damaged
		At 5th gear collar	32.975−32.991 mm (1.2982−1.2989 in.)	When worn or damaged
		At 3rd gear	46.986−46.999 mm (1.8498−1.8503 in.)	When worn or damaged
	I.D. of gears	5th gear	37.000−37.016 mm (1.4567−1.4573 in.)	When worn or damaged
		3rd gear	52.000−52.013 mm (2.0472−2.0478 in.)	When worn or damaged
	End play	5th gear	015−0.27 mm (0.006−0.106 in.)	———
		3rd gear	0.04−0.10 mm (0.002−0.004 in.)	———
	40 x 63 mm thrust washer thickness	No. 1	3.750 mm (0.1476 in.)	When worn or damaged
		No. 2	3.775 mm (0.1486 in.)	When worn or damaged
		No. 3	3.800 mm (0.1496 in.)	When worn or damaged
		No. 4	3.825 mm (0.1506 in.)	When worn or damaged
		No. 5	3.850 mm (0.1516 in.)	When worn or damaged
		No. 6	3.875 mm (0.1526 in.)	When worn or damaged
		No. 7	3.900 mm (0.1534 in.)	When worn or damaged
		No. 8	3.925 mm (0.1545 in.)	When worn or damaged
		No. 9	3.950 mm (0.1555 in.)	When worn or damaged
		No. 10	3.975 mm (0.1565 in.)	When worn or damaged
		No. 11	4.000 mm (0.1575 in.)	When worn or damaged
	5th gear collar length		60.4−60.5 mm (2.380−2.381 in.)	———
	5th gear collar flange thickness		3.70−3.85 mm (0.146−0.152 in.)	When worn or damaged
	Sealing ring thickness		1.91−1.97 mm (0.0752−0.0776 in.)	1.86 mm (0.0732 in.)
	Width of sealing ring groove		2.025−2.060 mm (0.0797−0.0811 in.)	2.080 mm (0.0819 in.)
	3rd clutch feed pipe O.D.		7.97−7.98 mm (0.3138−0.3142 in.)	7.95 mm (0.313 in.)
	Feed pipe bushing I.D.		8.000−8.015 mm (0.3150−0.3156 in.)	8.030 mm (0.3161 in.)

Secondary shaft - 1/2

Item	Measurement	Qualification	Standard or New	Service Limit
Secondary shaft - 1/2	Diameter of needle bearing contact area	1st gear	30.986−30.999 mm (1.2199−1.2204 in.)	When worn or damaged
		2nd gear	42.986−42.999 mm (1.6924−1.6929 in.)	When worn or damaged
		4th gear collar	34.975−34.991 mm (1.3770−1.3776 in.)	When worn or damaged
	I.D. of gears	1st gear	38.000−38.016 mm (1.4961−1.4967 in.)	When worn or damaged
		2nd gear	49.000−49.016 mm (1.9291−1.9298 in.)	When worn or damaged
		4th gear	41.000−41.016 mm (1.6142−1.6148 in.)	When worn or damaged
	End play	1st gear	0.04−0.12 mm (0.002−0.005 in.)	———
		2nd gear	0.04−0.12 mm (0.002−0.005 in.)	———
		4th gear	0.10−0.22 mm (0.004−0.009 in.)	———
	31 x 50 mm thrust washer thickness	No. 1	3.925 mm (0.1545 in.)	When worn or damaged
		No. 2	3.950 mm (0.1555 in.)	When worn or damaged
		No. 3	3.975 mm (0.1565 in.)	When worn or damaged
		No. 4	4.000 mm (0.1575 in.)	When worn or damaged
		No. 5	4.025 mm (0.1585 in.)	When worn or damaged
		No. 6	4.050 mm (0.1594 in.)	When worn or damaged
		No. 7	4.075 mm (0.1604 in.)	When worn or damaged
		No. 8	4.100 mm (0.1614 in.)	When worn or damaged
		No. 9	4.125 mm (0.1624 in.)	When worn or damaged
		No. 10	4.150 mm (0.1634 in.)	When worn or damaged
		No. 11	4.175 mm (0.1644 in.)	When worn or damaged
		No. 12	4.200 mm (0.1654 in.)	When worn or damaged
		No. 13	4.225 mm (0.1663 in.)	When worn or damaged
		No. 14	4.250 mm (0.1673 in.)	When worn or damaged
		No. 15	4.275 mm (0.1683 in.)	When worn or damaged
		No. 16	4.300 mm (0.1693 in.)	When worn or damaged
		No. 17	4.325 mm (0.1703 in.)	When worn or damaged
	43 x 54.5 mm thrust washer thickness	No. 1	2.900 mm (0.114 in.)	When worn or damaged
		No. 2	2.925 mm (0.115 in.)	When worn or damaged
		No. 3	2.950 mm (0.116 in.)	When worn or damaged
		No. 4	2.975 mm (0.117 in.)	When worn or damaged
		No. 5	3.000 mm (0.118 in.)	When worn or damaged
		No. 6	3.025 mm (0.119 in.)	When worn or damaged
		No. 7	3.050 mm (0.120 in.)	When worn or damaged
		No. 8	3.075 mm (0.121 in.)	When worn or damaged
		No. 9	3.100 mm (0.122 in.)	When worn or damaged
		No. 10	3.125 mm (0.123 in.)	When worn or damaged
		No. 11	3.150 mm (0.124 in.)	When worn or damaged
		No. 12	3.175 mm (0.125 in.)	When worn or damaged
		No. 13	3.200 mm (0.126 in.)	When worn or damaged

Secondary shaft - 2/2

Item	Measurement	Qualification	Standard or New	Service Limit
Secondary shaft - 2/2	4th gear collar length		32.9−33.0 mm (1.295−1.299 in.)	———
	4th gear collar flange thickness		3.75−3.90 mm (0.148−0.154 in.)	When worn or damaged
	Sealing ring thickness		1.87−1.97 mm (0.074−0.078 in.)	1.82 mm (0.072 in.)
	Width of sealing ring groove		2.025−2.060 mm (0.0797−0.0811 in.)	2.080 mm (0.0819 in.)
	Clutch feed pipe O.D.	2nd clutch	6.97−6.98 mm (0.2744−0.2748 in.)	6.95 mm (0.2736 in.)
		4th clutch	11.47−11.48 mm (0.4516−0.4520 in.)	11.45 mm (0.4508 in.)
	Clutch feed pipe bushing O.D.	2nd clutch	7.018−7.030 mm (0.2763−0.2768 in.)	7.045 mm (0.2774 in.)
		4th clutch	11.500−11.518 mm (0.4528−0.4553 in.)	11.530 mm (0.4539 in.)
	ATF guide collar I.D. at sealing ring contact area		21.200−21.221 mm (0.8346−0.8355 in.)	21.25 mm (0.8366 in.)

Clutch

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch	Clutch between clutch end-plate and top disc	1st	———	1.62−1.82 mm (0.064−0.072 in.)
		2nd	———	0.5−0.7 mm (0.020−0.028 in.)
		3rd	———	0.73−0.93 mm (0.029−0.037 in.)
		4th	———	0.7−0.9 mm (0.028−0.035 in.)
		5th	———	0.73−0.93 mm (0.029−0.037 in.)
	Clutch return spring free length	1st	35.2 mm (1.39 in.)	34.5 mm (1.36 in.)
		2nd	39.5 mm (1.56 in.)	37.4 mm (1.47 in.)
		3rd	45.15 mm (1.778 in.)	43.0 mm (1.69 in.)
		4th	39.5 mm (1.56 in.)	37.4 mm (1.47 in.)
		5th	45.15 mm (1.778 in.)	43.0 mm (1.69 in.)
	Clutch disc thickness	1st	1.94 mm (0.076 in.)	———
		2nd	1.96 mm (0.077 in.)	———
		3rd	1.94 mm (0.076 in.)	———
		4th	1.96 mm (0.077 in.)	———
		5th	1.94 mm (0.076 in.)	———
	Clutch plate thickness	1st	1.6 mm (0.063 in.)	When discolored
		2nd	2.3 mm (0.091 in.)	When discolored
		3rd	2.0 mm (0.079 in.)	When discolored
		4th	1.6 mm (0.063 in.)	When discolored
		5th	2.0 mm (0.079 in.)	When discolored
	Clutch waved-plate height 1st, 3rd, and 5th clutches		0.07−0.20 mm (0.003−0.008 in.)	0.05 mm (0.002 in.)
	1st, 3rd, and 5th clutch end-plate thickness	Mark 1	2.1 mm (0.082 in.)	When discolored
		Mark 2	2.2 mm (0.087 in.)	When discolored
		Mark 3	2.3 mm (0.091 in.)	When discolored
		Mark 4	2.4 mm (0.094 in.)	When discolored
		Mark 5	2.5 mm (0.098 in.)	When discolored
		Mark 6	2.6 mm (0.102 in.)	When discolored
		Mark 7	2.7 mm (0.106 in.)	When discolored
		Mark 8	2.8 mm (0.110 in.)	When discolored
		Mark 9	2.9 mm (0.114 in.)	When discolored
	2nd and 4th clutch end-plate thickness	Mark AC or AM	2.1 mm (0.082 in.)	When discolored
		Mark AD or AN	2.2 mm (0.087 in.)	When discolored
		Mark AE or AP	2.3 mm (0.091 in.)	When discolored
		Mark AF or AQ	2.4 mm (0.094 in.)	When discolored
		Mark AG or AR	2.5 mm (0.098 in.)	When discolored
		Mark AH or AS	2.6 mm (0.102 in.)	When discolored
		Mark AJ or AT	2.7 mm (0.106 in.)	When discolored
		Mark AK or AU	2.8 mm (0.110 in.)	When discolored
		Mark AL or AV	2.9 mm (0.114 in.)	When discolored

A/T differential carrier

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential carrier	Pinion shaft contact area I.D.		18.010−18.028 mm (0.709−0.710 in.)	———
	Clearance between carrier and pinion shaft		0.023−0.057 mm (0.001−0.002 in.)	0.1 mm (0.004 in.)
	Driveshaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and driveshaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Intermediate shaft contact area I.D.		26.025−26.045 mm (1.024−1.025 in.)	———
	Clearance between carrier and Intermediate shaft		0.045−0.086 mm (0.002−0.003 in.)	0.12 mm (0.005 in.)
	Tapered roller bearing starting torque (preload)	For new bearing	2.7−3.9 N·m(28−40 kgf·cm, 24−35 lbf·in.)	Adjust
		For reused bearing	2.5−3.5 N·m(25−37 kgf·cm, 21−32 lbf·in.)	Adjust
	Final driven gear backlash	(Reference)	0.085−0.144 mm (0.003−0.006 in.)	0.2 mm (0.008 in.)

A/T differential pinion gear

Item	Measurement	Qualification	Standard or New	Service Limit
A/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———
	I.D.		18.042−18.066 mm (0.7103−0.7113 in.)	———
	Clearance between pinion gear and pinion shaft		0.055−0.095 mm (0.002−0.004 in.)	0.12 mm (0.005 in.)

Idler gear shaft

Item	Measurement	Qualification	Standard or New	Service Limit
Idler gear shaft	End cover bearing contact area		30.003−30.013 mm (1.1812−1.1816 in.)	When worn or damaged
	Cotters thickness		1.39−1.42 mm (0.055−0.056 in.)	———

Torque converter

Item	Measurement	Qualification	Standard or New	Service Limit
Torque converter	Stall speed Check with vehicle on level ground		2,200 rpm (min $^{-1}$)	2,050−2,350 rpm (min $^{-1}$)

ATF pump

Item	Measurement	Qualification	Standard or New	Service Limit
ATF pump	ATF pump thrust clearance		0.03−0.06 mm (0.001−0.002 in.)	0.07 mm (0.003 in.)
	Clearance between ATF pump gear and body	Drive gear	0.210−0.265 mm (0.008−0.010 in.)	———
		Driven gear	0.070−0.125 mm (0.003−0.005 in.)	———
	ATF pump driven gear I.D.		14.016−14.034 mm (0.5518−0.5525 in.)	When worn or damaged
	ATF pump driven gear shaft O.D.		13.980−13.990 mm (0.5504−0.5508 in.)	When worn or damaged

Main valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Main valve body spring	Cut valve B spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0
	Shift valve A spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Shift valve C spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	Relief valve spring		1.0 mm (0.039 in.)	9.6 mm (0.378 in.)	34.1 mm (1.343 in.)	10.2
	Lock-up control valve spring		0.6 mm (0.024 in.)	7.1 mm (0.280 in.)	29.6 mm (1.165 in.)	11.2
	Cooler check valve spring		0.85 mm (0.033 in.)	6.6 mm (0.260 in.)	27.0 mm (1.063 in.)	11.3
	Shift valve D spring		0.8 mm (0.031 in.)	5.6 mm (0.220 in.)	28.1 mm (1.106 in.)	15.9
	Servo control valve spring		0.8 mm (0.031 in.)	9.9 mm (0.290 in.)	27.3 mm (1.075 in.)	8.0

Regulator valve body

Item	Measurement	Qualification	Standard or New	Service Limit
Regulator valve body	Sealing ring contact I.D.		29.000−29.021 mm (1.1417−1.1426 in.)	29.05 mm (1.144 in.)

Regulator valve body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Regulator valve body spring	Stator reaction spring		4.5 mm (0.177 in.)	35.4 mm (1.394 in.)	30.3 mm (1.193 in.)	1.92
	Regulator valve spring A		1.9 mm (0.075 in.)	14.7 mm (0.579 in.)	80.6 mm (3.173 in.)	16.1
	Regulator valve spring B		1.6 mm (0.063 in.)	9.2 mm (0.362 in.)	44.0 mm (1.732 in.)	12.5
	Torque converter check valve spring		1.2 mm (0.047 in.)	8.6 mm (0.339 in.)	33.8 mm (1.331 in.)	12.2
	Lock-up shift valve spring		1.0 mm (0.039 in.)	6.6 mm (0.260 in.)	35.5 mm (1.398 in.)	18.2
	1st accumulator spring B		2.4 mm (0.094 in.)	12.2 mm (0.480 in.)	35.0 mm (1.378 in.)	7.7
	1st accumulator spring A		2.4 mm (0.094 in.)	18.6 mm (0.732 in.)	50.1 mm (1.972 in.)	6.7
	4th accumulator spring		2.5 mm (0.098 in.)	14.6 mm (0.575 in.)	29.9 mm (1.177 in.)	4.9

Servo body

Item	Measurement	Qualification	Standard or New	Service Limit
Servo body	Shift fork shaft bore I.D.		14.000−14.010 mm (0.5512−0.5526 in.)	When worn or damaged
	Shift fork shaft valve bore I.D.		37.000−37.039 mm (1.4567−1.4582 in.)	37.045 mm (1.4585 in.)

Servo body spring

Item	Measurement	Qualification	Standard or New			
			Wire Diameter	O.D.	Free Length	No. of Coils
Servo body spring	Cut valve A spring		0.9 mm (0.035 in.)	9.9 mm (0.390 in.)	22.3 mm (0.878 in.)	6.9
	Shift valve B spring		0.8 mm (0.031 in.)	7.1 mm (0.280 in.)	23.7 mm (0.933 in.)	9.7
	5th accumulator spring A		2.5 mm (0.098 in.)	16.6 mm (0.654 in.)	46.9 mm (1.846 in.)	7.8
	5th accumulator spring B		1.9 mm (0.075 in.)	10.0 mm (0.394 in.)	38.5 mm (1.516 in.)	10.6
	2nd accumulator spring A		1.8 mm (0.071 in.)	14.6 mm (0.575 in.)	43.8 mm (1.724 in.)	7.9
	2nd accumulator spring B		1.85 mm (0.073 in.)	9.4 mm (0.370 in.)	32.5 mm(1.280 in.)	8.7

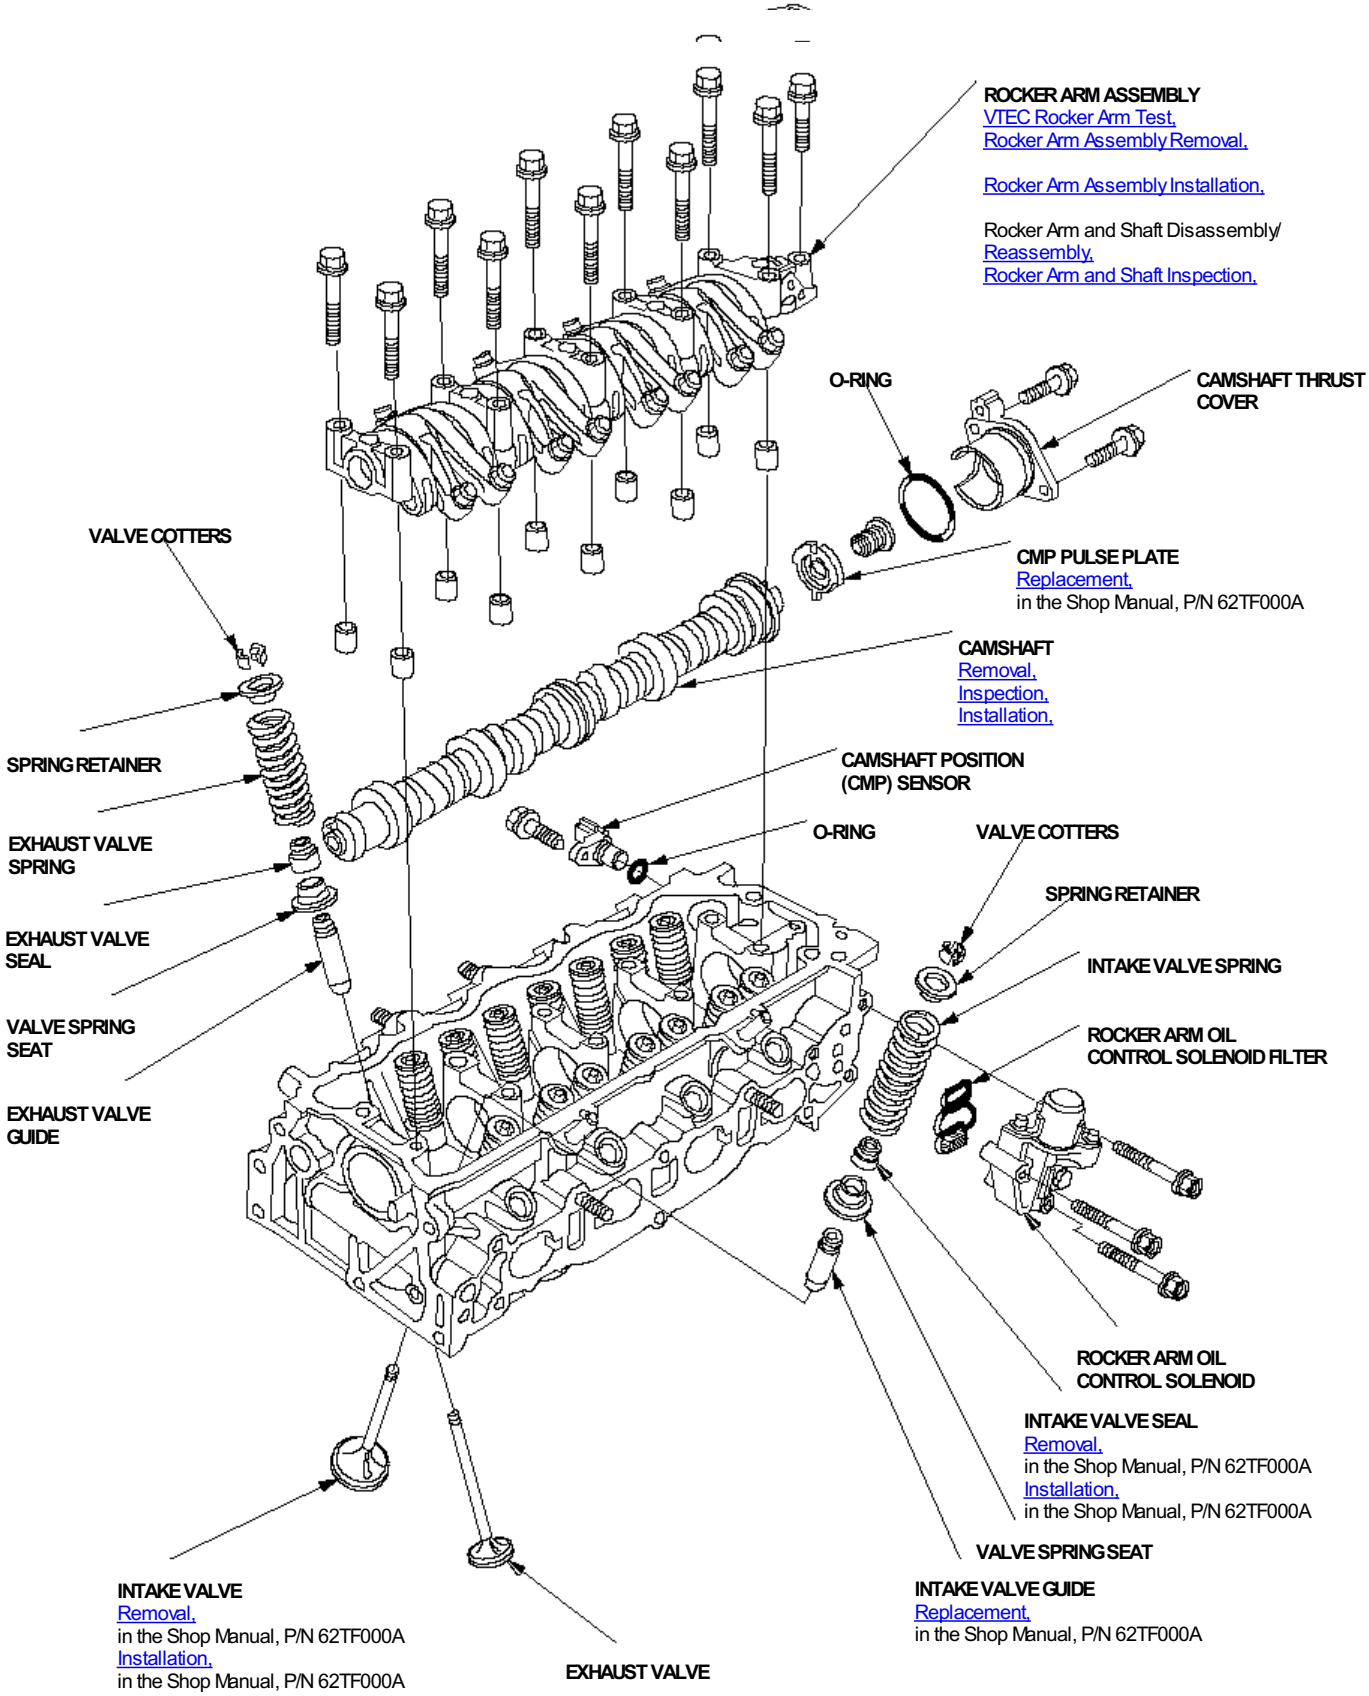
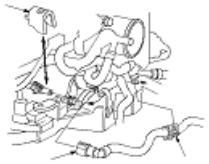
M/T differential 80 mm shim (L15A7, L15A8)	80 mm shim-to-bearing outer race clearance in transmission housing		0.01−0.1 mm (0.0004−0.004 in.)	Adjust

Cylinder Head Component Location Index



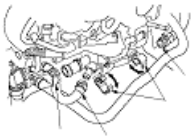
Cylinder Head Removal

NOTE:



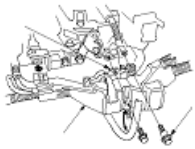
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 38 °C (100 °F) before loosening the cylinder head bolts.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Relieve fuel pressure.
2. Drain the engine coolant.
3. Do the battery removal procedure.
4. Remove the air cleaner housing assembly.
5. Remove the fuel feed hose clamp (A) and the quick-connect fitting cover (B), then disconnect the fuel feed hose (C).

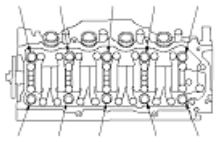


6. Disconnect the upper radiator hose (A), the heater hose (B), and the water bypass hose (C).
7. Remove the heater hose from the clamps (D).
8. Remove the intake manifold bracket C.
9. Remove the subfuel feed line.
10. Remove the intake manifold/chamber assembly.
11. Remove the warm up three way catalytic converter (WU-TWC).
12. Remove the following engine wire harness connectors and wire harness clamps from the cylinder head:
    - Four injector connector
    - Engine coolant temperature (ECT) sensor 1 connector
    - Camshaft position (CMP) sensor connector
    - Secondary heated oxygen sensor (secondary HO2S) connector
    - Rocker arm oil control solenoid connector

13. Remove the harness holder.



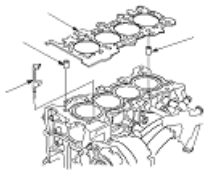
14. Remove the harness holder mounting bolt (A) and the ground cable (B), then remove the harness holder (C) from the bracket.
15. Remove the cylinder head cover.
16. Remove the cam chain.



17. Remove the cylinder head bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.
18. Remove the cylinder head.

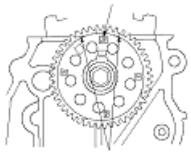
Cylinder Head Installation

1. Clean the cylinder head and the block surface.
2. Install a new coolant separator (A) in the engine block whenever the engine block is replaced.
3. Install the new cylinder head gasket (B) and the dowel pins (C) on the engine block. Always use a new cylinder head gasket.

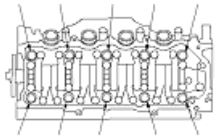


4. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the oil pump.

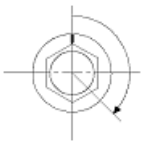
5. Set the camshaft TDC. The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.
6. Install the cylinder head on the engine block.
7. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.



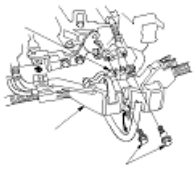
8. Tighten the cylinder head bolts in sequence to 29 N·m (3.0 kgf·m, 22 lbf·ft). Using a beam-type torque wrench. When using a preset-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and retighten it from the first step.



9. Tighten all cylinder head bolts an additional 130 °.
10. Install the cam chain.
11. Install the cylinder head cover.

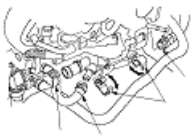


12. Install the harness holder (A), then install the ground cable (B).

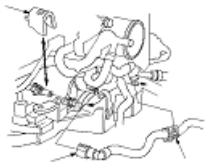


13. Install the harness holder.
14. Connect the engine wire harness connectors, and install the wire harness clamps to the cylinder head.
    - Four injector connector
    - Engine coolant temperature (ECT) sensor 1 connector
    - Camshaft position (CMP) sensor connector
    - Secondary heated oxygen sensor (secondary HO2S) connector
    - Rocker arm oil control solenoid connector
15. Install the warm up three way catalytic converter (WU-TWC).
16. Install the intake manifold bracket C.
17. Install the subfuel feed line.
18. Install the intake manifold/chamber assembly.

19. Install the upper radiator hose (A), the heater hose (B), and the water bypass hose (C).
20. Install the heater hose to the clamps (D).

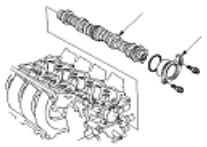


21. Connect the fuel feed hose (A), then install the quick-connect fitting cover (B) and the fuel feed hose clamp (C).



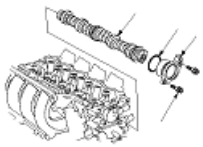
22. Install the air cleaner housing assembly.
23. Do the battery installation procedure.
24. Inspect for fuel leaks. Turn the ignition switch to ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation three times, then check for fuel leakage at any point in the fuel line.
25. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open.
26. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.
27. Inspect the idle speed.
28. Inspect the ignition timing.

Camshaft Removal



1. Remove the air cleaner housing assembly.
2. Remove the intake manifold chamber.
3. Remove the following engine wire harness connectors and wire harness clamps from the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - Camshaft position (CMP) sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
4. Remove the harness holder mounting bolt and the ground cable, then remove the harness holder from the bracket.
5. Remove the camshaft sprocket.
6. Remove the rocker arm assembly.
7. Remove the CMP sensor.
8. Remove the camshaft thrust cover (A), then remove the camshaft (B).

Camshaft Installation

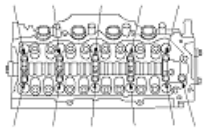


1. Install the camshaft (A), then install the camshaft thrust cover (B) with new O-ring (C).
2. Install the camshaft position (CMP) sensor.
3. Install the rocker arm assembly.
4. Install the camshaft sprocket.
5. Install the harness holder, then install the ground cable.
6. Install the following engine wire harness connectors and wire harness clamps to the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - CMP sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
7. Install the intake manifold chamber.
8. Install the air cleaner housing assembly.

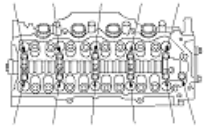
Camshaft Inspection

1. Remove the camshaft sprocket.
2. Remove the rocker arm assembly, then disassemble the rocker arm.
3. Put the rocker shaft holder bridge/rocker shaft holders on the cylinder head, then tighten the bolts to the specified torque.
   Specified Torque
   6 x 1.0 mm
   (1)–(10): 15 N·m (1.5 kgf·m, 11 lbf·ft)
   (11): 10 N·m (1.0 kgf·m, 7.2 lbf·ft)
4. Seat the camshaft by pushing it toward the rear of the cylinder head.

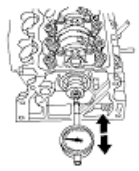
L15A8 engine



L13Z3 engine

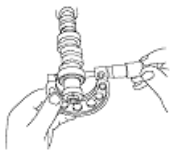


5. Zero the dial indicator against the end of the camshaft. Push the camshaft back and forth, and read the end play. If the end play is beyond the service limit, replace the thrust cover and recheck. If it is still beyond the service limit, replace the camshaft.
   Camshaft End Play
   Standard (New): 0.05–0.25 mm (0.002–0.010 in.)
   Service Limit: 0.5 mm (0.02 in.)



6. Remove the camshaft.
7. Wipe the camshaft clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn.

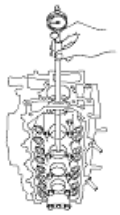
8. Measure the diameter of each camshaft journal.



9. Zero the gauge to the journal diameter.

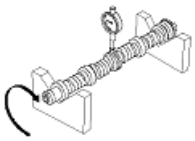
10. Clean the camshaft bearing surfaces in the cylinder head. Measure the inside diameter of each camshaft bearing surface, and check for an out-of-round condition.
    - If the camshaft-to-holder clearance is within limits, go to Step 12 .
    - If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has been replaced, replace the cylinder head.
    - If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has not been replaced, go to Step 11 .

    Camshaft-to-Holder Oil Clearance
    Standard (New): 0.045–0.084 mm (0.0018–0.0033 in.)
    Service Limit: 0.100 mm (0.004 in.)

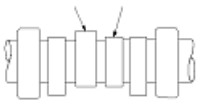


11. Check the total runout with the camshaft supported on V-blocks.
    - If the total runout of the camshaft is within the service limit, replace the cylinder head.
    - If the total runout is beyond the service limit, replace the camshaft, and recheck the oil clearance. If the oil clearance is still out of tolerance, replace the cylinder head.

    Camshaft Total Runout
    Standard (New): 0.03 mm (0.001 in.) max.
    Service Limit: 0.04 mm (0.002 in.)



12. Measure the cam lobe height.



Cam Lobe Height Standard (New):

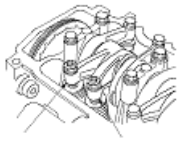
		INTAKE	EXHAUST
L15A8 engine	PRI	35.162 mm (1.3843 in.)	35.614 mm (1.4021 in.)
	SEC	30.529 mm (1.2019 in.)	
L13Z3 engine	PRI	34.290 mm (1.3500 in.)	35.047 mm (1.3798 in.)
	SEC	30.529 mm (1.2019 in.)	

PRI: Primary SEC: Secondary IN: Intake
EX: Exhaust C/C: Cam Chain

VTEC Rocker Arm Test

Special Tools Required

L15A8, L13Z3 engines



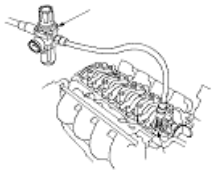
Air supply, 3/8
07LAJ-PR30102

Air adapter, M10 x 1.0
070AJ-0010101

1. Start the engine, and let it run for 5 minutes, then turn the ignition switch to LOCK (0).
2. Remove the cylinder head cover.
3. Rotate the crankshaft clockwise, and visually check that all the primary rocker arms (A) and secondary rocker arms (B) move freely.
   - If the primary rocker arm and secondary rocker arm move together, remove the primary and secondary rocker arms as an assembly, and check that the pistons in the primary and secondary rocker arms move smoothly. If any rocker arm needs replacing, replace the primary and secondary rocker arms as an assembly, then retest.
   - If all the primary rocker arms and secondary rocker arms move freely, go to Step 4 .
4. Check that the air pressure on the shop air compressor gauge indicates over 400 kPa (4 kgf/cm ^{2}, 57 psi).
5. Inspect the valve clearance.

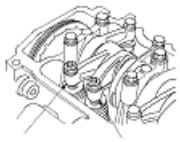
L15A8, L13Z3 engines

6. Install the air adapter (A) to the inspection hole, then connect the valve inspection set (B).
7. Loosen the valve on the regulator, and apply the specified air pressure.
   Specified Air Pressure:
   340 kPa (3.5 kgf/cm ^{2}, 50 psi)



L15A8, L13Z3 engines

8. With the specified air pressure applied, rotate the crankshaft clockwise, and visually check that all the primary rocker arms (A) and secondary rocker arms (B) move together.
   If the primary rocker arm and secondary rocker arm move freely and independently of each other, remove the primary and secondary rocker arms as an assembly, and check that the pistons in the primary and secondary rocker arms move smoothly. If any rocker arm needs replacing, replace the primary and secondary rocker arms as an assembly, and test.

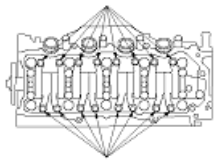


9. Remove the air supply and the VTEC adapter.
10. Install the cylinder head cover.

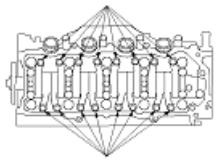
Cylinder Head Rocker Arm Assembly Removal

1. Remove the cylinder head cover.
2. Loosen the rocker arm adjusting screws (A).

L15A8 engine

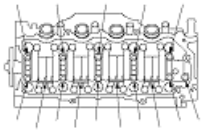


L13Z3 engine

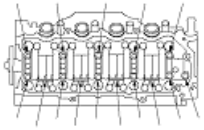


3. Unscrew the rocker shaft mounting bolts two turns at a time, in sequence below.
   NOTE: Bundle the intake rocker arms with rubber bands (A) to keep them together as a set.

L15A8 engine

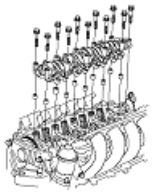


L13Z3 engine

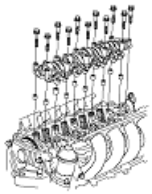


4. Remove the rocker shaft mounting bolts, then remove the rocker arm assembly.

L15A8 engine



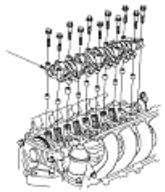
L13Z3 engine



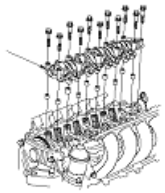
Cylinder Head Rocker Arm Assembly Installation

1. Install the rocker arm assembly (A).

L15A8 engine

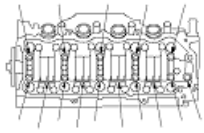


L13Z3 engine

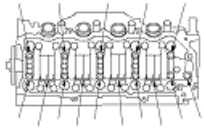


2. Tighten each bolts two turns at a time in sequence.
   NOTE: Remove the rubber bands (A) from the intake rocker arms.
   Specified Torque
   6 x 1.0 mm
   (1)–(10): 15 N·m (1.5 kgf·m, 11 lbf·ft)
   (11): 10 N·m (1.0 kgf·m, 7.2 lbf·ft)

L15A8 engine



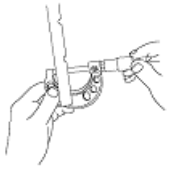
L13Z3 engine



3. Adjust the valve clearance.
4. Install the cylinder head cover.

Cylinder Head Rocker Arm and Shaft Inspection

1. Remove the rocker arm assembly.
2. Disassemble the rocker arm assembly.
3. Measure the diameter of the shaft at the first rocker location.



4. Zero the gauge (A) to the shaft diameter.

5. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition.

Rocker Arm-to-Shaft Clearance

L15A8 engine:	
Intake:	
Standard (New):	**0.017–0.067 mm (0.0007–0.0026 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Exhaust:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Intake:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Exhaust:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**

6. Repeat for all rockers and shaft. If the clearance is beyond the service limit, replace the rocker shaft and all out of service limit rocker arms. If any VTEC rocker arm needs replacement, replace the rocker arms as an assembly.

VTEC Rocker Arms

7. Inspect the rocker arm pistons (A). Push on them manually. If they do not move smoothly, replace the rocker arm set.
   NOTE:
   - Apply new engine oil to the rocker arm pistons when reassembling.
   - When reassembling the secondary rocker arm A, carefully apply air pressure to the oil passage of the rocker arm.
8. Reassemble the rocker arm assembly.
9. Install the rocker arm assembly.

L15A8 engine

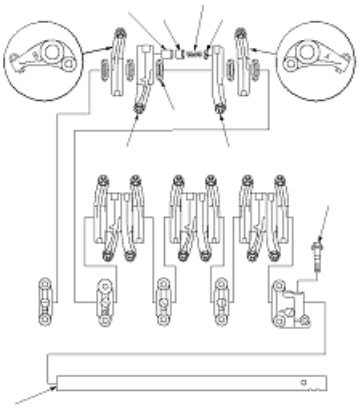
L13Z3 engine

Cylinder Head Rocker Arm and Shaft Disassembly/Reassembly

L15A8 engine

NOTE:

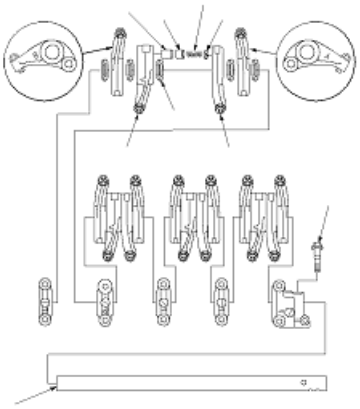
- Identify each part as it is removed so that each item can be reinstalled in its original position.
- Inspect the rocker arm shaft and the rocker arms.
- If reused, the rocker arms must be installed in the their original location.
- Remove the rocker shaft bolt before removing the rocker shaft from the No. 5 rocker shaft holder.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to any contact points.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.
- When reassembling the rocker arm and shaft assembly, position the arrows on the rocker shaft holders facing the cam chain side.



L13Z3 engine

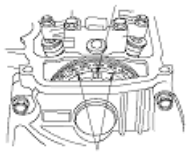
NOTE:

- Identify each part as it is removed so that each item can be reinstalled in its original position.
- Inspect the rocker arm shaft and the rocker arms.
- If reused, the rocker arms must be installed in the their original location.
- Remove the rocker shaft bolt before removing the rocker shaft from the No. 5 rocker shaft holder.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to any contact points.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.
- When reassembling the rocker arm and shaft assembly, position the arrows on the rocker shaft holders facing the cam chain side.

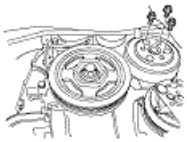


Cam Chain Removal

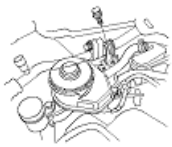
NOTE: Keep the cam chain away from magnetic fields.



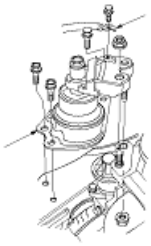
1. Remove the cylinder head cover.
2. Set the No. 1 piston at top dead center (TDC). The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.
3. Remove the right front wheel.
4. Remove the right side splash shield.
5. Loosen the water pump pulley mounting bolts.
6. Remove the drive belt.



7. Remove the water pump pulley.
8. Remove the crankshaft pulley.
9. Remove the drive belt auto-tensioner.

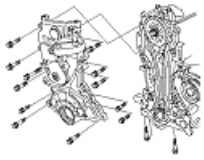


10. Remove the A/C line bracket mounting bolt.
11. Support the engine with a jack and wood block under the oil pan.

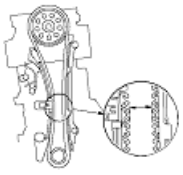


12. Remove the ground cable (A), then remove the side engine mount/bracket assembly (B).

L15A8, L13Z3 engines



13. Remove the chain case.



14. Measure the cam chain separation. If the distance is less than the service limit, replace the cam chain and cam chain tensioner.
    Standard Distance: 19 mm (0.75 in.)
    Service Limit: 15 mm (0.59 in.)

15. Apply new engine oil to the sliding surface of the cam chain tensioner slider (A).
16. Hold the cam chain tensioner slider with the screwdriver, then remove the bolt (B), and loosen the bolt (C).

17. Remove the cam chain tensioner slider.

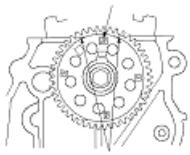
18. Remove the cam chain tensioner (A) and the cam chain guide (B).
19. Remove the cam chain.

Cam Chain Installation

NOTE: Keep the cam chain away from magnetic fields.

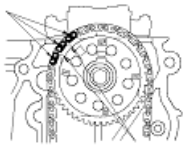
1. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the oil pump.
2. Remove the crankshaft sprocket.

3. Set the camshaft to TDC. The “UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.

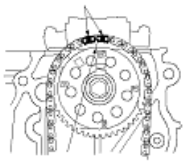


4. Install the cam chain on the crankshaft sprocket with the colored piece (A) aligned with the TDC mark (B) on the crankshaft sprocket, then install the crankshaft sprocket to the crankshaft.

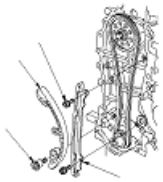
5. With L15A8 engine: Install the cam chain on the camshaft sprocket with the pointers (A) aligned with the three colored pieces (B) as shown.



6. With L13Z3 engine: Install the cam chain on the camshaft sprocket with the pointer (A) aligned with the center of the two colored pieces (B).

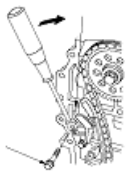


7. Install the cam chain tensioner (A) and the cam chain guide (B).

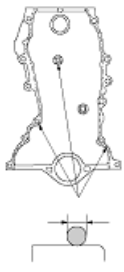


8. Install the cam chain tensioner slider, and tighten the bolt loosely.

9. Apply new engine oil to the sliding surface of the cam chain tensioner slider (A).
10. Rotate the cam chain tensioner slider clockwise to compress the cam chain tensioner, and install the remaining bolt, then tighten the bolts.
11. Check the chain case oil seal for damage. If the oil seal is damaged, replace the chain case oil seal.
12. Remove the all of the old liquid gasket from the chain case mating surfaces, the bolts, and the bolt holes.
13. Clean and dry the chain case mating surfaces.

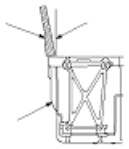


14. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the engine block mating surface of the chain case and to the inner threads of the bolt holes.
NOTE: Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).



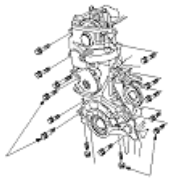
15. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the oil pan mating surface of the chain case and to the inner threads of the bolt holes.
NOTE:
    - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).
    - Apply liquid gasket about 5.0 mm (0.20 in.) diameter bead to the shaded area (B).
    - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.

16. Set the edge of the chain case (A) to the edge of the oil pan (B), then install the chain case on the engine block (C).
NOTE:
    - When installing the chain case, do not slide the bottom surface onto the oil pan mounting surface.
    - Wait at least 30 minutes before filling the engine with oil.
    - Do not run the engine for at least 3 hours after installing the chain case.

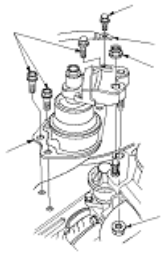


17. Tighten the chain case mounting bolts. Wipe off the excess liquid gasket on the oil pan and the chain case mating area.

L15A8, L13Z3 engines

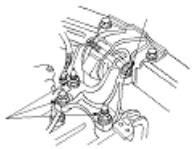


18. Install the side engine mount/bracket assembly (A), then tighten the new side engine mount/bracket assembly mounting bolts (B).
19. Loosely tighten the new side engine mount/bracket assembly mounting nuts (C).
20. Install the ground cable (D).
21. Remove the air cleaner housing assembly.

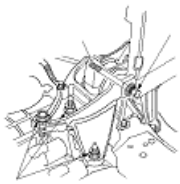


22. Loosen the transmission mount bracket mounting bolts and nuts (A).
23. Raise the vehicle on the lift to full height.

M/T model



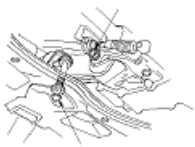
A/T model



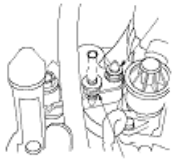
24. Loosen the torque rod mounting bolt and nut (A).
25. Lower the vehicle on the lift.

M/T model

A/T model

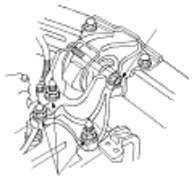


26. Tighten the side engine mount/bracket assembly mounting nuts in the numbered sequence shown.



27. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
28. Raise the vehicle on the lift to full height.

M/T model



A/T model

---

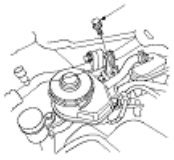
29. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.
30. Lower the vehicle on the lift.
31. Install the air cleaner housing assembly.

M/T model

A/T model

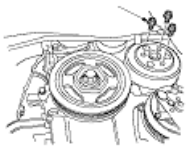
---

32. Install the A/C line bracket mounting bolt.
33. Install the cylinder head cover.
34. Install the drive belt auto-tensioner.
35. Install the crankshaft pulley.



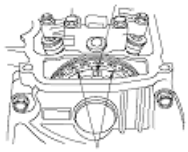
---

36. Install the water pump pulley.
37. Install the drive belt.
38. Tighten the water pump pulley mounting bolts.
39. Install the right side splash shield.
40. Install the right front wheel.
41. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.



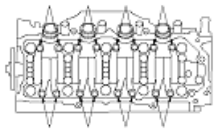
Cylinder Head Valve Clearance Adjustment

NOTE: Adjust the valves only when the cylinder head temperature is less than 38 °C (100 °F).



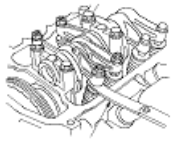
1. Remove the cylinder head cover.
2. Set the No. 1 piston at top dead center (TDC). The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.

L15A8, L13Z3 engines



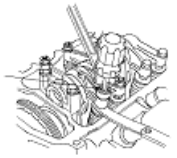
3. Select the correct thickness feeler gauge for the valves you are going to check.
   Valve Clearance
   Intake: 0.15–0.19 mm (0.006–0.007 in.)
   Exhaust: 0.26–0.30 mm (0.010–0.012 in.)

L15A8, L13Z3 engines

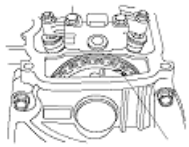


4. Insert the feeler gauge (A) between the adjusting screw and the end of the valve stem on No. 1 cylinder and slide it back and forth; you should feel a slight amount of drag.

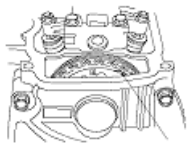
L15A8, L13Z3 engines



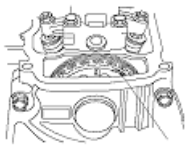
5. If you feel too much or too little drag, loosen the locknut, and turn the adjusting screw (A) until the drag on the feeler gauge is correct.
6. Tighten the locknut and recheck the clearance. Repeat the adjustment, if necessary.
7. Tighten the locknut to the specified torque, and recheck the valve clearance. Repeat the adjustment if necessary.
   Specified Torque
   7 x 0.75 mm 14 N·m (1.4 kgf·m, 10 lbf·ft)
   Apply new engine oil to the nut threads.



8. Rotate the crankshaft clockwise. Align the No. 3 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
9. Check, and if necessary, adjust the valve clearance on the No. 3 cylinder.



10. Rotate the crankshaft clockwise. Align the No. 4 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
11. Check, and if necessary, adjust the valve clearance on the No. 4 cylinder.



12. Rotate the crankshaft clockwise. Align the No. 2 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
13. Check, and if necessary, adjust the valve clearance on the No. 2 cylinder.
14. Install the cylinder head cover.

Fuel and Emissions System Description - VTEC System

Removal/Installation,
in the Shop Manual, P/N 62TF000A

VTEC System Oil Pressure Troubleshooting

Special Tools Required

Oil pressure gauge joint attachment
07NAJ-P070100

Low pressure gauge assy. 1,000 kPa
07406-0070002

Oil pressure hose
07ZAJ-S5A0200

NOTE:

- Check for Temporary DTCs or DTCs with the HDS before this procedure. If there are any DTCs indicated, troubleshoot them first, then do this procedure.
- Check that the oil pressure indicator goes off after starting engine before this procedure.

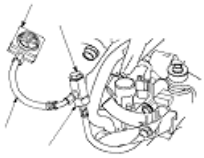
1. Turn the ignition switch to ON (II).
2. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Can you hear the rocker arm oil control solenoid click?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the rocker arm oil control solenoid 2P connector.
5. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.

   Is the rocker arm oil control solenoid clicking?
   YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
   NO - Go to Step 22 .
6. Turn the ignition switch to LOCK (0).

---

7. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt (A) that was removed to the oil pressure gauge joint attachment.



8. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
9. Check the oil pressure at the engine speed of 1,000 to 2,000 rpm (min $^{-1}$).
   NOTE: Keep the measuring time as short as possible (less than 1 minute).

   Is the oil pressure below 49 kPa (0.5 kgf/cm ^{2} , 7 psi)?
   YES - Go to Step 10 .
   NO - Go to Step 22 .
10. Turn the ignition switch to LOCK (0).
11. Disconnect the rocker arm oil control solenoid 2P connector.

---

12. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
13. Start the engine.

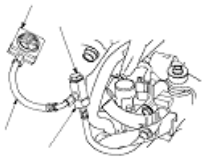
14. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2} , 56.9 psi)?
    YES - The VTEC system oil pressure is normal.■
    NO - Go to Step 15 .
15. Turn the ignition switch to LOCK (0).
16. Remove the rocker arm oil control valve.
17. Check the rocker arm oil control solenoid filter for dirt and clogging.

    Is the rocker arm oil control solenoid filter dirty or clogged?
    YES - Replace the engine oil, engine oil filter, and the rocker arm oil control solenoid filter, then go to Step 18 .
    NO - Go to Step 22 .

---

18. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt that was removed to the oil pressure gauge joint attachment.

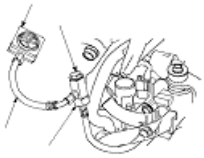


19. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
20. Start the engine.

21. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2}, 56.9 psi)?
    YES - Troubleshooting is complete.■
    NO - Go to Step 22.
22. Replace the rocker arm oil control valve.

23. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt that was removed to the oil pressure gauge joint attachment.



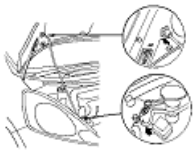
24. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
25. Start the engine.

26. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2}, 56.9 psi)?
    YES - Troubleshooting is complete.■
    NO - Clean the oil passage of the cylinder block or replace the cylinder block.■

Engine Removal

Special Tools Required



Engine tilt hanger set
07KAK-SJ40101

Engine hanger stay
07KAK-SJ40200

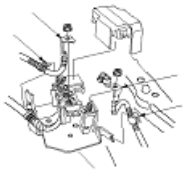
Sub hanger stay
07MAK-PY30100

NOTE:

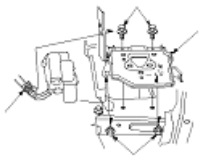
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Remove the hood support rod, then use it as shown to prop the hood in the wide-open position.
2. Relieve fuel pressure.
3. Do the battery removal procedure.
4. Remove the under-cowl panel.
5. Remove the air cleaner housing assembly.

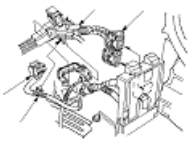
6. Remove the battery cables (A) from the battery terminal fuse box.
7. Remove the harness clamps (B).



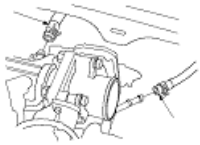
8. With M/T model: Remove the harness clamp (A). Remove the two bolts (B) and loosen the two bolts (C), then remove the battery base (D).



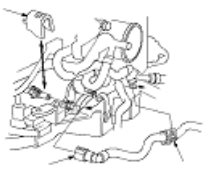
9. Disconnect the engine control module (ECM)/ powertrain control module (PCM) connectors (A) and the engine wire harness connector (B).
10. Remove the harness clamp (C) and harness holder (D).



11. Disconnect the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).



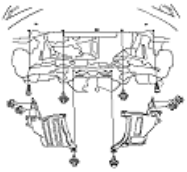
12. Remove the fuel feed hose clamp (A) and the quick-connect fitting cover (B), then disconnect the fuel feed hose (C).



13. Disconnect the secondary heated oxygen sensor (secondary HO2S) connector (A), then remove the secondary HO2S harness from the clamps (B).
14. M/T model: Remove the shift cable.
15. M/T model: Remove the clutch slave cylinder, and clutch line bracket mounting bolt.
16. Remove the radiator cap.
17. Remove the subfuel fill cap, then retighten the subfuel cap.
18. Remove the bolt, then disconnect the subfuel feed line from the subfuel solenoid holder.
19. Raise the vehicle on the lift to full height.
20. Remove the front wheels.

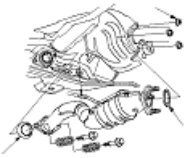
---

21. Remove the splash shields.
22. Remove the drive belt.
23. Loosen the drain plug in the radiator, and drain the engine coolant.
24. Drain the engine oil.
25. Drain the transmission fluid:
    - Manual transmission
    - Automatic transmission



---

26. Remove the under-floor three way catalytic converter (under-floor TWC).
27. A/T model: Remove the shift cable.
28. Remove the stabilizer links from the stabilizer.
29. Separate the knuckles from the lower arms.

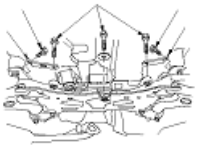


---

30. Remove the driveshaft heat shield.
31. Remove the driveshafts. Coat all precision-finished surfaces with clean engine oil. Tie a plastic bags over the driveshaft ends.

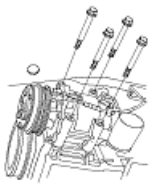
---

32. Remove the bolts (A) securing the steering gearbox, then remove the steering gearbox stiffeners (B).



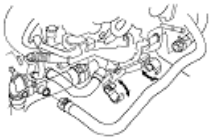
---

33. Remove the A/C compressor without disconnecting the A/C hoses.
34. Lower the vehicle on the lift.
35. Remove the radiator.



---

36. Disconnect the heater hoses.
37. Raise the vehicle on the lift to full height.
38. Support the transmission with a jack and wood block under the transmission.



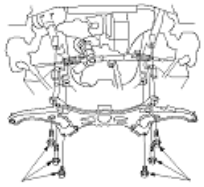
---

39. Remove the torque rod.
40. Remove the jack.

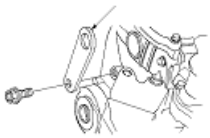
M/T model

A/T model

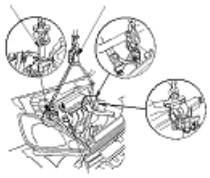
41. Remove the front subframe.
42. Lower the vehicle on the lift.



43. Install the sub hanger stay.

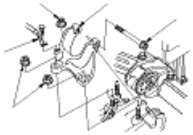


44. Attach the special tools to the engine/transmission as shown.

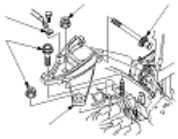


45. Remove the ground cable (A), then remove the transmission mount bracket (B).

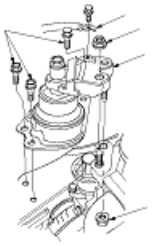
M/T model



A/T model

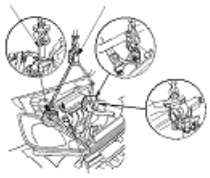


46. Remove the ground cable (A), then remove the side engine mount/bracket assembly (B).
47. Check that the engine/transmission is completely free of vacuum hoses, fuel and coolant hoses, and electrical wiring.
48. Slowly lower the engine/transmission about 150 mm (6 in.). Check once again that all hoses and electrical wiring are disconnected and free from the engine/transmission, then lower it all the way.
49. Disconnect the chain hoist from the engine/transmission.
50. Raise the vehicle, and remove the engine/ transmission from under the vehicle.



Engine Installation

Special Tools Required



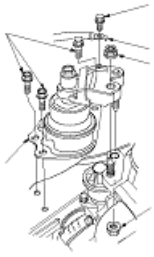
Engine tilt hanger set
07KAK-SJ40101

Engine hanger stay
07KAK-SJ40200

Sub hanger stay
07MAK-PY30100

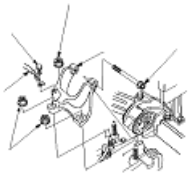
1. Raise the vehicle on the lift, and position the engine/transmission under the vehicle. Lower the vehicle, and attach the special tools to the engine/transmission, then lift the engine/transmission into position in the vehicle.
   NOTE: Reinstall the mounting bolts and support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

2. Install the side engine mount/bracket assembly (A), then tighten the new side engine mount/bracket assembly mounting bolts (B) and nuts (C).
3. Loosely tighten the new side engine mount/bracket assembly mounting nuts (C).
4. Install the ground cable (D).



5. Install the transmission mount bracket (A), and loosely tighten the new transmission mount bracket mounting bolts and nuts (B).
6. Install the ground cable (C).
7. Remove the engine tilt hanger set from the engine/transmission.

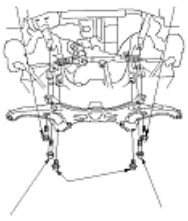
M/T model



A/T model

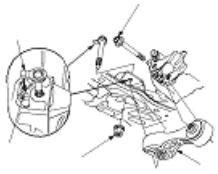
8. Remove the sub hanger stay.
9. Raise the vehicle on the lift to full height.

10. Install the front subframe, then tighten the new front subframe mounting bolts in the numbered sequence shown.



11. Install the torque rod (A). Install the new bolt with the tab (B) on the bolt head aligned with the guide (C) on the front subframe, then loosely tighten the new torque rod mounting bolt and nut (D).
12. Lower the vehicle on the lift.

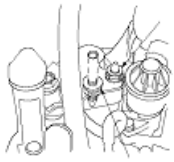
M/T model



A/T model

---

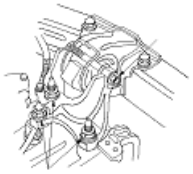
13. Tighten the side engine mount/bracket assembly mounting nuts in the numbered sequence shown.



---

14. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
15. Raise the vehicle on the lift to full height.

M/T model



A/T model

---

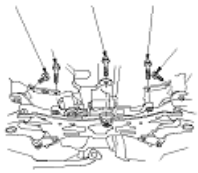
16. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.

M/T model

A/T model

---

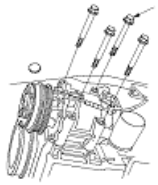
17. Install the securing the steering gearbox and the steering gearbox stiffeners, then tighten the new bolts in the numbered sequence shown.
18. Install a new set ring on the end of each driveshaft, then install the driveshafts. Make sure each ring ‘‘clicks" into place in the differential and the intermediate shaft.



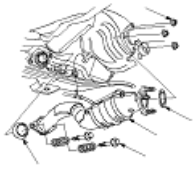
---

19. Install the driveshaft heat shield.
20. Connect the lower arms to the knuckles.
21. Install the stabilizer links to the stabilizer.
22. A/T model: Install the shift cable.

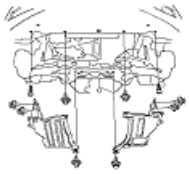
23. Install the A/C compressor.
24. Install the drive belt.



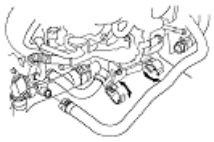
25. Install the under-floor three way catalytic converter (under-floor TWC) (A). Use new gaskets (B) and new self locking nuts (C).



26. Install the splash shields.
27. Lower the vehicle on the lift.

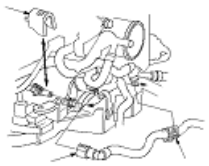


28. Install the heater hoses.
29. Install the radiator.
30. M/T model: Install the clutch slave cylinder, and clutch line bracket mounting bolt.
31. M/T model: Install the shift cable.
32. Install the subfuel fill cap, then retighten the subfuel cap.
33. Connect the subfuel feed line, then install the subfuel solenoid holder bolt.

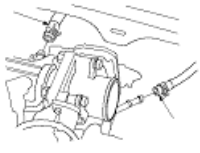


34. Connect the secondary heated oxygen sensor (secondary HO2S) connector (A), then install the secondary HO2S harness to the clamps (B).

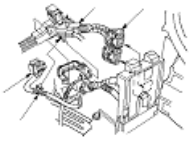
35. Connect the fuel feed hose (A) , then install the quick-connect fitting cover (B) and the fuel feed hose clamp (C).



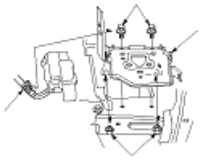
36. Install the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).



37. Install the harness holder (A), then install the harness clamp (B).
38. Connect the engine wire harness connector (C) and the engine control module (ECM)/powertrain control module (PCM) connectors (D).

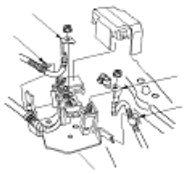


39. With M/T model: Install the battery base (A), then install the harness clamp (B).



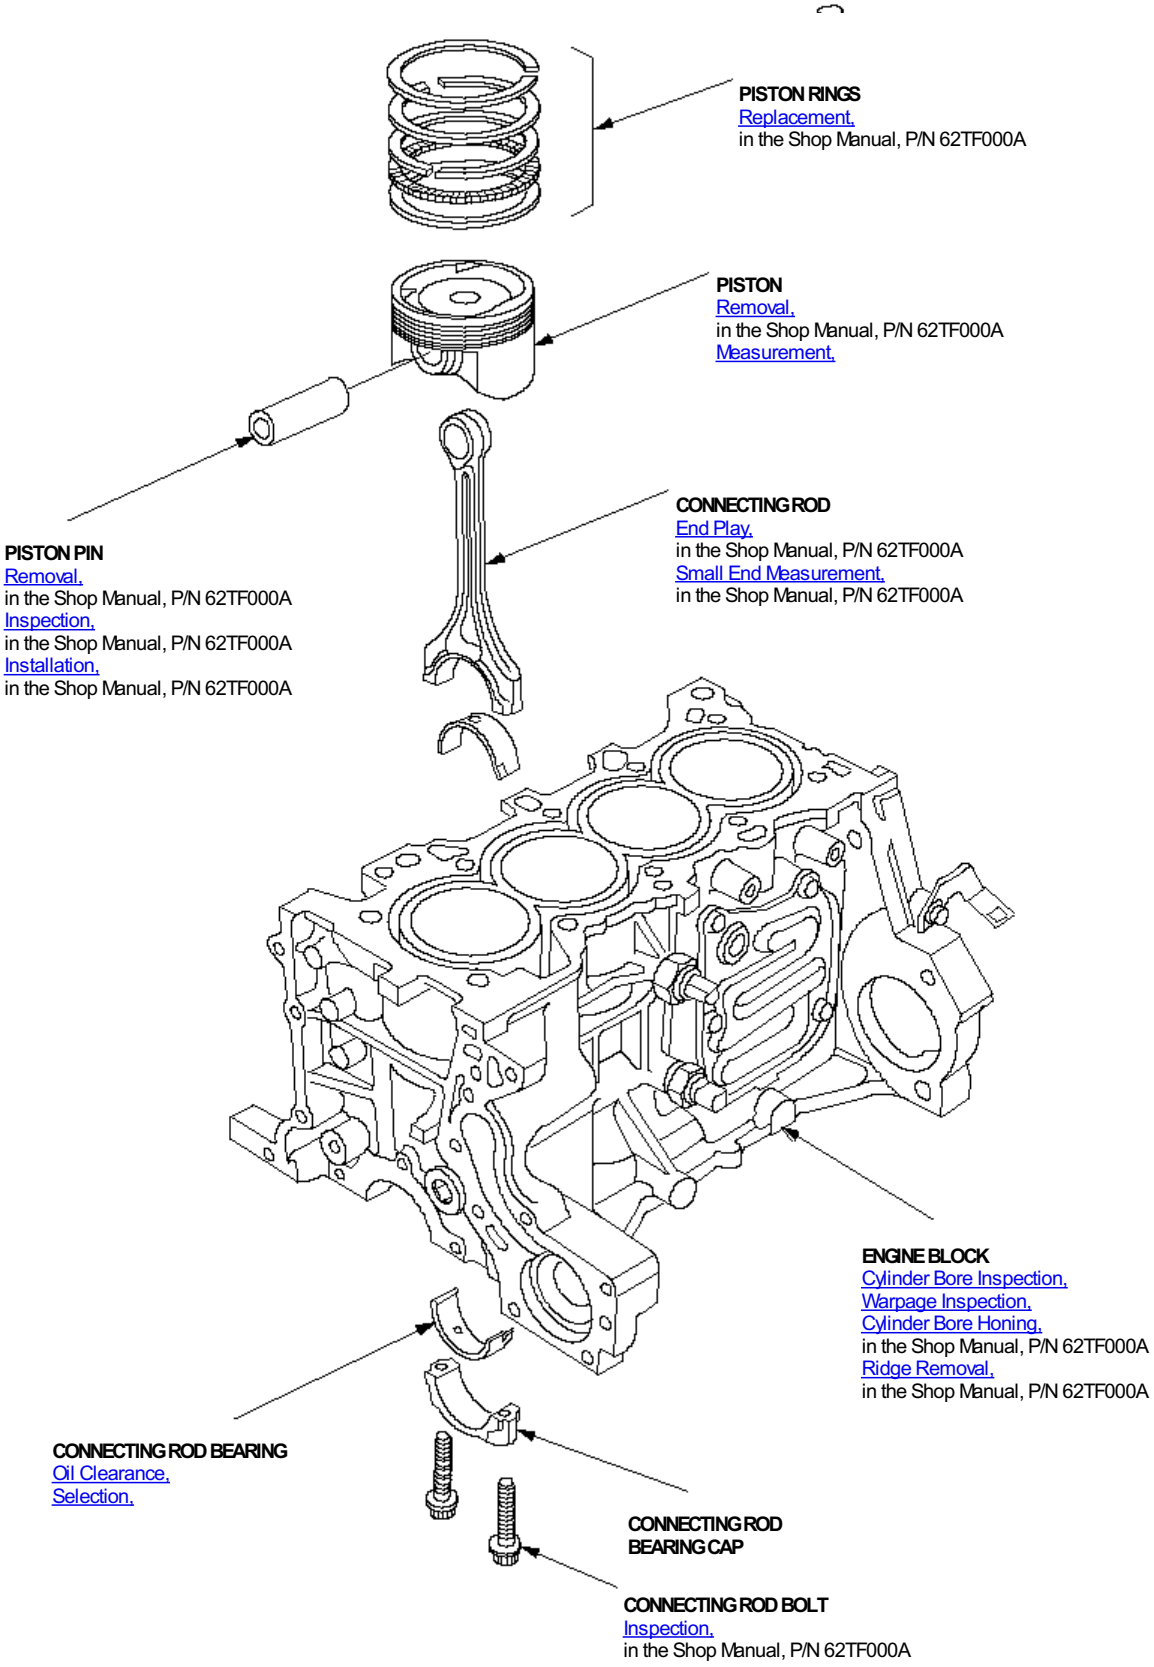
---

40. Install the battery cables (A) to the battery terminal fuse box.
41. Install the harness clamps (B).
42. Install the front wheels.
43. Install the under-cowl panel.
44. Do the battery installation procedure.
45. Refill the transmission with fluid:
    - Manual transmission
    - Automatic transmission
46. Install the air cleaner housing assembly.
47. A/T model: Move the shift lever to each gear, and verify that the A/T gear position indicator follows the transmission range switch.
48. M/T model: Check that the transmission shifts into all gear smoothly.
49. Inspect for fuel leaks. Turn the ignition switch to ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation three times, then check for fuel leakage at any point in the fuel line.
50. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open.
51. Refill the engine with engine oil.
52. Do the ECM/PCM reset procedure.
53. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.
54. Inspect the idle speed.
55. Inspect the ignition timing.



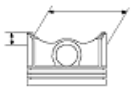
Engine Block Component Location Index

L15A8 engine



Engine Block and Piston Inspection

1. Remove the crankshaft and the pistons.
2. Check the piston for distortion or cracks.

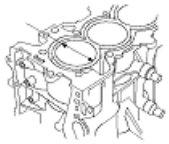


3. Measure the piston diameter (A) at a point 16 mm (0.6 in.) from the bottom of the skirt.

Piston Diameter
L15A8 engine:
Standard (New): **72.980−72.990 mm (2.8732−2.8736 in.)**
Service Limit: **72.97 mm (2.8728 in.)**
L13Z3 engine:
Standard (New): **72.972−72.982 mm (2.8729−2.8733 in.)**
Service Limit: **72.97 mm (2.8728 in.)**

Oversize Piston Diameter
L15A8 engine:
0.25: **73.230−73.240 mm (2.88307−2.88346 in.)**
L13Z3 engine:
0.25: **73.222−73.232 mm (2.88275−2.88314 in.)**

4. Measure wear and taper in direction Y at three levels in each cylinder as shown. If measurements in any cylinder are beyond the Oversize Bore Service Limit, replace the engine block. If the engine block is to be rebored, refer to Step 7 after reboring.



Cylinder Bore Size

Standard (New): **73.000−73.015 mm (2.8740−2.8746 in.)**
Service Limit: **73.065 mm (2.8766 in.)**

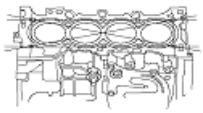
Oversize
0.25: **73.250−73.265 mm (2.8839−2.8844 in.)**

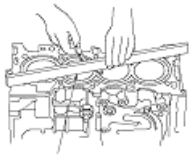
Reboring limit: **0.25 mm (0.01 in.) max.**

Bore Taper
Limit: **(Difference between first and third measurement) 0.05 mm (0.002 in.)**

5. Scored or scratched cylinder bores must be honed.

6. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

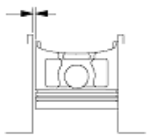




Engine Block Warpage

Standard (New): **0.07 mm (0.003 in.) max.**
Service Limit: **0.10 mm (0.004 in.)**

7. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near or exceeds the service limit, inspect the piston and engine block for excessive wear.

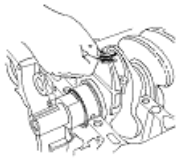


Piston-to-Cylinder Clearance

L15A8 engine:
Standard (New): **0.010−0.035 mm (0.0004−0.0014 in.)**
Service Limit: **0.05 mm (0.002 in.)**
L13Z3 engine:
Standard (New): **0.018−0.043 mm (0.0007−0.0017 in.)**
Service Limit: **0.05 mm (0.002 in.)**

Connecting Rod Bearing Replacement

Rod Bearing Clearance Inspection

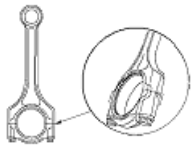


1. To check rod bearing-to-journal oil clearance, remove the bearing cap bridge.
2. Remove the connecting rod cap and bearing half.
3. Clean the crankshaft rod journal and bearing half with a clean shop towel.
4. Place plastigage across the rod journal.
5. Reinstall the bearing half and cap, and torque the bolts to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft) +90 °.
   NOTE: Do not rotate the crankshaft during inspection.
6. Remove the rod cap and bearing half, and measure the widest part of the plastigage.
   Connecting Rod Bearing-to-Journal Oil Clearance

L15A8 engine:	
Standard (New):	**0.020–0.038 mm (0.0008–0.0015 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**
L13Z3 engine:	
Standard (New):	**0.026–0.044 mm (0.0010–0.0017 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**

7. If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
8. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearing, replace the crankshaft and start over.

Rod Bearing Selection



1. Inspect each connecting rod for cracks and heat damage.

Connecting Rod Big End Bore Code Locations

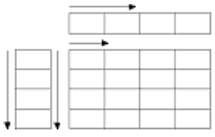
2. Each rod falls into one of four tolerance ranges (from 0 to 0.024 mm (0.0009 in.), in 0.006 mm (0.0002 in.) increments) depending on the size of its big end bore. It's then stamped with a number or bar (1, 2, 3, or 4) indicating the range. You may find any combination of 1, 2, 3, or 4 in any engine.
   If the codes are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.
   Normal Bore Size: **43.0 mm (1.69 in.)**

Connecting Rod Journal Code Location

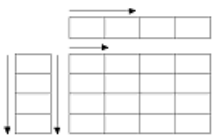
3. The connecting rod journal codes are stamped on the crankshaft.

4. Use the big end bore codes and rod journal codes to select appropriate replacement bearings from the following table.
   NOTE: Color code is on the edge of the bearing.

L15A8 engine

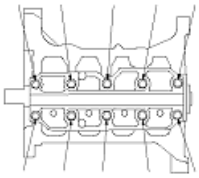


L13Z3 engine



Crankshaft Main Bearing Replacement

Main Bearing Clearance Inspection



1. To check main bearing-to-journal oil clearance, remove the bearing cap bridge and bearing halves.
2. Clean each main journal and bearing half with a clean shop towel.
3. Place one strip of plastigage across each main journal.
4. Reinstall the bearings and bearing cap bridge, then tighten the bearing cap bolts to 25 N·m (2.5 kgf·m, 18 lbf·ft) in the proper sequence.
   NOTE: Do not rotate the crankshaft during inspection.
5. Tighten the bearing cap bolts an additional 40 °.

6. Remove the bearing cap bridge and bearings again, and measure the widest part of the plastigage.

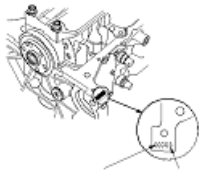
Main Bearing-to-Journal Oil Clearance

Standard (New):	**0.018–0.036 mm (0.0007–0.0014 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**

7. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
8. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

Main Bearing Selection

Crankshaft Bore Code Location



1. Letters have been stamped on the end of the block as a code for the size of each of the five main journal bores. Write down the crank bore codes.
   If you can't read the codes because of accumulated dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

Main Journal Code Location

2. The main journal codes are stamped on the crankshaft.

3. Use the crank bore codes and crank journal codes to select the appropriate replacement bearings from the following table.
   NOTE: Color code is on the edge of the bearing.

Engine will not start (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Test the starter.
3. Check the fuel pressure.
4. Troubleshoot the fuel pump circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination

Engine will not start (MIL comes on and stays on, no DTCs set)

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination
- No power to ECM/PCM
- No ground to ECM/PCM
- Shorted reference voltage

MIL comes on and stays on, or never comes on at all, no DTCs set

Diagnostic procedure

1. Troubleshoot the MIL circuit.

Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Also check for

- Camshaft timing
- Low compression
- Intake vacuum leaks
- Fuel contamination
- Weak spark

Engine is hard start (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Check the fuel pressure.
3. Test the throttle body.

Also check for

- Low compression
- Intake air leaks
- Fuel contamination
- Weak spark

Engine is hard to start (engine coolant temperature below 20 °C (68 °F) and/or fuel grade (alcohol contained level) above 61 %)

Diagnostic procedure

1. Troubleshoot the subfuel pump circuit.
2. Test the subfuel pressure.
3. Test the subfuel solenoid.

Cold fast idle too low (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Throttle body cleaning.

Also check for

- Incorrect valve adjustment

Cold fast idle too high (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Test the throttle body.

Also check for

- Incorrect valve adjustment

After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Test the throttle body.

Also check for

- Intake vacuum leaks
- Incorrect valve adjustment

After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Inspect the APP sensor.

Also check for

- Intake vacuum leaks

Idle speed fluctuates (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Test the injectors.
4. Troubleshoot the alternator FR signal circuit.
5. Inspect the PCV valve.
6. Test the throttle body.
7. Troubleshoot the A/C signal circuit.
8. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Intake vacuum leaks

Misfire or rough running (MIL works OK, no DTCs set)

Diagnostic procedure

1. Check the spark plugs.
2. Test the fuel pressure.
3. Test the injectors.
4. Troubleshoot the fuel pump circuit.
5. Troubleshoot the VTEC system oil pressure.

Also check for

- Low compression
- Valve clearance
- Fuel contamination

Fails emission test (MIL works OK, no DTCs set)

Diagnostic procedure

1. Inspect the three way catalytic converter (TWC).
2. Check the spark plugs.
3. Test the fuel pressure.
4. Test the injectors.
5. Check the EVAP system.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Broken cam chain

Low power (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the fuel pressure.
2. Check the air cleaner element.
3. Test the throttle body.
4. Inspect the three way catalytic converter (TWC).
5. Test the injectors.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Camshaft timing
- Engine oil level

Engine stalls (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Check the idle speed.
4. Troubleshoot the brake pedal position switch signal circuit.
5. Check the spark plugs.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Intake vacuum leaks
- Faulty harness and sensor connections
- Fuel contamination

Difficult to refuel

Diagnostic procedure

1. Inspect the breather line and the suction line.

HDS does not communicate with the ECM/PCM or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Low subfuel indicator does not come on

Diagnostic procedure

1. Troubleshoot the low fuel indicator unit circuit.

Low subfuel indicator stays on

Diagnostic procedure

1. Troubleshoot the low fuel indicator unit circuit.

Fuel and Emissions Systems Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set)	1.Test the battery. 2.Test the starter. 3.Check the fuel pressure. 4.Troubleshoot the fuel pump circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination
Engine will not start (MIL comes on and stays on, no DTCs set)	Troubleshoot the DLC circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination • No power to ECM/PCM • No ground to ECM/PCM • Shorted reference voltage
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit.	
Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	• Camshaft timing • Low compression • Intake vacuum leaks • Fuel contamination • Weak spark
Engine is hard start (MIL works OK, no DTCs set)	1.Test the battery. 2.Check the fuel pressure. 3.Test the throttle body.	• Low compression • Intake air leaks • Fuel contamination • Weak spark
Engine is hard to start (engine coolant temperature below 20 °C (68 °F) and/or fuel grade (alcohol contained level) above 61 %)	1.Troubleshoot the subfuel pump circuit. 2.Test the subfuel pressure. 3.Test the subfuel solenoid.	
Cold fast idle too low (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Check the idle speed. 3.Throttle body cleaning.	Incorrect valve adjustment
Cold fast idle too high (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Check the idle speed. 3.Test the throttle body.	Incorrect valve adjustment
After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)	1.Troubleshoot the alternator FR signal circuit. 2.Test the throttle body.	• Intake vacuum leaks • Incorrect valve adjustment
After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)	1.Troubleshoot the alternator FR signal circuit. 2.Inspect the APP sensor.	Intake vacuum leaks
Idle speed fluctuates (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Test the fuel pressure. 3.Test the injectors. 4.Troubleshoot the alternator FR signal circuit. 5.Inspect the PCV valve. 6.Test the throttle body. 7.Troubleshoot the A/C signal circuit. 8.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Intake vacuum leaks
Misfire or rough running (MIL works OK, no DTCs set)	1.Check the spark plugs. 2.Test the fuel pressure. 3.Test the injectors. 4.Troubleshoot the fuel pump circuit. 5.Troubleshoot the VTEC system oil pressure.	• Low compression • Valve clearance • Fuel contamination
Fails emission test (MIL works OK, no DTCs set)	1.Inspect the three way catalytic converter (TWC). 2.Check the spark plugs. 3.Test the fuel pressure. 4.Test the injectors. 5.Check the EVAP system. 6.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Broken cam chain

Symptom	Diagnostic procedure	Also check for
Low power (MIL works OK, no DTCs set)	1.Test the fuel pressure. 2.Check the air cleaner element. 3.Test the throttle body. 4.Inspect the three way catalytic converter (TWC). 5.Test the injectors. 6.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Camshaft timing • Engine oil level
Engine stalls (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Test the fuel pressure. 3.Check the idle speed. 4.Troubleshoot the brake pedal position switch signal circuit. 5.Check the spark plugs. 6.Troubleshoot the VTEC system oil pressure.	• Intake vacuum leaks • Faulty harness and sensor connections • Fuel contamination
Difficult to refuel	Inspect the breather line and the suction line.	
HDS does not communicate with the ECM/PCM or the vehicle	Troubleshoot the DLC circuit.	
Low subfuel indicator does not come on	Troubleshoot the low fuel indicator unit circuit.	
Low subfuel indicator stays on	Troubleshoot the low fuel indicator unit circuit.	

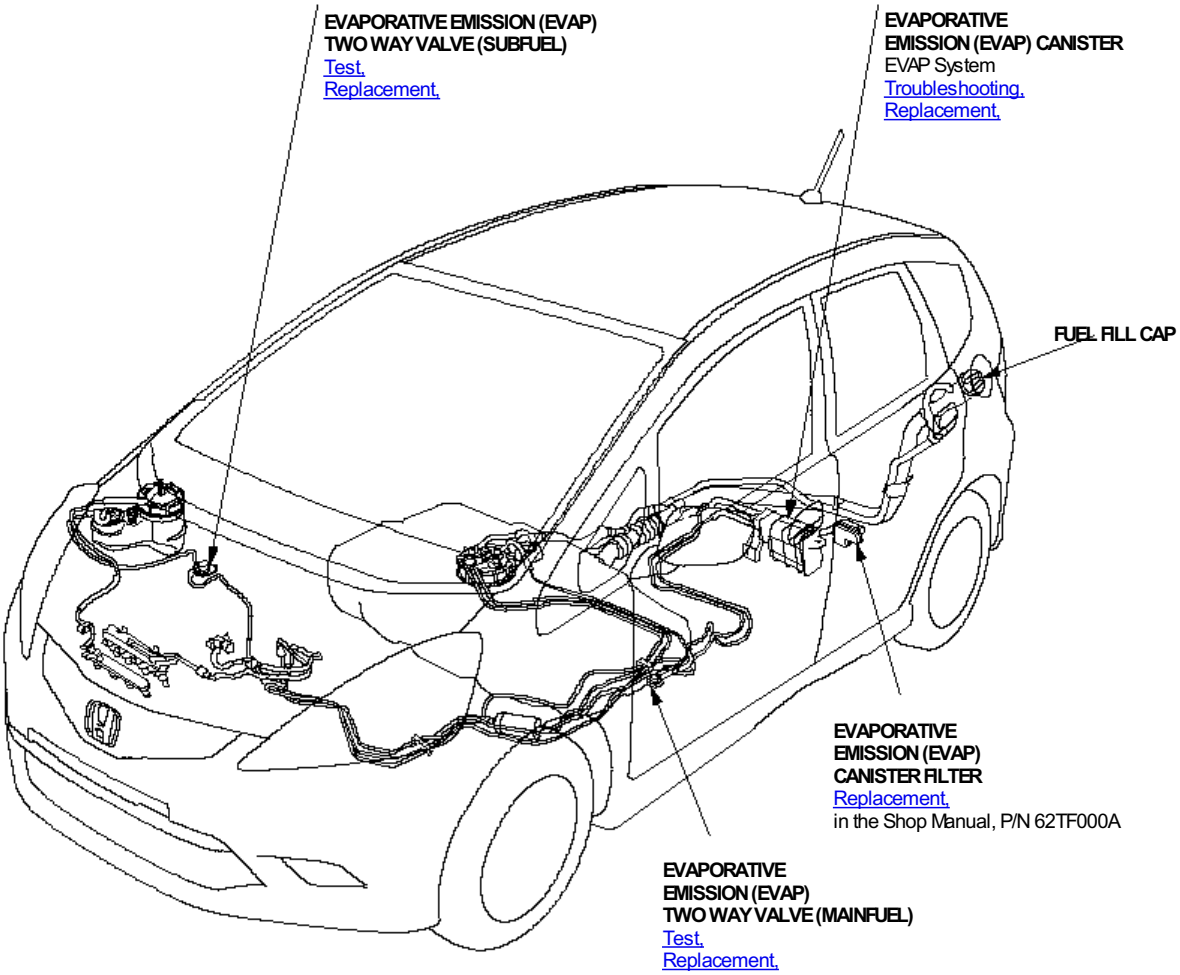
Fuel and Emissions System Description - Vacuum Lines

[Vacuum Hose Routing]
[Vacuum Distribution]

Fuel and Emissions System Description - EVAP Control Diagram

Evaporative Emission (EVAP) Control Diagram

EVAP System Component Location Index



EVAP System Troubleshooting

1. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) and connect a vacuum pump/gauge (C) to the hose.
2. Start the engine, and let it idle.
   NOTE: Engine coolant temperature must be below 60 °C (140 °F).

   Is there vacuum?
   YES - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve.■
   NO - Go to Step 3 .
3. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in N or P, M/T in neutral) until the radiator fan comes on, then hold the engine speed to 3,000 rpm (min $^{-1}$).

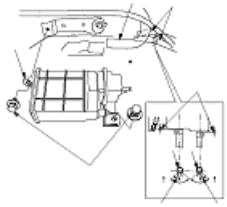
   Is there vacuum?
   YES - Go to Step 4 .
   NO - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve. ■
4. Turn the ignition switch to LOCK (0).
5. Reconnect the vacuum hose to the EVAP canister purge valve.
6. Remove the fuel fill cap.
7. Lift the vehicle, and support it with jackstands.

8. Disconnect drain tube (A) from the EVAP canister and connect the combination gauge kit and tube joint adapter to EVAP canister (B).
9. Lower the vehicle.
10. Start the engine and raise speed to 3,000 rpm (min $^{-1}$).

    Does vacuum appear on gauge within 1 minute?
    YES - See EVAP two way valve test to complete. Evaporative emission controls are OK.■
    NO - Replace the EVAP canister. ■

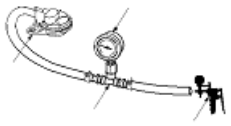
EVAP Canister Replacement

1. Lift the vehicle, and support it with jackstands.
2. Disconnect the hoses (A) and tube (B).
3. Remove the EVAP canister (C).
4. Install the parts in the reverse order of removal.
   NOTE: Align the marks (D) on the hose as shown, then insert the hose. Make sure the clamp is positioned as shown.



EVAP Two Way Valve Test

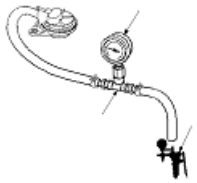
Special Tools Required



Combination gauge kit 20/−100 kPa
07YAJ-0010610

Tube joint adapter
07410-5790503

1. Remove the fuel fill cap.
2. Remove the EVAP two way valve.
3. Disconnect the vapor line from the EVAP two way valve (A). Connect it to the combination gauge kit and tube joint adapter and the vacuum pump (B) as shown.
4. Apply vacuum slowly and continuously while watching the gauge. The valve should open below 1.33 kPa (1.0 mmHg, 0.04 in.Hg).
   - If the vacuum hold below 1.33 kPa (1.0 mmHg, 0.04 in.Hg), go to Step 5 .
   - If the vacuum doesn't hold, replace the EVAP two way valve.

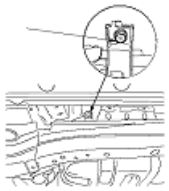


5. Move the vacuum pump from the vacuum fitting to the pressure fitting (A) as shown.
6. Slowly pressurize the vapor line while watching the gauge. The valve should open above 5.07 kPa (38 mmHg, 1.5 in.Hg).
   - If the pressure hold below 5.07 kPa (38 mmHg, 1.5 in.Hg), the valve is OK.
   - If the pressure doesn't hold, replace the EVAP two way valve.

EVAP Two Way Valve Replacement

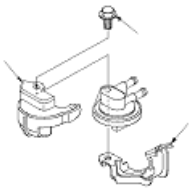
MAINFUEL

1. Lift the vehicle, and support with jackstands.
2. Remove the bolt (A).



3. Pull the EVAP two way valve (A) and the hoses (B) out of the frame.
4. Disconnect the hoses (B) from the EVAP two way valve (A).

5. Remove the EVAP two way valve lower stay (A) and EVAP two way valve cover (B).
6. Install the parts in the reverse order of removal.

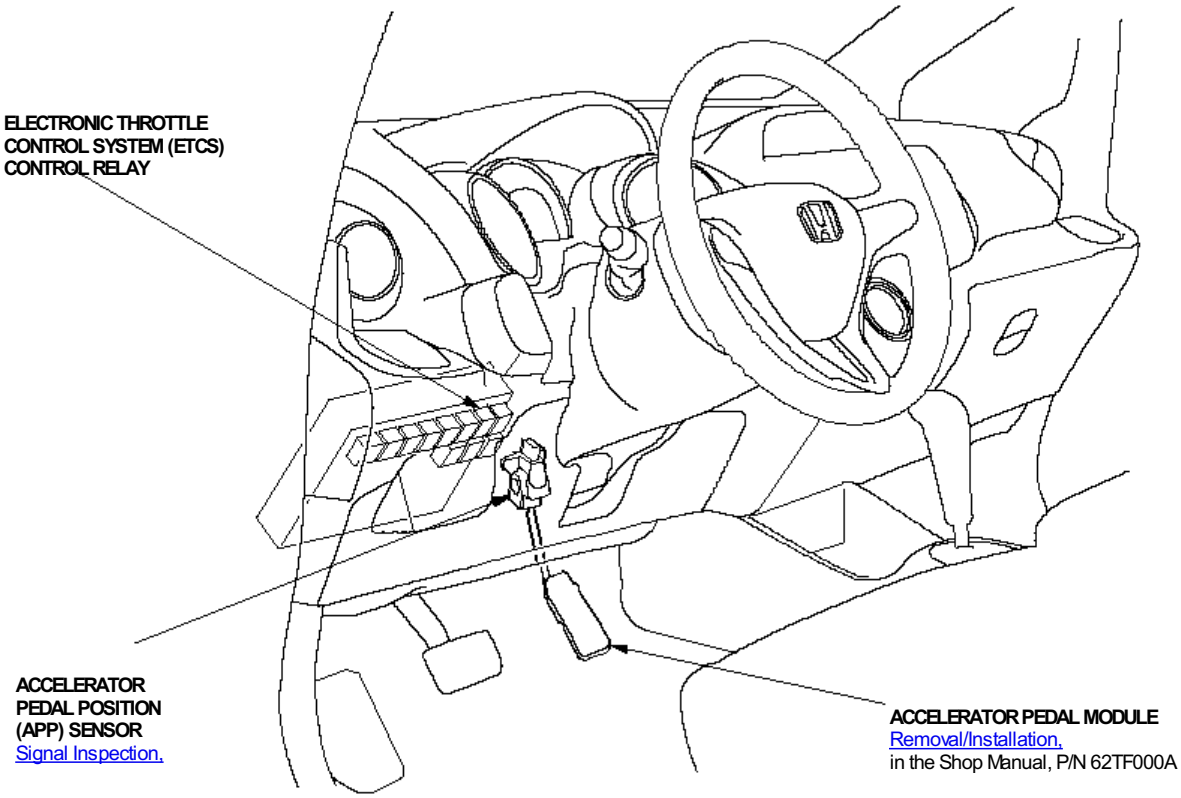


Subfuel

1. Remove the EVAP two way valve cover (A).

2. Disconnect the hoses (A).
3. Remove the nut (B).
4. Remove the EVAP two way valve (C).
5. Install the parts in the reverse order of removal.

Electronic Throttle Control System Component Location Index



APP Sensor Signal Inspection

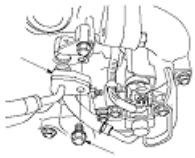
NOTE:

- This procedure checks the APP sensor in this fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.
- Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.
- Press the accelerator pedal several times to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module.

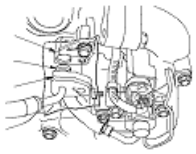
1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then go to Step 5 .
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, replace the accelerator pedal module, then go to Step 1 .

Subfuel Pressure Relieving

Before disconnecting subfuel lines or hoses, relieve pressure from the system by disabling the subfuel pump and then disconnecting the fuel tube/quick connect fitting in the engine compartment.



1. Do the battery terminal disconnection procedure.
2. Remove the subfuel fill cap, then retighten the subfuel cap.
3. Remove the bolt (A), then disconnect the subfuel feed line (B).



4. Place a rag or shop towel over the subfuel feed line (A) and (B).
5. Install the parts in the reverse order of removal, with a new O-ring (C).
6. Do the battery terminal reconnection procedure.
7. Turn the ignition switch to ON (II), but do not operate the starter. After the subfuel pump runs for about 2 seconds, the fuel pressure in the line rises. Repeat this two or three times, then check for fuel leakage.

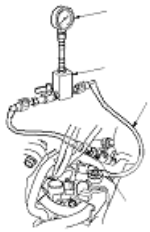
Fuel Pressure Test

Special Tools Required



Fuel gauge assy. 600 kPa
07406-0040004

Fuel pressure gauge attachment set
07ZAJ-S5A0101

Fuel attachment C hose
07ZAJ-S7C0100

Fuel attachment C joint
07ZAJ-S7C0200

1. Relieve the fuel pressure.
2. Disconnect the quick-connect fitting. Attach the fuel pressure gauge set and the fuel gauge assy.
3. Start the engine, and let it idle.
   - If the engine starts, go to Step 5 .
   - If the engine does not start, go to Step 4 .
4. Check to see if the fuel pump is running: Listen to the fuel filler port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is first turned on.
   - If the pump runs, go to Step 5 .
   - If the pump does not run, do the fuel pump circuit troubleshooting.
5. Read the fuel pressure gauge. The pressure should be 380−430 kPa (3.9−4.4 kgf/cm ^{2} , 55−63 psi).
   - If the pressure is OK, the test is complete.
   - If the pressure is out of specification, replace the fuel pump and the fuel filter, then recheck the fuel pressure.

Subfuel Pressure Test

Special Tools Required

Fuel pressure gauge
07406-0040004

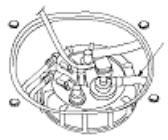
1. Relieve the subfuel pressure.
2. Disconnect the fuel feed line. Attach the fuel pressure gauge.
3. Turn the ignition switch to ON (II).
4. Read the fuel pressure gauge. The pressure should be 200−250 kPa (2.0−2.5 kgf/cm ^{2} , 28−36 psi).
   - If the pressure is OK, the test is complete.
   - If the pressure is out of specification, replace the subfuel pump, then recheck the subfuel pressure.

Subfuel pressure

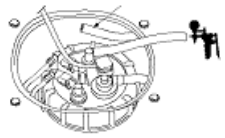
Item	Measurement	Qualification	Standard or New
Subfuel pressure	Pressure with fuel pressure gauge connected		200−250 kPa (2.0−2.5 kgf/cm ^{2} , 28−36 psi)

Fuel Breather Line and Suction Line Inspection

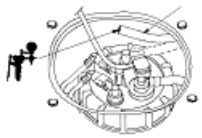
1. Remove the center console.
2. Remove the parking brake lever, then remove the access panel from the floor.
3. Disconnect the fuel vapor hose (A) from the fuel tank unit and let the fuel tank pressure out of a fuel tank.
4. Reconnect the fuel vapor hose (A).



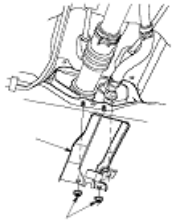
5. Disconnect the suction line (A) from the fuel tank unit, and connect a vacuum pump/gauge, 0−30 in.Hg (B) to the hose as shown.
6. Start the engine, and check the vacuum.
   - If there is vacuum, go to Step 7 .
   - If there is no vacuum, replace the fuel filter.
7. Turn the ignition switch to LOCK (0).



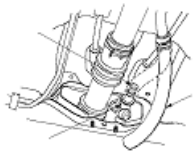
8. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply vacuum to the line.
   - If the line holds vacuum, check for blockage in the suction line. If there is blockage, replace the suction line.
   - If the line does not hold vacuum, go to Step 9 .
9. Lift the vehicle, and support it with jackstands.



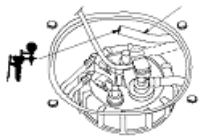
10. Remove the fill neck tube cover (A).



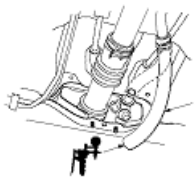
11. Disconnect the breather line (A), then plug the suction joint (B) with a rubber cap (C).



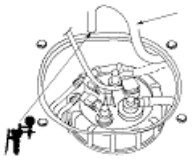
12. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply vacuum to the line.
    - If the line holds vacuum, check for blockage in the breather line between the fuel tank and the suction joint. If there is blockage, replace the fuel tank.
    - If the line does not hold vacuum, go to Step 14 .
13. Lift the vehicle, and support it with jackstands.



14. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the filler side of the breather line (B), and apply air pressure to the line.
    - If the air pressure holds, check for blockage between the suction line and the filler neck on the breather pipe, and replace the part that is causing the blockage.
    - If the air pressure does not hold, go to Step 15 .
15. Remove the rubber cap from the suction line, and reconnect the breather pipe to the suction line.

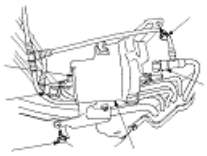


16. Connect a vacuum pump/gauge, 0−30 in.Hg (A) to the suction line (B), and apply pressure to the line.
    - If the air pressure holds, the breather line and the suction line are OK.
    - If the air pressure does not hold, check for a vacuum leak in the suction line, and replace the suction line if necessary.

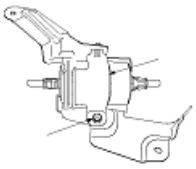


Fuel Filter Replacement

1. Relieve the fuel pressure.
2. Lift the vehicle, and support it with jackstands.
3. Remove the bolt (A).
4. Disconnect the quick-connect fittings (A).
5. Remove the fuel filter (C), and the fuel filter band (D).

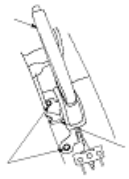


6. Remove the bolt (A), then open the band (B).
7. Install the parts in the reverse order of removal with new retainers.

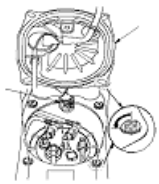


Fuel Gauge Sending Unit Test

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram.

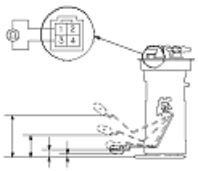


1. Check the No. 22 METER (7.5 A) fuse in the under-dash fuse/relay box before testing.
2. Check for body electrical system DTCs.
   - If no problem is found, go to Step 3 .
   - If DTC B1175 or B1176 is indicated, go to the indicated DTC's troubleshooting.
3. Turn the ignition switch to LOCK (0).
4. Remove the center console.
5. Remove the bolts (A), the wire (B), then remove the parking brake lever (C).



6. Remove the access panel (A) from the floor.
7. Disconnect the fuel tank unit 4P connector (B).

8. Measure the voltage between fuel tank unit 4P connector terminals No. 1 and No. 3 with the ignition switch to ON (II). There should be battery voltage.
   - If the voltage is OK, go to Step 9 .
   - If the voltage is not as specified, check for:
     - a short in the LT GRN wire to ground.
     - an open in the LT GRN or BLK wire.
9. Turn the ignition switch to LOCK (0).
10. Remove the fuel tank unit from the fuel tank.



11. Measure the resistance between fuel tank unit 4P connector terminals No. 1 and No. 3 with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), 1/2 (HALF FULL), and F (FULL) positions.
    If you do not get the following readings, replace the fuel gauge sending unit.

Float Position	F 91.2 mm (3.6 in.)	1/2 46 mm (1.8 in.)	LOW 13.7 mm (0.5 in.)	E 6 mm (0.2 in.)
Resistance (Ω)	18.5 to 21.5	203.3 to 213.3	569.1 to 583.1	772 to 788

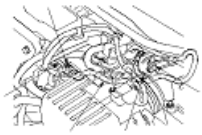
12. Reconnect the fuel tank unit 4P connector.
13. Remove the No. 1 BACK UP (7.5 A) fuse from the under-dash fuse/relay box for at least 10 seconds, then reinstall it.
14. Turn the ignition switch to ON (II).
15. Check that the pointer of the fuel gauge indicates “F" with the float at F.
    - If the pointer of the fuel gauge does not indicate “F", replace the gauge assembly.
    - If the gauge is OK, the test is complete.

    NOTE:
    - The pointer of the fuel gauge returns to the bottom of the gauge dial when the ignition switch is to LOCK (0), regardless of the fuel level.
    - Remove the No. 1 BACK UP (7.5 A) fuse from the under-dash fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

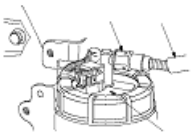
Fuel Indicator Unit Replacement

1. Lower the glove box.
2. Disconnect the fuel indicator connector (A).
3. Remove the fuel indicator unit (B).
4. Install the parts in the reverse order of removal.

Fuel Line/Quick-Connect Fitting Precaution



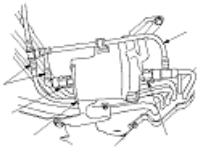
The fuel line/quick-connect fittings (A), (B), (C), and (D) connect the fuel rail (E) to the fuel feed hose (F), the fuel feed hose to the fuel line (G), the subfuel pump (H) to the subfuel feed hose (I), the fuel line (J) to the fuel tank unit (K), the fuel filter (L) to the fuel feed hose (M).
When removing or installing the fuel feed hose, the fuel tank unit, the fuel tank, the subfuel tank, the subfuel pump, the subfuel feed hose, or the fuel return hose, it is necessary to disconnect or connect the quick-connect fittings.
Pay attention to the following:



- The fuel feed hoses, fuel line, subfuel feed hose, and quick-connect fittings are not heat-resistant; be careful not to damage them during welding or other heat-generating procedures.
- The fuel feed hoses, fuel line, subfuel feed hose, and quick-connect fittings are not acid-proof; do not touch them with a shop towel that was used for wiping battery electrolyte. Replace them if they come in contact with electrolyte or something similar.
- When connecting or disconnecting the fuel feed hoses, fuel line, subfuel feed hose, and quick-connect fittings, be careful not to bend or twist them excessively. Replace them if they are damaged.

A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line. Replace the retainer when:

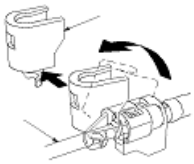
- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the fuel gauge sending unit.
- replacing the subfuel tank.
- replacing the subfuel pump.
- it has been removed from the line.
- it is damaged.



Location	Manufacturer	Retainer color	Line diameter
A	Tokai	Green or BLUE	8 mm (0.31 in.)
B	Sanoh	GREEN	6.3 mm (0.25 in.)
C	Sanoh	White	9.5 mm (0.37 in.)
D	Sanoh	White	8 mm (0.31 in.)

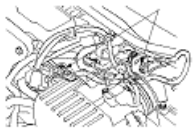
Fuel Line/Quick-Connect Fitting Removal

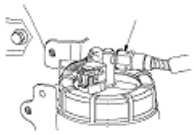
NOTE: Before you work on fuel the lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions".

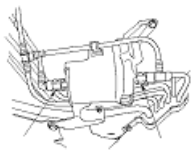


1. If equipped, remove the quick-connect fitting cover from the fuel line. Raise the cover (A) the fuel line (B), and remove it as shown.
2. Relieve the fuel pressure, and the subfuel pressure.

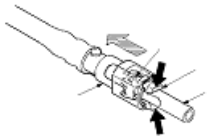
3. Check the fuel quick-connect fittings (A) for dirt, and clean them if needed.



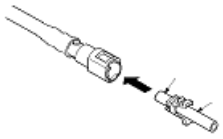




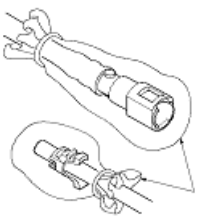
4. Place a rag or shop towel over the quick-connect fitting. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C). Pull the connector off.
   NOTE:
   - Be careful not to damage the line (D) or other parts. Do not use tools.
   - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
   - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



5. Check the contact area (A) of the line (B) for dirt or damage.
   - If it is dirty, clean the connector with a pressure washer, and dry it with the compressed air.
   - If it is rusty or damaged, replace the fuel filter, or the fuel feed line.



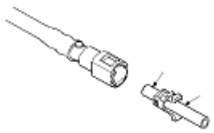
6. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).
   NOTE: The retainer cannot be reused once it has been removed from the line.
   Replace the retainer when:
   - replacing the fuel rail.
   - replacing the fuel feed line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel gauge sending unit.
   - replacing the subfuel tank.
   - replacing the subfuel pump.
   - it has been removed from the line.
   - it is damaged.



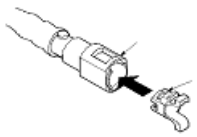
Fuel Line/Quick-Connect Fitting Installation

NOTE: Before you work on fuel lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions".

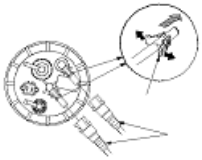
1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.

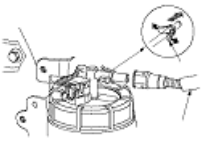


2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:
   - replacing the fuel rail.
   - replacing the fuel feed line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel gauge sending unit.
   - replacing the subfuel tank.
   - replacing the subfuel pump.
   - removing the retainer from the line.
   - Use the same manufacturer retainer and the same size retainer when the replacing the retainer.



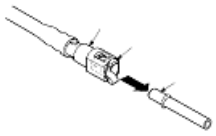
3. Before connecting a new fuel tube/quick-connect fitting assembly (A), remove the old retainer (B) from the mating line.
   NOTE:
   - When replacing the fuel tube/quick-connect fitting assembly at the engine compartment, remove the air cleaner, and the cover (C).
   - When installing the fuel tube/quick-connect fitting assembly at the engine compartment, align the mark (D) on the fuel tube.



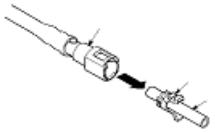


4. Align the quick-connect fittings with the line (A), and align the retainer locking tabs (B) with the connector grooves (C). Then press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.
   NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

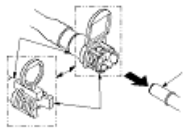
Connection with new retainer



Reconnection to existing retainer

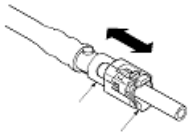


Connection to new fuel line

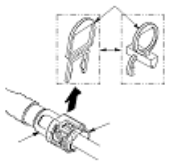


5. When you reconnecting the connector with the old retainer, make sure the connection is secure and the tabs (A) are firmly locked into place; check visually and also by pulling the connector (B). When you replacing the fuel line with a new one, make sure you remove the ring pull (C) upwards after you confirm the connection is secure.
   NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.
6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) (but do not operate the starter motor). The fuel pump will run for about 2 seconds, and fuel pressure will rise. Repeat two or three times, and check that there is no leakage in the fuel supply system.

Reconnection to existing retainer

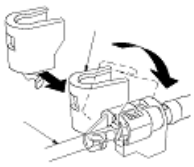


Connection to new fuel line

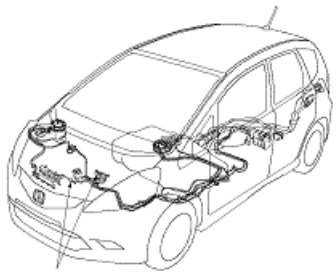


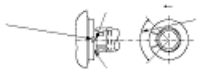
---

7. If equipped, install the quick-connect fitting cover. Set the groove of the cover (A) on the fuel line (B) as shown, then install it. Make sure the cover is firmly locked in place.



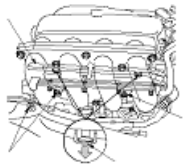
Fuel Line Inspection



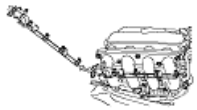


Fuel Nozzle Replacement

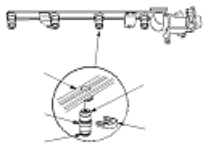
1. Relieve subfuel pressure.
2. Remove the subfuel solenoid.
3. Push the engine wire harness holder lock (A).
4. Remove the engine wire harness holder (B) from the injector pipe, and put it on the injector pipe.
5. Remove the subfuel pipe mounting bolts (C).



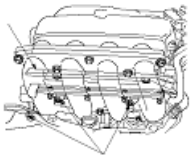
6. Pull out the subfuel pipe from the intake manifold, then rotate it forward 180° and pull it out in the direction shown.
   NOTE: Do not scratch or damage the surface of the subfuel nozzle.



7. Remove the clip (A), and the nozzle (B).
8. Coat the new O-ring (C) with clean engine oil, and insert the fuel nozzle (B) with the clip (A) into the subfuel pipe (D).
9. Coat the new O-ring (E) with clean engine oil, insert the fuel nozzle.
10. Install the subfuel pipe and the subfuel nozzle in the reverse order of removal.
    NOTE: Do not scratch or damage the surface of the subfuel nozzle and O-ring.



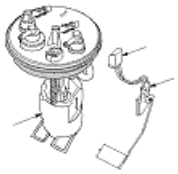
11. Install the subfuel pipe mounting bolts (A).
12. Install the engine wire harness holder (B).
13. Install the subfuel solenoid.
14. Turn the ignition switch to ON (II), but do not operate the starter. After the subfuel pump runs for about 2 seconds, the fuel pressure in the fuel line rises. Repeat this two or three times, then check for fuel leakage.
15. Install the intake manifold stay.



Fuel pressure regulator

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected		380−430 kPa (3.9−4.4 kgf/cm ^{2} , 55−63 psi)

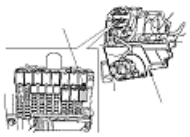
Fuel Pump/Fuel Gauge Sending Unit Replacement



1. Remove the fuel tank unit.
2. Remove the fuel level sensor (fuel sending unit) (A) from the fuel tank unit (B).
3. Check these items before installing the fuel tank unit:
   - When connecting the wire harness, make sure the connection is secure and the connector (C) is firmly locked into place.
   - When installing the fuel gauge sending unit, make sure the connection is secure. Be careful not to bend or twist it excessively.
4. Install the parts in the reverse order of removal. When installing the fuel tank unit, align the marks on the unit and the fuel tank.

Fuel Pump Circuit Troubleshooting

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is turned on. If the fuel pump does not make noise, check as follows:



1. Turn the ignition switch to LOCK (0).
2. Open the fuse lid (A), then remove PGM-FI main relay 2 (B) from the under-dash fuse/relay box.
3. Turn the ignition switch to ON (II).

---

4. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 4 and body ground.

Is there battery voltage?
YES - Go to Step 5 .
NO -
- Replace the under-dash fuse/relay box. ■
- Replace the PGM-FI main relay 1 .■

---

5. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

Is there battery voltage?
YES - Go to Step 6
NO -
- Check the No. 20 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.■
- If the fuse is OK, replace the under-dash fuse/relay box. ■

6. Turn the ignition switch to LOCK (0).

---

7. Connect PGM-FI main relay 2 4P connector terminal No. 3 to body ground with a jumper wire.
8. Jump the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).

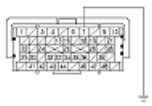
---

10. Check for continuity between body ground and ECM/PCM connector terminal A16.

Is there continuity?
YES - Go to Step 11 .
NO - Repair open in the wire between PGM-FI main relay 2 and the ECM/PCM (A16).■
11. Reinstall PGM-FI main relay 2.

---

12. Connect ECM/PCM connector terminal A7 to body ground with a jumper wire.
13. Turn the ignition switch to ON (II).



---

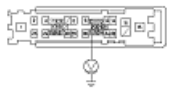
14. Measure the voltage between ECM/PCM connector terminal A16 and body ground.

Is there battery voltage?
YES - Go to Step 15 .
NO -
- Repair open in the wire between the under-dash fuse/relay box and the ECM/PCM (A7, A16).■
- Replace PGM-FI main relay 2. ■

15. Turn the ignition switch to LOCK (0).
16. Reconnect ECM/PCM connector A (49P).

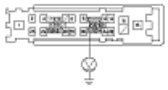
---

17. Turn the ignition switch to ON (II), and measure the voltage between under-dash fuse/relay box connector B (36P) terminal No. 31 and body ground within 2 seconds.



Is there battery voltage?
YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
NO - Go to Step 18 .

18. Turn the ignition switch to ON (II), and measure the voltage between under-dash fuse/relay box connector B (36P) terminal No. 31 and body ground after 2 seconds.



Is there battery voltage?
YES - Go to Step 19 .
NO - If needed, replace the under-dash fuse/relay box, then go to Step 19 .

19. Turn the ignition switch to LOCK (0).

20. Remove the center console.

21. Remove the parking brake lever, then remove the access panel from the floor.

---

22. Turn the ignition switch to ON (II), and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground within 2 seconds.

Is there battery voltage?
YES - Go to Step 27 .
NO - Go to Step 23 .

23. Turn the ignition switch to LOCK (0).

24. Remove PGM-FI main relay 2.

---

25. Connect PGM-FI main relay 2 4P connector terminals No. 1 and No. 2 with a jumper wire.

---

26. Turn the ignition switch to ON (II), and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground.

Is there battery voltage?
YES - Replace PGM-FI main relay 2 .■
NO - Repair open in the wire between PGM-FI main relay 2 and the fuel tank unit 4P connector.■

27. Turn the ignition switch to LOCK (0).

---

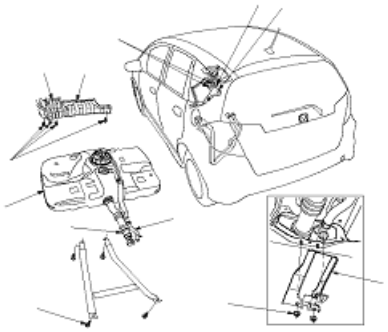
28. Check for continuity between fuel tank unit 4P connector terminal No. 4 and body ground.

Is there continuity?
YES - Replace the fuel pump. ■
NO - Repair open in the wire between the fuel tank unit 4P connector and G502. ■

Fuel Tank Draining

1. Remove the fuel tank unit.
2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the fuel tank.
3. Reinstall the fuel tank unit.

Fuel Tank Replacement



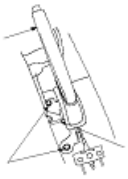
1. Drain the fuel tank, then disconnect the fuel tank unit 4P connector (A), the fuel vapor hose (B), and the quick-connect fittings (C).
2. Lift the vehicle, and support it with jackstands.
3. Remove the fill neck tube cover (D), then disconnect the fuel fill tube (E) and the suction hose (F). Slide back the clamps, then twist the hoses as you pull to avoid damaging them.
4. Remove the fuel tank guard bracket (G) and the fuel tank protector (H).
5. Place a jack or other support under the tank (I).
6. Remove the strap bolts and the straps (J).
7. Remove the fuel tank.
8. Install the parts in the reverse order of removal.

Fuel tank

Item	Measurement	Qualification	Standard or New
Fuel tank	Capacity		42 L (11.0 US gal, 9.2 Imp gal)

Fuel Tank Unit Removal and Installation

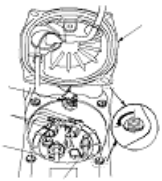
Special Tools Required



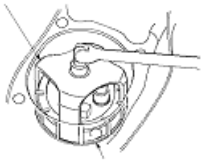
Fuel sender wrench
07AAA-S0XA100

Removal

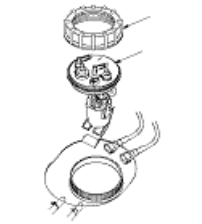
1. Relieve the fuel pressure.
2. Remove the center console.
3. Remove the bolts (A), the wire harness (B), the remove the parking brake lever (C).



4. Remove the access panel (A) from the floor.
5. Disconnect the fuel tank unit 4P connector (B).
6. Disconnect the fuel vapor hose (C), the suction hose (D), the quick-connect fittings (E) from the fuel tank unit.



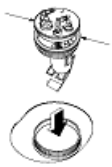
7. Using the special tool, loosen the locknut (A).



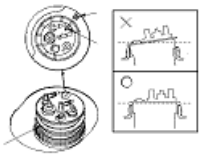
8. Remove the locknut (A) and the fuel tank unit (B).

Installation

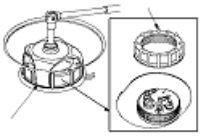
1. Temporarily attach a new base gasket (A) to the fuel tank unit (B), then insert the fuel tank unit partially into the fuel tank.
   NOTE:
   - Be careful not to damage the new base gasket.
   - Be careful not to bend the fuel gauge sending unit.
   - Do not coat the base gasket with oil.



2. Transfer the base gasket (A) from the fuel tank unit to the fuel tank.
3. Align the marks (B) on the fuel tank and fuel tank unit, then insert the fuel tank unit into the fuel tank until the fuel tank unit rests on top of the base gasket.
   NOTE: To avoid a fuel leak, check the base gasket, visually or by hand, to make sure it is not pinched.

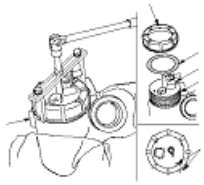


4. Using the special tool, tighten a new locknut (A) to the specified torque.
   NOTE:
   - After tightening, make sure the marks are still aligned.
   - After installation, check the base gasket, visually or by hand, to make sure it is not pinched.
5. Connect the fuel tank unit 4P connector, then connect the quick-connect fitting, the suction hose, and the fuel vapor hose.
6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) (but do not operate the starter motor). The fuel pump will run for about 2 seconds, and fuel pressure rises. Repeat this two or three times, then check that there is no leakage in the fuel supply system.
7. Install the access panel, the parking brake lever, and the center console.



Subfuel Pump Replacement

Special Tools Required



Fuel sender wrench, clysler fuel pump module wrench
No. 7998

, or equivalent, commercially available

1. Remove the subfuel tank.
2. Set the fuel subtank (A) to the vice.
3. Using the tool, loosen the locknut (B). Remove the subfuel pump (C).
4. Install the parts in the reverse order of removal with a new gasket (D) and locknut plate (E).
   NOTE:
   - Align the marks (F) on the fuel tank and the fuel tank unit, then tighten a new locknut by hand.
   - After installation and tightening, check the base gasket visually or by hand to be sure the gasket is not pinched.
   - Do not coat the base gasket with engine oil.

Subfuel Pump Circuit Troubleshooting

If you suspect a problem with the subfuel pump, check that the subfuel pump actually runs; when it is on, you will hear some noise if you listen to the subfuel fill port with the subfuel fill cap removed. The subfuel pump should run for 2 seconds when the ignition switch is first turned on. If the subfuel pump does not make noise, check as follows:

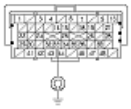
1. Turn the ignition switch to LOCK (0).
2. Remove the subfuel pump relay from the auxiliary under-hood relay box.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the subfuel pump relay 4P connector terminals No. 2, No.4 and body ground individually.

   Is there battery voltage?
   YES - Go to Step 5 .
   NO -
   - Repair open in the wire between the subfuel pump relay and the auxiliary under-dash fuse holder (15 A) fuse. Also replace the auxiliary under-hood fuse box (15 A) fuse.■
   - Repair open in the wire between the auxiliary under-dash fuse holder (15 A) fuse and the ignition switch.■

5. Turn the ignition switch to LOCK (0).

---

6. Connect subfuel pump relay 4P connector terminal No. 3 to body ground with a jumper wire.
7. Jump the SCS line with the HDS.
8. Disconnect ECM/PCM connector A (49P).



9. Check for continuity between ECM/PCM connector terminal A33 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the subfuel pump relay and the ECM/PCM (A33).■

10. Test the subfuel pump relay.

    Is the subfuel pump relay OK?
    YES - Go to Step 11 .
    NO - Replace the subfuel pump relay .■

11. Reinstall the subfuel pump relay.
12. Reconnect ECM/PCM connector A (49P).

---

13. Turn the ignition switch to ON (II), and measure the voltage between subfuel pump relay 4P connector terminal No. 1 and body ground within 2 seconds.

    Is there battery voltage?
    YES - Go to Step 14 .
    NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

14. Turn the ignition switch to LOCK (0).
15. Remove the glove box.

---

16. Disconnect the fuel subharness 4P connector (A) from the dashboard wire harness.

---

17. Turn the ignition switch to ON (II), and measure the voltage between dashboad wire harness 4P connector terminals No. 1 and No. 2 within 2 seconds.

    Is there battery voltage?
    YES - Go to Step 20 .
    NO - Go to Step 18 .

18. Turn the ignition switch to LOCK (0).

---

19. Check for continuity between body ground and dashboad wire harness 4P connector terminal No. 2.

Is there continuity?

YES - Repair open in the wire between the subfuel pump relay and the fuel subharness 4P connector.■
NO - Repair open in the wire between the fuel subharness 4P connector and G502. ■

20. Remove the right front fender.

21. Disconnect the subfuel pump 4P connector.

---

22. Connect subfuel pump 4P connector terminal No. 2 to body ground with a jumper wire.

---

23. Check for continuity between body ground and fuel subharness 4P connector terminal No. 1.

Is there continuity?
YES - Go to Step 24 .
NO - Repair open in the wire between the subfuel pump and the fuel subharness 4P connector.■

---

24. Connect subfuel pump 4P connector terminal No. 4 to body ground with a jumper wire.

---

25. Check for continuity between body ground and fuel subharness 4P connector terminal No. 2.

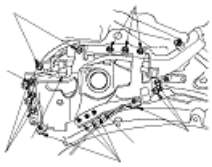
Is there continuity?
YES - Replace the subfuel pump. ■
NO - Repair open in the wire between the subfuel pump and the fuel subharness 4P connector.■

Subfuel Tank Draining

1. Remove the subfuel fill cap.
2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the subfuel tank.

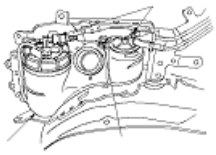
Subfuel Tank Replacement

1. Relieve the subfuel pressure.
2. Remove the front bumper.
3. Remove the right headlight.
4. Remove the front pillar corner trim.
5. Remove the right side front inner fender clips.
6. Remove the right front fender.
7. Disconnect the subfuel feed pump 4P connector (A).
8. Remove the bolt (B) from the subfuel pump subharness holder (C).
9. Remove the bolt (D) and nut (E) from the fuel subtank (F).



10. Remove the subfuel feed pipe protector (A) and (B).

11. Disconnect the hoses (A).
12. Remove the bolt (B) from the subfuel tank (C).
13. Install the parts in the reverse order of removal.



Subfuel tank

Item	Measurement	Qualification	Standard or New
Subfuel tank	Capacity		0.76 L (0.20 US gal, 0.17 Imp gal)

Subfuel Tank Low Fuel Indicator Circuit Troubleshooting

Subfuel tank Low fuel indicator does not come on

1. Turn the ignition switch to ON (II).
2. Do the gauge self-diagnostic function.

   Does the subfuel tank low fuel indicator flash?
   YES - Go to Step 3 .
   NO - Substitute a known-good gauge control module, and recheck. If the subfuel tank low fuel indicator circuit is OK, replace the original gauge control module. ■
3. Turn the ignition switch to LOCK (0).
4. Connect fuel indicator unit 5P connector terminal No. 2 to body ground with a jumper wire.
5. Turn the ignition switch to ON (II).
6. Check the subfuel tank low fuel indicator.

   Is the subfuel tank low fuel indicator indicated?
   YES - Go to Step 7 .
   NO - Go to Step 12 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the fuel indicator unit 5P connector.
9. Turn the ignition switch to ON (II).

10. Measure the voltage between fuel indicator unit 5P connector terminal No. 1 and body ground.

    Is there battery voltage?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the fuel indicator unit and the No. 22 METER (7.5 A) fuse in the under-dash fuse/relay box.■

11. Measure the voltage between fuel indicator unit 5P connector terminals No. 1 and No. 5.

    Is there battery voltage?
    YES - Replace the fuel indicator unit .■
    NO - Repair open in the wire between the fuel indicator unit and G502. ■
12. Turn the ignition switch to LOCK (0).
13. Remove the gauge control module.

14. Connect gauge control module 32P connector terminal No. 15 to body ground with a jumper wire.
15. Turn the ignition switch to ON (II).
16. Check the subfuel tank low fuel indicator.

    Is the subfuel tank low fuel indicator indicated?
    YES - Repair open in the wire between the fuel indicator unit and the gauge control module.■
    NO - Replace the original gauge control module. ■

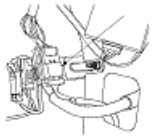
Subfuel Tank Low Fuel Indicator stays on with enough fuel

1. Turn the ignition switch to LOCK (0).
2. Turn the ignition switch to ON (II), and watch the subfuel tank low fuel indicator.

   Does the subfuel tank low fuel indicator stay on for more than 2 seconds after turning the ignition switch to ON (II)?
   YES - Go to Step 17 .
   NO - Go to Step 3 .
3. Measure the voltage between fuel indicator unit 5P connector terminal No. 4 and body ground.

   Is there battery voltage?
   YES - Go to Step 4 .
   NO - Replace the fuel indicator unit.
4. Turn the ignition switch to LOCK (0).
5. Remove the glove box.

6. Disconnect the fuel subharness 4P connector (A) from the dashboard wire harness.
7. Turn the ignition switch to ON (II).



---

8. Measure the voltage between dashboard wire harness 4P connector terminal No. 4 and body ground.

   Is there battery voltage?
   YES - Go to Step 9 .
   NO - Repair open in the wire between the fuel indicator unit (sensor out line) and the fuel subharness.■

---

9. Measure the voltage between dashboard wire harness 4P connector terminals No. 3 and No. 4.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the fuel indicator unit (sensor in line) and the fuel subharness.■

10. Turn the ignition switch to LOCK (0).
11. Reconnect the fuel subharness 4P connector to the dashboard wire harness.
12. Remove the right front fender.
13. Disconnect the subfuel pump 4P connector.
14. Turn the ignition switch to ON (II).

---

15. Measure the voltage between subfuel pump 4P connector terminal No. 3 and body ground.

   Is there battery voltage?
   YES - Go to Step 16 .
   NO - Repair open in the wire between the dashboard wire harness (sensor out line) and the subfuel pump.■

---

16. Measure the voltage between subfuel pump 4P connector terminals No. 1 and No. 3.

   Is there battery voltage?
   YES - Replace the subfuel pump. ■
   NO - Repair open in the wire between the fuel subharness (sensor in line) and the subfuel pump.■

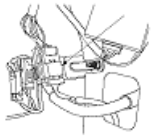
17. Turn the ignition switch to LOCK (0).
18. Disconnect the fuel indicator unit 5P connector.
19. Turn the ignition switch to ON (II), and watch the subfuel tank low fuel indicator.

   Does the subfuel tank low fuel indicator stay on for more than 2 seconds after turning the ignition switch to ON (II)?
   YES - Repair short in the wire between the fuel indicator unit and the gauge control module.■
   NO - Go to Step 20 .

20. Turn the ignition switch to LOCK (0).
21. Remove the glove box.

---

22. Disconnect the fuel subharness 4P connector (A) from the dashboard wire harness.



---

23. Check for continuity between dashboard wire harness 4P connector terminal No. 4 and body ground.

   Is there continuity?
   YES - Repair short in the wire between the fuel indicator unit (sensor out line) and the fuel subharness.■
   NO - Go to Step 24 .

24. Remove the right front fender.
25. Disconnect the subfuel pump 4P connector.

---

26. Check for continuity between subfuel pump 4P connector terminal No. 3 and body ground.

Is there continuity?

YES - Repair short in the wire between the dashboard wire harness (sensor out line) and the subfuel pump.■

NO - Replace the fuel indicator unit .■

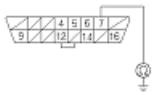
DLC Circuit Troubleshooting

NOTE: Make sure the HDS and its DLC cable are working properly.



1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the DLC.
   NOTE: Make sure the HDS is properly connected to the DLC.
3. Turn the ignition switch to ON (II), and read the HDS.

   Does the HDS identify the vehicle?
   YES - Go to Step 4 .
   NO - Go to Step 21 .
4. Check for Temporary DTCs or DTCs in the PGM-FI system with the HDS.

   Are any Temporary DTCs or DTCs indicated?
   YES - Go to the indicated DTC's troubleshooting.■
   NO -
   - If the HDS does not communicate with the SRS system, go to Step 5 .
   - If the HDS does not communicate with the ABS system, go to Step 7 .
   - If the HDS does not communicate with the EPS system, go to Step 9 .
   - If the HDS does not communicate with the IMMOBI (immobilizer) system, go to Step 11 .
   - If the HDS does not communicate with the BODY ELECTRICAL system, go to Step 13 .
5. Turn the ignition switch to LOCK (0).
6. Turn the ignition switch to ON (II), and watch the SRS indicator.

   Does the SRS indicator stay on?
   YES - Go to the SRS system's general troubleshooting information. ■
   NO - Go to Step 13 .
7. Turn the ignition switch to LOCK (0).
8. Turn the ignition switch to ON (II), and watch the ABS indicator.

   Does the ABS indicator stay on?
   YES - Go to the ABS system's general troubleshooting information. ■
   NO - Go to Step 13 .
9. Turn the ignition switch to LOCK (0).
10. Turn the ignition switch to ON (II), and watch the EPS indicator.

    Does the EPS indicator stay on?
    YES - Go to the EPS system's general troubleshooting information. ■
    NO - Go to Step 13 .
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II), and watch the immobilizer indicator.

    Does the immobilizer indicator stay on or flash?
    YES - Go to the immobilizer system's troubleshooting. ■
    NO - Go to Step 13 .
13. Do the gauge self-diagnostic function.
14. Check the gauge display.

    Is Error 2 indicated?
    YES - Check for B-CAN system DTCs.■
    NO - Go to Step 15 .
15. Turn the ignition switch to LOCK (0).
16. Disconnect the HDS from the DLC.
17. Check for continuity between DLC terminal No. 7 and body ground.

    Is there 5 Ω or less?
    YES - Go to Step 18 .
    NO - Go to Step 19 .
18. Continue to check for continuity between DLC terminal No. 7 and body ground, while disconnecting these parts, one at a time:
    - SRS unit connector A (39P)
    - ABS modulator-control unit 25P connector
    - EPS control unit connector C (16P)
    - Immobilizer-keyless control unit 7P connector
    - Audio unit 24P connector

- Under-dash fuse/relay box connector Q (16P)

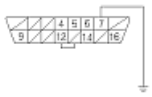
Does continuity go away when one of the above components is disconnected?

YES - Replace the part caused an open when it was disconnected.■

NO - Repair short in the wire between the DLC (K-line) and the ABS control unit, the SRS unit, the EPS control unit, the immobilizer-keyless control unit, the audio unit, the under-dash fuse/relay box, or the ECM/PCM.■

---

19. Connect DLC terminal No. 7 to body ground with a jumper wire.



20. Check for continuity between body ground and these connector terminals:

Connector	Terminal
SRS unit A (39P)	No. 18 (BLU)
ABS control unit 25P	No. 10 (BLU)
EPS control unit C (16P)	No. 16 (BLU)
Immobilizer-keyless control unit 7P	No. 5 (BLU)
Audio unit 24P	No. 3 (BLU)
Under-dash fuse/relay box Q (16P)	No. 2 (BLU)

Is there continuity between the DLC terminal and each of the terminals in the chart?

YES - Replace the part that does not communicate with the HDS.■

NO - Repair open in the wire between the DLC (K-line) and the appropriate connector.■

21. Check for B-CAN system DTCs without the HDS.

Is DTC U0029 and/or U0100 indicated?

YES - Go to Step 34 .

NO - Go to Step 22 .

22. Turn the ignition switch to LOCK (0).

23. Disconnect the HDS from the DLC.

---

24. Measure the voltage between DLC terminal No. 16 and body ground.

Is there battery voltage?

YES - Go to Step 25 .

NO - Repair open in the wire between DLC terminal No. 16 and the No. 1 BACK UP (7.5 A) fuse in the under-dash fuse/relay box.■

---

25. Measure the voltage between DLC terminals No. 4 and No. 16.

Is there battery voltage?

YES - Go to Step 26 .

NO - Repair open in the wire between DLC terminal No. 4 and body ground (G502).■

26. Connect the HDS to the DLC.

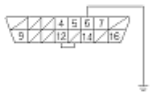
27. Jump the SCS line with the HDS.

28. Disconnect ECM/PCM connector A (49P).

29. Disconnect the HDS from the DLC.

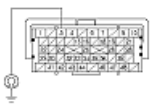
---

30. Connect DLC terminal No. 6 to body ground with a jumper wire.



---

31. Check for continuity between ECM/PCM connector terminal A3 and body ground.



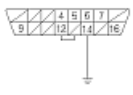
Is there continuity?

YES - Go to Step 32 .

NO - Repair open in the wire between the ECM/PCM (A3) and DLC terminal No. 6.■

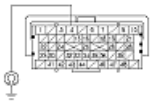
---

32. Connect DLC terminal No. 14 to body ground with a jumper wire.



---

33. Check for continuity between ECM/PCM connector terminal A4 and body ground.



Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

NO - Repair open in the wire between the ECM/PCM (A4) and DLC terminal No. 14.■

34. Try to start the engine.

Does the engine start and idle smoothly?

YES - Go to F-CAN circuit troubleshooting. ■

NO - Go to Step 35 .

35. Turn the ignition switch to LOCK (0).

36. Check the No. 60 IGSW (50 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

YES - Repair open in the wire the No. 60 IGSW (50 A) fuse and the ignition switch. If the wire is OK go to Step 37 .

NO - Repair short in the wire the No. 60 IGSW (50 A) fuse and the under-dash fuse/relay box. Also replace the No. 60 IGSW (50 A) fuse.■

37. Inspect the No. 39 IGP (15 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

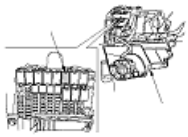
YES - Go to Step 44 .

NO - Go to Step 38 .

38. Remove the blown No. 39 IGP (15 A) fuse from the under-dash fuse/relay box.

---

39. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.



---

40. Check for continuity between body ground and PGM-FI main relay 1 4P connector terminals No. 2 and No. 3 individually.

Is there continuity?

YES - Replace the under-dash fuse/relay box. ■

NO - Go to Step 41 .

---

41. While disconnecting each of the parts or connectors below, one at a time, check for continuity between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

- PGM-FI main relay 2
- ECM/PCM connector A (49P)
- Each injector 2P connector
- Camshaft position (CMP) sensor 3P connector
- Crankshaft position (CKP) sensor 3P connector
- Electronic throttle control system (ETCS) control relay

Does continuity go away when one of the above components is disconnected?

YES - Replace the part that made the short to body ground go away when disconnected. If the part is the ECM/PCM, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. Also replace the No. 39 IGP (15 A) fuse.■

NO - Go to Step 42 .

42. Disconnect these parts or connectors:
    - PGM-FI main relay 2
    - ECM/PCM connector A
    - Injectors
    - Camshaft position (CMP) sensor
    - Crankshaft position (CKP) sensor
    - Electronic throttle control system (ETCS) control relay

---

43. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

Is there continuity?
YES - Repair short in the wire between PGM-FI main relay 1 and each item. Also replace the No. 39 IGP (15 A) fuse.■
NO - Replace PGM-FI main relay 1. Also replace the No. 39 IGP (15 A) fuse.■

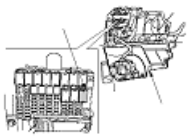
44. Inspect the No. 20 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?
YES - Go to Step 54 .
NO - Go to Step 45 .

45. Remove the blown No. 20 FUEL PUMP (15 A) fuse from the under-dash fuse/relay box.

---

46. Open the fuse lid (A), then remove the PGM-FI main relay 2 (B) from the under-dash fuse/relay box.



47. Test PGM-FI main relay 2.

Is the fuse OK?
YES - Go to Step 48 .
NO - Replace PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■

---

48. Check for continuity between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

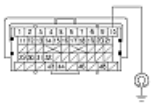
Is there continuity?
YES - Go to Step 49 .
NO - Go to Step 52 .

49. Jump the SCS line with the HDS.

50. Disconnect ECM/PCM connector C (49P).

---

51. Check for continuity between ECM/PCM connector terminal C10 and body ground.



Is there continuity?
YES - Repair short in the wire between the No. 20 FUEL PUMP (15 A) fuse and the ECM/PCM (C10), or PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■
NO - Go to Step 52 .

52. Disconnect the fuel pump 4P connector.

---

53. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

Is there continuity?
YES - Repair short in the wire between the fuel pump and PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■
NO - Check the fuel pump, and replace it if necessary. Also replace the No. 20 FUEL PUMP (15 A) fuse.■

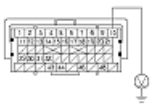
54. Jump the SCS line with the HDS.

55. Disconnect ECM/PCM connectors A (49P) and C (49P).

56. Turn the ignition switch to ON (II).

---

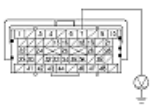
57. Measure the voltage between ECM/PCM connector terminal C10 and body ground.



Is there battery voltage?
YES - Go to Step 58 .
NO - Repair open in the wire between the No. 20 FUEL PUMP (15 A) fuse and the ECM/PCM (C10).■

---

58. Measure the voltage between ECM/PCM connector terminal A7 and body ground.

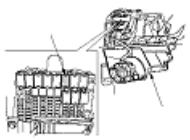


Is there battery voltage?
YES - Go to Step 64 .
NO - Go to Step 59 .

59. Turn the ignition switch to LOCK (0).

---

60. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.



---

61. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 3 and body ground.

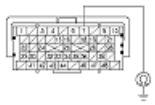
Is there battery voltage?
YES - Go to Step 62 .
NO - Replace the under-dash fuse/relay box.

---

62. Connect PGM-FI main relay 1 4P connector terminal No. 4 to body ground with a jumper wire.

---

63. Check for continuity between ECM/PCM connector terminal A7 and body ground.

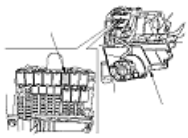


Is there battery voltage?
YES - Test PGM-FI main relay 1. If the relay is OK, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
NO - Repair open in the wire between the ECM/PCM (A7) and PGM-FI main relay 1.■

64. Turn the ignition switch to LOCK (0).

---

65. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.



---

66. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.

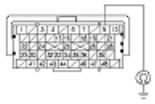
Is there battery voltage?
YES - Go to Step 67 .
NO - Replace the under-dash fuse/relay box. ■

---

67. Connect PGM-FI main relay 1 4P connector terminal No. 1 to body ground with a jumper wire.

---

68. Check for continuity between ECM/PCM connector terminal A9 and body ground.



Is there continuity?
YES - Go to Step 69 .
NO - Repair open in the wire between the ECM/PCM (A9) and PGM-FI main relay 1.■

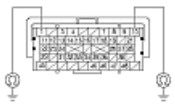
69. Test PGM-FI main relay 1.

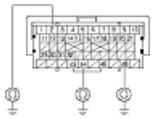
Is PGM-FI main relay 1 OK?
YES - Go to Step 70 .
NO - Replace the PGM-FI main relay 1 .■

70. Disconnect ECM/PCM connector B (49P).

---

71. Check for continuity between body ground and ECM/PCM connector terminals B1, B10, C2, C44, and C48 individually.

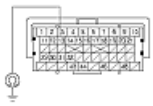




Is there continuity?
YES - Go to Step 72 .
NO - Repair open in the wire between the ECM/PCM (B1, B10, C2, C44, C48) and G101.■

---

72. Check for continuity between ECM/PCM connector terminal C13 and body ground.



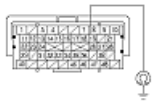
Is there continuity?
YES - Go to Step 73 .
NO - Go to Step 74 .

73. Continue to check for continuity between ECM/PCM connector terminal C13 and body ground, while disconnecting these parts, one at a time:
    - MAP sensor 3P connector
    - Output shaft (countershaft) speed sensor 3P connector

Does continuity go away when one of the above components is disconnected?
YES - Repair the part that caused an open when it was disconnected.■
NO - Repair short in the between the ECM/PCM (C13) and the MAP sensor or the output shaft (countershaft) speed sensor.■

---

74. Check for continuity between ECM/PCM connector terminal B19 and body ground.



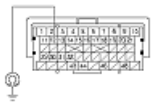
Is there continuity?
YES - Go to Step 75 .
NO - Go to Step 76 .

75. Continue to check for continuity between ECM/PCM connector terminal B19 and body ground, while disconnecting the input shaft (mainshaft) speed sensor 3P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (B19) and the input shaft (mainshaft) speed sensor.■
NO - Replace the input shaft (mainshaft) speed sensor. ■

---

76. Check for continuity between ECM/PCM connector terminal C12 and body ground.



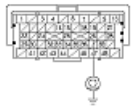
Is there continuity?
YES - Go to Step 77 .
NO - Go to Step 78 .

77. Continue to check for continuity between ECM/PCM connector terminal C12 and body ground, while disconnecting the throttle body 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (C12) and the throttle body.■
NO - Replace the throttle body. ■

---

78. Check for continuity between ECM/PCM connector terminal A26 and body ground.



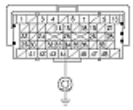
Is there continuity?
YES - Go to Step 79 .
NO - Go to Step 80 .

79. Continue to check for continuity between ECM/PCM connector terminal A26 and body ground, while disconnecting the APP sensor 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (A26) and APP sensor A.■
NO - Replace the accelerator pedal module. ■

---

80. Check for continuity between ECM/PCM connector terminal A25 and body ground.



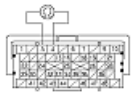
Is there continuity?
YES - Go to Step 81 .
NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

81. Continue to check for continuity between ECM/PCM connector terminal A25 and body ground, while disconnecting the APP sensor 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (A25) and APP sensor B.■
NO - Replace the accelerator pedal module. ■

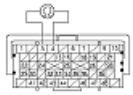
F-CAN Circuit Troubleshooting

NOTE: Information marked with an asterisk (*) applies to the CANL line.



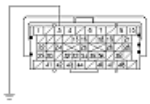
1. Turn the ignition switch to LOCK (0).
2. Jump the SCS line with the HDS.
3. Disconnect ECM/PCM connector A (49P), then disconnect the HDS.
4. Measure the resistance between ECM/PCM connector terminals A3 and A4.

   Is there about 95−116 Ω?
   YES - Go to Step 27 .
   NO - Go to Step 5 .
5. Disconnect these connectors:
   - Gauge control module 32P
   - ABS modulator-control unit 25P
   - EPS control unit C (16P)
   - SRS unit A (39P)



6. Check for continuity between ECM/PCM connector terminals A3 and A4.

   Is there continuity?
   YES - Repair short in the wire between ECM/PCM terminals A3 and A4 * .■
   NO - Go to Step 7 .



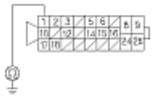
7. Connect ECM/PCM connector terminal A3 to body ground with a jumper wire.

---

8. Check for continuity between gauge control module 32P connector terminal No. 30 and body ground.

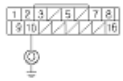
   Is there continuity?
   YES -
   - With ABS: Go to Step 9 .
   - Without ABS: Go to Step 10 .

   NO - Repair open in the wire between the ECM/PCM (A3) and the gauge control module.■



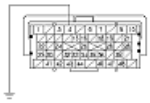
9. Check for continuity between ABS modulator-control unit 25P connector terminal No. 1 and body ground.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the ECM/PCM (A3) and the ABS modulator-control unit.■



10. Check for continuity between EPS control unit connector C (16P) terminal No. 10 and body ground.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the ECM/PCM (A3) and the EPS control unit.■
11. Remove the jumper wire from ECM/PCM connector A (49P).



12. Connect ECM/PCM connector terminal A4 to body ground with a jumper wire.

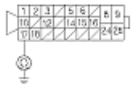
---

13. Check for continuity between gauge control module 32P connector terminal No. 29 and body ground.

    Is there continuity?
    YES -
    - With ABS: Go to Step 14 .
    - Without ABS: Go to Step 15 .

    NO - Repair open in the wire between the ECM/PCM (A4) and the gauge control module.■

14. Check for continuity between ABS modulator-control unit 25P connector terminal No. 17 and body ground.



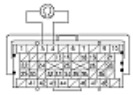
Is there continuity?
YES - Go to Step 15 .
NO - Repair open in the wire between the ECM/PCM (A4) and the ABS modulator-control unit.■

15. Check for continuity between EPS control unit connector C (16P) terminal No. 9 and body ground.

Is there continuity?
YES - Go to Step 16 .
NO - Repair open in the wire between the ECM/PCM (A4) and the EPS control unit.■

16. Reconnect the gauge control module 32P connector.

17. Measure the resistance between ECM/PCM connector terminals A3 and A4.



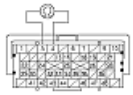
Is there about 108−132 Ω?
YES -
- With ABS: Go to Step 18 .
- Without ABS: Go to Step 21 .

NO - Substitute a known-good gauge control module. If the HDS identifies the vehicle, replace the original gauge control module. ■

18. Disconnect the gauge control module 32P connector.

19. Reconnect the ABS modulator-control unit 25P connector.

20. Measure the resistance between ECM/PCM connector terminals A3 and A4.

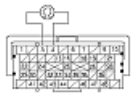


Is there about 2.34−2.86 kΩ?
YES - Go to Step 21 .
NO - Substitute a known-good ABS modulator-control unit, If the HDS identifies the vehicle, replace the original ABS modulator-control unit. ■

21. Disconnect the ABS modulator-control unit 46P connector (with ABS) or the gauge control module 32P connector (without ABS).

22. Reconnect EPS control unit connector C (16P).

23. Measure the resistance between ECM/PCM connector terminals A3 and A4.

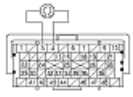


Is there about 2.34−2.86 kΩ?
YES - Go to Step 24 .
NO - Substitute a known-good EPS control unit, If the HDS identifies the vehicle, replace the original EPS control unit. ■

24. Disconnect EPS control unit connector C (16P).

25. Reconnect SRS unit connector A (39P).

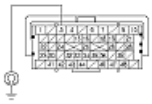
26. Measure the resistance between ECM/PCM connector terminals A3 and A4.



Is there about 2.34−2.86 kΩ?
YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
NO - Substitute a known-good SRS unit. If the HDS identifies the vehicle, replace the original SRS unit. ■

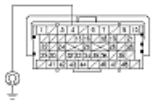
27. Disconnect these connectors:
- Gauge control module 32P
- ABS modulator-control unit 25P
- EPS control unit C (16P)
- SRS unit A (39P)

28. Check for continuity between ECM/PCM connector terminal A3 and body ground.



Is there continuity?
YES - Repair short in the wire between ECM/PCM terminals A3 and the gauge control module, the ABS modulator-control unit, the EPS control unit, the SRS unit, or the DLC.■
NO - Go to Step 29 .

29. Check for continuity between ECM/PCM connector terminal A4 and body ground.



Is there continuity?

YES - Repair short in the wire between ECM/PCM terminals A4 and the gauge control module, the ABS modulator-control unit, the EPS control unit, the SRS unit, or the DLC.■

NO - Go to Step 30 .

30. Reconnect all connectors.

31. Connect the HDS to the DLC.

32. Disconnect the gauge control module 32P connector.

33. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the gauge control module. ■

NO -
- With ABS: Go to Step 34 .
- Without ABS: Go to Step 38 .

34. Turn the ignition switch to LOCK (0).

35. Reconnect the gauge control module 32P connector.

36. Disconnect the ABS modulator-control unit 25P connector.

37. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the ABS modulator-control unit. ■

NO - Go to Step 38 .

38. Turn the ignition switch to LOCK (0).

39. Reconnect the ABS modulator-control unit 25P connector (with ABS) or the gauge control module 32P connector (without ABS).

40. Disconnect EPS control unit connector C (16P).

41. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the EPS control unit. ■

NO - Go to Step 42 .

42. Turn the ignition switch to LOCK (0).

43. Reconnect EPS control unit connector D (28P).

44. Disconnect SRS unit connector A (39P).

45. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

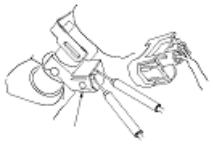
YES - Replace the SRS unit. ■

NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

Injector Test

NOTE: Check the following items before testing; idle speed, ignition timing, and idle CO%.

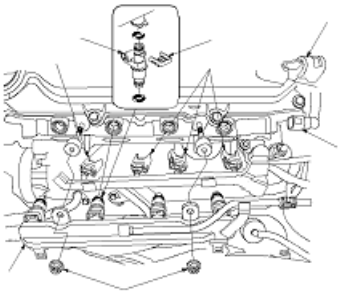
1. Try to start the engine.
   - If the engine starts, go to Step 2 .
   - If the engine does not start, go to Step 8 .
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Select ONE INJECTOR in INSPECTION MENU with the HDS.
5. Disable each injector at a time by selecting number of an injector which you want to step.
6. Inspect the change in the idle speed.
   - If the idle speed drop is almost the same for each cylinder, the fuel injectors are normal.
   - If the idle speed or quality remains the same when you disconnect a particular injector, faulty injector is suspected. Replace the injector and retest.
7. Check the clicking sound of each injector by means of a stethoscope when the engine is idling.
   - If any fuel injector fails to make the typical clicking sound, check the sound again after replacing the injector.
   - If clicking sound is still absent, check the following.
     - Whether there is wire breakage or poor connection in the YEL/BLK wire between the PGM-FI main relay 1 and the junction connector.
     - Whether the junction connector is open or corroded.
     - Whether there is wire breakage or poor connection in the YEL/BLK wire between the junction connector and the injector.
     - Whether there is any short-circuiting, wire breakage or poor connection in the wire between the injector and the ECM/PCM.
   - If all is OK, the test is complete.
8. Turn the ignition switch to LOCK (0).
9. Remove the intake manifold.
10. Disconnect the injector connector.



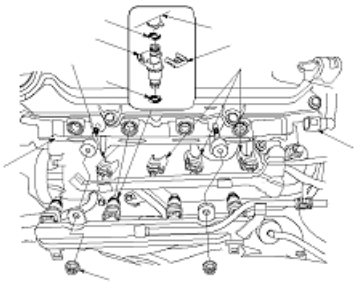
11. Measure the resistance between injector (A) terminals No. 1 and No. 2. There should be 10−13 Ω.
    - If the resistance is OK, go to Step 12 .
    - If the resistance is not as specified, replace the injector.
12. Check the fuel pressure.
    - If the fuel pressure is as specified, check the following:
      - Whether there is wire breakage, or poor connection in the YEL/BLK wire between the PGM-FI main relay 1 and the junction connector.
      - Whether the junction connector is open or corroded.
      - Whether there is wire breakage, or poor connection in the YEL/BLK wire between the junction connector and the injector.
      - Whether there is any short-circuiting, wire breakage or poor connection in the wire between the injector and the ECM/PCM.
    - If the fuel pressure is not as specified, recheck the fuel pressure.

Injector Replacement

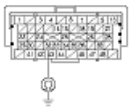
1. Relieve the fuel pressure.
2. Remove the intake manifold, and intake manifold chamber.
3. Remove the cover (A), then disconnect the quick-connect fitting (B).
4. Disconnect the injector connectors (C).
5. Remove the fuel rail mounting nuts (D) from the fuel rail (E).
6. Remove the fuel rail and the injectors from the cylinder head.
7. Remove the injector clips (F) from the fuel rail.
8. Remove the injectors (G) from the fuel rail.



9. Coat the new O-rings (black) (A) with clean engine oil, and insert the injectors (B) into the fuel rail (C).
10. Install the injector clips (D).
11. Coat the new injector O-rings (brown) (E) with clean engine oil.
12. Install the fuel rail and the injectors in the cylinder head (F).
13. Install the fuel rail mounting nuts (G).
14. Connect the injector connectors (H).
15. Connect the quick-connect fitting (I).
16. Turn the ignition switch to ON (II), but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.
17. Reinstall the intake manifold, and intake manifold chamber.



MIL Circuit Troubleshooting



1. Turn the ignition switch to ON (II).
2. Do the gauge self-diagnostic function.

   Does the MIL indicator flash?
   YES - Go to Step 3 .
   NO - Substitute a known-good gauge control module, and recheck. If the symptom/indication goes away with a known-good gauge control module, replace the original gauge control module. ■
3. Connect the HDS to the DLC.
4. Check the SCS in the DATA LIST with the HDS.

   Is a short indicated?
   YES - Go to Step 5 .
   NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect ECM/PCM connector A (49P), then disconnect the HDS.
7. Check for continuity between ECM/PCM connector terminal A32 and body ground.

   Is there continuity?
   YES - Repair short in the wire between the ECM/PCM (A32) and the DLC.■
   NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

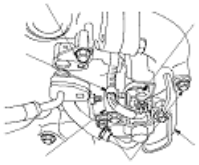
Subfuel Solenoid Test

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
3. Select the SUBFUEL SOLENOID ON and OFF in the INSPECTION MENU with the HDS.
4. Check the clicking sound of subfuel solenoid by means of a stethoscope.
   - If any subfuel solenoid fails to make the typical clicking sound, check the sound again after replacing the subfuel solenoid.
   - If clicking sound is still absent, check the following.
     - Whether there is wire breakage or poor connection in the YEL/BLK, YEL wire between subfuel pump relay and the subfuel solenoid.
     - Whether there is wire breakage or poor connection in the WHT wire between subfuel pump relay and the auxiliary under-dash fuse holder (15 A) fuse.
     - Whether there is any short-circuiting, wire breakage or poor connection in the wire between the subfuel solenoid and the ECM/PCM.
5. Turn the ignition switch to LOCK (0).
6. Disconnect the subfuel solenoid 2P connector.

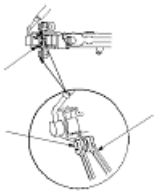
7. Measure the resistance between subfuel solenoid (A) terminals No. 1 and No. 2. There should be 10.3 Ω.
   - If the resistance is OK, go to Step 8 .
   - If the resistance is not as specified, replace the subfuel solenoid.
8. Remove the subfuel solenoid.
9. Check the subfuel solenoid for dirt or rusty.
   - If it is dirty or rusty, replace the subfuel solenoid, and the fuel nozzle.

Subfuel Solenoid Replacement

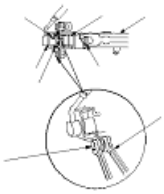
1. Relieve the subfuel pressure.
2. Remove the bolt (A).
3. Remove the intake manifold stay (B).
4. Disconnect the connector (C) from the subfuel solenoid.
5. Remove the harness band (D) from the subfuel solenoid holder (E).



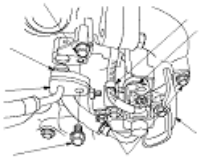
6. Place the wrench (A), then remove the bolts (B).
7. Remove the injector clip (C) from the subfuel solenoid.

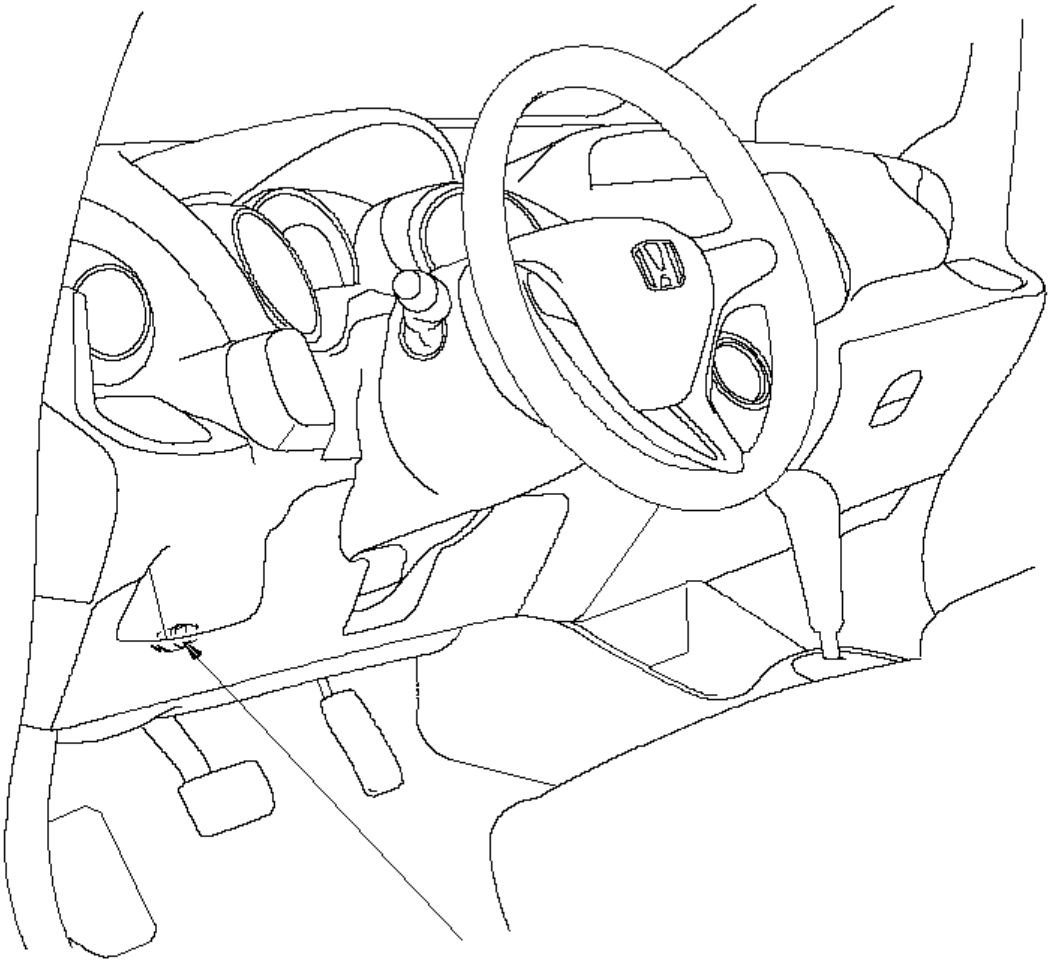


8. Coat the new O-ring (A) with clean engine oil, and insert the subfuel solenoid (B) into the subfuel solenoid holder (C).
9. Install the injector clip (D).
10. Coat the injector O-ring (E) with clean engine oil, and insert the subfuel solenoid into the subfuel pipe (F).
11. Place the wrench (G), then tighten the bolts (H).



12. Install the bolt (A).
13. Install the subfuel feed pipe (B), with a new O-ring (C).
14. Reconnect the connector (D).
15. Turn the ignition switch to ON (II), but do not operate the starter. After the subfuel pump runs for about 2 seconds, the subfuel pressure in the subfuel line rises. Repeat this two or three time, then check for fuel leakage.
16. Install the harness band (E).
17. Install the intake manifold stay (F).

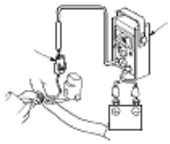




BRAKE PEDAL POSITION SWITCH
Signal Circuit Troubleshooting,

in the Shop Manual, P/N 62TF000A

Idle Speed Inspection



NOTE:

- Before checking the idle speed, check these items:
  - The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.
  - Ignition timing
  - Spark plugs
  - Air cleaner
  - PCV system
  - Headlight OFF

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard, or a tachometer (B) to the test tachometer connector (C).
3. When using the HDS, make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.
   Idle speed should be:

L13Z3 engine

M/T	**700±50 rpm (min $^{-1}$)**
A/T	**700±50 rpm (min $^{-1}$) (in N or P)**

L15A8 engine

M/T	**700±50 rpm (min $^{-1}$)**
A/T	**700±50 rpm (min $^{-1}$) (in N or P)**

6. Let the engine idle for 1 minute with high electric load (A/C switch on, temperature set to max cool, blower fan on High, and headlights on high beam).
   Idle speed should be:

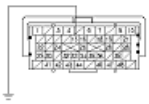
M/T	**790±50 rpm (min $^{-1}$)**
A/T	**790±50 rpm (min $^{-1}$) (in N or P)**

   NOTE: If the idle speed is not within specification, do the ECM/PCM idle learn procedure. If the idle speed is still not within specification, go to symptom troubleshooting.
7. Reconnect the EVAP canister purge valve connector.

Engine idle

Item	Measurement	Qualification	Standard or New
Engine idle	Idle speed without load	M/T (in neutral)	700±50 rpm
		A/T (in N or P)	
	Idle speed with high electrical load (A/C switch ON, temperature set to max cool, blower fan on High, rear window defogger ON, and headlights on high beam)	M/T (in neutral), A/T (in N or P)	790±50 rpm
	Idle CO		0.1 % max

A/C Signal Circuit Troubleshooting



1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

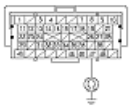
   Does it indicate ON?
   YES - Go to Step 5 .
   NO - Do the A/C system test. ■
5. Check the A/C system.

   Does the A/C system operate?
   YES - The air conditioning system circuit is OK.■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Turn the ignition switch to ON (II).
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   Is there a clicking noise from the A/C compressor clutch?
   YES - Do the A/C system test. ■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (49P).
12. Turn the ignition switch to ON (II).
13. Momentarily connect ECM/PCM connector terminal A15 to body ground with a jumper wire several times.

    Is there a clicking noise from the A/C compressor clutch?
    YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
    NO - Check for poor connections or loose terminals at the A/C compressor clutch relay and the ECM/PCM. If the connections are OK, check the A/C compressor clutch relay, repair open in the wire between the ECM/PCM (A15) and the A/C compressor clutch relay and the other A/C systems.■

Alternator FR Signal Circuit Troubleshooting



1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is turned on.

   Does the percentage vary?
   YES - The alternator signal circuit is OK.■
   NO - Go to Step 4 .
4. Turn the headlight switch off and the ignition switch to LOCK (0).
5. Jump the SCS line with the HDS.
6. Disconnect the alternator 4P connector.
7. Disconnect ECM/PCM connector B (49P).
8. Check for continuity between body ground and ECM/PCM connector terminal B47.

   Is there continuity?
   YES - Repair short in the wire between the ECM/PCM (B47) and the alternator.■
   NO -
   - Troubleshoot the alternator and regulator circuit. ■
   - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

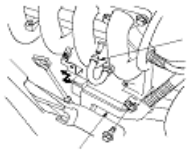
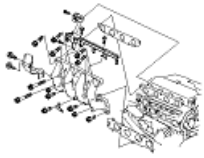
Intake Manifold Removal and Installation



Exploded View

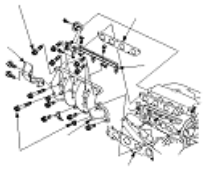
Removal

1. Remove the harness holder mounting bolt, then remove the harness holder (A) from the bracket.
2. Remove the positive crankcase ventilation (PCV) hose (B).
3. Disconnect the exhaust gas recirculation (EGR) valve connector.
4. Remove the dipstick.
5. Remove the intake manifold.
6. Remove the intake manifold bracket C.

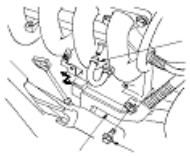


7. Remove the subfuel pipe from the intake manifold.

Installation



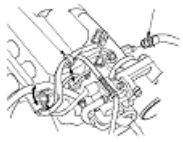
1. Install the subfuel pipe (A) to the intake manifold.
2. Install the intake manifold bracket C (B).
3. Install the intake manifold (C) with new gaskets (D), and tighten the bolts and nuts in a crisscross pattern in three steps, beginning with the inner bolt.
4. Install the dipstick.
5. Connect the EGR valve connector.



6. Install the PCV hose (A) and harness holder (B).

Intake Manifold Chamber Removal and Installation

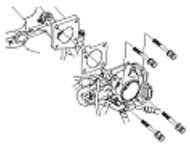
Exploded View



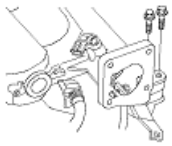
Removal

1. Remove the under-cowl panel.
2. Remove the air cleaner housing assembly.
3. Remove the engine wire harness connectors and wire harness clamps from the intake manifold chamber.
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
4. Remove the brake booster vacuum hose (A) and the harness clamp (B).
5. Remove the water bypass hose from the clamp (C).

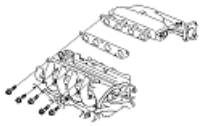
6. Remove the throttle body without disconnecting the water bypass hoses.



7. Remove the intake manifold bracket mounting bolts.

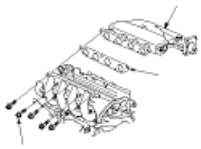


8. Remove the intake manifold chamber.

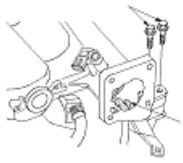


Installation

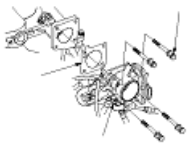
1. Install the intake manifold chamber (A) with a new gaskets (B), and tighten the bolts in a crisscross pattern in three steps, beginning with the inner bolt.



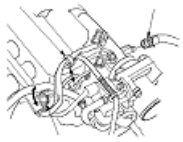
2. Loosen the intake manifold bracket mounting bolt (A). Tighten the mounting bolts (B), then tighten the mounting bolt (A).



3. Install the throttle body (A) with a new gasket (B).

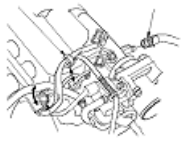


4. Install the water bypass hose to the clamp (A).
5. Install the brake booster vacuum hose (B) and the harness clamp (C).
6. Install the engine wire harness connectors and wire harness clamps to the intake manifold chamber.
   - Throttle actuator connector
   - MAP sensor connector
7. Install the air cleaner housing assembly.
8. Install the under-cowl panel.



Intake Manifold/Chamber Assembly Removal and Installation

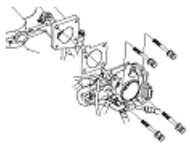
Exploded View



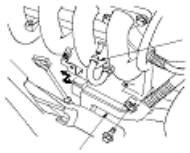
Removal

1. Remove the under-cowl panel.
2. Remove the air cleaner housing assembly.
3. Remove the engine wire harness connectors and wire harness clamps from the intake manifold chamber.
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
   - Exhaust gas recirculation (EGR) valve connector
4. Remove the brake booster vacuum hose (A) and the harness clamp (B).
5. Remove the water bypass hose from the clamp (C).

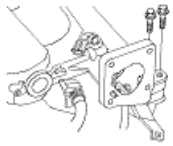
6. Remove the throttle body without disconnecting the water bypass hoses.



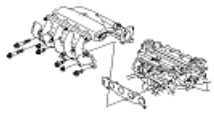
7. Remove the harness holder mounting bolt, then remove the harness holder (A) from the bracket.
8. Remove the positive crankcase ventilation (PCV) hose (B).
9. Remove the dipstick.



10. Remove the intake manifold bracket mounting bolts.

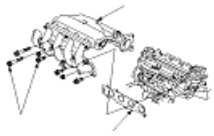


11. Remove the intake manifold/chamber assembly.

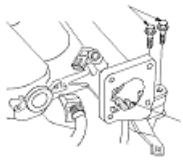


Installation

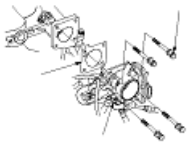
1. Install the intake manifold/chamber assembly (A) with a new gasket (B), and tighten the bolts and nuts in a crisscross pattern in three steps, beginning with the inner bolt.



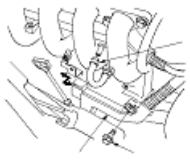
2. Loosen the intake manifold bracket mounting bolt (A). Tighten the mounting bolts (B), then tighten the mounting bolt (A).



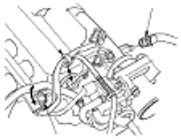
3. Install the throttle body (A) with a new gasket (B).
4. Install the dipstick.



5. Install the PCV hose (A) and harness holder (B).



6. Install the water bypass hose to the clamp (A).
7. Install the brake booster vacuum hose (B) and the harness clamp (C).
8. Install the engine wire harness connectors and wire harness clamps to the intake manifold chamber.
    - Throttle actuator connector
    - MAP sensor connector
    - EGR valve connector
9. Install the air cleaner housing assembly.
10. Install the under-cowl panel.



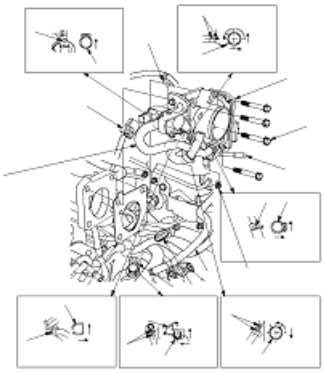
Throttle Body Test

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check REL TP SENSOR in the DATA LIST the HDS. The reading should be below 2.46 deg. If it is not, clean the throttle body.

Throttle Body Removal/Installation

⚠CAUTION

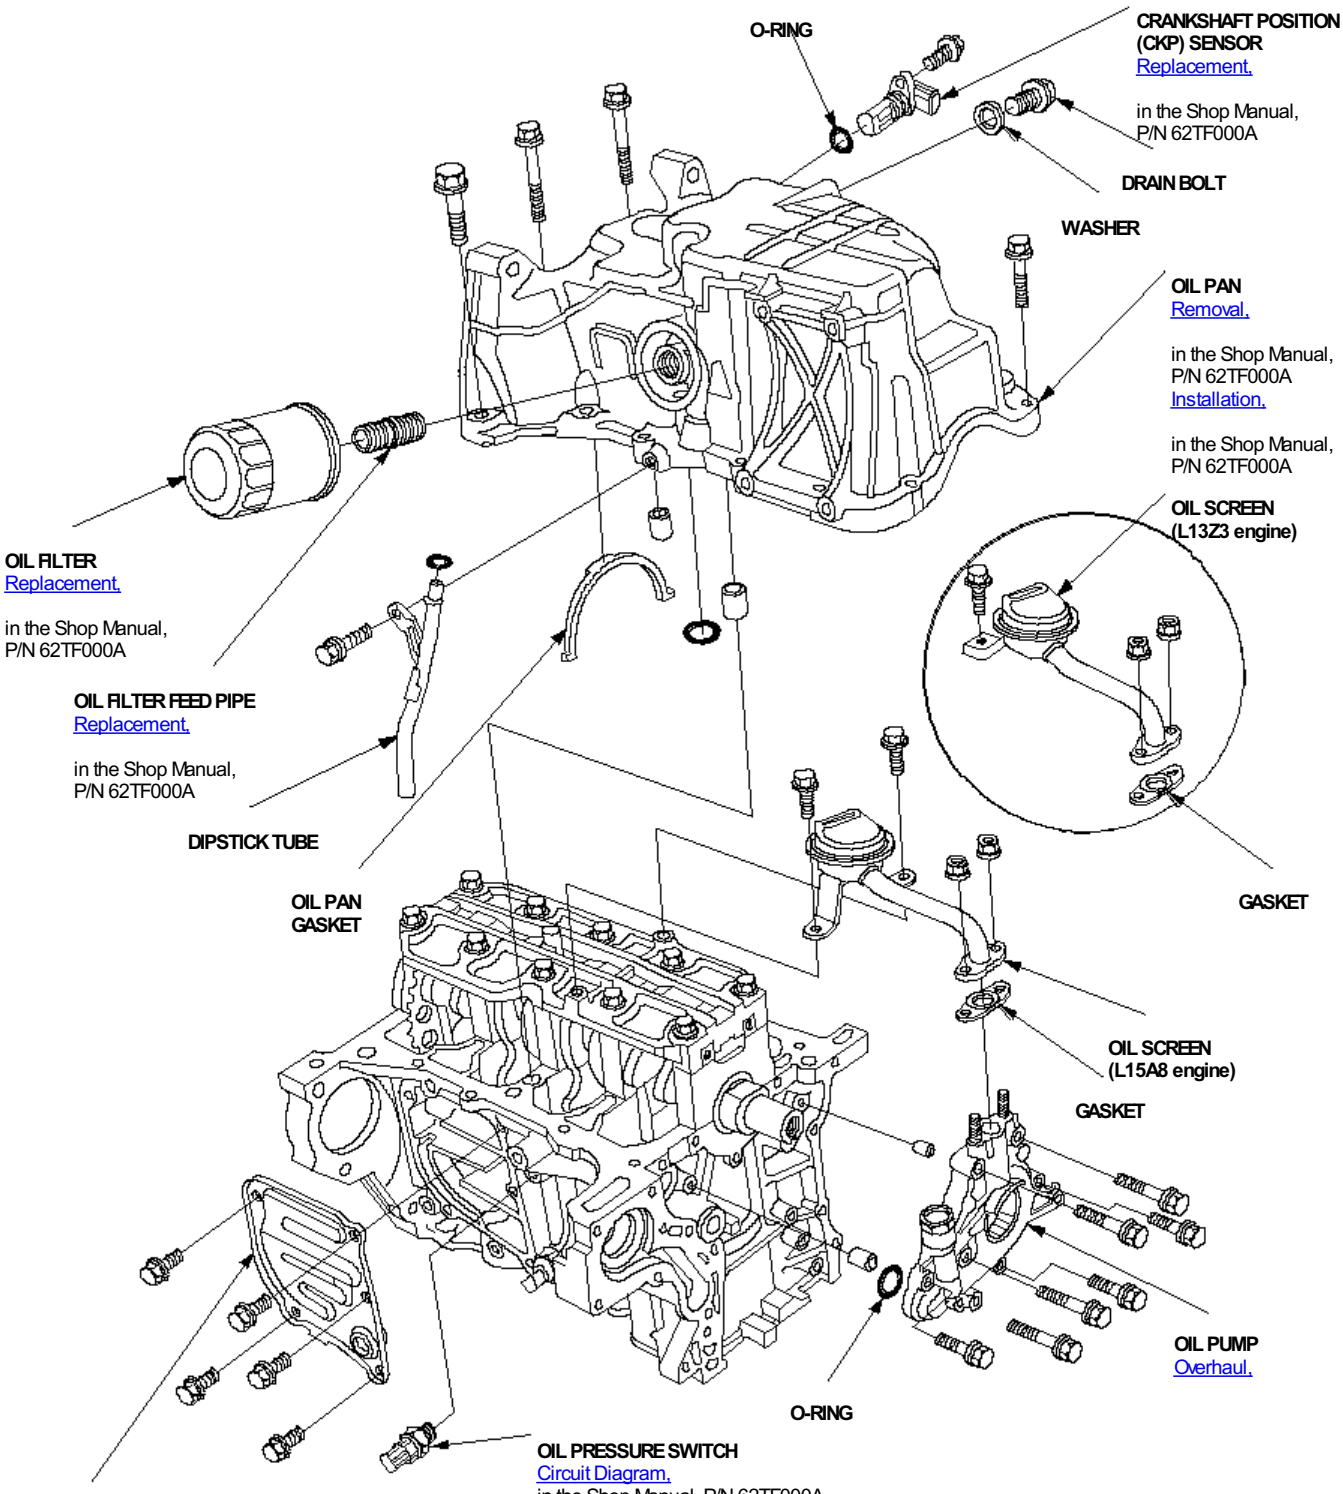
Do not insert your fingers into the installed throttle body when you turn the ignition switch to ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.



1. Remove the air cleaner.
2. Remove the harness clamp (A).
3. Disconnect the throttle body connector (B), and the EVAP canister purge valve connector (C).
4. Disconnect and plug the water bypass hoses (D), the purge hose (E).
5. Remove the throttle body (F).
6. Remove the purge pipe (G), the water bypass hoses, and the purge hose from the throttle body.
7. Install the parts in the reverse order of removal with a new gasket (H), then refill the radiator with engine coolant.
   NOTE:
   - If you replace or clean the throttle body, go to Step 8 .
   - If you did not replace or clean the throttle body, this procedure is complete.
   - Align the marks (I) on the hose and throttle body, then insert the hose. Make sure the clamp (J) is positioned as shown.
   - Align the mark (K) on the hose as shown, then insert the hose. Make sure the clamp (L) is positioned as shown.

8. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
9. Turn the ignition switch to ON (II).
10. Reset the ECM/PCM with the HDS.
11. Select the ETCS TEST in the INSPECTION MENU with the HDS.
12. Select TP POSITION CHECK and clear the throttle position (TP) learned value.
13. Turn the ignition switch to LOCK (0).
14. Turn the ignition switch to ON (II), and wait 2 seconds without pressing the accelerator pedal.
15. Do the ECM/PCM idle learn procedure.

Engine Lubrication Component Location Index



Engine Oil Pump Overhaul

Exploded View

Special Tools Required

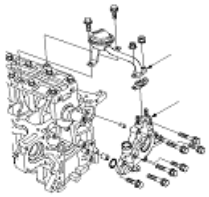
Sub hanger stay
07MAK-PY30100

Removal

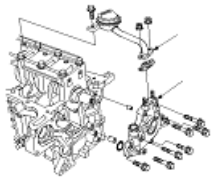
1. Remove the cam chain.
2. Remove the alternator mounting bolt, then install the sub hanger stay.
3. Attach the chain to the sub hanger stay. Lift and support the engine with the chain.
4. Remove the oil pan.

5. Remove the oil screen (A), then remove the oil pump (B).

L15A8 engine



L13Z3 engine

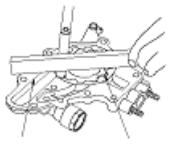


Inspection

1. Remove the screws from the oil pump housing, then separate the pump housing and pump cover.
2. Check the inner-to-outer rotor radial clearance between the inner rotor (A) and the outer rotor (B). If the inner-to-outer rotor clearance exceeds the service limit, replace the oil pump assembly.

Inner Rotor-to-Outer Rotor Radial Clearance

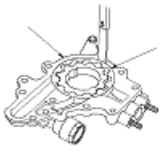
Standard (New):	**0.06–0.16 mm (0.002–0.006 in.)**
Service Limit:	**0.20 mm (0.008 in.)**



3. Check the pump housing-to-rotor axial clearance between the rotors (A) and pump housing (B). If the pump housing-to-rotor axial clearance exceeds the service limit, replace the oil pump assembly.

Housing-to-Rotor Axial Clearance

Standard (New):	**0.02–0.06 mm (0.001–0.002 in.)**
Service Limit:	**0.15 mm (0.006 in.)**



4. Check the pump housing-to-outer rotor radial clearance between the outer rotor (A) and the pump housing (B). If the pump housing-to-outer rotor radial clearance exceeds the service limit, replace the oil pump assembly.

Pump Housing-to-Outer Rotor Radial Clearance

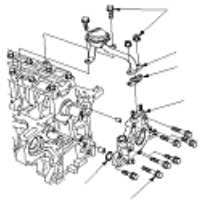
Standard (New):	**0.100–0.175 mm (0.0039–0.0069 in.)**
Service Limit:	**0.20 mm (0.008 in.)**

5. Inspect both rotors and the pump housing for scoring or other damage. Replace the parts, if necessary.
6. Check that the oil pump turns freely.

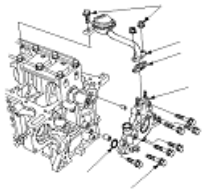
Installation

1. Clean the O-ring groove and the mating surface of the engine block.
2. Install the oil pump (A) with a new O-ring (B).
3. Install the oil screen (C) with a new gasket (D).
4. Install the oil pan.
5. Support the engine with a jack and wood block under the oil pan.

L15A8 engine

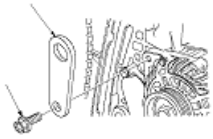


L13Z3 engine



---

6. Remove the chain and sub hanger stay, then tighten the alternator mounting bolt.
7. Install the cam chain.



Right Front Fender Removal/Installation

FFV Model

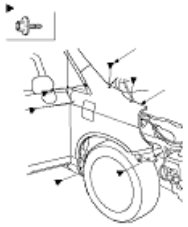
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front fender and body.

1. Remove these items:
   - Front bumper
   - Headlight
   - Front pillar corner trim
2. Remove the front inner fender.
3. Remove the fuel filler cap (A).
4. Remove the fuel fill door trim.

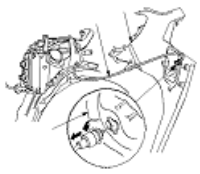
---

5. Remove the bolts from the right front fender (A).



---

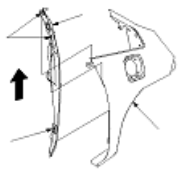
6. From back of the front fender (A), remove the fuel fill door opener cable (B) from the fuel filler lid (C), take care not to scratch the front fender.



7. Install the front fender in the reverse order of removal, and note these items:
   - Make sure the fuel fill door latch is installed properly.
   - Make sure the fuel fill door opens properly and locks securely.
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Apply touch-up paint to the front fender installation bolts, and around the front fender.
   - Front fender in or out until it's flush with the door, and up or down as necessary to equalize the gaps.
   - Apply multipurpose grease to the fuel fill door latch.

Front Fender Fairing Replacement - Supplement

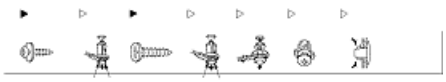
Right Front Fender Fairing - FFV Model

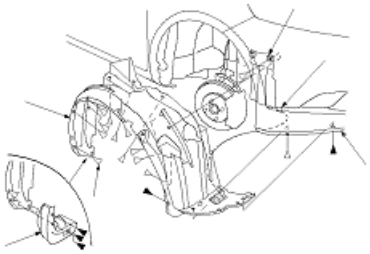


1. Remove the front right fender.
2. Remove the hooks (A), then remove the front fender fairing (B) from the front right fender (C).
3. Install the front fender fairing in the reverse order of removal.

Front Inner Fender Replacement

FFV Model





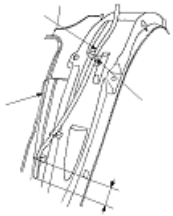
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.

1. For some models: Remove the side sill panel.
2. Remove the front inner fender (A).
   -1. On the back of the wheel arch, remove the screws (B), and remove the front splash guard (C) (for some models).
   -2. From under the front bumper (D), remove the screw (E) securing the front bumper, the splash shield (F), and the front inner fender.
   -3. Remove the clip (G) securing the front bumper and the front inner fender.
   -4. From the wheel arch, remove the screw (H), clips (I, J, K), clips (L).
   -5. Release the hook (M) of the splash shield, then remove the front inner fender.
   NOTE: To remove the clips G, I, pry the inner the clip up at the edge near the line (N) on its head.

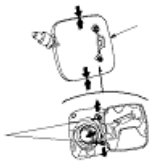
---

3. Install the inner fender in the reverse order of removal, and note these items:
   - Pull the lower end of the drain tube (A) down fully, then the inner fender (B) fasten the tube with the clips (C). And make sure that water is drained through the tube.
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.



Fuel Fill Door Adjustment

FFV Model



NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front fender.

1. Remove the fuel fill door trim.
2. Slightly loosen the hinge mounting bolts (A).
3. Adjust the fuel fill door (B) in or out until it's flush with the front fender, and up or down as necessary to equalize the gaps.
4. Tighten the hinge mounting bolts.
5. Check that the fuel fill door opens properly and locks securely, and check that the rear of the door is flush with the front fender.

---

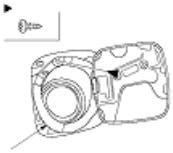
6. Apply multipurpose grease to each location indicated by the arrows.
7. Apply touch-up paint to the hinge mounting bolts and around the hinges.
8. Reinstall the fuel fill door trim.

Fuel Fill Door Trim Replacement

FFV Model

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front fender and body.



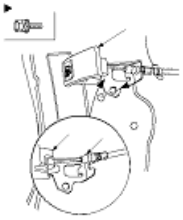
1. Remove the fuel filler cap.
2. Remove the screw securing the fuel fill door trim (A).

3. Remove the fuel fill door trim (A) with the drain tube (B) from the front fender (C).

4. Disconnect the drain tube (A) from the fuel fill door trim (B).
5. Install the trim in the reverse order of removal and make sure the drain tube is connected securely.

Fuel Fill Door Opener Replacement

FFV Model

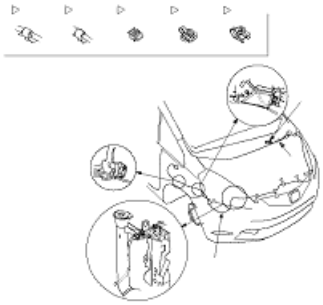


1. Remove the driver's side kick panel.
2. Remove the bolt, then remove the fuel fill door opener handle (A).
3. Disconnect the fuel fill door cable (B) from the fuel fill door release handle. Take care not to bend the cable.
4. Install the fuel fill door release handle in the reverse order of removal, and note these items:
   - Make sure the fuel fill door opener cable is connected properly.
   - Make sure the fuel fill door opens properly.

Fuel Fill Door Opener Cable Replacement

FFV Model

NOTE:

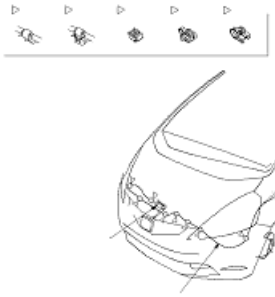


- Put on gloves to protect your hands.
- Take care not to scratch the body and related parts.

1. Remove the right front fender.
2. Remove these items:
   - Left front inner fender
   - Driver's side kick panel
3. Disconnect the fuel fill door opener cable (A) from the fuel fill door opener (B). Take care not to kink the cable.
4. Using a clip remover, detach the clips (C, D). Release the fuel fill door opener cable from the clips (E, F, G) being wound onto the opener cable off, then remove the fuel fill door opener cable from the grommet (H). Take care not to kink the cable.
5. Install the cable in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the fuel fill door opens properly and locks securely.

Hood Opener Cable Replacement

FFV Model



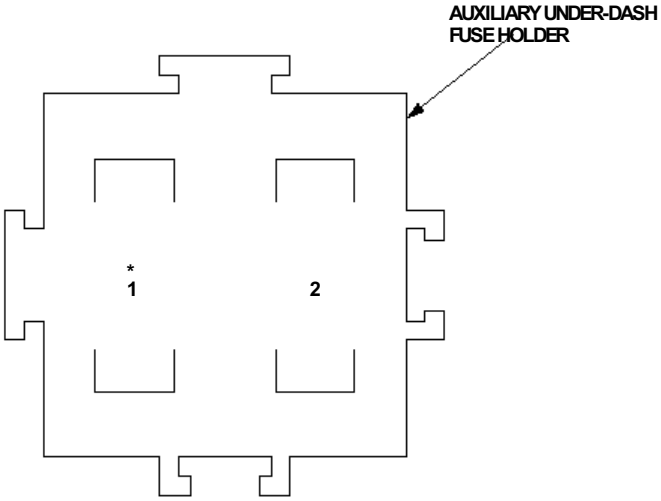
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body and the related parts.

1. Remove these items:
   - Left front inner fender
   - Kick panel, driver's side
2. Disconnect the hood opener cable (A) from the hood latch (B), and disconnect the hood opener cable from the hood release handle (C). Take care not to kink the cable.
3. Using a clip remover, detach the clips (D, E), release the cable from the clips (F, G, H) being wound onto the opener cable off, then remove the hood opener cable from the grommet (I). Take care not to kink the cable.
4. Install the cable in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the cable is connected properly.
   - Make sure the hood opens properly and locks securely.

Auxiliary Under-dash Fuse Holder (FFV)

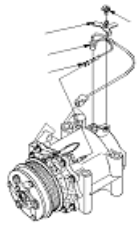
Fuse Number	Amps	Component(s) or Circuit(s) Protected
1	———	Not used
2	15 A	Subfuel pump relay, Subfuel solenoid (via subfuel pump relay)



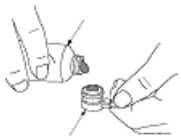
*: Not used

A/C Compressor Thermal Protector Replacement

1. Remove the bolt and the holder (A). Disconnect the field coil connector (B), then remove the thermal protector (C).



2. Replace the thermal protector (A) with a new one, and apply silicone sealant (B) to the bottom of the thermal protector.
3. Install the thermal protector in the reverse order of removal.



SRS Precautions and Procedures

General Precautions

Please read the following precautions carefully before servicing the airbag system. Observe the instructions described in this manual, or the airbags could accidentally deploy and cause damage or injuries.

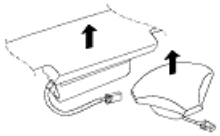
- Except when doing electrical inspections, always turn the ignition switch to LOCK (0), disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
  NOTE: The SRS memory is not erased even if the ignition switch is turned to LOCK (0) or the battery cables are disconnected from the battery.
- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it.
  Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.
- Before disconnecting the SRS unit connectors, always disconnect the appropriate SRS parts connectors.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.

Steering-Related Precautions

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, making the SRS system, remote steering wheel controls, and the horn inoperative. Center the cable reel whenever you do the following.
  - Installation of the steering wheel
  - Installation of the cable reel
  - Installation of the steering column
  - Other steering-related adjustment or installation
- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if it does not rotate smoothly, replace the cable reel.

Airbag Handling and Storage

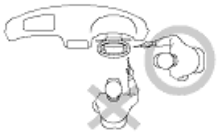


Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.
For temporary storage of an airbag during service, observe the following precautions.

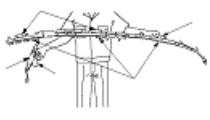
- Store the removed airbag with the pad surface up. Never put anything on the airbag.

- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.

- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200 °F/93 °C).
- Never do electrical tests on the airbags, such as measuring resistance.



- Do not position yourself in front of the airbag during removal, inspection, or replacement.
- For proper disposal of a damaged airbag , refer to airbag disposal.



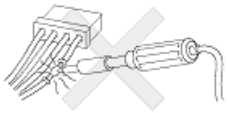
- The side curtain airbag module assembly is a long, jointed part containing an inflator (A), a flexible bag (B), and brackets (C). When removing or installing the side curtain airbag inflator assembly, never do these things:
  - Drop the curtain airbag.
  - Cut, tear, or real the tape.
  - Handle the flexible bag (B).

SRS Unit, Front and Side Impact Sensors

- Turn the ignition switch to LOCK (0), disconnect the negative cable from the battery, then wait at least 3 minutes before beginning installation or replacement of the SRS unit or disconnecting the connectors from the SRS unit.
- Be careful not to bump or impact the SRS unit, front impact sensors or side impact sensors when the ignition switch is at ON (II), or for at least 3 minutes after the ignition switch is turned to LOCK (0).
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, front impact sensors or side impact sensors. The airbags could accidentally deploy and cause damage or injury.

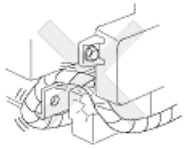
- After a collision where a front airbag, side airbags, side curtain airbags, or a seat belt tensioner deployed, go to Component Replacement/Inspection after Deployment. After a collision where the airbags or the side airbags did not deploy, inspect for any damage or any deformation on the SRS unit, front impact sensors and side impact sensors. Replace all damaged parts.
- Do not disassemble the SRS unit, front impact sensors and side impact sensors.
- Be sure the SRS unit, front impact sensors and side impact sensors are installed securely with the mounting bolts torqued to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft) whenever you remove or replace the SRS unit, all impact sensors, always install the components with new TORX bolts.
- Do not spill water or oil on the SRS unit or the side impact sensors.

Wiring Precautions



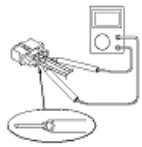
Some of the SRS wiring can be identified by special yellow outer covering, and the SRS connectors can be identified by their yellow color. Observe the instructions.

- Never attempt to modify, splice, or repair SRS wiring.
  If there is an open or damage in SRS wiring, replace the harness.

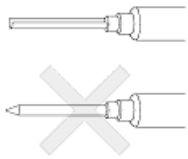


- Be sure to install the harness wires so they do not get pinched or interfere with other parts.
- Make sure all SRS ground locations are clean, and grounds are securely fastened for optimum metal-to-metal contact. Poor grounds can cause intermittent problems that are difficult to diagnose.
- Do not use any silicone based cleaners or lubricants on any SRS connectors or terminals.

Precautions for Electrical Inspections

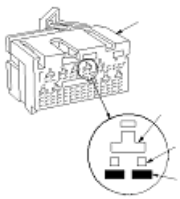


- When using electrical test equipment, insert the probe of the tester into the wire side of the connector (except waterproof connector). Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.



- Use a U-shaped probe. Do not insert the probe forcibly.
- Use specified service connectors in troubleshooting.
  Using improper tools could cause an error in inspection due to poor metal-to-metal contact.

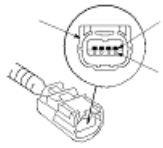
SRS Unit Connectors



When diagnosis/troubleshooting is done at the SRS unit connector (A), use the terminal test port (B) below the terminal (C) you need to check. Gently insert the pin probes of the tester or jumper wire at the terminal test port from the terminal side.
NOTE:

- Do not insert the pin probes of the tester or jumper wire at the terminal port and SRS short canceller terminal port (D).
- To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an in correct measurement.

Water Proof Connectors for SRS System

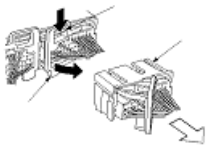


When diagnosis/troubleshooting is done at the water proof connector (A), use the terminal test port (B) above the terminal (C) you need to check. Gently contact the pin probe of the tester or jumper wire at the terminal test port from the terminal side.
NOTE:

- Do not insert the pin probes of the tester or jumper wire at the terminal port.
- To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an in correct measurement.

Lever-Locked Connector

The SRS unit connectors have a lever lock.



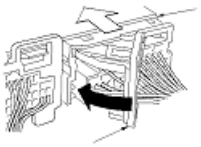
SRS Unit Connectors

Disconnecting

To release the lock, pull the lever (A) while pushing the lock (B), on the outside of the connector, then pull the connector (C).

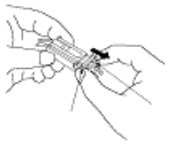
Connecting

To reconnect the connector, push in on the connector sleeve (A). As the connector is pressed in, the lever (B) moves to the locked position.



Spring-Loaded Lock Connector

Some SRS system connectors have a spring-loaded lock.



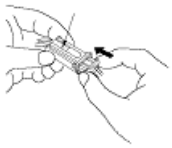
Front Airbag Connectors

Disconnecting

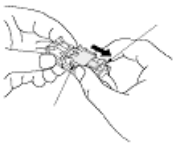
To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.

Connecting

To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve (A) is pushed back by the pawl (C). Do not touch the sleeve.



Side Airbag Connector



Disconnecting

To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.

Connecting

Hold both connector halves, and press them firmly together until the projection (C) of the sleeve-side connector clicks.

Opening the SRS Unit Shorting Connectors for Diagnosis

Special Tools Required

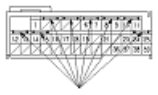
SRS short canceller
070AZ-SAA0100

NOTE:

- To prevent damaging the connector cavity, insert the short canceller straight into the cavity from the terminal side.
- Before installing the short canceller, wash it with electrical contact cleaner, then dry it with compressed air.
- Do not use the short canceller if it is damaged.
- Make sure to remove the short canceller before reconnection.

When SRS unit connectors A (39P) or B (39P) are disconnected, a short circuit is created in the connector by its own function to prevent an airbag deployment. The circuit may need to be open sometimes when diagnosis is done on the system. Insert the short canceller (070AZ-SAA0100) in the specified cavities when it is necessary to keep the circuit open for diagnosis.

Terminal numbers are shown from the wire side of the female terminals. Insert the short canceller(s) into the cavities on the terminal side of the connector.

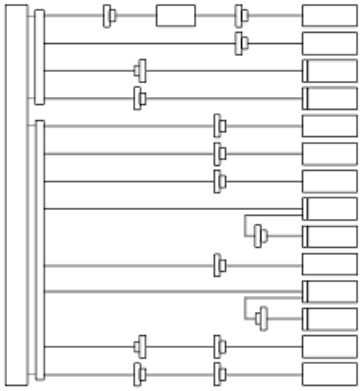


Seats with Side Airbags

Seats with side airbags have a “SIDE AIRBAG" label on the seat-back. Because the component parts (seat-back cover/pad etc.) of seats with and without airbags are different, make sure you install only the correct replacement parts.

- When cleaning, use a damp cloth to clean the seat. Do not soak the seat with liquid. Do not spray steam on the seat.
- Do not repair a torn or frayed seat-back cover. Replace the seat-back cover.
- After a collision where the side airbag was deployed, replace the side airbag and seat frame with new parts. If the seat-back cushion is split, it must be replaced.
- Never put aftermarket accessories on the seat (covers, pads, seat heaters, lights, etc.).

Disconnecting System Connectors



Turn the ignition switch to LOCK (0). Disconnect the negative cable from the battery. Wait for 3 minutes before starting the following procedures.

- Before disconnecting the cable reel 4P connector (1), disconnect the driver's airbag 4P connector (2).

---

1. Turn the ignition switch to LOCK (0). Disconnect the negative cable from the battery, then wait for 3 minutes.

Driver's Airbag

2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.

Front Passenger's Airbag

3. Lower the glove box, then remove the connector clip. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness (B).

Side Airbag

4. Disconnect both side airbag 2P connectors (A) from the floor wire harness.

Side Curtain Airbag

5. Remove the cargo area side trim panel.
6. Disconnect both floor wire harness 2P connectors (A) from the side curtain airbags.

Seat Belt Tensioner

7. Remove the center pillar lower trim:
   - Without side curtain airbag
   - With side curtain airbag
8. Disconnect both floor wire harness 4P connectors (A) from the seat belt tensioners.

SRS Unit

9. Remove the center console.
10. Remove the heater joint duct.
11. Disconnect SRS unit connectors A (39P) and B (39P) from the SRS unit.

Audio System Symptom Troubleshooting - Audio unit power switch will not turn on (No information display and no sound)

Audio unit power switch will not turn on (No information display and no sound)

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Push the power button on to see if audio unit turns on.

   Does the audio unit display operate properly, and does the audio unit sound normal?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 3 .
3. Turn off the audio unit, then turn the ignition switch to LOCK (0).
4. Check the No. 1 (10 A) and No. 14 (7.5 A) fuses in the under-dash fuse/relay box.

   Are the fuses OK?
   YES - Go to Step 5 .
   NO - Replace the fuse(s), and recheck.■
5. Remove the audio unit. Check that the audio unit connectors are properly connected.
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.

   Are they connected properly?
   YES - Go to Step 6 .
   NO - Repair poor connections and reconnect the connectors, and recheck the function.■
6. Disconnect audio unit connector A (24P).
7. Turn the ignition switch to ON (II).
8. Measure the voltage between body ground and audio unit connector A (24P) No. 14 and No. 24 terminals individually.

   Is there battery voltage?
   YES - Go to Step 9 .
   NO - Repair open or short in the wire(s) between the No. 1 (10 A) and No. 14 (7.5 A) fuse in the under-dash fuse/relay box and the audio unit.■
9. Turn the ignition switch to LOCK (0).
10. Reconnect audio unit connector A (24P).
11. Turn the ignition switch to ON (II).

---

12. Measure the voltage between audio unit connector A (24P) terminal No. 12 and body ground.

    Is there less than 0.1 V?
    YES - Substitute a known-good audio unit, and recheck. If the symptom/indication goes away, replace the original audio unit.■
    NO - Repair open in the wire between the audio unit and body ground (G503).■

Audio System Symptom Troubleshooting - Audio unit power switch will not turn off

Audio unit power will not turn off

NOTE:

- Check for aftermarket accessories plugged into the vehicle's accessory power sockets.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Push the power switch to see if the audio unit turn off.

   Does the audio unit turn off?
   YES - Operation is normal.■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).

   Does the audio unit turn off?
   YES - Replace the audio unit. ■
   NO - Go to Step 4 .
4. Remove the audio unit. and disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.
5. Measure the voltage between audio unit connector A (24P) No. 14 terminal and body ground.

   Is there battery voltage?
   YES - Check for short to power on the PUR wire.
   NO - Substitute a known-good audio unit, and recheck. If the symptom/indication goes away, replace the original audio unit.■

No sound is heard from the speaker(s) (display is normal)

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.
- Set the fader and balance positions to the center.
- Set the VOL knob except MIN position.

1. Do the speaker check mode with the self-diagnostic function.

   Do any or all of the speakers fail to sound?
   YES -
   - If at least one speaker is OK, go to Step 6 .
   - If all speakers fail to sound, go to Step 2 .

   NO - System is OK at this time. Check for poor connections at the audio unit and speakers.■

2. Make sure the ignition switch to LOCK (0).

3. Remove the audio unit and disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.

4. Check for continuity between audio unit connector A (24P) No. 14 terminal and body ground according to the table.

Speaker	Audio unit connector	Wire color
Left front door speaker	A23 (+)	LT BLU
	A22 (−)	LT GRN
Right front door speaker	A19 (+)	BRN
	A18 (−)	RED
Left rear door speaker	A11 (+)	GRY
	A10 (−)	BRN
Right rear door speaker	A7 (+)	BLU
	A6 (−)	ORN

   Is there continuity?
   YES - Repair short to body ground in the wire(s) between the audio unit and the faulty speaker(s).
   NO - Go to Step 5 .

5. Test the speaker(s).

   Is the speaker OK?
   YES - Go to Step 13 .■
   NO - Replace the speaker(s) and recheck.■

6. Make sure the ignition switch to LOCK (0).

7. Check the faulty speaker(s) face for damage.

   Is there any damage?
   YES - Replace the speaker(s) and recheck.■
   NO - Go to Step 8 .

8. Test the speaker(s) with no sound.

   Is the speaker OK?
   YES - Go to Step 9 .
   NO - Replace the speaker(s) and recheck.■

9. Remove the audio unit and disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.

10. Connect the speaker connector terminal (+) and (−) with a jumper wire.

11. Check for continuity between both pairs of speaker wires (+) and (−) at audio unit connector A (24P) according to the table.

Speaker	Audio unit connector	Wire color
Left front door speaker	A23 (+)	LT BLU
	A22 (−)	LT GRN
Right front door speaker	A19 (+)	BRN
	A18 (−)	RED
Left rear door speaker	A11 (+)	GRY
	A10 (−)	BRN
Right rear door speaker	A7 (+)	BLU
	A6 (−)	ORN

Is there continuity?

YES - Go to Step 12 .

NO - Repair open in the wires between the audio unit and the faulty speaker(s).■

12. Disconnect the jumper wire.

---

13. While disconnecting the speaker connector(s), check for continuity between both pairs of speaker wires (+) and (−) at audio unit connector A (24P) according to the table.

Speaker	Audio unit connector	Wire color
Left front door speaker	A23 (+)	LT BLU
	A22 (−)	LT GRN
Right front door speaker	A19 (+)	BRN
	A18 (−)	RED
Left rear door speaker	A11 (+)	GRY
	A10 (−)	BRN
Right rear door speaker	A7 (+)	BLU
	A6 (−)	ORN

Is there continuity?

YES - Repair short in the wire(s) between the audio unit and the faulty speaker(s).■

NO - Replace the audio unit. ■

Audio system sound is weak or distorted (display is normal)

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and check for sound in each mode (AM, FM, and CD).

Is there sound from the speakers, and is the sound quality normal in each mode?

YES - Intermittent failure. The system is OK at this time. Check for loose connections at the audio unit and each speaker.■

NO - Speakers all work, sound quality is poor.■

- If the sound quality is poor only with AM or FM, go to poor AM or FM radio reception or interference.
- If the sound is poor in all modes, go to no sound is heard from speaker(s).

Audio unit button illumination does no work

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Check the No. 29 (10 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 2 .
   NO - Replace the fuse, and recheck.■

2. Turn the ignition switch to ON (II).

3. Turn the combination lighting switch to the parking light position.

4. Check the illumination of the audio unit buttons.

   Are the buttons illuminated?
   YES - Intermittent failure: the audio unit is OK at this time. Check for loose or poor connections at the audio unit connector A (24P).■
   NO - Go to Step 5 .

5. Check the illumination of several other buttons not related to the audio system.

   Are the buttons illuminated?
   YES - Go to Step 6 .
   NO - Troubleshoot the dashboard illumination circuit.■

6. Turn the ignition switch to LOCK (0).

7. Disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.

8. Turn the ignition switch to ON (II).

9. With the headlight switch still on, measure the voltage between audio unit connector A (24P) terminal No. 13 and body ground.

   Is there battery voltage?
   YES - Check the connections at audio unit connector A (24P). If all connections are OK, replace the audio unit. ■
   NO - Repair open in the wire between the under-dash fuse/relay box and the audio unit.■

Audio System Symptom Troubleshooting - Audio disc does not eject

Audio disc does not eject

NOTE:

- Check the vehicle battery condition first.
- Disc labels should not be used in the audio unit. They may damage the player mechanism.
- Check the connectors for poor connections or loose terminals

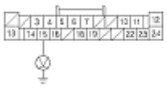
1. Turn the ignition switch to ON (II).
2. Turn on the audio unit.

   Does the system turn on?
   YES - Go to Step 3 .
   NO - Go to Audio unit power switch will not turn on. ■
3. Check to see if the disc ejects correctly with no binding when you push the EJECT button.

   Does the disc eject properly?
   YES - Operation is normal.■
   NO - Go to Step 4 .
4. Turn the ignition switch to LOCK (0).
5. Substitute a known-good center panel

   Is the symptom still present?
   YES - Replace the original center unit.■
   NO - Replace the audio unit. ■

Volume does not increase with speed



NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Test-drive the vehicle at highway speeds and monitor if the volume increases.

   Does the volume increase?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 2 .

2. Verify SVC mode setting in audio unit sound adjustment set-up.

   Is the SVC set to off?
   YES - Change setting to MID and retest.■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

4. Remove the audio unit , and disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.

5. Turn the ignition switch to ON (II).

6. Drive the vehicle and have an assistant measure the voltage at audio unit connector A (24P) terminal No. 15.

   Is there a 0−5 V pulse?
   YES - Substitute a known-good audio unit, and recheck. If the symptom/indication goes away, replace the original audio unit.■
   NO - Repair opens or shorts in the wire between audio unit connector A (24P) No. 15 terminal and ECM/PCM connector A (49P) No. 30 terminal. If no opens are found, substitute a known-good ECM/PCM and recheck. If the symptom/indicated goes away, replace the original ECM/PCM. ■

Volume is too high or too low when driving at freeway speeds

1. Test-drive the vehicle at highway speeds and monitor volume level.

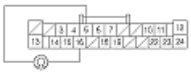
   Is the volume level too high or too low?
   YES - Go to Step 2 .
   NO - internal failre, the system is OK at this time.■

2. Change SVC mode setting in sound adjustment set-up to MID and retest.

   Is the volume level still too high, or too low?
   YES - Replace the audio unit. ■
   NO - Improper (SVC) setting for the customer's sound preference, Advise the customer to try different SVC settings.■

Audio remote switch does not work properly

NOTE:



- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and check the audio unit operation (volume up, volume down, CH (UP), CH (DOWN), MODE).

   Is the audio unit operation OK?
   YES - Go to Step 3 .
   NO - Go to audio unit button does not work. ■
3. Turn the ignition switch to LOCK (0).
4. Do the audio remote switch test.

   Is the audio remote switch OK?
   YES - Go to Step 5 .
   NO - Replace the audio remote switch.
5. Remove the audio unit.
6. Disconnect audio unit connector A (24P).
   NOTE: Eject the CD before removing the audio unit to prevent damaging the CD player's load mechanism.
7. Reconnect the audio remote switch, and measure the resistance between audio unit connector A (24P) terminals No. 5 and No. 16 as specified in the table.

AUDIO REMOTE SWITCH TABLE

Button held down	VOL DOWN	VOL UP	CH (−)	CH (+)	MODE	No button pressed
Resistance	about 100 Ω	about 357 Ω	about 775 Ω	about 1.7 kΩ	about 3.7 kΩ	about 10 kΩ

Is the resistance OK?
YES - Go to Step 8 .
NO - Repair short or high resistance in the circuit between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel. ■

8. Check for continuity between body ground and the No. 5 and No. 16 terminals of audio unit connector A (24P) individually.

   Is there continuity?
   YES - Repair short to body ground in the circuit between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel. ■
   NO - Substitute a known-good audio unit, and recheck. If the symptom/indication goes away, replace the original audio unit. ■

Audio unit button does not work

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.
- If the audio unit does not turn on, go to audio unit power switch will not turn on.

1. Turn the ignition switch to ON (II).
2. Using the owner's manual, check if the symptom is duplicated that uses the faulty button.

   Is the symptom duplicated?
   YES - Go to Step 3 .
   NO - The system is OK. There is a possibility of doing an improper operation.■
3. Turn the ignition switch to LOCK (0).
4. Substitute a known-good center panel. and recheck.

   Is the symptom still present?
   YES - Replace the original center panel.■
   NO - Replace the audio unit.

Audio unit disc indicator does not work

NOTE: CD with labels should not be used in the audio unit. They may damage the player mechanism.

1. Turn on the audio system.
2. Insert a known-good disc or press the EJECT button.

Is the DISC indicator (LED) indicated?

YES - The audio unit is OK at this time. Check for loose or poor connections at audio unit and center panel.■

NO - Substitute a known-good audio unit, and recheck. If the symptom/indication goes away, replace the original audio unit. If the symptom is still present, substitute a known-good center panel, and recheck. If the symptom/indication goes away, replace the original center panel.■

USB audio device input sound is low or cannot be heard

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Do the speaker check mode with the self-diagnostic mode.

   Do all speakers make a sound?
   YES - Go to Step 3 .
   NO - Go to no sound is heard from speaker(s).■
3. Turn the ignition switch to LOCK (0).
4. Connect the customer' s USB device to a known-good vehicle that equipped with the USB adapter and check the USB device operation.

   Is the USB device working properly?
   YES - Go to Step 5 .
   NO - USB device is faulty. Also check the USB cable and USB adapter connector condition.■
5. On the customer's vehicle, connect the customer's USB device to the USB adapter.
6. Turn the ignition switch to ON (II) and turn on the audio unit.
7. Check if the USB device can be operated with the audio unit (Folders or Files UP/DOWN, etc.).

   Can the USB device be operated but no sound is heard?
   YES - Go to Step 8 .
   NO - If the sound is normal, USB device is OK at this time. If the USB device cannot be operated, Go to USB audio device does not work. ■
8. Turn the ignition switch to LOCK (0).
9. Disconnect audio unit connector C (14P).
10. Disconnect USB adapter unit connector A (14P).
11. Check for continuity between the terminals of audio unit connector C (14P) according to the table.

From terminal(wire color)	To terminals(wire color)
C4 (PNK)	C5 (BRN), C6 (WHT), C13 (RED), C14 (LT BLU)
C5 (BRN)	C6 (WHT), C13 (RED), C14 (LT BLU)
C6 (WHT)	C13 (RED), C14 (LT BLU)
C13 (RED)	C14 (LT BLU)

   Is there continuity between any of the terminals?
   YES - Short in the wires between audio unit and USB adapter unit. Replace the affected shielded harness.■
   NO - Go to Step 12 .

12. Check for continuity between audio unit connector C (14P) and USB adapter unit connector A (14P) according to the table.

Audio unit connector	USB adapter unit connector	Wire color
C5	A5	BRN
C6	A6	WHT
C13	A13	RED
C14	A14	LT BLU

   Is there continuity?
   YES - Substitute a known-good USB adapter unit, then reconnect all of the connectors and recheck. If the symptom/indication goes away, replace the original USB adapter unit. If the symptom/indication is still present, replace the audio unit.■
   NO - Open in the wire(s) between the audio unit and the USB adapter unit. Replace the affected shielded harness.■

USB audio device does not work

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.
- Check the USB device requirement:
  - Mass-storage class ready digital audio player with USB 2.0 port
  - More than 256 MB of RAM
  - Supports MP3, WMA, and AAC (encorded with the i-Tunes) files, DRM files are not supported

1. Turn the ignition switch to ON (II) and turn on the audio unit.
2. Push the AUX button to select USB mode.

   Is USB NO DATA displayed?
   YES - Go to Step 3 .
   NO - Go to Step 8 .
3. Turn the ignition switch to LOCK (0).
4. Connect the customer's USB device to a known-good vehicle that equipped with the USB adapter and check the USB device operation.

   Is the USB device working properly?
   YES - Go to Step 5 .
   NO - USB device is faulty. Also check the USB cable and USB adapter connector condition.■
5. On the customer's vehicle, remove the USB adapter.
6. Disconnect USB adapter unit connector B (5P).
7. Check for continuity between the terminals of USB adapter unit connector B (5P) and USB adapter 5P connector according to the table.

USB adapterunit connector	USB adapterconnector
B1	1
B2	2
B3	3
B4	4

   Is there continuity?
   YES - Substitute a known-good USB adapter cable and recheck. If the symptom/indication goes away, replace the original USB adapter cable. If the symptom/indication still present, go to Step 9 .
   NO - Open in the wire(s) between the USB adapter unit and the USB adapter. Replace the affected shielded harness.■
8. Turn the ignition switch to LOCK (0).
9. Remove the audio unit. Check that the audio unit connectors and the USB adapter unit connectors properly connected.

   Is the connectors properly connected?
   YES - Go to Step 10 .
   NO - Connect the connectors and recheck.■
10. Disconnect USB adapter unit connector A (14P).
11. Turn the ignition switch to ON (II).

---

12. Measure the voltage between body ground and USB adapter unit connector A (14P) No. 1 and No. 2 terminals individually.

    Is there battery voltage?
    YES - Go to Step 14 .
    NO - Go to Step 13 .

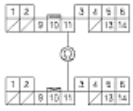
---

13. Measure the voltage between body ground and audio unit connector C (14P) No.1 and No.2 terminals individually.

    Is there battery voltage?
    YES - Repair open or short in the wire(s) between the audio unit and the USB adapter unit.■
    NO - Replace the audio unit.■
14. Turn the ignition switch to LOCK (0).
15. Disconnect audio unit connector C (14P).

---

16. Check for continuity between audio unit connector C (14P) No. 11 terminal and USB adapter unit connector A (14P) No. 11 terminal.



Is there continuity?

YES - Go to Step 17 .

NO - Repair open in the wire between the audio unit and the USB adapter unit.■

---

17. Check for continuity between the terminals of audio unit connector C (14P) according to the table.

From terminal(wire color)	To terminals(wire color)
C3 (GRY)	C9 (YEL), C10 (GRN)
C9 (YEL)	C10 (GRN)

Is there continuity between any of the terminals?

YES - Short in the wires between the audio unit and the USB adapter unit. Replace the affected shielded harness.■

NO - Go to Step 18 .

---

18. Check for continuity between the terminals of audio unit connector C (14P) and USB adapter unit connector A (14P) according to the table.

Audio unit connector	USB adapter unit connector	Wire color
C9	A9	YEL
C10	A10	GRN

Is there continuity?

YES - Substitute a known-good USB adapter unit, then reconnect all of the connectors and recheck. If the symptom/indication goes away, replace the original USB adapter unit. If the symptom/indication is still present, replace the audio unit. ■

NO - Open in the wire(s) between the audio unit and the USB adapter unit. Replace the affected shielded harness.■

Poor AM or FM radio reception or interference

Diagnostic procedure

1. Symptom Troubleshooting

Also check for

- Antenna lead and/or sublead short or open in the wire

Audio unit power switch will not turn on (No information display and no sound)

Diagnostic procedure

1. Symptom Troubleshooting

Audio unit power switch will not turn off

Diagnostic procedure

1. Symptom Troubleshooting

No sound is heard from the speaker(s) (display is normal)

Diagnostic procedure

1. Symptom Troubleshooting

Audio system sound is weak or distorted (display is normal)

Diagnostic procedure

1. Symptom Troubleshooting

Audio unit button illumination does not work

Diagnostic procedure

1. Symptom Troubleshooting

Audio disc does not eject

Diagnostic procedure

1. Symptom Troubleshooting

Volume does not change

Diagnostic procedure

1. Symptom Troubleshooting

Volume does not increase with speed

Diagnostic procedure

1. Symptom Troubleshooting

Volume is too high or too low when driving at freeway speeds

Diagnostic procedure

1. Symptom Troubleshooting

Audio disc does not load

Diagnostic procedure

1. Symptom Troubleshooting

Audio disc does not play

Diagnostic procedure

1. Symptom Troubleshooting

Audio disc skips

Diagnostic procedure

1. Symptom Troubleshooting

Also check for

- Tyre pressure (over-inflated), disc smudged, dirty, or scratched

Audio remote switch does not work properly

Diagnostic procedure

1. Symptom Troubleshooting

Audio unit button does not work

Diagnostic procedure

1. Symptom Troubleshooting

Audio unit disc indicator does not work

Diagnostic procedure

1. Symptom Troubleshooting

USB audio device input sound is low or cannot be heard

Diagnostic procedure

1. Symptom Troubleshooting

Also check for

- Requirement of the USB devices (see Owner's manual)

USB audio device does not work

Diagnostic procedure

1. Symptom Troubleshooting

Also check for

- Requirement of the USB devices (see Owner's manual)

Audio System Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Poor AM or FM radio reception or interference	Symptom Troubleshooting	Antenna lead and/or sublead short or open in the wire
Audio unit power switch will not turn on (No information display and no sound)	Symptom Troubleshooting	
Audio unit power switch will not turn off	Symptom Troubleshooting	
No sound is heard from the speaker(s) (display is normal)	Symptom Troubleshooting	
Audio system sound is weak or distorted (display is normal)	Symptom Troubleshooting	
Audio unit button illumination does not work	Symptom Troubleshooting	
Audio disc does not eject	Symptom Troubleshooting	
Volume does not change	Symptom Troubleshooting	
Volume does not increase with speed	Symptom Troubleshooting	
Volume is too high or too low when driving at freeway speeds	Symptom Troubleshooting	
Audio disc does not load	Symptom Troubleshooting	
Audio disc does not play	Symptom Troubleshooting

Audio unit button does not work	Symptom Troubleshooting	
Audio unit disc indicator does not work	Symptom Troubleshooting	
USB audio device input sound is low or cannot be heard	Symptom Troubleshooting	Requirement of the USB devices (see Owner's manual)
USB audio device does not work	Symptom Troubleshooting	Requirement of the USB devices (see Owner's manual)

Audio System Self-diagnostic Function

Audio Unit Self-diagnostic Mode

1. Turn the ignition switch to ON (II). Make sure turn off the audio unit.
2. Push and hold the preset No. 1 and No. 6 buttons. While holding the buttons, push the power button (A). Release the buttons and the self-diagnostic mode begins.

3. Each time you press the preset button, the diagnostic state is displayed according to the table.

	Button operation	Desired result	Diagnostic procedure
	Pressing the preset No. 2 button	The audio unit (center panel) buttons or audio remote switch name and/or value should be displayed (Except power button)	• Audio unit button does not work. • Audio remote switch does not work properly.
A	Pressing the preset No. 3 button	The all of display segments should become on/go off	If all of display segments does not come on, replace the audio unit.
B	Pressing the preset No. 4 button	When the parking light switch is on, the illumination steps should be changed from − step to 22 step while adjusting the dash brightness control knob	• Audio unit button illumination does not work. • Gauge control module (Lighting)
C	Pressing the preset No. 5 button	When you drive the vehicle, the VSP indicates the vehicle speed in km/h.	Volume does not increase with speed.

4. If the diagnosis result is not matching the desired result, do the affected system troubleshooting.
5. The self-diagnostic mode ends when you turn off the audio unit or turn the ignition switch to LOCK (0).

Speaker Check Mode

1. Turn the ignition switch to ON (II). Make sure turn off the audio unit.
2. Push and hold the preset No. 1 and No. 3 buttons. While holding the buttons, push the power button (A). Release the buttons and the speaker check mode begins. Low-Frequency hum should sound from left front door speaker.
3. Each time you press the or ►►| button, the speaker outputs a beep and test the speakers in the order listed. The volume of beep can de adjusted with the VOL PUSH SELECT knob.

Order of Speakers

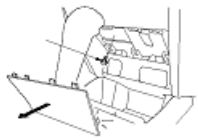
(►►|) is pressed: (1)→(2)→(3)→(4)→(5)
( ) is pressed: (1)→(5)→(4)→(3)→(2)

	Speaker	Displayed Segments
(1)	Left front door speaker	SPKR FR-L
(2)	Right front door speaker	SPKR FR-R
(3)	Right rear door speaker	SPKR RR-R
(4)	Left rear door speaker	SPKR RR-L
(5)	All speakers	SPKR ALL

4. If any speaker(s) fail to sound, go to symptom troubleshooting.
5. The speaker check mode ends when you turn off the audio unit or turn the ignition switch to LOCK (0).

Audio Unit Removal/Installation

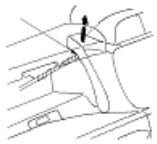
SRS components are located in this area. Review the SRS component location.
Also review the precautions and procedures in the SRS section before doing repairs or service.
NOTE:



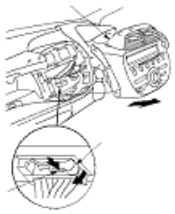
- Put on gloves to protect your hands.
- Take care not to scratch the dashboard and related parts.
- Lay a workshop towel under the parts when working on them to protect the face panel from scratches or other damage.
- Do not work in a dusty or dirty place.
- Discharge static electricity from your body before and during the work.
- Do not touch the circuit board(s) with your bare hands.
- Do not work with dirty hands.
- Be careful not to fold the flat plate cable.
- Eject the CD before remove the audio unit to prevent damaging the CD player's load mechanism.
- If you are replacing the audio unit, write down the audio presets (if possible), and enter them into the new audio unit.

1. If equipped with the anti-theft codes, make sure you have anti-theft codes for the audio system.
2. Remove the center lower cover.
3. Under the audio unit, remove the bolt (A).

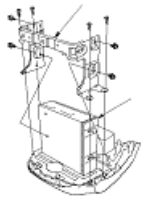
4. Open the dashboard upper tray lid. Insert a flat-tip screwdriver in the groove (A), then pull the screwdriver shaft up slightly.



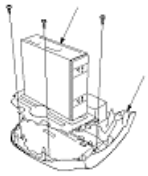
5. Pull the center panel (A) out and disconnect the connectors, then remove the center panel.
   NOTE: When you disconnect audio unit connector A, while pushing the tab (B), pull the lever (C) up and disconnect the connector.
6. With USB adapter, remove the USB adapter unit.



7. Remove the mounting screws and bolts from the audio unit (A), then remove the bracket (B).

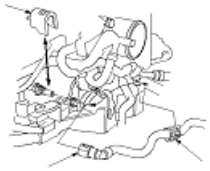


8. Remove the screws and the audio unit (A) from the center panel (B).
9. Install the audio unit in the reverse order of removal, and note these items:
   - Make sure all connectors are secure.
   - If needed, enter the anti-theft codes for the audio system.
   - Set the clock.



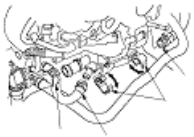
Cylinder Head Removal

NOTE:



- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.
- To avoid damaging the cylinder head, wait until the engine coolant temperature drops below 38 °C (100 °F) before loosening the cylinder head bolts.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

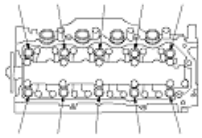
1. Relieve fuel pressure.
2. Drain the engine coolant.
3. Do the battery removal procedure.
4. Remove the air cleaner housing assembly.
5. Remove the fuel feed hose clamp (A) and the quick-connect fitting cover (B), then disconnect the fuel feed hose (C).



6. Disconnect the upper radiator hose (A), the heater hose (B), and the water bypass hose (C).
7. Remove the heater hose from the clamps (D).
8. Remove the intake manifold/chamber assembly.
9. Remove the warm up three way catalytic converter (WU-TWC).
10. Remove the following engine wire harness connectors and wire harness clamps from the cylinder head:
    - Four injector connector
    - Engine coolant temperature (ECT) sensor 1 connector
    - Camshaft position (CMP) sensor connector
    - Secondary heated oxygen sensor (secondary HO2S) connector
    - Rocker arm oil control solenoid connector

11. Remove the harness holder.

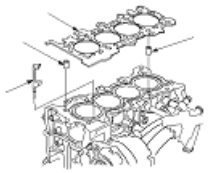
12. Remove the harness holder mounting bolt (A) and the ground cable (B), then remove the harness holder (C) from the bracket.
13. Remove the cylinder head cover.
14. Remove the cam chain.



15. Remove the cylinder head bolts. To prevent warpage, loosen the bolts in sequence 1/3 turn at a time; repeat the sequence until all bolts are loosened.
16. Remove the cylinder head.

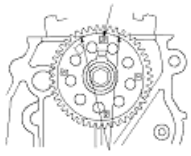
Cylinder Head Installation

1. Clean the cylinder head and the block surface.
2. Install a new coolant separator (A) in the engine block whenever the engine block is replaced.
3. Install the new cylinder head gasket (B) and the dowel pins (C) on the engine block. Always use a new cylinder head gasket.

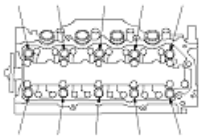


4. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the oil pump.

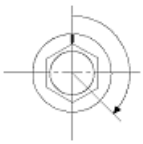
5. Set the camshaft TDC. The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.
6. Install the cylinder head on the engine block.
7. Apply new engine oil to the threads and under the bolt heads of all cylinder head bolts.



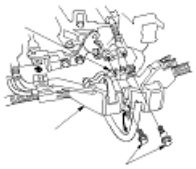
8. Tighten the cylinder head bolts in sequence to 29 N·m (3.0 kgf·m, 22 lbf·ft). Using a beam-type torque wrench. When using a preset-type torque wrench, be sure to tighten slowly and do not overtighten. If a bolt makes any noise while you are torquing it, loosen the bolt and retighten it from the first step.



9. Tighten all cylinder head bolts an additional 130 °
10. Install the cam chain.
11. Install the cylinder head cover.

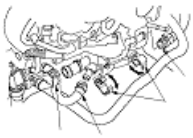


12. Install the harness holder (A), then install the ground cable (B).

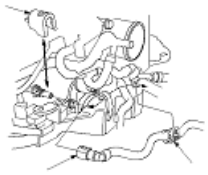


13. Install the harness holder.
14. Connect the engine wire harness connectors, and install the wire harness clamps to the cylinder head.
    - Four injector connector
    - Engine coolant temperature (ECT) sensor 1 connector
    - Camshaft position (CMP) sensor connector
    - Secondary heated oxygen sensor (secondary HO2S) connector
    - Rocker arm oil control solenoid connector
15. Install the warm up three way catalytic converter (WU-TWC).
16. Install the intake manifold/chamber assembly.

17. Install the upper radiator hose (A), the heater hose (B), and the water bypass hose (C).
18. Install the heater hose to the clamps (D).

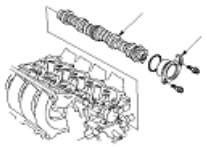


19. Connect the fuel feed hose (A), then install the quick-connect fitting cover (B) and the fuel feed hose clamp (C).



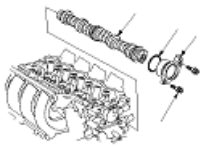
20. Install the air cleaner housing assembly.
21. Do the battery installation procedure.
22. Inspect for fuel leaks. Turn the ignition switch to ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation three times, then check for fuel leakage at any point in the fuel line.
23. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open.
24. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.
25. Inspect the idle speed.
26. Inspect the ignition timing.

Camshaft Removal



1. Remove the air cleaner housing assembly.
2. Remove the intake manifold chamber.
3. Remove the following engine wire harness connectors and wire harness clamps from the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - Camshaft position (CMP) sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
4. Remove the harness holder mounting bolt and the ground cable, then remove the harness holder from the bracket.
5. Remove the camshaft sprocket.
6. Remove the rocker arm assembly.
7. Remove the CMP sensor.
8. Remove the camshaft thrust cover (A), then remove the camshaft (B).

Camshaft Installation



1. Install the camshaft (A), then install the camshaft thrust cover (B) with new O-ring (C).
2. Install the camshaft position (CMP) sensor.
3. Install the rocker arm assembly.
4. Install the camshaft sprocket.
5. Install the harness holder, then install the ground cable.
6. Install the following engine wire harness connectors and wire harness clamps to the cylinder head:
   - Four injector connector
   - Engine coolant temperature (ECT) sensor 1 connector
   - CMP sensor connector
   - Air fuel ratio (A/F) sensor connector
   - Secondary heated oxygen sensor (secondary HO2S) connector
7. Install the intake manifold chamber.
8. Install the air cleaner housing assembly.

VTEC System Oil Pressure Troubleshooting

Special Tools Required

Oil pressure gauge joint attachment
07NAJ-P070100

Low pressure gauge assy. 1,000 kPa
07406-0070002

Oil pressure hose
07ZAJ-S5A0200

NOTE:

- Check for Temporary DTCs or DTCs with the HDS before this procedure. If there are any DTCs indicated, troubleshoot them first, then do this procedure.
- Check that the oil pressure indicator goes off after starting engine before this procedure.

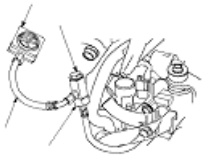
1. Turn the ignition switch to ON (II).
2. Do the VTEC TEST in the INSPECTION MENU with the HDS.

   Can you hear the rocker arm oil control solenoid click?
   YES - Go to Step 6 .
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the rocker arm oil control solenoid 2P connector.
5. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.

   Is the rocker arm oil control solenoid clicking?
   YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
   NO - Go to Step 22 .
6. Turn the ignition switch to LOCK (0).

---

7. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt (A) that was removed to the oil pressure gauge joint attachment.



8. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on.
9. Check the oil pressure at the engine speed of 1,000 to 2,000 rpm (min $^{-1}$).
   NOTE: Keep the measuring time as short as possible (less than 1 minute).

   Is the oil pressure below 49 kPa (0.5 kgf/cm ^{2} , 7 psi)?
   YES - Go to Step 10 .
   NO - Go to Step 22 .
10. Turn the ignition switch to LOCK (0).
11. Disconnect the rocker arm oil control solenoid 2P connector.

---

12. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
13. Start the engine.

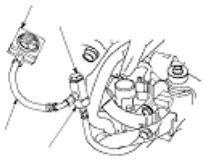
14. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2} , 56.9 psi)?
    YES - The VTEC system oil pressure is normal.■
    NO - Go to Step 15 .
15. Turn the ignition switch to LOCK (0).
16. Remove the rocker arm oil control valve.
17. Check the rocker arm oil control solenoid filter for dirt and clogging.

    Is the rocker arm oil control solenoid filter dirty or clogged?
    YES - Replace the engine oil, engine oil filter, and the rocker arm oil control solenoid filter, then go to Step 18 .
    NO - Go to Step 22 .

---

18. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt that was removed to the oil pressure gauge joint attachment.

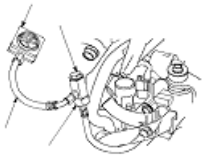


19. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
20. Start the engine.

21. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2}, 56.9 psi)?
    YES - Troubleshooting is complete.■
    NO - Go to Step 22 .
22. Replace the rocker arm oil control valve.

23. Remove the bolt (A) from the rocker arm oil control valve and connect the special tool as shown, the install the bolt that was removed to the oil pressure gauge joint attachment.



24. Connect the battery positive terminal (+) to terminal No. 1, and the negative terminal (−) with a wire.
25. Start the engine.

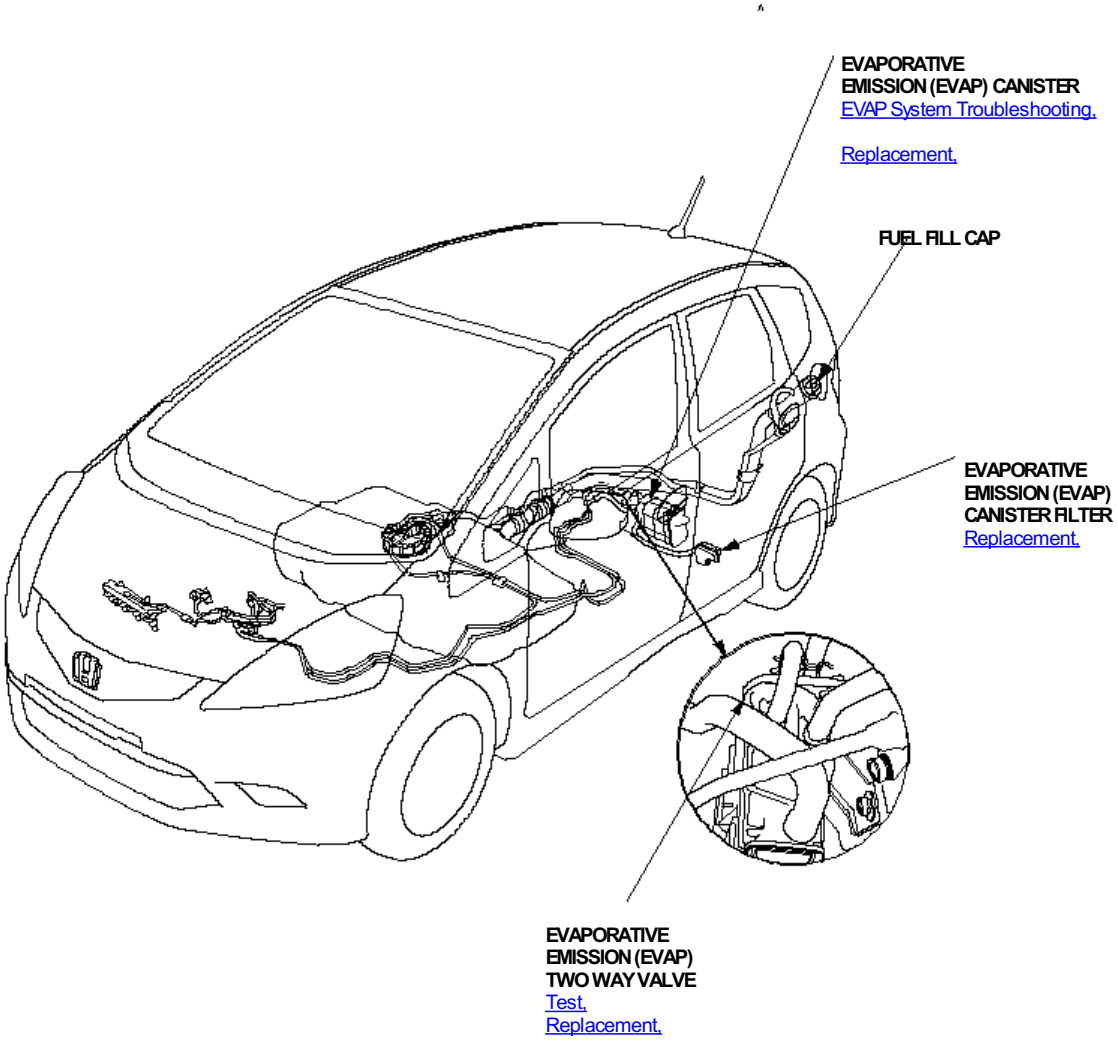
26. Check the oil pressure at the engine speed of 3,500 rpm (min $^{-1}$).
    NOTE: Keep the measuring time as short as possible (less than 1 minute).

    Is the oil pressure above 392 kPa (4.0 kgf/cm ^{2}, 56.9 psi)?
    YES - Troubleshooting is complete.■
    NO - Clean the oil passage of the cylinder block or replace the cylinder block.■

Fuel and Emissions System Description - EVAP Control Diagram

Evaporative Emission (EVAP) Control Diagram

EVAP System Component Location Index



EVAP System Troubleshooting

Special Tools Required

Combination gauge kit 20/−100 kPa
07YAJ-0010610

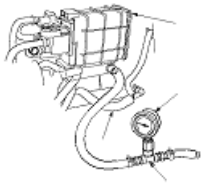
Tube joint adapter
07410-5790503

RHD model

1. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) and connect a vacuum pump/gauge (C) to the hose.
2. Start the engine, and let it idle.
   NOTE: Engine coolant temperature must be below 60 °C (140 °F).

   Is there vacuum?
   YES - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve.■
   NO - Go to Step 3 .
3. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then hold the engine speed to 3,000 rpm (min $^{-1}$).

   Is there vacuum?
   YES - Go to Step 4 .
   NO - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve. ■
4. Turn the ignition switch to LOCK (0).
5. Reconnect the vacuum hose to the EVAP canister purge valve.
6. Remove the fuel fill cap.
7. Remove the air cleaner.



8. Disconnect the drain tube joint (A) from the EVAP canister and connect the combination gauge kit and tube joint adapter to EVAP canister (B).
9. Install the air cleaner.
10. Start the engine and raise speed to 3,000 rpm (min $^{-1}$).

    Does vacuum appear on gauge within 1 minute?
    YES - See EVAP two way valve test to complete. Evaporative emission controls are OK.■
    NO - Replace the EVAP canister. ■

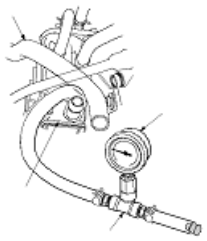
LHD model

1. Disconnect the vacuum hose (A) from the EVAP canister purge valve (B) and connect a vacuum pump/gauge (C) to the hose.
2. Start the engine, and let it idle.
   NOTE: Engine coolant temperature must be below 60 °C (140 °F).

   Is there vacuum?
   YES - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve.■
   NO - Go to Step 3 .
3. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in N or P, M/T in neutral) until the radiator fan comes on, then hold the engine speed to 3,000 rpm (min $^{-1}$).

   Is there vacuum?
   YES - Go to Step 4 .
   NO - Inspect vacuum hose routing. If OK, replace the EVAP canister purge valve. ■
4. Turn the ignition switch to LOCK (0).
5. Reconnect the vacuum hose to the EVAP canister purge valve.
6. Remove the fuel fill cap.
7. Lift the vehicle, and support it with jackstands.

8. Disconnect drain tube (A) from the EVAP canister and connect the combination gauge kit and tube joint adapter to EVAP canister (B).



9. Lower the vehicle.
10. Start the engine and raise speed to 3,000 rpm (min $^{-1}$).

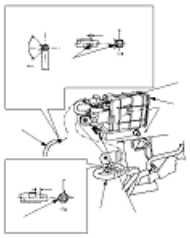
Does vacuum appear on gauge within 1 minute?

YES - See EVAP two way valve test to complete. Evaporative emission controls are OK.■

NO - Replace the EVAP canister. ■

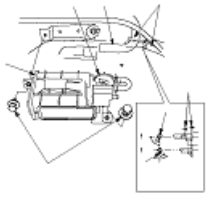
EVAP Canister Replacement

RHD model



1. Remove the air cleaner.
2. Disconnect the hoses (A).
3. Remove the EVAP canister (B).
4. Remove the EVAP two way valve (C) from the EVAP canister.
5. Install the parts in the reverse order of removal.
   NOTE: Align the marks (D) on the hose as shown, then insert the hose. Make sure the clamp is positioned as shown.

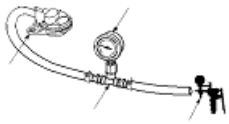
LHD model



1. Lift the vehicle, and support it with jackstands.
2. Disconnect the hoses (A) and tube (B).
3. Remove the EVAP canister (C).
4. Remove the EVAP two way valve (D) from the EVAP canister.
5. Install the parts in the reverse order of removal.
   NOTE: Align the marks (E) on the hose as shown, then insert the hose. Make sure the clamp is positioned as shown.

EVAP Two Way Valve Test

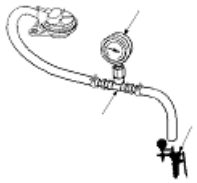
Special Tools Required



Combination gauge kit 20/−100 kPa
07YAJ-0010610

Tube joint adapter
07410-5790503

1. Remove the fuel fill cap.
2. Remove the EVAP two way valve.
3. Disconnect the vapor line from the EVAP two way valve (A). Connect it to the combination gauge kit and tube joint adapter and the vacuum pump (B) as shown.
4. Apply vacuum slowly and continuously while watching the gauge. The valve should open below 1.33 kPa (1.0 mmHg, 0.04 in.Hg).
   - If the vacuum hold below 1.33 kPa (1.0 mmHg, 0.04 in.Hg), go to Step 5 .
   - If the vacuum doesn't hold, replace the EVAP two way valve.



5. Move the vacuum pump from the vacuum fitting to the pressure fitting (A) as shown.
6. Slowly pressurize the vapor line while watching the gauge. The valve should open above 5.07 kPa (38 mmHg, 1.5 in.Hg).
   - If the pressure hold below 5.07 kPa (38 mmHg, 1.5 in.Hg), the valve is OK.
   - If the pressure doesn't hold, replace the EVAP two way valve.

EVAP Two Way Valve Replacement

1. Remove the EVAP canister.
2. Disconnect the hose (A).
3. Remove the EVAP two way valve (B).
4. Install the parts in the reverse order of removal.

RHD model

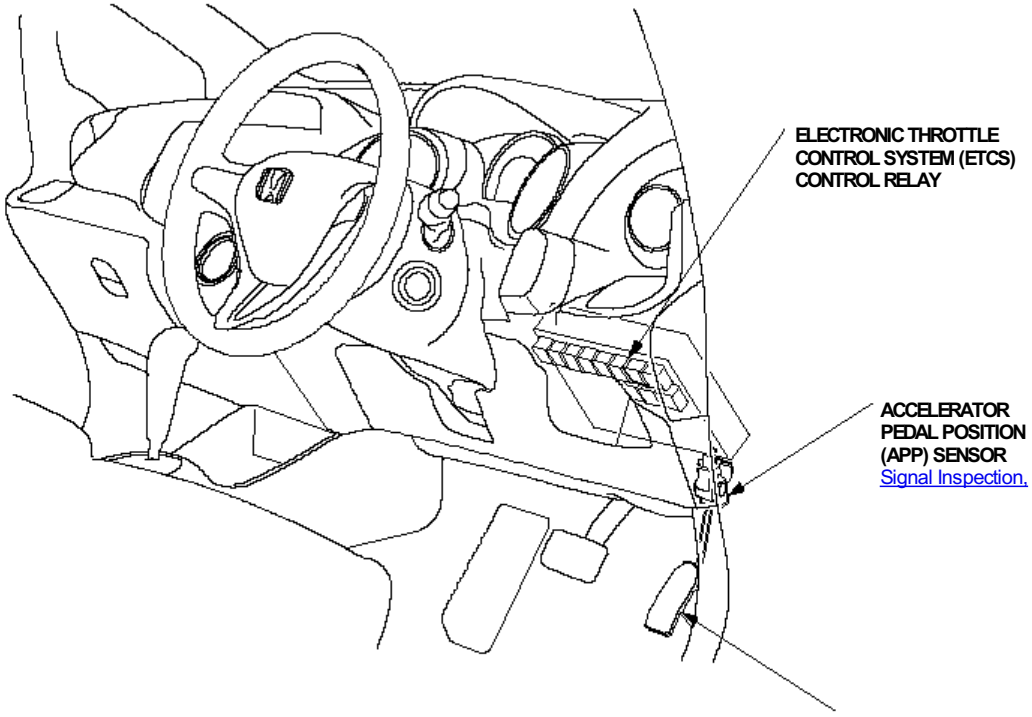
Electronic Throttle Control System Component Location Index



*: This illustration shows RHD model.

APP Sensor Signal Inspection

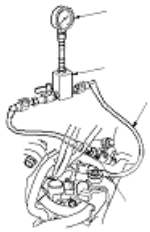
NOTE:

- This procedure checks the APP sensor in this fully closed position. In any other position, the APP sensor stores DTCs which are covered in other troubleshooting procedures.
- Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.
- Press the accelerator pedal several times to check its operation. If it does not operate smoothly, check the pedal. If you find a problem, replace the accelerator pedal module.

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then go to Step 5 .
5. Make sure the accelerator pedal is not pressed, then check the APP SENSOR in the DATA LIST with the HDS.
   - If it is 0 %, the APP sensor is OK.
   - If it is not 0 %, replace the accelerator pedal module, then go to Step 1 .

Fuel Pressure Test

Special Tools Required



Fuel gauge assy. 600 kPa
07406-0040004

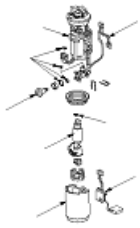
Fuel pressure gauge attachment set
07ZAJ-S5A0101

Fuel attachment C hose
07ZAJ-S7C0100

Fuel attachment C joint
07ZAJ-S7C0200

1. Relieve the fuel pressure.
2. Disconnect the quick-connect fitting. Attach the fuel pressure gauge set and the fuel gauge assy.
3. Start the engine, and let it idle.
   - If the engine starts, go to Step 5 .
   - If the engine does not start, go to Step 4 .
4. Check to see if the fuel pump is running: Listen to the fuel filler port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is first turned on.
   - If the pump runs, go to Step 5 .
   - If the pump does not run, do the fuel pump circuit troubleshooting.
5. Read the fuel pressure gauge. The pressure should be 320−370 kPa (3.3−3.8 kgf/cm ^{2} , 47−54 psi).
   - If the pressure is OK, the test is complete.
   - If the pressure is out of specification, replace the fuel pressure regulator and the fuel filter, then recheck the fuel pressure.

Fuel Filter Replacement

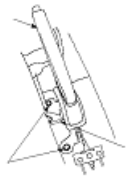


The fuel filter should be replaced whenever the fuel pressure drops below the specified value, after making sure that the fuel pump and the fuel pressure regulator are OK.

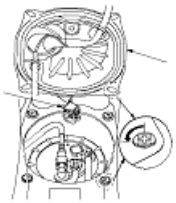
1. Remove the fuel tank unit.
2. Remove the fuel gauge sending unit (A), and the reservoir (B).
3. Remove the fuel pressure regulator (C), the fuel pump (D), and the wire harness (E) from the fuel filter set (F).
4. Check these items before installing the fuel tank unit:
   - When connecting the wire harness, make sure the connection is secure and the connectors are firmly locked into place.
   - When installing the fuel gauge sending unit, make sure the connection is secure and the connector is firmly locked into place. Be careful not to bend or twist it excessively.
5. Install the parts in the reverse order of removal with new O-rings (G). When installing the fuel tank unit, align the marks on the unit and the fuel tank.
   NOTE:
   - Coat the O-rings with clean engine oil; do not use any other oil or fluid.
   - Do not pinch the O-rings during installation.
   - Use all the new parts supplied in the fuel filter replacement kit.

Fuel Gauge Sending Unit Test

NOTE: For the fuel gauge system circuit diagram, refer to the Gauges Circuit Diagram.

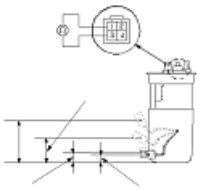


1. Check the No. 22 METER (7.5 A) fuse in the under-dash fuse/relay box before testing.
2. Check for body electrical system DTCs.
   - If no problem is found, go to Step 3 .
   - If DTC B1175 or B1176 is indicated, go to the indicated DTC's troubleshooting.
3. Turn the ignition switch to LOCK (0).
4. Remove the center console.
5. Remove the bolts (A), the wire (B), then remove the parking brake lever (C).



6. Remove the access panel (A) from the floor.
7. Disconnect the fuel tank unit 4P connector (B).

8. Measure the voltage between fuel tank unit 4P connector terminals No. 1 and No. 3 with the ignition switch to ON (II). There should be battery voltage.
   - If the voltage is OK, go to Step 9 .
   - If the voltage is not as specified, check for:
     - a short in the LT GRN wire to ground.
     - an open in the LT GRN or BLK wire.
9. Turn the ignition switch to LOCK (0).
10. Remove the fuel tank unit from the fuel tank.



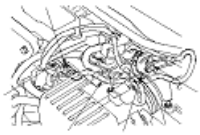
11. Measure the resistance between fuel tank unit 4P connector terminals No. 1 and No. 3 with the float at E (EMPTY), LOW (LOW FUEL INDICATOR), 1/2 (HALF FULL), and F (FULL) positions.
    If you do not get the following readings, replace the fuel gauge sending unit.

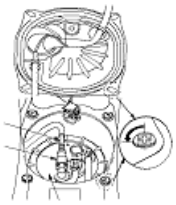
Float Position	F 109.5 mm (4.3 in.)	1/2 61 mm (2.4 in.)	LOW 24.7 mm (1.0 in.)	E 16 mm (0.6 in.)
Resistance (Ω)	19 to 21	203.3 to 213.3	529.8 to 714.1	772 to 788

12. Reconnect the fuel tank unit 4P connector.
13. Remove the No. 1 BACK UP (7.5 A) fuse from the under-dash fuse/relay box for at least 10 seconds, then reinstall it.
14. Turn the ignition switch to ON (II).
15. Check that the pointer of the fuel gauge indicates “F" with the float at F.
    - If the pointer of the fuel gauge does not indicate “F", replace the gauge assembly.
    - If the gauge is OK, the test is complete.

    NOTE:
    - The pointer of the fuel gauge returns to the bottom of the gauge dial when the ignition switch is to LOCK (0), regardless of the fuel level.
    - Remove the No. 1 BACK UP (7.5 A) fuse from the under-dash fuse/relay box for at least 10 seconds after completing troubleshooting, otherwise it may take up to 20 minutes for the fuel gauge to indicate the correct fuel level.

Fuel Line/Quick-Connect Fitting Precautions





The fuel line/quick-connect fittings (A), (B), (C) connect the fuel rail (D) to fuel feed hose (E), the fuel feed hose to the fuel line (F), and the fuel line (G) to the fuel tank unit (H). When removing or installing the fuel feed hose, fuel tank unit, or fuel tank, it is necessary to disconnect or connect the quick-connect fittings.
Pay attention to the following:

- The fuel feed hose, fuel line and quick-connect fittings are not heat-resistant; be careful not to damage them during welding or other heat-generating procedures.
- The fuel feed hose, fuel line and quick-connect fittings are not acid-proof; do not touch them with a shop towel which was used for wiping battery electrolyte. Replace them if they came into contact with electrolyte or something similar.
- When connecting or disconnecting the fuel feed hose, fuel line and quick-connect fittings, be careful not to bend or twist them excessively. Replace them it damaged.

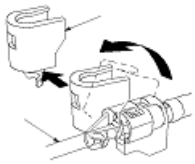
A disconnected quick-connect fitting can be reconnected, but the retainer on the mating line cannot be reused once it has been removed from the line. Replace the retainer when:

- replacing the fuel rail.
- replacing the fuel line.
- replacing the fuel pump.
- replacing the fuel filter.
- replacing the fuel tank.
- it has been removed from the pipe.
- it is damaged.

Location	Manufacturer	Retainer color	Piping diameter
A	Tokai	Blue green	8 mm (0.3 in.)
B	Tokai	Green	6.3 mm (0.3 in.)
C	Sanoh	White	9.5 mm (0.4 in.)

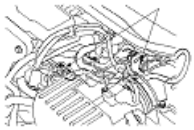
Fuel Line/Quick-Connect Fitting Removal

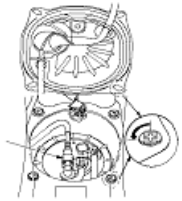
NOTE: Before you work on the fuel lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions".



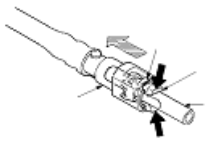
1. If equipped, remove the quick-connect fitting cover from the fuel line. Raise the cover (A) the fuel line (B), and remove it as shown.
2. Relieve the fuel pressure.

3. Check the fuel quick-connect fittings (A) for dirt, and clean them if needed.

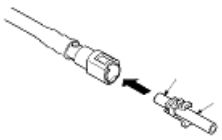




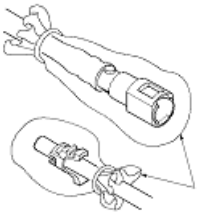
4. Place a rag or shop towel over the quick-connect fitting. Hold the connector (A) with one hand, and squeeze the retainer tabs (B) with the other hand to release them from the locking tabs (C). Pull the connector off.
   NOTE:
   - Be careful not to damage the line (D) or other parts. Do not use tools.
   - If the connector does not move, keep the retainer tabs pressed down, and alternately pull and push the connector until it comes off easily.
   - Do not remove the retainer from the line; once removed, the retainer must be replaced with a new one.



5. Check the contact area (A) of the line (B) for dirt or damage.
   - If it is dirty, clean the connector with a pressure washer, and dry it with the compressed air.
   - If it is rusty or damaged, replace the fuel filter or the fuel feed line.



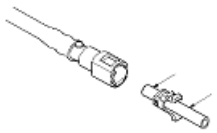
6. To prevent damage and keep foreign matter out, cover the disconnected connector and line ends with plastic bags (A).
   NOTE: The retainer cannot be reused once it has been removed from the line.
   Replace the retainer when:
   - replacing the fuel rail.
   - replacing the fuel line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel tank.
   - it has been removed from the line.
   - it is damaged.



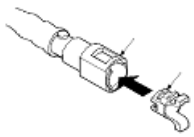
Fuel Line/Quick-Connect Fitting Installation

NOTE: Before you work on fuel lines and fittings, read the "Fuel Line/Quick-Connect Fitting Precautions".

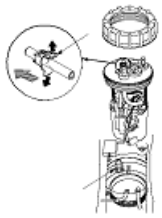
1. Check the contact area (A) of the line (B) for dirt or damage, and clean it if needed.



2. Insert a new retainer (A) into the connector (B) if the retainer is damaged, or after:
   - replacing the fuel rail.
   - replacing the fuel line.
   - replacing the fuel pump.
   - replacing the fuel filter.
   - replacing the fuel tank.
   - removing the retainer from the line.
   - Use the same manufacturer retainer and the same size retainer when replacing the retainer.

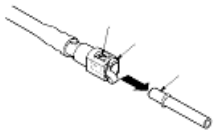


3. Before connecting a new fuel tube/quick-connect fitting assembly (A), remove the old retainer (B) from the mating line.
   NOTE:
   - When replacing the fuel tube/quick-connect fitting assembly at the engine compartment, remove the air cleaner, and the cover (C).
   - When installing the fuel tube/quick-connect fitting assembly at the engine compartment, align the mark (D) on the fuel tube.

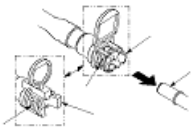


4. Align the quick-connect fittings with the line (A), and align the retainer locking tabs (B) with the connector grooves (C). Then press the quick-connect fittings onto the line until both retainer tabs lock with a clicking sound.
   NOTE: If it is hard to connect, put a small amount of new engine oil on the line end.

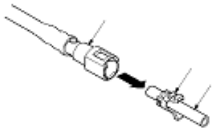
Connection with new retainer



Connection to new fuel line

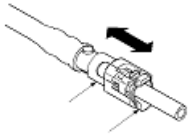


Reconnection to existing retainer

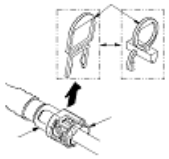


5. When you reconnect the connector with the old retainer, make sure the connection is secure and the tabs (A) are firmly locked into place; check visually and also by pulling the connector (B). When you replace the fuel line with a new one, make sure you remove the ring pull (C) upwards after you confirm the connection is secure.
   NOTE: Before you remove the ring pull, make sure the fuel line connection is secure. If the connection is not secure, the ring pull could break when you try to remove it.
6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) (but do not operate the starter motor). The fuel pump will run for about 2 seconds, and fuel pressure will rise. Repeat two or three times, and check that there is no leakage in the fuel supply system.

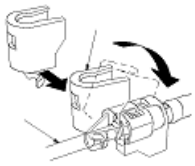
Reconnection to existing retainer



Connection to new fuel line

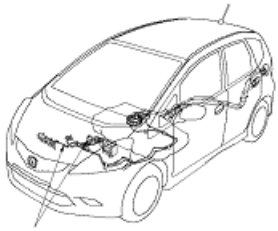


7. If equipped, install the quick-connect fitting cover. Set the groove of the cover (A) on the fuel line (B) as shown, then install it. Make sure the cover is firmly locked in place.

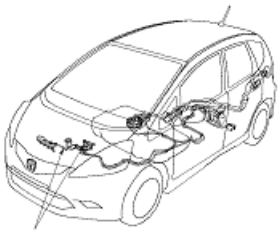


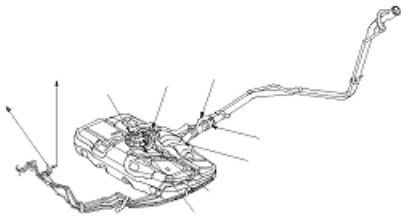
Fuel Line Inspection

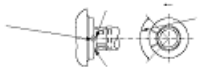
RHD model



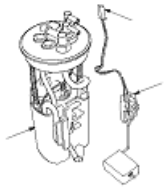
LHD model







Fuel Pump/Fuel Gauge Sending Unit Replacement



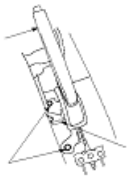
1. Remove the fuel tank unit.
2. Remove the fuel level sensor (fuel sending unit) (A) from the fuel tank unit (B).
3. Check these items before installing the fuel tank unit:
   - When connecting the wire harness, make sure the connection is secure and the connector (C) is firmly locked into place.
   - When installing the fuel gauge sending unit, make sure the connection is secure. Be careful not to bend or twist it excessively.
4. Install the parts in the reverse order of removal. When installing the fuel tank unit, align the marks on the unit and the fuel tank.

Fuel Tank Draining

1. Remove the fuel tank unit.
2. Using a hand pump, a hose, and a container suitable for fuel, draw the fuel from the fuel tank.
3. Reinstall the fuel tank unit.

Fuel Tank Unit Removal and Installation

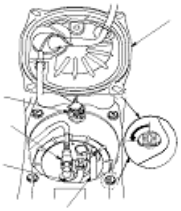
Special Tools Required



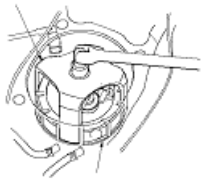
Fuel sender wrench
07AAA-S0XA100

Removal

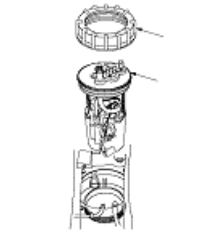
1. Relieve the fuel pressure.
2. Remove the center console.
3. Remove the bolts (A), the wire harness (B), the remove the parking brake lever (C).



4. Remove the access panel (A) from the floor.
5. Disconnect the fuel tank unit 4P connector (B).
6. Disconnect the suction hose (C), the fuel vapor hose (D), the quick-connect fitting (E) from the fuel tank unit.

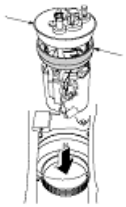


7. Using the special tool, loosen the locknut (A).

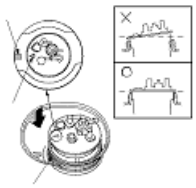


8. Remove the locknut (A) and the fuel tank unit (B).

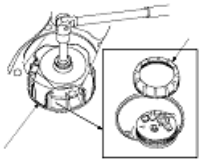
Installation



1. Temporarily attach a new base gasket (A) to the fuel tank unit (B), then insert the fuel tank unit partially into the fuel tank.
   NOTE:
   - Be careful not to damage the new base gasket.
   - Be careful not to bend the fuel gauge sending unit.
   - Do not coat the base gasket with oil.



2. Transfer the base gasket (A) from the fuel tank unit to the fuel tank.
3. Align the marks (B) on the fuel tank and fuel tank unit, then insert the fuel tank unit into the fuel tank until the fuel tank unit rests on top of the base gasket.
   NOTE: To avoid a fuel leak, check the base gasket, visually or by hand, to make sure it is not pinched.

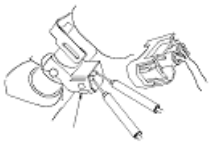


4. Using the special tool, tighten a new locknut (A) to the specified torque.
   NOTE:
   - After tightening, make sure the marks are still aligned.
   - After installation, check the base gasket, visually or by hand, to make sure it is not pinched.
5. Connect the fuel tank unit 4P connector, then connect the quick-connect fitting, the suction hose, and the fuel vapor hose.
6. Reconnect the negative cable to the battery, and turn the ignition switch to ON (II) (but do not operate the starter motor). The fuel pump will run for about 2 seconds, and fuel pressure rises. Repeat this two or three times, then check that there is no leakage in the fuel supply system.
7. Install the access panel, the parking brake lever, and the center console.

Injector Test

NOTE: Check the following items before testing; idle speed, ignition timing, and idle CO%.

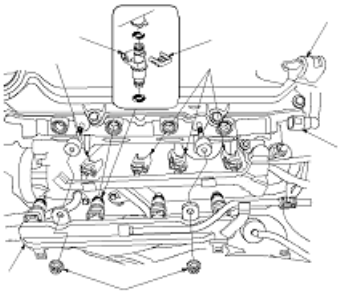
1. Try to start the engine.
   - If the engine starts, go to Step 2 .
   - If the engine does not start, go to Step 8 .
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Select ONE INJECTOR in INSPECTION MENU with the HDS.
5. Disable each injector at a time by selecting number of an injector which you want to step.
6. Inspect the change in the idle speed.
   - If the idle speed drop is almost the same for each cylinder, the fuel injectors are normal.
   - If the idle speed or quality remains the same when you disconnect a particular injector, faulty injector is suspected. Replace the injector and retest.
7. Check the clicking sound of each injector by means of a stethoscope when the engine is idling.
   - If any fuel injector fails to make the typical clicking sound, check the sound again after replacing the injector.
   - If clicking sound is still absent, check the following.
     - Whether there is wire breakage or poor connection in the YEL/BLK wire between the PGM-FI main relay 1 and the junction connector.
     - Whether the junction connector is open or corroded.
     - Whether there is wire breakage or poor connection in the YEL/BLK wire between the junction connector and the injector.
     - Whether there is any short-circuiting, wire breakage or poor connection in the wire between the injector and the ECM/PCM.
   - If all is OK, the test is complete.
8. Turn the ignition switch to LOCK (0).
9. Remove the intake manifold.
10. Disconnect the injector connector.



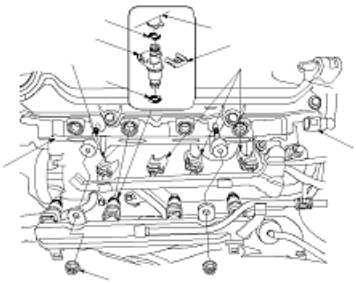
11. Measure the resistance between injector (A) terminals No. 1 and No. 2. There should be 10−13 Ω.
    - If the resistance is OK, go to Step 12 .
    - If the resistance is not as specified, replace the injector.
12. Check the fuel pressure.
    - If the fuel pressure is as specified, check the following:
      - Whether there is wire breakage, or poor connection in the YEL/BLK wire between the PGM-FI main relay 1 and the junction connector.
      - Whether the junction connector is open or corroded.
      - Whether there is wire breakage, or poor connection in the YEL/BLK wire between the junction connector and the injector.
      - Whether there is any short-circuiting, wire breakage or poor connection in the wire between the injector and the ECM/PCM.
    - If the fuel pressure is not as specified, recheck the fuel pressure.

Injector Replacement

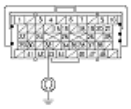
1. Relieve the fuel pressure.
2. Remove the intake manifold, and intake manifold chamber.
3. Remove the cover (A), then disconnect the quick-connect fitting (B).
4. Disconnect the injector connectors (C).
5. Remove the fuel rail mounting nuts (D) from the fuel rail (E).
6. Remove the fuel rail and the injectors from the cylinder head.
7. Remove the injector clips (F) from the fuel rail.
8. Remove the injectors (G) from the fuel rail.



9. Coat the new O-rings (black) (A) with clean engine oil, and insert the injectors (B) into the fuel rail (C).
10. Install the injector clips (D).
11. Coat the new injector O-rings (brown) (E) with clean engine oil.
12. Install the fuel rail and the injectors in the cylinder head (F).
13. Install the fuel rail mounting nuts (G).
14. Connect the injector connectors (H).
15. Connect the quick-connect fitting (I).
16. Turn the ignition switch to ON (II), but do not operate the starter. After the fuel pump runs for about 2 seconds, the fuel rail will be pressurized. Repeat this two or three times, then check for fuel leakage.
17. Reinstall the intake manifold, and intake manifold chamber.



MIL Circuit Troubleshooting



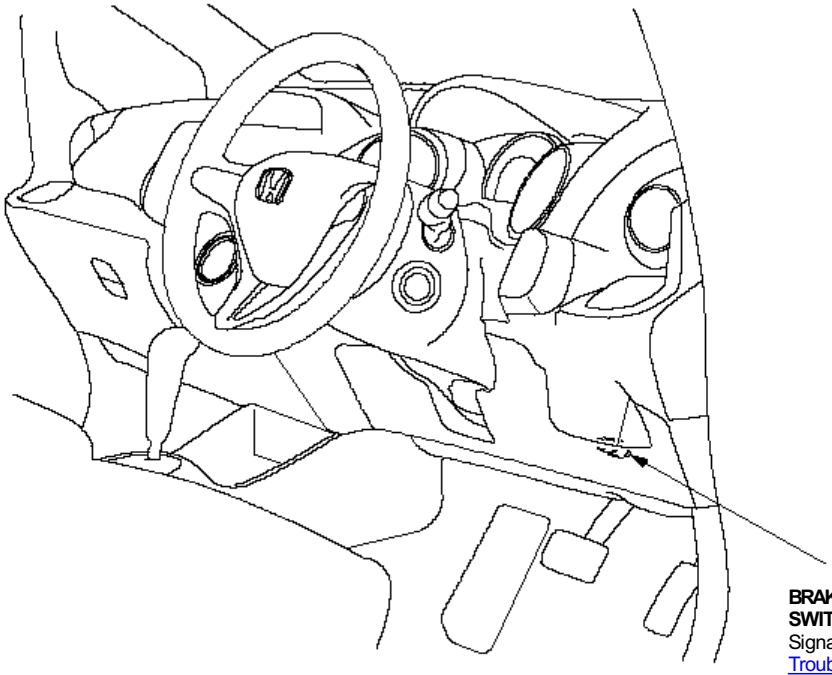
1. Turn the ignition switch to ON (II).
2. Do the gauge self-diagnostic function.

   Does the MIL indicator flash?
   YES - Go to Step 3 .
   NO - Substitute a known-good gauge control module, and recheck. If the symptom/indication goes away with a known-good gauge control module, replace the original gauge control module. ■
3. Connect the HDS to the DLC.
4. Check the SCS in the DATA LIST with the HDS.

   Is a short indicated?
   YES - Go to Step 5 .
   NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
5. Turn the ignition switch to LOCK (0).
6. Disconnect ECM/PCM connector A (49P), then disconnect the HDS.
7. Check for continuity between ECM/PCM connector terminal A32 and body ground.

   Is there continuity?
   YES - Repair short in the wire between the ECM/PCM (A32) and the DLC.■
   NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

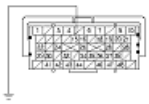
Idle Control System Component Location Index



BRAKE PEDAL POSITION SWITCH
Signal Circuit
Troubleshooting,

*: This illustration shows RHD model.
*: This illustration shows RHD model.

A/C Signal Circuit Troubleshooting



1. Start the engine, and let it idle.
2. Turn the blower switch on.
3. Turn the A/C switch on.
4. Check the A/C CLUTCH in the DATA LIST with the HDS.

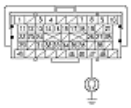
   Does it indicate ON?
   YES - Go to Step 5 .
   NO - Do the A/C system test. ■
5. Check the A/C system.

   Does the A/C system operate?
   YES - The air conditioning system circuit is OK.■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Turn the ignition switch to ON (II).
8. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   Is there a clicking noise from the A/C compressor clutch?
   YES - Do the A/C system test. ■
   NO - Go to Step 9 .
9. Turn the ignition switch to LOCK (0).
10. Jump the SCS line with the HDS.
11. Disconnect ECM/PCM connector A (49P).
12. Turn the ignition switch to ON (II).
13. Momentarily connect ECM/PCM connector terminal A15 to body ground with a jumper wire several times.

    Is there a clicking noise from the A/C compressor clutch?
    YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
    NO - Check for poor connections or loose terminals at the A/C compressor clutch relay and the ECM/PCM. If the connections are OK, check the A/C compressor clutch relay, repair open in the wire between the ECM/PCM (A15) and the A/C compressor clutch relay and the other A/C systems.■

Alternator FR Signal Circuit Troubleshooting



1. Start the engine, and let it idle.
2. Monitor the ALTERNATOR in the DATA LIST with the HDS.
3. Check if the indicated percentage varies when the headlight switch is turned on.

   Does the percentage vary?
   YES - The alternator signal circuit is OK.■
   NO - Go to Step 4 .
4. Turn the headlight switch off and the ignition switch to LOCK (0).
5. Jump the SCS line with the HDS.
6. Disconnect the alternator 4P connector.
7. Disconnect ECM/PCM connector B (49P).
8. Check for continuity between body ground and ECM/PCM connector terminal B47.

   Is there continuity?
   YES - Repair short in the wire between the ECM/PCM (B47) and the alternator.■
   NO -
   - Troubleshoot the alternator and regulator circuit. ■
   - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

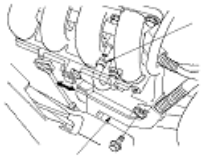
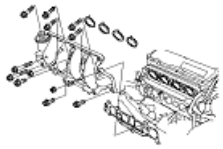
[Exploded View]



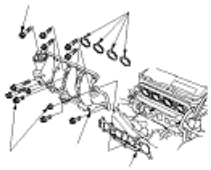
Removal

1. Remove the harness holder mounting bolt, then remove the harness holder (A) from the bracket.
2. Remove the positive crankcase ventilation (PCV) hose (B).
3. Disconnect the exhaust gas recirculation (EGR) valve connector.
4. Remove the dipstick.

5. Remove the intake manifold.

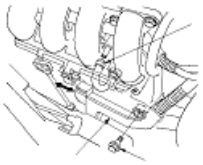


Installation



1. Install the intake manifold (A) with new gaskets (B), and tighten the bolts and nuts in a crisscross pattern in three steps, beginning with the inner bolt.
2. Install the dipstick.
3. Connect the EGR valve connector.

4. Install the PCV hose (A) and harness holder (B).



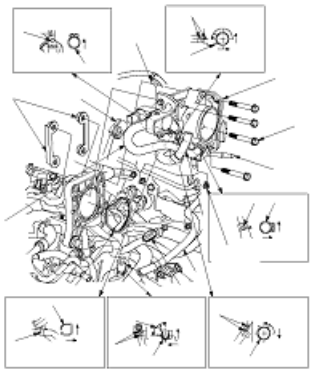
Throttle Body Test

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check REL TP SENSOR in the DATA LIST the HDS. The reading should be below 2.46 deg. If it is not, clean the throttle body.

Throttle Body Removal/Installation

⚠CAUTION

Do not insert your fingers into the installed throttle body when you turn the ignition switch ON (II) or while the ignition switch is ON (II). If you do, you will seriously injure your fingers if the throttle valve is activated.



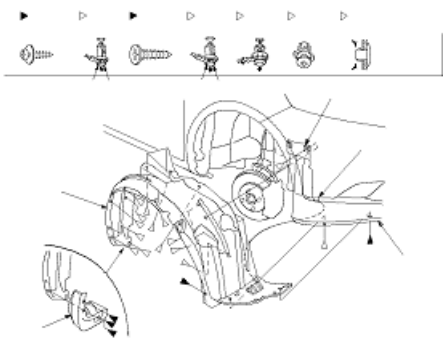
1. Remove the air cleaner.
2. Remove the harness clamp (A).
3. Disconnect the throttle body connector (B), and the EVAP canister purge valve connector (C).
4. Disconnect and plug the water bypass hoses (D), the purge hose (E).
5. Remove the throttle body (F).
6. Remove the purge pipe (G), the water bypass hoses, and the purge hose from the throttle body.
7. Install the parts in the reverse order of removal with a new gasket (H), then refill the radiator with engine coolant.
   NOTE:
   - If you replace or clean the throttle body, go to Step 8 .
   - If you did not replace or clean the throttle body, this procedure is complete.
   - Be careful not to damage to drops the plates (I).
   - Align the marks (J) on the hose and throttle body, then insert the hose. Make sure the clamp (K) is positioned as shown.
   - Align the mark (L) on the hose as shown, then insert the hose. Make sure the clamp (M) is positioned as shown.

8. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
9. Turn the ignition switch ON (II).
10. Reset the ECM/PCM with the HDS.
11. Select the ETCS TEST in the INSPECTION MENU with the HDS.
12. Select TP POSITION CHECK and clear the throttle position (TP) learned value.
13. Turn the ignition switch to LOCK (0).
14. Turn the ignition switch to ON (II), and wait 2 seconds without pressing the accelerator pedal.
15. Do the ECM/PCM idle learn procedure.

Front Inner Fender Replacement

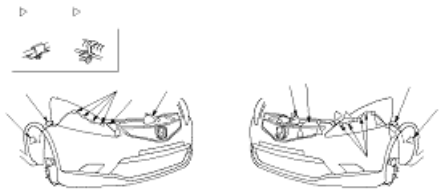
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.



1. For some models: Remove the side sill panel.
2. Remove the front inner fender (A).
   -1. On the back of the wheel arch, remove the screws (B), and remove the front splash guard (C) (for some models).
   -2. From under the front bumper (D), remove the screw (E) securing the front bumper, the splash shield (F), and the front inner fender.
   -3. Remove the clip (G) securing the front bumper and the front inner fender.
   -4. From the wheel arch, remove the screw (H), clip (I, J, K), clip (L).
   -5. Release the hook (M) of the splash shield, then remove the front inner fender.
   NOTE: To remove the clips G, I, pry the inner the clip up at the edge near the line (N) on its head.
3. Install the inner fender in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hook into place securely.

Hood Opener Cable Replacement



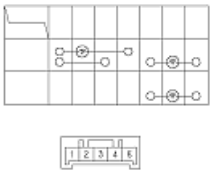
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body and the related parts.

1. Remove these items:
   - Front inner fender
   - Kick panel, driver's side
2. Disconnect the hood opener cable (A) from the hood latch (B), and disconnect the hood opener cable from the hood release handle (C). Take care not to kink the cable.
3. Using a clip remover, detach the clips (D, E), and peel the vinyl tapes (F) being wound onto the opener cable off, then remove the hood opener cable from the grommet (G). Take care not to kink the cable.
4. Install the cable in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Make sure the cable is connected properly.
   - Make sure the hood opens properly and locks securely.

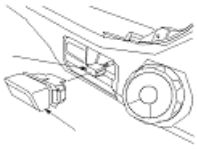
A/C Switch Test

1. Remove the A/C switch.
2. Check for continuity between the terminals in each switch position according to the table.
3. If the continuity is not as specified, replace the bulbs or the switch.

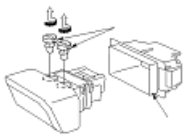


A/C Switch Replacement

1. Remove the heater control panel.
2. Disconnect the 5P connector (A) and push out the A/C switch (B) from behind the heater control panel.

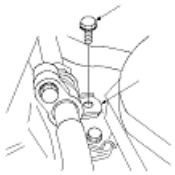


3. Remove the holder (A) and bulbs (B).
4. Install the A/C switch in the reverse order of removal.

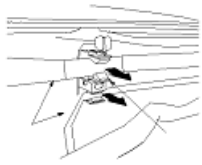


A/C Evaporator Core Replacement

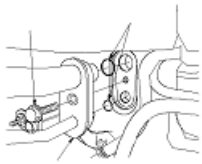
1. Recover the refrigerant with a recovery/recycling/charging station.
2. Remove the cowl cover and the under-cowl panel.
3. Remove the air cleaner.
4. Remove the bolt from the A/C line clamp (A).



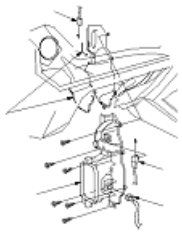
5. Open the clamp (A), then remove the A/C lines (B).
6. Remove the blower unit.



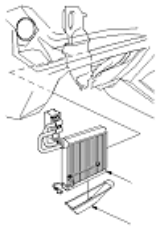
7. Remove the bolt, then disconnect the A/C line (A) from the evaporator core and remove the O-rings (B).



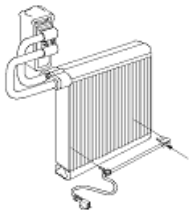
8. Disconnect the connectors (A) from the evaporator temperature sensor and the blower resistor, then remove the connector clip (B). Remove the self-tapping screws, the expansion valve cover (C), and the seal (D).



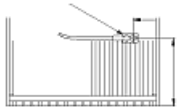
9. Carefully pull out the evaporator core assembly (A) without bending the lines, then remove the plate (B).



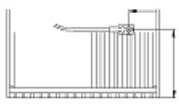
10. Pull out the evaporator temperature sensor (A) from the evaporator core.



11. Install the evaporator temperature sensor in the evaporator core, and note these items:
    - When the evaporator temperature sensor (A) is installed into the new evaporator core, set the sensor into the factory-preset position (B, C).
    - When the evaporator temperature sensor is reinstalled into the original evaporator core, set the sensor into the new position (D, E) because the fin may be deforming by the previous installation.

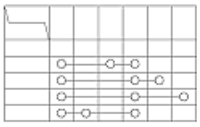


12. Install the core in the reverse order of removal and note these items:
    - If you're installing a new evaporator core, add refrigerant oil (SP-10).
    - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
    - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
    - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
    - Make sure that there is no air leakage.
    - Charge the system.



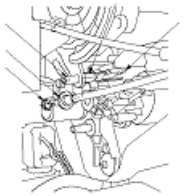
Heater Fan Switch Test

1. Remove the heater control panel.
2. Check for continuity between the terminals in each switch position according to the table.
3. If the continuity is not as specified, replace the heater fan switch.



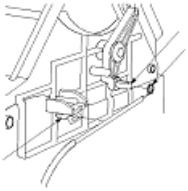
Heater Control Cable Removal/Installation

Mode Control Cable



1. Open the globe box. Release the glove box stop on each side, then let the glove box hang down.
2. Set the mode control dial to VENT ( ).
3. Detach the mode control cable housing from the clamp (A), and disconnect the inner cable (B) from the mode control linkage (C).
4. Install the cable in the reverse order of removal, and note these items:
   - Make sure insert the ring (D) in the groove (E).
   - After installation, operate the control panel controls to see whether it works properly.

Recirculation Control Cable



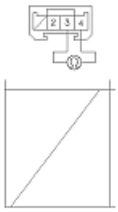
1. Open the globe box. Release the glove box stop on each side, then let the glove box hang down.
2. Set the recirculation control lever to RECIRCULATE ( ).
3. Detach the recirculation control cable housing from the clamp (A), and disconnect the inner cable (B) from the recirculation control linkage (C).
4. Turn the recirculation control linkage fully clockwise, and hold it. Attach the recirculation control cable to the recirculation control linkage, then snap the recirculation control cable housing into the clamp.
5. After installation, operate the control panel controls to see whether it works properly.

Air Mix Control Cable (Except KZ, KP, and MA models)

1. Open the globe box. Release the glove box stop on each side, then let the glove box hang down.
2. Set the temperature control dial to MAX COOL.
3. Detach the air mix control cable housing from the clamp (A), and disconnect the inner cable (B) from the air mix control linkage (C).
4. Install the cable in the reverse order of removal, and note these items:
   - Make sure insert the ring (D) in the groove (E).
   - After installation, operate the control panel controls to see whether it works properly.

Temperature Control Dial Test

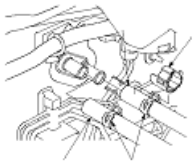
KZ, KP, and MA models



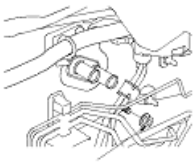
1. Remove the heater control panel, and disconnect the temperature control dial 4P connector.
2. Measure the resistance between the temperature control dial No. 3 and No. 4 terminals while rotating the adjusting dial and compare them with shown in the graph.
3. If the resistance is not as specified, replace the temperature control dial.

Heater Unit/Core Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

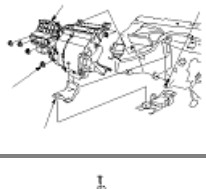


1. Do the battery terminal disconnection procedure.
2. Disconnect the A/C lines from the evaporator core.
3. Except KZ, KP, and MA models:
   - Drain the engine coolant from the radiator.
   - From the inlet heater hose, remove the clip (A). Slide the hose clamps (B) back, then disconnect the inlet heater hose (C) and the outlet heater hose (D) from the heater unit. Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.

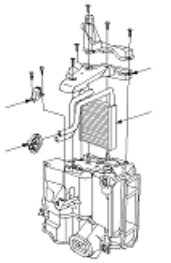


4. Remove the mounting nut from the heater unit. Take care not to damage or bend the fuel lines or brake lines, etc.
5. Remove the dashboard.

6. Disconnect the connector (A) from the evaporator sensor. Remove the wire harness (B).



7. Remove the duct (A) and the drain hose (B). Remove the mounting nuts and blower-heater unit (C).



8. Remove the self-tapping screws and the heater core cover (A).
9. Except KZ, KP, and MA models; Remove the stay (B), grommet (C), and carefully pull out the heater core (D).
10. Install the heater core, and the evaporator core in the reverse order of removal.
11. Install the heater unit in the reverse order of removal, and note these items:
    - Except KZ, KP, and MA models:
      - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
      - Refill the cooling system with engine coolant.
      - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Refer to the evaporator core replacement.
12. Do the battery terminal reconnection procedure.

Manual Transmission and M/T Differential (i-SHIFT)

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.4 L (1.5 US qt, 1.2 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)

Starter System Circuit Troubleshooting

i-SHIFT model
NOTE:

- Air temperature must be between 15 and 38 °C (59 and 100 °F) during this procedure.
- After this inspection, you must reset engine control module (ECM), otherwise the ECM will continue to stop the fuel injectors from functioning. Select ECM reset using the Honda Diagnostic System (HDS).
- The battery must be in good condition and fully charged.

1. Check the No. 24 (10 A) fuse in the under-hood fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 2 .
   NO - Replace the fuse and recheck.■

2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the ECM. If it does not, troubleshoot the DLC circuit.
5. Check the BRAKE SWITCH in the DATA LIST with the HDS.

   Dose it indicate OFF?
   YES - Go to Step 6 .
   NO - Inspect the brake pedal position switch.

6. Press the brake pedal, and check the BRAKE SWITCH in the DATA LIST with the HDS.

   Dose it indicate ON?
   YES - Go to Step 13 .
   NO - Go to Step 7 .

7. Turn the ignition switch OFF.
8. Disconnect the brake pedal position switch 4P connector.
9. Measure the voltage between brake pedal position switch 4P connector terminal No. 1 and body ground.

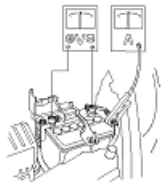
   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the brake pedal position switch 4P connector terminal No. 1 and under-hood fuse/relay box.■

10. Turn the ignition switch to ON (II).
11. Jump the SCS line with the HDS, then turn the ignition switch OFF.
    NOTE: This step must be done to protect the ECM from damage.

12. Check for continuity between ECM connector terminal A42 and the brake pedal position switch 4P connector terminal No. 2.

    Is there continuity?
    YES - Inspect the brake pedal position switch. ■
    NO - Repair open in the wire between ECM (A42) and the brake pedal position switch 4P connector terminal No. 2.■

13. Hook up the following equipment:
    - Ammeter, 0−400 A
    - Voltmeter, 0−20 V (accurate within 0.1 V)



14. Turn the ignition switch to ON (II).
15. Select PGM-FI, INSPECTION, then ALL INJECTORS OFF on the HDS.
16. With the shift lever in N position, the brake pedal pressed, turn the ignition switch ON (II), and press the engine start switch.

    Did the starter crank the engine normally?
    YES - The starting system is OK. Go to Step 21 .
    NO - Go to Step 17 .

17. Check the battery condition. Check electrical connections at the battery, the negative battery cable to body, the engine ground cables, and the starter for looseness and corrosion. Then try cranking the engine again.

    Did the starter crank the engine?
    YES - Repairing the loose connection corrected the problem. The starting system is OK. Go to Step 23 .
    NO - Check the following:

    - If the starter will not crank the engine at all, go to Step 18 .
    - If the starter cranks the engine erratically or too slowly, go to Step 20 .
    - If the starter does not disengage from the flywheel ring gear when you release the switch, replace the starter, or remove and disassemble it and check for the following:
      - Solenoid plunger and switch malfunction
      - Dirty drive gear or damaged overrunning clutch

---

18. Make sure the transmission is in Neutral, and set the parking brake. Disconnect the connector (A) from the starter solenoid S terminal. Connect a jumper wire from the battery positive terminal to the solenoid terminal.

    Did the starter crank the engine?
    YES - Go to Step 19 .
    NO - Remove the starter, and repair or replace as necessary.■

19. Check the following items in the order listed until you find the open circuit:
    - The BLK wire and connectors between the under-dash fuse/relay box and the starter cut relay 2.
    - The BLU wire and connectors between the starter cut relay 2 and the starter.
20. While cranking the engine, check the cranking voltage and the current draw.

    Is the cranking voltage greater than or equal to 8.0 V (KQ, KZ models), 9.0 V (Except KQ, KZ models) and the current draw less than or equal to 200 A (KQ, KZ models), 150 A (Except KQ, KZ models)?
    YES - Go to Step 21 .
    NO - Replace the starter, or remove and disassemble it, and check for the following:

    - Drag in the starter armature
    - Shorted armature winding
    - Excessive drag in the engine

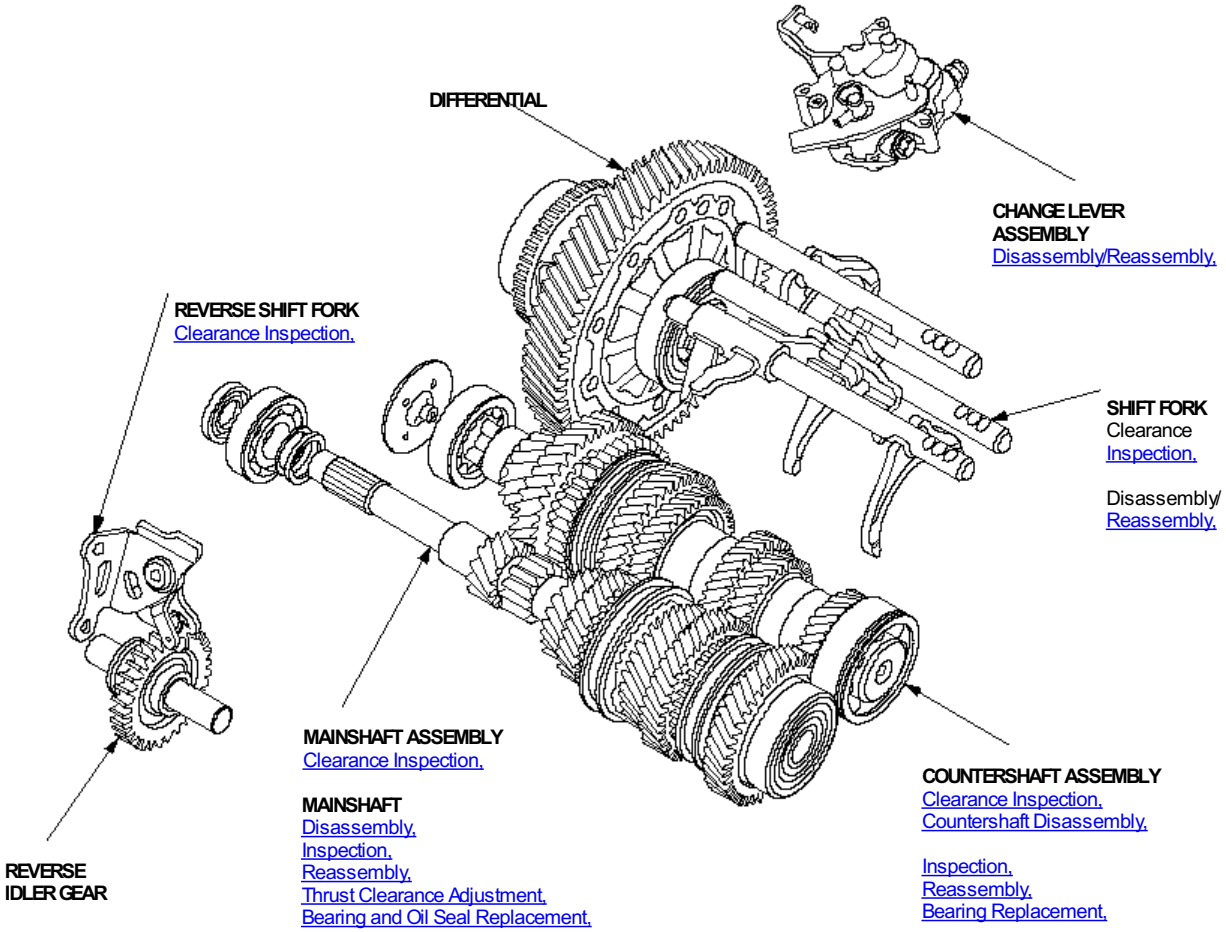
21. Check the engine speed while cranking the engine.

    Is the engine speed above 100 rpm (min^{-1})?
    YES - Go to Step 22 .
    NO - Replace the starter, or remove and disassemble it, and check for the following:

    - Open circuit in the starter armature commutator segments
    - Excessively worn starter brushes
    - Open circuit in the commutator brushes
    - Dirty or damaged helical splines or drive gear
    - Faulty drive gear clutch

22. Remove the starter, and inspect its drive gear and the flywheel ring gear for damage. Replace any damaged parts.
23. Select ECM reset to cancel ALL INJECTORS OFF on the HDS.

M/T Component Location Index



Hard to shift into 1st gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the clutch.
3. Check the change lever assembly.
4. Check the 1st synchro ring and the 1st gear.
5. Check the 1st/2nd synchro sleeve and hub.

Hard to shift into 2nd gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the change lever assembly.
3. Check the 2nd synchro ring and the 2nd gear.
4. Check the 1st/2nd synchro sleeve and hub.

Hard to shift into 3rd gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the change lever assembly.
3. Check the 3rd synchro ring and the 3rd gear.
4. Check the 3rd/4th synchro sleeve and hub.

Hard to shift into 4th gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the change lever assembly.
3. Check the 4th synchro ring and the 4th gear.
4. Check the 3rd/4th synchro sleeve and hub.

Hard to shift into 5th gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the change lever assembly.
3. Check the 5th synchro ring and the 5th gear.
4. Check the 5th/6th synchro sleeve and hub.

Hard to shift into 6th gear

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the change lever assembly.
3. Check the 6th synchro ring and the 6th gear.
4. Check the 5th/6th synchro sleeve and hub.

Hard to shift into reverse

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the clutch.
3. Check the change lever assembly.
4. Check the reverse shift fork and reverse idler gear.
5. Check reverse gears.

HDS does not communicate with the ECM or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Noise from the transmission

Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the MTF level (unfilled or in surplus the transmission with the MTF).
3. Check the transmission gears.
4. Check the transmission bearings.
5. Check the differential carrier, the final driven gear, and the carrier bearings.

Transmission jumps out of gear

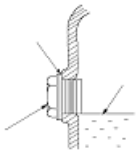
Diagnostic procedure

1. Check and/or replace the MTF.
2. Check the detent ball springs.
3. Check the teeth of the synchro rings and the gears.
4. Check for bent, deform, or damage of the shift forks.

M/T System Symptom Troubleshooting

Symptom	Diagnostic procedure
Hard to shift into 1st gear	1.Check and/or replace the MTF. 2.Check the clutch. 3.Check the change lever assembly. 4.Check the 1st synchro ring and the 1st gear. 5.Check the 1st/2nd synchro sleeve and hub.
Hard to shift into 2nd gear	1.Check and/or replace the MTF. 2.Check the change lever assembly. 3.Check the 2nd synchro ring and the 2nd gear. 4.Check the 1st/2nd synchro sleeve and hub.
Hard to shift into 3rd gear	1.Check and/or replace the MTF. 2.Check the change lever assembly. 3.Check the 3rd synchro ring and the 3rd gear. 4.Check the 3rd/4th synchro sleeve and hub.
Hard to shift into 4th gear	1.Check and/or replace the MTF. 2.Check the change lever assembly. 3.Check the 4th synchro ring and the 4th gear. 4.Check the 3rd/4th synchro sleeve and hub.
Hard to shift into 5th gear	1.Check and/or replace the MTF. 2.Check the change lever assembly. 3.Check the 5th synchro ring and the 5th gear. 4.Check the 5th/6th synchro sleeve and hub.
Hard to shift into 6th gear	1.Check and/or replace the MTF. 2.Check the change lever assembly. 3.Check the 6th synchro ring and the 6th gear. 4.Check the 5th/6th synchro sleeve and hub.
Hard to shift into reverse	1.Check and/or replace the MTF. 2.Check the clutch. 3.Check the change lever assembly. 4.Check the reverse shift fork and reverse idler gear. 5.Check reverse gears.
HDS does not communicate with the ECM or the vehicle	Troubleshoot the DLC circuit.
Noise from the transmission	1.Check and/or replace the MTF. 2.Check the MTF level (unfilled or in surplus the transmission with the MTF). 3.Check the transmission gears. 4.Check the transmission bearings. 5.Check the differential carrier, the final driven gear, and the carrier bearings.
Transmission jumps out of gear	1.Check and/or replace the MTF. 2.Check the detent ball springs. 3.Check the teeth of the synchro rings and the gears. 4.Check for bent, deform, or damage of the shift forks.

MTF Inspection and Replacement



1. Park the vehicle on level ground, and turn the engine OFF.
2. Raise the vehicle on a lift and make sure it is securely supported.
3. Remove the splash shield.
4. Remove the filler plug (A) and sealing washer (B), check the condition of the MTF and make sure it is at the proper level (C).

5. If the MTF is dirty, remove the drain plug (A) and drain the MTF.
6. Reinstall the drain plug with a new sealing washer (B), and refill the transmission with MTF to the proper level. Always use Genuine Honda Manual Transmission Fluid (MTF).

   Fluid Capacity

   1.4 L (1.5 US qt, 1.2 Imp qt) at fluid change
   1.6 L (1.7 US qt, 1.4 Imp qt) at overhaul

7. Install the filler plug (C) with a new sealing washer (D).
8. Install the splash shield.
9. Lower the vehicle on the lift.
10. Without service reminder system, this procedure is complete.

With service reminder system

11. If the service reminder system required to replace the MTF, reset the service reminder system, and this procedure is complete. If the service reminder system did not require to replace the MTF, go to Step 12 and reset the MTF life with the HDS.
12. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
13. Turn the ignition switch to ON (II).
14. Make sure the HDS communicates with the vehicle and the ECM. If it doesn't communicate, troubleshoot the DLC circuit.
15. Select BODY ELECTRICAL with the HDS.
16. Select ADJUSTMENT in the GAUGES MENU with the HDS.
17. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
18. Reset SERVICE REMINDER ITEM 3 (shows MTF) with the HDS.

Manual transmission fluid

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.4 L (1.5 US qt, 1.2 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)

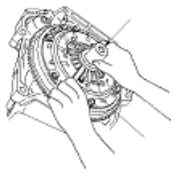
Clutch Replacement

Special Tools Required



Stop collar
070AF-SMGC150

Ring gear holder
07LAB-PV00100

Pressure plate compressor
070AE-0010100

Center shaft
070AF-SMGC140

Bearing remover shaft 15
07936-KC10100

Bearing remover head 15
07936-KC10200

Driver handle, 15 x 135L
07749-0010000

Bearing driver attachment, 28 x 30 mm
07946-1870100

Engine Side

NOTICE

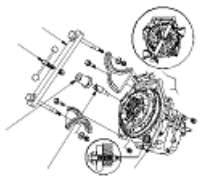
You must use the pressure plate compressor, the center shaft, and the stop collar required to remove and install the clutch pressure plate or you will damage it.

Pressure Plate Inspection and Removal

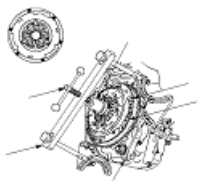
1. Remove the transmission.
2. Remove the transmission mount.
3. Check the evenness of the height of the diaphragm spring fingers using the center shaft, the stop collar (A), and a feeler gauge (B). If the height difference is more than the service limit, replace the pressure plate and clutch disc as a set.

Standard (New):	**0.8 mm (0.03 in.) max.**
Service Limit:	**1.0 mm (0.04 in.)**

4. Install the center shaft (A), the stop collar (B), the pressure plate compressor (C), and the ring gear holder (D).
5. Turn the center screw (E) clockwise by hand to apply pressure on the diaphragm spring. Continue turning the center screw until it stops.

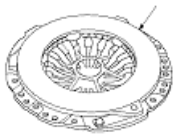


6. Loosen the pressure plate mounting bolts (A) in the pattern shown in several steps, then remove the bolts.
7. Turn the center screw (B) on the pressure plate compressor counterclockwise by hand to release the pressure, then install two pressure plate mounting bolts by finger-tight to hold the pressure plate (C).
8. Remove the stop collar, the pressure plate compressor, then remove the finger-tightened bolts and the pressure plate.



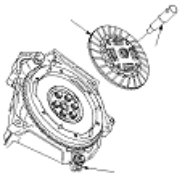
9. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.

10. Inspect the pressure plate surface (A) for wear, cracks, and burning.



11. Inspect for warpage using a straight edge (A) and a feeler gauge (B). Measure across the pressure plate (C). If the most measurement difference is more than the service limit, replace the pressure plate and clutch disc as a set.
    Standard (New): **0.03 mm (0.001 in.) max.**
    Service Limit: **0.15 mm (0.006 in.)**

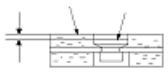
Clutch Disc Inspection and Removal



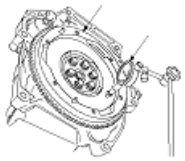
12. Remove the clutch disc (A) and clutch center shaft (B).
13. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch disc looks burnt or is oil soaked, replace the clutch disc and the pressure plate as a set. If the clutch disc is oil soaked, find and repair the source of the oil leak.

14. Measure clutch disc thickness. If the measurement is less than the service limit, replace the clutch disc and pressure plate as a set.
    Standard (New): **7.6−8.0 mm (0.299−0.315 in.)**
    Service Limit: **6.0 mm (0.236 in.)**

15. Measure the rivet depths from the clutch disc lining surface (A) to the rivets (B) on both sides. If the measurement is less than the service limit, replace the clutch disc and pressure plate as a set.
    Standard (New): **1.1 mm (0.043 in.) min.**
    Service Limit: **0.3 mm (0.012 in.)**

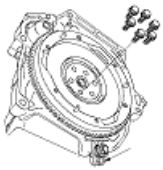


Flywheel Inspection



16. Remove the ring gear holder.
17. Inspect the ring gear teeth for wear and damage.
18. Inspect the clutch disc mating surface on the flywheel for wear, cracks and burning.
19. Measure the flywheel (A) runout using a dial indicator (B). Through at least two full turns with pushing against the flywheel each time you turn it to take up the crankshaft thrust washer clearance. If the measurement is not within the standard, replace the flywheel, and recheck the runout. Go to Step 20 .
    Standard (New): **0.05 mm (0.002 in.) max.**

Flywheel Replacement



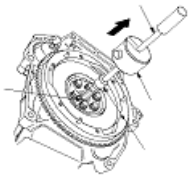
20. Install the ring gear holder.
21. Loosen the flywheel mounting bolts in a crisscross pattern in several steps. Remove the bolts, then remove the flywheel and the ring gear holder.
22. Install the flywheel on the crankshaft, and install the mounting bolts finger-tight.

23. Install the ring gear holder (A), then torque the flywheel mounting bolts (B) in a crisscross pattern in several steps.

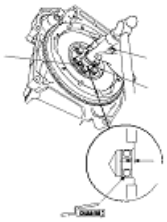
Pilot Bearing Inspection

24. Inspect the crankshaft pilot bearing for wear and damage.
25. Inspect the inside surface of the crankshaft pilot bearing with your finger. If the crankshaft pilot bearing is not smooth, replace it; go to Step 26 .

Pilot Bearing Replacement

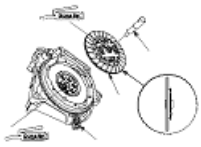


26. Remove the crankshaft pilot bearing (A) using the bearing remover shaft (B), bearing remover head (C), and the sliding hammer weight (D).



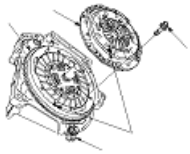
27. Install the new pilot bearing (A) into the crankshaft using the 15 x 135L driver handle (B) and 28 x 30 mm bearing driver attachment (C). Apply a light coat of molybdenum grease to the bearing surface.

Clutch Disc and Pressure Plate Installation

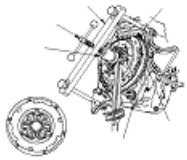


NOTE: The clutch disc and pressure plate are a matched set and must be replaced together.

28. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.
29. Apply a light coat of molybdenum grease to the crankshaft pilot bearing (A).
30. Apply molybdenum grease to the splines (B) of the clutch disc (C), then install the clutch disc using the clutch center shaft (D).

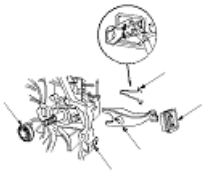


31. Align point marks (A) across the pressure plate (B) and flywheel (C).
32. Install the pressure plate and the mounting bolts (D) by finger-tight.



33. Install the stop collar (A) and the pressure plate compressor (B).
34. Turn the center screw (C) clockwise by hand to apply pressure on the diaphragm spring. Continue turning the center screw until it stops.
35. Be careful not to damage the pressure plate (D). Tighten (180 degrees apart) the pressure plate mounting bolts (E) in the pattern as shown in several steps.
    Specified Torque: **25 N·m (2.6 kgf·m, 19 lbf·ft)**
36. Turn the center screw on the pressure plate compressor counterclockwise by hand to release the pressure. Remove the pressure plate compressor, the stop collar, the center shaft, and the ring gear holder.
37. Make sure the diaphragm spring fingers are all the same height.
38. Do the release bearing inspection, and replace if it necessary.
39. Install the transmission mount.
40. Install the transmission.

Transmission Side
Release Bearing Removal

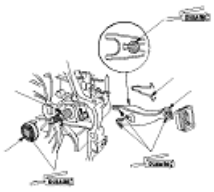


1. Remove the transmission.
2. Remove the release fork boot (A) from the clutch housing (B).
3. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D). Remove the release bearing (E).

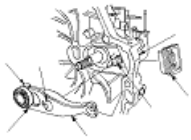
Release Bearing Inspection

4. Check the play of the release bearing by spinning it by hand. If there is excessive play or noise, replace the release bearing.
   NOTE: The release bearing is packed with grease. Do not wash it in solvent.

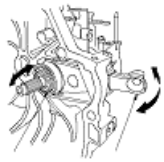
Release Bearing Installation



5. Apply molybdenum grease to the release fork (A), release fork bolt (B), the release bearing (C), and the release bearing guide (D) in the shaded areas, then set the release fork set spring (E).
   NOTE: Replace the release fork bolt if necessary.



6. With the release fork (A) slide between the release bearing pawls (B), install the release bearing on the mainshaft while inserting the release fork through the hole (C) in the clutch housing.
7. Align the detent (D) of the release fork with the release fork bolt (E), then press the detent of the release fork over the release fork bolt squarely.
8. Install the release fork boot (F). Make sure the boot seals around the release fork and clutch housing.



9. Move the release fork (A) right and left to make sure that it fits properly against the release bearing (B) and that the release bearing slides smoothly. Wipe off any excess grease.
10. Install the transmission.

Clutch disc

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch disc	Rivet head depth		1.1 mm (0.043 in.)	0.3 mm (0.012 in.)
	Thickness		7.6−8.0 mm (0.299−0.315 in.)	6.0 mm (0.236 in.)

Pressure plate

Item	Measurement	Qualification	Standard or New	Service Limit
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height of diaphragm spring fingers measured with feeler gauge and special tool		0.8 mm (0.03 in.)	1.0 mm (0.04 in.)

Flywheel

Item	Measurement	Qualification	Standard or New	Service Limit
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	———

i-SHIFT System Fail Safe Action Index

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
P0504	Diagnosis by the brake information in the F-CAN signal. • Received brake signal did not change for 3 drive cycles or more. i-SHIFT drive cycle is established under these conditions (Once all of these conditions mentioned are satisfied, 1 drive cycle is established.): - Two minutes elapsed after the ignition switch is turned ON. - Gear is shifted to the 3rd gear or higher. - Speed has reached 16 km/h or more.	Driving in manual mode is impossible.
P0512	Diagnosis by Starter Switch Signal (STS).	None
P0562	Diagnosis by voltage input. • Monitors the VBATT (+B) signal when voltage has reached 9 V or less.	i-SHIFT indicator comes on (When voltage decreases, symptoms such as delay in motor operation occur).
P0563	Diagnosis by voltage input. • Monitors the VBATT (+B) signal when voltage reached 28 V or more.	i-SHIFT indicator comes on.
P0603	Diagnosis by the TCM internal circuit check function. • Performs ROMSUM check of the Keep Alive Memory (KAM), and assumes a malfunction if the RONSUM value does not match.	• i-SHIFT indicator comes on. • Control is terminated and the condition when a malfunction has been detected (gear position, clutch position) is kept.
P0605	Diagnosis by the TCM internal circuit check function. • Checks the RONSUM in the rewritable part of the ROM, and assumes a malfunction if the RONSUM value does not match.	• i-SHIFT indicator comes on. • Control is terminated and the condition when a malfunction has been detected (gear position, clutch position) is kept.
P0666	Diagnosis by the TCM internal temperature sensor signal. • When the input value is higher or lower than the designed value.	i-SHIFT indicator comes on.
P0702	Determination by VCC voltage input value. • When the input value is higher or lower than the designed value.	• i-SHIFT indicator comes on. • Control is terminated and the condition when a malfunction has been detected (gear position, clutch position) is kept.
P0780	Diagnosis by shift position while shifting gears. • Even if synchro position is not reached, but reaching the connecting part in the gear has failed at least three times.	i-SHIFT indicator comes on.
P0810	Diagnosis by the value from the clutch actuator position sensor. • When the position sensor value does not change even if the clutch actuator has been commanded to operate.	• i-SHIFT indicator comes on. • When vehicle speed exceedes a certain speed (varies with the speed gear retained), the clutch actuator position when the malfunction occurred is retained, and control is performed. • When vehicle speed is below a certain speed, the mode becomes Neutral. • Although the engine can be restarted, the time elapsed to start the engine after pressing the starter switch is longer than usual (about 1 sec).
P0882	Diagnosis by input voltage value and F-CAN signal value. • When voltage input value in the TCM is almost 0 V, even if the IG1 signal (received F-CAN value) of the ECM is ON.	i-SHIFT indicator comes on (If the F-CAN signal from the ECM is sent continuously, control continues until the IG1 in the ECM turns OFF).

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
P0883	Diagnosis by input voltage value and F-CAN signal value. • When voltage input value in the TCM is almost equal or more than the battery voltage, even if the IG1 signal (received F-CAN value) of the ECM is OFF.	i-SHIFT indicator comes on.
P0904	Diagnosis by sensor signal. • Monitors PULSES SELECT signal. • When the line for PULSES SELECT signal is open. • When the line for PULSES SELECT signal is about 0 V (GND short). • When the line for PULSES SELECT signal is almost equal to the battery voltage (BATT short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P0909	Diagnosis by neutral width. • When the neutral width of the change actuator is 15.5 mm or above, or 25.5 mm or below	i-SHIFT indicator comes on.
P0910	Diagnosis by sensor signal. • Output from the sensor does not change even if the output value in the select actuator position does not detect electrical malfunction in the sensor.	i-SHIFT indicator comes on.
P0914	Diagnosis by sensor signal. • Monitors PULSES SHIFT signal. • When the line for PULSES SHIFT signal is open. • When the line for PULSES SHIFT signal is about 0 V (GND short). • When the line for PULSES SHIFT signal is almost equal to the battery voltage (BATT short).	• i-SHIFT indicator comes on. • Fixed at the speed gear at the time a malfunction has been confirmed. Connects or disconnects the clutch by vehicle speed.
P0919	Diagnosis by time spent in neutral position learning. • When confirmation of a neutral position is not possible.	i-SHIFT indicator comes on.
P0920	Diagnosis by sensor signal. • Output from the sensor does not change even if the output value in the shift actuator position does not detect electrical malfunction in the sensor.	i-SHIFT indicator comes on.
P0942	Diagnosis by in-gear action. • When synchro position cannot be achieved even if shift/select is operated and in-gear action is performed of halt condition.	i-SHIFT indicator comes on.
P16C0	CPU performs self-diagnosis while ignition switch is ON, and determines whether the malfunction has been recorded or not.	• i-SHIFT indicator comes on. • Control termination other than alteration of information.
P19E4	Diagnosis by gear actuator's input energy (calculated value). • For a certain period of time, an input from 2400 W to 3000 W, or an energy input from 1600 W to 2000 W occurred.	Transmission Temp indicator comes on.

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
P19E5	Diagnosis by the value from the clutch actuator position sensor. • Clutch actuator position sensor value is beyond the range of design value.	• i-SHIFT indicator comes on. • When vehicle speed exceedes a certain speed (varies with the speed gear retained), the clutch actuator position when the malfunction occurred is retained, and control is performed. • When vehicle speed is below a certain speed, the mode becomes Neutral. • Although the engine can be restarted, the time elapsed to start the engine after pressing the starter switch is longer than usual (about 1 sec).
P19E6	Diagnosis by clutch temperature value. • If clutch temperature value reaches 300 °C (572 °F) or more.	Creep termination.
P19E7	Diagnose when Clutch Contact Position 3 Learning was not completed or in progress.	i-SHIFT indicator comes on.
P19E8	Diagnosis using VSPOUT signal. • When VSPOUT signal is 0 V or approximately equal to the battery voltage.	i-SHIFT indicator comes on.
P19E9	Diagnosis by ECU BRAKE AND signal. • When ECU BRAKE AND signal is 0 V or approximately equal to the battery voltage.	i-SHIFT indicator comes on.
P19EA	Diagnosis by Starter Enable signal return input value. • When Starter Enable signal return value is 0 V or approximately equal to the battery voltage.	i-SHIFT indicator comes on.
P19EB	Diagnosis using F-CAN signal. • Diagnostic software protection not active.	None (Cannot perform commands and alteration necessary for KEY inspection.)
P19EC	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SHIFT signal. • When SENSOR SUPPLY SHIFT signal is about 0 V (GND short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when malfunction was confirmed (connects or disconnects the clutch by vehicle speed).
P19ED	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SHIFT signal. • When the line for SENSOR SHIFT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19EE	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SHIFT signal. • When the line for SENSOR SUPPLY SHIFT signal is almost equal to the battery voltage (BATT short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19EF	Diagnosis by GND signal. • Monitors SENSOR GND SHIFT signal. • When the line for SENSOR GND SHIFT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F0	Diagnosis by SENSOR signal. • Monitors DIRECTION SHIFT signal. • When the line for DIRECTION SHIFT signal is about 0 V (GND short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F2	Diagnosis by SENSOR signal. • Monitors DIRECTION SHIFT signal. • When the DIRECTION SHIFT signal is almost equal to the battery voltage (BATT short). • When the line for DIRECTION SHIFT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
P19F3	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SELECT signal. • When SENSOR SELECT signal is about 0 V (GND short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F4	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SELECT signal. • When the line for SENSOR SELECT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F5	Diagnosis by SUPPLY signal. • Monitors SENSOR SUPPLY SELECT signal. • When the line for SENSOR SUPPLY SELECT signal is almost equal to the battery voltage (BATT short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F6	Diagnosis by GND signal. • Monitors SENSOR GND SELECT signal. • When the line for SENSOR GND SELECT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F7	Diagnosis by SENSOR signal. • Monitors DIRECTION SELECT signal. • When the line for DIRECTION SELECT signal is about 0 V (GND short).	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19F9	Diagnosis by SENSOR signal. • Monitor of DIRECTION SELECT signal. • When DIRECTION SELECT signal is a rough voltage of the battery (BATT short). • When the line for DIRECTION SELECT signal is open.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P19FA	Diagnosis using F-CAN signal. • Torque instability signal received at the TCM is set at 10 minutes. or above.	None
P19FB	Diagnose when Clutch Contact Position 1/2 Learning was completed or in progress. • When all phases of learning was not completed.	None (1st or reverse gear only can be shifted. Drive at very slow speed available.)
P19FC	Diagnosis when Shift Change Actuator Position Learning and Synchronizing Position Learning is completed or in progress.	• i-SHIFT indicator comes on. • Control terminated (Engine startup impossible).
P19FD	Diagnosis by Shift Change Actuator Position Learning value. • Shift Position Gear 1/3/5 is +11.4 mm or above, +7.4 mm or below. • Shift Position Gear 2/4/6/R is −6.2 mm or above, −10.2 mm or below. • Select Position Gear 1/2 is −2.8 mm or above, −5.8 mm or below. • Select Position Gear 3/4 is +2.1 mm or above, −0.9 mm or below. • Select Position Gear 5/6 is +7.6 mm or above, +4.6 mm or below. • Select Position Gear R is +11.95 mm or above, +9.45 mm or below. • Synchronizer Position Gear 1/3/5 is +8.2 mm or above, +0.2 mm or below. • Synchronizer Position Gear 2/4/6 is +1.1 mm or above, −6.9 mm or below. A fault code is recorded if one of the conditions above exists.	None

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
P19FE	Diagnosis by Clutch Contact Position learning value. • Clutch Contact Position (long term) is 14 mm or above, or 7 mm or below. • Clutch Contact Position (medium term) is 14 mm or above, or 7 mm or below. • Clutch Contact Position (short term) is 14 mm or above, or 7 mm or below. A fault code is recorded if one of the conditions above exists.	None
P19FF	Diagnosis by Friction Coefficient value. • Friction Coefficient #1 is 865 or above, or 171 or below. • Friction Coefficient #2 is 865 or above, or 171 or below. • Friction Coefficient #3 is 865 or above, or 171 or below. • Friction Coefficient General is 865 or above, or 171 or below. A fault code is recorded if one of the conditions above exists.	None
P2785	Diagnosis by motor temperature value and PCB sensor's input value. • Motor temperature is 195 °C or above. • PCB sensor's input value is 118 °C or above. A fault code is recorded if one of the conditions above exists.	• Transmission Temp indicator comes on. • Gearshift limit (from 1st to 5th and R only) by Shift map for use during occurrence of malfunction.
P2786	Diagnosis by gear actuator's input energy (calculated value). • For a certain period of time, an input of 3000 W or more, or an energy input of 2000 or more occurred.	• i-SHIFT indicator comes on. • Fixed at the speed gear when a malfunction has been confirmed (connects or disconnects the clutch by vehicle speed).
P2787	Diagnosis by clutch temperature value. • If clutch temperature value reaches 400 °C or more.	• Transmission Temp indicator comes on. • Creep termination.
U0100	Diagnosis using CAN signal. • When TCM cannot receive signals from the ECM.	• i-SHIFT indicator comes on. • When vehicle speed exceedes a certain speed (varies with the speed gear retained), the clutch actuator position when the malfunction occurred is retained, and control is performed. • When vehicle speed is below a certain speed, the mode becomes Neutral. • Although the engine can be restarted, the time elapsed to start the engine after pressing the starter switch is longer than usual (about 1 sec).
U0103	Diagnosis using CAN signal. • When TCM cannot receive signals from gear shift control module.	• i-SHIFT indicator comes on. • If vehicle speed is over 5 km/h, the position at malfunction is retained, and control is done (change in auto mode from manual mode). • When vehicle speed is below 5 km/h, the mode becomes Neutral.
U0155	Diagnosis using CAN signal. • When TCM cannot receive signals from gauge control module.	i-SHIFT indicator comes on.

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
U0401	Diagnosis using CAN signal. • When an INVALID value is included in the ECM data received by the TCM.	• DTC set caused by IAT sensor malfunction/ECT sensor malfunction: None • For DTC set caused by other ECM malfunctions: When vehicle speed exceedes a certain speed (varies with the speed gear retained), the clutch actuator position when the malfunction occurred is retained, and control is performed. • When vehicle speed is below a certain speed, the mode becomes Neutral. • Although the engine can be restarted, the time elapsed to start the engine after pressing the starter switch is longer than usual (about 1 sec).
U0404	Diagnosis using CAN signal. • If the data received by the TCM from the gear shift control module contains an abnormal or INVALID value.	Fail safe action is classified according to malfunction mode. • Auto/Manual range abnormality: i-SHIFT indicator comes on. However, shifting between Automatic and manual is not possible. • For abnormality in other range and abnormality in the data received: i-SHIFT indicator comes on. • If vehicle speed is over 5 km/h, the position at malfunction is retained, and control is done. When vehicle speed is below 5 km/h, the mode becomes Neutral.
U1261	Diagnosis using CAN signal. • When TCM cannot receive signals from ABS or VSA.	• i-SHIFT indicator comes on. • If the shift lever is not at the N position: Speed gear is fixed at malfunction occurrence. However, to prevent engine stall, clutch opening and closing is controlled. • When shift lever is at the N position: Shifts gear to Neutral, and thereafter, Neutral mode is maintained even if shift lever is moved to other positions.
U1400	Diagnosis using CAN signal. • Abnormality exists in the ECM data received by TCM.	• When vehicle speed exceedes a certain speed (varies with the speed gear retained), the clutch actuator position when the malfunction occurred is retained, and control is performed. • When vehicle speed is below a certain speed, the mode becomes Neutral. • Although the engine can be restarted, the time elapsed to start the engine after pressing the starter switch is longer than usual (about 1 sec).
U1401	Diagnosis using CAN signal. • TCM received a shift down request, but when gear is shifted, maximum engine speed is exceeded.	None
U1402	Diagnosis using CAN signal. • Before TCM received 5-gear-down request, it received 4-gear-down request.	None
U1403	Diagnosis using CAN signal. • INVALID value in the ABS or VSA data received by TCM. When 1 piece of data is included.	• i-SHIFT indicator comes on. • When ABS or VSA unit detects malfunction: Disables downshift when brake is depressed. • If ABS or VSA unit did not detect a malfunction: None

SAE Fault Code (DTC)	Malfunction Criteria	Fail Safe Action
U1404	Diagnosis using CAN signal. • Abnormality exists in the ABS or VSA data received by TCM.	• When ABS or VSA unit detects malfunction: Disables downshift when brake is depressed. • If ABS or VSA unit has not detect a malfunction: None
U1405	Diagnosis using CAN signal. • When multiple INVALID values are included in the ABS or VSA data received by the TCM.	• i-SHIFT indicator comes on. • If shift lever is not at the N position: Speed gear is fixed at malfunction occurrence. However, to prevent engine stall, clutch opening and closing is controlled. • When shift lever is at the N position: Shifts gear to Neutral, and thereafter, Neutral mode is maintained even if shift lever is moved to other positions.

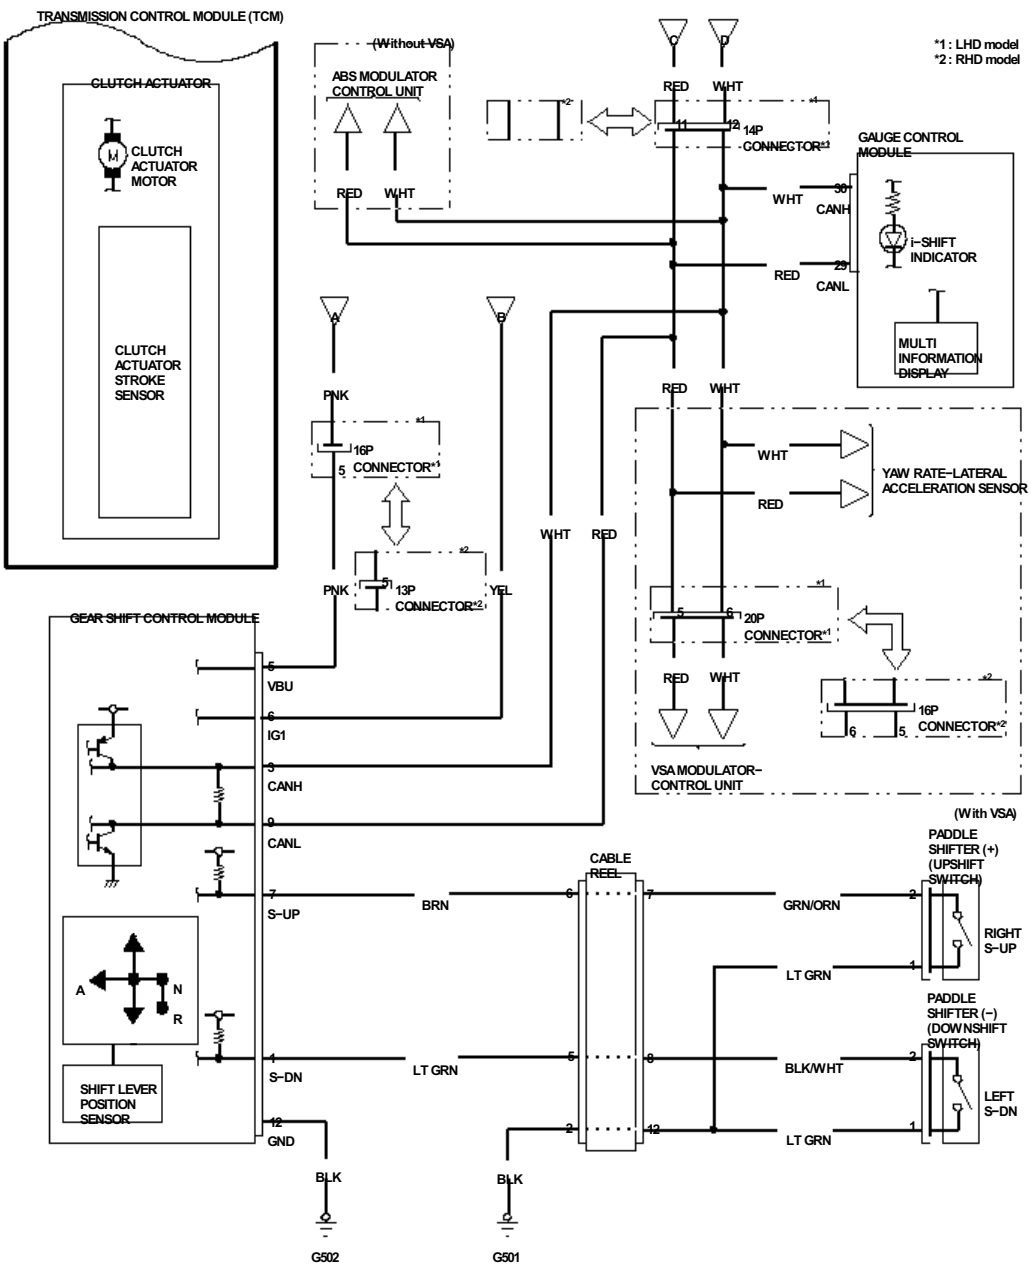
i-SHIFT System Circuit Diagram



i-SHIFT System Symptom Troubleshooting - Engine doesn't crank

Engine Doesn't Crank

1. Turn the ignition switch to ON (II).
2. Press the brake pedal, and change the shift lever to the N position.
3. Check the MECHANICAL GEAR STACK FOR STARTER ENABLE in the DATA LIST with the HDS.

   Is the starter enable signal OK?
   YES - Test the starter. ■
   NO - Go to Step 4 .
4. Check the FOOTBRAKE ON SIGNAL FOR STARTER ENABLE in the DATA LIST with the HDS.

   Is the starter enable signal OK?
   YES - Go to Step 5 .
   NO - Do the brake pedal position switch signal circuit troubleshooting. ■
5. Check the CLUTCH OPEN SIGNAL FOR STARTER ENABLE in the DATA LIST with the HDS.

   Is the starter enable signal OK?
   YES - Go to Step 7 .
   NO - Go to Step 6 .
6. Check the CLUTCH POSITION in the DATA LIST with the HDS.

   Is there more 15 mm (0.6 in.)?
   YES - Check for these conditions, and repair if necessary:■

   - Clutch disc and pressure plate
   - Diaphragm spring
   - Release bearing

   NO - Check for these conditions, and repair if necessary:■

   - Slave cylinder
   - Release fork
7. Check the NEUTRAL SHIFTER SIGNAL FOR STARTER ENABLE in the DATA LIST with the HDS.

   Is the starter enable OK?
   YES - Go to Step 9 .
   NO - Go to Step 8 .
8. Move the shift lever in N, then check the SHIFT VALID N FROM SHIFTER in the DATA LIST with the HDS.

   It is OK?
   YES - Go to Step 9 .
   NO - Replace the gear shift control module. ■
9. Check the ENGAGE GEAR NEUTRAL in the DATA LIST with the HDS.

   Does the gear change into the N position?
   YES - Go to Step 11 .
   NO - Repair the transmission internal failure.■
10. Make sure the battery is fully charged.
11. Try to start the engine.

    Does the engine start?
    YES - Troubleshooting is complete.■
    NO - Substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM . ■

i-SHIFT System Symptom Troubleshooting - No transmission power to wheels

No Transmission Power to Wheels

1. Start the engine.
2. Press the brake pedal, and change the shift lever to the A/M position.
3. Check the BRAKE SWITCH in the DATA LIST with the HDS.

   Is the brake switch OK?
   YES - Go to Step 4 .
   NO - Do the brake pedal position switch signal circuit troubleshooting. ■
4. Check that the gear position indicator is displayed in 1st gear while in Auto mode.
   NOTE: When all the doors are closed, the gear position indicator should not flash. If the gear position indicator flashes, go to Step 5 .

   Is the gear position displayed?
   YES - Go to Step 8 .
   NO - Go to Step 5 .
5. Check for these conditions:
   - Leaks at hoses and line joints and connections, and repair if necessary.
   - Clutch lines for damage and leaks. Also check for bent clutch lines.
   - Reservoir level.

   Are they OK?
   YES - Go to Step 6 .
   NO - Repair the problems, then go through Step 1 to 4 and make sure it is normal.■
6. Do the i-SHIFT system learning (static mode).
7. Check that the gear position indicator is displayed in 1st gear while in Auto mode.

   Is the 1st gear position displayed?
   YES - Go to Step 9 .
   NO - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
8. Read out error memory and remove errors if present.
9. Check the clutch, concentric slave cylinder.

   It is OK?
   YES - Go to Step 10 .
   NO - Repair the problems, then go through Step 1 to 4 and make sure it is normal.■
10. Do the ENGAGE GEARS in the FUNCTIONAL TEST MENU with the HDS, and try to shift the position that cannot be shifted.

    Does the actuator move normally?
    YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair the transmission internal failure, then go through Step 1 to 4 and make sure it is normal.■

i-SHIFT System Symptom Troubleshooting - Non-Creep

Non-creep

NOTE: The creep function is only supported in gears, 1, 2, and R.

1. Turn the ignition switch to ON (II).
2. Check these parameters in the DATA LIST with the HDS (check signal change inactive/active):
   - IDLE SWITCH
   - BRAKE SWITCH
   - PARKING BRAKE SWITCH
   - CLUTCH TEMPERATURE (with a clutch temperature increased to higher degrees, creeping torque is reduced linearly. With a clutch temperature of 300 °C creeping function is inactive).

   Do they show the proper valve?
   YES - Go to Step 3 .
   NO - Repair the items that did not show the proper valve.■
3. Press the brake pedal, and change the shift lever to the A/M position.
4. Compare the TARGET GEAR and the ACTUAL GEAR in the DATA LIST with the HDS.

   Is the gear position OK?
   YES - Go to Step 5 .
   NO - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
5. Do the i-SHIFT system learning (static mode).

   Is the i-SHIFT system learning OK?
   YES - Go to Step 6 .
   NO - Repeat the i-SHIFT system learning (static mode) and the i-SHIFT system bleeding. ■
6. Test-drive, under these conditions:
   - Full load start at least five times.
   - Shift to every gear.

   NOTE: During test drive, read out the actual clutch temperature with the HDS. Do not start test drive with clutch temperature of 100 °C.
7. Clear any DTCs with the HDS.
8. Check the creep condition.

   Is it OK?
   YES - Vehicle is normal.■
   NO - Go to Step 1 and recheck.

Engine Stalls When Stopping

1. Check the clutch line for leaks and low fluid level.

   Is there any problems?
   YES - Repair the problem part, then go to Step 2 .
   NO - Go to Step 3 .

2. Clear the DTCs with the HDS (invoked due to repair).

3. Bleed hydraulic system to remove any air bubbles.

4. Do the i-SHIFT system learning (static mode).

   Was the i-SHIFT system learning (static mode) successfully completed?
   YES - Go to Step 6 .
   NO - Go to Step 5 .

5. Check for DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTC's troubleshooting.■
   NO - Bleed hydraulic system to remove any air bubbles, then do the i-SHIFT system learning (static mode). ■

6. Test-drive the vehicle for 10 minutes with at least 5 full load start.
   NOTE: During the test-drive, read out the actual clutch temperature with the HDS. Do not start test-drive with clutch temperature above 100 °C (212 °F).

   Was the test successfully completed?
   YES - Troubleshooting is complete.■
   NO - Go to Step 7 .

7. Check for DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTC's troubleshooting.■
   NO - Bleed the hydraulic system to remove any air bubbles, then do the i-SHIFT system learning (static mode). ■

i-SHIFT indicator stay on, but no DTCs are stored

1. Turn the ignition switch to ON (II).
2. Do the gauge self-diagnostic function.

   Does the i-SHIFT indicator flash?
   YES - Go to Step 3 .
   NO - Update the TCM if it does not have the latest software, or substitute a known-good gauge control module, and recheck. If the i-SHIFT indicator circuit is OK, replace the original gauge control module. ■
3. Connect the HDS to the DLC.
4. Make sure the HDS communicates with the vehicle and the TCM. If it does not, troubleshoot the DLC circuit.
5. Check for DTCs with the HDS.

   Is DTC U0155 indicated?
   YES - Go to the troubleshooting DTC U0155. ■
   NO - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

i-SHIFT System Functional Test

Clutch Actuator Full Stroke Operation

By the command from the HDS, the master cylinder in the clutch actuator is moved to full stroke position.
This functional test can be done under these conditions:

- IG switch on.
- Engine not running.
- N position.
- Drivers side door closed.

Engage Gears

By the command from the HDS, the clutch actuator and transmission shift change actuator operates, and shifts to any gear.
This functional test can be done under these conditions:

- IG switch on.
- Engine not running.
- N position.
- Synchronizing position learning has been completed.

NOTE:

- Specify a gear, and forcibly shift to that gear (usual paddle shifter is until 2nd).
- When diagnosing malfunction of the TCM or Motor, use it depending on the cause of malfunction.

HDS does not communicate with the TCM or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

i-SHIFT indicator does not come on

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Check the i-SHIFT INDICATOR LIGHT F-CAN in the DATA LIST with the HDS. If it is NG, replace the TCM.

i-SHIFT indicator stays on, but no DTCs are stored

Diagnostic procedure

1. Symptom troubleshooting.

i-SHIFT position indicator does not come on

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.

i-SHIFT position indicator does not change or a gear position does not match

Diagnostic procedure

1. Do the gauge control module troubleshooting.
2. Move the shift lever to all position then check the SHIFT VALID N or D or A/M or + or − or R FROM SHIFTER in the DATA LIST with the HDS. If it is NG, replace the gear shift control module.

Paddle shifter + (upshift switch) does not gear change

Diagnostic procedure

1. Paddle shifter + (upshift switch) circuit troubleshooting.
2. Paddle shifter + (upshift switch) test.
3. Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.

Paddle shifter − (downshift switch) does not gear change

Diagnostic procedure

1. Paddle shifter − (downshift switch) circuit troubleshooting.
2. Paddle shifter − (downshift switch) test.
3. Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.

Manual mode does not gear change of gear shift control module

Diagnostic procedure

1. Move the shift lever to all positions then check the SHIFT VALID N or D or A/M or + or − or R FROM SHIFTER in the DATA LIST with the HDS. If it is NG, replace the gear shift control module.

Engine doesn't crank

Diagnostic procedure

1. Symptom troubleshooting.

No transmission power to wheels

Diagnostic procedure

1. Symptom troubleshooting.

Non-creep

Diagnostic procedure

1. Symptom troubleshooting.

Engine stalls when stopping

Diagnostic procedure

1. Symptom troubleshooting.

All segments of the gear position indicator turn on. (When starting the engine, N is not indicated on the gear position indicator although the shift lever is at N position)

Diagnostic procedure

1. Make sure the shift lever is at N position, press the brake pedal and keep it pressed.
2. Turn the ignition switch to ON (II).
3. Keep the brake pedal pressed until the gear position indicator indicates N. If the gear position indicator does not change to N, inspect the battery.

i-SHIFT System Symptom Troubleshooting

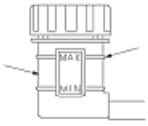
When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure
HDS does not communicate with the TCM or the vehicle	Troubleshoot the DLC circuit.
i-SHIFT indicator does not come on	1Do the gauge control module troubleshooting. 2Check the i-SHIFT INDICATOR LIGHT F-CAN in the DATA LIST with the HDS. If it is NG, replace the TCM.
i-SHIFT indicator stays on, but no DTCs are stored	Symptom troubleshooting.
i-SHIFT position indicator does not come on	1Do the gauge control module troubleshooting. 2Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.
i-SHIFT position indicator does not change or a gear position does not match	1Do the gauge control module troubleshooting. 2Move the shift lever to all position then check the SHIFT VALID N or D or A/M or + or − or R FROM SHIFTER in the DATA LIST with the HDS. If it is NG, replace the gear shift control module.
Paddle shifter + (upshift switch) does not gear change	1Paddle shifter + (upshift switch) circuit troubleshooting. 2Paddle shifter + (upshift switch) test. 3Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.
Paddle shifter − (downshift switch) does not gear change	1Paddle shifter − (downshift switch) circuit troubleshooting. 2Paddle shifter − (downshift switch) test. 3Substitute a known-good TCM, then recheck. If it is OK, replace the original TCM.
Manual mode does not gear change of gear shift control module	Move the shift lever to all positions then check the SHIFT VALID N or D or A/M or + or − or R FROM SHIFTER in the DATA LIST with the HDS. If it is NG, replace the gear shift control module.
Engine doesn't crank	Symptom troubleshooting.
No transmission power to wheels	Symptom troubleshooting.
Non-creep	Symptom troubleshooting.
Engine stalls when stopping	Symptom troubleshooting.
All segments of the gear position indicator turn on. (When starting the engine, N is not indicated on the gear position indicator although the shift lever is at N position)	1Make sure the shift lever is at N position, press the brake pedal and keep it pressed. 2Turn the ignition switch to ON (II). 3Keep the brake pedal pressed until the gear position indicator indicates N. If the gear position indicator does not change to N, inspect the battery.

i-SHIFT System Bleeding

NOTE:

- Do not reuse the drained fluid. Use only clean genuine Honda DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Make sure dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.



1. Make sure the brake fluid level in the reservoir (A) is at the MAX (upper) level line (B).

2. Remove the bleeder screw cap. Attach a hose to the bleeder (A), and suspend the hose in a container of brake fluid.
3. Do the CLUTCH FILLING in the ADJUSTMENT MENU with the HDS.
4. Tighten the bleeder screw securely.
5. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
6. Refill the brake fluid in the reservoir to the MAX (upper) level line.
7. Check the clutch operation and check for leaking fluid.

i-SHIFT System Learning

The i-SHIFT learning must be done so the TCM can learn characteristic information of the system. There are two learning modes, ‘‘Dynamic mode" and ‘‘Static mode", and the learning information is different between these two. It can only be done by doing the DYNAMIC MODE LEARNING or the STATIC MODE LEARNING in the ADJUSTMENT MENU with the HDS. The ‘‘Dynamic mode" requires driving procedures, and the ‘‘Static mode" does not require any driving procedures.

i-SHIFT System Learning (Dynamic Mode)

i-SHIFT system learning (Dynamic Mode) is learned through the following steps with the HDS.

1. Shift change actuator position learning.
2. Synchronizing position learning.
3. Clutch contact position 1 learning.
4. Clutch contact position 2 learning.
5. Clutch friction learning.
6. Clutch contact position 3 learning.
   Tasks necessary in the learning process.
   - Replace the clutch actuator (TCM).
   - Replace the clutch disc.
   - Replace the pressure plate.
   - Replace the flywheel.

i-SHIFT System Learning (Static Mode)

i-SHIFT system learning (static mode) is learned through the following steps with the HDS.

1. Shift change actuator position learning.
2. Synchronizing position learning.
3. Clutch contact position 1 learning.
4. Clutch contact position 2 learning.
5. Clutch contact position 3 learning.
   Tasks necessary in the learning process.
   - Replace the transmission shift change actuator.
   - Removal/installation the slave cylinder.
   - Disassembly/reassembly the transmission.
   - Removal/installation the transmission.

   When performing the following maintenance, perform Learning.

	i-SHIFT System Learning (Dynamic Mode)	i-SHIFT System Learning (Static Mode)
Replace the clutch actuator (TCM).	○	×
Replace the transmission shift change actuator.	×	○
Removal/installation the slave cylinder.	×	○
Replace the clutch disc.	○	×
Replace the pressure plate.	○	×
Replace the flywheel.	○	×
Removal/installation the transmission.	×	○
Disassembly/reassembly the transmission.	×	○

○: Maintenance to fall under
×: Maintenance to not fall under

Shift Change Actuator Position Learning

The transmission shift change actuator operates automatically and learns the transmission's neutral position (neutral reference) and the gear end position (from 1st to 6th and R) and stores the learning value into the TCM.
The shift change actuator position learning is required after these maintenance operations:

- Replace the clutch actuator (TCM).
- Removal/installation the transmission shift change actuator.
- Removal/installation the transmission.
- Disassembly/reassembly the transmission.

The shift change actuator position learning can be done by using the HDS under these conditions:

- IG switch on.
- Engine not running.
- N position.

NOTE:

- The commands are sorted for each gear, and can be shifted by the HDS.
- Depending on the gear position, shifting may become difficult. If unsuccessful after trying three times to shift, it is considered Fail.
- Usually, learning is done in the order R-1-2-3-4-5-6; but if there is failure at 2nd gear, try to relearn by shifting to

another gear at once as in the order R-1-2-3-2-4-2-5-6.

Synchronizing Position Learning

The transmission shift change actuator operates automatically and learns the synchro-timing (determined from the change of engine torque) just before gear is applied, and stores the learning value to the TCM.
The synchronizing position learning is required after these maintenance operations:

- Replace the clutch actuator (TCM).
- Removal/installation the transmission shift change actuator.
- Removal/installation the transmission.
- Disassembly/reassembly the transmission.

Synchronizing position learning can be done by using the HDS under these conditions:

- Engine running.
- N position.
- Foot brake on.
- Parking brake on.
- Shift change actuator position learning has been completed.

NOTE:

- The commands are sorted for each gear, and can be shifted by the HDS.
- In synchronizing position learning, a failure once is considered as fail.
- When performed together with shift change actuator position learning, learning values for both processes are stored in the EEPROM.

Clutch Contact Point 1·2 Learning

The clutch actuator automatically operates, learns the initial torque application on the clutch disc, and stores the learning value into the TCM.
‘‘1" means that the clutch actuator operated once and has learned the temporary value; ‘‘2" means that the clutch actuator operated twice and has done accurate learning. The learning value is stored in the TCM.
The clutch contact position 1·2 learning is required after these maintenance operations:

- Removal/installation the slave cylinder.
- Replace the clutch actuator (TCM).
- Removal/installation the transmission.
- Disassembly/reassembly the transmission.
- Replace the clutch disc.
- Replace the pressure plate.
- Replace the fly wheel.

Clutch contact position 1 and 2 learning can be done by using the HDS under these conditions:

- Engine running.
- N position.
- Foot brake on.
- Parking brake on.
- Synchronizing position learning has been completed.
- After the engine has warmed up (Engine torque is stable).

NOTE:

- The trigger has been set, and the function starts to operate when the shifter is changed from N to D.
- Perform the learning of clutch contact Position 1 and 2 in succession.
- If this learning process is not completed, the vehicle cannot be driven.

Clutch Friction Learning

The HDS stores the initial values specified for a certain model into the TCM.
Also, the HDS commands to increase the learning speed and perform driving test, and sends the frictional coefficient adjustment of the initial value to the TCM.
The clutch friction learning is required after these maintenance operations:

- Replace the clutch actuator (TCM).
- Replace the clutch disc.
- Replace the pressure plate.
- Replace the flywheel.

The clutch friction learning can be done by using the HDS under the these conditions:

- Clutch contact position 2 learning has been completed.
- With the road surface resistance acting, rotate the wheels of the vehicle, and apply 1st gear until 6th gear.

NOTE:

- Since there is no driving load during lift-up, correct adjustment cannot be achieved, thus connect the HDS and perform the driving test.
- In the Driving Test Mode, the specialized Shift Pattern and Auto does not perform downshift.

Clutch Contact Position 3 Learning

After the coefficient of friction is input during the clutch friction learning, the procedure is done in the same manner as in clutch contact position 2 and the final learning is performed and stored in the TCM.
The clutch contact position learning is required after these maintenance operations:

- Replace the clutch actuator (TCM).
- Replace the clutch disc.
- Replace the pressure plate.
- Replace the flywheel.
- Removal/installation the slave cylinder.*1
- Removal/installation the transmission.*1
- Disassembly/reassembly the transmission.*1

The clutch contact position 3 learning can be done by using the HDS under these conditions:

- Engine running.
- N position.
- Foot brake on.
- Parking brake on.
- Synchronizing position learning has been completed.
- After the engine has warmed up (Engine torque is stable).

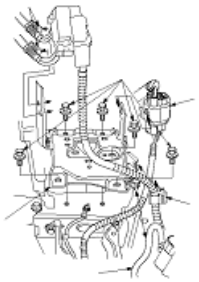
NOTE:

- The trigger has been set, and the function starts to operate when the shifter is changed from N to D.
- Driving Test is not needed when performing the maintenance for*1, so perform clutch contact position 1, 2, and 3 learning in succession.

i-SHIFT Clutch Actuator/TCM Removal/Installation

NOTE:

- Take care not to scratch body.
- Use fender covers to avoid damaging painted surfaces.



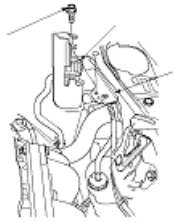
1. Do the battery terminal disconnection procedure.
2. Do the battery removal procedure.
3. Remove the air cleaner housing.
4. Remove the battery harness clamps (A), then release the lock and remove the clutch actuator connector (B).
5. Remove the battery base bolts (C) and the reservoir tube (D), then remove the battery base (E).

---

6. Remove the bolts (A) from the slave cylinder (B) so as not to bend the clutch line.

---

7. Remove the clutch reservoir tank (A) from the bulkhead (B).
   NOTE:
   - Do not spill brake fluid from the reservoir tank.
   - When remove the reservoir tank, fix the reservoir tank by hand.



---

8. Disconnect the clutch actuator connector (A) and the ground cable (B).

---

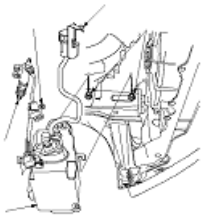
9. Release the lock and remove the transmission shift change actuator connector (A), then remove the transmission shift change actuator harness cover (B) and the harness clip (C).

---

10. Disconnect the transmission shift change actuator connector (A).
11. Raise the vehicle, and make sure it is securely supported.
12. Remove the splash shield.

---

13. Loosen the bolts (A), then remove the clutch actuator (B) with the clutch pipe comp (C) and the clutch fluid tube assembly (D).
14. Install the clutch actuator in the reverse order of removal.
15. Do the battery installation procedure.
16. Bleed the clutch hydraulic system.
17. Do the i-SHIFT system learning (dynamic mode).
18. Test-drive the vehicle.



i-SHIFT Clutch Fluid Tube Assembly Replacement

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

1. Raise the vehicle, and make sure it is securely supported.
2. Remove the splash shield.
3. Disconnect the clutch fluid tube (A) from the clutch actuator (B). Plug the end of the clutch fluid with a shop towel to prevent brake fluid from coming out.
4. Lower the vehicle, and make sure it is securely supported.

---

5. Remove the clutch reservoir tank (A) from the bulkhead (B), then remove the reservoir tube (C) from the clips (D). Replace to the new clutch fluid tube assembly.

---

6. Install the clutch reservoir tank (A) on the bulkhead (B), then install the reservoir tube (C), from the clips (D).
   NOTE:
   - Make a mark (E) on this side and insert the tube into the clip.
   - When install the reservoir tank, fix the reservoir tank by hand.
7. Raise the vehicle, and make sure it is securely supported.

---

8. Connect the clutch fluid tube (A) on to the clutch actuator (B).
   NOTE:
   - Match the mark of tube (C) with the mark of grommet (D).
   - Install the tube till the mark is matched to the protrusion of tube.
   - Application of oil is not allowed.
9. Install the splash shield.
10. Bleed the clutch hydraulic system.
11. Do the i-SHIFT system learning (static mode).
12. Check the clutch operation and check for leaking fluid.
13. Test-drive the vehicle.

i-SHIFT Clutch Pipe Assembly Replacement

NOTE:

- Use fender covers to avoid damaging painted surface.
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

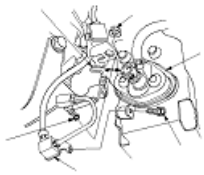
1. Remove the slave cylinder (A) from the transmission housing (B), so as not to bend the clutch line.
2. Raise the vehicle, and make sure it is securely supported.
3. Remove the splash shield.

---

4. Remove the clip (A) then Disconnect the clutch pipe comp (B) from the clutch actuator (C). Plug the end of the clutch line with a shop towel to prevent brake fluid from coming out.

---

5. Connect the clutch pipe comp (A) with the new O-ring (B) then install the clip (C) from the clutch actuator (D).
   NOTE:
   - No clip protrude after install.
   - Confirm the connector being set certainly.
   - Application of oil is not allowed.
6. Install the splash shield.
7. Lower the vehicle, and make sure it is securely supported.

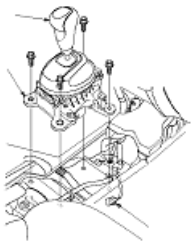


---

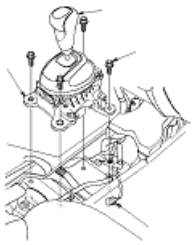
8. Pull the boot (A) back, and apply grease to the boot and slave cylinder rod (B). Reinstall the boot.
9. Apply a light coat of molybdenum grease to the tip of the push rod the slave cylinder and the release fork.
10. Install the slave cylinder (C) on the transmission housing (D).
11. Bleed the clutch hydraulic system.
12. Do the i-SHIFT system learning (static mode).
13. Check the clutch operation and check for leaking fluid.
14. Test-drive the vehicle.

i-SHIFT Gear Shift Control Module Replacement

NOTE: LHD model is shown, RHD model is similar.



1. Remove the center console.
2. Disconnect the connector (A), then remove the gear shift control module (B).
   NOTE: If the gear shift control module needs to be replaced, remove the shift lever knob (C) from the gear shift control module.



3. Install the gear shift control module (A), then connect the connector (B).
   NOTE: If the gear shift control module was replaced, install the shift lever knob (C) to the gear shift control module (turn the shift lever knob clockwise for 11 to 13 times, and make sure the shift pattern on the knob is at the right place).
4. Install the center console.
5. Test-drive the vehicle.

Paddle Shifter - (Downshift Switch) Circuit Troubleshooting

SRS components are located in this area. Review the SRS component locations, and the precautions and procedures before doing repair or service.

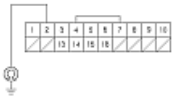
1. Remove the steering wheel.
2. Check for continuity between steering switch harness 20P connector terminals No. 8 and No. 12 while pressing paddle shifter − (downshift switch) and when the switch is released.

   Is there continuity while pressing paddle shifter − (downshift switch) and no continuity when the switch released?
   YES - Go to Step 5 .
   NO - Go to Step 3 .
3. Disconnect the paddle shifter − (downshift switch) connector.

---

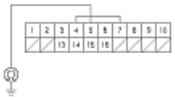
4. Check for continuity between paddle shifter − (downshift switch) connector terminals while pressing the switch and when the switch is released.

   Is there continuity while pressing the switch and no continuity when the switch released?
   YES - Replace the steering switch harness.■
   NO - Replace the paddle shifter − (downshift switch).
5. Remove the cable reel.



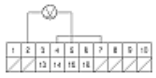
6. Check for continuity cable reel 20P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 7 .
   NO - Repair open in the wire between cable reel 20P connector terminal No. 2 and ground (G501), or repair poor ground (G501).■



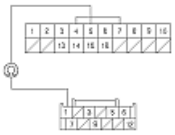
7. Check for continuity between cable reel 20P connector terminal No. 5 and body ground.

   Is there continuity?
   YES - Repair short to ground in the wire between cable reel 20P connector terminal No. 5 and gear shift control module 12P connector terminal No. 1.■
   NO - Go to Step 8 .
8. Turn the ignition switch to ON (II), and shift to the A position.



9. Measure voltage between cable reel 20P connector terminal No. 2 and No. 5.

   Is there battery voltage in neutral position and no voltage while pressing shift − (minus) switch?
   YES - Replace the cable reel. ■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect gear shift control module 12P connector.



13. Check for continuity between gear shift control module 12P connector terminal No. 1 and cable reel 20P connector terminal No. 5.

    Is there continuity?
    YES - Check for loose or poor connections at gear shift control module 12P connector terminal No. 1. If the connection is OK, substitute a known-good gear shift control module and recheck.■
    NO - Repair open in the wire between gear shift control module 12P connector terminal No. 1 and cable reel 20P connector.■

Paddle Shifter - (Downshift Switch) Test

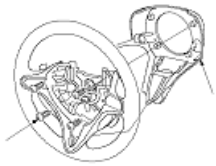
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Remove the steering wheel.
2. Check the paddle shifter − (downshift switch) for continuity between steering switch harness 20P connector terminals No. 8 and No. 12.
   There should be continuity while pressing the paddle shifter − (downshift switch), and no continuity when the switch is released.
3. Paddle shifter − (downshift switch) test has finished if the test result is OK.
   If the switch works incorrectly at the 20P connector, test the switch at the switch connector.

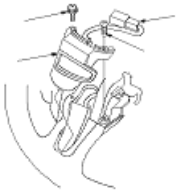
4. Remove paddle shifter − (downshift switch) connector from its holder, and disconnect the connector.
5. Check the paddle shifter − (downshift switch) for continuity between the switch connector terminals while pressing the switch and when the switch is released.
   There should be continuity while pressing the switch, and no continuity when the switch is released.
6. Replace the paddle shifter − (downshift switch) if the switch works incorrectly.
7. Replace the steering switch harness if the switch is OK.

Paddle Shifter - (Downshift Switch) Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



1. Remove the steering wheel.
2. Remove the four screws (A) securing the steering wheel rear cover (B), then remove the steering wheel rear cover.



3. Remove the paddle shifter − (downshift switch) connector (A) from its holder, and disconnect the connector.
4. Remove the screws (B) securing the paddle shifter − (C), remove the paddle shifter −, and replace it with a new one.
5. Install the new paddle shifter − on the steering wheel, and secure it with the screws.
6. Connect the paddle shifter − connector securely, and install the connector in the connector holder.
7. Install the steering wheel rear cover, and secure the rear cover with the four screws.
8. Install the steering wheel.

Paddle Shifter + (Upshift Switch) Circuit Troubleshooting

SRS components are located in this area. Review the SRS component locations, and the precautions and procedures before doing repair or service.

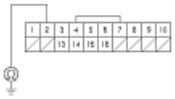
1. Remove the steering wheel.
2. Check for continuity between steering switch harness 20P connector terminals No. 7 and No. 12 while pressing paddle shifter + (upshift switch) and when the switch is released.

   Is there continuity while pressing paddle shifter + (upshift switch) and no continuity when the switch released?
   YES - Go to Step 5 .
   NO - Go to Step 3 .
3. Disconnect the paddle shifter + (upshift switch) connector.

---

4. Check for continuity between paddle shifter + (upshift switch) connector terminals while pressing the switch and when the switch is released.

   Is there continuity while pressing the switch and no continuity when the switch released?
   YES - Replace the steering switch harness.■
   NO - Replace the paddle shifter + (upshift switch).
5. Remove the cable reel.



6. Check for continuity cable reel 20P connector terminal No. 2 and body ground.

   Is there continuity?
   YES - Go to Step 7 .
   NO - Repair open in the wire between cable reel 20P connector terminal No. 2 and ground (G501), or repair poor ground (G501).■

---

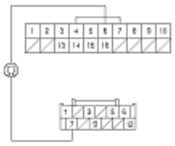
7. Check for continuity between cable reel 20P connector terminal No. 6 and body ground.

   Is there continuity?
   YES - Repair short to ground in the wire between cable reel 20P connector terminal No. 6 and gear shift control module 12P connector terminal No. 7.■
   NO - Go to Step 8 .
8. Turn the ignition switch to ON (II), and shift to the A position.

---

9. Measure voltage between cable reel 20P connector terminal No. 2 and No. 6.

   Is there about 5 V in neutral position and no voltage while pressing paddle shifter + (upshift switch)?
   YES - Replace the cable reel. ■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect gear shift control module 12P connector.

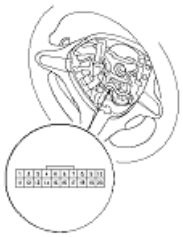


13. Check for continuity between gear shift control module 12P connector terminal No. 7 and cable reel 20P connector terminal No. 6.

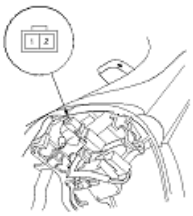
   Is there continuity?
   YES - Check for loose or poor connections at gear shift control module 12P connector terminal No. 7 If the connection is OK, substitute a known-good gear shift control module and recheck.■
   NO - Repair open in the wire between gear shift control module 12P connector terminal No. 7 and cable reel 20P connector.■

Paddle Shifter + (Upshift Switch) Test

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



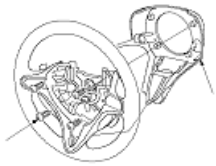
1. Remove the steering wheel.
2. Check the paddle shifter + (upshift switch) for continuity between steering switch harness 20P connector terminals No. 7 and No. 12.
   There should be continuity while pressing the paddle shifter + (upshift switch), and no continuity when the switch is released.
3. Paddle shifter + (upshift switch) test has finished if the test result is OK.
   If the switch works incorrectly at the 20P connector, test the switch at the switch connector.



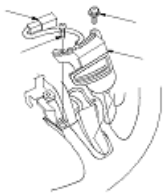
4. Remove paddle shifter + (upshift switch) connector from its holder, and disconnect the connector.
5. Check the paddle shifter + (upshift switch) for continuity between the switch connector terminals while pressing the switch and when the switch is released.
   There should be continuity while pressing the switch, and no continuity when the switch is released.
6. Replace the paddle shifter + (upshift switch) if the switch works incorrectly.
7. Replace the steering switch harness if the switch is OK.

Paddle Shifter + (Upshift Switch) Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.



1. Remove the steering wheel.
2. Remove the four screws (A) securing the steering wheel rear cover (B), then remove the steering wheel rear cover.

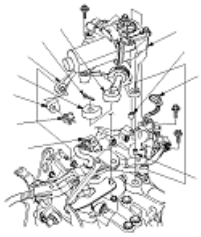


3. Remove the paddle shifter + (upshift switch) connector (A) from its holder, and disconnect the connector.
4. Remove the screws (B) securing the paddle shifter + (C), remove the paddle shifter +, and replace it with a new one.
5. Install the new paddle shifter + on the steering wheel, and secure it with the screws.
6. Connect the paddle shifter + connector securely, and install the connector in the connector holder.
7. Install the steering wheel rear cover, and secure the rear cover with the four screws.
8. Install the steering wheel.

i-SHIFT Transmission Shift Change Actuator Replacement

NOTE: Use fender covers to avoid damaging painted surface.

1. Do the battery terminal disconnection procedure.
2. Remove the air cleaner housing.
3. Remove the transmission shift change actuator harness cover (A) and the harness clip (B).

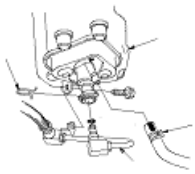


4. Disconnect the transmission shift change actuator connectors (A). Remove the cotter pin (B) and select wire washer (C).
5. Disconnect the select actuator rod (D) and shift actuator rod (E) with joint covers (F) from the change lever assembly (G).
6. Remove the transmission shift change actuator (H), then remove the dowel pins (I) from the top of the transmission housing.
7. Install the transmission shift change actuator in the reverse order of removal with the new cotter pin.
   NOTE:
   - Be careful of assemble direction of joint cover.
   - Application of grease is not allowed at installation to the rods.
   - Install the select wire washer certainly.
8. Do the battery terminal reconnection procedure.
9. Do the i-SHIFT system learning (static mode).
10. Test-drive the vehicle.

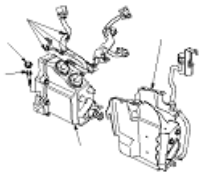
TCM Replacement

NOTE:

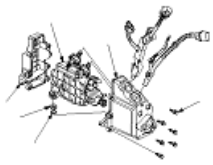
- Take care not to scratch the body.
- Use fender covers to avoid damaging painted surfaces.



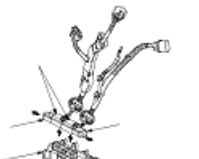
1. Remove the clutch actuator from the body.
2. Remove the clip (A) then remove the clutch pipe comp (B) and the clutch fluid tube assembly (C) from the clutch actuator (D). Plug the end of the clutch line with a shop towel to prevent brake fluid from coming out.



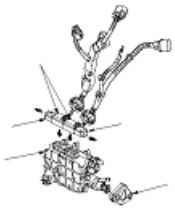
3. Remove the clutch actuator cover cap (A) and bolt (B). Remove the harness clips (C).
4. Remove the clutch actuator (D) from the clutch actuator bracket (E).



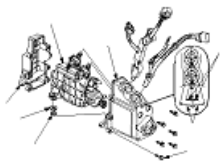
5. Remove the bolts (A) then remove the clutch actuator cover (B) from the clutch actuator case (C). Remove the clutch actuator case with the clutch actuator collar (D) and the O-ring (E) from the clutch actuator (F).
   NOTE: Do not damage the wire harness.



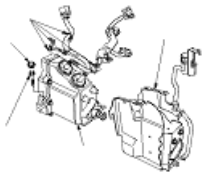
6. Pull the fixtures (A) then disconnect the clutch actuator connectors (B). Remove the clutch actuator grommet (C) from the clutch actuator (D). Replace to the new clutch actuator.



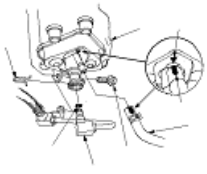
7. Connect the clutch actuator connectors (A) on the new clutch actuator (B), then fix the connectors by pushing the fixtures (C). Install the clutch actuator grommet (D) on the clutch actuator.



8. Install the clutch actuator (A) on the clutch actuator case (B) with the clutch actuator collar (C) and the O-ring (D).
   NOTE:
   - Do not damage the wire harness.
   - Match the mark of harness grommet with the mark of case at the angle shown.
   - Install the O-ring in the ditch of the collar certainly.
9. Install the clutch actuator cover (E) on the clutch actuator case.



10. Install the clutch actuator (A) from the clutch actuator bracket (B).
11. Install the bolt (C) and new clutch actuator cover cap (D). Install the harness clips (E).



12. Install the clutch fluid tube assembly (A) to the clutch actuator (B). Install the clutch pipe comp (C) with the new O-ring (D) then install the clip (E) to the clutch actuator.
    NOTE:
    - Match the mark of tube (F) with the mark of grommet (G).
    - Install the tube till the mark is matched to the protrusion of tube.
    - No clip protrude after install.
    - Confirm the connector being set certainly.
    - Application of oil is not allowed.
    - Apply industrial alcohol to the clutch tube assembly is allowed of installation.
13. Install the clutch actuator on the body.
14. Bleed the clutch hydraulic system.
15. Do the i-SHIFT system learning (dynamic mode).
16. Test-drive the vehicle.

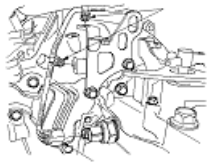
M/T Assembly Removal

Special Tools Required

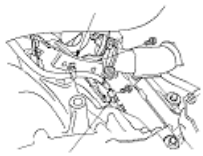
Engine support hanger
AAR-T-1256-J00
NOTE: Use fender covers to avoid damaging painted surfaces.

1. Secure the hood in the wide open position (support rod in the lower hole).
2. Remove the windshield wiper arms.
3. Remove the cowl covers and hood hinge cover.
4. Remove the wiper motor.
5. Remove under-cowl panel.
6. Do the battery terminal disconnection procedure.
7. Do the battery removal procedure.
8. Remove the clutch actuator (TCM).
9. Remove the transmission shift change actuator.
10. Remove the air cleaner stay.

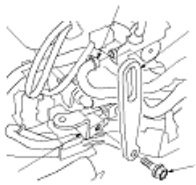
11. Disconnect the back-up light switch connector (A), then remove the harness clips (B).



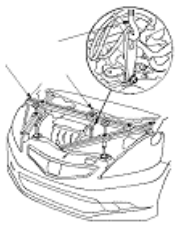
12. Disconnect the vehicle speed sensor (VSS) connector (A), then remove the harness clamp bracket (B).



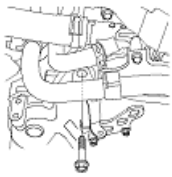
13. Remove the purge control SOL.V. hose (A). Install the hanger plate (B) to the air cleaner housing mounting bracket (C) with the 8 x 1.25 mm bolt (D).



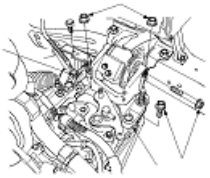
14. Install the engine support hanger (A) with the hook (B) to the vehicle. Tighten the wing nut (C) by hand, and lift and support the engine.



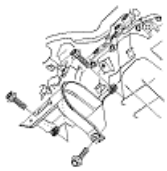
15. Remove the one upper transmission mounting bolt.



16. Remove the ground cable (A), transmission mount nuts (B), and transmission mount bolts (C), from the transmission bracket (D).
17. Raise the vehicle on a lift, and make sure it is securely supported.
18. Remove the splash shield.
19. Drain the transmission fluid. Reinstall the drain plug using a new sealing washer.
20. Remove the right and left driveshafts.

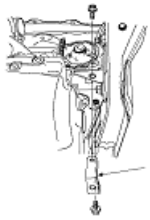


21. Remove the heat cover.

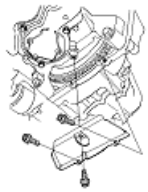


22. Remove the clutch pipe stay.

23. Remove the transmission mount bracket (A).
    NOTE: The bracket is used in the production process, not necessary to be reinstalled.



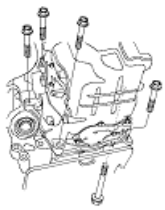
24. Remove the clutch case cover.
25. Securely support the transmission with a transmission jack.



26. Remove the torque rod.

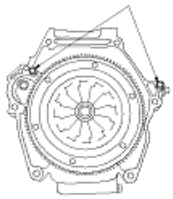
27. Remove the torque rod bracket.

28. Remove the lower transmission mounting bolts.
29. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate.
30. Slowly lower the transmission. Check once again that all hoses and electrical wiring are disconnected and free from the transmission then lower it completely. Remove the two dowel pins.



M/T Assembly Installation

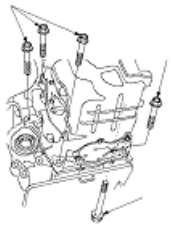
Special Tools Required



Engine support hanger
AAR-T-1256-J00
NOTE: Use fender covers to avoid damaging painted surfaces.

1. Make sure two dowel pins (A) are installed in prescribed hole on the engine block as shown.
2. Check the release bearing, and reinstall the release bearing and the release fork with applying appropriate grease.
3. Place the transmission on the transmission jack, and raise it to the engine unit level.

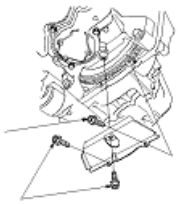
4. Install the lower transmission mounting bolts.



5. Install the torque rod bracket with new bolt (A) and bolts (B).

6. Loosely install the torque rod new bolt (A), new nut (B) and new bolt (C), then remove the transmission jack.

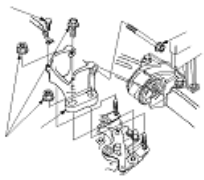
7. Install the clutch case cover.



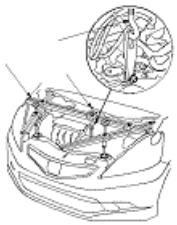
8. Install the clutch pipe stay.

9. Install the heat cover.
10. Install the right and left driveshafts.
11. Lower the vehicle on the lift.

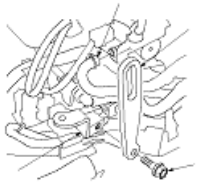
12. Install the transmission mount bracket (A), and loosely tighten the new transmission mount bracket mounting bolts and nuts (B).
13. Install the ground cable (C).



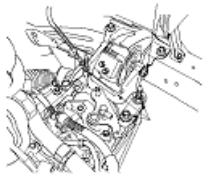
14. Loosen the wing nut (A). Remove the hook (B) and engine support hanger (C) from the vehicle.



15. Remove the hanger plate (A) to the air cleaner housing mounting bracket (B) with the 8 x 1.25 mm bolt (C). Install the purge control SOL.V. hose (D).

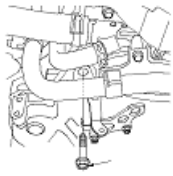


16. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.

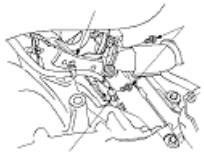


17. Tighten the torque rod with the bolts and nut to the specified torque value.

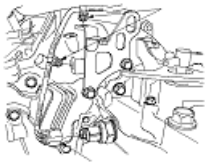
18. Install the one upper transmission mounting bolts.



19. Connect the vehicle speed sensor (VSS) connector (A), then install the harness clamp bracket (B).



20. Connect the back-up light switch connector (A), then install the harness clips (B).

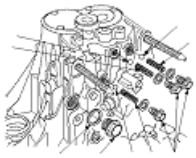


21. Install the air cleaner stay.
22. Install the transmission shift change actuator.
23. Install the clutch actuator (TCM).
24. Do the battery installation procedure.
25. Refill the transmission fluid to the proper level.
26. Install the splash shield.
27. Install the under-cowl panel.
28. Install the wiper motor.
29. Install the hood hinge cover and cowl cover.
30. Install the windshield wiper arms.
31. Do the i-SHIFT system learning (static mode).
32. Check the clutch operation.
33. Check the wheel alignment and adjust it if necessary.
34. Test-driver the vehicle.

M/T Assembly Disassembly

Exploded View - Clutch Housing

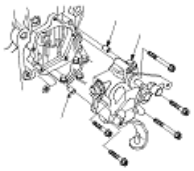
Exploded View - Transmission Housing



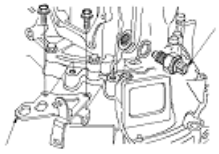
NOTE: Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.

1. Remove the detent bolts (A), springs (B), steel balls (C).
2. Remove the 20 mm bolt (D) and 20 mm washer (E).

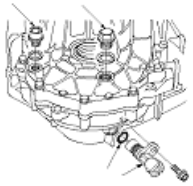
3. Remove the change lever assembly (A) and the 8 x 10 mm dowel pins (B).



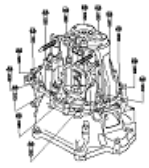
4. Remove the transmission hanger (A) and back-up light switch (B).



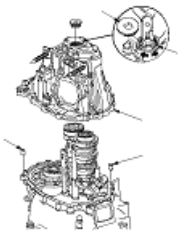
5. Remove the drain plug (A), filler plug (B) and the speed sensor (C), then remove the O-ring (D).



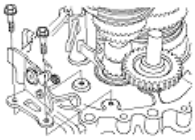
6. Remove the 8 mm flange bolts in a crisscross pattern in several steps.



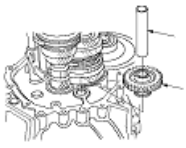
7. Remove the 32 mm sealing cap (A).
8. Expand the 69 mm snap ring (B) on the countershaft ball bearing, and remove it from the groove using a pair of snap ring pliers.
9. Remove the transmission housing (C) and 14 x 20 mm dowel pins (D).



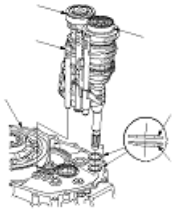
10. Remove the reverse shift fork.



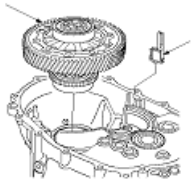
11. Remove the reverse idler gear (A) and reverse gear shaft (B).



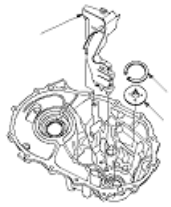
12. Apply tape to the mainshaft splines to protect the seal, then remove the mainshaft assembly (A) and countershaft assembly (B) with the shift forks (C) from the clutch housing (D).
13. Remove the 36 mm spring washer (E) and 26 mm washer (F).



14. Remove the differential assembly (A) and magnet (B).



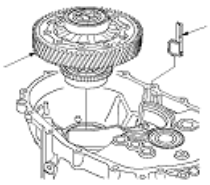
15. Remove the oil gutter plate (A), 52 x 62 mm shim (B), and oil guide plate M.



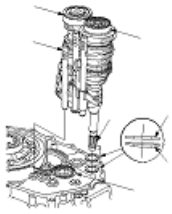
M/T Assembly Reassembly

NOTE: Prior to reassembling, clean all the parts in solvent, dry them, and apply lubricant to any contact surfaces.

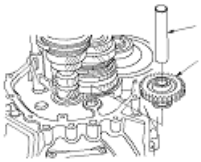
1. Install the magnet (A) and differential assembly (B).



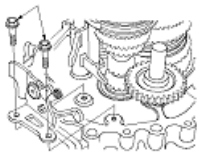
2. Install the 36 mm spring washer (A) and 26 mm washer (B) over the ball bearing (C). Note the installation direction of the spring washer.
3. Apply tape on the mainshaft spline (D) to protect the seal. Install the mainshaft and countershaft (E) into the shift forks (F), and install them as an assembly.



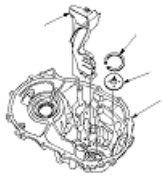
4. Install the reverse idler gear (A) and the reverse gear shaft (B).



5. Install the reverse shift fork.

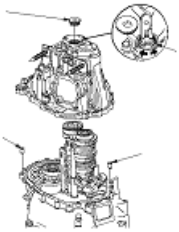


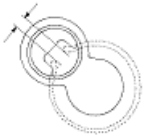
6. Select the proper size 52 x 62 mm shim (A) according to the measurements made during the mainshaft thrust clearance adjustment. Install the oil gutter plate (B), oil guide plate M, and the 52 x 62 mm shim into the transmission housing (C).



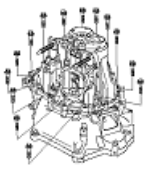
7. Remove any dirt and oil from the transmission housing sealing surface. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the sealing surface. Make sure you seal the entire circumference of the bolt holes to prevent oil leakage.
   NOTE: Do not install components if too much time has passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.

8. Install the 14 x 20 mm dowel pins (A).
9. Place the transmission housing over the clutch housing, being careful to line up the shafts.
10. Lower the transmission housing the rest of the way as you expand the 69 mm snap ring (B). Release the snap ring so it seats in the groove of the countershaft bearing.
11. Check that the 69 mm snap ring is securely seated in the groove of the countershaft bearing.
    Dimension (1) as installed:
    3.3−6.5 mm (0.13−0.25 in.)
12. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the threads of the 32 mm sealing cap (C), and install it on the transmission housing.

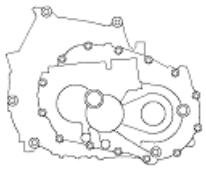




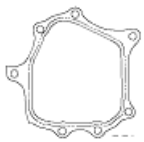
13. Install the 8 mm flange bolts finger-tight.



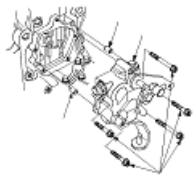
14. Tighten the 8 mm flange bolts in a crisscross pattern in several steps.
    Specified Torque: **8 x 1.25 mm 27 N·m (2.8 kgf·m, 20 lbf·ft)**



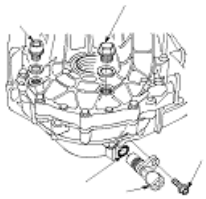
15. Remove any dirt and oil from the change lever cover sealing surface. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the sealing surface.
    NOTE: Do not install components if too much time has passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



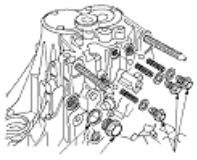
16. Install the 8 x 14 mm dowel pins (A), and change lever assembly (B).



17. Install the drain plug (A), filler plug (B), speed sensor (C), and new O-ring (D).



18. Install the detent bolts (A), the springs, and the steel balls with new washers.
19. Install the 20 mm bolt (B) and a new 20 mm washer (C).



20. Install the new washer (A), the back-up light switch (B), and the transmission hanger (C).

Back-up Light Switch Test

1. Disconnect the back-up light switch 2P connector (A).

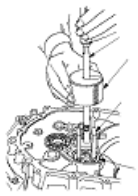
2. Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the shift lever is in reverse. If the result is faulty, go to Step 3 .

3. Remove the back-up light switch (A). Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the switch end (B) is pressed, and no continuity when the switch end is released. If the result is faulty, replace the back-up light switch. If the switch is OK, check the reverse shift piece in the transmission.

4. Install the removed or the new back-up light switch and new washer.
5. Connect the back-up light switch 2P connector.

M/T Clutch Housing Countershaft Bearing Replacement

Special Tools Required



Adjustable bearing remover head, 20–40 mm
07JAC-PH80100

Bearing remover shaft
07JAC-PH80200

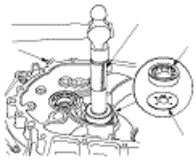
Slide hammer weight
07741-0010201

Oil seal driver, 65 mm
07JAD-PL90100

1. Remove the needle bearing (A) using the special tool, then remove the oil gauge plate C.

---

2. Position the oil guide plate C and new needle bearing (A) in the bore of the clutch housing (B).
3. Install the needle bearing using the special tools.



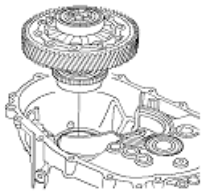
M/T Clutch Housing Differential Thrust Clearance Adjustment

Special Tools Required

Inner driver handle, 40 mm
07746-0030100

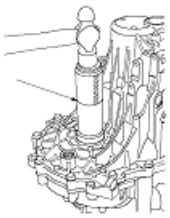
1. Install the 80 mm shim that's the same size as the one you removed.

2. Install the differential assembly into the clutch housing.



3. Install the transmission housing onto the clutch housing, then tighten the 8 mm flange bolts in a crisscross pattern in several steps.
   Specified Torque: **8 x 1.25 mm 27 N·m (2.8 kgf·m, 20 lbf·ft)**

4. Use the special tool to bottom the differential assembly in the clutch housing.



5. Measure clearance between 80 mm shim and bearing outer race in transmission housing.
   Standard: **0.01−0.10 mm (0.0004−0.0039 in.)**

6. If the clearance is more than the standard, select a new shim from the following table. If the clearance measured in step 5 is within the standard, go to Step 9 .

80 mm Shim

Type	Part Number	Thickness
A	41441-PL3-B00	1.00 mm (0.039 in.)
B	41442-PL3-B00	1.10 mm (0.043 in.)
C	41443-PL3-B00	1.20 mm (0.047 in.)
D	41444-PL3-B00	1.30 mm (0.051 in.)
E	41445-PL3-B00	1.40 mm (0.055 in.)
F	41446-PL3-B00	1.50 mm (0.059 in.)
G	41447-PL3-B00	1.60 mm (0.063 in.)
H	41448-PL3-B00	1.70 mm (0.067 in.)
J	41449-PL3-B00	1.80 mm (0.071 in.)
K	41450-PL3-B00	1.05 mm (0.041 in.)
L	41451-PL3-B00	1.15 mm (0.045 in.)
M	41452-PL3-B00	1.25 mm (0.049 in.)
N	41453-PL3-B00	1.35 mm (0.053 in.)
P	41454-PL3-B00	1.45 mm (0.057 in.)
Q	41455-PL3-B00	1.55 mm (0.061 in.)
R	41456-PL3-B00	1.65 mm (0.065 in.)
S	41457-PL3-B00	1.75 mm (0.069 in.)

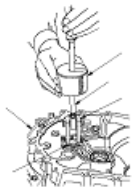
7. Remove the bolts and transmission housing.
8. Replace the thrust shim selected in step 6, then recheck the clearance.
9. Reinstall the transmission.

Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	I.D.		18.016−18.043 mm (0.7093−0.7104 in.)	18.08 mm (0.712 in.)
	Gear-to-reverse gear shaft clearance		0.032−0.077 mm (0.0013−0.003 in.)	0.14 mm (0.006 in.)

M/T Clutch Housing Mainshaft Bearing and Oil Seal Replacement

Special Tools Required



Adjustable bearing remover head, 20−40 mm
07JAC-PH80100

Bearing remover shaft
07JAC-PH80200

Slide hammer weight
07741-0010201

Driver handle, 15 x 135L
07749-0010000

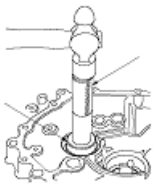
Bearing driver attachment, 42 x 47 mm
07746-0010300

Bearing driver attachment, 52 x 55 mm
07746-0010400

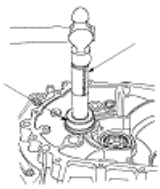
1. Remove the ball bearing (A) from the clutch housing (B) using the special tool.

2. Remove the oil seal (A) from the clutch side. Be careful when removing the seal so the clutch housing is not damaged.

3. Drive the new oil seal in from the transmission side using the special tools.

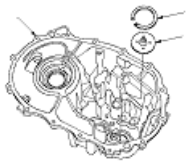


4. Drive the new ball bearing in from the transmission side using the special tools.



M/T Clutch Housing Mainshaft Thrust Clearance Adjustment

Special Tools Required



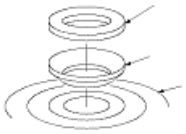
Catch adapter
07GAJ-PG20110

Base collar
07GAJ-PG20120

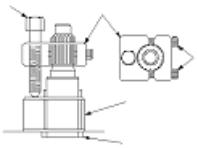
Base adapter
07GAJ-PG20130

Magnet stand base
07979-PJ40001

1. Remove the 52 x 62 mm shim (A) and oil guide plate M from the transmission housing (B).



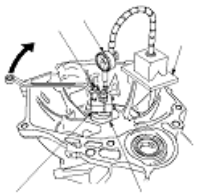
2. Thoroughly clean the spring washer (A) and washer (B) before installing them on the ball bearing (C). Note the installation direction of the spring washer.
3. Install the 3rd/4th synchro hub, the distance collar, the 5th synchro hub, the distance collar, and ball bearing on the mainshaft.
   NOTE: Refer to the mainshaft reassembly Exploded View.
4. Install the mainshaft in the clutch housing.
5. Place the transmission housing over the mainshaft and onto the clutch housing.
6. Secure the clutch and transmission housings with several 8 mm bolts.
   NOTE: It is not necessary to use sealing agent between the housings for this procedure.
7. Light tap the mainshaft with a plastic hammer.



8. Attach the special tools to the mainshaft as follows:
   - Back-out the catch adapter bolt (A) and loosen the two hex bolts (B).
   - Fit the holder over the mainshaft so its lip is toward the transmission.
   - Align the catch adapter lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.
9. Seat the mainshaft fully by tapping its end with a plastic hammer.
10. Thread the catch adapter bolt in until it just contacts the wide surface of the base adapter.

---

11. Zero a dial gauge (A) on the end of the mainshaft.



12. Turn the catch adapter bolt (B) clockwise; stop turning when the dial gauge (A) has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft thrust clearance.
NOTE: Do not turn the catch adapter bolt more than 60 degrees after the needle of the dial gauge stop moving. Applying more pressure with the catch adapter bolt could damage the transmission.

13. If the reading is with in the standard, the clearance is correct. If the reading is not within the standards, select the appropriate shim needed from the table, and recheck the thrust clearance.
Standard: 0.11−0.18 mm (0.004−0.007 in.)

(Example)
Measure reading: 1.93 mm (0.0759 in.)

Subtract the middle of the clearance standard 0.14 mm (0.0055 in.) from the total clearance measurement.
1.93 − 0.14 = 1.79 mm (0.0705 in.)

Select the shim closest to the amount calculated, for example the 1.78 mm (0.0701 in.) shim.

14. With oil guide plate M and the appropriate size shim installed in the transmission housing, check the thrust clearance again to verify the clearance is within the standard.

52 x 62 mm Shim

Type	Part Number	Thickness
A	23931-PZ9-000	0.85 mm (0.0335 in.)
B	23932-PZ9-000	0.88 mm (0.0346 in.)
C	23933-PZ9-000	0.91 mm (0.0358 in.)
D	23934-PZ9-000	0.94 mm (0.0370 in.)
E	23935-PZ9-000	0.97 mm (0.0382 in.)
F	23936-PZ9-000	1.00 mm (0.0394 in.)
G	23937-PZ9-000	1.03 mm (0.0406 in.)
H	23938-PZ9-000	1.06 mm (0.0417 in.)
I	23939-PZ9-000	1.09 mm (0.0429 in.)

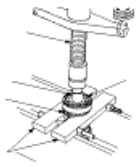
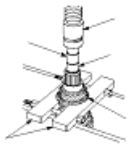
M/T Countershaft Disassembly

1. Securely clamp the countershaft assembly in a bench vise with wood blocks.
2. Remove the special bolt (left-hand threads).

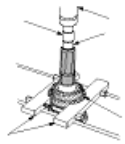
3. Support ball bearing (A) 6th gear (B) on steel blocks (C), then use a press (D) and an attachment (E) to press the countershaft out of the ball bearing.
4. Remove the 32 mm shim and distance collar.



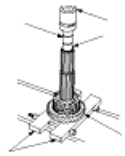
5. Support 4th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the 5th gear.



6. Support 2nd gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of 3rd gear.

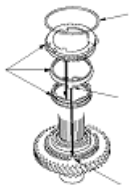


7. Support 1st gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the 1st/2nd synchro.



M/T Countershaft Reassembly

Exploded View



Special Tools Required

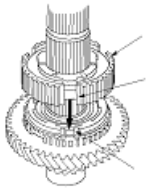
Inner driver handle, 40 mm
07746-0030100

Inner bearing driver attachment, 30 mm
07746-0030300

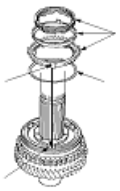
NOTE: Refer to the Exploded View as needed during this procedure.

1. Clean all parts in solvent, dry them, and apply lubricant to all contact surfaces.
2. Install the distance collar, the needle bearing, and 1st gear onto the countershaft.
3. Install the double cone synchro assembly (A) by aligning the synchro cone fingers (B) with the grooves in 1st gear (C), then install the synchro spring (D).

4. Install the 1st/2nd synchro hub (A) by aligning the synchro cone fingers (B) with the grooves in the 1st/2nd synchro hub (C).
5. Install the reverse gear.

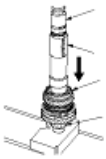


6. Install the synchro spring (A).
7. Install the double cone synchro assembly (B) by aligning the synchro cone fingers (C) with the grooves in the 1st/2nd synchro hub (D).
8. Install the distance collar and needle bearing.

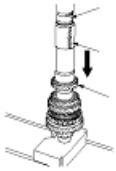


9. Install 2nd gear (A) by aligning the synchro cone fingers (B) with the grooves in 2nd gear (C).

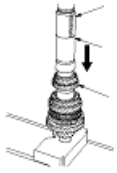
10. Support the countershaft (A) on the steel blocks, then install 3rd gear (B) using the special tool and a press (C). Do not exceed the maximum pressure.



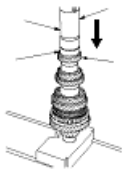
11. Install the 4th gear (A) using the special tool and a press (B). Do not exceed the maximum pressure.



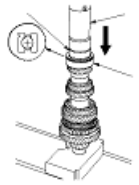
12. Install the 5th gear (A) using the special tool and a press (B). Do not exceed the maximum pressure.



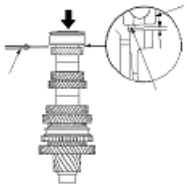
13. Install 6th gear (A) using the special tools and a press (B). Do not exceed the maximum pressure.



14. Install the 32 mm shim and the old ball bearing (A) using the special tools and a press.



15. Measure the clearance between the old bearing (A) and the 32 mm shim (B) with a feeler gauge (C).
Standard: 0.04−0.10 mm (0.0016−0.0039 in.)

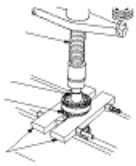


16. If the clearance is more than the standard, select a new shim from the following table. If the clearance measured in Step 17 is within the standard, replace only the new ball bearing.

32 mm Shim

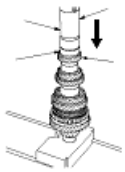
Type	Part Number	Thickness
A	23971-RPF-000	1.56 mm (0.061 in.)
B	23972-RPF-000	1.60 mm (0.063 in.)
C	23973-RPF-000	1.64 mm (0.065 in.)
D	23974-RPF-000	1.68 mm (0.066 in.)
E	23975-RPF-000	1.72 mm (0.068 in.)
F	23976-RPF-000	1.76 mm (0.069 in.)
G	23977-RPF-000	1.80 mm (0.071 in.)
H	23978-RPF-000	1.84 mm (0.072 in.)
J	23979-RPF-000	1.88 mm (0.074 in.)
K	23980-RPF-000	1.92 mm (0.076 in.)
L	23981-RPF-000	1.96 mm (0.077 in.)
M	23982-RPF-000	2.00 mm (0.079 in.)
N	23983-RPF-000	2.04 mm (0.080 in.)
P	23984-RPF-000	2.08 mm (0.082 in.)
Q	23985-RPF-000	2.12 mm (0.083 in.)
R	23986-RPF-000	2.16 mm (0.085 in.)
S	23987-RPF-000	2.20 mm (0.087 in.)
T	23988-RPF-000	2.24 mm (0.088 in.)
U	23989-RPF-000	2.28 mm (0.090 in.)
V	23990-RPF-000	2.32 mm (0.091 in.)

17. Support 6th gear (A) on steel blocks (B) then use a press (C) and an attachment (D) to press the countershaft out of the ball bearing.

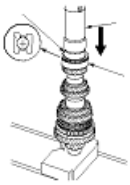


18. If necessary, install the 32 mm shim selected in step 15, then recheck the clearance.

19. Install 6th gear (A) using the special tools and a press (B). Do not exceed the maximum pressure.



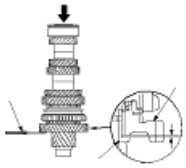
20. Install the new ball bearing (A) using the special tools and a press.



21. Tighten the new special bolt (A) (left-hand threads).

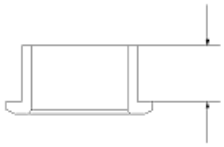
M/T Countershaft Assembly Clearance Inspection

1. Measure the clearance between the 1st gear (A) and the distance collar (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 2 .
   Standard: **0.06−0.16 mm (0.002−0.006 in.)**
   Service Limit: **0.25 mm (0.010 in.)**



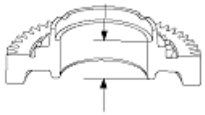
2. Measure the thickness of the distance collar.
   - If the thickness is not within than the standard, replace the distance collar.
   - If the thickness is within the standard, go to Step 3 .

   Standard: **21.53−21.58 mm (0.848−0.850 in.)**

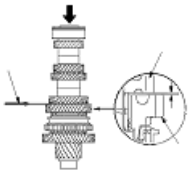


3. Measure the thickness of the 1st gear.
   - If the thickness is less than the standard, replace 1st gear.
   - If the thickness is within the standard, replace the 1st/2nd synchro hub and revers gear as a set.

   Standard: **21.42−21.47 mm (0.843−0.845 in.)**

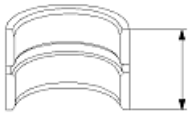


4. Measure the clearance between the 2nd gear (A) and 3rd gear (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 5 .
   Standard: **0.06−0.14 mm (0.02−0.006 in.)**
   Service Limit: **0.23 mm (0.009 in.)**



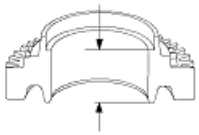
5. Measure the thickness of the distance collar.
   - If the thickness is not within the standard, replace the distance collar.
   - If the thickness is within the standard, go to Step 6 .

   Standard: **26.53−26.56 mm (1.044−1.046 in.)**



6. Measure the thickness of the 2nd gear.
   - If the thickness is less than the standard, replace 2nd gear.
   - If the thickness is within the standard, replace the 1st/2nd synchro hub and revers gear as a set.

   Standard: **26.42−26.47 mm (1.040−1.042 in.)**

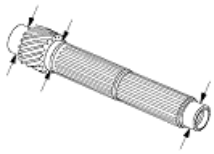


Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of ball bearing contact area (transmission housing side)		26.020−26.033 mm (1.0244−1.0249 in.)	25.97 mm (1.022 in.)
	Diameter of needle bearing contact area (clutch housing side)		34.000−34.015 mm (1.3386−1.3392 in.)	33.95 mm (1.337 in.)
	Diameter of distance collar contact area		38.987−39.000 mm (1.5349−1.5354 in.)	38.94 mm (1.533 in.)
	Runout		0.02 mm (0.001 in.) max.	0.05 mm (0.002 in.)
	32 mm shim-to-bearing inner race clearance		0.04−0.10 mm (0.0016−0.0039 in.)	Adjust

M/T Countershaft Inspection

1. Inspect the gear surface and bearing surface for wear and damage, then measure the countershaft at points A, B, and C. If any part of the countershaft is less than the service limit, replace it with a new one.

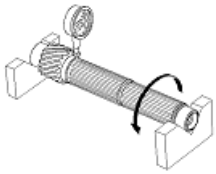


Standard:

A Ball Bearing Surface (Transmission Housing Side):
26.020−26.033 mm (1.0244−1.0249 in.)
B Distance Collar Surface:
38.987−39.000 mm (1.5349−1.5354 in.)
C Needle Bearing Surface (Clutch Housing Side):
34.000−34.015 mm (1.3386−1.3392 in.)

Service Limit:
A: 25.97 mm (1.022 in.)
B: 38.94 mm (1.533 in.)
C: 33.95 mm (1.337 in.)

2. Inspect the runout by supporting both ends of the countershaft. Rotate the countershaft two complete revolutions when measuring the runout. If the runout exceeds the service limit, replace the countershaft with a new one.
Standard: 0.02 mm (0.001 in.) max.
Service Limit: 0.05 mm (0.002 in.)



Countershaft 1st gear

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear	I.D.		48.509−48.525 mm (1.9098−1.9104 in.)	48.58 mm (1.913 in.)
	End play		0.06−0.16 mm (0.002−0.006 in.)	0.25 mm (0.010 in.)
	Thickness		21.42−21.47 mm (0.843−0.845 in.)	———

Countershaft 2nd gear

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear	I.D.		48.509−48.525 mm (1.9098−1.9104 in.)	48.52 mm (1.910 in.)
	End play		0.06−0.14 mm (0.002−0.006 in.)	0.23 mm (0.009 in.)
	Thickness		26.42−26.47 mm (1.040−1.042 in.)	———

Countershaft 1st gear distance collar

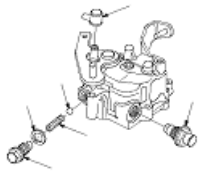
Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 1st gear distance collar	I.D.		39.00−39.01 mm (1.5354−1.5358 in.)	39.02 mm (1.536 in.)
	O.D.		44.489−44.500 mm (1.7515−1.7520 in.)	44.44 mm (1.750 in.)
	Length		21.53−21.58 mm (0.848−0.850 in.)	———

Countershaft 2nd gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear distance collar	I.D.		39.00−39.01 mm (1.5354−1.5358 in.)	39.02 mm (1.536 in.)
	O.D.		44.489−44.5 mm (1.7515−1.7520 in.)	44.44 mm (1.750 in.)
	Length		26.53−26.56 mm (1.044−1.046 in.)	———

M/T Change Lever Assembly Disassembly/Reassembly

Exploded View

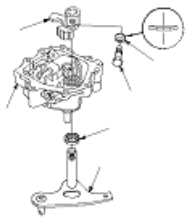


Special Tools Required

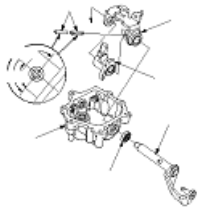
Bearing driver attachment, 24 x 26 mm
07746-0010700

Driver handle, 15 x 135L
07749-0010000

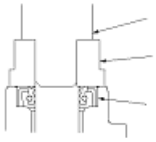
1. Remove the breather cap (A), detent bolt (B), washer (C), spring (D), and steel ball (E). Remove the detent bolt (F).



2. Remove the special bolt (A) and spring washer (B).
3. Remove the change lever (C) and shift arm (D) from the shift arm cover (E).
4. Remove the oil seal (F).
   NOTE: When installing, turn the alloy surface of the thrust washer to the shift arm cover side.



5. Remove the spring pins (A) from the select lever (B).
   NOTE: Install the spring pins into the interlock with the groove of the spring pins at the angle shown.
6. Remove the select lever from the shift arm cover (C), then remove the shift piece (D) and the interlock (E).
7. Remove the oil seal (F).
8. Install in the reverse order of removal.
9. Remove the dirt and oil from the sealing surface. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the sealing surface.
   NOTE: Do not install components if too much time has passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



10. Install the oil seal (A) using the special tools.

Inter lock

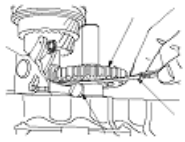
Item	Measurement	Qualification	Standard or New	Service Limit
Inter lock	I.D.		14.000−14.077 mm (0.5512−0.5542 in.)	———
	Inter lock to select lever		0.032−0.136 mm (0.0013−0.0054 in.)	———

Select lever

Item	Measurement	Qualification	Standard or New	Service Limit
Select lever	O.D.		13.941−13.968 mm (0.5489−0.5499 in.)	———
	Shift arm cover clearance		0.032−0.127 mm (0.0013−0.0050 in.)	———

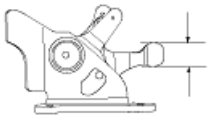
M/T Reverse Shift Fork Clearance Inspection

1. Measure the clearance between the reverse idler gear (A) and the reverse shift fork (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 2 .
   Standard: **0.20−0.60 mm (0.007−0.024 in.)**
   Service Limit: **1.2 mm (0.047 in.)**



2. Measure the width of the reverse shift fork.
   - If distance is not within the standard, replace the reverse shift fork.
   - If distance is within the standard, replace the reverse gear.

   Standard: **14.7−14.9 mm (0.527−0.587 in.)**



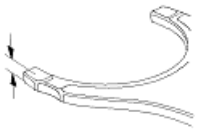
Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Finger width		14.7−14.9 mm (0.527−0.587 in.)	———
	Fork-to-reverse idler gear clearance		0.20−0.60 mm (0.007−0.024 in.)	1.2 mm (0.047 in.)

M/T Shift Forks Clearance Inspection

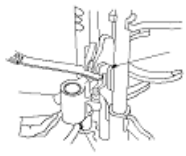
NOTE: The synchro sleeve and synchro hub should be replaced as a set.

1. Measure the clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to Step 2 .
   Standard: **0.35−0.65 mm (0.014−0.026 in.)**
   Service Limit: **1.0 mm (0.039 in.)**

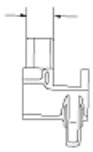


2. Measure the thickness of the shift fork fingers.
   - If the thickness is not within the standard, replace the shift fork.
   - If the thickness is within the standard, replace the synchro sleeve.

   Standard:
   1st/2nd shift fork:
   6.7−6.9 mm (0.26−0.27 in.)
   3rd/4th, 5th/6th shift fork:
   7.4−7.6 mm (0.29−0.30 in.)



3. Measure the clearance between the shift fork (A) and the shift piece (B). If the clearance exceeds the service limit, go to Step 4 .
   Standard: **0.2−0.5 mm (0.008−0.020 in.)**

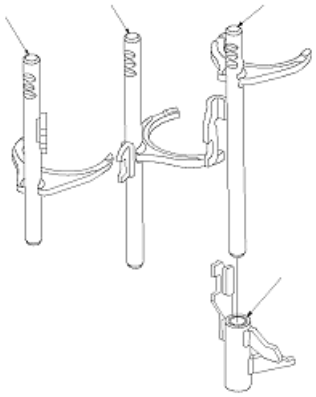


4. Measure the width of the shift piece.
   - If the width is not within the standard, replace the shift piece.
   - If the width is within the standard, replace the shift fork.

   Standard: **15.9−16.0 mm (0.626−0.630 in.)**

M/T Shift Forks Disassembly/Reassembly

Prior to reassembly, clean all the parts in solvent, dry them, and apply lubricant to any contact parts.



Shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Shift fork	Finger thickness	1st-2nd fork	6.7−6.9 mm (0.26−0.27 in.)	———
		3rd-4th and 5th-6th fork	7.4−7.6 mm (0.29−0.30 in.)	———
	Fork-to-synchro sleeve clearance		0.35−0.65 mm (0.014−0.026 in.)	1.0 mm (0.039 in.)

Shift piece

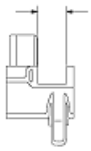
Item	Measurement	Qualification	Standard or New	Service Limit
Shift piece	I.D.		14.000−14.068 mm (0.5512−0.5539 in.)	———
	Shift-piece-to select lever clearance		0.032−0.127 mm (0.0013−0.0050 in.)	———
	Shift fork diameter at contact area		0.2−0.5 mm (0.008−0.020 in.)	———

M/T Shift Arm Clearance Inspection

1. Measure the clearance between the shift arm (A) and shift piece (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to Step 2 .
   Standard: **0.20−0.60 mm (0.008−0.024 in.)**
   Service Limit: **0.7 mm (0.028 in.)**

2. Measure the diameter of the shift piece.
   - If the diameter is not within the standard, replace the shift piece.
   - If the diameter is within the standard, replace the shift arm.

   Standard: **16.00−16.20 mm (0.630−0.638 in.)**

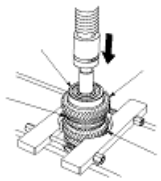


Shift arm

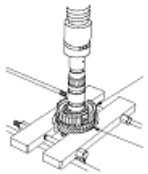
Item	Measurement	Qualification	Standard or New	Service Limit
Shift arm	I.D.		14.013−14.058 mm (0.5517−0.5535 in.)	———
	Shift piece diameter at contact area		0.20−0.60 mm (0.008−0.024 in.)	0.7 mm (0.028 in.)
	Shift arm-to-change lever clearance		0.013−0.085 mm (0.0005−0.0033 in.)	———

M/T Mainshaft Disassembly

1. Support 5th gear (A) on steel blocks, and press the mainshaft out of the 5th/6th synchro hub (B), 6th gear (C) and ball bearing (D). Use of a jaw-type puller can damage the gear teeth.



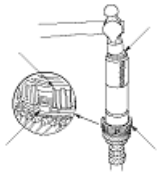
2. Support the 3rd gear (A) on steel blocks, and press the mainshaft out of the 3rd/4th synchro hub (B). Use of a jaw-type puller can damage the gear teeth.



M/T Mainshaft Reassembly

Exploded View

Special Tools Required

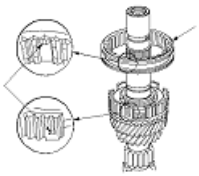


Inner driver handle, 40 mm
07746-0030100

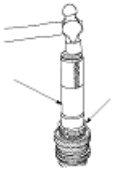
Inner bearing driver attachment, 30 mm
07746-0030300

NOTE: Refer to the Exploded View as needed during this procedure.

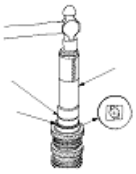
1. Clean all the parts in solvent, dry them, and apply lubricant to all contact surfaces except the 3rd/4th and 5th synchro hubs.
2. Install the needle bearing and 3rd gear on the mainshaft.
3. Install the 3rd gear synchro ring and synchro spring on the shaft.
4. Install the 3rd/4th synchro hub (A) by aligning the synchro cone fingers (B) with the grooves in 3rd/4th synchro hub (C).
5. Install the 3rd/4th synchro hub using the special tool.



6. Install the 3rd/4th synchro sleeve (A) by aligning the stops (B) with the 3rd/4th synchro sleeve and hub. After installing, check the operation of the 3rd/4th synchro hub set.
7. Install the 4th gear synchro spring and ring, 4th gear and needle bearing, the distance collar, and 5th gear and its needle bearing on the shaft.
8. Install the 5th gear synchro ring and synchro spring on the shaft.



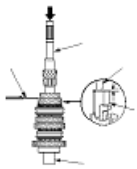
9. Install the 5th/6th synchro hub (A) using the special tool.
10. Install the 5th/6th synchro sleeve.
11. Install the distance collar and the 6th gear.



12. Install the new ball bearing (A) using the special tools.

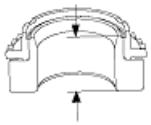
M/T Mainshaft Assembly Clearance Inspection

NOTE: If replacement is required, always replace the synchro sleeve and hub as a set.



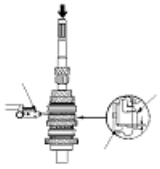
1. Support the bearing inner race with an appropriate sized socket (A), and push down on the mainshaft (B).
2. Measure the clearance between 2nd (C) and 3rd (D) gears with a feeler gauge (E).
   - If the clearance is more than the service limit, go to Step 3 .
   - If the clearance is within the service limit, go to Step 4 .

   Standard: **0.06−0.21 mm (0.002−0.008 in.)**
   Service Limit: **0.30 mm (0.012 in.)**



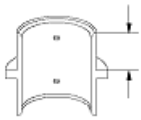
3. Measure the thickness of 3rd gear.
   - If the thickness is less than the service limit, replace 3rd gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro sleeve as a set.

   Standard: **27.02−27.07 mm (1.064−1.066 in.)**
   Service Limit: **26.95 mm (1.061 in.)**



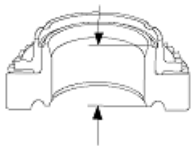
4. Measure the clearance between 4th gear (A) and the distance collar (B) with a dial indicator (C). If the clearance is more than the service limit, go to Step 5 .

   Standard: **0.06−0.19 mm (0.002−0.007 in.)**
   Service Limit: **0.28 mm (0.011 in.)**



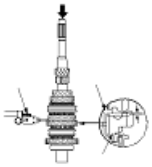
5. Measure distance (1) on the distance collar.
   - If distance (1) is not within the standard, replace the distance collar with a new one.
   - If distance (1) is within the standard, go to Step 6 .

   Standard: **22.53−22.56 mm (0.887−0.888 in.)**



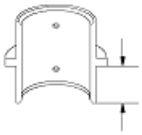
6. Measure the thickness of 4th gear.
   - If the thickness is less than the service limit, replace 4th gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and 3rd/4th synchro sleeve as a set.

   Standard: **25.52−25.57 mm (1.005−1.007 in.)**
   Service Limit: **25.45 mm (1.002 in.)**



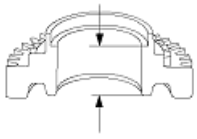
7. Measure the clearance between the distance collar (A) and 5th gear (B) with a dial indicator (C). If the clearance is more than the service limit, go to Step 8 .

   Standard: **0.06−0.14 mm (0.002−0.006 in.)**
   Service Limit: **0.23 mm (0.009 in.)**



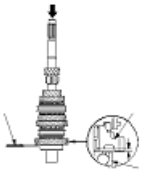
8. Measure distance (2) on the distance collar.
   - If distance (2) is not within the standard, replace the distance collar with a new one.
   - If distance (2) is within the standard, go to Step 9 .

   Standard: **22.53−22.56 mm (0.887−0.888 in.)**



9. Measure the thickness of 5th gear.
   - If the thickness is less than the service limit, replace 5th gear.
   - If the thickness is within the service limit, replace the 5th/6th synchro hub and 5th/6th synchro sleeve as a set.

   Standard: **22.42−22.47 mm (0.883−0.885 in.)**
   Service Limit: **22.35 mm (0.880 in.)**

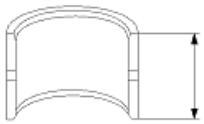


10. Measure the clearance between the 6th gear (A) and angular ball bearing (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 11 .

    Standard: **0.06−0.16 mm (0.002−0.006 in.)**
    Service Limit: **0.25 mm (0.010 in.)**

11. Measure the thickness of the distance collar.
    - If the thickness is not within the standard, replace the distance collar.
    - If the thickness is within the standard, go to Step 12 .

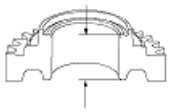
    Standard: **24.03−24.08 mm (0.946−0.948 in.)**



---

12. Measure the thickness of 6th gear.
    - If the thickness is less than the service limit, replace 6th gear.
    - If the thickness is within the service limit, replace the 5th/6th synchro hub and 5th/6th synchro sleeve as a set.

    Standard: **23.92−23.97 mm (0.942−0.944 in.)**
    Service Limit: **23.85 mm (0.939 in.)**

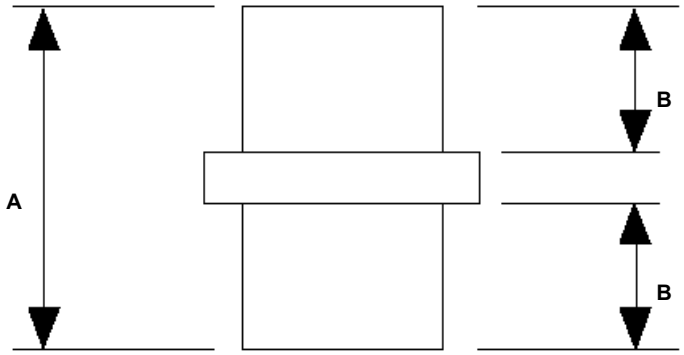


Mainshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	End play		0.11−0.18 mm (0.004−0.007 in.)	Adjust
	Diameter of bushing surface		14.870−14.890 mm (0.5854−0.5862 in.)	14.77 mm (0.5815 in.)
	Diameter of distance collar		28.992−29.005 mm (1.1414−1.1419 in.)	28.93 mm (1.139 in.)
	Diameter of ball bearing contact area (clutch housing side)		25.977−25.990 mm (1.0227−1.0232 in.)	25.92 mm (1.020 in.)
	Diameter of needle bearing contact area		34.984−35.000 mm (1.3773−1.3780 in.)	34.93 mm (1.375 in.)
	Diameter of ball bearing contact area (transmission housing side)		24.987−25.000 mm (0.9837−0.9843 in.)	24.93 mm (0.981 in.)
	Runout		0.02 mm (0.001 in.) max.	0.05 mm (0.002 in.)

Mainshaft 4th/5th gears distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 4th/5th gears distance collar	I.D.		29.014−29.024 mm (1.1423−1.1427 in.)	29.03 mm (1.143 in.)
	O.D.		34.989−35.000 mm (1.3775−1.3780 in.)	34.94 mm (1.376 in.)
	Length	A	48.97−49.03 mm (1.9279−1.9303 in.)	———
			37−0.888 in.)	———

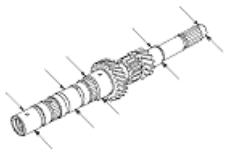


Mainshaft 6th gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 6th gear distance collar	I.D.		25.00−25.01 mm (0.984−0.985 in.)	25.12 mm (0.989 in.)
	Length		24.03−24.08 mm (0.946−0.948 in.)	———

M/T Mainshaft Inspection

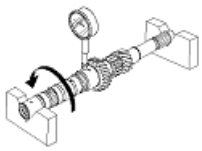
1. Inspect the gear surface and bearing surface for wear and damage, then measure the mainshaft at points A, B, C, D, and E. If any part of the mainshaft is less than the service limit, replace it with a new one.



Standard:

A Ball Bearing Surface (Transmission Housing Side):
24.987−25.000 mm (0.9837−0.9843 in.)
B Distance Collar Surface:
28.992−29.005 mm (1.1414−1.1419 in.)
C Needle Bearing Surface:
34.984−35.000 mm (1.3773−1.3780 in.)
D Ball Bearing Surface (Clutch Housing Side):
25.977−25.990 mm (1.0227−1.0232 in.)
E Bushing Surface:
14.870−14.890 mm (0.5854−0.5862 in.)
Service Limit:
A: 24.93 mm (0.981 in.)
B: 28.93 mm (1.139 in.)
C: 34.93 mm (1.375 in.)
D: 25.92 mm (1.020 in.)
E: 14.77 mm (0.5815 in.)

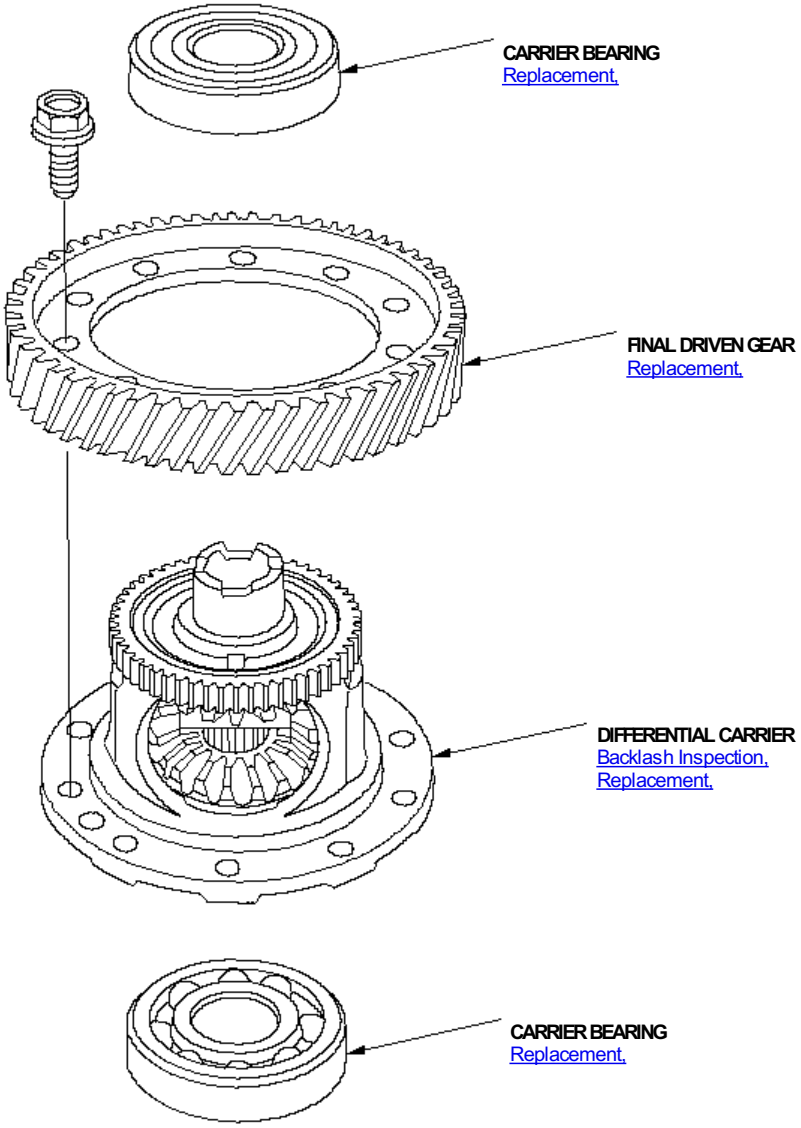
2. Inspect the runout by supporting both ends of the mainshaft. Rotate the mainshaft two complete revolutions when measuring the runout. If the runout is more than the service limit, replace the mainshaft with a new one.
Standard: 0.02 mm (0.001 in.) max.
Service Limit: 0.05 mm (0.002 in.)



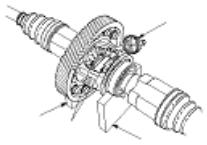
Mainshaft 3rd, 4th, 5th, and 6th gears

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 3rd, 4th, 5th, and 6th gears	I.D.	3rd/4th/5th	39.009−39.025 mm (1.5358−1.5364 in.)	38.95 mm (1.533 in.)
		6th	35.009−35.025 mm (1.3783−1.3789 in.)	34.95 mm (1.376 in.)
	Clearance	2nd-3rd	0.06−0.21 mm (0.002−0.008 in.)	0.30 mm (0.012 in.)
	End play	4th	0.06−0.19 mm (0.002−0.007 in.)	0.28 mm (0.011 in.)
		5th	0.06−0.14 mm (0.002−0.006 in.)	0.23 mm (0.009 in.)
		6th	0.06−0.16 mm (0.002−0.006 in.)	0.25 mm (0.010 in.)
	Thickness	3rd	27.02−27.07 mm (1.064−1.066 in.)	26.95 mm (1.061 in.)
		4th	25.52−25.57 mm (1.005−1.007 in.)	25.45 mm (1.002 in.)
		5th	22.42−22.47 mm (0.883−0.885 in.)	22.35 mm (0.880 in.)
		6th	23.92−23.97 mm (0.942−0.944 in.)	23.85 mm (0.939 in.)

M/T Differential Component Location Index



M/T Differential Backlash Inspection



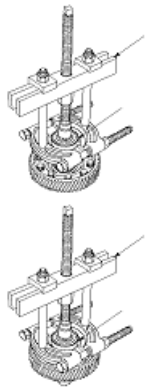
1. Place the differential assembly on V-blocks (A), and install both axles.
2. Measure the backlash of both pinion gears (B) with a dial indicator (C). If the backlash is not within the standard, replace the differential carrier.
   Standard (New): **0.05−0.15 mm (0.002−0.006 in.)**

M/T Differential Carrier Bearings Replacement

Special Tools Required

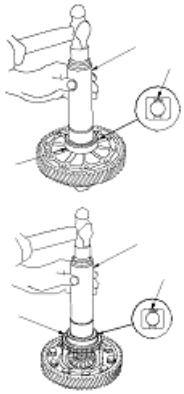
Commercially available
bearing puller

Inner driver handle, 40 mm
07746-0030100



1. Check the carrier bearings for wear and rough rotation. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearings (A) with commercially available bearing puller (B).

3. Install the new bearing (A) with the 40 mm inner driver handle and a press. Press each bearing on until it bottoms. There should be no clearance between the bearings and the carrier.
   NOTE: Turn the seal (B) part of the bearing to the outside of differential, and install it.



M/T differential 80 mm shim

Item	Measurement	Qualification	Standard or New	Service Limit
M/T differential 80 mm shim	80 mm shim-to-bearing outer race clearance in transmission housing		0.01−0.10 mm (0.0004−0.0039 in.)	Adjust

M/T Differential Oil Seal Replacement

Special Tools Required

Driver handle, 15 x 135L
07749-0010000

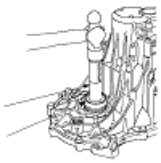
Bearing driver attachment, 52 x 55 mm
07NAD-P200100

Oil seal driver, 65 mm
07JAD-PL90100

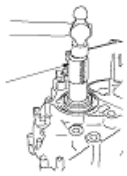
1. Remove the oil seal (A) from the transmission housing (B).
   NOTE: Be careful not to damage the transmission housing while removing the oil seals.

2. Remove the oil seal (A) from the clutch housing (B).

3. Install the new oil seal in the transmission housing with the special tools.



4. Install the new oil seal in the clutch housing with the special tools.

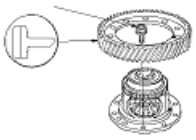


M/T differential pinion gear

Item	Measurement	Qualification	Standard or New	Service Limit
M/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———

M/T Differential Final Driven Gear/Carrier Replacement

1. Remove the bolts in a crisscross pattern in several steps, then remove the final driven gear from the differential carrier.
2. Install the final driven gear with the chamfer on the inside diameter facing the carrier. Tighten the bolts in a crisscross pattern in several steps.

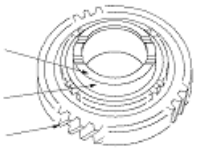


M/T Synchro Ring and Gear Inspection

1. Inspect the inside of each synchro ring (A) for wear.
   Inspect the teeth (B) on each synchro ring for wear (rounded off).

2. Inspect the teeth (A) on each synchro sleeve and matching teeth on each gear for wear (rounded off).

3. Inspect the thrust surface (A) on each gear hub for wear.
4. Inspect the cone surface (B) on each gear hub for wear and roughness.
5. Inspect the teeth on all gears (C) for uneven wear, scoring, and cracks.
6. Coat the cone surface of each gear with MTF, and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.

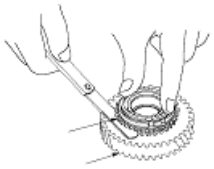


7. Measure the clearance between each gear (A) and its synchro ring (B) all around the gear. Hold the synchro ring against the gear evenly while measuring the clearance. If the clearance is less than the service limit, replace the synchro ring and gear.

   Synchro Ring-to-Gear Clearance

   Standard: **0.655−1.334 mm (0.026−0.053 in.)**

   Service Limit: **0.4 mm (0.016 in.)**



Synchro ring-to-gear

   Double Cone Synchro and Triple Cone Synchro-to-Gear Clearance

   Standard:

   (1): Outer Synchro Ring (B) to Synchro Cone (C) 0.70−1.19 mm (0.028−0.047 in.)

   (2): Synchro Cone (C) to Gear (A) 0.50−1.04 mm (0.020−0.041 in.)

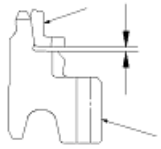
   (3): Outer Synchro Ring (B) to Gear (A) 0.95−1.68 mm (0.037−0.066 in.)

   Service Limit:

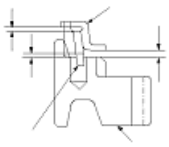
   (1): 0.3 mm (0.012 in.)

   (2): 0.3 mm (0.012 in.)

   (3): 0.6 mm (0.024 in.)



Double cone synchro and triple cone synchro-to-gear

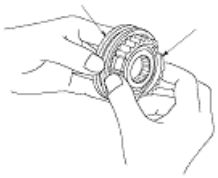


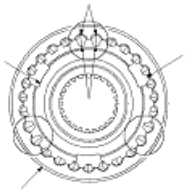
Synchro ring

Item	Measurement	Qualification	Standard or New	Service Limit
Synchro ring	Ring-to-gear clearance	Ring pushed against gear	0.655−1.334 mm (0.026−0.053 in.)	0.4 mm (0.016 in.)

M/T Synchro Sleeve and Hub Inspection and Reassembly

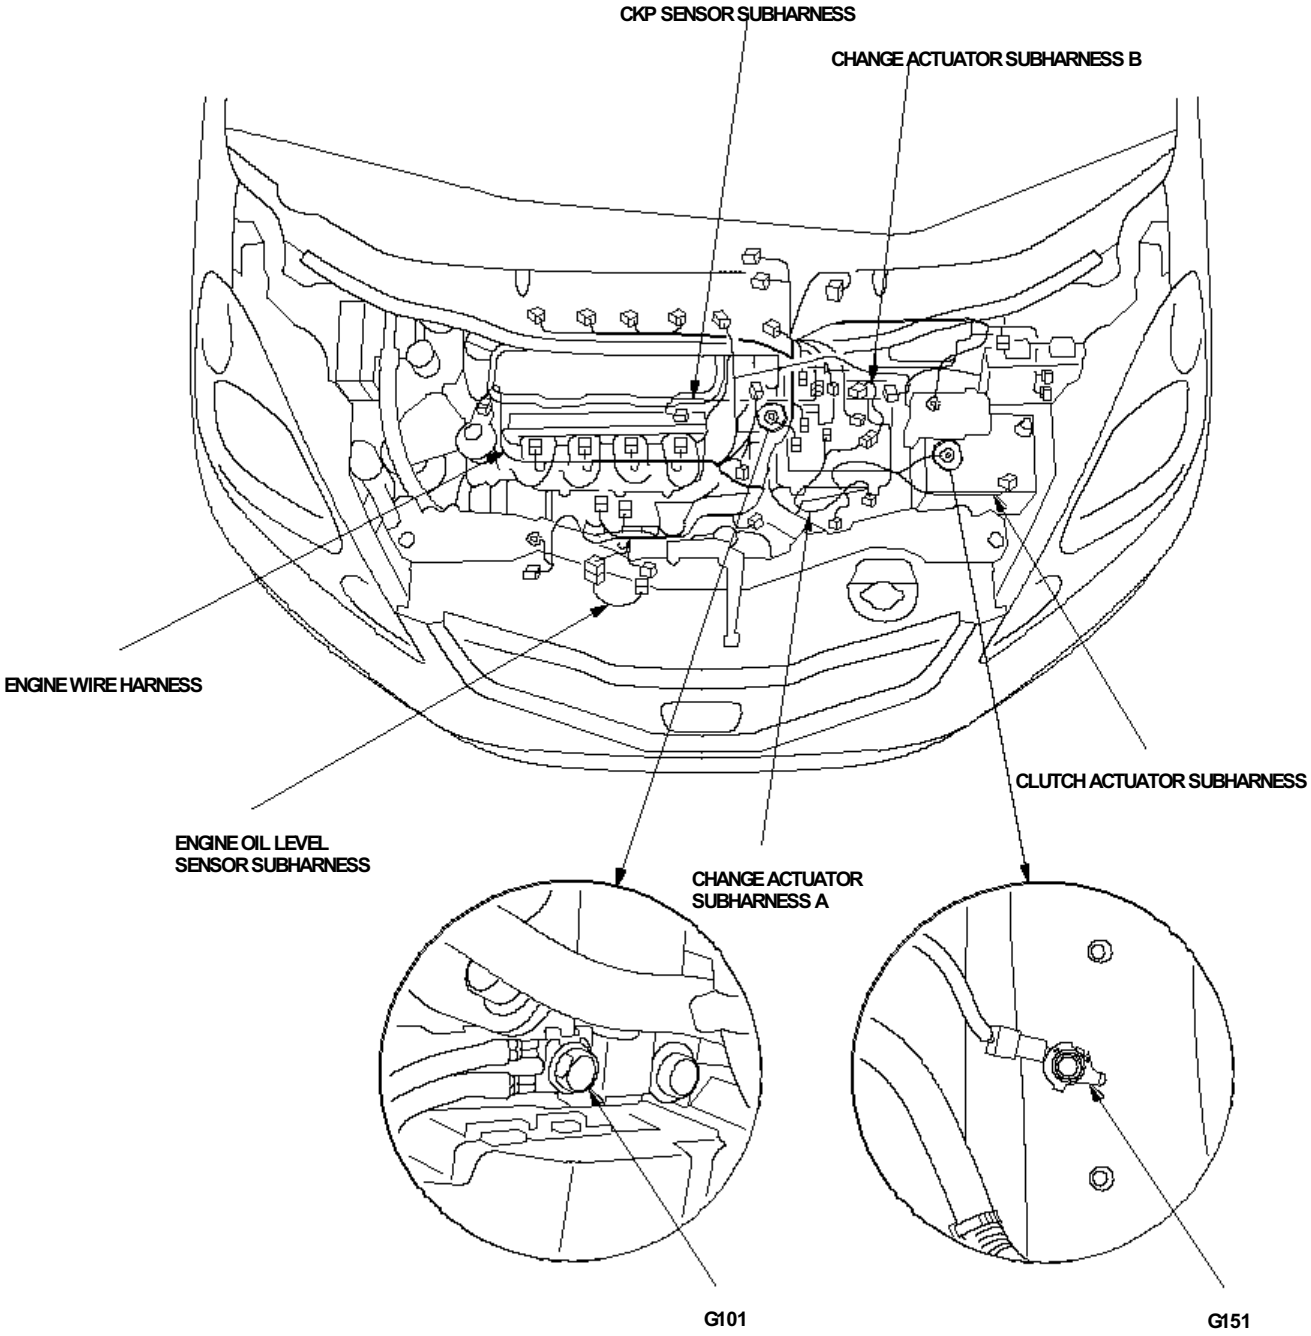
1. Inspect the gear teeth on all synchro hubs and synchro sleeves for wear (rounded off corners).
2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for free movement. Make sure to match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of deeper grooves (D) in the synchro hub.
   NOTE:
   - Do not install the synchro sleeve with its longer teeth in the 1st/2nd and 5th/6th synchro hub slots (E) because it will damage the spring ring.
   - If replacement is required, always replace the synchro sleeve and synchro hub as a set.





Engine Wire Harness, CKP Sensor Subharness, Change Actuator Subharness A/B, Clutch Actuator Subharness, and Engine Oil Level Sensor Subharness Locations

i-SHIFT system

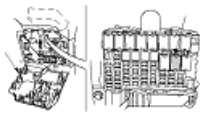


RHD model is shown, LHD model is similar.

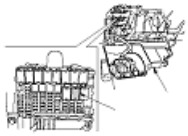
DTC Troubleshooting: P0615

DTC P0615:
Starter Relay STRLD Circuit Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

RHD model



LHD model



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Start the engine.
4. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P0615 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM.■
5. Turn the ignition switch to LOCK (0).
6. Check the 7.5 A fuse in the auxiliary under-dash fuse box.

   Is the fuse OK?
   YES - Go to Step 7 .
   NO - Replace the 7.5 A fuse in the auxiliary under-dash fuse box, then go to Step 12 .
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (49P).
9. Open the fuse lid (A), then remove starter relay 1 (B) from the under-dash fuse/relay box.

---

10. Connect starter relay 1 4P connector terminal No. 2 to body ground with a jumper wire.

---

11. Check for continuity between ECM connector terminal A14 and body ground.

    Is there continuity?
    YES - Go to Step 17 .
    NO - Repair open in the wire between the ECM (A14) and starter relay 1, then go to Step 12 .
12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0615 indicated?
    YES - Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
17. Reconnect all connectors.
18. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0615 indicated?
    YES - Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P0616

DTC P0616:
Starter Relay 2 Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

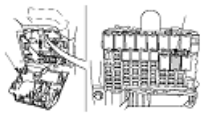
1. Turn the ignition switch to ON (II).
2. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is the 2.2 V or less indicated?
   YES - Go to Step 3 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM.■
3. Start the engine.

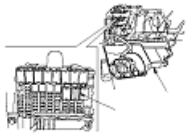
   Does the engine start?
   YES - Go to Step 4 .
   NO - Go to Step 7 .
4. Turn the ignition switch to LOCK (0).
5. Open the fuse lid (A), then remove starter relay 1 (B) for the under-dash fuse/relay box.
6. Test start relay 1.

   Is start relay 1 OK?
   YES - Replace starter relays 2, then go to Step 23 .
   NO - Replace starter relay 1, then go to Step 23 .
7. Turn the ignition switch to LOCK (0).

RHD model



LHD model



---

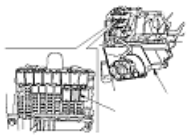
8. Open the fuse lid (A), then remove starter relay 1 (B) for the under-dash fuse/relay box.
9. Turn the ignition switch to ON (II).
10. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

    Is the 2.2 V or less indicated?
    YES - Go to Step 11 .
    NO - Replace starter relay 1, then go to Step 23 .
11. Turn the ignition switch to LOCK (0).
12. Remove the starter relay 2 for the auxiliary under-dash fuse/relay box.
13. Turn the ignition switch to ON (II).
14. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

    Is the 2.2 V or less indicated?
    YES - Go to Step 15 .
    NO - Replace starter relay 2, then go to Step 23 .
15. Turn the ignition switch to LOCK (0).
16. Jump the SCS line with the HDS.
17. Disconnect ECM connector A (49P).

RHD model

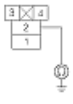
LHD model



---

18. Check for continuity starter relay 1 4P connector terminal No. 2 to body ground.

    Is the 1 MΩ or more?
    YES - Go to Step 28 .
    NO - Go to Step 19 .



19. Disconnect under-dash fuse/relay box connector X (3P).

---

20. Check for continuity under-dash fuse/relay box connector X (3P) terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair short in the wire between the ECM (A14) and the under-dash fuse/relay box, then go to Step 23 .
    NO - Go to Step 21 .

21. Disconnect under-dash fuse/relay box connector B (36P).

---

22. Check for continuity under-dash fuse/relay box connector B (36P) terminal No. 16 and body ground.

Is there continuity?

YES - Repair short in the wire between the under-dash fuse/relay box and starter relay 2, then go to Step 23 .
NO - Replace the under-dash fuse/relay box, then go to Step 23 .

23. Reconnect all connectors.
24. Turn the ignition switch to ON (II).
25. Reset the ECM with the HDS.
26. Do the idle learn procedure.
27. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0615 indicated?

YES - Check for poor connection or loose terminals at starter relay 1, starter relay 2, and the ECM, then go to Step 1 .
NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

28. Reconnect all connectors.
29. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
30. Check for Temporary DTCs or DTCs with the HDS.

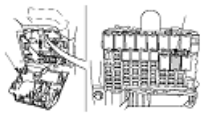
Is DTC P0615 indicated?

YES - Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM, If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

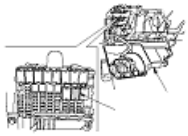
DTC Troubleshooting: P0617

DTC P0617:
Starter Relay 1 Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

RHD model



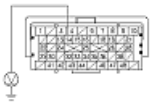
LHD model



1. Turn the ignition switch to ON (II).
2. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is the 3.2 V or more indicated?
   YES - Go to Step 3 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at starter relay 1, starter relay 2, and the ECM.■
3. Turn the ignition switch to LOCK (0).
4. Open the fuse lid (A), then remove starter relay 1 (B) for the under-dash fuse/relay box.
5. Turn the ignition switch to ON (II).
6. Check the STARTER CUT RELAY in the DATA LIST with the HDS.

   Is the 3.2 V or more indicated?
   YES - Go to Step 7 .
   NO - Replace starter relay 1, then go to Step 12 .
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (49P).
10. Turn the ignition switch to ON (II).



11. Measure the voltage between ECM connector terminal A14 and body ground.

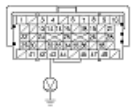
    Is there any voltage?
    YES - Repaire short to power in the wire between the ECM (A14) and starter relay 1, then go to Step 12 .
    NO - Go to Step 17 .
12. Reconnect all connectors.
13. Turn the ignition switch to ON (II).
14. Reset the ECM with the HDS.
15. Do the ECM idle learn procedure .
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0615 indicated?
    YES - Check for poor connections or loose terminals at starter relay 1 and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
17. Reconnect all connectors.
18. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
19. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P0617 indicated?
    YES - Check for poor connections or loose terminals at starter relay 1 and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P15B7

DTC P15B7:
Starter Control System Low Input



NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait 5 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P15B7 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the TCM and the ECM.■
6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (49P).
9. Turn the ignition switch to ON (II).
10. Measure the voltage between ECM connector terminal A43 and body ground.

    Is there voltage?
    YES - Substitute a known-good TCM, then go to Step 14 . If DTC P15B7 is not indicated, replace the original TCM, then go to Step 14 .
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect TCM connector A (37P).

---

13. Check for continuity between ECM connector terminal A43 and body ground.

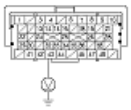
    Is there continuity?
    YES - Repair short in the wire between the ECM (A43) and the TCM, then go to Step 14 .
    NO - Go to Step 22 .
14. Turn the ignition switch to LOCK (0).
15. Reconnect all connectors and the battery.
16. Turn the ignition switch to ON (II).
17. Reset the ECM with the HDS.
18. Do the ECM idle learn procedure.
19. Turn the ignition switch to LOCK (0).
20. Turn the ignition switch to ON (II), and wait 5 seconds.
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P15B7 indicated?
    YES - Check for poor connections or loose terminals at the TCM and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
24. Turn the ignition switch to LOCK (0).
25. Turn the ignition switch to ON (II), and wait 5 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P15B7 indicated?
    YES - Check for poor connections or loose terminals at the TCM and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P15B8

DTC P15B8:
Starter Control System High Input
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait 5 seconds.
5. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P15B8 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the TCM and the ECM.■
6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect ECM connector A (49P).
9. Turn the ignition switch to ON (II).
10. Measure the voltage between ECM connector terminal A43 and body ground.

    Is there voltage?
    YES - Substitute a known-good TCM, then go to Step 14 . If DTC P15B8 is not indicated, replace the original TCM, then go to Step 14 .
    NO - Go to Step 11 .
11. Turn the ignition switch to LOCK (0).
12. Disconnect TCM connector A (37P).

---

13. Check for continuity between ECM connector terminal A43 and TCM connector A (37P) terminal No. 10.

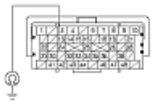
    Is there continuity?
    YES - Go to Step 22 .
    NO - Repair open in the wire between the ECM (A43) and the TCM, then go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Reconnect all connectors.
16. Turn the ignition switch to ON (II).
17. Reset the ECM with the HDS.
18. Do the ECM idle learn procedure.
19. Turn the ignition switch to LOCK (0).
20. Turn the ignition switch to ON (II), and wait 5 seconds.
21. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P15B8 indicated?
    YES - Check for poor connections or loose terminals at the TCM and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
22. Reconnect all connectors.
23. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
24. Turn the ignition switch to LOCK (0).
25. Turn the ignition switch to ON (II), and wait 5 seconds.
26. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P15B8 indicated?
    YES - Check for poor connections or loose terminals at the TCM and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: P15BF

DTC P16BF:
Starter Relay Circuit Malfunction
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS and wait 5 seconds.
3. Check for Temporary DTCs or DTCs with the HDS.

   Is DTC P16BF indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the starter cut relay and the ECM.■
4. Turn the ignition switch to LOCK (0).
5. Jump the SCS line with the HDS.
6. Remove starter relay 1.
7. Disconnect ECM connector A (49P).
8. Check for continuity between ECM connector terminal A13 and body ground.

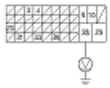
   Is there continuity?
   YES - Repair short in the wire between the ECM (A13) and starter relay 1, then go to Step 9 .
   NO - Go to Step 14 .
9. Reconnect all connectors.
10. Turn the ignition switch to ON (II).
11. Reset the ECM with the HDS.
12. Do the ECM idle learn procedure.
13. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BF indicated?
    YES - Check for poor connections or loose terminals at starter relay 1 and the ECM, then go to Step 1 .
    NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■
14. Reconnect all connectors.
15. Update the ECM if it does not have the latest software, or substitute a known-good ECM.
16. Check for Temporary DTCs or DTCs with the HDS.

    Is DTC P16BF indicated?
    YES - Check for poor connections or loose terminals at the starter cut relay and the ECM. If the ECM was updated, substitute a known-good ECM, then recheck. If the ECM was substituted, go to Step 1 .
    NO - If the ECM was updated, troubleshooting is complete. If the ECM was substituted, replace the original ECM. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: U0101

DTC U0101:
F-CAN Malfunction (ECM-TCM)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.



1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the DTCs MENU with the HDS.

   Is DTC U0101 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the TCM, and the ECM.■
4. Turn the ignition switch to LOCK (0).
5. Check the No. 60 AMT (40 A) fuse in the under-dash fuse/relay box.

   Is the fuse OK?
   YES - Go to Step 6 .
   NO - Repair short in the wire between the No. 60 AMT +B (40 A) fuse and the TCM. Also replace the No. 60 AMT +B (40 A) fuse, then go to Step 19 .
6. Remove the TCM.
7. Check for poor connections at TCM connector A (37P).

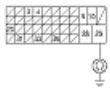
   Are the connections OK?
   YES - Go to Step 8 .
   NO - Repair the poor connections or loose terminals at TCM connector A (37P), then go to Step 19 .
8. Disconnect TCM connector A (37P).
9. Reconnect the engine compartment wire harness 10P connector; LHD model, RHD model.
10. Reconnect the ground cable of the TCM to the body ground.
11. Turn the ignition switch to ON (II).
12. Measure the voltage between TCM connector A (37P) terminal No. 28 and body ground.

    Is there battery voltage?
    YES - Go to Step 13 .
    NO - Repair open in the wire between the No. 60 AMT (40 A) fuse and the TCM, then go to Step 19 .
13. Turn the ignition switch to LOCK (0).

---

14. Check for continuity between TCM connector A (37P) terminal No. 29 and body ground.

    Is there continuity?
    YES - Go to Step 15 .
    NO - Repair open in the wire between the TCM and body ground (G151), then go to Step 19 .

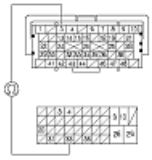


15. Jump the SCS line with the HDS.
16. Disconnect ECM connector A (49P).

---

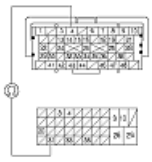
17. Check for continuity between ECM connector terminal A3 and TCM connector A (37P) terminal No. 33.

    Is there continuity?
    YES - Go to Step 18 .
    NO - Repair open in the wire between the ECM (A3) and the TCM, then go to Step 19 .



---

18. Check for continuity between ECM connector terminal A4 and TCM connector A (37P) terminal No. 31.



Is there continuity?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then go to Step 20 and recheck. If DTC U0101 is not indicated with a known-good TCM, replace the original TCM, then go to Step 20 .

NO - Repair open in the wire between the ECM (A4) and the TCM, then go to Step 20 .

19. Turn the ignition switch to LOCK (0).

20. Install the TCM.

21. Reconnect all connectors and the battery.

22. Turn the ignition switch to ON (II).

23. Reset the ECM with the HDS.

24. Do the ECM idle learn procedure.

25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC U0101 indicated?

YES - Check for poor connections or loose terminals at the gauge control module, the TCM, and the ECM, then go to Step 1 .

NO - Troubleshooting is complete. If any other Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.■

DTC Troubleshooting: U0103

DTC U0103:
F-CAN Malfunction (ECM-TCM)
NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Check for Temporary DTCs or DTCs in the DTCs MENU with the HDS.

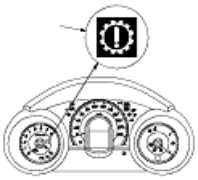
Is DTC U0103 indicated?

YES - Go to the i-SHIFT system's general troubleshooting information. ■

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, the TCM, and the ECM.■

How to Troubleshoot the i-SHIFT System

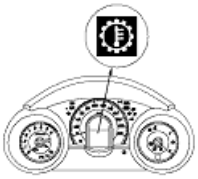
i-SHIFT Indicator



Under normal conditions, the i-SHIFT indicator (A) comes on when the ignition switch is turned to the ON (II) position, then goes off after the engine is started. This indicates that the LED and its circuit are operating correctly.
If there is a failure in the system after the engine is started, the i-SHIFT indicator will stay on.
The i-SHIFT indicator comes on under certain conditions even if the i-SHIFT system is working normally. Here are some examples:

- When you use high-powered wireless equipment in the vehicle.
- When the battery voltage suddenly drops below 9 volts or rises above 16 volts.

Transmission Temp Indicator



When the temperature of the clutch actuator, the gear actuator or the clutch actuator base rises, the indicator comes on. If this indicator comes on, avoid full-throttle acceleration, frequently shifting, and driving at high speed. The indicator will go off when the temperature of the i-SHIFT control system or clutch system drops. It is possible to continue driving normally with the indicator off.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are memorized in the EEPROM. Therefore, the memorized DTCs cannot be canceled by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

When a problem is detected by self-diagnosis, the system does the following:

- Turns the i-SHIFT indicator on.
- Memorizes the DTC.
- When the system detects a problem, the TCM shifts to fail-safe mode.

NOTE: If the malfunction indicator lamp (MIL) comes on at the same time as the i-SHIFT indicator, check for i-SHIFT system DTCs and troubleshoot them first.

Intermittent Failures

The term ‘‘intermittent failure" means a system may have had a failure, but it checks OK now. If the i-SHIFT indicator does not come on, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting. If the indicator comes ON, but then went out, the original problem may have been intermittent.

How to Check for DTCs with the Honda Diagnostic System (HDS)

If the i-SHIFT indicator has been reported on, or if a driveability problem is suspected, follow this procedure:

1. If the i-SHIFT indicator stays on, connect the HDS to the DLC (A).
2. Turn the ignition switch to ON (II).
3. Check the diagnostic trouble code (DTC) and note it.
   NOTE: For specific operations, refer to the user's manual that came with the HDS.
4. After recording the DTCs, clear all DTCs.
5. Recheck the system under the same conditions as the problem has been reported on. If the DTC returns, go to the DTC troubleshooting index. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

How to Clear DTCs

1. With the ignition switch to LOCK (0), connect the HDS to the DLC (A).
2. Turn the ignition switch to ON (II).
3. Clear the DTC(s) with the HDS.
4. Turn the ignition switch to LOCK (0).

How to Substitute the TCM

1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the DLC (A).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the TCM. If it doesn't, troubleshoot the DLC circuit.
5. Replace the clutch actuator (TCM).
6. Turn the ignition switch to ON (II).
7. Update the TCM if it does not have the latest software.
8. Reset the TCM with the HDS.
9. Do the i-SHIFT Learning (dynamic mode).

How to End a Troubleshooting Session (required after any troubleshooting)

1. When the ignition switch to LOCK (0), connect the HDS to the DLC (A).
2. Turn the ignition switch to ON (II).
3. Clear the DTC(s) by following the screen prompts on the HDS.
4. Turn the ignition switch to LOCK (0).
5. Disconnect the HDS from the DLC.

How to Update the TCM

NOTE:

- Make sure you have the latest software on the HDS.
- To ensure the latest program is installed, do a TCM update whenever the TCM is substituted or replaced.
- You can not update a TCM with the program it already has. It will only accept a new program.
- Before you update the TCM, make sure the battery is fully charged.
- To prevent TCM damage, do not operate anything electrical (audio system, brakes, A/C, power windows, sunroof, door locks, etc.) during the update.
- If you need to diagnose the Honda interface module (HIM) because the HIM's red (#3) light came on or was flashing during the update, leave the ignition switch in the ON (II) position when you disconnect the HIM from the DLC. This will prevent TCM damage.
- High temperature in the engine compartment might cause the TCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. Turn the ignition switch to ON (II) but do not start the engine.
2. Connect the HDS to the DLC (A).
3. If the HDS does not have the update function, disconnect the HDS from the vehicle and connect the Honda interface module (HIM).
4. If the software in the TCM is the latest, disconnect the HDS or the HIM from the DLC, and go back to the procedure that you were doing.
   If the software in the TCM is not the latest, do the TCM update procedure as described on the HIM label or in the TCM update system.
   NOTE: If the TCM update system requires you to cool the TCM, follow what is shown on the screen.
5. Do the i-SHIFT Learning (dynamic mode).

DTC Troubleshooting: P0504 (136-2)

DTC P0504:
Brake Pedal Position Signal Malfunction (from ECM by F-CAN)

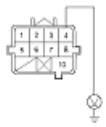
1. Check the BRAKE PEDAL POSITION SWITCH SIGNAL (NORMAL OPEN) and the BRAKE PEDAL POSITION SWITCH SIGNAL (NORMAL CLOSE) in the DATA LIST with the HDS.

   Does the NORMAL OPEN SIGNAL indicate OFF and NORMAL CLOSE SIGNAL indicate ON while the brake pedal is not pressed, and changes to the opposite when the brake pedal is pressed?

   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to the brake pedal position switch circuit troubleshooting. ■

DTC Troubleshooting: P0512 (137-2)

DTC P0512:
Starter Signal Circuit Malfunction
NOTE: If the engine is started without using the starter switch, DTC P0512 is stored.



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine.
4. Check for DTCs with the HDS.

   Is DTC P0512 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
7. Turn the ignition switch to START (III).
8. Measure voltage between clutch actuator subharness 10P connector terminal No. 4 and body ground.

   Is there battery voltage?
   YES - Remove the clutch actuator assembly, then check for the clutch actuator subharness, if the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - Repair an open in the wire between the starter switch and the TCM.■

DTC Troubleshooting: P0562 (138-3)

DTC P0562:
TCM Power Source Circuit (+B) Low Voltage
NOTE: Before troubleshooting, check if the battery condition and charging system are OK.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait for at least 1 second.
5. Check for DTCs with the HDS.

Is DTC P0562 indicated?

YES - Check for poor connections or loose terminals at the battery terminal fuse box, under-dash fuse/relay box and the TCM. If OK, update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0563 (138-4)

DTC P0563:
TCM Power Source Circuit (+B) High Voltage
NOTE: If a high voltage battery (24 V, etc.) is connected to the vehicle, this DTC can be stored.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait for at least 1 second.
5. Check for DTCs with the HDS.

Is DTC P0563 indicated?
YES - Check the battery condition and charging system.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0603 (0-3)

DTC P0603:
TCM Internal KAM Error

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

Is DTC P0603 indicated?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0605 (0-6)

DTC P0605:
TCM Programming Error

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

Is DTC P0605 indicated?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0666 (0-21)

DTC P0666:
TCM Internal Temperature Sensor Signal Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

Is DTC P0666 indicated?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0702 (0-22)

DTC P0702:
TCM Internal CPU Power Supply Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

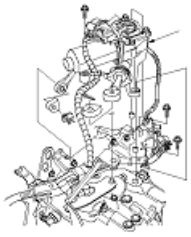
Is DTC P0702 indicated?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P0780 (165-2)

DTC P0780:
Transmission Shift Change System Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle and change the shift lever from 1st to 6th gear positions, and the reverse position.
4. Check for DTCs with the HDS.

   Is DTC P0780 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Check for foreign matter between the change actuator motors, the arms and the actuator rods.

   Are there any foreign matters?
   YES - Repair as necessary and recheck.■
   NO - Go to Step 7 .
7. Test-drive the vehicle and check the shift position it cannot be shifted.
8. Turn the ignition switch to LOCK (0).
9. Remove the transmission shift change actuator (A), then connect the shift actuator motor and select actuator motor 6P connectors.
10. Turn the ignition switch to ON (II).
11. Do the ENGAGE GEARS in the FUNCTIONAL TEST MENU with the HDS, and try to shift the position that could not be shifted.

    Does the actuator motor move normally?
    YES - Repair the transmission internal failure.■
    NO - Replace the change actuator motor. ■

DTC Troubleshooting: P0810 (163-3)

DTC P0810:
Clutch Operation Problem

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the CLUTCH ACTUATOR FULL STROKE OPERATION in the FUNCTIONAL TEST MENU with the HDS.
4. Turn the ignition switch to LOCK (0).
5. Turn the ignition switch to ON (II).
6. Check for DTCs with the HDS.

   Is DTC P0810 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Check the clutch hose and pipe between the slave cylinder and the TCM if they are twisted or cracked.

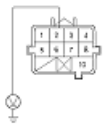
   Are they OK?
   YES - Go to Step 9 .
   NO - Replace the damaged hose or pipe.■
9. Remove the clutch pipe assembly from the clutch actuator.
10. Turn the ignition switch to ON (II).
11. Check for DTCs with the HDS.

    Is DTC P0810 indicated?
    YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Check for these conditions, and repair if necessary:■

    - Slave cylinder
    - Release syatem

DTC Troubleshooting: P0882 (139-3)

DTC P0882:
TCM Power Input Voltage Lower than ECM Power Input Signal
NOTE: Before troubleshooting, check for Fuel and Emissions systems DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait for at least 1 second.
5. Turn the ignition switch to START (III).
6. Check for DTCs with the HDS.

   Is DTC P0882 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Disconnect the clutch actuator subharness 10P connector.
9. Turn the ignition switch to ON (II).
10. Measure voltage between clutch actuator subharness 10P connector terminal No. 2 and body ground.

    Is there battery voltage?
    YES - Remove the clutch actuator assembly, then check for the clutch actuator subharness, if the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Go to Step 11 .
11. Check the No. 12 (10 A) fuse in the under-dash fuse/relay box.

    Is the fuse OK?
    YES - Repair an open in the wire between the No. 12 (10 A) fuse in the under-dash fuse/relay box and the clutch actuator subharness 10P connector.■
    NO - Go to Step 12 .
12. Remove the No. 12 (10 A) fuse from the under-dash fuse/relay box.

---

13. Check for continuity between clutch actuator subharness 10P connector terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair a short in the wire between the No. 12 (10 A) fuse in the under-dash fuse/relay box and the clutch actuator subharness 10P connector, and replace the No. 12 (10 A) fuse.■
    NO - Remove the clutch actuator assembly, and check for clutch actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

DTC Troubleshooting: P0883 (139-4)

DTC P0883:
TCM Power Input Voltage Higher than ECM Power Input Signal
NOTE: If there is communication error between the ECM and TCM, DTC P0883 is not stored.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P0883 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■

6. Check the IGNITION SWITCH ON SIGNAL in the DATA LIST with the HDS.

   Does it indicate ON?
   YES - Remove the clutch actuator assembly, then check for the clutch actuator subharness, if the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - Update the ECM if it does not have the latest software, or substitute a known-good ECM . If the ECM was updated, check for IG1 line between the ignition switch and the ECM.■

DTC Troubleshooting: P0904 (162-2)

DTC P0904:
Select Actuator Motor Rotating Pulse Sensor Signal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine.
4. Change the shift lever in D, N, D, and N.
5. Check for DTCs with the HDS.

   Is DTC P0904 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Check for DTCs with the HDS.

   Is DTC P0904 indicated?
   YES - Go to Step 10 .
   NO - Replace the transmission shift change actuator. ■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the change actuator subharness B 10P connector.
12. Check for continuity between select actuator motor 6P connector terminal No. 5 and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire of the change actuator subharness B.■
    NO - Go to Step 13 .
13. Turn the ignition switch to ON (II).

---

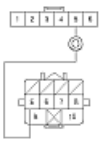
14. Measure voltage between select actuator motor 6P connector terminal No. 5 and body ground.

    Is there battery voltage?
    YES - Repair a short to power in the wire of the change actuator subharness B.■
    NO - Go to Step 15 .

---

15. Check for continuity between select actuator motor 6P connector terminal No. 5 and change actuator subharness B 10P connector terminal No. 5.

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness A. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire of the change actuator subharness B.■



DTC Troubleshooting: P0909 (162-3)

DTC P0909:
Transmission Shift Change Actuator Neutral Position Learned Value Out of Range

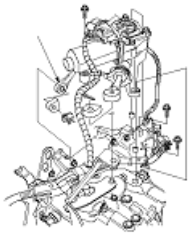
1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P0909 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the transmission shift change actuator.
7. Check the shift actuator and select actuator rods.

   Are they good condition?
   YES - Replace the transmission shift change actuator. ■
   NO - Repair the transmission internal failure.■

DTC Troubleshooting: P0910 (162-4)

DTC P0910:
Select Actuator Motor System Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P0910 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the transmission shift change actuator.
7. Reconnect the 6P connectors to the transmission shift change actuator.
8. Turn the ignition switch to ON (II).
9. Change the shift lever from D to N, then from N to D, and check the select actuator rod (A) operation.

   Does the select actuator rod move smoothly?
   YES - Repair the transmission internal failure.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Disconnect the select actuator motor 6P connector.

---

12. Change the shift lever from D to N, then from N to D, and measure voltage between select actuator motor 6P connector terminals No. 1 and No. 6.

    Does the battery voltage change from positive (or negative) to negative (or positive) depending by the shift lever operation?
    YES - Replace the transmission shift change actuator. ■
    NO - Go to Step 13 .

---

13. Change the shift lever from D to N, then from N to D, and measure voltage between select actuator motor 6P connector terminal No. 1 and body ground.

    Does the voltage change from 0 V (or battery voltage) to battery voltage (or 0 V) depending by the shift lever operation?
    YES - Go to Step 14 .
    NO - Repair an open in the wire between the TCM and the transmission shift change actuator.■

---

14. Change the shift lever from D to N, then from N to D, and measure voltage between select actuator motor 6P connector terminal No. 6 and body ground.

    Does the voltage change from 0 V (or battery voltage) to battery voltage (or 0 V) depending by the shift lever operation?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness A. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the TCM and the transmission shift change actuator.■

DTC Troubleshooting: P0914 (162-5)

DTC P0914:
Shift Actuator Motor Rotating Pulse Sensor Signal Circuit Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine.
4. Change the shift lever in D, then operate the shift lever between + and − positions.
5. Check for DTCs with the HDS.

   Is DTC P0914 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Check for DTCs with the HDS.

   Is DTC P0914 indicated?
   YES - Go to Step 10 .
   NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■
10. Turn the ignition switch to LOCK (0).
11. Remove the clutch actuator assembly.
12. Disconnect TCM connector B (40P).
13. Check for continuity between shift actuator motor 6P connector terminal No. 5 and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire of the change actuator subharness A.■
    NO - Go to Step 14 .
14. Turn the ignition switch to ON (II).

---

15. Measure voltage between shift actuator motor 6P connector terminal No. 5 and body ground.

    Is there battery voltage?
    YES - Repair a short to power in the wire of the change actuator subharness A.■
    NO - Go to Step 16 .
16. Turn the ignition switch to LOCK (0).

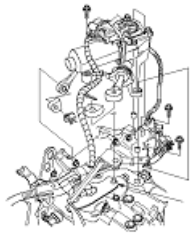
---

17. Check for continuity between shift actuator motor 6P connector terminal No. 5 and TCM connector terminal B9.

    Is there continuity?
    YES - Substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire of the change actuator subharness A.■

DTC Troubleshooting: P0919 (162-6)

DTC P0919:
Transmission Shift Change Actuator Neutral Position Learning Time Out



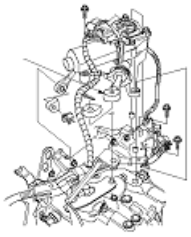
1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P0919 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the transmission shift change actuator.
7. Check if the shift arm (A) moves smoothly.

   Does the shift arm move smoothly?
   YES - Replace the transmission shift change actuator. ■
   NO - Repair the transmission internal failure.■

DTC Troubleshooting: P0920 (162-7)

DTC P0920:
Shift Actuator Motor System Malfunction



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P0920 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the transmission shift change actuator.
7. Reconnect the 6P connectors to the transmission shift change actuator.
8. Turn the ignition switch to ON (II).
9. Change the shift lever from D to N, then from N to D, and check the shift actuator rod (A) operation.

   Does the shift actuator rod move smoothly?
   YES - Repair the transmission internal failure.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Disconnect the shift actuator motor 6P connector.

---

12. Change the shift lever from D to N, then from N to D, and measure voltage between shift actuator motor 6P connector terminals No. 1 and No. 6.

    Does the battery voltage change from positive (or negative) to negative (or positive) depending by the shift lever operation?
    YES - Replace the transmission shift change actuator. ■
    NO - Go to Step 13 .

---

13. Change the shift lever from D to N, then from N to D, and measure voltage between shift actuator motor 6P connector terminal No. 1 and body ground.

    Does the voltage change from 0 V (or battery voltage) to battery voltage (or 0 V) depending by the shift lever operation?
    YES - Go to Step 14 .
    NO - Repair an open in the wire between the TCM and the transmission shift change actuator.■

---

14. Change the shift lever from D to N, then from N to D, and measure voltage between shift actuator motor 6P connector terminal No. 6 and body ground.

    Does the voltage change from 0 V (or battery voltage) to battery voltage (or 0 V) depending by the shift lever operation?
    YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the TCM and the transmission shift change actuator.■

DTC Troubleshooting: P0942 (163-4)

DTC P0942:
Clutch Hydraulic System Malfunction

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Change the shift lever in D.
4. Check for DTCs with the HDS.

   Is DTC P0942 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Make sure the clutch fluid is full in the reservoir, then check the clutch hose and line joint for leaks.

   Is it OK?
   YES - Go to Step 7 .
   NO - Replace the hose or tighten the joint if necessary.■
7. Turn the ignition switch to ON (II).
8. Change the shift lever in N.
9. Do the CLUTCH ACTUATOR FULL STROKE OPERATION in the FUNCTIONAL TEST MENU with the HDS.
10. Check the CLUTCH POSITION ACTUAL in the DATA LIST with the HDS.

    Is there more than 15 mm (0.6 in.)?
    YES - Check for these conditions, and repair if necessary:■

    - Clutch disc and pressure plate
    - Diaphragm spring
    - Release bearing

    NO - Check for these conditions, and repair if necessary:■

    - Slave cylinder
    - Release fork

DTC Troubleshooting: P16C0 (99-1)

DTC P16C0:
TCM Programming Error
NOTE:

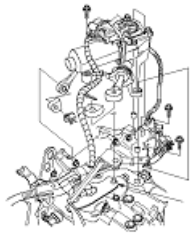
- DTC P16C0 is stored when the i-SHIFT system update is not completed.
- Do not turn the ignition switch to LOCK (0) while updating the i-SHIFT system. If you turn the ignition switch to LOCK (0) before completion, the i-SHIFT system can be damaged.

1. Do the i-SHIFT system update procedure.
2. Check for DTCs with the HDS.

   Is DTC P16C0 indicated?
   YES - Replace the TCM. ■
   NO - Update is complete.■

DTC Troubleshooting: P19E4 (162-8)

DTC P19E4:
Gear Shift Actuator Temperature Out of Range
NOTE: DTC P19E4 is stored when the gear change motor is protection mode. This can be caused due to frequent UP/DOWN operation. In this case, it is not a malfunction.



1. Check whether the driver changed gears excessively while driving.

   Did the driver change gears excessively while driving?
   YES - Not failure, just a rise of the transmission shift change actuator temperature due to excessive gear changes.■
   NO - Go to Step 2 .

2. Turn the ignition switch to ON (II).
3. Clear the DTCs with the HDS.
4. In order to cool the system, wait for at least 1 hour.
5. Test-drive the vehicle for at least 10 minutes.
6. Check for DTCs with the HDS.

   Is DTC P19E4 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■

7. Turn the ignition switch to LOCK (0).
8. Remove the transmission shift change actuator.
9. Check if the shift arm (A) moves smoothly.

   Does the shift arm move smoothly?
   YES - Replace the transmission shift change actuator. ■
   NO - Repair the transmission internal failure.■

DTC Troubleshooting: P19E5 (163-2)

DTC P19E5:
Clutch Actuator Stroke Sensor Signal Out of Range

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

Is DTC P19E5 indicated?

YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P19E6 (164-1)

DTC P19E6:
Clutch Temperature Too High (Over 300 °C (572 °F))
NOTE:

- DTC P19E6 is stored when the clutch temperature is higher than 300 °C (572 °F).
- If the DTC P19E6 is stored, the system stops the creep control.
- The value of the clutch temperature is reset when the DTC is cleared with the HDS.
- The clutch temperature is high when the UP/DOWN operation is done frequently at a short time.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle for at least 10 minutes.
4. Check for DTCs with the HDS.

   Is DTC P19E6 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
7. Check for DTCs with the HDS.

   Is DTC P19E6 indicated?
   YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - The system is OK at this time (Failure by air in the fluid).■

DTC Troubleshooting: P19E7 (160-27)

DTC P19E7:
Clutch Contact Position 3 Learning Not Completed
NOTE: If the Clutch Contact Position 3 Learning is incomplete after replacing the clutch disc, repeat the Clutch Contact Position 3 Learning several times. If the Clutch Contact Position 3 Learning is still incomplete, check the clutch disc installation.

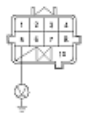
1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load until the radiator fan comes on, then let it idle.
4. Turn the headlight switch to ON.
5. Do the i-SHIFT System Learning (Dynamic Mode).
6. Check for DTCs with the HDS.

   Is DTC P19E7 indicated?
   YES - Go to Step 7 .
   NO - Intermittent failure, the system is OK at this time.■
7. Turn the ignition switch to LOCK (0).
8. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
9. Do the i-SHIFT System Learning (Dynamic Mode).
10. Check for DTCs with the HDS.

    Is DTC P19E7 indicated?
    YES - Go to Step 8 and repeat the steps.
    NO - Clutch Contact Position 3 Learning is complete.■

DTC Troubleshooting: P19E8 (130-1)

DTC P19E8:
Vehicle Speed Signal Malfunction (from ECM by Signal Line)



1. Turn the ignition switch to LOCK (0).
2. Raise the vehicle, and make sure it is securely supported.
3. Start the engine, and change the shift lever in D.
4. Compare the speedometer indication and the VEHICLE SPEED in the DATA LIST with the HDS.

   Does the HDS indication match with the speedometer?
   YES - Intermittent failure, the system is OK at this time.■
   NO - Go to Step 5 .
5. Check the VEHICLE SPEED in the DATA LIST with the HDS.

   Is 0 km/h (0 mph) indicated?
   YES - Repair a short to ground in the wire between the ECM (A33) and the TCM (A3).■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
8. Turn the ignition switch to ON (II).
9. Measure voltage between clutch actuator subharness 10P connector terminal No. 5 and body ground.

   Is there battery voltage?
   YES - Repair a short to power in the wire between the ECM (A33) and the clutch actuator subharness.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect ECM connector A (49P).

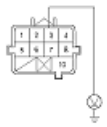
---

13. Check for continuity between ECM connector terminal A33 and clutch actuator subharness 10P connector terminal No. 5.

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for clutch actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the ECM (A33) and the clutch actuator subharness.■

DTC Troubleshooting: P19E9 (131-1)

DTC P19E9:
Brake Pedal Position Signal Malfunction (from ECM by Signal Line)



1. Turn the ignition switch to ON (II).
2. Press and release the brake pedal continuously for at least 2 minutes.
3. With the brake pedal released, check the BRAKE PEDAL POSITION SWITCH AND SIGNAL in the DATA LIST with the HDS.

   Does it indicate ON?
   YES - Repair a short to ground in the wire between the ECM (A28) and the TCM (A35).■
   NO - Go to Step 4 .
4. Turn the ignition switch to LOCK (0).
5. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
6. Turn the ignition switch to ON (II).
7. Measure voltage between clutch actuator subharness 10P connector terminal No. 3 and body ground.

   Is there battery voltage?
   YES - Repair a short to power in the wire between the ECM (A28) and the TCM (A35).■
   NO - Go to Step 8 .
8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect ECM connector A (49P).

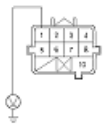
---

11. Check for continuity between ECM connector terminal A28 and clutch actuator subharness 10P connector terminal No. 3.

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for clutch actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the ECM (A28) and the clutch actuator subharness.■

DTC Troubleshooting: P19EA (132-1)

DTC P19EA:
Starter Signal Malfunction (from ECM by Signal Line)



1. Turn the ignition switch to ON (II).
2. With the shift lever in N and the brake pedal pressed, check the STARTER ENABLE SIGNAL in the DATA LIST with the HDS.

   Does it indicate ON?
   YES - Repair a short to ground in the wire between the ECM (A43) and the TCM (A10).■
   NO - Go to Step 3 .
3. Turn the ignition switch to LOCK (0).
4. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
5. Turn the ignition switch to ON (II).
6. Measure voltage between clutch actuator subharness 10P connector terminal No. 1 and body ground.

   Is there battery voltage?
   YES - Repair a short to power in the wire between the ECM (A43) and the TCM (A10).■
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect ECM connector A (49P).

---

10. Check for continuity between ECM connector terminal A43 and clutch actuator subharness 10P connector terminal No. 1.

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for clutch actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the ECM (A43) and the clutch actuator subharness.■

DTC Troubleshooting: P19EB (133-1)

DTC P19EB:
TCM initialization with Tester Error
NOTE: If DTC P19EB is indicated, replace the TCM.

DTC Troubleshooting: P19EC (150-21)

DTC P19EC:
Shift Actuator Motor Rotating Pulse/Rotating Direction Sensor Supply Signal Circuit Low Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19EC indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTCs with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Turn the ignition switch to ON (II).
12. Check for DTCs with the HDS.

    Is DTC P19EC indicated?
    YES - Repair a short to ground in the wire between the TCM (B20) and the shift actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19ED (150-22)

DTC P19ED:
Shift Actuator Motor Rotating Pulse/Rotating Direction Sensor Supply Signal Circuit High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19ED indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Connect the shift actuator motor 6P connector terminal No. 3 and body ground with a jumper wire.
9. Turn the ignition switch to ON (II).
10. Clear the DTCs with the HDS.
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II).
13. Check for DTCs with the HDS.

    Is DTC P19ED indicated?
    YES - Repair an open in the wire between the TCM (B20) and the shift actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19EE (150-23)

DTC P19EE:
Shift Actuator Motor Rotating Pulse/Rotating Direction Sensor Supply Signal Circuit High Voltage

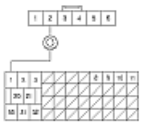
1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19EE indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Measure voltage between the shift actuator motor 6P connector terminal No. 3 and body ground.

   Is there battery voltage?
   YES - Repair a short to power in the wire between the TCM (B20) and the shift actuator motor.■
   NO - Replace the transmission shift change actuator. ■

DTC Troubleshooting: P19EF (151-22)

DTC P19EF:
Shift Actuator Motor Position Sensor Ground Line Open



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19EF indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Remove the clutch actuator assembly.
9. Disconnect TCM connector B (40P).
10. Check for continuity between TCM connector terminal B1 and shift actuator motor 6P connector terminal No. 2.

    Is there continuity?
    YES - Replace the transmission shift change actuator. ■
    NO - Repair an open in the wire of the change actuator subharness A.■

DTC Troubleshooting: P19F0 (152-21)

DTC P19F0:
Shift Actuator Motor Rotating Direction Sensor Signal Circuit Low Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F0 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTCs with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Turn the ignition switch to ON (II).
12. Check for DTCs with the HDS.

    Is DTC P19F0 indicated?
    YES - Repair a short to ground in the wire between the TCM (B8) and the shift actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19F2 (152-23)

DTC P19F2:
Shift Actuator Motor Rotating Direction Sensor Signal Circuit High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F2 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the shift actuator motor 6P connector.
8. Connect shift actuator motor 6P connector terminal No. 4 and body ground with a jumper wire.
9. Turn the ignition switch to ON (II).
10. Clear the DTCs with the HDS.
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II).
13. Check for DTCs with the HDS.

    Is DTC P19F2 indicated?
    YES - Repair an open in the wire between the TCM (B8) and the shift actuator motor.■
    NO - Go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Remove the clutch actuator assembly.
16. Disconnect the TCM connector B (40P).
17. Turn the ignition switch to ON (II).

---

18. Measure voltage between shift actuator motor 6P connector terminal No. 4 and body ground.

    Is there battery voltage?
    YES - Repair a short to power in the wire of the change actuator subharness A.■
    NO - Replace the transmission shift change actuator. ■

DTC Troubleshooting: P19F3 (153-21)

DTC P19F3:
Select Actuator Motor Rotating Pulse/Rotating Direction Sensor Supply Signal Circuit Low Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F3 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTCs with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Turn the ignition switch to ON (II).
12. Check for DTCs with the HDS.

    Is DTC P19F3 indicated?
    YES - Repair a short to ground in the wire between the TCM (B2) and the select actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19F4 (153-22)

DTC P19F4:
Select Actuator Motor Rotating Pulse/Rotating Direction Sensor Supply Signal Circuit High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F4 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Connect select actuator motor 6P connector terminal No. 3 and body ground with a jumper wire.
9. Turn the ignition switch to ON (II).
10. Clear the DTCs with the HDS.
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II).
13. Check for DTCs with the HDS.

    Is DTC P19F4 indicated?
    YES - Repair an open in the wire between the TCM (B3) and the select actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19F5 (153-23)

DTC P19F5:
Select Actuator Motor Rotating Pulse Sensor Signal Circuit High Voltage

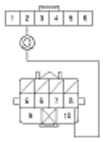
1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F5 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Measure voltage between select actuator motor 6P connector terminal No. 3 and body ground.

   Is there battery voltage?
   YES - Repair a short to power in the wire of the change actuator subharness B.■
   NO - Remove the clutch actuator assembly, and check for change actuator subharness A. If the wire harness is OK, replace the transmission shift change actuator. ■

DTC Troubleshooting: P19F6 (154-22)

DTC P19F6:
Select Actuator Motor Position Sensor Ground Line Open



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F6 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Disconnect the change actuator subharness B 10P connector.
9. Check for continuity between change actuator subharness B 10P connector terminal No. 8 and select actuator motor 6P connector terminal No. 2.

   Is there continuity?
   YES - Remove the clutch actuator assembly, and check for change actuator subharness A. If the wire harness is OK, replace the transmission shift change actuator. ■
   NO - Repair an open in the wire of the change actuator subharness B.■

DTC Troubleshooting: P19F7 (155-21)

DTC P19F7:
Select Actuator Motor Rotating Direction Sensor Signal Circuit Low Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F7 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTCs with the HDS.
10. Turn the ignition switch to LOCK (0).
11. Turn the ignition switch to ON (II).
12. Check for DTCs with the HDS.

    Is DTC P19F7 indicated?
    YES - Repair a short to ground in the wire between the TCM (B10) and the select actuator motor.■
    NO - Replace the transmission shift change actuator. (A few DTCs related with open circuit will be stored at this time.)■

DTC Troubleshooting: P19F9 (155-23)

DTC P19F9:
Select Actuator Motor Rotating Direction Sensor Signal Circuit High Voltage

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC P19F9 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Disconnect the select actuator motor 6P connector.
8. Connect select actuator motor 6P connector terminal No. 4 and body ground with a jumper wire.
9. Turn the ignition switch to ON (II).
10. Clear the DTCs with the HDS.
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II).
13. Check for DTCs with the HDS.

    Is DTC P19F9 indicated?
    YES - Repair an open in the wire between the TCM (B10) and the select actuator motor.■
    NO - Go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Disconnect the change actuator subharness B 10P connector.
16. Turn the ignition switch to ON (II).

---

17. Measure voltage between select actuator motor 6P connector terminal No. 4 and body ground.

    Is there battery voltage?
    YES - Repair a short to power in the wire of the change actuator subharness B.■
    NO - Remove the clutch actuator assembly, and check for change actuator subharness A. If the wire harness is OK, replace the transmission shift change actuator. ■

DTC Troubleshooting: P19FA (160-21)

DTC P19FA:
Clutch Contact Position Adaptation Condition Error

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine, and wait for at least 1 second.
4. Check for DTCs with the HDS.

   Is DTC P19FA indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Check the ENGINE TORQUE DISTURBANCE SIGNAL in the DATA LIST with the HDS.

   Does it indicate ACTIVE more than 10 minutes?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for Fuel and Emissions systems DTCs with the HDS.

   Are any Temporary DTCs or DTCs indicated?
   YES - Go to the indicated DTC's troubleshooting.
   NO - Electrical load change is continuing. Do the i-SHIFT System Learning (Static Mode) and the i-SHIFT System Learning (Dynamic Mode). ■

DTC Troubleshooting: P19FB (160-22)

DTC P19FB:
Clutch Contact Position 1 and 2 Learning Not Completed
NOTE: If the Clutch Contact Position 1, 2 Learning is incomplete after replacing the clutch disc, repeat the Clutch Contact Position 1, 2 Learning several times. If the Clutch Contact Position 1, 2 Learning is still incomplete, check the clutch disc installation.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P19FB indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
7. Do the i-SHIFT System Learning (Static Mode).
8. Check for DTCs with the HDS.

   Is DTC P19FB indicated?
   YES - Go to Step 7 and repeat the steps.
   NO - Clutch Contact Position 1, 2 Learning is complete.■

DTC Troubleshooting: P19FC (160-23)

DTC P19FC:
Shift Change Actuator Position Learning Not Completed
NOTE:

- DTC P19FC is stored when the Shift Change Actuator Position Learning is incomplete.
- Make sure the battery is fully charged.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

Is DTC P19FC indicated?

YES - Go to Step 3 , and repeat the steps. If DTC P19FC is stored again after doing the i-SHIFT System Learning (Static Mode), check the repair error, or there is a problem in a replacement part.

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: P19FD (160-24)

DTC P19FD:
Shift Change Actuator Position Learning Value Out of Range

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P19FD indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Clear the DTCs with the HDS.
6. Test-drive the vehicle for at least 10 minutes.
7. Check for DTCs with the HDS.

   Is DTC P19FD indicated?
   YES - Do the i-SHIFT System Learning (Static Mode), and recheck. If DTC P19FD is stored again, replace the transmission shift change actuator. ■
   NO - The system is OK at this time.■

DTC Troubleshooting: P19FE (160-25)

DTC P19FE:
Clutch Contact Position Adaptation Learning Value Out of Range

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Do the i-SHIFT System Learning (Static Mode).
4. Check for DTCs with the HDS.

   Is DTC P19FE indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
7. Do the i-SHIFT System Learning (Static Mode).
8. Turn the ignition switch to LOCK (0).
9. Check for DTCs with the HDS.

   Is DTC P19FE indicated?
   YES - Go to Step 10 .
   NO - The system is OK at this time.■
10. Turn the ignition switch to LOCK (0).
11. Remove the clutch pipe assembly from the clutch actuator.
12. Do the CLUTCH FLUID FILLING in the ADJUSTMENT MENU with the HDS.
13. Turn the ignition switch to ON (II).
14. Check for DTCs with the HDS.

    Is DTC P19FE indicated?
    YES - Replace the TCM. ■
    NO - Check for these conditions, and repair if necessary:■

    - Slave cylinder
    - Release system

DTC Troubleshooting: P19FF (160-26)

DTC P19FF:
Clutch Friction Coefficient Learning Value Out of Range

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle and change the shift lever from 1st to 6th gear.
4. Check for DTCs with the HDS.

   Is DTC P19FF indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the CLUTCH FLUID AIR BLEEDING in the ADJUSTMENT MENU with the HDS.
7. Do the i-SHIFT System Learning (Static Mode).
8. Turn the ignition switch to LOCK (0).
9. Check for DTCs with the HDS.

   Is DTC P19FF indicated?
   YES - Go to Step 10 .
   NO - The system is OK at this time.■
10. Turn the ignition switch to LOCK (0).
11. Remove the clutch pipe assembly from the clutch actuator.
12. Do the CLUTCH FLUID FILLING in the ADJUSTMENT MENU with the HDS.
13. Turn the ignition switch to ON (II).
14. Check for DTCs with the HDS.

    Is DTC P19FF indicated?
    YES - Replace the TCM. ■
    NO - Check for these conditions, and repair if necessary:■

    - Slave cylinder
    - Release system

DTC Troubleshooting: P2785 (163-1)

DTC P2785:
Clutch Actuator Temperature Too High
NOTE: DTC P2785 is stored when the clutch motor is protection mode. This can be caused due to frequent UP/DOWN operation. In this case, it is not a malfunction.

1. Check whether the driver changed gears excessively while driving.

   Did the driver change gears excessively while driving?
   YES - Not failure, just a rise of the clutch actuator temperature due to excessive gear changes.■
   NO - Go to Step 2 .

2. Check the CLUTCH ACTUATOR TEMPERATURE and the TRANSMISSION SHIFT CHANGE ACTUATOR TEMPERATURE in the DATA LIST with the HDS.

   Is the clutch actuator temperature about 195 °C (383 °F) or more, or the transmission shift change actuator temperature about 118 °C (244 °F) or more?
   YES - Go to Step 3 .
   NO - Go to Step 6 .

3. Turn the ignition switch to LOCK (0).

4. In order to cool the system, wait for at least 1 hour.

5. Check the CLUTCH ACTUATOR TEMPERATURE and the TRANSMISSION SHIFT CHANGE ACTUATOR TEMPERATURE in the DATA LIST with the HDS.

   Is the clutch actuator temperature about 195 °C (383 °F) or more, or the transmission shift change actuator temperature about 118 °C (244 °F) or more?
   YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - Go to Step 6 .

6. Test-drive the vehicle with changing gears frequently for at least 15 minutes.

7. Check the CLUTCH ACTUATOR TEMPERATURE and the TRANSMISSION SHIFT CHANGE ACTUATOR TEMPERATURE in the DATA LIST with the HDS.

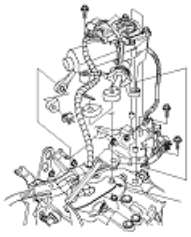
   Is the clutch actuator temperature about 195 °C (383 °F) or more, or the transmission shift change actuator temperature about 118 °C (244 °F) or more?
   YES - Go to Step 8 .
   NO - Intermittent failure, the system is OK at this time.■

8. Check the release fork moves smoothly.

   Does the release fork move smoothly?
   YES - Replace the TCM. ■
   NO - Replace the release bearing. ■

DTC Troubleshooting: P2786 (162-1)

DTC P2786:
Transmission Shift Change Actuator Temperature Too High



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. In order to cool the system, wait for at least 1 hour.
4. Test-drive the vehicle for at least 10 minutes.
5. Check for DTCs with the HDS.

   Is DTC P2786 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Turn the ignition switch to LOCK (0).
7. Remove the transmission shift change actuator.
8. Check if the shift arm (A) moves smoothly.

   Does the shift arm move smoothly?
   YES - Replace the transmission shift change actuator.■
   NO - Repair the transmission internal failure.■

DTC Troubleshooting: P2787 (164-2)

DTC P2787:
Clutch Temperature Too High (Over 400 °C (752 °F))
NOTE: DTC P2787 is stored when the clutch is protection mode. This can be caused due to frequent UP/DOWN operation. In this case, it is not a malfunction.

1. Check whether the driver changed gears excessively while driving.

   Did the driver change gears excessively while driving?
   YES - Not failure, just a rise of the clutch temperature due to excessive gear changes.■
   NO - Go to Step 2 .

2. Test-drive the vehicle for at least 15 minutes with the Auto mode, then repeat a start and a stop several times.

   Does the clutch slip?
   YES - Replace the clutch. ■
   NO - Go to Step 3 .

3. Turn the ignition switch to LOCK (0).

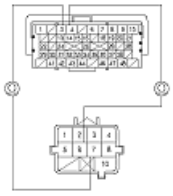
4. In order to cool the system, wait for at least 1 hour.

5. Check the CLUTCH TEMPERATURE in the DATA LIST with the HDS.

   Is the clutch temperature about 400 °C (752 °F) or more?
   YES - Update the TCM if it does not have the latest software, or substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U0100 (107-11)

DTC U0100:
F-CAN Malfunction (TCM Lost Communication with ECM)

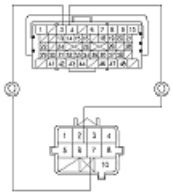


1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC U0100 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for DTCs with the HDS.

   Are DTC U0103, U0155, and U1261 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 13 .
7. Turn the ignition switch to LOCK (0).
8. Wait for at least 30 seconds.
9. Jump the SCS line with the HDS.
10. Disconnect ECM connector A (49P).
11. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
12. Check for continuity between ECM connector terminal A3 (A4) * and clutch actuator subharness 10P connector terminal No. 7 (No. 6) * .
    *: CANL

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the ECM (A3 (A4) *).■
    *: CANL
13. Turn the ignition switch to LOCK (0).
14. Wait for at least 30 seconds.
15. Jump the SCS line with the HDS.
16. Disconnect ECM connector A (49P).
17. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.

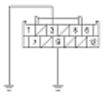


18. Check for continuity between ECM connector terminal A3 (A4) * and clutch actuator subharness 10P connector terminal No. 7 (No. 6) * .
    *: CANL

    Is there continuity?
    YES - Update the ECM if it does not have latest software. If the ECM was updated, substitute a known-good ECM, and recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the ECM (A3 (A4) *).■
    *: CANL

DTC Troubleshooting: U0103 (107-9)

DTC U0103:
F-CAN Malfunction (TCM Lost Communication with Gear Shift Control Module)



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC U0103 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for DTCs with the HDS.

   Are DTC U0100, U0155, and U1261 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 13 .
7. Turn the ignition switch to LOCK (0).
8. Wait for at least 30 seconds.
9. Disconnect the gear shift control module 12P connector.
10. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
11. Connect gear shift control module 12P connector terminal No. 3 (No. 9) * and body ground with jumper wires.
    *: CANL

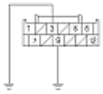
---

12. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the gear shift control module.■
13. Turn the ignition switch to LOCK (0).
14. Wait for at least 30 seconds.
15. Disconnect the gear shift control module 12P connector.
16. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.

---

17. Connect gear shift control module 12P connector terminal No. 3 (No. 9) * and body ground with jumper wires.
    *: CANL



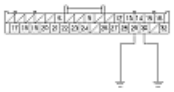
---

18. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Substitute a known-good gear shift control module, then recheck. If the symptom/indication goes away with a known-good gear shift control module, replace the original gear shift control module. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the gear shift control module.■

DTC Troubleshooting: U0155 (107-3)

DTC U0155:
F-CAN Malfunction (TCM Lost Communication with Gauge Control Module)



1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC U0155 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for DTCs with the HDS.

   Are DTC U0100, U0103, and U1261 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 13 .
7. Turn the ignition switch to LOCK (0).
8. Wait for at least 30 seconds.
9. Disconnect the gauge control module 32P connector.
10. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
11. Connect gauge control module 32P connector terminal No. 30 (No. 29) * and body ground with jumper wires.
    *: CANL

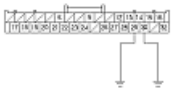
---

12. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the gauge control module.■
13. Turn the ignition switch to LOCK (0).
14. Wait for at least 30 seconds.
15. Disconnect the gauge control module 32P connector.
16. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.

---

17. Connect gauge control module 32P connector terminal No. 30 (No. 29) * and body ground with jumper wires.
    *: CANL



---

18. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Substitute a known-good shift lever, then recheck. If the symptom/indication goes away with a known-good shift lever, replace the original shift lever. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the gauge control module.■

DTC Troubleshooting: U0401 (134-2)

DTC U0401:
F-CAN Malfunction (TCM Received Invalid Data from ECM)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Start the engine.
4. Change the engine speed from idle to 4,000 rpm (min $^{-1}$) twice.
5. Check for DTCs with the HDS.

Is DTC U0401 indicated?
YES - Check for Fuel and Emissions systems DTCs with the HDS.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U0404 (134-7)

DTC U0404:
F-CAN Malfunction (TCM Received Invalid Data from Gear Shift Control Module)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Change the shift lever in all positions.
4. Check for DTCs with the HDS.

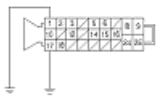
Is DTC U0404 indicated?

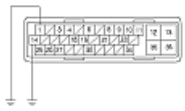
YES - Substitute a known-good gear shift control module, then recheck. If the symptom/indication goes away with a known-good gear shift control module, replace the original gear shift control module. ■

NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U1261 (107-21)

DTC U1261:
F-CAN Malfunction (TCM Lost Communication with ABS/VSA Modulator-Control Unit)
NOTE: If DTC U1261 is stored at the same time as DTC U1405, troubleshoot DTC U1261 first, then recheck for DTC U1405.

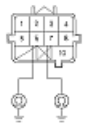




1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

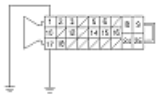
   Is DTC U1261 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for DTCs with the HDS.

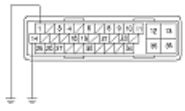
   Are DTC U0100, U0103, and U0155 indicated?
   YES - Go to Step 7 .
   NO - Go to Step 13 .
7. Turn the ignition switch to LOCK (0).
8. Wait for at least 30 seconds.
9. Disconnect the ABS modulator-control unit 25P connector (or the VSA modulator-control unit 36P connector).
10. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.
11. With ABS: Connect ABS modulator-control unit 25P connector terminal No. 1 (No. 17) * and body ground with jumper wires.
    With VSA: Connect VSA modulator-control unit 36P connector terminal No. 14 (No. 1) * and body ground with jumper wires.
    *: CANL



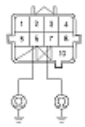
12. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Remove the clutch actuator assembly, and check for change actuator subharness. If the wire harness is OK, substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the ABS (or VSA) modulator-control unit.■
13. Turn the ignition switch to LOCK (0).
14. Wait for at least 30 seconds.
15. Disconnect the ABS modulator-control unit 25P connector (or the VSA modulator-control unit 36P connector).
16. Disconnect the clutch actuator subharness 10P connector from the engine compartment wire harness.





17. With ABS: Connect ABS modulator-control unit 25P connector terminal No. 1 (No. 17) * and body ground with jumper wires.
    With VSA: Connect VSA modulator-control unit 36P connector terminal No. 14 (No. 1) * and body ground with jumper wires.
    *: CANL



18. Check for continuity between clutch actuator subharness 10P connector terminal No. 7 (No. 6) * and body ground.
    *: CANL

    Is there continuity?
    YES - Substitute a known-good VSA modulator-control unit, then recheck. If the symptom/indication goes away with a known-good VSA modulator-control unit, replace the original VSA modulator-control unit. ■
    NO - Repair an open in the wire between the clutch actuator subharness 10P connector and the VSA modulator-control unit.■

DTC Troubleshooting: U1400 (135-2)

DTC U1400:
F-CAN Malfunction (TCM Received Out of Range Data from ECM)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II).
5. Check for DTCs with the HDS.

   Is DTC U1400 indicated?
   YES - Go to Step 6 .
   NO - Intermittent failure, the system is OK at this time.■
6. Check for Fuel and Emissions systems DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the Fuel and Emissions systems indicated DTCs troubleshooting.
   NO - Go to Step 7 .
7. Check these parameters in the DATA LIST with the HDS:
   - ENGINE SPEED
   - ENGINE COOLANT TEMPERATURE
   - INTAKE AIR TEMPERATURE

   Is the value 10,001 rpm (min^{-1}), 151 °C (304 °F), and 151 °C (304 °F) or more?
   YES - Remove the clutch actuator assembly, and substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■
   NO - Update the ECM if it does not have the latest software. If the ECM was updated, substitute a known-good ECM, then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■

DTC Troubleshooting: U1401 (161-21)

DTC U1401:
F-CAN Malfunction (TCM Received Invalid Shift Down Command While Cruise Control from ECM)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle with cruise control.
4. Check for DTCs with the HDS.

Is DTC U1401 indicated?
YES - Check for Fuel and Emissions systems.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U1402 (161-22)

DTC U1402:
F-CAN Malfunction (TCM Received Invalid Shift Down Command While Cruise Control from ECM)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle with cruise control.
4. Check for DTCs with the HDS.

Is DTC U1402 indicated?
YES - Check for Fuel and Emissions systems DTCs with the HDS.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U1403 (134-21)

DTC U1403:
F-CAN Malfunction (TCM Received Invalid Data from ABS/VSA Modulator-Control Unit)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle for at least 10 km/h (6.2 mph).
4. Check for DTCs with the HDS.

Is DTC U1403 indicated?
YES - Check for ABS (VSA) system DTCs with the HDS.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: U1404 (135-21)

DTC U1404:
F-CAN Malfunction (TCM Received Out of Range Data from ABS/VSA Modulator-Control Unit)

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle for several minutes.
4. Check for DTCs with the HDS.

   Is DTC U1404 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Check for ABS (VSA) system DTCs with the HDS.

   Are any ABS (VSA) system DTCs indicated?
   YES - Go to the VSA system indicated DTC's troubleshooting. ■
   NO - Go to Step 6 .
6. Test-drive the vehicle for at least 10 km/h (6.2 mph).
7. Check each WHEEL SENSOR in the DATA LIST with the HDS.

   Does any of wheel speeds indicate 2,594 rpm?
   YES - Substitute a known-good VSA modulator-control unit, then recheck. If the symptom/indication goes away with a known-good VSA modulator-control unit, replace the original VSA modulator-control unit. ■
   NO - Remove the clutch actuator assembly, and substitute a known-good TCM, then recheck. If the symptom/indication goes away with a known-good TCM, replace the original TCM. ■

DTC Troubleshooting: U1405 (134-22)

DTC U1405:
F-CAN Malfunction (TCM Received Invalid Data from ABS/VSA Modulator-Control Unit)
NOTE: If DTC U1261 is stored at the same time as DTC U1405, troubleshoot DTC U1261 first, then recheck for DTC U1405.

1. Turn the ignition switch to ON (II).
2. Clear the DTCs with the HDS.
3. Test-drive the vehicle for at least 10 km/h (6.2 mph).
4. Check for DTCs with the HDS.

Is DTC U1405 indicated?
YES - Check for ABS (VSA) system DTCs with the HDS.■
NO - Intermittent failure, the system is OK at this time.■

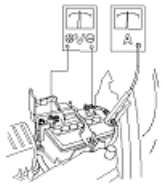
Starter System Circuit Troubleshooting



NOTE:

- Air temperature must be within 15−38 °C (59−100 °F) during this procedure.
- After this inspection, you must reset the engine control module (ECM)/powertrain control module (PCM). Otherwise, the ECM/PCM will continue to stop the fuel injectors from functioning.
- The battery must be in good condition and fully charged.

1. Hook up the this equipment:
   - Ammeter, 0−400 A
   - Voltmeter, 0−20 V (accurate within 0.1 V)
2. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the ECM/PCM. If it doesn't communicate, troubleshoot the DLC circuit.
5. Select PGM-FI, INSPECTION, then ALL INJECTORS STOP on the HDS.
6. Set the parking brake, then with the shift lever in P or N (A/T model) or neutral (M/T model), turn the ignition switch to START (III).

   Does the starter crank the engine normally?

   YES - The starting system is OK. Go to Step 13 .

   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Check the battery condition. Check the electrical connections at the battery, the negative battery cable to the body, the engine ground cables, and the starter for looseness and corrosion. Then try cranking the engine again.

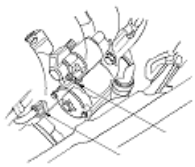
   Does the starter crank the engine normally?

   YES - Repairing the loose connection corrected the problem. The starting system is OK. Go to Step 13 .

   NO - Based on the following symptoms, take the appropriate action:

   - If the starter will not crank the engine at all, go to Step 9 .
   - If the starter cranks the engine erratically or too slowly, go to Step 11 .
   - If the starter will not disengage from the flywheel ring gear (M/T model) or torque converter ring gear (A/T model) when you release the key, replace the starter, or remove and disassemble it, and check for the following:■
     - Starter solenoid and switch malfunction
     - Dirty drive gear or damaged overrunning clutch

9. Make sure the transmission is in N or P (A/T model) or neutral (M/T model) then, disconnect the 1P connector (A) from the starter S terminal. Connect a jumper wire from the battery positive terminal to the S terminal.



Does the starter crank the engine?
YES - Go to Step 10 .
NO - Remove the starter , and repair or replace it as necessary.■

10. Check the following items in the order listed until you find the open circuit:
    - The YEL wire and connectors between the driver's under-dash fuse/relay box and the ignition switch.
    - The BLK/WHT wire and connectors between the driver's under-dash fuse/relay box.
    - The ignition switch.
    - The transmission range switch (A/T model) and connector.
    - The starter cut relay (A/T model).

Does these items OK?
YES - Go to Step 12 .
NO - Repair or replace it, then go to Step 13 .

11. While cranking the engine, check the cranking voltage and the current draw.

Is the cranking voltage greater than or equal to 9 V and is the current draw less than or equal to 150 A?
YES - Go to Step 12 .
NO - Replace the starter, or remove and disassemble it, and check for these problems:■

- Drag in the starter armature
- Shorted armature winding
- Excessive drag in the engine
- Open circuit in the starter armature commutator segments
- Excessively worn starter brushes
- Open circuit in the starter brushes
- Dirty or damaged helical splines or drive gear
- Faulty drive gear clutch

12. Remove the starter, and inspect its drive gear and the flywheel ring gear (M/T model) or torque converter ring gear (A/T model) for damage. Replace any damaged parts.

13. Select ECM/PCM reset to cancel ALL INJECTORS STOP on the HDS.

M/T System Description

Reverse Lockout System

Hard to shift into 1st gear

Probable cause(s)

1. Worn or incorrect MTF.
2. Clutch defective.
3. 1st synchro ring defective.
4. 1st/2nd synchro sleeve and hub defective.
5. 1st gear defective.
6. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the clutch.
- Check the 1st synchro ring.
- Check the 1st/2nd synchro sleeve and hub.
- Check 1st gear.
- Check the change lever assembly.

Hard to shift into 2nd gear

Probable cause(s)

1. Worn or incorrect MTF.
2. 2nd synchro ring defective.
3. 1st/2nd synchro sleeve and hub defective.
4. 2nd gear defective.
5. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the 2nd synchro ring.
- Check the 1st/2nd synchro sleeve and hub.
- Check 2nd gear.
- Check the change lever assembly.

Hard to shift into 3rd gear

Probable cause(s)

1. Worn or incorrect MTF.
2. 3rd synchro ring defective.
3. 3rd/4th synchro sleeve and hub defective.
4. 3rd gear defective.
5. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the 3rd synchro ring.
- Check the 3rd/4th synchro sleeve and hub.
- Check 3rd gear.
- Check the change lever assembly.

Hard to shift into 4th gear

Probable cause(s)

1. Worn or incorrect MTF.
2. 4th synchro ring defective.
3. 3rd/4th synchro sleeve and hub defective.
4. 4th gear defective.
5. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the 4th synchro ring.
- Check the 3rd/4th synchro sleeve and hub.
- Check 4th gear.
- Check the change lever assembly.

Hard to shift into 5th gear

Probable cause(s)

1. Worn or incorrect MTF.
2. 5th synchro ring defective.
3. 5th synchro sleeve defective.
4. 5th gear defective.
5. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the 5th synchro ring.
- Check the 5th synchro sleeve and hub.
- Check 5th gear.
- Check the change lever assembly.

Hard to shift into reverse

Probable cause(s)

1. Worn or incorrect MTF.
2. Clutch defective.
3. Reverse shift fork defective.
4. Reverse idler gear defective.
5. Reverse gear defective.
6. Change lever assembly defective.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the clutch.
- Check the reverse shift fork.
- Check the reverse idler gear.
- Check reverse gear.
- Check the change lever assembly.

Noise from the transmission

Probable cause(s)

1. Worn or incorrect MTF.
2. Low MTF level.
3. Worn or damaged transmission gears.
4. Worn or damaged transmission bearings.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the MTF level.
- Check the transmission gears.
- Check the transmission bearings.

Shift lever does not operate smoothly

Probable cause(s)

1. Worn or incorrect MTF.
2. Shift cable defective.
3. Joint in shift cable and transmission or body.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the shift cable.
- Check joint in the shift cable.

Transmission jumps out of gear

Probable cause(s)

1. Worn or incorrect MTF.
2. Detent ball springs defective.
3. Worn gear dogs.

Diagnostic procedure

- Check and/or replace the MTF.
- Check the detent ball springs.
- Check the gear dogs.

M/T Symptom Troubleshooting Index

Symptom	Probable cause(s)	Diagnostic procedure
Hard to shift into 1st gear	1. Worn or incorrect MTF. 2. Clutch defective. 3. 1st synchro ring defective. 4. 1st/2nd synchro sleeve and hub defective. 5. 1st gear defective. 6. Change lever assembly defective.	• Check and/or replace the MTF. • Check the clutch. • Check the 1st synchro ring. • Check the 1st/2nd synchro sleeve and hub. • Check 1st gear. • Check the change lever assembly.
Hard to shift into 2nd gear	1. Worn or incorrect MTF. 2. 2nd synchro ring defective. 3. 1st/2nd synchro sleeve and hub defective. 4. 2nd gear defective. 5. Change lever assembly defective.	• Check and/or replace the MTF. • Check the 2nd synchro ring. • Check the 1st/2nd synchro sleeve and hub. • Check 2nd gear. • Check the change lever assembly.
Hard to shift into 3rd gear	1. Worn or incorrect MTF. 2. 3rd synchro ring defective. 3. 3rd/4th synchro sleeve and hub defective. 4. 3rd gear defective. 5. Change lever assembly defective.	• Check and/or replace the MTF. • Check the 3rd synchro ring. • Check the 3rd/4th synchro sleeve and hub. • Check 3rd gear. • Check the change lever assembly.
Hard to shift into 4th gear	1. Worn or incorrect MTF. 2. 4th synchro ring defective. 3. 3rd/4th synchro sleeve and hub defective. 4. 4th gear defective. 5. Change lever assembly defective.	• Check and/or replace the MTF. • Check the 4th synchro ring. • Check the 3rd/4th synchro sleeve and hub. • Check 4th gear. • Check the change lever assembly.
Hard to shift into 5th gear	1. Worn or incorrect MTF. 2. 5th synchro ring defective. 3. 5th synchro sleeve defective. 4. 5th gear defective. 5. Change lever assembly defective.	• Check and/or replace the MTF. • Check the 5th synchro ring. • Check the 5th synchro sleeve and hub. • Check 5th gear. • Check the change lever assembly.
Hard to shift into reverse	1. Worn or incorrect MTF. 2. Clutch defective. 3. Reverse shift fork defective. 4. Reverse idler gear defective. 5. Reverse gear defective. 6. Change lever assembly defective.	• Check and/or replace the MTF. • Check the clutch. • Check the reverse shift fork. • Check the reverse idler gear. • Check reverse gear. • Check the change lever assembly.
Noise from the transmission	1. Worn or incorrect MTF. 2. Low MTF level. 3. Worn or damaged transmission gears. 4. Worn or damaged transmission bearings.	• Check and/or replace the MTF. • Check the MTF level. • Check the transmission gears. • Check the transmission bearings.
Shift lever does not operate smoothly	1. Worn or incorrect MTF. 2. Shift cable defective. 3. Joint in shift cable and transmission or body.	• Check and/or replace the MTF. • Check the shift cable. • Check joint in the shift cable.
Transmission jumps out of gear	1. Worn or incorrect MTF. 2. Detent ball springs defective. 3. Worn gear dogs.	• Check and/or replace the MTF. • Check the detent ball springs. • Check the gear dogs.

Clutch Replacement

Special Tools Required

Clutch alignment tool set
07PAF-0020000

Ring gear holder
07LAB-PV00100

Sliding hammer weight
07741-0010201

Driver handle, 15 x 135 L
07749-0010000

Bearing remover shaft 15
07936-KC10100

Bearing remover head 15
07936-KC10200

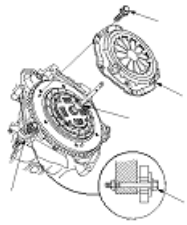
Bearing driver attachment, 28 x 30 mm
07946-1870100

Engine Side

Pressure Plate Inspection and Removal

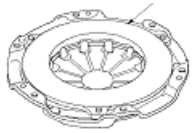
1. Remove the transmission.
2. Check the diaphragm spring fingers for height using the dial indicator (A). If the height is more than the service limit, replace the pressure plate.
   Standard (New): **0.6 mm (0.02 in.) max.**
   Service Limit: **1.0 mm (0.04 in.)**

3. Install the ring gear holder (A) and the clutch alignment tool set (B).
4. To prevent warping, unscrew the pressure plate mounting bolts (C) in a crisscross pattern in several steps, then remove the pressure plate (D).



5. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.

6. Inspect the pressure plate (A) surface for wear, cracks, and burning.



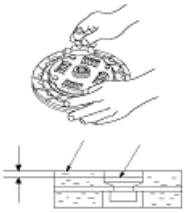
7. Inspect for warpage using a straight edge (A) and feeler gauge (B). Measure across the pressure plate (C). If the warpage is more than the service limit, replace the pressure plate.
   Standard (New): **0.03 mm (0.001 in.) max.**
   Service Limit: **0.15 mm (0.006 in.)**

Clutch Disc Inspection and Removal

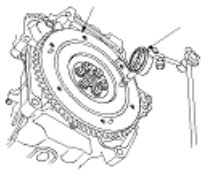
8. Remove the clutch disc (A) and the clutch alignment tool set (B).
9. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch disc looks burnt or is oil soaked, replace the clutch disc. If the clutch disc is oil soaked, find and repair the source of the oil leak.

10. Measure the clutch disc thickness. If the measurement is less than the service limit, replace the clutch disc.
    Standard (New): **7.25–7.95 mm (0.285–0.313 in.) max.**
    Service Limit: **5.0 mm (0.20 in.)**

11. Measure the rivet depth from the clutch disc lining surface (A) to the rivets (B) on both sides. If the measurement is less than the service limit, replace the clutch disc.
    Standard (New): **1.00–1.50 mm (0.039–0.059 in.) max.**
    Service Limit: **0.2 mm (0.008 in.)**



Flywheel Inspection

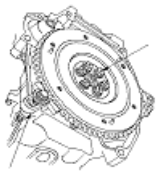


12. Remove the ring gear holder.
13. Inspect the ring gear teeth for wear and damage.
14. Inspect the clutch disc mating surface on the flywheel for wear, cracks and burning.
15. Measure the flywheel (A) runout using a dial indicator (B). Through at least two full turns with pushing against the flywheel each time you turn it to take up the crankshaft thrust washer clearance. If the measurement is not within the standard, replace the flywheel, and recheck the runout. Go to Step 16 .
    Standard (New): **0.05 mm (0.002 in.) max.**
    Service Limit: **0.15 mm (0.006 in.)**

Flywheel Replacement

16. Install the ring gear holder.
17. Loosen the flywheel mounting bolts in a crisscross pattern in several steps. Remove the bolts, then remove the flywheel and the ring gear holder.
18. Install the flywheel on the crankshaft, and install the mounting bolts finger-tight.

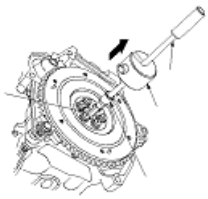
19. Install the ring gear holder (A), then torque the flywheel mounting bolts (B) in a crisscross pattern in several steps.



Pilot Bearing Inspection

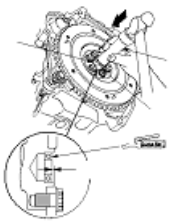
20. Inspect the crankshaft pilot bearing for wear and damage.
21. Inspect the inside surface of the crankshaft pilot bearing with your finger. If the crankshaft pilot bearing is not smooth, replace it; go to Step 22 .

Pilot Bearing Replacement



22. Remove the crankshaft pilot bearing (A) using the bearing remover shaft (B), bearing remover head (C), and the sliding hammer weight (D).

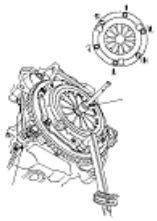
23. Install the new pilot bearing (A) into the crankshaft using the 15 x 135L driver handle (B) and 28 x 30 mm bearing driver attachment (C). Apply a light coat of molybdenum grease to the bearing surface.



Clutch Disc and Pressure Plate Installation

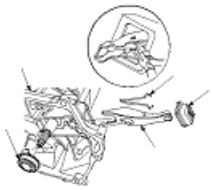
24. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.
25. Apply a light coat of molybdenum to the crankshaft pilot bearing (A).
26. Apply molybdenum grease to the splines (B) of the clutch disc (C), then install the clutch disc using the clutch alignment tool set (D).

27. Install the pressure plate (A) and the mounting bolts (B) finger-tight.



28. Torque the mounting bolts in a crisscross pattern. Tighten the bolts in several steps to prevent warping the diaphragm spring.
    PRESSURE PLATE MOUNTING BOLT TORQUE:
    25 N·m (2.6 kgf·m, 19 lbf·ft)
29. Remove the ring gear holder (A), and the clutch alignment tool set (B).
30. Make sure the diaphragm spring fingers are all the same height.
31. Do the release bearing inspection, and replace if it necessary.
32. Install the transmission.

Transmission Side
Release Bearing Removal

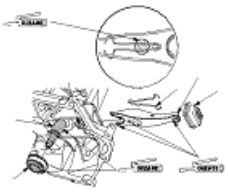


1. Remove the transmission.
2. Remove the release fork boot (A) from the clutch housing (B).
3. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D) with pliers. Remove the release bearing (E).

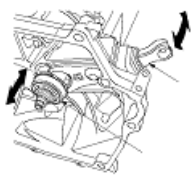
Release Bearing Inspection

4. Check the play of the release bearing by hand. If there is excessive play or noise, replace the release bearing.
   NOTE: The release bearing is packed with grease. Do not wash it in solvent.

Release Bearing Installation



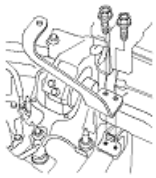
5. Apply Molybdenum Grease to the release fork (A), the release fork bolt (B), the release bearing (C), and the release bearing guide (D) in the shaded areas, then set the release fork set spring (E).
   NOTE: Replace the release fork bolt if necessary.
6. With the release fork slid between the release bearing pawls, install the release bearing on the mainshaft while inserting the release fork through the hole in the clutch housing.
7. Align the detent of the release fork with the release fork bolt, then press the release fork over the release fork bolt squarely.
8. Install the release fork boot (F). Make sure the boot seals around the release fork and clutch housing.



9. Move the release fork (A) right and left to make sure that it fits properly against the release bearing (B), and that the release bearing slides smoothly. Wipe off any excess grease.
10. Install the transmission.

M/T Assembly Removal

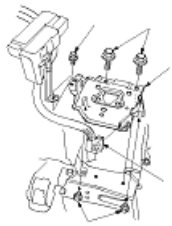
Special Tools Required



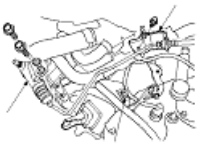
Engine support hanger
AAR-T-1256-J00
NOTE: Use fender covers to avoid damaging painted surfaces.

1. Secure the hood in the wide open position (support rod in the lower hole).
2. Remove the windshield wiper arms.
3. Remove the cowl covers and hood hinge cover.
4. Remove the wiper motor.
5. Remove under-cowl panel.
6. Do the battery removal procedure.
7. Remove the air cleaner housing.
8. Remove the air cleaner stay.

9. Remove the battery base bolts (A), loosen the two bolts (B), remove the battery harness clamp (C) and the bracket bolt (D) then remove the battery base (E).

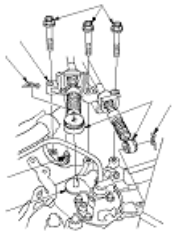


10. Remove the clutch hose bracket (A) and the slave cylinder (B). Remove the clutch line from the clip (C), then carefully move the slave cylinder out of the way to avoid bending the clutch line.
    NOTE:
    - Do not disconnect the clutch line joints.
    - Do not press the clutch pedal after the slave cylinder has been removed.

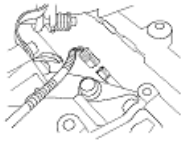


11. Disconnect the back-up light switch connector (A), then remove the harness clip (B).

12. Remove the lock pins (A), shift cable bracket bolts (B), and harness clip (C), then disconnect the shift cables (D), from the change lever assembly (E). Carefully remove both cables and the shift cable bracket (F) together to avoid bending the cables.



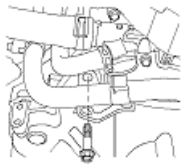
13. Disconnect the vehicle speed sensor (VSS) connector.



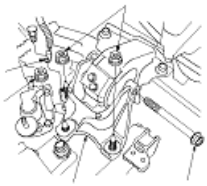
14. Remove the purge control SOL.V. hose (A). Install the hanger plate (B) to the bolt hole (C) at the air cleaner housing mounting bracket with the 8 x 1.25 mm bolt.

15. Install the engine support hanger (A) with the hook (B) to the vehicle. Tighten the wing nut (C) by hand, and lift and support the engine.

16. Remove the one upper transmission mounting bolt.



17. Remove the ground cable (A), transmission mount nuts (B), and transmission mount bolt (C), from the transmission bracket (D).
18. Raise the vehicle on a lift, and make sure it is securely supported.
19. Remove the splash shield.
20. Drain the transmission fluid. Reinstall the drain plug using a new sealing washer.
21. Remove the right and left driveshafts.



22. Remove the heat cover.

23. Remove the clutch case cover.
24. Securely support the transmission with a transmission jack.

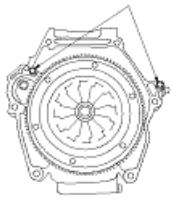
25. Remove the torque rod.

26. Remove the torque rod bracket.

27. Remove the lower transmission mounting bolts.
28. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate.
29. Slowly lower the transmission. Check once again that all hoses and electrical wiring are disconnected and free from the transmission then lower it completely. Remove the two dowel pins.

M/T Assembly Installation

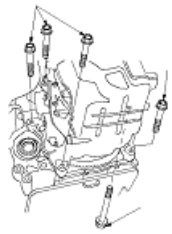
Special Tools Required



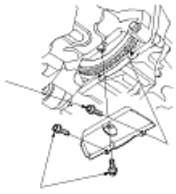
Engine support hanger
AAR-T-1256-J00
NOTE: Use fender covers to avoid damaging painted surfaces.

1. Make sure two dowel pins (A) are installed in prescribed hole on the engine block as shown.
2. Check the release bearing, and reinstall the release bearing and the release fork with applying appropriate grease.
3. Place the transmission on the transmission jack, and raise it to the engine unit level.

4. Install the lower transmission mounting bolts.



5. Install the clutch case cover.



6. Install the torque rod bracket with new bolt (A) and bolts (B).

7. Loosely install the torque rod new bolt (A), new nut (B) and new bolt (C), then remove the transmission jack.

8. Install the heat cover.
9. Install the right and left driveshafts.
10. Lower the vehicle on the lift.

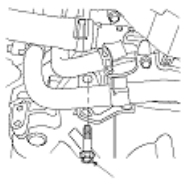
11. Tighten the new transmission mount bolts (A), three new engine mount nuts (B), and ground cable (C) to the specified torque value.

12. Loosen the wing nut (A). Remove the hook (B) and engine support hanger (C) from the vehicle.

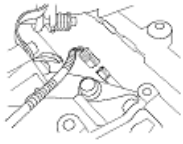
13. Remove the hanger plate (A) to the air cleaner stay (B) with the 8 x 1.25 mm bolt (C). Install the purge control SOL.V. hose (D).

14. Tighten the torque rod with the bolts and nut to the specified torque value.

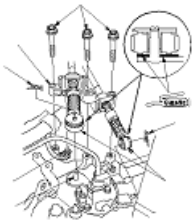
15. Install the one upper transmission mounting bolts.



16. Connect the vehicle speed sensor (VSS) connector.

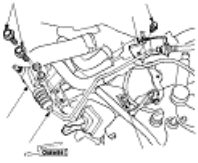


17. Apply a light coat of silicone grease to the cable ends (A), and connect the cable end to the change lever assembly (B), then install the shift cable bracket (C), harness clip (D) and the lock pins (E). Do not bend or damage the shift cables.
NOTE: When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.

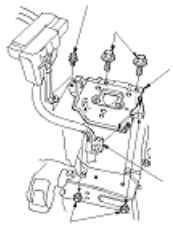


18. Connect the back-up light switch connector (A), then install the harness clip (B).

19. Apply a light coat of molybdenum grease to the end of the slave cylinder rod (A). Install the slave cylinder (B) and clutch line bracket (C). Install the clutch line in the clip (D). Take care not to bend the clutch line.

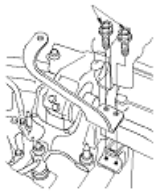


20. Install the battery base (A) and harness clip (B).



---

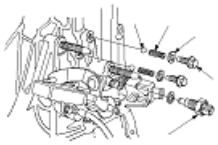
21. Install the air cleaner stay.
22. Install the air cleaner housing.
23. Do the battery installation procedure.
24. Refill the transmission fluid to the proper level.
25. Install the splash shield.
26. Install the under-cowl panel.
27. Install the wiper motor.
28. Install the hood hinge cover and cowl cover.
29. Install the windshield wiper arms.
30. Check the wheel alignment and adjust it if necessary.
31. Test-driver the vehicle.



M/T Assembly Disassembly

Exploded View - Clutch Housing

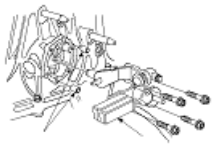
Exploded View - Transmission Housing



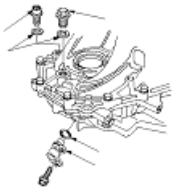
NOTE: Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.

1. Remove the release bearing and the release fork.
2. Remove the set screws (A), the 12 mm washers (B), the springs (C), the steel balls (D) and the back-up light switch (E).

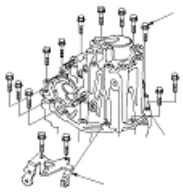
3. Remove the change lever assembly (A) and 8 x 10 mm dowel pins (B).



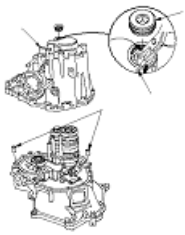
4. Remove the drain plug (A), filler plug (B), the sealing washers (C), and the vehicle speed sensor (VSS) (D), the O-rings (E).



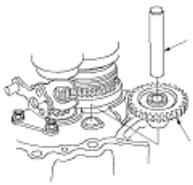
5. Remove the 8 mm flange bolts (A) and transmission hanger (B) in a crisscross pattern in several steps.



6. Remove the 32 mm sealing screw (A).
7. Expand the 52 mm snap ring (B) on the countershaft ball bearing, and remove it from the groove using a pair of snap ring pliers.
8. Remove the transmission housing (C) and 14 x 20 mm dowel pins (D).

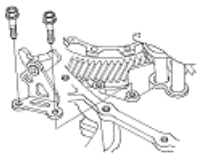


9. Remove the reverse idler gear (A) and the reverse gear shaft (B).

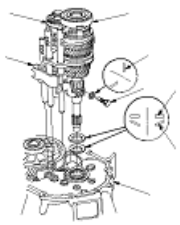


10. Remove the reverse shift fork.

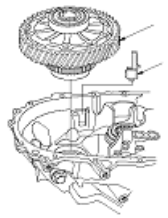
11. Remove the reverse lock cam.



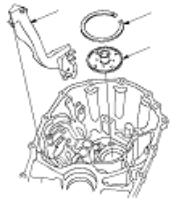
12. Tape the mainshaft splines, then remove the mainshaft assembly (A) and the countershaft assembly (B) with the shift forks (C) from the clutch housing (D).
13. Remove the 8 mm special bolt (E) and the 8 mm spring washer (F).
14. Remove the 36 mm spring washer (G) and the 26 mm washer (H).



15. Remove the differential assembly (A), and the magnet (B).



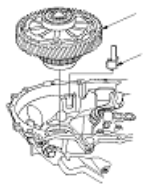
16. Remove the oil gutter plate (A), the oil guide plate M (B), and the 72 mm shim (C).



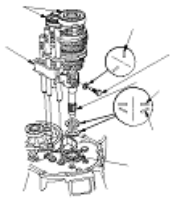
M/T Assembly Reassembly

NOTE: Prior to reassembly, clean all the parts in solvent, dry them, and apply MTF to any contact surfaces.

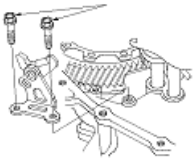
1. Install the magnet (A) and differential assembly (B).



2. Install the 8 mm spring washer (A) and the 8 mm special bolt (B).
3. Install the 36 mm spring washer (C) and 26 mm washer (D) over the ball bearing (E). Note the installation direction of the spring washer.
4. Tape the mainshaft splines (F) with vinyl tape to protect the seal. Install the mainshaft and countershaft (G) into the shift forks (H), and install them as an assembly.

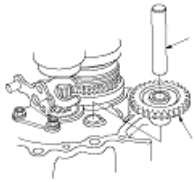


5. Install the reverse lock cam.

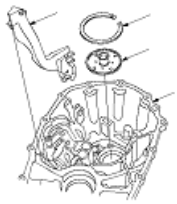


6. Install the reverse shift fork.

7. Install the reverse idler gear (A) and reverse gear shaft (B).

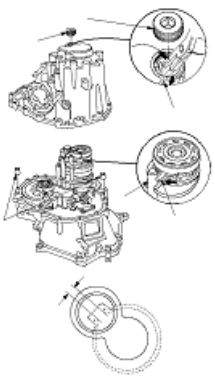


8. Select the proper size 72 mm shim (A) according to the measurements made during the Mainshaft Thrust Clearance Adjustment. Install the oil gutter plate (B), oil guide plate M (C) and 72 mm shim into the transmission housing (D).



9. Clean any dirt or oil from the transmission housing and clutch housing mating surface. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the sealing surface as shown.
   NOTE: Do not install components if too much time has passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.

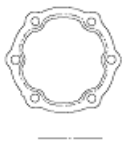
10. Install the 14 x 20 mm dowel pins (A).
11. Make the finger (B) of tapered cone ring touch the 5th shift fork (C) as shown.
12. Lower the transmission housing the rest of the way as you expand the 52 mm snap ring (D). Release the snap ring so it seats in the groove of the countershaft bearing.
13. Check that the 52 mm snap ring is securely seated in the groove of the countershaft bearing.
    Dimension (1) as installed: 4.6−8.3 mm (0.18−0.33 in.)
14. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the threads of the 32 mm sealing screw (E), and install it on the transmission housing.



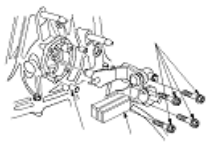
15. Install the transmission hanger (A) and the 8 mm flange bolts finger-tight.

16. Tighten the 8 mm flange bolts in a crisscross pattern in several steps.

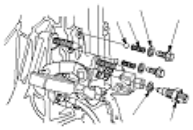
17. Clean any dirt or oil from the change lever assembly sealing surface. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the sealing surface.
NOTE: Do not install components if too much time has passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.



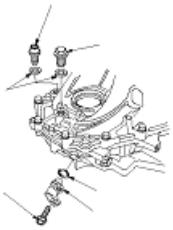
18. Install the 8 x 10 mm dowel pins (A) and change lever assembly (B).



19. Install the set screws (A), new 12 mm washers (B), springs (C), and steel balls (D).
20. Install the new washer (E) and back-up light switch (F).



21. Install the new washers (A), drain plug (B), filler plug (C), new O-ring (D), and vehicle speed sensor (VSS) (E).



Back-up Light Switch Test

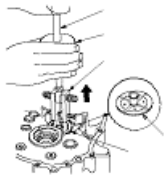
1. Disconnect the back-up light switch 2P connector (A).

2. Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the shift lever is in reverse. If the result is faulty, go to Step 3 .

3. Remove the back-up light switch (A). Check for continuity between the back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the switch end (B) is pressed, and no continuity when the switch end is released. If the result is faulty, replace the back-up light switch. If the switch is OK, check the reverse shift piece in the transmission.
4. Install the removed or the new back-up light switch and new washer.
5. Connect the back-up light switch 2P connector.

M/T Clutch Housing Countershaft Bearing Replacement

Special Tools Required



Adjustable bearing remover head, 20−40 mm
07JAC-PH80100

Bearing remover shaft
07JAC-PH80200

Sliding hammer weight
07741-0010201

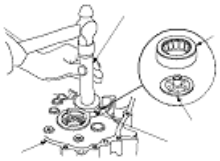
Driver handle, 15 x 135L
07749-0010000

Bearing driver attachment, 52 x 55 mm
07746-0010400

1. Remove the needle bearing (A) using the 20−40 mm adjustable bearing remover head (B), sliding hammer weight (C) and bearing remover shaft (D), then remove oil guide plate C (E).

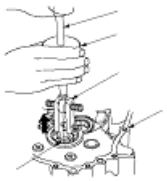
---

2. Position the oil guide plate C (A) and new needle bearing (B) in the bore of the clutch housing (C).
3. Press in the needle bearing using the 15 x 135L driver handle (D), 52 x 55 mm bearing driver attachment (E).



M/T Clutch Housing Mainshaft Bearing and Oil Seal Replacement

Special Tools Required



Adjustable bearing remover head, 20−40 mm
07JAC-PH80100

Bearing remover shaft
07JAC-PH80200

Sliding hammer weight
07741-0010201

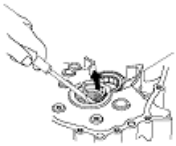
Driver handle, 15 x 135L
07749-0010000

Bearing driver attachment, 37 x 40 mm
07746-0010200

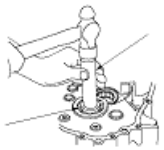
Bearing driver attachment, 52 x 55 mm
07746-0010400

1. Remove the differencial assembly.
2. Remove the ball bearing (A) from the clutch housing (B) using the 20−40 mm adjustable bearing remover head (C), sliding hammer weight (D) and bearing remover shaft (E).

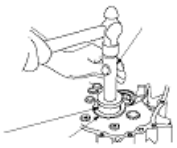
3. Remove the oil seal (A) from the clutch side.
   Be careful when removing the oil seal so the clutch housing is not damaged.



4. Drive the new oil seal in from the transmission side using the 15 x 135L driver handle (A) and 37 x 40 mm bearing driver attachment (B).

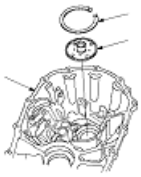


5. Drive the new ball bearing (A) in from the transmission side using the 15 x 135L driver handle (B) and 52 x 55 mm bearing driver attachment (C).



M/T Clutch Housing Mainshaft Thrust Clearance Adjustment

Special Tools Required

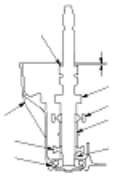


Base adapter
07GAJ-PG20130

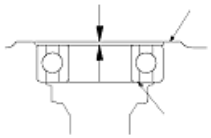
Base collar
07GAJ-PG20120

Catch adapter
07GAJ-PG20110

1. Remove the 72 mm shim (A) and oil guide plate M (B) from the transmission housing (C).

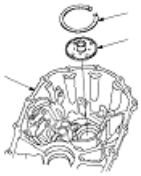


2. Install the 3rd/4th synchro hub (A), the distance collar (B), the 5th synchro hub (C), distance collar (D), and ball bearing (E) on the mainshaft (F), then install the assembled mainshaft in the transmission housing (G).
3. Install the washer (H) on the mainshaft.
4. Measure distance (1) between the end of the transmission housing and washer with a straight edge and vernier caliper. Measure at three locations and average the reading.



5. Measure distance (2) between the end of the clutch housing (A) and bearing inner race (B) with a straight edge and depth gauge. Measure at three locations and average the readings.

Shim Selection Formula



6. Select the proper 72 mm shim from the chart. Follow the example below, and use the measurements you made in steps 4 and 5:

(Basic Formula)

(1) + (2) − (0.75 + 0.11) = shim thickness (maximum)
(1) + (2) − (0.75 + 0.18) = shim thickness (minimum)

- Add distance (1) (step 4) to distance (2) (step 5).
- 0.75 mm (0.029 in): Spring washer, a dimension in the installation.
- 0.11 mm (0.004 in): Minimum thrust clearance.
- 0.18 mm (0.007 in): Maximum thrust clearance.

(For example)

2.41 + 0.22 − (0.75 + 0.11) = 1.77 mm (0.070 in.)
2.41 + 0.22 − (0.75 + 0.18) = 1.70 mm (0.067 in.)

7. Take the middle value of the minimum value and the maximum value, and select shim of 1.74 mm (0.069 in).

72 mm Shim

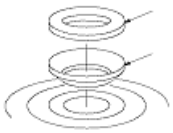
Type	Part Number	Thickness
A	23931-P21-000	0.60 mm (0.0236 in.)
B	23932-P21-000	0.63 mm (0.0248 in.)
C	23933-P21-000	0.66 mm (0.0260 in.)
D	23934-P21-000	0.69 mm (0.0271 in.)
E	23935-P21-000	0.72 mm (0.0283 in.)
F	23936-P21-000	0.75 mm (0.0295 in.)
G	23937-P21-000	0.78 mm (0.0307 in.)
H	23938-P21-000	0.81 mm (0.0319 in.)
I	23939-P21-000	0.84 mm (0.0331 in.)
J	23940-P21-000	0.87 mm (0.0343 in.)
K	23941-P21-000	0.90 mm (0.0354 in.)
L	23942-P21-000	0.93 mm (0.0366 in.)
M	23943-P21-000	0.96 mm (0.0378 in.)
N	23944-P21-000	0.99 mm (0.0390 in.)
O	23945-P21-000	1.02 mm (0.0402 in.)
P	23946-P21-000	1.05 mm (0.0413 in.)
Q	23947-P21-000	1.08 mm (0.0425 in.)
R	23948-P21-000	1.11 mm (0.0437 in.)

Type	Part Number	Thickness
S	23949-P21-000	1.14 mm (0.0449 in.)
T	23950-P21-000	1.17 mm (0.0461 in.)
U	23951-P21-000	1.20 mm (0.0472 in.)
V	23952-P21-000	1.23 mm (0.0484 in.)
W	23953-P21-000	1.26 mm (0.0496 in.)
X	23954-P21-000	1.29 mm (0.0508 in.)
Y	23955-P21-000	1.32 mm (0.0520 in.)
Z	23956-P21-000	1.35 mm (0.0531 in.)
AA	23957-P21-000	1.38 mm (0.0543 in.)
AB	23958-P21-000	1.41 mm (0.0555 in.)
AC	23959-P21-000	1.44 mm (0.0567 in.)
AD	23960-P21-000	1.47 mm (0.0579 in.)
AE	23961-P21-000	1.50 mm (0.0591 in.)
AF	23962-P21-000	1.53 mm (0.0602 in.)
AG	23963-P21-000	1.56 mm (0.0614 in.)
AH	23964-P21-000	1.59 mm (0.0626 in.)
AI	23965-P21-000	1.62 mm (0.0638 in.)
AJ	23966-P21-000	1.65 mm (0.0650 in.)
AK	23967-P21-000	1.68 mm (0.0661 in.)
AL	23968-P21-000	1.71 mm (0.0673 in.)
AM	23969-P21-000	1.74 mm (0.0685 in.)
AN	23970-P21-000	1.77 mm (0.0697 in.)
AO	23971-P21-000	1.80 mm (0.0709 in.)

8. Install the 72 mm shim (A) selected and oil guide plate M (B) in the transmission housing (C).

---

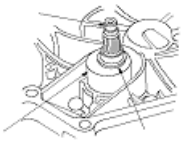
9. Throughly clean the spring washer (A) and washer (B) before installing them on the clutch housing side ball bearing (C). Note the installation direction of the spring washer.



10. Install the mainshaft in the clutch housing.
11. Place the transmission housing over the mainshaft and onto the clutch housing.
12. Tighten the clutch and transmission housings with several 8 mm bolts.
    NOTE: It is not necessary to use sealing agent between the housings.
13. Tap the mainshaft with a plastic hammer.

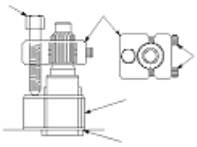
---

14. Slide the base collar (B), and base adapter (C) over the mainshaft (A).



---

15. Attach the catch adapter (A), base collar (B), and base adapter (C) to the mainshaft as follows:
    - Back-out the mainshaft holder bolt (D) and loosen the two hex bolts (E).
    - Fit the holder over the mainshaft so its lip is towards the transmission.
    - Align the mainshaft holder's lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.



16. Seat the mainshaft fully by tapping its end with a plastic hammer.
17. Thread the mainshaft holder bolt in until it just contacts the wide surface of the mainshaft base.

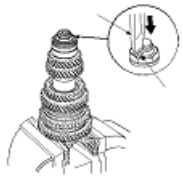
---

18. Zero a dial gauge (A) on the end of the mainshaft.
19. Turn the mainshaft holder bolt (B) clockwise; stop turning when the dial gauge (A) has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft end play.
    Do not turn the mainshaft holder bolt more than 60 degrees after the needle of the dial gauge stops moving, this may damage the transmission.

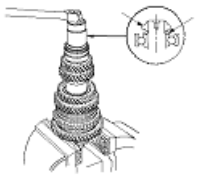
20. If the reading is within the standard, the clearance is correct. If the reading is not within the standard, recheck the shim thickness.
    Standard: **0.11−0.18 mm (0.004−0.007 in.)**

M/T Countershaft Disassembly

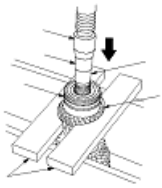
NOTE: Refer to the Exploded View in the countershaft reassembly as need removing components except pressing into the countershaft.



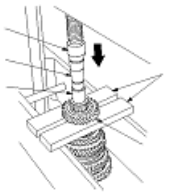
1. Securely clamp the countershaft assembly in a bench vise with wood blocks.
2. Use a chisel (A) to raise the locknut tab (B) from the groove in the countershaft.



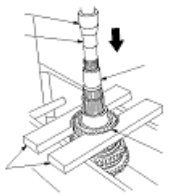
3. Remove the locknut (left-hand threads) (A) and the spring washer (B).



4. Support 5th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the ball bearing * (F).
   *L15A7 engine: Needle bearing



5. Support 4th gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the 4th gear.

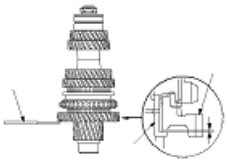


6. Support 3rd gear (A) on steel blocks (B), then use a press (C) and an attachment (D) to press the countershaft (E) out of the 3rd gear.

M/T Countershaft Assembly Clearance Inspection

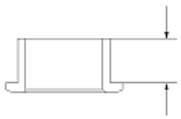
1. Measure the clearance between the 1st gear (A) and the countershaft (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 2.
   - If the clearance is more than the service limit, go to Step 2.
   - If the clearance is within the service limit, go to Step 4.

   Standard: **0.03−0.12 mm (0.001−0.005 in.)**
   Service Limit: **0.24 mm (0.009 in.)**



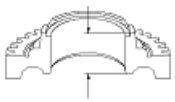
2. Measure the length of the 1st gear distance collar as shown.
   - If the thickness is not within than the standard, replace the distance collar.
   - If the thickness is within the standard, go to Step 3.

   Standard: **26.53−26.58 mm (1.044−1.046 in.)**



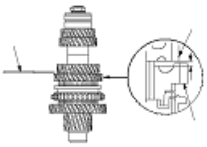
3. Measure the thickness of the 1st gear.
   - If the thickness of 1st gear is less than the service limit, replace 1st gear with a new one.
   - If the thickness of 1st gear is within the service limit, replace the 1st/2nd synchro hub with a new one.

   Standard: **27.42−27.47 mm (1.080−1.081 in.)**
   Service Limit: **27.39 mm (1.078 in.)**



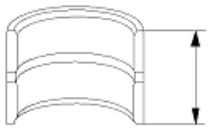
4. Measure the clearance between the 2nd gear (A) and 3rd gear (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 4.

   Standard: **0.04−0.12 mm (0.002−0.005 in.)**
   Service Limit: **0.24 mm (0.009 in.)**



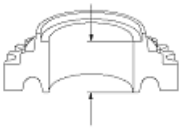
5. Measure the thickness of the distance collar.
   - If the thickness is less than the service limit, replace the distance collar with a new one.
   - If the thickness is within the service limit, go to Step 5.

   Standard: **27.53−27.56 mm (1.084−1.085 in.)**
   Service Limit: **27.51 mm (1.083 in.)**



6. Measure the thickness of the 2nd gear.
   - If the thickness of 2nd gear is less than the service limit, replace 2nd gear with new one.
   - If the thickness of 1st gear is within the service limit, replace the 1st/2nd synchro hub with a new one.

   Standard: **27.41−27.46 mm (1.079−1.081 in.)**
   Service Limit: **27.36 mm (1.077 in.)**

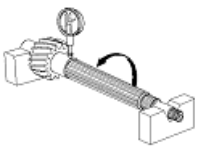


M/T Countershaft Inspection

1. Inspect the gear surface and bearing surface for wear and damage, then measure the mainshaft at points A, B, and C. If any part of the mainshaft is less than the service limit, replace it with a new one.

Standard:
A (Ball bearing contact area):
24.980−24.993 mm (0.9835−0.9840 in.)
B (Distance collar contact area):
36.487−36.500 mm (1.4365−1.4370 in.)
C (Needle bearing contact area):
34.000−34.015 mm (1.3386−1.3392 in.)
Service Limit:
A: 24.93 mm (0.981 in.)
B: 36.44 mm (1.4346 in.)
C: 33.95 mm (1.337 in.)

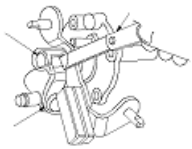
2. Inspect the runout by supporting both ends of the countershaft. Rotate the countershaft two complete revolutions when measuring the runout. If the runout exceeds the service limit, replace the countershaft with a new one.



Standard: 0.02 mm (0.001 in.) max.
Service Limit: 0.05 mm (0.002 in.)

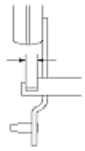
M/T Change Lever Clearance Inspection

1. Measure the clearance between change lever (A) and the select lever (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 2 .
   Standard: **0.05−0.35 mm (0.002−0.014 in.)**
   Service Limit: **0.55 mm (0.022 in.)**



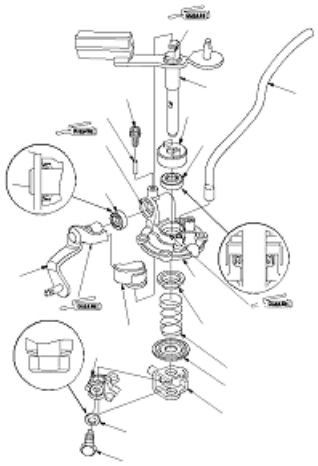
2. Measure the groove width of the change lever.
   - If distance is not within the standard, replace the change lever with a new one.
   - If distance is within the standard, replace the select lever with a new one.

   Standard: **13.00−13.15 mm (0.512−0.518 in.)**



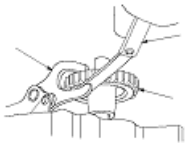
M/T Change Lever Assembly Disassembly/Reassembly

NOTE: Prior to reassembling, clean all the parts in solvent, dry them, and apply grease to contact surfaces as shown.



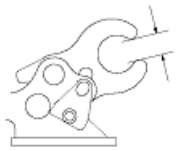
M/T Reverse Shift Fork Clearance Inspection

1. Measure the clearance between reverse idler gear (A) and the reverse shift fork (B) with a feeler gauge (C). If the clearance is more than the service limit, go to Step 2 .
   Standard: **1.30−1.90 mm (0.051−0.075 in.)**
   Service Limit: **2.5 mm (0.098 in.)**



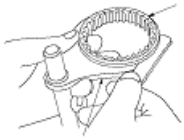
2. Measure the width of the reverse shift fork.
   - If distance is not within the standard, replace the reverse shift fork with a new one.
   - If distance is within the standard, replace the reverse idler gear with a new one.

   Standard: **13.5−13.8 mm (0.53−0.54 in.)**

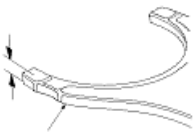


M/T Shift Forks Clearance Inspection

NOTE: The synchro sleeve and synchro hub should be replaced as a set.

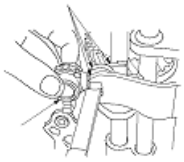


1. Measure the clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to Step 2 .
   Standard: **0.35−0.65 mm (0.014−0.026 in.)**
   Service Limit: **1.0 mm (0.04 in.)**



2. Measure the thickness of the shift fork (A) fingers.
   - If the thickness of the shift fork finger is not within the standard, replace the shift fork with a new one.
   - If the thickness of the shift fork finger is within the standard, replace the synchro sleeve with a new one.

   Standard:
   1st/2nd, 3rd/4th shift forks: **7.4−7.6 mm (0.29−0.30 in.)**
   5th shift fork: **6.7−6.9 mm (0.26−0.27 in.)**



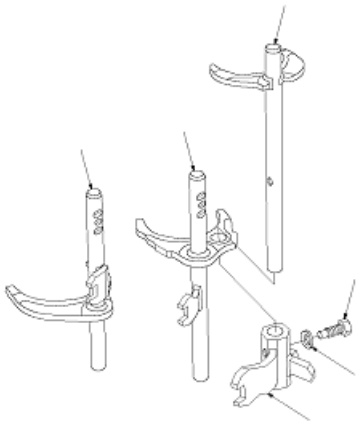
3. Measure the clearance between the shift forks (A) and the shift arm (B). If the clearance exceeds the service limit, go to Step 4 .
   Standard: **0.2−0.5 mm (0.008−0.020 in.)**
   Service Limit: **0.62 mm (0.024 in.)**

4. Measure the width of the shift arm (A).
   - If the width of the shift arm is not within the standard, replace the shift arm with a new one.
   - If the width of the shift arm is within the standard, replace the shift fork or shift piece with a new one.

   Standard: **12.9−13.0 mm (0.508−0.512 in.)**

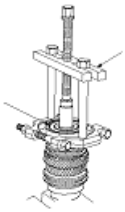
M/T Shift Forks Disassembly/Reassembly

NOTE: Prior to reassembling, clean all the parts in solvent, dry them, and apply MTF to all contact surfaces.



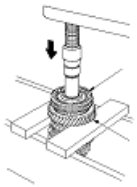
M/T Mainshaft Disassembly

Special Tools Required

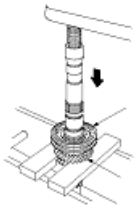


Bearing separator set
07631-0010000
NOTE: Refer to the Exploded View in the mainshaft Reassembly as need removing components except pressing into the mainshaft.

1. Remove the angular ball bearing (A) using bearing separator set (B).
2. Remove the tapered cone ring, distance collar, synchro ring and 5th synchro sleeve.



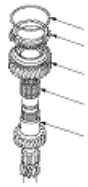
3. Support 5th gear (A) on steel blocks, and press the mainshaft out of the 5th synchro hub (B).
   NOTE: Do not use a jaw-type puller; it can damage the gear teeth.



4. Support the 3rd gear (A) on steel blocks, and press the mainshaft out of the 3rd/4th synchro hub (B).
   NOTE: Do not use a jaw-type puller; it can damage the gear teeth.

M/T Mainshaft Reassembly

Exploded View



Special Tools Required

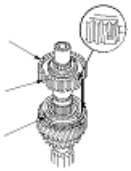
Inner driver handle, 40 mm
07746-0030100

Inner bearing driver attachment, 30 mm
07746-0030300

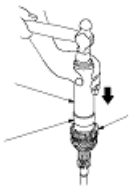
NOTE: Refer to the Exploded View, as needed during this procedure.

1. Clean all the parts in solvent, dry them, and apply lubricant all contact surfaces except the 3rd/4th and 5th synchro hubs.
2. Install the needle bearing (A) and 3rd gear (B) onto the mainshaft (C).
3. Install the synchro ring (D) with the synchro spring (E) onto the 3rd gear.

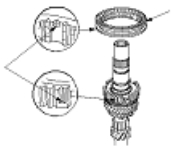
4. Install the 3rd/4th synchro hub (A) by aligning the synchro ring fingers (B) with the grooves (C) in the 3rd/4th synchro hub.
   NOTE: Make sure the installing direction of the 3rd/4th synchro hub.



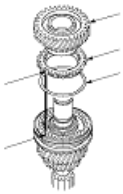
5. Press in the 3rd/4th synchro hub (A) using the 40 mm inner driver handle (B) and 30 mm inner bearing driver attachment (C).



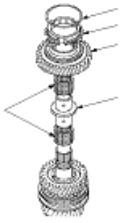
6. Install the 3rd/4th synchro sleeve (A) by aligning the stops (B) of the 3rd/4th synchro sleeve and 3rd/4th synchro hub. After installing, check the operation of the 3rd/4th synchro hub set.



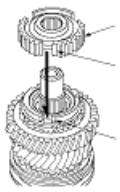
7. Install the synchro ring (A) with the synchro spring (B) by aligning the synchro ring fingers (C) with the grooves (D) in the 3rd/4th synchro hub.
8. Install 4th gear (E) onto the synchro ring.



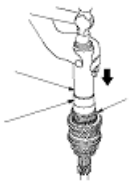
9. Install the 4th/5th gear distance collar (A) with the needle bearings (B) and 5th gear (C).
10. Install the synchro ring (D) with the synchro spring (E) onto the 5th gear.



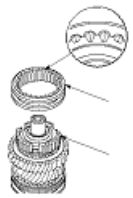
11. Install the 5th synchro hub (A) by aligning the synchro ring fingers (B) with the grooves (C) in the 5th synchro hub.



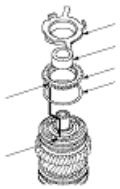
12. Press in the 5th synchro hub (A) using the 40 mm inner driver handle (B) and 30 mm inner bearing driver attachment (C).



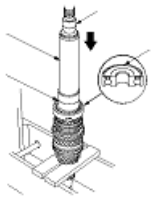
13. Install the 5th synchro sleeve (A) by aligning the slots of the 5th synchro sleeve and the 5th synchro hub (B). After installing, check the operation of the 5th synchro hub set.
NOTE: The slots layout is inequable. Set correctly them.



14. Install the synchro ring (A) with the synchro spring (B) by aligning the synchro ring fingers (C) with the grooves (D) in the 5th synchro hub.
15. Install the distance collar (E) and tapered cone ring (F).

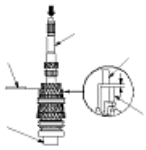


16. Press in the new angular ball bearing (A) using the 40 mm inner driver handle (B) 30 mm inner bearing driver attachment (C) and press (D).



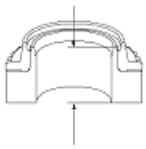
M/T Mainshaft Assembly Clearance Inspection

NOTE: If replacement is required, always replace the synchro sleeve and hub as a set.



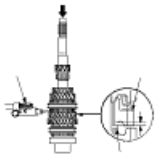
1. Support the bearing inner race with a socket (A), and push down on the mainshaft (B).
2. Measure the clearance between 2nd (C) and 3rd (D) gears with a feeler gauge (E).
   - If the clearance is more than the service limit, go to Step 3 .
   - If the clearance is within the service limit, go to Step 4 .

   Standard: **0.06–0.21 mm (0.002–0.008 in.)**
   Service Limit: **0.33 mm (0.013 in.)**



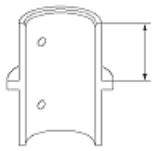
3. Measure the thickness of 3rd gear.
   - If the thickness of 3rd gear is less than the service limit, replace 3rd gear with a new one.
   - If the thickness of 3rd gear is within the service limit, replace the 3rd/4th synchro hub with a new one.

   Standard: **27.92–27.97 mm (1.099–1.101 in.)**
   Service Limit: **27.85 mm (1.096 in.)**



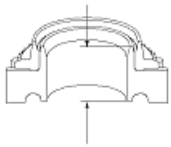
4. Measure the clearance between 4th gear (A) and the distance collar (B) with a dial indicator (C). If the clearance is more than the service limit, go to Step 5 .

   Standard: **0.06–0.19 mm (0.002–0.007 in.)**
   Service Limit: **0.31 mm (0.012 in.)**



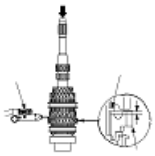
5. Measure distance (1) on the spacer collar.
   - If distance (1) is not within the standard, replace the distance collar with a new one.
   - If distance (1) is within the standard, go to Step 6 .

   Standard: **24.03–24.06 mm (0.946–0.947 in.)**



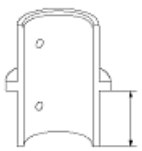
6. Measure the thickness of 4th gear.
   - If the thickness of 4th gear is less than the service limit, replace 4th gear with a new one.
   - If the thickness of 4th gear is within the service limit, replace the 3rd/4th synchro hub with a new one.

   Standard: **27.02–27.07 mm (1.064–1.066 in.)**
   Service Limit: **26.65 mm (1.049 in.)**



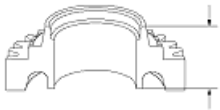
7. Measure the clearance between the distance collar (A) and 5th gear (B) with a dial indicator (C). If the clearance is more than the service limit, go to Step 8 .

   Standard: **0.06–0.19 mm (0.002–0.007 in.)**
   Service Limit: **0.31 mm (0.012 in.)**



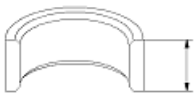
8. Measure distance (2) on the distance collar.
   - If distance (2) is not within the standard, replace the distance collar with a new one.
   - If distance (2) is within the standard, go to Step 9 .

   Standard: **24.03–24.06 mm (0.946–0.947 in.)**



9. Measure the thickness of 5th gear.
   - If the thickness of 5th gear is less than the service limit, replace 5th gear with a new one.
   - If the thickness of 5th gear is within the service limit, replace the 5th synchro hub with a new one.

   Standard: **28.92–28.97 mm (1.139–1.141 in.)**
   Service Limit: **28.85 mm (1.136 in.)**



10. Measure the thickness of the distance collar.
    If the thickness of distance collar is not within standard, replace the distance collar with a new one.

    Standard: **12.00–12.05 mm (0.472–0.474 in.)**

M/T Mainshaft Inspection

1. Inspect the gear surface and bearing surface for wear and damage, then measure the mainshaft at points A, B, C, D and E. If any part of the mainshaft is less than the service limit (except E), replace it with a new one.

Standard:

A (Ball bearing contact area):

25.987−26.000 mm (1.0231−1.0236 in.)

B (Distance collar contact area):

28.992−29.005 mm (1.1414−1.1419 in.)

C (Needle bearing contact area):

34.984−35.000 mm (1.3773−1.3780 in.)

D (Ball bearing contact area):

25.977−25.990 mm (1.0227−1.0232 in.)

E (Pilot bearing contact area):

14.870−14.890 mm (0.5854−0.5862 in.)

Service Limit:

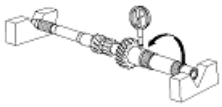
A: 25.93 mm (1.020 in.)

B: 28.93 mm (1.139 in.)

C: 34.93 mm (1.375 in.)

D: 25.92 mm (1.020 in.)

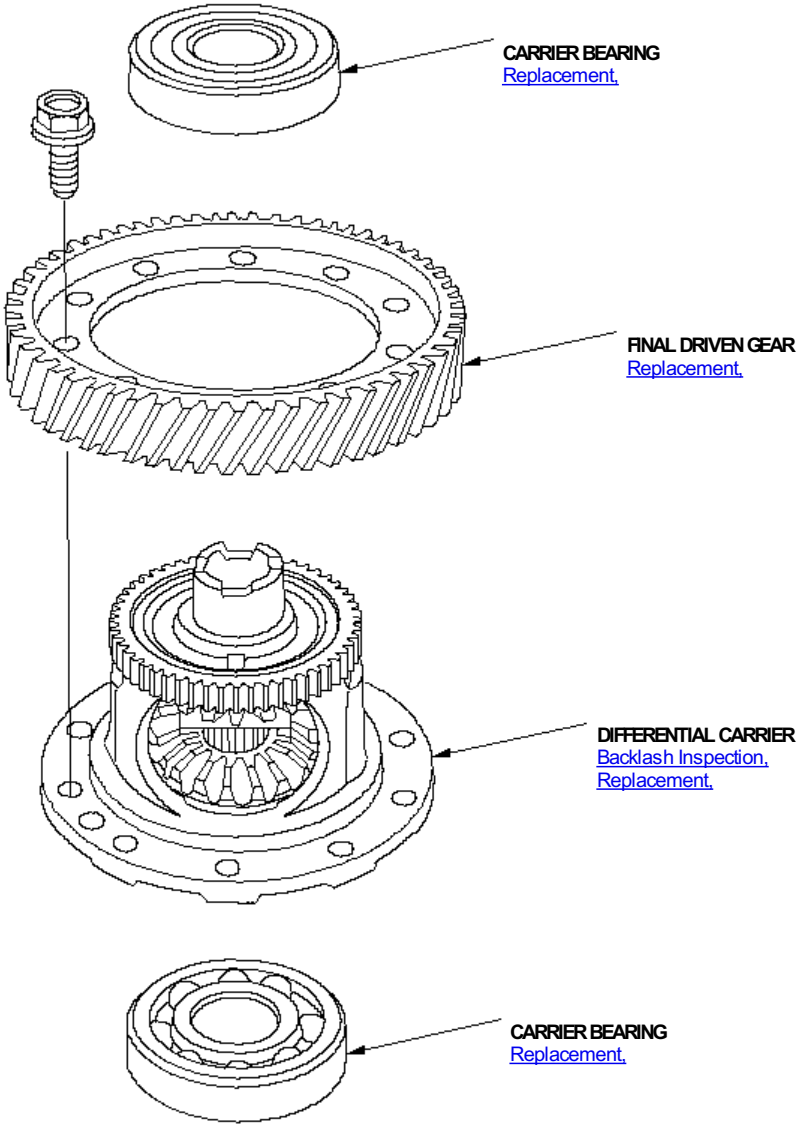
2. Inspect the runout by supporting both ends of the mainshaft. Rotate the mainshaft two complete revolutions when measuring the runout. If the runout is more than the service limit, replace the mainshaft with a new one.



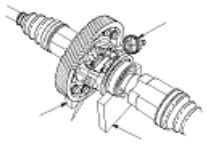
Standard: 0.02 mm (0.001 in.) max.

Service Limit: 0.05 mm (0.002 in.)

M/T Differential Component Location Index



M/T Differential Backlash Inspection



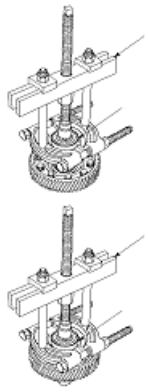
1. Place the differential assembly on V-blocks (A), and install both axles.
2. Measure the backlash of both pinion gears (B) with a dial indicator (C). If the backlash is not within the standard, replace the differential carrier.
   Standard (New): **0.05−0.15 mm (0.002−0.006 in.)**

M/T Differential Carrier Bearings Replacement

Special Tools Required

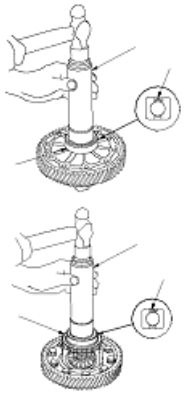
Commercially available
bearing puller

Inner driver handle, 40 mm
07746-0030100



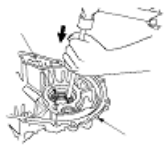
1. Check the carrier bearings for wear and rough rotation. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearings (A) with commercially available bearing puller (B).

3. Install the new bearing (A) with the 40 mm inner driver handle and a press. Press each bearing on until it bottoms. There should be no clearance between the bearings and the carrier.
   NOTE: Turn the seal (B) part of the bearing to the outside of differential, and install it.



M/T Differential Oil Seal Replacement

Special Tools Required

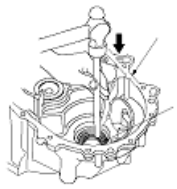


Driver handle, 15 x 135L
07749-0010000

Oil seal driver attachment, 62 x 72 mm
07JAD-PN00100

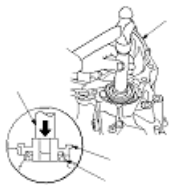
1. Remove the differential assembly.
   NOTE: Be careful not to damage the transmission housing while removing the oil seals.
2. Remove the oil seal (A) from the transmission housing (B).

3. Remove the oil seal (A) from the clutch housing (B).



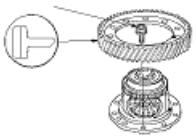
4. Install the new oil seal (A) in the transmission housing (B) with the 15 x 135L driver handle (C) and the 64 x 72 mm oil seal driver attachment (D).

5. Install the new oil seal (A) in the clutch housing (B) with the 15 x 135L driver handle (C) and the 64 x 72 mm oil seal driver attachment (D).



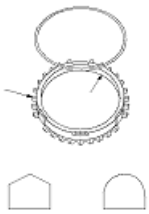
M/T Differential Final Driven Gear/Carrier Replacement

1. Remove the bolts in a crisscross pattern in several steps, then remove the final driven gear from the differential carrier.
2. Install the final driven gear with the chamfer on the inside diameter facing the carrier. Tighten the bolts in a crisscross pattern in several steps.

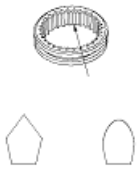


M/T Synchro Ring and Gear Inspection

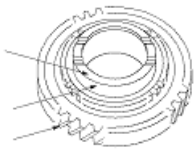
1. Inspect the inside of each synchro ring (A) for wear. Inspect the teeth (B) of each synchro ring for wear (rounded off).



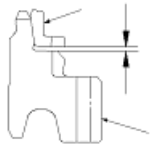
2. Inspect the teeth (A) on each synchro sleeve and matching teeth on each gear for wear (rounded off).



3. Inspect the thrust surface (A) on each gear hub for wear.
4. Inspect the cone surface (B) on each gear hub for wear and roughness.
5. Inspect the teeth on all gears (C) for uneven wear, scoring, and cracks.
6. Coat the cone surface of each gear with transmission fluid, and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.

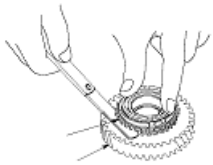


7. Measure the clearance between each gear (A) and its synchro ring (B) all the way round. Hold the synchro ring against the gear evenly while measuring the clearance. If the clearance is less than the service limit, replace the synchro ring and gear.



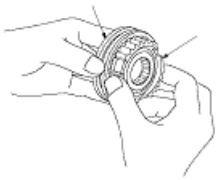
Synchro Ring-to-Gear Clearance

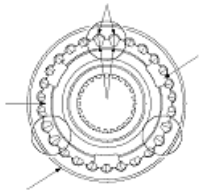
Standard:	**0.85−1.10 mm (0.033−0.043 in.)**
Service Limit:	**0.4 mm (0.02 in.)**



M/T Synchro Sleeve and Hub Inspection and Reassembly

1. Inspect gear teeth on all synchro hubs and synchro sleeves for rounded off corners, which indicate wear.
2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for freedom of movement. Be sure to match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of deeper grooves (D) in the synchro hub. Do not install the synchro sleeve with its longer teeth in the synchro hub slots (E) because it will damage the spring ring.
   NOTE: If replacement is required, always replace the synchro sleeve and synchro hub as a set.





Manual Transmission and M/T Differential (Except i-SHIFT)

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	
Mainshaft	End play		0.11–0.18 mm (0.004–0.007 in.)	Adjust

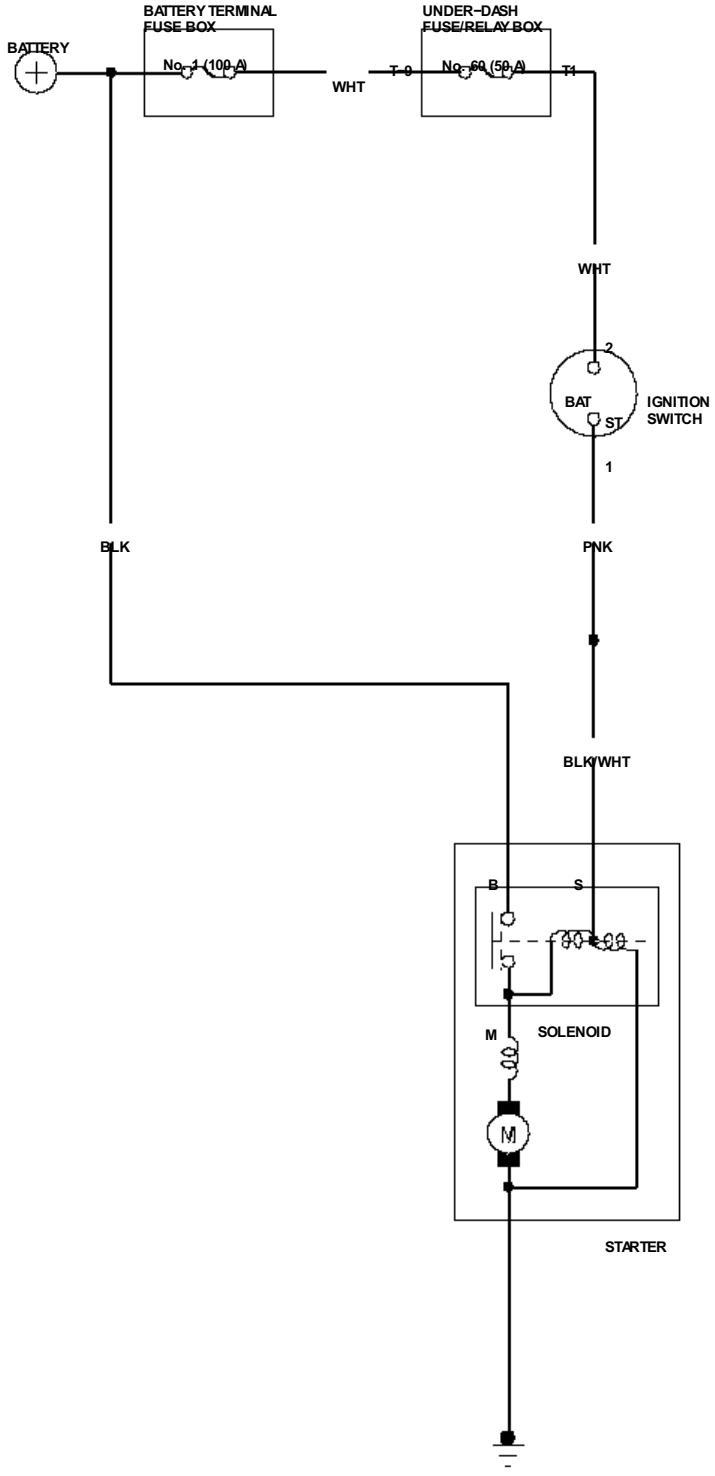
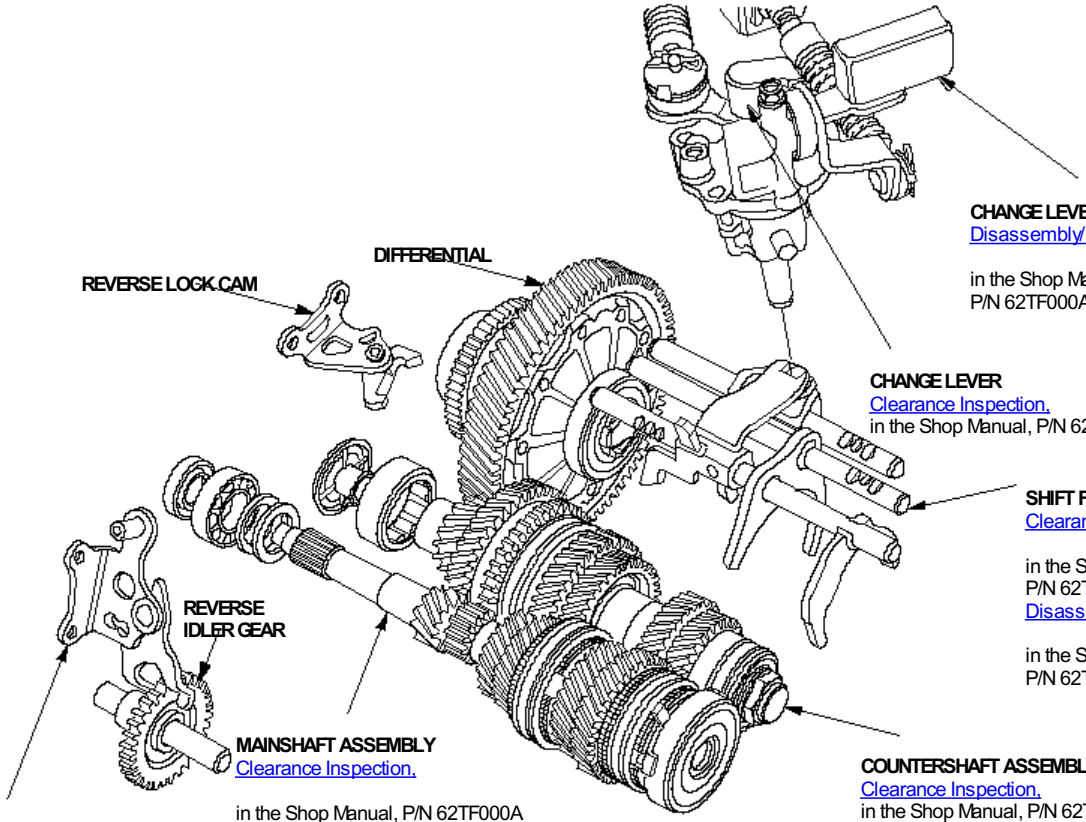
Starting System Circuit Diagram

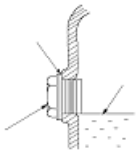
M/T model



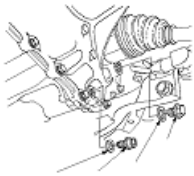
M/T Component Location Index



MTF Inspection and Replacement



1. Park the vehicle on level ground, and turn the engine OFF.
2. Raise the vehicle on a lift and make sure it is securely supported.
3. Remove the splash shield.
4. Remove the filler plug (A) and sealing washer (B), check the condition of the MTF and make sure it is at the proper level (C).



5. If the MTF is dirty, remove the drain plug (A) and drain the MTF.
6. Reinstall the drain plug with a new sealing washer (B), and refill the transmission with MTF to the proper level. Always use Genuine Honda Manual Transmission Fluid (MTF).

   Fluid Capacity

   1.5 L (1.6 US qt, 1.3 Imp qt) at fluid change
   1.6 L (1.7 US qt, 1.4 Imp qt) at overhaul

7. Install the filler plug (C) with a new sealing washer (D).
8. Install the splash shield.
9. Lower the vehicle on the lift.
10. Without service reminder system, this procedure is complete.

With service reminder system

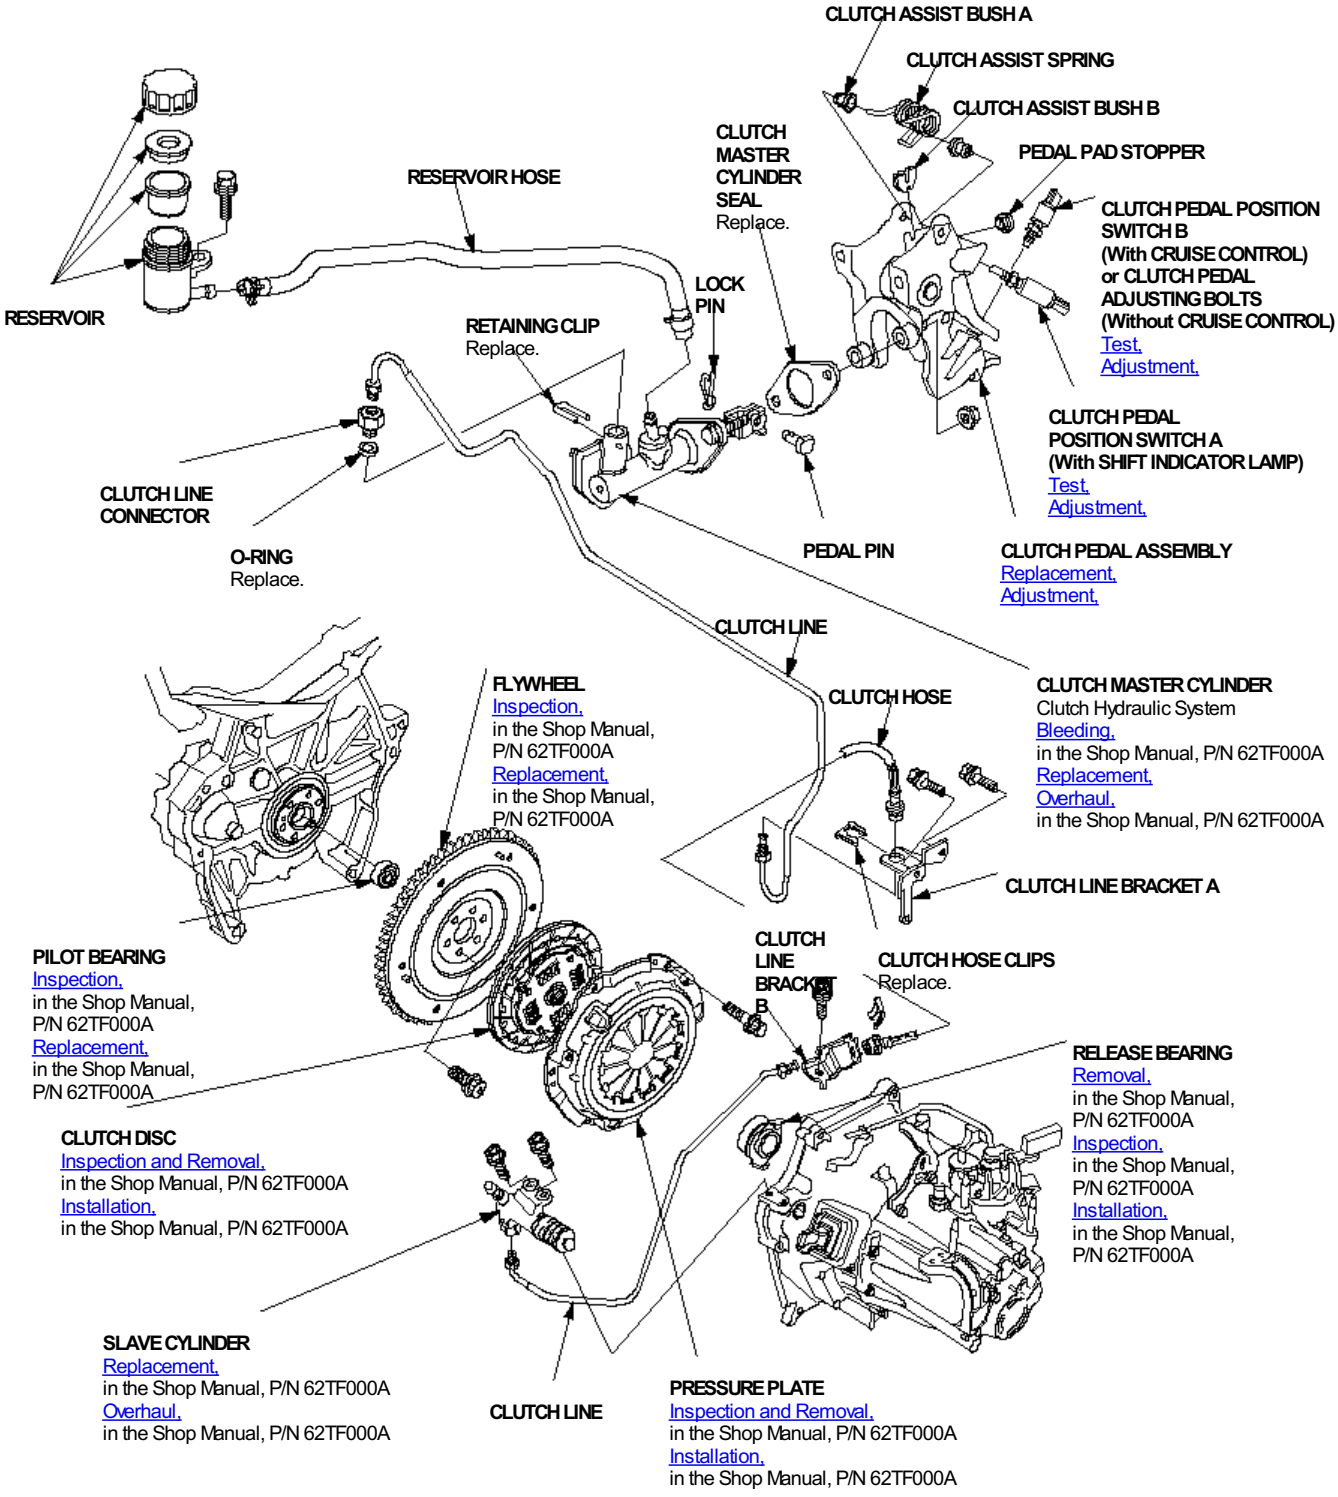
11. If the service reminder system required to replace the MTF, reset the service reminder system, and this procedure is complete. If the service reminder system did not require to replace the MTF, go to Step 12 and reset the MTF life with the HDS.
12. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
13. Turn the ignition switch to ON (II).
14. Make sure the HDS communicates with the vehicle and the ECM. If it doesn't communicate, troubleshoot the DLC circuit.
15. Select BODY ELECTRICAL with the HDS.
16. Select ADJUSTMENT in the GAUGES MENU with the HDS.
17. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
18. Reset SERVICE REMINDER ITEM 3 (shows MTF) with the HDS.

Manual transmission fluid

Item	Measurement	Qualification	Standard or New	Service Limit
Manual transmission fluid	Capacity Use genuine Honda MTF	Fluid change	1.5 L (1.6 US qt, 1.3 Imp qt)	
		Overhaul	1.6 L (1.7 US qt, 1.4 Imp qt)	

Clutch Component Location Index

NOTE: RHD model is shown, LHD model is similar.

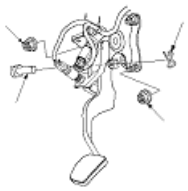


Clutch disc

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch disc	Rivet head depth		1.00−1.50 mm (0.039−0.059 in.)	0.2 mm (0.008 in.)
	Thickness		7.25−7.95 mm (0.285−0.313 in.)	5.0 mm (0.20 in.)

Clutch Master Cylinder Replacement

NOTE:

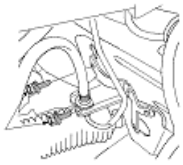


- Use fender covers to avoid damaging painted surfaces.
- Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.
- Without cruise control: Clutch pedal adjusting bolt is substituted as clutch pedal position switch B.
- Put on gloves to protect your hands.

1. Secure the hood in the wide open position (support rod in the lower hole).
2. Remove the windshield wiper arms.
3. Remove the cowl cover and hood hinge cover.
4. Remove the wiper motor.
5. Remove the under-cowl panel.
6. LHD model: Remove the air cleaner housing.
7. Remove the brake fluid from the clutch master cylinder reservoir with a syringe.
8. Remove the driver's dashboard under cover.
9. Pry out the lock pin (A), and pull the pedal pin (B) out of the yoke. Remove the master cylinder mounting nuts (C).

---

10. LHD model: Remove the clutch pipe bracket bolts (A).
11. LHD model: Remove the reservoir hose from two clips.

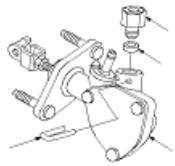


---

12. Disconnect the reservoir hose (A), then remove the clutch line (B) from the clutch master cylinder (C). Plug or wrap the end of the reservoir hose and clutch line with a shop towel to prevent brake fluid from coming out.
    NOTE:
    - Loosen the flare nut (D) while holding the clutch line connector (E) with a wrench.
    - Inspect the hose. If the hose has damage, leaks interference, or twisting, replace it.
13. Remove the clutch master cylinder seal (F) from the clutch master cylinder.

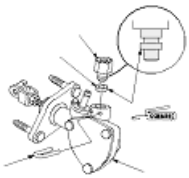
---

14. Remove the retaining clip (A), then remove the clutch line connector (B) and the O-ring (C) from the master cylinder (D).



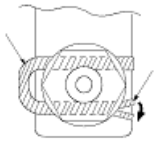
---

15. Install the clutch line connector (A) with a new O-ring (B), then set in a new retaining clip (C) to the master cylinder (D).
    NOTE: Apply the rubber grease on the O-ring and joint part (E) of the clutch line connector.



---

16. To prevent the retaining clip (A) from coming off, pry apart the tip (B) of the clip with a screwdriver.

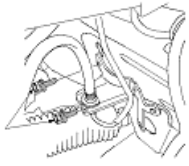


---

17. Install the new clutch master cylinder seal (A) to the clutch master cylinder (B).
18. Connect the clutch line (C), and reservoir hose (D).
    NOTE: Tighten the flare nut (E) while holding the clutch line connector (F) with a wrench.
19. LHD model: Install the two reservoir hose clips.

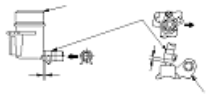
---

20. LHD model: Install the clutch pipe bracket bolts (A).

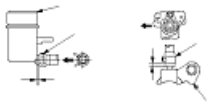


21. Make sure the hose clamps (A) are positioned on the master cylinder (B) and reservoir (C) as shown.
22. LHD model: Install the air cleaner housing.

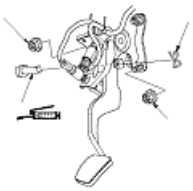
LHD model



RHD model



23. Install the master cylinder mounting nuts (A).
24. Apply multipurpose grease to the pedal pin (B), and slide it into the yoke, then install a lock pin (C).
25. Adjust the clutch pedal, clutch pedal position switch A, and clutch pedal position switch B.
26. Bleed the clutch hydraulic system.
27. Install the driver dashboard under cover.
28. Install the under-cowl panel.
29. Install the wiper motor.
30. Install the cowl cover and hood hinge cover.
31. Install the windshield wiper arms.
32. Check the clutch operation, and check for leaks.
33. Test-drive the vehicle.



Clutch Pedal Assembly Replacement

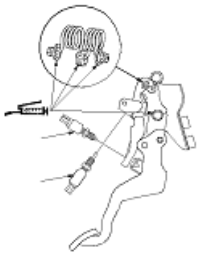
NOTE:

- Without cruise control: The adjusting bolt is substituted as clutch pedal position switch B.
- The illustrations show RHD model.

1. Remove the driver's dashboard under cover .
2. Disconnect the clutch pedal position switch A and the clutch pedal position switch B connectors (C).
3. Pry out the lock pin (D), and pull the pedal pin (E) out of the yoke.
4. Remove the master cylinder mounting nuts (F) and the clutch pedal mounting nuts (G).
5. Remove the clutch pedal assembly (H).
6. Remove clutch pedal position switch A and clutch pedal position switch B.

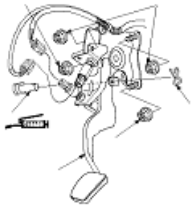
---

7. Loosely install clutch pedal position switch A and clutch pedal position switch B.



---

8. Install the clutch pedal assembly (A).
9. Install the clutch pedal mounting nuts (B) and master cylinder mounting nuts (C).
10. Apply multipurpose grease to the pedal pin (D), and slide it into the yoke, then install a lock pin (E).
11. Adjust the clutch pedal, clutch pedal position switch A, and clutch pedal position switch B.
    NOTE: Connect the switch connectors after adjusting them.
12. Check the clutch operation.
13. Install the driver's dashboard under cover .



Clutch Pedal, Clutch Pedal Position Switch A, and Clutch Pedal Position Switch B Adjustment

NOTE:

- With cruise control: For cruise control, check clutch pedal position switch B.
- With shift indicator lamp: For shift indicator, check clutch pedal position switch A.
- Without cruise control: The adjusting bolt is substituted as clutch pedal position switch B. The clutch pedal height adjustment is same procedure as with clutch pedal position switch B.
- Remove the driver's floor mat before adjusting the clutch pedal.
- If there is no clearance between the master cylinder piston and push rod, the release bearing will be held against the diaphragm spring, which can result in clutch slippage or other clutch problems.

1. Disconnect the clutch pedal position switch A and the clutch pedal position switch B connectors.
2. Loosen the clutch pedal position switch B locknut (A), and back off the clutch pedal position switch B until it no longer touches the clutch pedal (C).
3. Loosen the clutch pushrod locknut (D), and turn the pushrod (E) in or out to get the specified height (F), and the stroke (G) at the clutch pedal.
   F Clutch Pedal Height:
   LHD model: 150 mm (5.91 in.)
   RHD model: 145 mm (5.71 in.)

   G Clutch Pedal Stroke:
   120−130 mm (4.72−5.12 in.)

4. Tighten the clutch pushrod locknut (A).
5. With the clutch pedal released, turn in clutch pedal position switch B until it contacts the clutch pedal.
6. Turn in clutch pedal position switch B an additional 3/4 to 1 turn.
7. While holding clutch pedal position switch B, tighten the locknut (C).

8. Loosen the clutch pedal position switch A locknut (B).
9. Adjust the position of clutch pedal position switch A. Press the clutch pedal fully to the floor, then release the clutch pedal (C) and hold it at the height, so that the switch should be ON/OFF at clutch pedal position switch A ON/OFF height.
   C Clutch Pedal Position Switch A ON/OFF Height:
   LHD model: 36.8−42.0 mm (1.45−1.65 in.)
   RHD model: 36.2−41.9 mm (1.43−1.65 in.)
10. While holding clutch pedal position switch A, tighten the locknut.
11. Check the clutch operation.
12. Connect the clutch pedal position switch A and the clutch pedal position switch B connectors, then check the cruise control and the shift indicator lamp operation.

Clutch pedal

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor	RHD	145 mm (5.71 in.)	———
		LHD	150 mm (5.91 in.)	———
	Stroke		120−130 mm (4.72−5.12 in.)	———

Pressure plate

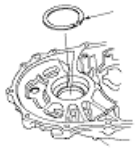
Item	Measurement	Qualification	Standard or New	Service Limit
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height difference of diaphragm spring fingers measured with dial indicator		0.6 mm (0.02 in.) max.	1.0 mm (0.04 in.)

Flywheel

Item	Measurement	Qualification	Standard or New	Service Limit
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	0.15 mm (0.006 in.)

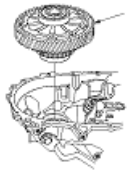
M/T Clutch Housing Differential Thrust Clearance Adjustment

Special Tools Required



Inner driver handle, 40 mm
07746-0030100

1. Remove the left driveshaft side oil seal.
2. Install the 72 mm shim (A) that's the same size as the one you removed.



3. Install the differential assembly (A) into the clutch housing.
4. Install the transmission housing onto the clutch housing, then tighten the 8 mm flange bolts in a crisscross pattern in several steps.
   8 x 1.25 mm
   27 N·m (2.8 kgf·m, 20 lbf·ft)

5. Use the 40 mm inner driver handle to bottom the differential assembly in the clutch housing.

6. Measure clearance between 72 mm shim and bearing outer race in transmission housing.
   Standard: 0.01−0.1 mm (0.0004−0.004 in.)
7. If the clearance is more than the standard, select a new 72 mm shim from the following table. If the clearance measured in Step 6 is within the standard, go to Step 10 .

72 mm Shim: L12B1 engine

Type	Part Number	Thickness
A	41441-PL3-A000	1.0 mm (0.0394 in.)
B	41442-PL3-A000	1.1 mm (0.0433 in.)
C	41443-PL3-A000	1.2 mm (0.0472 in.)
D	41444-PL3-A000	1.3 mm (0.0512 in.)
E	41445-PL3-A000	1.4 mm (0.0551 in.)
F	41446-PL3-A000	1.5 mm (0.0591 in.)
G	41447-PL3-A000	1.6 mm (0.0630 in.)
H	41448-PL3-A000	1.7 mm (0.0669 in.)
J	41449-PL3-A000	1.8 mm (0.0709 in.)
K	41450-PL3-A000	1.05 mm (0.0413 in.)
L	41451-PL3-A000	1.15 mm (0.0453 in.)
M	41452-PL3-A000	1.25 mm (0.0492 in.)
N	41453-PL3-A000	1.35 mm (0.0531 in.)
P	41454-PL3-A000	1.45 mm (0.0571 in.)
Q	41455-PL3-A000	1.55 mm (0.0610 in.)
R	41456-PL3-A000	1.65 mm (0.0650 in.)
S	41457-PL3-A000	1.75 mm (0.0689 in.)

8. Remove the bolts and transmission housing.
9. Replace the thrust shim selected in Step 7 , then recheck the clearance.
10. Install the new left driveshaft side oil seal.
11. Reinstall the transmission housing.

Reverse idler gear

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse idler gear	I.D.		15.016−15.043 mm (0.5912−0.5922 in.)	15.08 mm (0.594 in.)
	Gear-to-reverse gear shaft clearance		0.032−0.077 mm (0.0012−0.0030 in.)	0.14 mm (0.006 in.)

M/T Countershaft Reassembly

Exploded View

Countershaft

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft	Diameter of needle bearing contact area (transmission housing side)		34.000−34.015 mm (1.3386−1.3392 in.)	33.95 mm (1.337 in.)

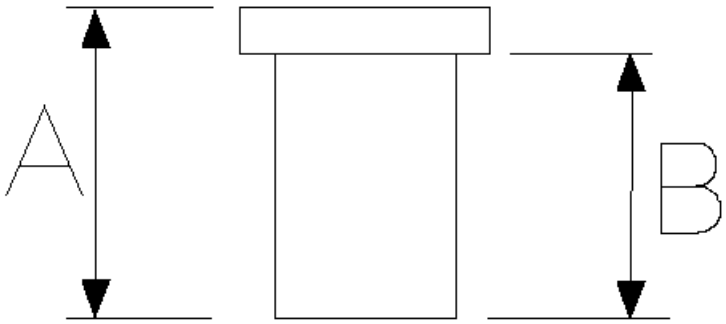
	O.D.		44.489−45.000 mm (1.7515−1.7717 in.)	44.44 mm (1.7500 in.)
	Length	A	30.50−30.54 mm (1.2007−1.2023 in.)	———
			044−1.046 in.)	———



Countershaft 2nd gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Countershaft 2nd gear distance collar	I.D.		34.000−34.010 mm (1.3386−1.3390 in.)	34.04 mm (1.340 in.)
	O.D.		39.989−40.000 mm (1.5744−1.5748 in.)	39.93 mm (1.572 in.)
	Length		27.53−27.56 mm (1.084−1.085 in.)	27.51 mm (1.083 in.)

Change lever

Item	Measurement	Qualification	Standard or New	Service Limit
Change lever	Shaft-to-select lever clearance		0.05−0.35 mm (0.002−0.014 in.)	0.55 mm (0.022 in.)
	Groove width		13.00−13.15 mm (0.512−0.518 in.)	———
	Shaft-to-shift arm clearance		0.013−0.070 mm (0.0005−0.0028 in.)	0.1 mm (0.004 in.)

Select lever

Item	Measurement	Qualification	Standard or New	Service Limit
Select lever	Finger width		12.80−12.95 mm (0.504−0.510 in.)	———

Reverse shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Reverse shift fork	Finger width		13.5−13.8 mm (0.53−0.54 in.)	———
	Fork-to-reverse idler gear clearance		1.30−1.90 mm (0.051−0.075 in.)	2.5 mm (0.098 in.)

Shift fork

Item	Measurement	Qualification	Standard or New	Service Limit
Shift fork	Finger thickness	1st-2nd and 3rd-4th forks	7.4−7.6 mm (0.29−0.30 in.)	———
		5th fork	6.7−6.9 mm (0.26−0.27 in.)	———
	Fork-to-synchro sleeve clearance		0.35−0.65 mm (0.014−0.026 in.)	1.0 mm (0.04 in.)

Shift arm

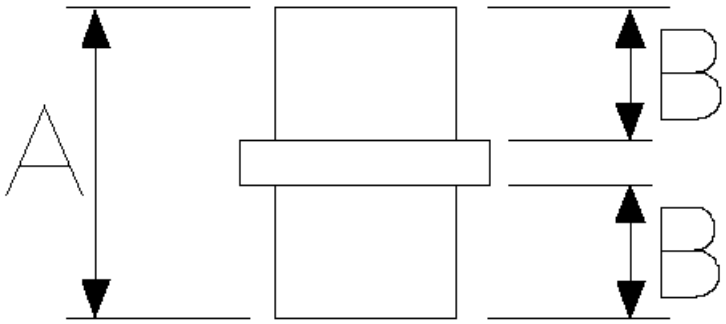
Item	Measurement	Qualification	Standard or New	Service Limit
Shift arm	I.D.		13.973−14.000 mm (0.5501−0.5512 in.)	———
	Finger width		12.9−13.0 mm (0.508−0.512 in.)	———
	Shift arm-to-shift fork clearance		0.2−0.5 mm (0.008−0.020 in.)	0.62 mm (0.024 in.)

Mainshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft	End play		0.11−0.18 mm (0.004−0.007 in.)	Adjust
	Diameter of ball bearing contact area (transmission housing side)		25.987−26.000 mm (1.0231−1.0236 in.)	25.93 mm (1.020 in.)
	Diameter of distance collar contact area		28.992−29.005 mm (1.1414−1.1419 in.)	28.93 mm (1.139 in.)
	Diameter of needle bearing contact area		34.984−35.000 mm (1.3773−1.3780 in.)	34.93 mm (1.375 in.)
	Diameter of ball bearing contact area (clutch housing side)		25.977−25.990 mm (1.0227−1.0232 in.)	25.92 mm (1.020 in.)
	Diameter of pilot bearing contact area		14.870−14.890 mm (0.5854−0.5862 in.)	———
	Runout		0.02 mm (0.001 in.) max.	0.05 mm (0.002 in.)

Mainshaft 4th/5th gear distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 4th/5th gear distance collar	I.D.		29.014−29.024 mm (1.1423−1.1427 in.)	29.06 mm (1.144 in.)
	O.D.		34.989−35.000 mm (1.3775−1.3780 in.)	34.93 mm (1.375 in.)
	Length	A	51.97−52.03 mm (2.046−2.048 in.)	———
			).946−0.947 in.)	———



MBS distance collar

Item	Measurement	Qualification	Standard or New	Service Limit
MBS distance collar	I.D.		26.02−26.17 mm (1.024−1.030 in.)	———
	Length		12.00−12.05 mm (0.472−0.474 in.)	———

Mainshaft 3rd and 4th gear

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 3rd and 4th gear	I.D.		39.009−39.025 mm (1.5358−1.5364 in.)	39.07 mm (1.538 in.)
	Clearance	2nd-3rd	0.06−0.21 mm (0.002−0.008 in.)	0.33 mm (0.013 in.)
	Endplay	4th	0.06−0.19 mm (0.002−0.007 in.)	0.31 mm (0.012 in.)
	Thickness	3rd	27.92−27.97 mm (1.099−1.101 in.)	27.85 mm (1.096 in.)
		4th	27.02−27.07 mm (1.064−1.066 in.)	26.65 mm (1.049 in.)

Mainshaft 5th gear

Item	Measurement	Qualification	Standard or New	Service Limit
Mainshaft 5th gear	I.D.		39.009−39.025 mm (1.5358−1.5364 in.)	39.07 mm (1.538 in.)
	End play		0.06−0.19 mm (0.002−0.007 in.)	0.31 mm (0.012 in.)
	Thickness		28.92−28.97 mm (1.139−1.141 in.)	28.85 mm (1.136 in.)

M/T differential pinion gear

Item	Measurement	Qualification	Standard or New	Service Limit
M/T differential pinion gear	Backlash		0.05−0.15 mm (0.002−0.006 in.)	———

Synchro ring

Item	Measurement	Qualification	Standard or New	Service Limit
Synchro ring	Ring-to-gear clearance	Ring pushed against gear	0.85−1.10 mm (0.033−0.043 in.)	0.4 mm (0.02 in.)

Fuel and Emissions System Description - VTEC System

VTEC System (L12B1 engine)
Operation (L12B1 engine)

M/T differential 72 mm shim

Item	Measurement	Qualification	Standard or New	Service Limit
M/T differential 72 mm shim (L12B1, L13Z1)	72 mm shim-to-bearing outer race clearance in transmission housing		0.01−0.1 mm (0.0004−0.004 in.)	Adjust

Safety Messages

Safety Messages

Your safety, and the safety of others, is very important. To help you make informed decisions, we have provided safety messages, and other safety information throughout this manual. Of course, it is not practical or possible to warn you about all the hazards associated with servicing this vehicle. You must use your own good judgment.
You will find important safety information in a variety of forms including:

- **Safety Labels –** on the vehicle.
- **Safety Messages –** preceded by a safety alert symbol and one of three signal words, DANGER, WARNING, or CAUTION.
  These signal words mean:

  You WILL be KILLED or SERIOUSLY HURT if you don't follow instructions.
  You CAN be KILLED or SERIOUSLY HURT if you don't follow instructions.
  You CAN be HURT if you don't follow instructions.

- **Instructions –** how to service this vehicle correctly and safely.

All information contained in this manual is based on the latest product information available at the time of printing. We reserve the right to make changes at anytime without notice. No part of this publication may be reproduced, or stored in a retrieval system, or transmitted, in any form by any means, electronic, mechanical, photocopying, recording, or otherwise, without the prior written permission of the publisher. This includes text, figures, and tables.
As you read this manual, you will find information that is preceded by a symbol. The purpose of this message is to help prevent damage to your vehicle, other property, or the environment.

Maintenance Schedule for Normal and Severe Conditions - Australia

This maintenance schedule outlines the minimum required maintenance that you should perform to ensure the trouble-free operation of the vehicle. Due to regional and climatic differences, some additional service may be required. Please consult the warranty booklet for a more detailed description.
The following items must be used for "severe conditions" indicated on schedule, if the vehicle is driven MAINLY under the specified conditions A to F.

- Engine oil and engine oil filter: A/B/C/D/E
- Transmission fluid
  M/T: B/D
  A/T: B/C/D/F

A: Driving less than 8 km (5 miles) per trip or, in freezing temperatures, driving less than 16 km (10 miles) per trip.
B: Driving in extremely hot over 35 °C (95 °F) conditions.
C: Extensive idling, or long periods of stop-and-go driving.
D: Towing trailer, driving with a loaded roof rack, or driving in mountainous conditions.
E: Driving on muddy, dusty, or de-iced roads.
F: Driving more than 20,000 km (12,500 miles) per year, or driving at high speed frequently.

Service at the indicated distance or time whichever comes first		km x 1,000	20	40	60	80	100	120	140	160	180	200
		miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
		months	12	24	36	48	60	72	84	96	108	120
Replace engine oil *	Normal Conditions		Every 10,000 km (6,250 miles) or 1 year									
	Severe Conditions		Every 5,000 km (3,125 miles) or 6 months									
Replace engine oil filter *	Normal Conditions		●	●	●	●	●	●	●	●	●	●
	Severe Conditions		Every 10,000 km (6,250 miles) or 6 months									
Replace air cleaner element			Every 30,000 km (18,750 miles)									
Inspect valve clearance			Every 40,000 km (25,000 miles)									
Replace fuel filter						●				●		
Replace spark plugs			Every 100,000 km (62,500 miles)									
Inspect and adjust drive belt Look for cracks and damage, then check the deflection and tension.				●		●		●		●		●
Inspect idle speed								●				
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.			At 200,000 km (120,000 miles) or 10 years, then every 100,000 km (60,000 miles) or 5 years									
Replace Manual Transmission Fluid Use genuine Honda MTF.	Normal Conditions							●				
	Severe Conditions				●			●			●	
Replace Automatic Transmission Fluid Use genuine Honda ATF-Z1.	Normal Conditions							●				●
	Severe Conditions				●		●		●		●	

*: Only severe schedule is required in some countries, refer to local warranty booklet.

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
	months	12	24	36	48	60	72	84	96	108	120
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.	Every 10,000 km (6,250 miles)										
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level is between upper and lower marks on the reservoir.	Every 3 years										
Check parking brake adjustment Check the parking brake operation.		●	●		●		●		●		●
Replace dust and pollen filter		●	●	●	●	●	●	●	●	●	●
Rotate tyres Check tyre inflation and condition at least once per month.	Every 10,000 km (6,250 miles)										
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.											
Tie-rod ends, steering gearbox, and boots • Check rack grease and steering linkage. • Check the boot for damage and leaking grease.	Every 10,000 km (6,250 miles) or 6 months										
Suspension components • Check the bolts for tightness. • Check all dust covers for deterioration and damage.											

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
	months	12	24	36	48	60	72	84	96	108	120
Driveshaft boots • Check the boot and boot band for cracks. • Check rack grease.											
Brake hoses and lines (including ABS lines) Check the master cylinder and ABS modulator-control unit and leakage.		•	•	•	•	•	•	•	•	•	•
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • MTF • ATF • Brake fluid • Clutch fluid • Windshield washer fluid											
Exhaust system Check the exhaust pipe and muffler for damage, leaks, and tightness.											
Fuel lines, and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.											

Maintenance Schedule for Normal and Severe Conditions - Except Australia

This maintenance schedule outlines the minimum required maintenance that you should perform to ensure the trouble-free operation of the vehicle. Due to regional and climatic differences, some additional service may be required. Please consult the warranty booklet for a more detailed description.
The following items must be used for "severe conditions" indicated on schedule, if the vehicle is driven MAINLY under the specified conditions A to F.

- Engine oil and engine oil filter: A/B/C/D/E
- Transmission fluid
  M/T: B/D
  A/T: B/C/D/F

A: Driving less than 8 km (5 miles) per trip or, in freezing temperatures, driving less than 16 km (10 miles) per trip.
B: Driving in extremely hot over 35 °C (95 °F) conditions.
C: Extensive idling, or long periods of stop-and-go driving.
D: Towing trailer, driving with a loaded roof rack, or driving in mountainous conditions.
E: Driving on muddy, dusty, or de-iced roads.
F: Driving more than 20,000 km (12,500 miles) per year, or driving at high speed frequently.

Service at the indicated distance or time whichever comes first		km x 1,000	20	40	60	80	100	120	140	160	180	200
		miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
		months	12	24	36	48	60	72	84	96	108	120
Replace engine oil *	Normal Conditions		Every 10,000 km (6,250 miles) or 1 year

Design Specifications

Item	Measurement		Qualification	Specification
DIMENSION	Overall length			3,900−3,920 mm (153.5−154.3 in.)
	Overall width			1,695 mm (66.7 in.)
	Overall height			1,525 mm (60.0 in.)
	Wheelbase			2,500 mm (98.4 in.)
	Track	15 inch wheel model	Front	1,490 mm (58.7 in.)
			Rear	1,475 mm (58.1 in.)
		16 inch wheel model	Front	1,475 mm (58.1 in.)
			Rear	1,460 mm (57.5 in.)
	Ground clearance			150 mm (5.9 in.)
	Seating capacity			Five (5)
	WEIGHT (except KQ)	Curb weight	M/T	1,045 kg (2,304 lbs)
			A/T	1,070 kg (2,359 lbs)
	WEIGHT (KQ)	Curb weight (L13Z1)	M/T	1,025−1,040 kg (2,260−2,293 lbs)
			A/T	1,070−1,093 kg (2,359−2,410 lbs)
		Curb weight (L15A7)	M/T	1,048−1,060 kg (2,310−2,337 lbs)
			A/T	1,075−1,085 kg (2,370−2,392 lbs)
ENGINE	Type			Water-cooled, 4-stroke SOHC i-VTEC engine
	Cylinder arrangement			Inline 4-cylinder, transverse
	Bore and stroke		L13Z1	73 x 80 mm (2.87 x 3.15 in.)
			L15A7	73 x 89.4 mm (2.87 x 3.52 in.)
	Displacement		L13Z1	1,339 cm ^{3} (82 cu in.)
			L15A7	1,496 cm ^{3} (91 cu in.)
	Compression ratio		L13Z1	10.5
			L15A7	10.4
	Valve train			Chain drive, SOHC 2 valves per cylinder
	Lubrication system			Forced, wet sump, with trochoid pump
	Oil pump displacement		at 6,300 engine rpm (min $^{-1}$)	45.3 L (47.9 US qt, 39.9 Imp qt)
	Water pump displacement		at 6,000 engine rpm (min $^{-1}$)	120 L (127 US qt, 106 Imp qt)
STARTER	Type			Gear reduction
	Normal output		Except L13Z1 KP, KQ	0.7 kW
			L13Z1 KP, KQ	0.6 kW, 0.7 kW
	Hour rating			30 seconds
	Rotation direction			Clockwise as viewed from drive end
CLUTCH	Type			Single plate dry, diaphragm spring

Item	Measurement	Qualification	Specification
MANUAL TRANSMISSION	Type		Synchronized, five-speed forward, one reverse
	Primary reduction		Direct 1:1
	Gear ratio (L13Z1)	1st	3.461
		2nd	1.869
		3rd	1.235
		4th	0.948
		5th	0.809
		Reverse	3.307
		Final	4.294
	Gear ratio (L15A7: except IN)	1st	3.461
		2nd	1.869
		3rd	1.303
		4th	1.054
		5th	0.853
		Reverse	3.307
		Final	4.294
	Gear ratio (L15A7: IN)	1st	3.307

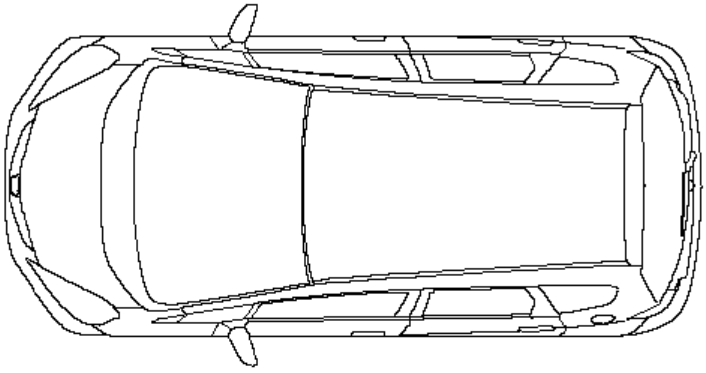
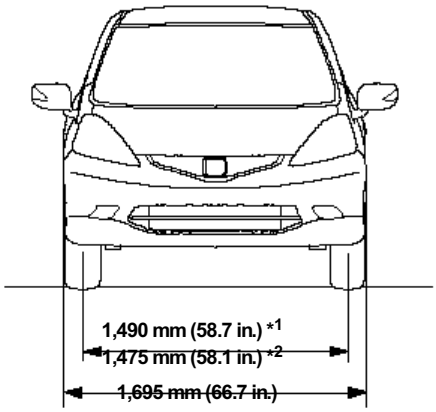
		3rd	1.235
		4th	0.948
		5th	0.809
		Reverse	3.307
		Final	4.625
	Final reduction	Type	Single helical gear
AUTOMATIC TRANSMISSION	Type		Electronically controlled automatic, five-speed forward, one reverse, three-element torque converter with lock-up clutch

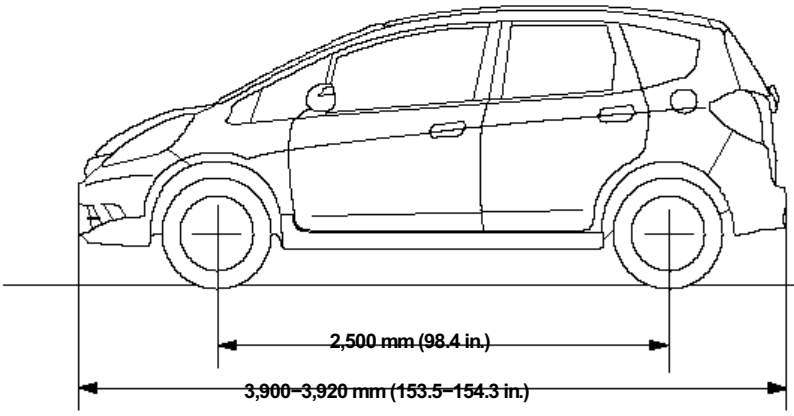
Item	Measurement	Qualification	Specification
	Primary reduction		Direct 1:1
	Gear ratio	1st	2.995
		2nd	1.678
		3rd	1.066
		4th	0.760
		5th	0.551
		Reverse	1.956
		Final	4.562
	Final reduction	Type	Single helical gear
STEERING	Type		Electrical power-assisted rack and pinion
	Overall ratio		16.09
	Turns, lock-to-lock		3.29
	Steering wheel diameter		370 mm (14.6 in.)
SUSPENSION	Type	Front	Independent strut with stabilizer, coil spring
		Rear	Torsion beam, coil spring
	Shock absorber	Front and rear	Telescopic, hydraulic, nitrogen gas-filled
TYRES	Size		See tyre information label attached to the doorjambs
BRAKES	Type of service brake	Front	Power-assisted self-adjusting ventilated disc
		Rear	Power-assisted self-adjusting solid disc
	Type of parking brake		Mechanical actuating, rear wheels
	Pad friction surface area (swept area)	Front	40.8 cm^2 (6.32 sq in.) x 2
		Rear	21.0 cm^2 (3.26 sq in.) x 2

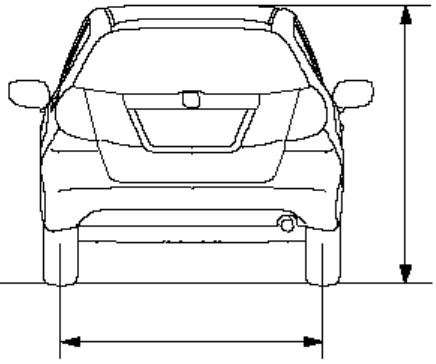
Item	Measurement	Qualification	Specification
AIR CONDITIONING	Compressor	Type	Scroll
		Capacity	77.1 mL (4.7 cu in.)/rev.
		Maximum speed	10,000 rpm (min^{-1})
		Lubricant capacity	80 mL (2 2/3 fl·oz, 2.8 Imp·oz)
		Lubricant type	SP-10
	Condenser	Type	Corrugated fin
	Evaporator	Type	Corrugated fin
	Blower	Type	Radial
		Motor type	170 W/12 V
		Speed control	4 speed
		Maximum capacity	400 m^3 (14,126 cu ft)/h
	Temperature control		Air-mix type
	Compressor clutch	Type	Dry, single plate, Poly V-belt drive
		Electrical power consumption at 20 °C (68 °F)	42 W maximum at 12 V
	Refrigerant	Type	HFC-134a (R-134a)
		Capacity	370–420 g (13.1–14.8 oz)
ELECTRICAL RATINGS	Battery	KZ, KP	12 V–30 Ah/20 HR (12 V–24 Ah/5 HR)
		KQ	12 V–35 Ah/20 HR (12 V–28 Ah/5 HR)
		IN	12 V–30 Ah/20 HR (12 V–27 Ah/5 HR)
	Fuses	Battery terminal fuse box (with trailer light connector)	100 A, 60 A, 30 A
		Battery terminal fuse box (without trailer light connector)	100 A, 60 A, 20 A
		Under-dash fuse/relay box	50 A, 40 A, 30 A, 20 A, 15 A, 10 A, 7.5 A
	Light bulbs	Headlight high/low beam	12 V–60/55 W
		Front turn signal lights	12 V–21 W
		Mirror turn signal lights	LED
		Side turn signal lights	12 V–5 W
		Front position lights	12 V–5 W
		Rear turn signal lights	12 V–21 W
		Brake/taillights	12 V–21/5 W
		High mount brake light	12 V–21 W
		Back-up lights	12 V–21 W
		License plate lights	12 V–5 W
		Ceiling lights	12 V–8 W
		Cargo area light	12 V–5 W
		Front individual map lights	12 V–8 W
		Gauge lights	LED
		Indicator lights	12 V–0.84 W
	Washer reservoir	Capacity	2.5 L (2.6 US qt, 2.2 Imp qt)

Body Specifications









*1: 15 inch wheel model
*2: 16 inch wheel model

Engine Electrical

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Rated voltage		12 V	
	Firing order		1−3−4−2	
Spark plug	Type		NGK: IZFR6K13 DENSO: SKJ20DR-M13	
	Gap		1.2−1.3 mm (0.047−0.051 in.)	———
Ignition timing		At idle (check the *white* mark)	M/T (in neutral): 0±2 ° BTDC	
			A/T (in N or P): 0±2 ° BTDC	
Drive belt	Tension		Auto-tensioner	
Alternator	Output	At 13.5 V and normal engine temperature	95 A	
	Coil (rotor) resistance	At 20 °C (68 °F)	2.1−2.3 Ω	
	Slip ring O.D.		22.7 mm (0.89 in.)	21.2 mm (0.83 in.)
	Brush length		23.0 mm (0.91 in.)	18.0 mm (0.71 in.)
	Brush spring tension		4.1−5.3 N (0.42−0.54 kgf, 0.93−1.19 lbs)	
Starter	Output	Except L13Z1 KP, KQ	0.7 kw	
		L13Z1 KP, KQ	0.6 kw, 0.7 kw	
	Commutator mica depth		0.45−0.75 mm (0.018−0.030 in.)	0.20 mm (0.008 in.)
	Commutator runout		0.05 mm (0.002 in.) max.	0.4 mm (0.02 in.)
	Commutator O.D.		27.9−28.0 mm (1.098−1.102 in.)	27.0 mm (1.06 in.)
	Brush length		9.7−10.3 mm (0.38−0.41 in.)	6.0 mm (0.20 in.)

Engine Assembly

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure check at 250 rpm (min $^{-1}$) with wide open throttle. (See Design Specs for ratio)	Minimum	980 kPa (10.0 kgf/cm ^{2}, 142 psi)	———
		Maximum variation	200 kPa (2.0 kgf/cm ^{2}, 28 psi)	———

Cylinder Head

Item	Measurement	Qualification		Standard or New	Service Limit
Head	Warpage			0.07 mm (0.0028 in.)	0.08 mm (0.003 in.)
	Height			119.9−120.1 mm (4.720−4.728 in.)	———
Camshaft	End play			0.05−0.25 mm (0.002−0.010 in.)	0.5 mm (0.02 in.)
	Camshaft-to-holder oil clearance			0.045−0.084 mm (0.0018−0.0033 in.)	0.100 mm (0.004 in.)
	Total runout			0.03 mm (0.001 in.) max.	0.04 mm (0.002 in.)
	Cam lobe height	L13Z1	Intake, primary	34.290 mm (1.3500 in.)	———
			Intake, secondary	30.529 mm (1.2019 in.)	———
			Exhaust	35.047 mm (1.3798 in.)	———
		L15A7	Intake, primary	35.241 mm (1.3874 in.)	———
			Intake, secondary	36.173 mm (1.4241 in.)	———
			Exhaust	35.471 mm (1.3964 in.)	———
Valve	Clearance (cold)	Intake		0.15−0.19 mm (0.006−0.007 in.)	———
		Exhaust		0.26−0.30 mm (0.010−0.012 in.)	———
	Stem O.D.	Intake		5.48−5.49 mm (0.216−0.216 in.)	5.45 mm (0.215 in.)
		Exhaust		5.45−5.46 mm (0.215−0.215 in.)	5.42 mm (0.213 in.)
	Stem-to-guide clearance	Intake		0.020−0.050 mm (0.0008−0.0020 in.)	0.08 mm (0.003 in.)
		Exhaust		0.050−0.080 mm (0.0020−0.0031 in.)	0.11 mm (0.004 in.)
Valve seat	Width	Intake		0.850−1.150 mm (0.0335−0.0453 in.)	1.60 mm (0.063 in.)
		Exhaust		1.250−1.550 mm (0.0492−0.0610 in.)	2.00 mm (0.079 in.)
	Stem installed height	Intake		46.1−46.5 mm (1.815−1.831 in.)	46.8 mm (1.843 in.)
		Exhaust		46.2−46.6 mm (1.819−1.835 in.)	46.9 mm (1.846 in.)
Valve spring	Free length	L13Z1	Intake	51.17 mm (2.014 in.)	———
			Exhaust	57.26 mm (2.254 in.)	———
		L15A7	Intake	48.55 mm (1.911 in.)	———
			Exhaust	54.52 mm (2.146 in.)	———
Valve guide	I.D.	Intake		5.51−5.53 mm (0.217−0.218 in.)	5.55 mm (0.219 in.)
		Exhaust		5.51−5.53 mm (0.217−0.218 in.)	5.55 mm (0.219 in.)
	Installed height	Intake		15.85−16.35 mm (0.624−0.644 in.)	———
		Exhaust		15.85−16.35 mm (0.624−0.644 in.)	———
Rocker arm	Arm-to-shaft clearance	Intake		0.019−0.058 mm (0.0007−0.0023 in.)	0.08 mm (0.003 in.)

Item	Measurement	Qualification	Standard or New	Service Limit
		Exhaust	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)

Engine Block

Item	Measurement	Qualification	Standard or New	Service Limit
Block	Warpage of deck		0.07 mm (0.003 in.) max.	0.10 mm (0.004 in.)
	Bore diameter		73.000–73.015 mm (2.8740–2.8746 in.)	73.065 mm (2.8776 in.)
	Bore taper		———	0.05 mm (0.002 in.)
	Reboring limit		———	0.25 mm (0.01 in.)
Piston	Skirt O.D. at 16 mm (0.6 in.) from bottom of skirt	L13Z1	72.972–72.982 mm (2.8729–2.8733 in.)	72.97 mm (2.8728 in.)
		L15A7	72.980–72.990 mm (2.8732–2.8736 in.)	72.97 mm (2.8728 in.)
	Clearance in cylinder	L13Z1	0.018–0.043 mm (0.007–0.0017 in.)	0.05 mm (0.002 in.)
		L15A7	0.010–0.035 mm (0.0004–0.0014 in.)	0.05 mm (0.002 in.)
	Ring groove width	Top	1.050–1.060 mm (0.0413–0.0417 in.)	1.080 mm (0.0425 in.)
		Second	1.020–1.030 mm (0.0401–0.0405 in.)	1.050 mm (0.0413 in)
		Oil	2.005–2.020 mm (0.0789–0.0795 in.)	2.050 mm (0.0807 in.)
Piston ring	Ring-to-groove clearance	Top	0.065–0.090 mm (0.0026–0.0035 in.)	0.15 mm (0.006 in.)
		Second	0.030–0.055 mm (0.0012–0.0022 in.)	0.12 mm (0.005 in.)
	Ring end gap	Top	0.15–0.30 mm (0.006–0.012 in.)	0.60 mm (0.024 in.)
		Second	0.30–0.42 mm (0.012–0.017 in.)	0.65 mm (0.026 in.)
		Oil	0.20–0.70 mm (0.008–0.028 in.)	0.80 mm (0.031 in.)
Piston pin	O.D.		17.996–18.000 mm (0.7085–0.7087 in.)	———
	Pin-to-piston clearance		0.010–0.017 mm (0.0004–0.0007 in.)	———
Connecting rod	Pin-to-rod interferemce		0.019–0.036 mm (0.007–0.0014 in.)	———
	Small-end bore diameter		17.964–17.977 mm (0.707–0.708 in.)	———
	Large-end bore diameter	Nominal	43.0 mm (1.69 in.)	———
	End play installed on crankshaft		0.15–0.35 mm (0.006–0.014 in.)	0.40 mm (0.016 in.)
Crankshaft	Main journal diameter		49.976–50.000 mm (1.9676–1.9685 in.)	———
	Rod journal diameter		39.976–40.000 mm (1.5739–1.5748 in.)	———
	Rod/main journal taper		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	Rod/main journal out-of-round		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	End play		0.10–0.35 mm (0.004–0.014 in.)	0.45 mm (0.018 in.)
	Runout		0.03 mm (0.0012 in.) max.	0.04 mm (0.0016 in.)
Crankshaft bearing	Main bearing-to-journal oil clearance		0.018–0.036 mm (0.0007–0.0014 in.)	0.050 mm (0.0020 in.)
	Rod bearing clearance	L15A7	0.020–0.038 mm (0.0008–0.0015 in.)	0.050 mm (0.0020 in.)
		L13Z1	0.026–0.044 mm (0.0010–0.0017 in.)	0.050 mm (0.0020 in.)

Engine Lubrication

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.2 L (4.4 US qt, 3.7 Imp qt)	———
		Oil change including oil filter	3.6 L (3.8 US qt, 3.2 Imp qt)	———
		Oil change without oil filter	3.4 L (3.6 US qt, 3.0 Imp qt)	———
Oil pump	Inner rotor-to-outer rotor clearance		0.06–0.16 mm (0.002–0.006 in.)	0.20 mm (0.008 in.)
	Pump housing-to-outer rotor clearance		0.100–0.175 mm (0.0039–0.0069 in.)	0.20 mm (0.008 in.)
	Pump housing-to-rotor axial clearance		0.02–0.06 mm (0.001–0.002 in.)	0.15 mm (0.006 in.)
Relief valve	Relief valve, oil pressure with oil temperature at 80°C (176°F)	At idle	70 kPa (0.7 kgf/cm ^{2}, 10 psi) min.	———
		At 3,000 rpm (min $^{-1}$)	340 kPa (3.5 kgf/cm ^{2}, 50 psi) min.	———

Cooling

Item	Measurement	Qualification				Standard or New
Radiator	Coolant capacity (Includes engine, heater, hoses, and reservoir) Use genuine Honda All Season Antifreeze/Coolant Type 2	L13Z1	M/T	With heater	Engine overhaul	5.02 L (1.326 US gal, 1.104 Imp gal)
					Coolant change	4.53 L (1.197 US gal, 0.997 Imp gal)
				Without heater	Engine overhaul	4.59 L (1.213 US gal, 1.010 Imp gal)
					Coolant change	4.10 L (1.083 US gal, 0.902 Imp gal)
			A/T	With heater	Engine overhaul	4.94 L (1.305 US gal, 1.087 Imp gal)
					Coolant change	4.45 L (1.176 US gal, 0.979 Imp gal)
				Without heater	Engine overhaul	4.51 L (1.192 US gal, 0.992 Imp gal)
					Coolant change	4.02 L (1.062 US gal, 0.884 Imp gal)
		L15A7	M/T	With heater	Engine overhaul	5.03 L (1.329 US gal, 1.107 Imp gal)
					Coolant change	4.54 L (1.199 US gal, 0.999 Imp gal)
				Without heater	Engine overhaul	4.60 L (1.215 US gal, 1.012 Imp gal)

Item	Measurement			Qualification		Standard or New
					Coolant change	4.11 L (1.086 US gal, 0.904 Imp gal)
			A/T	With heater	Engine overhaul	4.95 L (1.308 US gal, 1.089 Imp gal)
					Coolant change	4.46 L (1.178 US gal, 0.981 Imp gal)
				Without heater	Engine overhaul	4.52 L (1.195 US gal, 0.994 Imp gal)
					Coolant change	4.03 L (1.065 US gal, 0.887 Imp gal)
Coolant reservoir	Coolant capacity				0.44 L (0.116 US qt, 0.097 Imp qt)	
Radiator cap	Opening pressure				93−123 kPa (0.95−1.25 kgf/cm ^{2}, 14−18 psi)	
Thermostat	Opening temperature	Begins to open			76−80 °C (169−176 °F)	
		Fully open			90 °C (194 °F)	
	Valve lift at fully open				8.0 mm (0.31 in.) min.	

Fuel and Emissions

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected		320−370 kPa (3.3−3.8 kgf/cm ^{2}, 47−54 psi)
Fuel tank	Capacity		42 L (11.0 US gal, 9.2 Imp gal)
Engine idle	Idle speed without load (L13Z1)	M/T (in neutral)	650±50 rpm
		A/T (in N or P)	700±50 rpm
	Idle speed without load (L15A7)	M/T (in neutral), A/T (in N or P)	700±50 rpm
	Idle speed with high electrical load (A/C switch ON, temperature set to max cool, blower fan on High, rear window defogger ON, and headlights on high beam)	M/T (in neutral), A/T (in N or P)	790±50 rpm
	Idle CO		0.1 % max.

Clutch

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor	RHD	145 mm (5.71 in.)	———
		LHD	150 mm (5.91 in.)	———
	Stroke		120−130 mm (4.72−5.12 in.)	———
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	0.15 mm (0.006 in.)
Clutch disc	Rivet head depth		1.00−1.50 mm (0.039−0.059 in.)	0.2 mm (0.008 in.)
	Thickness		7.25−7.95 mm (0.285−0.313 in.)	5.0 mm (0.20 in.)
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height difference of diaphragm spring fingers measured with dial indicator		0.6 mm (0.02 in.) max.	1.0 mm (0.04 in.)

Steering

Item	Measurement	Qualification	Standard or New
Steering wheel	Rotational play measured at outside edge with engine running		0−10 mm (0−0.39 in.)
	Initial load measured at outside edge with engine running		29 N (3.0 kgf, 6.6 lbf)
Gearbox	Angle of rack guide screw loosened from locked position		10±3 °

Suspension

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel alignment	Camber	Front	0 ° 00 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 20 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (10±0.10 in.)	
	Front wheel turning angle	Inward	40 ° 19 ′±2 °	
		Outward (reference)	33 ° 19 ′±1 °	
Wheel	Steel wheel runout	Axial	0−1.0 mm (0−0.04 in.)	2.0 mm (0.08 in.)
		Radial	0−1.0 mm (0−0.04 in.)	1.5 mm (0.06 in.)
	Aluminium wheel runout	Axial	0−0.7 mm (0−0.03 in.)	2.0 mm (0.08 in.)
		Radial	0−0.7 mm (0−0.03 in.)	1.5 mm (0.06 in.)
Wheel bearing	End play	Front	0−0.05 mm (0−0.002 in.)	
		Rear	0−0.05 mm (0−0.002 in.)	

Brakes

Item	Measurement	Qualification	Standard or New		Service Limit
Parking brake	Distance traveled when lever pulled with 196 N (20 kgf, 44 lbf) of force		6 to 8 clicks		
Brake pedal	Pedal height (carpet moved aside)	M/T	139 mm (5.5 in.)		
		A/T	138 mm (5.4 in.)		
	Free play		1−5 mm (0.04−0.20 in.)		
Brake disc	Thickness	Front	20.9−21.1 mm (0.82−0.83 in.)		19.0 mm (0.75 in.)
		Rear	8.9−9.1 mm (0.35−0.36 in.)		8.0 mm (0.31 in.)
	Runout		———		0.04 mm (0.0016 in.)
	Parallelism		———		0.015 mm (0.0006 in.)
Brake pad	Thickness	Front	9.5−10.2 mm (0.37−0.41 in.)		1.6 mm (0.06 in.)
		Rear	6.8−7.5 mm (0.27−0.30 in.)		1.6 mm (0.06 in.)
Brake booster	Master cylinder oil pressure	Vacuum booster Vacuum kPa (mmHg, in.Hg)	Brake pedal pressure N (kgf, lbf)	Master cylinder oil pressure kPa (kgf/cm ^{2} , psi)	
		0 (0, 0)	98 (10, 22)	0 (0, 0)	
			196 (20, 44)	Except LHD (M/T)	577 (5.9, 84)
				LHD (M/T)	501 (5.1, 73)
		66.7 (500, 19.7)	98 (10, 22)	Except LHD (M/T)	4,523 (46.1, 656)
				LHD (M/T)	4,235 (43.2, 614)
			196 (20, 44)	Except LHD (M/T)	9,538 (97.3, 1.383)
				LHD (M/T)	9,468 (96.5, 1.373)

Air Conditioning

Item	Measurement	Qualification	Standard or New
Refrigerant	Type		HFC-134a (R-134a)
	Capacity of system		370−420 g (13.1−14.8 oz)
Refrigerant oil	Type		SP-10 (P/N 38897-P13-A01, 38898-P13-003, or 38899-P13-A01)
	Capacity of components	Condenser	25 mL (5/6 fl·oz, 0.9 Imp·oz)
		Evaporator	35 mL (1 1/6 fl·oz, 1.2 Imp·oz)
		Each line and hose	10 mL (1/3 fl·oz, 0.4 Imp·oz)
		Receiver/Dryer	10 mL (1/3 fl·oz, 0.4 Imp·oz)
		Compressor	80−90 mL (2 2/3−3 fl·oz, 2.8−3.2 Imp·oz)
Compressor	Field coil resistance	At 20 °C (68 °F)	3.15−3.45 Ω

Item	Measurement	Qualification	Standard or New
	Pulley-to-armature plate clearance		0.35−0.65 mm (0.014−0.026 in.)

Abbreviations

List of automotive abbreviations which may be used in shop manual.

ABS	Anti-lock Brake System
A/C	Air Conditioning, Air Conditioner
ACEA	Association des Constructeurs Europeens d' Automobiles
ACL	Air Cleaner
A/F	Air Fuel Ratio
AHB	Advanced Hydraulic Booster
ALR	Automatic Locking Retractor
ALT	Alternator
AMP	Ampere(s)
ANT	Antenna
API	American Petroleum Institute
APP	Accelerator Pedal Position
APPROX	Approximately
ASSY	Assembly
A/T	Automatic Transmission
ATDC	After Top Dead Center
ATF	Automatic Transmission Fluid
ATT	Attachment
AUTO	Automatic
AUX	Auxiliary
BARO	Barometric
BAT	Battery
BCM	Battery Condition Monitor
BDC	Bottom Dead Center
BTDC	Before Top Dead Center
CARB	Carburetor
CAT or CATA	Catalytic Converter
CD	Compact Disc
CHG	Charge
CKF	Crankshaft Speed Fluctuation
CKP	Crankshaft Position
CLV	Calculated Load Value
CMBS	Collision Mitigation Brake System
CMP	Camshaft Position
CO	Carbon Monoxide
COMP	Complete
CPB	Clutch Pressure Back up
CPC	Clutch Pressure Control
CPU	Central Processing Unit
CVT	Continuously Variable Transmission
CVTF	Continuously Variable Transmission Fluid
CYL	Cylinder
CYP	Cylinder Position
DIFF	Differential
DLC	Data Link Connector
DLI	Distributor Less Ignition
DOHC	Double Overhead Camshaft
DOT	Department of Transportation
DPF	Diesel Particulate Filter
DPI	Dual Point Injection
DPSF	Dual Pump System Fluid
DTC	Diagnostic Trouble Code
EBD	Electronic Brake Distribution
ECM	Engine Control Module
ECT	Engine Coolant Temperature
EGR	Exhaust Gas Recirculation
EGT	Exhaust Gas Temperature
ELD	Electrical Load Detector
EPR	Evaporator Pressure Regulator
EPS	Electrical Power Steering
ETCS	Electronic Throttle Control System
EVAP	Evaporative Emission
EX	Exhaust
F	Front
FIA	Fuel Injection Air
FL	Front Left
FP	Fuel Pump
FR	Front Right
FRP	Fuel Rail Pressure

FSR	Fail Safe Relay
FWD	Front Wheel Drive
GAL	Gallon
GND	Ground
GPS	Global Positioning System
H/B	Hatchback
HBA	Hydraulic Brake Assist
HC	Hydrocarbons
HDS	Honda Diagnostic System
HFT	Hands Free Telephone
HID	High Intensity Discharge
HIM	Honda Interface Module
HO2S	Heated Oxygen Sensor
HPS	Hydraulic Power Steering
HVAC	Heating, Ventilation, and Air Conditioning
IAB	Intake Air Bypass
IAC	Idle Air Control
IACV	Idle Air Control Valve
IAR	Intake Air Resonator
IAT	Intake Air Temperature
ICM	Ignition Control Module
ID	Identification
ID or I.D.	Inside Diameter
i-DSI	Intelligent-Dual & Sequential Ignition
IG or IGN	Ignition
IMA	Idle Mixture Adjustment
	Integrated Motor Assisted
IMMOBI.	Immobilizer (Immobiliser)
IMRC	Intake Manifold Runner Control
IMT	Intake Manifold Tuning
IN	Intake
INJ	Injection
INT	Intermittent
IQA	Injector Quantity Adjustment (Diesel model)
ISV	Intake Shutter Valve
KS	Knock Sensor
L	Left
L/C	Lock-up Clutch
LCD	Liquid Crystal Display
LED	Light Emitting Diode
LEV	Low Emission Vehicle
LF	Left Front
LH	Left Handle
LHD	Left Handle Drive
LR	Left Rear
LSD	Limited Slip Differential
L4	In-line Four Cylinder (engine)
MAF	Mass Air Flow
MAP	Manifold Absolute Pressure
MAX.	Maximum
MBS	Mainshaft Brake System
MCK	Motor Check
MCM	Motor Control Module
MCU	Moment Control Unit
MICS	Multiplex Integrated Control System
MICU	Multiplex Integrated Control Unit
MIL	Malfunction Indicator Lamp
MIN.	Minimum
MPI	Multi Point Injection
M/S	Manual Steering
M/T	Manual Transmission
MTF	Manual Transmission Fluid
NOx	Oxides of Nitrogen
OBD	On-board Diagnostic
OD or O.D.	Outside Diameter
OPDS	Occupant Position Detection System
O2S	Oxygen Sensor
PAIR	Pulsed Secondary Air Injection
PCM	Powertrain Control Module
PCV	Positive Crankcase Ventilation
	Proportioning Control Valve
PDU	Power Drive Unit

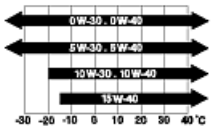
PGM-FI	Programmed-fuel Injection
PGM-IG	Programmed Ignition
PH	Pressure High
PL	Pilot Light or Pressure Low
PMR	Pump Motor Relay
P/N	Part Number
PRI	Primary
P/S	Power Steering
PSF	Power Steering Fluid
PSP	Power Steering Pressure
PSW	Pressure Switch
Qty	Quantity
R	Right
REF	Reference
RH	Right Handle
RHD	Right Handle Drive
RL	Rear Left
RON	Research Octane Number
RR	Rear Right
SAE	Society of Automotive Engineers
SCS	Service Check Signal
SEC	Second, Secondary
SOHC	Single Overhead Camshaft
SOL	Solenoid
SPEC	Specification
S/R	Sun Roof
SRS	Supplemental Restraint System
STD	Standard
SW	Switch
T	Torque
TB	Throttle Body
T/B	Timing Belt
TC	Torque Converter
TCM	Transmission Control Module
TCS	Traction Control System
TDC	Top Dead Center
TFT	Thin Film Transistor
T/N	Tool Number
TP	Throttle Position
TPMS	Tyre Pressure Monitoring System
TWC	Three Way Catalytic Converter
VC	Viscous Coupling
VCM	Variable Cylinder Management
VIN	Vehicle Identification Number
VSA	Vehicle Stability Assist
VSS	Vehicle Speed Sensor
VTEC	Variable Valve Timing & Valve Lift Electronic Control
VVIS	Variable Volume Intake System
V6	V-engine Six Cylinder (engine)
W	With
W/O	Without
WOT	Wide Open Throttle
2WD	Two Wheel Drive
4WD	Four Wheel Drive
4AT	4-speed Automatic Transmission
5AT	5-speed Automatic Transmission
5MT	5-speed Manual Transmission
6MT	6-speed Manual Transmission
P	Park
R	Reverse
N	Neutral
D4	Drive (1st through 4th gear)
D3	Drive (1st through 3rd gear)
D	Drive
M	Manual mode
S	Second
L	Low
O/D	Over Drive
1ST	Low (gear)
2ND	Second (gear)
3RD	Third (gear)

4TH	Fourth (gear)
5TH	Fifth (gear)
6TH	Sixth (gear)

Lubricants and Fluids

⚠CAUTION

Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil.



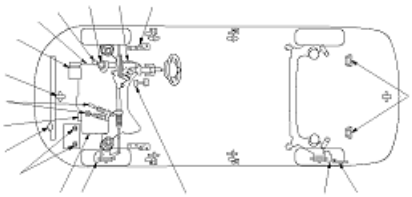
For the details of the lubrication points and the type of lubricants to be applied, refer to the illustrated index and the various work procedures (such as Assembly/Reassembly, Replacement, Overhaul, Installation, etc.) contained in each section.

	Application	Lubricant or Fluid
A	Engine	Always use API service grade SL or higher SAE viscosity: See chart.
B	Manual transmission	Honda Manual Transmission Fluid (MTF) Always use genuine Honda MTF *. Using motor oil can cause stiffer shifting because it does not contain the proper additives.
	Automatic transmission	Honda ATF-Z1 Always use genuine Honda ATF-Z1. Using a non-Honda ATF can affect shift quality.
C D	Brake system (including ABS lines) Clutch system (manual transmission)	Brake Fluid DOT 3 or DOT 4 We recommend genuine Honda Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
E F G H I J K	Release fork (manual transmission) Battery terminals Brake booster clevis pin Clutch master cylinder clevis pin (manual transmission) Fuel fill door Hood hinges and hood latch Tailgate hinges	Multipurpose Grease
L	Caliper piston boot	Rubber Grease
M N	Caliper piston seal, caliper pins and boots Shift cable ends (manual transmission)	Silicone Grease
O	Air conditioning compressor	Compressor Oil:SP-10 (P/N 38897-P13-A01 or 38899-P13-A01) for refrigerant HFC-134a (R-134a)
P	Cooling system	Always use genuine Honda All Season Antifreeze/Coolant Type 2

If genuine Honda MTF is not available, use API service SL or higher grade motor oil with a viscosity of SAE 10W-30 or 10W-40 as a temporary replacement.

NOTE:

- Lubricate the following grease using the recommended lubricants and fluids.
- In corrosive area, more frequent lubrication is necessary.
- The illustration shows the RHD model, the LHD model is symmetrical.



Alternator

Item	Measurement	Qualification	Standard or New	Service Limit
Alternator	Output	At 13.5 V and normal engine temperature	95 A	
	Coil (rotor) resistance	At 20 °C (68 °F)	2.1−2.3 Ω	
	Slip ring O.D.		22.7 mm (0.89 in.)	21.2 mm (0.83 in.)
	Brush length		23.0 mm (0.91 in.)	18.0 mm (0.71 in.)
	Brush spring tension		4.1−5.3 N (0.42−0.54 kgf, 0.93−1.19 lbs)	

Drive belt

Item	Measurement	Qualification	Standard or New	Service Limit
Drive belt	Tension		Auto-tensioner	

Coolant reservoir

Item	Measurement	Qualification	Standard or New
Coolant reservoir	Coolant capacity		0.44 L (0.116 US qt, 0.097 Imp qt)

Radiator

Item	Measurement	Qualification				Standard or New
Radiator	Coolant capacity (Includes engine, heater, hoses, and reservoir) Use genuine Honda All Season Antifreeze/Coolant Type 2	L13Z1	M/T	With heater	Engine overhaul	5.02 L (1.326 US gal, 1.104 Imp gal)
					Coolant change	4.53 L (1.197 US gal, 0.997 Imp gal)
				Without heater	Engine overhaul	4.59 L (1.213 US gal, 1.010 Imp gal)
					Coolant change	4.10 L (1.083 US gal, 0.902 Imp gal)
			A/T	With heater	Engine overhaul	4.94 L (1.305 US gal, 1.087 Imp gal)
					Coolant change	4.45 L (1.176 US gal, 0.979 Imp gal)
				Without heater	Engine overhaul	4.51 L (1.192 US gal, 0.992 Imp gal)
					Coolant change	4.02 L (1.062 US gal, 0.884 Imp gal)
		L15A7	M/T	With heater	Engine overhaul	5.03 L (1.329 US gal, 1.107 Imp gal)
					Coolant change	4.54 L (1.199 US gal, 0.999 Imp gal)
				Without heater	Engine overhaul	4.60 L (1.215 US gal, 1.012 Imp gal)
					Coolant change	4.11 L (1.086 US gal, 0.904 Imp gal)
			A/T	With heater	Engine overhaul	4.95 L (1.308 US gal, 1.089 Imp gal)
					Coolant change	4.46 L (1.178 US gal, 0.981 Imp gal)
				Without heater	Engine overhaul	4.52 L (1.195 US gal, 0.994 Imp gal)
					Coolant change	4.03 L (1.065 US gal, 0.887 Imp gal)

Radiator cap

Item	Measurement	Qualification	Standard or New
Radiator cap	Opening pressure		93−123 kPa (0.95−1.25 kgf/cm ^{2}, 14−18 psi)

Thermostat

Item	Measurement	Qualification	Standard or New
Thermostat	Opening temperature	Begins to open	76−80 °C (169−176 °F)
		Fully open	90 °C (194 °F)
	Valve lift at fully open		8.0 mm (0.31 in.) min.

Head

Item	Measurement	Qualification	Standard or New	Service Limit
Head	Warpage		0.07 mm (0.0028 in.)	0.08 mm (0.003 in.)
	Height		119.9−120.1 mm (4.720−4.728 in.)	———

Camshaft

Item	Measurement	Qualification		Standard or New	Service Limit
Camshaft	End play			0.05–0.25 mm (0.002–0.010 in.)	0.5 mm (0.02 in.)
	Camshaft-to-holder oil clearance			0.045–0.084 mm (0.0018–0.0033 in.)	0.100 mm (0.004 in.)
	Total runout			0.03 mm (0.001 in.) max.	0.04 mm (0.002 in.)
	Cam lobe height	L13Z1	Intake, primary	34.290 mm (1.3500 in.)	———
			Intake, secondary	30.529 mm (1.2019 in.)	———
			Exhaust	35.047 mm (1.3798 in.)	———
		L15A7	Intake, primary	35.241 mm (1.3874 in.)	———
			Intake, secondary	36.173 mm (1.4241 in.)	———
			Exhaust	35.471 mm (1.3964 in.)	———

Rocker arm

Item	Measurement	Qualification	Standard or New	Service Limit
Rocker arm	Arm-to-shaft clearance	Intake	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)
		Exhaust	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)

Valve

Item	Measurement	Qualification	Standard or New	Service Limit
Valve	Clearance (cold)	Intake	0.15−0.19 mm (0.006−0.007 in.)	———
		Exhaust	0.26−0.30 mm (0.010−0.012 in.)	———
	Stem O.D.	Intake	5.48−5.49 mm (0.216−0.216 in.)	5.45 mm (0.215 in.)
		Exhaust	5.45−5.46 mm (0.215−0.215 in.)	5.42 mm (0.213 in.)
	Stem-to-guide clearance	Intake	0.020−0.050 mm (0.0008−0.0020 in.)	0.08 mm (0.003 in.)
		Exhaust	0.050−0.080 mm (0.0020−0.0031 in.)	0.11 mm (0.004 in.)

Valve guide

Item	Measurement	Qualification	Standard or New	Service Limit
Valve guide	I.D.	Intake	5.51−5.53 mm (0.217−0.218 in.)	5.55 mm (0.219 in.)
		Exhaust	5.51−5.53 mm (0.217−0.218 in.)	5.55 mm (0.219 in.)
	Installed height	Intake	15.85−16.35 mm (0.624−0.644 in.)	———
		Exhaust	15.85−16.35 mm (0.624−0.644 in.)	———

Valve spring

Item	Measurement	Qualification		Standard or New	Service Limit
Valve spring	Free length	L13Z1	Intake	51.17 mm (2.014 in.)	———
			Exhaust	57.26 mm (2.254 in.)	———
		L15A7	Intake	48.55 mm (1.911 in.)	———
			Exhaust	54.52 mm (2.146 in.)	———

Valve seat

Item	Measurement	Qualification	Standard or New	Service Limit
Valve seat	Width	Intake	0.850−1.150 mm (0.0335−0.0453 in.)	1.60 mm (0.063 in.)
		Exhaust	1.250−1.550 mm (0.0492−0.0610 in.)	2.00 mm (0.079 in.)
	Stem installed height	Intake	46.1−46.5 mm (1.815−1.831 in.)	46.8 mm (1.843 in.)
		Exhaust	46.2−46.6 mm (1.819−1.835 in.)	46.9 mm (1.846 in.)

Compression

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure check at 250 rpm (min^{-1}) with wide open throttle. (See Design Specs for ratio)	Minimum	980 kPa (10.0 kgf/cm^2, 142 psi)	———
		Maximum variation	200 kPa (2.0 kgf/cm^2, 28 psi)	———

Block

Item	Measurement	Qualification	Standard or New	Service Limit
Block	Warpage of deck		0.07 mm (0.003 in.) max.	0.10 mm (0.004 in.)
	Bore diameter		73.000−73.015 mm (2.8740−2.8746 in.)	73.065 mm (2.8776 in.)
	Bore taper		———	0.05 mm (0.002 in.)
	Reboring limit		———	0.25 mm (0.01 in.)

Connecting rod

Item	Measurement	Qualification	Standard or New	Service Limit
Connecting rod	Pin-to-rod interferemce		0.019−0.036 mm (0.007−0.0014 in.)	———
	Small-end bore diameter		17.964−17.977 mm (0.707−0.708 in.)	———
	Large-end bore diameter	Nominal	43.0 mm (1.69 in.)	———
	End play installed on crankshaft		0.15−0.35 mm (0.006−0.014 in.)	0.40 mm (0.016 in.)

Crankshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Crankshaft	Main journal diameter		49.976−50.000 mm (1.9676−1.9685 in.)	———
	Rod journal diameter		39.976−40.000 mm (1.5739−1.5748 in.)	———
	Rod/main journal taper		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	Rod/main journal out-of-round		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	End play		0.10−0.35 mm (0.004−0.014 in.)	0.45 mm (0.018 in.)
	Runout		0.03 mm (0.0012 in.) max.	0.04 mm (0.0016 in.)

Crankshaft bearing

Item	Measurement	Qualification	Standard or New	Service Limit
Crankshaft bearing	Main bearing-to-journal oil clearance		0.018−0.036 mm (0.0007−0.0014 in.)	0.050 mm (0.0020 in.)
	Rod bearing clearance	L15A7	0.020−0.038 mm (0.0008−0.0015 in.)	0.050 mm (0.0020 in.)
		L13Z1	0.026−0.044 mm (0.0010−0.0017 in.)	0.050 mm (0.0020 in.)

Piston

Item	Measurement	Qualification	Standard or New	Service Limit
Piston	Skirt O.D. at 16 mm (0.6 in.) from bottom of skirt	L13Z1	72.972−72.982 mm (2.8729−2.8733 in.)	72.97 mm (2.8728 in.)
		L15A7	72.980−72.990 mm (2.8732−2.8736 in.)	72.97 mm (2.8728 in.)
	Clearance in cylinder	L13Z1	0.018−0.043 mm (0.007−0.0017 in.)	0.05 mm (0.002 in.)
		L15A7	0.010−0.035 mm (0.0004−0.0014 in.)	0.05 mm (0.002 in.)
	Ring groove width	Top	1.050−1.060 mm (0.0413−0.0417 in.)	1.080 mm (0.0425 in.)
		Second	1.020−1.030 mm (0.0401−0.0405 in.)	1.050 mm (0.0413 in)
		Oil	2.005−2.020 mm (0.0789−0.0795 in.)	2.050 mm (0.0807 in.)

Piston pin

Item	Measurement	Qualification	Standard or New	Service Limit
Piston pin	O.D.		17.996−18.000 mm (0.7085−0.7087 in.)	———
	Pin-to-piston clearance		0.010−0.017 mm (0.0004−0.0007 in.)	———

Piston ring

Item	Measurement	Qualification	Standard or New	Service Limit
Piston ring	Ring-to-groove clearance	Top	0.065−0.090 mm (0.0026−0.0035 in.)	0.15 mm (0.006 in.)
		Second	0.030−0.055 mm (0.0012−0.0022 in.)	0.12 mm (0.005 in.)
	Ring end gap	Top	0.15−0.30 mm (0.006−0.012 in.)	0.60 mm (0.024 in.)
		Second	0.30−0.42 mm (0.012−0.017 in.)	0.65 mm (0.026 in.)
		Oil	0.20−0.70 mm (0.008−0.028 in.)	0.80 mm (0.031 in.)

Engine will not start (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Test the starter.
3. Check the fuel pressure.
4. Troubleshoot the fuel pump circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination

Engine will not start (MIL comes on and stays on, no DTCs set)

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination
- No power to ECM/PCM
- No ground to ECM/PCM
- Shorted reference voltage

MIL comes on and stays on, or never comes on at all, no DTCs set

Diagnostic procedure

1. Troubleshoot the MIL circuit.

Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Engine is hard starting (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Check the fuel pressure.
3. Test the throttle body.

Also check for

- Low compression
- Intake air leaks
- Fuel contamination
- Weak spark

Cold fast idle too low (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Throttle body cleaning.

Also check for

- Incorrect valve adjustment

Cold fast idle too high (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Test the throttle body.

Also check for

- Incorrect valve adjustment

After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Test the throttle body.

Also check for

- Intake vacuum leaks
- Incorrect valve adjustment

After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Inspect the APP sensor.

Also check for

- Intake vacuum leaks

Idle speed fluctuates (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Except KQ model: Test the injectors.
4. Troubleshoot the alternator FR signal circuit.
5. Inspect the PCV valve.
6. Test the throttle body.
7. Troubleshoot the A/C signal circuit.
8. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Intake vacuum leaks

Misfire or rough running (MIL works OK, no DTCs set)

Diagnostic procedure

1. Check the spark plugs.
2. Test the fuel pressure.
3. Test the injectors.
4. Troubleshoot the fuel pump circuit.
5. Troubleshoot the VTEC system oil pressure.

Also check for

- Low compression
- Valve clearance
- Fuel contamination

Fails emission test (MIL works OK, no DTCs set)

Diagnostic procedure

1. Except KQ model: Inspect the three way catalytic converter (TWC).
2. Except KQ model: Check the spark plugs.
3. Test the fuel pressure.
4. Except KQ model: Test the injectors.
5. Check the EVAP system.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Broken cam chain

Low power (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the fuel pressure.
2. Check the air cleaner element.
3. Test the throttle body.
4. Except KQ model: Inspect the three way catalytic converter (TWC).
5. Except KQ model: Test the injectors.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Camshaft timing
- Engine oil level

Engine stalls (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Check the idle speed.
4. Troubleshoot the brake pedal position switch signal circuit.
5. Except KQ model: Check the spark plugs.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Intake vacuum leaks
- Faulty harness and sensor connections
- Fuel contamination

Difficult to refuel

Diagnostic procedure

1. Inspect the breather line and the suction line.

HDS does not communicate with the ECM/PCM or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Fuel and Emissions Systems Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set)	1.Test the battery. 2.Test the starter. 3.Check the fuel pressure. 4.Troubleshoot the fuel pump circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination
Engine will not start (MIL comes on and stays on, no DTCs set)	Troubleshoot the DLC circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination • No power to ECM/PCM • No ground to ECM/PCM • Shorted reference voltage
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit.	
Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	
Engine is hard starting (MIL works OK, no DTCs set)	1.Test the battery. 2.Check the fuel pressure. 3.Test the throttle body.	• Low compression • Intake air leaks • Fuel contamination • Weak spark
Cold fast idle too low (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Check the idle speed. 3.Throttle body cleaning.	Incorrect valve adjustment
Cold fast idle too high (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Check the idle speed. 3.Test the throttle body.	Incorrect valve adjustment
After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)	1.Troubleshoot the alternator FR signal circuit. 2.Test the throttle body.	• Intake vacuum leaks • Incorrect valve adjustment
After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)	1.Troubleshoot the alternator FR signal circuit. 2.Inspect the APP sensor.	Intake vacuum leaks
Idle speed fluctuates (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Test the fuel pressure. 3.Except KQ model: Test the injectors. 4.Troubleshoot the alternator FR signal circuit. 5.Inspect the PCV valve. 6.Test the throttle body. 7.Troubleshoot the A/C signal circuit. 8.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Intake vacuum leaks
Misfire or rough running (MIL works OK, no DTCs set)	1.Check the spark plugs. 2.Test the fuel pressure. 3.Test the injectors. 4.Troubleshoot the fuel pump circuit. 5.Troubleshoot the VTEC system oil pressure.	• Low compression • Valve clearance • Fuel contamination
Fails emission test (MIL works OK, no DTCs set)	1.Except KQ model: Inspect the three way catalytic converter (TWC). 2.Except KQ model: Check the spark plugs. 3.Test the fuel pressure. 4.Except KQ model: Test the injectors. 5.Check the EVAP system. 6.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Broken cam chain
Low power (MIL works OK, no DTCs set)	1.Test the fuel pressure. 2.Check the air cleaner element. 3.Test the throttle body. 4.Except KQ model: Inspect the three way catalytic converter (TWC). 5.Except KQ model: Test the injectors. 6.Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Camshaft timing • Engine oil level
Engine stalls (MIL works OK, no DTCs set)	1.Do the ECM/PCM idle learn procedure. 2.Test the fuel pressure. 3.Check the idle speed. 4.Troubleshoot the brake pedal position switch signal circuit. 5.Except KQ model: Check the spark plugs. 6.Troubleshoot the VTEC system oil pressure.	• Intake vacuum leaks • Faulty harness and sensor connections • Fuel contamination

Symptom	Diagnostic procedure	Also check for
Difficult to refuel	Inspect the breather line and the suction line.	
HDS does not communicate with the ECM/PCM or the vehicle	Troubleshoot the DLC circuit.	

Fuel pressure regulator

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected		320−370 kPa (3.3−3.8 kgf/cm ^{2} , 47−54 psi)

Fuel tank

Item	Measurement	Qualification	Standard or New
Fuel tank	Capacity		42 L (11.0 US gal, 9.2 Imp gal)

Engine idle

Item	Measurement	Qualification	Standard or New
Engine idle	Idle speed without load (L13Z1)	M/T (in neutral)	650±50 rpm
		A/T (in N or P)	700±50 rpm
	Idle speed without load (L15A7)	M/T (in neutral), A/T (in N or P)	700±50 rpm
	Idle speed with high electrical load (A/C switch ON, temperature set to max cool, blower fan on High, rear window defogger ON, and headlights on high beam)	M/T (in neutral), A/T (in N or P)	790±50 rpm
	Idle CO		0.1 % max.

Ignition timing

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition timing		At idle (check the *white* mark)	M/T (in neutral): 0±2 ° BTDC	
			A/T (in N or P): 0±2 ° BTDC	

Ignition coil

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Rated voltage		12 V	
	Firing order		1−3−4−2	

Spark plug

Item	Measurement	Qualification	Standard or New	Service Limit
Spark plug	Type		NGK: IZFR6K13 DENSO: SKJ20DR-M13	
	Gap		1.2−1.3 mm (0.047−0.051 in.)	———

Oil pump

Item	Measurement	Qualification	Standard or New	Service Limit
Oil pump	Inner rotor-to-outer rotor clearance		0.06−0.16 mm (0.002−0.006 in.)	0.20 mm (0.008 in.)
	Pump housing-to-outer rotor clearance		0.100−0.175 mm (0.0039−0.0069 in.)	0.20 mm (0.008 in.)
	Pump housing-to-rotor axial clearance		0.02−0.06 mm (0.001−0.002 in.)	0.15 mm (0.006 in.)

Relief valve

Item	Measurement	Qualification	Standard or New	Service Limit
Relief valve	Relief valve, oil pressure with oil temperature at 80°C (176°F)	At idle	70 kPa (0.7 kgf/cm ^{2}, 10 psi) min.	———
		At 3,000 rpm (min $^{-1}$)	340 kPa (3.5 kgf/cm ^{2}, 50 psi) min.	———

Engine oil

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.2 L (4.4 US qt, 3.7 Imp qt)	———
		Oil change including oil filter	3.6 L (3.8 US qt, 3.2 Imp qt)	———
		Oil change without oil filter	3.4 L (3.6 US qt, 3.0 Imp qt)	———

Starter

Item	Measurement	Qualification	Standard or New	Service Limit
Starter	Output	Except L13Z1 KP, KQ	0.7 kw	
		L13Z1 KP, KQ	0.6 kw, 0.7 kw	
	Commutator mica depth		0.45−0.75 mm (0.018−0.030 in.)	0.20 mm (0.008 in.)
	Commutator runout		0.05 mm (0.002 in.) max.	0.4 mm (0.02 in.)
	Commutator O.D.		27.9−28.0 mm (1.098−1.102 in.)	27.0 mm (1.06 in.)
	Brush length		9.7−10.3 mm (0.38−0.41 in.)	6.0 mm (0.20 in.)

Wheel alignment

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel alignment	Camber	Front	0 ° 00 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 20 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (10±0.10 in.)	
	Front wheel turning angle	Inward	40 ° 19 ′±2 °	
		Outward (reference)	33 ° 19 ′±1 °	

Wheel bearing

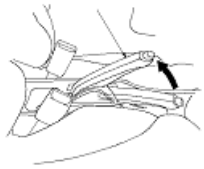
Item	Measurement	Qualification	Standard or New	Service Limit
Wheel bearing	End play	Front	0−0.05 mm (0−0.002 in.)	
		Rear	0−0.05 mm (0−0.002 in.)	

Wheel

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel	Steel wheel runout	Axial	0−1.0 mm (0−0.04 in.)	2.0 mm (0.08 in.)
		Radial	0−1.0 mm (0−0.04 in.)	1.5 mm (0.06 in.)
	Aluminium wheel runout	Axial	0−0.7 mm (0−0.03 in.)	2.0 mm (0.08 in.)
		Radial	0−0.7 mm (0−0.03 in.)	1.5 mm (0.06 in.)

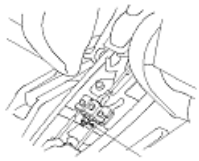
Parking Brake Inspection and Adjustment

Inspection

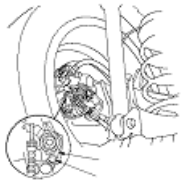


1. Pull the parking brake lever (A) with 196 N (20 kgf, 44 lbf) of force to fully apply the parking brake. The parking brake lever should be locked within the specified number of clicks.
   Lever locked clicks: 6 to 8
2. If the number of lever clicks is not as specified, adjust the parking brake.

Adjustment



1. Release the parking brake lever fully.
2. Press the brake pedal several times.
3. Remove the center console.
4. Loosen the parking brake adjusting nut (A).
5. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
6. Remove the rear wheels.



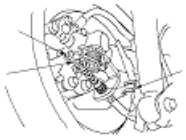
7. Make sure the lever (A) on the rear brake caliper contacts the stop pin (B).
   NOTE: The parking brake lever will contact the stop pin when the parking brake adjusting nut is loosened.
8. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
9. Pull the parking brake lever 1 click.
10. Tighten the parking brake adjusting nut until the parking brakes drag slightly when the rear wheels are turned.
11. Release the parking brake lever fully, and check that the parking brakes do not drag when the rear wheels are turned. Readjust if necessary.
12. Make sure the parking brake lever within the specified number of clicks (6 to 8 clicks).
13. Install the center console.

Parking brake

Item	Measurement	Qualification	Standard or New	Service Limit
Parking brake	Distance traveled when lever pulled with 196 N (20 kgf, 44 lbf) of force		6 to 8 clicks	

Parking Brake Cable Replacement

Exploded View



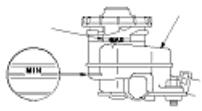
NOTE:

- The parking brake cables must not be bent or distorted. This will lead to stiff operation and premature cable failure.
- Refer to the Exploded View as needed during this procedure.

1. Release the parking brake lever fully.
2. Loosen the parking brake cable adjustment nut.
3. Remove the parking brake cable clip (A) from the brake cable (B).
4. Disconnect the parking brake cable from the lever (C).
5. Remove the parking brake cable mounting hardware, then remove the cable.
6. Install the parking brake cable in the reverse order of removal, and note these items:
   - Be careful not to bend or distort the cable.
   - Make sure the parking brake cable clip is fully seated on the cable housing.
   - Adjust the parking brake.

Brake System Bleeding

NOTE:



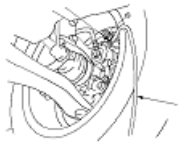
- Do not reuse the drained fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.
- The reservoir connected to the master cylinder must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each wheel location. Add fluid as required.

1. Make sure the brake fluid level in the reservoir (A) is at the MAX (upper) level line (B).
2. Have someone slowly pump the brake pedal several times, then apply steady pressure.

3. Start the bleeding at the driver's side of the front brake system.
   NOTE: Bleed the calipers or the wheel cylinders in the sequence shown.

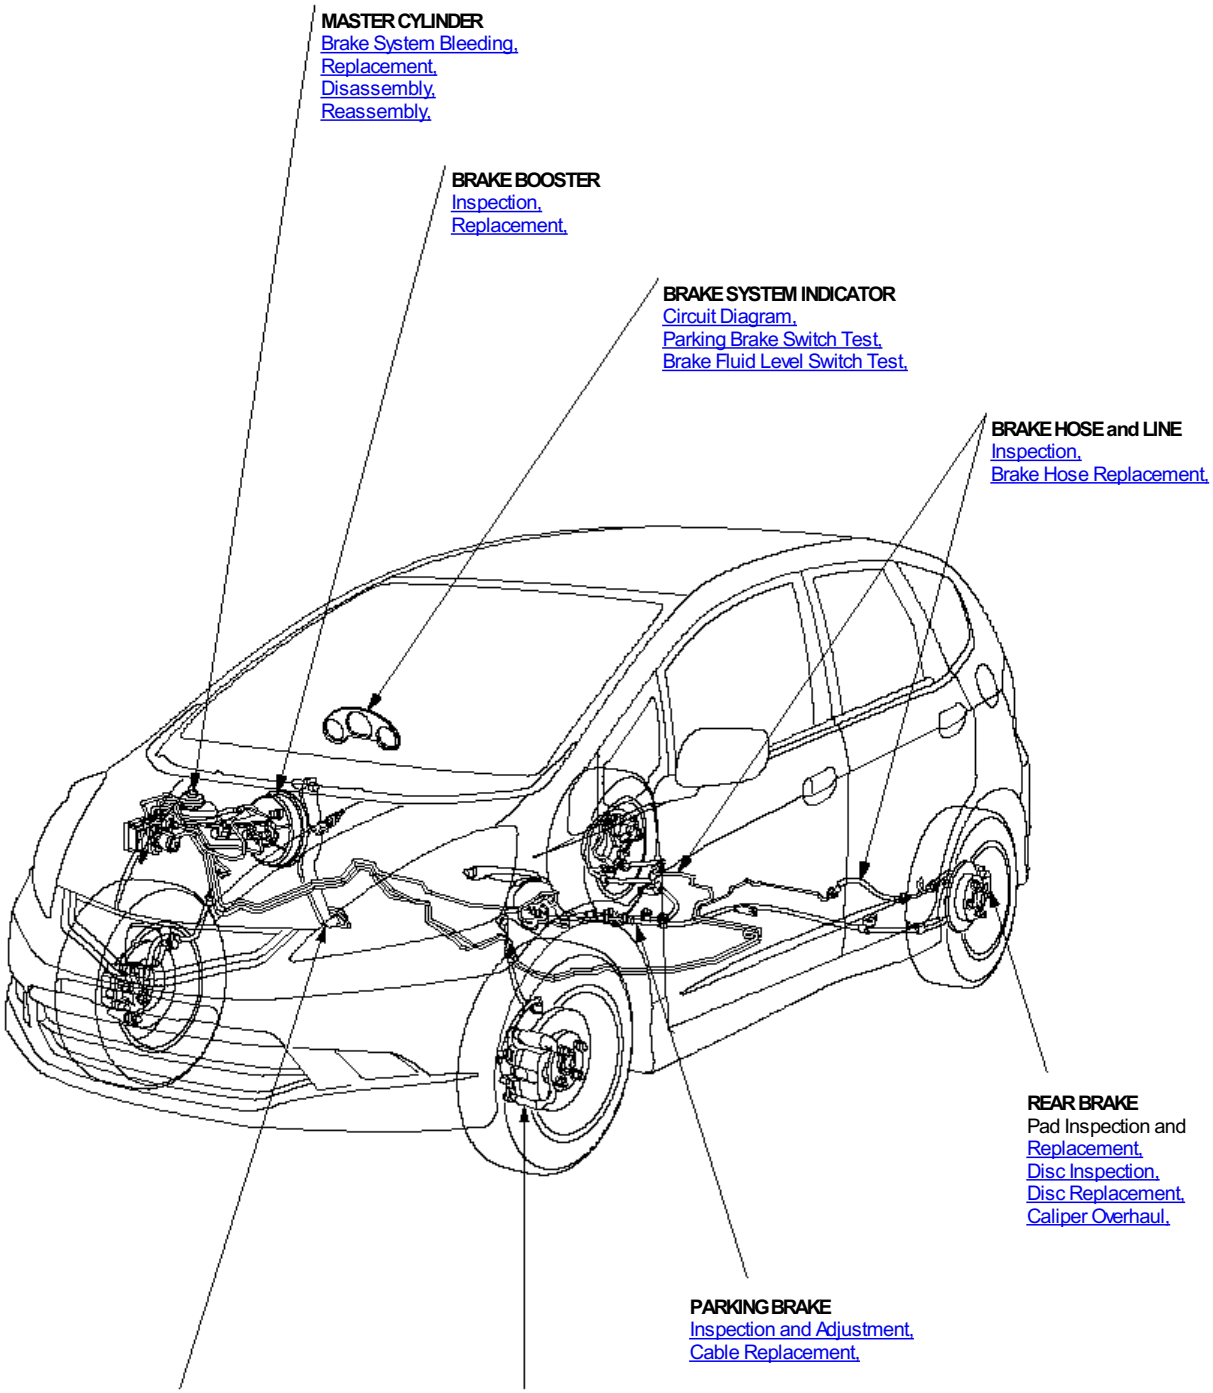
4. Attach a length of clear drain tube (A) to the bleed screw (B), then, loosen the bleed screw to allow air to escape from the system. Then tighten the bleed screw securely.
5. Refill the master cylinder reservoir to the MAX (upper) level line.
6. Repeat the procedure for each brake circuit until there are no air bubbles are in the fluid.

Front



Rear

Conventional Brake Component Location Index

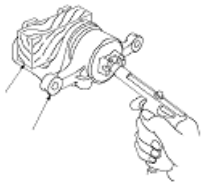


*: The illustration shows RHD model, LHD model is similar.

Brake booster

Item	Measurement	Qualification	Standard or New		Service Limit
Brake booster	Master cylinder oil pressure	Vacuum booster Vacuum kPa (mmHg, in.Hg)	Brake pedal pressure N (kgf, lbf)	Master cylinder oil pressure kPa (kgf/cm ^{2} , psi)	
		0 (0, 0)	98 (10, 22)	0 (0, 0)	
			196 (20, 44)	Except LHD (M/T)	577 (5.9, 84)
				LHD (M/T)	501 (5.1, 73)
		66.7 (500, 19.7)	98 (10, 22)	Except LHD (M/T)	4,523 (46.1, 656)
				LHD (M/T)	4,235 (43.2, 614)
			196 (20, 44)	Except LHD (M/T)	9,538 (97.3, 1.383)
				LHD (M/T)	9,468 (96.5, 1.373)

Front Brake Caliper Overhaul



Exploded View

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

NOTE: Make sure that the caliper pins are installed correctly. Upper caliper pin B and lower caliper pin A are different. If these caliper pins are installed in the wrong location, it will cause vibration, uneven or rapid pad wear, and possibly uneven tyre wear.

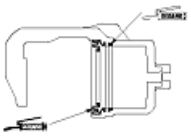
- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets in the brake fluid.
- Make sure no grease or oil gets on the brake discs or the brake pads.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Coat the piston, the piston seal groove, and the caliper bore with clean brake fluid.
- Use recommended greases in the front caliper set.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.
- When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.

Disassembly

1. Remove the caliper body.
2. Set the wooden block (A) or several shop towels to the caliper body (B) as shown. Blow out the piston with compressed air gradually, and remove the piston from the caliper body.
   NOTE: Do not put the hand into the caliper body because the piston will come out hardly from the caliper body.

3. Remove the piston boot (A) and the piston seal (B) from the caliper body (C).
   NOTE: Be careful not to damage the inner surface of the cylinder wall with the tool.

Reassembly



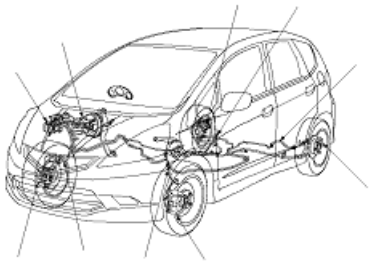
1. Apply a thin coat of silicone grease to the new piston seal (A), then install it into the groove in the caliper body.
2. Apply a thin coat of rubber grease to the new piston boot (B), then install it into the groove in the caliper body.
3. Apply the brake fluid to the outer surface of the piston, then set the piston in place on the caliper body.

4. Mount the commercially available brake caliper piston compressor tool (A) on the caliper body (B).
5. Press in the piston with the brake caliper piston compressor tool. Make sure that the piston boot is properly positioned into the groove of the piston.
   NOTE:
   - Do not press the piston diagonally, and do not press it forcibly.
   - Be careful not to damage the piston boot when press the piston.
6. Install the caliper body.
7. Bleed the brake system.

Brake disc

Item	Measurement	Qualification	Standard or New	Service Limit
Brake disc	Thickness	Front	20.9−21.1 mm (0.82−0.83 in.)	19.0 mm (0.75 in.)
		Rear	8.9−9.1 mm (0.35−0.36 in.)	8.0 mm (0.31 in.)
	Runout		———	0.04 mm (0.0016 in.)
	Parallelism		———	0.015 mm (0.0006 in.)

Brake Hose and Line Inspection



1. Inspect the brake hoses for damage, deterioration, leaks, interference, and twisting.
2. Check the brake lines for damage, rusting, and leaks. Also check for bent brake lines.
3. Check for leaks at hose and line joints and connections, and retighten if necessary.
4. Check the master cylinder and the ABS modulator-control unit for damage and leaks.

Connection Point	Component	Connected to	Specified Torque Value	Note
A	Front brake caliper	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Bleed screw	8 N·m (0.8 kgf·m, 6 lbf·ft)	
B	Rear brake caliper	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Bleed screw	9 N·m (0.9 kgf·m, 7 lbf·ft)	
C	Brake hose	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
D	Master cylinder	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
E	ABS modulator-control unit	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut

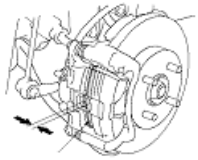
Front Brake Pad Inspection and Replacement

⚠CAUTION

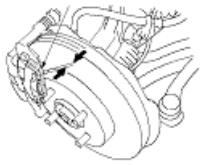
Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

Inner pad



Outer pad



Inspection

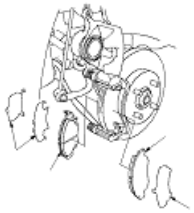
1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Check the thickness (A) of the inner pad (B) and the outer pad (C). Do not include the thickness of the backing plate.
   Brake pad thickness:

Standard:	**9.5–10.2 mm (0.37–0.41 in.)**
Service limit:	**1.6 mm (0.06 in.)**

4. If the brake pad thickness of any of the pads is less than the service limit, replace the front brake pads as a set.
5. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.

Replacement

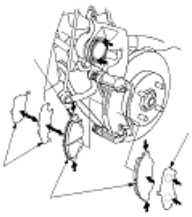
1. Remove some brake fluid from the master cylinder.
2. Raise the front of the vehicle, and support it with safety stands in the proper locations.
3. Remove the front wheels.
4. Remove the brake hose mounting bolt (A).
5. Remove the flange bolt (B) while holding the caliper pin (C) with a wrench. Be careful not to damage the pin boot, and pivot the caliper (D) up out of the way. Check the hose and the pin boots for damage and deterioration.



6. Remove the pad shims (A) and the brake pads (B).

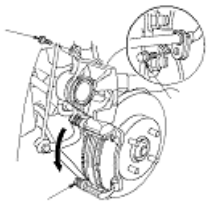
7. Remove the pad retainers (A).
8. Clean the caliper bracket (B) thoroughly; remove any rust, and check for grooves and cracks.
   Verify that the caliper pins (C) move in and out smoothly. Clean and lube if needed.
9. Inspect the brake disc, and check for damage and cracks.
10. Install the pad retainers. Wipe excess grease off the retainers. Keep grease off the brake disc and the brake pads.

11. Mount a commercially available brake caliper piston compressor tool (A) on the caliper body (B).
12. Press in the piston with the brake caliper piston compressor tool so the caliper will fit over the brake pads. Make sure the piston boot is in position to prevent damaging it when pivoting the caliper down.
    NOTE: Be careful when pressing in the piston; brake fluid might overflow from the master cylinder's reservoir. If brake fluid gets on any painted surface, wash it off immediately with water.
13. Remove the brake caliper piston compressor tool.



14. Apply Molykote M77 grease to the pad side of the shims (A), the back of the brake pads (B) and the other areas indicated by the arrows. Wipe excess grease off the pad shims and the brake pads. Keep grease off the brake discs and the brake pads. Contaminated brake discs or brake pads reduce stopping ability.
15. Install the brake pads and the pad shims correctly. Install the brake pad with the wear indicator (C) on the upper inside. If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.

16. Pivot the caliper down into position. Install the flange bolt (A), and tighten it to the specified torque while holding the caliper pin (B) with a wrench being careful not to damage the pin boot.



17. Install the brake hose mounting bolt (C).
18. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
19. Press the brake pedal several times to make sure the brakes work.
    NOTE: Engagement may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.
20. Add brake fluid as needed.
21. After installation, check for leaks at hose and line joints or connections, and retighten if necessary.
    Test-drive the vehicle, then check for leaks.

Brake pad

Item	Measurement	Qualification	Standard or New	Service Limit
Brake pad	Thickness	Front	9.5−10.2 mm (0.37−0.41 in.)	1.6 mm (0.06 in.)
		Rear	6.8−7.5 mm (0.27−0.30 in.)	1.6 mm (0.06 in.)

Brake pedal

Item	Measurement	Qualification	Standard or New	Service Limit
Brake pedal	Pedal height (carpet moved aside)	M/T	139 mm (5.5 in.)	
		A/T	138 mm (5.4 in.)	
	Free play		1−5 mm (0.04−0.20 in.)	

Gearbox

Item	Measurement	Qualification	Standard or New
Gearbox	Angle of rack guide screw loosened from locked position		10±3 °

Steering wheel

Item	Measurement	Qualification	Standard or New
Steering wheel	Rotational play measured at outside edge with engine running		0−10 mm (0−0.39 in.)
	Initial load measured at outside edge with engine running		29 N (3.0 kgf, 6.6 lbf)

A/C condenser fan does not run at all (but radiator fan runs with the A/C on)

Diagnostic procedure

1. A/C condenser fan circuit troubleshooting

Also check for

- Blown fuse No. 47 (30 A) in the under-dash fuse/relay box
- Poor ground at G202
- Cleanliness and tightness of all connectors

Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)

Diagnostic procedure

1. Radiator and A/C condenser fan common circuit troubleshooting

Also check for

- Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box
- Poor ground at G202
- Cleanliness and tightness of all connectors

The A/C compressor clutch does not engage (but both fans run with the A/C on)

Diagnostic procedure

1. A/C compressor clutch circuit troubleshooting

Also check for

- Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all connectors

A/C system does not come on (both fans and the A/C compressor do not work); heater is OK

Diagnostic procedure

1. A/C pressure switch circuit troubleshooting

Also check for

- Poor ground at G502
- Cleanliness and tightness of all connectors

A/C Pressure Switch Circuit Troubleshooting

NOTE:

- Do not use this troubleshooting procedure if any of these items are working properly with the A/C switch ON; condenser fan, radiator fan, A/C compressor, or if the heater does not work. Refer to the symptom troubleshooting index.
- Check the A/C high-side pressure.

1. Disconnect the A/C pressure switch 2P connector.
2. Turn the ignition switch to ON (II).
3. Measure the voltage between the A/C pressure switch 2P connector No. 2 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 4 .
   NO - Go to Step 23 .
4. Turn the ignition switch to LOCK (0).

---

5. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

   Is there continuity?
   YES - Go to Step 6 .
   NO - Replace the A/C pressure switch.■
6. Reconnect the A/C pressure switch 2P connector.
7. Disconnect the A/C switch 5P connector.
8. Turn the ignition switch to ON (II).

---

9. Measure the voltage between the A/C switch 5P connector No. 2 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the A/C pressure switch and the A/C switch.■
10. Turn the ignition switch to LOCK (0).
11. Test the A/C switch.

    Is the A/C switch OK?
    YES - Go to Step 12 .
    NO - Replace the A/C switch.■
12. Disconnect the heater fan switch 8P connector.

---

13. Check for continuity between the A/C switch 5P connector No. 1 terminal and the heater fan switch 8P connector No. 6 terminal.

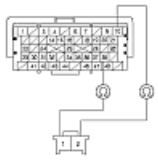
    Is there continuity?
    YES - Go to Step 14 .
    NO - Repair open in the wire between the A/C switch and the heater fan switch.■
14. Test the heater fan switch.

    Is the heater fan switch OK?
    YES - Go to Step 15 .
    NO - Replace the heater fan switch. ■
15. Remove the evaporator temperature sensor and test it.

    Is the evaporator temperature sensor OK?
    YES - Go to Step 16 .
    NO - Replace the evaporator temperature sensor. ■
16. Jump the SCS line with the HDS.
    NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
17. Disconnect ECM/PCM connector A (49P).

---

18. Check for continuity between the following terminals of ECM/PCM connector A (49P) and the evaporator temperature sensor 2P connector.



49P:	2P:
No. 10	No. 2
No. 38	No. 1

Is there continuity?

YES -
- KZ, KP, and MA models: Go to Step 19 .
- Except KZ, KP, and MA models: Go to Step 22 .

NO - Repair open in the wire(s) between the ECM/PCM and the evaporator temperature sensor.■

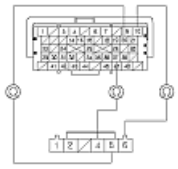
19. Test the temperature control dial.

Is the temperature control dial OK?

YES - Go to Step 20 .
NO - Replace the temperature control dial. ■

---

20. Check for continuity between the following terminals of ECM/PCM connector A (49P) and the heater control panel 6P connector.



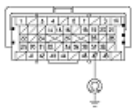
49P:	6P:
No. 10	No. 6
No. 20	No. 5
No. 37	No. 4

Is there continuity?

YES - Go to Step 21 .
NO - Repair open in the wire(s) between the ECM/PCM and the heater control panel. Also check the heater control panel harness.■

---

21. Check for continuity between ECM/PCM connector A (49P) No. 37 terminal and body ground.

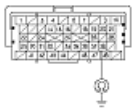


Is there continuity?

YES - Repair short to body ground in the wire between the ECM/PCM and the temperature control dial.■
NO - Go to Step 22 .

---

22. Check for continuity between ECM/PCM connector A (49P) No. 38 terminal and body ground.



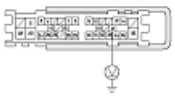
Is there continuity?

YES - Repair short to body ground in the wire between the ECM/PCM and the evaporator temperature sensor.■
NO - Check for loose wires or poor connections at ECM/PCM connector A (49P), the evaporator temperature sensor 2P connector, the A/C pressure switch 2P connector, the A/C switch 5P connector and at the heater fan switch 8P connector. If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM.■

23. Turn the ignition switch to LOCK (0).
24. Reconnect the A/C pressure switch 2P connector.
25. Make sure the A/C switch is OFF.
26. Turn the ignition switch to ON (II).

---

27. Measure the voltage between under-dash fuse/relay box connector A (36P) No. 21 terminal and body ground with the under-dash fuse/relay box connectors connected.



Is there battery voltage?

YES - Repair open in the wire between the A/C pressure switch and the MICU.■
NO - Check for loose wires or poor connections at the under-dash fuse/relay box. If the connections are OK, substitute a known-good MICU and recheck. If the symptom goes away, replace the original MICU .■

Refrigerant

Item	Measurement	Qualification	Standard or New
Refrigerant	Type		HFC-134a (R-134a)
	Capacity of system		370−420 g (13.1−14.8 oz)

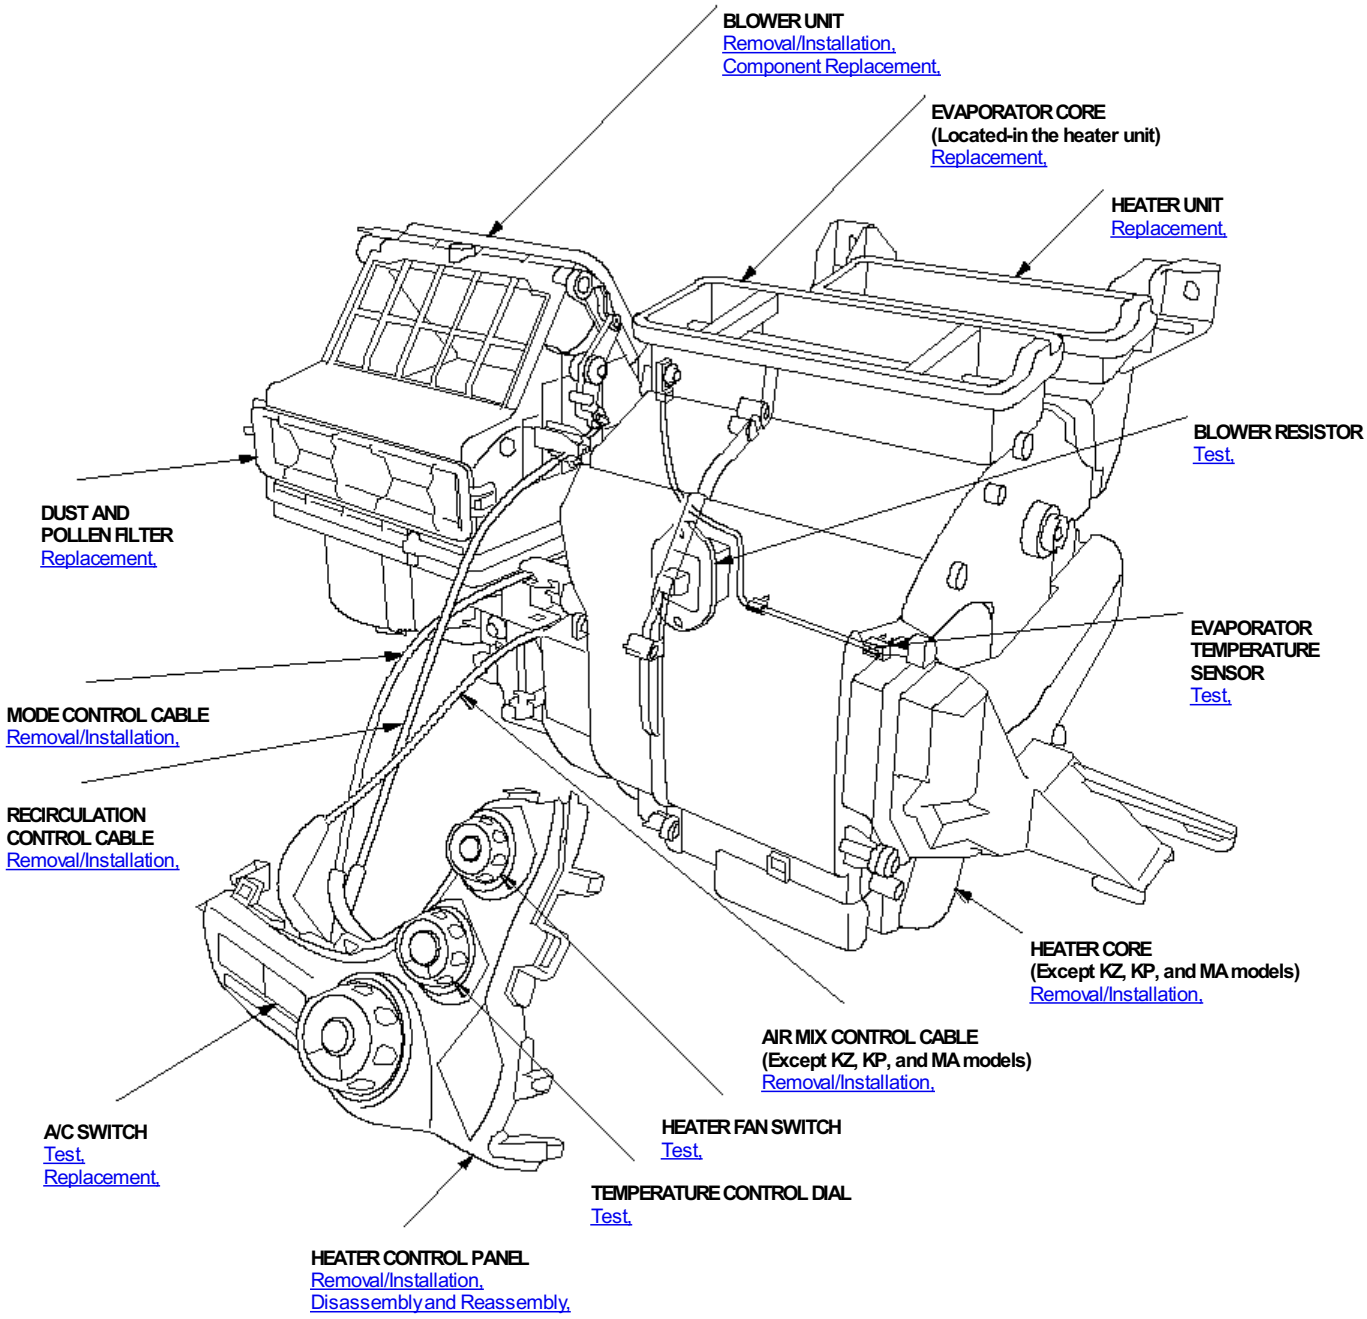
Refrigerant oil

Item	Measurement	Qualification	Standard or New
Refrigerant oil	Type		SP-10 (P/N 38897-P13-A01, 38898-P13-003, or 38899-P13-A01)
	Capacity of components	Condenser	25 mL (5/6 fl·oz, 0.9 Imp·oz)
		Evaporator	35 mL (1 1/6 fl·oz, 1.2 Imp·oz)
		Each line and hose	10 mL (1/3 fl·oz, 0.4 Imp·oz)
		Receiver/Dryer	10 mL (1/3 fl·oz, 0.4 Imp·oz)
		Compressor	80−90 mL (2 2/3−3 fl·oz, 2.8−3.2 Imp·oz)

Compressor

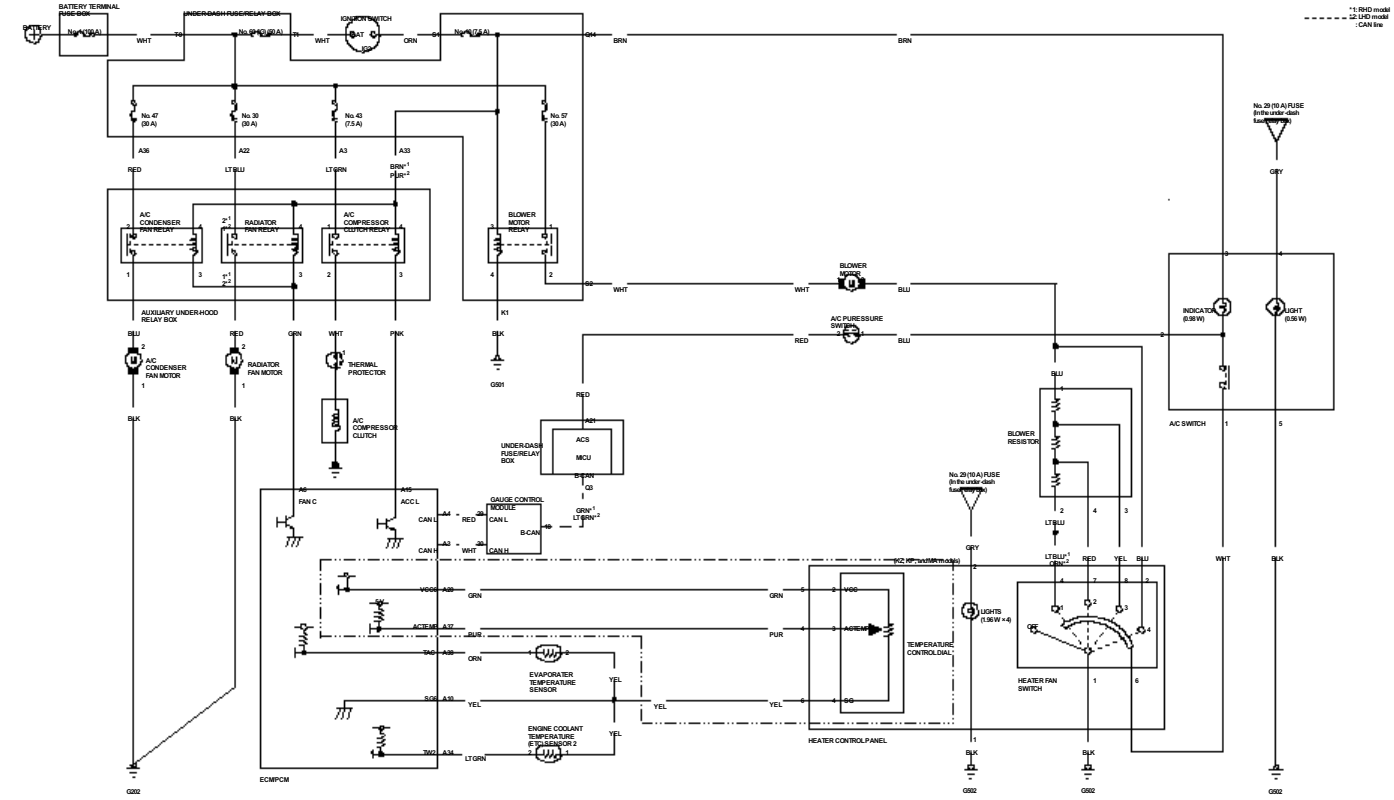
Item	Measurement	Qualification	Standard or New
Compressor	Field coil resistance	At 20 °C (68 °F)	3.15−3.45 Ω
	Pulley-to-armature plate clearance		0.35−0.65 mm (0.014−0.026 in.)

Heating and A/C Component Location Index



RHD model is shown, LHD model is similar.

Heating and A/C Circuit Diagram



Blower motor runs, but one or more speeds are inoperative

Diagnostic procedure

1. Blower motor circuit troubleshooting

Also check for

- Cleanliness and tightness of all connectors

Blower motor does not run at all

Diagnostic procedure

1. Blower motor circuit troubleshooting

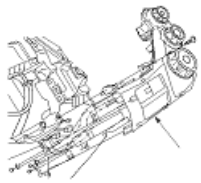
Also check for

- Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box
- Poor ground at G501
- Cleanliness and tightness of all connectors

Heating and A/C Symptom Troubleshooting

Symptom	Diagnostic procedure	Also check for
Blower motor runs, but one or more speeds are inoperative	Blower motor circuit troubleshooting	Cleanliness and tightness of all connectors
Blower motor does not run at all	Blower motor circuit troubleshooting	• Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box • Poor ground at G501 • Cleanliness and tightness of all connectors
A/C condenser fan does not run at all (but radiator fan runs with the A/C on)	A/C condenser fan circuit troubleshooting	• Blown fuse No. 47 (30 A) in the under-dash fuse/relay box • Poor ground at G202 • Cleanliness and tightness of all connectors
Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)	Radiator and A/C condenser fan common circuit troubleshooting	• Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box • Poor ground at G202 • Cleanliness and tightness of all connectors
The A/C compressor clutch does not engage (but both fans run with the A/C on)	A/C compressor clutch circuit troubleshooting	• Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all connectors
A/C system does not come on (both fans and the A/C compressor do not work); heater is OK	A/C pressure switch circuit troubleshooting	• Poor ground at G502 • Cleanliness and tightness of all connectors

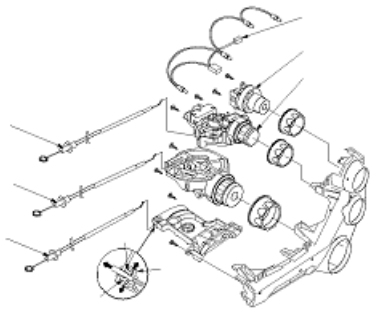
Heater Control Panel Removal/Installation



1. Remove the audio unit.
2. Remove the control cables from the blower/heater unit.
3. Remove the screw and pull the heater control panel (A).
4. Disconnect the connectors and remove the heater control panel.
5. Install the control panel in the reverse order of removal. After installation, operate the control panel controls to see whether it works properly.

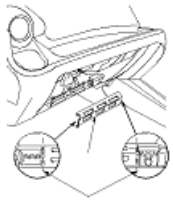
Heater Control Panel Disassembly/Reassembly

1. Remove the heater control panel.
2. Using a snap ring pliers, widen the cable stops (A) in the cable holder (B), then pull out the recirculation control cable (C), mode control cable (D), and air mix control cable (E).
3. Hook the tip of the new control cables to the dial or slider, then push the cable housing into the cable holder until it locks into place.
4. After assembly, check that the lever slides or the dial turns smoothly through the full stroke from right to left.

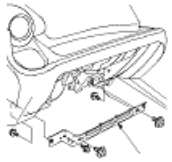


Blower Unit Removal/Installation

1. Remove the passenger's dashboard undercover and the glove box.
2. Remove the recirculation control cable from the blower unit.
3. Cut the plastic cross brace (A) in the glove box opening with diagonal cutters in the area (B). Retain plastic cross brace to be reinstalled later.

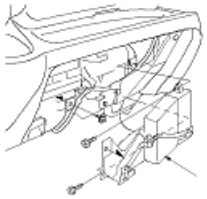


4. Remove the bolts, and the glove box frame (A).

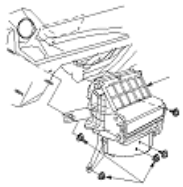


5. Disconnect the connector (A) from the blower motor. Remove the clips (B).

6. Remove the self-tapping screws and the passenger's heater duct (A).

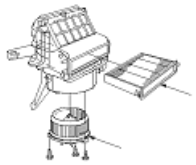


7. Remove the self-tapping screws and the mounting nuts, and pull the blower unit (A) out.
8. Install the unit in the reverse order of removal. Make sure that there is no air leakage.



Blower Unit Component Replacement

NOTE: The these items when overhauling the blower unit.

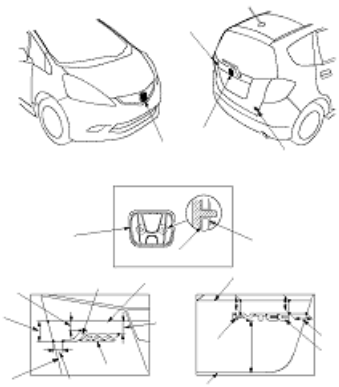


- The blower motor (A) and the dust and pollen filter (B) can be placed without removing the blower unit.
- Before reassembly, make sure that the recirculation control linkage and door move smoothly.

Emblem/Sticker Replacement

NOTE: When removing the emblems, take care not to scratch the body.

1. To remove the front “H" emblem, remove the upper front grille.
2. To remove the rear “H" emblem, remove the rear license trim.
3. Clean the body surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
4. Apply the emblems where shown.



Lower Front Grille Replacement

NOTE:

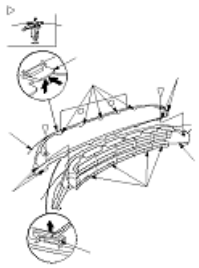
- Put on gloves to protect your hands.
- Take care not to scratch the front bumper.

1. Remove the front bumper.

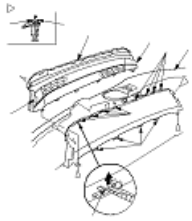
2. Detach the clips and the hooks (A) by using a flat-tip screwdriver wrapped with the protective tape, then remove the front bumper lower grille (B) from the front bumper (C).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (D) on its head.

3. Install the grille in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.

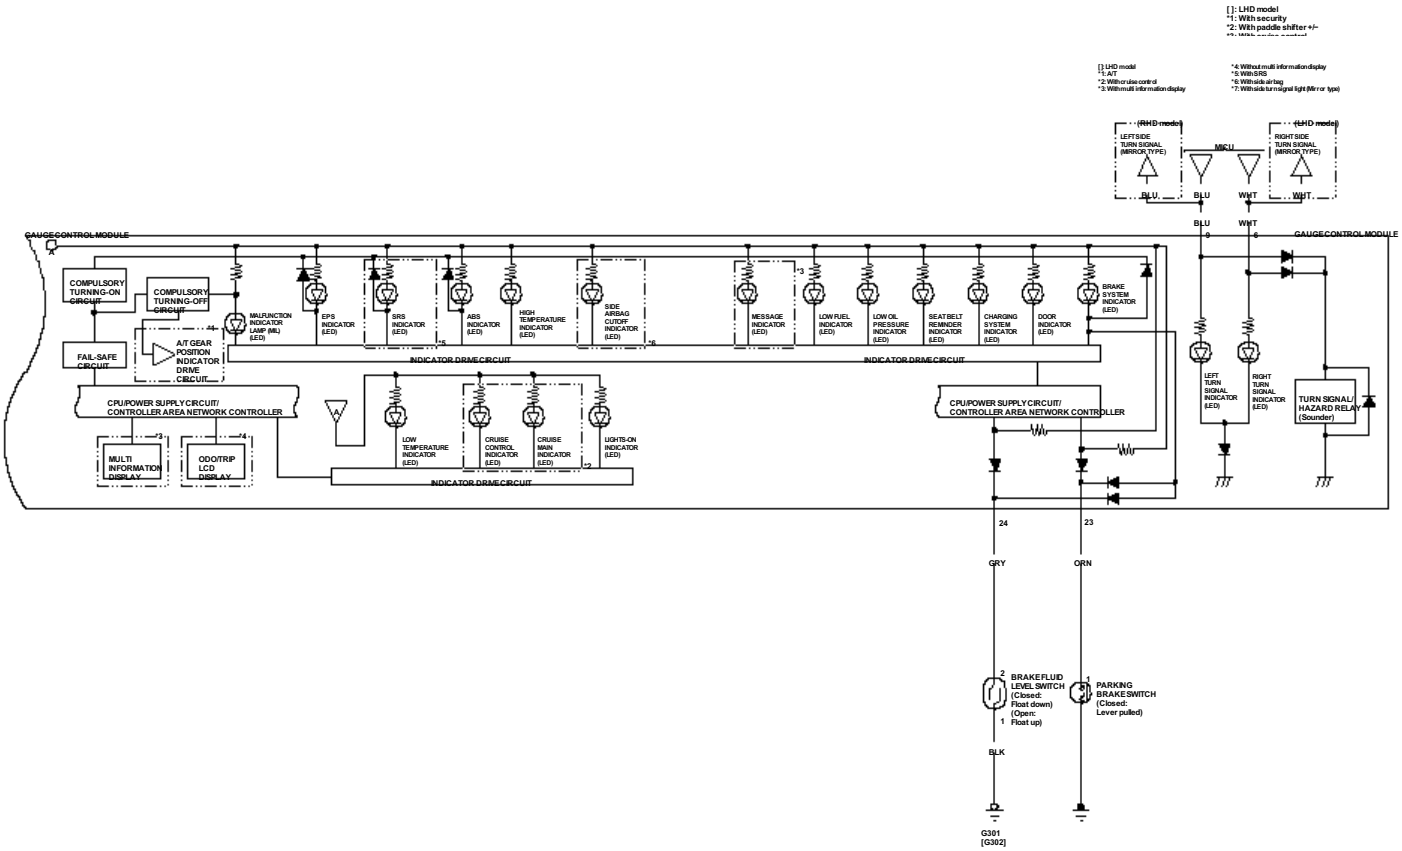
With front air spoiler



Without front air spoiler

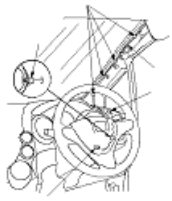


Gauges Circuit Diagram



Headliner Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

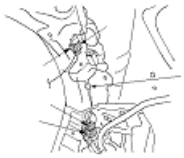


- Put on gloves to protect your hands.
- When removing components, use the trim tools or equivalent.
- Take care not to bend or scratch the trim and panels.
- RHD model is shown; LHD model is symmetrical.

1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Remove these items:
   - Driver's dashboard undercover
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Center pillar upper/lower trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Quarter pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Individual map light
   - Ceiling light
   - Sunvisors, both sides
   - Grab handles, four places
   - Rear center seat belt (for some model)
   - Ultrasonic sensor (for some model)
3. Remove the roof wire harness (A) by detaching the harness clips (B, C, D) and disconnect the roof wire harness connector (E) from the driver's side front pillar.

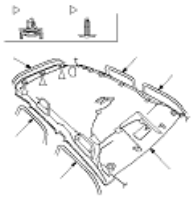
4. Remove the antenna lead (A) by detaching the harness clips (B) and disconnect the antenna lead connector (C) from the passenger's side front pillar.

5. Disconnect the tailgate sub lead connectors (A, B) by detaching the harness clips (C, D).

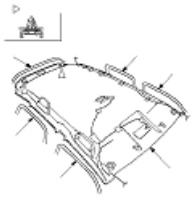


6. Lower the headliner (A).
   -1. Remove the front door inner seals (B), rear door inner seals (C), and tailgate weatherstrip (D) from each roof portion.
   -2. Release the clips (E, F) from the headliner.
   -3. Lower the headliner.

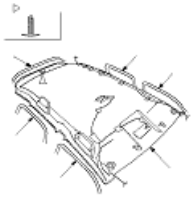
With child seat tether anchor model



With ultra sonic sensor model

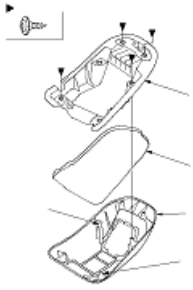


Without child seat tether anchor and ultra sonic sensor model



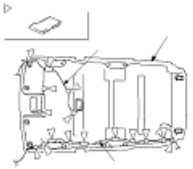
7. With the help of an assistant, pull the headliner (A) out through the tailgate opening. Do not bend the headliner. Bending the headliner will crease and damage it.

8. For some model: Remove the screws, and release the hooks (A), then remove the retractor cover bracket (B) and retractor cover (C) from the headliner (D).

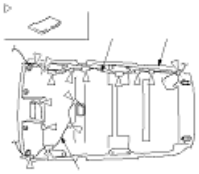


9. Remove the cushion tapes, then remove the roof wire harness (A) and antenna lead (B) from the headliner (C).

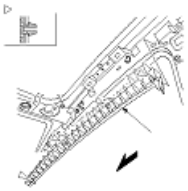
RHD model



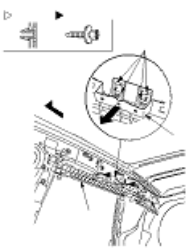
LHD model



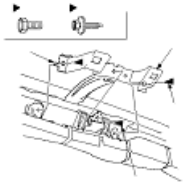
10. Without side curtain airbags: If necessary, detach the hooks, then remove the front roof side pad (A).



11. Without side curtain airbags: If necessary, remove the hooks and screws, and remove the center roof side pad (A) with a glove rail bracket (B), then release the hooks (C) and remove the bracket from the pad.

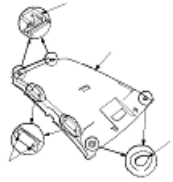


12. With side curtain airbags: If necessary, remove the grab handle bracket mounting bolts (A) and the side curtain airbag mounting screw (B), then remove the grab handle bracket (C) from each side by releasing the hooks (D).



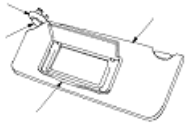
13. Install the headliner in the reverse order of removal, and note these items:
    - If the side curtain airbag has deployed, replace the headliner and removed trim pieces with new ones.
    - To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect removed pieces and replace them if they have any of these types of damage:
      - Any crease or tears in the headliner (A)
      - Any cracks or breakages in the grab handle (B)
      - Any damages around the grab handle holes (C) or sunvisor holes in the headliner
      - Any cracks in the sunvisor stay base (D)
      - Any bends or cracks in the sunvisor stay shaft (E)
      - Any cracks in the sunvisor base (F)
      - Any cracks or breakages in the vanity mirror base (G)
      - Any clip bases (H) which have come off the headliner
    - When installing the grab handle, push on the handle against the bracket (I) until the clips (J) snap into place securely.
    - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
    - Replace the removed cushion tape with new ones.
    - Check that both sides of the headliner are securely attached to the trim.
    - Make sure the headliner overlaps the trim pieces correctly.
    - When reinstalling the headliner through the tailgate opening, be careful not to fold or bend it. Also, be careful not to scratch the body.

Headliner



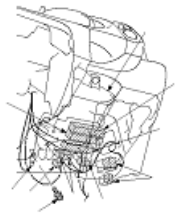
Grab handle

Sunvisor



Dashboard/Steering Hanger Beam Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:



- Put on gloves to protect your hands.
- Have an assistant help you when removing and installing the dashboard/steering hanger beam.
- Take care not to scratch the dashboard, body and other related parts.
- RHD model is shown; LHD model is symmetrical.

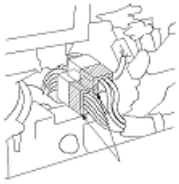
1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Remove these items:
   - Front seats, both sides
   - Driver's dashboard undercover
   - Kick panels, both sides
   - Center console
   - Glove box
   - Fuse lid panel:
     - RHD model
     - LHD model
   - Passenger's dashboard undercover
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Steering column
   - AC control cables

Driver's side

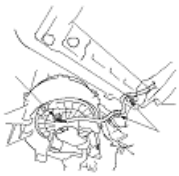
3. From under the dash, disconnect the right engine compartment wire harness connector (A), the left engine compartment wire harness connector (B), the driver's door wire harness connectors (C), the interior wire harness connectors (D), floor wire harness connector (E), and remove the bolt (F), then release the battery cable (G) from the driver's under-dash fuse/relay box (H).

Center

4. Disconnect the sub harness connectors (A).

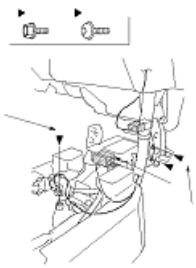


5. Release the harness clips (A), then disconnect the blower motor connector (B).

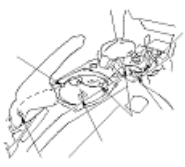


6. Remove the heater joint duct (A).

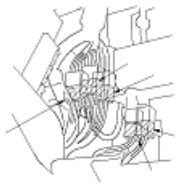
7. From under dash, disconnect SRS control unit connector A and remove the bolt (B). Remove the ground bolt (C) using a TORX T30 bit.



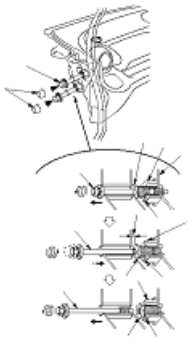
8. Detach the wire harness clips (A), then disconnect the parking brake switch connector (B), fuel pump connector (C), and A/T position switch connector (D) (A/T model).



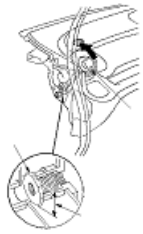
Passenger's side



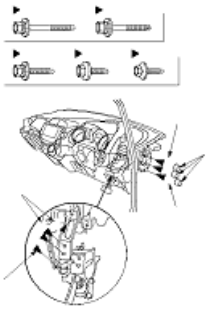
9. From under the dash, disconnect the passenger's floor wire harness connectors (A), passenger's door wire harness connector (B), the left engine compartment wire harness connectors (RHD model)/the right engine compartment wire harness connectors (LHD model) (C), and SRS sensor sub harness connector (D).
10. Detach all of the harness and the connector clips.



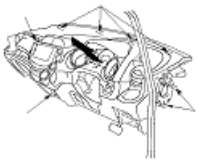
11. Remove the special bolts (A, B) from outside the passenger's door. RHD model is shown; LHD model is symmetrical.
    -1. Remove the caps (C).
    -2. Loosen the special bolts until its threads have come off the side bracket (D) of the steering hanger beam. The bolt will be screwed into the inside threads of the collar bolt (E) by loosening the bolt. Because of the thread lock on the threads of the bolt, the bolt and the collar bolt will be fixed.
    -3. Loosen the bolt again to screw the collar bolt into the fixed space adjuster (F) until it is stopped by the stopper (G). This will provide a gap (H) between the collar bolt and the body.
    -4. Remove the bolts.



12. If the collar bolts (A) are not screwed fully into the fixed space adjuster when removing the special bolts, slightly screw the collar bolt into the space adjuster with a 21 mm open-end wrench (B). In this case, the special bolt should be replaced with a new one because its thread locks were worn out.



13. From outside the driver's door, remove the caps (A), then remove the bolts (B, C, D, E, F).

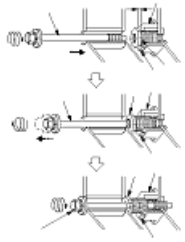


14. Lift up on the dashboard (A) to release it from the guide pins (B, C). Carefully remove the dashboard through the front door opening. Take care not to scratch the body with the collar nuts on the passenger's side.
    NOTE: Do not rest the dashboard on its lower center cover opening, or it may be damaged. Lay it on its front or back.

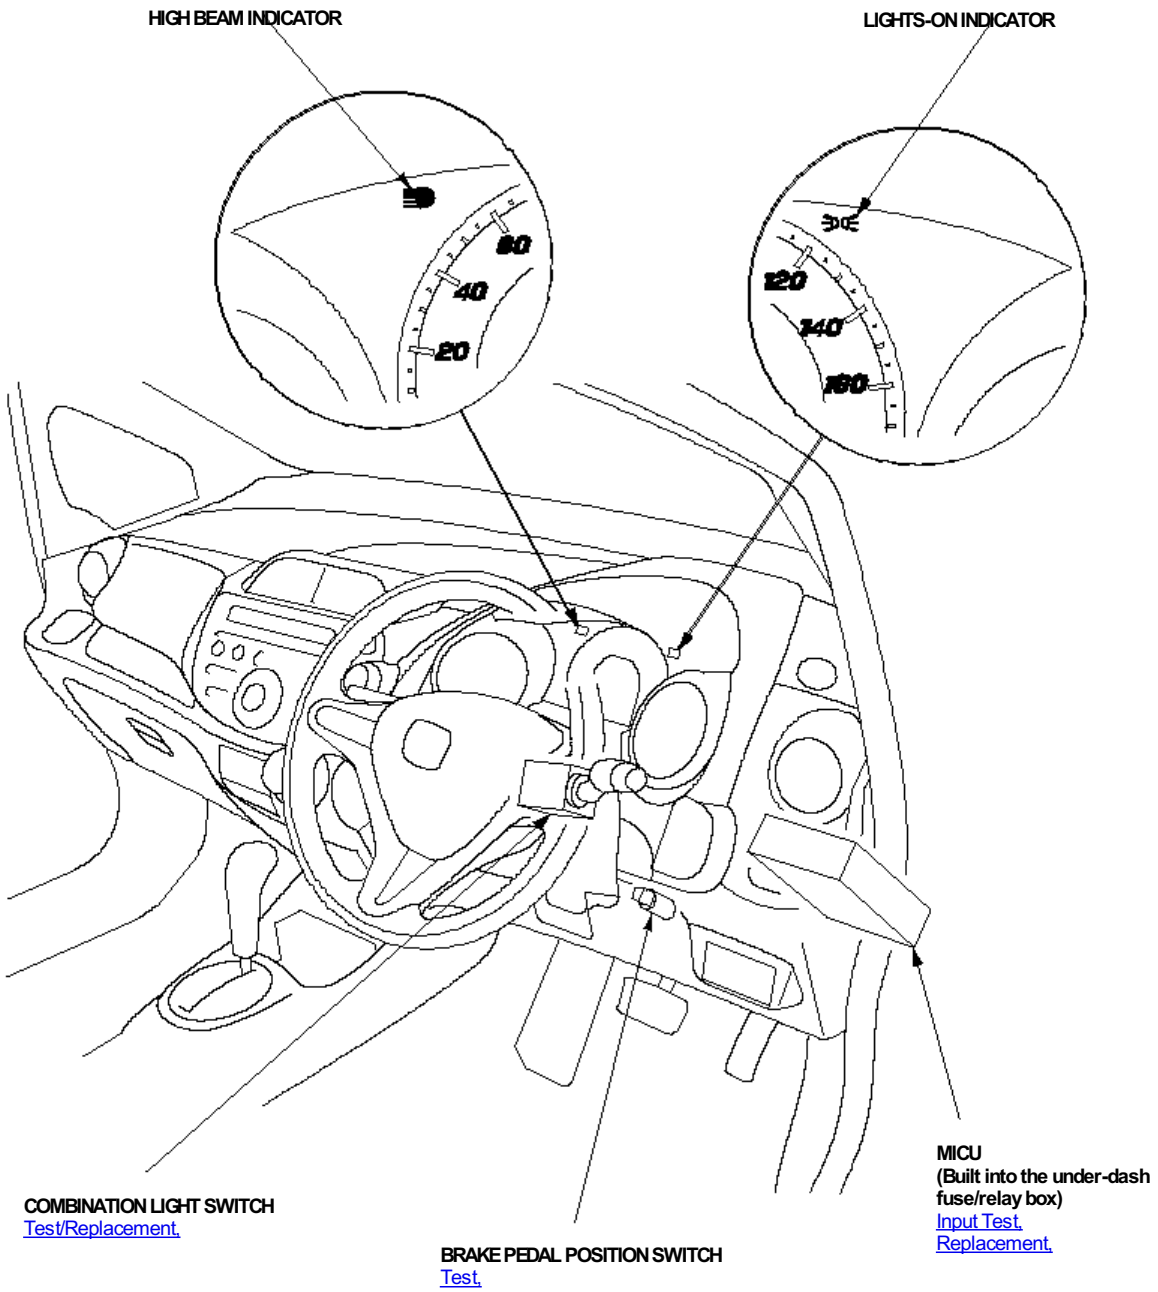
---

15. Install the dashboard in the reverse order of removal, and note these items:
    - Make sure the dashboard fits onto the guide pins correctly.
    - Before tightening the bolts, make sure the wire harnesses are not pinched.
    - Make sure the connectors are plugged in properly.
    - Before reinstalling the dashboard, be sure the collar bolt (A) on passenger's side can be screwed/unscrewed lightly by hand, and then screw all of them into the fixed space adjuster (B) until they contact the stoppers (C) by hand. Do not tighten them fully with any tools.
    - Before reinstalling the dashboard, try to screw the special bolt (D) into the loosened collar bolt. If the collar bolt is not unscrewed by screwing the special bolt, replace this special bolt with a new one.
    - After setting the dashboard on the body, reinstall all of the mounting bolts to the dashboard, tighten the driver's side bracket to the specified torque, then torque the special bolt D on the passenger's side. First screw the special bolt into the collar bolt A, they will be fixed because of the thread lock on the bolt. Continue tightening the bolt with the collar bolt, they are loosened from the fixed space adjuster B until the collar bolt contacts the inside face of the body. Then tighten the bolts again to the specified torque.
    - Apply medium strength type liquid thread lock to the bolts securing the center joint bracket and the dashboard before reinstallation.
    - After tightening the dashboard mounting bolts, tighten the center joint bracket mounting bolts, and then tighten the center frame mounting bolts.
    - Do the battery terminal reconnection procedure.
    - Check for any DTCs that may have been set during repairs, and clear them.

Special bolt tightening on passenger's side



Exterior Lights Component Location Index



RHD model is shown, LHD model is similar.

BACK-UP LIGHT

Replacement,

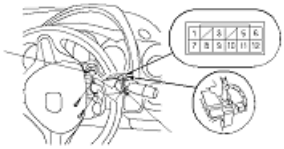
Bulb Replacement,

RHD model is shown, LHD model is similar.

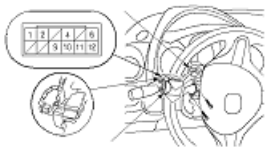
Combination Light Switch Test/Replacement

1. Remove the steering column covers.
2. Disconnect the 12P connector (A) from the combination light switch (B).
3. Remove the two screws, then slide out the combination light switch.

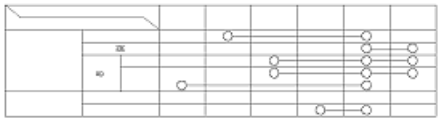
RHD model

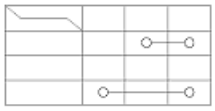


LHD model

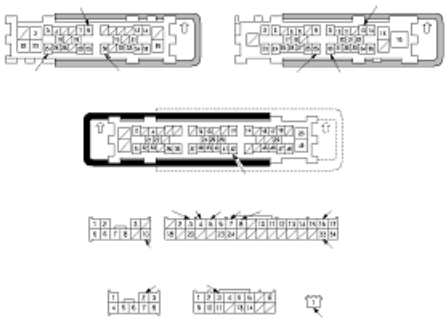


4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, check for continuity between the terminals in each switch position according to the tables.
     - If the continuity is not as specified, replace the switch.





Exterior Lights (MICU) Input Test



NOTE:

- Before performing the input tests, check the No. 1, No. 5, No. 22, No. 24, No. 32, No. 34, No. 48, and No. 51 fuses in the under-dash fuse/relay box.
- The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, C, K, M, N, Q, and W.
   NOTE: All connector views are wire side of female terminals.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
W1	YEL	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 60 (IGN) (50 A) fuse in the under-dash fuse/relay box • Faulty ignition switch • An open in the wire
A24	PNK	Ignition switch ON (II)	Connect W1 terminal and A24 terminal with a jumper wire: The right headlight (low beam) should come on.	• Blown bulb • Poor ground (G202) [G401] • An open in the wire
A30	GRN	Ignition switch ON (II)	Connect W1 terminal and A30 terminal with a jumper wire: The right headlight (high beam) should come on.	• Blown bulb • Poor ground (G202) [G401] • An open in the wire
B29	BRN	Ignition switch ON (II)	Connect W1 terminal and B29 terminal with a jumper wire: The left headlight (low beam) should come on.	• Blown bulb • Poor ground (G401) [G202] • An open in the wire
B13	GRY	Ignition switch ON (II)	Connect W1 terminal and B13 terminal with a jumper wire: The left headlight (high beam) should come on.	• Blown bulb • Poor ground (G401) [G202] • An open in the wire
A8	GRY	Ignition switch ON (II)	Connect W1 terminal and A8 terminal with a jumper wire: The right front position light should come on.	• Blown bulb • Poor ground (G202) [G401] • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if result is not obtained
B30	GRY	Ignition switch ON (II)	Connect W1 terminal and B30 terminal with a jumper wire: The left front position light should come on.	• Blown bulb • Poor ground (G401) [G202] • An open in the wire
C42	GRY	Ignition switch ON (II)	Connect W1 terminal and C42 terminal with a jumper wire: The taillights and license plate lights should come on.	• Blown bulb • Poor ground (G602, G604) • An open in the wire
C21	GRN	Ignition switch ON (II)	Connect W1 terminal and C21 terminal with a jumper wire: The back-up lights should come on.	• Blown bulb • Poor ground (G602, G604) • An open in the wire

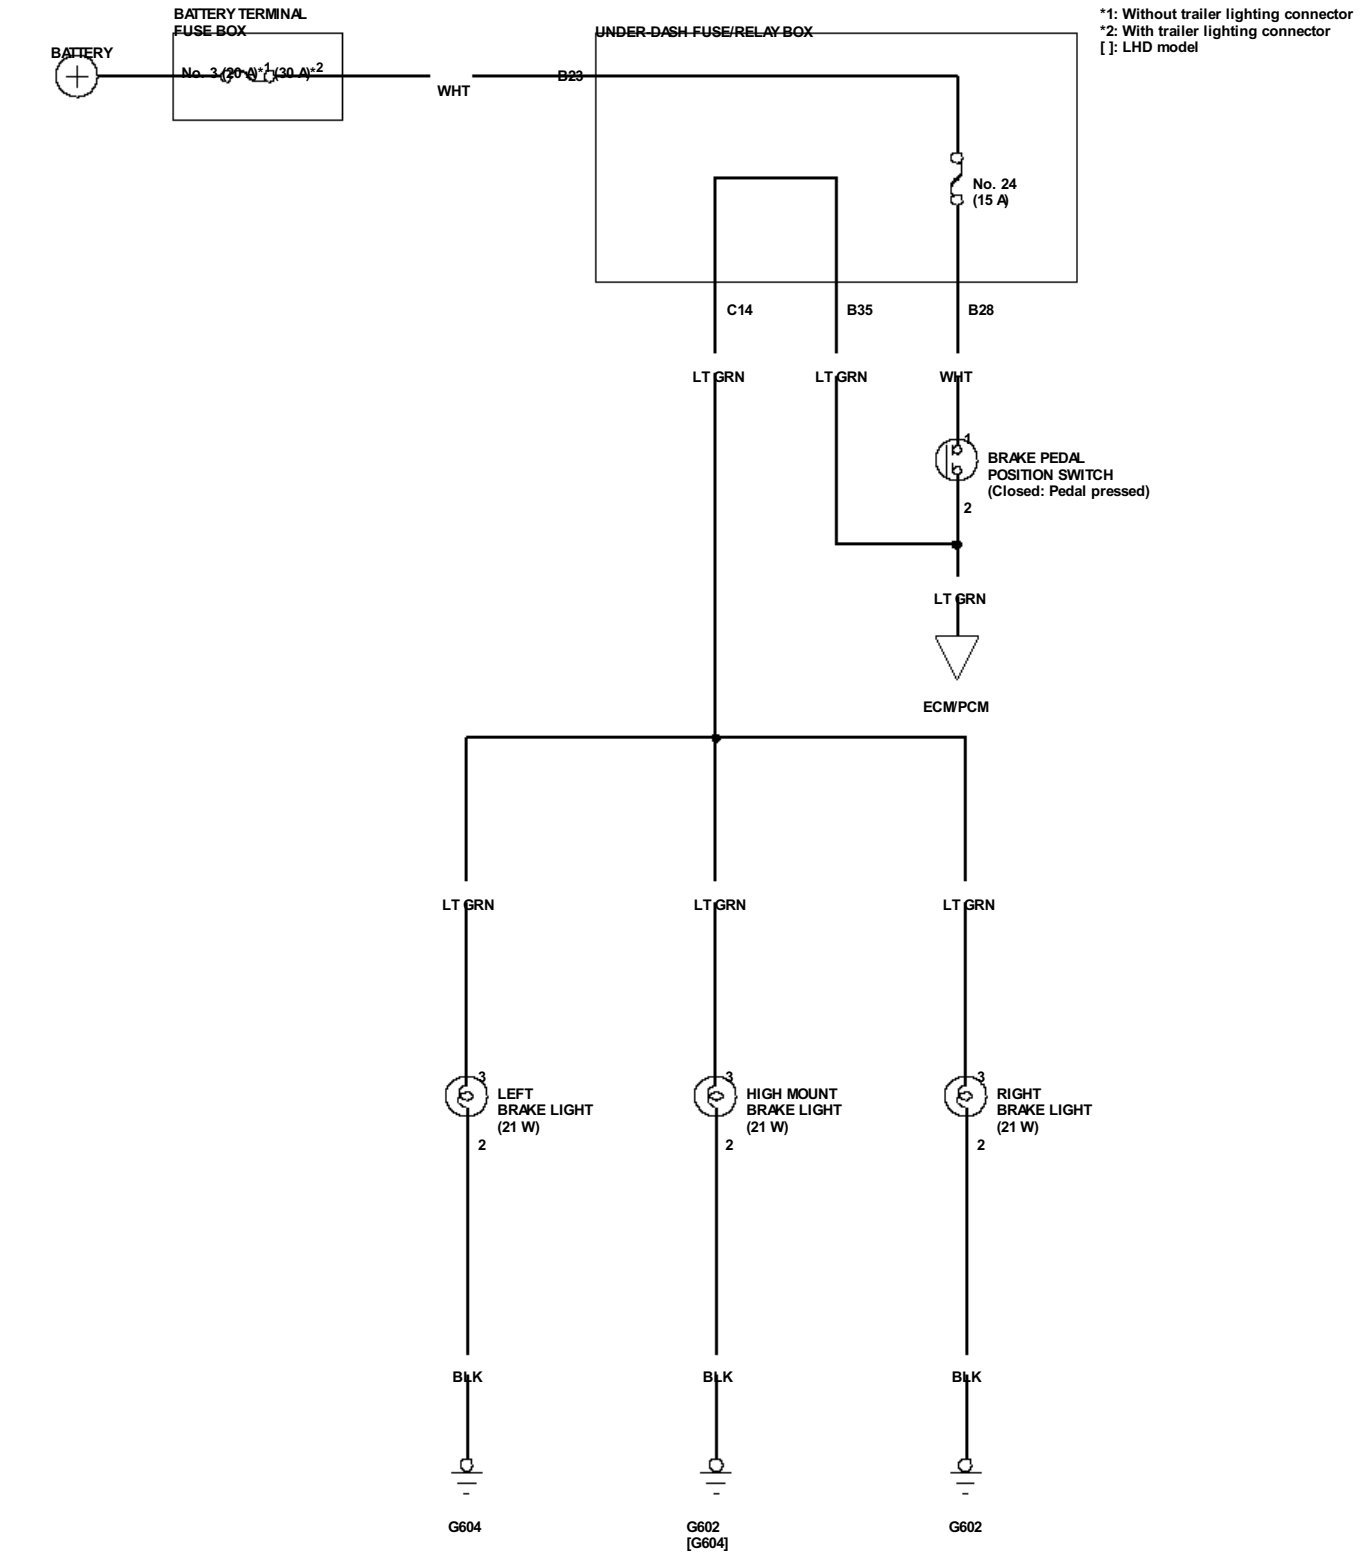
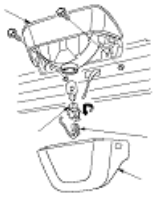
Brake Lights Circuit Diagram

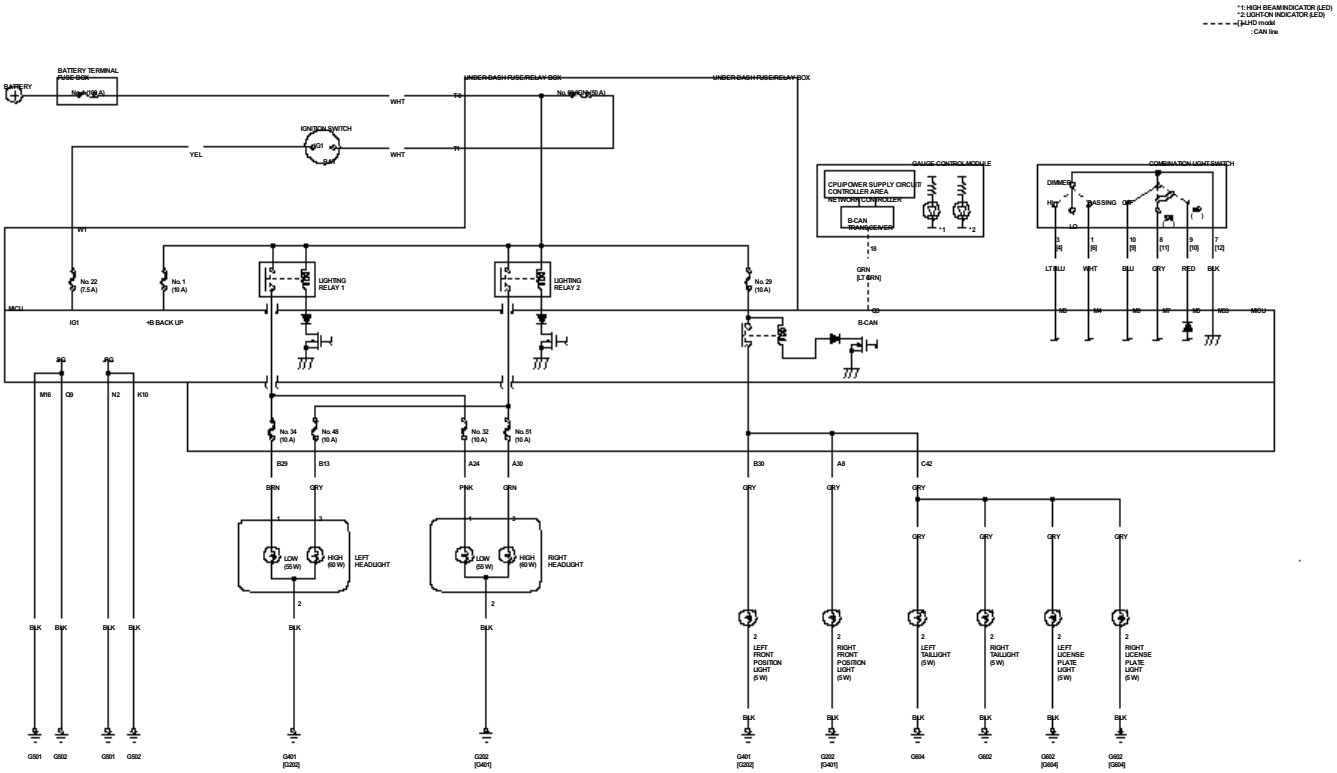


High Mount Brake Light Replacement



1. Open the tailgate.
2. Push in the clips, and remove the cover (A) from the high mount brake light (B).
   High Mount Brake Light: 21 W
3. Disconnect the 2P connector (C) from the bulb socket (D).
4. Remove the two mounting bolts and the high mount brake light.
5. Install the light in the reverse order of removal.

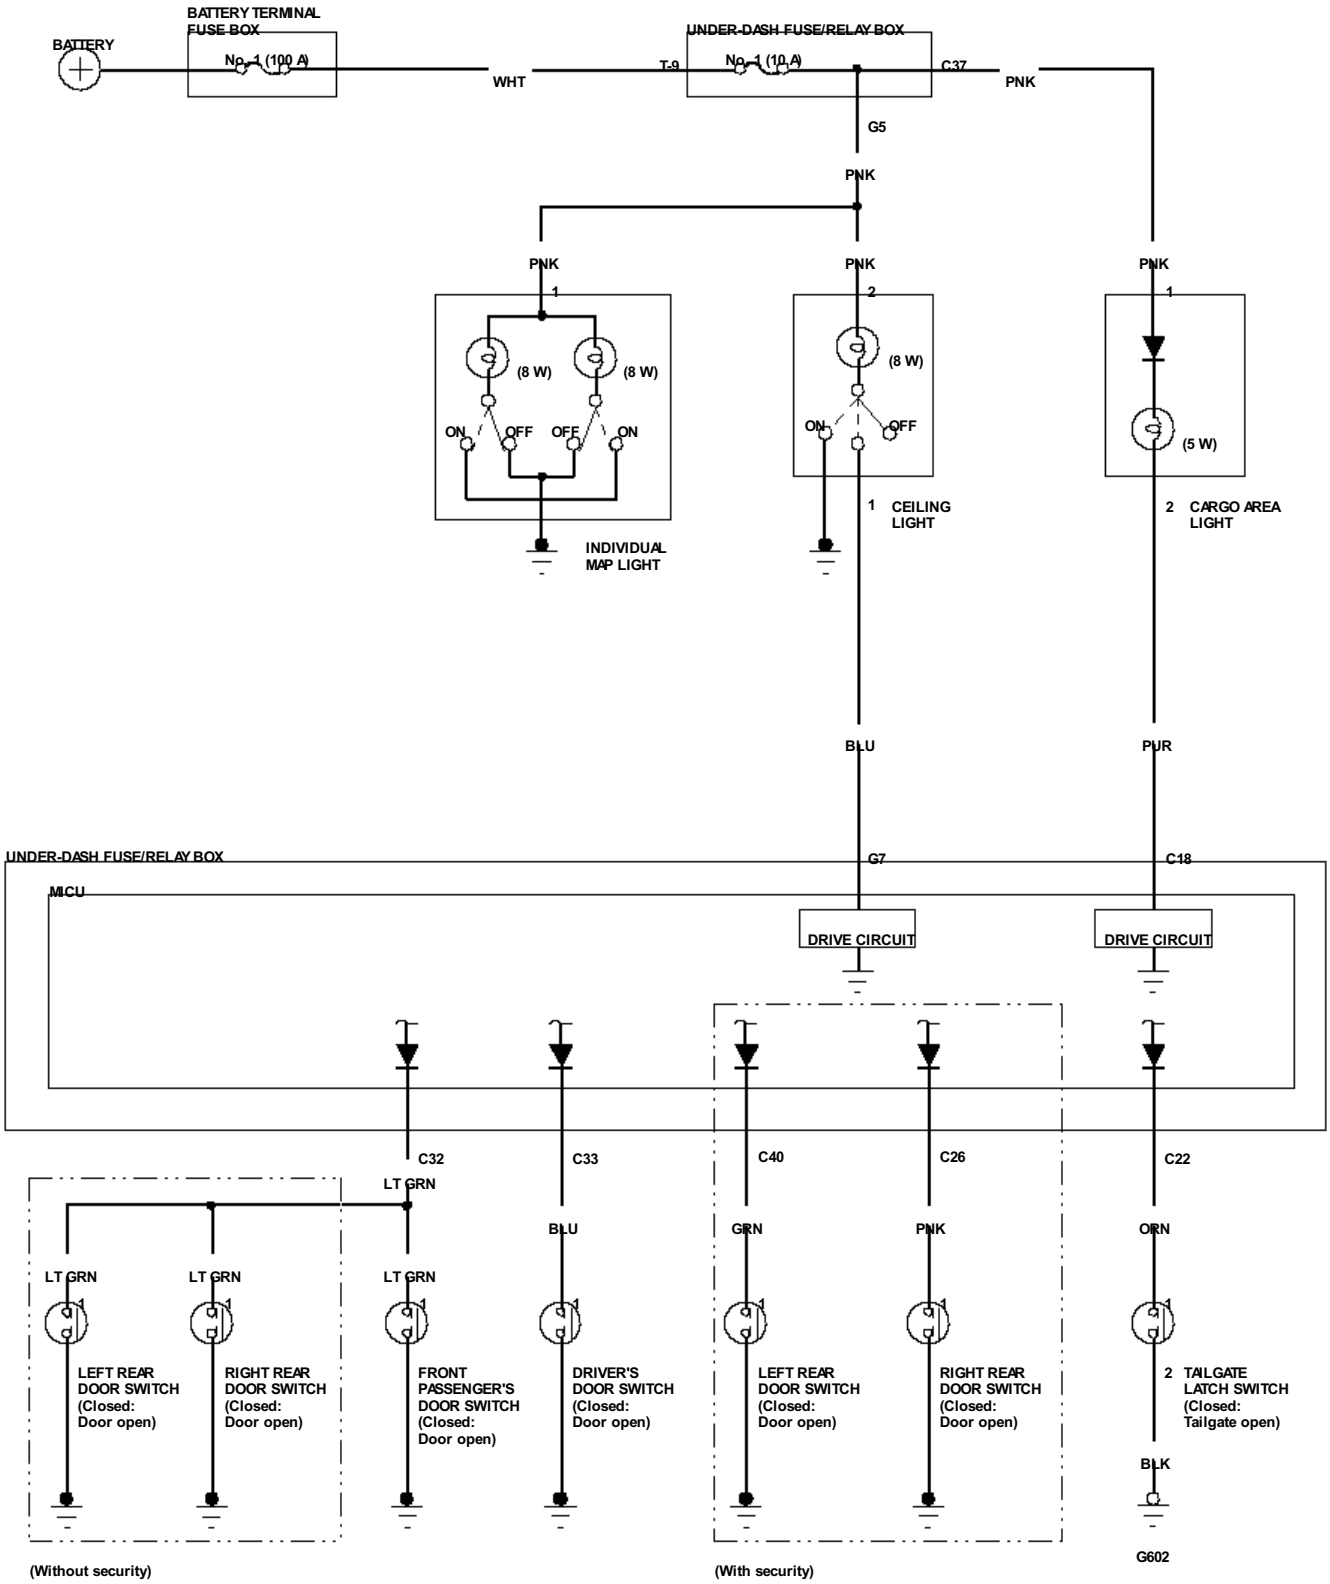
Headlights, Front Position Lights, Taillights, and License Plate Lights Circuit Diagram



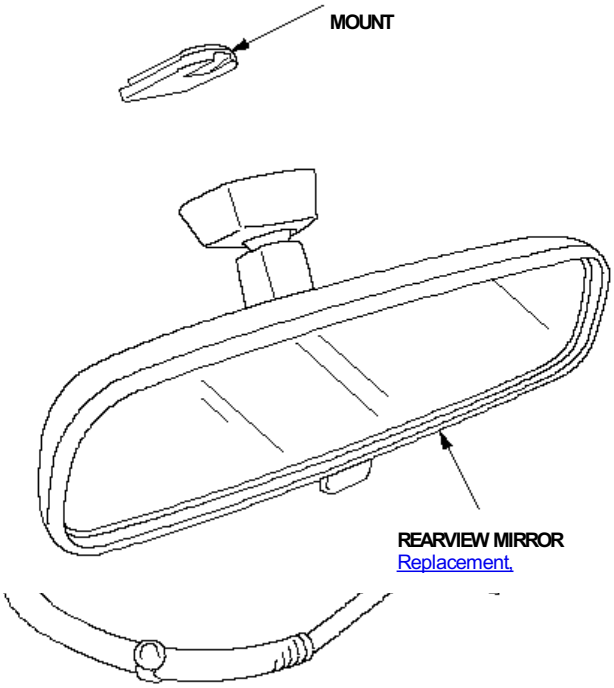
Taillight Replacement

1. Open the tailgate and remove the maintenance lid.
2. Disconnect the connectors (A) from the taillights (B).
3. Remove the mounting nuts from the taillight.
4. Install the taillight in the reverse order of removal.

Interior Lights Circuit Diagram



Mirrors Component Location Index

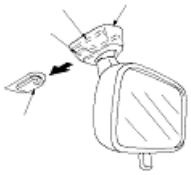


Rearview Mirror Replacement

1. Release the hooks (A), then pull the mirror base cover (B) down.

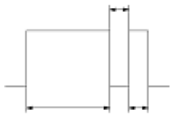
2. Pull the hook (A) down to release it from the mount (B), and slide the mirror base (C) rearward, then remove the rearview mirror (D).
3. Install the mirror base cover on the mirror base securely.

4. Fit the mirror base (A) over the mount (B), and secure the rearview mirror with the spring (C) and hook (D).



MICS Self-diagnostic Function

NOTE: Use only if the HDS is unavailable.



Test Mode 1

Special Tools Required

MPCS short connector
07WAZ-0010100

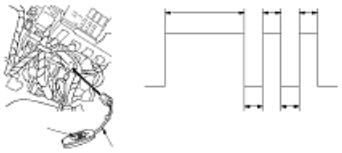
1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover. LHD model: Remove the fuse lid panel.
3. Check the No. 1 (10 A) fuse in the under-dash fuse/relay box and the No. 22 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is blown, find and correct the cause, then replace the fuse.
4. Turn the ceiling light switch in "DOOR" (middle) position. Close all doors. Turn the ignition switch to ON (II).
   NOTE: If the driver's seat belt is unbuckled, the beeper will beep.
5. Connect the MPCS short connector (A) to the MICU service check connector (B), and turn the switch (C) on.
6. After 5 seconds, the ceiling light should come on for 2 seconds, go out, then blink once for 0.2 second. This means that you are in Test Mode 1 of the self-diagnostic function.
7. About 1 second after step 5, the ceiling light will blink and indicate the DTC, and repeat it every 3 seconds. If there is more than one DTC, the system will indicate them in ascending order, beginning from the DTC with the lowest numerical value. Troubleshoot the DTCs as indicated below:

DTC	Cause and Troubleshooting
1	The MICU cannot receive signals sent from the MICU itself (for checking the sending signals), or the MICU cannot receive signals from the gauge control module. If DTC 1 only indicates, substitute a known-good gauge control module and an MICU one at a time, in that order, and recheck for the DTC after each substitution.
5	The MICU cannot receive signals (VSP/NE message) from the gauge control module. If DTC 5 only indicates, substitute a known-good gauge control module, and recheck for the DTC.

How to cancel the Test Mode 1

NOTE: To cancel Test Mode 1, turn off the MICU short connector switch for more than 10 seconds or turn the ignition switch to LOCK (0).

Test Mode 2



1. While in Test Mode 1, turn off the MPCS short connector switch (A) for about 5 to 10 seconds, then turn it on again.
2. The ceiling light should come on for 2 seconds, go out, then blinks twice more at 0.2 second intervals. This means the system has gone from Test Mode 1 to Test Mode 2.
3. While still in Test Mode 2, operate the switches in the table shown. If the circuit is OK, the ceiling light blinks once. If the circuit is faulty, the ceiling light does not blink.
    - If the ceiling light do not blink even a switch is operated, check two or three other circuits listed in the table. If the ceiling light blinks for each circuit, the additional circuits are OK, repair the short or open circuit that failed the test in Step 3 .
    - If the ceiling light does not blink again, this multiple failed circuits mean that the control unit has failed without triggering a DTC. Test a few more circuits. If they also fail, test the MICU input test. If all the input tests prove OK, substitute a known-good MICU or gauge control module one at a time, then recheck. If the system works properly, the part that was substituted is faulty; replace it.

Driver's door lock switch (UNLOCK) Driver's door lock switch (LOCK) Driver's door lock knob switch (UNLOCK) Driver's door lock knob switch (LOCK) Driver's door key cylinder switch (UNLOCK) * Driver's door key cylinder switch (LOCK) * Front passenger's door lock knob switch (UNLOCK) * Left rear door lock knob switch (UNLOCK) * Right rear door lock knob switch (UNLOCK) * Driver's door switch Front passengers' door switch Left rear door switch Right rear door switch Tailgate latch switch Audio switch Windshield wiper HI/LO switch Windshield wiper INT/LO switch	Windshield wiper MIST switch Windshield washer switch Rear window wiper switch Rear window washer switch Turn signal switch (LEFT) Turn signal switch (RIGHT) Hazard warning switch Headlight switch (ON) Headlight switch (OFF) Lighting switch Dimmer switch Passing switch Hood switch * Brake pedal position switch Transmission range switch (P) Transmission range switch (R) Ignition key switch

*: With security

How to cancel the Test Mode 2

NOTE: To cancel Test Mode 2, disconnect the MPCS short connector from the multiplex control inspection connector for more than 10 seconds or turn the ignition switch to LOCK (0).

MICS System Description

The MICU that is combined with the under-dash fuse/relay box is one of the B-CAN network components. The MICU controls many systems related to the body controller area and security system, and also works as a gateway to diagnose the other B-CAN connected ECUs with the HDS.
Refer to each system circuit diagram for details.

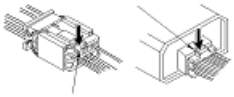
How to Troubleshoot the Body Electrical

Tips and Precautions

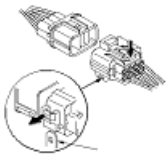
Before Troubleshooting

1. Check applicable fuses in the appropriate fuse/relay box.
2. Check the battery for damage, state of charge, and clean and tight connections.
   NOTICE
   - Do not quick-charge a battery unless the battery ground cable has been disconnected, otherwise you will damage the alternator diodes.
   - Do not attempt to crank the engine with the battery ground cable loosely connected or you will severely damage the wiring.

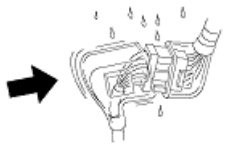
Handling Connectors



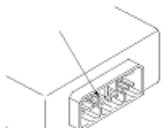
- Make sure the connectors are clean and have no loose wire terminals.
- Make sure multiple cavity connectors are packed with dielectric grease (except watertight connectors).
- All connectors have push-down release type locks (A).



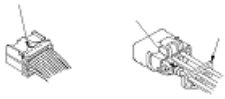
- Some connectors have a clip on their side used to attach them to a mount bracket on the body or on another component. This clip has a pull type lock.
- Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).



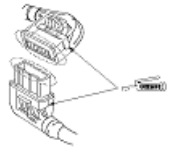
- Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
- Always reinstall plastic covers.



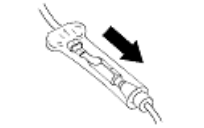
- Before connecting connectors, make sure the terminals (A) are in place and not bent.



- Check for loose retainers (A) and rubber seals (B).

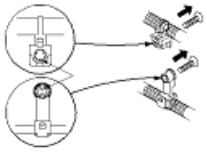


- The backs of some connectors are packed with dielectric grease. Add grease if necessary. If the grease is contaminated, replace it.



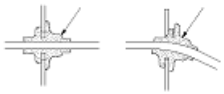
- Insert the connector all the way and make sure it is securely locked.
- Position wires so that the open end of the cover faces down.

Handling Wires and Harnesses

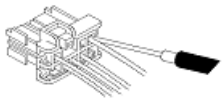


- Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
- Remove clips carefully; don't damage their locks (A).

- After installing harness clips, make sure the harness doesn't interfere with any moving parts.
- Keep wire harnesses away from exhaust components and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
- Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).



Testing and Repairs



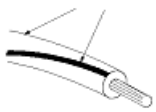
- Do not use wires or harnesses with broken insulation. Replace them or repair them by wrapping the break with electrical tape.
- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage is SRS wiring or terminals, replace the harness.
- After installing parts, make sure that no wires are pinched under them.
- When using electrical test equipment, follow the manufacturer's instructions and those described in this manual.
- If possible, insert the probe of the tester from the wire side (except waterproof connector).

- Use back probe adaptor 07TAZ-001020A.
- Refer to the instructions in the Honda Terminal Kit for identification and replacement of connector terminals.

Five-step Troubleshooting

1. Verify The Complaint:
   Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.
2. Analyze The Schematic:
   Look up the schematic for the problem circuit. Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or a ground is a likely cause.
   Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.
3. Isolate The Problem By Testing The Circuit:
   Make circuit tests to check the diagnosis you made in Step 2 . Keep in mind that a logical, simple procedure is the key to efficient troubleshooting. Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.
4. Fix The Problem:
   Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.
5. Make Sure The Circuit Works:
   Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

Wire Color Codes



The following abbreviations are used to identify wire colors in the circuit schematics:

WHT.	White
YEL.	Yellow
BLK.	Black
BLU.	Blue
GRN.	Green
RED.	Red
ORN.	Orange
PNK.	Pink
BRN.	Brown
GRY.	Gray
PUR.	Purple
LT BLU.	Light Blue
LT GRN.	Light Green

The wire insulation has one color or one color with another color stripe. The second color is the stripe.

Troubleshoot the B-CAN Circuit Related Problems

How to check for DTCs with the HDS (preferred method)

The HDS can check the F-CAN and B-CAN communication status, read and clear the DTCs, display the data list, and perform function test.

Check for DTCs

1. Connect the HDS to the data link connector (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with vehicle.
   NOTE: If the HDS does not communicate with the vehicle, troubleshoot the DLC circuit.
4. Select the BODY ELECTRICAL, then select the desired TEST MODE menu, and check the DTCs. If the DTCs do not pertain to the select menu, select the All DTC Check icon to view all Body DTCs.
   NOTE: For specific operations, refer to the HDS user's manual.
5. If any DTCs are indicated, go to the indicated DTCs troubleshooting.
   NOTE: If the DTC B1000, B1150, B1178, and/or B1900 are stored, troubleshoot these DTCs first (beginning with the lowest number).

How to check for DTCs without the HDS (Use only if the HDS is unavailable)

Special Tools Required

MPCS short connector
07WAZ-0010100

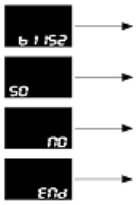
If the HDS is unavailable, using the following method, you can check the B-CAN communication status, DTCs, and some F-CAN communication status related with the gauge control module.

Check for DTCs

1. Turn the ignition switch to ON (II).
2. Connect the MPCS short connector (A) to the MICU service check connector (B), and turn the switch (C) ON.

---

3. After 5 to 10 seconds, the DTCs which have been detected and stored individually by various B-CAN unit, will be indicated one by one on the odo/trip display if the communication line between the MICU and the gauge control module is OK. To scroll through the DTCs, press the select/reset button.



The unit that has stored the code can be identified by the number shown on the odo/trip display.

Control Unit	Control Unit I.D. Number
MICU	10
Gauge control module	50
Immobilizer-keyless control unit	96

NOTE: Also you can check the B-CAN communication status by following methods:

- The MICU self-diagnostic function Test Mode 1 and Test Mode 2 can check some communication status and some switch circuits.
- The gauge control module self-diagnostic function can check the communication status.

How to Clear the DTCs with the HDS

1. Connect the HDS to the data link connector (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Clear the DTCs with the HDS.
4. Turn the ignition switch to LOCK (0), and disconnect the HDS from the data link connector (DLC).

How to Clear the DTCs without the HDS

1. While in DTCs indication status, press and hold the SELECT/RESET switch for more than 10 seconds.
2. Turn the MPCS short connector switch off, and disconnect the connector from the MICU service check connector.
3. Turn the ignition switch to LOCK (0).

HDS Inputs and Commands

Certain inputs happen so quickly that the HDS cannot update fast enough. Hold the switch that is being tested while monitoring the Data List. This should give the HDS time to update the signal on the Data List.
Because the HDS software is updated to support the release for newer vehicles it is not uncommon to see system function tests that are not supported.
Make sure that the most current software is loaded.

Input

System Menu	Data List	Data List Indication
Lighting	Driver's Door Switch	OFF/ON

Wipers/washers	Windshield Wiper Motor LOW Command	Operates windshield wiper for 5 seconds (low speed)
	Windshield Wiper Motor HIGH Command	Operates windshield wiper for 5 seconds (high speed)
	Windshield Washer Command	Operates windshield washer for 5 seconds
	Rear window washer motor command	Operates for 5 seconds
	Rear Wiper motor	Operates for 5 seconds

Loss of Communication DTC cross-reference chart

When an ECU is unable to communicate with the other ECUs on the CAN circuit, the other control units will set loss of communication DTCs. Use this chart to find the control unit that is not communicating.

1. Find the Transmitting Control Unit that is in the same row as all of the loss of communication DTCs retrieved.
2. Perform the input test for the transmitting control unit.

Bus Off and Internal Error Codes

DTC type	Related Unit		
	MICU	Gauge Control Module	Immobilizer-Keyless Control Unit
BUS OFF	B1000	B1150	B1900
ECU (EEPROM) Error	B1002	B1152	

Transmitting Control Unit	Message	Receiving Unit/Loss of Communication DTC		
		MICU	Gauge Control Module	Immobilizer-Keyless Control Unit
MICU	RM		B1188	
	HLSW		B1155	
	WIPSW		B1156	
	MICU		B1157	
	DOORSW		B1159	
	DRLOCKSW		B1160	B1905

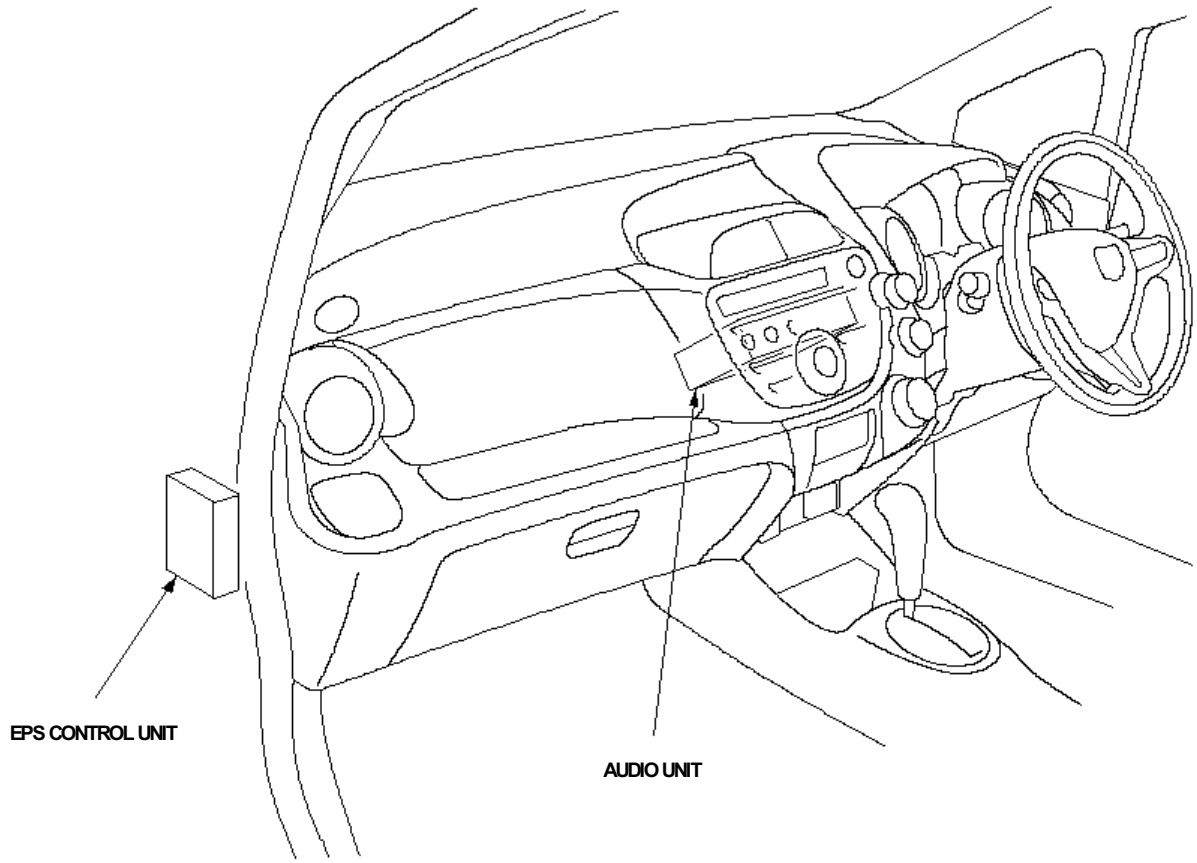
Relay and Control Unit Locations - Dashboard 2

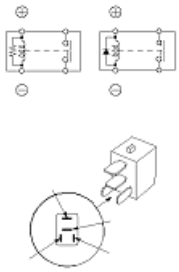


RHD model is shown, LHD model is similar.

Power Relay Test

Use this chart to identify the type of relay, then do the test listed for it.

Relay	Test
A/C compressor clutch relay	Normally-open type
A/C condenser fan relay	
A/F sensor relay	
Blower motor relay	
ETCS control relay	
Horn relay	
Ignition coil relay	
Lighting relay 1	
Lighting relay 2	
PGM-FI main relay 1 (FI MAIN)	
PGM-FI main relay 2 (FUEL PUMP)	
Power window relay (P/W)	
Radiator fan relay	
Rear window defogger relay	
Starter cut relay (ST CUT)	



Normally-open type

Check for continuity between the terminals:

- There should be continuity between the No. 1 and No. 2 terminals when battery power is connected to the No. 4 terminal, and body ground is connected to the No. 3 terminal.
- There should be no continuity between the No. 1 and No. 2 terminals when power is disconnected.

Under-dash Fuse/Relay Box Connector Locations

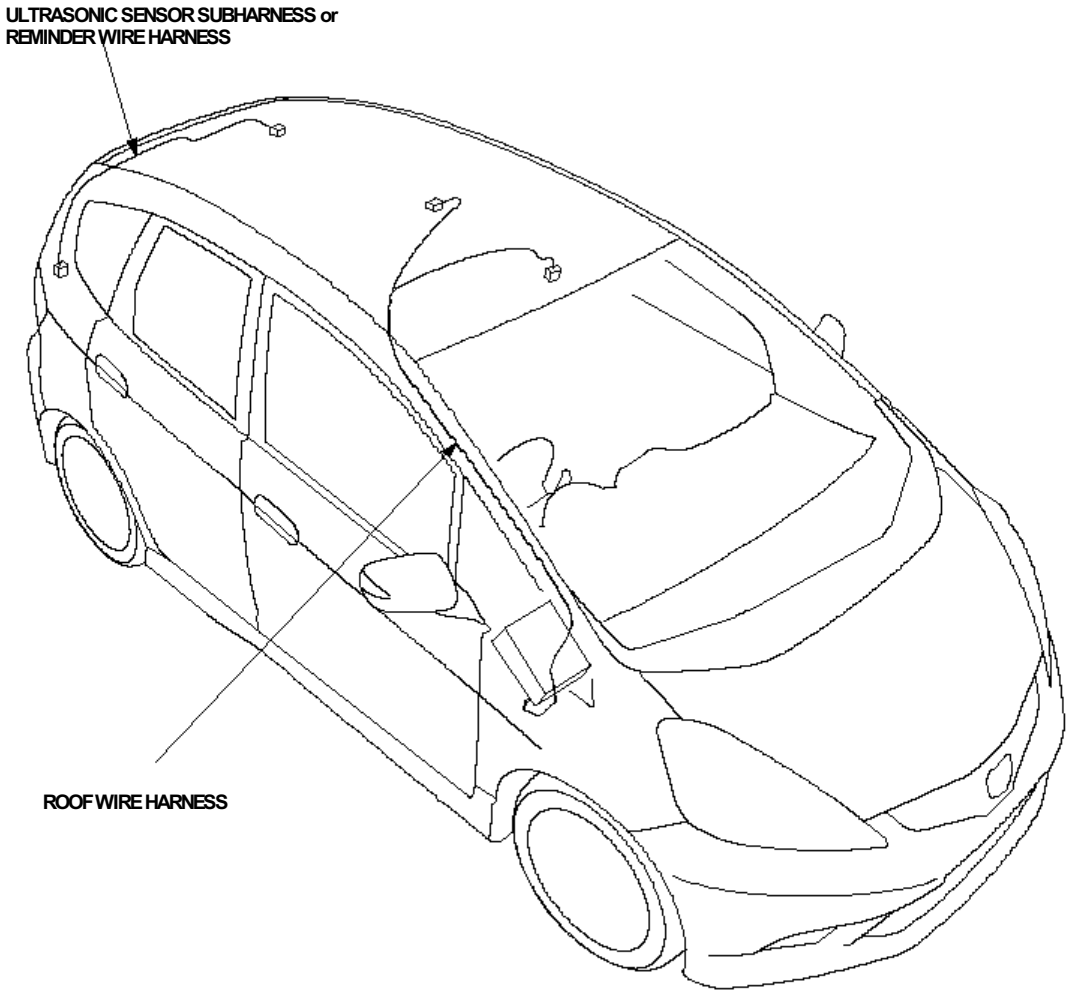
Roof Wire Harness, Reminder Wire Harness, and Ultrasonic Sensor Subharness Locations



RHD model is shown, LHD model is symmetrical.

DTC Troubleshooting: B1029

DTC B1029:
MICU Lost Communication with Ultrasonic Unit

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B1029 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
4. Do the ultrasonic sensor input test, and check power supply and ground for ultrasonic sensor.

   Do all of the input tests prove OK?
   YES - Go to Step 5 .
   NO - If any input tests indicate a problem, find and correct them, then recheck the system.■
5. Do the alarm control siren input test, and check power supply and ground for alarm control siren.

   Do all of the input tests prove OK?
   YES - Go to Step 6 .
   NO - If any input tests indicate a problem, find and correct them, then recheck the system.■
6. Disconnect under-dash fuse/relay box connector C (49P).
7. Connect the alarm control siren 6P connector No. 3 terminal and body ground with a jumper wire.

---

8. Check for continuity between under-dash fuse/relay box connector C (49P) No. 25 terminal and body ground.
   NOTE: The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

   
   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair an open in the wire between the MICU and the alarm control siren.■
9. Disconnect the jumper wire from the alarm control siren 6P connector.

---

10. Check for continuity between under-dash fuse/relay box connector C (49P) No. 25 terminal and body ground.
    NOTE: The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

    
    Is there continuity?
    YES - Repair a short to ground in the wire between the MICU and the alarm control siren.■
    NO - Faulty alarm control siren, replace it.■

DTC Troubleshooting: B1030

DTC B1030:
Ultrasonic System Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Check for DTCs with the HDS.

Is DTC B1030 indicated?
YES - Faulty alarm control siren, replace it.■
NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■

DTC Troubleshooting: B1031

DTC B1031:
Ultrasonic Sensor Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B1031 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
4. Do the ultrasonic sensor input test, and check power supply and ground for ultrasonic sensor.

   Do all of the input tests prove OK?
   YES - Go to Step 5 .
   NO - If any input tests indicate a problem, find and correct them, then recheck the system■
5. Do the alarm control siren input test, and check power supply and ground for alarm control siren.

   Do all of the input tests prove OK?
   YES - Faulty alarm control siren, replace it.■
   NO - If any input tests indicate a problem, find and correct them, then recheck the system.■

Brake System Symptom Troubleshooting - Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

NOTE: Make sure that the caliper pins are installed correctly.
Upper caliper pin B and lower caliper pin A are different. If the pins are installed in the wrong location, it will cause vibration, uneven or rapid brake pad wear, and possibly uneven tyre wear. For proper caliper pin location.

1. Drive the vehicle until the brakes drag or until the pedal is high and hard. This can take 20 or more brake pedal applications during an extended test-drive.
2. With the engine running, raise the vehicle on a lift, and spin all four wheels by hand.

   Is there brake drag at any of the wheels?
   YES - Go to Step 3 .
   NO - Look for other causes of pad wear, high pedal, or vehicle vibration.■
3. Turn the ignition switch to LOCK (0), press the brake pedal several times to deplete the vacuum in the brake booster, and then spin the wheels again to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 4 .
   NO - Replace the brake booster.

   - RHD model. ■
   - LHD model. ■
4. Without removing the brake lines, unbolt and separate the master cylinder from the booster, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 5 .
   NO - Check the brake pedal position switch adjustment and pedal free play. ■
5. Loosen the hydraulic lines at the master cylinder, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 6 .
   NO - Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid. If the brake fluid is OK, replace the master cylinder.

   - RHD model. ■
   - LHD model. ■
6. Loosen the bleed screws at each caliper, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid. If the brake fluid is OK, disassemble and repair the caliper on the wheel(s) with brake drag.■
   NO - Look for and replace any damaged brake lines. If all brake lines are OK, replace the ABS modulator-control unit. ■

Brake System Inspection and Test

Inspect the brake system components listed. Repair or replace any parts that are leaking or damaged.

Component Inspections:

Component	Procedure	Also check for
Master Cylinder	Look for damage or signs of fluid leakage at: • Reservoir tank, subreservoir or master cylinder body. • Lines, reservoir tank hose and grommets, and their joints. • Between master cylinder and booster.	Bulging seal at reservoir cap. This is a sign of fluid contamination.
Brake Hoses	Look for damage or signs of fluid leakage at: • Line joints and banjo bolt connections. • Hoses and lines, also inspect for twisting or damage.	Bulging, twisted, or bent lines.
Caliper	Look for damage or signs of fluid leakage at: • Piston seal. • Banjo bolt connections. • Bleed screw.	Seized or sticking caliper pins.
ABS Modulator-control Unit	Look for damage or signs of fluid leakage at: • Line joints. • Modulator-control unit.	

Brake System Test

Brake pedal sinks/fades when braking

1. Set the parking brake, and start the engine, then turn off the A/C. Allow the engine to warm up to normal operating temperature (radiator fan comes on twice).
2. Attach a 50 mm (2 in.) piece of masking tape along the bottom of the steering wheel, and draw a horizontal reference mark across it.
3. With the transmission in neutral (M/T) or P or N (A/T), press and hold the brake pedal lightly (about the same pressure needed to keep an A/T-equipped vehicle from creeping), then release the parking brake.
4. While still holding the brake pedal, hook the end of the tape measure behind the brake pedal, then pull the tape up to the steering wheel. Note the measurement between the brake pedal and the reference mark on the steering wheel.
5. Apply steady pressure to the brake pedal for 3 minutes.
6. Watch the tape measure.
   - If the measurement increases 10 mm (0.39 in.) or less, the master cylinder is OK.
   - If the measurement increases more than 10 mm (0.39 in.), replace the master cylinder.

RHD model is shown, LHD model is similar.

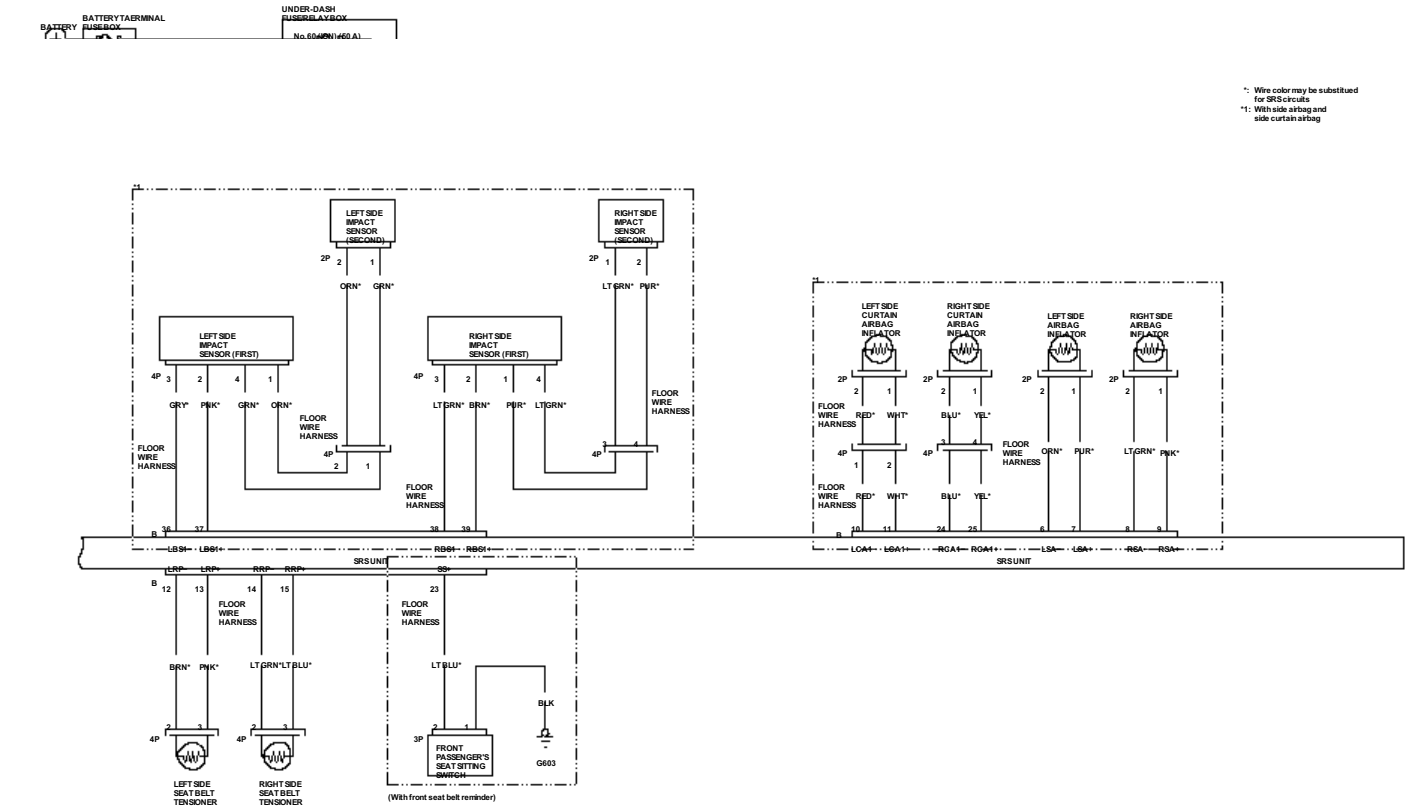
SRS Circuit Diagram



Side Impact Sensor (First) Replacement

Removal

1. Do the battery terminal disconnection procedure, then wait for 3 minutes before starting work.
2. Remove the front seat assembly.
3. Remove the center pillar lower trim:
   - Without side curtain airbag
   - With side curtain airbag
4. Disconnect the floor wire harness 4P connector (A) from the side impact sensor (first) (B).
5. Using a TORX T30 bit, remove the TORX bolt (C), then remove the side impact sensor (first).

Installation

1. Install the side impact sensor (first) with a new TORX bolt (A), then connect the floor wire harness 4P connector (B) to the side impact sensor (first) (C).
2. Do the battery terminal reconnection procedure.
3. After installing the side impact sensor (first) confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for 6 seconds and then go off.
4. Reinstall all removed parts.

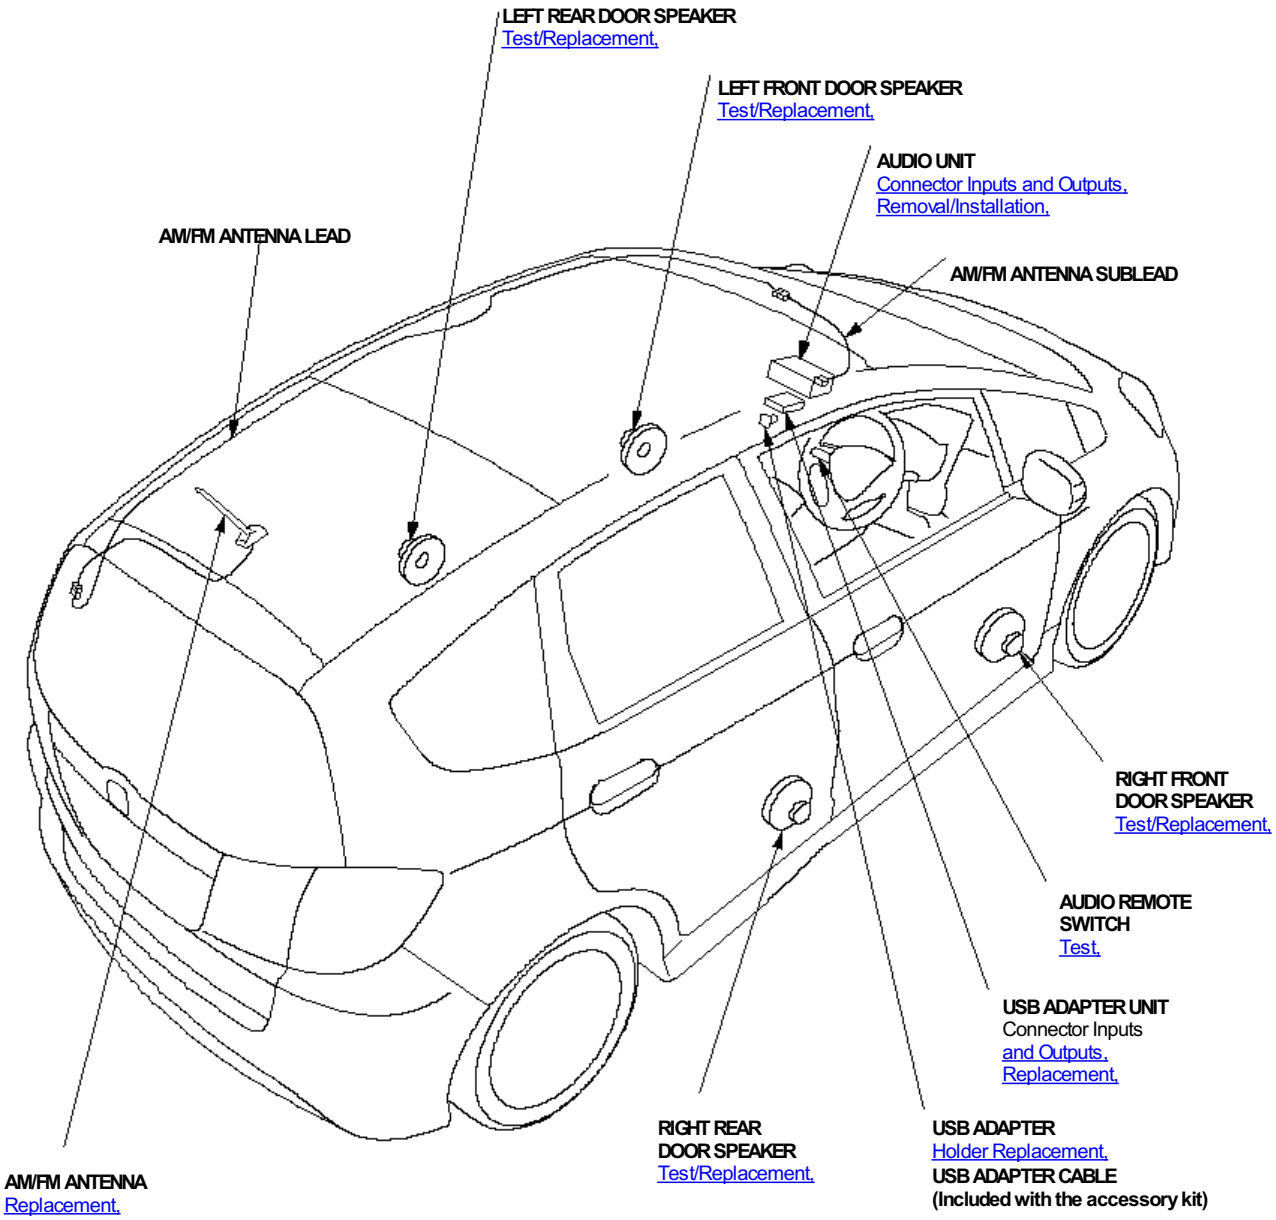
Audio System Error Codes

The audio system displays error codes when a problem is detected with the disc player or the disc.

CD Error Codes

Error Code Displayed	Possible Cause	Solution
CD UNSUPPORTED	Track/File format not supported.	Current track will skipped. The next supported track or file plays automatically. • Verify that CD file names end in CDA. • Verify that CD-R or CD-RW with compressed music formats end in MP3 or WMA. • Other file formats like i-Tunes (AAC) or Ogg are not recognized. • WMA files may have (DRM) copy protection and cannot be read.
BAD DISC/PLEASE CHECK/OWNERS MANUAL/PUSH EJECT	• CD label jammed in the mechanism. • The wrong type disc is inserted. • CD eject mechanism or motor is inoperative. • CD spindle motor won't spin up the CD.	• Eject CD and insert a known-good CD. • If flashing the PUSH EJECT, press the EJECT button and hold it for 5 seconds. If the disc does not eject, try again. If the disc still won't eject, replace the unit.
HEAT ERROR	Disc player is hot. This error can happen if the vehicle is parked out in the hot sun all day.	Park the vehicle in a cooler place for a while and play the disc again. If the error code is still present, try another disc. If the error code is still present, replace the audio unit.

Audio System Component Location Index



RHD model is shown, LHD model is similar.
Part of items are not equipped for some models.

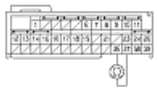
SRS DTC Troubleshooting: 43-11

DTC 43-11:
No Signal From the Left Side Impact Sensor (first)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

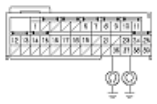
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 43-11 indicated?
   YES -
   - If DTC 43-11 is indicated alone, go to Step 4 .
   - If DTC 43-11 and 45-11 are indicated, faulty left side impact sensor (first); replace the left side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure , then wait for 3 minutes.
6. Check the connections between SRS unit connector B (39P) and the SRS unit, between the floor wire harness 4P connector and the left side impact sensor (first), and at floor wire harness 4P connector.

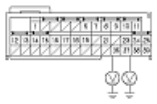
   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect SRS unit connector B (39P) from the SRS unit.
8. Disconnect the floor wire harness 4P connector from the left side impact sensor (first).
9. Measure the resistance between No. 36 and No. 37 terminals of SRS unit connector B (39P). There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■



10. Measure the resistance between No. 36 terminal of SRS unit connector B (39P) and body ground, and between the No. 37 terminal and body ground. There should be an open circuit or at least 1 MΩ.

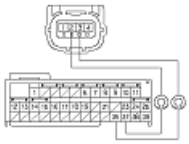
    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Do the battery terminal reconnection procedure.
12. Turn the ignition switch to ON (II).



13. Measure the voltage between No. 36 terminal of SRS unit connector B (39P) and body ground, and between the No. 37 terminal and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

15. Measure the resistance between the No. 2 terminal of the floor wire harness 4P connector and the No. 37 terminal of the SRS unit connector B (39P), and between the No. 3 terminal of the floor wire harness 4P connector and the No. 36 terminal of the SRS unit connector B (39P). There should be 0−1.0 Ω.



Is the resistance as specified?
YES - Go to Step 16 .
NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good left side impact sensor (first) and recheck.

17. Connect SRS unit connector B (39P) to the SRS unit.

18. Clear the DTC memory.

19. Turn the ignition switch to ON (II), then wait for 10 seconds.

20. Read the DTC.

Is DTC 43-11 indicated?
YES - Faulty SRS unit; replace the SRS unit. ■
NO - Faulty left side impact sensor (first); replace the left side impact sensor (first). ■

SRS DTC Troubleshooting: 44-11

DTC 44-11:
No Signal From the Right Side Impact Sensor (first)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

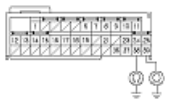
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 44-11 indicated?
   YES -
   - If DTC 44-11 is indicated alone, go to Step 4 .
   - If DTC 44-11 and 46-11 are indicated, faulty right side impact sensor (first); replace the right side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.
4. Turn the ignition switch to LOCK (0).
5. Do the battery terminal disconnection procedure, then wait for 3 minutes.
6. Check the connections between SRS unit connector B (39P) and the SRS unit, between the floor wire harness 4P connector and the right side impact sensor (first), and at floor wire harness 4P connector.

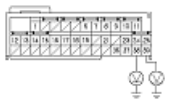
   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.
7. Disconnect SRS unit connector B (39P) from the SRS unit.
8. Disconnect the floor wire harness 4P connector from the right side impact sensor (first).
9. Measure the resistance between the No. 38 and No. 39 terminals of SRS unit connector B (39P). There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■



10. Measure the resistance between No. 38 terminal of SRS unit connector B (39P) and body ground, and between the No. 39 terminal and body ground. There should be an open circuit at least 1 MΩ.

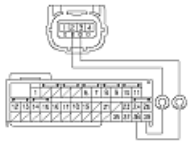
    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Do the battery terminal reconnection procedure.
12. Turn the ignition switch to ON (II).



13. Measure the voltage between No. 38 terminal of SRS unit connector B (39P) and body ground, and between the No. 39 terminal and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

15. Measure the resistance between the No. 2 terminal of the floor wire harness 4P connector and the No. 39 terminal of the SRS unit connector B (39P), and between the No. 3 terminal of the floor wire harness 4P connector and the No. 38 terminal of the SRS unit connector B (39P). There should be 0−1.0 Ω.



Is the resistance as specified?
YES - Go to Step 16 .
NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good right side impact sensor (first) and recheck.

17. Connect SRS unit connector B (39P) to the SRS unit.

18. Clear the DTC memory.

19. Turn the ignition switch to ON (II), then wait for 10 seconds.

20. Read the DTC.

Is DTC 44-11 indicated?
YES - Faulty SRS unit; replace the SRS unit. ■
NO - Faulty right side impact sensor (first); replace the right side impact sensor (first). ■

Safety Messages

Safety Messages

Your safety, and the safety of others, is very important. To help you make informed decisions, we have provided safety messages, and other safety information throughout this manual. Of course, it is not practical or possible to warn you about all the hazards associated with servicing this vehicle. You must use your own good judgement.
You will find important safety information in a variety of forms including:

- **Safety Labels –** on the vehicle.
- **Safety Messages –** preceded by a safety alert symbol and one of three signal words, DANGER, WARNING, or CAUTION.
  These signal words mean:

  You WILL be KILLED or SERIOUSLY HURT if you don't follow instructions.
  You CAN be KILLED or SERIOUSLY HURT if you don't follow instructions.
  You CAN be HURT if you don't follow instructions.

- **Instructions –** how to service this vehicle correctly and safely.

All information contained in this manual is based on the latest product information available at the time of printing. We reserve the right to make changes at anytime without notice. No part of this publication may be reproduced, or stored in a retrieval system, or transmitted, in any form by any means, electronic, mechanical, photocopying, recording, or otherwise, without the prior written permission of the publisher. This includes text, figures, and tables.
As you read this manual, you will find information that is preceded by a symbol. The purpose of this message is to help prevent damage to your vehicle, other property, or the environment.

Service Reminder System Maintenance Items - for applicable EU countries

Symbol	Maintenance Items
A	Replace engine oil and oil filter
B	Inspect front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.
	Check parking brake adjustment Check the number of clicks when the parking brake lever is pulled with 196 N (20 kgf, 44 lbf) of force. • Rear disc brake : 6 to 8 clicks • Rear drum in disc brake : 5 to 7 clicks
	Inspect tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.
	Inspect suspension components • Check the bolts for tightness. • Check all dust covers for deterioration and damage.
	Inspect driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.
	Inspect brake hoses and lines including ABS/VSA lines Check the master cylinder and ABS/VSA modulator-control unit for damage or leakage.
	Inspect all fluid levels and condition of fluids • Engine coolant • M/T • i-SHIFT • Brake fluid • Clutch fluid M/T , i-SHIFT • Windshield washer fluid
	Inspect exhaust system • KE, KG model • Except KE, KG model Check the exhaust pipe and muffler for damage, leaks, and tightness.
	Inspect fuel lines and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.
	Inspect tyre condition
	Check expiration date for TRK (Temporary Repair Kit) bottle
	Test drive (noise, stability, dashboard operation)
	Check lights alignment Check the position of the headlights.
	Inspect vehicle corrosion: refer to the Body Repair Manual If the symbol B appears before one year has passed, inspect for the vehicle corrosion every year. • External Paintwork and Panel Corrosion Check • Under Body Corrosion Check

Number	Maintenance Items
2	Replace dust and pollen filter • If the vehicle is driven mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace every 20,000 km (12,500 miles) or 1 year. • Replace the filter whenever airflow from the heating and air conditioning system is less than normal.
	Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.

Number	Maintenance Items
3	Replace transmission fluid • Driving in mountainous areas at very low vehicle speeds or towing trailer results in higher transmission temperatures. This requires transmission fluid changes more frequently than recommended by the service reminder system. If the vehicle is driven under these conditions, have the Manual Transmission Fluid changed at 60,000 km (37,500 miles) or 4 years. • For automatic transmission, have the Automatic Transmission Fluid changed at 60,000 km (37,500 miles) or after the first 4 years, then every 40,000 km (25,000 miles) or 2 years. Capacity: • M/T : 1.5 L (1.6 US qt, 1.3 Imp qt); always use genuine Honda MTF. • i-SHIFT : 1.4 L (1.5 US qt, 1.2 Imp qt); always use genuine Honda MTF.
4	Replace fuel filter
	Inspect idle speed
	Replace spark plugs Use IZFR6K-13 (NGK) or SKJ20DR-M13 (DENSO).
5	Replace engine coolant Capacity (including the reservoir): • L12B1 (M/T, RHD): 4.42 L (1.168 US gal, 0.972 Imp gal) • L12B1 (M/T, LHD Manufactured in Japan model): 4.42 L (1.168 US gal, 0.972 Imp gal) • L12B1 (M/T, LHD Manufactured in China model): 4.46 L (1.178 US gal, 0.981 Imp gal) • L13Z1 (A/T): 4.52 L (1.194 US gal, 0.994 Imp gal) • L13Z1 (M/T, LHD): 4.42 L (1.168 US gal, 0.972 Imp gal) • L13Z1 (M/T, RHD): 4.46 L (1.178 US gal, 0.981 Imp gal) • L15A7 (M/T): 4.43 L (1.170 US gal, 0.975 Imp gal) • L15A7 (A/T): 4.53 L (1.197 US gal, 0.997 Imp gal) Always use genuine Honda All Season Antifreeze/Coolant Type 2.
7	Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level is between upper and lower marks on the reservoir.
8	Replace air cleaner element If the vehicle is driven in dusty conditions, replace every 30,000 km (18750 miles).
9	Inspect valve clearance Intake: 0.15−0.19 mm (0.006−0.007 in.), Exhaust: 0.26−0.30 mm (0.010−0.012 in.)

Maintenance Schedule for Normal Conditions - for Service Reminder System non-applicable EU countries

Follow the normal conditions maintenance schedule if the severe driving conditions specified in the severe conditions maintenance schedule do not apply.

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150
	months	12	24	36	48	60	72	84	96	108	120	132	144
Replace engine oil		•	•	•	•	•	•	•	•	•	•	•	•
Replace engine oil filter													
Replace air cleaner element		Every 60,000 km (37,500 miles)											
Inspect valve clearance		Every 100,000 km (62,500 miles)											
Replace fuel filter							•						•
Replace spark plugs		Every 120,000 km (75,000 miles)											
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.			•		•		•		•		•		•
Inspect idle speed							•						•
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.		At 200,000 km (120,000 miles) or 10 years, then every 100,000 km (60,000 miles) or 5 years											
Replace Manual Transmission Fluid • M/T • i-SHIFT Use genuine Honda MTF.		Every 120,000 km (75,000 miles) or 8 years											
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.		•	•	•	•	•	•	•	•	•	•	•	•
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level is between upper and lower marks on the reservoir.		Every 3 years											
Check parking brake adjustment Check the parking brake operation.		•	•		•		•		•		•		•
Replace dust and pollen filter • If the vehicle is driven mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace every 20,000 km (12,500 miles) or 1 year. • Replace the filter whenever airflow from the heating and air conditioning system is less than normal.			•		•		•		•		•		•
Check lights alignment Check the position of the headlights.		•	•	•	•	•	•	•	•	•	•	•	•
Test drive (noise, stability, dashboard operation)													
Check expiration date for TRK (Temporary Repair Kit) bottle (if equipped)													

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150
	months	12	24	36	48	60	72	84	96	108	120	132	144
Inspect vehicle corrosion: refer to the Body Repair Manual • External Paintwork and Panel Corrosion Check • Under Body Corrosion Check		Every year											
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.													
Tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.		•	•	•	•	•	•	•	•	•	•	•	•
Suspension components • Check the bolts for tightness. • Check all dust covers for deterioration and damage.													
Driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.													

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150
	months	12	24	36	48	60	72	84	96	108	120	132	144
Brake hoses and lines (including ABS/VSA lines) Check the master cylinder and ABS/VSA modulator- control unit and leakage.													
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • MTF • M/T • i-SHIFT • Brake fluid • Clutch fluid M/T , i-SHIFT • Windshield washer fluid													
Exhaust system • KE, KG model • Except KE, KG model Check the exhaust pipe and muffler for damage, leaks, and tightness.													
Fuel lines and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.													
Tyre condition													

Maintenance Schedule for Severe Conditions - for Service Reminder System non-applicable EU countries

Follow the severe conditions maintenance schedule if the customer's vehicle is driven MAINLY under one or more of the following conditions:

- Driving less than 8 km (5 miles) per trip or, in freezing temperatures, driving less than 16 km (10 miles) per trip.
- Driving in extremely hot over 35 °C (95 °F) conditions.
- Extensive idling, or long periods of stop-and-go driving.
- Towing trailer, driving with a car-top carrier, or driving in mountainous conditions.
- Driving on muddy, dusty, or de-iced roads.

NOTE: If the vehicle is driven OCCASIONALLY under severe conditions, follow the normal conditions maintenance schedule.

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150
	months	12	24	36	48	60	72	84	96	108	120	132	144
Replace engine oil		Replace every 10,000 km (6,250 miles) or 6 months											
Replace engine oil filter		●	●	●	●	●	●	●	●	●	●	●	●
Replace air cleaner element Use normal conditions except in dusty conditions.		Every 30,000 km (18,750 miles)											
Inspect valve clearance		Every 100,000 km (62,500 miles)											
Replace fuel filter							●						●
Replace spark plugs		Every 120,000 km (75,000 miles)											
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.			●		●		●		●		●		●
Inspect idle speed							●						●
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.		At 200,000 km (120,000 miles) or 10 years, then every 100,000 km (60,000 miles) or 5 years											
Replace Manual Transmission Fluid • M/T • i-SHIFT Use genuine Honda MTF.		Every 60,000 km (37,500 miles) or 4 years											
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.		Every 10,000 km (6,250 miles) or 6 months											
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level is between upper and lower marks on the reservoir.		Every 3 years											
Check parking brake adjustment Check the parking brake operation.		●	●	●	●	●	●	●	●	●	●	●	●
Replace dust and pollen filter When the vehicle is driven mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace the filter whenever airflow from the heating and air conditioning system is less than normal.													
Check lights alignment Check the position of the headlights.													

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150

Test drive (noise, stability, dashboard operation)		●	●	●	●	●	●	●	●	●	●	●	●
Check expiration date for TRK (Temporary Repair Kit) bottle (if equipped)													
Inspect vehicle corrosion: refer to the Body Repair Manual • External Paintwork and Panel Corrosion Check • Under Body Corrosion Check		Every year											
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.													
Tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.		Every 10,000 km (6,250 miles) or 6 months											
Suspension components • Check the bolts for tightness. • Check all dust covers for deterioration and damage.													

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200	220	240
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0	137.5	150
	months	12	24	36	48	60	72	84	96	108	120	132	144
Driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.													
Brake hoses and lines (including ABS/VSA lines) Check the master cylinder and ABS/VSA modulator- control unit and leakage.		•	•	•	•	•	•	•	•	•	•	•	•
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • MTF • M/T • i-SHIFT • Brake fluid • Clutch fluid M/T , i-SHIFT • Windshield washer fluid													
Exhaust system • KE, KG model • Eexcept KE, KG model Check the exhaust pipe and muffler for damage, leaks, and tightness.													
Fuel lines and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.													
Tyre condition													

Maintenance Schedule for Normal and Severe Conditions - New Zealand

This maintenance schedule outlines the minimum required maintenance that you should perform to ensure the trouble-free operation of the vehicle. Due to regional and climatic differences, some additional service may be required. Please consult the warranty booklet for a more detailed description.
The following items must be used for “severe conditions" indicated on schedule, if the vehicle is driven MAINLY under the specified conditions A to F.

- Engine oil and engine oil filter: A/B/C/D/E
- Transmission fluid
  M/T: B/D
  A/T: B/C/D/F

A: Driving less than 8 km (5 miles) per trip or, in freezing temperatures, driving less than 16 km (10 miles) per trip.
B: Driving in extremely hot over 35 °C (95 °F) conditions.
C: Extensive idling, or long periods of stop-and-go driving.
D: Towing trailer, driving with a loaded roof rack, or driving in mountainous conditions.
E: Driving on muddy, dusty, or de-iced roads.
F: Driving more than 20,000 km (12,500 miles) per year, or driving at high speed frequently.
*:Only severe schedule is required in some countries, refer to local warranty booklet.

Service at the indicated distance or time whichever comes first		km x 1,000	20	40	60	80	100	120	140	160	180	200
		miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
		months	12	24	36	48	60	72	84	96	108	120
Replace engine oil *	Normal Conditions		Every 10,000 km (6,250 miles) or 1 year									
	Severe Conditions		Every 5,000 km (3,125 miles) or 6 months									
Replace engine oil filter *	Normal Conditions		●	●	●	●	●	●	●	●	●	●
	Severe Conditions		Every 10,000 km (6,250 miles) or 6 months									
Replace air cleaner element			Every 30,000 km (18,750 miles)									
Inspect valve clearance			Every 40,000 km (25,000 miles)									
Replace fuel filter						●				●		
Replace spark plugs			Every 100,000 km (62,500 miles)									
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.				●		●		●		●		●
Inspect idle speed								●				
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.			At 200,000 km (120,000 miles) or 10 years, then every 100,000 km (60,000 miles) or 5 years									
Replace Manual Transmission Fluid Use genuine Honda MTF.	Normal Conditions							●				
	Severe Conditions				●			●			●	
Replace Automatic Transmission Fluid Use genuine Honda ATF-Z1.	Normal Conditions							●				●
	Severe Conditions				●		●		●		●	

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
	months	12	24	36	48	60	72	84	96	108	120
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.	Every 10,000 km (6,250 miles)										
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level is between upper and lower marks on the reservoir.	Every 3 years										
Check parking brake adjustment Check the parking brake operation.	●	●		●		●		●		●	
Replace dust and pollen filter	●	●	●	●	●	●	●	●	●	●	
Rotate tyres Check tyre inflation and condition at least once per month.	Every 10,000 km (6,250 miles)										
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.											
Tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.	Every 10,000 km (6,250 miles) or 6 months										
Suspension components • Check the bolts for tightness. • Check all dust covers for deterioration and damage.											

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200
	miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
	months	12	24	36	48	60	72	84	96	108	120
Driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.											
Brake hoses and lines (including ABS lines) Check the master cylinder and ABS modulator-control unit and leakage.		•	•	•	•	•	•	•	•	•	•
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • M/T • ATF • Brake fluid • Clutch fluid • Windshield washer fluid											
Exhaust system Check the exhaust pipe and muffler for damage, leaks, and tightness.											
Fuel lines , and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.											

Maintenance Schedule for Normal Conditions - South Africa

Follow the normal conditions maintenance schedule if the severe driving conditions specified in the severe conditions maintenance schedule do not apply.

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
Replace engine oil		●	●	●	●	●	●	●	●	●	●
Replace engine oil filter			●		●		●		●		●
Replace air cleaner element		Every 15,000 km									
Inspect valve clearance		Every 45,000 km									
Replace fuel filter Replace fuel filter every 45,000 km or 3 years, if the fuel the customer uses is suspected to be contaminated.							●				
Replace spark plugs		Every 105,000 km									
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.				●			●			●	
Inspect idle speed								●			
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.		At 200,000 km or 10 years, then every 100,000 km or 5 years									
Replace Manual Transmission Fluid										●	
Replace Automatic Transmission Fluid Use genuine Honda ATF-Z1. Replace 120,000 km or 8 years, then every 75,000 km or 4 years										●	
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.		Every 10,000 km or 6 months									
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check that brake fluid level between upper and lower marks on the reservoir.		Every 3 years									
Check parking brake adjustment Check the parking brake operation.		●	●		●		●		●		●

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
Replace dust and pollen filter • If the vehicle is drive mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace every 15,000 km or 1 year. • Replace the filter whenever airflow from the heating and air conditioning system is less than normal.		Every 30,000 km or 1 year									
Rotate tyres Check tyre inflation and condition at least once per month.		Every 15,000 km									
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.											
Tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.		●	●	●	●	●	●	●	●	●	●
Suspension components • Check the bolts for tightness. • Check all dust cover for deterioration and damage.											
Driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.											
Brake hoses and lines (including ABS lines) Check the master cylinder and ABS modulator-control unit and leakage.											

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • M/T • ATF • Brake fluid • Clutch fluid • Windshield washer fluid											
Exhaust system Check the exhaust pipe and muffler for damage, leaks, and tightness.											
Fuel lines and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.											

Maintenance Schedule for Severe Conditions - South Africa

Follow the severe conditions maintenance schedule if the customer's vehicle is driven MAINLY under one or more of the following conditions:

- Driving less than 8 km per trip or, in freezing temperatures, driving less than 16 km per trip.
- Driving in extremely hot over 35 °C (95 °F) conditions.
- Extensive idling, or long periods of stop-and-go driving.
- Towing trailer, driving with a car-top carrier, or driving in mountainous conditions.
- Driving on muddy, dusty, or de-iced roads.

NOTE: If the vehicle is driven OCCASIONALLY under severe conditions, follow the normal conditions maintenance schedule.

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
Replace engine oil		Every 7,500 km									
Replace engine oil filter		●	●	●	●	●	●	●	●	●	●
Replace air cleaner element		Every 15,000 km									
Inspect valve clearance		Every 45,000 km									
Replace fuel filter Replace fuel filter every 45,000 km or 3 years, if the fuel the customer uses is suspected to be contaminated.							●				
Replace spark plugs		Every 105,000 km									
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.				●			●			●	
Inspect idle speed								●			
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.		At 200,000 km or 10 years, then every 100,000 km or 5 years									
Replace Manual Transmission Fluid Use genuine Honda MTF.					●				●		
Replace Automatic Transmission Fluid Use genuine Honda ATF-Z1. Replace 60,000 km or 4 years, then every 45,000 km or 3 years					●			●			●
Check front and rear brakes • Check the brake pad and disc thickness. Check for damage. • Check the calipers for damage, leaks, and tightness.		Every 7,500 km or 6 months									
Replace brake fluid • Use only DOT 3 or DOT 4 brake fluid. We recommend genuine Honda Brake Fluid. • Check the brake fluid level between upper and lower marks on the reservoir.		Every 3 years									
Check parking brake adjustment Check the parking brake operation.		●	●		●		●		●		●

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
Replace dust and pollen filter When the vehicle is drive mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace the filter whenever airflow from the heating.		●	●	●	●	●	●	●	●	●	●
Rotate tyres Check tyre inflation and condition at least once per month.		Every 15,000 km									
Visually inspect the following items: • Check for correct installation and position, check for cracks, deterioration, rust, and leaks. • Check tightness of screws, nuts, and joints. If necessary, retighten.											
Tie-rod ends, steering gearbox, and boots • Check steering linkage. • Check the boot for damage and leaking grease.		Every 7,500 km or 6 months									
Suspension components • Check the bolts for tightness. • Check all dust cover for deterioration and damage.											
Driveshaft boots • Check the boot and boot band for cracks. • Check boots for leaking grease.											
Brake hoses and lines (including ABS lines) Check the master cylinder and ABS modulator-control unit and leakage.		●	●	●	●	●	●	●	●	●	●

Service at the indicated distance or time whichever comes first	km x 1,000	15	30	45	60	75	90	105	120	135	150
	miles x 1,000	9.4	18.8	28.1	37.5	46.9	56.3	65.6	75.0	84.4	93.8
	months	12	24	36	48	60	72	84	96	108	120
All fluid levels and condition of fluids Check levels and check for leaks. If necessary, add. • Engine coolant • M/T • ATF • Brake fluid • Clutch fluid • Windshield washer fluid											
Exhaust system Check the exhaust pipe and muffler for damage, leaks, and tightness.											
Fuel lines and connections • Check fuel lines for loose connections, cracks, and deterioration. • Retighten loose connections and replace any damaged parts.											

Maintenance Schedule for Normal and Severe Conditions - Except EU, New Zealand, and South Africa

This maintenance schedule outlines the minimum required maintenance that you should perform to ensure the trouble-free operation of the vehicle. Due to regional and climatic differences, some additional service may be required. Please consult the warranty booklet for a more detailed description.
The following items must be used for "severe conditions" indicated on schedule, if the vehicle is driven MAINLY under the specified conditions A to F.

- Engine oil and engine oil filter: A/B/C/D/E
- Transmission fluid
  M/T: B/D
  A/T: B/C/D/F

A: Driving less than 8 km (5 miles) per trip or, in freezing temperatures, driving less than 16 km (10 miles) per trip.
B: Driving in extremely hot over 35 °C (95 °F) conditions.
C: Extensive idling, or long periods of stop-and-go driving.
D: Towing trailer, driving with a loaded roof rack, or driving in mountainous conditions.
E: Driving on muddy, dusty, or de-iced roads.
F: Driving more than 20,000 km (12,500 miles) per year, or driving at high speed frequently.
*:Only severe schedule is required in some countries, refer to local warranty booklet.

Service at the indicated distance or time whichever comes first		km x 1,000	20	40	60	80	100	120	140	160	180	200
		miles x 1,000	12.5	25.0	37.5	50.0	62.5	75.0	87.5	100.0	112.5	125.0
		months	12	24	36	48	60	72	84	96	108	120
Replace engine oil *	Normal Conditions		Every 10,000 km (6,250 miles) or 1 year									
	Severe Conditions		Every 5,000 km (3,125 miles) or 6 months									
Replace engine oil filter *	Normal Conditions		●	●	●	●	●	●	●	●	●	●
	Severe Conditions		Every 10,000 km (6,250 miles) or 6 months									
Replace air cleaner element			Every 30,000 km (18,750 miles)									
Inspect valve clearance			Every 40,000 km (25,000 miles)									
Replace fuel filter						●				●		
Replace spark plugs			Every 100,000 km (62,500 miles)									
Inspect drive belt Look for cracks and damage, then check the position of the drive belt auto-tensioner indicator.				●		●		●		●		●
Inspect idle speed								●				
Replace engine coolant Use genuine Honda All Season Antifreeze/Coolant Type 2.			At 200,000 km (120,000 miles) or 10 years, then every 100,000 km (60,000 miles) or 5 years									
Replace Manual Transmission Fluid • M/T • i-SHIFT Use genuine Honda MTF.	Normal Conditions							●				
	Severe Conditions				●			●			●	
Replace Automatic Transmission Fluid Use genuine Honda ATF-Z1.	Normal Conditions							●				●
	Severe Conditions				●		●		●		●	

Service at the indicated distance or time whichever comes first	km x 1,000	20	40	60	80	100	120	140	160	180	200

Design Specifications

Item	Measurement		Qualification	Specification
DIMENSION	Overall length			3,900−3,920 mm (153.5−154.3 in.)
	Overall width			1,695 mm (66.7 in.)
	Overall height			1,525 mm (60.0 in.)
	Wheelbase			2,500 mm (98.4 in.)
	Track	15 inch wheel model	Front	1,490 mm (58.7 in.)
			Rear	1,475 mm (58.1 in.)
		16 inch wheel model	Front	1,475 mm (58.1 in.)
			Rear	1,460 mm (57.5 in.)
	Ground clearance			150 mm (5.9 in.)
	Seating capacity			Five (5)
	WEIGHT (except KQ)	Curb weight	M/T	1,045 kg (2,304 lbs)
			A/T	1,070 kg (2,359 lbs)
	WEIGHT (KQ)	Curb weight (L13Z1)	M/T	1,025−1,040 kg (2,260−2,293 lbs)
			A/T	1,070−1,093 kg (2,359−2,410 lbs)
		Curb weight (L15A7)	M/T	1,048−1,060 kg (2,310−2,337 lbs)
			A/T	1,075−1,085 kg (2,370−2,392 lbs)
ENGINE	Type			Water-cooled, 4-stroke SOHC i-VTEC engine
	Cylinder arrangement			Inline 4-cylinder, transverse
	Bore and stroke		L12B1	73 x 71.58 mm (2.87 x 2.82 in.)
			L13Z1	73 x 80 mm (2.87 x 3.15 in.)
			L15A7	73 x 89.4 mm (2.87 x 3.52 in.)
	Displacement		L12B1	1.198 cm^3 (73 cu in.)
			L13Z1	1,339 cm^3 (82 cu in.)
			L15A7	1,496 cm^3 (91 cu in.)
	Compression ratio		L12B1	10.8
			L13Z1	10.5
			L15A7	10.4
	Valve train			Chain drive, SOHC 2 valves per cylinder
	Lubrication system			Forced, wet sump, with trochoid pump
	Oil pump displacement		at 6,300 engine rpm (min^{-1})	45.3 L (47.9 US qt, 39.9 Imp qt)
	Water pump displacement		at 6,000 engine rpm (min^{-1})	120 L (127 US qt, 106 Imp qt)
STARTER	Type			Gear reduction
	Normal output		Except L13Z1 KQ	0.7 kW
			L13Z1 KQ	0.6 kW, 0.7 kW
	Hour rating			30 seconds
	Rotation direction			Clockwise as viewed from drive end
CLUTCH (Except i-SHIFT)	Type			Single plate dry, diaphragm spring
CLUTCH (i-SHIFT)	Type			Single plate dry, diaphragm spring
MANUAL TRANSMISSION (i-SHIFT)	Type			Synchronized, six-speed forward, one reverse
	Primary reduction			Direct 1:1
	Gear ratio		1st	3.461
			2nd	1.869
			3rd	1.235
			4th	0.948
			5th	0.809
			6th	0.727
			Reverse	3.307
			Final	4.294
	Final reduction		Type	Single helical gear
			Gear ratio	4.294

Item	Measurement	Qualification	Specification
MANUAL TRANSMISSION	Type		Synchronized, five-speed forward, one reverse
	Primary reduction		Direct 1:1
	Gear ratio (L12B1: 12S, 12LS, 12LSR)	1st	3.307
		2nd	1.869
		3rd	1.171
		4th	0.853
		5th	0.727
		Reverse	3.307
		Final	4.625

Item	Measurement	Qualification	Specification
	Gear ratio (L12B1: KE, KG (12SE, 12LSE, 12LSRE))	1st	3.307

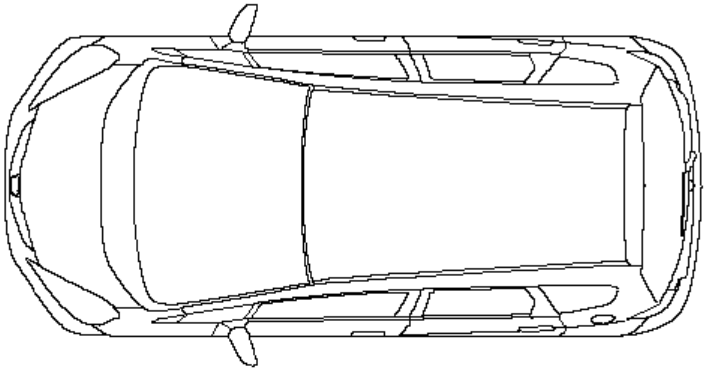
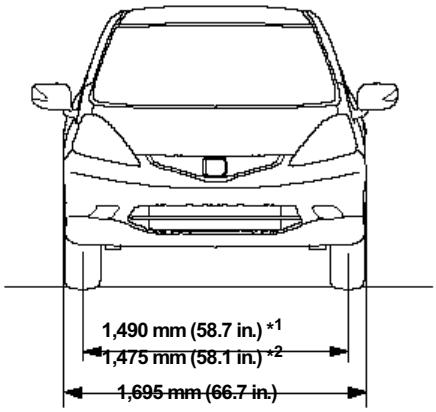
		3rd	1.303
		4th	1.054
		5th	0.853
		Reverse	3.307
		Final	4.294
	Final reduction	Type	Single helical gear
AUTOMATIC TRANSMISSION	Type		Electronically controlled automatic, five-speed forward, one reverse, three-element torque converter with lock-up clutch
	Primary reduction		Direct 1:1
	Gear ratio	1st	2.995
		2nd	1.678
		3rd	1.066
		4th	0.760
		5th	0.551
		Reverse	1.956
		Final	4.562
	Final reduction	Type	Single helical gear
STEERING	Type		Electrical power-assisted rack and pinion
	Overall ratio		16.09
	Turns, lock-to-lock		3.29
	Steering wheel diameter		370 mm (14.6 in.)
SUSPENSION	Type	Front	Independent strut with stabilizer, coil spring
		Rear	Torsion beam, coil spring
	Shock absorber	Front and rear	Telescopic, hydraulic, nitrogen gas-filled
TYRES	Size		See tyre information label attached to the doorjambs
BRAKES	Type of service brake	Front	Power-assisted self-adjusting ventilated disc
		Rear (disc)	Power-assisted self-adjusting solid disc
		Rear (drum)	Power-assisted self-adjusting solid drum
	Type of parking brake		Mechanical actuating, rear wheels
	Pad friction surface area (swept area)	Front	40.8 cm^2 (6.32 sq in.) x 2
		Rear	21.0 cm^2 (3.26 sq in.) x 2
	Shoe friction surface area	Rear	57.6 cm^2 (8.93 sq in.) x 2
AIR CONDITIONING	Compressor	Type	Scroll
		Capacity	77.1 mL (4.7 cu in.)/rev.
		Maximum speed	10,000 rpm (min^{-1})
		Lubricant capacity	80 mL (2 2/3 fl·oz, 2.8 Imp·oz)
		Lubricant type	SP-10
	Condenser	Type	Corrugated fin
	Evaporator	Type	Corrugated fin
	Blower	Type	Radial
		Motor type	170 W/12 V
		Speed control	4 speed

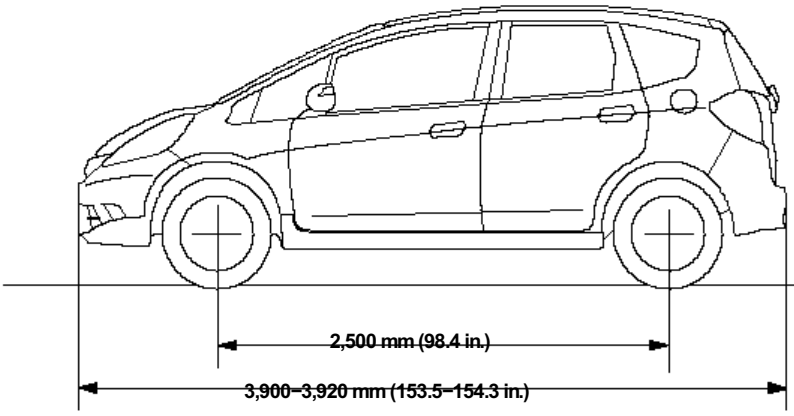
Item	Measurement	Qualification	Specification
		Maximum capacity	400 m^3 (14,126 cu ft)/h
	Temperature control		Air-mix type
	Compressor clutch	Type	Dry, single plate, Poly V-belt drive
		Electrical power consumption at 20 °C (68 °F)	42 W maximum at 12 V
	Refrigerant	Type	HFC-134a (R-134a)
		Capacity	370−420 g (13.1−14.8 oz)

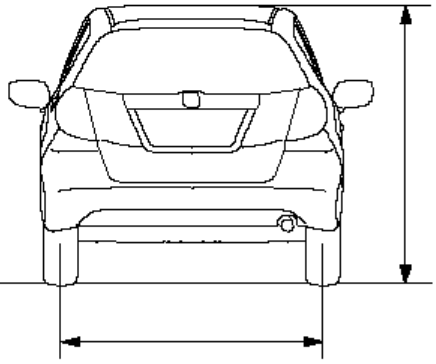
Item	Measurement	Qualification	Specification
ELECTRICAL RATINGS	Battery	KG (with daytime running light)	12 V−40 Ah/20 HR (32 Ah/5 HR)
		KE, KG (without daytime running light), KZ, KQ, KT, KU, KY	12 V−35 Ah/20 HR (12 V−28 Ah/5 HR)
	Fuses	Battery terminal fuse box (with trailer light connector)	100 A, 60 A, 30 A
		Battery terminal fuse box (without trailer light connector)	100 A, 60 A, 20 A
		Under-dash fuse/relay box	50 A, 40 A, 30 A, 20 A, 15 A, 10 A, 7.5 A
		Auxiliary under-dash fuse holder	7.5 A
	Light bulbs	Headlight high/low beam	12 V−60/55 W (without HID)
		Headlight high/low beam	12 V−35 W (with HID and high/low beam switching solenoid)
		Front turn signal lights	12 V−21 W
		Mirror turn signal lights	LED
		Side turn signal lights	12 V−5 W
		Front position lights	12 V−5 W
		Front fog lights	12 V−55 W
		Rear turn signal lights	12 V−21 W
		Brake/taillights	12 V−21/5 W or LED
		Rear fog light	12 V−21 W
		High mount brake light	12 V−21 W or LED
		Back-up lights	12 V−21 W
		License plate lights	12 V−5 W
		Ceiling lights	12 V−8 W
		Cargo area light	12 V−5 W
		Front individual map lights	12 V−8 W
		Gauge lights	LED
		Indicator lights	12 V−0.84 W
	Washer reservoir	Capacity	2.5 L (2.6 US qt, 2.2 Imp qt)

Body Specifications









*1: 15 inch wheel model
*2: 16 inch wheel model

Engine Electrical

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Rated voltage		12 V	
	Firing order		1−3−4−2	
Spark plug	Type		NGK: IZFR6K13 DENSO: SKJ20DR-M13	
	Gap		1.2−1.3 mm (0.047−0.051 in.)	———
Ignition timing		At idle (check the *white* mark)	M/T (in neutral): 0±2 ° BTDC	
			A/T (in N or P): 0±2 ° BTDC	
Drive belt	Tension		Auto-tensioner	
Alternator	Output	At 13.5 V and normal engine temperature	95 A	
	Coil (rotor) resistance	At 20 °C (68 °F)	2.1−2.3 Ω	
	Slip ring O.D.		22.7 mm (0.89 in.)	21.2 mm (0.83 in.)
	Brush length		23.0 mm (0.91 in.)	18.0 mm (0.71 in.)
	Brush spring tension		4.1−5.3 N (0.42−0.54 kgf, 0.93−1.19 lbs)	
Starter	Output	Except L13Z1 KQ	0.7 kW	
		L13Z1 KQ	0.6 kW, 0.7 kW	
	Commutator mica depth		0.45−0.75 mm (0.018−0.030 in.)	0.20 mm (0.008 in.)
	Commutator runout		0.05 mm (0.002 in.) max.	0.4 mm (0.02 in.)
	Commutator O.D.		27.9−28.0 mm (1.098−1.102 in.)	27.0 mm (1.06 in.)
	Brush length		9.7−10.3 mm (0.38−0.41 in.)	6.0 mm (0.20 in.)

Engine Assembly

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure check at 250 rpm (min^{-1}) with wide open throttle. (See Design Specs for ratio)	Minimum	980 kPa (10.0 kgf/cm^2, 142 psi)	———
		Maximum variation	200 kPa (2.0 kgf/cm^2, 28 psi)	———

Cylinder Head

Item	Measurement	Qualification		Standard or New	Service Limit
Head	Warpage			0.07 mm (0.0028 in.)	0.08 mm (0.003 in.)
	Height			119.9−120.1 mm (4.720−4.728 in.)	———
Camshaft	End play			0.05−0.25 mm (0.002−0.010 in.)	0.5 mm (0.02 in.)
	Camshaft-to-holder oil clearance			0.045−0.084 mm (0.0018−0.0033 in.)	0.100 mm (0.004 in.)
	Total runout			0.03 mm (0.001 in.) max.	0.04 mm (0.002 in.)
	Cam lobe height	L12B1	Intake, primary	34.290 mm (1.3500 in.)	
			Intake, secondary	30.529 mm (1.2019 in.)	
			Exhaust	35.047 mm (1.3798 in.)	
		L13Z1	Intake, primary	34.290 mm (1.3500 in.)	———
			Intake, secondary	30.529 mm (1.2019 in.)	———
			Exhaust	35.047 mm (1.3798 in.)	———
		L15A7	Intake, primary	35.241 mm (1.3874 in.)	———
			Intake, secondary	36.173 mm (1.4241 in.)	———
			Exhaust	35.471 mm (1.3964 in.)	———
Valve	Clearance (cold)	Intake		0.15−0.19 mm (0.006−0.007 in.)	———
		Exhaust		0.26−0.30 mm (0.010−0.012 in.)	———
	Stem O.D.	Intake		5.48−5.49 mm (0.216−0.216 in.)	5.45 mm (0.215 in.)
		Exhaust		5.45−5.46 mm (0.215−0.215 in.)	5.42 mm (0.213 in.)
	Stem-to-guide clearance	Intake		0.020−0.050 mm (0.0008−0.0020 in.)	0.08 mm (0.003 in.)
		Exhaust		0.050−0.080 mm (0.0020−0.0031 in.)	0.11 mm (0.004 in.)
Valve seat	Width	Intake		0.850−1.150 mm (0.0335−0.0453 in.)	1.60 mm (0.063 in.)
		Exhaust		1.250−1.550 mm (0.0492−0.0610 in.)	2.00 mm (0.079 in.)
	Stem installed height	Intake		46.1−46.5 mm (1.815−1.831 in.)	46.8 mm (1.843 in.)
		Exhaust		46.2−46.6 mm (1.819−1.835 in.)	46.9 mm (1.846 in.)
Valve spring	Free length	L12B1	Intake	51.17 mm (2.014 in.)	
			Exhaust	57.26 mm (2.254 in.)	
		L13Z1	Intake	51.17 mm (2.014 in.)	———
			Exhaust	57.26 mm (2.254 in.)	———
		L15A7	Intake	48.55 mm (1.911 in.)	———
			Exhaust	54.52 mm (2.146 in.)	———
Valve guide	I.D.	Intake		5.51−5.53 mm (0.217−0.218 in.)	5.55 mm (0.219 in.)

Item	Measurement	Qualification	Standard or New	Service Limit
		Exhaust	5.51–5.53 mm (0.217–0.218 in.)	5.55 mm (0.219 in.)
	Installed height	Intake	15.85–16.35 mm (0.624–0.644 in.)	———
		Exhaust	15.85–16.35 mm (0.624–0.644 in.)	———
Rocker arm	Arm-to-shaft clearance	Intake	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)
		Exhaust	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)

Engine Block

Item	Measurement	Qualification	Standard or New	Service Limit
Block	Warpage of deck		0.07 mm (0.003 in.) max.	0.10 mm (0.004 in.)
	Bore diameter		73.000–73.015 mm (2.8740–2.8746 in.)	73.065 mm (2.8776 in.)
	Bore taper		———	0.05 mm (0.002 in.)
	Reboring limit		———	0.25 mm (0.01 in.)
Piston	Skirt O.D. at 16 mm (0.6 in.) from bottom of skirt	L12B1	72.975–72.985 mm (2.8730–2.8734 in.)	72.97 mm (2.8728 in.)
		L13Z1	72.972–72.982 mm (2.8729–2.8733 in.)	72.97 mm (2.8728 in.)
		L15A7	72.980–72.990 mm (2.8732–2.8736 in.)	72.97 mm (2.8728 in.)
	Clearance in cylinder	L12B1	0.015–0.040 mm (0.0006–0.0015 in.)	0.05 mm (0.002 in.)
		L13Z1	0.018–0.043 mm (0.0007–0.0017 in.)	0.05 mm (0.002 in.)
		L15A7	0.010–0.035 mm (0.0004–0.0014 in.)	0.05 mm (0.002 in.)
	Ring groove width	Top	1.050–1.060 mm (0.0413–0.0417 in.)	1.080 mm (0.0425 in.)
		Second	1.020–1.030 mm (0.0401–0.0405 in.)	1.050 mm (0.0413 in)
		Oil	2.005–2.020 mm (0.0789–0.0795 in.)	2.050 mm (0.0807 in.)
Piston ring	Ring-to-groove clearance	Top	0.065–0.090 mm (0.0026–0.0035 in.)	0.15 mm (0.006 in.)
		Second	0.030–0.055 mm (0.0012–0.0022 in.)	0.12 mm (0.005 in.)
	Ring end gap	Top	0.15–0.30 mm (0.006–0.012 in.)	0.60 mm (0.024 in.)
		Second	0.30–0.42 mm (0.012–0.017 in.)	0.65 mm (0.026 in.)
		Oil	0.20–0.70 mm (0.008–0.028 in.)	0.80 mm (0.031 in.)
Piston pin	O.D.		17.996–18.000 mm (0.7085–0.7087 in.)	———
	Pin-to-piston clearance		0.010–0.017 mm (0.0004–0.0007 in.)	———
Connecting rod	Pin-to-rod interference		0.019–0.036 mm (0.007–0.0014 in.)	———
	Small-end bore diameter		17.964–17.977 mm (0.707–0.708 in.)	———
	Large-end bore diameter		43.0 mm (1.69 in.)	———
	End play installed on crankshaft		0.15–0.35 mm (0.006–0.014 in.)	0.40 mm (0.016 in.)
Crankshaft	Main journal diameter		49.976–50.000 mm (1.9676–1.9685 in.)	———
	Rod journal diameter		39.976–40.000 mm (1.5739–1.5748 in.)	———
	Rod/main journal taper		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	Rod/main journal out-of-round		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	End play		0.10–0.35 mm (0.004–0.014 in.)	0.45 mm (0.018 in.)
	Runout		0.03 mm (0.0012 in.) max.	0.04 mm (0.0016 in.)
Crankshaft bearing	Main bearing-to-journal oil clearance		0.018–0.036 mm (0.0007–0.0014 in.)	0.050 mm (0.0020 in.)
	Rod bearing clearance	L15A7	0.020–0.038 mm (0.0008–0.0015 in.)	0.050 mm (0.0020 in.)
		L13Z1	0.026–0.044 mm (0.0010–0.0017 in.)	0.050 mm (0.0020 in.)
		L12B1	0.026–0.044 mm (0.0010–0.0017 in.)	0.050 mm (0.0020 in.)

Engine Lubrication

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.2 L (4.4 US qt, 3.7 Imp qt)	———
		Oil change including oil filter	3.6 L (3.8 US qt, 3.2 Imp qt)	———
		Oil change without oil filter	3.4 L (3.6 US qt, 3.0 Imp qt)	———
Oil pump	Inner rotor-to-outer rotor clearance		0.06–0.16 mm (0.002–0.006 in.)	0.20 mm (0.008 in.)
	Pump housing-to-outer rotor clearance		0.100–0.175 mm (0.0039–0.0069 in.)	0.20 mm (0.008 in.)
	Pump housing-to-rotor axial clearance		0.02–0.06 mm (0.001–0.002 in.)	0.15 mm (0.006 in.)
Relief valve	Relief valve, oil pressure with oil temperature at 80°C (176°F)	At idle	70 kPa (0.7 kgf/cm ^{2}, 10 psi) min.	———
		At 3,000 rpm (min $^{-1}$)	340 kPa (3.5 kgf/cm ^{2}, 50 psi) min.	———

Cooling System

Item	Measurement	Qualification				Standard or New
Radiator	Coolant capacity (Includes engine, heater, hoses, and reservoir) Use genuine Honda All Season Antifreeze/Coolant Type 2	L12B1	RHD	M/T	Engine overhaul	4.91 L (1.297 US gal, 1.080 Imp gal)
					Coolant change	4.42 L (1.168 US gal, 0.972 Imp gal)
			LHD	M/T	Engine overhaul (Manufactured in Japan model)	4.91 L (1.297 US gal, 1.080 Imp gal)

Item	Measurement	Qualification				Standard or New
					Engine overhaul (Manufactured in China model)	4.95 L (1.308 US gal, 1.089 Imp gal)
					Coolant change (Manufactured in Japan model)	4.42 L (1.168 US gal, 0.972 Imp gal)
					Coolant change (Manufactured in China model)	4.46 L (1.178 US gal, 0.981 Imp gal)
		L13Z1	RHD	M/T	Engine overhaul	4.95 L (1.308 US gal, 1.089 Imp gal)
					Coolant change	4.46 L (1.178 US gal, 0.981 Imp gal)
				A/T	Engine overhaul	5.01 L (1.324 US gal, 1.102 Imp gal)
					Coolant change	4.52 L (1.194 US gal, 0.994 Imp gal)
			LHD	M/T	Engine overhaul	4.91 L (1.297 US gal, 1.080 Imp gal)
					Coolant change	4.42 L (1.168 US gal, 0.972 Imp gal)
				A/T	Engine overhaul	5.01 L (1.324 US gal, 1.102 Imp gal)
					Coolant change	4.52 L (1.194 US gal, 0.994 Imp gal)
		L15A7	M/T		Engine overhaul	4.92 L (1.300 US gal, 1.082 Imp gal)
					Coolant change	4.43 L (1.170 US gal, 0.975 Imp gal)
			A/T		Engine overhaul	5.02 L (1.326 US gal, 1.104 Imp gal)
					Coolant change	4.53 L (1.197 US gal, 0.997 Imp gal)
Coolant reservoir	Coolant capacity				0.44 L (0.116 US qt, 0.097 Imp qt)	
Radiator cap	Opening pressure				93−123 kPa (0.95−1.25 kgf/cm ^{2}, 14−18 psi)	
Thermostat	Opening temperature	Begins to open			76−80 °C (169−176 °F)	
		Fully open			90 °C (194 °F)	
	Valve lift at fully open				8.0 mm (0.31 in.) min.	

Fuel and Emissions

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected		320−370 kPa (3.3−3.8 kgf/cm ^{2}, 47−54 psi)
Fuel tank	Capacity		42 L (11.0 US gal, 9.2 Imp gal)
Engine idle	Idle speed without load (L12B1)	M/T (in neutral)	700±50 rpm (min $^{-1}$)
	Idle speed without load (L13Z1)	M/T (in neutral)	650±50 rpm (min $^{-1}$)
		A/T (in N or P)	700±50 rpm (min $^{-1}$)
		i-SHIFT (in neutral)	650±50 rpm (min $^{-1}$)
	Idle speed without load (L15A7)	M/T (in neutral), A/T (in N or P)	700±50 rpm (min $^{-1}$)
	Idle speed with high electrical load (A/C switch ON, temperature set to max cool, blower fan on High, rear window defogger ON, and headlights on high beam)	M/T (in neutral), A/T (in N or P), i-SHIFT (in neutral)	790±50 rpm (min $^{-1}$)
	Idle CO		0.1 % max.

Clutch (Except i-SHIFT)

Item	Measurement	Qualification	Standard or New	Service Limit
Clutch pedal	Height from the floor	RHD	145 mm (5.71 in.)	———
		LHD	150 mm (5.91 in.)	———
	Stroke		120−130 mm (4.72−5.12 in.)	———
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	0.15 mm (0.006 in.)
Clutch disc	Rivet head depth		1.00−1.50 mm (0.039−0.059 in.)	0.2 mm (0.008 in.)
	Thickness		7.25−7.95 mm (0.285−0.313 in.)	5.0 mm (0.20 in.)
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)
	Height difference of diaphragm spring fingers measured with dial indicator		0.6 mm (0.02 in.) max.	1.0 mm (0.04 in.)

Clutch (i-SHIFT)

Item	Measurement	Qualification	Standard or New	Service Limit
Flywheel	Runout on clutch mating surface		0.05 mm (0.002 in.) max.	———
Clutch disc	Rivet head depth		1.1 mm (0.043 in.)	0.3 mm (0.012 in.)
	Thickness		7.6−8.0 mm (0.299−0.315 in.)	6.0 mm (0.236 in.)
Pressure plate	Warpage		0.03 mm (0.001 in.) max.	0.15 mm (0.006 in.)

Item	Measurement	Qualification	Standard or New	Service Limit
	Height of diaphragm spring fingers measured with feeler gauge and special tool		0.8 mm (0.03 in.)	1.0 mm (0.04 in.)

Steering

Item	Measurement	Qualification	Standard or New
Steering wheel	Rotational play measured at outside edge with engine running		0−10 mm (0−0.39 in.)
	Initial load measured at outside edge with engine running		29 N (3.0 kgf, 6.6 lbf)
Gearbox	Angle of rack guide screw loosened from locked position		10±3 °

Suspension

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel alignment (except KY 1.5LXE, 1.5EXE models)	Camber	Front	0 ° 00 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 20 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (0.10±0.10 in.)	
	Front wheel turning angle (except 16 inch wheel model and KE 1.2SE model and KG 1.4ES, 1.4ESH models)	Inward	42 ° 51 ′±2 °	
		Outward (reference)	34 ° 42 ′±1 °	
	Front wheel turning angle (16 inch wheel model and KE 1.2SE model and KG 1.4ES, 1.4ESH models)	Inward	40 ° 18 ′±2 °	
		Outward (reference)	33 ° 19 ′±1 °	
Wheel alignment (KY 1.5LXE, 1.5EXE models)	Camber	Front	0 ° 07 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 13 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (0.10±0.10 in.)	
	Front wheel turning angle	Inward	40 ° 38 ′±2 °	
		Outward (reference)	33 ° 30 ′±1 °	
Wheel	Steel wheel runout	Axial	0−1.0 mm (0−0.04 in.)	2.0 mm (0.08 in.)
		Radial	0−1.0 mm (0−0.04 in.)	1.5 mm (0.06 in.)
	Aluminium wheel runout	Axial	0−0.7 mm (0−0.03 in.)	2.0 mm (0.08 in.)
		Radial	0−0.7 mm (0−0.03 in.)	1.5 mm (0.06 in.)
Wheel bearing	End play	Front	0−0.05 mm (0−0.002 in.)	
		Rear	0−0.05 mm (0−0.002 in.)	

Brakes

Item	Measurement	Qualification	Standard or New	Service Limit
Parking brake	Distance traveled when lever pulled with 196 N (20 kgf, 44 lbf) of force	Disc	6 to 8 clicks	
		Drum	5 to 7 clicks	
Brake pedal	Pedal height (carpet moved aside)	M/T	139 mm (5.5 in.)	
		A/T	138 mm (5.4 in.)	
	Free play		1−5 mm (0.04−0.20 in.)	
Brake disc	Thickness	Front	20.9−21.1 mm (0.82−0.83 in.)	19.0 mm (0.75 in.)
		Rear	8.9−9.1 mm (0.35−0.36 in.)	8.0 mm (0.31 in.)
	Runout		———	0.04 mm (0.0016 in.)
	Parallelism		———	0.015 mm (0.0006 in.)
Brake pad	Thickness	Front	KE, KG: 9.3−10.2 mm (0.36−0.41 in.)	1.6 mm (0.06 in.)

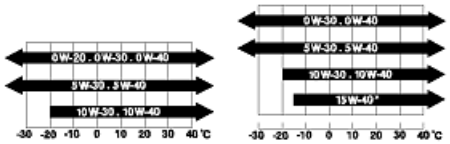
5TH	Fifth (gear)
6TH	Sixth (gear)

Lubricants and Fluids

⚠CAUTION

Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil.



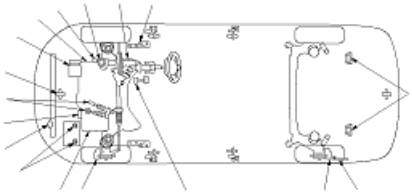
For the details of the lubrication points and the type of lubricants to be applied, refer to the illustrated index and the various work procedures (such as Assembly/Reassembly, Replacement, Overhaul, Installation, etc.) contained in each section.

	Application	Lubricant or Fluid
A	Engine (for Service Reminder System applicable EU countries)	Always use genuine Honda Motor Oil, ACEA A3/B3 or ACEA A5/B5 ACEA/SAE viscosity: See chart.
	Engine (for Service Reminder System non-applicable EU countries)	Always use genuine Honda Motor Oil, ACEA A1/B1 , ACEA A3/B3 or ACEA A5/B5 ACEA/SAE viscosity: See chart.
	Engine (except EU)	Always use API service grade SL or higher SAE viscosity: See chart.
B	Manual transmission	Honda Manual Transmission Fluid (MTF) Always use genuine Honda MTF *. Using motor oil can cause stiffer shifting because it does not contain the proper additives.
	Automatic transmission	Honda ATF-Z1 Always use genuine Honda ATF-Z1. Using a non-Honda ATF can affect shift quality.
C D	Brake system (including VSA lines) Clutch system (manual transmission)	Brake Fluid DOT 3 or DOT 4 We recommend genuine Honda Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
E F G H I J K	Release fork (manual transmission) Battery terminals Brake booster clevis pin Clutch master cylinder clevis pin (manual transmission) Fuel fill door Hood hinges and hood latch Trunk hinges	Multipurpose Grease
L	Caliper piston boot	Rubber Grease
M N	Caliper piston seal, caliper pins and boots Shift cable ends (manual transmission)	Silicone Grease
O	Air conditioning compressor	Compressor Oil:SP-10 (P/N 38897-P13-003 or 38899-P13-A01) for refrigerant HFC-134a (R-134a)
P	Cooling system	Always use genuine Honda All Season Antifreeze/Coolant Type 2

If genuine Honda MTF is not available, use API service SL or higher grade motor oil with a viscosity of SAE 10W-30 or 10W-40 as a temporary replacement.

NOTE:

- Lubricate the following grease using the recommended lubricants and fluids.
- In corrosive area, more frequent lubrication is necessary.
- The illustration shows the RHD model, the LHD model is simillar.

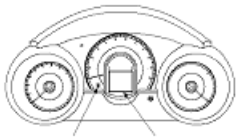


Service Reminder System General Information - for applicable EU countries

Service Reminder Information Display

The service reminder system is an important feature of the multi-information display. Based on engine operating conditions, the Fit/Jazz onboard computer (ECM/PCM) calculates the remaining engine oil life. The system also shows the service reminder information display along with the code for other scheduled maintenance items needing service.

Meter:



Steering Wheel:

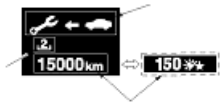
Applicable Countries

The service reminder system will not be applied for all the EU countries. Confirm the countries where the system is applied. The system is not active in default setting. The system needs to be activated by HDS at Honda dealer. If the vehicle is taken to outside of the applicable countries, apply the maintenance schedule for non-applicable countries.
NOTE: If you turn the service reminder system OFF after the first activation, it cannot be reactivated. When one month or more passes after disconnecting battery terminal, adjust the date and time on service reminder system using HDS.

How to Deactivate/Reactivate Service Reminder System with HDS

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the ignition switch to ON (II).
3. Select GAUGES from the BODY ELECTRICAL system select menu with the HDS.
4. Select ADJUSTMENT, then select SERVICE REMINDER.
5. Select SETTING, then ON/OFF the service reminder system.

Service Information

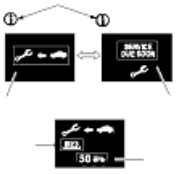


1. The service reminder information display is shown on the multi-information display. When the ignition switch is ON (II), and the remaining days are more than 30 days, the display shows a warning symbol (A), the maintenance item (B), and remaining distance or days (C). To see the service reminder information display, turn the ignition switch to ON (II), then push and release the SEL/RESET switch until the service reminder information display appears.

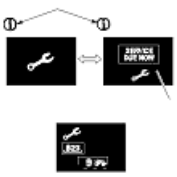
NOTE:

- Depending on the customer's driving condition, the remaining distance may not be always in agreement with the mileage in the odometer.
- The system switches the display between the remaining distance and the remaining days, depending on customer's driving conditions. If the customer does not drive frequently, generally the display shows the remaining days. The system monitors the driving condition, and records the elapsed time and distance from the last maintenance. Based on this data, the system assumes the future driving conditions and selects the appropriate service reminder information display.

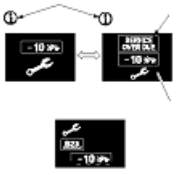
2. When the ignition switch is ON (II), and the remaining days are within 29 to 10 days, the warning symbol (A) or the maintenance service message ‘‘SERVICE DUE SOON" (B) is displayed. The message indicator (C) remains lit until the warning symbol or the message is canceled. To cancel the message or warning symbol, press the INFO or SET/RESET switch. The service reminder information display continues to show the warning symbol and the remaining distance or days (D) along with all the maintenance item(s) currently needing service.
Complete list of maintenance items (E).
NOTE: The language used in the warning message can be changed into several language. Refer to the Owner's Manual for details.



3. When the ignition switch is ON (II), and the remaining days are within 9 to 0 day, the warning symbol or the maintenance service message ‘‘SERVICE DUE NOW" (A) is displayed. The message indicator (B) remains lit until the warning symbol or the message is canceled. To cancel the message or warning symbol, press the INFO or SEL/RESET switch. The service reminder information display continues to show the warning symbol and the remaining distance or days along with all the maintenance item(s) currently needing service.



4. If the indicated maintenance is not done, the ‘‘SERVICE OVER DUE" message (A) or warning symbol appears along with total negative distance or days (B), for example ‘‘−10," on the display. This means the indicated maintenance item should have been done more than 10 days (or 10 km) ago. The message indicator (C) remains lit until the indicated maintenance is done.



Resetting the Service Reminder Information Display

NOTE:

- The vehicle must be stopped to reset the display.
- If a required service is done and the display is not reset, or if the service reminder information display is reset without doing the service the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.
- Each maintenance item can be independently reset with the HDS.

1. Turn the ignition switch to ON (II).
2. Press the SEL/RESET switch repeatedly until the service reminder information display appears.
3. Press and hold the SEL/RESET button for about 10 seconds, the service reminder reset display appears.
   NOTE:
   - If you are resetting the display when the remaining days are more than 30 days, make sure any maintenance item(s) requiring service are done before resetting the display.
   - To cancel the reset mode, push the SEL/RESET switch.

---

4. To reset the service reminder information display, select reset indicator (A) by pressing the INFO switch, then push the SEL/RESET switch. The maintenance item code(s) will disappear, and the remaining distance or days will also reset.
   The display will return to the service reminder information display, and you will see the next required maintenance item and remaining distance or days.

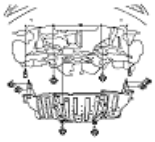
Alternator

Item	Measurement	Qualification	Standard or New	Service Limit
Alternator	Output	At 13.5 V and normal engine temperature	95 A	
	Coil (rotor) resistance	At 20 °C (68 °F)	2.1−2.3 Ω	
	Slip ring O.D.		22.7 mm (0.89 in.)	21.2 mm (0.83 in.)
	Brush length		23.0 mm (0.91 in.)	18.0 mm (0.71 in.)
	Brush spring tension		4.1−5.3 N (0.42−0.54 kgf, 0.93−1.19 lbs)	

Drive Belt Removal/Installation

1. Remove the splash shield.



2. Move the tensioner (A) with a wrench (B) in the direction shown to relieve tension from the drive belt, then remove the drive belt.
3. Install the new belt in the reverse order of removal.

With A/C compressor:

Without A/C compressor:

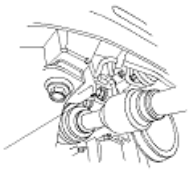
Drive belt

Item	Measurement	Qualification	Standard or New	Service Limit
Drive belt	Tension		Auto-tensioner	

Coolant Replacement

1. Start the engine. Set the heater temperature control dial to maximum heat, then turn the ignition switch to LOCK (0). Make sure the engine and radiator are cool to the touch.
2. Remove the radiator cap.
3. Remove the undercover.
4. Loosen the drain plug (A), and drain the coolant.

5. Remove the drain bolt (A) located at the rear of the engine block.
6. After the coolant has drained, then reinstall the bolt with a new washer and tighten it securely.
7. Tighten the radiator drain plug securely.
8. Remove, drain, and reinstall the coolant reservoir.



9. Fill the coolant reservoir to the MAX mark (A) with genuine Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001).

10. Pour genuine Honda Long Life Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck.

NOTE:
    - Always use genuine Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
    - Genuine Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.

    Engine Coolant Capacities (Including the coolant reservoir capacity of 0.44 L (0.116 US gal, 0.097 Imp gal)):
    L15A7 engine: M/T model: At Coolant Change: 4.43L (1.170 US gal, 0.975 Imp gal)
    After Engine Overhaul: 4.92L (1.300 US gal, 1.082 Imp gal)
    A/T model: At Coolant Change: 4.53L (1.197 US gal, 0.997 Imp gal)
    After Engine Overhaul: 5.02L (1.326 US gal, 1.104 Imp gal)
    L13Z1 engine: RHD M/T model: At Coolant Change: 4.46L (1.178 US gal, 0.981 Imp gal)
    After Engine Overhaul: 4.95L (1.308 US gal, 1.089 Imp gal)
    A/T model: At Coolant Change: 4.52L (1.194 US gal, 0.994 Imp gal)
    After Engine Overhaul: 5.01L (1.324 US gal, 1.102 Imp gal)
    L13Z1 engine: LHDM/T model: At Coolant Change: 4.42L (1.168 US gal, 0.972 Imp gal)
    After Engine Overhaul: 4.91L (1.297 US gal, 1.080 Imp gal)
    A/T model: At Coolant Change: 4.52L (1.194 US gal, 0.994 Imp gal)
    After Engine Overhaul: 5.01L (1.324 US gal, 1.102 Imp gal)
    L12B1 engine: RHD M/T model: At Coolant Change: 4.42L (1.168 US gal, 0.972 Imp gal)
    After Engine Overhaul: 4.91L (1.297 US gal, 1.080 Imp gal)
    L12B1 engine: LHD M/T model (JHM): At Coolant Change: 4.42L (1.168 US gal, 0.972 Imp gal)
    After Engine Overhaul: 4.91L (1.297 US gal, 1.080 Imp gal)
    L12B1 engine: LHD M/T model (RKT): At Coolant Change: 4.46L (1.178 US gal, 0.981 Imp gal)
    After Engine Overhaul: 4.95L (1.308 US gal, 1.089 Imp gal)

11. Loosely install the radiator cap.
12. Start the engine, and let it run until it warms up (the radiator fan comes on at least twice).
13. Turn off the engine. Check the level in the radiator and add genuine Honda Long Life Antifreeze/ Coolant Type 2, if needed.
14. Put the radiator cap on tightly, then start the engine again, and check for leaks.
15. Clean up any spilled engine coolant.
16. Without service reminder system, this procedure is complete.
17. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
18. Turn the ignition switch to ON (II).
19. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
20. Select BODY ELECTRICAL with the HDS.
21. Select ADJUSTMENT in GAUGE MENU with the HDS.
22. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
23. Select SERVICE REMINDER ITEM 5 with the HDS.
24. Install the undercover.

Coolant reservoir

Item	Measurement	Qualification	Standard or New
Coolant reservoir	Coolant capacity		0.44 L (0.116 US qt, 0.097 Imp qt)

Radiator

Item	Measurement	Qualification				Standard or New
Radiator	Coolant capacity (Includes engine, heater, hoses, and reservoir) Use genuine Honda All Season Antifreeze/Coolant Type 2	L12B1	RHD	M/T	Engine overhaul	4.91 L (1.297 US gal, 1.080 Imp gal)
					Coolant change	4.42 L (1.168 US gal, 0.972 Imp gal)
			LHD	M/T	Engine overhaul (Manufactured in Japan model)	4.91 L (1.297 US gal, 1.080 Imp gal)

in the Shop Manual, P/N 62TF000A

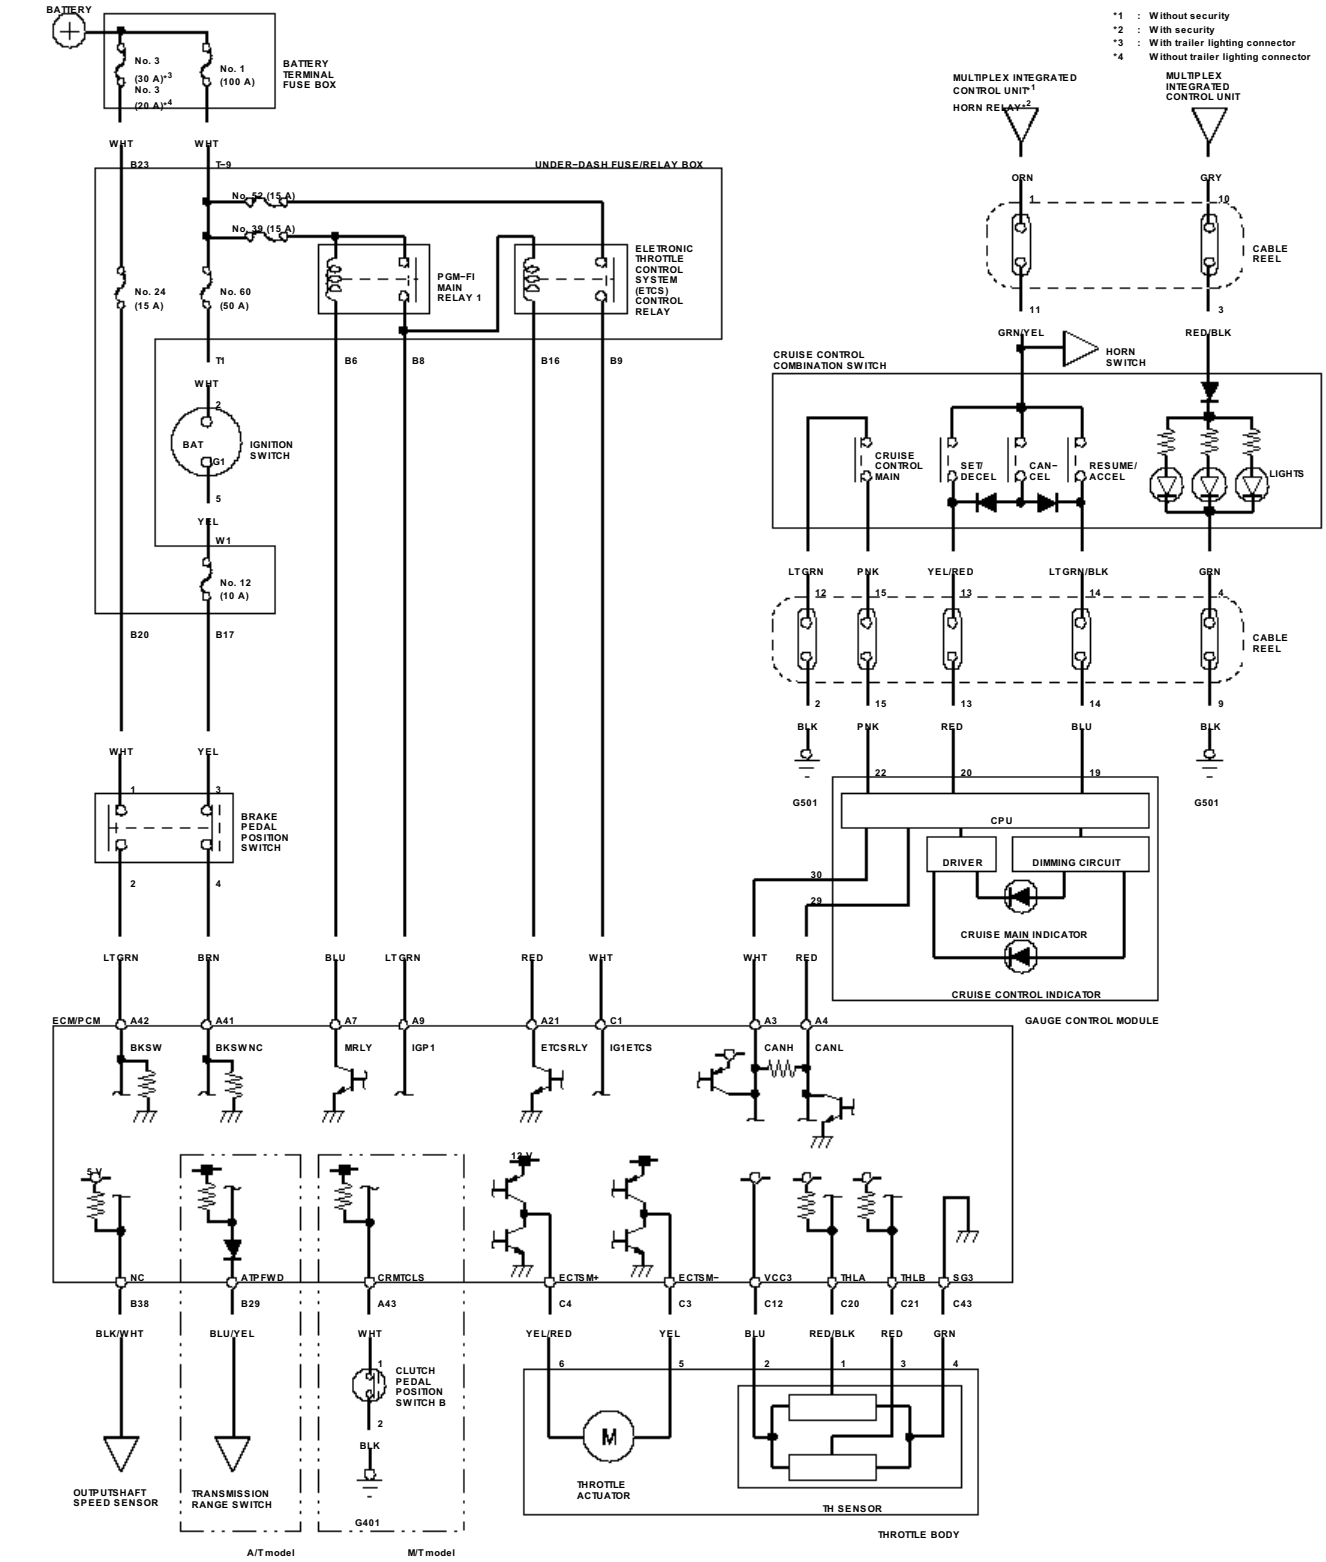
Cruise Control Circuit Diagram



Cruise control cannot be set

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the No. 24 (10 A) fuse in the under-dash fuse/relay box.
3. Do the cruise control combination switch test.
4. Do the cruise control input test.

Also check for

- Poor ground G101 (A/T model) or G401 (M/T model)

Cruise control can be set, but the cruise main indicator does not come on

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the gauge control module self-diagnostic function procedure.
3. Do the cruise control input test. Test the cruise control main switch signal input.

Also check for

- Faulty gauge control module

Cruise control can be set, but the cruise control indicator does not come on

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the gauge control module self-diagnostic function procedure.
3. Do the cruise control input test. Test the cruise control indicator signal input.

Also check for

- Faulty gauge control module

Vehicle does not decelerate or accelerate accordingly when the set/decel or resume/accel switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control set/decel and resume/accel switch signal input.

Also check for

- Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire

Set speed does not cancel when the brake pedal is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the brake pedal position switch test.
3. Do the cruise control input test. Test the brake pedal position switch signal input.

Also check for

- Short to power on the BRN wire
- Faulty brake pedal position switch

Set speed does not cancel when the cruise control main switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control main switch signal input.

Also check for

- Short to power on the PNK wire

Set speed does not cancel when the cancel switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control cancel switch signal input.

Also check for

- Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire

Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the brake pedal position switch adjustment.
3. Do the cruise control combination switch test.
4. Do the cruise control input test. Test the cruise control resume/accel switch signal input. Test the brake pedal position switch signal input.

Also check for

- Faulty brake pedal position switch
- Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire

With the ignition switch in ON (II), and the lighting switch turned on, the cruise control combination switch illumination does not come on

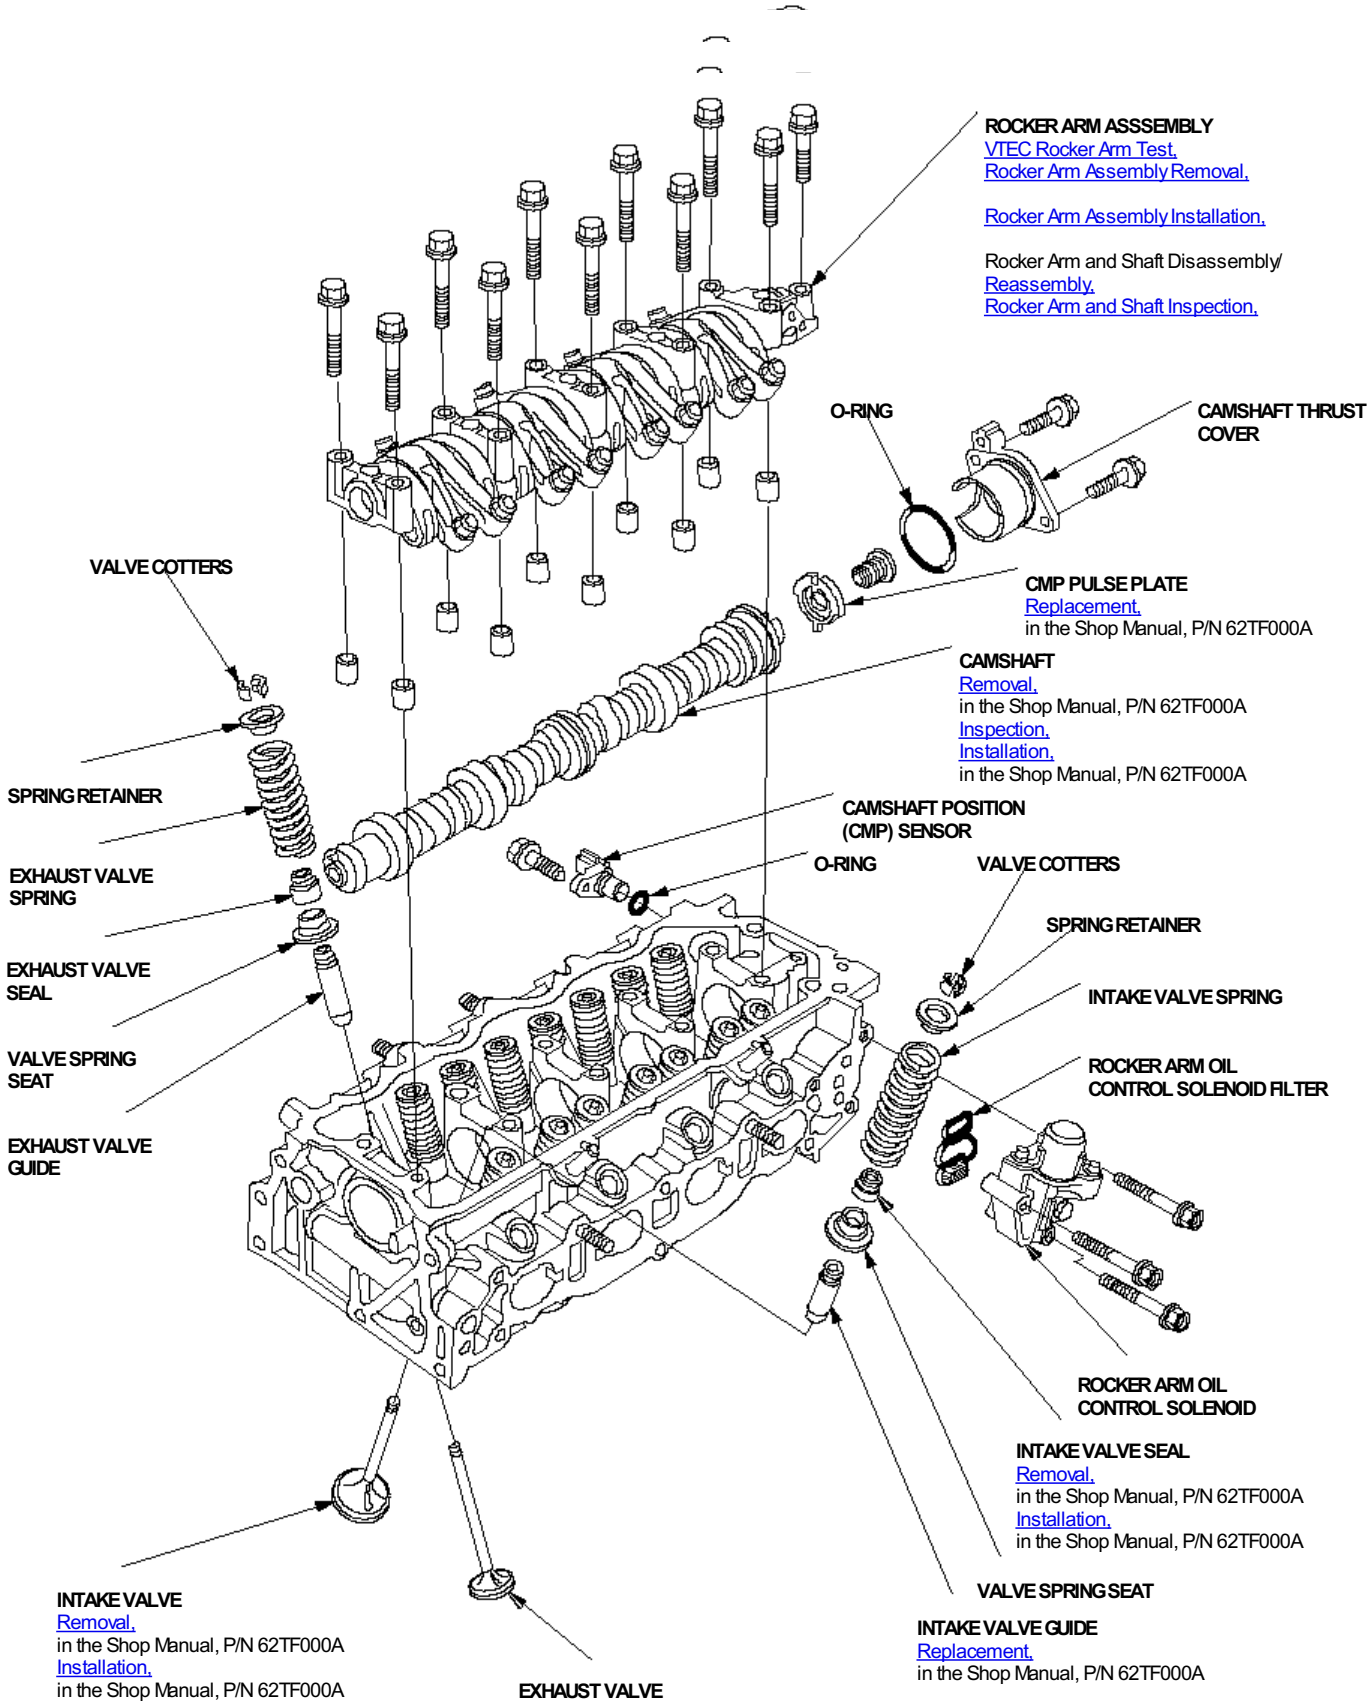
Diagnostic procedure

1. Do the cruise control combination switch test.

Cruise Control Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Cruise control cannot be set	1. Check for PGM-FI DTCs. 2. Check the No. 24 (10 A) fuse in the under-dash fuse/relay box. 3. Do the cruise control combination switch test. 4. Do the cruise control input test.	Poor ground G101 (A/T model) or G401 (M/T model)
Cruise control can be set, but the cruise main indicator does not come on	1. Check for PGM-FI DTCs. 2. Do the gauge control module self-diagnostic function procedure. 3. Do the cruise control input test. Test the cruise control main switch signal input.	Faulty gauge control module
Cruise control can be set, but the cruise control indicator does not come on	1. Check for PGM-FI DTCs. 2. Do the gauge control module self-diagnostic function procedure. 3. Do the cruise control input test. Test the cruise control indicator signal input.	Faulty gauge control module
Vehicle does not decelerate or accelerate accordingly when the set/decel or resume/accel switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control set/decel and resume/accel switch signal input.	Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire
Set speed does not cancel when the brake pedal is pressed	1. Check for PGM-FI DTCs. 2. Do the brake pedal position switch test. 3. Do the cruise control input test. Test the brake pedal position switch signal input.	• Short to power on the BRN wire • Faulty brake pedal position switch
Set speed does not cancel (engine rpm stays high) when the clutch pedal is pressed	1. Check for PGM-FI DTCs. 2. Do the clutch pedal position switch B test. 3. Do the cruise control input test. Test the clutch pedal position switch B signal input.	• Short to ground on the WHT wire • Faulty clutch pedal position switch B
Set speed does not cancel when the cruise control main switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control main switch signal input.	Short to power on the PNK wire
Set speed does not cancel when the cancel switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control cancel switch signal input.	Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)	1. Check for PGM-FI DTCs. 2. Check the brake pedal position switch adjustment. 3. Do the cruise control combination switch test. 4. Do the cruise control input test. Test the cruise control resume/accel switch signal input. Test the brake pedal position switch signal input.	• Faulty brake pedal position switch • Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the clutch pedal)	1. Check for PGM-FI DTCs. 2. Check the clutch pedal position switch B adjustment. 3. Do the cruise control combination switch test. 4. Do the cruise control input test. Test the cruise control resume/accel switch B signal input. Test the clutch pedal position switch B signal input.	• Faulty clutch pedal position switch B • Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire
With the ignition switch in ON (II), and the lighting switch turned on, the cruise control combination switch illumination does not come on	Do the cruise control combination switch test.	

Cylinder Head Component Location Index



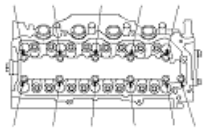
Head

Item	Measurement	Qualification	Standard or New	Service Limit
Head	Warpage		0.07 mm (0.0028 in.)	0.08 mm (0.003 in.)
	Height		119.9−120.1 mm (4.720−4.728 in.)	———

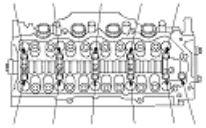
Camshaft Inspection

1. Remove the camshaft sprocket.
2. Remove the rocker arm assembly, then disassemble the rocker arm.
3. Put the rocker shaft holder bridge/rocker shaft holders on the cylinder head, then tighten the bolts to the specified torque.
   Specified Torque
   6 x 1.0 mm
   (1)–(10): 15 N·m (1.5 kgf·m, 11 lbf·ft)
   (11): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)
4. Seat the camshaft by pushing it toward the rear of the cylinder head.

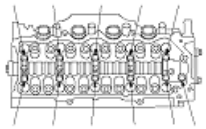
L15A7 engine



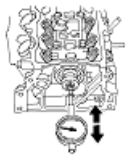
L13Z1 engine



L12B1 engine

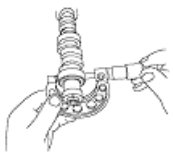


5. Zero the dial indicator against the end of the camshaft. Push the camshaft back and forth, and read the end play. If the end play is beyond the service limit, replace the thrust cover and recheck. If it is still beyond the service limit, replace the camshaft.
   Camshaft End Play
   Standard (New): 0.05–0.25 mm (0.002–0.010 in.)
   Service Limit: 0.5 mm (0.02 in.)



6. Remove the camshaft.
7. Wipe the camshaft clean, then inspect the lift ramps. Replace the camshaft if any lobes are pitted, scored, or excessively worn.

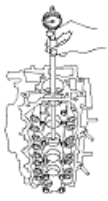
8. Measure the diameter of each camshaft journal.



9. Zero the gauge to the journal diameter.

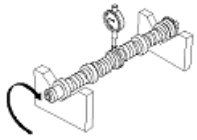
10. Clean the camshaft bearing surfaces in the cylinder head. Measure the inside diameter of each camshaft bearing surface, and check for an out-of-round condition.
    - If the camshaft-to-holder clearance is within limits, go to Step 12 .
    - If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has been replaced, replace the cylinder head.
    - If the camshaft-to-holder clearance is beyond the service limit, and the camshaft has not been replaced, go to Step 11 .

    Camshaft-to-Holder Oil Clearance
    Standard (New): 0.045–0.084 mm (0.0018–0.0033 in.)
    Service Limit: 0.100 mm (0.004 in.)

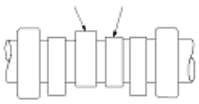


11. Check the total runout with the camshaft supported on V-blocks.
    - If the total runout of the camshaft is within the service limit, replace the cylinder head.
    - If the total runout is beyond the service limit, replace the camshaft, and recheck the oil clearance. If the oil clearance is still out of tolerance, replace the cylinder head.

    Camshaft Total Runout
    Standard (New): 0.03 mm (0.001 in.) max.
    Service Limit: 0.04 mm (0.002 in.)



12. Measure the cam lobe height.



Cam Lobe Height Standard (New):

		INTAKE	EXHAUST
L15A7 engine	PRI	35.241 mm (1.3874 in.)	35.471 mm (1.3965 in.)
	SEC	36.173 mm (1.4241 in.)	
L13Z1 engine	PRI	34.290 mm (1.3500 in.)	35.047 mm (1.3798 in.)
	SEC	30.529 mm (1.2019 in.)	
L12B1 engine	PRI	34.290 mm (1.3500 in.)	35.047 mm (1.3798 in.)
	SEC	30.529 mm (1.2019 in.)	

PRI: Primary SEC: Secondary IN: Intake
EX: Exhaust C/C: Cam Chain

VTEC Rocker Arm Test

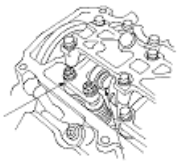
Special Tools Required

Air supply, 3/8
07LAJ-PR30102

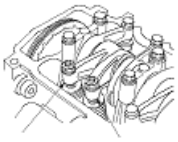
Air adapter, M10 x 1.0
070AJ-0010101

1. Start the engine, and let it run for 5 minutes, then turn the ignition switch to LOCK (0).
2. Remove the cylinder head cover.
3. Rotate the crankshaft clockwise, and visually check that all the primary rocker arms (A) and secondary rocker arms (B) move freely.
   - If the primary rocker arm and secondary rocker arm move together, remove the primary and secondary rocker arms as an assembly, and check that the pistons in the primary and secondary rocker arms move smoothly. If any rocker arm needs replacing, replace the primary and secondary rocker arms as an assembly, then retest.
   - If all the primary rocker arms and secondary rocker arms move freely, go to Step 4 .
4. Check that the air pressure on the shop air compressor gauge indicates over 400 kPa (4 kgf/cm ^{2}, 57 psi).
5. Inspect the valve clearance.

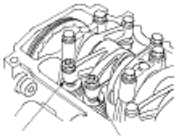
L15A7 engine



L13Z1 engine



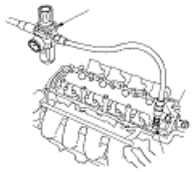
L12B1 engine



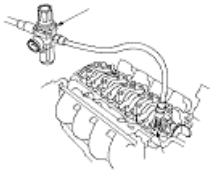
---

6. Install the air adapter (A) to the inspection hole, then connect the valve inspection set (B).
7. Loosen the valve on the regulator, and apply the specified air pressure.
   Specified Air Pressure:
   340 kPa (3.5 kgf/cm ^{2}, 50 psi)

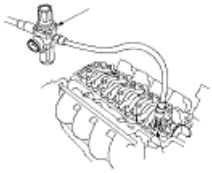
L15A7 engine



L13Z1 engine



L12B1 engine

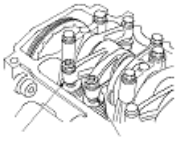


---

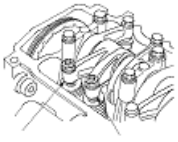
8. With the specified air pressure applied, rotate the crankshaft clockwise, and visually check that all the primary rocker arms (A) and secondary rocker arms (B) move together.
   If the primary rocker arm and secondary rocker arm move freely and independently of each other, remove the primary and secondary rocker arms as an assembly, and check that the pistons in the primary and secondary rocker arms move smoothly. If any rocker arm needs replacing, replace the primary and secondary rocker arms as an assembly, and test.
9. Remove the air supply and the VTEC adapter.
10. Install the cylinder head cover.

L15A7 engine

L13Z1 engine



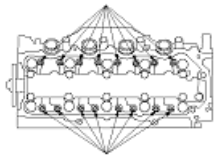
L12B1 engine



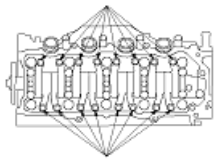
Cylinder Head Rocker Arm Assembly Removal

1. Remove the cylinder head cover.
2. Loosen the rocker arm adjusting screws (A).

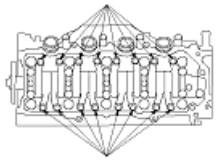
L15A7 engine



L13Z1 engine

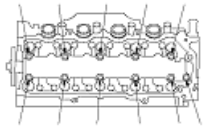


L12B1 engine

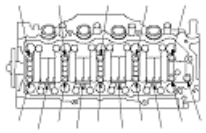


3. Unscrew the rocker shaft mounting bolts two turns at a time, in sequence below.
   NOTE: With L13Z1 engine, L12B1 engine: Bundle the intake rocker arms with rubber bands (A) to keep them together as a set.

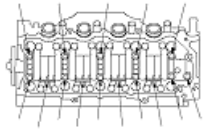
L15A7 engine



L13Z1 engine

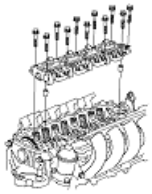


L12B1 engine

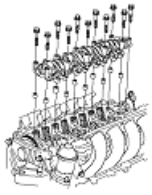


4. Remove the rocker shaft mounting bolts, then remove the rocker arm assembly (A).

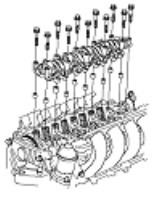
L15A7 engine



L13Z1 engine



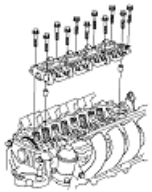
L12B1 engine



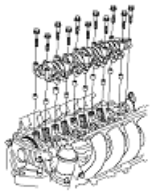
Cylinder Head Rocker Arm Assembly Installation

1. Install the rocker arm assembly (A).

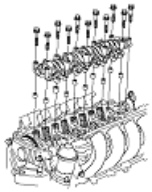
L15A7 engine



L13Z1 engine

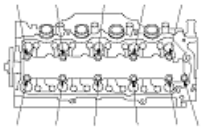


L12B1 engine

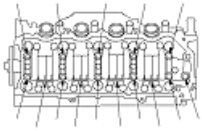


2. Tighten each bolts two turns at a time in sequence.
   NOTE: With L13Z1 engine, L12B1 engine: Remove the rubber bands (A) from the intake rocker arms.
   Specified Torque
   6 x 1.0 mm
   (1)–(10): 15 N·m (1.5 kgf·m, 11 lbf·ft)
   (11): 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft)

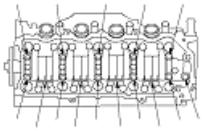
L15A7 engine



L13Z1 engine



L12B1 engine



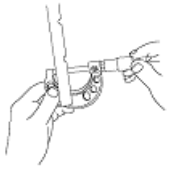
3. Adjust the valve clearance.
4. Install the cylinder head cover.

Rocker arm

Item	Measurement	Qualification	Standard or New	Service Limit
Rocker arm	Arm-to-shaft clearance	Intake	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)
		Exhaust	0.019–0.058 mm (0.0007–0.0023 in.)	0.08 mm (0.003 in.)

Cylinder Head Rocker Arm and Shaft Inspection

1. Remove the rocker arm assembly.
2. Disassemble the rocker arm assembly.
3. Measure the diameter of the shaft at the first rocker location.



4. Zero the gauge (A) to the shaft diameter.

5. Measure the inside diameter of the rocker arm, and check it for an out-of-round condition.

Rocker Arm-to-Shaft Clearance

L15A7 engine:	
Intake:	
Standard (New):	**0.017–0.048 mm (0.0007–0.0019 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Exhaust:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Intake:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Exhaust:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Intake:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**
Exhaust:	
Standard (New):	**0.019–0.050 mm (0.0007–0.0020 in.)**
Service Limit:	**0.08 mm (0.0031 in.)**

6. Repeat for all rockers and shaft. If the clearance is beyond the service limit, replace the rocker shaft and all out of service limit rocker arms. If any VTEC rocker arm needs replacement, replace the rocker arms as an assembly.

VTEC Rocker Arms

7. Inspect the rocker arm pistons (B). Push on them manually. If they do not move smoothly, replace the rocker arm set.
   NOTE:
   - Apply new engine oil to the rocker arm pistons when reassembling.
   - When reassembling the secondary rocker arm A, carefully apply air pressure to the oil passage of the rocker arm.
8. Reassemble the rocker arm assembly.
9. Install the rocker arm assembly.

L15A7 engine

L13Z1 engine

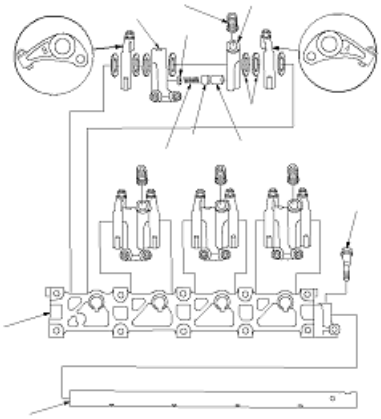
L12B1 engine

Cylinder Head Rocker Arm and Shaft Disassembly/Reassembly

L15A7 engine

NOTE:

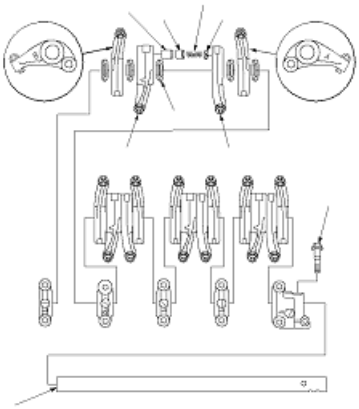
- Identify each part as it is removed so that each item can be reinstalled in its original position.
- Inspect the rocker arm shaft and the rocker arms.
- If reused, the rocker arms must be installed in the their original location.
- Remove the rocker shaft bolt before removing the rocker shaft from the rocker shaft holder bridge.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to any contact points.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.



L13Z1 engine

NOTE:

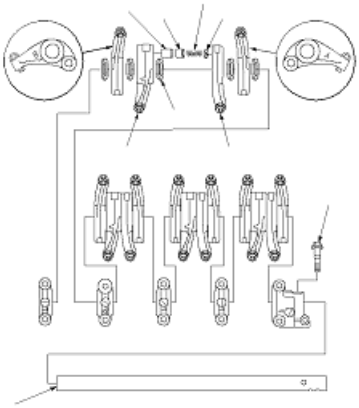
- Identify each part as it is removed so that each item can be reinstalled in its original position.
- Inspect the rocker arm shaft and the rocker arms.
- If reused, the rocker arms must be installed in the their original location.
- Remove the rocker shaft bolt before removing the rocker shaft from the No. 5 rocker shaft holder.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to any contact points.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.
- When reassembling the rocker arm and shaft assembly, position the arrows on the rocker shaft holders facing the cam chain side.



L12B1 engine

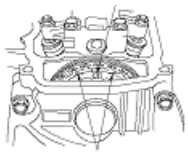
NOTE:

- Identify each part as it is removed so that each item can be reinstalled in its original position.
- Inspect the rocker arm shaft and the rocker arms.
- If reused, the rocker arms must be installed in the their original location.
- Remove the rocker shaft bolt before removing the rocker shaft from the No. 5 rocker shaft holder.
- Prior to reassembling, clean all the parts in solvent, dry them, and apply new engine oil to any contact points.
- When replacing the rocker arm assembly, remove the fastening hardware from the new rocker arm assembly.
- When reassembling the rocker arm and shaft assembly, position the arrows on the rocker shaft holders facing the cam chain side.

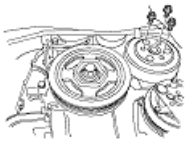


Cam Chain Removal

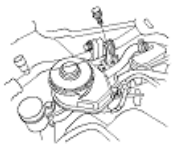
NOTE: Keep the cam chain away from magnetic fields.



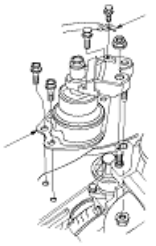
1. Remove the cylinder head cover.
2. Set the No. 1 piston at top dead center (TDC). The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.
3. Remove the right front wheel.
4. Remove the right side splash shield.
5. Loosen the water pump pulley mounting bolts.
6. Remove the drive belt.



7. Remove the water pump pulley.
8. Remove the crankshaft pulley.
9. Remove the drive belt auto-tensioner.



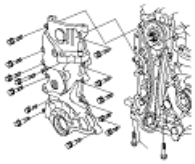
10. Remove the A/C line bracket mounting bolt.
11. Support the engine with a jack and wood block under the oil pan.



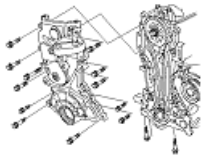
12. Remove the ground cable (A), then remove the side engine mount/bracket assembly (B).

13. Remove the chain case.

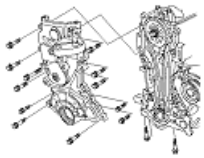
L15A7 engine



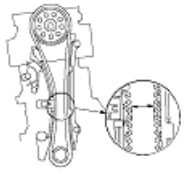
L13Z1 engine



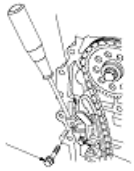
L12B1 engine



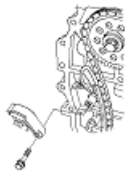
14. Measure the cam chain separation. If the distance is less than the service limit, replace the cam chain and cam chain tensioner.
    Standard Distance: 19 mm (0.75 in.)
    Service Limit: 15 mm (0.59 in.)



15. Apply new engine oil to the sliding surface of the cam chain tensioner slider (A).
16. Hold the cam chain tensioner slider with the screwdriver, then remove the bolt (B), and loosen the bolt (C).



17. Remove the cam chain tensioner slider.



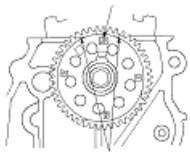
18. Remove the cam chain tensioner (A) and the cam chain guide (B).
19. Remove the cam chain.

Cam Chain Installation

NOTE: Keep the cam chain away from magnetic fields.

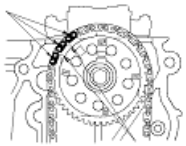
1. Set the crankshaft to top dead center (TDC). Align the TDC mark (A) on the crankshaft sprocket with the pointer (B) on the oil pump.
2. Remove the crankshaft sprocket.

3. Set the camshaft to TDC. The “UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.

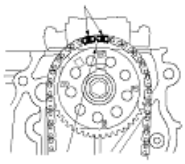


4. Install the cam chain on the crankshaft sprocket with the colored piece (A) aligned with the TDC mark (B) on the crankshaft sprocket, then install the crankshaft sprocket to the crankshaft.

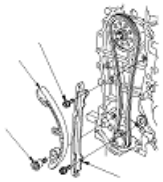
5. With L15A7 engine: Install the cam chain on the camshaft sprocket with the pointers (A) aligned with the three colored pieces (B) as shown.



6. With L13Z1 engine, L12B1 engine: Install the cam chain on the camshaft sprocket with the pointer (A) aligned with the center of the two colored pieces (B).

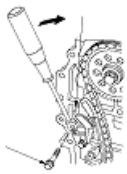


7. Install the cam chain tensioner (A) and the cam chain guide (B).

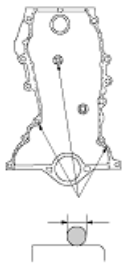


8. Install the cam chain tensioner slider, and tighten the bolt loosely.

9. Apply new engine oil to the sliding surface of the cam chain tensioner slider (A).
10. Rotate the cam chain tensioner slider clockwise to compress the cam chain tensioner, and install the remaining bolt, then tighten the bolts.
11. Check the chain case oil seal for damage. If the oil seal is damaged, replace the chain case oil seal.
12. Remove the all of the old liquid gasket from the chain case mating surfaces, the bolts, and the bolt holes.
13. Clean and dry the chain case mating surfaces.

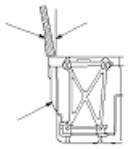


14. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the engine block mating surface of the chain case and to the inner threads of the bolt holes.
NOTE: Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).



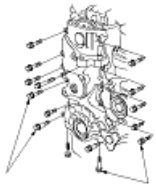
15. Apply liquid gasket (P/N 08C70-K0234M, 08C70-K0334M, or 08C70-X0331S) to the oil pan mating surface of the chain case and to the inner threads of the bolt holes.
NOTE:
    - Apply liquid gasket about 2.5 mm (0.098 in.) diameter bead along the broken line (A).
    - Apply liquid gasket about 5.0 mm (0.20 in.) diameter bead to the shaded area (B).
    - Do not install components if 5 minutes or more have passed after applying the liquid gasket. Instead, remove the old residue and reapply the liquid gasket.

16. Set the edge of the chain case (A) to the edge of the oil pan (B), then install the chain case on the engine block (C).
NOTE:
    - When installing the chain case, do not slide the bottom surface onto the oil pan mounting surface.
    - Wait at least 30 minutes before filling the engine with oil.
    - Do not run the engine for at least 3 hours after installing the chain case.

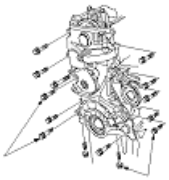


17. Tighten the chain case mounting bolts. Wipe off the excess liquid gasket on the oil pan and the chain case mating area.

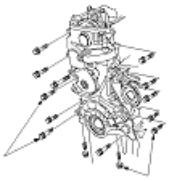
L15A7 engine



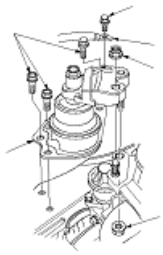
L13Z1 engine



L12B1 engine

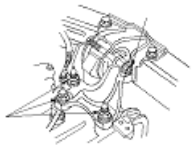


18. Install the side engine mount/bracket assembly (A), then tighten the new side engine mount/bracket assembly mounting bolts (B).
19. Loosely tighten the new side engine mount/bracket assembly mounting nuts (C).
20. Install the ground cable (D).
21. Remove the air cleaner housing assembly.



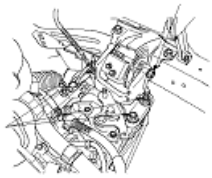
22. Loosen the transmission mount bracket mounting bolts and nuts (A).
23. Raise the vehicle on the lift to full height.

M/T model



A/T model

i-SHIFT model



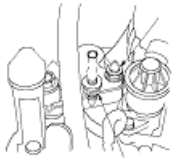
24. Loosen the torque rod mounting bolt and nut (A).
25. Lower the vehicle on the lift.

M/T model

A/T model

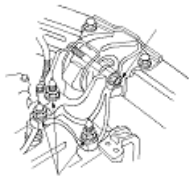
i-SHIFT model

26. Tighten the side engine mount/bracket assembly mounting nuts in the numbered sequence shown.



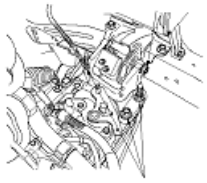
27. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
28. Raise the vehicle on the lift to full height.

M/T model



A/T model

i-SHIFT model



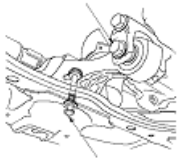
---

29. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.
30. Lower the vehicle on the lift.
31. Install the air cleaner housing assembly.

M/T model

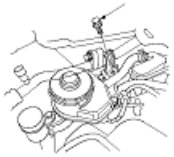
A/T model

i-SHIFT model



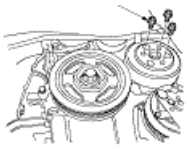
---

32. Install the A/C line bracket mounting bolt.
33. Install the cylinder head cover.
34. Install the drive belt auto-tensioner.
35. Install the crankshaft pulley.



---

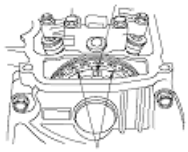
36. Install the water pump pulley.
37. Install the drive belt.
38. Tighten the water pump pulley mounting bolts.
39. Install the right side splash shield.
40. Install the right front wheel.
41. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.



Cylinder Head Valve Clearance Adjustment

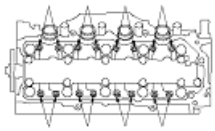
NOTE: Adjust the valves only when the cylinder head temperature is less than 38 °C (100 °F).

1. Remove the cylinder head cover.
2. Set the No. 1 piston at top dead center (TDC). The ‘‘UP" mark (A) on the camshaft sprocket should be at the top, and the TDC grooves (B) on the camshaft sprocket should line up with the top edge of the head.

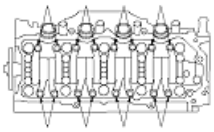


3. Select the correct thickness feeler gauge for the valves you are going to check.
   Valve Clearance
   Intake: 0.15–0.19 mm (0.006–0.007 in.)
   Exhaust: 0.26–0.30 mm (0.010–0.012 in.)

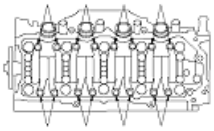
L15A7 engine



L13Z1 engine

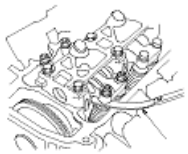


L12B1 engine

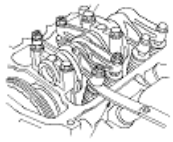


4. Insert the feeler gauge (A) between the adjusting screw and the end of the valve stem on No. 1 cylinder and slide it back and forth; you should feel a slight amount of drag.

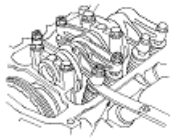
L15A7 engine



L13Z1 engine



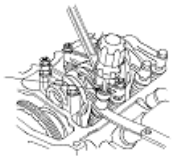
L12B1 engine



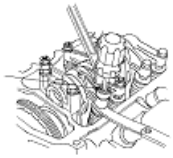
5. If you feel too much or too little drag, loosen the locknut, and turn the adjusting screw (A) until the drag on the feeler gauge is correct.
6. Tighten the locknut and recheck the clearance. Repeat the adjustment, if necessary.
7. Tighten the locknut to the specified torque, and recheck the valve clearance. Repeat the adjustment if necessary.
   Specified Torque
   7 x 0.75 mm 14 N·m (1.4 kgf·m, 10 lbf·ft)
   Apply new engine oil to the nut threads.

L15A7 engine

L13Z1 engine

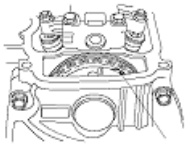


L12B1 engine



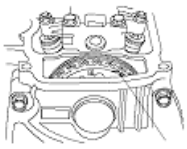
---

8. Rotate the crankshaft clockwise. Align the No. 3 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
9. Check, and if necessary, adjust the valve clearance on the No. 3 cylinder.



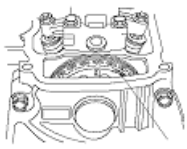
---

10. Rotate the crankshaft clockwise. Align the No. 4 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
11. Check, and if necessary, adjust the valve clearance on the No. 4 cylinder.



---

12. Rotate the crankshaft clockwise. Align the No. 2 piston TDC groove (A) on the camshaft sprocket with the top edge of the head.
13. Check, and if necessary, adjust the valve clearance on the No. 2 cylinder.
14. Install the cylinder head cover.
15. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
16. Turn the ignition switch to ON (II).
17. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it does not communicate, troubleshoot the DLC circuit.
18. Select BODY ELECTRICAL with the HDS.
19. Select ADJUSTMENT in GAUGE MENU with the HDS.
20. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
21. Select SERVICE REMINDER ITEM 9 with the HDS.



Valve

Item	Measurement	Qualification	Standard or New	Service Limit
Valve	Clearance (cold)	Intake	0.15−0.19 mm (0.006−0.007 in.)	———
		Exhaust	0.26−0.30 mm (0.010−0.012 in.)	———
	Stem O.D.	Intake	5.48−5.49 mm (0.216−0.216 in.)	5.45 mm (0.215 in.)
		Exhaust	5.45−5.46 mm (0.215−0.215 in.)	5.42 mm (0.213 in.)

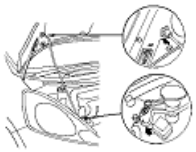
Engine Removal

Special Tools Required



Engine tilt hanger set
07KAK-SJ40101

Engine hanger stay
07KAK-SJ40200

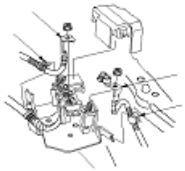
Sub hanger stay
07MAK-PY30100

NOTE:

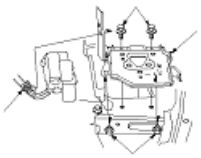
- Use a fender covers to avoid damaging painted surfaces.
- To avoid damaging the wiring and terminals, unplug the wiring connectors carefully while holding the connector portion.
- Mark all wiring and hoses to avoid misconnection. Also, be sure that they do not contact other wiring or hoses, or interfere with other parts.

1. Remove the hood support rod, then use it as shown to prop the hood in the wide-open position.
2. Relieve the fuel pressure.
3. Do the battery terminal disconnect procedure.
4. Remove the battery.
5. Remove the under-cowl panel.
6. Remove the air cleaner housing assembly.

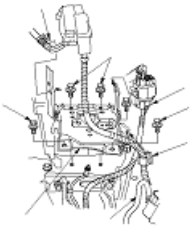
7. Without i-SHIFT model: Remove the battery cables (A) from the battery terminal fuse box.
8. Remove the harness clamps (B).



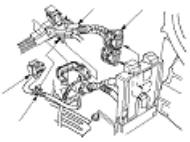
9. With M/T model: Remove the battery harness clamp (A). Remove the two bolts (B) and loosen the two bolts (C), then remove the battery base (D).



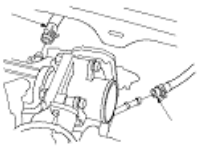
10. With i-SHIFT model: Remove the battery harness clamp (A). Remove the battery bolts (B), and the bracket (C), then release the lock and the bracket, then release the lock and remove the clutch actuator connector (C) and reservoir tube (D), then remove the battery base (E).
11. With i-SHIFT model: Remove the clutch actuator (TCM).



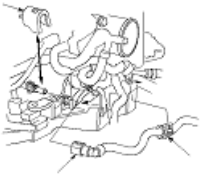
12. Disconnect the engine control module (ECM)/ powertrain control module (PCM) connectors (A) and the engine wire harness connector (B).
13. Remove the harness clamp (C) and harness holder (D).



14. Disconnect the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).



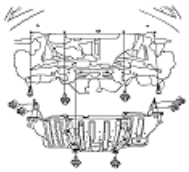
15. Remove the fuel feed hose clamp (A) and the quick-connect fitting cover (B), then disconnect the fuel feed hose (C).



16. Disconnect the secondary heated oxygen sensor (secondary HO2S) connector (A), then remove the secondary HO2S harness from the clamps (B).
17. M/T model: Remove the shift cable.
18. M/T model: Remove the clutch slave cylinder, and clutch line bracket mounting bolt.
19. With i-SHIFT model: Remove the clutch slave cylinder.
20. Remove the radiator cap.
21. Raise the vehicle on the lift to full height.
22. Remove the front wheels.

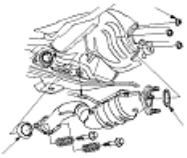
---

23. Remove the splash shields.
24. Remove the drive belt.
25. Loosen the drain plug in the radiator, and drain the engine coolant.
26. Drain the engine oil.
27. Drain the transmission fluid:
    - Manual transmission
    - Automatic transmission
    - i-SHIFT system transmission



---

28. Remove the under-floor three way catalytic converter (under-floor TWC).
29. A/T model: Remove the shift cable.
30. Remove the stabilizer links from the stabilizer.
31. With HID lamp model: If removing the left side lower arm, disconnect the suspension stroke sensor, and the lower arm.
32. Separate the knuckles from the lower arms.

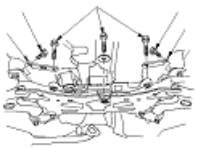


---

33. Remove the driveshaft heat shield.
34. Remove the driveshafts. Coat all precision-finished surfaces with clean engine oil. Tie a plastic bags over the driveshaft ends.

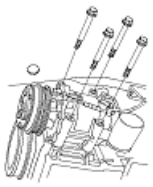
---

35. Remove the bolts (A) securing the steering gearbox, then remove the steering gearbox stiffeners (B).



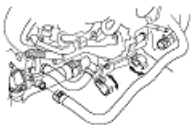
---

36. Remove the A/C compressor without disconnecting the A/C hoses (with A/C).
37. Lower the vehicle on the lift.
38. Remove the radiator.



---

39. Disconnect the heater hoses.
40. Raise the vehicle on the lift to full height.
41. Support the transmission with a jack and wood block under the transmission.



---

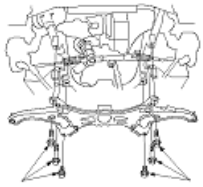
42. Remove the torque rod.
43. Remove the jack.

M/T model

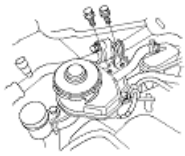
A/T model

i-SHIFT model

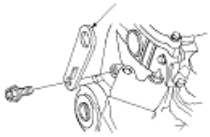
44. Remove the front subframe.
45. Lower the vehicle on the lift.



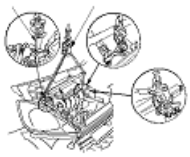
46. With RHD model: Remove the brake fluid reservoir tank bracket mounting bolts.



47. Install the sub hanger stay.

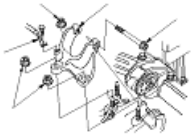


48. Attach the special tools to the engine/transmission as shown.

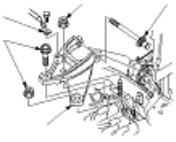


49. Remove the ground cable (A), then remove the transmission mount bracket (B).

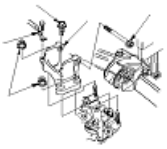
M/T model



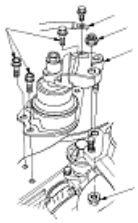
A/T model



i-SHIFT model



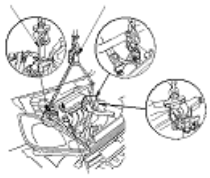
50. Remove the ground cable (A), then remove the side engine mount/bracket assembly (B).



51. Check that the engine/transmission is completely free of vacuum hoses, fuel and coolant hoses, and electrical wiring.
52. Slowly lower the engine/transmission about 150 mm (6 in.). Check once again that all hoses and electrical wiring are disconnected and free from the engine/transmission, then lower it all the way.
53. Disconnect the chain hoist from the engine/transmission.
54. Raise the vehicle, and remove the engine/transmission from under the vehicle.

Engine Installation

Special Tools Required



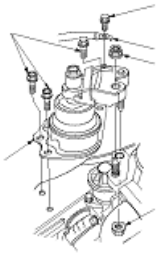
Engine tilt hanger set
07KAK-SJ40101

Engine hanger stay
07KAK-SJ40200

Sub hanger stay
07MAK-PY30100

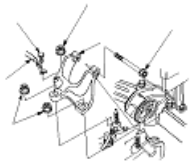
1. Raise the vehicle on the lift, and position the engine/transmission under the vehicle. Lower the vehicle, and attach the special tools to the engine/transmission, then lift the engine/transmission into position in the vehicle.
   NOTE: Reinstall the mounting bolts and support nuts in the sequence given in the following steps. Failure to follow this sequence may cause excessive noise and vibration, and reduce engine mount life.

2. Install the side engine mount/bracket assembly (A), then tighten the new side engine mount/bracket assembly mounting bolts (B) and nuts (C).
3. Loosely tighten the new side engine mount/bracket assembly mounting nuts.
4. Install the ground cable (D).

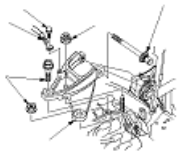


5. Install the transmission mount bracket (A), and loosely tighten the new transmission mount bracket mounting bolts and nuts (B).
6. Install the ground cable (C).
7. Remove the engine tilt hanger set from the engine/transmission

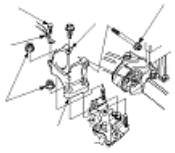
M/T model



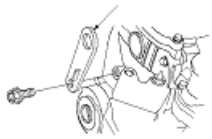
A/T model



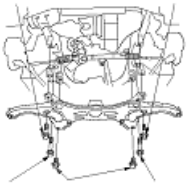
i-SHIFT model



8. Remove the sub hanger stay.
9. Raise the vehicle on the lift to full height.

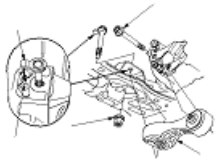


10. Install the front subframe, then tighten the new front subframe mounting bolts in the numbered sequence shown.

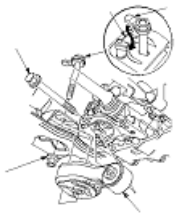


11. Install the torque rod (A). Install the new bolt with the tab (B) on the bolt head aligned with the guide (C) on the front subframe, then loosely tighten the new torque rod mounting bolt and nut (D).
12. Lower the vehicle on the lift.

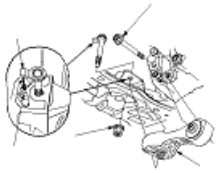
M/T model



A/T model

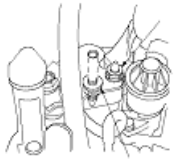


i-SHIFT model



---

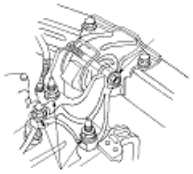
13. Tighten the side engine mount/bracket assembly mounting nuts in the numbered sequence shown.



---

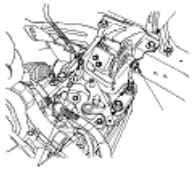
14. Tighten the transmission mount mounting bolts and nuts in the numbered sequence shown.
15. Raise the vehicle on the lift to full height.

M/T model



A/T model

i-SHIFT model

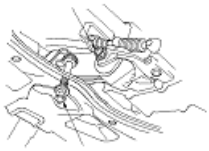


---

16. Tighten the torque rod mounting bolt and nut in the numbered sequence shown.

M/T model

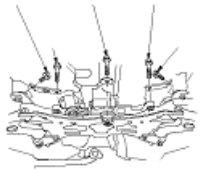
A/T model



i-SHIFT model

---

17. Install the securing the steering gearbox and the steering gearbox stiffeners, then tighten the new bolts in the numbered sequence shown.
18. Install a new set ring on the end of each driveshaft, then install the driveshafts. Make sure each ring “clicks" into place in the differential and the intermediate shaft.

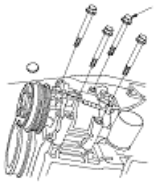


---

19. Install the driveshaft heat shield.
20. Connect the lower arms to the knuckles.
21. Install the stabilizer links to the stabilizer.
22. A/T model: Install the shift cable.

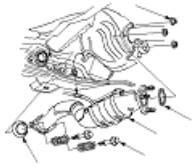
---

23. Install the A/C compressor (with A/C).
24. Install the drive belt.



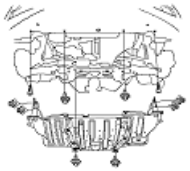
---

25. Install the under-floor three way catalytic converter (under-floor TWC) (A). Use new gaskets (B) and new self locking nuts (C).



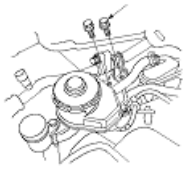
---

26. Install the splash shields.
27. Lower the vehicle on the lift.



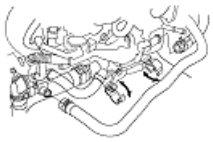
---

28. With RHD model: Install the brake fluid reservoir tank bracket mounting bolts.



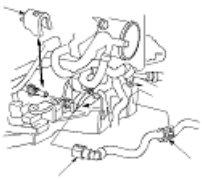
---

29. Install the heater hoses.
30. Install the radiator.
31. M/T model: Install the clutch slave cylinder, and clutch line bracket mounting bolt.
32. With i-SHIFT model: Install the clutch slave cylinder.
33. M/T model: Install the shift cable.

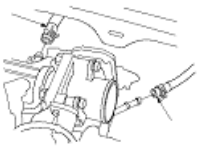


34. Connect the secondary heated oxygen sensor (secondary HO2S) connector (A), then install the secondary HO2S harness to the clamps (B).

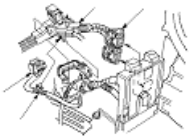
35. Connect the fuel feed hose (A) , then install the quick-connect fitting cover (B) and the fuel feed hose clamp (C).



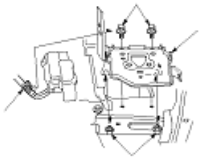
36. Install the evaporative emission (EVAP) canister hose (A) and brake booster vacuum hose (B).



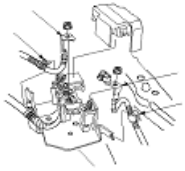
37. Install the harness holder (A), then install the harness clamp (B).
38. Connect the engine wire harness connector (C) and the engine control module (ECM)/powertrain control module (PCM) connectors (D).



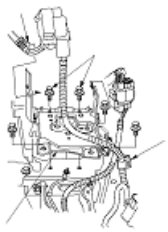
39. With M/T model: Install the battery base (A), then install the battery harness clamp (B).



40. Without i-SHIFT model: Install the battery cables (A) to the battery terminal fuse box.
41. Without i-SHIFT model: Install the harness clamps (B).



42. With i-SHIFT model: Install the battery base (A) and harness clip (B).



43. With i-SHIFT model: Install the air cleaner stay.
44. Install the front wheels.
45. Install the under-cowl panel.
46. Do the battery reconnection procedure.
47. Do the battery installation procedure.
48. With HID lamp model: If the left side lower arm was removed, do the headlight initial position learning procedure.
49. Refill the transmission with fluid:
    - Manual transmission
    - Automatic transmission
    - i-SHIFT system transmission
50. Install the air cleaner housing assembly.
51. A/T model: Move the shift lever to each gear, and verify that the A/T gear position indicator follows the transmission range switch.
52. M/T model: Check that the transmission shifts into all gear smoothly.
53. With i-SHIFT model: Do the i-SHIFT system learning (static mode).
54. Check the clutch operation.
55. Inspect for fuel leaks. Turn the ignition switch to ON (II) (do not operate the starter) so the fuel pump runs for about 2 seconds and pressurizes the fuel line. Repeat this operation three times, then check for fuel leakage at any point in the fuel line.
56. Refill the radiator with engine coolant, and bleed air from the cooling system with the heater valve open.
57. Refill the engine with engine oil.
58. Do the ECM/PCM reset procedure.
59. Do the crankshaft position (CKP) pattern clear/CKP pattern learn procedure.
60. Inspect the idle speed.
61. Inspect the ignition timing.

Compression

Item	Measurement	Qualification	Standard or New	Service Limit
Compression	Pressure check at 250 rpm (min^{-1}) with wide open throttle. (See Design Specs for ratio)	Minimum	980 kPa (10.0 kgf/cm^2, 142 psi)	———
		Maximum variation	200 kPa (2.0 kgf/cm^2, 28 psi)	———

Engine Block Component Location Index

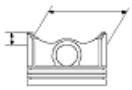
Engine Block and Piston Inspection

1. Remove the crankshaft and the pistons.
2. Check the piston for distortion or cracks.

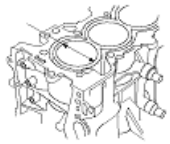


3. Measure the piston diameter (A) at a point 16 mm (0.6 in.) from the bottom of the skirt.

Piston Diameter
L15A7 engine:
Standard (New): 72.980−72.990 mm (2.8732−2.8736 in.)
Service Limit: 72.97 mm (2.8728 in.)
L13Z1 engine:
Standard (New): 72.972−72.982 mm (2.8729−2.8733 in.)
Service Limit: 72.97 mm (2.8728 in.)
L12B1 engine:
Standard (New): 72.972−72.982 mm (2.8729−2.8733 in.)
Service Limit: 72.97 mm (2.8728 in.)

Oversize Piston Diameter
L15A7 engine:
0.25: 73.230−73.240 mm (2.88307−2.88346 in.)
L13Z1 engine:
0.25: 73.222−73.232 mm (2.88275−2.88314 in.)
L12B1 engine:
0.25: 73.225−73.235 mm (2.88287−2.88326 in.)

4. Measure wear and taper in direction Y at three levels in each cylinder as shown. If measurements in any cylinder are beyond the Oversize Bore Service Limit, replace the engine block. If the engine block is to be rebored, refer to Step 7 after reboring.



Cylinder Bore Size

Standard (New): 73.000−73.015 mm (2.8740−2.8746 in.)
Service Limit: 73.065 mm (2.8766 in.)

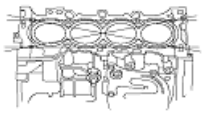
Oversize
0.25: 73.250−73.265 mm (2.8839−2.8844 in.)

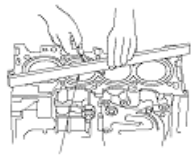
Reboring limit: 0.25 mm (0.01 in.) max.

Bore Taper
Limit: (Difference between first and third measurement) 0.05 mm (0.002 in.)

5. Scored or scratched cylinder bores must be honed.

6. Check the top of the engine block for warpage. Measure along the edges and across the center as shown.

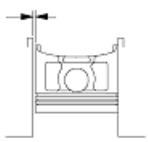




Engine Block Warpage

Standard (New): 0.07 mm (0.003 in.) max.
Service Limit: 0.10 mm (0.004 in.)

7. Calculate the difference between the cylinder bore diameter and the piston diameter. If the clearance is near or exceeds the service limit, inspect the piston and engine block for excessive wear.



Piston-to-Cylinder Clearance

L15A7 engine:
Standard (New): 0.010−0.035 mm (0.0004−0.0014 in.)
Service Limit: 0.05 mm (0.002 in.)
L13Z1 engine:
Standard (New): 0.018−0.043 mm (0.0007−0.0017 in.)
Service Limit: 0.05 mm (0.002 in.)
L12B1 engine:
Standard (New): 0.018−0.043 mm (0.0007−0.0017 in.)
Service Limit: 0.05 mm (0.002 in.)

Block

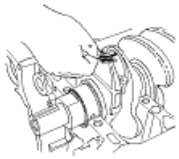
Item	Measurement	Qualification	Standard or New	Service Limit
Block	Warpage of deck		0.07 mm (0.003 in.) max.	0.10 mm (0.004 in.)
	Bore diameter		73.000−73.015 mm (2.8740−2.8746 in.)	73.065 mm (2.8776 in.)
	Bore taper		———	0.05 mm (0.002 in.)
	Reboring limit		———	0.25 mm (0.01 in.)

Connecting rod

Item	Measurement	Qualification	Standard or New	Service Limit
Connecting rod	Pin-to-rod interference		0.019−0.036 mm (0.007−0.0014 in.)	———
	Small-end bore diameter		17.964−17.977 mm (0.707−0.708 in.)	———
	Large-end bore diameter		43.0 mm (1.69 in.)	———
	End play installed on crankshaft		0.15−0.35 mm (0.006−0.014 in.)	0.40 mm (0.016 in.)

Connecting Rod Bearing Replacement

Rod Bearing Clearance Inspection

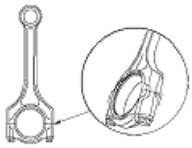


1. To check rod bearing-to-journal oil clearance, remove the bearing cap bridge.
2. Remove the connecting rod cap and bearing half.
3. Clean the crankshaft rod journal and bearing half with a clean shop towel.
4. Place plastigage across the rod journal.
5. Reinstall the bearing half and cap, and torque the bolts to 9.8 N·m (1.0 kgf·m, 7.2 lbf·ft) +90 °.
   NOTE: Do not rotate the crankshaft during inspection.
6. Remove the rod cap and bearing half, and measure the widest part of the plastigage.
   Connecting Rod Bearing-to-Journal Oil Clearance

L15A7 engine:	
Standard (New):	**0.020–0.038 mm (0.0008–0.0015 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**
L13Z1 engine:	
Standard (New):	**0.026–0.044 mm (0.0010–0.0017 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**
L12B1 engine:	
Standard (New):	**0.026–0.044 mm (0.0010–0.0017 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**

7. If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
8. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check clearance again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearing, replace the crankshaft and start over.

Rod Bearing Selection



1. Inspect each connecting rod for cracks and heat damage.

Connecting Rod Big End Bore Code Locations

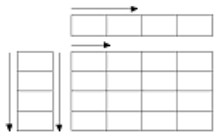
2. Each rod falls into one of four tolerance ranges (from 0 to 0.024 mm (0.0009 in.), in 0.006 mm (0.0002 in.) increments) depending on the size of its big end bore. It's then stamped with a number or bar (1, 2, 3, or 4) indicating the range. You may find any combination of 1, 2, 3, or 4 in any engine.
   If the codes are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.
   Normal Bore Size: **43.0 mm (1.69 in.)**

Connecting Rod Journal Code Location

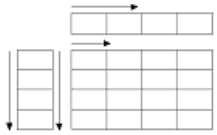
3. The connecting rod journal codes are stamped on the crankshaft.

4. Use the big end bore codes and rod journal codes to select appropriate replacement bearings from the following table.
   NOTE: Color code is on the edge of the bearing.

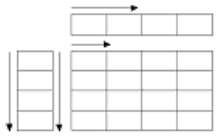
L15A7 engine



L13Z1 engine



L12B1 engine

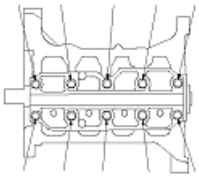


Crankshaft

Item	Measurement	Qualification	Standard or New	Service Limit
Crankshaft	Main journal diameter		49.976−50.000 mm (1.9676−1.9685 in.)	———
	Rod journal diameter		39.976−40.000 mm (1.5739−1.5748 in.)	———
	Rod/main journal taper		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	Rod/main journal out-of-round		0.005 mm (0.0002 in.)	0.010 mm (0.0004 in.)
	End play		0.10−0.35 mm (0.004−0.014 in.)	0.45 mm (0.018 in.)
	Runout		0.03 mm (0.0012 in.) max.	0.04 mm (0.0016 in.)

Crankshaft Main Bearing Replacement

Main Bearing Clearance Inspection



1. To check main bearing-to-journal oil clearance, remove the bearing cap bridge and bearing halves.
2. Clean each main journal and bearing half with a clean shop towel.
3. Place one strip of plastigage across each main journal.
4. Reinstall the bearings and bearing cap bridge, then tighten the bearing cap bolts to 25 N·m (2.5 kgf·m, 18 lbf·ft) in the proper sequence.
   NOTE: Do not rotate the crankshaft during inspection.
5. Tighten the bearing cap bolts an additional 40 °.

6. Remove the bearing cap bridge and bearings again, and measure the widest part of the plastigage.

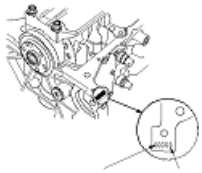
Main Bearing-to-Journal Oil Clearance

Standard (New):	**0.018–0.036 mm (0.0007–0.0014 in.)**
Service Limit:	**0.050 mm (0.0020 in.)**

7. If the plastigage measures too wide or too narrow, remove the crankshaft, and remove the upper half of the bearing. Install a new, complete bearing with the same color code(s), and recheck the clearance. Do not file, shim, or scrape the bearings or the caps to adjust clearance.
8. If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below the current one), and check again. If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

Main Bearing Selection

Crankshaft Bore Code Location



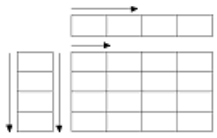
1. Letters have been stamped on the end of the block as a code for the size of each of the five main journal bores. Write down the crank bore codes.
   If you can't read the codes because of accumulated dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

Main Journal Code Location

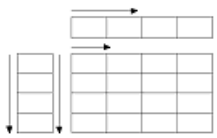
2. The main journal codes are stamped on the crankshaft.

3. Use the crank bore codes and crank journal codes to select the appropriate replacement bearings from the following table.
   NOTE: Color code is on the edge of the bearing.

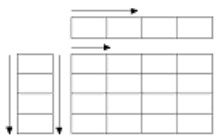
L15A7 engine



L13Z1 engine



L12B1 engine



Crankshaft bearing

Item	Measurement	Qualification	Standard or New	Service Limit
Crankshaft bearing	Main bearing-to-journal oil clearance		0.018−0.036 mm (0.0007−0.0014 in.)	0.050 mm (0.0020 in.)
	Rod bearing clearance	L15A7	0.020−0.038 mm (0.0008−0.0015 in.)	0.050 mm (0.0020 in.)
		L13Z1	0.026−0.044 mm (0.0010−0.0017 in.)	0.050 mm (0.0020 in.)
		L12B1	0.026−0.044 mm (0.0010−0.0017 in.)	0.050 mm (0.0020 in.)

Piston

Item	Measurement	Qualification	Standard or New	Service Limit
Piston	Skirt O.D. at 16 mm (0.6 in.) from bottom of skirt	L12B1	72.975−72.985 mm (2.8730−2.8734 in.)	72.97 mm (2.8728 in.)
		L13Z1	72.972−72.982 mm (2.8729−2.8733 in.)	72.97 mm (2.8728 in.)
		L15A7	72.980−72.990 mm (2.8732−2.8736 in.)	72.97 mm (2.8728 in.)
	Clearance in cylinder	L12B1	0.015−0.040 mm (0.0006−0.0015 in.)	0.05 mm (0.002 in.)
		L13Z1	0.018−0.043 mm (0.0007−0.0017 in.)	0.05 mm (0.002 in.)
		L15A7	0.010−0.035 mm (0.0004−0.0014 in.)	0.05 mm (0.002 in.)
	Ring groove width	Top	1.050−1.060 mm (0.0413−0.0417 in.)	1.080 mm (0.0425 in.)
		Second	1.020−1.030 mm (0.0401−0.0405 in.)	1.050 mm (0.0413 in)
		Oil	2.005−2.020 mm (0.0789−0.0795 in.)	2.050 mm (0.0807 in.)

Piston pin

Item	Measurement	Qualification	Standard or New	Service Limit
Piston pin	O.D.		17.996−18.000 mm (0.7085−0.7087 in.)	———
	Pin-to-piston clearance		0.010−0.017 mm (0.0004−0.0007 in.)	———

Piston ring

Item	Measurement	Qualification	Standard or New	Service Limit
Piston ring	Ring-to-groove clearance	Top	0.065−0.090 mm (0.0026−0.0035 in.)	0.15 mm (0.006 in.)
		Second	0.030−0.055 mm (0.0012−0.0022 in.)	0.12 mm (0.005 in.)
	Ring end gap	Top	0.15−0.30 mm (0.006−0.012 in.)	0.60 mm (0.024 in.)
		Second	0.30−0.42 mm (0.012−0.017 in.)	0.65 mm (0.026 in.)
		Oil	0.20−0.70 mm (0.008−0.028 in.)	0.80 mm (0.031 in.)

Exhaust Pipe and Muffler Replacement

KE, KG models

NOTE: Use new gaskets and self-locking nuts when reassembling.

Engine will not start (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Test the starter.
3. Check the fuel pressure.
4. Troubleshoot the fuel pump circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination

Engine will not start (MIL comes on and stays on, no DTCs set)

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Also check for

- Low compression
- No ignition spark
- Intake vacuum leaks
- Locked up engine
- Broken cam chain
- Fuel contamination
- No power to ECM/PCM
- No ground to ECM/PCM
- Shorted reference voltage

MIL comes on and stays on, or never comes on at all, no DTCs set

Diagnostic procedure

1. Troubleshoot the MIL circuit.

Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)

Diagnostic procedure

1. Check the immobilizer system.

Also check for

- Camshaft timing
- Low compression
- Intake vacuum leaks
- Fuel contamination
- Weak spark

Engine is hard to start (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the battery.
2. Check the fuel pressure.
3. Test the throttle body.

Also check for

- Low compression
- Intake vacuum leaks
- Fuel contamination
- Weak spark

Cold fast idle too low (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Throttle body cleaning.

Also check for

- Incorrect valve adjustment

Cold fast idle too high (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Check the idle speed.
3. Test the throttle body.

Also check for

- Incorrect valve adjustment

After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Test the throttle body.

Also check for

- Intake vacuum leaks
- Incorrect valve adjustment

After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)

Diagnostic procedure

1. Troubleshoot the alternator FR signal circuit.
2. Inspect the APP sensor.

Also check for

- Intake vacuum leaks

Idle speed fluctuates (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Except FO, KE, KG, KQ, KU models: Test the injectors.
4. Troubleshoot the alternator FR signal circuit.
5. Inspect the PCV valve.
6. Test the throttle body.
7. Troubleshoot the A/C signal circuit.
8. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Intake vacuum leaks

Misfire or rough running (MIL works OK, no DTCs set)

Diagnostic procedure

1. Check the spark plugs.
2. Test the fuel pressure.
3. Test the injectors.
4. Troubleshoot the fuel pump circuit.
5. Troubleshoot the VTEC system oil pressure.

Also check for

- Low compression
- Valve clearance
- Fuel contamination

Fails emission test (MIL works OK, no DTCs set)

Diagnostic procedure

1. Except FO, KE, KG, KQ, KU models: Inspect the three way catalytic converter (TWC).
2. Except FO, KE, KG, KQ, KU models: Check the spark plugs.
3. Test the fuel pressure.
4. Except FO, KE, KG, KQ, KU models: Test the injectors.
5. Check the EVAP system.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Broken cam chain

Low power (MIL works OK, no DTCs set)

Diagnostic procedure

1. Test the fuel pressure.
2. Check the air cleaner element.
3. Test the throttle body.
4. Except FO, KE, KG, KQ, KU models: Inspect the three way catalytic converter (TWC).
5. Except FO, KE, KG, KQ, KU models: Test the injectors.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Fuel contamination
- Low compression
- Camshaft timing
- Engine oil level

Engine stalls (MIL works OK, no DTCs set)

Diagnostic procedure

1. Do the ECM/PCM idle learn procedure.
2. Test the fuel pressure.
3. Check the idle speed.
4. Troubleshoot the brake pedal position switch signal circuit.
5. Except FO, KE, KG, KQ, KU models: Check the spark plugs.
6. Troubleshoot the VTEC system oil pressure.

Also check for

- Intake vacuum leaks
- Faulty harness and sensor connections
- Fuel contamination

Engine oil level indicator (amber) stays on or flashes, or CHECK SYSTEM (CHECK OIL LEVEL SENSOR) display is on (MIL works OK, no DTCs set)

Diagnostic procedure

1. Inspect the engine oil level sensor.

Difficult to refuel

Diagnostic procedure

1. Inspect the breather line and the suction line.

HDS does not communicate with the ECM/PCM or the vehicle

Diagnostic procedure

1. Troubleshoot the DLC circuit.

Fuel and Emissions Systems Symptom Troubleshooting Index

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
Engine will not start (MIL works OK, no DTCs set)	1. Test the battery. 2. Test the starter. 3. Check the fuel pressure. 4. Troubleshoot the fuel pump circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination
Engine will not start (MIL comes on and stays on, no DTCs set)	Troubleshoot the DLC circuit.	• Low compression • No ignition spark • Intake vacuum leaks • Locked up engine • Broken cam chain • Fuel contamination • No power to ECM/PCM • No ground to ECM/PCM • Shorted reference voltage
MIL comes on and stays on, or never comes on at all, no DTCs set	Troubleshoot the MIL circuit.	
Engine will not start (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	
Engine starts but stalls immediately (MIL works OK, no DTCs set, immobilizer indicator stays on or flashes)	Check the immobilizer system.	• Camshaft timing • Low compression • Intake vacuum leaks • Fuel contamination • Weak spark
Engine is hard to start (MIL works OK, no DTCs set)	1. Test the battery. 2. Check the fuel pressure. 3. Test the throttle body.	• Low compression • Intake vacuum leaks • Fuel contamination • Weak spark
Cold fast idle too low (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure. 2. Check the idle speed. 3. Throttle body cleaning.	Incorrect valve adjustment
Cold fast idle too high (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure. 2. Check the idle speed. 3. Test the throttle body.	Incorrect valve adjustment
After warming up, idle speed is below specifications without load (MIL works OK, no DTCs set)	1. Troubleshoot the alternator FR signal circuit. 2. Test the throttle body.	• Intake vacuum leaks • Incorrect valve adjustment
After warming up, idle speed is above specifications without load (MIL works OK, no DTCs set)	1. Troubleshoot the alternator FR signal circuit. 2. Inspect the APP sensor.	Intake vacuum leaks
Idle speed fluctuates (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure. 2. Test the fuel pressure. 3. Except FO, KE, KG, KQ, KU models: Test the injectors. 4. Troubleshoot the alternator FR signal circuit. 5. Inspect the PCV valve. 6. Test the throttle body. 7. Troubleshoot the A/C signal circuit. 8. Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Intake vacuum leaks
Misfire or rough running (MIL works OK, no DTCs set)	1. Check the spark plugs. 2. Test the fuel pressure. 3. Test the injectors. 4. Troubleshoot the fuel pump circuit. 5. Troubleshoot the VTEC system oil pressure.	• Low compression • Valve clearance • Fuel contamination
Fails emission test (MIL works OK, no DTCs set)	1. Except FO, KE, KG, KQ, KU models: Inspect the three way catalytic 2. converter (TWC). 3. Except FO, KE, KG, KQ, KU models: Check the spark plugs. 4. Test the fuel pressure. 5. Except FO, KE, KG, KQ, KU models: Test the injectors. 6. Check the EVAP system. Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Broken cam chain

Symptom	Diagnostic procedure	Also check for
Low power (MIL works OK, no DTCs set)	1. Test the fuel pressure. 2. Check the air cleaner element. 3. Test the throttle body. 4. Except FO, KE, KG, KQ, KU models: Inspect the three way catalytic 5. converter (TWC). 6. Except FO, KE, KG, KQ, KU models: Test the injectors. Troubleshoot the VTEC system oil pressure.	• Fuel contamination • Low compression • Camshaft timing • Engine oil level
Engine stalls (MIL works OK, no DTCs set)	1. Do the ECM/PCM idle learn procedure. 2. Test the fuel pressure. 3. Check the idle speed. 4. Troubleshoot the brake pedal position switch signal circuit. 5. Except FO, KE, KG, KQ, KU models: Check the spark plugs. 6. Troubleshoot the VTEC system oil pressure.	• Intake vacuum leaks • Faulty harness and sensor connections • Fuel contamination
Engine oil level indicator (amber) stays on or flashes, or CHECK SYSTEM (CHECK OIL LEVEL SENSOR) display is on (MIL works OK, no DTCs set)	Inspect the engine oil level sensor.	
Difficult to refuel	Inspect the breather line and the suction line.	
HDS does not communicate with the ECM/PCM or the vehicle	Troubleshoot the DLC circuit.	
SIL never comes on	Troubleshoot shift indicator lamp.	
When the clutch pedal pressed, light out of SIL is slow	Troubleshoot shift indicator lamp.	
SIL does not work once in a while	Troubleshoot shift indicator lamp.	
Shift up indicator lamp does not come on, or shift down indicator lamp does not come on	Check for body electrical system DTCs.	
SIL stays on	Check for body electrical system DTCs.

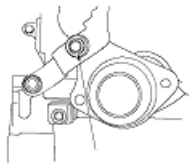
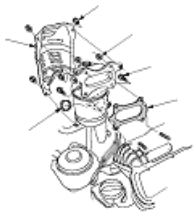
*: This illustration shows RHD model.

TWC (Warm Up) Removal/Installation

1. Lift the vehicle, and support it with jackstands.
2. Remove the bolt (A).
3. Remove the EGR pipe (KE, KG models).
4. Remove the cowl cover and under cowl-cover panel.
5. Remove the A/F sensor (Sensor 1).



6. Remove the cover (A).
7. Remove the bolts (B) and the nuts (C).
8. Remove the WU-TWC from the gaskets (D).



9. Remove the WU-TWC (A).
10. Install the parts in the reverse order of removal with new gaskets.

EGR Pipe Removal/Installation

Removal

1. Lift the vehicle, and support it with jackstands.
2. Remove the engine undercover (KE, KG models).
3. Remove the bolts (A) and nuts (B).
4. Remove the EGR pipe (C).

Installation

1. Install the EGR pipe to the water passage side, tighten the nuts (A) by the hand with a new gasket (B).
2. Install the EGR pipe to the TWC side, tighten the bolts (C) by the hand with a new gasket (D). Then tighten the bolts of TWC side.
3. Tighten the nuts of water passage side.
4. Install the engine undercover (KE, KG models).

EGR Valve Replacement

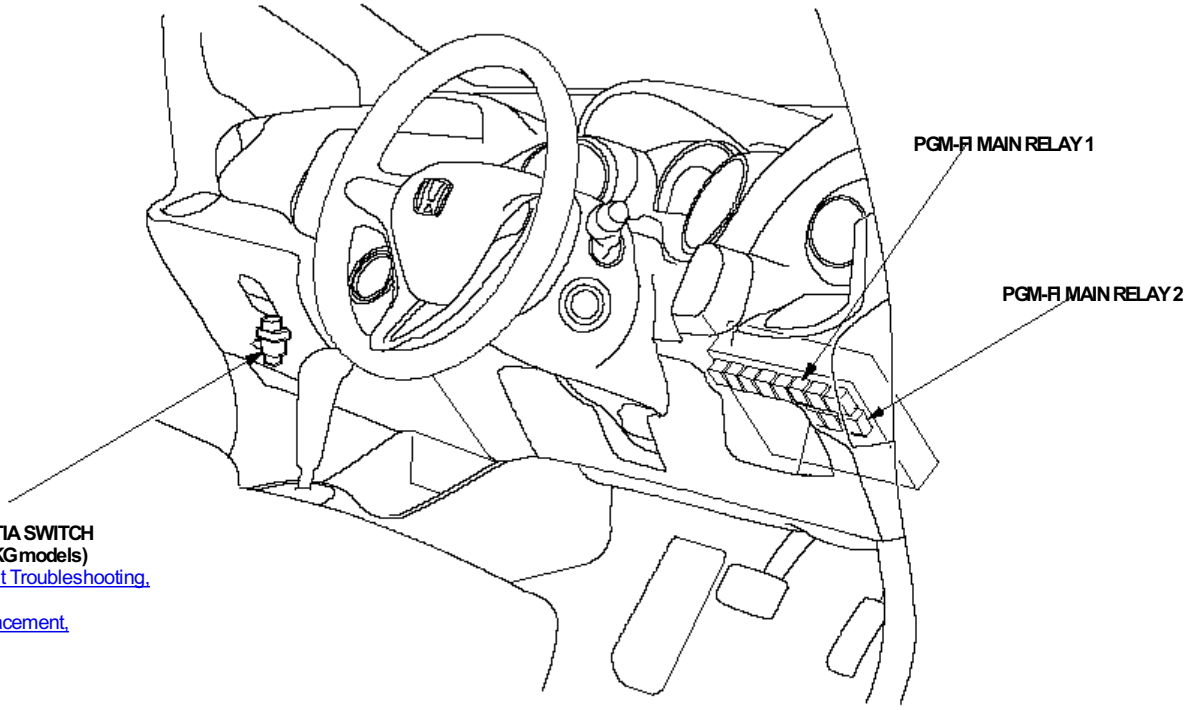
1. Disconnect the EGR valve 6P connector (A).
2. Remove the EGR valve (B).
3. Install the parts in the reverse order of removal with a new gasket (C).

Fuel and Emissions System Description - Fuel Supply System

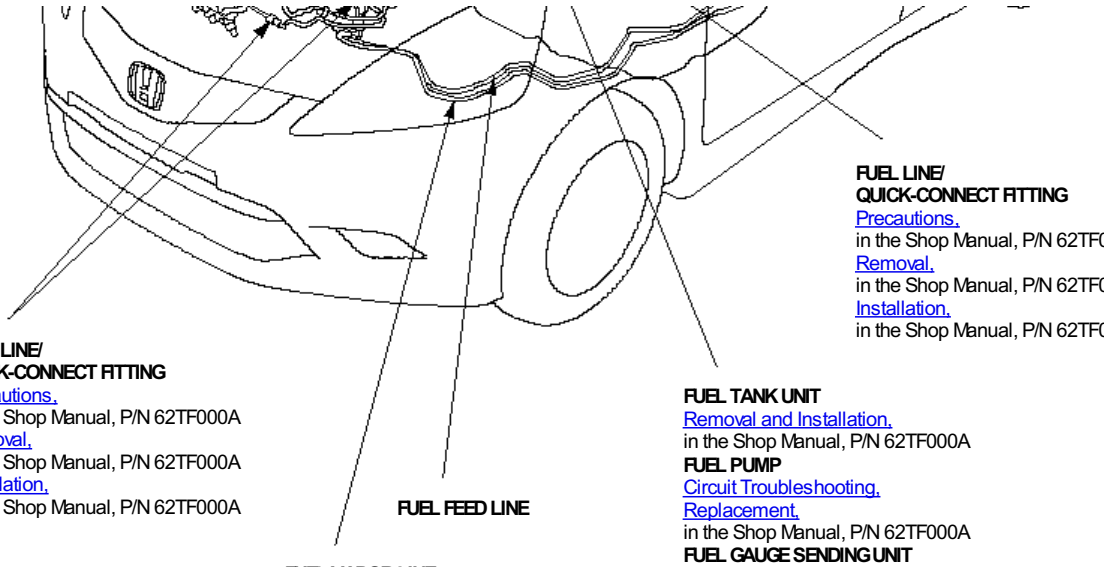
Fuel Supply System

Fuel Supply System Component Location Index

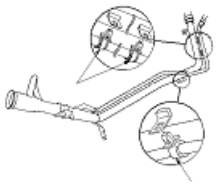
RHD model



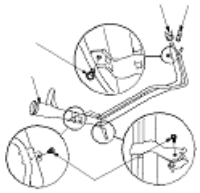
*: This illustration shows RHD model.



Fuel Fill Pipe Removal/Installation



1. Drain the fuel tank.
2. Remove the fuel fill cap.
3. Lift the vehicle, and support it with jackstands.
4. Remove the left rear wheel.
5. Remove the floor undercover (KE, KG models).
6. Remove the axle beam.
7. Remove the EVAP canister filter pipe clamp (A) (LHD model).



8. Disconnect the fuel fill tube (A) and the breather tube (B) from the fuel fill pipe. Slide back the clamp, then twist the hose as you pull to avoid damaging them.
9. Remove the fuel fill pipe (C).
10. Install the parts in the reverse order of removal.

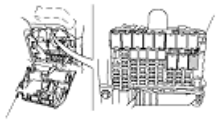
Fuel pressure regulator

Item	Measurement	Qualification	Standard or New
Fuel pressure regulator	Pressure with fuel pressure gauge connected		320−370 kPa (3.3−3.8 kgf/cm ^{2} , 47−54 psi)

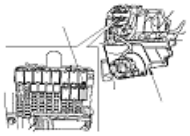
Fuel Pump Circuit Troubleshooting

If you suspect a problem with the fuel pump, check that the fuel pump actually runs; when it is on, you will hear some noise if you listen to the fuel fill port with the fuel fill cap removed. The fuel pump should run for 2 seconds when the ignition switch is turned on. If the fuel pump does not make noise, check as follows:

RHD model



LHD model



1. Turn the ignition switch to LOCK (0).
2. Open the fuse lid (A), then remove PGM-FI main relay 2 (B) from the under-dash fuse/relay box.
3. Turn the ignition switch to ON (II).

---

4. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 4 and body ground.

Is there battery voltage?
YES - Go to Step 5 .
NO -
- Replace the under-dash fuse/relay box. ■
- Replace the PGM-FI main relay 1 .■

---

5. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

Is there battery voltage?
YES - Go to Step 11 .
NO - KE, KG models: Go to Step 6 .
Except KE, KG models:

- Check the No. 20 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.■
- If the fuse is OK, replace the under-dash fuse/relay box. ■

6. Turn the ignition switch to LOCK (0).
7. Disconnect the inertia switch 3P connector.

---

8. Connect inertia switch 3P connector terminals No. 1 and No. 3 with a jumper wire.
9. Turn the ignition switch to ON (II).

---

10. Measure the voltage between PGM-FI main relay 2 4P connector terminal No. 2 body ground.

Is there battery voltage?
YES - Replace the inertia switch.
NO -
- Replace the No. 20 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.■
- Replace the under-dash fuse/relay box. ■
- Repair open in wire between inertia switch and under-dash fuse/relay box.■

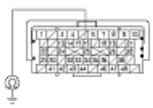
11. Turn the ignition switch to LOCK (0).

---

12. Connect PGM-FI main relay 2 4P connector terminal No. 3 to body ground with a jumper wire.
13. Jump the SCS line with the HDS.
14. Disconnect ECM/PCM connector A (49P).

---

15. Check for continuity between body ground and ECM/PCM connector terminal A16.

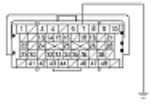


Is there continuity?
YES - Go to Step 11 .
NO - Repair open in the wire between PGM-FI main relay 2 and the ECM/PCM (A16).■

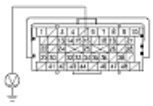
16. Reinstall PGM-FI main relay 2.

---

17. Connect ECM/PCM connector terminal A7 to body ground with a jumper wire.
18. Turn the ignition switch to ON (II).



19. Measure the voltage between ECM/PCM connector terminal A16 and body ground.



Is there battery voltage?

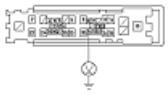
YES - Go to Step 15 .

NO -
- Repair open in the wire between the under-dash fuse/relay box and the ECM/PCM (A7, A16).■
- Replace PGM-FI main relay 2. ■

20. Turn the ignition switch to LOCK (0).

21. Reconnect ECM/PCM connector A (49P).

22. Turn the ignition switch to ON (II), and measure the voltage between under-dash fuse/relay box connector B (36P) terminal No. 31 and body ground within 2 seconds.

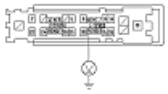


Is there battery voltage?

YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

NO - Go to Step 18 .

23. Turn the ignition switch to ON (II), and measure the voltage between under-dash fuse/relay box connector B (36P) terminal No. 31 and body ground after 2 seconds.



Is there battery voltage?

YES - Go to Step 19 .

NO - If needed, replace the under-dash fuse/relay box, then go to Step 19 .

24. Turn the ignition switch to LOCK (0).

25. Remove the center console.

26. Remove the parking brake lever, then remove the access panel from the floor.

27. Turn the ignition switch to ON (II), and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground within 2 seconds.

Is there battery voltage?

YES - Go to Step 27 .

NO - Go to Step 23 .

28. Turn the ignition switch to LOCK (0).

29. Remove PGM-FI main relay 2.

30. Connect PGM-FI main relay 2 4P connector terminals No. 1 and No. 2 with a jumper wire.

31. Turn the ignition switch to ON (II), and measure the voltage between fuel tank unit 4P connector terminal No. 2 and body ground.

Is there battery voltage?

YES - Replace PGM-FI main relay 2 .■

NO - Repair open in the wire between PGM-FI main relay 2 and the fuel tank unit 4P connector.■

32. Turn the ignition switch to LOCK (0).

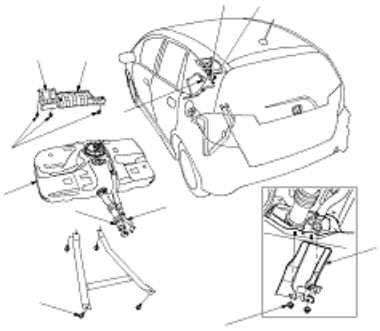
33. Check for continuity between fuel tank unit 4P connector terminal No. 4 and body ground.

Is there continuity?

YES - Replace the fuel pump. ■

NO - Repair open in the wire between the fuel tank unit 4P connector and G502. ■

Fuel Tank Replacement



1. Drain the fuel tank, then disconnect the fuel tank unit 4P connector (A), the fuel vapor hose (B), and the quick-connect fittings (C).
2. Lift the vehicle, and support it with jackstands.
3. Remove the floor undercover (KE, KG models).
4. Remove the fill neck tube cover (D), then disconnect the fuel fill tube (E) and the suction hose (F). Slide back the clamps, then twist the hoses as you pull to avoid damaging them.
5. Remove the fuel tank guard bracket (G) and the fuel tank protector (H).
6. Place a jack or other support under the tank (I).
7. Remove the strap bolts and the straps (J).
8. Remove the fuel tank.
9. Install the parts in the reverse order of removal.

Fuel tank

Item	Measurement	Qualification	Standard or New
Fuel tank	Capacity		42 L (11.0 US gal, 9.2 Imp gal)

Inertia Switch Replacement

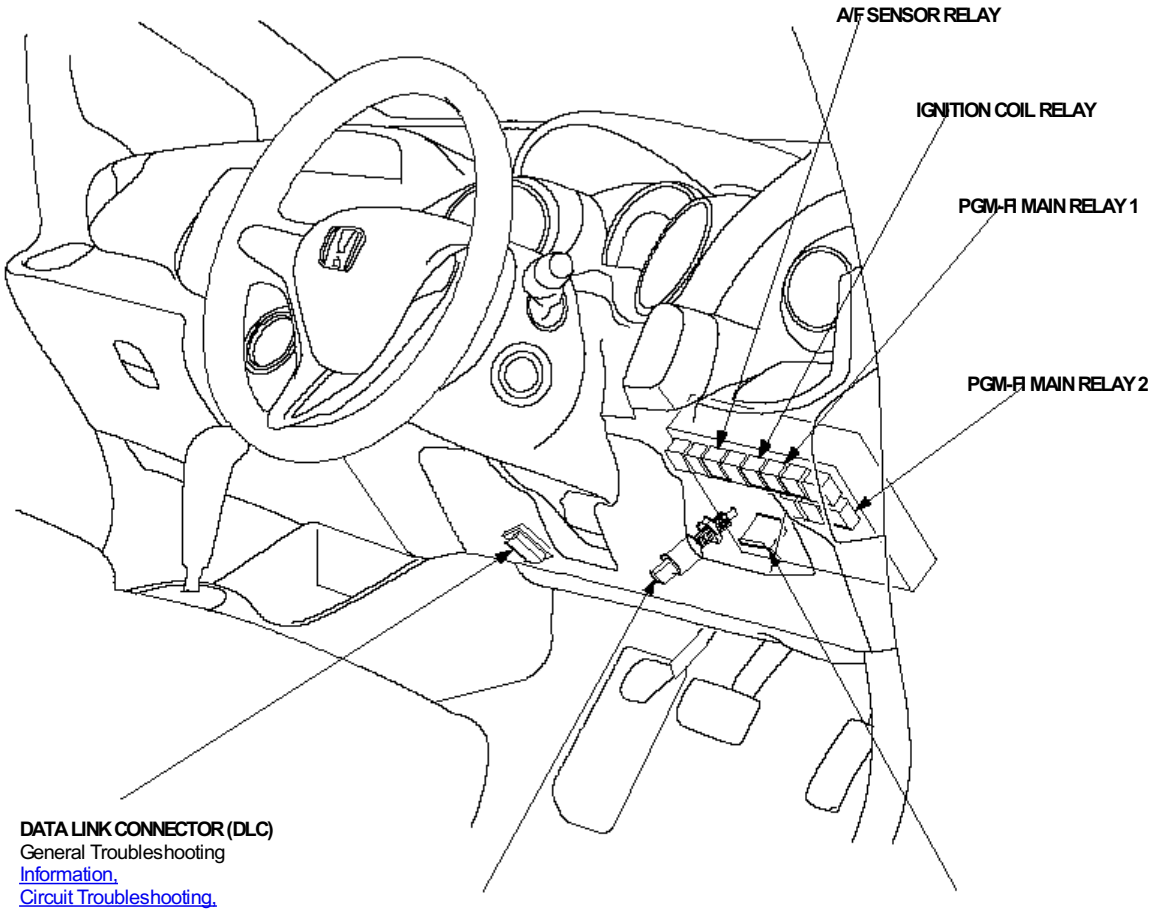
KE, KG models

1. Remove the passenger's side kick panel.
2. Disconnect the inertia switch 3P connector (A).
3. Remove the inertia switch (B).
4. Install the parts in the reverse order of removal.

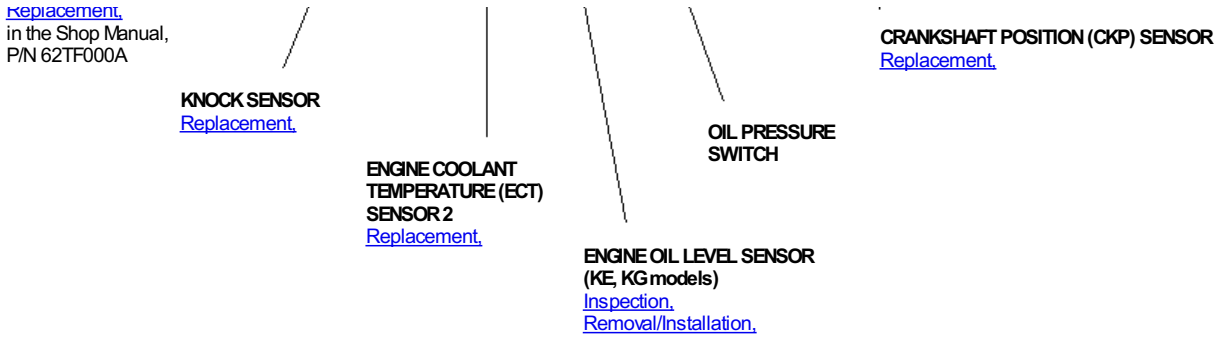
Fuel and Emissions System Description - PGM-FI System: Supplement

PGM-FI System

PGM-FI System Component Location Index



*: This illustration shows RHD model.

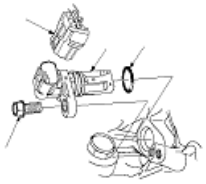


*: This illustration shows RHD model.

CKP Sensor Replacement

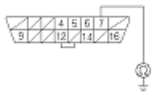
1. Lift the vehicle, and support it with jackstands.
2. Remove the engine undercover (KE, KG models).
3. Remove the CKP sensor cover (A).

4. Disconnect the CKP sensor connector (A).
5. Remove the CKP sensor (B).
6. Install the parts in the reverse order of removal with a new O-ring (C).
7. Do the CKP pattern clear/CKP pattern learn procedure.



DLC Circuit Troubleshooting

NOTE: Make sure the and the DLC cable of the HDS is normal.



1. Turn the ignition switch to LOCK (0).
2. Connect the HDS to the DLC.
   NOTE: Make sure the HDS is properly connected to the DLC.
3. Turn the ignition switch to ON (II), and read the HDS.

   Does the HDS identify the vehicle?
   YES - Go to Step 4 .
   NO - Go to Step 23 .
4. Check for Temporary DTCs or DTCs in the PGM-FI system with the HDS.

   Are any Temporary DTCs or DTCs indicated?
   YES - Go to the indicated DTC's troubleshooting.■
   NO -
   - If the HDS does not communicate with the SRS system, go to Step 5 .
   - If the HDS does not communicate with the VSA system, go to Step 7 .
   - If the HDS does not communicate with the ABS system, go to Step 9 .
   - If the HDS does not communicate with the EPS system, go to Step 11 .
   - If the HDS does not communicate with the IMMOBI (immobilizer) system, go to Step 13 .
   - If the HDS does not communicate with the BODY ELECTRICAL system, go to Step 15 .
5. Turn the ignition switch to LOCK (0).
6. Turn the ignition switch to ON (II), and watch the SRS indicator.

   Does the SRS indicator stay on?
   YES - Go to the SRS system's general troubleshooting information. ■
   NO - Go to Step 15 .
7. Turn the ignition switch to LOCK (0).
8. Turn the ignition switch to ON (II), and watch the VSA indicator.

   Does the VSA indicator stay on?
   YES - Go to the VSA system's general troubleshooting information. ■
   NO - Go to Step 15 .
9. Turn the ignition switch to LOCK (0).
10. Turn the ignition switch to ON (II), and watch the ABS indicator.

    Does the ABS indicator stay on?
    YES - Go to the ABS system's general troubleshooting information. ■
    NO - Go to Step 15 .
11. Turn the ignition switch to LOCK (0).
12. Turn the ignition switch to ON (II), and watch the EPS indicator.

    Does the EPS indicator stay on?
    YES - Go to the EPS system's general troubleshooting information. ■
    NO - Go to Step 15 .
13. Turn the ignition switch to LOCK (0).
14. Turn the ignition switch to ON (II), and watch the immobilizer indicator.

    Does the immobilizer indicator stay on or flash?
    YES - Go to the immobilizer system's troubleshooting. ■
    NO - Go to Step 15 .
15. Do the gauge self-diagnostic function.
16. Check the gauge display.

    Is Error 2 indicated?
    YES - Check for B-CAN system DTCs.■
    NO - Go to Step 17 .
17. Turn the ignition switch to LOCK (0).
18. Disconnect the HDS from the DLC.
19. Check for continuity between DLC terminal No. 7 and body ground.

    Is there 5 Ω or less?
    YES - Go to Step 20 .

NO - Go to Step 21 .

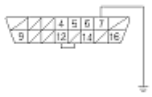
20. Continue to check for continuity between DLC terminal No. 7 and body ground, while disconnecting these parts, one at a time:
    - SRS unit connector A (39P)
    - VSA modulator-control unit 36P connector
    - ABS modulator-control unit 25P connector
    - EPS control unit connector C (16P)
    - Immobilizer-keyless control unit 7P connector
    - Audio unit 24P connector
    - Under-dash fuse/relay box connector Q (16P)

    Does continuity go away when one of the above components is disconnected?
    YES - Replace the part caused an open when it was disconnected.■
    NO - Repair short in the wire between the DLC (K-line) and the VSA modulator-control unit, the ABS modulator-control unit, the SRS unit, the EPS control unit, the immobilizer-keyless control unit, the audio unit, the under-dash fuse/relay box.■

---

21. Connect DLC terminal No. 7 to body ground with a jumper wire.

22. Check for continuity between body ground and these connector terminals:



Connector	Terminal
SRS unit A (39P)	No. 18 (BLU)
ABS control unit 25P	No. 10 (BLU)
VSA control unit 36P	No. 3 (BLU)
EPS control unit C (16P)	No. 16 (BLU)
Immobilizer-keyless control unit 7P	No. 5 (BLU)
Audio unit 24P	No. 3 (BLU)
Under-dash fuse/relay box (Q) (16P)	No. 2 (BLU)

    Is there continuity between the DLC terminal and each of the terminals in the chart?
    YES - Replace the part that does not communicate with the HDS.■
    NO - Repair open in the wire between the DLC (K-line) and the appropriate connector.■

23. Check for B-CAN system DTCs without the HDS.

    Is DTC U0029 and/or U0100 indicated?
    YES - Go to Step 36 .
    NO - Go to Step 24 .

24. Turn the ignition switch to LOCK (0).

25. Disconnect the HDS from the DLC.

---

26. Measure the voltage between DLC terminal No. 16 and body ground.

    Is there battery voltage?
    YES - Go to Step 27 .
    NO - Repair open in the wire between DLC terminal No. 16 and the No. 1 BACK UP (7.5 A) fuse in the under-dash fuse/relay box.■

---

27. Measure the voltage between DLC terminals No. 4 and No. 16.

    Is there battery voltage?
    YES - Go to Step 28 .
    NO - Repair open in the wire between DLC terminal No. 4 and body ground (G502).■

28. Connect the HDS to the DLC.

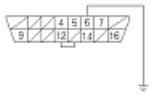
29. Jump the SCS line with the HDS.

30. Disconnect ECM/PCM connector A (49P).

31. Disconnect the HDS from the DLC.

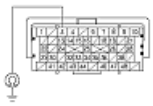
---

32. Connect DLC terminal No. 6 to body ground with a jumper wire.



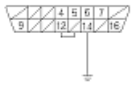
---

33. Check for continuity between ECM/PCM connector terminal A3 and body ground.

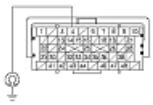


Is there continuity?
YES - Go to Step 34 .
NO - Repair open in the wire between the ECM/PCM (A3) and DLC terminal No. 6.■

34. Connect DLC terminal No. 14 to body ground with a jumper wire.



35. Check for continuity between ECM/PCM connector terminal A4 and body ground.



Is there continuity?
YES - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
NO - Repair open in the wire between the ECM/PCM (A4) and DLC terminal No. 14.■

36. Try to start the engine.

Does the engine start and idle smoothly?
YES - Go to F-CAN circuit troubleshooting. ■
NO - Go to Step 37 .

37. Turn the ignition switch to LOCK (0).

38. Check the No. 60 IGSW (50 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?
YES - Repair open in the wire the No. 60 IGSW (50 A) fuse and the ignition switch. If the wire is OK go to Step 39 .
NO - Repair short in the wire the No. 60 IGSW (50 A) fuse and the under-dash fuse/relay box. Also replace the No. 60 IGSW (50 A) fuse.■

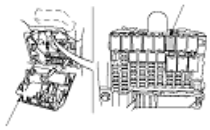
39. Inspect the No. 39 IGP (15 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?
YES - Go to Step 46 .
NO - Go to Step 40 .

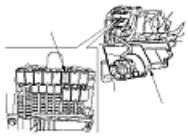
40. Remove the blown No. 39 IGP (15 A) fuse from the under-dash fuse/relay box.

41. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.

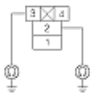
RHD model



LHD model



42. Check for continuity between body ground and PGM-FI main relay 1 4P connector terminals No. 2 and No. 3 individually.



Is there continuity?
YES - Replace the under-dash fuse/relay box. ■
NO - Go to Step 43 .

43. While disconnecting each of the parts or connectors below, one at a time, check for continuity between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.
    - PGM-FI main relay 2
    - ECM/PCM connector A (49P)
    - Each injector 2P connector
    - Camshaft position (CMP) sensor 3P connector
    - Crankshaft position (CKP) sensor 3P connector
    - Electronic throttle control system (ETCS) control relay

    Does continuity go away when one of the above components is disconnected?
    YES - Replace the part that made the short to body ground go away when disconnected. If the part is the ECM/PCM, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. Also replace the No. 39 IGP (15 A) fuse.■
    NO - Go to Step 44 .

44. Disconnect these parts or connectors:
    - PGM-FI main relay 2
    - ECM/PCM connector A
    - Injectors
    - Camshaft position (CMP) sensor
    - Crankshaft position (CKP) sensor
    - Electronic throttle control system (ETCS) control relay

---

45. Check for continuity between PGM-FI main relay 1 4P connector terminal No. 1 and body ground.

    Is there continuity?
    YES - Repair short in the wire between PGM-FI main relay 1 and each item. Also replace the No. 39 IGP (15 A) fuse.■
    NO - Replace PGM-FI main relay 1. Also replace the No. 39 IGP (15 A) fuse.■

46. Inspect the No. 20 FUEL PUMP (15 A) fuse in the under-dash fuse/relay box.

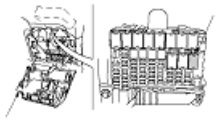
    Is the fuse OK?
    YES - Go to Step 56 .
    NO - Go to Step 47 .

47. Remove the blown No. 20 FUEL PUMP (15 A) fuse from the under-dash fuse/relay box.

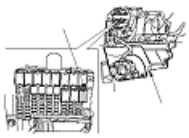
---

48. Open the fuse lid (A), then remove the PGM-FI main relay 2 (B) from the under-dash fuse/relay box.

RHD model



LHD model



49. Test PGM-FI main relay 2.

    Is the relay OK?
    YES - Go to Step 50 .
    NO - Replace PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■

---

50. Check for continuity between PGM-FI main relay 2 4P connector terminal No. 2 and body ground.

    Is there continuity?
    YES - Go to Step 51 .
    NO - Go to Step 54 .

51. Jump the SCS line with the HDS.

52. Disconnect ECM/PCM connector A (49P).

---

53. Check for continuity between ECM/PCM connector terminal C10 and body ground.

    Is there continuity?
    YES - Repair short in the wire between the No. 20 FUEL PUMP (15 A) fuse and the ECM/PCM (C10), or PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■
    NO - Replace the No. 20 FUEL PUMP (15 A) fuse, and update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

54. Disconnect the fuel pump 4P connector.

---

55. Check for continuity between fuel pump 4P connector terminal No. 2 and body ground.

Is there continuity?
YES - Repair short in the wire between the fuel pump and PGM-FI main relay 2. Also replace the No. 20 FUEL PUMP (15 A) fuse.■
NO - Check the fuel pump, and replace it if necessary. Also replace the No. 20 FUEL PUMP (15 A) fuse.■

56. Jump the SCS line with the HDS.

57. Disconnect ECM/PCM connectors A (49P) and C (49P).

58. Turn the ignition switch to ON (II).

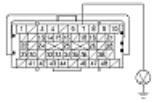
---

59. Measure the voltage between ECM/PCM connector terminal C10 and body ground.

Is there battery voltage?
YES - Go to Step 60 .
NO - Repair open in the wire between the No. 20 FUEL PUMP (15 A) fuse and the ECM/PCM (C10).■

---

60. Measure the voltage between ECM/PCM connector terminal A7 and body ground.



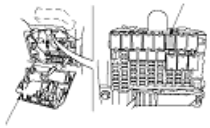
Is there battery voltage?
YES - Go to Step 66 .
NO - Go to Step 61 .

61. Turn the ignition switch to LOCK (0).

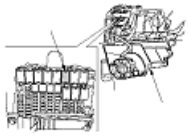
---

62. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.

RHD model



LHD model



---

63. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 3 and body ground.

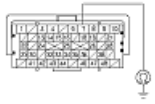
Is there battery voltage?
YES - Go to Step 64 .
NO - Replace the under-dash fuse/relay box. ■

---

64. Connect PGM-FI main relay 1 4P connector terminal No. 4 to body ground with a jumper wire.

---

65. Check for continuity between ECM/PCM connector terminal A7 and body ground.



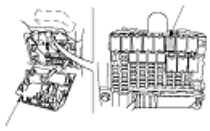
Is there battery voltage?
YES - Test PGM-FI main relay 1. If the relay is OK, update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■
NO - Repair open in the wire between the ECM/PCM (A7) and PGM-FI main relay 1.■

66. Turn the ignition switch to LOCK (0).

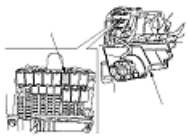
---

67. Open the fuse lid (A), then remove the PGM-FI main relay 1 (B) from the under-dash fuse/relay box.

RHD model



LHD model



---

68. Measure the voltage between PGM-FI main relay 1 4P connector terminal No. 2 and body ground.

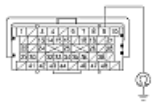
Is there battery voltage?
YES - Go to Step 69 .
NO - Replace the under-dash fuse/relay box. ■

---

69. Connect PGM-FI main relay 1 4P connector terminal No. 1 to body ground with a jumper wire.

---

70. Check for continuity between ECM/PCM connector terminal A9 and body ground.



Is there continuity?
YES - Go to Step 71 .
NO - Repair open in the wire between the ECM/PCM (A9) and PGM-FI main relay 1.■

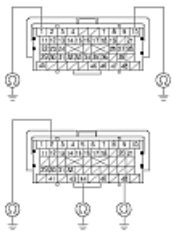
71. Test PGM-FI main relay 1.

Is PGM-FI main relay 1 OK?
YES - Go to Step 72 .
NO - Replace the PGM-FI main relay 1 .■

72. Disconnect ECM/PCM connector B (49P).

---

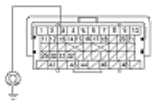
73. Check for continuity between body ground and ECM/PCM connector terminals B1, B10, C2, C44, and C48 individually.



Is there continuity?
YES - Go to Step 74 .
NO - Repair open in the wire between the ECM/PCM (B1, B10, C2, C44, C48) and G101.■

---

74. Check for continuity between ECM/PCM connector terminal C13 and body ground.



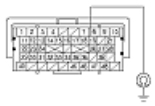
Is there continuity?
YES - Go to Step 75 .
NO - Go to Step 76 .

75. Continue to check for continuity between ECM/PCM connector terminal C13 and body ground, while disconnecting these parts, one at a time:
    - MAP sensor 3P connector
    - Output shaft (countershaft) speed sensor 3P connector

Does continuity go away when one of the above components is disconnected?
YES - Repair the part that caused an open when it was disconnected.■
NO - Repair short in the between the ECM/PCM (C13) and the MAP sensor or the output shaft (countershaft) speed sensor.■

---

76. Check for continuity between ECM/PCM connector terminal B19 and body ground.



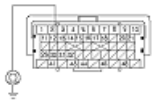
Is there continuity?
YES - Go to Step 77 .
NO - Go to Step 78 .

77. Continue to check for continuity between ECM/PCM connector terminal B19 and body ground, while disconnecting the input shaft (mainshaft) speed sensor 3P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (B19) and the input shaft (mainshaft) speed sensor.■
NO - Replace the input shaft (mainshaft) speed sensor. ■

---

78. Check for continuity between ECM/PCM connector terminal C12 and body ground.



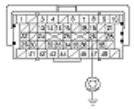
Is there continuity?
YES - Go to Step 79 .
NO - Go to Step 80 .

79. Continue to check for continuity between ECM/PCM connector terminal C12 and body ground, while disconnecting the throttle body 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (C12) and the throttle body.■
NO - Replace the throttle body. ■

---

80. Check for continuity between ECM/PCM connector terminal A26 and body ground.



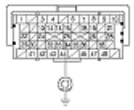
Is there continuity?
YES - Go to Step 81 .
NO - Go to Step 82 .

81. Continue to check for continuity between ECM/PCM connector terminal A26 and body ground, while disconnecting the APP sensor 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (A26) and APP sensor A.■
NO - Replace the accelerator pedal module. ■

---

82. Check for continuity between ECM/PCM connector terminal A25 and body ground.

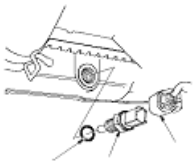


Is there continuity?
YES - Go to Step 83 .
NO - Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

83. Continue to check for continuity between ECM/PCM connector terminal A25 and body ground, while disconnecting the APP sensor 6P connector.

Is there continuity?
YES - Repair short in the wire between the ECM/PCM (A25) and APP sensor B.■
NO - Replace the accelerator pedal module. ■

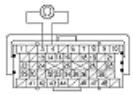
ECT Sensor 2 Replacement



1. Lift the vehicle, and suppor it with jackstands.
2. Remove the engine undercover (KE, KG models).
3. Drain the engine coolant.
4. Disconnect the ECT sensor 2 connector (A), then remove ECT sensor 2 (B).
5. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant.

F-CAN Circuit Troubleshooting

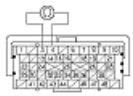
NOTE: Information marked with an asterisk (*) applies to the CANL line.



1. Turn the ignition switch to LOCK (0).
2. Jump the SCS line with the HDS.
3. Disconnect ECM/PCM connector A (49P), then disconnect the HDS.
4. Measure the resistance between ECM/PCM connector terminals A3 and A4.

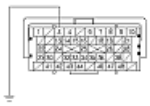
   Is there about 108−132 Ω?
   YES - Go to Step 44 .
   NO - Go to Step 5 .

5. Disconnect these connectors:
   - Gauge control module 32P.
   - VSA modulator-control unit 36P (With VSA).
   - Yaw rate-lateral/longitudinal acceleration sensor 5P (With VSA).
   - ABS modulator-control unit 25P.
   - EPS control unit C (16P).
   - SRS unit A (39P).
   - Engine compartment wire harness (i-SHIFT System).
   - Gear shift control module (i-SHIFT System).



6. Check for continuity between ECM/PCM connector terminals A3 and A4.

   Is there continuity?
   YES - Repair short in the wire between ECM/PCM terminals A3 and A4 * .■
   NO - Go to Step 7 .



7. Connect ECM/PCM connector terminal A3 to body ground with a jumper wire.

---

8. Check for continuity between gauge control module 32P connector terminal No. 30 and body ground.

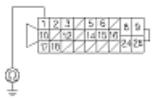
   Is there continuity?
   YES -
   - With VSA: Go to Step 9 .
   - With ABS: Go to Step 10 .

   NO - Repair open in the wire between the ECM/PCM (A3) and the gauge control module.■

---

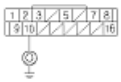
9. Check for continuity between VSA modulator-control unit 36P connector terminal No. 14 and body ground.

   Is there continuity?
   YES - Go to Step 11 .
   NO - Repair open in the wire between the ECM (A3) and the VSA modulator-control unit.■



10. Check for continuity between ABS modulator-control unit 25P connector terminal No. 1 and body ground.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the ECM/PCM (A3) and the ABS modulator-control unit.■



11. Check for continuity between EPS control unit connector C (16P) terminal No. 10 and body ground.

    Is there continuity?
    YES -
    - With i-SHIFT System: Go to Step 12 .
    - Without i-SHIFT System: Go to Step 13 .

    NO - Repair open in the wire between the ECM/PCM (A3) and the EPS control unit.■

---

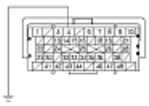
12. Check for continuity between engine compartment wire harness 10P connector terminal No. 7 and body ground.

    Is there continuity?
    YES - Go to Step 13 .
    NO -
    - Repair open in the wire between the ECM (A3) and the engine compartment wire harness.■
    - Check the clutch actuator wire harness for an open.■

13. Remove the jumper wire from ECM/PCM connector A (49P).

---

14. Connect ECM/PCM connector terminal A4 to body ground with a jumper wire.



15. Check for continuity between gauge control module 32P connector terminal No. 29 and body ground.

Is there continuity?

YES -
- With VSA: Go to Step 16 .
- With ABS: Go to Step 17 .

NO - Repair open in the wire between the ECM/PCM (A4) and the gauge control module.■

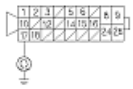
16. Check for continuity between VSA modulator-control unit 36P connector terminal No. 1 and body ground.

Is there continuity?

YES - Go to Step 18 .

NO - Repair open in the wire between the ECM (A4) and the VSA modulator-control unit.■

17. Check for continuity between ABS modulator-control unit 25P connector terminal No. 17 and body ground.



Is there continuity?

YES - Go to Step 18 .

NO - Repair open in the wire between the ECM/PCM (A4) and the ABS modulator-control unit.■

18. Check for continuity between EPS control unit connector C (16P) terminal No. 9 and body ground.

Is there continuity?

YES -
- With i-SHIFT System: Go to Step 19 .
- Without i-SHIFT System: Go to Step 20 .

NO - Repair open in the wire between the ECM/PCM (A4) and the EPS control unit.■

19. Check for continuity between engine compartment wire harness 10P connector terminal No. 6 and body ground.

Is there continuity?

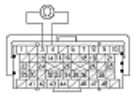
YES - Go to Step 20 .

NO -
- Repair open in the wire between the ECM (A4) and the engine compartment wire harness.■
- Check the clutch actuator wire harness for an open.■

20. Remove the jumper wire from ECM/PCM connector A (49P).

21. Reconnect the gauge control module 32P connector.

22. Measure the resistance between ECM/PCM connector terminals A3 and A4.



Is there about 108−132 Ω?

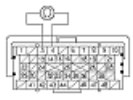
YES -
- With VSA: Go to Step 23 .
- With ABS: Go to Step 29 .

NO - Substitute a known-good gauge control module, If the HDS identifies the vehicle, replace the original gauge control module. ■

23. Disconnect the gauge control module 32P connector.

24. Reconnect the VSA modulator-control unit 36P connector.

25. Measure the resistance between ECM connector terminals A3 and A4.



Is there about 2.34−2.86 kΩ?

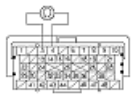
YES - Go to Step 26 .

NO - Substitute a known-good VSA modulator-control unit, If the HDS identifies the vehicle, replace the original VSA modulator-control unit. ■

26. Disconnect the VSA modulator-control unit 36P connector.

27. Reconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector.

28. Measure the resistance between ECM connector terminals A3 and A4.



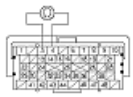
Is there about 2.34–2.86 Ω?
YES - Go to Step 32 .
NO - Substitute a known-good yaw rate-lateral/longitudinal acceleration sensor, If the HDS identifies the vehicle, replace the original yaw rate-lateral/longitudinal acceleration sensor. ■

29. Disconnect the gauge control module 32P connector.

30. Reconnect the ABS modulator-control unit 25P connector.

---

31. Measure the resistance between ECM/PCM connector terminals A3 and A4.



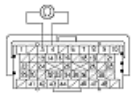
Is there about 2.34–2.86 kΩ?
YES - Go to Step 32 .
NO - Substitute a known-good ABS modulator-control unit, If the HDS identifies the vehicle, replace the original ABS modulator-control unit. ■

32. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector (With VSA) or ABS modulator-control unit 25P connector (With ABS).

33. Reconnect EPS control unit connector C (16P).

---

34. Measure the resistance between ECM/PCM connector terminals A3 and A4.



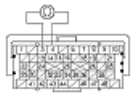
Is there about 2.34–2.86 kΩ?
YES - Go to Step 35 .
NO - Substitute a known-good EPS control unit, If the HDS identifies the vehicle, replace the original EPS control unit. ■

35. Disconnect EPS control unit connector C (16P).

36. Reconnect SRS unit connector A (39P).

---

37. Measure the resistance between ECM/PCM connector terminals A3 and A4.



Is there about 2.34–2.86 kΩ?
YES -
- With i-SHIFT System: Go to Step 38 .
- Without i-SHIFT System:
  Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

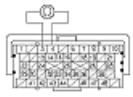
NO - Substitute a known-good SRS unit, If the HDS identifies the vehicle, replace the original SRS unit. ■

38. Disconnect SRS unit connector A (39P).

39. Reconnect the engine compartment wire harness 10P connector.

---

40. Measure the resistance between ECM connector terminals A3 and A4.



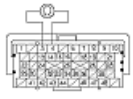
Is there about 2.34–2.86 kΩ?
YES - Go to Step 41 .
NO -
- Check the clutch actuator wire harness for an open or short.■
- Substitute a known-good TCM, If the HDS identifies the vehicle, replace the original TCM. ■

41. Disconnect engine compartment wire harness 10P connector.

42. Reconnect gear shift control module 12P connector.

---

43. Measure the resistance between ECM connector terminals A3 and A4.

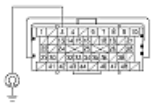


Is there about 2.34–2.86 kΩ?
YES - Update the ECM if it does not have the latest software, or substitute a known-good ECM, then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■
NO - Substitute a known-good gear shift control module. If the HDS identifies the vehicle, replace the original gear shift control module. ■

44. Disconnect these connectors:
- Gauge control module 32P.
- VSA modulator-control unit 36P (With VSA).
- Yaw rate-lateral/longitudinal acceleration sensor 5P (With VSA).
- ABS modulator-control unit 25P.
- EPS control unit C (16P).
- SRS unit A (39P).
- Engine compartment wire harness (i-SHIFT System).
- Gear shift control module (i-SHIFT System).

---

45. Check for continuity between ECM/PCM connector terminal A3 and body ground.



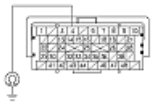
Is there continuity?

YES - Repair short in the wire between ECM/PCM terminals A3 and the gauge control module, the VSA modulator-control unit, the yaw rate-lateral/longitudinal acceleration sensor, the ABS modulator-control unit, the EPS control unit, the SRS unit, the TCM, the gear shift control module, or the DLC.■

NO - Go to Step 46 .

---

46. Check for continuity between ECM/PCM connector terminal A4 and body ground.



Is there continuity?

YES - Repair short in the wire between ECM/PCM terminals A4 and the gauge control module, the VSA modulator-control unit, the yaw rate-lateral/longitudinal acceleration sensor, the ABS modulator-control unit, the EPS control unit, the SRS unit, the TCM, the gear shift control module, or the DLC.■

NO - Go to Step 47 .

47. Reconnect all connectors.

48. Connect the HDS to the DLC.

49. Disconnect the gauge control module 32P connector.

50. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the gauge control module. ■

NO -
- With VSA: Go to Step 51 .
- With ABS: Go to Step 59 .

51. Turn the ignition switch to LOCK (0).

52. Reconnect the gauge control module 32P connector.

53. Disconnect the VSA modulator-control unit 36P connector.

54. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the VSA modulator-control unit. ■

NO - Go to Step 55 .

55. Turn the ignition switch to LOCK (0).

56. Reconnect the VSA modulator-control unit 36P connector.

57. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector.

58. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the yaw rate-lateral/longitudinal acceleration sensor. ■

NO - Go to Step 63 .

59. Turn the ignition switch to LOCK (0).

60. Reconnect gauge control module 32P connector.

61. Disconnect ABS modulator-control unit 25P.

62. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the ABS modulator-control unit. ■

NO - Go to Step 63 .

63. Turn the ignition switch to LOCK (0).

64. Reconnect the yaw rate-lateral/longitudinal acceleration sensor 5P connector (With VSA) or ABS modulator-control unit 25P connector (With ABS).

65. Disconnect EPS control unit connector C (16P).

66. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the EPS control unit. ■

NO - Go to Step 67 .

67. Turn the ignition switch to LOCK (0).

68. Reconnect EPS control unit connector D (28P).

69. Disconnect SRS unit connector A (39P).

70. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the SRS unit. ■

NO -
- With i-SHIFT System: Go to Step 71 .
- Without i-SHIFT System:
  Update the ECM/PCM if it does not have the latest software, or substitute a known-good ECM/PCM, then recheck. If the symptom/indication goes away with a known-good ECM/PCM, replace the original ECM/PCM. ■

71. Turn the ignition switch to LOCK (0).

72. Reconnect SRS unit connector A (39P).

73. Disconnect the engine compartment wire harness 10P connector.

74. Turn the ignition switch to ON (II), and read the HDS.

Does the HDS identify the vehicle?

YES - Replace the clutch actuator (TCM). ■

NO - Go to Step 75 .

75. Turn the ignition switch to LOCK (0).

76. Reconnect the engine compartment wire harness 10P connector.

77. Disconnect the gear shift control module 12P connector

78. Turn the ignition switch to ON (II), and read the HDS.

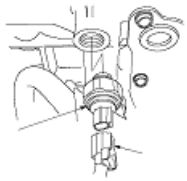
Does the HDS identify the vehicle?

YES - Replace the gear shift control module. ■

NO - Update the ECM if it does not have the latest software, or substitute a known-good ECM, then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■

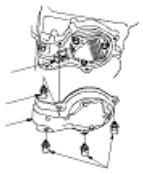
Knock Sensor Replacement

1. Remove the dipstick.
2. Disconnect the knock sensor 1P connector (A).
3. Remove the knock sensor (B).
4. Install the parts in the reverse order of removal.



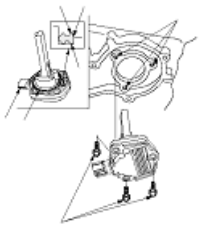
Engine Oil Level Sensor Removal/Installation

1. Remove the engine undercover.
2. Drain the engine oil.
3. Remove the bolts (A), the engine oil level sensor cover (B), and the engine oil level sensor connector (C).
   NOTE: If the cover is damaged, replace it.



4. Remove the bolts (A), then remove the engine oil level sensor (B) from the oil pan (C).
   NOTE:
   - To avoid damaging the oil pan and the sensor mounting surface, do not use sharp tools when removing the sensor.
   - If you find any damage at the oil level sensor, replace it.
5. Clean the surface around the engine oil level sensor mounting hole at the oil pan if there is oil, dirt or grease.
   NOTE: Do not make and scratch or damage at the engine oil level sensor mounting surface.

6. Install the parts in the reverse order of removal, noting these items:
   - Use a new O-ring (A), and make sure it is not twisted when you install it.
   - Remove any oil, dirt or grease from the O-ring groove on the sensor (B), the bolts (C), and the bolt holes (D).
   - Be careful not to scratch the sensor mounting surfaces.
   - Do not cover the sensor connector (E) with oil.
   - Make sure the oil level sensor O-ring surface (F) is 1.0 mm±0.15 mm from the sensor (all around) (G).
7. Install the engine oil drain bolt and refill the engine oil to maximum level.
8. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (in neutral) until the radiator fan comes on, then let it idle for more than 10 minutes.
9. Check the ENGINE OIL LEVEL MONITOR CONDITION in the DATA LIST with the HDS.
   - If it is ACTIVE, go to Step 10 .
   - If it is INACTIVE, install a new sensor, then go to Step 7 .
10. Turn the ignition switch to LOCK (0), wait 3 minutes, then measure the engine oil level. If needed, adjust the engine oil to maximum level.
11. Start the engine, and let it idle for 5 minutes.
12. Check the ENGINE OIL LEVEL in the DATA LIST with the HDS and note it.
13. Stop the engine, leave the ignition switch to ON (II), and wait 3 minutes.
14. Check the ENGINE OIL LEVEL in the DATA LIST with the HDS, and compare it with the level you noted in Step 12 .
    - If the level changed more than 2 mm, the engine oil level sensor is OK.
    - If the level did not change more than 2 mm, install a new sensor, then go to Step 6 .
15. Check for oil leaks around the sensor.
    - If there are no leaks, go to Step 16 .
    - If you find a leak, repair it, then go to Step 16 .



16. Install the engine oil level sensor cover (A), and torque the bolts.
17. Install the engine undercover.

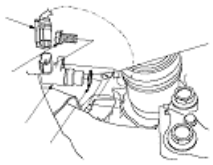
Engine Oil Level Sensor Inspection

NOTE:

- This procedure checks the engine oil level sensor normality.
- Do this procedure at a flat place.
- Make sure that the customer hasn't added oil before doing this procedure.
- Check for any oil leaks before doing this procedure.
- Make sure the vehicle has the genuine oil level gauge.
- Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any Temporary DTCs or DTCs are indicated, troubleshoot them first, then do this procedure.

1. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (in neutral) until the radiator fan comes on.
2. Turn the ignition switch to LOCK (0), and wait 5 minutes.
3. Check the engine oil level with the oil level gauge.
   - If the engine oil level is OK, and the engine oil wasn't added by the customer after the engine oil display came on, replace the engine oil level sensor, then go to Step 4 .
   - If the engine oil level is not in the proper level, adjust the engine oil level, then go to Step 1 and recheck.
4. Start the engine. Hold the engine speed at 3,000 rpm (min^{-1}) without load (in neutral) until the radiator fan comes on.
5. Check for Temporary DTCs or DTCs with the HDS.
   - If there are no DTCs indicated, the engine oil level sensor is OK.
   - If any Temporary DTCs or DTCs are indicated, go to the indicated DTC's troubleshooting.

Output Shaft (Countershaft) Speed Sensor Replacement



1. Lift the vehicle, and support it with jackstands.
2. Remove the engine undercover (KE, KG models).
3. Disconnect the output shaft (countershaft) speed sensor 3P connector (A).
4. Remove the output shaft (countershaft) speed sensor (B).
5. Install the parts in the reverse order of removal with a new O-ring (C).

Fuel and Emissions System Description - SIL

Shift Indicator Lamp (SIL) (KE, KG models (M/T))

SIL Troubleshooting

NOTE: Check for Temporary DTCs or DTCs with the HDS before doing this procedure. If any DTCs are indicated, troubleshoot them first, then do this procedure.

1. Connect the HDS to the DLC.
2. Start the engine.
3. Test-drive several minutes.
4. Check the C SHAFT SPD in the DATA LIST with the HDS.

   In any vehicle speed indicated?
   YES - Go to Step 5 .
   NO - Go to troubleshooting P0720.
5. Do the gauge self-diagnostic function. ■

   Is the result OK?
   YES - Go to Step 6 .
   NO - Substitute a known-good gauge control module, and recheck. If the symptom/indication goes away with a known-good gauge control module, replace the original gauge control module.
6. Do the APP sensor signal inspection. ■

   Is the result OK?
   YES - Go to Step 7 .
   NO - Depending on the result, replace the appropriate part.■
7. Do the brake pedal position switch signal circuit troubleshooting. ■

   Is the result OK?
   YES - Go to Step 8 .
   NO - Depending on the result, repair or replace the appropriate part.■
8. Turn the ignition switch to LOCK (0).
9. Check clutch pedal position switch A position. ■

   Is a position proper?
   YES - Go to Step 10 .
   NO - Do the clutch pedal and clutch pedal position switch A adjustment. ■
10. Turn the ignition switch to ON (II).
11. Check CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

    Is OFF indicated?
    YES - Go to Step 12 .
    NO - Go to Step 28 .
12. Press the clutch pedal.
13. Check CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

    Is ON indicated?
    YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module, clutch pedal position switch A, and the ECM.■
    NO - Go to Step 14 .
14. Turn the ignition switch to LOCK (0).
15. Disconnect the clutch pedal position switch A 2P connector.
16. Connect clutch pedal position switch A 2P connector terminals No. 1 and No. 2 with a jumper wire.
17. Turn the ignition switch to ON (II).
18. Check CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

    Is ON indicated?
    YES - Replace clutch pedal position switch A. ■
    NO - Go to Step 19 .
19. Turn the ignition switch to LOCK (0).
20. Remove the jumper wire from the clutch pedal position switch A 2P connector.

21. Connect clutch pedal position switch A 2P connector terminal No. 1 and body ground with a jumper wire.
22. Turn the ignition switch to ON (II).
23. Check CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

Is ON indicated?

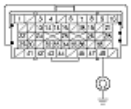
YES - Repair open in the wire between clutch pedal position switch A and body ground (LHD model: G302, RHD model: G401).■

NO - Go to Step 24 .

24. Turn the ignition switch to LOCK (0).
25. Jump the SCS line with the HDS.
26. Disconnect ECM connector A (49P).

---

27. Check for continuity between ECM connector terminal A48 and body ground.



Is there continuity?

YES - Update the ECM if it does not have the latest software, or substitute a known-good ECM, then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■

NO - Repair open in the wire between the ECM (A48) and clutch pedal position switch A.■

28. Turn the ignition switch to LOCK (0).
29. Disconnect the clutch pedal position switch A 2P connector.
30. Turn the ignition switch to ON (II).
31. Check CLUTCH PEDAL POSITION SWITCH A in the DATA LIST with the HDS.

Is OFF indicated?

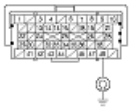
YES - Replace clutch pedal position switch A. ■

NO - Go to Step 32 .

32. Turn the ignition switch to LOCK (0).
33. Jump the SCS line with the HDS.
34. Disconnect ECM connector A (49P).

---

35. Check for continuity between ECM connector terminal A48 and body ground.

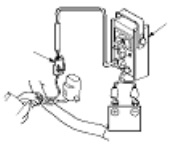


Is there continuity?

YES - Repair short in the wire between the ECM (A48) and clutch pedal position switch A.■

NO - Update the ECM if it does not have the latest software, or substitute a known-good ECM, then recheck. If the symptom/indication goes away with a known-good ECM, replace the original ECM. ■

Idle Speed Inspection



NOTE:

- Before checking the idle speed, check these items:
  - The malfunction indicator lamp (MIL) has not been reported on, and there are no DTCs.
  - Ignition timing
  - Spark plugs
  - Air cleaner
  - PCV system
  - Headlight OFF

1. Disconnect the evaporative emission (EVAP) canister purge valve connector.
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard, or a tachometer (B) to the test tachometer connector (C).
3. When using the HDS, make sure the HDS communicates with the ECM/PCM. If it doesn't, go to the DLC circuit troubleshooting.
4. Start the engine. Hold the engine speed at 3,000 rpm (min $^{-1}$) without load (A/T in P or N, M/T in neutral) until the radiator fan comes on, then let it idle.
5. Check the idle speed without load conditions: headlights, blower fan, radiator fan, and air conditioner off.
   Idle speed should be:

L12B1 engine

M/T	**700±50 rpm (min $^{-1}$)**

L13Z1 engine

M/T	**650±50 rpm (min $^{-1}$)**
A/T	**700±50 rpm (min $^{-1}$) (in N or P)**
i-SHIFT	**650±50 rpm (min $^{-1}$)**

L15A7 engine

M/T	**700±50 rpm (min $^{-1}$)**
A/T	**700±50 rpm (min $^{-1}$) (in N or P)**

6. Let the engine idle for 1 minute with high electric load (A/C switch on, temperature set to max cool, blower fan on High, and headlights on high beam).
   Idle speed should be:

M/T	**790±50 rpm (min $^{-1}$)**
A/T	**790±50 rpm (min $^{-1}$) (in N or P)**
i-SHIFT	**790±50 rpm (min $^{-1}$)**

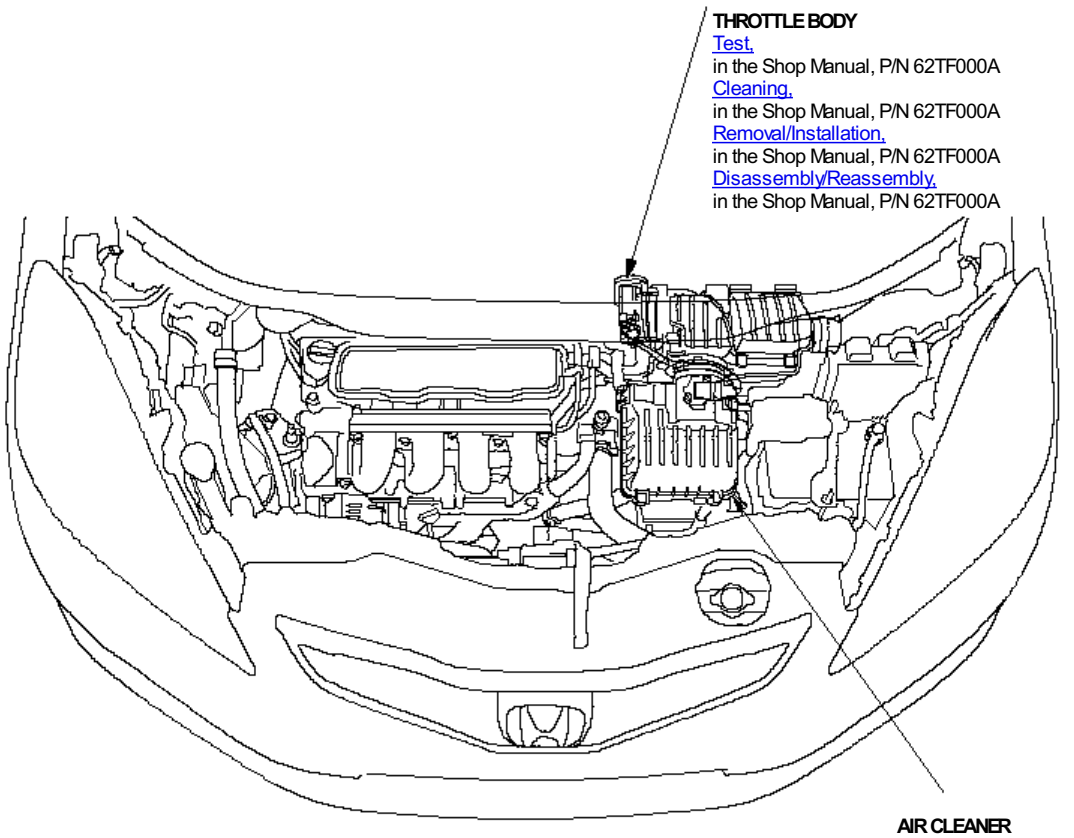
   NOTE: If the idle speed is not within specification, do the ECM/PCM idle learn procedure. If the idle speed is still not within specification, go to symptom troubleshooting.

7. Reconnect the EVAP canister purge valve connector.

Engine idle

Item	Measurement	Qualification	Standard or New
Engine idle	Idle speed without load (L12B1)	M/T (in neutral)	700±50 rpm (min^{-1})
	Idle speed without load (L13Z1)	M/T (in neutral)	650±50 rpm (min^{-1})
		A/T (in N or P)	700±50 rpm (min^{-1})
		i-SHIFT (in neutral)	650±50 rpm (min^{-1})
	Idle speed without load (L15A7)	M/T (in neutral), A/T (in N or P)	700±50 rpm (min^{-1})
	Idle speed with high electrical load (A/C switch ON, temperature set to max cool, blower fan on High, rear window defogger ON, and headlights on high beam)	M/T (in neutral), A/T (in N or P), i-SHIFT (in neutral)	790±50 rpm (min^{-1})
	Idle CO		0.1 % max.

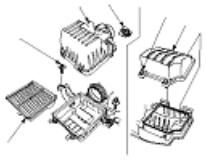
Intake Air System Component Location Index



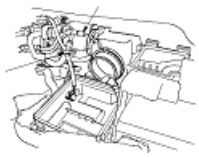
*: This illustration shows RHD model.

Air Cleaner Removal/Installation

1. Disconnect the MAF sensor/IAT sensor connector(A), then remove the air cleaner cover (B), and the air cleaner element (C).
   NOTE: Be careful not to damage the MAF sensor/IAT sensor on the air cleaner cover.
2. Remove the air cleaner chamber (D).

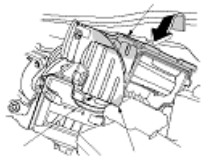


3. Remove the harness clamp (A), and the breather pipe (B) as shown.

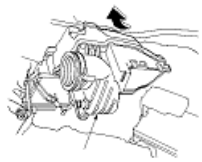


4. Wrap the air cleaner, the cowl cover, and the battery terminal fuse box with the tapes (A) as shown.
5. Remove the battery setting plate, and reposition the battery (B). Reposition the radiator upper hose (C), and the breather pipe (D) as shown.
   NOTE: Do not disconnect the battery terminals.

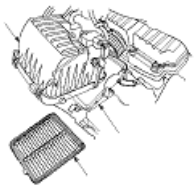
6. Wrap the air cleaner with the tapes (A) as shown.
7. Turn the air cleaner (B) case as shown.



8. Remove the air cleaner case (A) as shown.
9. Install the parts in the reverse order of removal.



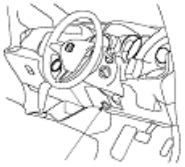
Air Cleaner Element Inspection/Replacement



1. Open the air cleaner housing cover (A).
2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage, dirt, or clogging. If it is damage or clogged, replace it.
   NOTE: Do not use compressed air to clean the air cleaner element.
4. Clean and remove any debris from inside the air cleaner housing.
5. Install the parts in the reverse order of removal.
   - If you did not replace the air cleaner element, this procedure is complete.
   - If you replace the air cleaner element, reset the ECM/PCM with the HDS and do the ECM/PCM idle learn procedure.
6. Without service reminder system, this procedure is complete.

With service reminder system

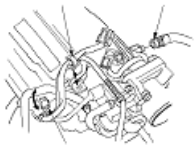
7. If the srevice reminder system required to replace the air cleaner element, reset the service reminder system, and this procedure is complete. If the service reminder system did not require to replace the air cleaner, go to Step 8 .



8. Connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.
9. Turn the ignition switch to ON (II).
10. Make sure the HDS communicates with the vehicle and the ECM. If it doesn't communicate, troubleshoot the DLC circuit.
11. Select BODY ELECTRICAL with the HDS.
12. Select ADJUSTMENT in GAUGE MENU with the HDS.
13. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
14. Select SERVICE REMINDER ITEM 8 with the HDS.

Intake Manifold Chamber Removal and Installation

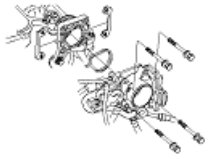
Exploded View



Removal

1. Remove the under-cowl panel.
2. Remove the air cleaner housing assembly.
3. Remove the engine wire harness connectors and wire harness clamps from the intake manifold chamber.
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
4. Remove the brake booster vacuum hose (A) and the harness clamp (B).
5. Remove the water bypass hose from the clamp (C).

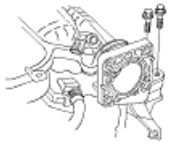
6. Remove the throttle body without disconnecting the water bypass hoses.



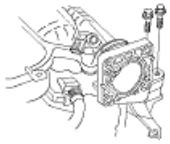
7. Remove the intake manifold bracket mounting bolts.

L15A7 engine

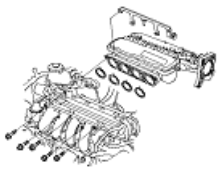
L13Z1 engine



L12B1 engine

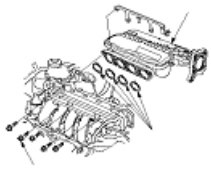


8. Remove the intake manifold chamber.



Installation

1. Install the intake manifold chamber (A) with a new gaskets (B), and tighten the bolts in a crisscross pattern in three steps, beginning with the inner bolt.

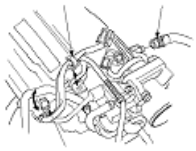


2. With L15A7 engine: Loosen the intake manifold bracket mounting bolt (A), (B). Tighten the mounting bolts (C), then tighten the mounting bolt (A). Loosely tighten the mounting bolt (D), and tighten the mounting bolt (B), then tighten the mounting bolt (D).

3. With L13Z1 engine, L12B1 engine: Loosen the intake manifold bracket mounting bolt (A). Tighten the mounting bolts (B), then tighten the mounting bolt (A).

4. Install the throttle body (A) with a new gasket (B).

5. Install the water bypass hose to the clamp (A).
6. Install the brake booster vacuum hose (B) and the harness clamp (C).
7. Install the engine wire harness connectors and wire harness clamps to the intake manifold chamber.
   - Throttle actuator connector
   - MAP sensor connector



8. Install the air cleaner housing assembly.
9. Install the under-cowl panel.

Intake Manifold/Chamber Assembly Removal and Installation

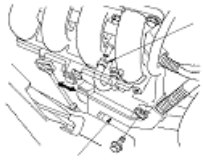
Exploded View

Removal

1. Remove the under-cowl panel.
2. Remove the air cleaner housing assembly.
3. Remove the engine wire harness connectors and wire harness clamps from the intake manifold chamber.
   - Throttle actuator connector
   - Manifold absolute pressure (MAP) sensor connector
   - Exhaust gas recirculation (EGR) valve connector
4. Remove the brake booster vacuum hose (A) and the harness clamp (B).
5. Remove the water bypass hose from the clamp (C).

6. Remove the throttle body without disconnecting the water bypass hoses.

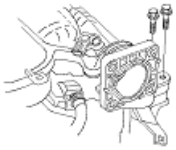
7. Remove the harness holder mounting bolt, then remove the harness holder (A) from the bracket.
8. Remove the positive crankcase ventilation (PCV) hose (B).
9. Remove the dipstick.



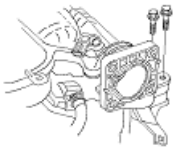
10. Remove the intake manifold bracket mounting bolts.

L15A7 engine

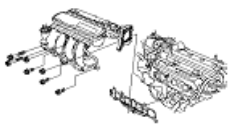
L13Z1 engine



L12B1 engine

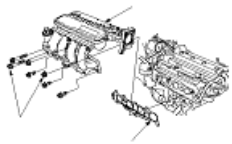


11. Remove the intake manifold/chamber assembly.



Installation

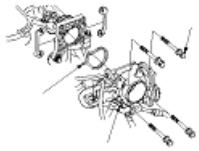
1. Install the intake manifold/chamber assembly (A) with a new gasket (B), and tighten the bolts and nuts in a crisscross pattern in three steps, beginning with the inner bolt.



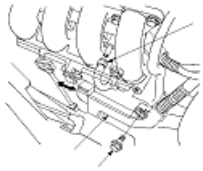
2. With L15A7 engine: Loosen the intake manifold bracket mounting bolt (A), (B). Tighten the mounting bolts (C), then tighten the mounting bolt (A). Loosely tighten the mounting bolt (D), and tighten the mounting bolt (B), then tighten the mounting bolt (D).

3. With L13Z1 engine, L12B1 engine: Loosen the intake manifold bracket mounting bolt (A). Tighten the mounting bolts (B), then tighten the mounting bolt (A).

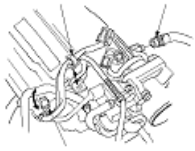
4. Install the throttle body (A) with a new gasket (B).
5. Install the dipstick.



6. Install the PCV hose (A) and harness holder (B).



7. Install the water bypass hose to the clamp (A).
8. Install the brake booster vacuum hose (B) and the harness clamp (C).
9. Install the engine wire harness connectors and wire harness clamps to the intake manifold chamber.
    - Throttle actuator connector
    - MAP sensor connector
    - EGR valve connector



10. Install the air cleaner housing assembly.
11. Install the under-cowl panel.

Ignition timing

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition timing		At idle (check the *white* mark)	M/T (in neutral): 0±2 ° BTDC	
			A/T (in N or P): 0±2 ° BTDC	

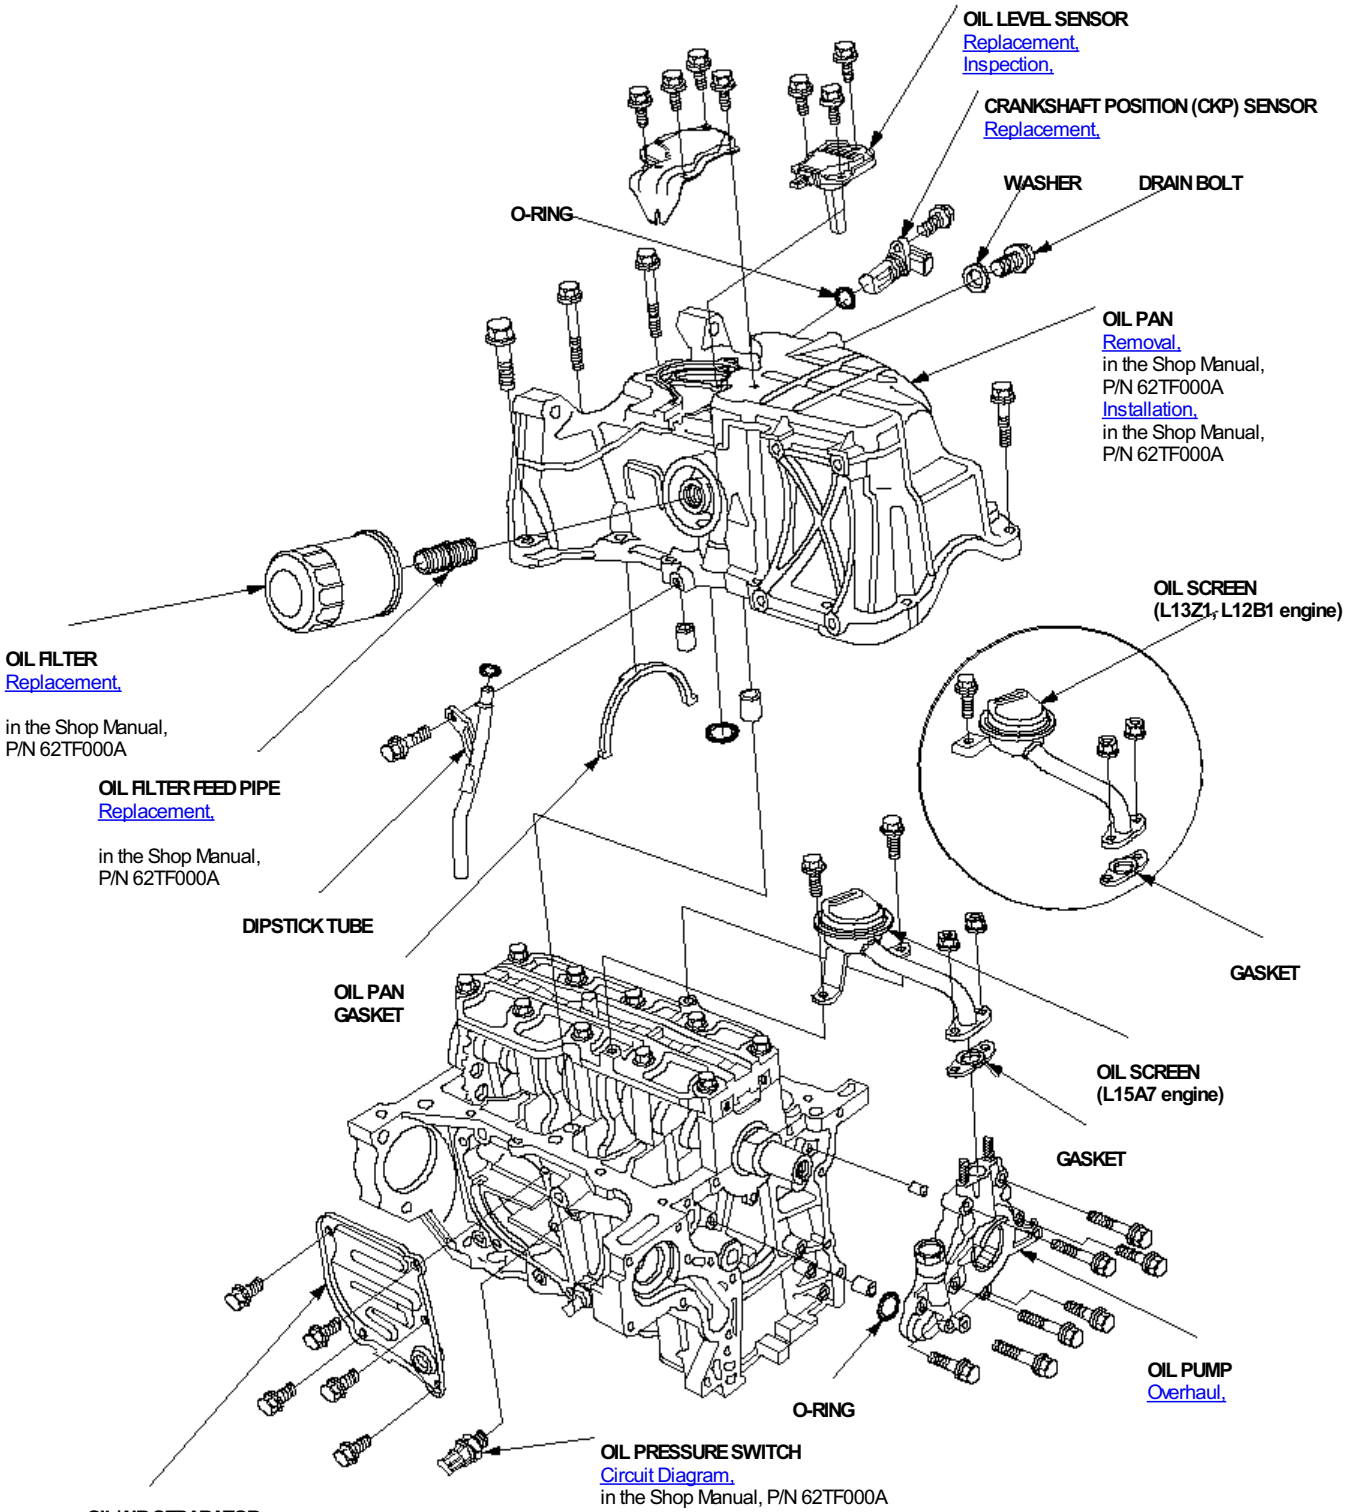
Ignition coil

Item	Measurement	Qualification	Standard or New	Service Limit
Ignition coil	Rated voltage		12 V	
	Firing order		1−3−4−2	

Spark plug

Item	Measurement	Qualification	Standard or New	Service Limit
Spark plug	Type		NGK: IZFR6K13 DENSO: SKJ20DR-M13	
	Gap		1.2−1.3 mm (0.047−0.051 in.)	———

Engine Lubrication Component Location Index



Excessive engine oil consumption

Diagnostic procedure

1. Verify that the engine oil filler cap, oil drain bolt, and oil filter are tight.
2. Check for oil leaks.
3. Check for worn valve guide(s) or worn valve stem seal(s).
4. Check for damaged or worn piston ring(s).
5. Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.).

Low oil pressure indicator does not come on with the ignition switch ON (II)

Diagnostic procedure

1. Do the low oil pressure indicator circuit troubleshooting (Open).
2. Test the oil pressure switch.

Also check for

- An open in the wire between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch

Engine oil level sensor system indication symbol comes on in the multi information display

1. Refer to the Fuel and Emissions general troubleshooting information.

Low oil pressure indicator stays on

Diagnostic procedure

1. Check the engine oil level.
2. Do the low oil pressure indicator circuit troubleshooting (Short).
3. Test the oil pressure switch.
4. Check the engine oil pressure.
5. Check the oil filter for clogging.
6. Check the oil screen for clogging.
7. Check the relief valve.
8. Inspect the oil pump.

Also check for

- A wire shorted to ground between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch

Engine Lubrication Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Excessive engine oil consumption	1. Verify that the engine oil filler cap, oil drain bolt, and oil filter are tight. 2. Check for oil leaks. 3. Check for worn valve guide(s) or worn valve stem seal(s). 4. Check for damaged or worn piston ring(s). 5. Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.).	
Low oil pressure indicator does not come on with the ignition switch ON (II)	1. Do the low oil pressure indicator circuit troubleshooting (Open). 2. Test the oil pressure switch.	An open in the wire between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch
Engine oil level sensor system indication symbol comes on in the multi information display	Refer to the Fuel and Emissions general troubleshooting information.	
Low oil pressure indicator stays on	1. Check the engine oil level. 2. Do the low oil pressure indicator circuit troubleshooting (Short). 3. Test the oil pressure switch. 4. Engine Oil Pump Overhaul

Exploded View

Special Tools Required

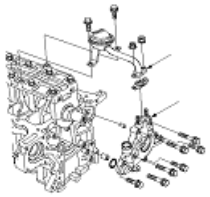
Sub hanger stay
07MAK-PY30100

Removal

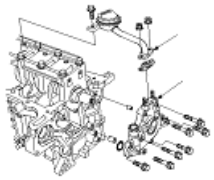
1. Remove the cam chain.
2. Remove the alternator mounting bolt, then install the sub hanger stay.
3. Attach the chain to the sub hanger stay. Lift and support the engine with the chain.
4. Remove the oil pan.

5. Remove the oil screen (A), then remove the oil pump (B).

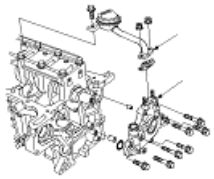
L15A7 engine



L13Z1 engine



L12B1 engine

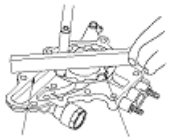


Inspection

1. Remove the screws from the oil pump housing, then separate the pump housing and pump cover.
2. Check the inner-to-outer rotor radial clearance between the inner rotor (A) and the outer rotor (B). If the inner-to-outer rotor clearance exceeds the service limit, replace the oil pump assembly.

Inner Rotor-to-Outer Rotor Radial Clearance

Standard (New):	**0.06–0.16 mm (0.002–0.006 in.)**
Service Limit:	**0.20 mm (0.008 in.)**

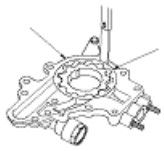


3. Check the pump housing-to-rotor axial clearance between the rotors (A) and pump housing (B). If the pump housing-to-rotor axial clearance exceeds the service limit, replace the oil pump assembly.

Housing-to-Rotor Axial Clearance

Standard (New):	**0.02–0.06 mm (0.001–0.002 in.)**
Service Limit:	**0.15 mm (0.006 in.)**

4. Check the pump housing-to-outer rotor radial clearance between the outer rotor (A) and the pump housing (B). If the pump housing-to-outer rotor radial clearance exceeds the service limit, replace the oil pump assembly.



Pump Housing-to-Outer Rotor Radial Clearance

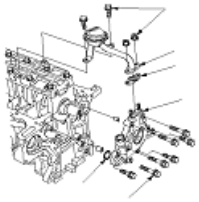
Standard (New):	**0.100–0.175 mm (0.0039–0.0069 in.)**
Service Limit:	**0.20 mm (0.008 in.)**

5. Inspect both rotors and the pump housing for scoring or other damage. Replace the parts, if necessary.
6. Check that the oil pump turns freely.

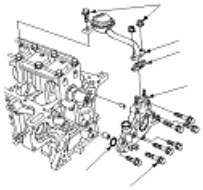
Installation

1. Clean the O-ring groove and the mating surface of the engine block.
2. Install the oil pump (A) with a new O-ring (B).
3. Install the oil screen (C) with a new gasket (D).
4. Install the oil pan.
5. Support the engine with a jack and wood block under the oil pan.

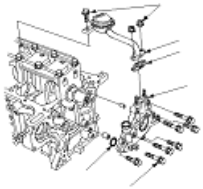
L15A7 engine



L13Z1 engine

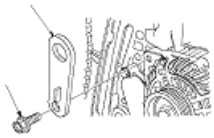


L12B1 engine



---

6. Remove the chain and sub hanger stay, then tighten the alternator mounting bolt.
7. Install the cam chain.



Oil pump

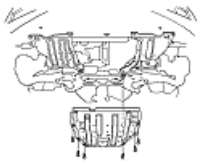
Item	Measurement	Qualification	Standard or New	Service Limit
Oil pump	Inner rotor-to-outer rotor clearance		0.06−0.16 mm (0.002−0.006 in.)	0.20 mm (0.008 in.)
	Pump housing-to-outer rotor clearance		0.100−0.175 mm (0.0039−0.0069 in.)	0.20 mm (0.008 in.)
	Pump housing-to-rotor axial clearance		0.02−0.06 mm (0.001−0.002 in.)	0.15 mm (0.006 in.)

Relief valve

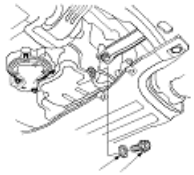
Item	Measurement	Qualification	Standard or New	Service Limit
Relief valve	Relief valve, oil pressure with oil temperature at 80°C (176°F)	At idle	70 kPa (0.7 kgf/cm ^{2}, 10 psi) min.	———
		At 3,000 rpm (min $^{-1}$)	340 kPa (3.5 kgf/cm ^{2}, 50 psi) min.	———

Engine Oil Replacement

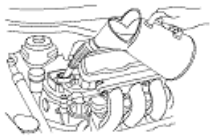
1. Warm up the engine.
2. Remove the undercover.



3. Remove the drain bolt (A), and drain the engine oil.
4. Reinstall the drain bolt with a new washer (B).
5. Install the undercover.



6. Refill the engine with the recommended oil.
   Capacity
   At Oil Change:
   3.4 L (3.6 US qt, 3.0 Imp qt)
   At Oil Change Including Filter:
   3.6 L (3.8 US qt, 3.2 Imp qt)
   After Engine Overhaul:
   4.2 L (4.4 US qt, 3.7 Imp qt)



7. Without service reminder system, this procedure is complete.
8. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
9. Turn the ignition switch to ON (II).
10. Make sure the HDS communicates with the vehicle and the engine control module (ECM)/powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
11. Select BODY ELECTRICAL with the HDS.
12. Select ADJUSTMENT in GAUGE MENU with the HDS.
13. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
14. Select SERVICE REMINDER ITEM A with the HDS.
15. Run the engine for more than 3 minutes, then check the oil level and oil leaks.

Engine oil

Item	Measurement	Qualification	Standard or New	Service Limit
Engine oil	Capacity	Engine overhaul	4.2 L (4.4 US qt, 3.7 Imp qt)	———
		Oil change including oil filter	3.6 L (3.8 US qt, 3.2 Imp qt)	———
		Oil change without oil filter	3.4 L (3.6 US qt, 3.0 Imp qt)	———

Engine does not start (does not crank)

Diagnostic procedure

1. Check for i-SHIFT DTCs (i-SHIFT model).
2. Check for PGM-FI DTCs.
3. Check for loose battery terminals or connections.
4. Test the battery for a low charge.
5. Check the starter.
6. Check the starter cut relay (A/T model).
7. Check the starter cut relay 1 (i-SHIFT model).
8. Check the starter cut relay 2 (i-SHIFT model).
9. Check the transmission range switch (A/T model).
10. Check the transmission control module (i-SHIFT model).
11. Check the brake switch (i-SHIFT model).
12. Check the ignition switch or related circuits.

Also check for

- Poor ground at G302 (LHD model), G401 (RHD model)

Engine cranks, but does not start

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the fuel pressure.
3. Check for a plugged or damaged fuel line.
4. Check for a plugged fuel filter.
5. Check the throttle body.
6. Check for low engine compression.
7. Check for a damage or broken cam chain.

Engine is hard to start

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the fuel pressure.
3. Check for a plugged or damaged fuel line.
4. Check for a plugged fuel filter.

Engine cranks slowly

Diagnostic procedure

1. Check for loose battery terminals or connections.
2. Test the battery for a low charge.
3. Check the starter for binding.
4. Check for excessive drag in the engine.

Starting System Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for

Wheel Alignment

Special Tool Required

Wheel alignment gauge attachment, 56 x 62 mm
07NAJ-SS00301

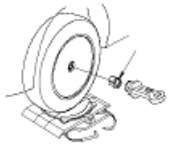
The suspension can be adjusted for front camber and front toe. However, each of these adjustments are interrelated to each other. For example, when you adjust the camber, the toe will change. Therefore, you must adjust the front wheel alignment whenever you adjust camber or toe.

Pre-Alignment Checks

For proper inspection and adjustment of the wheel alignment, do these checks:

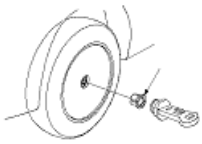
1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.
3. Make sure the fuel tank is full, and that the spare tyre or the temporary repair kit, the jack, and the tools are in place on the vehicle.
4. Check the tyre size and tyre pressure according to tyre information.
5. Check the runout of the wheels and tyres.
6. Check the suspension ball joints.
   - Ball joint boot inspection.
   - Lower arm ball joint inspection.
7. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers).
8. Bounce the vehicle up and down several times to stabilize the suspension.
9. Check that the steering column is set at the center tilt and telescopic position.

Front Caster Inspection



1. Raise the front of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
2. Set the turning radius gauges beneath the front wheels, and place the boards under the rear wheels the same thickness as the turning radius gauges, then lower the vehicle.
   NOTE: Be sure that the vehicle is level with the wheels on the turning radius gauges and the boards.
3. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub, and apply the front brake.
4. Turn the front wheel 20 ° outward, then turn the adjusting screw of the camber/caster gauge to set the bubble at 0 °.
5. Turn the wheel 20 ° inward and read the caster angle on the gauge with the bubble at the center of the gauge.
   Front caster angle:
   Except KY 1.5LXE, 1.5EXE models: 3 ° 20 '± 1 °
   KY 1.5LXE, 1.5EXE models: 3 ° 13 '± 1 °
   - If the measurement is within specifications, measure the front camber angle.
   - If the measurement is not within specifications, check for bent or damaged suspension components.

Front Camber Inspection

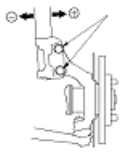


1. Turn the front wheels to the straight ahead position.
2. Raise the front of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
3. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub.
4. Read the camber angle on the gauge with the bubble at the center of the gauge.
   Front camber angle:
   Except KY 1.5LXE, 1.5EXE models: 0 ° 00 '± 1 °
   KY 1.5LXE, 1.5EXE models: 0 ° 07 '± 1 °
   (Maximum difference between the right and left side: 0 ° 45 ')
   - If the measurement is within specifications, measure the rear camber.
   - If the measurement for the front camber is not within specifications, go to the front camber adjustment.

Front Camber Adjustment

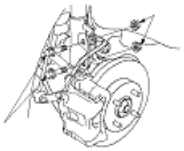
The front camber can be adjusted by exchanging one or both of the damper pinch bolts with the smaller diameter adjusting bolt(s). The difference between the adjusting bolt diameter and the pinch bolt hole diameter allows for a small range of adjustment.

1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Loosen the damper pinch bolts (A), and adjust the camber angle by moving the bottom of the damper within the range of the damper pinch bolt free play.
4. Tighten the damper pinch bolts to the specified torque.
5. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
6. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
7. Measure the camber angle.
   - If the measurement is within specification, measure the rear camber.
   - If the measurement is not within specification, go to Step 8 .
8. Raise the front of the vehicle, and support it with safety stands in the proper locations.
9. Remove the front wheels.



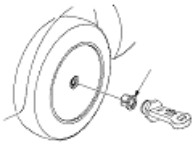
---

10. Replace the damper pinch bolts with the adjusting bolts (A), and adjust the camber angle.
    NOTE:
    - The camber angle can be adjusted up to ±20 ' (center of tolerance) by replacing one damper pinch bolt with the adjusting bolt.
    - The camber angle can be adjusted up to ±40 ' by replacing both the damper pinch bolts with the adjusting bolts.
11. Tighten the adjusting bolts to the specified torque value.
12. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
13. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
14. Measure the camber angle. If the camber angle is not within specification, repeat Step 8 through 13 to readjust the camber angle. If the camber measurement is correct, measure the toe-in, and adjust it if necessary.



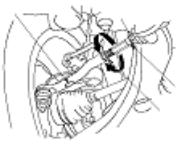
Rear Camber Inspection

1. Raise the rear of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
2. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub.
3. Read the camber angle on the gauge with the bubble at the center of the gauge.
   Rear camber angle: −1 ° 00 '±1 °
   (Maximum difference between the right and left side: 0 ° 45 ')
   - If the measurement is within specifications, measure the toe-in.
   - If the measurement is not within specifications, check for bent or damaged suspension components.



Front Toe Inspection/Adjustment

1. Set the steering column to the middle tilt and telescopic positions. Center the steering wheel spokes, and hold it.
2. Check the toe with the wheels pointed straight ahead.
   Front toe-in: 0±3 mm (0±0.12 in.)
   - If adjustment is required, go to Step 3 .
   - If no adjustment is required, go to rear toe inspection.
3. Loosen the tie-rod locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications.
4. After adjusting, tighten the tie-rod locknuts to the specified torque value. Reposition the rack end boot if it is twisted or displaced.
5. Go to rear toe inspection.
   NOTE: Adjust both the right and left wheels at the same time by the same amount in opposite directions to obtain the correct toe and to keep the steering wheel straight.



Rear Toe Inspection

1. Release the parking brake to avoid and incorrect measurement.
2. Check the toe.
   Rear toe-in: 2.5±2.5 mm (0.10±0.10 in.)

   - If the measurement is within specifications, measure the turning angle.
   - If the measurement is not within specifications, check for bent or damaged suspension components.

Turning Angle Inspection

1. Raise the vehicle and set the turning radius gauges beneath the front wheels, and place the boards under the rear wheels the same thickness as the turning radius gauges, then lower the vehicle.
   NOTE: Be sure that the vehicle is level with the wheels on the turning radius gauges and the boards.
2. Turn the wheel right and left while applying the brake, and measure the turning angle of the both wheels.
   Turning angle:
   16 inch wheel model and KE 1.2SE model and KG 1.4ES, 1.4ESH models:
   Inward: 40 ° 18 '±2 °
   Outward (reference): 33 ° 19 '±1 °
   KY 1.5LXE, 1.5EXE models:
   Inward: 40 ° 38 '±2 °
   Outward (reference): 33 ° 30 '±1 °
   Except 16 inch wheel model and KE 1.2SE model, KG 1.4ES, 1.4ESH models and KY 1.5LXE, 1.5EXE models:
   Inward: 42 ° 51 '±2 °
   Outward (reference): 34 ° 42 '±1 °
3. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

Wheel alignment (except KY 1.5LXE, 1.5EXE models)

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel alignment (except KY 1.5LXE, 1.5EXE models)	Camber	Front	0 ° 00 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 20 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (0.10±0.10 in.)	
	Front wheel turning angle (except 16 inch wheel model and KE 1.2SE model and KG 1.4ES, 1.4ESH models)	Inward	42 ° 51 ′±2 °	
		Outward (reference)	34 ° 42 ′±1 °	
	Front wheel turning angle (16 inch wheel model and KE 1.2SE model and KG 1.4ES, 1.4ESH models)	Inward	40 ° 18 ′±2 °	
		Outward (reference)	33 ° 19 ′±1 °	

Wheel alignment (KY 1.5LXE, 1.5EXE models)

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel alignment (KY 1.5LXE, 1.5EXE models)	Camber	Front	0 ° 07 ′±1 °	
		Rear	−1 ° 00 ′±1 °	
	Caster	Front	3 ° 13 ′±1 °	
	Total toe-in	Front	0±3 mm (0±0.12 in.)	
		Rear	2.5±2.5 mm (0.10±0.10 in.)	
	Front wheel turning angle	Inward	40 ° 38 ′±2 °	
		Outward (reference)	33 ° 30 ′±1 °	

Front Lower Arm Removal/Installation

Special Tools Required

Ball joint remover, 28 mm
07MAC-SL00201

NOTICE

Do not remove the lower arm of both sides at the same time.

1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Remove the splash shield.
4. With HID lamp model: If removing the left side lower arm, disconnect the suspension stroke sensor from the lower arm.
5. Remove the lock pin (A) from the lower arm ball joint, then remove the castle nut (B).
   NOTE: During installation, install the lock pin as shown after tightening the new castle nut.
6. Disconnect the lower ball joint from the knuckle using the ball joint remover.
   NOTE:
   - Be careful not to damage the ball joint boot when installing the remover.
   - Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.

---

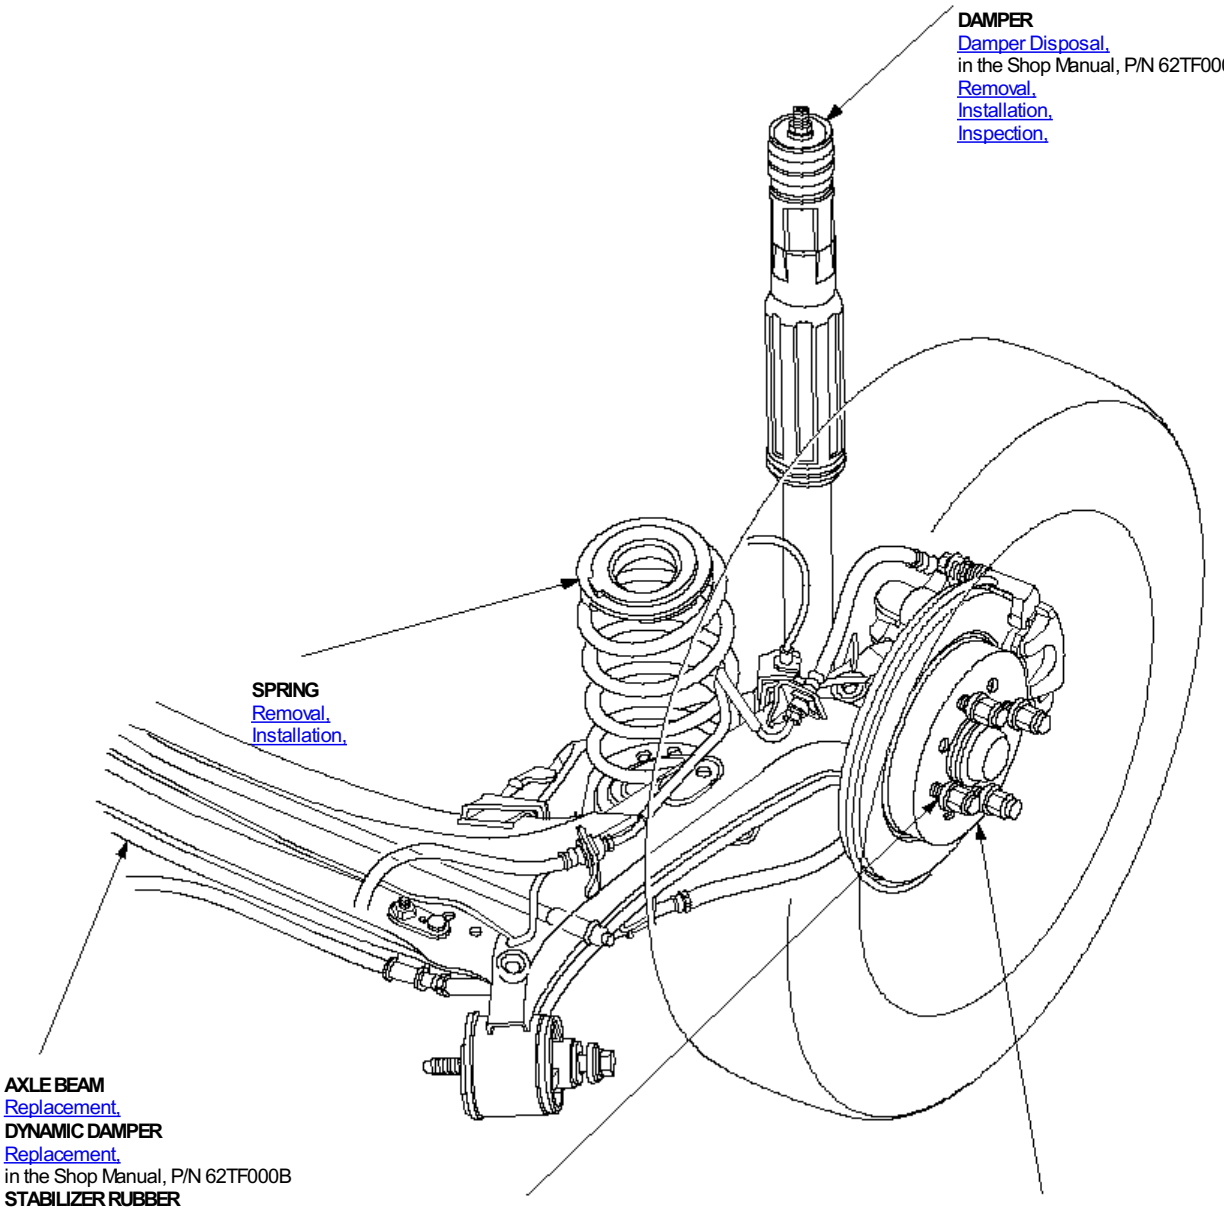
7. Remove the lower arm mounting bolts, then remove the lower arm (A) from the front subframe.
   NOTE: Use new lower arm mounting bolts during reassembly.
8. Install the lower arm in the reverse order of removal, and note these items:
   - First install all the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint of the lower arm.
   - Be careful not to damage the ball joint boot when connecting the lower arm to the knuckle.
   - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, and the threaded section and the mating surfaces of the castle nut.
   - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
   - Before installing the wheel, clean the mating surfaces on the brake disc and the inside of the wheel.
9. Check the wheel alignment, and adjust it if necessary.
10. With HID lamp model: If the left side lower arm was removed, do the headlight initial position learning procedure.

Wheel bearing

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel bearing	End play	Front	0−0.05 mm (0−0.002 in.)	
		Rear	0−0.05 mm (0−0.002 in.)	

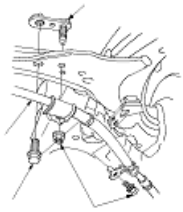
Rear Suspension Component Location Index

Rear Suspension

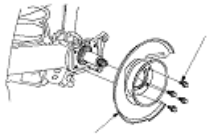


Rear Axle Beam Replacement

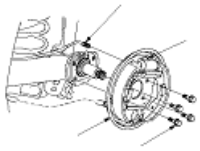
1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the rear spring seat lower cover.
4. Remove the rear hub bearing unit.
5. With HID lamp model: Disconnect the suspension stroke sensor from axle beam.
6. Remove the parking brake cable bracket (left side) (A), the brake line bracket (right side), and the parking brake cable (B) from the axle beam.



7. Disc brake type: Remove the splash guard (A).



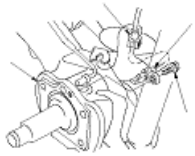
8. Drum brake type: Disconnect the brake line (A) from the wheel cylinder (B). Remove the backing plate (C) with brake shoe assembly from the axle beam.



9. Remove the wheel speed sensor (A) and the wheel speed sensor stay (B) from the axle beam (C). Do not disconnect the wheel speed sensor connector.
10. Remove the rear spring.

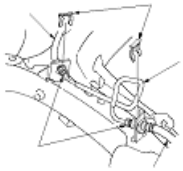
Disc brake type

Drum brake type

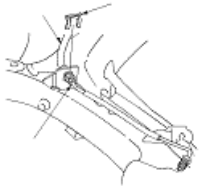


11. Disconnect the brake hose (A) from both sides of the brake line (B), then remove the brake line by removing the brake hose clip (C).
    NOTE:
    - Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
    - Plug the end of a hose and joints to prevent spilling brake fluid.
    - Use the new brake hose clip during reassembly.

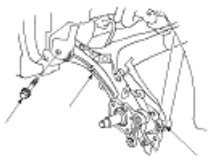
Disc brake type



Drum brake type



12. Place a floor jack under the lower spring seat (A) on both sides of the axle beam (B), and support it by raising the floor jack. Do not place the floor jack under the center of the axle beam.



13. Remove the axle beam mounting bolts (C) on both sides.
    NOTE: Use new axle beam mounting bolts during reassembly.

14. Lower the jack slowly, then remove the axle beam.

15. Install the axle beam in the reverse order of removal, and note these items:
    - First install all the components, and lightly tighten bolts and the nuts, and place a jack under the lower spring seat of the axle beam on both sides, then raise the suspension to load with the vehicle's weight before fully tightening to the specified torque values.
    - Connect the brake pipe from the vehicle front side first.
    - After installing the brake hose, the brake line, and the parking brake cable, check interference and twisting to other parts.
    - Before installing the brake disc/drum clean the mating surfaces of the hub bearing unit and the inside of the brake disc/drum.
    - After installing, fill the reservoir with new brake fluid, and bleed the brake system.
    - Check the brake hose and line joint for leaks, and tighten if necessary.
    - Before installing the wheel, clean the mating surfaces of the brake disc/drum and the inside of the wheel.

16. Check the wheel alignment, and adjust it if necessary.

17. With HID lamp model: Do the headlight initial position learning procedure.

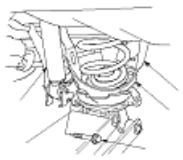
Rear Damper Replacement

Exploded View

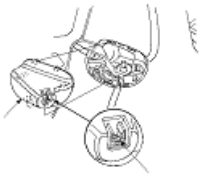
Removal

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. With HID lamp model: Disconnect the suspension stroke sensor from rear axle beam.
4. Remove the wheel speed sensor stay (A) from both sides of the axle beam.

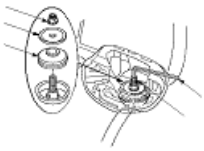
5. Position a floor jack under lower spring seat (A) on both sides of the axle beam (B). Raise the floor jack until the suspension begins to compress.
6. Remove the damper mounting bolt (C) that connects the axle beam and the damper (D) from both sides.



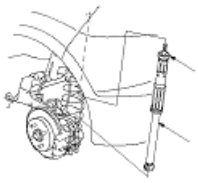
7. Remove the lid (A) from the trunk side trim.
   NOTE: Remove the screw (B) if the lid fixed by it.



8. Remove the self-locking nut (A) while holding the damper shaft (B) with a hex wrench (C).
9. Remove the damper mounting washer (D) and the damper mounting rubber (E) from the top of the damper.

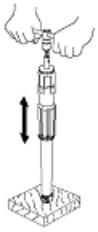


10. Compress the damper unit (A) by hand, and remove it from the vehicle.
    NOTE: Be careful not to damage the body.
11. Remove the damper mounting rubber (B).



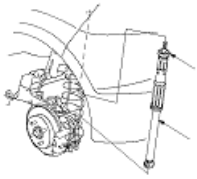
Inspection

1. Install the flange nut on the damper shaft end, and set the socket wrench and T-handle on the nut.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.
3. Check for oil leaks, abnormal noises, and binding during these tests.

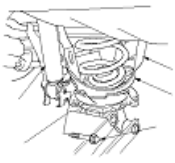


Installation

1. Install the damper mounting rubber (A) onto the damper unit. Position the damper assembly (B) between the body and the axle beam.
   NOTE: Be careful not to damage the body.



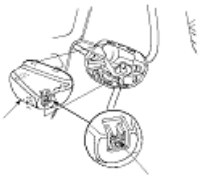
2. Position the floor jack under lower spring seat (A) on both sides of the axle beam (B).
3. Slowly raise the jack until you can align the bolt hole with the holes in the axle beam and the damper (C), and loosely tighten the new damper mounting bolt (D) on both sides.
4. Raise the rear suspension with the jack until the vehicle just lifts off of the safety stands, then tighten the damper mounting bolts to the specified torque value.



5. Install the damper mounting rubber (A), the damper mounting washer (B), and the self-locking nut (C) on the damper shaft (D).
   NOTE: During installation, note the direction of the damper mounting rubber and the damper mounting washer.

6. Tighten the self-locking nut (A) to the specified torque value while holding the damper shaft (B) with a hex wrench (C).

7. Install the lid (A) on the trunk side trim.
   NOTE: Install the screw (B) if the lid fixed by it.

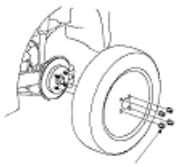


8. Install the wheel speed sensor stay (A) on both sides of the axle beam.
9. With the HID lamp model: Connect the suspension stroke sensor to rear axle beam.
10. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
11. Check the wheel alignment, and adjust if necessary.
12. With HID lamp model: Do the headlight initial position learning procedure.

Rear Hub Bearing Unit Replacement

Exploded View - Disc Brake Type

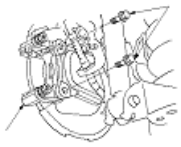
Exploded View - Drum Brake Type



Replacement - Disc Brake Type

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the wheel nuts (A) and the rear wheel.
3. Release the parking brake lever fully.
4. Remove the caliper body and the brake pads from the caliper bracket.
   NOTE: To prevent damage to the caliper body or the brake hose, use a short piece of wire to hang the caliper body from the undercarriage. Do not twist the brake hose excessively.

5. Remove the caliper bracket (A) from the axel beam.

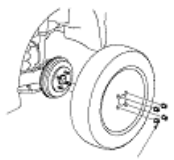


6. Remove the hub cap (A). Raise the stake (B), then remove the spindle nut (C).
7. Remove the rear brake disc.

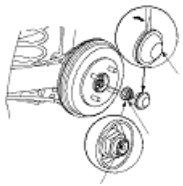
8. Remove the hub bearing unit (A) from the spindle.
9. Check the hub bearing unit for damage and cracks.
10. Install the hub bearing unit in the reverse order of removal, and note these items:
    - Use new a spindle nut and hub cap during reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the spindle.
    - Before installing the brake disc, clean the mating surfaces of the hub bearing unit and the inside of the brake disc.
    - Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.
11. Check the wheel alignment, and adjust it if necessary.

Replacement - Drum Brake Type

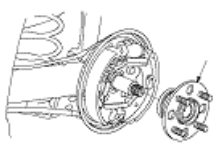
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the wheel nuts (A) and the rear wheel.
3. Release the parking brake lever fully.



4. Remove the hub cap (A). Raise the stake (B), then remove the spindle nut (C).
5. Remove the brake drum.

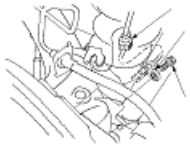


6. Remove the hub bearing unit (A) from the spindle.
7. Check the hub bearing unit for damage and cracks.
8. Install the hub bearing unit in the reverse order of removal, and note these items:
    - Use new a spindle nut and hub cap during reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the spindle.
    - Before installing the brake drum, clean the mating surfaces of the hub bearing unit and the inside of the brake drum.
    - Before installing the wheel, clean the mating surfaces of the brake drum and the inside of the wheel.
9. Check the wheel alignment, and adjust it if necessary.



Rear Spring Replacement

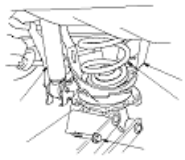
Exploded View



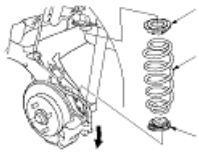
Removal

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. With HID lamp model: Disconnect the suspension stroke sensor from rear axle beam.
4. Remove the wheel speed sensor (A) and the wheel speed sensor stay (B) from both sides of the axle beam. Do not disconnect the wheel speed sensor connector.

5. Position a floor jack under spring seat (A) on both sides of the axle beam (B). Raise the floor jack until the suspension begins to compress.
6. Remove the damper mounting bolt (C) that connects the axle beam and the damper (D) from both sides.
7. Lower the floor jack gradually.

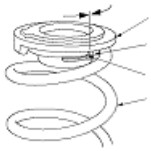


8. Remove the spring (A), the upper mounting rubber (B), and the lower mounting rubber (C). Do not lower the jack more than necessary.

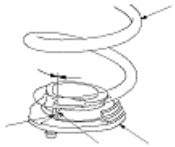


Installation

1. Install the upper mounting rubber (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the upper mounting rubber.



2. Install the lower mounting rubber (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the lower mounting rubber.



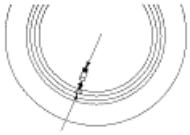
3. Install the tab (A) of the lower mounting rubber into the groove (B) of the lower spring seat.
   NOTE:
   - Make sure that the tab of the lower mounting rubber is properly installed into the axle beam (C).
   - Make sure that the spring was installed correctly.

4. Position the floor jack under the lower spring seat (A) on both sides of the axle beam (B).
5. Slowly raise the jack until you can align the bolt hole with the holes in the axle beam and the damper (C), and loosely tighten the new damper mounting bolt (D) on both sides.
6. Raise the rear suspension with the jack until the vehicle just lifts off of the safety stands, then tighten the damper mounting bolts to the specified torque value.

7. Install the wheel speed sensor (A) and the wheel speed sensor stay (B) on both sides of the axle beam.
8. With the HID lamp model: Connect the suspension stroke sensor to rear axle beam.
9. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
10. Check the wheel alignment, and adjust it if necessary.
11. With HID lamp model: Do the headlight initial position learning procedure.

The Extraction of the Fluid Sealant of the Tyre Inflator

NOTE:



- The TRK (Temporary Repair Kit) is employed for the spare-tyreless models instead of a spare tyre.
- The fluid sealant used to reinflate a flat tyre must be extracted and retrieved from the inside. The out-of-date fluid sealant and the extracted fluid sealant must be retrieved by the transactor for the sake of the environment after separated as well as oil waste such as the oil and fluid, because they include the ethylene glycol, the industrial waste. (The address and telephone number of the transactor is labeled on the bottle.)

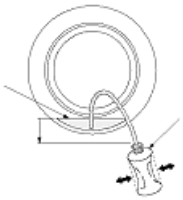
NOTICE

Do not dispose the tyre with the fluid sealant filled.

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Deflate the tyre.
3. Cut off the valve (A) at its base, and push the remaining rubber portion of the valve into the tyre.
   NOTICE
   Avoid damage to the wheel disc when using the tools.
   NOTE: Replace the valve with a new one when reassembling the tyre.
4. Put the tyre on the working table, and set it up.
   NOTE: Be careful not to spill the fluid sealant from the drain hole (B).

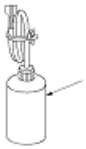
---

5. Use the empty bottle (A) to extract the fluid sealant. Insert the tube into the tyre through the drain hole, and stick it down until the end of the tube is immersed into the fluid sealant (B).
6. Set the empty bottle in the lower position than the tyre and pump the fluid sealant into the bottle. To empty the tyre, pump it completely by shaking the tyre or doing something else.



---

7. Bend and bind up the tube of the bottle (A) that is filled with the fluid sealant as shown in the figure.



8. If you reuse the tyre, completely wipe up the fluid sealant sat around the drain hole, fix a flat, and replace the valve.
   NOTE:
   - Wipe the fluid sealant completely so that the beaded edge of the tyre and the mating portion of the wheel rim and the bead are cleared.
   - The damaged portion such as punctures may be filled with the fluid sealant, and can not be found depending on the extent of the damage.
   - If you drive on a flat tyre, often check the tyre pressure and replace the tyre with a normal one when you detect any abnormality (air pressure reduction in the tyre).

Wheel

Item	Measurement	Qualification	Standard or New	Service Limit
Wheel	Steel wheel runout	Axial	0−1.0 mm (0−0.04 in.)	2.0 mm (0.08 in.)
		Radial	0−1.0 mm (0−0.04 in.)	1.5 mm (0.06 in.)
	Aluminium wheel runout	Axial	0−0.7 mm (0−0.03 in.)	2.0 mm (0.08 in.)
		Radial	0−0.7 mm (0−0.03 in.)	1.5 mm (0.06 in.)

Brake System Symptom Troubleshooting - Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

NOTE: Make sure that the caliper pins are installed correctly.
Upper caliper pin A and lower caliper pin B are different. If the pins are installed in the wrong location, it will cause vibration, uneven or rapid brake pad wear, and possibly uneven tyre wear. For proper caliper pin location.

1. Drive the vehicle until the brakes drag or until the pedal is high and hard. This can take 20 or more brake pedal applications during an extended test-drive.
2. With the engine running, raise the vehicle on a lift, and spin all four wheels by hand.

   Is there brake drag at any of the wheels?
   YES - Go to Step 3 .
   NO - Look for other causes of pad wear, high pedal, or vehicle vibration.■
3. Turn the ignition switch to LOCK (0), press the brake pedal several times to deplete the vacuum in the brake booster, and then spin the wheels again to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 4 .
   NO - Replace the brake booster.

   - LHD model. ■
   - RHD model. ■
4. Without removing the brake lines, unbolt and separate the master cylinder from the booster, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 5 .
   NO - Check the brake pedal position switch adjustment and pedal free play. ■
5. Loosen the hydraulic lines at the master cylinder, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Go to Step 6 .
   NO - Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid. If the brake fluid is OK, replace the master cylinder.

   - LHD model. ■
   - RHD model. ■
6. Loosen the bleed screws at each caliper, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?
   YES - Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid. If the brake fluid is OK, disassemble and repair the caliper on the wheel(s) with brake drag.■
   NO - Look for and replace any damaged brake lines. If all brake lines are OK, replace the ABS or the VSA modulator-control unit.

   - ABS modulator-control unit. ■
   - VSA modulator-control unit. ■

Brake System Inspection and Test

Inspect the brake system components listed. Repair or replace any parts that are leaking or damaged.

Component Inspections:

Component	Procedure	Also check for
Master Cylinder	Look for damage or signs of fluid leakage at: • Reservoir tank, subreservoir or master cylinder body. • Lines, reservoir tank hose and grommets, and their joints. • Between master cylinder and booster.	Bulging seal at reservoir cap. This is a sign of fluid contamination.
Brake Hoses	Look for damage or signs of fluid leakage at: • Line joints and banjo bolt connections. • Hoses and lines, also inspect for twisting or damage.	Bulging, twisted, or bent lines.
Caliper	Look for damage or signs of fluid leakage at: • Piston seal. • Banjo bolt connections. • Bleed screw.	Seized or sticking caliper pins.
Wheel Cylinder	Look for damage or signs of fluid leakage at: • Wheel cylinder. • Line joints. • Bleed screw.	
ABS or VSA Modulator-control Unit	Look for damage or signs of fluid leakage at: • Line joints. • Modulator-control unit.	

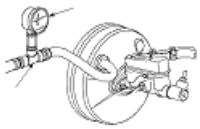
Brake System Test

Brake pedal sinks/fades when braking

1. Set the parking brake, and start the engine, then turn off the A/C. Allow the engine to warm up to normal operating temperature (radiator fan comes on twice).
2. Attach a 50 mm (2 in.) piece of masking tape along the bottom of the steering wheel, and draw a horizontal reference mark across it.
3. With the transmission in neutral (M/T) or P or N (A/T), press and hold the brake pedal lightly (about the same pressure needed to keep an A/T-equipped vehicle from creeping), then release the parking brake.
4. While still holding the brake pedal, hook the end of the tape measure behind the brake pedal, then pull the tape up to the steering wheel. Note the measurement between the brake pedal and the reference mark on the steering wheel.
5. Apply steady pressure to the brake pedal for 3 minutes.
6. Watch the tape measure.
   - If the measurement increases 10 mm (0.39 in.) or less, the master cylinder is OK.
   - If the measurement increases more than 10 mm (0.39 in.), replace the master cylinder.

Brake Booster Inspection

Special Tools Required



Pressure gauges set, 16,000 kPa
07YAJ-0010410

Combination gauge kit
07YAJ-0010610

Attachments
07410-5790102

Tube joint adapter
07410-5790503

Pressure gauge joint pipes, 10 x 1.0 mm
07510-6340101

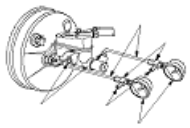
Pressure gauge joint pipes, 12 x 1.0 mm
07HAK-SG00110

Leak Test

1. Install the vacuum gauge (A) between the brake booster and check valve.
2. Start the engine, adjust the engine speed with the accelerator pedal so that the vacuum gauge readings show 66.7 kPa (500 mmHg, 19.7 in.Hg), then stop the engine.
3. Read the vacuum gauge.
   If the vacuum reading decreases 2.7 kPa (20 mmHg, 0.8 in.Hg) or more after 30 seconds, check following parts for leaks.
   - Check valve
   - Vacuum hose, pipe
   - Seals
   - Brake booster
   - Master cylinder

   NOTE: Do not try to disassemble the brake booster. Replace the brake booster as an assembly with a new one.

Function Test



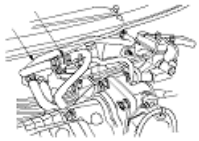
1. Install the vacuum gauge as same as the leak test.
2. Connect the oil pressure gauges (A) to the master cylinder using the attachments pressure gauge joint pipes as shown.
3. Bleed air through the valves (B).
4. Start the engine, and let it idle.

5. Have an assistant depress the brake pedal with a 98 N (10 kgf, 22 lbf) and 196 N (20 kgf, 44 lbf) of pressure measuring with a commercially available pressure gauge (A).
6. The following pressures should be observed at the pressure gauges in each vacuum.

Vacuum booster Vacuum kPa (mmHg, in.Hg)	Brake pedal pressure N (kgf, lbf)	Master cylinder oil pressure kPa (kgf/cm ^{2}, psi)	
0 (0, 0)	98 (10, 22)	0 (0, 0)	
	196 (20, 11)	Except LHD model of M/T	577 (5.9, 83.7)
		LHD model of M/T	501 (5.1, 72.6)
66.7 (500, 19.7)	98 (10, 22)	KE, KG models of i-SHIFT	5,393 (55, 782)
		KG model of 5MT	5,153 (52.5, 747)
		Except LHD model of M/T	4,523 (46.1, 656)
		LHD model of M/T	4,235 (43.2, 614)
	196 (20, 11)	KE, KG models of i-SHIFT	8,125 (82.9, 1,178)
		KG model of 5MT	8,060 (82.2, 1,169)
		Except LHD model of M/T	9,538 (97.3, 1,383)
		LHD model of M/T	9,468 (96.5, 1,373)

7. Inspect the master cylinder for leaks if the readings do not fall within the limits shown above.

Booster Check Valve Test



1. Disconnect the brake booster vacuum hose (A) at the booster.
   NOTE: If the check valve (B) is faulty, replace the brake booster vacuum hose/check valve as an assembly.
2. Start the engine, and let it idle. There should be vacuum available. If no vacuum is available, the check valve is not working properly. Replace the brake booster vacuum hose and check valve, and retest.

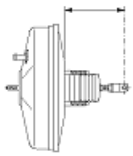
Brake Assist Check (For KE, KG ABS models)

Make sure the brake assist is not activated early in case of installing brake booster and brake pedal. You may hear mechanical noises when pressing the brake pedal with some vacuum remained in brake booster. That could be caused in a normal condition, it would be not a symptom of abnormalities. The noises would not be created in the condition that the brake booster has no vacuum.

1. Check the brake pedal height and free play, and adjust it if necessary.
2. Press the brake pedal hard.
3. Release the brake pedal and start the engine, and allow the engine warm up to normal operating temperature.
4. Test-drive the vehicle at low speed.
5. Press the brake pedal lightly, and make sure it does not cause a rapid brake.

Brake Booster Pushrod Thickness (Reference)

NOTE: The illustration shows except KE, KG ABS models.

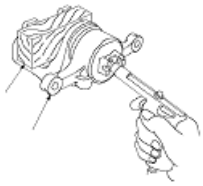


KE, KG ABS models:	**123−124 mm (4.84−4.88 in.)**
Except KE, KG ABS models:	**115.5−1116.5 mm (4.55−4.59 in.)**

Brake booster

Item	Measurement	Qualification	Standard or New		Service Limit
Brake booster	Master cylinder oil pressure	Vacuum booster vacuum kPa (mmHg, in.Hg)	Brake pedal pressure N (kgf, lbf)	Master cylinder oil pressure kPa (kgf/cm ^{2}, psi)	
		0 (0, 0)	98 (10, 22)	0 (0, 0)	
			196 (20, 11)	Except LHD model of M/T	577 (5.9, 84)
				LHD model of M/T	501 (5.1, 73)
		66.7 (500, 19.7)	98 (10, 22)	KE/KG model of 1.3 L i-SHIFT	5,393 (55, 782)
				KG model of 1.2/1.3 L 5MT	5,153 (52.5, 747)
				Except LHD model of M/T	4,523 (46.1, 656)
				LHD model of M/T	4,235 (43.2, 614)
			196 (20, 11)	KE/KG model of 1.3 L i-SHIFT	8,125 (82.9, 1,178)
				KG model of 1.2/1.3 L 5MT	8,060 (82.2, 1,169)
				Except LHD model of M/T	9,538 (97.3, 1,383)
				LHD model of M/T	9,468 (96.5, 1,373)

Front Brake Caliper Overhaul



Exploded View

⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

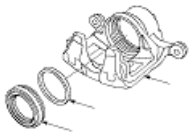
NOTE: Make sure that the caliper pins are installed correctly. Upper caliper pin B and lower caliper pin A are different. If these caliper pins are installed in the wrong location, it will cause vibration, uneven or rapid pad wear, and possibly uneven tyre wear.

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected hose joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets in the brake fluid.
- Make sure no grease or oil gets on the brake discs or the brake pads.
- When reusing brake pads, always reinstall them in their original positions to prevent loss of braking efficiency.
- Do not reuse drained brake fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Coat the piston, the piston seal groove, and the caliper bore with clean brake fluid.
- Use recommended greases in the front caliper set.
- After installing the caliper, check the brake hose and line for leaks, interference, and twisting.
- Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

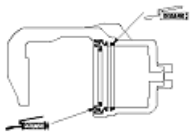
Disassembly

1. Remove the caliper body.
2. Set the wooden block (A) or several shop towels to the caliper body (B) as shown. Blow out the piston with compressed air gradually, and remove the piston from the caliper body.
   NOTE: Do not put the hand into the caliper body because the piston will come out hardly from the caliper body.

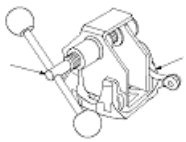
3. Remove the piston boot (A) and the piston seal (B) from the caliper body (C).
   NOTE: Be careful not to damage the inner surface of the cylinder wall with the tool.



Reassembly



1. Apply a thin coat of silicone grease to the new piston seal (A), then install it into the groove in the caliper body.
2. Apply a thin coat of rubber grease to the new piston boot (B), then install it into the groove in the caliper body.
3. Apply the brake fluid to the outer surface of the piston, then set the piston in place on the caliper body.

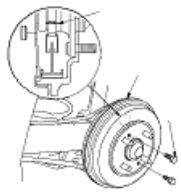


4. Mount the commercially available brake caliper piston compressor tool (A) on the caliper body (B).
5. Press in the piston with the brake caliper piston compressor tool. Make sure that the piston boot is properly positioned into the groove of the piston.
   NOTE:
   - Do not press the piston diagonally, and do not press it forcibly.
   - Be careful not to damage the piston boot when press the piston.
6. Install the caliper body.
7. Bleed the brake system.

Brake disc

Item	Measurement	Qualification	Standard or New	Service Limit
Brake disc	Thickness	Front	20.9−21.1 mm (0.82−0.83 in.)	19.0 mm (0.75 in.)
		Rear	8.9−9.1 mm (0.35−0.36 in.)	8.0 mm (0.31 in.)
	Runout		———	0.04 mm (0.0016 in.)
	Parallelism		———	0.015 mm (0.0006 in.)

Rear Drum Brake Replacement



NOTE: Keep any grease off the brake drum and brake shoes.

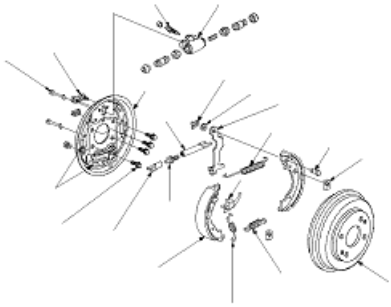
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheel.
3. Remove the parking brake, and remove the brake drum (A) from the hub bearing unit.
   NOTE:
   - If necessary, turn the adjuster bolt (B) with a flat-tip screwdriver until the shoes become loose.
   - If the brake drum stuck to the hub bearing unit. Thread two 8 x 1.25 mm bolts (C) into the brake drum to push it away from the hub bearing unit. Turn each bolt 90 degrees at a time to prevent the brake drum from binding.
   - After installation, press the brake pedal several times to make sure the brakes work and self adjust the brake shoes.
4. Install the brake drum in the reverse order of removal.
   NOTE: Before installing the brake drum, clean the mating surfaces of the rear hub and the inside of the brake drum.
5. Clean the mating surfaces of the brake drum and the inside of the wheel, then install the rear wheel.

Rear Drum Brake Inspection

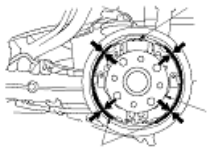
⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

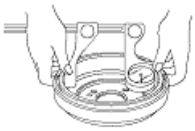
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.



1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Release the parking brake, and remove the brake drum.



4. Check the wheel cylinder (A) for leakage.
5. Check the brake linings (B) for cracking, glazing, wear, and contamination.
   NOTE: Contaminated brake linings or drums reduce stopping ability.
6. Measure the brake lining thickness (C). Measurement does not include brake shoe thickness.
   Brake lining thickness:
   Standard: 4.0 mm (0.16 in.)
   Service limit: 1.0 mm (0.04 in.)
7. If the brake lining thickness is less than the service limit, replace the brake shoes as a set.
8. Check the hub (D) for smooth operation. If it requires servicing, replace the hub bearing unit.

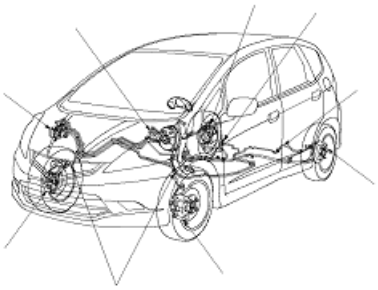


9. Measure the inside diameter of the brake drum with inside vernier calipers.
   Drum inside diameter:
   Standard: 199.9–200 mm (7.870–7.874 in.)
   Service limit: 201 mm (7.91 in.)
10. If the inside diameter of the brake drum is more than the service limit, replace the brake drum.
11. Check the brake drum for scoring, grooves, corrosion, and cracks.
12. Install the brake drum.
    NOTE: Before installing the brake drum, clean the mating surfaces of the rear hub and the inside of the brake drum.
13. Clean the mating surfaces of the brake drum and the inside of the wheel, then install the rear wheel.

Rear brake (drum brake)

Item	Measurement	Qualification	Standard or New	Service Limit
Rear brake (drum brake)	Brake drum I.D.		199.9−200 mm (7.870−7.874 in.)	201 mm (7.91 in.)
	Brake shoe lining thickness		4.0 mm (0.16 in.)	1.0 mm (0.04 in.)

Brake Hose and Line Inspection



1. Inspect the brake hoses for damage, deterioration, leaks, interference, and twisting.
2. Check the brake lines for damage, rusting, and leaks. Also check for bent brake lines.
3. Check for leaks at hose and line joints and connections, and retighten if necessary.
4. Check the master cylinder and the ABS/VSA modulator-control unit for damage and leaks.

Connection Point	Component	Connected to	Specified Torque Value	Note
A	Front brake caliper	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Bleed screw	8.5 N·m (0.9 kgf·m, 6.5 lbf·ft)	
B	Rear brake caliper (disc type)	Brake hose	34 N·m (3.5 kgf·m, 25 lbf·ft)	Banjo bolt
		Bleed screw	8.5 N·m (0.9 kgf·m, 6.5 lbf·ft)	
	Rear wheel cylinder (drum type)	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
		Bleed screw	7 N·m (0.7 kgf·m, 5 lbf·ft)	
C	Brake hose	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
D	Master cylinder	Brake line	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
E	ABS modulator-control unit	Brake line (10 mm nut)	15 N·m (1.5 kgf·m, 11 lbf·ft)	Flare nut
	VSA modulator-control unit	Brake line (12 mm nut)	22 N·m (2.2 kgf·m, 16 lbf·ft)	Flare nut

Brake Master Cylinder Replacement

NOTICE

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- Plug the end of a hose and joints to prevent spilling brake fluid.

LHD Model

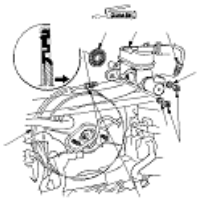
1. Remove the air cleaner cover, and the air cleaner case.
2. Remove the dashboard lid (A).
3. Remove the reservoir cap, and the brake fluid from the reservoir tank with a syringe.

4. Disconnect the brake fluid level switch connector (A).
5. Remove the reservoir tank mounting bolt (B) from the bracket (C).

6. Disconnect the brake lines (A) from the master cylinder (B). To prevent spills, cover the hose joints with rags or shop towels.
7. Remove the master cylinder mounting nuts (C) and washers (D).
8. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the bake lines when removing the master cylinder.
9. Except KG ABS model: Remove the rod seal (F) from the master cylinder.
   NOTE: During installation, set the new rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
10. KG ABS model: Remove the O-ring (H) from the master cylinder.
    NOTE: Use the new O-ring during installation.
11. Install the master cylinder in the reverse order of removal, and note these items:
    - Coat the inner bore lip and the outer circumference of the new rod seal with the silicone grease in the master cylinder set.
    - Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
12. Bleed the brake system.
13. Spin the wheels to check for brake drag.

KG ABS model:

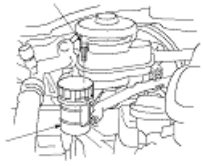
Except KG ABS model:



RHD Model

1. Remove the dashboard lid (A).

2. M/T: Remove the clutch reservoir tank (A), and move it aside. Do not disconnect the clutch line from the reservoir tank.
3. Remove the reservoir cap and the brake fluid from the reservoir tank with a syringe.



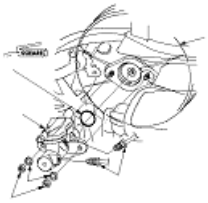
4. Disconnect the brake fluid level switch connector (A).
5. Remove the reservoir tank (B) and the clip (C) from the bracket (D).

6. Remove the bracket mount bolt (A) and the clip (B).

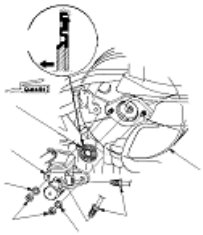
---

7. Disconnect the brake lines (A) from the master cylinder (B). To prevent spills, cover the hose joints with rags or shop towels.
8. Remove the master cylinder mounting nuts (C) and the washers (D).
9. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the bake lines when removing the master cylinder.
10. Except KE ABS model: Remove the rod seal (F) from the master cylinder.
    NOTE: During installation, set the new rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
11. KE ABS model: Remove the O-ring (H) from the master cylinder.
    NOTE: Use the new O-ring during installation.
12. Install the master cylinder in the reverse order of removal, and note these items:
    - Coat the inner bore lip and the outer circumference of the new rod seal with the silicone grease in the master cylinder set.
    - Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
13. Bleed the brake system.
14. Spin the wheels to check for brake drag.

KE ABS model:



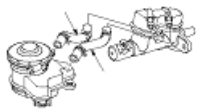
Except KE ABS model:



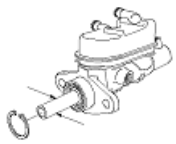
Brake Master Cylinder Disassembly

VSA Model

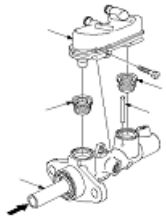
NOTE: The illustrations show LHD model.



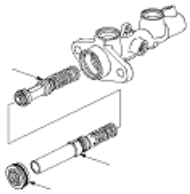
1. Remove the rod seal from the master cylinder.
2. Disconnect the reservoir tank hose (A).



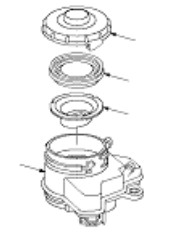
3. Remove the circlip (A) while pushing in the secondary piston (B).



4. Remove the subreservoir (A) and the grommets (B) from the master cylinder.
5. Remove the stop pin (C) while pushing in the secondary piston (D).
   NOTE: When subreservoir and master cylinder body are separated, replace the grommets with new ones.



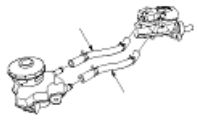
6. Remove the secondary piston (A), primary piston (B) and piston guide (C).



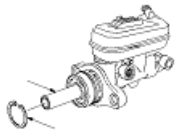
7. Remove the reservoir seal (A) from the reservoir cap (B).
8. Remove the strainer (C) from the reservoir tank (D).

KE, KG ABS Models

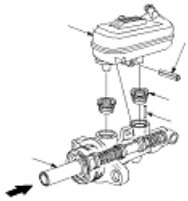
NOTE: The illustrations show LHD model.



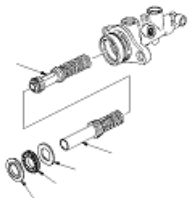
1. Remove the rod seal from the master cylinder.
2. Disconnect the reservoir tank hose (A).



3. Remove the circlip (A) while pushing in the secondary piston (B).

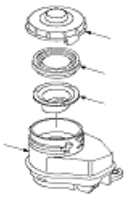


4. Remove the subreservoir (A) and the grommets (B) from the master cylinder.
   NOTE: When subreservoir and master cylinder body are separated, replace the grommets with new ones.
5. Remove the stop pin (C) while pushing in the secondary piston (D).



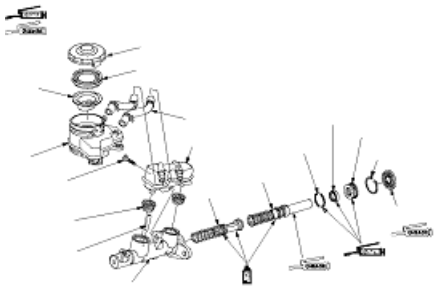
6. Remove the secondary piston (A), the primary piston (B), the plate (C), the cylinder cup (D) and the piston guide (E).

7. Remove the reservoir seal (A) from the reservoir cap (B).
8. Remove the strainer (C) from the reservoir tank (D).



Brake Master Cylinder Reassembly

VSA Model

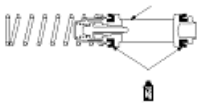


NOTE:

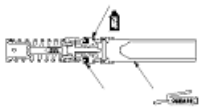
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all the parts are free of dirt and other foreign particles.
- Replace parts with new ones whenever specified to do so.
- Use only genuine DOT 3 or DOT 4 Honda Brake Fluid. Non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Replace the master cylinder if the bore is damaged or worn. Do not hone or attempt to refinish the bore.
- Coat the piston cups, pressure cup and master cylinder bore with clean brake fluid.
- Use recommended greases in the master cylinder seal set.
- Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.
- The illustrations show LHD model.

1. Install the reservoir seal in the groove of the reservoir cap.
2. Install the strainer, assembled reservoir cap on the reservoir tank.

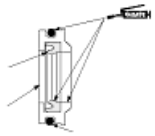
3. Coat the cups (A) of a new primary piston (B) with clean brake fluid, then install the primary piston into the master cylinder.



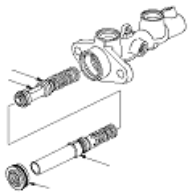
4. Coat the cup (A) of a new secondary piston (B) with clean brake fluid, and apply the silicone grease to the piston surface (C).



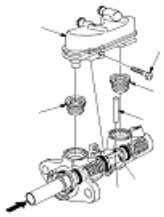
5. Apply the rubber grease to the piston guide (A), a new O-ring (B) and a new secondary cup (C).



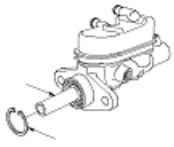
6. Install the primary piston (A), secondary piston (B) and piston guide (C) into the master cylinder. Make sure the direction of piston guide.
   NOTE: Install the primary piston so the slot (D) in the piston aligns with the stop pin hole in the master cylinder.



7. Install the new grommets (A) and subreservoir (B) to the master cylinder.
8. Align the slot (C) in the primary piston with the stop pin hole (D) by pushing the secondary piston in, and install the stop pin (E).



9. Install the new circlip (A) while pushing in the secondary piston (B). Be careful not to scratched damage on the piston surface with the circlip edges.



10. Install the reservoir tank (A) and the reservoir tank hose (B) to the subreservoir (C).
    NOTE:
    - Align the "△" mark (D) on the reservoir and subreservoir with the paint mark (E) on the hose.
    - Position the direction of the clamp (F).

11. Apply the silicone grease to a new rod seal, and install the seal onto the master cylinder.
    - LHD model.
    - RHD model.

Front Brake Pad Inspection and Replacement

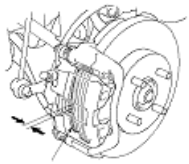
⚠CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

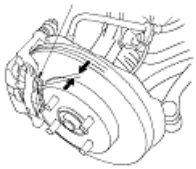
- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

Inspection

Inner pad



Outer pad



1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Check the thickness (A) of the inner pad (B) and the outer pad (C). Do not include the thickness of the backing plate.

   Brake pad thickness:

   Standard:

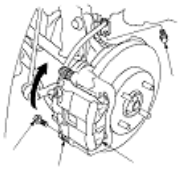
   Except KE, KG models: **9.5–10.2 mm (0.37–0.41 in.)**

   KE, KG models: **9.3–10.2 mm (0.37–0.41 in.)**

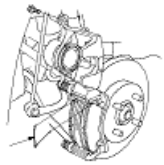
   Service limit: **1.6 mm (0.06 in.)**

4. If the brake pad thickness of any of the pads is less than the service limit, replace the front brake pads as a set.
5. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.

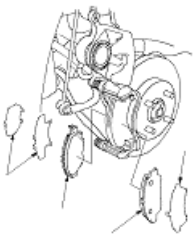
Replacement



1. Remove some brake fluid from the master cylinder.
2. Raise the front of the vehicle, and support it with safety stands in the proper locations.
3. Remove the front wheels.
4. Remove the brake hose mounting bolt (A).
5. Remove the flange bolt (B) while holding the caliper pin (C) with a wrench. Be careful not to damage the pin boot, and pivot the caliper (D) up out of the way. Check the hose and the pin boots for damage and deterioration.

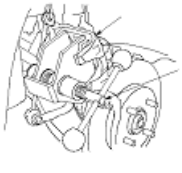


6. KE, KG models: Remove the pad return spring (A).



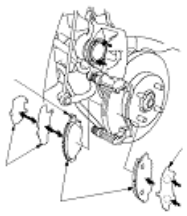
7. Remove the pad shims (A) and the brake pads (B).

8. Remove the pad retainers (A).
9. Clean the caliper bracket (B) thoroughly; remove any rust, and check for grooves and cracks. Verify that the caliper pins (C) move in and out smoothly. Clean and lube if needed.
10. Inspect the brake disc, and check for damage and cracks.
11. Install the pad retainers. Wipe excess grease off the retainers. Keep grease off the brake disc and the brake pads.
    NOTE: KE, KG models: Upper retainer and lower retainer are different. Make sure retainers are installed correctly.



12. Mount a commercially available brake caliper piston compressor tool (A) on the caliper body (B).
13. Press in the piston with the brake caliper piston compressor tool so the caliper will fit over the brake pads. Make sure the piston boot is in position to prevent damaging it when pivoting the caliper down.
    NOTE: Be careful when pressing in the piston; brake fluid might overflow from the master cylinder's reservoir. If brake fluid gets on any painted surface, wash it off immediately with water.
14. Remove the brake caliper piston compressor tool.

15. Apply Molykote M77 grease to the pad side of the shims (A), and the back of the brake pads (B). Wipe excess grease off the pad shims and the brake pads. Keep grease off the brake discs and the brake pads. Contaminated brake discs or brake pads reduce stopping ability.
16. Install the brake pads and the pad shims correctly. Install the brake pad with the wear indicator (C) on the upper inside. If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.

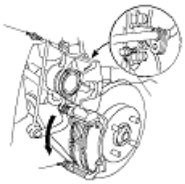


---

17. KE, KG models: Install the pad return spring (A).

---

18. Pivot the caliper down into position. Install the flange bolt (A), and tighten it to the specified torque while holding the caliper pin (B) with a wrench being careful not to damage the pin boot.
19. Install the brake hose mounting bolt (C).
20. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
21. Press the brake pedal several times to make sure the brakes work.
    NOTE: Engagement may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.
22. Add brake fluid as needed.
23. After installation, check for leaks at hose and line joints or connections, and retighten if necessary.
    Test-drive the vehicle, then check for leaks.



Brake pad

Item	Measurement	Qualification	Standard or New	Service Limit
Brake pad	Thickness	Front	KE, KG: 9.3−10.2 mm (0.36−0.41 in.)	1.6 mm (0.06 in.)
			Except KE, KG: 9.5−10.2 mm (0.37−0.41 in.)	1.6 mm (0.06 in.)
		Rear	6.8−7.5 mm (0.27−0.30 in.)	1.6 mm (0.06 in.)

Brake pedal

Item	Measurement	Qualification	Standard or New	Service Limit
Brake pedal	Pedal height (carpet moved aside)	M/T	139 mm (5.5 in.)	
		A/T	138 mm (5.4 in.)	
	Free play		1−5 mm (0.04−0.20 in.)	

Rear Brake Shoe Replacement

⚠CAUTION

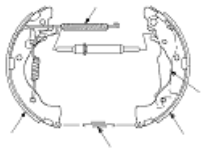
Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use an air hose or brush to clean brake assemblies. Use an appropriate vacuum cleaner.

Disassembly

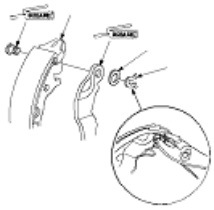
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Release the parking brake, and remove the brake drum.
4. Remove the tension pins (A) by pushing respective retainer spring (B) and turning the pin.

5. Remove the lower return spring (A), and remove the brake shoe assembly over the hub.
6. Remove the forward brake shoe (B) by removing the upper return spring (C), and disassemble the brake shoe assembly.
7. Remove the rearward brake shoe (D) by disconnecting the parking brake cable from the parking brake lever (E).



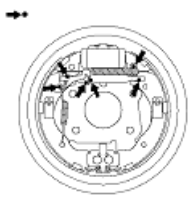
8. Remove the U-clip (A), wave washer (B), and pivot pin (C), and separate the parking brake lever (D) from the brake shoe (E).

Reassembly

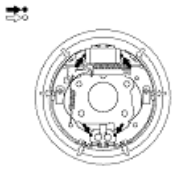


1. Apply rubber grease to the sliding surface of the pivot pin (A) and parking brake lever (B) for the rearward brake shoe (C).
2. Install the parking brake lever and the wave washer (D) on the pivot pin, and secure with a new U-clip (E).
   NOTE: Pinch the U-clip securely to prevent the parking brake lever from coming out of the brake shoe.
3. Connect the parking brake cable to the parking brake lever.

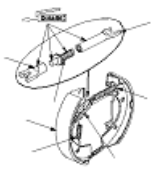
4. Apply a thin coat of rubber grease to the connecting rod ends (A), and the sliding surfaces (B) as shown. Wipe off any excess. Keep grease off the brake linings.



5. Apply a thin coat of Molykote 44 MA grease to the shoe ends (A) and the edge of the shoe surfaces (B) that contact the backing plate as shown. Wipe off any excess. Keep grease off the brake linings.



6. Install connecting rods A and B on the adjuster bolt (C).
   NOTE:
   - Clean the threaded portions of connecting rod A and the sliding surface of connecting rod B, then coat them with rubber grease.
   - Shorten connecting rod A by fully turning the adjuster bolt.
7. Assemble the brake shoes, the upper return spring (D), and with the connecting rods the adjuster bolt on the backing plate, then install the self-adjuster lever (E) and the self-adjuster spring (F) on the forward brake shoe (G).



8. Install the tension pins (A) and the retainer springs (B) by pushing in respective spring and turning each pin.

9. Install the lower return spring.
   NOTE: Make sure the brake shoe positioning on the brake shoe bosses of the backing plate, and fitting the top of the brake shoes onto the wheel cylinder pistons.
10. Install the brake drum.
    NOTE: Before installing the brake drum, clean the mating surface of the rear hub and the inside of the brake drum.
11. Clean the mating surfaces of the brake drum and the inside of the wheel, then install the rear wheel.
12. Press the brake pedal several times to make sure the brakes work and to set the self-adjusting brake.
    NOTE: Engagement of the brakes may require a greater pedal stroke immediately after the brake shoes have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.
13. Adjust the parking brake.

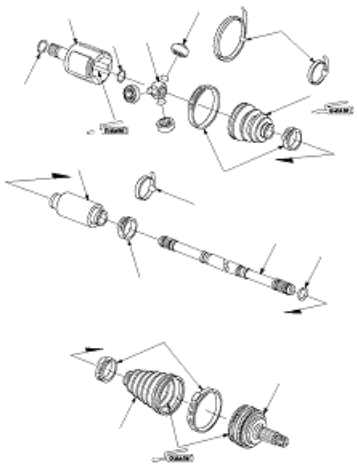
Driveshaft Reassembly

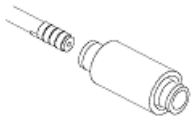
Refer to the procedures for the Manual Transmission model.

i-SHIFT

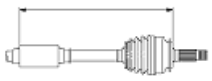


Driveshaft Dynamic Damper Replacement

1. Remove the inboard joint.
2. Remove the dynamic damper band.
3. Remove the dynamic damper.
4. Install the new dynamic damper.



5. Adjust the specified distance (A) between the outboard joint side and the dynamic damper edge.
   NOTE: Check the type of dynamic damper by its shape.



Model	Left/Right Driveshaft	Specified Distance (A)
i-SHIFT	Left	———
	Right	287−292 mm (11.30−11.50 in.)

6. Install the dynamic damper band.
7. Install the inboard joint.

Steering Gearbox Removal and Installation

Special Tools Required

Ball joint remover, 28 mm
07MAC-SL00201

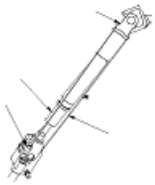
Engine support hanger
AAR-T1256-J00*
*: This special tool is available from Snap-on Tools International, LLC.
Note these items during removal:

- Use solvent and a brush, wash any oil and dirt off the end of the steering gearbox. Avoid any electrical parts. Blow dry with compressed air.
- Be sure to remove the steering wheel before disconnecting the steering joint. Damage to the cable reel can occur.
- Lower the front subframe from the body and remove the steering gearbox through the gap produced by lowering the front subframe.
- The illustrations show LHD model, RHD model is similar for items not shown in this section.

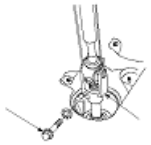
Removal

1. Do the battery terminal disconnection procedure.
2. Raise the vehicle on a lift, and support it with safety stands in the proper locations.
3. Remove the front wheels.
4. Release the lock lever, and adjust the steering column to the full tilt up position, and to the full telescopic in position.
5. Tighten the lock lever.
6. Remove the driver's airbag and the steering wheel.
7. Remove the steering joint cover (A).

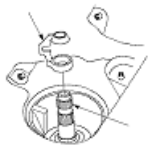
8. Hold the lower slide shaft (A) on the column with a piece of wire (B) between the joint yoke (C) of the lower slide shaft and joint yoke (D) of the upper shaft to prevent the lower slide from pulling out.
9. Release the lock lever, and adjust the steering column to the full telescopic out position, then tighten the lock lever.



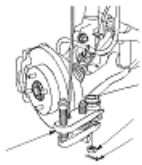
10. Remove the steering joint bolt (A).
11. Disconnect the steering joint (B) by moving the steering joint toward the column.



12. Remove the center guide (A) (if equipped) from top of the pinion shaft (B), and discard it. The center guide is for factory assembly use only.

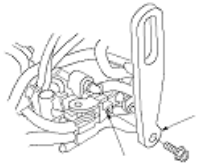


13. Remove the cotter pin (A) from the tie-rod ball joint, then remove the nut (B).
14. Separate the tie-rod ball joint and knuckle using the ball joint remover.

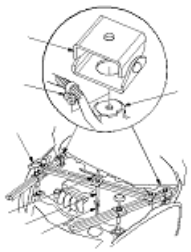


15. Remove the clip (A) from the castle nut (B), and remove the nut.
16. Separate the lower arm ball joint and the knuckle using the ball joint remover.
17. Remove the stabilizer link from the stabilizer bar.
18. Remove the air cleaner.

19. Install the hanger adapter (A) to the threaded hole (B) in the cylinder head using the 8 mm bolt.

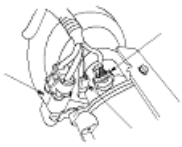


20. On the left side, remove the harness clip (A) from the harness clamp bracket (B).
21. Place the cross arm foot (C) to the harness clamp bracket on both side.
22. Install the engine support hanger (AAR-T1256-J00) to the vehicle, and attach the hook (D) to the hanger adapter (E). Tighten the wing nut (F) by hand, and lift and support the engine.
23. Raise the vehicle on a lift.
24. Remove the splash shield.
25. With HID lamp model: Disconnect the suspension stroke sensor connector.

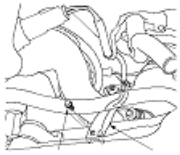


26. LHD model: Disconnect the motor 2P connector (A), and torque sensor 4P connector (B) from the torque sensor.

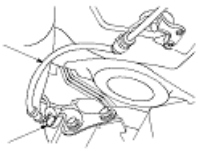
27. RHD model: Disconnect the motor 2P connector (A), torque sensor 3P connector (B), and steering gearbox 1P connector (C) from the torque sensor.
28. Wrap the connectors with the vinyl tape to avoid the contamination from grease or water.



29. LHD model: Remove the secondary HO2S wire clamp (A) on steering gearbox. Do not disconnect secondary HO2S 4P connector and secondary HO2S.

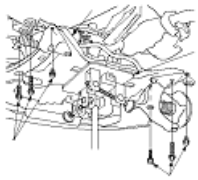


30. RHD model: Remove the secondary HO2S wire (A) from the clamp (B) on steering gearbox. Do not disconnect secondary HO2S 4P connector and secondary HO2S.

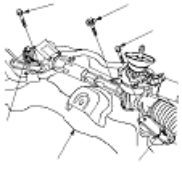


31. Remove the lower torque rod (A).

32. Attach a jack (A) to the center of the front subframe (B) and support the front subframe securely by raising the jack.
33. Remove the front subframe mounting bolts (C).
34. Lower the front subframe and steering gearbox as an assembly by lowering the jack slowly.



35. Remove the steering gearbox (A) from the front subframe (B).



36. Remove the pinion shaft grommet (A) from the top of the torque sensor.

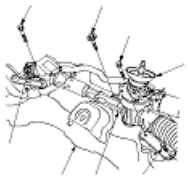
Installation

1. Before installing the steering gearbox, make sure that no grease is on the mating surface of the steering gearbox and the front subframe. To prevent the gearbox mounting bolts from loosening after the installation, remove any grease from the bolt holes.
2. Install the pinion shaft grommet (A). Align the cutout portion (B) in the pinion shaft grommet with the lug portion (C) on the torque sensor 3P connector. The grommet must not have a gap at the mating surface of the grommet and torque sensor.

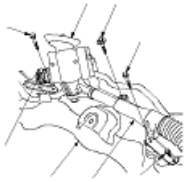
---

3. Place the steering gearbox (A) on the front subframe (B).
4. Loosely install the stiffener plates, and new gearbox mounting bolts, then tighten the bolts to the specified torque in the sequence shown.
5. Turn the lip (C) of the pinion shaft grommet to ease installation.

LHD model

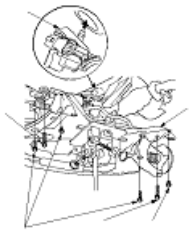


RHD model



---

6. Set the front subframe (A) mounting with the steering gearbox on the transmission jack and support it.
7. Carefully raise the front subframe with the jack, and pass the pinion shaft into the cabin. Return the lip (B) of the pinion shaft grommet.
   NOTE:
   - Be sure that the pinion shaft grommet is securely in place. Check whether the pinion shaft grommet is not turning up. Incorrect installation can cause leakage of water, mud, or noise.
   - Take care not to damage the lower arm ball joint boot with the edge of the knuckle, etc.
8. Loosely install new front subframe mounting bolts, then tighten the bolts to the specified torque in the sequence shown.

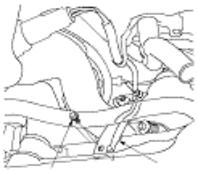


---

9. Install the lower torque rod (A) with new mounting bolts and new mounting nut, and tighten them to the specified torque.
   NOTE: Make sure the stopper (B) of flange bolt securely installed.

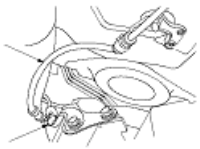
---

10. LHD model: Install the secondary HO2S wire clamp (A) to the steering gearbox.



---

11. RHD model: Install the secondary HO2S wire (A) to the clamp (B) on steering gearbox.
12. Remove the vinyl tape from the connectors.

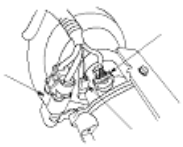


---

13. LHD model: Connect the motor 2P connector (A), and torque sensor 4P connector (B) to the torque sensor.

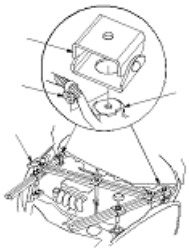
---

14. RHD model: Connect the motor 2P connector (A), torque sensor 3P connector (B), and steering gearbox 1P connector (C) to the torque sensor.
15. With HID lamp model: Connect the suspension stroke sensor connector.
16. Install the splash shield.
17. Connect the stabilizer links.
18. Lower the vehicle.
19. Remove the engine support hanger (AAR-T1256-J00) from the vehicle.



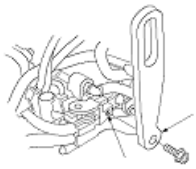
---

20. Remove the cross arm foot (A), then install the harness clip (B) to the harness clamp bracket (C) on the left side.



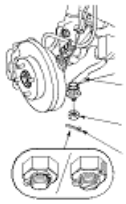
---

21. Remove the hanger adapter (A) from the threaded hole (B) in the cylinder head.
22. Install the air cleaner.



---

23. Wipe off any grease contamination from the tapered section and the threads of the ball joint. Connect the tie-rod ends (A) to the knuckles with a nut, then tighten it to the specified torque.
24. Install the new cotter pin (B), and bend it as shown.

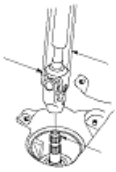


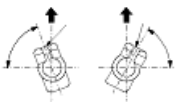
---

25. Wipe off any grease contamination from the tapered section and threads of the lower arm ball joint. Then reconnect the lower arm (A) to the knuckle. Install the new castle nut (B) and tighten it.
NOTE:
    - Be careful not to damage the lower ball joint boot (C). Check the ball joint boot for deformation before connecting the knuckle.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the joint pin clip hole. Do not align the castle nut by loosening it.
26. Install the clip (D).
27. Install the front wheels, then set the wheels in the straight ahead position.
NOTE: Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.

---

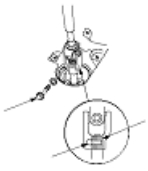
28. Cut the wire (A).
29. Slip the lower end of the steering joint (B) onto the pinion shaft (C) taking care to align the gap (D) within the angle shown.
30. Release the lock lever, and adjust the steering column to the full tilt down position, and to the full telescopic out position, then tighten the lock lever.





---

31. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, then loosely install the lower steering joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft.
32. Pull on the steering joint to make sure that the steering joint is fully seated, then tighten the lower joint bolt to the specified torque.



---

33. Install the steering joint cover (A).

34. Install the steering wheel and the driver's airbag.

35. With the tyres raised off the ground, check for the following symptoms by turning the steering wheel fully to the right and left several times.

Symptom	Probable cause
Rubbing sound coming from the lower steering column area.	Steering column joint is contacting the cover.
Grating sound from the lower steering column area, or a rough feeling during steering.	Poor engagement of the pinion shaft serrations.
Noise from around the steering wheel during steering.	Poor engagement of the SRS cable reel with the steering wheel, or a damaged cable reel.

36. Do the battery terminal reconnection procedure, and do these tasks:
    - Turn the ignition switch to ON (II) and check that the SRS indicator should came on for about 6 seconds and then go off.
    - Make sure the horn and turn signal switches work properly.
    - Make sure the steering wheel switches work properly.

37. After installation, do these checks:
    - Start the engine, allow it to idle, and turn the steering wheel from lock-to-lock several times.
    - Check that the EPS indicator does not come on.
    - Check the steering wheel spoke angle. If steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft serrations, then adjust the front toe by turning the tie-rod ends, if necessary.

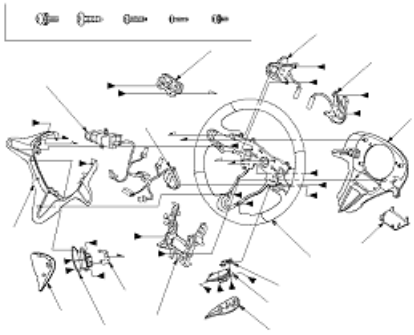
38. Do the memorizing the torque sensor neutral position.

39. Check the wheel alignment, and adjust it if necessary.

Gearbox

Item	Measurement	Qualification	Standard or New
Gearbox	Angle of rack guide screw loosened from locked position		10±3 °

Steering Wheel Disassembly/Reassembly



Steering wheel

Item	Measurement	Qualification	Standard or New
Steering wheel	Rotational play measured at outside edge with engine running		0−10 mm (0−0.39 in.)
	Initial load measured at outside edge with engine running		29 N (3.0 kgf, 6.6 lbf)

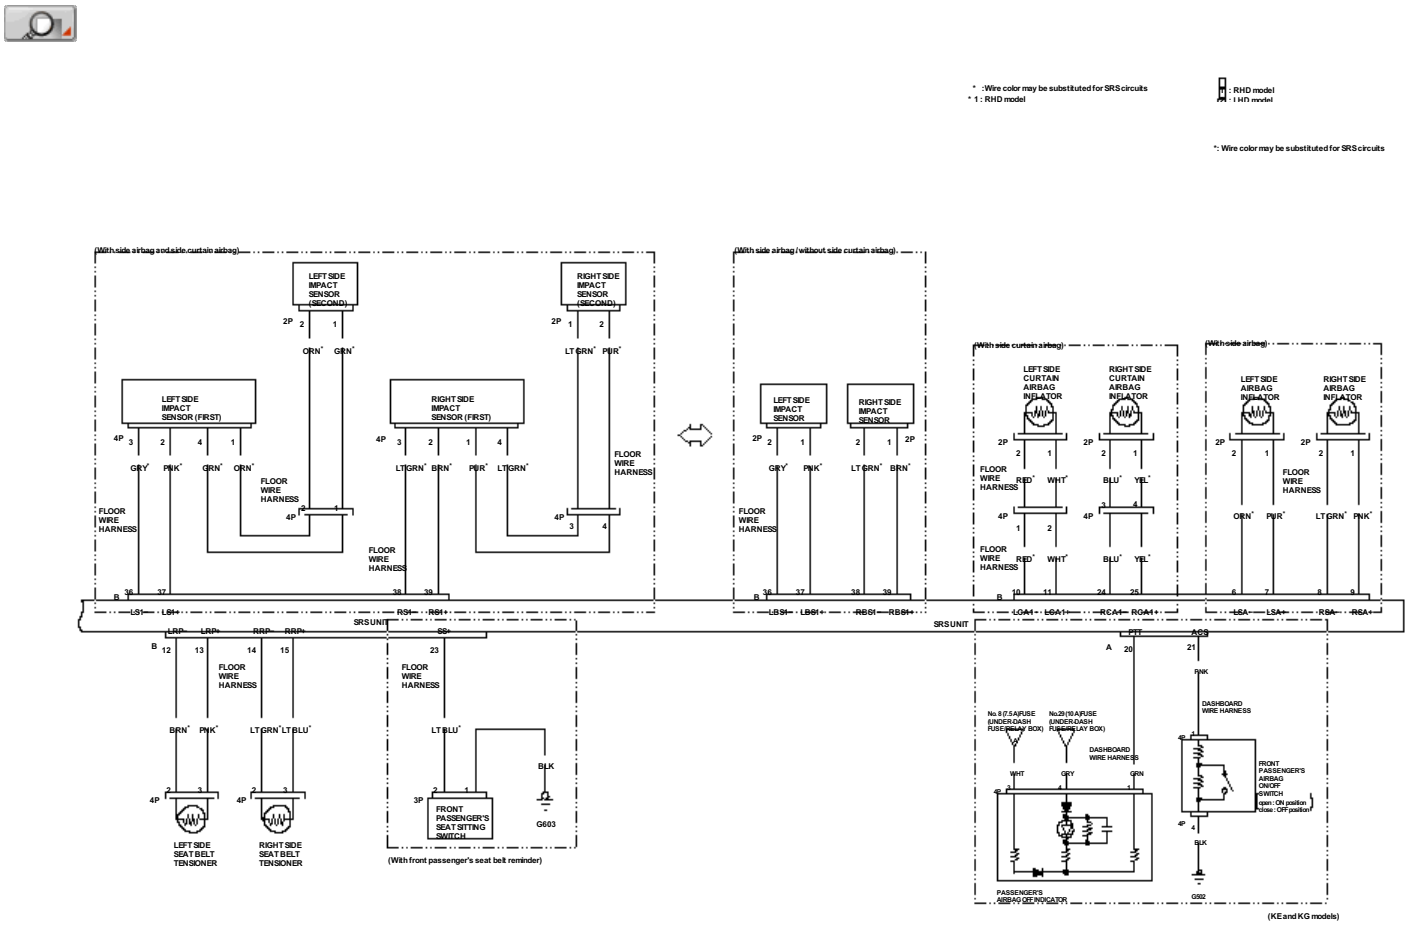
SRS Circuit Diagram



SRS Symptom Troubleshooting - Front Passenger's airbag ON/OFF switch to OFF, but passenger's airbag off indicator does not come on

Front passenger's airbag ON/OFF switch to OFF, but passenger's airbag off indicator does not come on

NOTE: Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
2. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator come on?
   YES - Go to the System Troubleshooting "SRS indicator stay on, but no DTCs are stored".■
   NO - Go to Step 3 .
3. Check for front passenger's airbag on/off switch to OFF.
4. Connect the HDS to the data link connector (DLC).
5. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the "FRONT PASSENGER'S AIRBAG ON/OFF SWITCH", and read the HDS indicated.

   Is OFF indicated on the HDS?
   YES - Faulty passenger's airbag off indicator, replace the passenger's airbag off indicator. ■
   NO - Faulty front passenger's airbag on/off switch, replace the front passenger's airbag on/off switch.■

SRS Symptom Troubleshooting - Passenger's airbag off indicator does not come on

Passenger's airbag off indicator does not come on

NOTE: Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Check for front passenger's airbag on/off switch to ON.
2. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
3. Turn the ignition switch to ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator come on?

   YES - Go to the System Troubleshooting "SRS indicator stay on, but no DTCs are stored".■
   NO - Go to Step 4 .
4. Connect the HDS to the data link connector (DLC).
5. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the "FRONT PASSENGER'S AIRBAG ON/OFF SWITCH", and read the HDS indicated.

   Is OFF indicated on the HDS?

   YES - Faulty passenger's airbag off indicator, replace the passenger's airbag off indicator. ■
   NO - Faulty front passenger's airbag on/off switch, replace the front passenger's airbag on/off switch.■

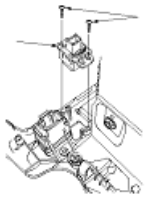
Front Passenger's Airbag Off Indicator Replacement

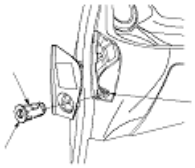
1. Remove the audio panel.
   - With audio unit.
   - Without audio unit.
2. Remove the two screws (A) and the passenger's airbag off indicator (B).
3. Reinstall the parts in the reverse order of removal.

With audio unit



Without audio unit

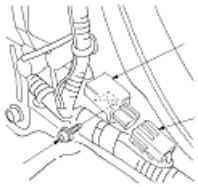
Front Passenger's Airbag ON/OFF Switch Replacement



1. Remove the passenger's dashboard side lid.
2. Disconnect the 4P connector (A) from the front passenger's airbag ON/OFF switch (B).
3. Pull out the front passenger's airbag ON/OFF switch, while pushing the lock (C) on the inside of the front passenger's airbag ON/OFF switch.
4. Reinstall the parts in the reverse order of removal.

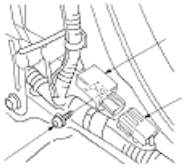
Side Impact Sensor (First) Replacement

Removal



1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before starting work.
2. Remove the front seat assembly.
3. Remove the center pillar lower trim.
4. Disconnect the floor wire harness 2P or 4P connector (A) from the side impact sensor (first) (B).
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag
5. Using a TORX T30 bit, remove the TORX bolt (C), then remove the side impact sensor (first).

Installation



1. Install the new side impact sensor (first) with a new TORX bolt (A), then connect the floor wire harness 2P or 4P connector (B) to the side impact sensor (first) (C).
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag
2. Do the battery terminal reconnection procedure.
3. After installing the side impact sensor (first) confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.
4. Reinstall all removed parts.

Audio System Error Codes

The audio system displays error codes when a problem is detected with the disc player, the disc or the anti-theft code.

CD Error Codes

Error Code Displayed	Possible Cause	Solution
CD UNSUPPORTED	Track/File format not supported.	Current track will skipped. The next supported track or file plays automatically. • Verify that CD file names end in CDA. • Verify that CD-R or CD-RW with compressed music formats end in MP3 or WMA. • Other file formats like i-Tunes (AAC) or Ogg are not recognized. • WMA files may have (DRM) copy protection and cannot be read.
BAD DISC/PLEASE CHECK/OWNERS MANUAL/PUSH EJECT	• CD label jammed in the mechanism. • The wrong type disc is inserted. • CD eject mechanism or motor is inoperative. • CD spindle motor won't spin up the CD.	• Eject CD and insert a known-good CD. • If flashing the PUSH EJECT, press the EJECT button and hold it for 5 seconds. If the disc does not eject, try again. If the disc still won't eject, replace the unit.
HEAT ERROR	Disc player is hot. This error can happen if the vehicle is parked out in the hot sun all day.	Park the vehicle in a cooler place for a while and play the disc again. If the error code is still present, try another disc. If the error code is still present, replace the audio unit.

Audio Unit Error Codes

Error Code Displayed	Possible Cause	Solution
CODE ERROR 1	Anti-theft code mismatch (1st try).	Enter the correct anti-theft code.
CODE ERROR E	Anti-theft code mismatch (10th try).	Remove fuse No. 1 (10 A) in the under-dash fuse/relay box, then reinsert it. You will have 10 more tries to enter the correct anti-theft code.

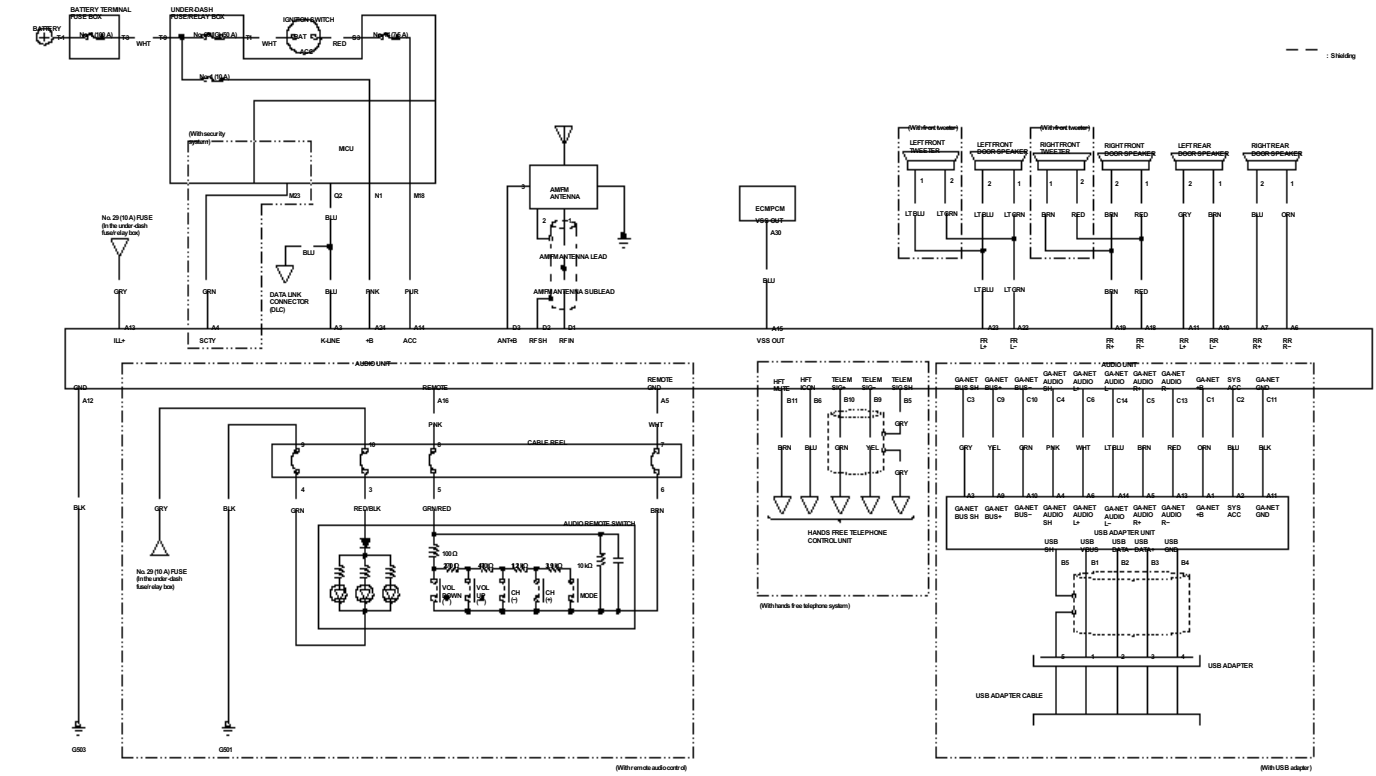
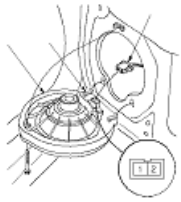
Part of items are not equipped for some models.

Audio System Circuit Diagram



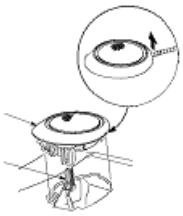
Speaker Test/Replacement

Front/Rear Door Speaker



1. Remove the door panel:
   - Front
   - Rear
2. Remove the bolt. Then lift the speaker (A) straight up to release the lower clips (B).
   NOTICE
   If you pull the speaker out too far from the door, you will damage the lower clips.
3. Disconnect the 2P connector (C), and remove the speaker.
4. Measure the resistance between the terminals No. 1 and No. 2. There should be about 4 Ω.
5. If the resistance is not as specified, replace the door speaker.

Front Tweeter

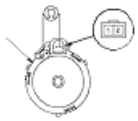


NOTE:

- Be careful not to damage the front tweeter grille and the dashboard.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.

1. Carefully pry the tweeter grille (A) out of the dashboard.
2. Disconnect the 2P connector (B) from the front tweeter.

3. Remove the front tweeter (A) from the speaker grille (B).
4. Check the capacitor condition. If any malfunction is found, replace the front tweeter.

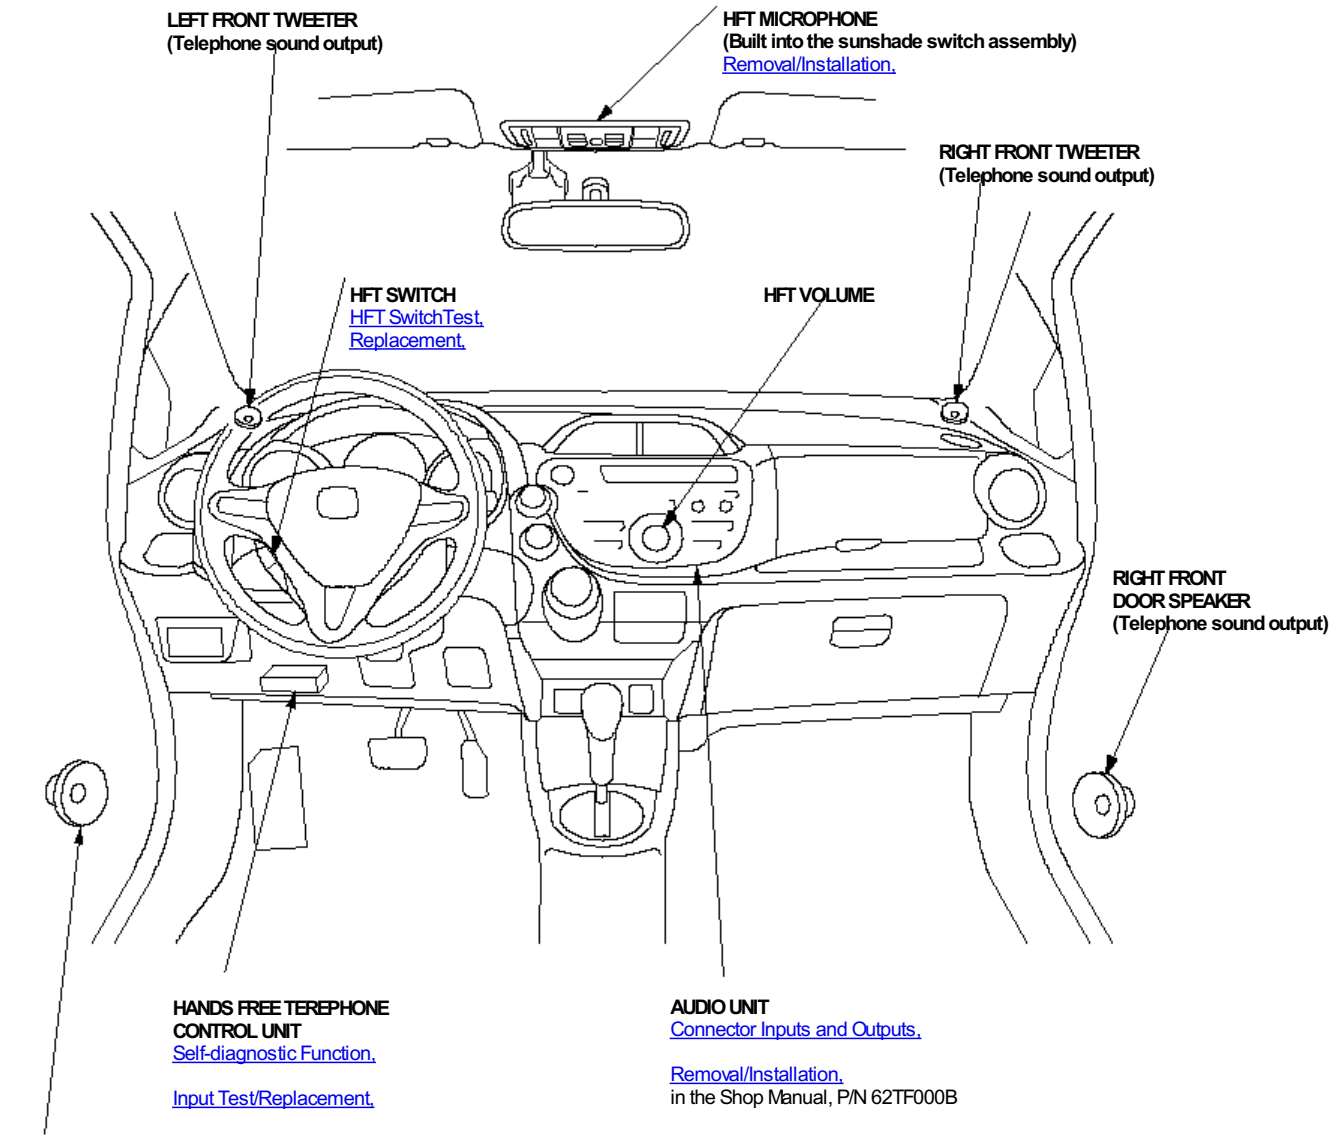


5. Measure the resistance between the front tweeter (A) terminal No. 2 and the outside terminal of the capacitor. There should be about 4 Ω.
6. If the resistance is not as specified, replace the front tweeter.

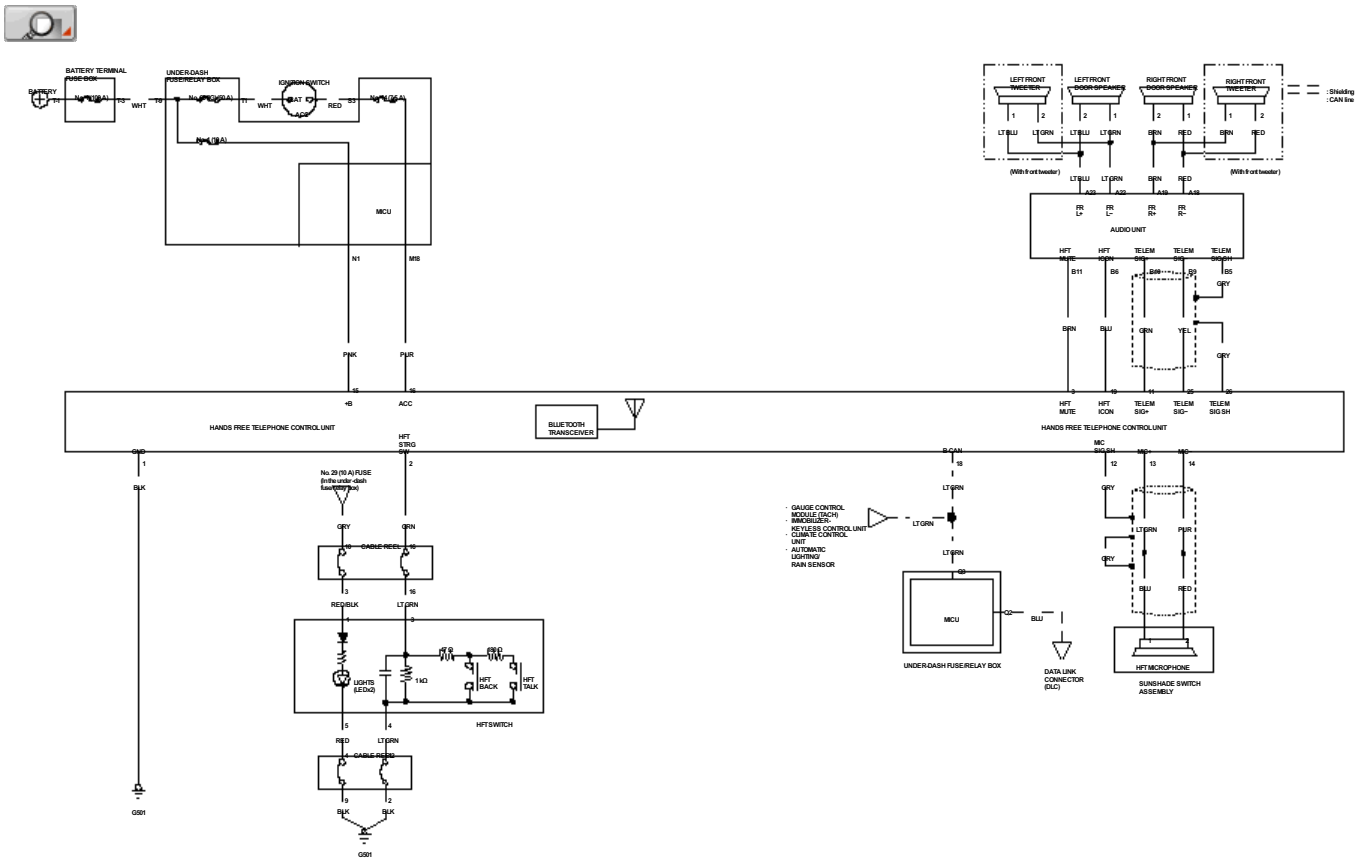
HFT System Description

[Hands Free Telephone Control Unit Inputs and Outputs]

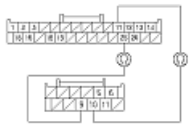
HFT System Component Location Index



HFT System Circuit Diagram



The HFT messages cannot be heard or are weak



1. Turn the ignition switch to ON (II).
2. Check that the audio system is operating normally and the speaker sound levels from different audio sources (AM, FM, CD, TA, etc.).

   Does the audio system work normally and is the audio output from the speaker normal when playing various audio sources?
   YES - Go to Step 3 .
   NO - Refer to the audio system symptom troubleshooting.■
3. Press the HFT talk button.

   Does the audio system mute when HFT messages are being played?
   YES - Go to Step 4 .
   NO - Go to Step 9 .
4. Turn the ignition switch to LOCK (0).
5. Disconnect audio unit connector B (20P) and the Hands Free Telephone control unit 28P connector.
6. Check for continuity between Hands Free Telephone control unit 28P connector terminals No. 11 and No. 25 and audio unit connector B (12P) terminals No. 10 and No. 9.

   Is there continuity?
   YES - Go to Step 7 .
   NO - Open in the wire(s) between Hands Free Telephone control unit and audio unit. Replace the affected harness.■

---

7. Check for continuity between body ground and audio unit connector B (12P) terminals No. 10 and No. 9 individually.

   Is there continuity?
   YES - Short to body ground in the wire(s) between Hands Free Telephone control unit and audio unit. Replace the affected shielded harness.■
   NO - Go to Step 8 .

---

8. Check for continuity between the terminals of audio unit connector B (12P) according to the table.

From terminal	To terminal
B10	B9, B5
B9	B5

   Is there continuity?
   YES - Short in the wire(s) between Hands Free Telephone control unit and audio unit. Replace the appropriate harness.■
   NO - Substitute a known-good Hands Free Telephone control unit and recheck. If the symptom goes away, replace the original Hands Free Telephone control unit. If the symptom does not go away, replace the audio unit. ■
9. Press the HFT talk button.

   Does the audio unit display show "TEL" when pressing the HFT talk button?
   YES - Go to Step 10 .
   NO - Go to Step 14 .
10. Turn the ignition switch to LOCK (0).
11. Disconnect the Hands Free Telephone control unit 28P connector and audio unit connector B (12P).

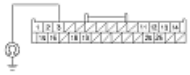
---

12. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 3 and audio unit connector B (12P) terminal No. 11.

    Is there continuity?
    YES - Go to Step 12 .
    NO - Repair open in the wire between Hands Free Telephone control unit and audio unit.■

---

13. Check for continuity between body ground and Hands Free Telephone control unit 28P connector terminal No. 3.



Is there continuity?

YES - Repair short to body ground in the wire between Hands Free Telephone control unit and audio unit.■

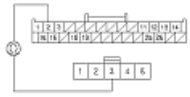
NO - Substitute a known-good Hands Free Telephone control unit and recheck. If symptom goes away, replace the original Hands Free Telephone control unit. If the symptom does not go away, replace the audio unit. ■

14. Turn the ignition switch to LOCK (0).

15. Disconnect the Hands Free Telephone control unit 28P connector and HFT switch 5P connector.

---

16. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 2 and HFT switch 5P connector terminal No. 3.

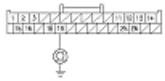


Is there continuity?

YES - Refer to HFT Switch Test. ■

NO - Repair open in the wire between Hands Free Telephone control unit and HFT switch.■

The Bluetooth icon does not display(the Bluetooth phone is linked)

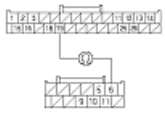


1. Turn the ignition switch to ON (II).
2. Disconnect audio unit connector B (12P) and Hands Free Telephone control unit 28P connector.
3. Check for continuity between body ground and Hands Free Telephone control unit 28P connector terminal No. 19.

   Is there continuity?

   YES - Repair short to body ground in the wire between Hands Free Telephone control unit and audio unit.■

   NO - Go to Step 4 .



4. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 19 and audio unit connector B (12P) terminal No. 6.

   Is there continuity?

   YES - Substitute a known-good Hands Free Telephone control unit and recheck. If the symptom/indication goes away, replace the original Hands Free Telephone control unit. If the symptom/indication is still present, replace the audio unit. ■

   NO - Repair open in the wire between Hands Free Telephone control unit and audio unit.■

Nothing happens

Diagnostic procedure

1. Control Unit Input Test

Also check for

- Check for DTCs
- The phone must be Honda approved Bluetooth phones and configured correctly

The HFT system does not recognize all voice prompts

Diagnostic procedure

1. Voice Control Tips

Also check for

- Check for DTCs

The HFT messages cannot be heard or are weak

Diagnostic procedure

1. Symptom Troubleshooting

Also check for

- Excessive interior noise (open windows, vents blowing on microphone, etc.)

The HFT system speaks in another country language

Diagnostic procedure

1. See the HFL section in the Owner's Manual for “Changing Language"

The HFT system is locked and the pass code has been lost or forgotten

Diagnostic procedure

1. Clearing the pass code

The Bluetooth icon does not display (the Bluetooth phone is linked)

Diagnostic procedure

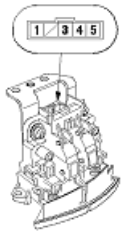
1. Symptom Troubleshooting

HFT System Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Nothing happens	Control Unit Input Test	• Check for DTCs • The phone must be Honda approved Bluetooth phones and configured correctly
The HFT system does not recognize all voice prompts	Voice Control Tips	Check for DTCs
The HFT messages cannot be heard or are weak	Symptom Troubleshooting	Excessive interior noise (open windows, vents blowing on microphone, etc.)
The HFT system speaks in another country language	See the HFL section in the Owner's Manual for “Changing Language"	
The HFT system is locked and the pass code has been lost or forgotten	Clearing the pass code	
The Bluetooth icon does not display (the Bluetooth phone is linked)	Symptom Troubleshooting	

HFT Switch Test

1. Remove the HFT switch.
2. Measure resistance between the No. 3 and No. 4 terminals in each switch position according to the table.



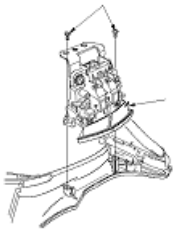
HFT Switch

Position	Resistance
No button pressed	About 1 kΩ
HFT Talk button pressed	About 185 Ω
HFT Back button pressed	About 45 Ω

3. If the resistance is not as specified, replace the HFT switch.

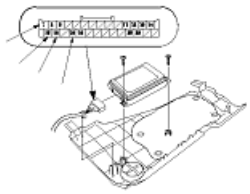
HFT Switch Replacement

SRS components are located in this area. Review the SRS component location.
Also review the precautions and procedures in the SRS section before doing repairs or service.



1. Remove the steering wheel.
2. Remove the steering wheel trim.
3. Remove the screws (A) from the HFT switch (B).
4. Install the HFT switch in the reverse order of removal.

HFT Control Unit Input Test/Replacement



1. Remove the driver's dashboard undercover.
2. Disconnect the 28P connector (A) from the Hands Free Telephone control unit (B).
3. Inspect the connector and socket terminals for a good pinfit to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. Reconnect the connector and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 5 .

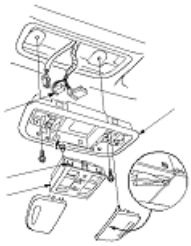
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
1	BLK	Under all conditions	Check for voltage to ground: There should be less than 0.5 V.	• Poor ground (G602) • An open in the wire
15	PNK	Under all conditions	Check for voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-hood fuse/relay box • An open in the wire
16	PUR	Ignition switch ON (II)	Check for voltage to ground: There should be battery voltage.	• Blown No. 14 (7.5 A) fuse in the under-dash fuse/relay box • An open in the wire

5. Disconnect the 28P connector again, and make this input test at the connector.
   - If the test indicates a problem, find and correct the cause, then recheck the system.
   - If the input test proves OK, the Hands Free Telephone control unit must be faulty, replace it.

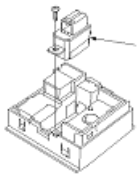
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
18	LT GRN	Under all conditions	Check for continuity between No. 18 terminal and the driver's under-dash fuse/relay box connector Q (16P) terminal No. 3: There should be continuity.	An open in the wire
		Driver's under-dash fuse/relay box connector Q (16P) disconnected	Check for continuity to ground: There should be no continuity.	Short to ground

HFT Microphone Removal/Installation

1. Remove the front individual map light.
2. Disconnect the 3P connector (A) from the HFT microphone.
3. Carefully pry off the sunshade switch assembly (B) from the map light housing (C) while pressing in on the retaining tabs (D).



4. Remove the screw from the HFT microphone (A).
5. Install the HFT microphone in the reverse order of removal.



Emblem/Sticker Replacement

NOTE: When removing the emblems, take care not to scratch the body.

1. To remove the front “H" emblem, remove the upper front grille.
2. To remove the rear “H" emblem, remove the rear license trim.
3. Clean the body surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
4. Apply the emblems where shown.

How to Troubleshoot the Body Electrical

Troubleshoot the B-CAN Circuit Related Problems

How to check for DTCs with the HDS (preferred method)

The HDS can check the F-CAN and B-CAN communication status, read and clear the DTCs, display the data list, and perform function test.

Check for DTCs

1. Connect the HDS to the data link connector (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with vehicle.
   NOTE: If the HDS does not communicate with the vehicle, troubleshoot the DLC circuit.
4. Select the BODY ELECTRICAL, then select the desired TEST MODE menu, and check the DTCs. If the DTCs do not pertain to the select menu, select the All DTC Check icon to view all Body DTCs.
   NOTE: For specific operations, refer to the HDS user's manual.
5. If any DTCs are indicated, go to the indicated DTCs troubleshooting.
   NOTE: If the DTC B1000, B1150, B1178, B1200, B1750, B1900, B2350, and/or B2450 are stored, troubleshoot these DTCs first (beginning with the lowest number).

How to check for DTCs without the HDS (Use only if the HDS is unavailable)

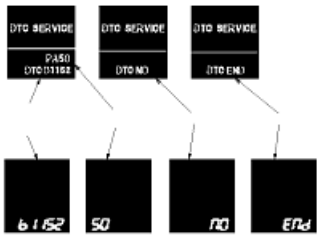
Special Tools Required

MPCS short connector
07WAZ-0010100

If the HDS is unavailable, using the following method, you can check the B-CAN communication status, DTCs, and some F-CAN communication status related with the gauge control module.

Check for DTCs

1. Turn the ignition switch to ON (II).
2. Connect the MPCS short connector (A) to the MICU service check connector (B), and turn the switch (C) ON.
3. After 5 to 10 seconds, the DTCs which have been detected and stored individually by various B-CAN unit, will be indicated one by one on the multi-information display or the odo/trip display if the communication line between the MICU and the gauge control module is OK. To scroll through the DTCs, press the select/reset button.



The unit that has stored the code can be identified by the number shown on the odo/trip display.

Control Unit	Control Unit I.D. Number
MICU	10
Gauge control module	50
Climate control unit	51
Automatic lighting/rain sensor	71
Headlight leveling control unit	75
Hands Free Telephone control unit	94
Immobilizer-keyless control unit	96

NOTE: Also you can check the B-CAN communication status by following methods:

- The MICU self-diagnostic function Test Mode 1 and Test Mode 2 can check some communication status and some switch circuits.
- The gauge control module self-diagnostic function can check the communication status.

How to Clear the DTCs with the HDS

1. Connect the HDS to the data link connector (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Clear the DTCs with the HDS.
4. Turn the ignition switch to LOCK (0), and disconnect the HDS from the data link connector (DLC).

How to Clear the DTCs without the HDS

1. While in DTCs indication status, press and hold the SELECT/RESET switch for more than 10 seconds.
2. Turn the MPCS short connector switch off, and disconnect the connector from the MICU service check connector.
3. Turn the ignition switch to LOCK (0).

HDS Inputs and Commands

Certain inputs happen so quickly that the HDS cannot update fast enough. Hold the switch that is being tested while monitoring the Data List. This should give the HDS time to update the signal on the Data List.
Because the HDS software is updated to support the release for newer vehicles it is not uncommon to see system function tests that are not supported.
Make sure that the most current software is loaded.

Loss of Communication DTC cross-reference chart

When an ECU is unable to communicate with the other ECUs on the CAN circuit, the other control units will set loss of communication DTCs. Use this chart to find the control unit that is not communicating.

1. Find the Transmitting Control Unit that is in the same row as all of the loss of communication DTCs retrieved.
2. Perform the input test for the transmitting control unit.

Bus Off and Internal Error Codes

DTC type	Related Unit						
	MICU	Gauge Control Module	Climate Control Unit	Immobilizer-Keyless Control Unit	Automatic Lighting/ Rain Sensor	Hands Free Telephone Control Unit	Headlight Auto Leveling Control Unit

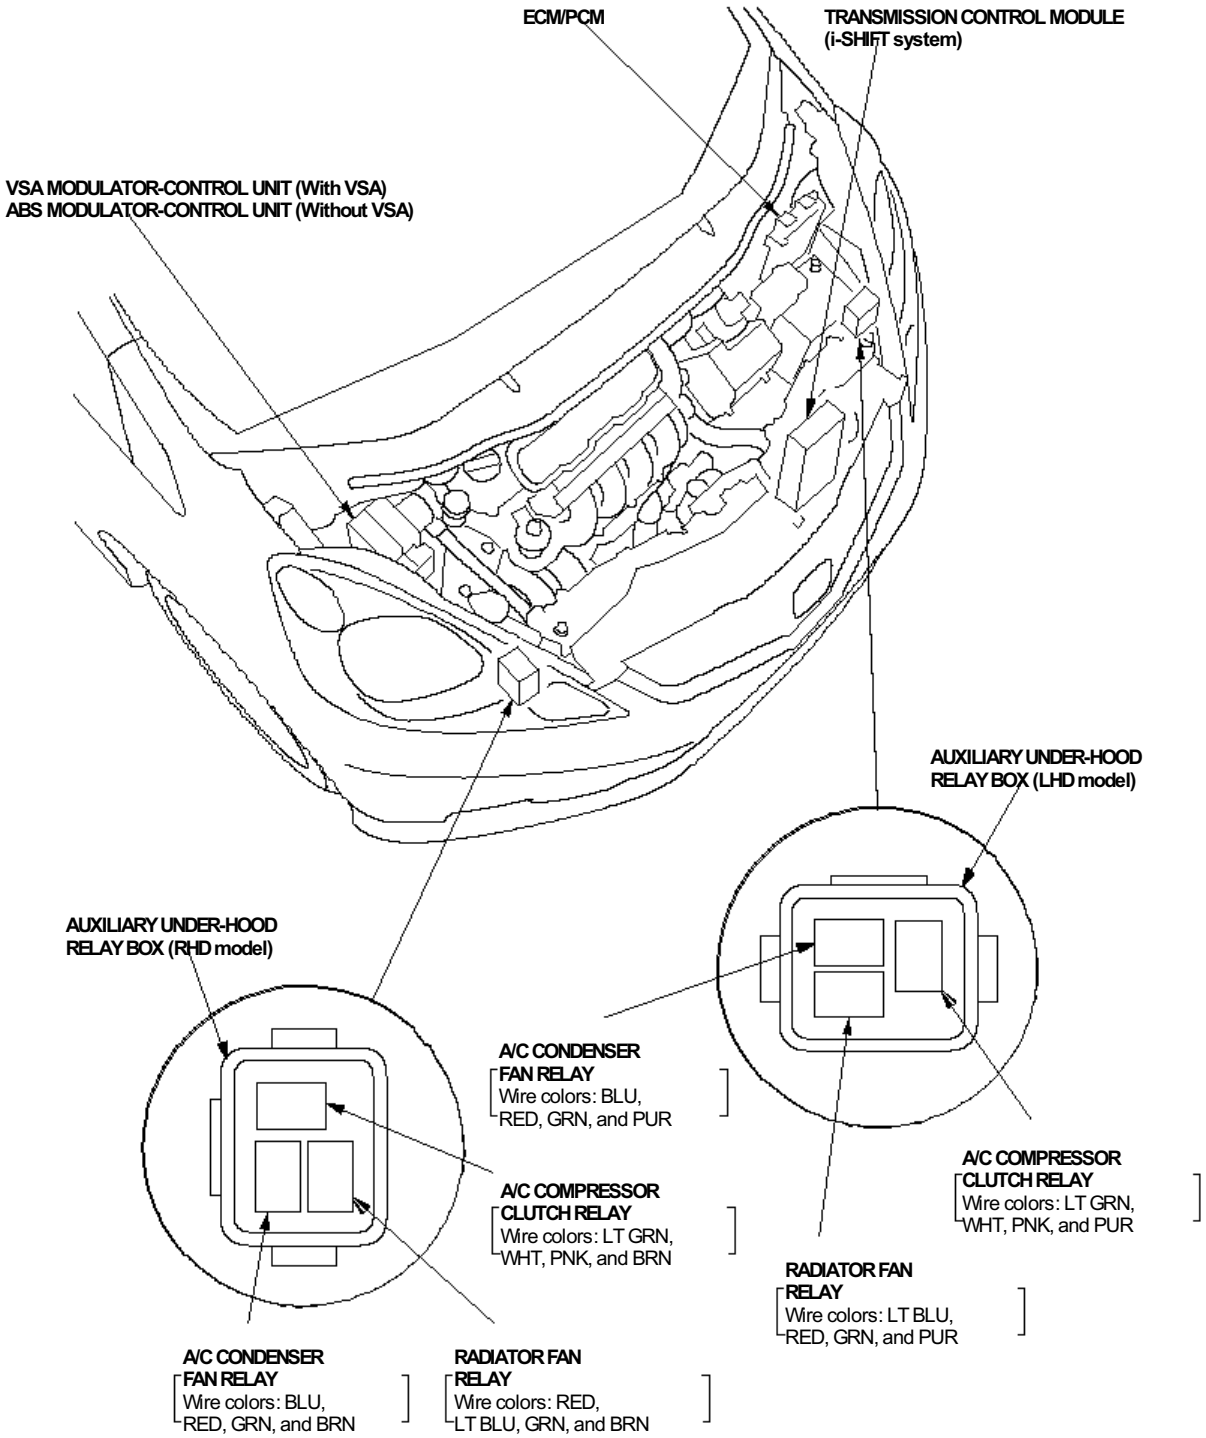
Relay and Control Unit Locations - Engine Compartment

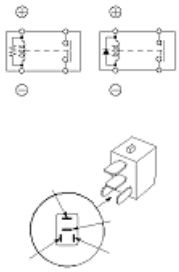


RHD model is shown, LHD model is similar.

Power Relay Test

Use this chart to identify the type of relay, then do the test listed for it.

Relay	Test
A/C compressor clutch relay	Normally-open type
A/C condenser fan relay	
A/F sensor relay	
Blower motor relay	
ETCS control relay	
Horn relay	
Ignition coil relay	
Lighting relay 1	
Lighting relay 2	
PGM-FI main relay 1 (FI MAIN)	
PGM-FI main relay 2 (FUEL PUMP)	
Power window relay (P/W)	
Radiator fan relay	
Rear window defogger relay	
Starter cut relay (Starter relay 1)	
Starter cut relay (Starter relay 2)	
Front fog light relay	
Rear fog light relay	
Driver's seat heater relay (high)	
Front passenger's seat heater relay (high)	
Driver's seat heater relay (low)	Five-terminal type
Front passenger's seat heater relay (low)	
Front super locking relay	
Rear super locking relay	
Daytime running lights relay	
Driver's door unlock relay	



Normally-open type

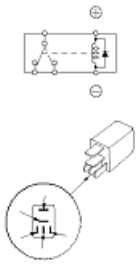
Check for continuity between the terminals:

- There should be continuity between the No. 1 and No. 2 terminals when battery power is connected to the No. 4 terminal, and body ground is connected to the No. 3 terminal.
- There should be no continuity between the No. 1 and No. 2 terminals when power is disconnected.

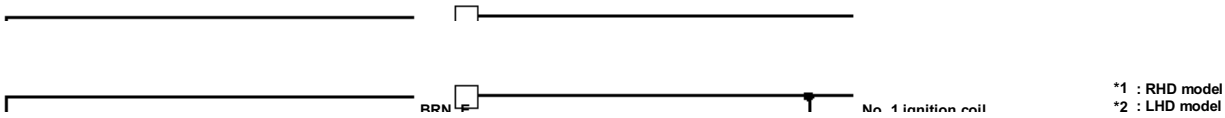
Five-terminal type

Check for continuity between the terminals:

- There should be continuity between the No. 1 and No. 2 terminals when battery positive terminal is connected to the No. 5 terminal, and battery negative terminal is connected to the No. 3 terminal.
- There should be continuity between the No. 1 and No. 4 terminals when power is disconnected.



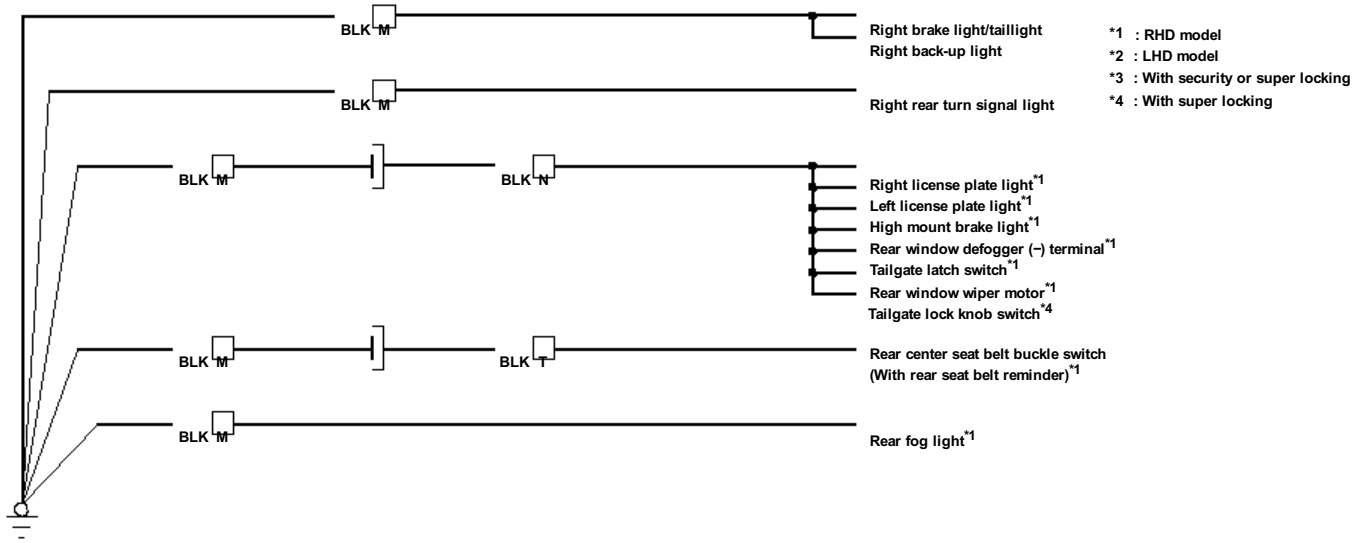
Ground Circuit Identification



*1 : RHD model
*2 : LHD model

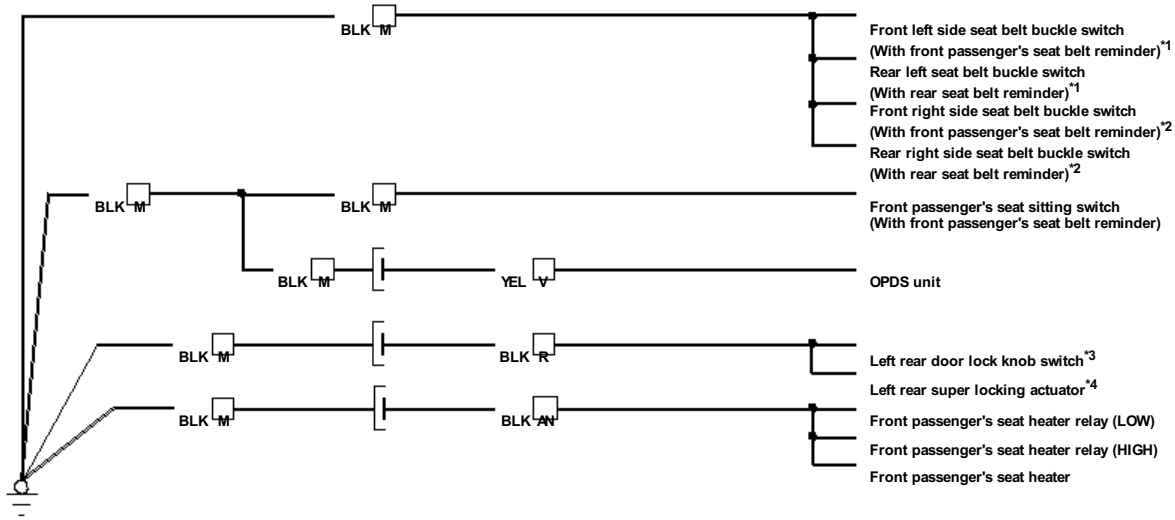
*1 : M/T (KE model)
*2 : i-SHIFT system

*1 : M/T (KG model)

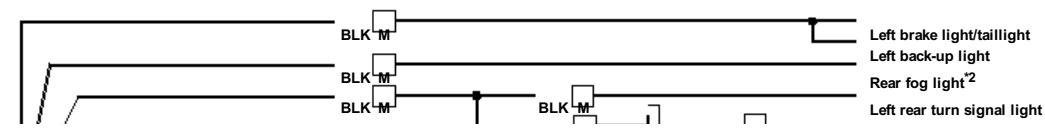


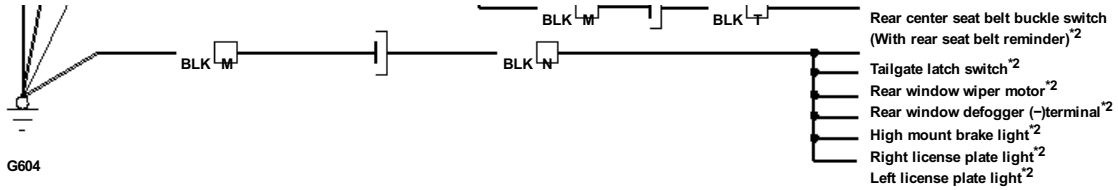
*1 : RHD model
*2 : LHD model
*3 : With security or super locking
*4 : With super locking

G602



G603





M : Floor wire harness

N : Tailgate wire harness

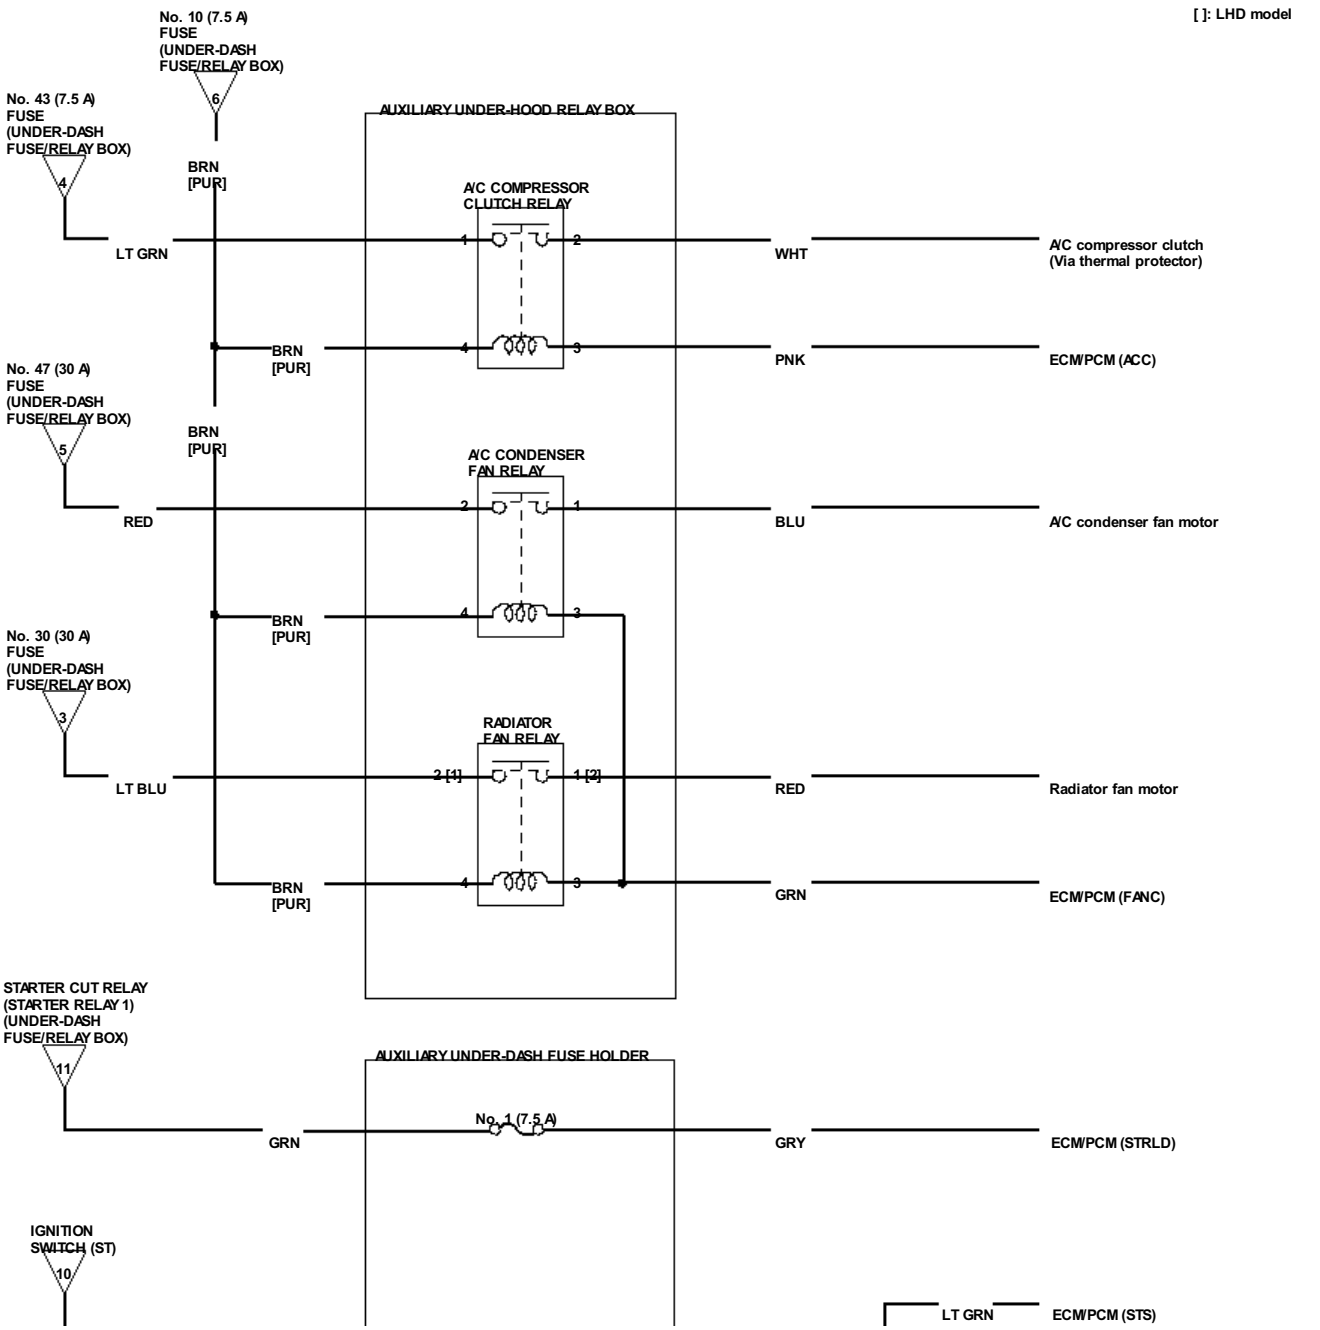
R : Left rear door wire harness

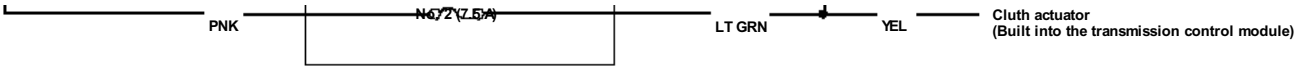
T : Reminder wire harness

V : OPDS unit harness

AN : Front passenger's seat wire harness

Power Circuit Identification





PNK
LT GRN
YEL
Cluth actuator
(Built into the transmission control module)

Under-dash fuse/relay box

Fuse Number	Amps	Component(s) or Circuit(s) Protected
1	10 A	Audio unit, Cargo area light, Ceiling light, Data link connector (DLC), Gauge control module, Immobilizer-keyless control unit, Individual map light, MICU (+B BACK UP), Automatic lighting/rain sensor, Hands free telephone control unit
2	10 A	Rear fog light relay, Rear fog light (Via rear fog light relay)
3	20 A	Power window master switch
4	———	Not used
5	10 A	MICU (IG BACK LT) (A/T), Back-up lights (Via back-up light switch) (M/T or i-SHIFT system), Headlight leveling control unit (With HID), Headlight leveling switch (Without HID), Headlight leveling motors (Without HID)
6	10 A	SRS unit (VB)
7	10 A	PCM (VBSOL)
8	7.5 A	SRS unit (VA), OPDS unit, Passenger's airbag off indicator
9	20 A	Front fog light relay, Front fog lights (Via front fog light relay)
10	7.5 A	A/C compressor clutch relay *2, A/C condenser fan relay *2, A/C switch indicator *4, Blower motor relay, Optional connector, Power mirror switch, Radiator fan relay *2, Rear window defogger relay, Rear window defogger switch indicator light *4, Climate control unit *5, HVAC control unit *6, Recirculation control motor *6, Seat heater switch indicators, Seat heater relays (Via seat heater switches)
11	7.5 A	ABS modulator-control unit (MTR) (Without VSA), EPS control unit, VSA modulator-control unit (MTR) (With VSA), Yaw rate-lateral/longitudinal acceleration sensor (With VSA)
12	10 A	MAF sensor, ECM/PCM (BKSWNC) (Via brake pedal position switch), EVAP canister purge valve, Secondary HO2S, Alternator, Gear shift control module (i-SHIFT system), Transmission control module (i-SHIFT system)
13	20 A	Accessory power socket, Cigarette lighter
14	7.5 A	Key interlock solenoid (A/T), Audio unit, MICU (ACC)
15 *7	7.5 A	Daytime running lights relay
16	10 A	Rear window wiper motor
17	20 A	Front passenger's power window motor (Via front passenger's power window switch), Power window master switch
18	20 A	Power window master switch, Right rear power window motor (Via right rear power window switch)
19	20 A	Left rear power window motor (Via left rear power window switch), Power window master switch
20	15 A	ECM/PCM (IG1), Fuel pump (Via PGM-FI main relay 2 (FUEL PUMP)), Immobilizer-keyless control unit
21	15 A	MICU (IG1 WASHER)
22	7.5 A	Electrical load detector (ELD), Gauge control module, Shift lock solenoid (A/T), Automatic lighting/rain sensor, MICU (IG1 METER)
23	10 A	MICU (+B HAZARD)
24	15 A	ECM/PCM (BKSW) *3, High mount brake light *3, Horn (High) (Via horn relay), Horn (Low) (Via horn relay), Horn relay *1, Left brake light *3, Right brake light *3, MICU (+B HORN) (Without security)
25	———	Not used
26	10 A	A/F sensor (Via A/F sensor relay), A/F sensor relay, No. 31 (7.5 A) fuse (Via A/F sensor relay)
27	30 A	MICU (+B DOOR LOCK)
28 *8	20 A	MICU (+B H/L MAIN)

*7: With daytime running light
*8: With HID

Fuse Number	Amps	Component(s) or Circuit(s) Protected
29	10 A	MICU (+B SMALL LT)
30	30 A	Radiator fan motor (Via radiator fan relay)
31	7.5 A	Engine oil level sensor
32	15 A	Right HID unit (With HID)
	10 A	Right headlight (LO) (Without HID)
33	15 A	Ignition coil relay, Ignition coils (Via ignition coil relay)
34	10 A	Left headlight (LO) (Without HID), Left high/low beam switching solenoid (With HID)
35	15 A	Front passenger's door lock actuator, Left [Right] rear door lock actuator, Tailgate lock actuator
36	15 A	Driver's door lock actuator, Fuel lid lock actuator, Right [Left] rear door lock actuator
37	30 A	ABS modulator-control unit (FSR) (Without VSA), VSA modulator-control unit (FSR) (With VSA)
38	———	Not used
39	15 A	CKP sensor, CMP sensor, ECM/PCM (IGP), Electronic throttle control system (ETCS) control relay *1, Injectors, PGM-FI main relay 1 (FI MAIN), PGM-FI main relay 2 (FUEL PUMP) *1
40	20 A	Driver's seat heater (Via driver's seat heater relay), Front passenger's seat heater (Via front passenger's seat heater relay)
41 *2	10 A	Front position lights (Via daytime running lights relay), Taillights (Via daytime running lights relay), License plate lights (Via daytime running lights relay)
42	———	Not used
43	7.5 A	A/C compressor clutch (Via A/C compressor clutch relay)

Fuse Number	Amps	Component(s) or Circuit(s) Protected
44 *7	7.5 A	Starter cut relay (Starter relay 1)
45	15 A *3	Driver's door unlock relay, Fuel lid actuator (Via driver's door unlock relay), Driver's door lock actuator (Via driver's door unlock relay)
	20 A *4	Front super locking relay, Rear super locking relay, Driver's super locking actuator (Via front super locking relay), Passenger's super locking actuator (Via front super locking relay), Right rear super locking actuator (Via rear super locking relay), Left rear super locking actuator (Via rear super locking relay)
46	20 A	Sunshade motor/control unit
47	30 A	A/C condenser fan motor (Via A/C condenser fan relay)
48	15 A	Left HID unit (With HID)
	10 A	Left headlight (HI) (Without HID)
49	15 A	Front passenger's door lock actuator, Left [Right] rear door lock actuator, Tailgate lock actuator
50	15 A	Driver's door lock actuator, Fuel lid lock actuator, Right [Left] rear door lock actuator
51	10 A	Right headlight (HI) (Without HID), Right high/low beam switching solenoid (With HID)
52	15 A	ECM/PCM (IG1ETCS) (Via electronic throttle control system (ETCS) control relay)
53	10 A	Transmission control module (i-SHIFT system)
54 *5	20 A	Rear window defogger
55 *5	10 A	Power mirror defoggers
56	30 A	MICU (IG1 FR WIPER)
57	30 A	Blower motor (Via blower motor relay)
58	30 A	ABS modulator-control unit (MTR) (Without VSA), VSA modulator-control unit (MTR) (With VSA)
59	20 A *6	Rear window defogger (Via rear window defogger relay)
	30 A *5	No. 54 (20 A) fuse (Via rear window defogger relay), No. 55 (10 A) fuse (Via rear window defogger relay)
60	(IGN)50 A	Ignition switch
	(AMT)40 A	Gear shift control module (i-SHIFT system)

How to Troubleshoot the HFT System

How to Check for DTCs with the HDS

1. Make sure the ignition switch is turned to LOCK (0).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the Hands Free Telephone control unit. If it doesn't, troubleshoot the DLC circuit.
5. Select HandsFreeLink in the BODY ELECTRICAL menu.
6. Select DTCs in the HandsFreeLink menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, refer to symptom troubleshooting.
   NOTE:
   - After troubleshooting, clear the DTCs with the HDS.
   - For specific operations, refer to the HDS user's manual.

The HFT gives the user the convenience of hands free operation. It can't control the phone's performance (call quality and signal strength). To avoid performance problems, don't put the phone in a metal briefcase or in a purse under the seat.
This guide shows you just a few of the HFT's many features. You will see how to pair your phone to the HFT and then make and receive calls, all using simple voice commands. If you want a complete description of this system, please refer to the owner's manual and quick start guide.

Voice Control Tips

To give any voice command, press and release the Talk button. Always wait for the beep, then give your command in a clear, natural voice. The HFT microphone is on the ceiling, by the front individual map lights.
If the HFT doesn't recognize your voice command, you'll hear ‘‘Pardon." If after repeating your command, it still doesn't recognize it, you'll hear ‘‘Please repeat." If after repeating your command again, it still doesn't recognize it, the HFT sends you to the Help menu.
To hear a list of available options at any time, say ‘‘Hands free help."
You can give many voice commands together. For example, you can say ‘‘Dial 123-456-7890."
To give a string of numbers in a call or dial voice command, you can say them all at once, or separate them into blocks of 3, 4, 7, 10, or 11.
To skip a voice prompt, press and release the Talk button while the HFT is speaking. The HFT begins listening for your next voice command.
To go back a step in a voice command sequence, press and release the Back button, or say ‘‘Go back."
If you don't say anything while the HFT is listening for your voice command, it will time out and stop its voice recognition. The next time you press and release the Talk button, the HFT begins listening from the point where it timed out.
To stop a voice command sequence at any time, press and hold the Back button, or press and release the Talk button, wait for the beep, and say ‘‘Cancel." The next time you press and release the Talk button, the HFT begins from its main menu.
When you're done with a voice command sequence, the HFT goes back to its main menu. The next time you press and release the Talk button, you'll be at the main menu.
Remember to press and hold the Back button until you exit the main menu, otherwise, the audio system stays muted.

Pairing Your Cell Phone (A One Time Procedure)

NOTE:

- You cannot pair a phone if the vehicle is moving.
- Your phone must be in its Discovery mode.
- Up to six Bluetooth compatible phones can be paired by the HFT.

1. Turn on your phone, and follow the prompts to activate Bluetooth.
2. Give these voice commands to the HFT by pressing the talk button.

You say	You'll hear
‘‘Phone setup"	‘‘Phone setup options are status, pair, edit, delete, and list."
‘‘Pair"	‘‘The pairing process requires operation of your mobile phone. For safety, only perform this function while the vehicle is stopped. State a four-digit code for pairing. Note this code, it will be requested by the phone."
‘‘1. 2. 3. 4." (This can be any four-digit code you want.)	‘‘1. 2. 3. 4. is this correct?"
‘‘Yes"	‘‘Searching for a Bluetooth phone. Make sure the phone you are trying to pair is in Discovery mode!"

3. Follow the cell phone manufacturer's instructions to put the phone in its Discovery mode. The phone will search for the HFT. When you see Hands Free Telephone in the device list on the phone, select it.
4. When prompted, enter the four-digit PIN from step 2 into the phone. You will hear the HFT say ‘‘A new phone has been found. Would you like to name this phone?"
5. Press and release the Talk button, and say what the phone name will be. For example, say ‘‘John's phone". You'll hear ‘‘John's phone has been successfully paired", returning to the main menu.
6. To pair another phone, repeat Step 1 thru 5.

Clearing the Pass Code

If the system is locked and the pass code is lost or forgotten, do the following.

1. Connect the HDS to the DLC.
2. Turn the ignition switch to ON (II).
3. From the ‘‘Body Electrical menu", then select ‘‘HandsFreeLink".
4. Select ‘‘Miscellaneous Tests", then select ‘‘Pass code reset".
5. Follow the HDS system prompts to reset the pass code.

Self-diagnostic Function

NOTE: This procedure should be used only if HDS is unavailable.
To run the self-diagnostic function, do the following:

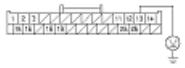
1. Turn the ignition switch to ON (II).
2. Press and hold the HFT Back button for more than 5 seconds.
3. When the Hands Free Telephone system enters the self-diagnostic function, the following will occur.
   - If there is no DTC, the Hands Free Telephone control unit audibly outputs ‘‘European Hands Free system is OK" and ‘‘Europe no handsfree system wa ok desu".
   - If there is any DTC, the Hands Free Telephone control unit audibly outputs ‘‘European Hands Free system needs to be serviced" and ‘‘Europe no handsfree system wa service ga hitsuyou desu".

NOTE:

- The self-diagnostic function can only be initiated while the HFT is in its idle state.
- The self-diagnostic function is considered to start once the 5 seconds press and hold is detected, and ends when the units returns to idle state.

DTC Troubleshooting: B1775

DTC B1775:
Microphone Input/Output Short to Battery or Open or Microphone Failure



1. Connect the HDS to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II).
4. Check for DTCs with the HDS.

   Is DTC B1775 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the HFT microphone and the driver's dashboard undercover.
7. Disconnect the 3P connector from the HFT microphone and the 28P connector from the Hands Free Telephone control unit.
8. Turn the ignition switch to ON (II).
9. Measure the voltage between Hands Free Telephone control unit 28P connector terminal No. 13 and body ground.

   Is there voltage?
   YES - Replace the faulty harness between the Hands Free Telephone control unit and the HFT microphone.■
   NO - Go to Step 10 .
10. Turn the ignition switch to LOCK (0).

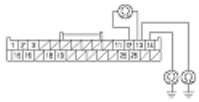
---

11. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 13 and HFT microphone 3P connector terminal No. 1.

   Is there continuity?
   YES - Substitute a known-good Hands Free Telephone control unit, then recheck. If the symptom goes away, replace the original Hands Free Telephone control unit .■
   NO - Replace the faulty harness between the Hands Free Telephone control unit and the HFT microphone.■

DTC Troubleshooting: B1776

DTC B1776:
Microphone Input/Output Short to Ground or Microphone Failure or Open



1. Connect the HDS to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II).
4. Check for DTCs with the HDS.

   Is DTC B1776 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Remove the HFT microphone and the driver's dashboard undercover.
7. Disconnect the 3P connector from the HFT microphone and the 28P connector from the Hands Free Telephone control unit.
8. Check for continuity between body ground and terminals No. 13 and No. 14 of the Hands Free Telephone control unit 28P connector individually, then between terminals No. 12 and No. 13.

   Is there continuity?
   YES - Replace the faulty harness between the Hands Free Telephone control unit and the HFT microphone.■
   NO - Go to Step 9 .

9. Check for continuity between the terminals shown of the Hands Free Telephone control unit 28P connector and the HFT microphone 3P connector.

   Is there continuity?
   YES - Substitute a known-good Hands Free Telephone control unit, then recheck. If the symptom goes away, replace the original Hands Free Telephone control unit. If the symptom does not go away, replace the faulty HFT microphone.■
   NO - Replace the faulty harness between the Hands Free Telephone control unit and the HFT microphone.■

DTC Troubleshooting: B1779

DTC B1779:
Hands Free Telephone Steering Wheel Open or Short to Battery or Switch Failure

1. Connect the HDS to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0), then start the vehicle and turn the steering wheel back and forth several times.
4. Check for DTCs with the HDS.

   Is DTC B1779 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the HFT switch test.

   Is the switch OK?
   YES - Go to Step 7 .
   NO - Replace the HFT switch. ■
7. Remove the driver's dashboard undercover.
8. Disconnect Hands Free Telephone control unit 28P connector.
9. Disconnect HFT switch 5P connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage of the HFT switch connector (5P) terminal No. 3 to body ground.

    Is there voltage?
    YES - Repair short in the wire between the Hands Free Telephone control unit and the HFT switch.■
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).

---

13. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 2 and HFT switch 5P connector terminal No. 3.

    Is there continuity?
    YES - Go to Step 14 .
    NO - Repair open in the wire between the HFT switch and the Hands Free Telephone control unit.■
14. Turn the ignition switch to ON (II).

---

15. Measure the voltage between Hands Free Telephone control unit 28P connector terminal No. 2 and body ground.

    Is there voltage?
    YES - Repair short to body ground in the wire between the Hands Free Telephone control unit and the HFT switch.■
    NO - Go to Step 15 .
16. Turn the ignition switch to LOCK (0).

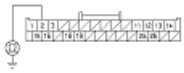
---

17. Check for continuity between HFT switch connector (5P) terminal No. 4 and body ground.

    Is there continuity?
    YES - Replace the Hands Free Telephone control unit. ■
    NO - Repair open in the wire between the HFT switch and body ground (G501).

DTC Troubleshooting: B1780

DTC B1780:
Hands Free Telephone Steering Wheel Short to Ground or Switch Failure



1. Connect the HDS to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0), then start the vehicle and turn the steering wheel back and forth several times.
4. Check for DTCs with the HDS.

   Is DTC B1780 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time.■
5. Turn the ignition switch to LOCK (0).
6. Do the HFT switch test.

   Is the switch OK?
   YES - Go to Step 7 .
   NO - Replace the HFT switch. ■
7. Remove the driver's dashboard undercover.
8. Disconnect the Hands Free Telephone control unit 28P connector.
9. Disconnect the HFT switch 5P connector.
10. Check for continuity between Hands Free Telephone control unit 28P connector terminal No. 2 and body ground.

    Is there continuity?
    YES - Repair short in the wire between the Hands Free Telephone control unit and HFT switch.■
    NO - Replace the Hands Free Telephone control unit. ■

DTC Troubleshooting: B1792

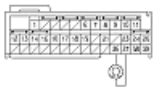
DTC B1792:
Hands Free Telephone Control Module Error

1. Connect the HDS to the DLC.
2. Clear the DTCs with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II).
4. Check for DTCs with the HDS.

Is DTC B1792 indicated?
YES - Replace the Hands Free Telephone control unit. ■
NO - Intermittent failure, the system is OK at this time.■

SRS DTC Troubleshooting: 43-11

DTC 43-11:
No Signal From the Left Side Impact Sensor (first)
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 43-11 indicated?
   YES -
   - If DTC 43-11 is indicated alone, go to Step 4 .
   - If DTC 43-11 and 45-11 are indicated, faulty left side impact sensor (first); replace the left side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check the connections between SRS unit connector B (39P) and the SRS unit, between the floor wire harness 2P or 4P connector and the left side impact sensor (first), and at floor wire harness 2P or 4P connector.
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.■
7. Disconnect SRS unit connector B (39P) from the SRS unit.
8. Disconnect the floor wire harness 2P or 4P connector from the left side impact sensor (first). ■
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag
9. Measure the resistance between No. 36 and No. 37 terminals of SRS unit connector B (39P). There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■

---

10. Measure the resistance between No. 36 terminal of SRS unit connector B (39P) and body ground, and between the No. 37 terminal and body ground.
    There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Reconnect the negative cable to the battery.
12. Turn the ignition switch to ON (II).

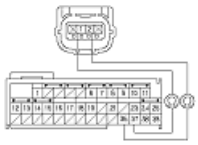
---

13. Measure the voltage between No. 36 terminal of SRS unit connector B (39P) and body ground, and between the No. 37 terminal and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

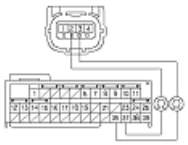
---

15. Measure the resistance between the following terminals of the floor wire harness 2P or 4P connector, and the SRS unit connector B (39P). There should be less than 1.0 Ω.



- With side airbag/without side curtain airbag

2P:	39P:
No. 2	No. 36
No. 1	No. 37



- With side airbag and side curtain airbag

4P:	39P:
No. 3	No. 36
No. 2	No. 37

Is the resistance as specified?

YES - Go to Step 16 .

NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good left side impact sensor (first) and recheck.

17. Connect SRS unit connector B (39P) to the SRS unit.

18. Clear the DTC memory.

19. Turn the ignition switch to ON (II), then wait for 10 seconds.

20. Read the DTC.

Is DTC 43-11 indicated?

YES - Faulty SRS unit; replace the SRS unit. ■

NO - Faulty left side impact sensor (first); replace the left side impact sensor (first). ■

SRS DTC Troubleshooting: 44-11

DTC 44-11:
No Signal From the Right Side Impact Sensor (first)
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and Battery Terminal Disconnection/Reconnection.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 44-11 indicated?
   YES -
   - If DTC 44-11 is indicated alone, go to Step 4 .
   - If DTC 44-11 and 46-11 are indicated, faulty right side impact sensor (first); replace the right side impact sensor (first). ■

   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Turn the ignition switch to LOCK (0).
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check the connections between SRS unit connector B (39P) and the SRS unit, between the floor wire harness 2P or 4P connector and the left side impact sensor (first), and at floor wire harness 2P or 4P connector.
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag

   Are the connections OK?
   YES - Go to Step 7 .
   NO - Repair the poor connections and retest.■
7. Disconnect SRS unit connector B (39P) from the SRS unit.
8. Disconnect the floor wire harness 2P or 4P connector from the right side impact sensor (first).
   - 2P: With side airbag/without side curtain airbag
   - 4P: With side airbag and side curtain airbag
9. Measure the resistance between No. 38 and No. 39 terminals of SRS unit connector B (39P). There should be an open circuit or at least 1 MΩ.

   Is the resistance as specified?
   YES - Go to Step 10 .
   NO - Short in the floor wire harness; replace the floor wire harness.■

---

10. Measure the resistance between No. 38 terminal of SRS unit connector B (39P) and body ground, and between the No. 39 terminal and body ground. There should be an open circuit or at least 1 MΩ.

    Is the resistance as specified?
    YES - Go to Step 11 .
    NO - Short to ground in the floor wire harness; replace the floor wire harness.■
11. Reconnect the negative cable to the battery.
12. Turn the ignition switch to ON (II).

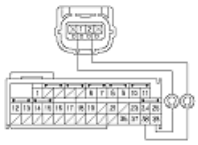
---

13. Measure the voltage between No. 38 terminal of SRS unit connector B (39P) and body ground, and between the No. 39 terminal and body ground. There should be less than 1.0 V.

    Is the voltage as specified?
    YES - Go to Step 14 .
    NO - Short to power in the floor wire harness; replace the floor wire harness.■
14. Turn the ignition switch to LOCK (0).

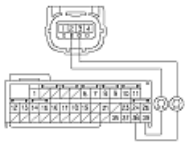
---

15. Measure the resistance between the following terminals of the floor wire harness 2P or 4P connector, and the SRS unit connector B (39P). There should be less than 1.0 Ω.



- With side airbag/without side curtain airbag

2P:	39P:
No. 2	No. 38
No. 1	No. 39



- With side airbag and side curtain airbag

4P:	39P:
No. 3	No. 38
No. 2	No. 39

Is the resistance as specified?

YES - Go to Step 16 .

NO - Open in the floor wire harness; replace the floor wire harness.■

16. Substitute a known-good right side impact sensor (first) and recheck.
17. Connect SRS unit connector B (39P) to the SRS unit.
18. Clear the DTC memory.
19. Turn the ignition switch to ON (II), then wait for 10 seconds.
20. Read the DTC.

Is DTC 44-11 indicated?

YES - Faulty SRS unit; replace the SRS unit. ■

NO - Faulty right side impact sensor (first); replace the right side impact sensor (first). ■

SRS DTC Troubleshooting: 68-1x

DTC 68-1x ("x" can be 0 thru 9 or A thru F):
Open in the Front Passenger's Airbag ON/OFF Switch
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
3. Turn the ignition switch to ON (II).
4. Read the DTC.

   Is DTC 68-1x indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
5. Turn the ignition switch to LOCK (0).
6. Remove the dashboard side lid, then disconnect the dashboard wire harness 4P connector from the front passenger's airbag on/off switch.
7. Measure the resistance between the No. 1 and No. 4 terminals of front passenger's airbag on/off switch 4P connector according to the table.

Position	Resistance
ON	3.11−3.88 kΩ
OFF	0.68−0.83 kΩ

   Is the resistance as specified?
   YES - Go to Step 8 .
   NO - Faulty front passenger's airbag on/off switch or poor connection at front passenger's airbag on/off switch 4P connector and the front passenger's airbag on/off switch. Check the connection between the connector and the front passenger's airbag on/off switch. If the connection is OK, replace the front passenger's airbag on/off switch. ■

8. Install a jumper wire between the No. 1 and the No. 4 terminals of dashboard wire harness 4P connector.

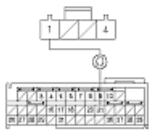
9. Measure the voltage between the dashboard wire harness 4P connector No. 1 and No. 4 terminals.

   Is there battery voltage?
   YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
   NO -
   - If voltage is about 0 V, go to Step 10 .
   - If voltage is 5 V, reconnect the front passenger's airbag on/off switch, then check the DTC. If no DTCs are indicated, intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, replace the SRS unit.

10. Turn the ignition switch to LOCK (0).
11. Disconnect the negative cable from the battery, then wait at least 3 minutes.
12. Disconnect SRS unit connector A (39P) from the SRS unit.

13. Check for continuity between the No. 1 terminal of the dashboard wire harness 4P connector and the No. 21 terminal of the SRS unit connector A (39P).

    Is there continuity?
    YES - Go to Step 14 .
    NO - Open in the dashboard wire harness; replace the dashboard wire harness.■



14. Check for continuity between the No. 4 terminal of the dashboard wire harness 4P connector and body ground.

    Is there continuity?
    YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit. ■
    NO - Open between the dashboard wire harness 4P connector and body ground (G502) or poor connection at G502.■

SRS DTC Troubleshooting: 68-2x

DTC 68-2x ("x" can be 0 thru 9 or A thru F):
Short in the Front Passenger's Airbag ON/OFF Switch
NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to LOCK (0), then wait for 10 seconds.
3. Turn the ignition switch to ON (II).
4. Read the DTC.

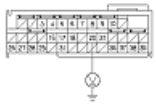
   Is DTC 68-2x indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
5. Turn the ignition switch to LOCK (0).
6. Remove the dashboard side lid, then disconnect the dashboard wire harness 4P connector from the front passenger's airbag on/off switch.
7. Turn the ignition switch to ON (II).
8. Read the DTC.

   Is DTC 68-2x indicated?
   YES - Go to Step 9 .
   NO - Faulty front passenger's airbag on/off switch or poor connection at front passenger's airbag on/off switch 4P connector and the front passenger's airbag on/off switch. Check the connection between the connector and the front passenger's airbag on/off switch. If the connection is OK, replace the front passenger's airbag on/off switch. ■
9. Turn the ignition switch to LOCK (0).
10. Disconnect the negative cable from the battery, then wait at least 3 minutes.
11. Disconnect SRS unit connector A (39P) from the SRS unit.
12. Check for continuity between the No. 4 terminals of the dashboard wire harness 4P connector and body ground.

    Is there continuity?
    YES - Short in the dashboard wire harness; replace the dashboard wire harness.■
    NO - Faulty SRS unit; replace the SRS unit. ■

SRS DTC Troubleshooting: 92-1x

DTC 92-1x (‘‘x" can be 0 thru 9 or A thru F):
Short to Power in the Passenger's Airbag Off Indicator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Troubleshoot DTC A1-1x before doing this troubleshooting procedure.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

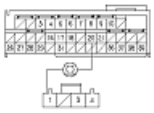
1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 92-1x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Disconnect the passenger's airbag off indicator 6P connector.
5. Turn the ignition switch to LOCK (0).
6. Disconnect the negative cable from the battery, then wait at least 3 minutes.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II).
10. Measure the voltage between the No. 20 terminal of SRS unit connector A (39P) and body ground. There should be less than 0.5 V.

    Is the voltage as specified?
    YES - Faulty SRS unit or passenger's airbag off indicator; replace the passenger's airbag off indicator. If the problem is still present, replace the SRS unit. ■
    NO - Short to power in the dashboard wire harness or the audio wire harness; replace the faulty harness.■

SRS DTC Troubleshooting: 92-2x

DTC 92-2x (‘‘x" can be 0 thru 9 or A thru F):
Open or Short to Ground in the Passenger's Airbag Off Indicator
NOTE:



- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.
- Troubleshoot DTC A1-1x before doing this troubleshooting procedure.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software and retest.

1. Clear the DTC memory.
2. Turn the ignition switch to ON (II), then wait for 10 seconds.
3. Read the DTC.

   Is DTC 92-2x indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.■
4. Disconnect the passenger's airbag off indicator 4P connector.
5. Turn the ignition switch to LOCK (0).
6. Do the battery terminal disconnection procedure.
7. Disconnect SRS unit connector A (39P) from the SRS unit.
8. Measure the resistance between the No. 20 terminal of SRS unit connector A (39P) and the No. 1 terminal of the passenger's airbag off indicator 4P connector. There should be less than 1.0 Ω.

   Is the resistance as specified?
   YES - Go to Step 9 .
   NO - Open in the dashboard wire harness; replace the dashboard wire harness.■

---

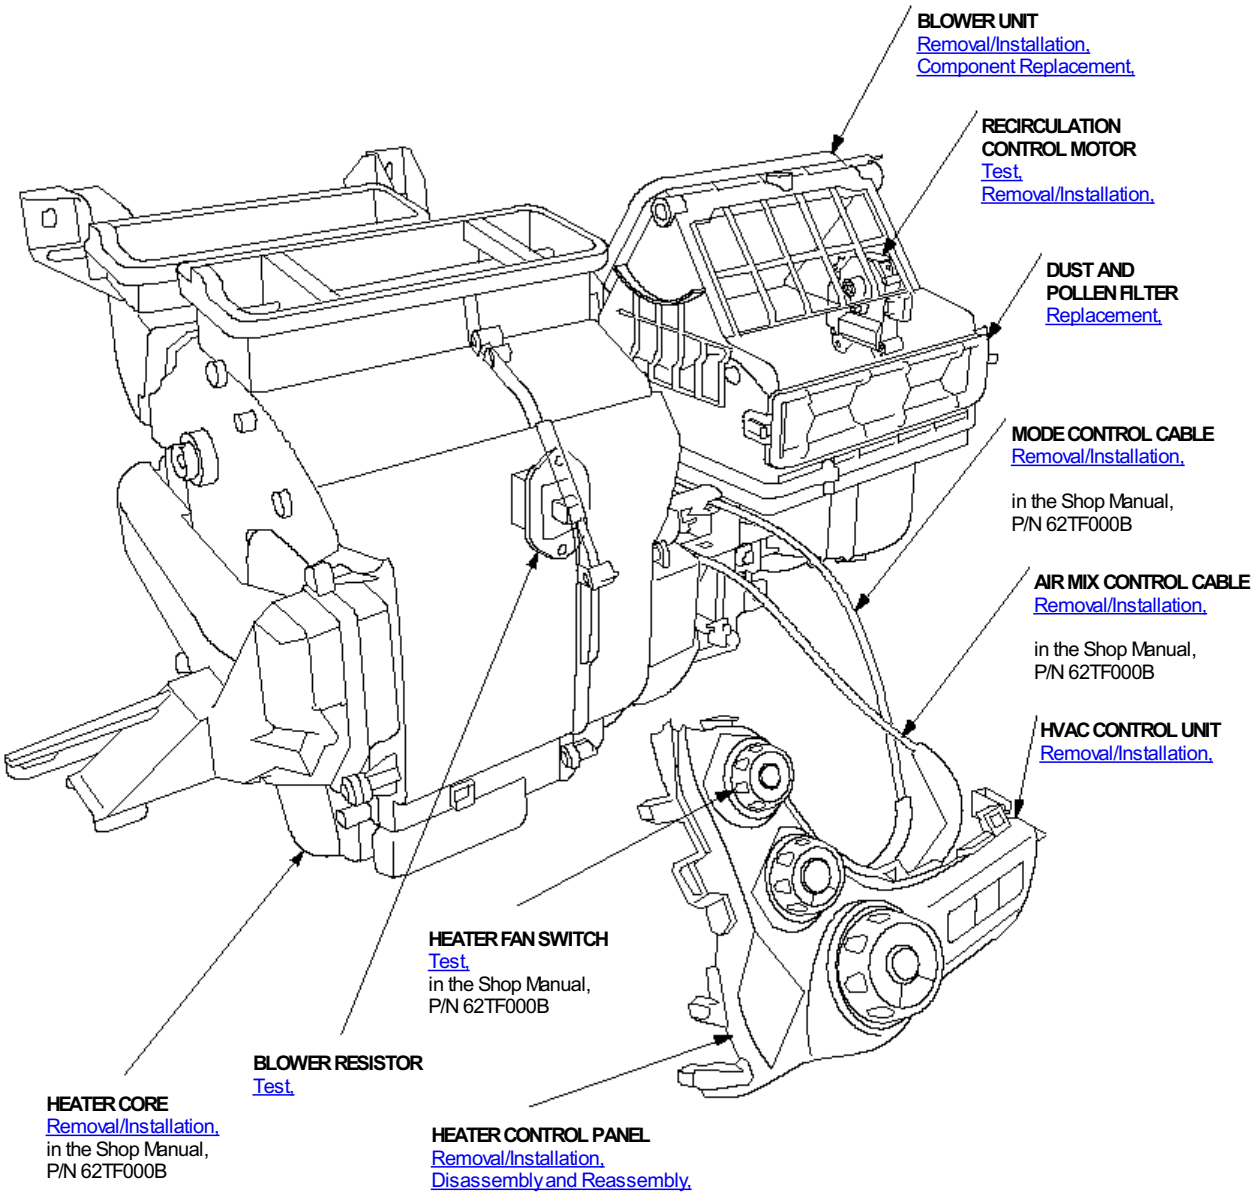
9. Measure the resistance between No. 20 terminal of SRS unit connector A (39P) and body ground. There should be more than 1 MΩ.

   Is the resistance as specified?
   YES - Faulty SRS unit or passenger's airbag off indicator; replace the passenger's airbag off indicator. If the problem is still present, replace the SRS unit. ■
   NO - Short to ground in the dashboard wire harness or the audio wire harness; replace the faulty harness.■

Heating System Description

[HVAC Control Unit Inputs and Outputs]

Heating Component Location Index

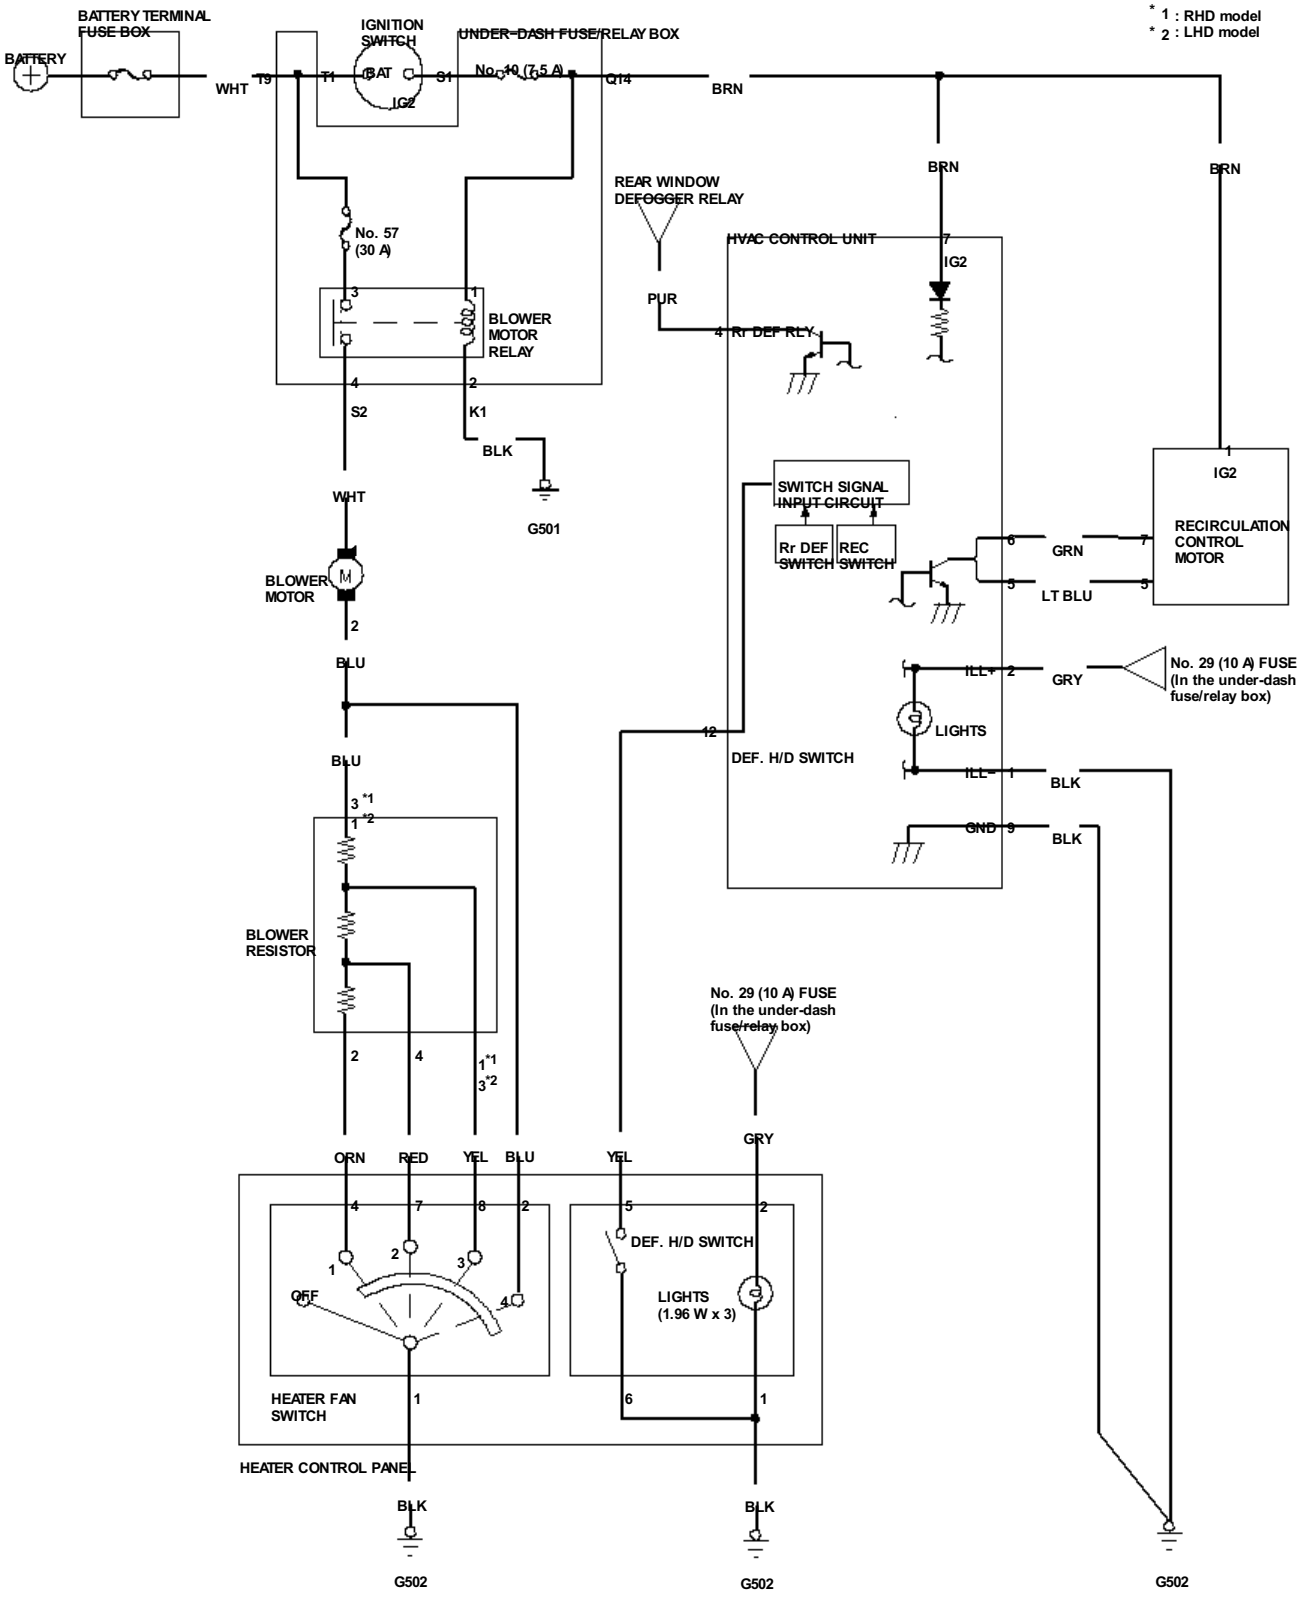


LHD model is shown, RHD model is similar.

A/C CONDENSER FAN RELAY
Test,

LHD model is shown, RHD model is similar.

Heating Circuit Diagram



Blower motor runs, but one or more speeds are inoperative

Diagnostic procedure

1. Blower motor circuit troubleshooting

Also check for

- Cleanliness and tightness of all connectors

Blower motor does not run at all

Diagnostic procedure

1. Blower motor circuit troubleshooting

Also check for

- Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box
- Poor ground at G501
- Cleanliness and tightness of all connectors

Recirculation control doors do not change between Fresh and Recirculate

Diagnostic procedure

1. Recirculation Control motor circuit troubleshooting

Also check for

- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all connectors

Heater Control do not work

Diagnostic procedure

1. HVAC control power and ground circuit troubleshooting

Also check for

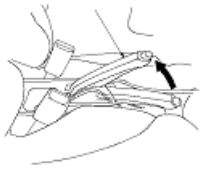
- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Poor ground at G502
- Cleanliness and tightness of all connectors

Heating Symptom Troubleshooting

Symptom	Diagnostic procedure	Also check for
Blower motor runs, but one or more speeds are inoperative	Blower motor circuit troubleshooting	Cleanliness and tightness of all connectors
Blower motor does not run at all	Blower motor circuit troubleshooting	• Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box • Poor ground at G501 • Cleanliness and tightness of all connectors
Recirculation control doors do not change between Fresh and Recirculate	Recirculation Control motor circuit troubleshooting	• Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all connectors
Heater Control do not work	HVAC control power and ground circuit troubleshooting	• Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Poor ground at G502 • Cleanliness and tightness of all connectors

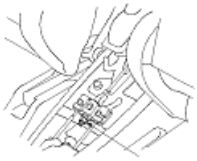
Parking Brake Inspection and Adjustment

Inspection



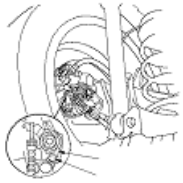
1. Pull the parking brake lever (A) with 196 N (20 kgf, 44 lbf) of force to fully apply the parking brake. The parking brake lever should be locked within the specified number of clicks.
   Lever locked clicks:
   Rear Disc Brake Model: 6 to 8
   Rear Drum Brake Model: 5 to 7
2. If the number of lever clicks is not as specified, adjust the parking brake.

Adjustment - Rear Disc Brake Type



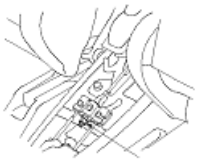
NOTE: After servicing the rear brake caliper, loosen the parking brake adjusting nut, start the engine, and press the brake pedal several times to set the self-adjusting brake before adjusting the parking brake.

1. Release the parking brake lever fully.
2. Press the brake pedal several times.
3. Remove the center console.
4. Loosen the parking brake adjusting nut (A).
5. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
6. Remove the rear wheels.



7. Make sure the lever (A) on the rear brake caliper contacts the stop pin (B).
   NOTE: When the parking brake lever does not contact the stop pin, loosen the adjusting nut in the center console until the parking brake lever contacts the stop pin, then start the engine, and press the brake pedal several times.
8. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
9. Pull the parking brake lever 1 click.
10. Tighten the parking brake adjusting nut until the parking brakes drag slightly when the rear wheels are turned.
11. Release the parking brake lever fully, and check that the parking brakes do not drag when the rear wheels are turned. Readjust if necessary.
12. Make sure the parking brake lever within the specified number of clicks (6 to 8 clicks).
13. Install the center console.

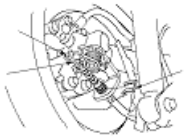
Adjustment - Rear Drum Brake Type



NOTE: After servicing the rear brake shoe, press the brake pedal several times before adjusting the parking brake.

1. Release the parking brake lever fully.
2. Press the brake pedal several times.
3. Remove the center console.
4. Loosen the parking brake adjusting nut (A).
5. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
6. Remove the rear wheels.
7. Pull the parking brake lever 1 click.
8. Tighten the parking brake adjusting nut until the parking brakes drag slightly when the rear wheels are turned.
9. Release the parking brake lever fully, and check that the parking brakes do not drag when the rear wheels are turned. Readjust if necessary.
10. Make sure the parking brake lever within the specified number of clicks (5 to 7 clicks).
11. Install the center console.

Parking Brake Cable Replacement



Exploded View

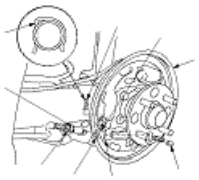
Rear Disc Brake Model

NOTE:

- The parking brake cables must not be bent or distorted. This will lead to stiff operation and premature cable failure.
- Refer to the Exploded View as needed during this procedure.

1. Release the parking brake lever fully.
2. Loosen the parking brake cable adjustment nut.
3. Remove the parking brake cable clip (A) from the brake cable (B).
4. Disconnect the parking brake cable from the lever (C).
5. Remove the parking brake cable mounting hardware, then remove the cable.
6. Install the parking brake cable in the reverse order of removal, and note these items:
   - Be careful not to bend or distort the cable.
   - Make sure the parking brake cable clip is fully seated on the cable housing.
   - Adjust the parking brake.

Rear Drum Brake Model



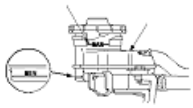
NOTE:

- The parking brake cables must not be bent or distorted. This will lead to stiff operation and premature cable failure.
- Refer to the Exploded View as needed during this procedure.

1. Release the parking brake lever fully.
2. Loosen the parking brake cable adjusting nut.
3. Remove the brake drum and shoes, and disconnect the parking brake cable (A) from the parking brake lever.
4. Remove the cable clip (B) from the cable insertion part (C) at the reverse side of the backing plate (D).
5. Pull the parking brake cable and remove it from the backing plate.
6. Install the parking brake cable in the reverse order of removal, and note these items:
   - Be careful not to bend or distort the cable.
   - Align the projection (E) of the parking cable holder with the cutout (F) at the backing plate insertion part.
   - Insert until the groove (G) in the cable holder aligns with the cutout (H) at the cable insertion part.
   - Install the cable clip by inserting the straight end (I) of the clip into the cutout at the cable insertion part and secure the parking cable holder securely.
   - Connect the parking brake cable to the brake lever, and install the brake shoes and drum.
   - Adjust the parking brake. Apply the parking brake firmly 10 times then adjust it again.

Brake System Bleeding

NOTE:



- Do not reuse the drained fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.
- The reservoir connected to the master cylinder must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each wheel location. Add fluid as required.

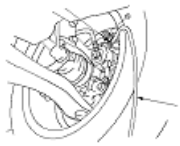
Brake System Bleeding

1. Make sure the brake fluid level in the reservoir (A) is at the MAX (upper) level line (B).
2. Have someone slowly pump the brake pedal several times, then apply steady pressure.

3. Start the bleeding at the driver's side of the front brake system.
   NOTE: Bleed the calipers or the wheel cylinders in the sequence shown.

4. Attach a length of clear drain tube (A) to the bleed screw (B), then, loosen the bleed screw to allow air to escape from the system. Then tighten the bleed screw securely.
5. Refill the master cylinder reservoir to the MAX (upper) level line.
6. Repeat the procedure for each brake circuit until there are no air bubbles are in the fluid.

Front



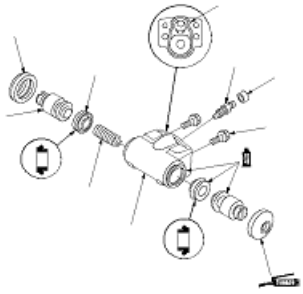
Rear - disc type

Rear - drum type

To replace all brake fluid for models with service reminder system

1. If the service reminder system required to replace the brake fluid, reset the service reminder system, and this procedure is complete. If the service reminder system did not require to replace the brake fluid, go to Step 2 and reset the brake fluid life with the HDS.
2. Connect the HDS to the DLC (A), located under the driver's side of the dashboard.
3. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting.
4. Select GAUGES in the BODY ELECTRICAL menu with the HDS.
5. Select ADJUSTMENT in the GAUGES MENU with the HDS.
6. Select EU MAINTENANCE MINDER in the ADJUSTMENT menu with the HDS.
7. Select SERVICE REMINDER in the EU MAINTENANCE MINDER menu with the HDS.
8. Select Service Reminder ITEM 7, and reset the brake fluid life with the HDS.

Rear Wheel Cylinder Disassembly/Inspection

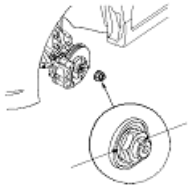


Remove, disassemble, inspect, reassemble, and install the wheel cylinder, and note these items:

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- To prevent dripping brake fluid, cover disconnected line joints with rags or shop towels.
- Clean all parts in brake fluid and air dry; blow out all passages with compressed air.
- Before reassembling, check that all parts are free of dirt and other foreign particles.
- Replace parts with new ones as specified in the illustration.
- Make sure no dirt or other foreign matter gets into the brake fluid.
- Make sure no grease or oil gets on the brake linings or the brake drum.
- Do not reuse drained brake fluid. Use only clean genuine Honda DOT 3 or DOT 4 Brake Fluid from an unopened container. Using a non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Coat the piston cup groove, and the wheel cylinder bore with clean brake fluid.
- After installing the wheel cylinder, check the brake hose and line for leaks, interference, and twisting.
- Apply Cemedine 366E sealant or equivalent between the wheel cylinder and backing plate and install the wheel cylinder.
- Use recommended greases in the wheel cylinder seal set.
- Bleed the brake system.

Driveshaft Removal

Special Tools Required

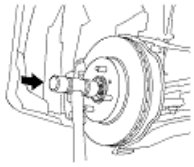


Ball joint remover, 28 mm
07MAC-SL00201

1. Raise the vehicle on a lift.
2. Remove the front wheels.
3. Pry up the locking tab (A) on the spindle nut (B), then remove the nut.
4. Drain the transmission fluid. Reinstall the drain plug using a new sealing washer:
   - Manual transmission
   - Automatic transmission
   - i-SHIFT system transmission
5. With HID lamp model: If removing the left side driveshaft, disconnect the suspension stroke sensor from the lower arm.

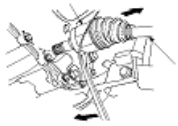
6. Remove the lock pin (A) from the lower arm ball joint, and remove the castle nut (B), then separate the ball joint from the knuckle using the ball joint remover.
   NOTE:
   - Be careful not to damage the ball joint boot when installing the remover.
   - Do not force or hammer on the lower arm, or pry could damage the ball joint.

7. Pull the knuckle outward, and separate the outboard joint from the front hub using a plastic hammer.

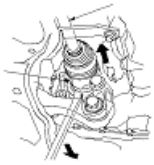


8. Left and Right driveshaft (M/T model, i-SHIFT model)/Left driveshaft (A/T model): Pry the inboard joint (A) from the differential with a prybar. Remove the driveshaft as an assembly.
   NOTE:
   - Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out to avoid damaging the oil seal.
   - Be careful not to damage the oil seal with the prybar.

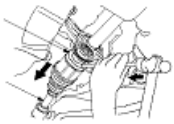
Left



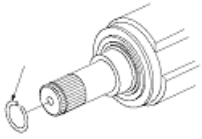
Right



9. Right driveshaft (A/T model): Drive the inboard joint (A) off of the intermediate shaft using a drift and a hammer. Remove the driveshaft as an assembly.
   NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart.



10. Remove the set ring (A) from the inboard joint (Except A/T model right driveshaft).

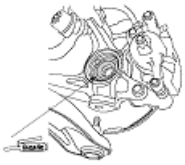


11. Remove the set ring (A) from the intermediate shaft (A/T model right driveshaft).

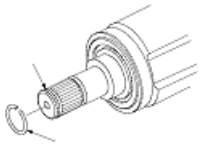
Driveshaft Installation

NOTE: Before starting installation, make sure the mating surfaces of the joint and the splined section are clean.

1. Apply about 5 g (0.18 oz) molybdenum grease to the contact area (A) of the outboard joint and the front wheel bearing.
   NOTE: The grease helps to prevent noise and vibration.

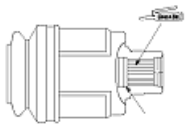


2. Install a new set ring (A) onto the set ring groove (B) of the driveshaft inboard joint (except A/T model right driveshaft).



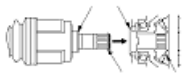
3. Install a new set ring (A) onto the set ring groove (B) of the intermediate shaft (A/T model).

4. Apply 0.5−1.0 g (0.02−0.04 oz) of molybdenum grease to the whole splined surface (A) of the right driveshaft. After applying grease, remove the grease from the splined grooves at intervals of 2−3 splines and from the set ring groove (B) so that air can bleed from the intermediate shaft.
5. Clean the areas where the driveshaft contacts the differential thoroughly with solvent or brake cleaner, and dry with compressed air.
   NOTE: Do not wash the rubber parts with solvent.

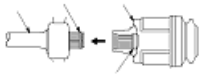


6. Insert the inboard end (A) of the driveshaft into the differential (B) or intermediate shaft (C) until the set ring (D) locks in the groove (E).
   NOTE: Insert the driveshaft horizontally to prevent damaging the oil seal.

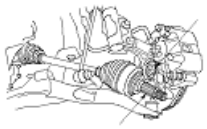
Left



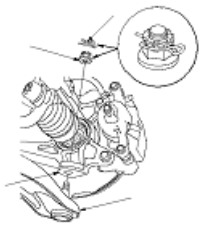
Right



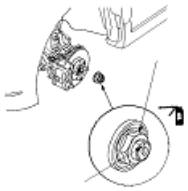
7. Install the outboard joint (A) into the front hub (B) on the knuckle.



8. Wipe off any grease contamination from the ball joint tapered section and threads, then install the knuckle (A) onto the lower arm (B). Be careful not to damage the ball joint boot. Wipe off the grease before tightening the nut at the ball joint. Torque the new castle nut (C) to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole.
   NOTE:
   - Make sure the ball joint boot is not damaged or cracked.
   - Do not align the nut by loosening it.
9. Install the lock pin (D) into the ball joint pin hole.
10. With HID lamp model: If the left side driveshaft was removed, connect the suspension stroke sensor to the lower arm.



11. Apply a small amount of engine oil to the seating surface of the new spindle nut (A).

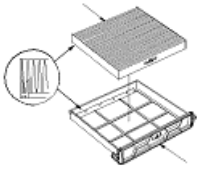


12. Install the spindle nut, then tighten it. After tightening, use a drift to stake the spindle nut shoulder (B) against the driveshaft.
13. Clean the mating surfaces of the brake disc and the wheel, then install the front wheels.
14. Turn the front wheel by hand, and make sure there is no interference between the driveshaft and surrounding parts.
15. Refill the transmission with the recommended transmission fluid:
    - Manual transmission
    - Automatic transmission
    - i-SHIFT system transmission
16. Lower the vehicle on the lift.
17. Check the wheel alignment, and adjust it if necessary.
18. With HID lamp model: If the left side driveshaft was removed, do the headlight initial position learning procedure.
19. Test-drive the vehicle.

Dust and Pollen Filter Replacement

LHD model (Except FO model)

1. Open the glove box. Remove the glove box stop on each side, then let the glove box hang down.
2. Pull out the dust and pollen filter assembly (A) from the blower unit.



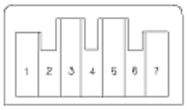
3. Remove the filter (A) from the housing (B), and replace the filter.
4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the blower unit.
5. If the service reminder system required to replace the dust and pollen filter, reset the service reminder system, this procedure is complete. If the service reminder system did not required to replace the dust and pollen filter, go to Step 6 and reset the dust and pollen filter life with the HDS.
6. Connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.
7. Turn the ignition switch to ON (II).
8. Make sure the HDS communicates with the vehicle and the climate control unit. If it doesn't, troubleshoot the DLC circuit.
9. Select BODY ELECTRICAL with the HDS.
10. Select ADJUSTMENT in GAUGE MENU with the HDS.
11. Select SERVICE REMINDER in the EU MAINTENANCE MINDER with the HDS.
12. Select SERVICE REMINDER ITEM 2 with the HDS.

RHD model and LHD (FO) model

1. Open the glove box. Remove the glove box stop on each side, then let the glove box hang down.
2. Remove the lid (A) from the blower unit.
3. Pull out the dust and pollen filter (B).
4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the blower unit.

Recirculation Control Motor Test

1. Disconnect the 7P connector from the recirculation control motor.



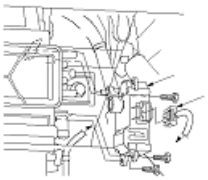
NOTICE

Incorrectly applying power and ground to the recirculation control motor will damage it. Follow the instructions carefully.

2. Connect battery power to the No. 1 terminal of the recirculation control motor, and ground the No. 5 and No. 7 terminals; the recirculation control motor should run smoothly. To avoid damaging the recirculation control motor, do not reverse power and ground. Disconnect the No. 5 or No. 7 terminals from ground; the recirculation control motor should stop at Fresh (when the No. 7 terminal is disconnected) or Recirculate (when the No. 5 terminal is disconnected). Don't cycle the recirculation control motor for a long time.

3. If the recirculation control motor did not run in Step 2 , remove it, then check the recirculation control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the recirculation control motor.
   - If the linkage or door stick or bind, repair them as needed.

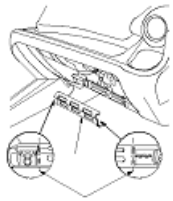
Recirculation Control Motor Replacement



1. Open the glove box. Release the glove box stop on each side, then let the glove box hang down.
2. Disconnect the 7P connector (A) from the recirculation control motor (B). Remove the self-tapping screws and the recirculation control motor from the blower unit.
3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

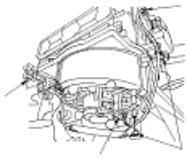
Blower Unit Removal/Installation

1. Remove the passenger's dashboard undercover and the glove box.
2. Cut the plastic cross brace (A) in the glove box opening with diagonal cutters in the area (B). Retain plastic cross brace to be reinstalled later.

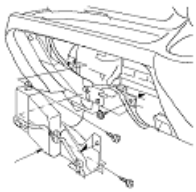


3. Remove the bolts, and the glove box frame (A).

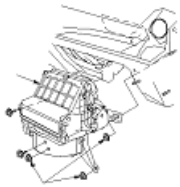
4. Disconnect the connectors (A) from the blower motor and the recirculation control motor. Remove the clips (B).



5. Remove the self-tapping screws and the passenger's heater duct (A).

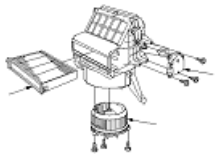


6. Remove the self-tapping screws, the mounting nuts, and the blower unit (A).
7. Install the unit in the reverse order of removal. Make sure that there is no air leakage.



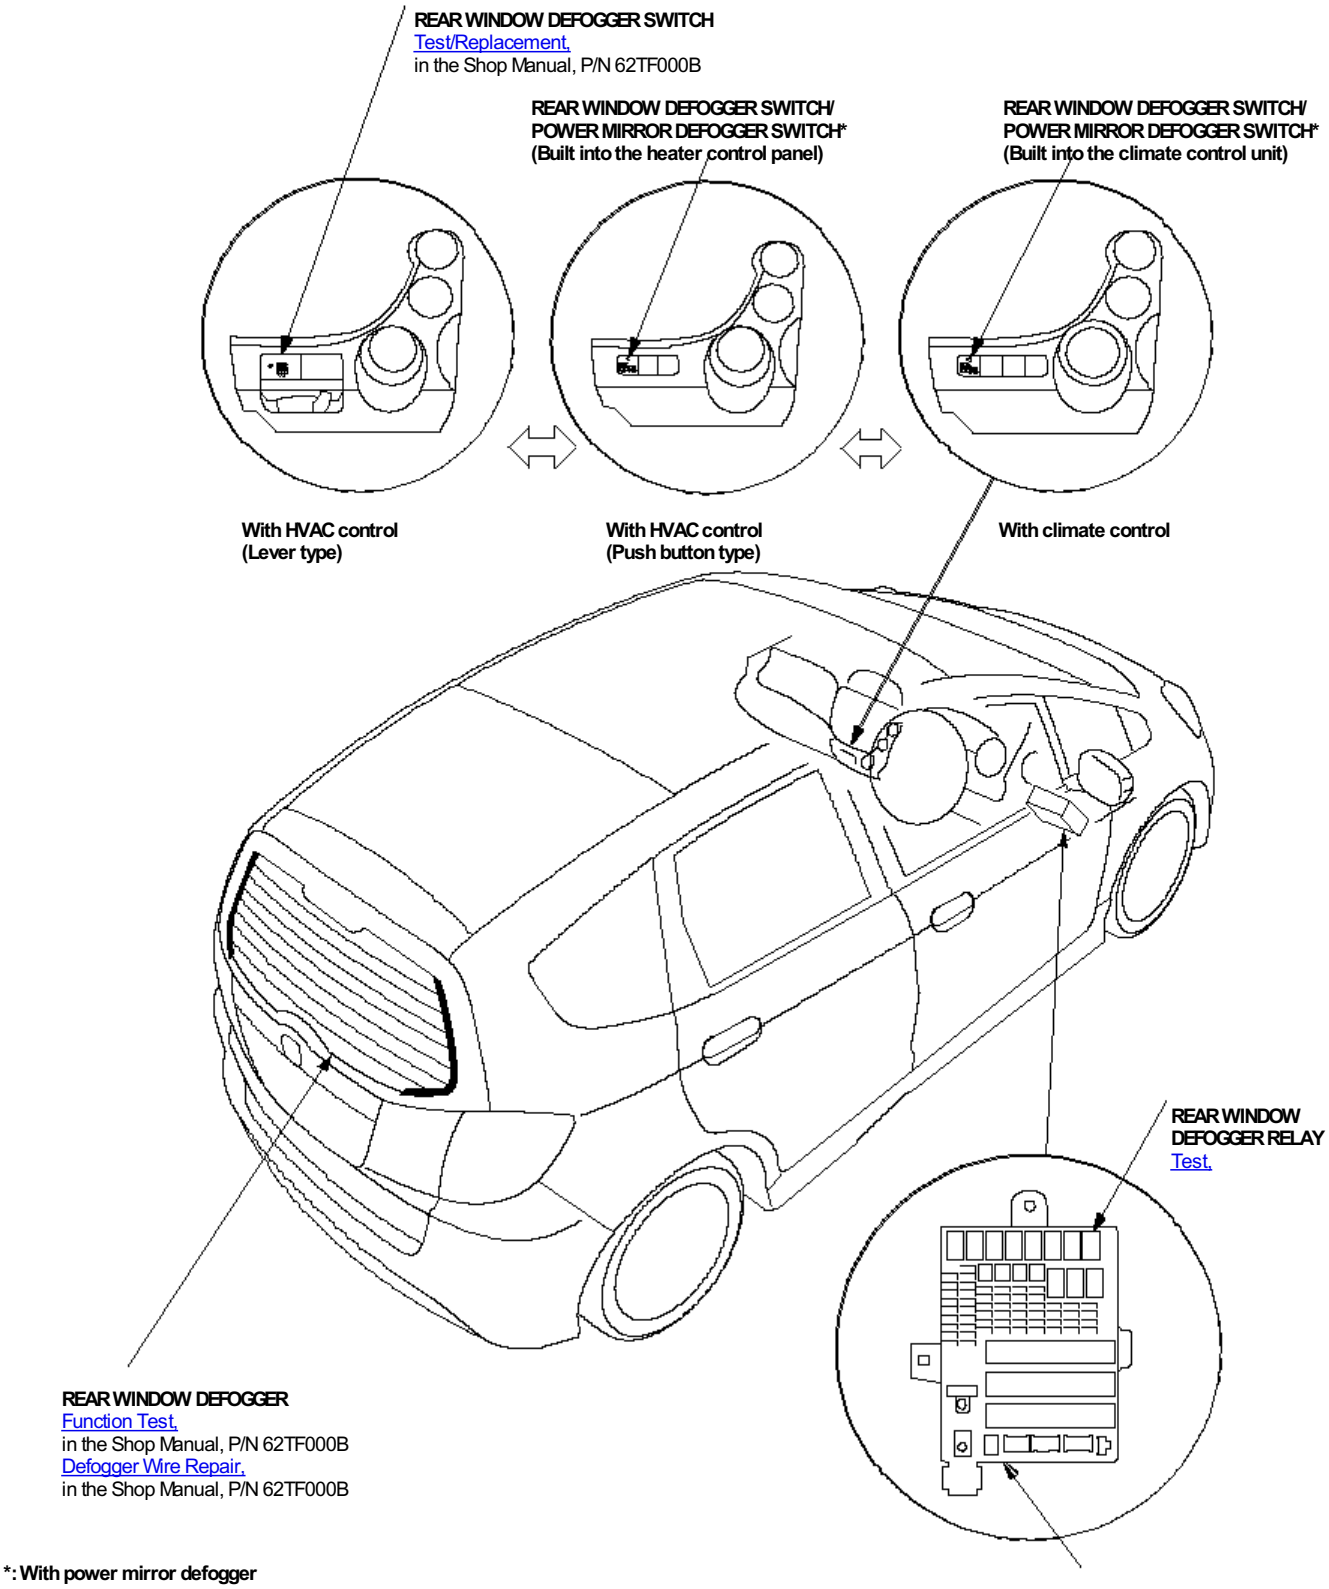
Blower Unit Component Replacement

Note these items when overhauling the blower unit:



- The recirculation control motor (A), blower motor (B), and the dust and pollen filter (C) can be replaced without removing the blower unit.
- Before reassembly, make sure that the recirculation control linkage and door move smoothly without binding.
- After reassembly, make sure the recirculation control motor runs smoothly.

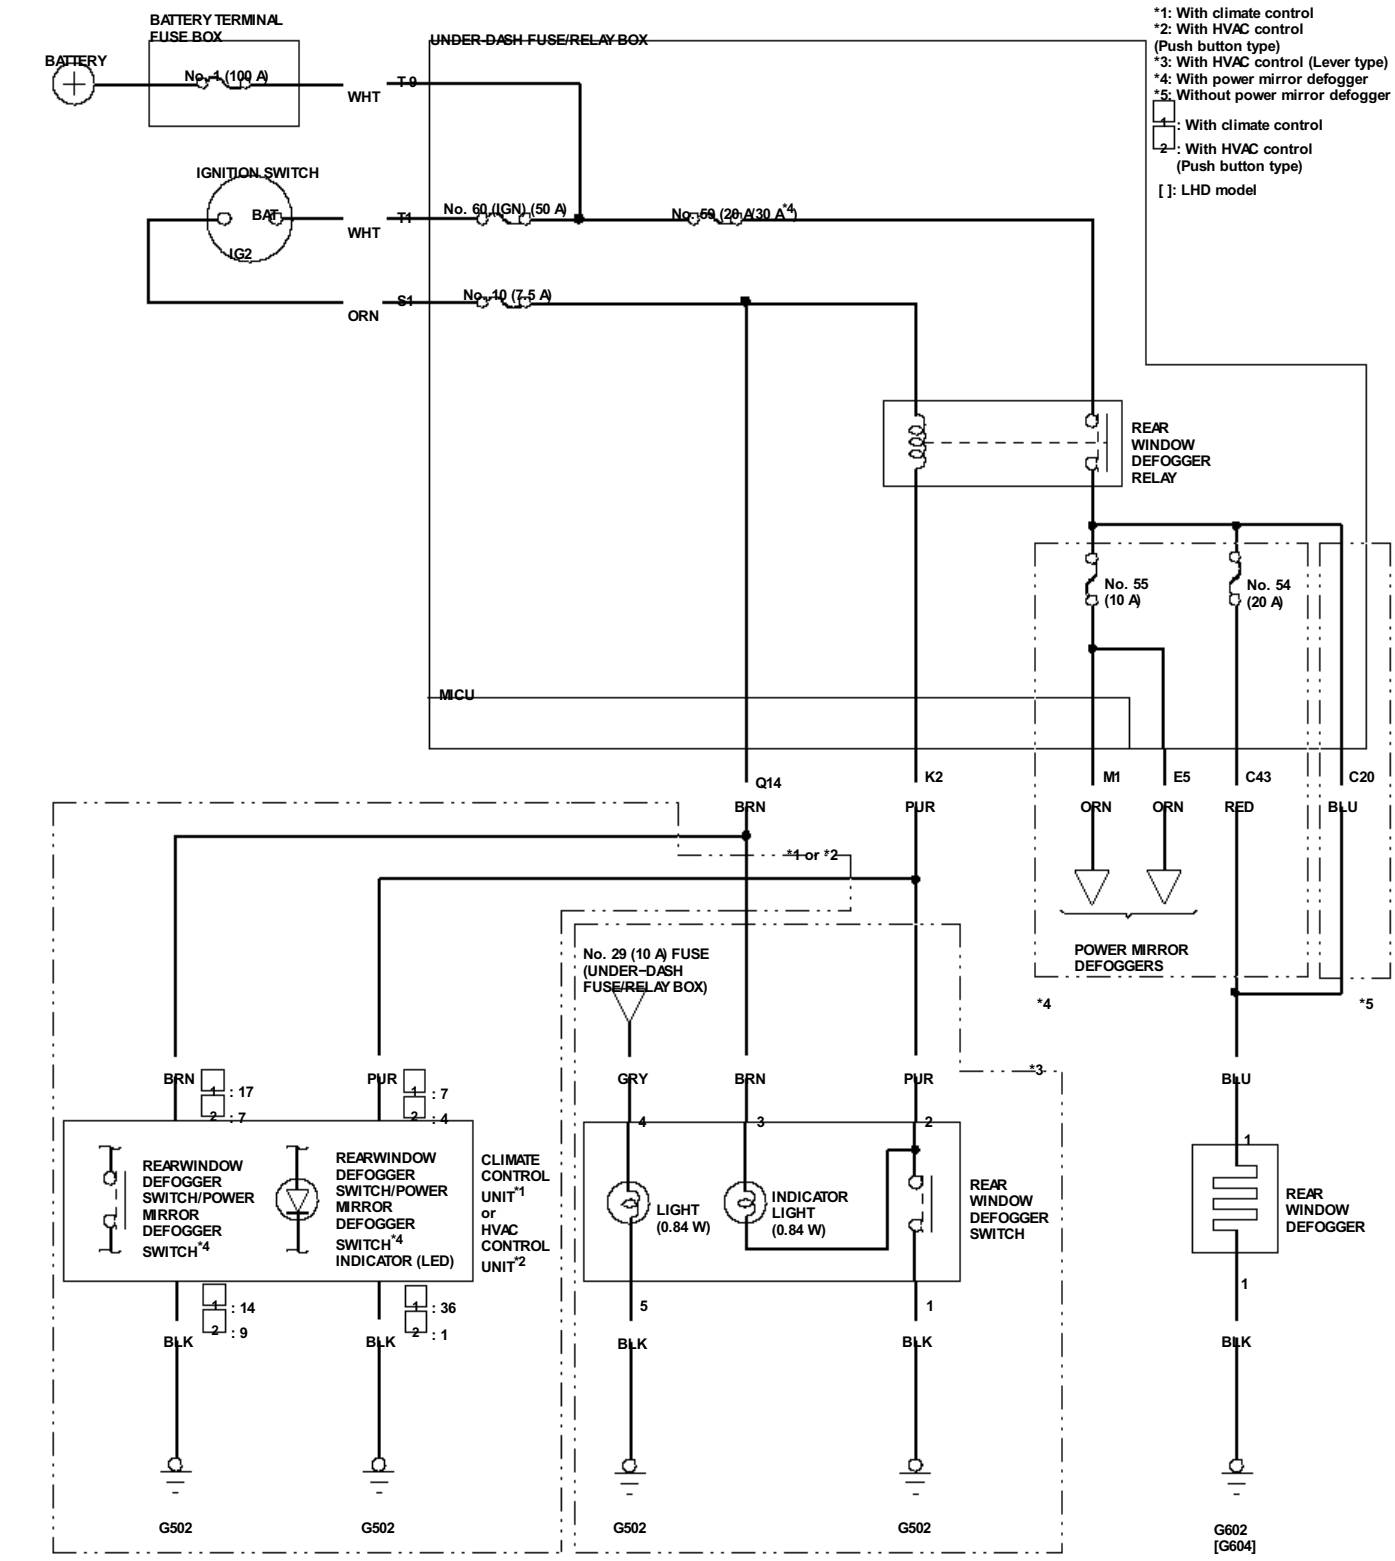
Rear Window Defogger Component Location Index



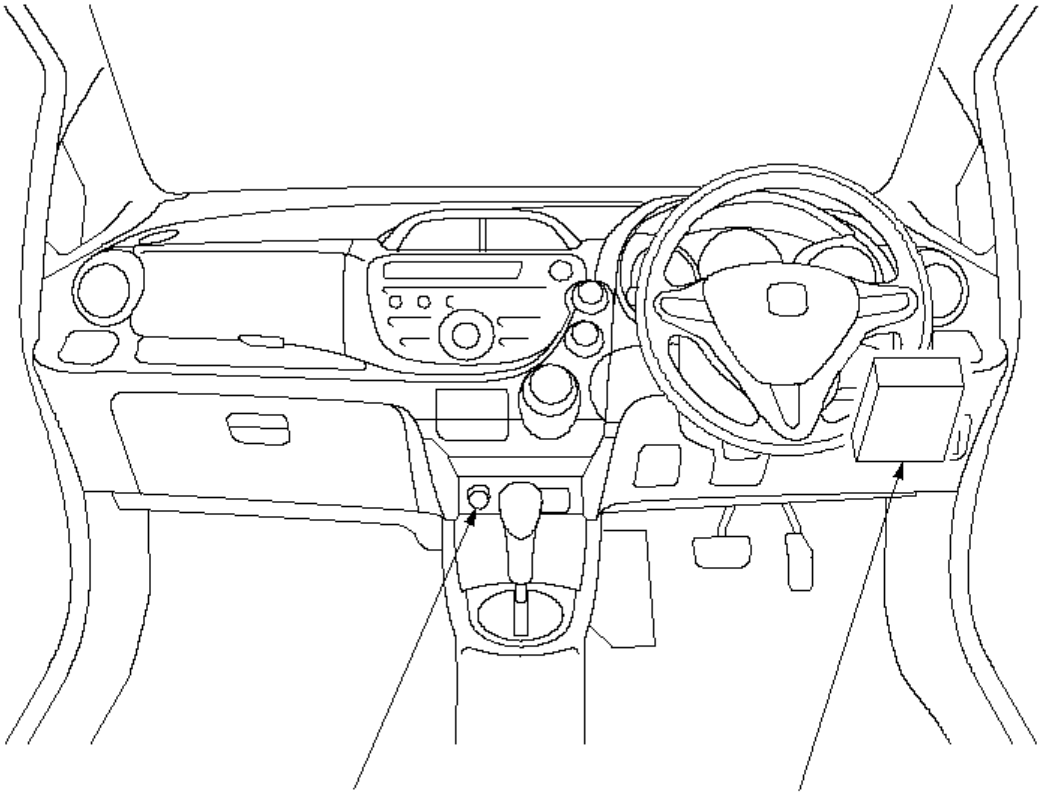
***: With power mirror defogger**

RHD model is shown, LHD model is similar.

Rear Window Defogger Circuit Diagram



Cigarette Lighter Component Location Index

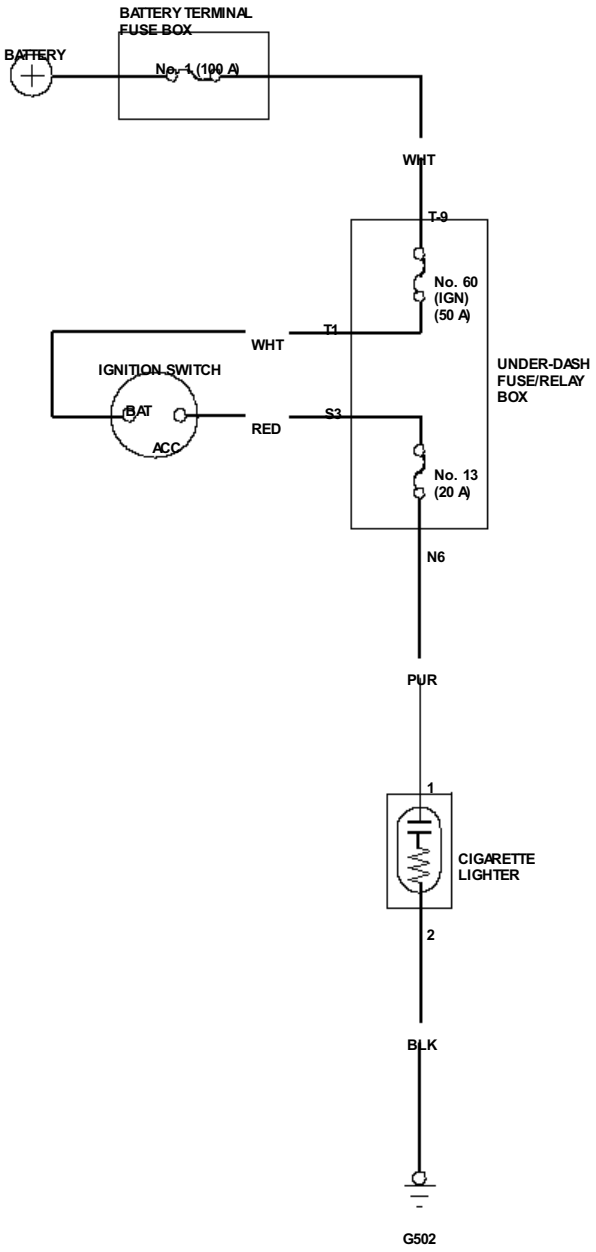


CIGARETTE LIGHTER
Test/Replacement.

UNDER-DASH FUSE/RELAY BOX

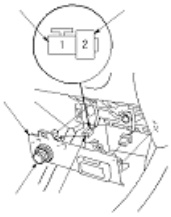
RHD type is shown, LHD type is similar.

Cigarette Lighter Circuit Diagram



Cigarette Lighter Test/Replacement

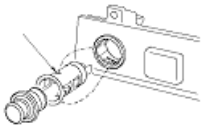
NOTE: If the cigarette lighter does not work, check the No. 13 (20 A) fuse in the under-dash fuse/relay box and ground (G502) first.



1. Remove the center lower trim (A).
2. Disconnect the 2P connector (B) from the cigarette lighter (C).
3. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. Turn the ignition switch to ACC (I).
5. Measure the voltage between the cigarette lighter socket 2P connector No. 1 terminal and body ground. There should be battery voltage.
   - If there is battery voltage, go to Step 6 .
   - If there is no battery voltage, check for an open in the wire.
6. Check for continuity between the No. 2 terminal and body ground. There should be continuity.
   - If there is continuity, go to Step 7 .
   - If there is no continuity, check for an open in the wire.

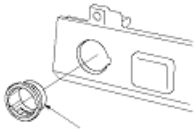
---

7. Remove the socket (A).

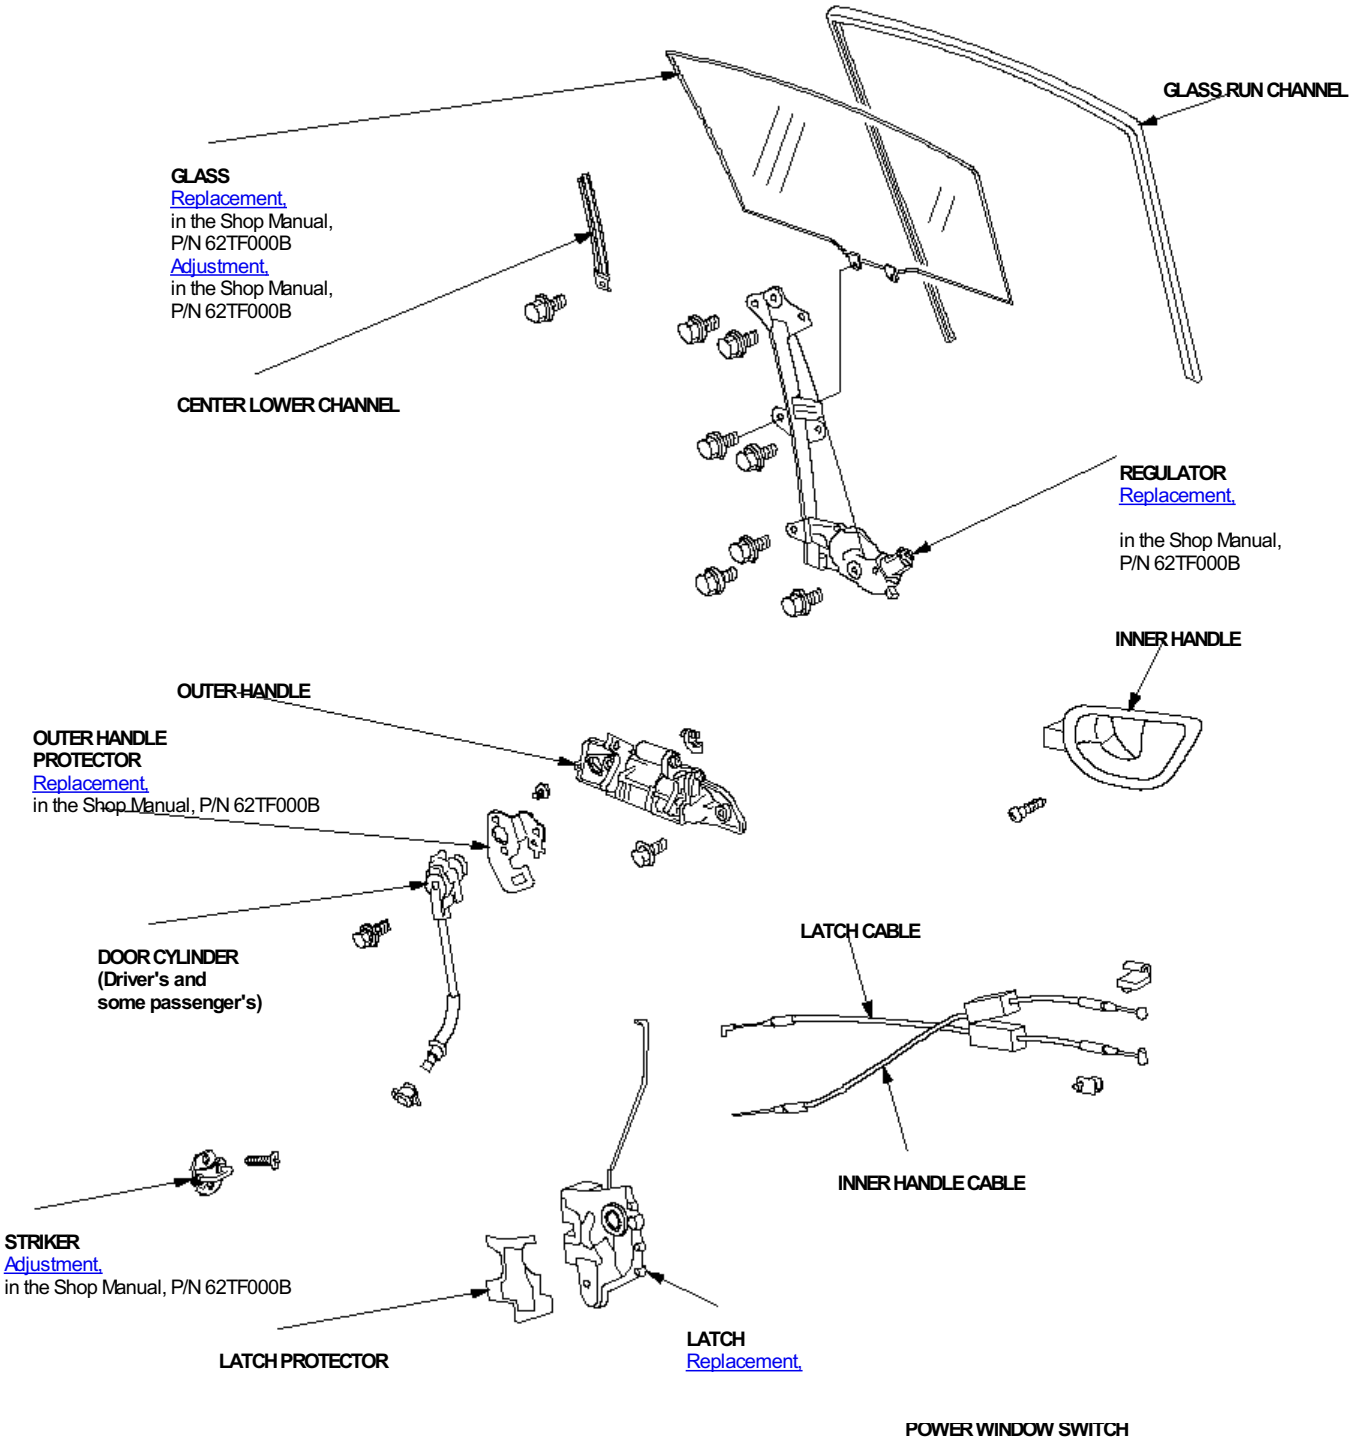


---

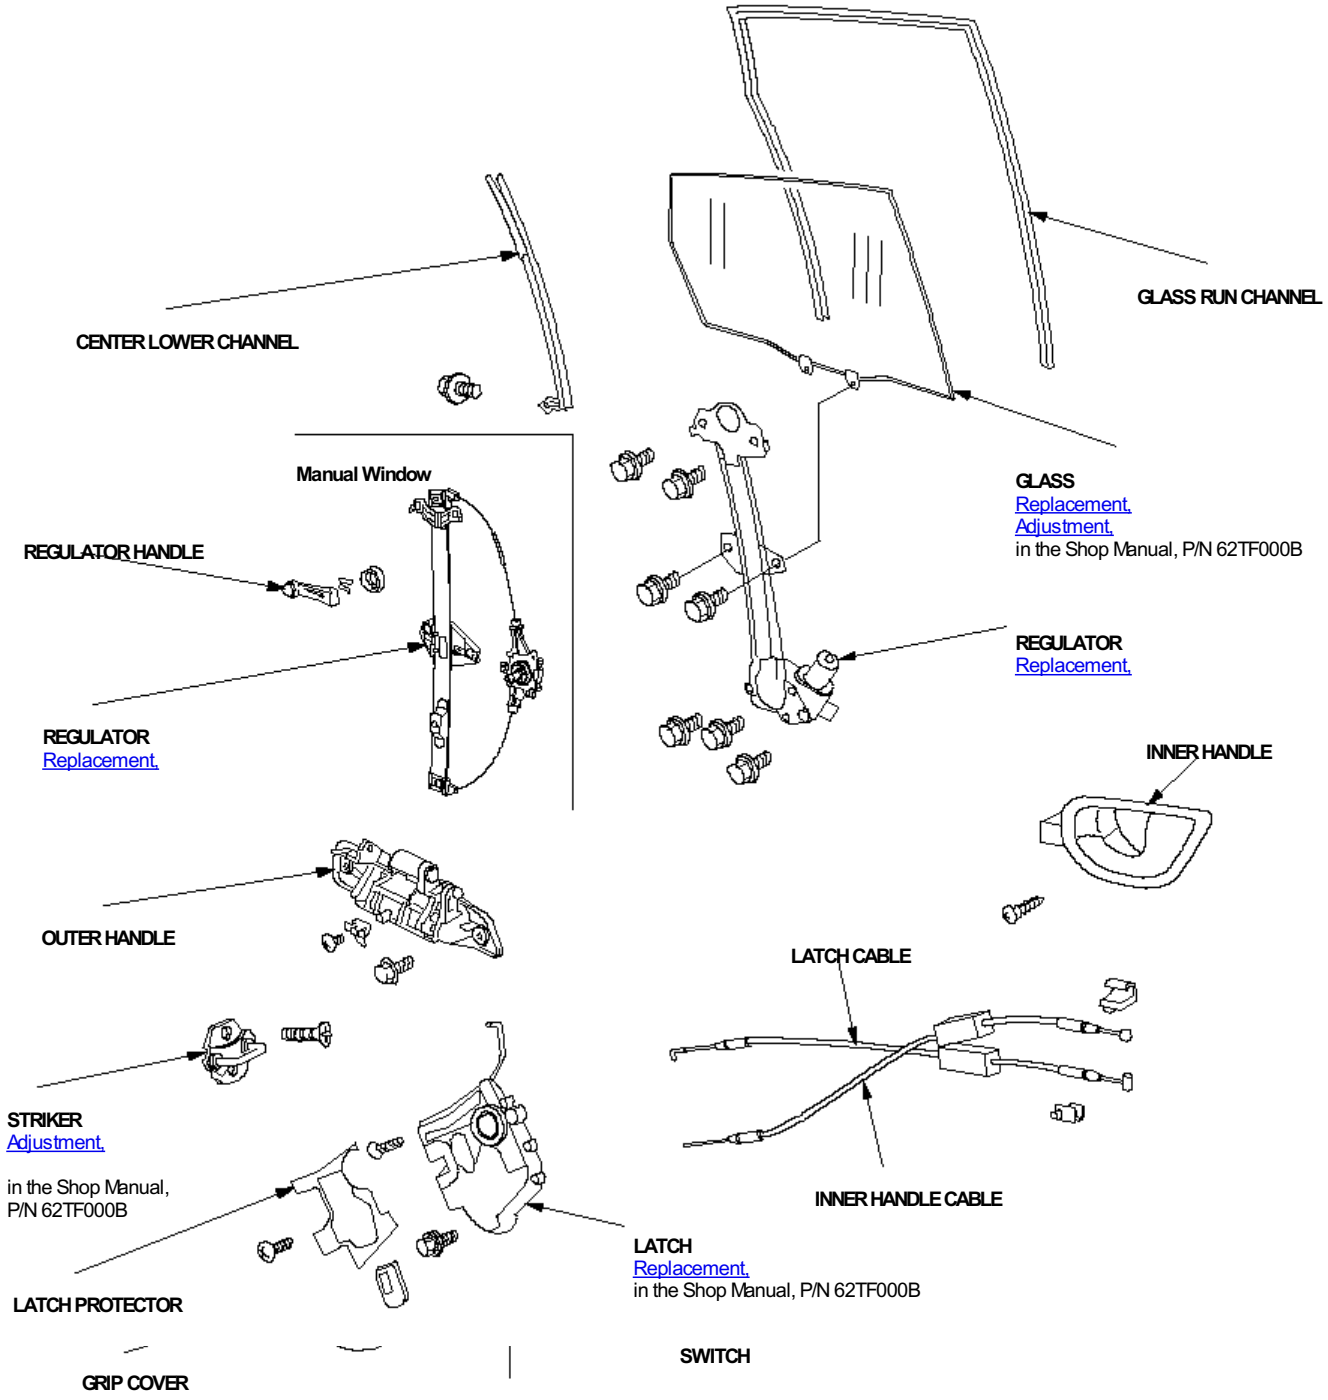
8. Remove the housing (A) from the center lower trim.
9. Install in the reverse order of removal.



Front Door Component Location Index



Rear Door Component Location Index

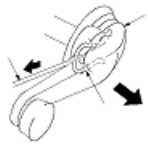


Rear Door Panel Removal/Installation

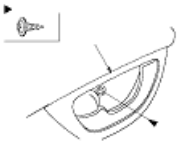
NOTE:

- LHD model is shown; RHD model is symmetrical.
- Take care not to scratch the door and related parts.
- When removing components, use the trim tools or equivalent.

1. Manual window: Remove the regulator handle (A) by pulling the clip (B) out with a wire hook (C)

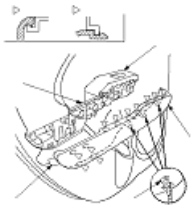


2. Remove the screw securing the inner handle (A).

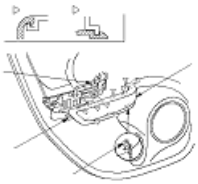


3. Remove the grip cover (A).
   -1. Using a flat-tip screwdriver wrapped with protective tape, pry out the front bottom edge of the cover while pushing up the hooks (B).
   -2. From front to rear, pry out along the edge of the cover to release the hooks (C, D) from the power window switch panel (E) and the grip base (F).
   -3. Release the rear hook (G), while pulling the cover forward.

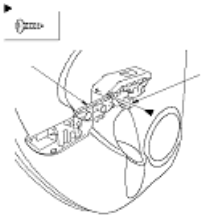
Power window



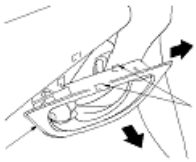
Manual window



4. Power window: Disconnect the power window switch connector (A). Remove the screw from the grip base (B).

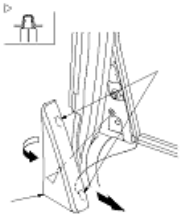


5. Pull the inner handle (A) forward and out half-way to release the hooks (B).

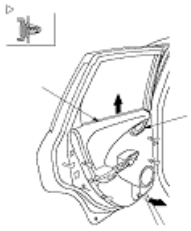


6. Apply protective tape (A) to the door panel (B) as shown.

7. Pull out the rear edge on the quarter inner trim (A) to detach the clip, then remove it by releasing the hooks (B).

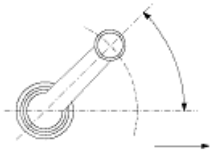


8. Remove the door panel (A) with as little bending as possible to avoid creasing or breaking it.
   -1. Start at the bottom edge of the door panel, release the clips with a commercially available trim pad remover.
   -2. Detach the upper clips.
   -3. Starting at the rear, pull the door panel upward.
   NOTE: Do not pull the door panel up too far, or the door panel will be damaged by the inner handle (B).



9. Remove the door panel (A) while pulling the inner handle (B) out through the hole in the door panel.

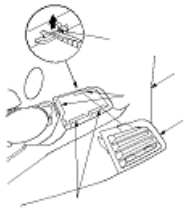
10. Install the door panel in the reverse order of removal, and note these items:
    - If the clips are damaged or stress-whitened, replace them with new ones.
    - Make sure the connector is plugged in properly.
    - If applicable, install the regulator handle so it points forward and up at a 45 ° angle with the glass fully closed.



Front Bumper Fog Cover Replacement

For Some Models

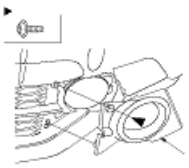
NOTE: Take care not to scratch the front bumper.



1. Remove the front fog light trim.
2. Remove the hooks (A) by using flat-tip screwdriver wrapped with the protective tape, then remove the front bumper fog cover (B) from the front bumper (C).
3. Install the front bumper fog cover by pushing on the hook portions until the hooks snap into place.

Front Fog Light Trim Replacement

Without Front Air Spoiler

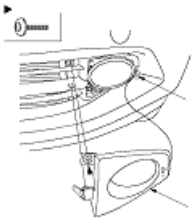


NOTE:

- Take care not to scratch the front bumper.
- Put on gloves to protect your hands.

1. Remove the screw, then remove the front fog light trim (A).
2. Install the front fog light trim in the reverse order of removal.

With Front Air Spoiler



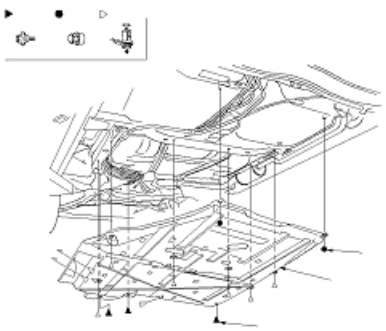
NOTE:

- Take care not to scratch the front bumper.
- Put on gloves to protect your hands.

1. Remove the screw and release the hook (A), then remove the front fog light trim (B).
2. Install the front fog light trim in the reverse order of removal.

Floor Undercover Replacement

For Some Models



NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.

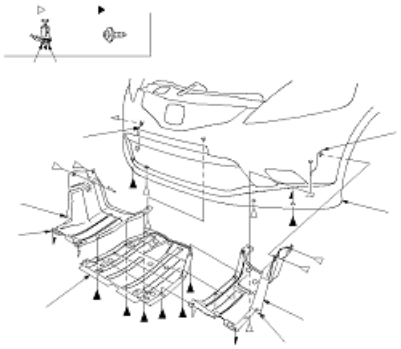
1. Remove the floor undercover (A).
   -1. Remove the nuts and the clips and the bolts, then remove the floor undercover.

2. Install the floor undercover in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.

Splash Shield Replacement

NOTE:

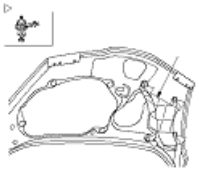
- Put on gloves to protect your hands.
- Take care not to scratch the body.



1. Remove the splash shield (A).
   -1. From the wheel arch on both sides, remove the clips (B) securing the front splash shield and the front inner fender (C) to the body, and remove the clips (D) securing the front splash shield to the body.
   -2. From under the front bumper (E), remove the clips (F) and the screws (G).
   -3. From under the body, remove the clips (H).
   -4. Release the hooks (I) of the front splash shield from the front inner fender, then pull the splash shield out.
   -5. If necessary remove the screw (J), then remove the engine under cover (K) (for some models).
   NOTE: To remove the clips, pry the inner pin up at the edge near the line (L) on its head.
2. Install the splash shield in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips and the hooks into place securely.

Hood Cooling Duct Replacement

NOTE: Take care not to scratch the hood and hood insulator.



1. Remove the cilps, then remove the cooling duct (A).
2. Install the cooling duct in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips into place securely.

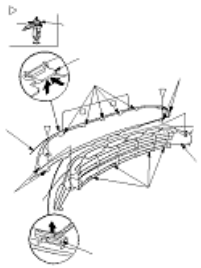
Lower Front Grille Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the front bumper.

1. Remove the front bumper.
2. Remove the front fog light.
3. Detach the clips and the hooks (A) by using a flat-tip screwdriver wrapped with the protective tape, then remove the front bumper lower grille (B) from the front bumper (C).
   NOTE: To remove the clips, pry the inner clip up at the edge near the line (D) on its head.
4. Install the grille in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Push the clips and the hooks into place securely.

With front air spoiler



Without front air spoiler

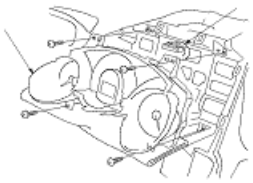
Data to a New Gauge Control Module, Replacement,

Gauge Control Module Replacement

NOTE: Before replacing the gauge control module, retrieve the ODO value and the service reminder system information from the gauge control module with the HDS.



1. Remove the instrument panel.
2. Remove the four screws from the gauge control module (A).
3. Disconnect the 32P connector (B) from the gauge control module.
4. Install the gauge control module in the reverse order of removal.
5. Write the ODO value and service reminder system information to the new gauge control module.

Rewriting the ODO Data and Transferring the Service Reminder System Data to a New Gauge Control Module

NOTE:

- Obtain a new gauge control module before starting the rewriting process.
- Rewriting is not possible on a gauge control module that will not communicate with the HDS.
- Make sure that the HDS shows the correct VIN for the vehicle you are working on.
- Once you have started this procedure, you must complete it before removing the HDS from the DLC.
- Connect a battery jumper box (not a battery charger) to insure that correct battery voltage will be maintained.

Rewriting and Transferring

1. Before replacing the gauge control module, connect the HDS.
2. Select GAUGES from the BODY ELECTRICAL system select menu with the HDS.
3. Select Gauge Control Module Replacement (ODO Rewrite) from the ADJUSTMENT menu, and follow the instructions on the display to retrieve the ODO value and the Service Reminder System Information.
4. Replace the gauge control module.
5. Follow the instructions on the display to write the new ODO value and Service Reminder System Data to the new gauge control module. If the data transfer fails, refer to the instructions below to release the locked ODO value.

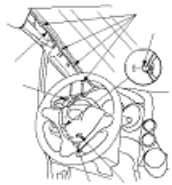
Release Locked odometer mileage to the original gauge control module.

If, after you attempt to transfer mileage, the odometer display has dashes (---), is garbled, or shows an incorrect value, the original gauge control module needs to be unlocked and restored to its original state:

1. Confirm that you have the latest HDS version of software.
2. Make sure that the HDS shows the correct VIN for the vehicle you are working on.
3. With the ignition switch in LOCK (0), reconnect the original gauge control module.
4. Completely re-boot the HDS.
5. Clear any stored DTCs.
6. Navigate to Body Electric/Gauges/Adjustment/Instrument Panel Replacement.
7. Select 3. Releasing Locked ODO Value.
8. Follow the prompts and the odometer mileage will be restored.
9. Start over and make sure the screen prompts are followed.

Headliner Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:



- Put on gloves to protect your hands.
- When removing components, use the trim tools or equivalent.
- Take care not to bend or scratch the trim and panels.
- LHD model is shown; RHD model is symmetrical.

1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Remove these items:
   - Driver's dashboard undercover
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Center pillar upper/lower trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Quarter pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Individual map light
   - Ceiling light
   - Sunvisors, both sides
   - Grab handles, four places
   - Ultrasonic sensor (for some models)
   - Automatic lighting/rain sensor (for some models)
3. Remove the roof wire harness (A) by detaching the harness clips (B, C, D) and disconnect the roof wire harness connector (E), (F) (with HFT unit) from the driver's side front pillar.

---

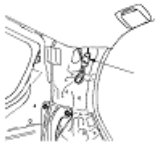
4. Remove the antenna lead (A) by detaching the harness clips (B) and disconnect the antenna lead connector (C) from the passenger's side front pillar.

---

5. Disconnect the roof harness connector (A).

---

6. Disconnect the antenna lead connector (A).

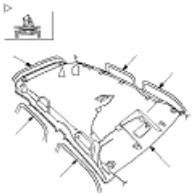


---

7. Lower the headliner (A).
   -1. Remove the front door inner seals (B), rear door inner seals (C), and tailgate weatherstrip (D) from each roof portion.
   -2. Detach the clips from the body.
   -3. With glass roof: Remove the roof trim (E) from the headliner.
   -4. Lower the headliner.

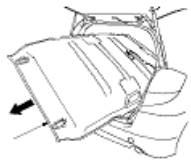
With glass roof model

Without glass roof model

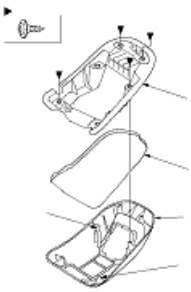


---

8. With the help of an assistant, pull the headliner (A) out through the tailgate opening. Do not bend the headliner. Bending the headliner will crease and damage it.

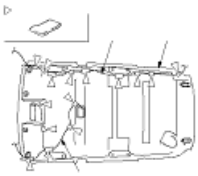


9. For some models: Remove the screws, and release the hooks (A), then remove the retractor cover bracket (B) and retractor cover (C) from the headliner (D).

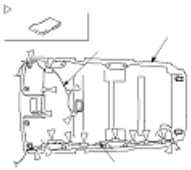


10. Remove the cushion tapes, then remove the roof wire harness (A) and antenna lead (B) from the headliner (C).

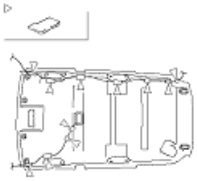
Without glass roof - LHD model



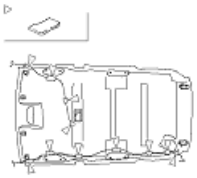
Without glass roof - RHD model



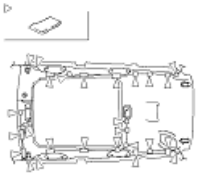
Without glass roof and map light - LHD model



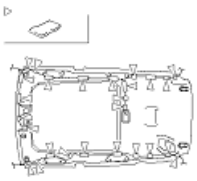
Without glass roof and map light - RHD model



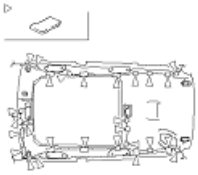
With glass roof - LHD model



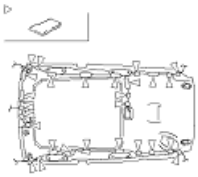
With glass roof - RHD model



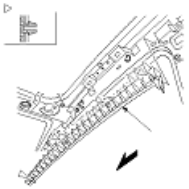
With glass roof and automatic lighting/rain sensor - LHD model



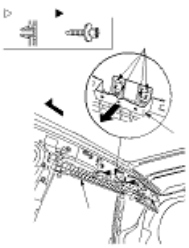
With glass roof and automatic lighting/rain sensor - RHD model



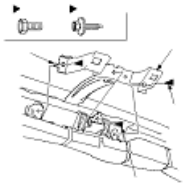
11. Without side curtain airbags: If necessary, detach the hooks, then remove the front roof side pad (A).



12. Without side curtain airbags: If necessary, remove the hooks and screws, and remove the center roof side pad (A) with a glove rail bracket (B), then release the hooks (C) and remove the bracket from the pad.

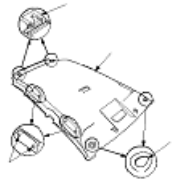


13. With side curtain airbags: If necessary, remove the grab handle bracket mounting bolts (A) and the side curtain airbag mounting screw (B), then remove the grab handle bracket (C) from each side by releasing the hooks (D).

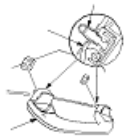


14. Install the headliner in the reverse order of removal, and note these items:
    - If the side curtain airbag has deployed, replace the headliner and removed trim pieces with new ones.
    - To prevent the side curtain airbags from deploying improperly and possibly causing injury, inspect removed pieces and replace them if they have any of these types of damage:
        - Any crease or tears in the headliner (A)
        - Any cracks or breakages in the grab handle (B)
        - Any damages around the grab handle holes (C) or sunvisor holes in the headliner
        - Any cracks in the sunvisor stay base (D)
        - Any bends or cracks in the sunvisor stay shaft (E)
        - Any cracks in the sunvisor base (F)
        - Any cracks or breakages in the vanity mirror base (G)
        - Any clip bases (H) which have come off the headliner
    - When installing the grab handle, push on the handle against the bracket (I) until the clips (J) snap into place securely.
    - If the clips are damaged or stress-whitened, replace them with new ones.
    - Replace the removed cushion tape with new ones.
    - Check that both sides of the headliner are securely attached to the trim.
    - Make sure the headliner overlaps the trim pieces correctly.
    - When reinstalling the headliner through the tailgate opening, be careful not to fold or bend it. Also, be careful not to scratch the body.

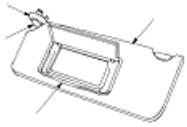
Headliner



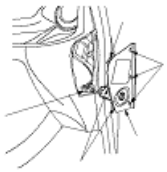
Grab handle



Sunvisor



Dashboard Side Lid Removal/Installation



SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Take care not to scratch the dashboard and its related parts.
- When removing components, use the trim tools or equivalent.
- LHD model is shown; RHD model is symmetrical.

1. Lower the glove box.
2. Remove the Passenger's dashboard side lid (A).
   -1. Insert a hand through the opening of the glove box and push the back side of the lid, and release the hooks (B).
   -2. Release the hooks (C) from the dashboard and disconnect the front passenger's airbag ON/OFF switch connector (for some models) (D), then remove the lid.
3. Install the lid in the reverse order of removal, and push the hooks into place securely.

Dashboard/Steering Hanger Beam Removal/Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Put on gloves to protect your hands.
- Have an assistant help you when removing and installing the dashboard/steering hanger beam.
- Take care not to scratch the dashboard, body and other related parts.
- LHD model is shown; RHD model is symmetrical.

1. Do the battery terminal disconnection procedure, then wait at least 3 minutes before beginning work.
2. Remove these items:
   - Front seats, both sides
   - Driver's dashboard undercover
   - Kick panels, both sides
   - Center console
   - Glove box
   - Fuse lid panel:
     - RHD model
     - LHD model
   - Passenger's dashboard undercover
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Steering column
   - AC control cables

Driver's side

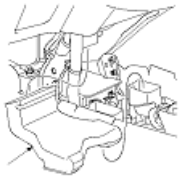
3. From under the dash, disconnect the right engine compartment wire harness connector (A), the left engine compartment wire harness connector (B), the floor wire harness connectors (C), the driver's door wire harness connectors (D), roof wire harness connector (E), and remove the bolt (F), then release the left engine compartment wire harness (G) from the driver's under-dash fuse/relay box (H).

Center

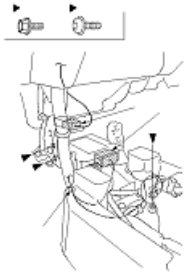
4. From under the dash, disconnect the air hose (A), then remove it.

5. Disconnect the blower resister sub harness connectors (A).

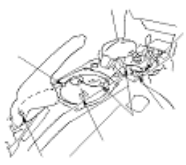
6. Remove the heater joint duct (A).



7. From under dash, disconnect SRS control unit connector A and yaw rate-lateral/longitudinal sensor B and remove the bolts (C). Remove the ground bolt (D) using a TORX T30 bit and harness clip (E).

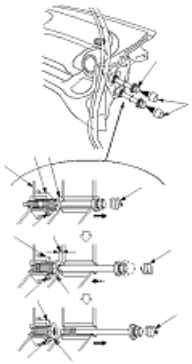


8. Detach the wire harness clips (A), then disconnect the parking brake switch connector (B), fuel pump connector (C), and A/T position switch connector (D) (A/T model).

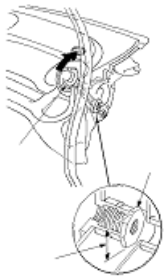


Passenger's side

9. From under the dash, disconnect the passenger's door wire harness connector (A), the left engine compartment wire harness connectors (RHD model)/the right engine compartment wire harness connectors (LHD model) (B), dashboard wire harness connector (with front passenger's airbag ON/OFF switch) (C) and SRS sensor sub harness connector (D).
10. Detach all of the harness and the connector clips.



11. Remove the special bolts (A, B) from outside the passenger's door. LHD model is shown; RHD model is symmetrical.
    -1. Remove the caps (C).
    -2. Loosen the special bolts until its threads have come off the side bracket (D) of the steering hanger beam. The bolt will be screwed into the inside threads of the collar bolt (E) by loosening the bolt. Because of the thread lock on the threads of the bolt, the bolt and the collar bolt will be fixed.
    -3. Loosen the bolt again to screw the collar bolt into the fixed space adjuster (F) until it is stopped by the stopper (G). This will provide a gap (H) between the collar bolt and the body.
    -4. Remove the bolts.

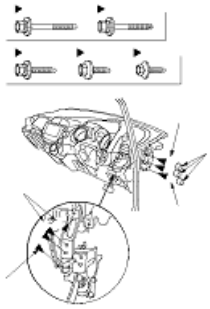


12. If the collar bolts (A) are not screwed fully into the fixed space adjuster when removing the special bolts, slightly screw the collar bolt into the space adjuster with a 21 mm open-end wrench (B). In this case, the special bolt should be replaced with a new one because its thread locks were worn out.

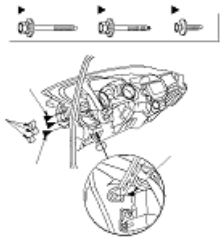
---

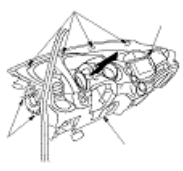
13. From outside the driver's door, remove the caps (A), then remove the bolts (B, C, D, E, F).

RHD model



LHD model





14. Lift up on the dashboard (A) to release it from the guide pins (B, C). Carefully remove the dashboard through the front door opening. Take care not to scratch the body with the collar nuts on the passenger's side.
    NOTE: Do not rest the dashboard on its lower center cover opening, or it may be damaged. Lay it on its front or back.

---

15. Install the dashboard in the reverse order of removal, and note these items:
    - Make sure the dashboard fits onto the guide pins correctly.
    - Before tightening the bolts, make sure the wire harnesses are not pinched.
    - Make sure the connectors are plugged in properly.
    - Before reinstalling the dashboard, be sure the collar bolt (A) on passenger's side can be screwed/unscrewed lightly by hand, and then screw all of them into the fixed space adjuster (B) until they contact the stoppers (C) by hand. Do not tighten them fully with any tools.
    - Before reinstalling the dashboard, try to screw the special bolt (D) into the loosened collar bolt. If the collar bolt is not unscrewed by screwing the special bolt, replace this special bolt with a new one.
    - After setting the dashboard on the body, reinstall all of the mounting bolts to the dashboard, tighten the driver's side bracket to the specified torque, then torque the special bolt D on the passenger's side. First screw the special bolt into the collar bolt A, they will be fixed because of the thread lock on the bolt. Continue tightening the bolt with the collar bolt, they are loosened from the fixed space adjuster B until the collar bolt contacts the inside face of the body. Then tighten the bolts again to the specified torque.
    - Apply medium strength type liquid thread lock to the bolts securing the center joint bracket and the dashboard before reinstallation.
    - After tightening the dashboard mounting bolts, tighten the center joint bracket mounting bolts, and then tighten the center frame mounting bolts.
    - Do the battery terminal reconnection procedure.
    - Check for any DTCs that may have been set during repairs, and clear them.

Outside Air Temperature Indicator Calibration

NOTE: To test the outside air temperature sensor, refer to the outside air temperature sensor test procedure.

Description

The outside temperature sensor is located behind the center of the front bumper. The gauge control module uses measurements from this sensor to display the outside air temperature.
Because of the location of the sensor, it may be affected by heat reflection from the road, engine and radiator heat or hot exhaust from surrounding traffic.
These conditions can soak the outside air temperature sensor in heat and cause inaccurate readings. Logic has been written into the gauge control module to help prevent abnormal or fluctuating outside air temperature indicator readings.

Outside Air Temperature Indicator Logic

Initial outside air temperature is indicated after the ignition switch is turned ON (II).

- If the engine coolant temperature is 60 °C (140 °F) or higher when the ignition switch is turned ON (II), the outside air temperature indicated the last time the key was turned off will be displayed regardless of the current temperature measured by the outside air temperature sensor.
- If the engine coolant temperature is 59 °C (139 °F) or lower when the ignition switch is turned ON (II), the current temperature measured by the outside air temperature sensor will be indicated.

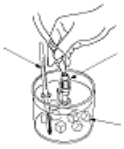
Troubleshooting

If the indicator displays — — — °C (or — — — °F) for more than 2 seconds after selecting the outside air temperature display mode, check the outside air temperature sensor, or gauge control module self-diagnostic function.

Calibration

The outside air temperature indicator's displayed temperature can be recalibrated ±3 °C (or ±5 °F) to meet the customer's expectations.

1. Turn the ignition switch ON (II).
2. Push and hold the INFO switch for more than 3 seconds to enter the customizing mode.
3. While in the customizing mode, select and enter the “CHG SETTING". Then select and enter the “ADJUST OUTSIDE TEMP. DISPLAY", and calibrate the value with the SEL/RESET switch and the INFO switch.



4. When the desired correction value appears on the display, release the button, and the recalibrated outside air temperature will be displayed.

Example:

Incorrect value	**=**	**20 °C (68 °F)**
Desired correction value	**=**	**+1 °C (+2 °F)**
Correct value	**=**	**21 °C (70 °F)**
Desired correction value	**=**	**−1 °C (−2 °F)**
Correct value	**=**	**19 °C (66 °F)**

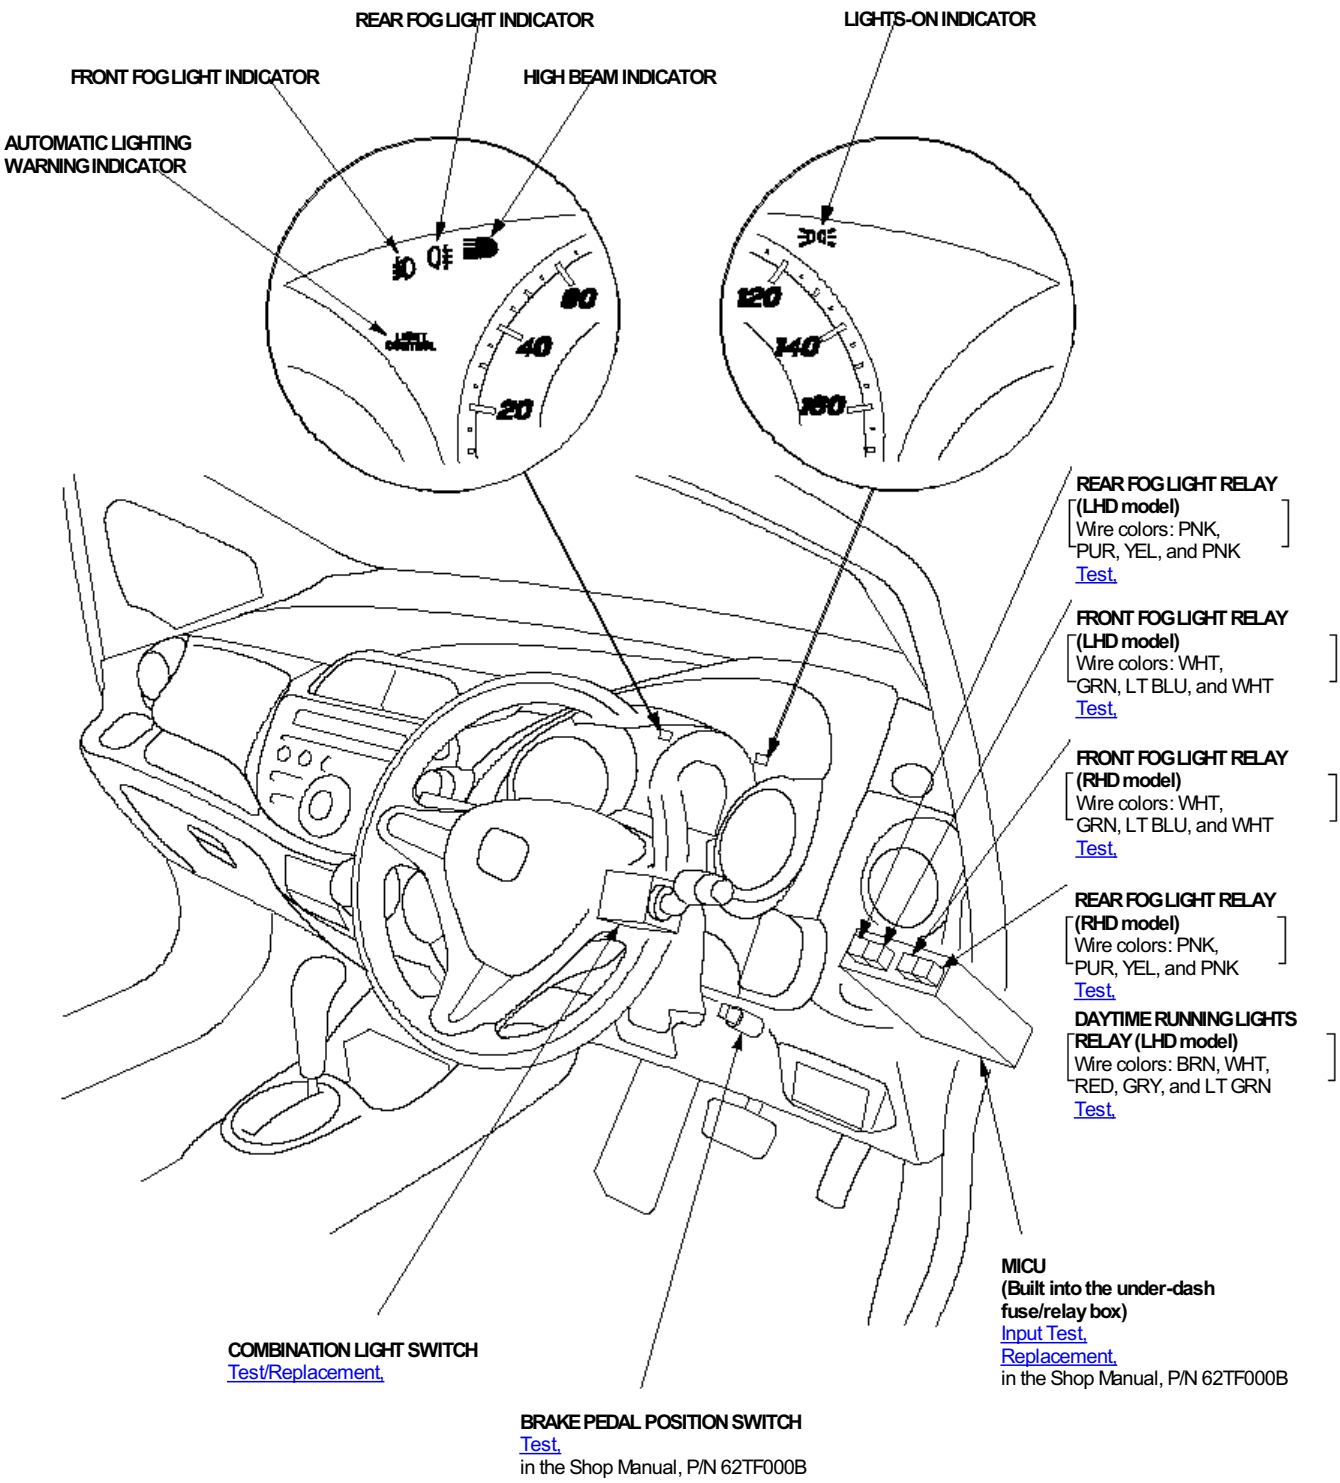
NOTE: The recalibration temperature is not the value the sensor sees.
Therefore the temperature can only be adjusted ±5 degrees from sensors.
NOTE: To recalibrate the display to the true temperature, remove the outside air temperature sensor (A), but leave it connected. Submerge the sensor and a thermometer (B) in a container of ice water (C). Select the calibration mode as described above, then recalibrate the display to the true temperature.

5. Snow mark is enlarged when the temperature becomes 3 °C (37 °F) or less for the first time during turning the ignition switch ON (II).

Exterior Lights System Description

[Automatic Lighting System](#)
[Daytime Running Lights](#)

Exterior Lights Component Location Index

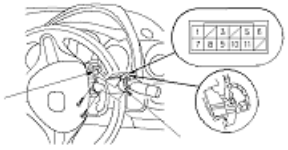


RHD model is shown, LHD model is similar.

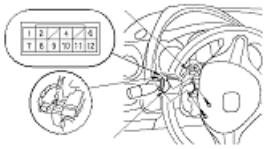
Combination Light Switch Test/Replacement

1. Remove the steering column covers.
2. Disconnect the 12P connector (A) from the combination light switch (B).
3. Remove the two screws, then slide out the combination light switch.

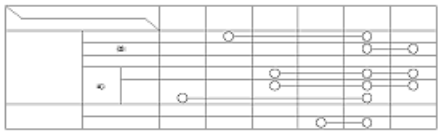
RHD model (Except KE and KN models)

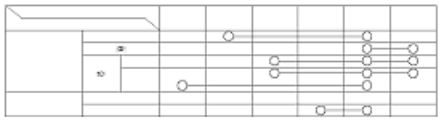


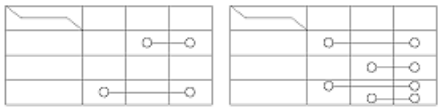
LHD model (Include KE and KN models)



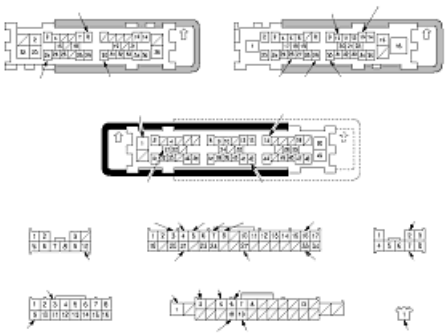
4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, check for continuity between the terminals in each switch position according to the tables.
     - If the continuity is not as specified, replace the switch.







Exterior Lights (MICU) Input Test



NOTE:

- Before performing the input tests, check the No. 1, No. 2, No. 5, No. 9, No. 15, No. 22, No. 24, No. 28, No. 29, No. 32, No. 34, No. 41, No. 48, No. 51, and No. 60 fuses in the under-dash fuse/relay box.
- The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, C, K, M, N, Q, R, and W.
   NOTE: All connector views are wire side of female terminals.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire

B13	BRN *1	Ignition switch ON (II)	Connect W1 terminal and B13 terminal with a jumper wire: The left headlight (low beam) should come on.	• Blown bulb • Poor ground (G401) • An open in the wire
	GRY *2		Connect W1 terminal and B13 terminal with a jumper wire: The left headlight (high beam) should come on.	• Blown bulb • Poor ground (G401) [G202] • An open in the wire
N7 *3	GRY	Under all conditions	Connect battery power to the N7 terminal: The front position lights, taillights and license plate lights should come on.	• Poor ground (G202, G401, G602, G604) • Faulty daytime running lights relay • Blown bulb • An open in the wire
M27 *3	LT GRN	Under all conditions	Check for continuity between the M27 terminal and R3 terminal: There should be continuity.	• Faulty daytime running lights relay • An open in the wire
R3 *3	RED			
C1 *3	WHT	Under all conditions	Connect battery power to the M27 terminal and ground the R3 terminal momentarily, then connect battery power to the C1 terminal: The front position lights, taillights and license plate lights should come on.	• Poor ground (G202, G401, G602, G604) • Faulty daytime running lights relay • Blown bulb • An open in the wire
C14	LT GRN	Ignition switch ON (II)	Connect W1 terminal and C14 terminal with a jumper wire: Brake lights and the high mount brake lamp should come on.	• Blown bulb • Poor ground (G604, G602) • An open in the wire

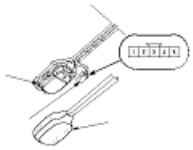
*1:With HID
*2:Without HID
*3:With daytime running lights

[ ]: LHD model

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
M8·M33	BLU·BLK	Combination light switch OFF	Check for continuity between M8 and M33 terminals: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch in any other position than OFF	Check for continuity between M8 and M33 terminals: There should be no continuity.	• Faulty combination light switch • A short in the wire
M7·M33	GRY·BLK	Combination light switch (SMALL position) ON	Check for continuity between M7 and M33 terminals: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF	Check for continuity between M7 and M33 terminals: There should be no continuity.	• Faulty combination light switch • A short in the wire
M5·M33	BLU·BLK	Combination light switch (headlight) ON	Check for continuity between M5 and M33, or M5 and M7 terminals: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF	Check for continuity between M5 and M33, or M5 and M7 terminals: There should be no continuity.	• Faulty combination light switch • A short in the wire
M4·M33	WHT·BLK	Combination light switch lever pulled (Passing)	Check for continuity between M4 and M33 terminals: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch lever released (OFF)	Check for continuity between M4 and M33 terminals: There should be no continuity.	• Faulty combination light switch • A short in the wire
M3·M33	LT BLU·BLK	Combination light switch (Dimmer) in high beam position	Check for continuity between M3 and M33 terminals: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch (Dimmer) in low beam position	Check for continuity between M3 and M33 terminals: There should be no continuity.	• Faulty combination light switch • A short in the wire
B10 (M/T) (i-SHIFT system)	LT GRN	Ignition switch ON (II) and shift lever in R position	Connect W1 terminal and B10 terminal with a jumper wire: The back-up lights should come on.	• Blown bulb • Faulty back-up light switch • Poor ground (G602, G604) • An open in the wire
B26(A/T)	GRN	Shift lever in R position	Check for continuity to ground: There should be continuity.	• Faulty transmission range switch • Poor ground (G101) • An open in the wire
Q3	LT GRN	Under all condition	Check for continuity between the Q3 terminal and the gauge control module No. 18 terminal: There should be continuity.	An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
R6·M33	PUR·BLK	Combination light switch in REAR FOG or FRONT/REAR FOG position	Check for continuity between the R6 terminal and M33 terminal: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF or in FRONT FOG position	Check for continuity between the R6 terminal and M33 terminal: There should be no continuity.	• Faulty combination light switch • A short in the wire
R19·M33	GRN·BLK	Combination light switch in FRONT FOG or FRONT/REAR FOG position	Check for continuity between the R19 terminal and M33 terminal: There should be continuity.	• Faulty combination light switch • An open in the wire
		Combination light switch OFF or in REAR FOG position	Check for continuity between the R19 terminal and M33 terminal: There should be no continuity.	• Faulty combination light switch • A short in the wire
R1·R18	WHT·LT BLU	Under all conditions	Check for continuity between the R1 terminal and R18 terminal: There should be continuity.	• Faulty front fog light relay • An open in the wire
M21·R5	PNK·YEL	Under all conditions	Check for continuity between the M21 terminal and R5 terminal: There should be continuity.	• Faulty rear fog light relay • An open in the wire

Automatic Lighting/Rain Sensor Input Test



1. Remove the cover (A) from the automatic lighting/rain sensor (B).
2. Disconnect the 5P connector (C) from the automatic lighting/rain sensor.
3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 4 .
4. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the automatic lighting/rain sensor.

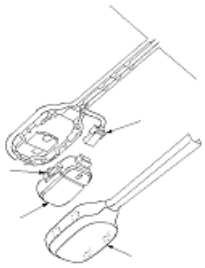
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
1	LT BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-hood fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
2	YEL	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • Faulty ignition switch • An open in the wire
4	PUR	Under all conditions	Check for continuity between the No. 4 terminal and No. 9 (No. 10) * terminal of the combination light switch 12P connector: There should be continuity.	An open in the wire
5	GRN	Under all conditions	Check for continuity between the No. 5 terminal and No. 3 terminal of the under-dash fuse/relay box connector Q (16P): There should be continuity.	An open in the wire

*: LHD model (Include KE and KN models)

Automatic Lighting/Rain Sensor Replacement

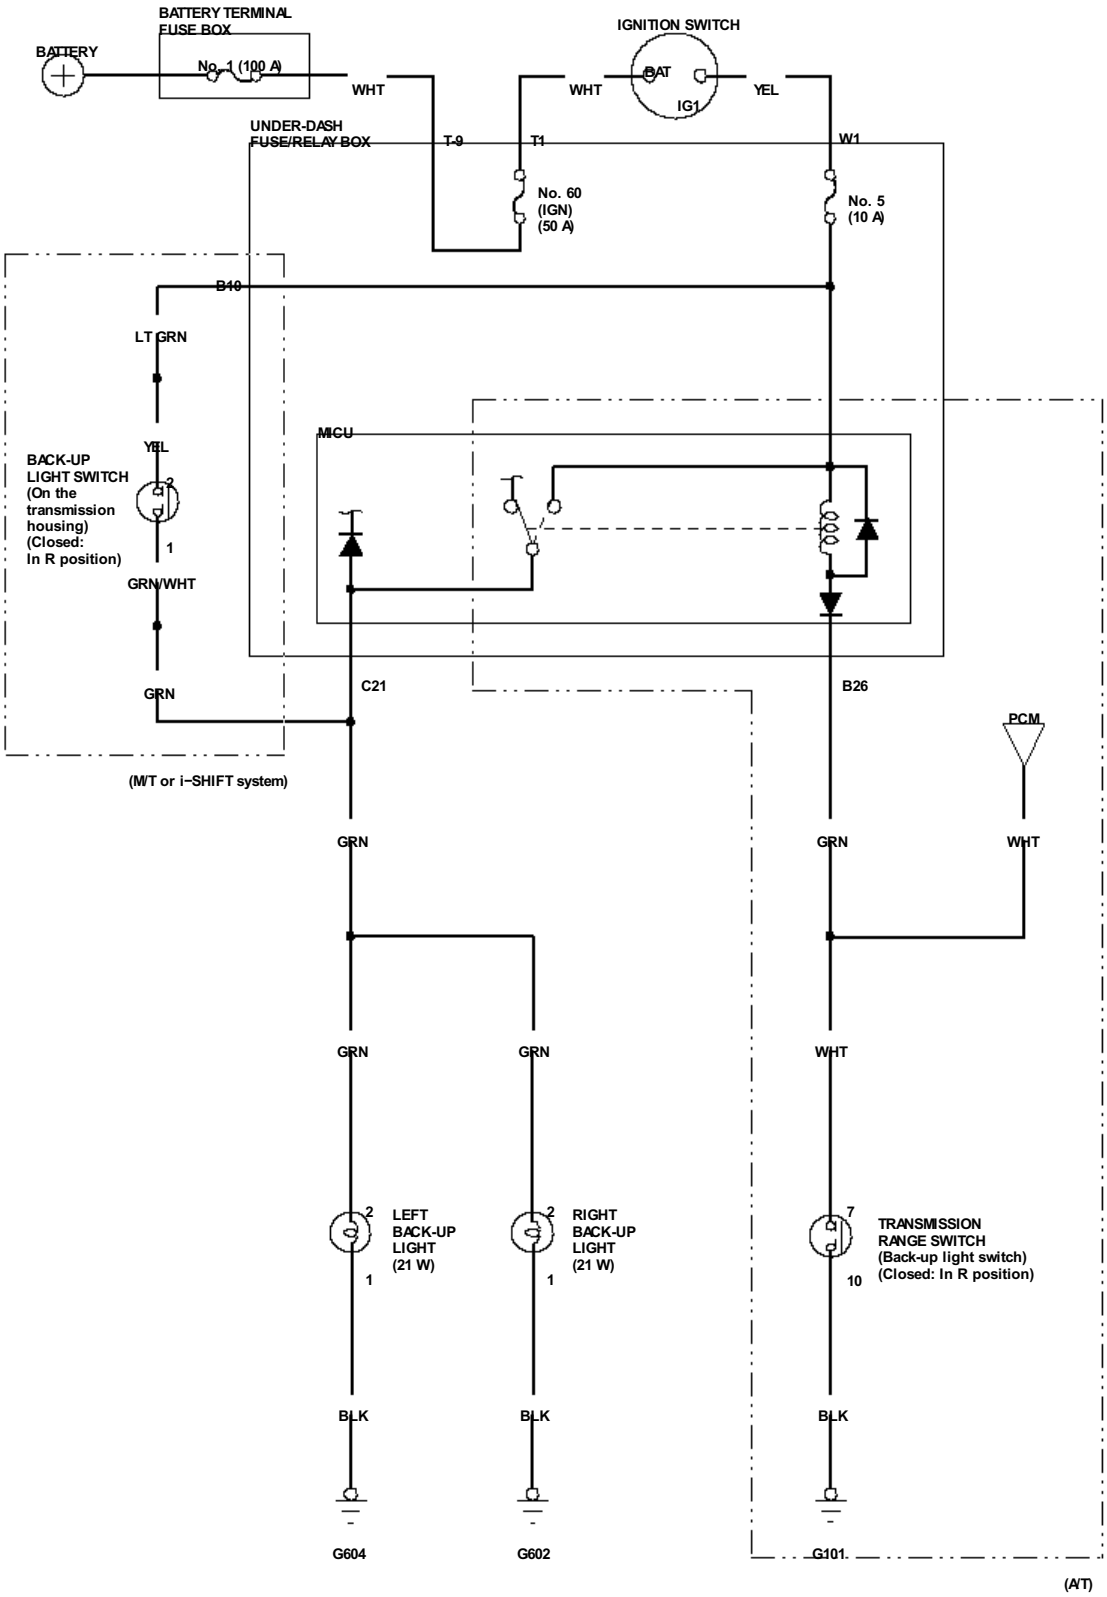
NOTE:

- If the automatic lighting/rain sensor 5P connector is connected after the battery terminal is connected, the automatic lighting/rain sensor is not confirmed by the MICU.
- If the MICU does not confirm the automatic lighting/rain sensor, automatic wiper system does not work.
- Connect the automatic lighting/rain sensor 5P connector first, then connect the battery terminal.

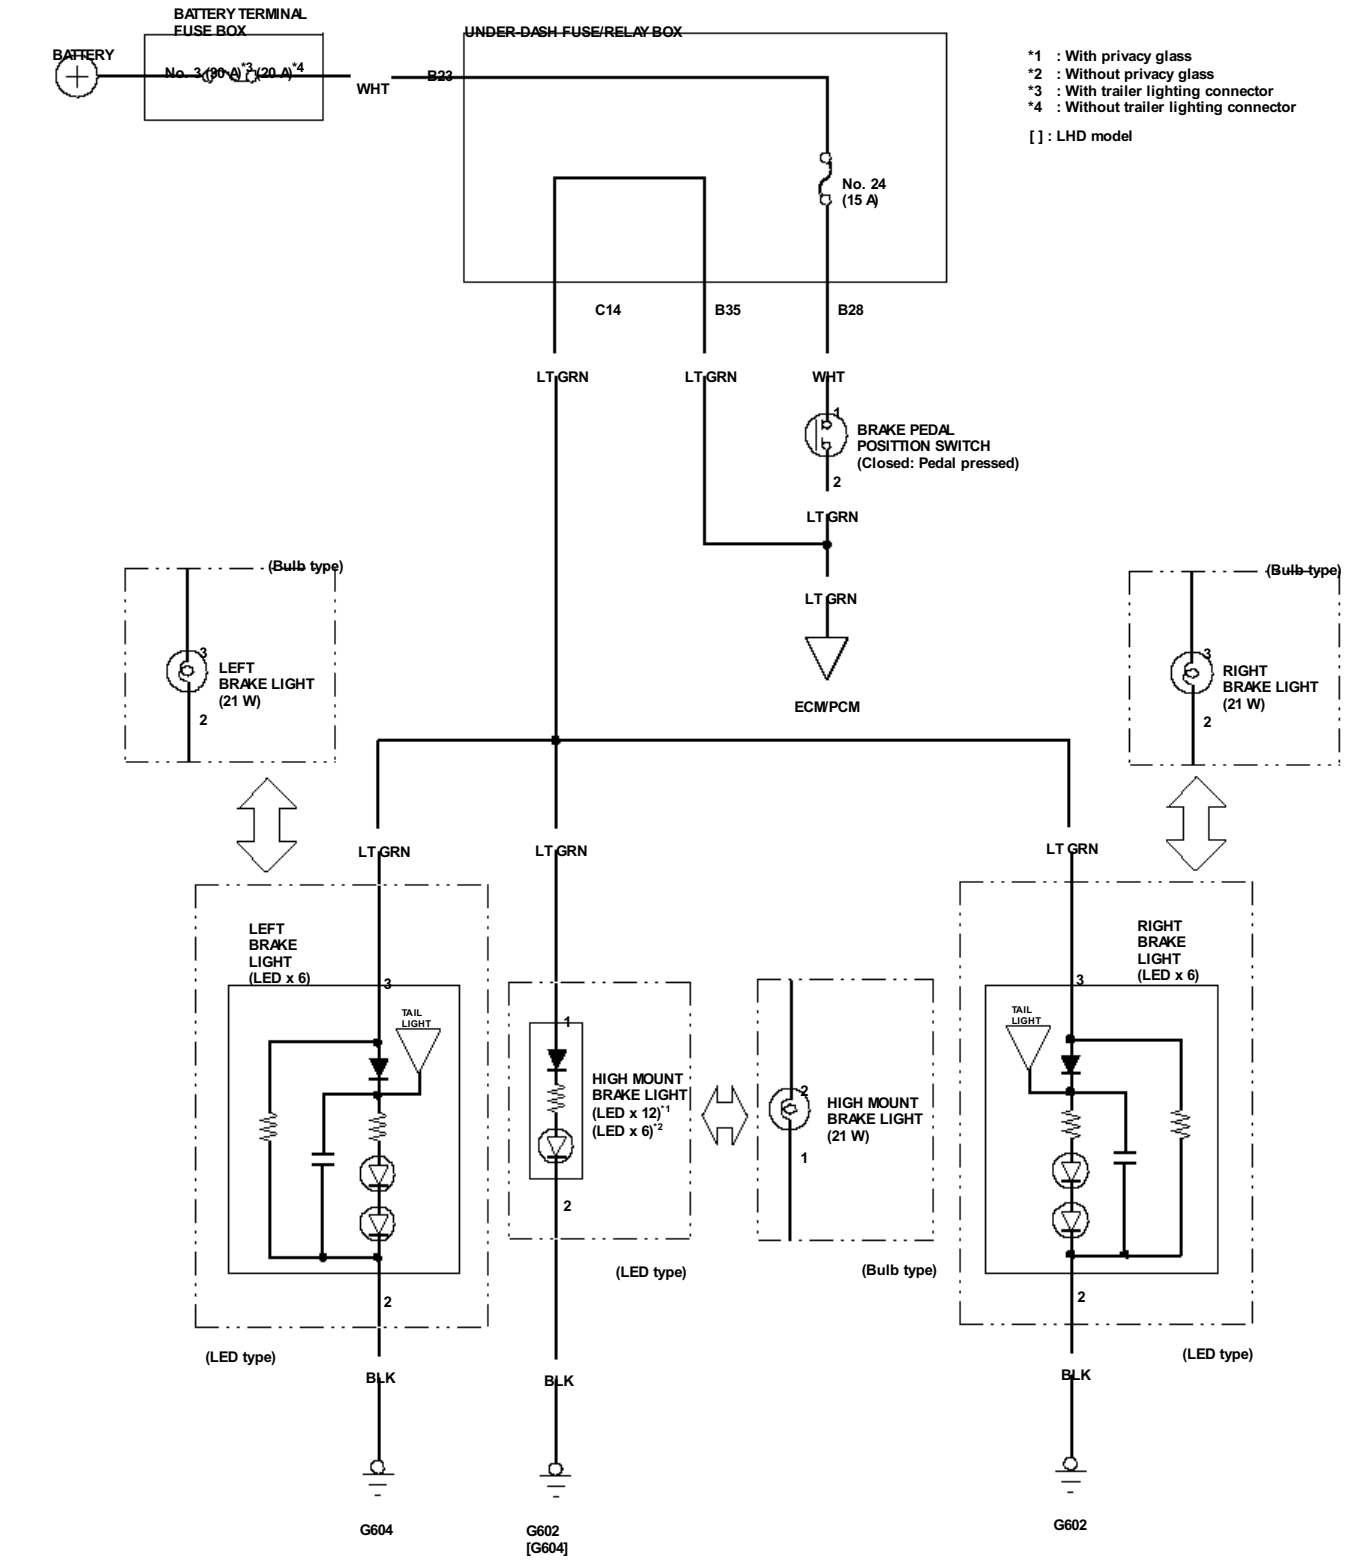


1. Remove the automatic lighting/rain sensor cover (A) and disconnect the 5P connector (B).
2. Remove the lock (C), then remove the automatic lighting/rain sensor (D).
3. Install the automatic lighting/rain sensor in the reverse order of removal.

Back-up Lights Circuit Diagram

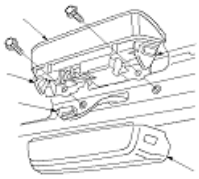


Brake Lights Circuit Diagram



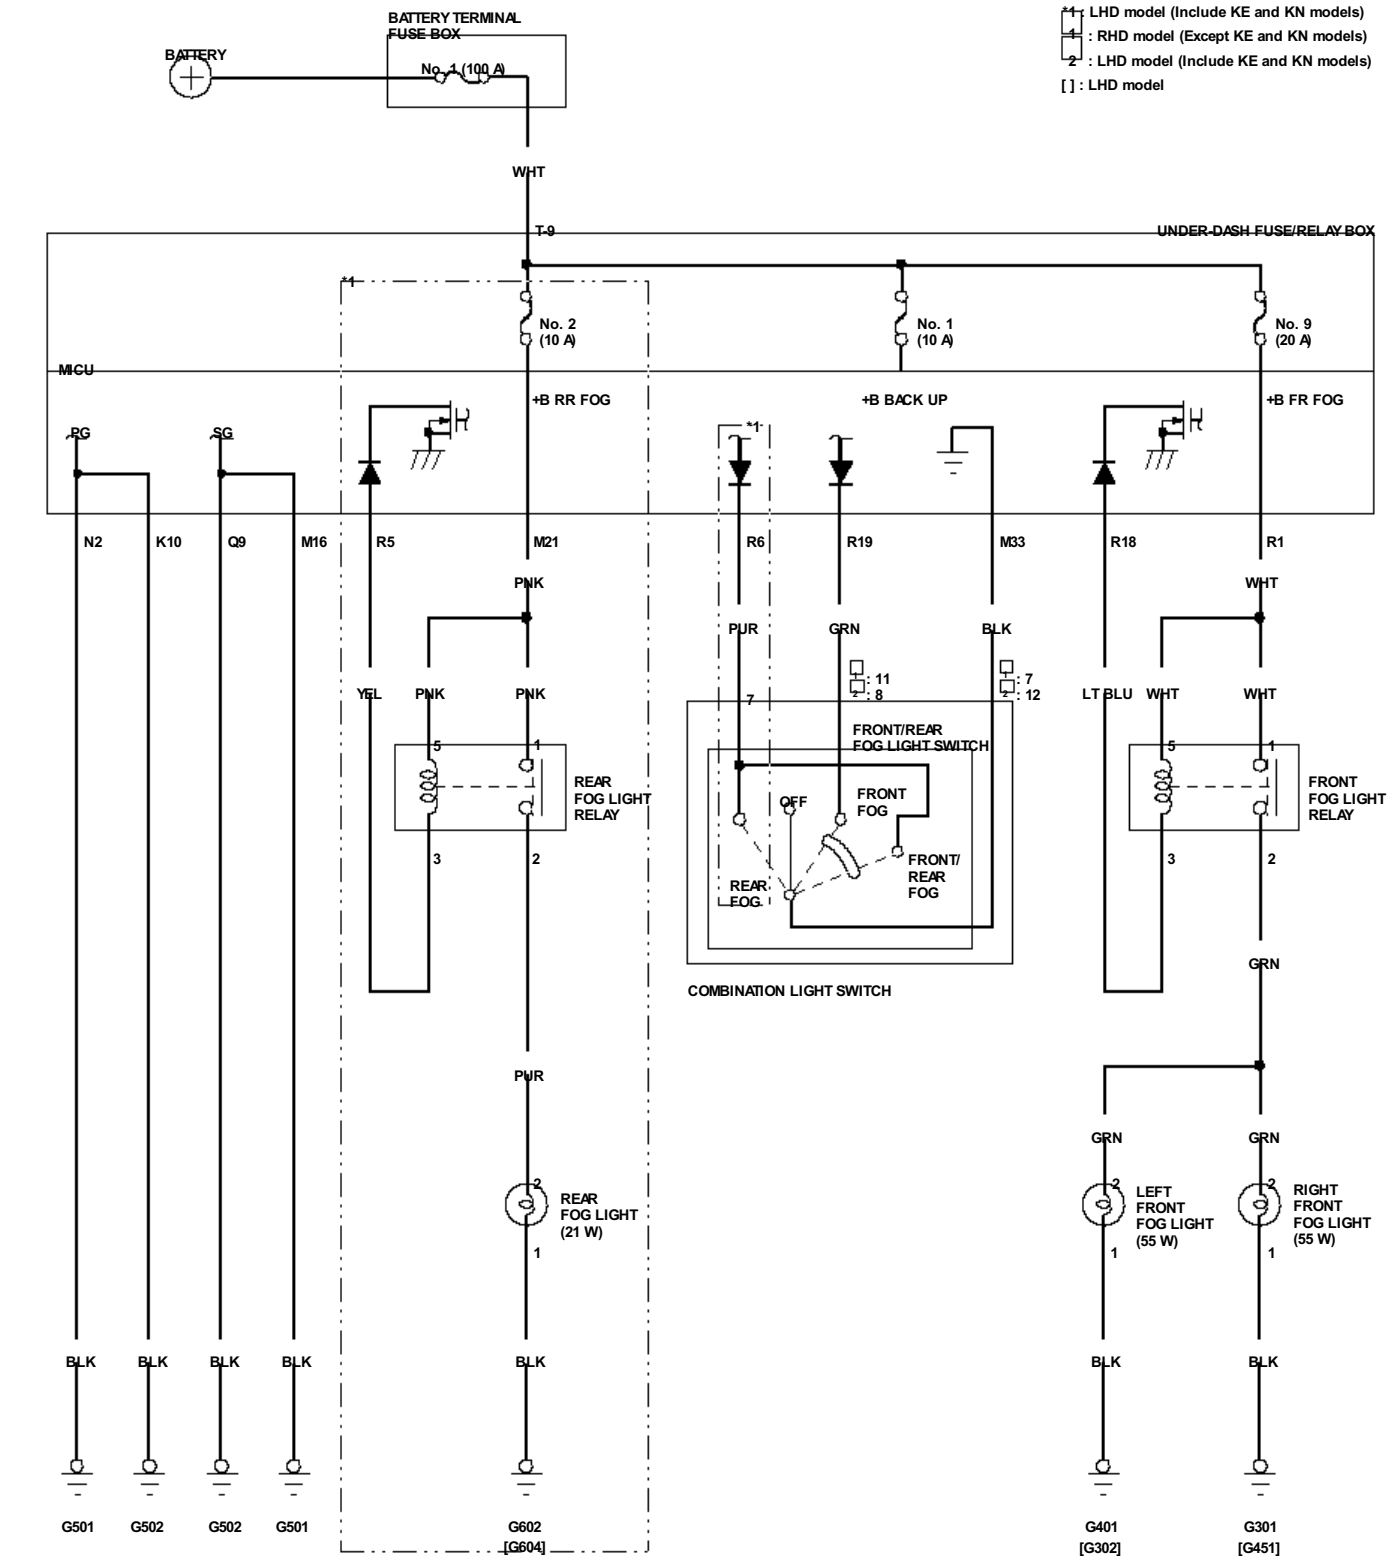
High Mount Brake Light Replacement

LED type



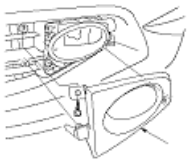
1. Open the tailgate.
2. Push in the clips (A), and remove the cover (B) from the high mount brake light (C).
   High Mount Brake Light: (LED)
3. Disconnect the 2P connector (D) from the high mount brake light.
4. Remove the two mounting bolts and the high mount brake light.
5. Install the light in the reverse order of removal.

Front Fog Light/Rear Fog Light Circuit Diagram



Front Fog Light Replacement

1. Remove the fog light trim (A).
   NOTE: The illustration shows the vehicle with front air spoiler.
2. Remove the front bumper.

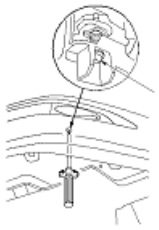


3. Disconnect the front fog light 2P connector (A).
4. With front air spoiler: Remove the three screws and the clip.
   Without front air spoiler: Remove the four screws.
5. Remove the front fog light (B).

Front Fog Light Adjustment

Before adjusting the fog lights:

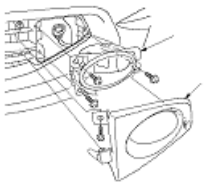
- Park the vehicle on a level surface.
- Make sure the tyre pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.



Adjust the fog lights to local requirements by turning the adjuster (A).

Front Fog Light Bulb Replacement

1. Remove the fog light trim (A).
   NOTE: The illustration shows the vehicle with front air spoiler.
2. With front air spoiler: Remove the three screws.
   Without front air spoiler: Remove the two screws.
3. Disconnect the 2P connector, then remove the front fog light (B) from the front bumper.



4. Turn the bulb socket (A) 60 ° counterclockwise to remove it from the housing.
   FRONT FOG LIGHT: 55 W

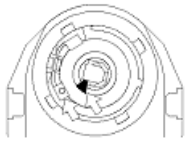
HID Lamp System Troubleshooting

⚠WARNING

A transient high tension (25,000 V) occurs at the bulb sockets or the high intensity discharge (HID) lamps when the combination light switch is turned ON, it may cause serious electrical shock or electrocution if you do not observe the cautions below.



⚠CAUTION

- Never turn on the combination light switch before fitting the HID bulbs to their bulb sockets and completing the reassembly of the headlight assembly.
- Do not service the headlights assembly in wet conditions, such as rain or snow, near a sprinkler system, or when your hands are wet to prevent electrocution.
- Do not touch the surface of the HID bulbs with your bare hands and do not stain it with any oils and fats.
- Do not disassemble the inverter unit and the igniter unit.
- Do not turn on the HID bulb by using a power source other than the battery mounted on your vehicle.

NOTE:

- Before troubleshooting, check the No. 32 (15 A) fuse and No. 48 (15 A) fuse in the under-dash fuse/relay box.
- Cool down the HID bulb before checking.
- After checking, the HID system requires about 5 minutes to be normal condition.

1. Connect the HDS to the data link connector, then turn the ignition switch to ON (II).
2. Select the BODY ELECTRICAL menu, then enter the HEADLIGHT COMMAND from the FUNCTIONAL TESTS, and turn the headlights on repeatedly.

   Do the headlights come on?
   YES - Go to the combination light switch test and the MICU input test. ■
   NO - Go to Step 3.
3. Turn the headlight switch OFF and the ignition switch in LOCK (0) position.
4. Do the battery terminal disconnection procedure.
5. Remove the bulb socket from the HID bulb.
6. Check for loose or poor connections between the bulb socket and the HID bulb.

   Is the connection OK?
   YES - Go to Step 7.
   NO - Install the bulb and the bulb socket correctly and recheck, then go to Step 15.
7. Check for corrosion and traces of electrical arcing at the socket mating part.

   Is the socket corroded or burnt?
   YES - Replace the bulb socket, and recheck, then go to Step 15.
   NO - Go to Step 8.

8. Remove the bulb, and check the luminescence part of the HID bulb.

   Is there black discoloration or transformation?
   YES - Replace the HID bulb(s), and recheck, then go to Step 15.
   NO - Go to Step 9.
9. Substitute the right and left HID bulbs.

   Does the symptom change to the other side?
   YES - Replace the HID bulb and recheck, then go to Step 15.
   NO - Go to Step 10.
10. Turn the combination light switch OFF.
11. Disconnect the HID unit 2P connector.
12. Turn the combination light (headlight) switch ON.

13. Measure the voltage between the No. 2 terminal of the HID unit 2P connector and body ground.

    Is there battery voltage?
    YES - Go to Step 14.
    NO - Repair open in the wire between the HID unit and the under-dash fuse/relay box. If the wire is OK, replace the under-dash fuse/relay box, then go to Step 15.

14. Check for continuity between the No. 1 terminal of the HID unit 2P connector and body ground.

Is there continuity?

YES - Replace the HID unit, then go to Step 15 .

NO - Repair open in the wire between the HID unit and body ground. If the wire is OK, check for poor ground (G301/G401), then go to Step 15 .

15. Do the battery terminal reconnection procedure.

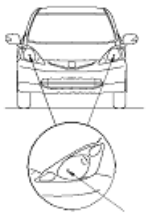
Headlight Replacement

1. Remove the front bumper.
2. Disconnect the connectors (A) from the bulb sockets.
3. Remove the headlight (B) with the corner upper beam (C).
   NOTE: Be careful not to scratch the headlight lens and the fender.
4. Remove the bolt (D), and separate the corner upper beam and the headlight.
5. Install the headlight in the reverse order of removal.
6. After replacement, adjust the headlight.

Headlight Adjustment

⚠CAUTION

Headlights become very hot during use; do not touch them or any attaching hardware immediately after they have been turned off.

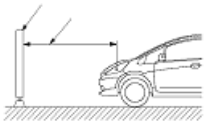


Before adjusting the headlights:

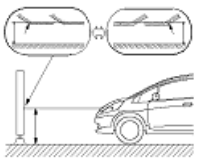
- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.
- Unload the vehicle.
- Turn the headlight leveling switch in 0 position (Without HID).

1. Clean the outer lens so that you can see the center (A) of the headlights.

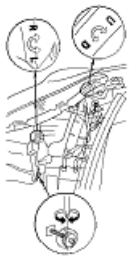
2. Park the vehicle in front of a wall or a screen (A).
3. Turn the low beams on.

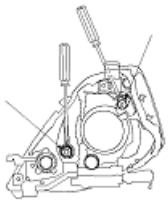


4. Determine if the headlights are aimed properly.
   Vertical adjustment:
   Measure the height of the headlights (A).
   Adjust the cut line (B) to the light's height.



5. If necessary, open the hood and adjust the headlights to local requirements by turning the adjuster.





Exterior Light Bulb Replacement

HID Bulb

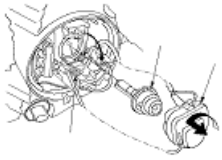
⚠WARNING

A transient high tension (25,000 V) occurs at the bulb sockets of the high intensity discharge (HID) lamps when the combination light switch is turned ON, it may cause serious electrical shock or electrocution if you do not observe the cautions below.

⚠CAUTION

- Never turn on the combination light switch before fitting the HID bulbs to their bulb sockets and completing the reassembly of the headlight assembly.
- Do not service the headlights assembly in wet conditions, such as rain or snow, near a sprinkler system, or when your hands are wet to prevent electrocution.
- Do not touch the surface of the HID bulbs with your bare hands and do not stain it with any oils and fats.
- Do not disassemble the inverter unit and the ignitor unit.
- Do not turn on the HID bulb by using a power source other than the battery mounted on your vehicle.

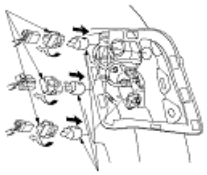
1. Turn the combination light switch OFF.
2. Turn the ignition switch to LOCK (0).
3. Do the battery terminal disconnection procedure.
4. Turn the cover (A) 45 ° counterclockwise to remove it from the headlight assembly.



5. Turn the socket (A) 45 ° counterclockwise to remove it from the bulb (B).
   Headlight: 35 W
6. Pull the retaining spring (C) away from the bulb then remove the bulb.
7. Install a new bulb in the reverse order of removal. Make sure the notches in the bulb align with the tabs in the headlight.
8. Install the parts in the reverse order of removal.
9. Do the battery terminal reconnection procedure.

Taillights (LED type)

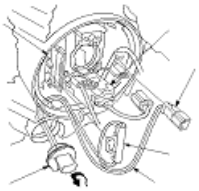
1. Open the tailgate and remove the maintenance lid (A).



2. Disconnect the connectors from the lights.
   Brake Light/Taillight: (LED)
   Rear Turn Signal Light: 21 W
   Back-up Light: 21 W
   Rear Fog Light: 21 W

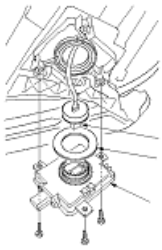
   NOTE: The brake light/taillight (LED) is a part of the taillight assembly, and it cannot be replaced itself.
3. Turn the bulb socket (A) 45 ° counterclockwise to remove the bulb (B).
4. Install new bulb(s) in the reverse order of removal.

HID Cord Complete Replacement



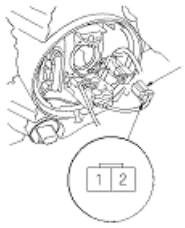
1. Remove the headlight.
2. Remove the HID bulb from the headlight.
3. Disconnect the 2P connector (A) from the high/low beam switching solenoid (B).
4. Turn the connector (C) 45 ° counterclockwise to remove it from the headlight housing (D).
5. Slide the diode (E) up and remove the cord complete (F).
6. Install in the reverse order of removal.
7. After replacement, adjust the headlight.

HID Unit Replacement



1. Turn the combination light switch OFF.
2. Make sure the ignition switch is in LOCK (0) position, then do the battery terminal disconnection procedure.
3. Remove the headlight assembly.
4. Remove the three mounting screws and the HID unit (A).
5. Disconnect the 4P connector (B) from the HID unit.
6. Inspect the gasket (C) for damage. If damaged, replace it.
7. Install the HID unit in the reverse order of removal.
8. Do the battery terminal reconnection procedure.
9. Adjust the headlight.

High/Low Beam Switching Solenoid Test



1. Remove the headlight.
2. Remove the HID bulb from the headlight.
3. Disconnect the high/low beam switching solenoid 2P connector (A).
4. Check the hood of the high/low beam switching solenoid.
   - The hood should open (high beam) when the battery power is connected to the No. 1 terminal and ground the No. 2 terminal.
   - The hood should close (low beam) when the battery power is disconnected.
5. If the solenoid does not work properly, replace it.

High/Low Beam Switching Solenoid Replacement

1. Remove the headlight.
2. Remove the HID bulb from the headlight.
3. Disconnect the high/low beam switching solenoid 2P connector (A).
4. Place a clean shop towel or paper (B) under the high/low beam switching solenoid.
5. Remove the headlight leveling motor.
6. Slightly push down the headlight reflector to secure the space.

7. Remove the two screws (A) from the high/low beam switching solenoid (B).
8. Disconnect the 1P terminal (C) and remove the high/low beam switching solenoid.
   NOTE: Do not touch the hood and the moving part. It is necessary to clean if touch the parts.
9. Install the switching solenoid in the reverse order of removal.
10. After replacement, check the hood operation , and adjust the headlight.

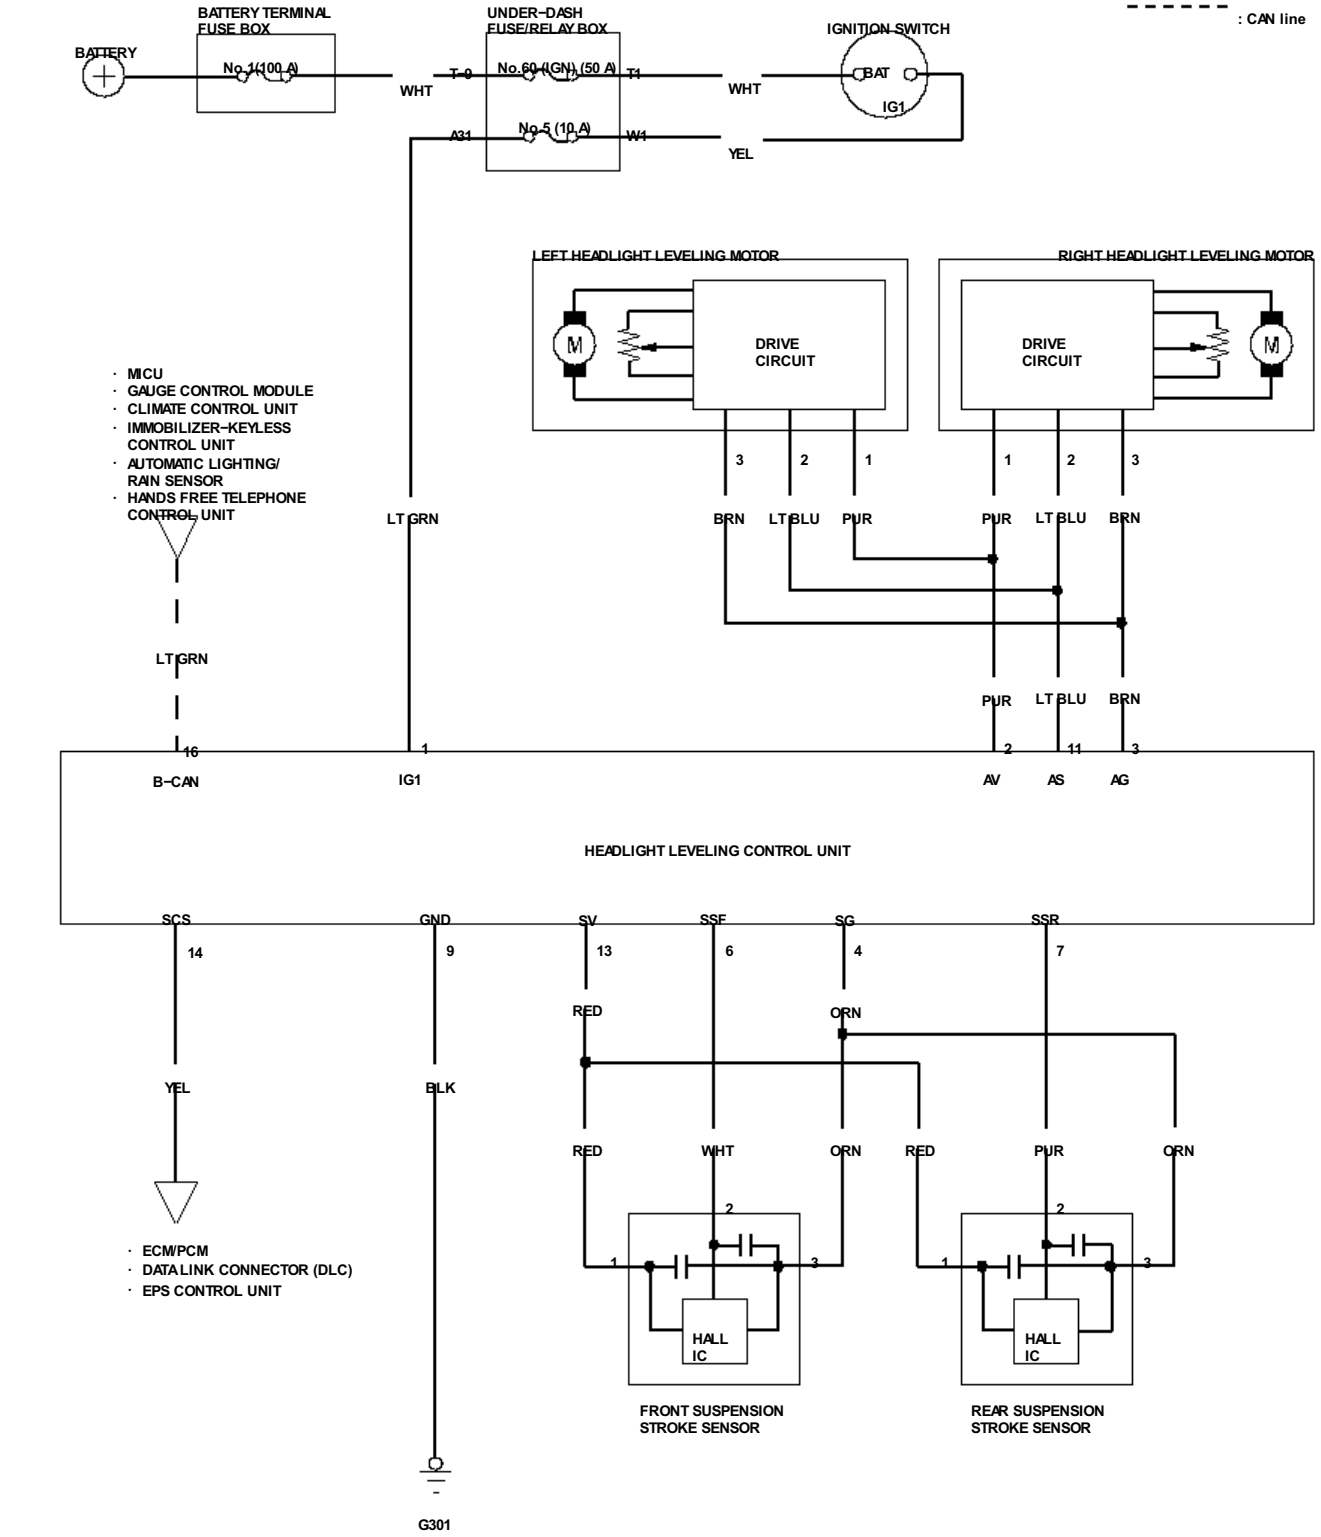
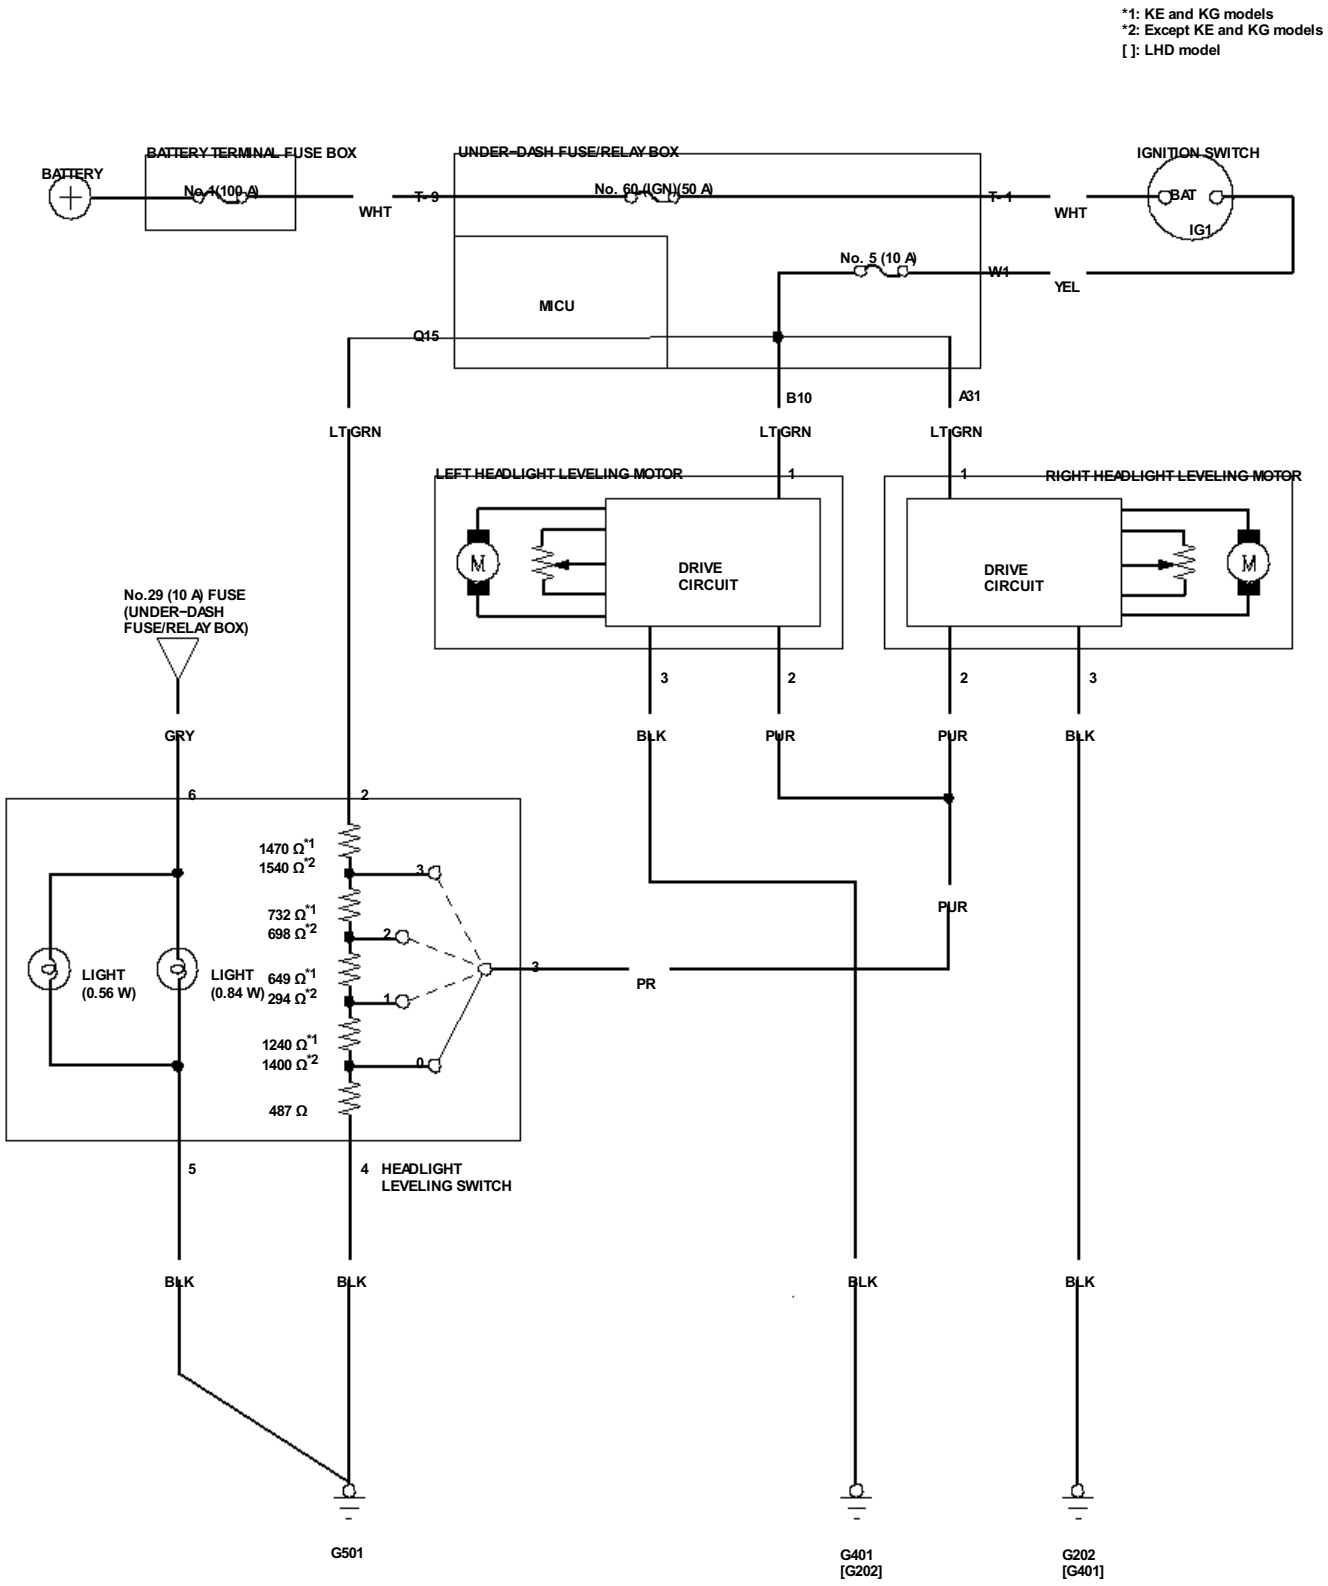
Headlight Leveling System Circuit Diagram - With HID

With HID



Headlight Leveling System Circuit Diagram - Without HID

Without HID



Headlight Initial Position Learning Procedure

Do the headlight initial position learning when any of the related parts of the headlight leveling system shown is replaced:

- Headlight leveling control unit
- Suspension stroke sensor

NOTE: The headlight initial position learning is required also when the suspension stroke sensor is reattached or the suspension stroke sensor arm is reconnected to the lower arm.

Learning Procedure

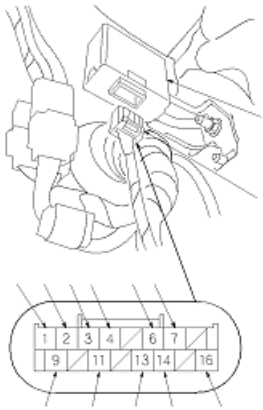
Before learning the headlights:

- Park the vehicle on a level surface, and remove all of the baggage from the vehicle.
- Make sure the tire pressures are correct.

1. Turn the ignition switch to LOCK (0).
2. Slide the front seats backward fully.
3. Have the driver (about 75 kg (165 lb)) or someone who weighs the same sit in the driver's seat.
4. Connect the HDS to the data link connector
5. Jump the SCS line with the HDS.
6. Turn the ignition switch to ON (II).
7. Within 5 seconds, turn the headlights (low beam) or passing switch ON and OFF three times repeatedly, and leave them on.
   - If the headlights aiming move down then return to the original position, the initial position learning is complete.
   - If the headlights aiming don't move, go to Step 1 and repeat the procedure.
8. Turn the ignition switch to LOCK (0).
9. Disconnect the HDS from the data link connector.
10. Adjust the headlight aiming to conform with the applicable requirements.

Headlight Leveling Control Unit Input Test

With HID



NOTE: Before testing, make sure that there is no DTC and combination light switch circuit is ok.

1. Remove the driver's dashboard undercover.
2. Turn the ignition switch to LOCK (0).
3. Disconnect the 16P connector (A) from the headlight auto leveling control unit (B).
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to Step 5 .
5. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G301) • An open in the wire
1	LT GRN	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 5 (10 A) fuse in the driver's under-dash fuse/relay box • An open in the wire

6. Reconnect the connector, turn the ignition switch to ON (II), and make these input tests at the connector.
   - If any tests indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the headlight leveling control unit.

NOTE: After replacing the control unit, do the headlight initial position learning procedure.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3	BRN	Under all conditions	Measure the voltage to ground: There should be less than 0.5 V.	• Poor ground (G301) • An open in the wire
4	ORN	Under all conditions	Measure the voltage to ground: There should be less than 0.5 V.	• Poor ground (G301) • An open in the wire
2 3	PUR BRN	Ignition switch ON (II), headlight switch ON	Measure the voltage between the No. 2 and No. 3 terminals: There should be battery voltage.	• Faulty headlight leveling motor • An open in the wire
11 3	LT BLU BRN	Ignition switch ON (II), headlight switch ON	Measure the voltage between the No. 11 and No. 3 terminals: There should be about 2 to 12 V.	• Faulty headlight leveling motor • An open in the wire
4 6 13	ORN WHT RED	Ignition switch ON (II)	• Measure the voltage between the No. 4 and No. 13 terminals: There should be about 5 V. • Measure the voltage between the No. 4 and No. 6 terminals: There should be about 0.5 to 4.5 V.	• Faulty front suspension stroke sensor • An open in the wire
4 7 13	ORN PUR RED	Ignition switch ON (II)	• Measure the voltage between the No. 4 and No. 13 terminals: There should be about 5 V. • Measure the voltage between the No. 4 and No. 7 terminals: There should be about 0.5 to 4.5 V.	• Faulty rear suspension stroke sensor • An open in the wire

Headlight Leveling Motor Input Test

NOTE: Before input test, check the No. 5 (10 A) fuse in the under-dash fuse/relay box.

1. Turn the ignition switch to LOCK (0).
2. Disconnect the 3P connector (A) from the headlight leveling motor (B).
3. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals are OK, go to Step 4 .
4. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, replace the headlight leveling motor.
   - With HID: Do the headlight leveling control unit input test.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
3	BRN *1	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G301) • Faulty headlight leveling control unit • An open in the wire
	BLK *2	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G202, G401) • An open in the wire
1	PUR *1	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Faulty headlight leveling control unit • An open in the wire
	LT GRN *2	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	An open in the wire
2	LT BLU *1	Ignition switch ON (II)	Measure the voltage to ground: There should be about 3−13 V.	• Faulty headlight leveling control unit • An open in the wire
	PUR *2	Headlight leveling switch in 3 position	Measure the resistance between the No. 2 terminal and body ground: There should be about 2.9 kΩ [3.1 kΩ].	• Poor ground (G501) • Faulty headlight leveling switch • An open in the wire

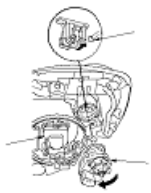
*1:With HID
*2:Without HID

[ ]: KE and KG models

Headlight Leveling Motor Replacement

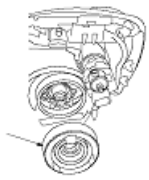
With HID

1. Remove the headlight assembly.
2. Turn the HID light cover (A) 45 ° counterclockwise to remove it from the headlight housing.

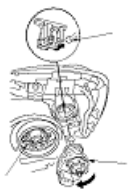


3. Pulling the headlight reflector (A) slightly, turn the leveling motor (B) 45 ° clockwise, and pull down the tip (C) of the leveling motor.
4. Install in the reverse order of removal.
5. After installation, adjust the headlight.

Without HID

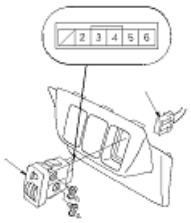


1. Remove the headlight assembly.
2. Remove the rubber cap (A).



3. Pulling the headlight reflector (A) slightly, turn the leveling motor (B) 45 ° clockwise, and pull down the tip (C) of the leveling motor.
4. Install in the reverse order of removal.
5. After installation, adjust the headlight.

Headlight Leveling Switch Test/Replacement



1. Remove the fuse lid panel.
2. Disconnect the 6P connector (A) from the headlight leveling switch (B), then push out the switch from the dashboard lower cover.
3. Measure the resistance between the No. 2 and No. 4 terminals, and No. 3 and No. 4 terminals at positions 0, 1, 2, and 3 by moving the switch knob.
   Between the No. 2 and No. 4 terminals:
   About 4.4 kΩ or 4.6 kΩ (KE and KG models)

   Between the No. 3 and No. 4 terminals:

Knob position	0	1	2	3
Resistance [About (kΩ)]	0.487	1.887 or 1.727 *	2.181 or 2.376 *	2.879 or 3.108 *

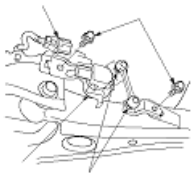
   *: KE and KG models

4. If the resistance is not as specified, replace the switch.

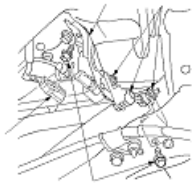
Headlight Leveling System Suspension Stroke Sensor Replacement

1. Raise the vehicle, make sure it is securely supported.
2. Disconnect the 3P connector (A) from the suspension stroke sensor (B).
3. Remove the bolts, then remove the suspension stroke sensor.
4. Install the sensor in the reverse order of removal.
5. After installing, do the headlight initial position learning.

Front



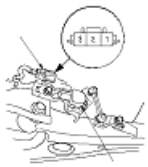
Rear



Headlight Leveling System Suspension Stroke Sensor Circuit Troubleshooting

NOTE:

- Before troubleshooting, check the No. 5 (10 A) fuse in the under-dash fuse/relay box.
- Before troubleshooting, check for DTCs and make sure the B-CAN communication lines are OK.



1. Raise the vehicle, make sure it is securely supported.
2. Disconnect the 3P connector (A) from the front suspension stroke sensor (B).

3. Disconnect the 3P connector (A) from the rear suspension stroke sensor (B).
4. Turn the ignition switch to ON (II).
5. Turn the combination light (headlight) switch ON.

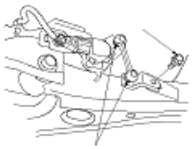
6. Check for continuity between the front and rear suspension stroke sensors 3P connector No. 3 terminal and body ground individually.

Is there continuity?
YES - Go to Step 7 .
NO - Repair open in the wire or poor ground (G301), if the wire is OK, replace the headlight leveling control unit .■

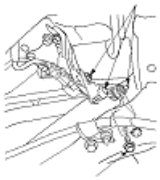
7. Measure the voltage between the front and rear suspension stroke sensors 3P connector No. 1 terminal and body ground individually.

Is there about 5 V?
YES - Go to Step 8 .
NO - Check for an open or a short in the wire between the headlight leveling control unit and the front (or rear) suspension stroke sensor. If the wire is OK, replace the front (or rear) suspension stroke sensor .■

8. Turn the ignition switch to LOCK (0).
9. Reconnect the 3P connector to each suspension stroke sensor.

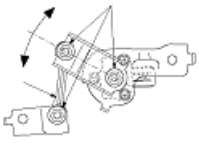


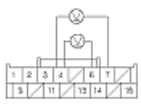
10. Remove the bolt (A) and the front suspension stroke sensor from the lower arm.



11. Remove the nut (A) and the rear suspension stroke sensor from the lower arm.
12. Turn the ignition switch to ON (II).

13. Measure the voltage between the headlight leveling control unit 16P connector No. 4 and No. 6 terminals, and No. 4 and No. 7 terminals while the suspension stroke sensor arm (A) is moved.

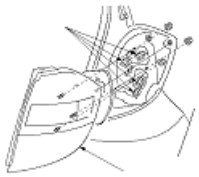




Is there about 0.5−4.5 V?
YES - Intermittent failure, the system is OK at this time. Check for loose or poor connection between the headlight leveling control unit and the front (or rear) suspension stroke sensor, if the connections are OK, replace the front (or rear) suspension stroke sensor .■
NO - Check for an open or a short in the wire between the headlight leveling control unit and the front (or rear) suspension stroke sensor, if the wires are OK, replace the front (or rear) suspension stroke sensor .■

Taillight Replacement

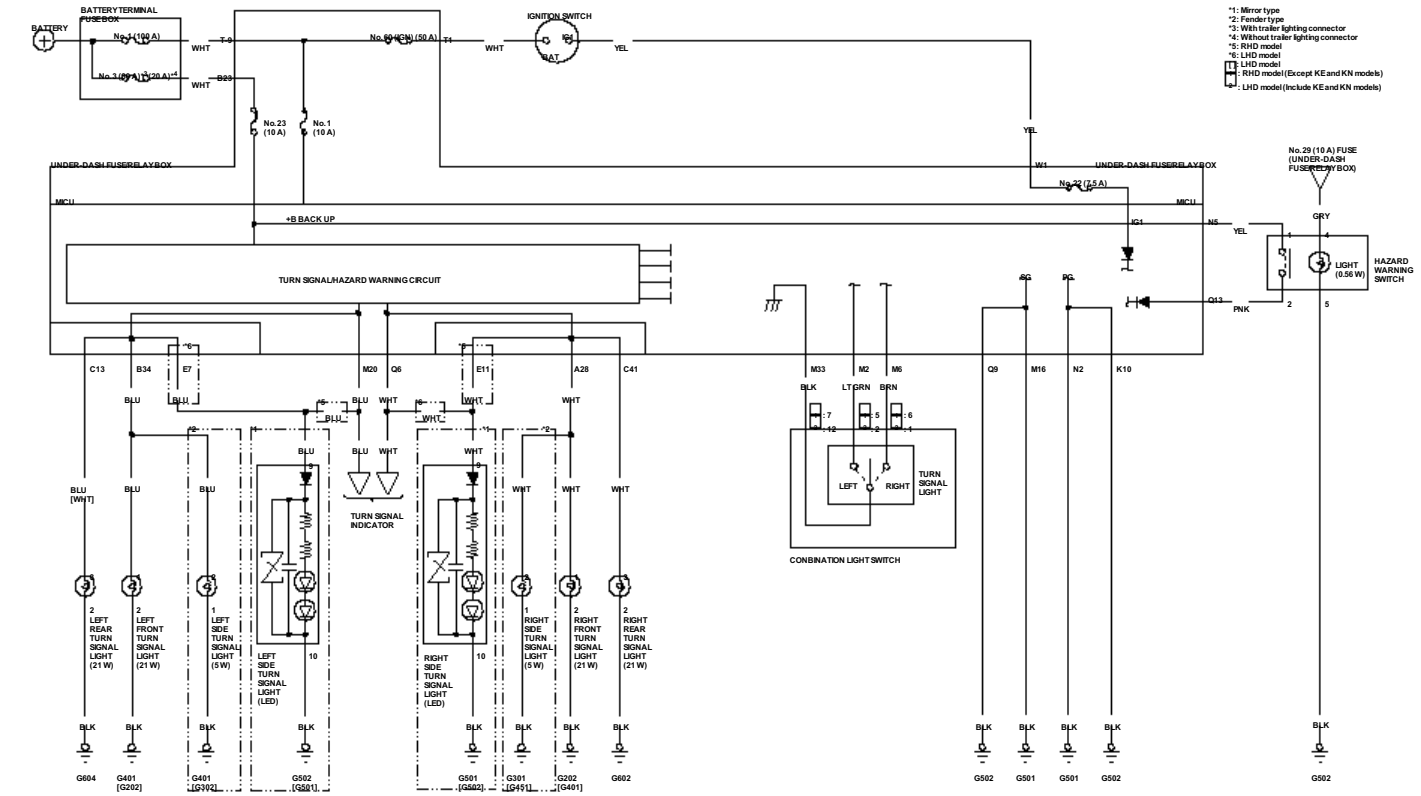
1. Open the tailgate and remove the maintenance lid.
2. Disconnect the connectors (A) from the taillights (B).
3. Remove the mounting nuts from the taillight.
4. Install the taillight in the reverse order of removal.



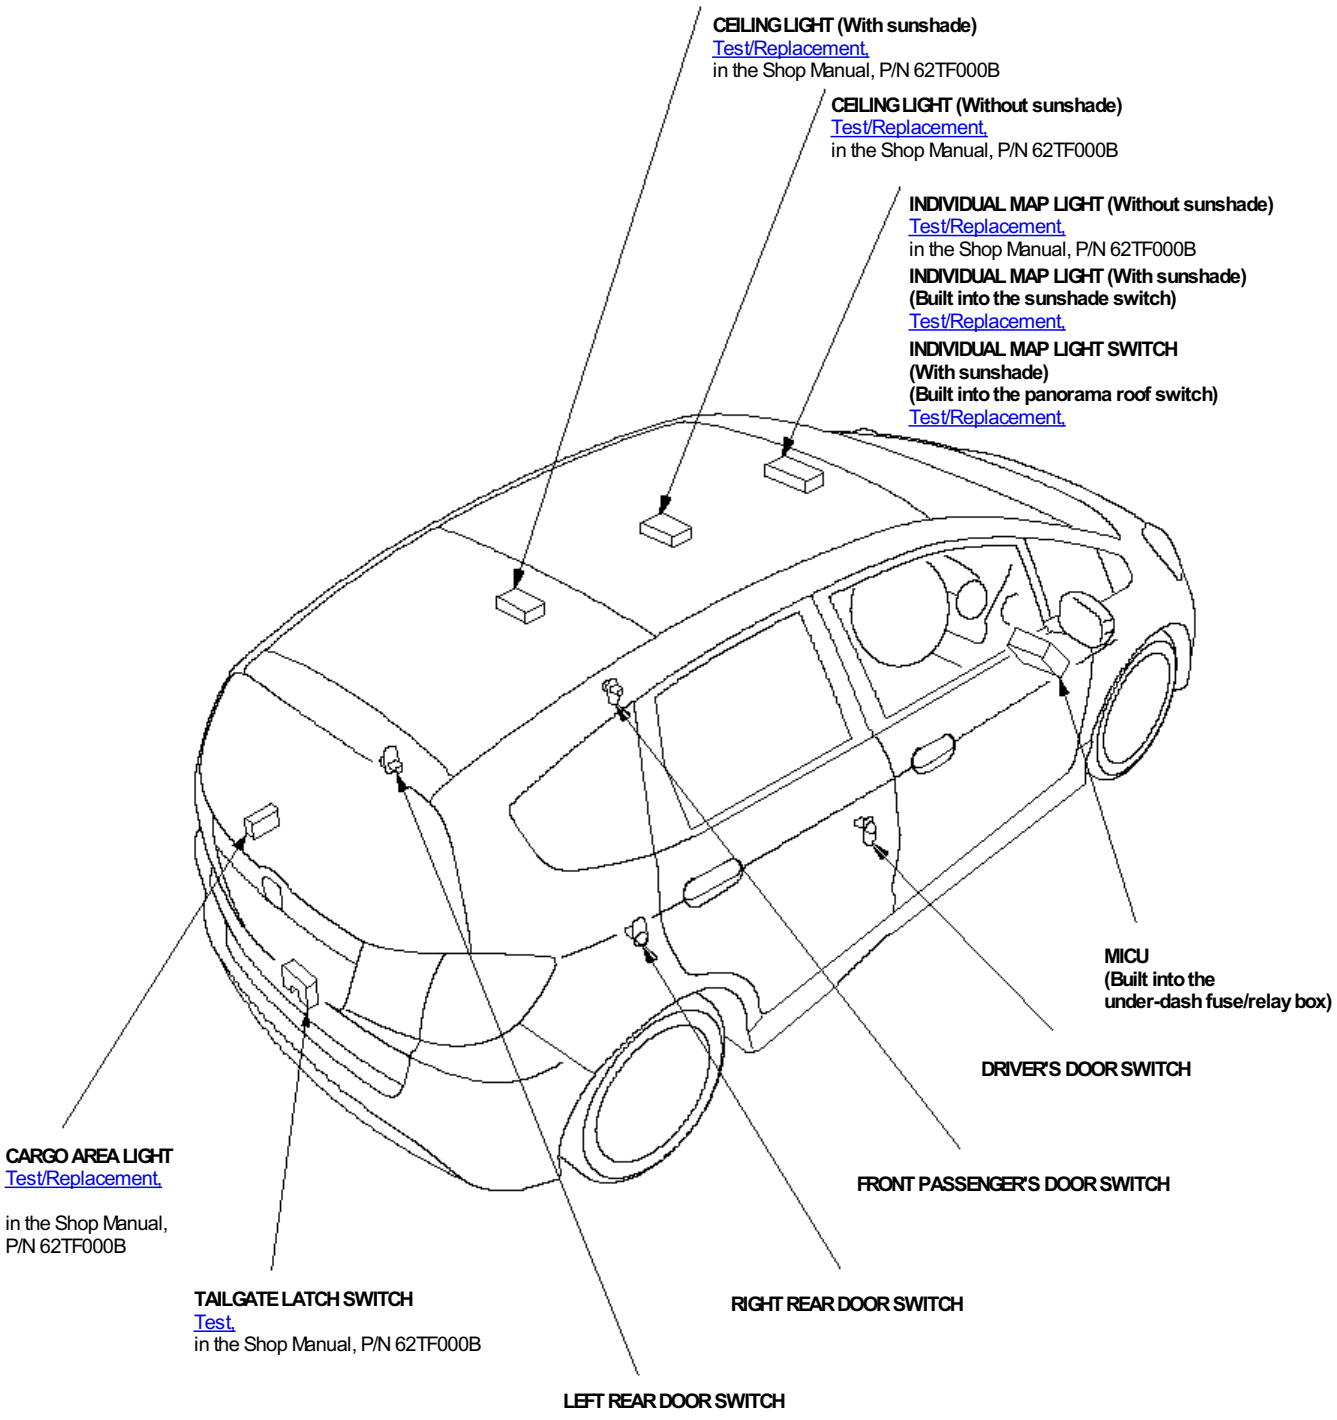
Turn Signal/Hazard Warning Lights System Description

[One-push Turn Signal]

Turn Signal/Hazard Warning Lights Circuit Diagram

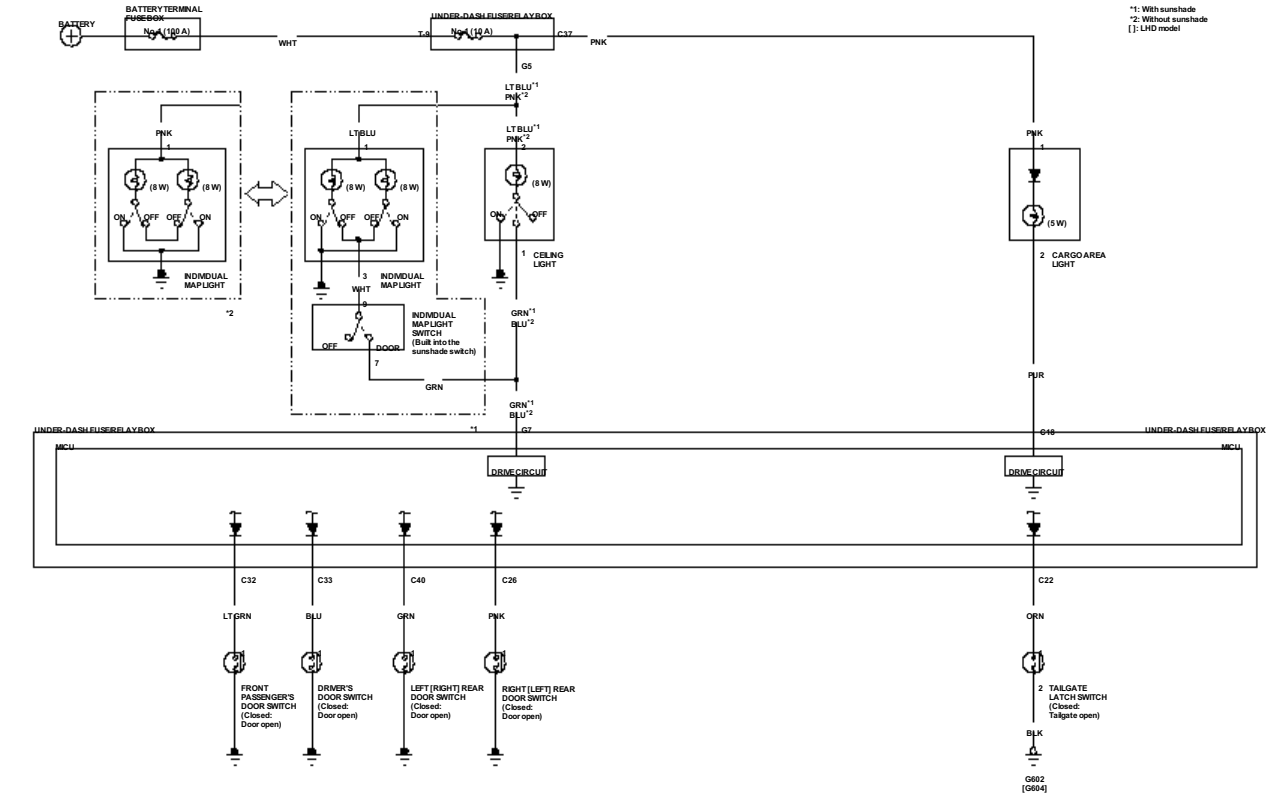


Interior Lights Component Location Index

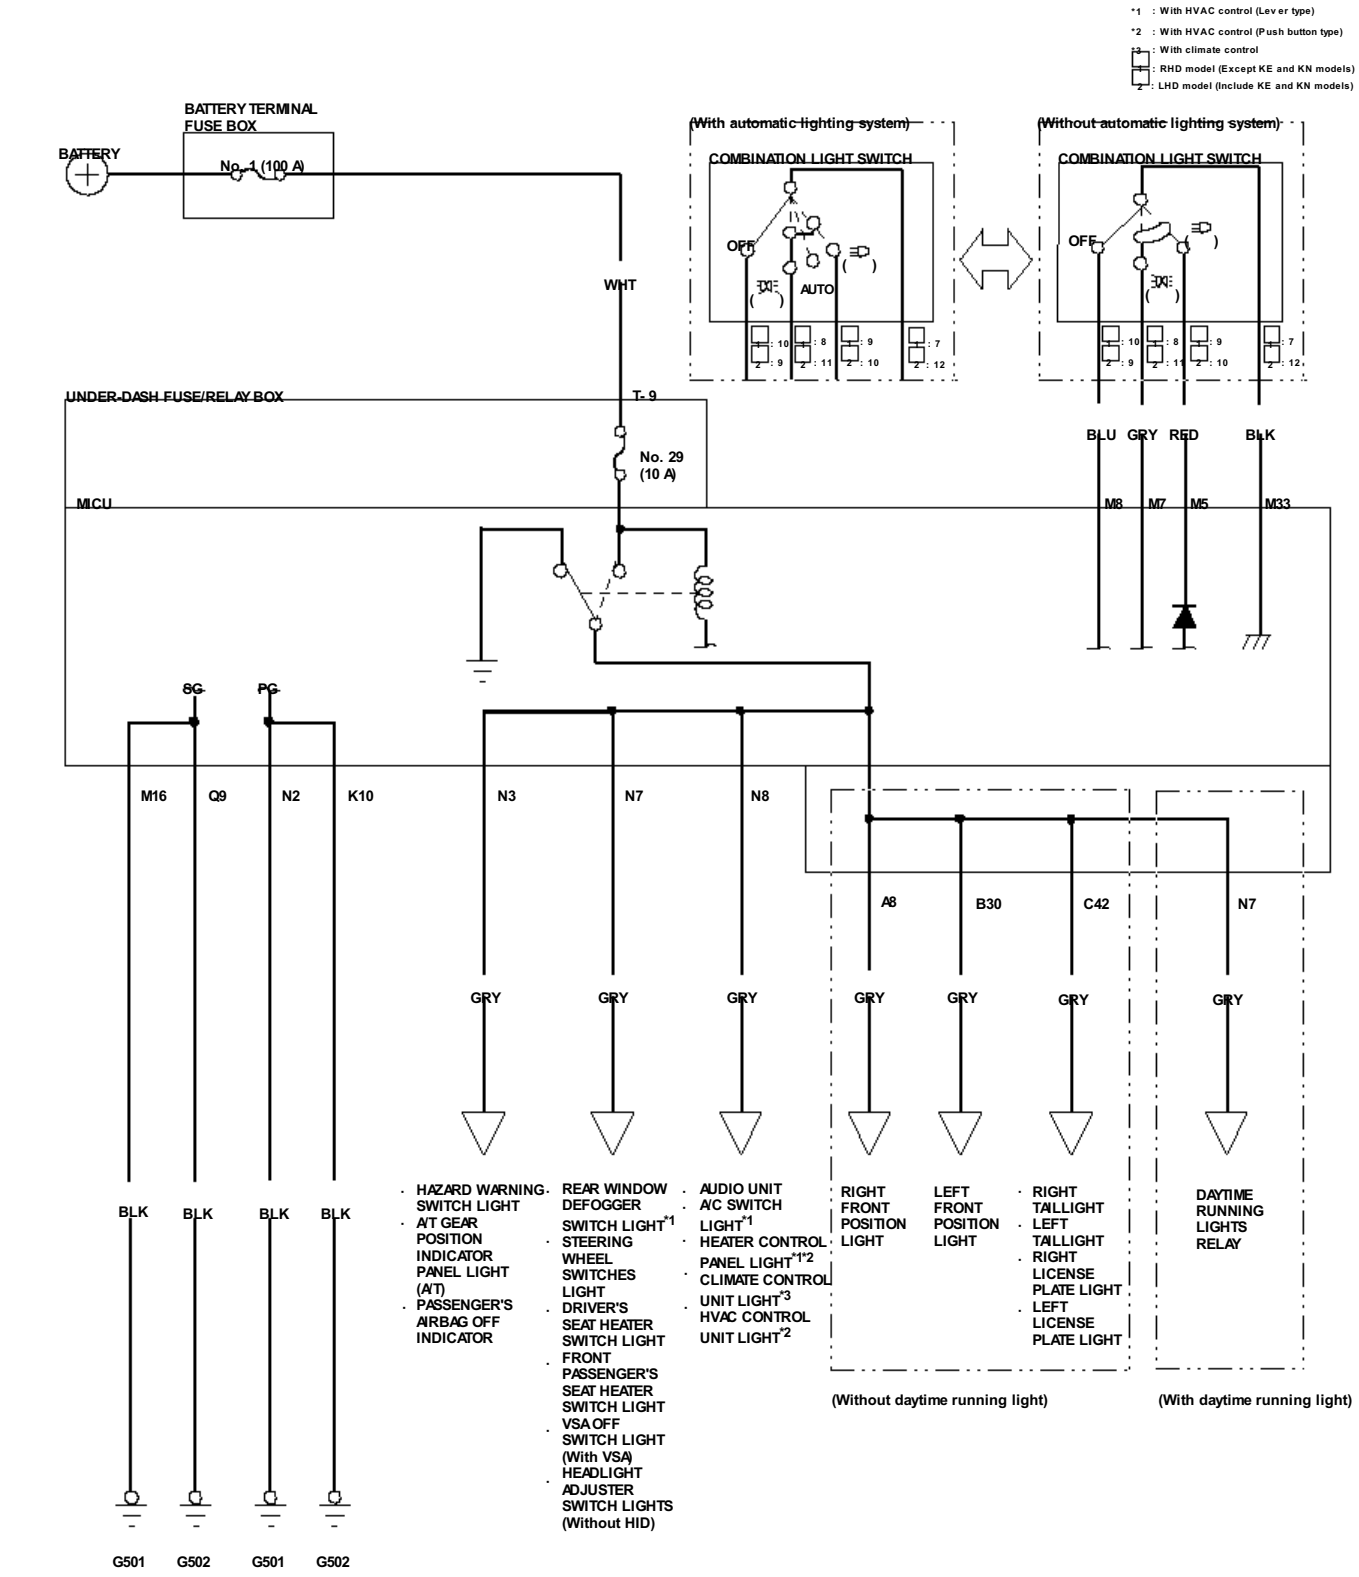


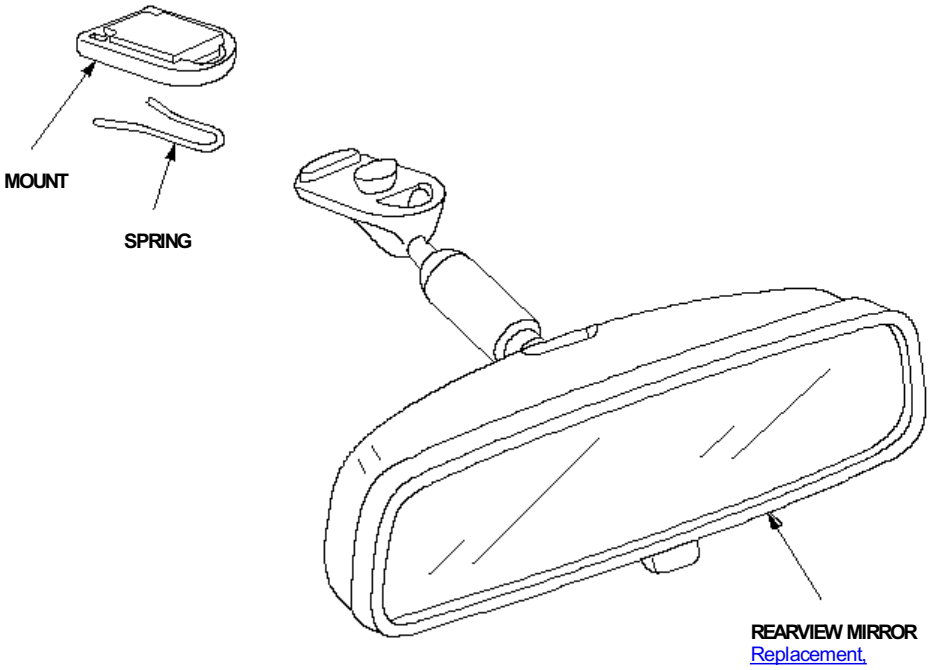
RHD model is shown, LHD model is similar.

Interior Lights Circuit Diagram



Dash Lights Circuit Diagram



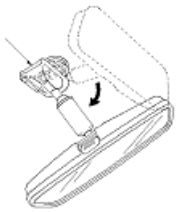


MOUNT
SPRING
REARVIEW MIRROR
Replacement,

Rearview Mirror Replacement

For Some Models

1. Turn the rearview mirror base (A) 90 °.



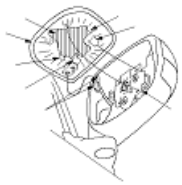
2. Slide the rearview mirror (A) down toward the bottom of the windshield to detach it from the spring (B) in the mount (C).
3. If necessary, remove the spring from the mount.
4. Install the rearview mirror in the reverse order of removal.

Mirror Holder Replacement

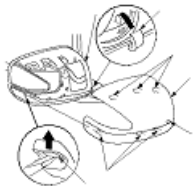
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the power mirror and related parts.
- LHD model is shown; RHD model is symmetrical.

1. Carefully push on the top edge of the mirror holder (A) by hand.
2. Put a shop towel in the opening between the lower edge of the mirror holder and the mirror housing to prevent scratches, and detach the bottom hooks (B) with a flat-tip screwdriver wrapped with protective tape.

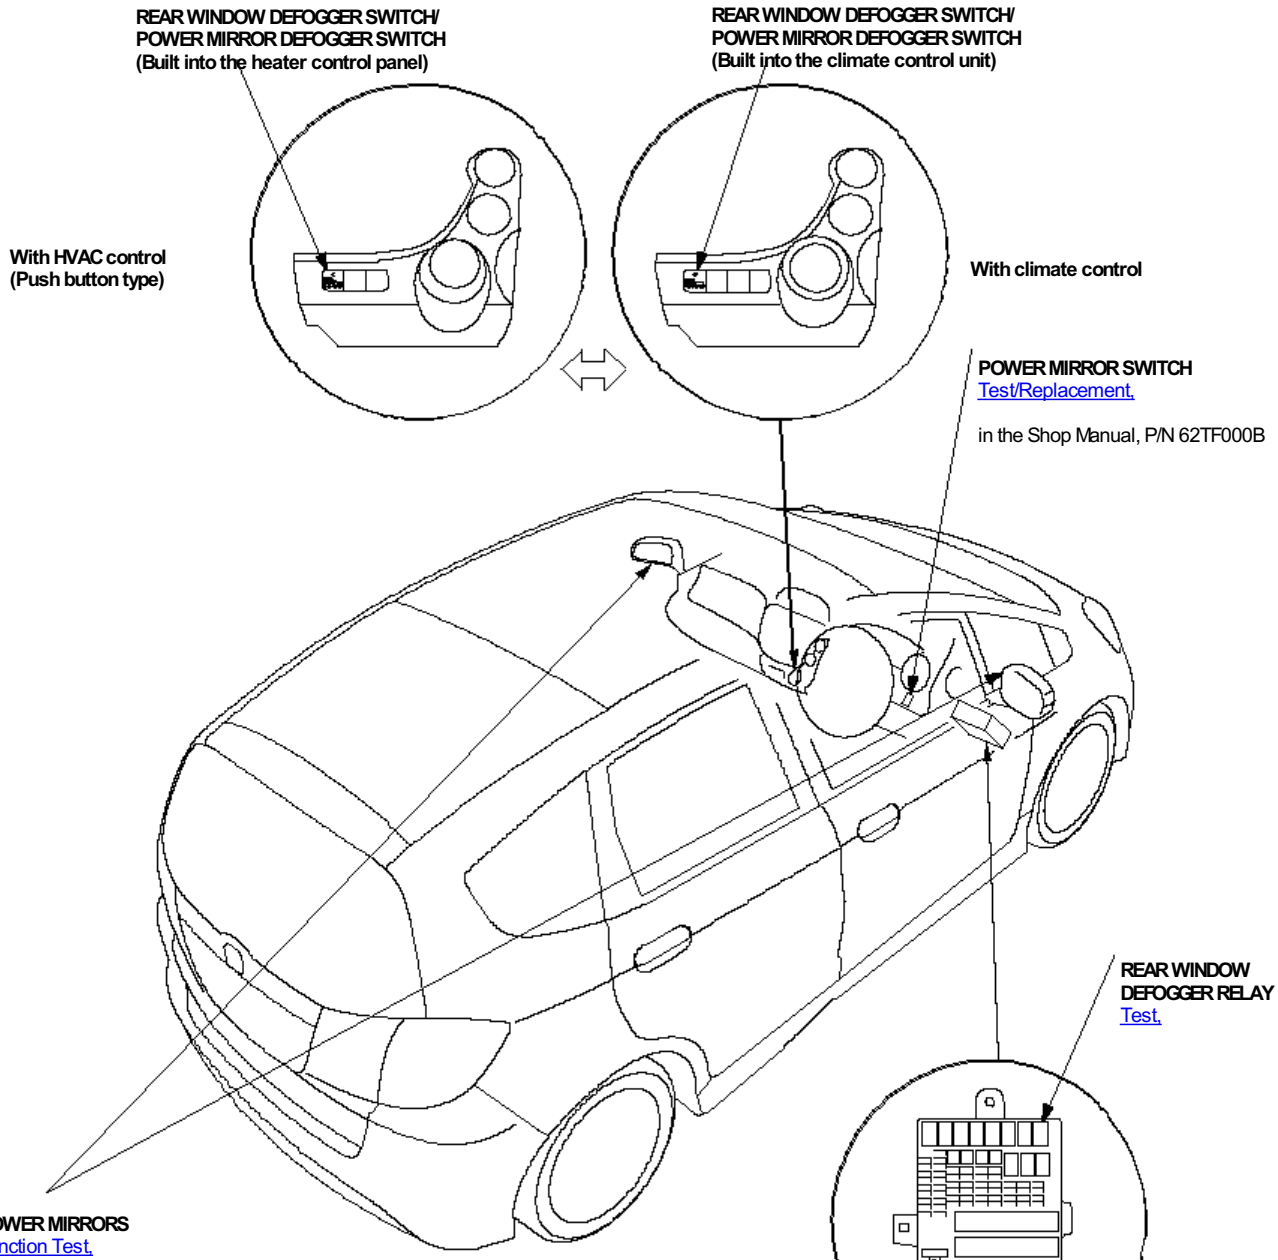


3. Carefully pull out the bottom edge of the mirror holder (A) to separate the adhesive (B), and then release the side clips (C).
4. Separate the mirror holder from the actuator (D) by releasing the hooks (E). If equipped, disconnect the mirror defogger terminals (F).



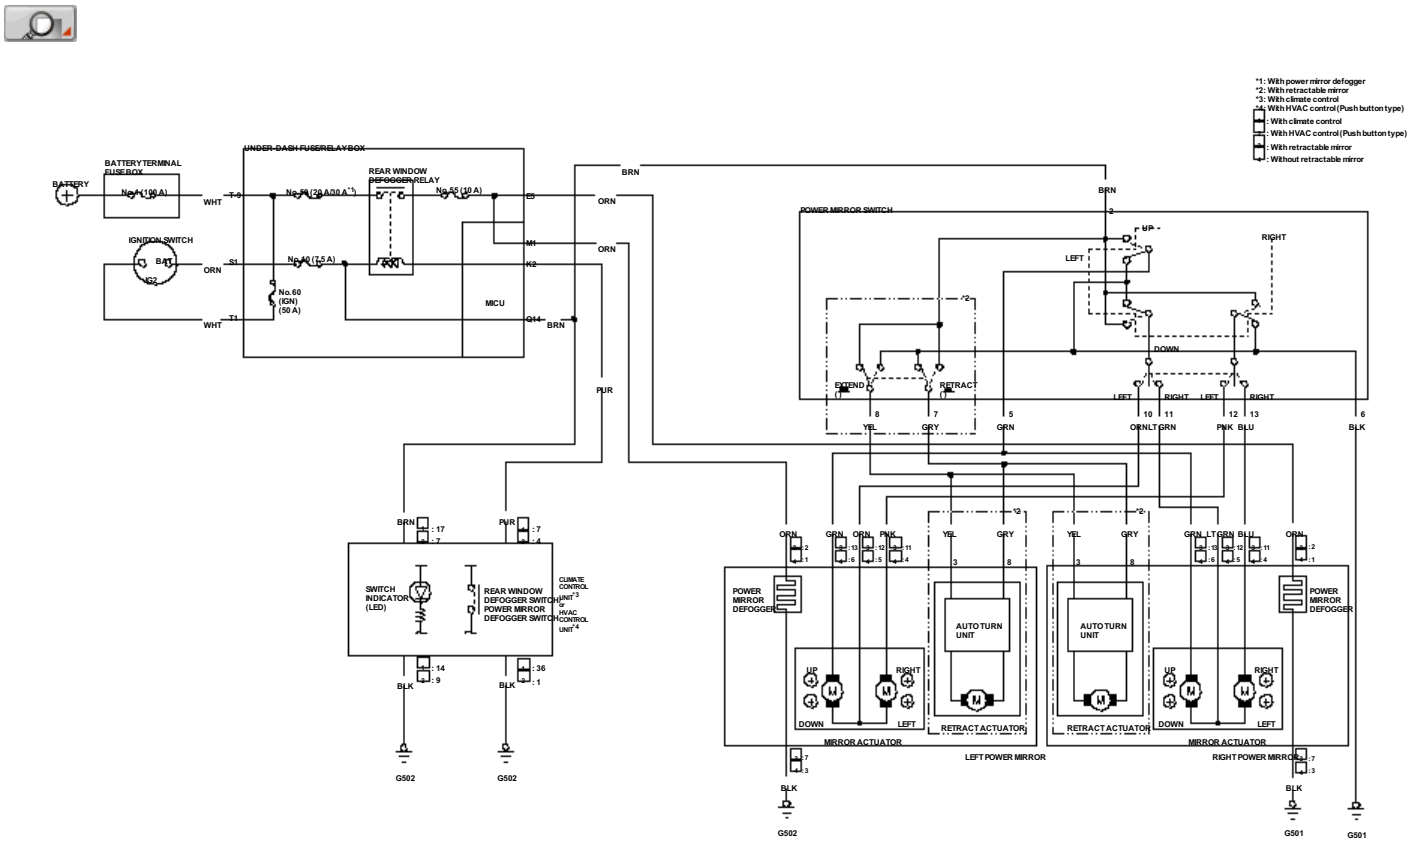
5. If necessary, remove the skull cap (A).
   -1. Remove the tabs (B) from inside the mirror housing (C).
   -2. Release the hook (D), then remove the skull cap.

Power Mirrors Component Location Index



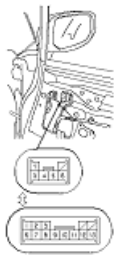
RHD model is shown, LHD model is similar.

Power Mirrors Circuit Diagram

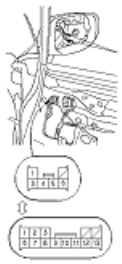


Power Mirror Defogger Test

NOTE: Before testing, check the No. 10, No. 55, No. 59 and No. 60 fuses in the under-dash fuse/relay box.
[ ]: Without retractable power mirror



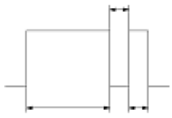
1. Remove the door panel.
2. Disconnect the power mirror 13P [6P] connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the power mirror 13P [6P] connector No. 2 [No. 1] terminal and body ground with the rear window defogger switch/power mirror defogger switch ON.
   There should be battery voltage.
   - If there is no voltage, check for:
     - Faulty rear window defogger switch/power mirror defogger switch
     - Faulty rear window defogger relay
     - An open in the wire.
     - Poor ground (G502)
   - If there is battery voltage, go to Step 5 .
5. Check for continuity between the power mirror 13P [6P] connector No. 7 [No. 3] terminal and body ground.
   There should be continuity.
   - If there is no continuity, check for:
     - An open in the wire.
     - Poor ground (G501, G502)
   - If there is continuity, go to Step 6 .
6. Remove the mirror holder and disconnect the mirror defogger terminals .



7. Check for an open in the wire between the power mirror 13P [6P] connector and the mirror defogger terminals (A). If the wire harness is OK, replace the mirror holder.

MICS Self-diagnostic Function

NOTE: Use only if the HDS is unavailable.



Test Mode 1

Special Tools Required

MPCS short connector
07WAZ-0010100

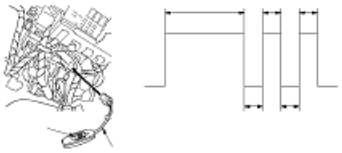
1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover. LHD model: Remove the fuse lid panel.
3. Check the No. 1 (10 A) fuse in the under-dash fuse/relay box and the No. 22 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is blown, find and correct the cause, then replace the fuse.
4. Turn the ceiling light switch in "DOOR" (middle) position. Close all doors. Turn the ignition switch to ON (II).
   NOTE: If the driver's seat belt is unbuckled, the beeper will beep.
5. Connect the MPCS short connector (A) to the MICU service check connector (B), and turn the switch (C) on.
6. After 5 seconds, the ceiling light should come on for 2 seconds, go out, then blink once for 0.2 second. This means that the system is in Test Mode 1 of the self-diagnostic function.
7. About 1 second after step 6, the ceiling light will blink and indicate the DTC, and repeat it every 3 seconds. If there is more than one DTC, the system will indicate them in ascending order, beginning from the DTC with the lowest numerical value. Troubleshoot the DTCs as indicated below:

DTC	Cause and Troubleshooting
1	The MICU cannot receive signals sent from the MICU itself (for checking the sending signals), or the MICU cannot receive signals from the gauge control module. If DTC 1 only indicates, substitute a known-good gauge control module and an MICU one by one at a time, in that order, and recheck for the DTC after each substitution.
5	The MICU cannot receive signals (VSP/NE message) from the gauge control module. If DTC 5 only indicates, substitute a known-good gauge control module, and recheck for the DTC.

How to cancel the Test Mode 1

NOTE: To cancel Test Mode 1, turn off the MICU short connector switch for more than 10 seconds or turn the ignition switch to LOCK (0).

Test Mode 2



1. While in Test Mode 1, turn off the MPCS short connector switch (A) for about 5 to 10 seconds, then turn it on again.
2. The ceiling light should come on for 2 seconds, go out, then blinks twice at 0.2 second intervals. This means the system has gone from Test Mode 1 to Test Mode 2.
3. While still in Test Mode 2, operate the switches in the table shown. If the circuit is OK, the ceiling light blinks once. If the circuit is faulty, the ceiling light does not blink.
   - If the ceiling light do not blink even a switch is operated, check two or three other circuits listed in the table. If the ceiling light blinks for each circuit, the additional circuits are OK, repair the short or open circuit that failed the test in Step 3 .
   - If the ceiling light does not blink again, this multiple failed circuits mean that the control unit has failed without triggering a DTC. Test a few more circuits. If they also fail, test the MICU input test. If all the input tests prove OK, substitute a known-good MICU or gauge control module one at a time, then recheck. If the system works properly, the part that was substituted is faulty; replace it.

Driver's door lock switch (UNLOCK) Driver's door lock switch (LOCK) Driver's door lock knob switch (UNLOCK) Driver's door lock knob switch (LOCK) Driver's door key cylinder switch (UNLOCK) *1 Driver's door key cylinder switch (LOCK) *1 Front passenger's door lock knob switch (UNLOCK) *1 Left rear door lock knob switch (UNLOCK) *1 Right rear door lock knob switch (UNLOCK) *1 Tailgate lock knob switch *2 Driver's door switch Front passengers' door switch Left rear door switch Right rear door switch Tailgate latch switch Audio switch Windshield wiper HI/LO switch Windshield wiper INT/LO switch Windshield wiper MIST switch Windshield washer switch	Rainfall sensitivity adjuster *3 Windshield wiper intermittent dwell time controller Rear window wiper switch Rear window washer switch Turn signal switch (LEFT) Turn signal switch (RIGHT) Hazard warning switch Headlight switch (ON) Headlight switch (OFF) Lighting switch Dimmer switch Passing switch Front fog light switch Rear fog light switch Hood switch *4 Brake pedal position switch Transmission range switch (P) Transmission range switch (R) Back-up light switch (M/T) Ignition key switch

How to cancel the Test Mode 2

NOTE: To cancel Test Mode 2, disconnect the MPCS short connector from the multiplex control inspection connector for more than 10 seconds or turn the ignition switch to LOCK (0).

MICS System Description

The MICU that is combined with the under-dash fuse/relay box is one of the B-CAN network components. The MICU controls many systems related to the body controller area and security system, and also works as a gateway to diagnose the other B-CAN connected ECUs with the HDS.
Refer to each system circuit diagram for details.

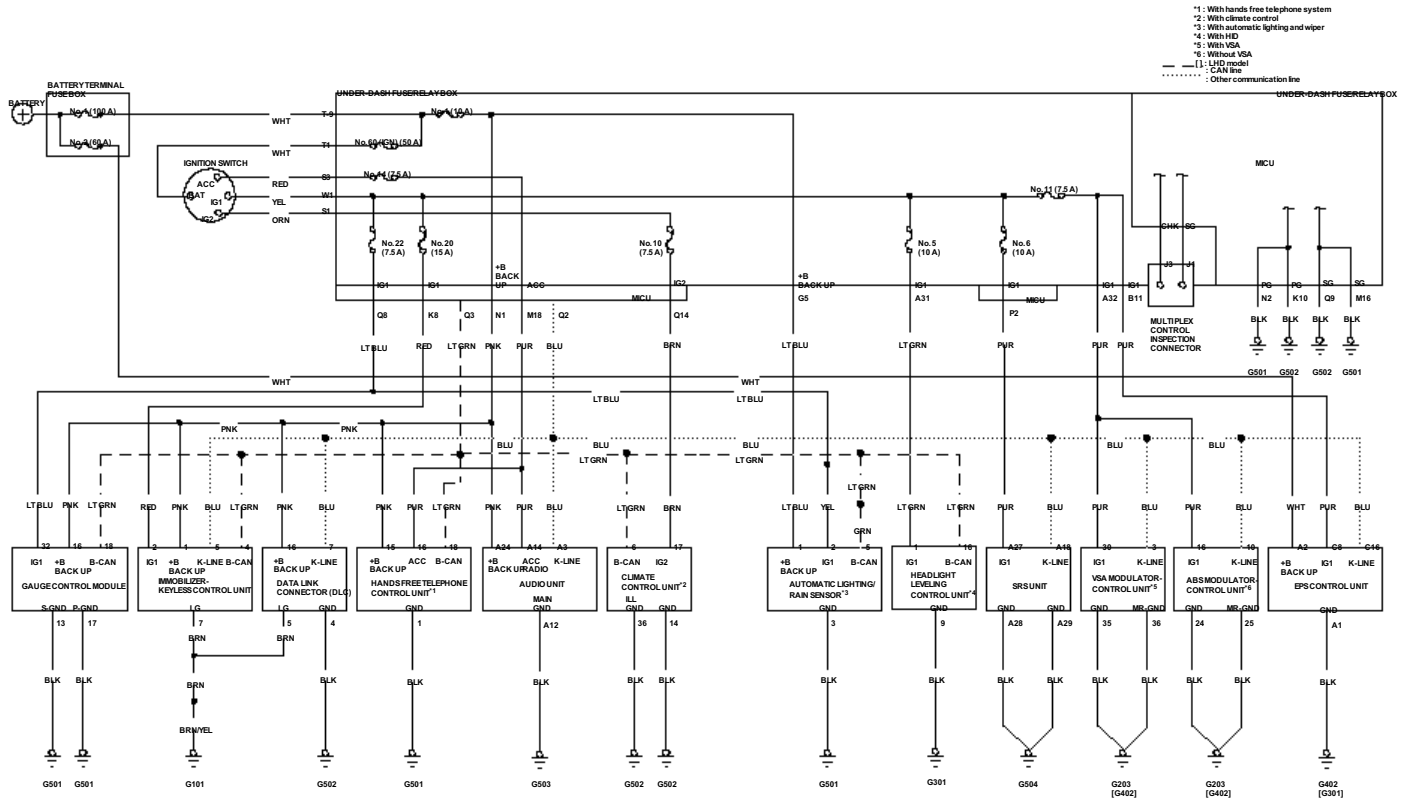
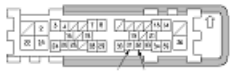
MICS Circuit Diagram



MICS (MICU) Input Test



1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, G, K, M, N, P, and Q.
   NOTE: All connector views are shown from wire side of female terminals.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
Q2	BLU	Under all conditions	Check for continuity between the Q2 terminal and the data link connector (16P) connector No. 7 terminal: There should be continuity.	An open in the wire
Q2	BLU	Immobilizer-keyless control unit 7P connector disconnected	Check for continuity between the Q2 terminal and the immobilizer-keyless control unit 7P connector No. 5 terminal: There should be continuity.	An open in the wire
Q2	BLU	Audio unit connector A (24P) disconnected	Check for continuity between the Q2 terminal and audio unit connector A (24P) No. 3 terminal: There should be continuity.	An open in the wire
Q2	BLU	SRS unit connector A (39P) disconnected	Check for continuity between the Q2 terminal and SRS unit connector A (39P) No. 18 terminal: There should be continuity.	An open in the wire
Q2	BLU	ABS modulator-control unit 25P connector disconnected	Check for continuity between the Q2 terminal and the ABS modulator-control unit 25P connector No. 10 terminal: There should be continuity.	An open in the wire
Q2	BLU	VSA modulator-control unit 36P connector disconnected	Check for continuity between the Q2 terminal and the VSA modulator-control unit 36P connector No. 3 terminal: There should be continuity.	An open in the wire
Q2	BLU	EPS control unit connector C (16P) disconnected	Check for continuity between the Q2 terminal and EPS control unit connector C (16P) No. 16 terminal: There should be continuity.	An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q3	LT GRN	Immobilizer-keyless control unit 7P connector disconnected	Check for continuity between the Q3 terminal and the immobilizer-keyless control unit 7P connector No. 4 terminal: There should be continuity.	An open in the wire
Q3	LT GRN	Gauge control module 32P connector disconnected	Check for continuity between the Q3 terminal and the gauge control module 32P connector No. 18 terminal: There should be continuity.	An open in the wire
Q3	LT GRN	Climate control unit 36P connector disconnected	Check for continuity between the Q3 terminal and the climate control unit 36P connector No. 6 terminal: There should be continuity.	An open in the wire
Q3	LT GRN	Hands free telephone control unit 28P connector disconnected	Check for continuity between the Q3 terminal and the hands free telephone control unit 28P connector No. 18 terminal: There should be continuity.	An open in the wire
Q3	LT GRN	Headlight leveling control unit 16P connector disconnected	Check for continuity between the Q3 terminal and the headlight leveling control unit 16P connector No. 16 terminal: There should be continuity.	An open in the wire
Q3	LT GRN	Automatic lighting/rain sensor 5P connector disconnected	Check for continuity between the Q3 terminal and the automatic lighting/rain sensor 5P connector No. 5 terminal: There should be continuity.	An open in the wire
Q2	BLU	Disconnect these connectors: • Immobilizer-keyless control unit 7P connector • Audio unit connector A (24P) • SRS unit connector A (39P) • ABS modulator control unit 25P connector (Without VSA) • VSA modulator control unit 36P connector (With VSA) • EPS control unit connector C (16P)	Check for continuity to ground: There should be no continuity.	A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q3	LT GRN	Disconnect these connectors: • Immobilizer-keyless control unit 7P connector • Gauge control module 32P connector • Climate control unit 36P connector (With climate control) • Hands free telephone control unit 28P connector (With hands free telephone system) • Headlight leveling control unit 16P connector (With HID) • Automatic lighting/rain sensor 5P connector (With automatic lighting/automatic wiper system)	Check for continuity to ground: There should be no continuity.	A short to ground in the wire

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 7 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
N1	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
M18	PUR	Ignition switch ACC (I)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 14 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K8	RED	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 20 (15 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
Q8	LT BLU	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
P2	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 6 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
A32	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 11 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
B11	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 11 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
Q14	BRN	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 10 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

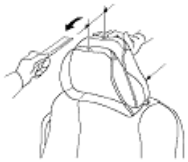
Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A31	LT GRN	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 5 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
G5	LT BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

7. If multiple failures are found on more than one control unit, replace the under-dash fuse/relay box (includes the MICU). If input failures are related to a particular control unit, replace the control unit.

Front Seat Active Head Restraint Inspection

NOTE: If the vehicle has been in a collision, always inspect the active head restraint, even if they appear reusable, by doing the following procedure.

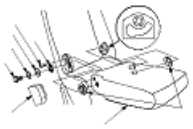
1. Fold the seat-back forward, then recline the seat-back to the first lock position, and adjust the head restraint to the highest position.
2. Apply masking tape on the top of the head restraint.
3. Make marks (A) on both sides at 250 mm (9.84 in.) upward from the roots of the head restraint frame (B) along the back of the head restraint (C) surface. Make a center of these points as a datum point (D).



4. Push the head restraint (A) forward, and check: With a scale, measure the level amount of the head restraint movement. The head restraint should move more than 50 mm (2.0 in.) without resistance. If it is less than 50 mm (2.0 in.), or the head restraint doesn't move smoothly, replace the seat-back frame:
   - Driver's seat
   - Passenger's seat

Rear Seat Armrest Replacement

NOTE: Take care not to tear the seams or damage the seatcovers.

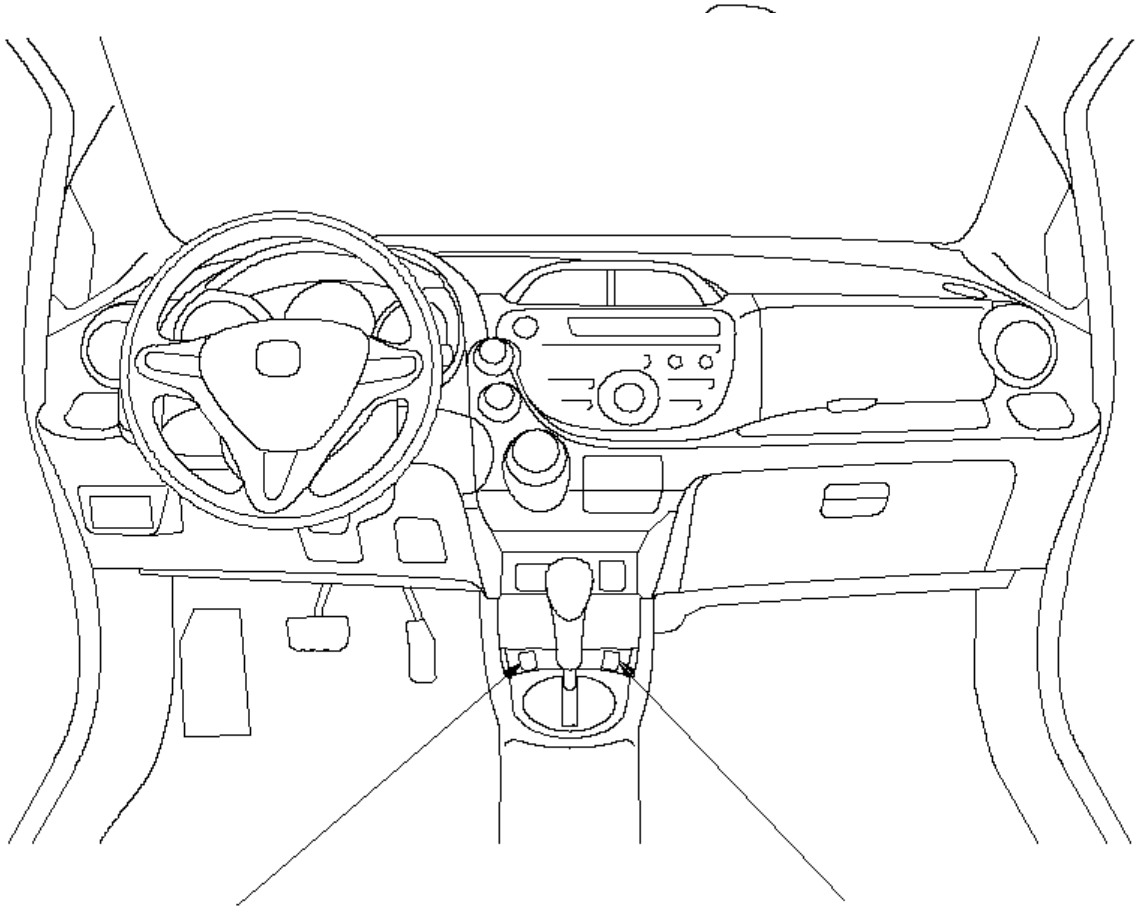


1. Remove the rear seat armrest (A).
   -1. Remove the rear center armrest garnish (B).
   -2. Remove the bolt (C) and pivot bolt (D) and wave washer (E) and plain washer (F) nylon washer (G), then remove the rear seat armrest.
   -3. If necessary, remove the collar (I).

2. Install the armrest in the reverse order of removal, and note these items:
   If the collar and nylon washer are damaged or stress-whitened, replace them with new ones.

Seat Heaters Component Location Index

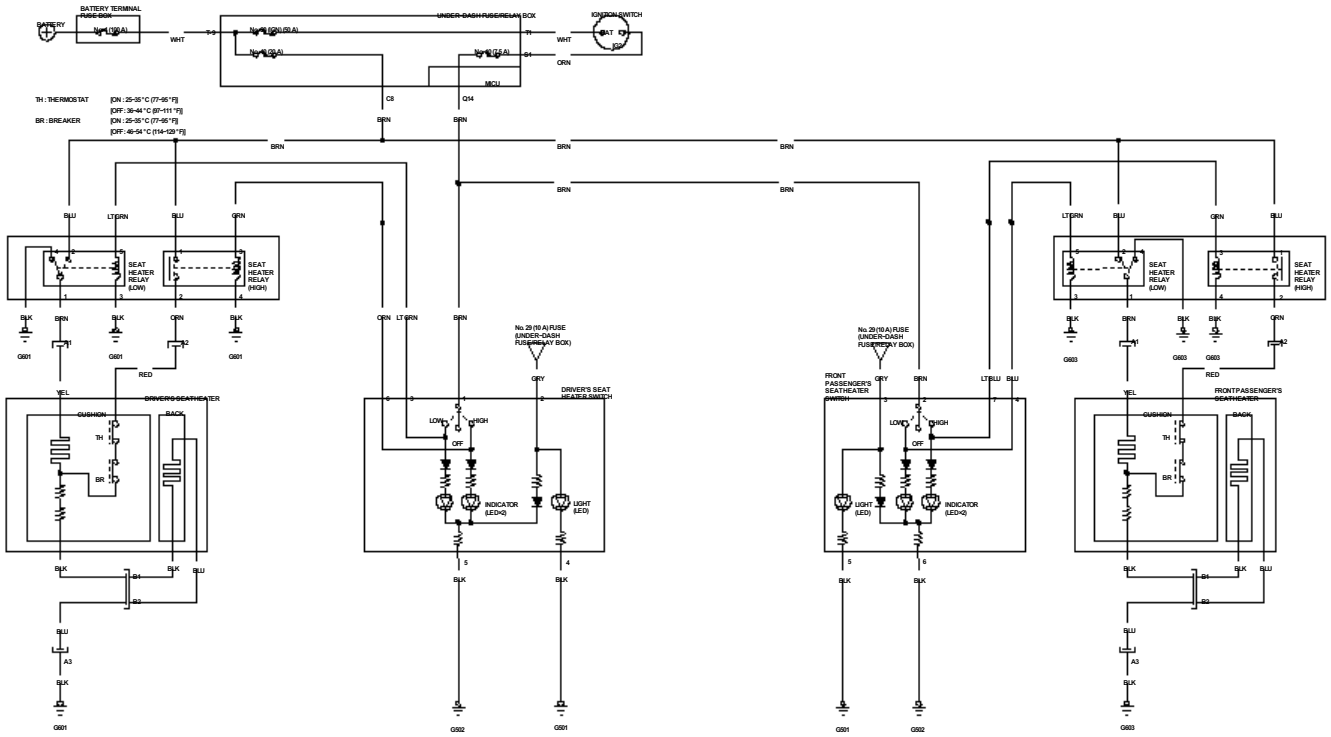
Driver's Seat



DRIVER'S SEAT HEATER SWITCH
Test/Replacement.

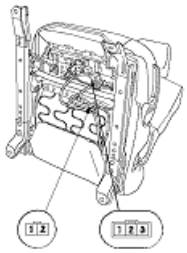
FRONT PASSENGER'S SEAT HEATER SWITCH
Test/Replacement.

Seat Heaters Circuit Diagram



Seat Heater Test

Driver's Seat



1. Remove the driver's seat.
2. Disconnect the connector A (3P) and connector B (2P) from the seat heaters.
3. Check for continuity between the seat heater connector B (2P) No. 1 and No. 2 terminals. There should be continuity. If the continuity is not as specified, replace the seat-back heater.
4. Reconnect seat heater connector B (2P) to the seat-back heater.
5. Check for continuity between the seat heater connector A (3P) No. 1 and No. 2, No. 2 and No. 3 terminals, and No. 1 and No. 3 terminals. There should be continuity. If the continuity is not as specified, replace the seat cushion heater.

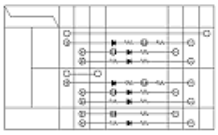
Front Passenger's Seat

1. Remove the passenger's seat.
2. Disconnect the connector A (3P) and connector B (2P) from the seat heaters.
3. Check for continuity between the seat heater connector B (2P) No. 1 and No. 2 terminals. There should be continuity. If the continuity is not as specified, replace the seat-back heater.
4. Reconnect seat heater connector B (2P) to the seat-back heater.
5. Check for continuity between the seat heater connector A (3P) No. 1 and No. 2, No. 2 and No. 3 terminals, and No. 1 and No. 3 terminals. There should be continuity. If the continuity is not as specified, replace the seat cushion heater.

Seat Heater Switch Test/Replacement

1. Remove the center console panel.
2. Disconnect the 6P (or 7P *) connector from the seat heater switch, then remove the switch.
   *: Front passenger's seat heater switch

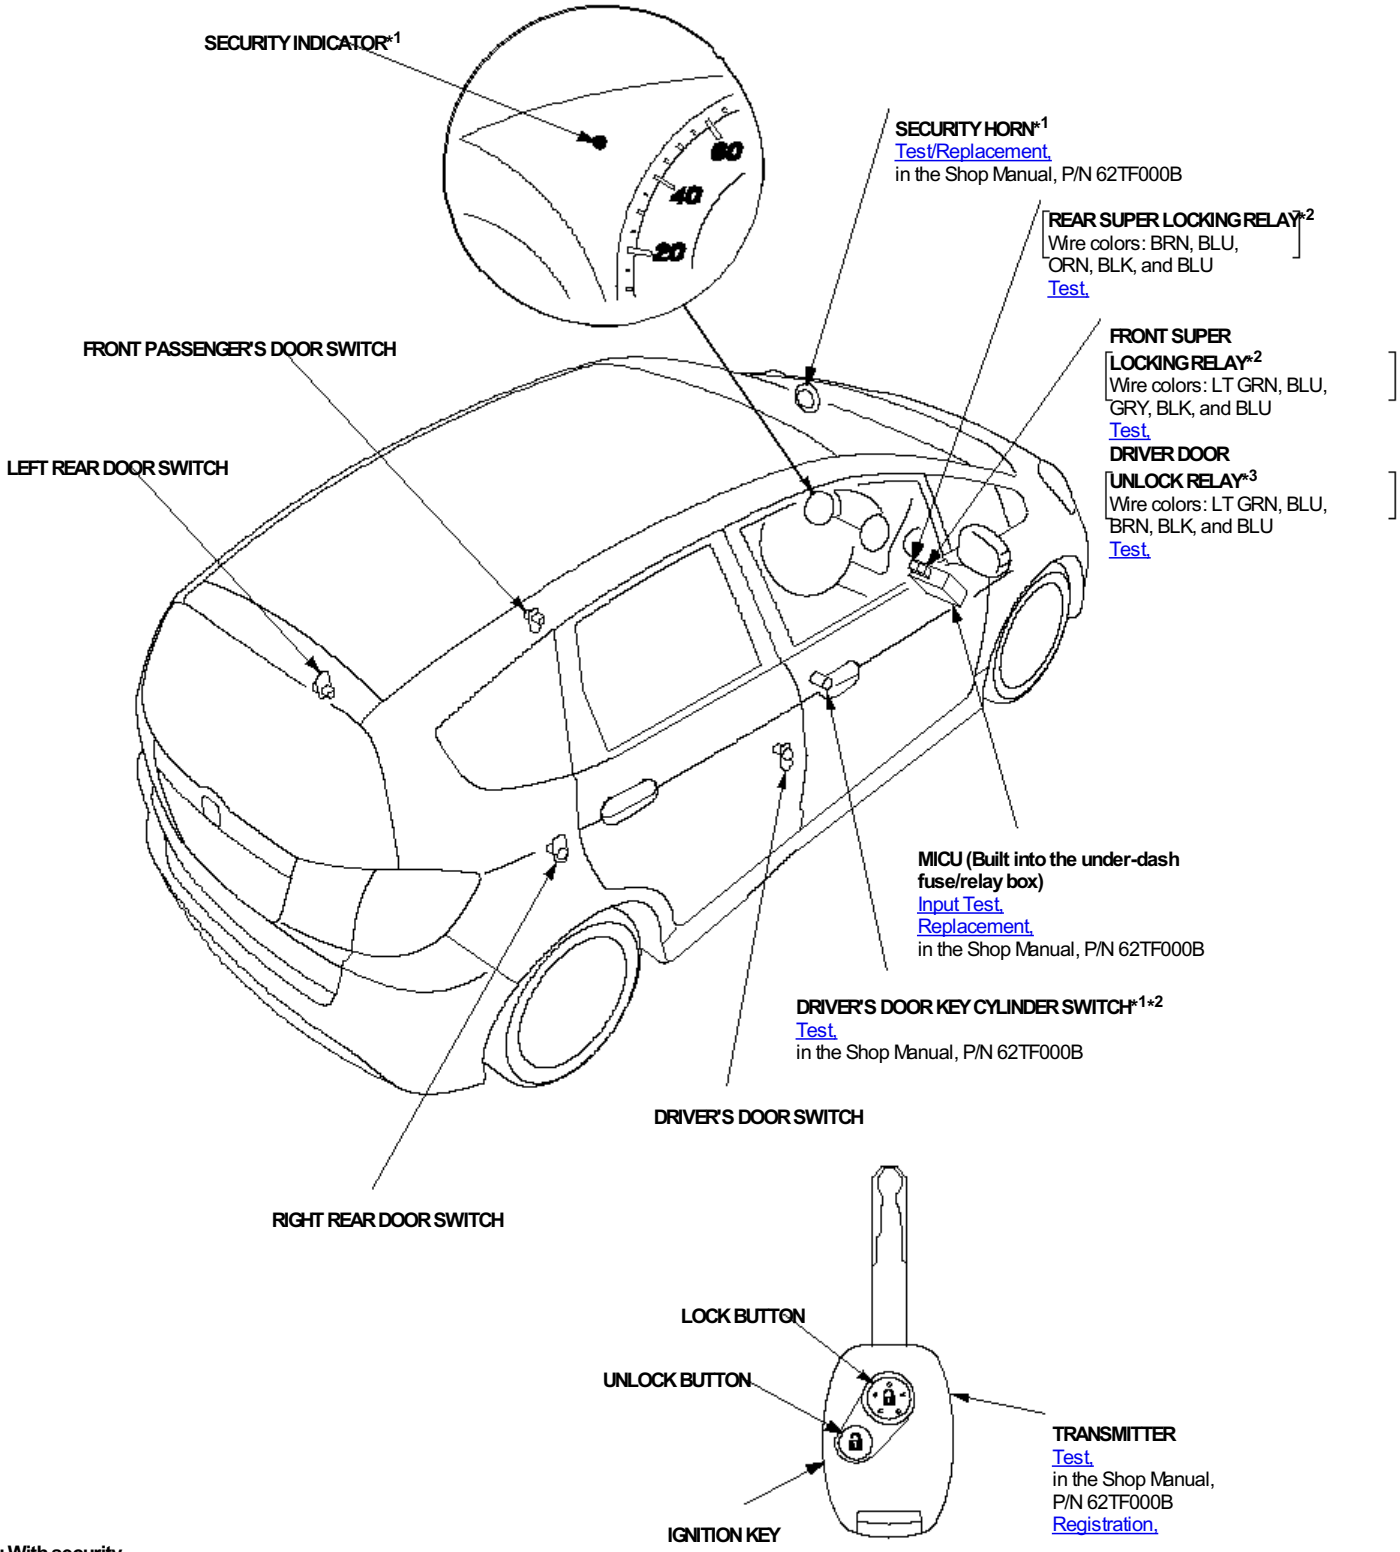
3. Check for continuity between the terminals in each switch position according to the table.
   NOTE: Make sure the correct test lead (+ or −) is placed on the terminal.
4. If the continuity is not as specified, replace the switch.



Keyless/Power Door Locks/Security System Description - Supplement

Super locking system

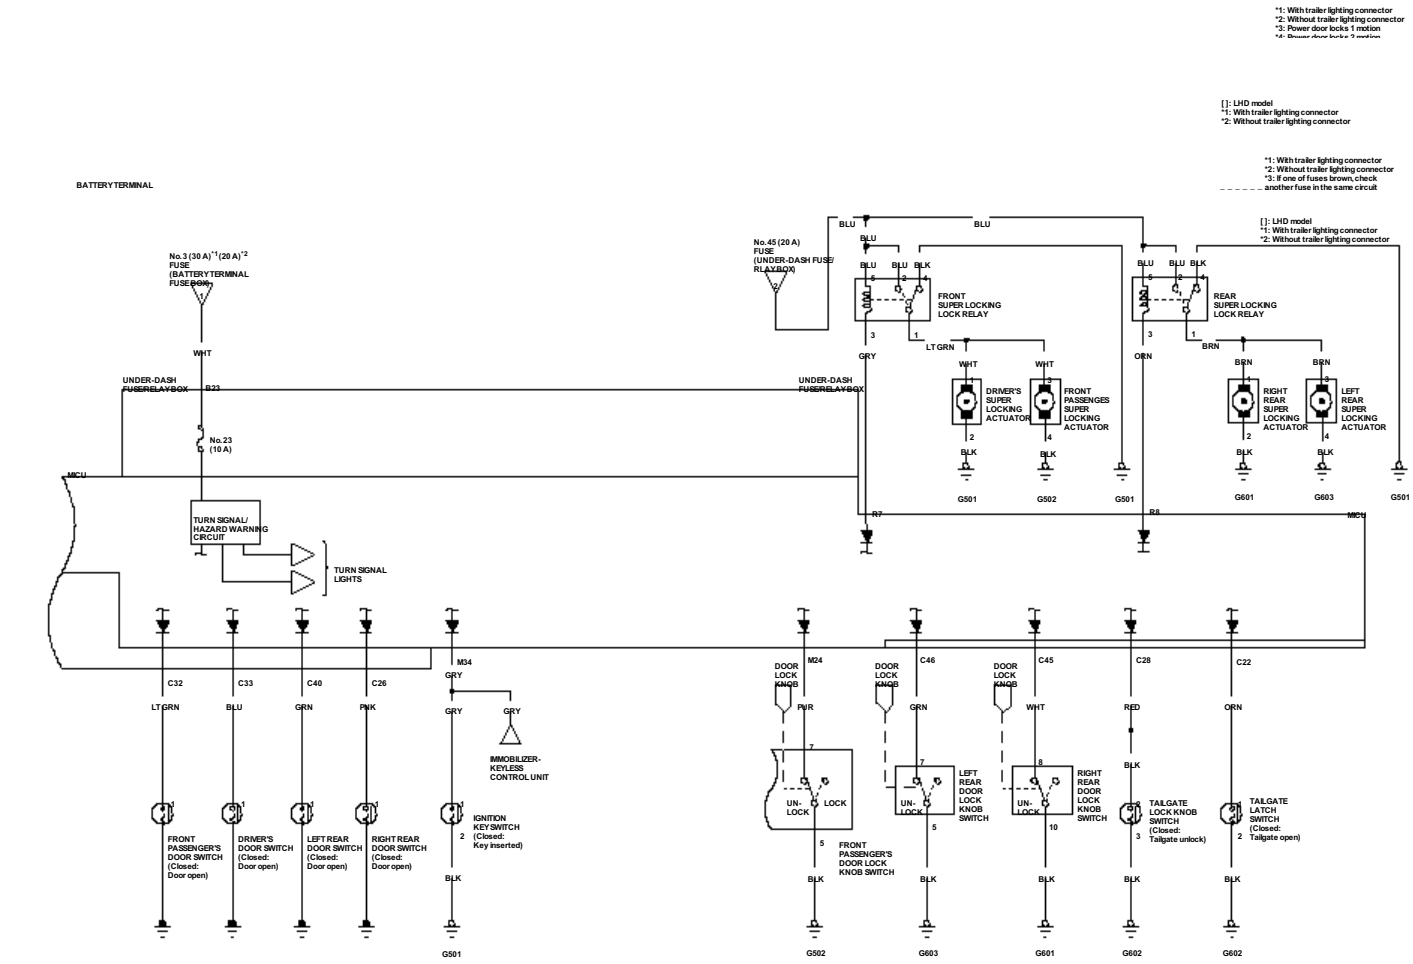
Keyless/Power Door Locks/Security System Component Location Index



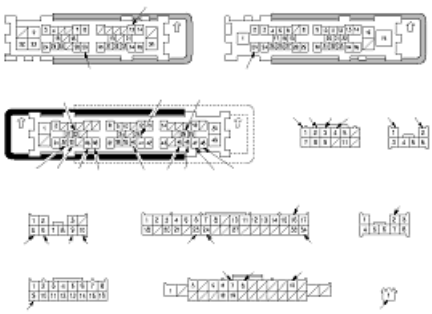
***1: With security**
***2: With super locking**
***3: Power door locks 2motion**
RHD model is shown, LHD model is similar.

Keyless/Power Door Locks/Security System Circuit Diagram

Without super locking



Keyless/Power Door Locks/Security System (MICU) Input Test



NOTE:

- Before testing, make sure the turn signal/hazard warning lights work properly.
- Before testing, check the No. 1 (10 A), No. 20 (15 A), No. 22 (7.5 A), No. 27 (30 A), No. 35 (10 A), No. 36 (15 A), No. 45 (15 A or 20 A), No. 49 (15 A), No. 50 (15 A), and No. 60 (50 A) fuses in the under-dash fuse/relay box.
- There are two pairs of fuses in the same circuit (No. 35 and No. 49 fuses, No. 36 and No. 50 fuses). If one fuse is brown, make sure to check another fuse in the same circuit. If necessary, replace the damaged fuse(s).

1. Turn the ignition switch to LOCK (0).

2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.

3. Disconnect under-dash fuse/relay box connectors A, B, C, E, F, K, M, N, Q, R, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .

5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

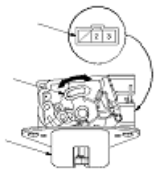
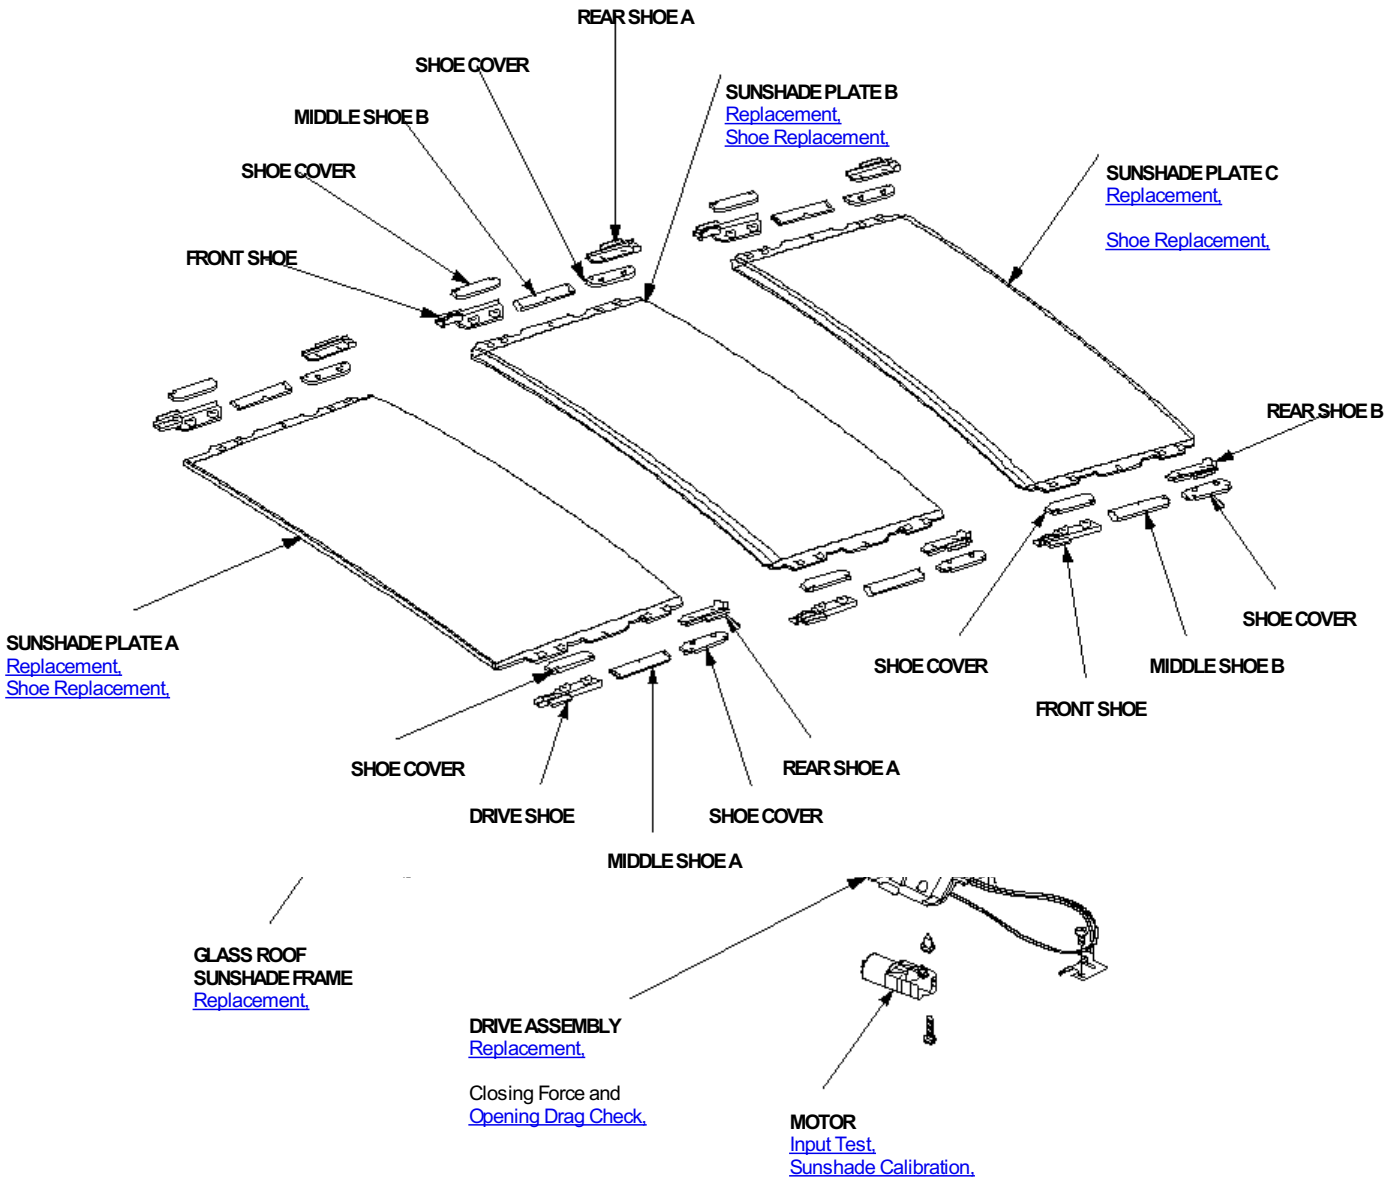
Tailgate Lock Knob Switch Test

With Super Locking

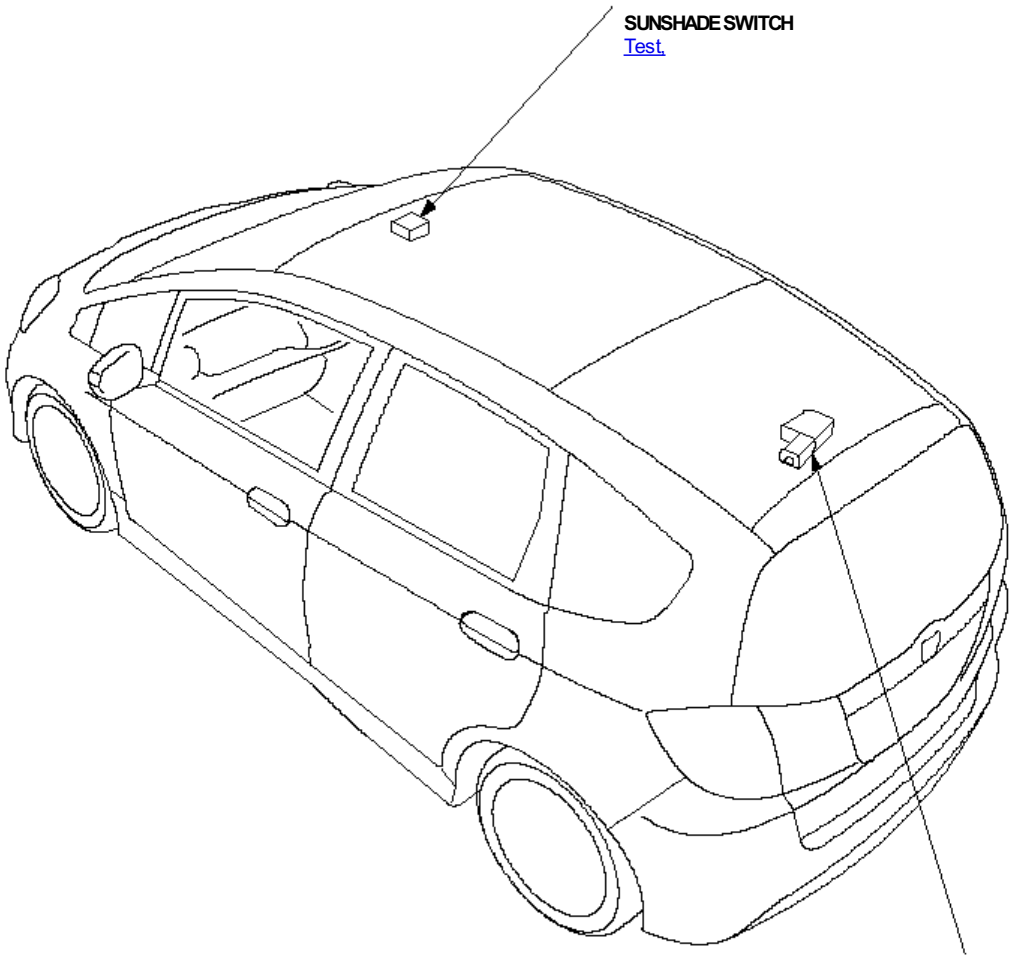


1. Remove the tailgate latch (A).
2. Check for continuity between the tailgate lock knob switch 3P connector (B) terminals.
   - There should be continuity between the No. 2 and No. 3 terminals when the lock knob (C) is turned counterclockwise (UNLOCK position).
   - There should be no continuity between the No. 2 and No. 3 terminals when the lock knob (C) is turned clockwise (LOCK position)
3. If the continuity is not as specified, replace the tailgate latch.

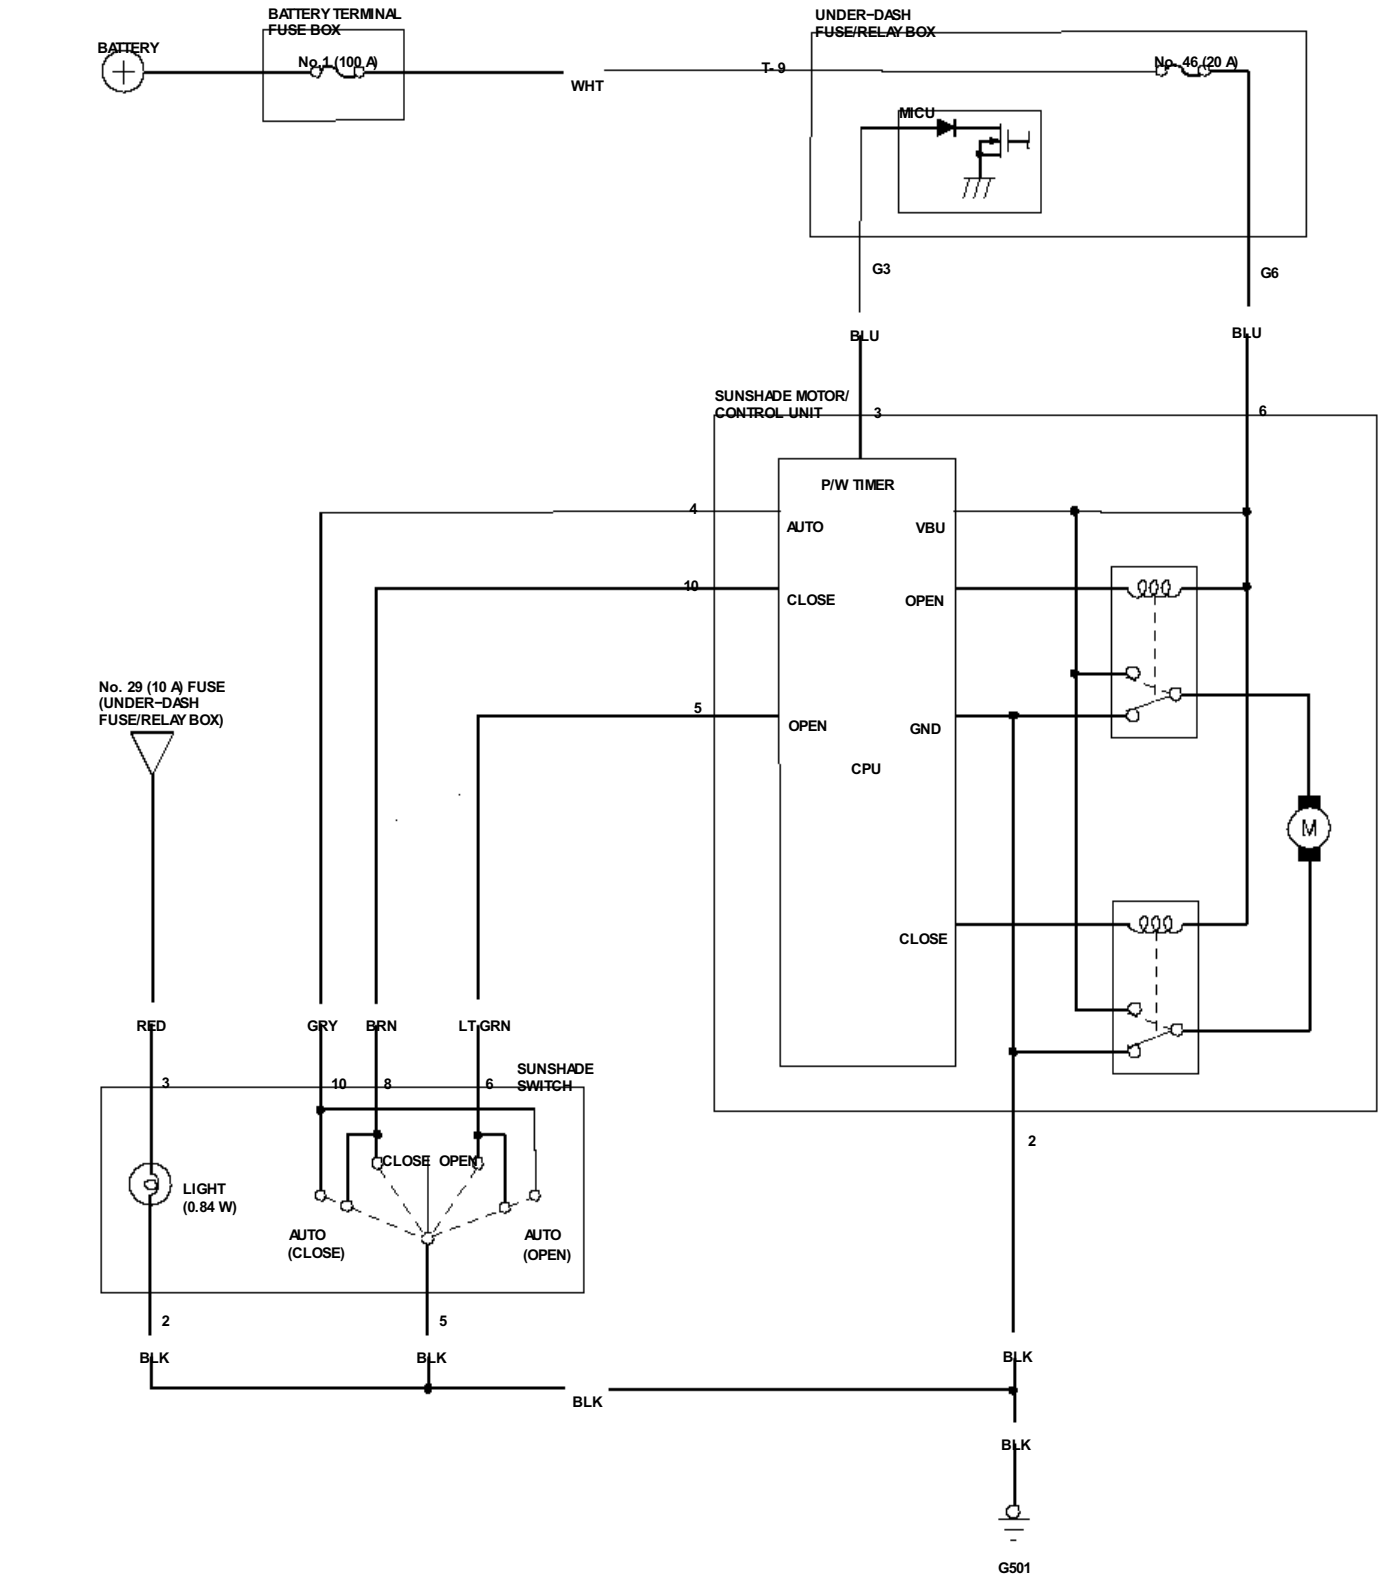
Glass Roof Sunshade Mechanical Component Location Index



Glass Roof Sunshade Electrical Component Location Index



Glass Roof Sunshade Circuit Diagram



Glass Roof Sunshade Opening Drag Check

1. Remove the sunshade motor.
2. Operate the sunshade switch to open the sunshade until a spring scale (B) can be set to the sunshade plate A (about 100 mm (0.39 in.)).
3. With a shop towel (C) on the leading edge of the sunshade plate A, attach a spring scale as shown.
4. Pull the spring scale rearward and read the load when the sunshade starts to move.
   Moving load:
   Standard value 53.9 N·m (5.5 kgf·m) or less
5. When the moving load is more than the standard value, check the sunshade plate A, B, and C for poor connection or for drag with the headliner or the roof seal. If no fault, check the motor. If necessary, remove the sunshade frame and check the sliding part for damage.
6. Install the sunshade motor.
7. Reset the sunshade control unit after reinstalling the sunshade motor.

Glass Roof Sunshade Calibration

NOTE: The sunshade calibration must be performed when any of the following events have occurred.

- The sunshade motor is replaced with a new one.
- Any component related to the sunshade replaced.
  - Sunshade bracket
  - Sunshade cables, etc.

The sunshade will reverse while it is closing

1. Turn the ignition switch to ON (II).
2. Press and release the sunshade AUTO CLOSE switch.
   NOTE: The sunshade will reverse and stop while closing.
3. Press and hold the sunshade CLOSE switch for more than 13 seconds.
   NOTE: The sunshade moves to close position by the jog operation *, then stop in fully closed position.
   *: moves 40 mm, stops 0.4 seconds, then repeats
4. Release the CLOSE switch. Within 5 seconds, press and hold the CLOSE switch again.
   NOTE: The sunshade moves to fully open position, then it moves to fully closed position.
5. Calibration is complete.

The sunshade will stop while it is operated

1. Turn the ignition switch to ON (II).
2. Press and release the sunshade AUTO CLOSE switch.
   NOTE: The sunshade will stop while it is operated.
3. Press and hold the sunshade CLOSE switch for more than 13 seconds.
   NOTE: The sunshade moves to close position by the jog operation *, then stop in fully closed position.
   *: moves 40 mm, stops 0.4 seconds, then repeats
4. Release the CLOSE switch. Within 5 seconds, press and hold the CLOSE switch again.
   NOTE: The sunshade moves to fully open position, then it moves to fully closed position.
5. Calibration is complete.

Motor noise from sunshade

Diagnostic procedure

1. Check for a loose motor.
2. Check for a worn gear or bearing.
3. Check for a deformed cable assembly.
4. Check for dirt or debris.

Sunshade does not move, but motor turns

Diagnostic procedure

1. Check for foreign matter stuck between the guide rail and the slider.
2. Make sure the cable assembly is attached properly.
3. Check for a loose inner cable.
4. Check for a defective gear or inner cable.
5. Check for a connect shoe.

Sunshade does not move and motor does not turn (sunshade can be moved with 4 mm hexagonal wrench)

Diagnostic procedure

1. Check for a run down battery.
2. Check for a blown fuse.
3. Check for a faulty sunshade switch.
4. Check for a defective motor control unit.

Sunshade does not stop at proper flush closed position

Diagnostic procedure

1. Reset the sunshade control unit.

Sunshade moves in a jerking motion (moves 40 mm (1.57 in.), stops for 0.4 seconds, and repeats)

Diagnostic procedure

1. Reset the sunshade control unit.

During auto close operation, sunshade reverses when no object is trapped

Diagnostic procedure

1. Check for sunshade circuit.
2. Reset the sunshade control unit.

Sunshade moves, but there is no AUTO function

Diagnostic procedure

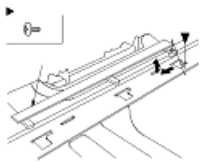
1. Reset the sunshade control unit.

Glass Roof Sunshade Symptom Troubleshooting Index

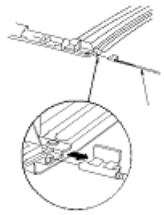
Symptom	Diagnostic procedure
Motor noise from sunshade	1Check for a loose motor. 2Check for a worn gear or bearing. 3Check for a deformed cable assembly. 4Check for dirt or debris.
Sunshade does not move, but motor turns	1Check for foreign matter stuck between the guide rail and the slider. 2Make sure the cable assembly is attached properly. 3Check for a loose inner cable. 4Check for a defective gear or inner cable. 5Check for a connect shoe.
Sunshade does not move and motor does not turn (sunshade can be moved with 4 mm hexagonal wrench)	1Check for a run down battery. 2Check for a blown fuse. 3Check for a faulty sunshade switch. 4Check for a defective motor control unit.
Sunshade does not stop at proper flush closed position	Reset the sunshade control unit.
Sunshade moves in a jerking motion (moves 40 mm (1.57 in.), stops for 0.4 seconds, and repeats)	Reset the sunshade control unit.
During auto close operation, sunshade reverses when no object is trapped	1Check for sunshade circuit. 2Reset the sunshade control unit.
Sunshade moves, but there is no AUTO function	Reset the sunshade control unit.

Glass Roof Sunshade Cable Replacement

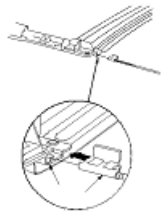
1. Remove the drive assembly.
2. Remove the screw, then remove the slide plate (A) from the rail on both sides.



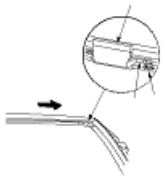
3. Pull out the cable assembly (A) on both side.
4. Install the slide plate in the rail.



5. Insert the slider (A) on the end of the cable in the rail (B) of the frame.

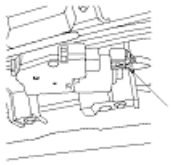


6. Pull the cable forward, and fit the end (A) of the slider (B) to the stopper (screw) (C) in the front side of the rail.
7. Install the drive assembly.
8. Reset the sunshade control unit.



Glass Roof Sunshade Frame Replacement

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

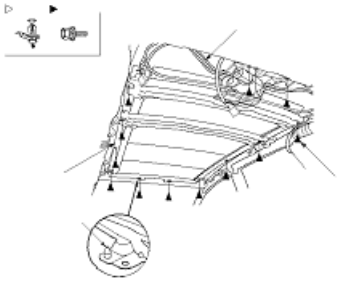


NOTE:

- Put on the gloves to protect your hands.
- Take care not to scratch the seat, dashboard, body and other related parts.

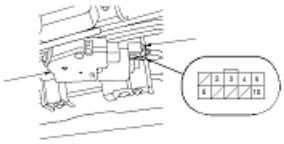
1. Close the sunshade fully.
2. Remove the headliner.
3. Disconnect the motor connector (A).

4. With an assistant holding the frame, remove the clip and the bolts, starting at the rear, and remove the glass roof sunshade frame (A). Do not hold the tube (B) of the drive assembly during removal.



5. Install the frame in the reverse order of removal, and note these items:
   - When installing the frame, first put the positioning pin (C) in the hole of the body, then attach the clip.
   - Make sure the connectors are plugged in properly.
   - After all pares are installed, including the headliner, reset the sunshade control unit.

Glass Roof Sunshade Control Unit (Motor) Input Test



If the sunshade does not work in AUTO, or reverse frequently (pinch detection), do the sunshade calibration before proceeding with the input test.

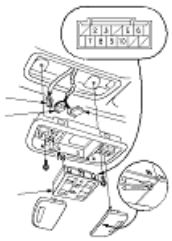
1. Turn the ignition switch to LOCK (0).
2. Remove the headliner.
3. Disconnect the 10P connector (A) from the sunshade control unit (B).
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connector still disconnected, make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the control unit must be faulty; replace the control unit.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
6	BLU	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 46 (20 A) fuse in the under-dash fuse/relay box • An open in the wire
2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
3	BLU	Disconnect under-dash fuse/relay box connector G (8P)	Check for continuity between the sunshade control unit 10P connector No. 3 terminal and under-dash fuse/relay box connector G (8P) No. 3 terminal:There should be continuity.	An open in the wire
4	GRY	Sunshade switch in AUTO OPEN or AUTO CLOSE position	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • Faulty sunshade switch • An open in the wire
5	LT GRN	Sunshade switch in OPEN position	Check for continuity to ground: There should be continuity.	
10	BRN	Sunshade switch in CLOSE position	Check for continuity to ground: There should be continuity.	

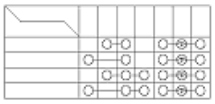
[ ]: RHD type

Glass Roof Sunshade Switch Test/Replacement

1. Remove the front individual map lights.
2. Disconnect the sunshade switch 10P connector (A), map light switch 3P connector (B), and HFT microphone 3P connector (C) (if equipped).
3. Remove the sunshade switch (D).



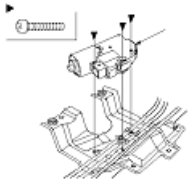
4. Check for continuity between the terminals in each switch position according to the table.
5. If the continuity is not as specified, replace the illumination bulb or the switch.
6. Install the switch and light in the reverse order of removal.



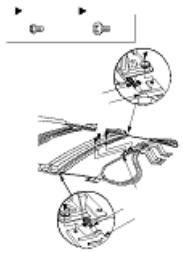
Glass Roof Sunshade Drive Assembly Replacement

NOTE: Take care not to scratch the sunshade plate.

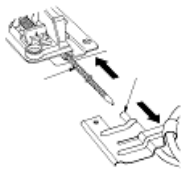
1. Remove the sunshade.
2. Remove the screws, then remove the motor (A).



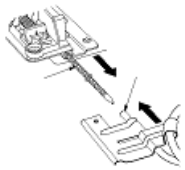
3. Remove the screws (A) of the tube clips (B) and the screws (C) of the motor bracket (D).
4. Pull gradually each side of the tube clip alternately, remove the tube clips from the frame, and pull out the cable (E).



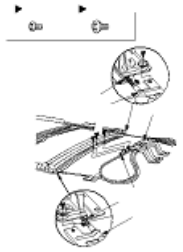
5. Tightly pushing the cable (A) in the frame side, pull the drive assembly side rearward and remove the cable from the tube (B). Do not hold and pull the tube of the drive assembly during removal.



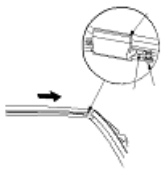
6. Insert the tube (A) of the drive assembly in the end of the cable (B) on each side.



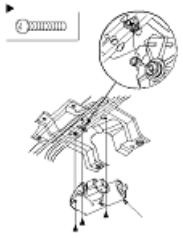
7. Putting the cable in the tube, move the drive assembly (A) to the frame side and insert the tube clip (B) in the rail (C) of the frame.
8. Install the motor bracket (D) of the drive assembly to the frame with the screws (E).
9. Apply the medium strength liquid thread lock to the screws (F), taking care not to protrude it, then install each side of the tube clip to the frame.



10. Pull the cable forward, and fit the end (A) of the slider (B) to the stopper (screw) (C) in the front side of the rail.



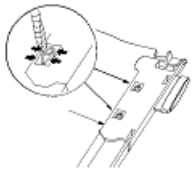
11. Install the motor (A) with the screws.
12. Install the sunshade.
    - Make sure the connector is plugged in properly.
    - Reset the sunshade control unit.



Glass Roof Sunshade Drive Shoe Replacement

NOTE:

- Take care not to scratch the sunshade plate.
- Even if old sunshade is to be reused, the shoes should be replaced with new ones.

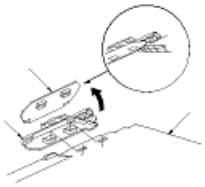


1. Remove the sunshade.

Drive shoe/front shoe/rear shoe

2. Fold the four claws (A) on the shoe cover from the drive shoe (front shoe) (B) side with a flat-tip screwdriver wrapped with protective tape, then push them in. Take care not to deform the square holes in the sunshade plate during this work.

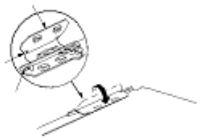
3. Turn over the sunshade plate, and remove the shoe cover (A) and the drive shoe (front shoe) (B) from the sunshade plate (C) using the flat-tip screwdriver wrapped with protective tape. Remove the rear shoe and the shoe cover in the same way.



4. Taking care of installation direction, align the new drive shoe (front shoe) or the new rear shoe (A) with the square holes (B) not to deform them, then install.

	Interior side (Interior color surface)		Outside (Black color surface)
Sunshade plate A	Front	Drive shoe	Shoe cover
	Rear	Shoe cover	Rear shoe
Sunshade plate B	Front	Front shoe	Shoe cover
	Rear	Shoe cover	Rear shoe
Sunshade plate C	Front	Front shoe	Shoe cover
	Rear	Shoe cover	Rear shoe B

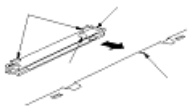
5. Hitch the hook (A) of the new shoe cover (B) to the sunshade plate (C), push the square holes on the shoe and install securely.



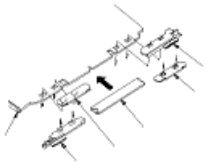
Middle shoe

6. Remove the middle shoe (A), from sunshade plate (B).

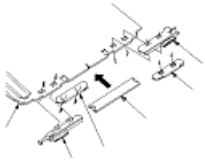
7. Align the inside rid (A) of the new middle shoe (B) with the cutout (C) of the sunshade plate, and install the middle shoe with projections (D) in the interior side (interior color surface).



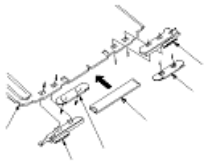
8. Replace the drive shoe (B), middle shoe (C), rear shoe (D), and shoe covers (E) on the sunshade plate A following step 2 through step 7.



9. Replace the front shoe (A), middle shoe (C), rear shoe (D), and shoe covers (E) on the sunshade plate B following step 2 through step 7.



10. Replace the front shoe (A), middle shoe (B), rear shoe (D), and shoe covers (E) on the sunshade plate C following step 2 through step 7.



---

11. After installing the drive shoe (front shoe), middle shoe, rear shoe, make sure that the matching face (A) of each shoe is the same level.

12. Install the sunshade.

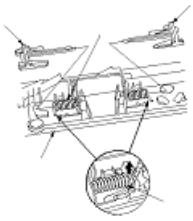
Glass Roof Sunshade Plate Replacement

NOTE:

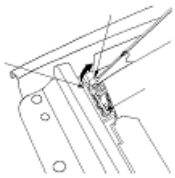
- Put on the gloves to protect your hands.
- Take care not to scratch the seat, dashboard, body and other related parts.

1. Close the sunshade fully.
2. Remove the glass roof sunshade frame.
3. Push the lock (A) and move the spring base (B) in the direction of an arrow.

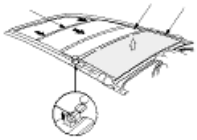
4. Raising the end (A) of the torsion spring (B), move the spring base (C) and remove the spring base and the torsion spring from the stage (D).



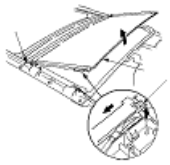
5. Turn to open the clamp (A) on the drive shoe (B) and detach the slider (C) from the drive shoe. Detach from both sides.



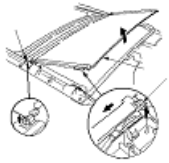
6. Make sure that the sliders are detached from the drive shoes, then slowly push the sunshade plate A rearward.
7. Push the sunshade plate A rearward furthermore until both the sunshade plate B and the sunshade plate C are raised.



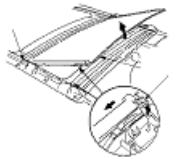
8. Pull the rear portion of the sunshade plate C rearward until the rear shoe B comes off from the stage, then raise and remove the sunshade plate C. Remove the front portion of the sunshade plate along with the rail (A) on the stage.



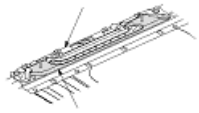
9. Pull the rear portion of the sunshade plate B rearward until the rear shoe A comes off from the stage, then raise and remove the sunshade plate B. Remove the front portion of the sunshade plate along with the rail (A) on the stage.



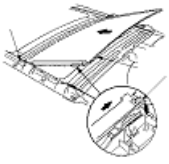
10. Pull the rear portion of the sunshade plate A rearward until the rear shoe B comes off from the stage, then raise and remove the sunshade plate A. Remove the front portion of the sunshade plate along with the rail (C) on the stage.



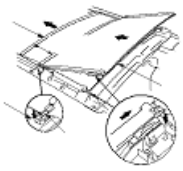
11. Apply multipurpose grease to the sliding surface (shaded area) (B) of the shoe on the stage (A) on both sides.



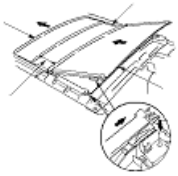
12. Insert the drive shoe of the sunshade plate A along with the rail (C) on the stage, then insert the rear shoe B in the rail.
13. Slowly pull the center of the front portion of the sunshade plate A, taking care not to deform it, and slide it forward by 100 to 300 mm (3.9 to 11.8 in.).



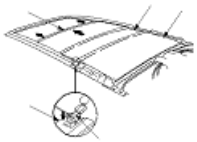
14. Install the sunshade plate B in the same way as Step 12 .
15. Slowly pull the center of the front portion of the sunshade plate A, taking care not to deform it, and make sure that the rear shoe (C) of the sunshade plate A and the front shoe (D) of the sunshade plate B are connected.



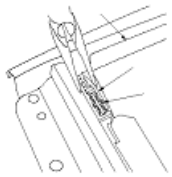
16. Also, slowly pull the center of the front portion of the sunshade plate A, taking care not to deform it, and slide the sunshade plate B forward by 100 to 300 mm (3.9 to 11.8 in.).
17. Install the sunshade plate C in the same way as Step 12 .



18. Slowly pull the sunshade plate A in the same way as Step 15 , and make sure that the rear shoe (D) of the sunshade plate B and the front shoe (E) of the sunshade plate C are connected. Pull the sunshade plate A to slide sunshade plate assembly until it is closed.



19. Fully pull the sunshade plate A to fit the slider (B) to the clamp (C) on the drive shoe.
20. Securely lock the clamps on the drive shoe on both sides, and connect the drive shoe to the cable.



21. Install the torsion spring (A) on the stage (B).
22. Insert the spring base (C) in the torsion spring on the stage, and securely fix it with the lock (D) on the stage.
23. Install the glass roof sunshade frame.

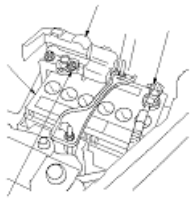
Battery Terminal Disconnection/Reconnection

Disconnection

NOTE: Some systems store data in memory that is lost when the battery is disconnected. Do the following steps before disconnecting the battery. When one month or more passes after disconnecting battery terminal, adjust the data and time on Service Reminder System using HDS.

1. Make sure you have the anti-theft code(s) for the audio and/or the navigation system (if equipped), then write down the audio presets.
   NOTE: For some models, it maybe necessary to write down the audio presets (AM and FM), because the audio unit does not retain the presets after the battery is disconnected.
2. Make sure the ignition switch is in LOCK (0).
3. Disconnect and isolate the negative cable from the battery.
   NOTE: Always disconnect the negative cable from the battery first.
4. Disconnect the positive cable from the battery.

Reconnection



NOTE: Some system store data in memory is lost when the battery is disconnected. Do the following procedures to restore the system back to normal operation.

1. Clean the battery terminals.
2. Test the battery.
3. Reconnect the positive cable (A) to the battery (B) first, then reconnect the negative cable (C) to the battery.
   NOTE: Always connect the positive cable to the battery first.
4. Apply multipurpose grease to the terminals to prevent corrosion.
5. Install the terminal cover (D).
6. Enter the anti-theft code(s) for the audio system and/or the navigation system (if equipped).
7. Enter the audio presets (if applicable).
8. Set the clock (for vehicles without navigation).

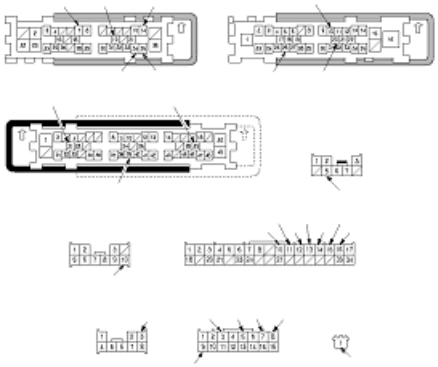
Wipers/Washers (MICU) Input Test



NOTE:

- Before performing the input tests, check the No. 1 (10 A), No. 5 (10 A), No. 16 (10 A), No. 21 (15 A), No. 22 (7.5 A), No. 56 (30 A), and No. 60 (50 A) fuse in the under-dash fuse/relay box.
- If there is malfunction of the rear windshield wiper operation, and no DTCs are detected, check the rear windshield wiper motor and an open in the ground circuit of the rear windshield wiper.

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, C, G, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
W1	YEL	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 60 (IGN) (50 A) fuse in the under-dash fuse/relay box • Faulty ignition switch • An open in the wire
A7	GRN	Under all conditions	Connect the A7 terminal to the battery power: The windshield wiper motor should run at high speed.	• Poor ground (G202) • Faulty windshield wiper motor • An open in the wire
A14	BLU	Under all conditions	Connect the A14 terminal to the battery power: The windshield wiper motor should run at low speed.	
A34	ORN	Under all conditions	Connect the A34 terminal to battery power and A35 terminal to body ground:The windshield/rear window washer motor should run.	• Faulty windshield/rear window washer motor • An open in the wire
A35	LT BLU	Under all conditions	Connect the A35 terminal to battery power and A34 terminal to body ground:The windshield/rear window washer motor should run.	• Faulty windshield/rear window washer motor • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A19[B20]	PNK	The motor stops at auto-stop position.	Check for continuity to ground: There should be continuity.	• Faulty windshield wiper motor • Poor ground (G202) • An open in the wire
		Connect the A14 terminal to the battery power momentarily, and stop the motor operation before the motor reaches the auto-stop position.	Check for continuity to ground: There should be no continuity.	Faulty windshield wiper motor

[ ]: LHD model

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C39·C29	PUR·BRN	Connect battery power to C39 terminal, then connect C29 terminal to body ground momentarily.	Check rear window wiper motor operation: The rear window wiper motor should run, and the park position.	• Faulty rear window wiper motor • An open in the wire • Poor ground (G602) [G604]
M10·Q5	RED·BLK	Windshield wiper/washer switch (LO or HI) ON	Check for continuity between M10 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M10 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M11·Q5	ORN·BLK	Windshield wiper/washer switch (INT or LO) ON	Check for continuity between M11 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M11 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M12·Q5	GRN·BLK	Windshield wiper/washer switch (MIST) ON	Check for continuity between M12 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M12 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M13·Q5	PUR·BLK	Windshield wash switch ON	Check for continuity between M13 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wash switch OFF	Check for continuity between M13 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M14·Q5	YEL·BLK	Rear window wiper/washer switch (RR WIPER) ON	Check for continuity between M14 and Q5 terminals: There should be continuity.	• Faulty Rear window wiper/washer switch • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
		Rear window wiper/washer switch OFF	Check for continuity between M14 and Q5 terminals:There should be no continuity.	Faulty Rear window wiper/washer switch
M15-Q5	BLU BLK	Rear window wiper/washer switch (RR WASH) ON	Check for continuity between M15 and Q5 terminals:There should be continuity.	• Faulty Rear window wiper/washer switch • An open in the wire
		Rear window wiper/washer switch OFF	Check for continuity between M15 and Q5 terminals:There should be no continuity.	Faulty Rear window wiper/washer switch

[ ]: LHD model

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
G5	LT BLU	Under all conditions	Check for continuity between the G5terminal and the automatic lighting/rain sensor 5P connector No. 1 terminal:There should be continuity.	An open in the wire
			Check for continuity to ground:There should be no continuity.	A short to ground in the wire
Q3	LT GRN	Under all conditions	Check for continuity between the Q3terminal and the automatic lighting/rain sensor 5P connector No. 5 terminal:There should be continuity.	An open in the wire
			Check for continuity to ground:There should be no continuity.	A short to ground in the wire
Q7	PNK	Intermittent dwell time controller turned *1 Rainfall sensitivity adjuster turned *2	Check resistance between the Q7 and Q5 terminals:The resistance should vary between 0 to 1 k.	• Faulty wiper/washer switch • An open in the wire
Q8	LT BLU	Under all conditions	Check for continuity between the Q8terminal and the automatic lighting/rain sensor 5P connector No. 2 terminal:There should be continuity.	An open in the wire
			Check for continuity to ground:There should be no continuity.	A short to ground in the wire
A34 *3	ORN	Under all conditions	Connector battery power to the A34 terminal:The windshield washer motor should run.	• Poor ground (G301) [G451] • Faulty washer motor • An open in the wire
B26(A/T)	GRN	Transmission range switch in R	Check for continuity to ground:There should be no continuity.	• Poor ground (G101) • Faulty transmission range switch • An open in the wire
		Transmission range switch in any other position than R	Check for continuity to ground:There should be no continuity.	• Faulty transmission range switch • A short to ground in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
B10·C21(M/T or i-SHIFT system)	LT GRN·GRN	Back-up light switch ON	Check for continuity between the B10and C21 terminals:There should be continuity.	• Faulty back-up light switch • An open in the wire
		Back-up light switch OFF	Check for continuity between the B10and C21 terminals:There should be no continuity.	• Faulty back-up light switch • A short to ground in the wire

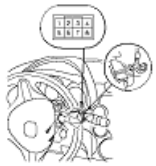
*1: With windshield wiper intermittent dwell time controller
*2: With automatic wiper system
*3: Without rear wiper
[ ]: LHD model

Wiper/Washer Switch Test/Replacement

1. Remove the steering column covers.
2. Disconnect the dashboard wire harness 8P connector (A) from the wiper/washer switch (B).
3. Remove the two screws, then slide out the wiper/washer switch.
4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 5 .

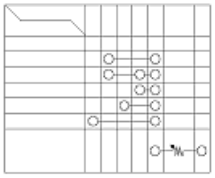
RHD model (Except KE and KN models)

LHD model (Include KE and KN models)

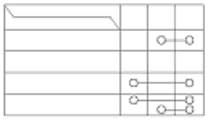


5. Check for continuity between the terminals in each switch position according to the table.
6. If the continuity is not as specified, replace the switch.
7. Install the switch in the reverse order of removal.

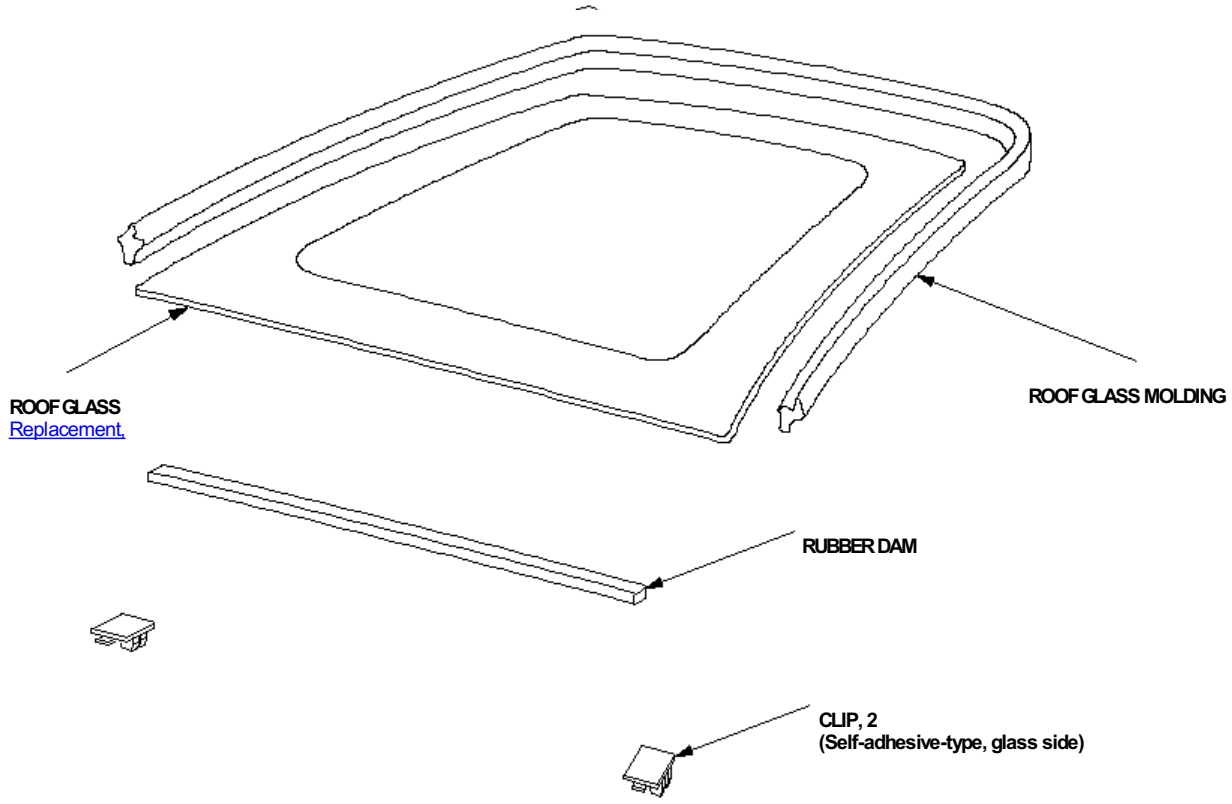
Windshield



Rear window

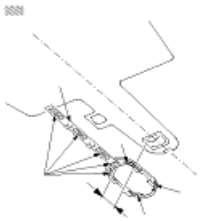


Glass Component Location Index



Automatic Lighting/Rain Sensor Cover Base Replacement

With Automatic Wiper



NOTE:

- Wear eye protection while cutting the glass adhesive with piano wire.
- LHD model is shown; RHD model is symmetrical.

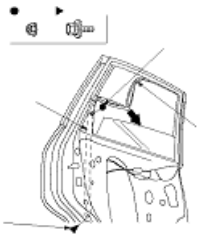
1. Remove these items:
   - Headliner
   - Automatic lighting/rain sensor
   - Rearview mirror
2. Carefully cut through the adhesive tape under the rain sensor cover base using the piano wire, then remove the base.
   NOTE: Take care not to damage the optical connector.
3. Use a putty knife to scrape off all of the old adhesive tape from the windshield. Clean the inside face of the windshield with isopropyl alcohol where new rain sensor cover is to be applied. Make sure the installing surface is kept free of water, oil and grease.
4. Apply primer on the double sided adhesive tape (A) of the automatic lighting/rain sensor cover base (B). Let the primer dry at least 10 minutes, then attach it to the windshield with in 12 hours.
5. Attach the automatic lighting/rain sensor cover base with adhesive tape to the inside face of the windshield as shown, then press the adhesive portions into place securely.
6. Reinstall all remaining removed parts.

Rear Door Glass and Regulator Replacement

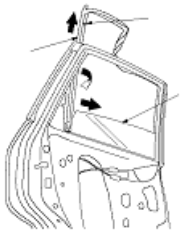
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- LHD model is shown; RHD model is symmetrical.

1. Remove the these items:
   - Rear door glass outer weatherstrip
   - Rear door sash trim
   - Rear door panel
2. Detach the harness clip, then disconnect the power door lock actuator connector.
3. Remove the plastic cover, as needed.
4. Carefully raise the glass (A) until you can see the bolts, then remove them. Remove the glass from the regulator (B), and carefully lower the glass.
   NOTE: Take care not to drop the glass inside the door.



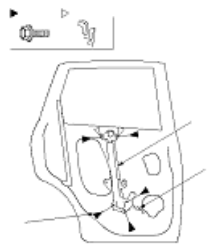
5. Pull the glass run channel (A) away as needed. Loosen the nut, and remove the bolt securing the rear lower channel (B).



6. Release the rear lower channel (A) from the glass (B).
   -1. Pull the channel forward, then remove the nut portion (C) from the door.
   -2. Twist the channel to pass it through the gap between the door panel and the rear sash.
   -3. Pull the channel up to remove it.

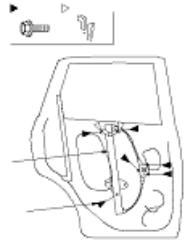
7. Carefully remove the glass (A) out through the window slot. Take care not to drop the glass inside the door.

Power window



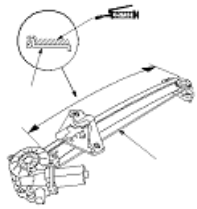
8. Power window: Disconnect and detach the connector (A) from the regulator (B).
9. Remove the bolts, pull the regulator up to release the hooks, then remove the regulator through the hole in the door.

Manual window

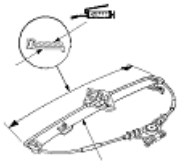


10. Apply multipurpose grease to all the sliding surfaces of the regulator (A) where shown.

Power window



Manual window



Roof Glass Replacement

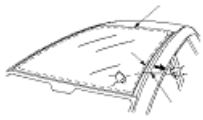
NOTE:

- Put on gloves to protect your hands.
- Wear eye protection when removing the glass with piano wire.
- Use seat covers to avoid damaging the seat.
- When replacing a broken roof glass a commercially available windshield cutter can be efficiently used for cutting the adhesive. For details, follow the instructions of the tool manufacturer.
- Use glass adhesive set P/N 08C73-X0230N.

1. Remove these items:
   - Roof sunshade frame
   - Windshield molding
2. Remove the roof glass molding (A) from the edge of the roof glass (B), then remove it. If necessary, cut the molding with a utility knife.
3. If the old roof glass will be reinstalled, make alignment marks (C) across the glass and body with a grease pencil.
4. Apply protective tape along the edge of the body. Using an awl, make a hole through the adhesive from inside the vehicle at the corner portion of the roof glass. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

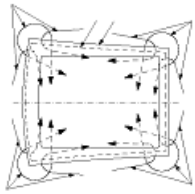
---

5. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the roof glass (B) as possible to prevent damage to the body. Carefully cut through the rubber dam and adhesive (C) around the entire roof glass.



6. Carefully remove the roof glass.
7. With a knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire roof glass opening flange:
   - Do not scrape down to the painted surface of the body; damage piano will interface with proper bonding.
   - Remove the clips, fasteners, and rubber dams from the body.

Cutting portions

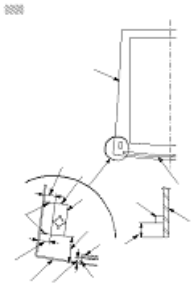


8. Clean the body bonding surface with a sponge dampened in alcohol. After cleaning, keep oil, grease and water from getting on the clean surface.
9. If the old roof glass will be reinstalled, use a putty knife to scrape off all of the old adhesive, and fasteners and the rubber dams from the roof glass. Clean the inside face and the edge of the roof glass with alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.

---

10. Attach the rubber dam (A) and clips (B) with adhesive tapes to the inside face of the roof glass (C) as shown:
    - Before installing the rubber dam and clips, apply primer to the inside face of the roof glass.
    - Be sure the clip line up with the alignment marks (D).
    - Be sure to install the left clip with its convex portion (E) backward.
    - Be sure to install the right clip with its convex portion rightward.
    - Be careful not to touch the roof glass where adhesive will be applied.

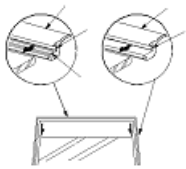
    Rubber dam adhesive tape:
    Thickness 0.16 mm (0.006 in.)
    Width 4 mm (0.30 in.)
    Clips adhesive tape:
    Thickness 0.4 mm (0.016 in.)
    Width 23.1 mm (0.91 in.)



---

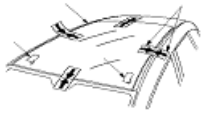
11. Attach the roof glass molding (A) with adhesive tapes (B, C) to the inside face of the roof glass as shown. Be careful not to touch the roof glass where adhesive will be applied.

    Molding adhesive tape: (B)
    Thickness 0.2 mm (0.008 in.)
    Width 4 mm (0.16 in.)
    Molding adhesive tape: (C)
    Thickness 0.2 mm (0.008 in.)
    Width 4 mm (0.11 in.)



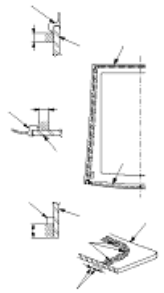
---

12. Set the roof glass (A) in the opening, and center it. Make alignment marks (B) across the roof glass and body with a grease pencil at the four points shown:
    - Align the clips (C) on the roof glass with the hole in the opening flange.
    - Be careful not to touch the roof glass where adhesive will be applied.
13. Remove the roof glass.

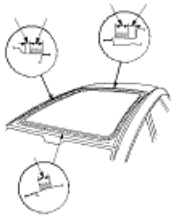


---

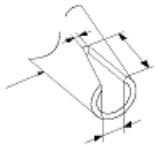
14. With a sponge, apply a light coat of glass primer roof glass (A) along the edge of the molding (B), and rubber dams (C) as shown, then lightly wipe it off with gauze or cheesecloth:
    - Do not apply body primer to the roof glass, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surface with your hands. If you do, the adhesive may not bond to the roof glass properly, causing a leak after the roof glass is installed.
    - Keep water, dust, and adhesive materials away from the primed surfaces.
    - With the printed dots (D) on the roof glass as a guide, apply the glass primer to the corner portion of the roof glass.



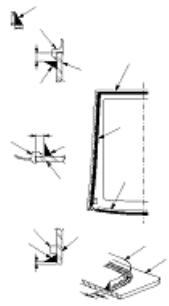
15. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.



16. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



17. Put the cartridge in a caulking gun, and run a bead of adhesive (A) around the edge of the roof glass (B) between the molding (C) and rubber dams (D) as shown. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.
18. Use suction cups to hold the roof glass over the opening align it with the alignment marks made in Step 12 , and set it down on the adhesive. Lightly push on the roof glass until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close the doors until the adhesive is dry.
19. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the roof glass, wipe with a soft shop towel dampened with isopropyl alcohol.
20. Install the windshield molding.
21. After the adhesive has dried, then spray water over the roof glass and check for leaks. Mark leaking areas, and let the roof glass dry, then seal with sealant:
    - Let the vehicle stand for at least 4 hours after roof glass installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
    - Keep the roof glass dry for the first hour after installation.
22. Reinstall all remaining remove parts. Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angel or driving over rough, uneven roads).



Windshield Replacement

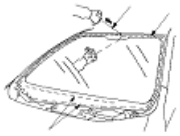
NOTE:

- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with a piano wire.
- Use seat covers to avoid damaging the seat.
- When replacing a broken windshield, a commercially available windshield cutter can be efficiently used for cutting the adhesive. For details, follow the instructions of the manufacturer of the tool.
- LHD model is shown; RHD model is symmetrical.

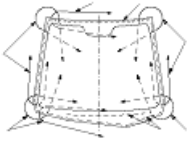
1. Remove these items:
   - Cowl covers
   - Rearview mirror
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Roof moldings, both sides
   - Automatic lighting/rain sensor (for some models)
2. Remove the molding (A) from the edge of the windshield (B). If necessary, cut the molding with a utility knife.
3. If the old windshield will be reinstalled, make alignment marks across the glass and body with a grease pencil.
4. Pull down the front portion of the headliner. Take care not to bend the headliner excessively, or you may crease or break it.
5. Apply protective tape along the edge of the dashboard and body. Using an awl, make a hole through the rubber dam and adhesive from inside the vehicle at the corner portion of the windshield. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

---

6. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the windshield (B) as possible to prevent damage to the body and dashboard.
   Carefully cut through the rubber dam and adhesive (C) around the entire windshield.
7. Carefully remove the windshield.
8. With a utility knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire windshield opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the rubber dams and upper clips from the body.
9. Clean the body bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease and water from getting on the clean surface.
10. If the old windshield will be reinstalled, use a putty knife to scrape off all of the old adhesive, the upper clips and the rubber dams from the windshield. Clean the inside face and the edge of the windshield with isopropyl alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.



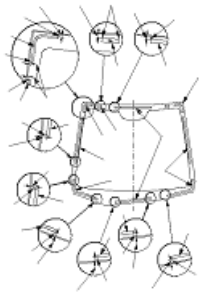
Cutting positions



---

11. Attach the rubber dam A, rubber dam B, rubber dam C, rubber dam D, and the upper clips (E) with adhesive tape to the inside face of the windshield (F) as shown:
    - Be sure the rubber dam and upper clips line up with the alignment marks (G).
    - Be careful not to touch the windshield where adhesive will be applied.

    Rubber dam adhesive tape:
    Thickness 0.16 mm (0.006 in.)
    Width 3 mm (0.118 in.)
    Upper clip adhesive tape:
    Thickness 0.4 mm (0.02 in.)
    Width 13 mm (0.512 in.)



---

12. Attach the molding (A) with adhesive tape (B) to the edge of the windshield (C):
    - Be sure each corner of the molding lines up with the ones of the windshield.
    - Be careful not to touch the windshield where adhesive will be applied.

    Molding adhesive tape:
    Thickness 0.8 mm (0.03 in.)
    Width 4 mm (0.16 in.)

---

13. With glass roof:
    Attach the upper seal (A) to the inside of the molding (B).
    Molding adhesive tape:
    Thickness 0.1 mm (0.004 in.)
    Width 7 mm (0.28 in.)

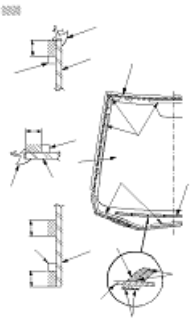
---

14. Set the windshield (A) in the opening, and center it.
    Make alignment marks (B) across the windshield and body with a grease pencil at the four points shown. Make sure the upper clips (C) contact with the edge of the body holes. Be careful not to touch the windshield where adhesive will be applied.

15. Remove the windshield.

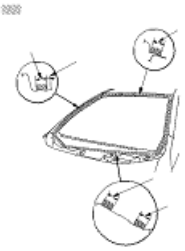
---

16. With a sponge, apply a light coat of glass primer to the windshield (A) along the edge of the molding (B) and the rubber dams (C) as shown, then lightly wipe it off with gauze or cheesecloth:
    - With the printed dots (D) on the windshield as a guide, apply glass primer to the bottom (E) of the windshield.
    - Apply glass primer to the molding.
    - Do not apply body primer to the windshield, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the windshield properly, causing a leak after the windshield is installed.
    - Keep water, dust, and abrasive materials away from the primed surface.



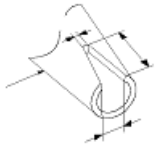
---

17. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.
    - Mask off the dashboard before painting the flange.



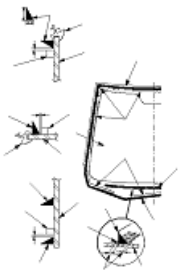
---

18. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



---

19. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) to the windshield (B) along the edge of the molding (C) and rubber dams (D) as shown. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.
    - Apply glass primer to the bottom (E) of the windshield.
    - Apply glass primer to the molding.



20. Use suction cups to hold the windshield over the opening, align it with the alignment marks made in Step 14, and set it down on the adhesive. Lightly push on the windshield until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.

21. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the windshield, wipe with a soft shop towel dampened with isopropyl alcohol.

22. After the adhesive has dried, spray water over the windshield and check for leaks. Mark leaking areas, and let the windshield dry, then seal with sealant:
    - Let the vehicle stand for at least 4 hours after windshield installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
    - Keep the windshield dry for the first hour after installation.

23. Reinstall all remaining removed parts. Install the rearview mirror after the adhesive has dried thoroughly. Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

DTC Troubleshooting: B2350

DTC B2350:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B2350?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B2352

DTC B2352:
Rain Light Sensor Unit Internal Error

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Is DTC B2352 indicated?
YES - Replace the automatic lighting/rain sensor .■
NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■

DTC Troubleshooting: B2355

DTC B2355:
Rain Light Sensor Unit Lost Communication with MICU (Headlight Switch Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2355 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
4. Check for DTCs with the HDS.

   Are DTC B1155, B1156, B1157, B1159, B1160, and B1188 also indicated with DTC B2355?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the automatic lighting/rain sensor .■

DTC Troubleshooting: B2356

DTC B2356:
Rain Light Sensor Unit Lost Communication with MICU (Wiper Switch Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2356 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
4. Check for DTCs with the HDS.

   Are DTC B1155, B1156, B1157, B1159, B1160, and B1188 also indicated with DTC B2356?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the automatic lighting/rain sensor .■

DTC Troubleshooting: B2357

DTC B2357:
Rain Light Sensor Unit Lost Communication with MICU

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2357 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
4. Check for DTCs with the HDS.

   Are DTC B1155, B1156, B1157, B1159, B1160, and B1188 also indicated with DTC B2357?
   YES - Faulty MICU; replace the under-dash fuse/relay box. ■
   NO - Replace the automatic lighting/rain sensor .■

DTC Troubleshooting: B2375

DTC B2375:
Rain Sensing Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2375 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time.■
4. Check for loose or poor connections at the automatic lighting/rain sensor 5P connector.

   Is the connection OK?
   YES - Go to Step 5 .
   NO - Reconnect or repair the 5P connector.■
5. Check for damage of the automatic lighting/rain sensor 5P connector terminals.

   Are there any damage?
   YES - Repair the terminal.■
   NO - Go to Step 6 .
6. Check for dirt or damage of the windshield glass.

   Are there any dirt or damage?
   YES - Remove the dirt and, if necessary, repair or replace the windshield glass.■
   NO - Replace the automatic lighting/rain sensor .■

DTC Troubleshooting: B2376

DTC B2376:
Rain Sensing Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

Is DTC B2376 indicated?
YES - Replace the automatic lighting/rain sensor.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1200

DTC B1200:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Are DTCs B1000 and B1011 also indicated with DTC B1200?
   YES - Go to DTC B1000 troubleshooting.■
   NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1150

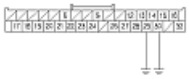
DTC B1150:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B1150?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1170

DTC B1170:
Gauge Control Module Lost Communication with VSA Modulator-Control Unit (VSA Message)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1170 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for VSA system DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTCs, then recheck.■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Disconnect the VSA modulator-control unit 36P connector.
9. Connect the gauge control module 32P connector No. 29 and No. 30 terminals and body ground with jumper wires.

10. Check for continuity between the VSA modulator-control unit 36P connector No. 1 and No. 14 terminals and body ground individually.

    Is there continuity?
    YES - Substitute a known-good VSA modulator-control unit, and recheck. If the indication goes away, replace the original VSA modulator-control unit. If the DTC is still present, replace the gauge control module. ■
    NO - Repair an open in the wire.■

DTC Troubleshooting: B1750

DTC B1750:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B1750?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B2450

DTC B2450:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B2450?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B2455

DTC B2455:
Auto Leveling Unit Lost Communication with Gauge Control Module

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B2455 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the gauge control module and the headlight leveling control unit.■
5. Check for DTCs with the HDS.

   Is DTC B1011 also indicated with DTC B2455?
   YES - Go to Step 6 .
   NO - Go to the headlight leveling control unit input test. ■
6. Connect the HDS to the data link connector, then turn the ignition switch to ON (II).
7. From the BODY ELECTRICAL system menu, select UNIT INFORMATION, and then select CONNECTED UNIT.

   Is the gauge control module detected?
   YES - Replace the gauge control module. ■
   NO - Go to Step 8 .
8. Turn the ignition switch to LOCK (0).
9. Disconnect the gauge control module 32P connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between the gauge control module 32P connector No. 16 and No. 32 terminals and body ground respectively.

    Is there battery voltage?
    YES - Go to Step 12 .
    NO - Check the No. 1 (10 A) fuse and No. 22 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is blown, replace the fuse and recheck the DTCs. If the fuses are OK, repair and open in the wire between the under-dash fuse/relay box and the gauge control module.■
12. Turn the ignition switch to LOCK (0).

---

13. Check for continuity between the gauge control module 32P connector No. 13 and No. 17 terminals and body ground respectively.

    Is there continuity?
    YES - Go to Step 14 .
    NO - Repair an open in the wire or poor ground (G501).■
14. Disconnect the under-dash fuse/relay box connector Q (16P).

---

15. Check for continuity between the under-dash fuse/relay box connector Q (16P) No. 3 terminal and the gauge control module 32P connector No. 18 terminal.

    Is there continuity?
    YES - Replace the gauge control module. ■
    NO - Repair an open in the wire.■

DTC Troubleshooting: B2456

DTC B2456:
Auto Leveling Unit Lost Communication with MICU (Headlight Message)

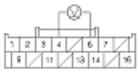
1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B2456 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections between the MICU and the headlight auto leveling control unit.■
5. Check for DTCs with the HDS.

   Are DTCs B1155, B1156, B1157, B1159, B1160, and B1188 also indicated with DTC B2456?
   YES - Faulty MICU, replace the under-dash fuse/relay box. ■
   NO - Go to the headlight auto leveling control unit input test. ■

DTC Troubleshooting: B2476

DTC B2476:
Front Height Sensor Failure

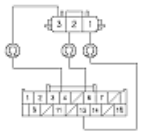


1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2476 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time.■
4. Check for DTCs with the HDS.

   Is DTC B2477 also indicated with the DTC B2476?
   YES - Go to Step 10 .
   NO - Go to Step 5 .
5. Measure the voltage between the headlight leveling control unit 16P connector No. 4 and No. 6 terminals.

   Is there less than 0.4 V?
   YES - Go to Step 6 .
   NO - Go to Step 27 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the front suspension stroke sensor 3P connector.
8. Disconnect the headlight leveling control unit 16P connector.

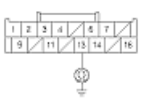


9. Check for continuity between the headlight leveling control unit 16P connector No. 4, No. 6 and No. 13 terminals and the front suspension stroke sensor 3P connector No. 3, No. 2 and No. 1 terminals individually.

   Is there continuity?
   YES - Replace the front suspension stroke sensor .■
   NO - Repair an open in the wire.■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the front suspension stroke sensor 3P connector.
12. Turn the ignition switch to ON (II).
13. Clear the DTCs with the HDS.
14. Turn the ignition switch to LOCK (0) and then back to ON (II).
15. Check for DTCs with the HDS.

    Is only DTC B2476 indicated?
    YES - Replace the front suspension stroke sensor .■
    NO - Go to Step 16 .
16. Turn the ignition switch to LOCK (0).
17. Disconnect the rear suspension stroke sensor 3P connector.
18. Turn the ignition switch to ON (II).
19. Clear the DTCs with the HDS.
20. Turn the ignition switch to LOCK (0) and then back to ON (II).
21. Check for DTCs with the HDS.

    Is only DTC B2477 indicated?
    YES - Replace the rear suspension stroke sensor .■
    NO - Go to Step 22 .
22. Turn the ignition switch to LOCK (0).
23. Disconnect the headlight leveling control unit 16P connector.

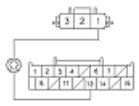


24. Check for continuity between the headlight leveling control unit 16P connector No. 13 terminal and body ground.

    Is there continuity?
    YES - Repair a short in the wire.■
    NO - Go to Step 25 .

---

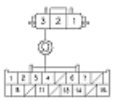
25. Check for continuity between the headlight leveling control unit 16P connector No. 13 terminal and the front suspension stroke sensor 3P connector No. 1 terminal.



Is there continuity?
YES - Go to Step 26 .
NO - Repair an open in the wire.■

---

26. Check for continuity between the headlight leveling control unit 16P connector No. 4 terminal and the front suspension stroke sensor 3P connector No. 3 terminal.



Is there continuity?
YES - Replace the headlight leveling control unit .■
NO - Repair an open in the wire.■

27. Turn the ignition switch to LOCK (0).

28. Disconnect the front suspension stroke sensor 3P connector.

29. Disconnect the headlight leveling control unit 16P connector.

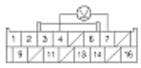
---

30. Check for continuity between the front suspension stroke sensor 3P connector No. 1 and No. 2 terminals.

Is there continuity?
YES - Repair a short in the wire.■
NO - Replace the front suspension stroke sensor .■

DTC Troubleshooting: B2477

DTC B2477:
Rear Height Sensor Failure



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2477 indicated?
   YES - Go to Step 4 .
   NO - Intermittent failure, the system is OK at this time.■
4. Check for DTCs with the HDS.

   Is DTC B2476 also indicated with the DTC B2477?
   YES - Go to Step 10 .
   NO - Go to Step 5 .
5. Measure the voltage between the headlight leveling control unit 16P connector No. 4 and No. 7 terminals.

   Is there less than 0.4 V?
   YES - Go to Step 6 .
   NO - Go to Step 27 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the rear suspension stroke sensor 3P connector.
8. Disconnect the headlight leveling control unit 16P connector.

---

9. Check for continuity between the headlight leveling control unit 16P connector No. 4, No. 7 and No. 13 terminals and the rear headlight leveling sensor 3P connector No. 3, No. 2 and No. 1 terminals individually.

   Is there continuity?
   YES - Replace the rear suspension stroke sensor .■
   NO - Repair an open in the wire.■
10. Turn the ignition switch to LOCK (0).
11. Disconnect the front suspension stroke sensor 3P connector.
12. Turn the ignition switch to ON (II).
13. Clear the DTCs with the HDS.
14. Turn the ignition switch to LOCK (0) and then back to ON (II).
15. Check for DTCs with the HDS.

    Is only DTC B2476 indicated?
    YES - Replace the front suspension stroke sensor .■
    NO - Go to Step 16 .
16. Turn the ignition switch to LOCK (0).
17. Disconnect the rear suspension stroke sensor 3P connector.
18. Turn the ignition switch to ON (II).
19. Clear the DTCs with the HDS.
20. Turn the ignition switch to LOCK (0) and then back to ON (II).
21. Check for DTCs with the HDS.

    Is only DTC B2477 indicated?
    YES - Replace the rear suspension stroke sensor .■
    NO - Go to Step 22 .
22. Turn the ignition switch to LOCK (0).
23. Disconnect the headlight leveling control unit 16P connector.

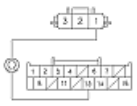
---

24. Check for continuity between the headlight leveling control unit 16P connector No. 13 terminal and body ground.

    Is there continuity?
    YES - Repair a short in the wire.■
    NO - Go to Step 25 .

---

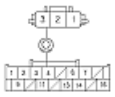
25. Check for continuity between the headlight leveling control unit 16P connector No. 13 terminal and the rear suspension stroke sensor 3P connector No. 1 terminal.



Is there continuity?
YES - Go to Step 26 .
NO - Repair an open in the wire.■

---

26. Check for continuity between the headlight leveling control unit 16P connector No. 4 terminal and the rear suspension stroke sensor 3P connector No. 3 terminal.



Is there continuity?
YES - Replace the headlight leveling control unit .■
NO - Repair an open in the wire.■

27. Turn the ignition switch to LOCK (0).

28. Disconnect the rear suspension stroke sensor 3P connector.

29. Disconnect the headlight leveling control unit 16P connector.

---

30. Check for continuity between the rear suspension stroke sensor 3P connector No. 1 and No. 2 terminals.

Is there continuity?
YES - Repair a short in the wire.■
NO - Replace the rear suspension stroke sensor .■

DTC Troubleshooting: B2479

DTC B2479:
Auto Leveling Unit EEPROM Error

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

Is DTC B2479 indicated?
YES - Replace the headlight leveling control unit .■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B2480

DTC B2480:
VSP Sensor Failure
NOTE: This DTC is stored when the vehicle speed circuit malfunction is occurred. If this DTC is stored, go to the PGM-FI system and A/T system DTCs troubleshooting.

DTC Troubleshooting: B2481

DTC B2481:
VSP Sensor Failure

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Check for DTCs with the HDS.

   Is DTC B2481 indicated?
   YES - Substitute a known-good gauge control module, then go to Step 4 .
   NO - Intermittent failure, the system is OK at this time.■
4. Check for DTCs with the HDS.

   Is DTC B2481 indicated?
   YES - Replace the headlight leveling control unit .■
   NO - The original gauge control module must be faulty; replace the gauge control module. ■

DTC Troubleshooting: B2482

DTC B2482:
Combination Switch Headlight Switch Signal Error

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Turn the headlight ON, and then back OFF.
4. Check for DTCs with the HDS.

Is DTC B2482 indicated?
YES - Replace the combination light switch.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1900

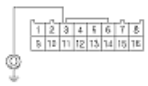
DTC B1900:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B1900?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1000

DTC B1000:
Communication Circuit Error (BUS-OFF)



1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1000 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure. The communication bus line is OK at this time. Check for any worn or shorted wires.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the appropriate connector at each control unit in the table.

Unit	Connector
Gauge control module	32P connector
Climate control unit	36P connector
Automatic lighting/rain sensor	5P connector
Headlight leveling control unit	16P connector
Hands free telephone control unit	28P connector
Immobilizer-keyless control unit	7P connector

7. Turn the ignition switch to ON (II).
8. Clear the DTCs with the HDS.
9. Turn the ignition switch to LOCK (0) and then back to ON (II).
10. Wait for 6 seconds.
11. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Go to Step 12 .
    NO - Go to Step 17 .
12. Turn the ignition switch to LOCK (0).
13. Disconnect the under-dash fuse/relay box connector Q (16P).
14. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire between the under-dash fuse/relay box connector and the affected control unit.■
    NO - Go to Step 15 .
15. Turn the ignition switch to ON (II).

---

16. Measure the voltage between under-dash fuse/relay box connector Q (16P) No. 3 terminal and body ground.

    Is there voltage?
    YES - Repair a short to power in the wire between the under-dash fuse/relay box connector and the affected control unit.■
    NO - Faulty MICU, replace the under-dash fuse/relay box. ■
17. Turn the ignition switch to LOCK (0).
18. Reconnect the gauge control module 32P connector.
19. Turn the ignition switch to ON (II).
20. Clear the DTCs with the HDS.
21. Turn the ignition switch to LOCK (0) and then back to ON (II).
22. Wait for 6 seconds or more.
23. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Replace the gauge control module. ■
    NO - Go to Step 24 .
24. Reconnect the climate control unit 36P connector. If the climate control unit is not equipped, skip this step, then go

to Step 30 .

25. Turn the ignition switch to ON (II).
26. Clear the DTCs with the HDS.
27. Turn the ignition switch to LOCK (0) and then back to ON (II).
28. Wait for 6 seconds or more.
29. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Replace the climate control unit. ■
    NO - Go to Step 30 .

30. Reconnect the automatic lighting/rain sensor 5P connector. If the automatic lighting/rain sensor is not equipped, skip this step, then go to Step 36 .
31. Turn the ignition switch to ON (II).
32. Clear the DTCs with the HDS.
33. Turn the ignition switch to LOCK (0) and then back to ON (II).
34. Wait for 6 seconds or more.
35. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Replace the automatic lighting/rain sensor. ■
    NO - Go to Step 36 .

36. Reconnect the headlight leveling control unit 16P connector. If the headlight leveling control unit is not equipped, skip this step, then go to Step 42 .
37. Turn the ignition switch to ON (II).
38. Clear the DTCs with the HDS.
39. Turn the ignition switch to LOCK (0) and then back to ON (II).
40. Wait for 6 seconds or more.
41. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Replace the headlight leveling control unit .■
    NO - If the hands free telephone system is equipped, go to Step 42 . If not equipped, replace the immobilizer-keyless control unit. ■

42. Reconnect the hands free telephone control unit 28P connector.
43. Turn the ignition switch to ON (II).
44. Clear the DTCs with the HDS.
45. Turn the ignition switch to LOCK (0) and then back to ON (II).
46. Wait for 6 seconds or more.
47. Check for DTCs with the HDS.

    Is DTC B1000 indicated?
    YES - Replace the hands free telephone control unit. ■
    NO - Replace the immobilizer-keyless control unit. ■

DTC Troubleshooting: B1277

DTC B1277:
Headlight AUTO Position Circuit Malfunction

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0) and then back to ON (II).
3. Turn the combination light switch POSITION (SMALL), AUTO, and ON (low beam) positions for 6 seconds in each position, and then OFF position.
4. Check for DTCs with the HDS.

   Is DTC B1277 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Select LIGHTING from the BODY ELECTRICAL system select menu, and enter the DATA LIST.
6. Check each combination light switch position value with the DATA LIST menu.

When the combination light switch is turned OFF

Data List	Value
Headlight Switch (OFF)	ON
Headlight Switch (SMALL)	OFF
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

When the combination light switch is turned to POSITION (SMALL)

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (SMALL)	ON
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

When the combination light switch is turned to AUTO

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (SMALL)	ON
Headlight Switch (AUTO)	ON
Headlight Switch (HEADLIGHT)	ON

When the combination light switch is turned ON (HEADLIGHT)

Data List	Value
Headlight Switch (OFF)	OFF
Headlight Switch (SMALL)	ON
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	ON

Are all data list values correct?
YES - Faulty MICU; replace the under-dash fuse/relay box. ■
NO - Go to Step 7 .

7. Turn the ignition switch to LOCK (0).
8. Disconnect the combination light switch 12P connector.
9. Turn the ignition switch to ON (II).
10. Select LIGHTING from the BODY ELECTRICAL system select menu, and enter the DATA LIST.
11. Check each combination light switch position value with the DATA LIST menu.

When the combination light switch is turned OFF

Data List	Value
Headlight Switch (OFF)	OFF

Data List	Value
Headlight Switch (SMALL)	OFF
Headlight Switch (AUTO)	OFF
Headlight Switch (HEADLIGHT)	OFF

Are all data list values indicated OFF?
YES - Go to Step 15 .
NO - Go to Step 12 .

12. Turn the ignition switch to LOCK (0).
13. Disconnect under-dash fuse/relay box connector M (34P).
14. Check for continuity between body ground and under-dash fuse/relay box connector M (34P) No. 5, No. 7, and No. 8 terminals individually.

Is there continuity?
YES - Repair a short to ground in the wire.■
NO - Faulty MICU; replace the under-dash fuse/relay box. ■

15. Turn the ignition switch to LOCK (0).
16. Do the combination light switch test.

Is the combination light switch OK?
YES - Go to Step 17 .
NO - Replace the combination light switch.■

17. Disconnect under-dash fuse/relay box connectors M (34P).

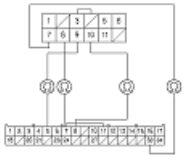
---

18. Check for continuity between under-dash fuse/relay box connector M (34P) terminals and the combination light switch 12P connector terminals as shown:

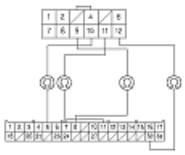
Under-dash fuse/relay box connector M (34P)	Combination light switch 12P connector
8	10 [9]
5	9 [10]
7	8 [11]
33	7 [12]

[ ]: LHD model (Include KE and KN models)

RHD model (Except KE and KN models)



LHD model (Include KE and KN models)



Is there continuity?
YES - Go to Step 19 .
NO - Repair an open in the wire.■

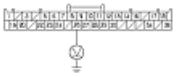
19. Check for continuity between under-dash fuse/relay box connector M (34P) terminals as shown:

From terminal	To terminal
8	3, 4, 5, 7
7	3, 4, 5

Is there continuity?
YES - Repair a short between the wires.■
NO - Faulty MICU; replace the under-dash fuse/relay box. ■

A/C Pressure Switch Circuit Troubleshooting

NOTE:



- If the blower motor does not run at all speeds, the A/C compressor will be inoperative. Run the self-diagnostic function, and check the DTC B1241. Before performing any other troubleshooting, repair the cause of the inoperative blower motor.
- Do not use this troubleshooting procedure if any of the following items are operative; condenser fan, radiator fan, A/C compressor, or if the heater is inoperative. Refer to the symptom troubleshooting index.
- Check the A/C high-side pressure.
- Before doing symptom troubleshooting, check for powertrain DTCs. Also check for B-CAN codes.

1. Turn the ignition switch to ON (II).
2. Check if the blower motor operates at all speeds.

   Does the blower motor operate at all speeds?
   YES - Go to Step 3 .
   NO - Repair the problem in the blower motor circuit. ■
3. Turn the ignition switch to LOCK (0).
4. Disconnect the climate control unit 36P connector.
5. Turn the ignition switch to ON (II).
6. Measure the voltage between the climate control unit 36P connector No. 26 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 14 .
   NO - Go to Step 7 .
7. Turn the ignition switch to LOCK (0).
8. Disconnect the A/C pressure switch 2P connector.
9. Turn the ignition switch to ON (II).

---

10. Measure the voltage between the A/C pressure switch 2P connector No. 2 terminal and body ground.

    Is there battery voltage?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the A/C pressure switch and the MICU. If the wire is OK, substitute a known-good MICU and recheck. If the symptom goes away, replace the original MICU .■

---

11. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

    Is there continuity?
    YES - Go to Step 12 .
    NO - Replace the A/C pressure switch .■

---

12. Connect the A/C pressure switch 2P connector No. 2 terminal to body ground with a jumper wire.

    Do the compressor and fans operate?
    YES - Go to Step 13 .
    NO - Check for B-CAN codes. ■
13. Disconnect the jumper wire and A/C pressure switch 2P connector.

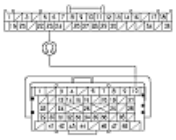
---

14. Check for continuity between the climate control unit 36P connector No. 26 terminal and the A/C pressure switch 2P connector No. 1 terminal.

    
    Is there continuity?
    YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the A/C pressure switch 2P connector.■
    NO - Repair open in the wire between the climate control unit and A/C pressure switch.■
15. Turn the ignition switch to LOCK (0).
16. Jump the SCS line with the HDS.
    NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
17. Disconnect ECM/PCM connector A (49P).

---

18. Measure the evaporator temperature sensor resistance between the climate control unit 36P connector No. 23 terminal and ECM/PCM connector A (49P) No. 10 terminal.



Is the resistance less than 24 kΩ?

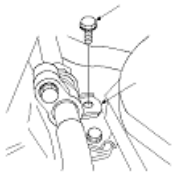
YES - Check for loose wires or poor connections at the climate control unit connectors. If the connections are good, substitute a known-good climate control unit and recheck. If the symptom goes away, replace the original climate control unit .■

NO - Test the evaporator temperature sensor. ■

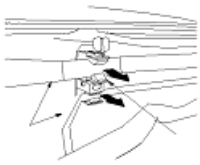
A/C Evaporator Core Replacement

LHD model

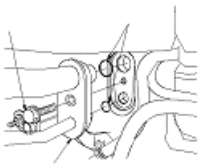
1. Recover the refrigerant with a recovery/recycling/charging station.
2. Remove the cowl cover and the under-cowl panel.
3. Remove the bolt from the A/C line clamp (A).



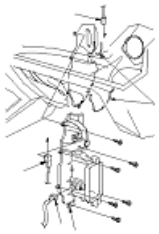
4. Open the clamp (A), then remove the A/C lines (B).



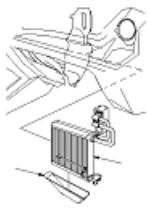
5. Remove the bolt, then disconnect the A/C line (A) from the evaporator core and remove the O-rings (B).
6. Remove the blower unit.
7. Remove the mode control motor.



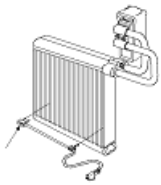
8. Disconnect the connectors (A) from the evaporator temperature sensor and the power transistor, then remove the connector clip (B). Remove the self-tapping screws, the expansion valve cover (C), and the seal (D).



9. Carefully pull out the evaporator core assembly (A) without bending the lines, the remove the plate (B).

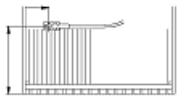


10. Pull out the evaporator temperature sensor (A) from the evaporator core.

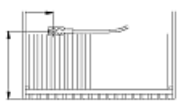


11. Install the evaporator temperature sensor in the evaporator core, and note these items:
    - When the evaporator temperature sensor (A) is installed into the new evaporator core, set the sensor into the factory-preset position (B, C).
    - When the evaporator temperature sensor is reinstalled into the original evaporator core, set the sensor into the new position (D, E) because the fin may be deforming by the previous installation.

Installing into the factory-preset position



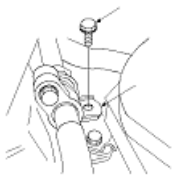
Installing into the new position



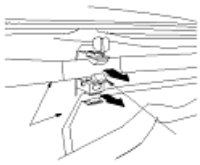
12. Install the core in the reverse order of removal and note these items:
    - If you're installing a new evaporator core, add refrigerant oil (SP-10).
    - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
    - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
    - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
    - Make sure that there is no air leakage.
    - Charge the system.

RHD model

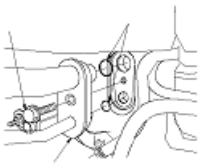
1. Recover the refrigerant with a recovery/recycling/charging station.
2. Remove the cowl cover and the under-cowl panel.
3. Remove the bolt from the A/C line clamp (A).



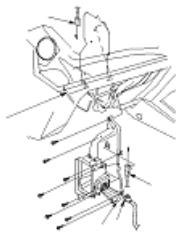
4. Open the clamp (A), then remove the A/C lines (B).



5. Remove the bolt, then disconnect the A/C line (A) from the evaporator core and remove the O-rings (B).
6. Remove the blower unit.
7. Remove the mode control motor.

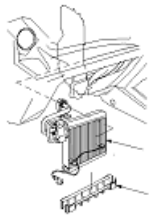


8. Disconnect the connectors (A) from the evaporator temperature sensor and the power transistor, then remove the connector clip (B). Remove the self-tapping screws, the expansion valve cover (C), and the seal (D).

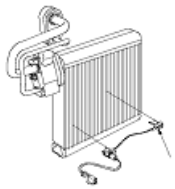


9. The tapping screw (A) is removed, the cover (B) is knocked down to the insulator side, and it removes.

10. Carefully pull out the evaporator core assembly (A) without bending the lines, the remove the plate (B).

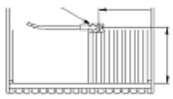


11. Pull out the evaporator temperature sensor (A) from the evaporator core.

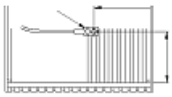


12. Install the evaporator temperature sensor in the evaporator core, and note these items:
    - When the evaporator temperature sensor (A) is installed into the new evaporator core, set the sensor into the factory-preset position (B, C).
    - When the evaporator temperature sensor is reinstalled into the original evaporator core, set the sensor into the new position (D, E) because the fin may be deforming by the previous installation.

Installing into the factory-preset position



Installing into the new position

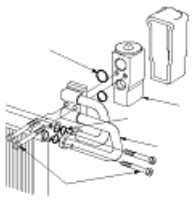


13. Install the core in the reverse order of removal and note these items:
    - If you're installing a new evaporator core, add refrigerant oil (SP-10).
    - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
    - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
    - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
    - Make sure that there is no air leakage.
    - Charge the system.

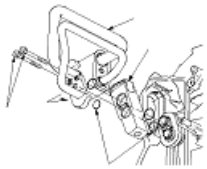
A/C Evaporator Expansion Valve Replacement

1. Remove the evaporator core.
2. Remove the bolts, O-rings (A) and the expansion valve (B) from the pipe (C).
3. Install the expansion valve in the reverse order of removal, and note these items:
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Make sure that there is no air leakage.
   - Charge the system.

LHD model

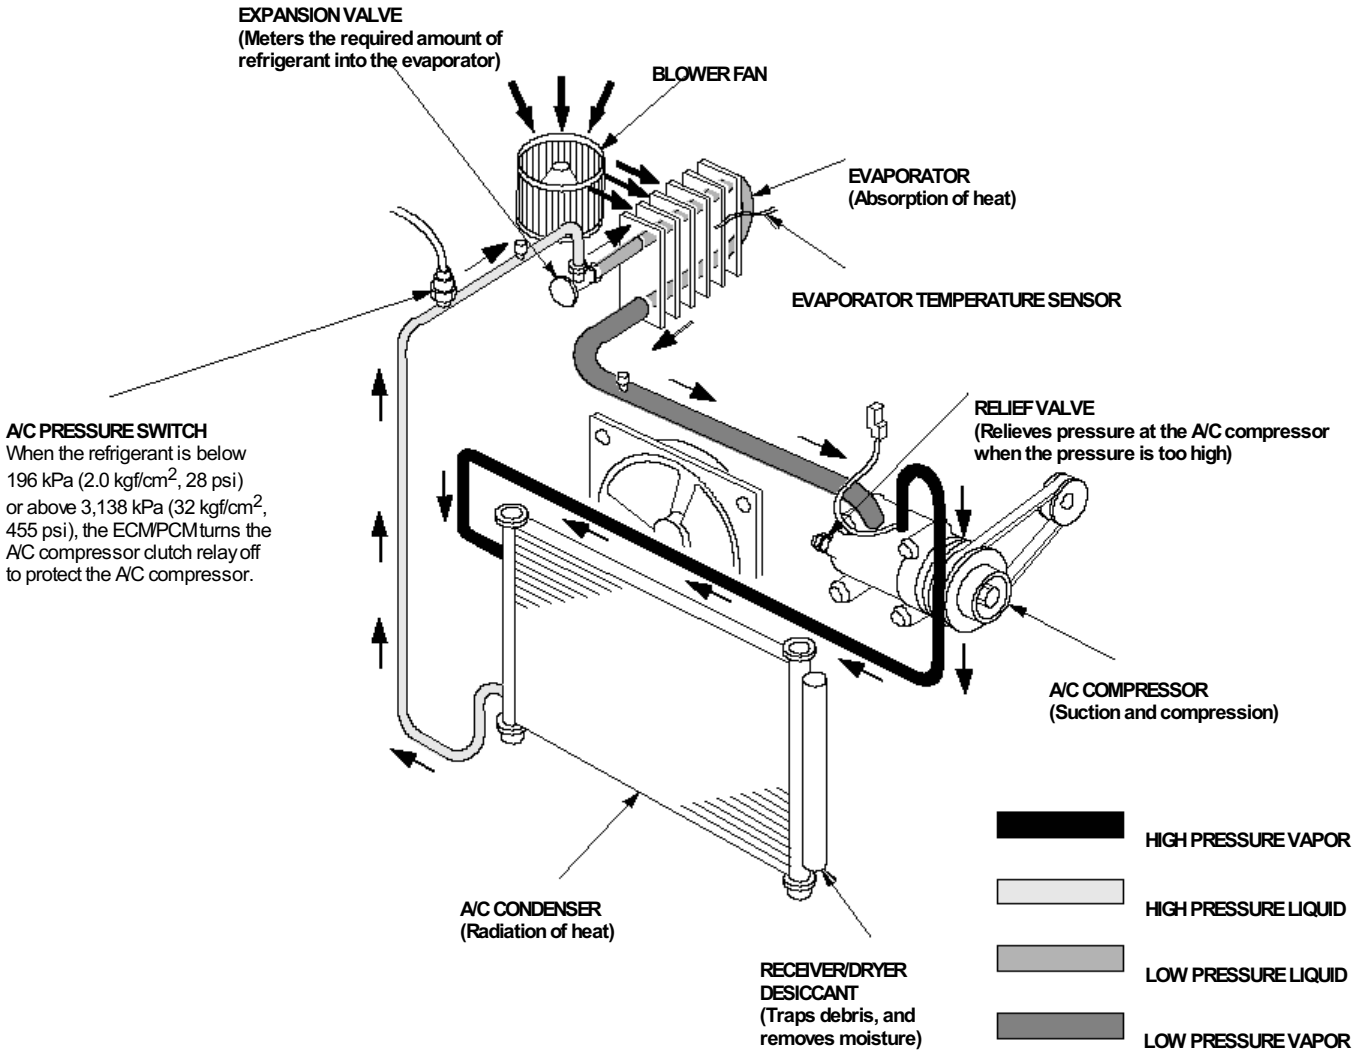


RHD model

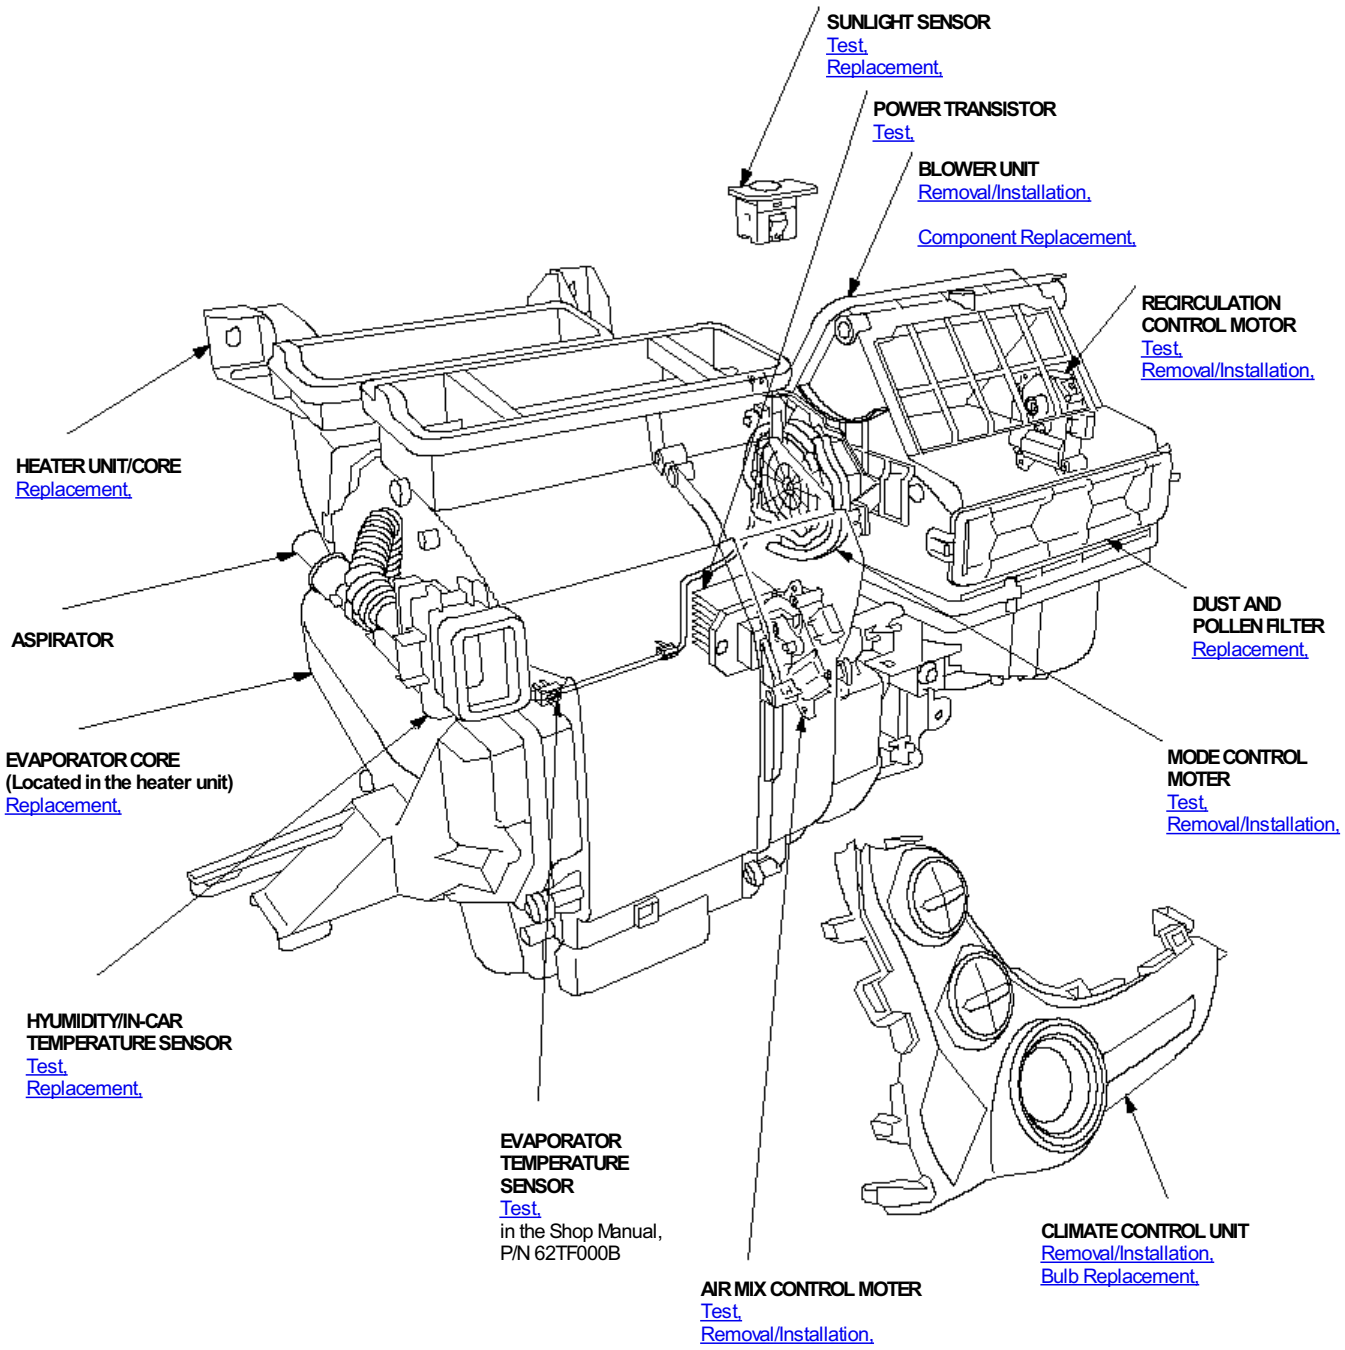


Climate Control System Description

The air conditioning system removes heat from the passenger compartment by transferring heat from the ambient air to the evaporator. The evaporator cools the air with the refrigerant that is circulating through the evaporator. The refrigerant expands in the evaporator, and the evaporator becomes very cold and absorbs the heat from the ambient air. The blower fan pushes air across the evaporator where the heat is absorbed, and then it blows the cool air into the passenger compartment.

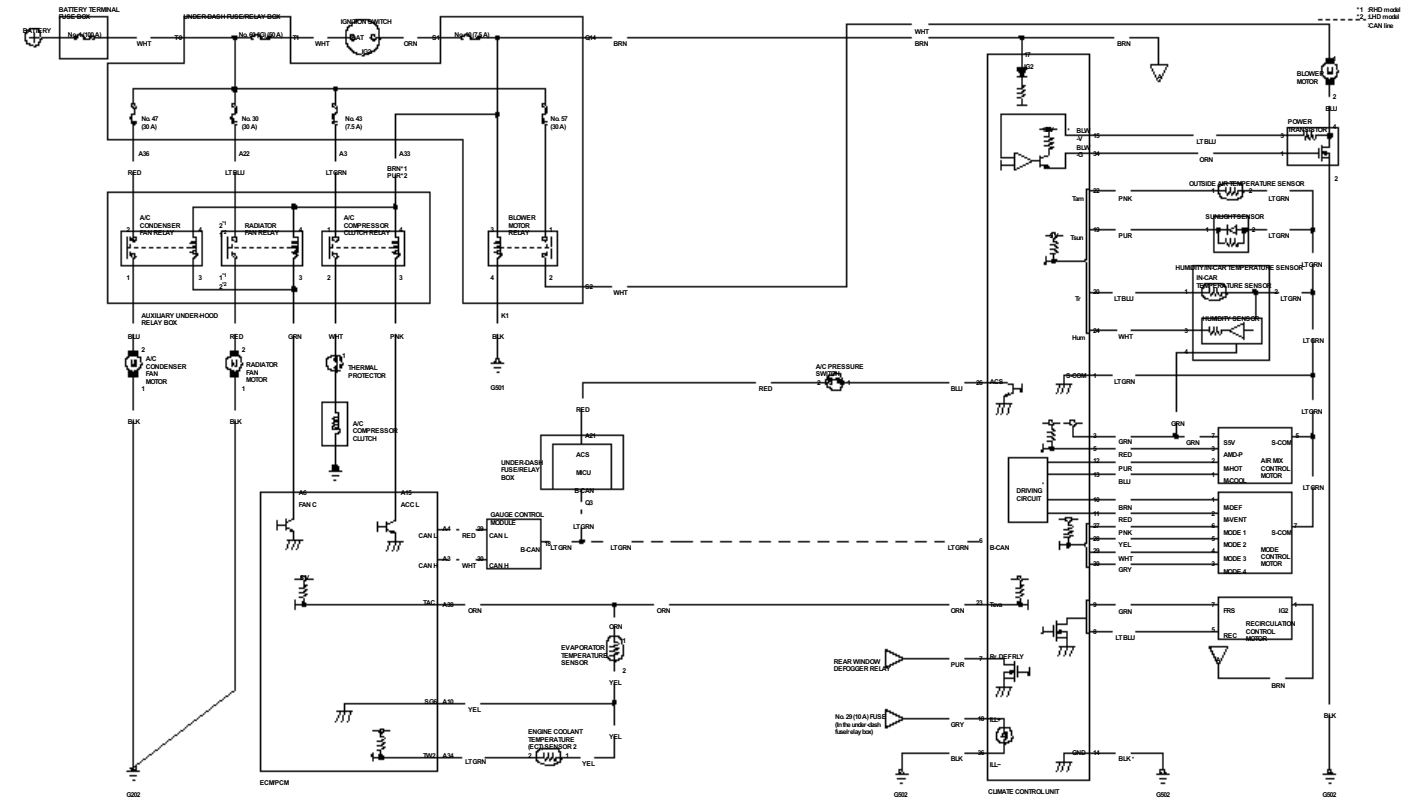


Climate Control Component Location Index



LHD model is shown, RHD model is similar.

Climate Control Circuit Diagram



Recirculation control doors do not change between Fresh and Recirculate

Diagnostic procedure

1. Recirculation control motor circuit troubleshooting

Also check for

- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all terminals

Blower, heater controls, and A/C do not work

Diagnostic procedure

1. Climate control power and ground circuit troubleshooting

Also check for

- HVAC DTCs
- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Poor ground at G502
- Cleanliness and tightness of all terminals

Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)

Diagnostic procedure

1. Radiator and A/C condenser fans common circuit troubleshooting

Also check for

- HVAC DTCs
- Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box
- Poor ground at G202
- Cleanliness and tightness of all terminals

A/C condenser fan does not run at all (but radiator fan runs with the A/C on)

Diagnostic procedure

1. A/C condenser fan circuit troubleshooting

Also check for

- HVAC DTCs
- Blown fuse No. 47 (30 A) in the under-hood fuse/relay box
- Cleanliness and tightness of all terminals

A/C compressor clutch does not engage (but both fans run with the A/C on)

Diagnostic procedure

1. A/C compressor clutch circuit troubleshooting

Also check for

- HVAC DTCs
- Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all terminals

A/C system does not come on (both fans and the A/C compressor do not work); heater is OK

Diagnostic procedure

1. A/C pressure switch circuit troubleshooting

Also check for

- Powertrain DTCs
- Cleanliness and tightness of all terminals

Blower fan runs slower than expected in cold weather

Diagnostic procedure

1. ECT troubleshooting: ECT sensor 2 circuit low voltage, ECT sensor 2 circuit high voltage
2. NOTE: It is normal for the blower to run slowly until the engine coolant temperature begins to rise. If the blower continues to run slowly for an abnormal length of time, continue to troubleshoot the problem.

Also check for

- Powertrain DTCs

HDS does not communicate with the climate control unit or the vehicle

Diagnostic procedure

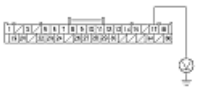
1. DLC circuit troubleshooting

Climate Control Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Recirculation control doors do not change between Fresh and Recirculate	Recirculation control motor circuit troubleshooting	• Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all terminals
Blower, heater controls, and A/C do not work	Climate control power and ground circuit troubleshooting	• HVAC DTCs • Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Poor ground at G502 • Cleanliness and tightness of all terminals
Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)	Radiator and A/C condenser fans common circuit troubleshooting	• HVAC DTCs • Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box • Poor ground at G202 • Cleanliness and tightness of all terminals
A/C condenser fan does not run at all (but radiator fan runs with the A/C on)	A/C condenser fan circuit troubleshooting	• HVAC DTCs • Blown fuse No. 47 (30 A) in the under-hood fuse/relay box • Cleanliness and tightness of all terminals
A/C compressor clutch does not engage (but both fans run with the A/C on)	A/C compressor clutch circuit troubleshooting	• HVAC DTCs • Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all terminals
A/C system does not come on (both fans and the A/C compressor do not work); heater is OK	A/C pressure switch circuit troubleshooting	• Powertrain DTCs • Cleanliness and tightness of all terminals
Blower fan runs slower than expected in cold weather	ECT troubleshooting: ECT sensor 2 circuit low voltage, ECT sensor 2 circuit high voltage NOTE: It is normal for the blower to run slowly until the engine coolant temperature begins to rise. If the blower continues to run slowly for an abnormal length of time, continue to troubleshoot the problem.	Powertrain DTCs
HDS does not communicate with the climate control unit or the vehicle	DLC circuit troubleshooting	

Climate Control Power and Ground Circuit Troubleshooting

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.



Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit.■

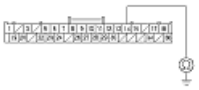
2. Disconnect the climate control unit 36P connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the climate control unit 36P connector No. 17 terminal and body ground.

Is there battery voltage?
YES - Go to Step 5 .
NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the climate control unit.■

5. Turn the ignition switch to LOCK (0).

---

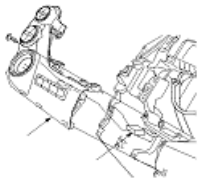
6. Check for continuity between the climate control unit 36P connector No. 14 terminal and body ground.



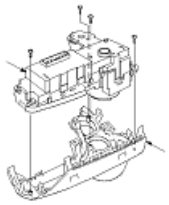
Is there continuity?
YES - Check for loose wires and poor connections at the climate control unit 36P connector. If connections are good, substitute a known-good climate control unit and recheck. If the symptom/indication goes away, replace the original climate control unit .■
NO - Check for open in the wire between the climate control unit and body ground. If the wire is OK, check for poor body ground at G502. ■

Climate Control Unit Removal/Installation

1. Remove the audio unit.
2. Remove the self-tapping screw and pull the climate control unit (A).
3. Disconnect the connector (B) and climate control unit.



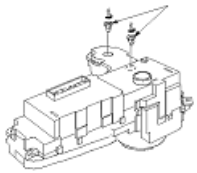
4. Remove the self-tapping screws and the climate control unit (A) from the panel (B).
5. Install the control unit in the reverse order of removal. After installation, operate the various functions to see whether work properly.
6. Run the self-diagnostic function to confirm that there are no problems in the system.



Climate Control Unit Bulb Replacement

NOTE:

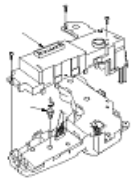
- Do not work in a dusty or dirty place.
- Do not work with dusty hands.
- Discharge static electricity from your body before and during the work.
- Do not touch the circuit board(s) with your bare hands.



1. Remove the climate control unit.
2. Remove the bulb(s) (A) with a flat-tip screwdriver.

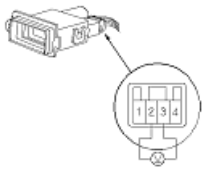
---

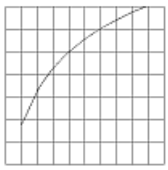
3. Remove the self-tapping screws and open the cover (A), then remove the bulb (B) with a flat-tip screwdriver.
4. Install the bulb(s) in the reverse order of removal. After installation, operate the various functions to see whether it works properly.
5. Run the self-diagnostic function to confirm that there are no problems in the system.



Humidity/In-car Temperature Sensor Test

Humidity Sensor Test





1. Remove the humidity/in-car temperature sensor.
2. Connect the humidity/in-car temperature sensor 4P connector.
3. Turn the ignition switch to ON (II). Measure the voltage between the terminals with the (+) probe on the No. 3 terminal and the (−) probe on the No. 2 terminal with the connector connected.
4. If the voltage is not as specified, replace the humidity/in-car temperature sensor.

In-car Temperature Sensor Test

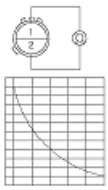
1. Remove the humidity/in-car temperature sensor.
2. Connect the humidity/in-car temperature sensor 4P connector.
3. Test the humidity/in-car temperature sensor while holding it in front of the dashboard center vent.
   - Measure the resistance with the system set to Max Cool.
   - Measure the resistance with the system set to Max Hot.
4. Compare the resistance reading between the No. 1 and No. 2 terminals of the humidity/in-car temperature sensor with the specifications shown in the graph; the resistance should be within the specifications.
5. If the resistance is not as specified, replace the humidity/in-car temperature sensor.

Humidity/In-car Temperature Sensor Replacement

1. Remove the instrument panel.
2. Remove the aspirator air hose (A) and disconnect the connector (B).
3. Remove the self-tapping screw and humidity/in-car temperature sensor (C) from the adapter (D).
4. Install the sensor in the reverse order of removal. Be sure to connect the air hose securely.

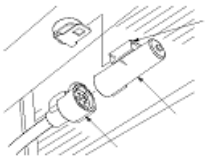
Outside Air Temperature Sensor Test

1. Remove the outside air temperature sensor.
2. Dip the sensor in ice water, and measure the resistance. Then pour warm water on the sensor, and check for a change in resistance.
3. Compare the resistance reading between the No. 1 and No. 2 terminals of the outside air temperature sensor with the specifications shown in the graph; the resistance should be within the specifications.
4. If the resistance is not as specified, replace the outside air temperature sensor.



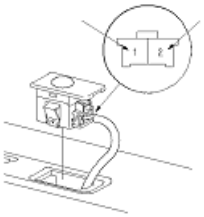
Outside Air Temperature Sensor Replacement

NOTE: The L15A7 engine model remove the front bumper.



1. Lift the tab (A) to release the lock, then remove the outside air temperature sensor (B) from the front bumper beam. Disconnect the 2P connector (C) from the outside air temperature sensor.
2. Install the sensor in the reverse order of removal.

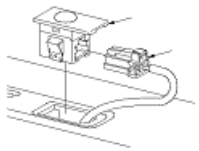
Sunlight Sensor Test



1. Remove the sunlight sensor.
2. Turn the ignition switch to ON (II). Measure the voltage between the terminals with the (+) probe on the No. 1 terminal and the (−) probe on the No. 2 terminal with the connector connected.
   NOTE: The voltage readings will not change under the light of a flashlight or a fluorescent lamp. Voltage should be:
   - 3.6−3.7 V or more with the sensor out of direct sunlight.
   - 3.3−3.5 V or less with the sensor in direct sunlight.
3. If the voltage is not as specified, replace the sunlight sensor.

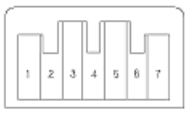
Sunlight Sensor Replacement

1. Remove the sunlight sensor (A) from the dashboard, then disconnect the connector (B). Be careful not to damage the sensor and the dashboard.
2. Install the sensor in the reverse order of removal.



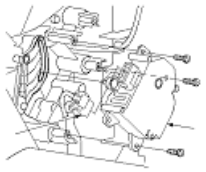
Air Mix Control Motor Test

NOTE: Before testing, check for HVAC DTCs.



1. Disconnect the 7P connector from the air mix control motor.
   NOTICE
   Incorrectly applying power and ground to the air mix control motor will damage it. Follow the instructions carefully.
2. Connect battery power to the No. 1 terminal of the air mix control motor, and ground the No. 2 terminal; the air mix control motor should run, and stop at Max Cool. If it doesn't, reverse the connections; the air mix control motor should run, and stop at Max Hot. When the air mix control motor stops running, disconnect battery power immediately.
3. If the air mix control motor did not run in Step 2 , remove it, then check the air mix control linkage and door for smooth movement.
   - If the linkage and door move smoothly, replace the air mix control motor.
   - If the linkage or door sticks or binds, repair them as needed.
   - If the air mix control motor runs smoothly, go to Step 4 .
4. Measure the resistance between the No. 5 and No. 7 terminals. It should be between 4.2 to 7.8 kΩ.
5. Reconnect the air mix control motor 7P connector, then turn the ignition switch to ON (II).
6. Using the backprobe set, measure the voltage between the No. 3 and No. 5 terminals.
   Max Cool: **About 1.0 V**
   Max Hot: **About 4.0 V**
7. If either the resistance or voltage readings are not as specified, replace the air mix control motor.

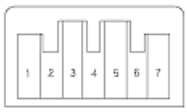
Air Mix Control Motor Replacement



1. Remove the passenger's dashboard undercover and the glove box.
2. Disconnect the 7P connector (A) from the air mix control motor (B). Remove the self-tapping screws and the air mix control motor from the heater unit.
3. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

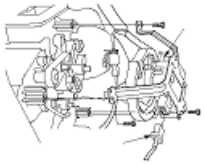
Mode Control Motor Test

NOTE: Before testing, check for HVAC DTCs.



1. Disconnect the 7P connector from the mode control motor.
   NOTICE
   Incorrectly applying power and ground to the mode control motor will damage it. Follow the instructions carefully.
2. Connect battery power to the No. 1 terminal of the mode control motor, and ground the No. 2 terminal; the mode control motor should run smoothly, and stop at Vent. If it doesn't, reverse the connections; the mode control motor should run smoothly, and stop at Defrost. When the mode control motor stops running, disconnect battery power immediately.
3. If the mode control motor did not run in Step 2, remove it, then check the mode control linkage and doors for smooth movement.
   - If the linkage and doors move smoothly, replace the mode control motor.
   - If the linkage or doors stick or bind, repair them as needed.
   - If the mode control motor runs smoothly, go to Step 4.
4. Use a digital multimeter with an output of 1 mA or less at the 20 kΩ range. With the mode control motor running as in Step 2, check for continuity between the No. 3, 4, 5, and 6 terminals and the No. 7 terminal individually. There should be continuity for a moment at each terminal as the motor moves past the switch's terminal.
5. If there is no continuity for a moment at each terminal, replace the mode control motor.

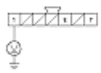
Mode Control Motor Replacement



1. Remove the passenger's dashboard undercover.
2. Remove the glove box.
3. Disconnect the 7P connector (A) from the mode control motor (B). Remove the self-tapping screws and the mode control motor from the heater unit.
4. Install the motor in the reverse order of removal. Make sure the pin on the motor is properly engaged with the linkage. After installation, make sure the motor runs smoothly.

Recirculation Control Motor Circuit Troubleshooting

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.



Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit.■

2. Disconnect the recirculation control motor 7P connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the recirculation control motor 7P connector No. 1 terminal and body ground.

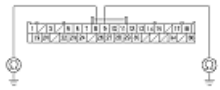
Is there battery voltage?
YES - Go to Step 5 .
NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the recirculation control motor.■

5. Turn the ignition switch to LOCK (0).
6. Test the recirculation control motor.

Is the recirculation control motor OK?
YES - Go to Step 7 .
NO - Replace the recirculation control motor, or repair the recirculation control linkage or door.■

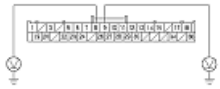
7. Disconnect the climate control unit 36P connector.

8. Check for continuity between body ground and the climate control unit 36P connector No. 8 and No. 9 terminals individually.



Is there continuity?
YES - Repair short to body ground in the wire(s) between the climate control unit and the recirculation control motor.■
NO - Go to Step 9 .

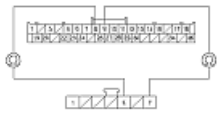
9. Turn the ignition switch to ON (II), and check the same terminals for voltage to body ground.



Is there any voltage?
YES - Repair short to power in the wires between the climate control unit and the recirculation control motor. This short may also damage the climate control unit. Repair the short to power before replacing the climate control unit.■
NO - Go to Step 10 .

10. Turn the ignition switch to LOCK (0).

11. Check for continuity between the following terminals of the climate control unit 36P connector and the recirculation control motor 7P connector.



36P:	7P:
No. 8	No. 5
No. 9	No. 7

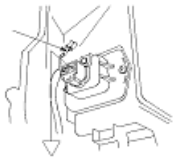
Is there continuity?
YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the recirculation control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
NO - Repair open in the wire(s) between the climate control unit and the recirculation control motor.■

Blower Power Transistor Test

1. Remove the passenger's dashboard undercover.
2. Disconnect the 4P connector from the power transistor.

3. Measure the resistance between the No. 3 and No. 4 terminals of the power transistor. It should be about 1.5 kΩ.
   - If the resistance is within the specifications, go to Step 4 .
   - If the resistance is not within the specifications, replace the power transistor.
     NOTE: Also check the blower motor. Power transistor failure can be caused by a defective blower motor.

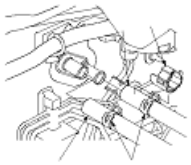
4. Carefully release the lock tab on the No. 1 terminal (ORN) (A) in the 4P connector, then remove the terminal and insulate it from body ground.



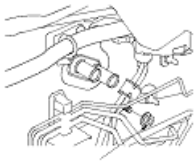
5. Reconnect the 4P connector to the power transistor.
6. Make sure the ORN wire is completely isolated, then supply 12 V to the No. 1 cavity with a jumper wire.
7. Turn the ignition switch to ON (II), and check that the blower motor runs.
   - If the blower motor does not run, replace the power transistor.
     NOTE: A faulty blower motor can cause the power transistor to fail. If the power transistor is replaced, also check the blower motor for binding, and replace it if necessary.
   - If the blower motor runs, the power transistor is OK.

Heater Unit/Core Replacement

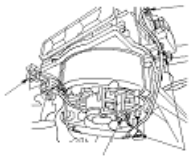
SRS components are located in this area. Review the SRS component locations, and the precautions and procedures before doing repairs or service.



1. Do the battery terminal disconnection procedure.
2. Disconnect the A/C line from the evaporator core.
3. Drain the engine coolant from the radiator.
4. From the inlet heater hose, remove the clip (A). Slide the hose clamps (B) back, then disconnect the inlet heater hose (C) and the outlet heater hose (D) from the heater unit. Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.



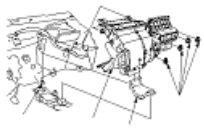
5. Remove the mounting nut from the heater unit. Take care not to damage or bend the fuel lines or brake lines, etc.
6. Remove the dashboard.



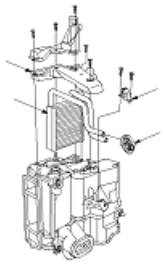
7. Disconnect the connectors (A) from the blower motor and the recirculation control motor. Remove the clips (B).

---

8. Disconnect these connectors (A): The mode control motor, the power transistor, the evaporator temperature sensor, air mix control motor. Remove the wire harness (B).



9. Remove the duct (A) and the drain hose (B). Remove the mounting nuts and blower-heater unit (C).



10. Remove the self-tapping screws and the heater core cover (A), the stay (B), the grommet (C), and carefully pull out the heater core (D).
11. Install the heater core, and the evaporator core in the reverse order of removal.
12. Install the heater unit in the reverse order of removal, and note these items:
    - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
    - Refill the cooling system with engine coolant.
    - Make sure that there is no coolant leakage.
    - Make sure that there is no air leakage.
    - Refer to the evaporator core replacement.
13. Do the battery terminal reconnection procedure.

How to Troubleshoot the Climate Control

How to Check for DTCs with the HDS

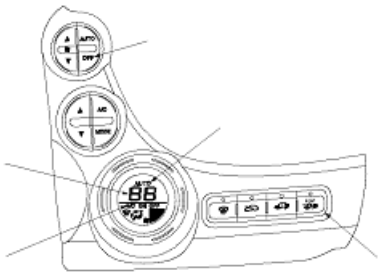
1. Make sure the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the climate control unit. If it doesn't, troubleshoot the DLC circuit.
5. Select HVAC/CLIMATE CONTROL in the BODY ELECTRICAL menu.
6. Select DTCs in the HVAC/CLIMATE CONTROL menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, refer to symptom troubleshooting.
   NOTE:
   - After troubleshooting, clear the DTCs with the HDS.
   - For specific operations, refer to the user's manual that came with the HDS.

How to Use the Self-diagnostic Function with the HDS

1. Make sure the ignition switch to LOCK (0).
2. Connect the HDS to the data link connector (DLC).
3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the climate control unit. If it doesn't, troubleshoot the DLC circuit.
5. Select HVAC/CLIMATE CONTROL in the BODY ELECTRICAL menu.
6. Select INSPECTION in the HVAC/CLIMATE CONTROL menu.
7. Select CLIMATE CONTROL SELF TEST in the INSPECTION menu.
8. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting.
   NOTE:
   - After troubleshooting, clear the DTCs with the HDS.
   - For specific operations, refer to the user's manual that came with the HDS.

How to Use the Self-diagnostic Function without the HDS

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:



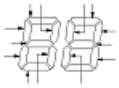
1. Turn the ignition switch to LOCK (0), and then to ON (II).
2. Press and hold the OFF button. While pressing the REAR WINDOW DEFOGGER/MIRROR HEATER button five times within 10 seconds, then release the OFF button and the self-diagnostic will begin.
   NOTE:
   - The blower motor will run at various speeds regardless of what the panel is displaying.
   - If there is a problem with the system, it will flash 88, or 88 AUTO or 88 A/C, and one or more of the 14 indicator segments (A through P). Refer to checking for DTCs.
   - If there are no problems detected, the segments will not illuminate, and the system will appear to be turned off.

Canceling the Self-diagnostic Function

1. Turn the ignition switch to LOCK (0) to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other DTCs.

Checking for DTCs

The temperature display indicates single or multiple DTCs. If indicator segments A, C, E, J, AUTO and A/C are on at the same time, there may be an open in the common ground wire. If no DTCs are present, the indicator remains blank.



DTC (Temperature Indicator Segment and AUTO Indicator)	Detection Item
A and AUTO	An open in the in-car temperature sensor circuit
B and AUTO	A short in the in-car temperature sensor circuit
C and AUTO	An open in the outside air temperature sensor circuit
D and AUTO	A short in the outside air temperature sensor circuit
E and AUTO	An open in the sunlight sensor circuit
F and AUTO	A short in the sunlight sensor circuit
G and AUTO	An open in the evaporator temperature sensor circuit
H and AUTO	A short in the evaporator temperature sensor circuit
J and AUTO	An open in the humidity sensor circuit
K and AUTO	A short in the humidity sensor circuit
A and A/C	An open in the air mix control motor circuit
B and A/C	A short in the air mix control motor circuit
C and A/C	A problem in the air mix control motor circuit, linkage, door, or motor
D and A/C	An open or short in the mode control motor circuit
E and A/C	A problem in the mode control motor circuit, linkage, doors, or motor
F and A/C	A problem in the blower motor circuit
A	Climate control unit internal error
B	Climate control unit lost communication with gauge control module (VSP message)
C	Climate control unit lost communication with gauge control module (ECT message)
D	Climate control unit lost communication with gauge control module (ILLUMI message)
E	Communication circuit error (BUS-OFF)

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

Check these items before using the sensor input display mode

1. Turn the ignition switch to ON (II), and check the recirculation door function; press the recirculation button to switch from FRESH to RECIRC. The air volume and sound should change slightly.
2. Set the temperature control knob to the desired test temperature. When selecting the test temperature, note these items:
   - "Lo" temperature setting will default to MAX COOL, VENT, and RECIRC.
   - "Hi" temperature setting will default to MAX HOT, FLOOR, and FRESH.
   - 19 through 31 °C settings will use the automatic climate control logic.
3. Turn the ignition switch to LOCK (0).

To run the sensor input display mode, follow these steps

1. Turn the ignition switch to LOCK (0).
2. Press and hold both the AUTO and RECIRCULATION buttons, then start the engine.
3. After the engine starts, release both buttons. The display panel control unit will flash the sensor number and then the value for that sensor. Record the value displayed.
4. To advance to the next sensor, press the REAR WINDOW DEFOGGER button.

Sensor	Item	Displayed Value
1	Mode Positioning	BIT
2	In-car Temperature	°C
3	Outside Air Temperature	°C

Sensor	Item	Displayed Value
4	Solar Radiation Sensor Value: Dark = 00, Flashlight = 04, Cloudy = 10, Sunny = 65	10 kcal/m ^{2} ·h
5	Evaporator Outlet Air Temperature	°C
6	Air Mix Opening (Low value indicates cooler air distribution, higher value indicates warmer air distribution)	% of opening
7	Vehicle speed (Vehicle must be driven to display speed)	10 km/h
8	Engine Coolant Temperature	°C
9	Vent Temperature Air Out (TAO)	°C
A	Humidity Sensor Value	%
B	Illumination duty	Step
C	Software version	———

NOTE:

- The sensor values will be displayed in degrees Celsius (°C) or an alphanumeric code. Use the chart to convert the value to degrees Fahrenheit (°F).
- If the sensor value displays ‘‘Er" this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or refer to checking DTCs by DTC indication to check for DTCs.
- If necessary, compare the sensor input display to a like, known-good vehicle under the same test conditions.
- If the sensor is out of the normal range, refer to the sensor test or substitute a known-good sensor, and recheck.

5. To cancel the sensor input display mode, press the AUTO button or turn the ignition switch to LOCK (0).

Celsius to Fahrenheit Conversion Table

°C	°F	°C	°F	°C	°F	°C	°F	°C	°F
0	32	10	50	20	68	30	86	40	104
1	34	11	52	21	70	31	88	41	106
2	36	12	54	22	72	32	90	42	108
3	37	13	55	23	73	33	91	43	109
4	39	14	57	24	75	34	93	44	111
5	41	15	59	25	77	35	95	45	113
6	43	16	61	26	79	36	97	46	115
7	45	17	63	27	81	37	99	47	117
8	46	18	64	28	82	38	100	48	118
9	48	19	66	29	84	39	102	49	120
50	122	60	140	70	158	80	176	90	194
51	124	61	142	71	160	81	178	91	196
52	126	62	144	72	162	82	180	92	198
53	127	63	145	73	163	83	181	93	199
54	128	64	147	74	165	84	183	94	201
55	131	65	149	75	167	85	185	95	203
56	133	66	151	76	169	86	187	96	205
57	135	67	152	77	170	87	188	97	207
58	136	68	154	78	172	88	190	98	208
59	139	69	158	79	174	89	192	99	210

Alphanumeric Conversion Table

Display Reading (Alphanumeric)	°C	°F	%
A1 thru A9	−1 thru −9	30 thru 16	−1 thru −9
B0 thru B9	−10 thru −19	14 thru −2	−10 thru −19
C0 thru C9	−20 thru −29	−4 thru −20	−20 thru −29
D0 thru D9	−30 thru −39	−22 thru −38	−30 thru −39

F0 thru F9	———	———	+100 thru +109

HVAC DTC Troubleshooting: A

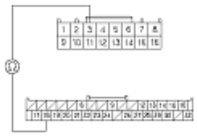
DTC indicator A:
Climate Control Unit Internal Error
NOTE: Check the battery condition and the charging system.

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the climate control unit.
4. Check for DTCs.

Is DTC A indicated?
YES - The climate control unit is faulty, replace the climate control unit. ■
NO - Intermittent failure, the climate control unit is OK at this time.■

DTC Troubleshooting: B1205 (B), B1206 (C), B1207

DTC B1205 or DTC indicator B:
Climate Control Unit Lost Communication with Gauge Control Module (VSP/NE message)
DTC B1206 or DTC indicator C:
Climate Control Unit Lost Communication with Gauge Control Module (ECT message)
DTC B1207 or DTC indicator D:
Climate Control Unit Lost Communication with Gauge Control Module (ILLUMI message)



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check the DTCs.

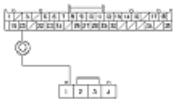
   Is DTC B1205 or B, and/or B1206 or C, and/or B1207 or D indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the gauge control module and climate control unit circuit.■
5. Select UNIT INFORMATION in the BODY ELECTRICAL menu.
6. Select CONNECTED UNIT in the UNIT INFORMATION menu.

   Is gauge control module detected?
   YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
   NO - Go to Step 7 .
7. Disconnect under-dash fuse/relay box connector Q (16P).
8. Disconnect the gauge control module 32P connector.
9. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and the gauge control module 32P connector No. 18 terminal.

   Is there continuity?
   YES - Go to the gauge control module input test. ■
   NO - Repair open in the wire between the MICU and the gauge control module.■

DTC Troubleshooting: B1225 (A and AUTO)

DTC B1225 or DTC indicator A and AUTO:
An Open in the In-car Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1225 or A and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the in-car temperature sensor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Remove the humidity/in-car temperature sensor, and test it.

   Is the in-car temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the humidity/in-car temperature sensor .■
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between the climate control unit 36P connector No. 20 terminal and the humidity/in-car temperature sensor 4P connector No. 1 terminal.

   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair open in the wire between the climate control unit and the in-car temperature sensor.■

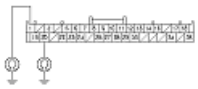
---

9. Check for continuity between the climate control unit 36P connector No. 1 terminal and the humidity/in-car temperature sensor 4P connector No. 2 terminal.

   Is there continuity?
   YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the humidity/in-car temperature sensor 4P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
   NO - Repair open in the wire between the climate control unit and the in-car temperature sensor.■

DTC Troubleshooting: B1226 (B and AUTO)

DTC B1226 or DTC indicator B and AUTO:
A Short in the In-car Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1226 or B and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Remove the humidity/in-car temperature sensor , and test it.

   Is the in-car temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the humidity/in-car temperature sensor .■
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between body ground and the climate control unit 36P connector No. 1 and No. 20 terminals individually.

   Is there continuity?
   YES - Repair short to body ground in the wires between the climate control unit and the in-car temperature sensor.■
   NO - Go to Step 9 .

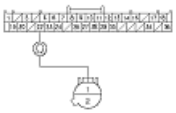
---

9. Check for continuity between the climate control unit 36P connector No. 1 and No. 20 terminals.

   Is there continuity?
   YES - Repair short in the wires between the climate control unit and the in-car temperature sensor.■
   NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1227 (C and AUTO)

DTC B1227 or DTC indicator C and AUTO:
An Open in the Outside Air Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1227 or C and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the outside air temperature sensor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Remove the outside air temperature sensor, and test it.

   Is the outside air temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the outside air temperature sensor .■
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between the climate control unit 36P connector No. 22 terminal and the outside air temperature sensor 2P connector No. 1 terminal.

   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair open in the wire between the climate control unit and the outside air temperature sensor.■

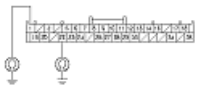
---

9. Check for continuity between the climate control unit 36P connector No. 1 terminal and the outside air temperature sensor 2P connector No. 2 terminal.

   Is there continuity?
   YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the outside air temperature sensor 2P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
   NO - Repair open in the wire between the climate control unit and the outside air temperature sensor.■

DTC Troubleshooting: B1228 (D and AUTO)

DTC B1228 or DTC indicator D and AUTO:
A Short in the Outside Air Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1228 or D and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Remove the outside air temperature sensor, and test it.

   Is the outside air temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the outside air temperature sensor .■
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between body ground and the climate control unit 36P connector No. 1 and No. 22 terminals individually.

   Is there continuity?
   YES - Repair short to body ground in the wires between the climate control unit and the outside air temperature sensor.■
   NO - Go to Step 9 .

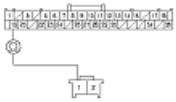
---

9. Check for continuity between the climate control unit 36P connector No. 1 and No. 22 terminals.

   Is there continuity?
   YES - Repair short in the wires between the climate control unit and the outside air temperature sensor.■
   NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1229 (E and AUTO)

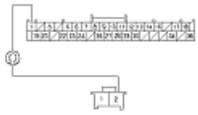
DTC B1229 or DTC indicator E and AUTO:
An Open in the Sunlight Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1229 or E and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the sunlight sensor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the sunlight sensor connector.
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between the climate control unit 36P connector No. 19 terminal and the sunlight sensor 2P connector No. 1 terminal.

   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair open in the wire between the climate control unit and the sunlight sensor.■



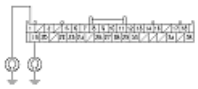
9. Check for continuity between the climate control unit 36P connector No. 1 terminal and the sunlight sensor 2P connector No. 2 terminal.

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the climate control unit and the sunlight sensor.■
10. Reconnect the sunlight sensor connector.
11. Reconnect the climate control unit 36P connector.
12. Test the sunlight sensor.

    Is the sunlight sensor OK?
    YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the sunlight sensor connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
    NO - Replace the sunlight sensor. ■

DTC Troubleshooting: B1230 (F and AUTO)

DTC B1230 or DTC indicator F and AUTO:
A Short in the Sunlight Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1230 or F and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the sunlight sensor connector.
7. Disconnect the climate control unit 36P connector.
8. Check for continuity between body ground and the climate control unit 36P connector No. 1 and No. 19 terminals individually.

   Is there continuity?
   YES - Repair short to body ground in the wires between the climate control unit and the sunlight sensor.■
   NO - Go to Step 9 .

---

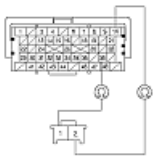
9. Check for continuity between the climate control unit 36P connector No. 1 and No. 19 terminals.

   Is there continuity?
   YES - Repair short in the wires between the climate control unit and the sunlight sensor.■
   NO - Go to Step 10 .
10. Reconnect the sunlight sensor connector.
11. Reconnect the climate control unit 36P connector.
12. Test the sunlight sensor.

    Is the sunlight sensor OK?
    YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
    NO - Replace the sunlight sensor. ■

DTC Troubleshooting: B1231 (G and AUTO)

DTC B1231 or DTC indicator G and AUTO:
An Open in the Evaporator Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1231 or G and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the evaporator temperature sensor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Remove the evaporator temperature sensor, and test it.

   Is the evaporator temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the evaporator temperature sensor .■
7. Jump the SCS line with the HDS.
   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
8. Disconnect ECM/PCM connector A (49P).
9. Check for continuity between the following terminals of ECM/PCM connector A (49P) and the evaporator temperature sensor 2P connector.

49P:	2P:
No. 10	No. 2
No. 38	No. 1

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wire(s) between the ECM/PCM and the evaporator temperature sensor.■

---

10. Check for continuity between the climate control unit 36P connector No. 23 terminal and the evaporator temperature sensor 2P connector No. 1 terminal.

    Is there continuity?
    YES - Go to Step 11 .
    NO - Repair open in the wire between the climate control unit and the evaporator temperature sensor.■
11. Reconnect ECM/PCM connector A (49P).
12. Reconnect the climate control unit 36P connector.
13. Turn the ignition switch to ON (II).

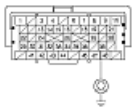
---

14. Measure the voltage between the climate control unit 36P connector No. 23 terminal and body ground.

    Is there about 4.30–5.25 V?
    YES - Check for loose wires or poor connections at ECM/PCM connector A (49P). If the connections are good, substitute a known-good ECM/PCM and recheck the original climate control unit.■
    NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1232 (H and AUTO)

DTC B1232 or DTC indicator H and AUTO:
A Short in the Evaporator Temperature Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

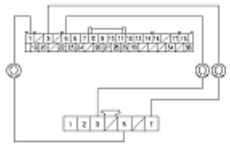
   Is DTC B1232 or H and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Remove the evaporator temperature sensor, and test it.

   Is the evaporator temperature sensor OK?
   YES - Go to Step 7 .
   NO - Replace the evaporator temperature sensor .■
7. Disconnect the climate control unit 36P connector.
8. Jump the SCS line with the HDS.
   NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between ECM/PCM connector A (49P) No. 38 terminal and body ground.

    Is there continuity?
    YES - Repair short to body ground in the wire between the ECM/PCM and the climate control unit.■
    NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1233 (A and A/C)

DTC B1233 or DTC indicator A and A/C:
An Open in the Air Mix Control Motor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1233 or A and A/C indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the air mix control motor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor.

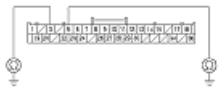
   Is the air mix control motor OK?
   YES - Go to Step 7 .
   NO - Replace the air mix control motor. ■
7. Disconnect the air mix control motor 7P connector.
8. Disconnect the climate control unit 36P connector.
9. Check for continuity between the following terminals of the climate control unit 36P connector and the air mix control motor 7P connector.

36P:	7P:
No. 1	No. 5
No. 3	No. 7
No. 5	No. 3

   Is there continuity?
   YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the air mix control motor 7P connector. If the connections are good, substitute a known-good climate control unit and recheck. If the symptom/indication goes away, replace the original climate control unit .■
   NO - Repair open in the wires between the climate control unit and the air mix control motor.■

DTC Troubleshooting: B1234 (B and A/C)

DTC B1234 or DTC indicator B and A/C:
A Short in the Air Mix Control Motor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1234 or B and A/C indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor.

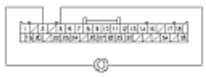
   Is the air mix control motor OK?
   YES - Go to Step 7 .
   NO - Replace the air mix control motor. ■
7. Disconnect the air mix control motor 7P connector.
8. Disconnect the climate control unit 36P connector.
9. Check for continuity between body ground and the climate control unit 36P connector No. 3 and No. 5 terminals individually.

   Is there continuity?
   YES - Repair short to body ground in the wires between the climate control unit and the air mix control motor.■
   NO - Go to Step 10 .

---

10. Check for continuity between the climate control unit 36P connector No. 3 and No. 5 terminals.

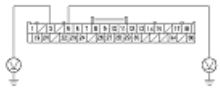
    Is there continuity?
    YES - Repair short in the wires.■
    NO - Go to Step 11 .



---

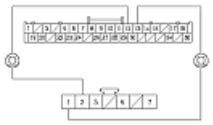
11. Turn the ignition switch to ON (II), and check the same terminals for voltage to body ground.

    Is there any voltage?
    YES - Repair short to power in the wires between the climate control unit and the air mix control motor. This short may also damage the climate control unit. Repair the short to power before replacing the climate control unit.■
    NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■



DTC Troubleshooting: B1235 (C and A/C)

DTC B1235 or DTC indicator C and A/C:
A Problem in the Air Mix Control Motor Circuit, Linkage, Door, or Motor



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1235 or C and A/C indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Test the air mix control motor.

   Is the air mix control motor OK?
   YES - Go to Step 7 .
   NO - Replace the air mix control motor, or repair the air mix control linkage or door.■
7. Disconnect the air mix control motor 7P connector.
8. Disconnect the climate control unit 36P connector.
9. Check for continuity between the following terminals of the climate control unit 36P connector and the air mix control motor 7P connector.

36P:	7P:
No. 12	No. 2
No. 13	No. 1

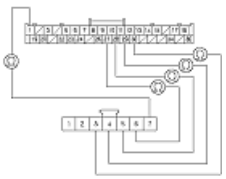
   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wires between the climate control unit and the air mix control motor.■

10. Check for continuity between body ground and the climate control unit 36P connector No. 12 and No. 13 terminals individually.

    Is there continuity?
    YES - Repair short to body ground in the wires between the climate control unit and the air mix control motor.■
    NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1239 (D and A/C)

DTC B1239 or DTC indicator D and A/C:
An Open or Short in the Mode Control Motor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1239 or D and A/C indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the mode control motor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Test the mode control motor.

   Is the mode control motor OK?
   YES - Go to Step 7 .
   NO - Replace the mode control motor. ■
7. Disconnect the mode control motor 7P connector.
8. Disconnect the climate control unit 36P connector.
9. Check for continuity between the following terminals of the climate control unit 36P connector and the mode control motor 7P connector.

36P:	7P:
No. 1	No. 7
No. 27	No. 6
No. 28	No. 5
No. 29	No. 4
No. 30	No. 3

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wires between the climate control unit and the mode control motor.■

---

10. Check for continuity between body ground and the climate control unit 36P connector No. 27, No. 28, No. 29, and No. 30 terminals individually.

    Is there continuity?
    YES - Repair short to body ground in the wires between the climate control unit and the mode control motor.■
    NO - Go to Step 11 .
11. Check for continuity between the climate control unit 36P connector terminals as follows.

From terminal	To terminals
27	28, 29, 30
28	29, 30
29	30

    Is there continuity between any of the terminals?
    YES - Repair the short in the wires.■
    NO - Go to Step 12 .

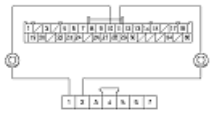
---

12. Turn the ignition switch to ON (II), and check the same terminals for voltage to body ground.

    Is there any voltage?
    YES - Repair short to power in the wires between the climate control unit and the mode control motor. This short may also damage the climate control unit. Repair the short to power before replacing the climate control unit.■
    NO - Check for loose wires or poor connections at the climate control unit 36P connector and at the mode control motor 7P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1240 (E and A/C)

DTC B1240 or DTC indicator E and A/C:
A Problem in the Mode Control Motor Circuit, Linkage, Doors, or Motor



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1240 or E and A/C indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Test the mode control motor.

   Is the mode control motor OK?
   YES - Go to Step 7 .
   NO - Replace the mode control motor, or repair the mode control linkage or doors.■
7. Disconnect the mode control motor 7P connector.
8. Disconnect the climate control unit 36P connector.
9. Check for continuity between the following terminals of the climate control unit 36P connector and the mode control motor 7P connector.

36P:	7P:
No. 10	No. 1
No. 11	No. 2

   Is there continuity?
   YES - Go to Step 10 .
   NO - Repair open in the wires between the climate control unit and the mode control motor.■

10. Check for continuity between body ground and the climate control unit 36P connector No. 10 and No. 11 terminals individually.

    Is there continuity?
    YES - Repair short to body ground in the wires between the climate control unit and the mode control motor.■
    NO - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■

DTC Troubleshooting: B1241 (F and A/C)

DTC B1241 or DTC indicator F and A/C:
A Problem in the Blower Motor Circuit

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B1241 or F and A/C indicated?
   YES - Go to Step 5.
   NO - Intermittent failure, check for loose wires or poor connections on the blower motor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Check the No. 10 (7.5 A) and No. 57 (30 A) fuses in the under-dash fuse/relay box.

   Are the fuses OK?
   YES - Go to Step 7.
   NO - Replace the fuses, and recheck. If fuses blow again, check for a short in the No. 10 (7.5 A) and No. 57 (30 A) fuses circuit.■
7. Connect the blower motor 2P connector No. 2 terminal to body ground with a jumper wire.
8. Turn the ignition switch to ON (II).

   Does the blower motor run?
   YES - Go to Step 9.
   NO - Go to Step 24.
9. Turn the ignition switch to LOCK (0).
10. Disconnect the jumper wire.
11. Disconnect the power transistor 4P connector.

---

12. Check for continuity between the power transistor 4P connector No. 2 terminal and body ground.

    Is there continuity?
    YES - Go to Step 13.
    NO - Check for an open in the wire between the power transistor and body ground. If the wire is OK, check for poor body ground at G502. ■

---

13. Connect the power transistor 4P connector No. 2 and No. 4 terminals with a jumper wire.
14. Turn the ignition switch to ON (II).

    Does the blower motor run at high speed?
    YES - Go to Step 15.
    NO - Repair open in the BLU wire between the power transistor and the blower motor.■
15. Turn the ignition switch to LOCK (0).
16. Disconnect the jumper wire.
17. Disconnect the climate control unit 36P connector.

---

18. Check for continuity between body ground and the climate control unit 36P connector No. 15 and No. 34 terminals individually.

    Is there continuity?
    YES - Repair short to body ground in the wires between the climate control unit and the power transistor.■
    NO - Go to Step 19.

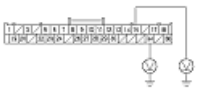
---

19. Check for continuity between the following terminals of the climate control unit 36P connector and the power transistor 4P connector.

36P:	4P:
No. 15	No. 3
No. 34	No. 1

    Is there continuity?
    YES - Go to Step 20.
    NO - Repair open in the wires between the climate control unit and the power transistor.■
20. Turn the ignition switch to ON (II).

21. Measure the voltage between body ground and the climate control unit 36P connector No. 15 and No. 34 terminals individually.



Is there voltage?
YES - Repair short to power in the wires.■
NO - Go to Step 22 .

22. Reconnect the climate control unit 36P connector.

23. Test the power transistor.

Is the power transistor OK?
YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the power transistor 4P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
NO - Replace the power transistor. ■

24. Disconnect the blower motor 2P connector.

25. Measure the voltage between the blower motor 2P connector No. 1 terminal and body ground.

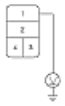
Is there battery voltage?
YES - Replace the blower motor. ■
NO - Go to Step 26 .

26. Turn the ignition switch to LOCK (0).

27. Remove the blower motor relay from the under-dash fuse/relay box, and test it.

Is the relay OK?
YES - Go to Step 28 .
NO - Replace the blower motor relay .■

28. Measure the voltage between the blower motor relay 4P socket No. 1 terminal and body ground.



Is there battery voltage?
YES - Go to Step 29 .
NO - Replace the under-dash fuse/relay box. ■

29. Turn the ignition switch to ON (II).

30. Measure the voltage between the blower motor relay 4P socket No. 3 terminal and body ground.

Is there battery voltage?
YES - Go to Step 31 .
NO - Replace the under-dash fuse/relay box. ■

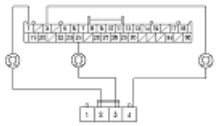
31. Turn the ignition switch to LOCK (0).

32. Check for continuity between the blower motor relay 4P socket No. 4 terminal and body ground.

Is there continuity?
YES - Repair open in the WHT wire between the blower motor relay and the blower motor.■
NO - Check for open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor body ground at G501. ■

DTC Troubleshooting: B2967 (J and AUTO)

DTC B2967 or DTC indicator J and AUTO:
An Open in the Humidity Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B2967 or J and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the humidity sensor circuit.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the climate control unit 36P connector.
7. Disconnect the humidity/in-car temperature sensor 4P connector.
8. Check for continuity between the following terminals of the climate control unit 36P connector and the humidity/in-car temperature sensor 4P connector.

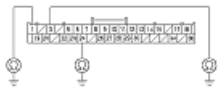
36P:	4P:
No. 1	No. 2
No. 3	No. 4
No. 24	No. 3

   Is there continuity?
   YES - Go to Step 9 .
   NO - Repair open in the wires between the climate control unit and the humidity sensor.■
9. Reconnect the humidity/in-car temperature sensor 4P connector.
10. Reconnect the climate control unit 36P connector.
11. Test the humidity temperature sensor.

    Is the humidity sensor OK?
    YES - Check for loose wires or poor connections at the climate control unit 36P connector and at the humidity/in-car temperature sensor 4P connector. If the connections are good, substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
    NO - Replace the humidity/in-car temperature sensor. ■

DTC Troubleshooting: B2968 (K and AUTO)

DTC B2968 or DTC indicator K and AUTO:
A Short in the Humidity Sensor Circuit



1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check for DTCs.

   Is DTC B2968 or K and AUTO indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the climate control unit 36P connector.
7. Disconnect the humidity/in-car temperature sensor 4P connector.
8. Check for continuity between body ground and the climate control unit 36P connector No. 1, 3, and No. 24 terminals individually.

   Is there continuity?
   YES - Repair short to body ground in the wires between the climate control unit and the humidity sensor.■
   NO - Go to Step 9 .
9. Check for continuity between terminals of the climate control unit 36P connector as follows.

From terminal	To terminals
1	3, 24
3	24

   Is there continuity between any of the terminals?
   YES - Repair the short in the wires.■
   NO - Go to Step 10 .

---

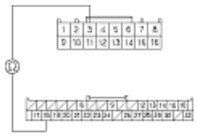
10. Turn the ignition switch to ON (II), and check the same terminals for voltage to body ground.

    Is there any voltage?
    YES - Repair short to power in the wires between the climate control unit and the humidity sensor. This short may also damage the climate control unit. Repair the short to power before replacing the climate control unit .■
    NO - Go to Step 11 .
11. Reconnect the humidity/in-car temperature sensor 4P connector.
12. Reconnect the climate control unit 36P connector.
13. Test the humidity temperature sensor.

    Is the humidity temperature sensor OK?
    YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
    NO - Replace the humidity/in-car temperature sensor. ■

DTC Troubleshooting: B2969

DTC B2969:
Climate Control Unit Lost Communication with MICU (WIPSW message)



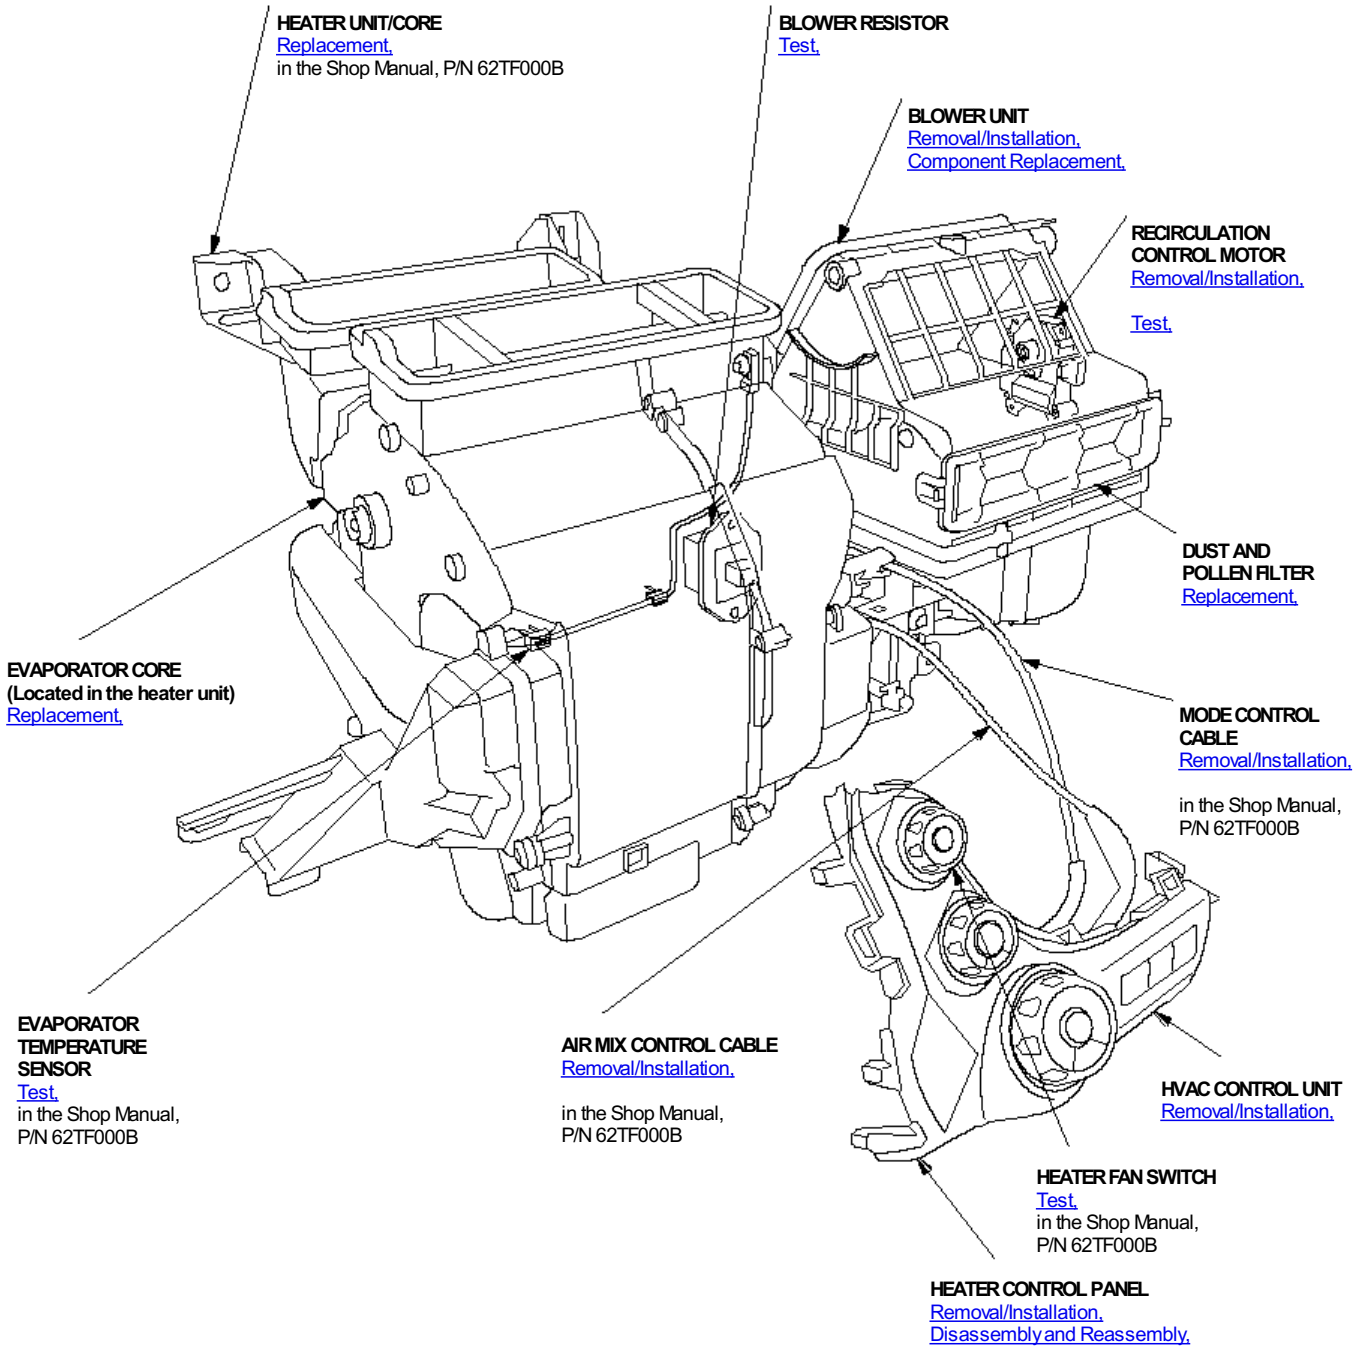
1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), and then to ON (II).
3. Do the self-diagnostic function with the HDS or climate control unit.
4. Check the DTCs.

   Is DTC B2969 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, check for loose wires or poor connections on the gauge control module and climate control unit circuit.■
5. Select UNIT INFORMATION in the BODY ELECTRICAL menu.
6. Select CONNECTED UNIT in the UNIT INFORMATION menu.

   Is MICU detected?
   YES - Substitute a known-good climate control unit, and recheck. If the symptom/indication goes away, replace the original climate control unit .■
   NO - Go to Step 7 .
7. Disconnect under-dash fuse/relay box connector Q (16P).
8. Disconnect the gauge control module 32P connector.
9. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and the gauge control module 32P connector No. 18 terminal.

   Is there continuity?
   YES - Go to the MICU input test. ■
   NO - Repair open in the wire between the MICU and the gauge control module.■

Heating and A/C Component Location Index



LHD model is shown, RHD model is similar.

A/C condenser fan does not run at all (but radiator fan runs with the A/C on)

Diagnostic procedure

1. A/C condenser Fan Circuit Troubleshooting

Also check for

- Blown fuse No. 47 (30 A) in the under-dash fuse/relay box
- Poor ground at G202
- Cleanliness and tightness of all connectors

Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)

Diagnostic procedure

1. Radiator and A/C condenser Fans Common Circuit Troubleshooting

Also check for

- Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box
- Poor ground at G202
- Cleanliness and tightness of all connectors

A/C compressor clutch does not engage (but both fans run with the A/C on)

Diagnostic procedure

1. A/C compressor Clutch Circuit Troubleshooting

Also check for

- Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all connectors

A/C system does not come on (both fans and the A/C compressor do not work); heater is OK

Diagnostic procedure

1. A/C Pressure Switch Circuit Troubleshooting

Also check for

- Poor ground at G502
- Cleanliness and tightness of all connectors

A/C Pressure Switch Circuit Troubleshooting

HVAC Control (Lever type)

NOTE:

- Do not use this troubleshooting procedure if any of these items are working properly with the A/C switch ON; condenser fan, radiator fan, A/C compressor, or if the heater does not work. Refer to the symptom troubleshooting index.
- Check the A/C high-side pressure.

1. Disconnect the A/C pressure switch 2P connector.
2. Turn the ignition switch to ON (II).
3. Measure the voltage between the A/C pressure switch 2P connector No. 2 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 4 .
   NO - Go to Step 20 .
4. Turn the ignition switch to LOCK (0).

---

5. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

   Is there continuity?
   YES - Go to Step 6 .
   NO - Replace the A/C pressure switch.■
6. Reconnect the A/C pressure switch 2P connector.
7. Disconnect the A/C switch 5P connector.
8. Turn the ignition switch to ON (II).

---

9. Measure the voltage between the A/C switch 5P connector No. 2 terminal and body ground.

   Is there battery voltage?
   YES - Go to Step 10 .
   NO - Repair open in the wire between the A/C pressure switch and the A/C switch.■
10. Turn the ignition switch to LOCK (0).
11. Test the A/C switch.

    Is the A/C switch OK?
    YES - Go to Step 12 .
    NO - Replace the A/C switch.■
12. Disconnect the heater fan switch 8P connector.

---

13. Check for continuity between the A/C switch 5P connector No. 1 terminal and the heater fan switch 8P connector No. 6 terminal.

    Is there continuity?
    YES - Go to Step 14 .
    NO - Repair open in the wire between the A/C switch and the heater fan switch.■
14. Test the heater fan switch.

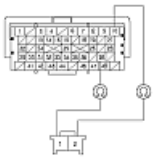
    Is the heater fan switch OK?
    YES - Go to Step 15 .
    NO - Replace the heater fan switch. ■
15. Remove the evaporator temperature sensor and test it.

    Is the evaporator temperature sensor OK?
    YES - Go to Step 16 .
    NO - Replace the evaporator temperature sensor. ■
16. Jump the SCS line with the HDS.
    NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.
17. Disconnect ECM/PCM connector A (49P).

---

18. Check for continuity between the following terminals of ECM/PCM connector A (49P) and the evaporator temperature sensor 2P connector.

49P:	2P:
No. 10	No. 2
No. 38	No. 1

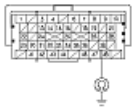


Is there continuity?

YES - Go to Step 19 .
NO - Repair open in the wire(s) between the ECM/PCM and the evaporator temperature sensor.■

---

19. Check for continuity between ECM/PCM connector A (49P) No. 38 terminal and body ground.



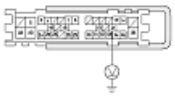
Is there continuity?

YES - Repair short to body ground in the wire between the ECM/PCM and the evaporator temperature sensor.■
NO - Check for loose wires or poor connections at ECM/PCM connector A (49P), the evaporator temperature sensor 2P connector, the A/C pressure switch 2P connector, the A/C switch 5P connector and at the heater fan switch 8P connector. If the connections are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM /PCM.■

20. Turn the ignition switch to LOCK (0).
21. Reconnect the A/C pressure switch 2P connector.
22. Make sure the A/C switch is OFF.
23. Turn the ignition switch to ON (II).

---

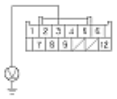
24. Measure the voltage between under-dash fuse/relay box connector A (36P) No. 21 terminal and body ground with the under-dash fuse/relay box connectors connected.



Is there battery voltage?

YES - Repair open in the wire between the A/C pressure switch and the MICU.■
NO - Check for loose wires or poor connections at the under-dash fuse/relay box. If the connections are OK, substitute a known-good MICU and recheck. If the symptom goes away, replace the original MICU .■

HVAC Control (Push button type)



NOTE:

- Do not use this troubleshooting procedure if any of the following items are operative; condenser fan, radiator fan, A/C compressor, or if the heater is inoperative. Refer to the symptom troubleshooting index.
- Check the A/C high-side pressure.

1. Turn the ignition switch to ON (II).
2. Check if the blower motor operates at all speeds.

Does the blower motor operate at all speeds?

YES - Go to Step 3 .
NO - Repair the problem in the blower motor circuit. ■

3. Turn the ignition switch to LOCK (0).
4. Disconnect the HVAC control unit 12P connector.
5. Turn the ignition switch to ON (II).
6. Measure the voltage between the HVAC control unit 12P connector No. 3 terminal and body ground.

Is there battery voltage?

YES - Go to Step 13 .
NO - Go to Step 7 .

7. Turn the ignition switch to LOCK (0).
8. Disconnect the A/C pressure switch 2P connector.
9. Turn the ignition switch to ON (II).

---

10. Measure the voltage between the A/C pressure switch 2P connector No. 2 terminal and body ground.

Is there battery voltage?

YES - Go to Step 11 .
NO - Go to Step 23 .

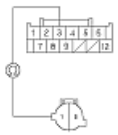
---

11. Check for continuity between the No. 1 and No. 2 terminals of the A/C pressure switch.

Is there continuity?
YES - Go to Step 12 .
NO - Replace the A/C pressure switch.■

---

12. Check for continuity between the HVAC control unit 12P connector No. 3 terminal and the A/C pressure switch 2P connector No. 1 terminal.



Is there continuity?
YES - Check for loose wires or poor connections at the HVAC control unit 12P connector and at the A/C pressure switch 2P connector.■
NO - Repair open in the wire between the HVAC control unit and A/C pressure switch.■

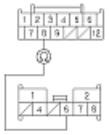
13. Turn the ignition switch to LOCK (0).

14. Disconnect the heater fan switch 8P connector.

15. Disconnect the HVAC control unit 12P connector.

---

16. Check for continuity between the HVAC control unit 12P connector No. 8 terminal and the heater fan switch 8P connector No. 6 terminal.



Is there continuity?
YES - Go to Step 17 .
NO - Repair open in the wire between the HVAC control unit and heater fan switch.■

17. Disconnect the evaporator temperature sensor 2P connector.

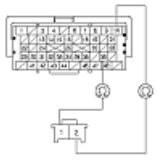
18. Jump the SCS line with the HDS.
NOTE: This step must be done to protect the engine control module (ECM)/powertrain control module (PCM) from damage.

19. Disconnect ECM/PCM connector A (49P).

---

20. Check for continuity between the following terminals of ECM/PCM connector A (49P) and the evaporator temperature sensor 2P connector.

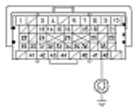
49P:	2P:
No. 10	No. 2
No. 38	No. 1



Is there continuity?
YES - Go to Step 21 .
NO - Repair open in the wire(s) between the ECM/PCM and the evaporator temperature sensor.■

---

21. Check for continuity between ECM/PCM connector A (49P) No. 38 terminal and body ground.



Is there continuity?
YES - Repair short to body ground in the wire between the ECM/PCM and evaporator temperature sensor.■
NO - Go to Step 22 .

22. Remove the evaporator temperature sensor and test it.

Is the evaporator temperature sensor OK?
YES - Check for loose wires or poor connections at ECM/PCM connector A (49P). If the connections are good, check the ECM/PCM grounds. If the grounds are good, substitute a known-good ECM/PCM, and recheck. If the symptom/indication goes away, replace the original ECM/PCM. ■
NO - Replace the evaporator temperature sensor .■

23. Turn the ignition switch to LOCK (0).

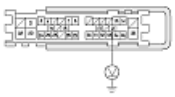
24. Reconnect the A/C pressure switch 2P connector.

25. Make sure the A/C switch is OFF.

26. Turn the ignition switch to ON (II).

---

27. Measure the voltage between under-dash fuse/relay box connector A (36P) No. 21 terminal and body ground with the under-dash fuse/relay box connectors connected.



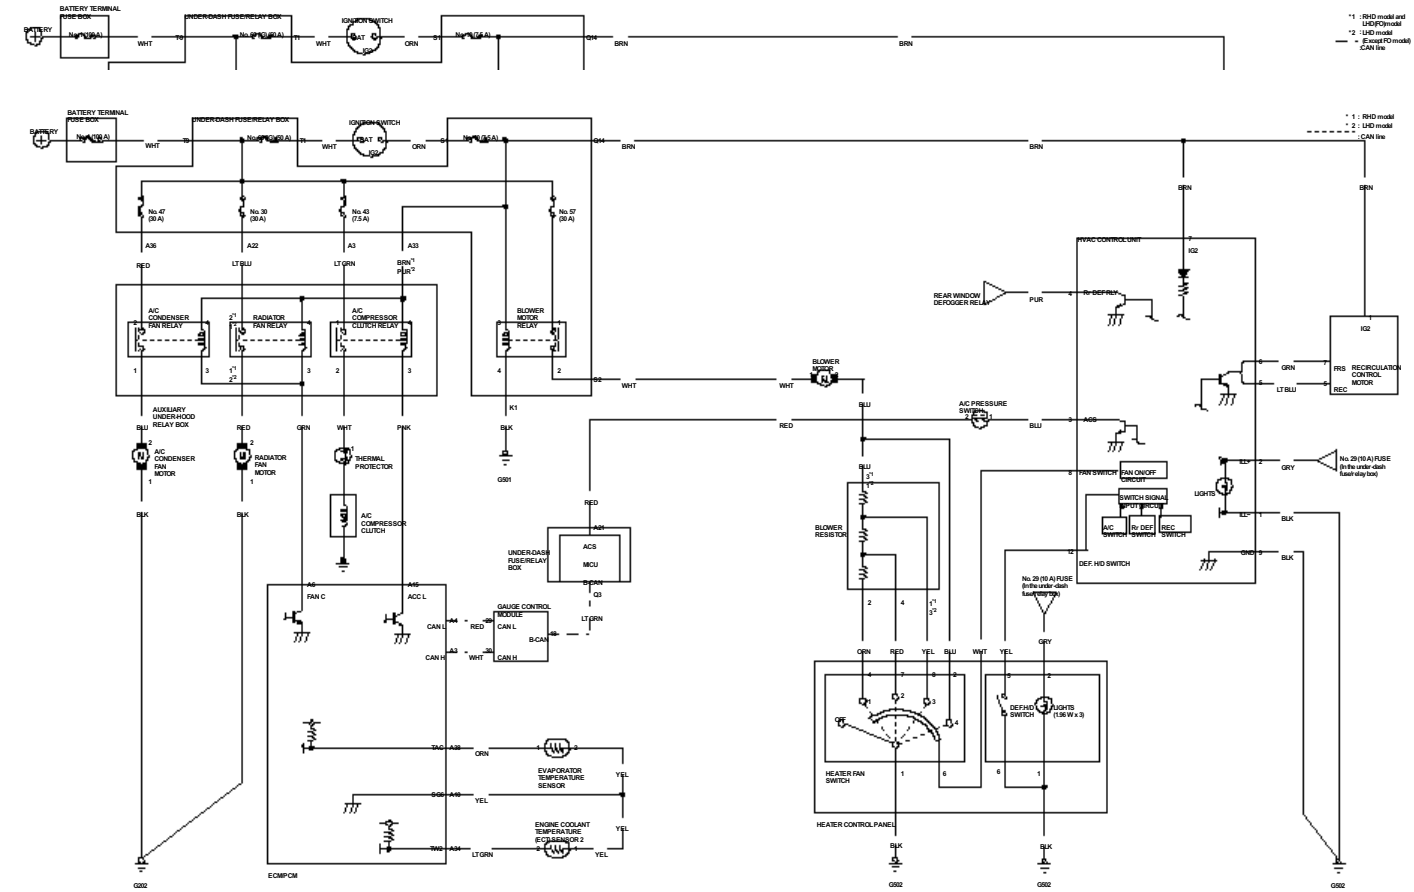
Is there battery voltage?
YES - Repair open in the wire between the A/C pressure switch and the MICU.■
NO - Check for loose wires or poor connections at the under-dash fuse/relay box. If the connections are OK, substitute a known-good MICU and recheck. If the symptom goes away, replace the original MICU .■

Heating and A/C System Description

[HVAC Control Unit Inputs and Outputs]

Heating and A/C Circuit Diagram

HVAC Control (Lever type)



Recirculation control doors do not change between Fresh and Recirculate

Diagnostic procedure

1. Recirculation control motor circuit troubleshooting

Also check for

- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Cleanliness and tightness of all terminals

Heater controls, and A/C do not work

Diagnostic procedure

1. HVAC control power and ground circuit troubleshooting

Also check for

- Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box
- Poor ground at G502
- Cleanliness and tightness of all terminals

Blower motor runs, but one or more speeds are inoperative

Diagnostic procedure

1. Blower Motor Circuit Troubleshooting

Also check for

- Cleanliness and tightness of all connectors

Blower motor does not run at all

Diagnostic procedure

1. Blower Motor Circuit Troubleshooting

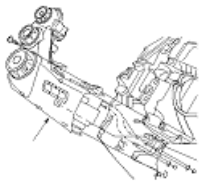
Also check for

- Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box
- Poor ground at G501
- Cleanliness and tightness of all connectors

Heating and A/C Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Recirculation control doors do not change between Fresh and Recirculate	Recirculation control motor circuit troubleshooting	• Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all terminals
Heater controls, and A/C do not work	HVAC control power and ground circuit troubleshooting	• Blown fuse No. 10 (7.5 A) in the under-dash fuse/relay box • Poor ground at G502 • Cleanliness and tightness of all terminals
Blower motor runs, but one or more speeds are inoperative	Blower Motor Circuit Troubleshooting	Cleanliness and tightness of all connectors
Blower motor does not run at all	Blower Motor Circuit Troubleshooting	• Blown fuse No. 10 (7.5 A) and No. 57 (30 A) in the under-dash fuse/relay box • Poor ground at G501 • Cleanliness and tightness of all connectors
A/C condenser fan does not run at all (but radiator fan runs with the A/C on)	A/C condenser Fan Circuit Troubleshooting	• Blown fuse No. 47 (30 A) in the under-dash fuse/relay box • Poor ground at G202 • Cleanliness and tightness of all connectors
Both fans do not run with the A/C on (but the A/C compressor runs with the A/C on)	Radiator and A/C condenser Fans Common Circuit Troubleshooting	• Blown fuse No. 30 (30 A) and No. 47 (30 A) in the under-dash fuse/relay box • Poor ground at G202 • Cleanliness and tightness of all connectors
A/C compressor clutch does not engage (but both fans run with the A/C on)	A/C compressor Clutch Circuit Troubleshooting	• Blown fuse No. 43 (7.5 A) in the under-dash fuse/relay box • Cleanliness and tightness of all connectors
A/C system does not come on (both fans and the A/C compressor do not work); heater is OK	A/C Pressure Switch Circuit Troubleshooting	• Poor ground at G502 • Cleanliness and tightness of all connectors

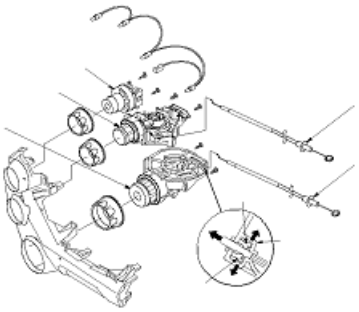
Heater Control Panel Removal/Installation



1. Remove the audio unit.
2. Remove the control cables from the heater unit.
3. Remove the self-tapping screw and pull the heater control panel (A).
4. Disconnect the connectors and remove the heater control panel.
5. Install the control panel in the reverse order of removal. After installation, operate the various functions to see whether it works properly.

Heater Control Panel Disassembly/Reassembly

1. Remove the heater control panel.
2. Using a snap ring pliers, widen the cable stops (A) in the cable holder (B), then pull out the mode control cable (C) and air mix control cable (D).
3. Hook the tip of the new control cables to the dial or slider, then push the cable housing into the cable holder until it locks into place.
4. After assembly, check that the dial turns smoothly.



HVAC Control Power and Ground Circuit Troubleshooting

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit.■

2. Disconnect the HVAC control unit 12P connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the HVAC control unit 12P connector No. 7 terminal and body ground.

Is there battery voltage?
YES - Go to Step 5 .
NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the HVAC control unit.■

5. Turn the ignition switch to LOCK (0).

---

6. Check for continuity between the HVAC control unit 12P connector No. 9 terminal and body ground.

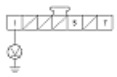
Is there continuity?
YES - Check for loose wires or poor connections at the HVAC control unit 12P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck.■
NO - Check for open in the wire between the HVAC control unit and body ground. If the wire is OK, check for poor ground at G502. ■

HVAC Control Unit Removal/Installation

1. Remove the heater control panel.
2. Remove the self-tapping screws and the HVAC control unit (A). If necessary, replace the bulbs (B).
3. Install the control unit in the reverse order of removal. After installation, operate the various functions to make sure they work properly.

Recirculation Control Motor Circuit Troubleshooting

1. Check the No. 10 (7.5 A) fuse in the under-dash fuse/relay box.



Is the fuse OK?
YES - Go to Step 2 .
NO - Replace the fuse, and recheck. If the fuse blows again, check for a short in the No. 10 (7.5 A) fuse circuit.■

2. Disconnect the recirculation control motor 7P connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between the recirculation control motor 7P connector No. 1 terminal and body ground.

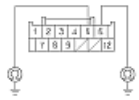
Is there battery voltage?
YES - Go to Step 5 .
NO - Repair open in the wire between the No. 10 (7.5 A) fuse in the under-dash fuse/relay box and the recirculation control motor.■

5. Turn the ignition switch to LOCK (0).
6. Test the recirculation control motor.

Is the recirculation control motor OK?
YES - Go to Step 7 .
NO - Replace the recirculation control motor, or repair the recirculation control linkage or door.■

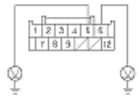
7. Disconnect the HVAC control unit 12P connector.

8. Check for continuity between body ground and the HVAC control unit 12P connector No. 5 and No. 6 terminals individually.



Is there continuity?
YES - Repair short to body ground in the wire(s) between the HVAC control unit and the recirculation control motor.■
NO - Go to Step 9 .

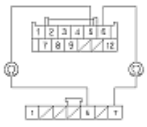
9. Turn the ignition switch to ON (II), and check the same terminals for voltage to body ground.



Is there any voltage?
YES - Repair short to power in the wires between the HVAC control unit and the recirculation control motor. This short may also damage the HVAC control unit. Repair the short to power before replacing the HVAC control unit.■
NO - Go to Step 10 .

10. Turn the ignition switch to LOCK (0).

11. Check for continuity between the following terminals of the HVAC control unit 12P connector and the recirculation control motor 7P connector.

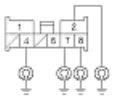


12P:	7P:
No. 5	No. 5
No. 6	No. 7

Is there continuity?
YES - Check for loose wires or poor connections at the HVAC control unit 12P connector and at the recirculation control motor 7P connector. If the connections are good, substitute a known-good HVAC control unit, and recheck. If the symptom/indication goes away, replace the original HVAC control unit .■
NO - Repair open in the wire(s) between the HVAC control unit and the recirculation control motor.■

Blower Motor Circuit Troubleshooting

1. Turn the ignition switch to ON (II) and the heater fan switch ON.



Does the blower motor run in each speed?
YES - Go to Step 2 .
NO - Go to Step 16 .

2. Turn the heater fan switch OFF.
3. Make sure the ignition switch is ON (II).

Does the blower motor run?
YES - Go to Step 4 .
NO - Go to Step 9 .

4. Turn the ignition switch to LOCK (0).
5. Disconnect the blower motor 2P connector.
6. Disconnect the blower resistor 4P connector.
7. Disconnect the heater fan switch 8P connector.
8. Check for continuity between the heater fan switch 8P connector No. 2, 4, 7, and No. 8 terminals and body ground individually.

Is there continuity?
YES - Repair short to body ground in the wires between the blower motor, the blower resistor and the heater fan switch.■
NO - Replace the heater fan switch. ■

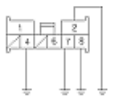
9. Turn the ignition switch to LOCK (0).
10. Disconnect the blower resistor 4P connector.
11. Test the blower resistor.

Is the blower resistor OK?
YES - Go to Step 12 .
NO - Replace the blower resistor.■

12. Reconnect the blower resistor 4P connector.
13. Disconnect the heater fan switch 8P connector.
14. Turn the ignition switch to ON (II).

---

15. Ground each of the heater fan switch 8P connector terminals individually in the following order: No. 4, 7, 8, and No. 2.



Does the blower motor run at progressively higher speeds?
YES - Replace the heater fan switch. ■
NO - Repair any open or cause of excessive resistance in the appropriate wires between the blower resistor and the heater fan switch.■

16. Turn the heater fan switch OFF and the ignition switch to LOCK (0).
17. Check the No. 57 (30 A) and the No. 10 (7.5 A) fuses in the under-dash fuse/relay box.

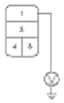
Are the fuses OK?
YES - Go to Step 18 .
NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 57 (30 A) and No. 10 (7.5 A) fuses circuit.■

18. Remove the blower motor relay from the under-dash fuse/relay box, and test it.

Is the relay OK?
YES - Go to Step 19 .
NO - Replace the blower motor relay .■

---

19. Measure the voltage between the blower motor relay 4P socket No. 1 terminal and body ground.



Is there battery voltage?
YES - Go to Step 20 .
NO - Replace the under-dash fuse/relay box.■

20. Turn the ignition switch to ON (II).

---

21. Measure the voltage between the blower motor relay 4P socket No. 3 terminal and body ground.

Is there battery voltage?

YES - Go to Step 22 .
NO - Replace the under-dash fuse/relay box.■

22. Turn the ignition switch to LOCK (0).

---

23. Check for continuity between the blower motor relay 4P socket No. 4 terminal and body ground.

Is there continuity?
YES - Go to Step 24 .
NO - Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G501. ■

---

24. Connect the blower motor 2P connector No. 2 terminal to body ground with a jumper wire.
25. Turn the ignition switch to ON (II).

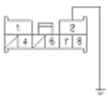
Does the blower motor run?
YES - Go to Step 26 .
NO - Go to Step 34 .

26. Turn the ignition switch to LOCK (0).
27. Disconnect the jumper wire.
28. Disconnect the heater fan switch 8P connector.
29. Test the heater fan switch.

Is the heater fan switch OK?
YES - Go to Step 30 .
NO - Replace the heater fan switch. ■

---

30. Connect the heater fan switch 8P connector No. 2 terminal to body ground with a jumper wire.
31. Turn the ignition switch to ON (II).

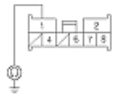


Does the blower motor run?
YES - Go to Step 32 .
NO - Repair open in the wire between the blower motor and the heater fan switch.■

32. Turn the ignition switch to LOCK (0).

---

33. Check for continuity between the heater fan switch 8P connector No. 1 terminal and body ground.



Is there continuity?
YES - Replace the heater fan switch. ■
NO - Check for an open in the wire between the heater fan switch and body ground. If the wire is OK, check for poor ground at G502. ■

34. Disconnect the jumper wire.
35. Disconnect the blower motor 2P connector.

---

36. Measure the voltage between the blower motor 2P connector No. 1 terminal and body ground.

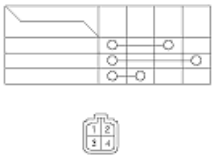
Is there battery voltage?
YES - Replace the blower motor.■
NO - Check for an open in the wire between the blower motor relay and blower motor.■

Blower Resistor Test

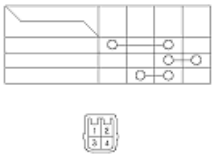
1. Disconnect the 4P connector (A) from the blower resistor.

2. Measure the resistance between the following terminals of the blower resistor and compare them with the values in the table.
3. If the resistance is not within the specifications, replace the blower resistor.

LHD (Except FO model)



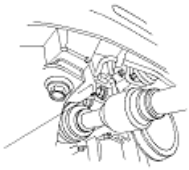
RHD model and LHD (FO) model



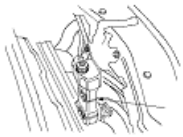
Coolant Replacement

1. Start the engine. Set the heater temperature control dial to maximum heat, then turn the ignition switch to LOCK (0). Make sure the engine and radiator are cool to the touch.
2. Remove the radiator cap.
3. Loosen the drain plug (A), and drain the coolant.

4. Remove the drain bolt (A) located at the rear of the engine block.
5. After the coolant has drained, then reinstall the bolt with a new washer and tighten it securely.
6. Tighten the radiator drain plug securely.
7. Remove, drain, and reinstall the coolant reservoir.



8. Fill the coolant reservoir to the MAX mark (A) with genuine Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001).



9. Pour genuine Honda Long Life Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck.
   NOTE:
   - Always use genuine Honda Long Life Antifreeze/Coolant Type 2 (P/N OL999-9001). Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.
   - Genuine Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Do not add water.

   Engine Coolant Capacities (Including the coolant reservoir capacity of 0.44 L (0.116 US gal, 0.097 Imp gal)):
   L15A7 engine: M/T model (With heater): At Coolant Change: 4.547 L (1.199 US gal, 0.999 Imp gal)
   After Engine Overhaul: 5.03 L (1.329 US gal, 1.107 Imp gal)
   M/T model (Without heater): At Coolant Change: 4.11 L (1.086 US gal, 0.904 Imp gal)
   After Engine Overhaul: 4.60 L (1.215 US gal, 1.012 Imp gal)
   A/T model (With heater): At Coolant Change: 4.46 L (1.178 US gal, 0.981 Imp gal)
   After Engine Overhaul: 4.95 L (1.308 US gal, 1.089 Imp gal)
   A/T model (Without heater): At Coolant Change: 4.03 L (1.065 US gal, 0.887 Imp gal)
   After Engine Overhaul: 4.52 L (1.195 US gal, 0.994 Imp gal)
   L13Z1 engine: M/T model (With heater): At Coolant Change: 4.53 L (1.197 US gal, 0.997 Imp gal)
   After Engine Overhaul: 5.02 L (1.326 US gal, 1.104 Imp gal)
   M/T model (Without heater): At Coolant Change: 4.10 L (1.083 US gal, 0.902 Imp gal)
   After Engine Overhaul: 4.59 L (1.213 US gal, 1.010 Imp gal)
   A/T model (With heater): At Coolant Change: 4.45 L (1.176 US gal, 0.979 Imp gal)
   After Engine Overhaul: 4.94 L (1.305 US gal, 1.087 Imp gal)
   A/T model (Without heater): At Coolant Change: 4.02 L (1.062 US gal, 0.884 Imp gal)
   After Engine Overhaul: 4.51 L (1.192 US gal, 0.992 Imp gal)

10. Loosely install the radiator cap.
11. Start the engine, and let it run until it warms up (the radiator fan comes on at least twice).
12. Turn off the engine. Check the level in the radiator and add genuine Honda Long Life Antifreeze/ Coolant Type 2, if needed.
13. Put the radiator cap on tightly, then start the engine again, and check for leaks.
14. Clean up any spilled engine coolant.

Wheel Alignment

Special Tool Required

Wheel alignment gauge attachment, 56 x 62 mm
07NAJ-SS00301

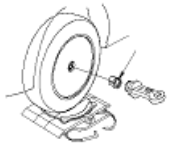
The suspension can be adjusted for front camber and front toe. However, each of these adjustments are interrelated to each other. For example, when you adjust the camber, the toe will change. Therefore, you must adjust the front wheel alignment whenever you adjust camber or toe.

Pre-Alignment Checks

For proper inspection and adjustment of the wheel alignment, do these checks:

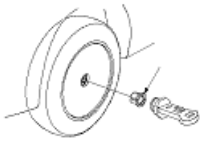
1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.
3. Make sure the fuel tank is full, and that the spare tyre or the temporary repair kit, the jack, and the tools are in place on the vehicle.
4. Check the tyre size and tyre pressure according to tyre information.
5. Check the runout of the wheels and tyres.
6. Check the suspension ball joints.
   - Ball joint boot inspection.
   - Lower arm ball joint inspection.
7. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers).
8. Bounce the vehicle up and down several times to stabilize the suspension.
9. Check that the steering column is set at the center tilt and telescopic position.

Front Caster Inspection



1. Raise the front of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
2. Set the turning radius gauges beneath the front wheels, and place the boards under the rear wheels the same thickness as the turning radius gauges, then lower the vehicle.
   NOTE: Be sure that the vehicle is level with the wheels on the turning radius gauges and the boards.
3. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub, and apply the front brake.
4. Turn the front wheel 20 ° outward, then turn the adjusting screw of the camber/caster gauge to set the bubble at 0 °.
5. Turn the wheel 20 ° inward and read the caster angle on the gauge with the bubble at the center of the gauge.
   Front caster angle: 3 ° 20 '± 1 °
   - If the measurement is within specifications, measure the front camber angle.
   - If the measurement is not within specifications, check for bent or damaged suspension components.

Front Camber Inspection

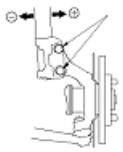


1. Turn the front wheels to the straight ahead position.
2. Raise the front of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
3. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub.
4. Read the camber angle on the gauge with the bubble at the center of the gauge.
   Front camber angle: 0 ° 00 '± 1 °
   (Maximum difference between the right and left side: 0 ° 45 ')
   - If the measurement is within specifications, measure the rear camber.
   - If the measurement for the front camber is not within specifications, go to the front camber adjustment.

Front Camber Adjustment

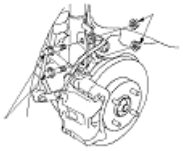
The front camber can be adjusted by exchanging one or both of the damper pinch bolts with the smaller diameter adjusting bolt(s). The difference between the adjusting bolt diameter and the pinch bolt hole diameter allows for a small range of adjustment.

1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheels.
3. Loosen the damper pinch bolts (A), and adjust the camber angle by moving the bottom of the damper within the range of the damper pinch bolt free play.
4. Tighten the damper pinch bolts to the specified torque.
5. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
6. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
7. Measure the camber angle.
   - If the measurement is within specification, measure the rear camber.
   - If the measurement is not within specification, go to Step 8 .
8. Raise the front of the vehicle, and support it with safety stands in the proper locations.
9. Remove the front wheels.



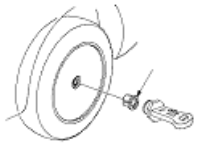
---

10. Replace the damper pinch bolts with the adjusting bolts (A), and adjust the camber angle.
    NOTE:
    - The camber angle can be adjusted up to ±20 ' (center of tolerance) by replacing one damper pinch bolt with the adjusting bolt.
    - The camber angle can be adjusted up to ±40 ' by replacing both the damper pinch bolts with the adjusting bolts.
11. Tighten the adjusting bolts to the specified torque value.
12. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the front wheels.
13. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to settle the suspension.
14. Measure the camber angle. If the camber angle is not within specification, repeat Step 8 through 13 to readjust the camber angle. If the camber measurement is correct, measure the toe-in, and adjust it if necessary.



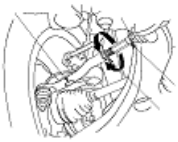
Rear Camber Inspection

1. Raise the rear of the vehicle, and remove the wheel caps.
   NOTE: Push out the cap on the aluminum wheel from the inside after removing the wheel.
2. Install the wheel alignment gauge attachment (A) and camber/caster gauge on the wheel hub.
3. Read the camber angle on the gauge with the bubble at the center of the gauge.
   Rear camber angle: −1 ° 00 '±1 °
   (Maximum difference between the right and left side: 0 ° 45 ')
   - If the measurement is within specifications, measure the toe-in.
   - If the measurement is not within specifications, check for bent or damaged suspension components.



Front Toe Inspection/Adjustment

1. Set the steering column to the middle tilt and telescopic positions. Center the steering wheel spokes, and hold it.
2. Check the toe with the wheels pointed straight ahead.
   Front toe-in: 0±3 mm (0±0.12 in.)
   - If adjustment is required, go to Step 3 .
   - If no adjustment is required, go to rear toe inspection.
3. Loosen the tie-rod locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications.
4. After adjusting, tighten the tie-rod locknuts to the specified torque value. Reposition the rack end boot if it is twisted or displaced.
5. Go to rear toe inspection.
   NOTE: Adjust both the right and left wheels at the same time by the same amount in opposite directions to obtain the correct toe and to keep the steering wheel straight.



Rear Toe Inspection

1. Release the parking brake to avoid and incorrect measurement.
2. Check the toe.
   Rear toe-in: **2.5±2.5 mm (0.10±0.10 in.)**

   - If the measurement is within specifications, measure the turning angle.
   - If the measurement is not within specifications, check for bent or damaged suspension components.

Turning Angle Inspection

1. Raise the vehicle and set the turning radius gauges beneath the front wheels, and place the boards under the rear wheels the same thickness as the turning radius gauges, then lower the vehicle.
   NOTE: Be sure that the vehicle is level with the wheels on the turning radius gauges and the boards.
2. Turn the wheel right and left while applying the brake, and measure the turning angle of the both wheels.
   Turning angle:

Inward:	**40 ° 19 '±2 °**
Outward (reference):	**33 ° 19 '±1 °**

3. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

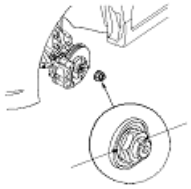
Driveshaft Removal

Special Tools Required

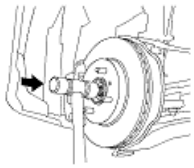


Ball joint remover, 28 mm
07MAC-SL00201

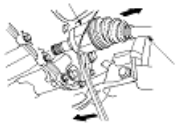
1. Raise the vehicle on a lift.
2. Remove the front wheels.
3. Pry up the locking tab (A) on the spindle nut (B), then remove the nut.
4. Drain the transmission fluid. Reinstall the drain plug using a new sealing washer:
   - Manual transmission
   - Automatic transmission

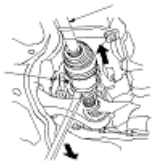
5. Remove the lock pin (A) from the lower arm ball joint, and remove the castle nut (B), then separate the ball joint from the knuckle using the ball joint remover.
   NOTE:
   - Be careful not to damage the ball joint boot when installing the remover.
   - Do not force or hammer on the lower arm, or pry could damage the ball joint.

6. Pull the knuckle outward, and separate the outboard joint from the front hub using a plastic hammer.

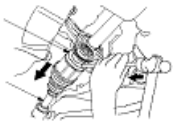


7. Left and Right driveshaft (M/T model)/Left driveshaft (A/T model): Pry the inboard joint (A) from the differential with a prybar. Remove the driveshaft as an assembly.
   NOTE:
   - Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out to avoid damaging the oil seal.
   - Be careful not to damage the oil seal with the prybar.

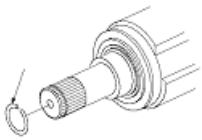




8. Right driveshaft (A/T model): Drive the inboard joint (A) off of the intermediate shaft using a drift and a hammer. Remove the driveshaft as an assembly.
   NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart.



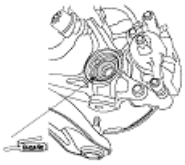
9. Remove the set ring (A) from the inboard joint (Except A/T model right driveshaft).



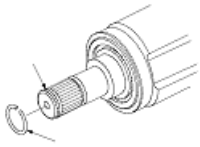
10. Remove the set ring (A) from the intermediate shaft (A/T model right driveshaft).

Driveshaft Installation

NOTE: Before starting installation, make sure the mating surfaces of the joint and the splined section are clean.

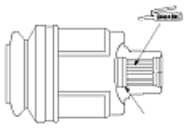


1. Apply about 5 g (0.18 oz) molybdenum grease to the contact area (A) of the outboard joint and the front wheel bearing.
   NOTE: The grease helps to prevent noise and vibration.

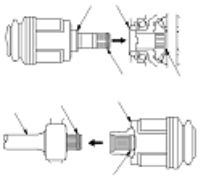


2. Install a new set ring (A) onto the set ring groove (B) of the driveshaft inboard joint (except A/T model right driveshaft).

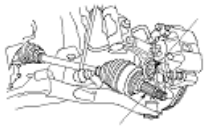
3. Install a new set ring (A) onto the set ring groove (B) of the intermediate shaft (A/T model).



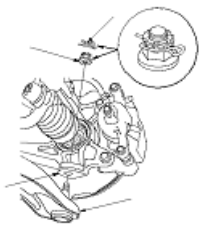
4. Apply 0.5−1.0 g (0.02−0.04 oz) of molybdenum grease to the whole splined surface (A) of the right driveshaft. After applying grease, remove the grease from the splined grooves at intervals of 2−3 splines and from the set ring groove (B) so that air can bleed from the intermediate shaft.
5. Clean the areas where the driveshaft contacts the differential thoroughly with solvent or brake cleaner, and dry with compressed air.
   NOTE: Do not wash the rubber parts with solvent.



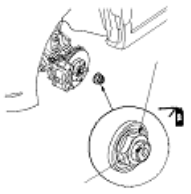
6. Insert the inboard end (A) of the driveshaft into the differential (B) or intermediate shaft (C) until the set ring (D) locks in the groove (E).
   NOTE: Insert the driveshaft horizontally to prevent damaging the oil seal.



7. Install the outboard joint (A) into the front hub (B) on the knuckle.



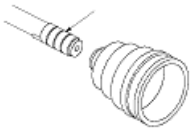
8. Wipe off any grease contamination from the ball joint tapered section and threads, then install the knuckle (A) onto the lower arm (B). Be careful not to damage the ball joint boot. Wipe off the grease before tightening the nut at the ball joint. Torque the new castle nut (C) to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole.
   NOTE:
   - Make sure the ball joint boot is not damaged or cracked.
   - Do not align the nut by loosening it.
9. Install the lock pin (D) into the ball joint pin hole.



10. Apply a small amount of engine oil to the seating surface of the new spindle nut (A).
11. Install the spindle nut, then tighten it. After tightening, use a drift to stake the spindle nut shoulder (B) against the driveshaft.
12. Clean the mating surfaces of the brake disc and the wheel, then install the front wheels.
13. Turn the front wheel by hand, and make sure there is no interference between the driveshaft and surrounding parts.
14. Refill the transmission with the recommended transmission fluid:
    - Manual transmission
    - Automatic transmission
15. Lower the vehicle on the lift.
16. Check the wheel alignment, and adjust it if necessary.
17. Test-drive the vehicle.

Driveshaft Reassembly

Exploded View
M/T model



Exploded View
A/T model

Special Tools Required

Boot band tool,
KD-3191

or equivalent commercially available
Boot band pincers,
Kent-Moore J-35910

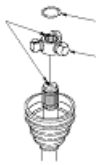
or equivalent commercially available
Boot band pliers,
commercially available

NOTE: Refer to the Exploded View as needed during this procedure.

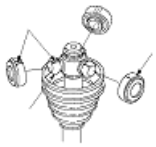
Inboard Joint Side

1. Wrap the splines with vinyl tape (A) to prevent damaging the inboard boot.
2. Install the inboard boot onto the driveshaft, then remove the vinyl tape. Be careful not to damage the inboard boot.

3. Install the spider (A) onto the driveshaft by aligning the marks (B) you made on the spider and the end of the driveshaft.
4. Install a new circlip (C) into the driveshaft groove. Always rotate the circlip in its groove to make sure it is fully seated.

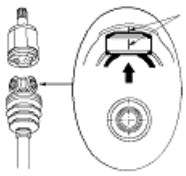


5. Fit the rollers (A) onto the spider (B) with the high shoulders facing outward, and note these items:
   - Reinstall the rollers in their original positions on the spider by aligning the marks (C) you made.
   - Hold the driveshaft pointed up to prevent the rollers from falling off.

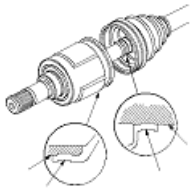


6. Pack the inboard joint with the joint grease included in the new inboard boot set.
   Grease quantity
   Inboard joint: **90−100 g (3.2−3.5 oz)**

7. Fit the inboard joint onto the driveshaft and note these items:
   - Reinstall the inboard joint onto the driveshaft by aligning the marks (A) you made on the inboard joint and the rollers.
   - Hold the driveshaft so the inboard joint is pointing up to prevent it from falling off.

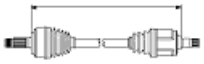


8. Fit the boot ends (A) onto the driveshaft (B) and the inboard joint (C).



9. Adjust the length (A) of the driveshafts to the figure as shown, then adjust the boots to halfway between full compression and full extension. Bleed excess air from the boots by inserting a flat-tipped screwdriver between the boot and the joint.

Driveshaft type 1



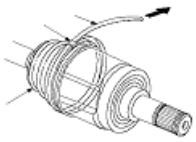
Driveshaft type 2

Model	Left/Right Driveshaft	Driveshaft Type	Specified Length (A)
M/T	Left	1	531−536 mm (20.91−21.10 in.)
	Right	1	787−792 mm (30.98−31.18 in.)
A/T	Left	1	529−534 mm (20.83−21.02 in.)
	Right	2	484−489 mm (19.06−19.25 in.)

10. Install the new boot bands.
    - For the double loop type, go to Step 11 .
    - For the low profile type, go to Step 20 .

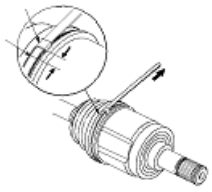
---

11. Fit the boot ends onto the driveshaft and the inboard joint, then install a new double loop band (A) onto the boot (B). NOTE: Pass the end of the new double loop band through the clip (C) twice in the direction of the forward rotation of the driveshaft.
12. Pull up the slack in the band by hand.



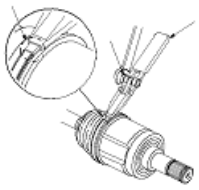
---

13. Mark a position (A) on the band 10−14 mm (0.4−0.6 in.) from the clip (B).



---

14. Thread the free end of the band through the nose section of the commercially available boot band tool KD-3191 or equivalent (A), and into the slot on the winding mandrel (B).
15. Using a wrench on the winding mandrel of the boot band tool, tighten the band until the marked spot (C) on the band meets the edge of the clip.

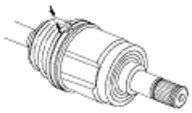


---

16. Lift up the boot band tool to bend the free end of the band 90 degrees to the clip. Center-punch the clip, then fold over the remaining tail onto the clip.

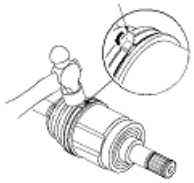
---

17. Unwind the boot band tool, and cut off the excess free end of the band to leave a 5−10 mm (0.2−0.4 in.) tail protruding from the clip.



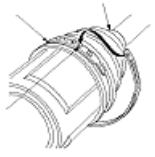
---

18. Bend the band end (A) by tapping it down with a hammer.
    NOTE:
    - Make sure the band and the clip do not interfere with anything on the vehicle and the band does not move.
    - Clean any grease remaining on the surrounding surfaces.
19. Repeat Step 11 through 18 for the band on the other end of the boot.



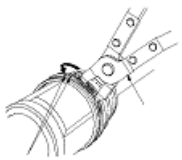
---

20. Install a new low profile band (A) onto the boot (B), then hook the tab (C) of the band.

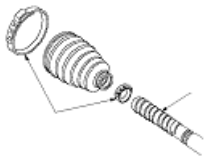


---

21. Close the hook portion of the band with a commercially available boot band pincers (A), then hook the tabs (B) of the band.
22. Install the boot band on the other end of the boot, and repeat Step 20 through 21.



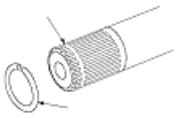
Outboard Joint Side



1. Wrap the splines with vinyl tape (A) to prevent damaging the outboard boot.
2. Install the new ear clamp bands (B) and the outboard boot, then remove the vinyl tape. Be careful not to damage the outboard boot.

---

3. Install a new stop ring (A) into the driveshaft groove (B).

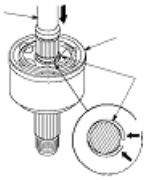


---

4. Pack about 35 g (1.2 oz) grease included in the new outboard boot set into the driveshaft hole in the outboard joint.
   NOTE: If you are installing a new outboard joint, the grease is already installed.

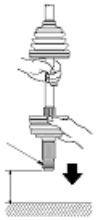
---

5. Insert the driveshaft (A) into the outboard joint (B) until the stop ring (C) is close to the joint.



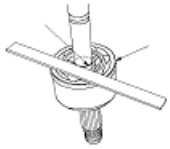
---

6. To completely seat the outboard joint, pick up the driveshaft and joint, and tap or hit them from a height of about 10 cm (4 in.) onto a hard surface.
   NOTE: Do not use a hammer as excessive force may damage the driveshaft. Be careful not to damage the threaded section (A) of the outboard joint.



---

7. Check the alignment of the paint mark (A) you made with the outboard joint rim (B).

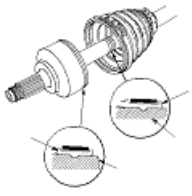


---

8. Pack the outboard joint (A) with the remaining joint grease included in the new outboard boot set.
   Total grease quantity
   Outboard joint:
   M/T model: 95−105 g (3.4−3.7 oz)
   A/T model: 90−100 g (3.2−3.5 oz)

---

9. Fit the boot ends (A) onto the driveshaft (B) and the outboard joint (C). Bleed any excess air from the boot by inserting a flat-tipped screwdriver between the boot and the joint.

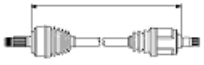


---

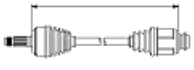
10. Inspect the length (A) of the driveshafts to the figure as shown, then adjust the boots to halfway between full compression and full extension.

Model	Left/Right Driveshaft	Driveshaft Type	Specified Length (A)
M/T	Left	1	531−536 mm (20.91−21.10 in.)
	Right	1	787−792 mm (30.98−31.18 in.)
A/T	Left	1	529−534 mm (20.83−21.02 in.)
	Right	2	484−489 mm (19.06−19.25 in.)

Driveshaft type 1

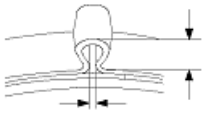


Driveshaft type 2



11. Close the ear portion (A) of the band with commercially available boot band pliers Kent-Moore J-35910 or equivalent (B).

12. Check the clearance between the closed ear portion of the band. If the clearance is not within the standard, close the ear portion of the band tighter.



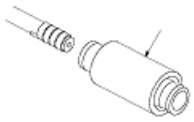
13. Repeat Step 11 and 12 for the band on the other end of the boot.

Driveshaft Dynamic Damper Replacement

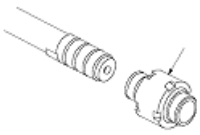
1. Remove the inboard joint.
2. Remove the dynamic damper band.
3. Remove the dynamic damper (A).
4. Install the new dynamic damper.
   NOTE: Be careful not to swap the dynamic dampers. Check the type of dynamic damper by its shape.

Model	Left/Right Driveshaft	Dynamic Damper (A) Type
M/T	Left	———
	Right	1
A/T	Left	2
	Right	2

Dynamic damper type 1



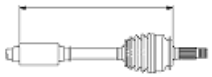
Dynamic damper type 2



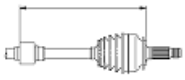
5. Adjust the specified distance (A) between the outboard joint side and the dynamic damper edge.
   NOTE: Check the type of dynamic damper by its shape.

Model	Left/Right Driveshaft	Dynamic Damper Type	Specified Distance (A)
M/T	Left	———	———
	Right	1	287–292 mm (11.30–11.50 in.)
A/T	Left	2	250.5–255.5 mm (9.86–10.06 in.)
	Right	2	

Dynamic damper type 1

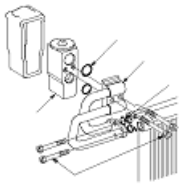


Dynamic damper type 2



6. Install the dynamic damper band.
7. Install the inboard joint.

A/C Evaporator Expansion Valve Replacement

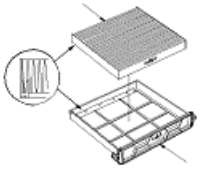


1. Remove the evaporator core.
2. Remove the bolts, O-rings (A) and the expansion valve (B) from the pipe (C).
3. Install the expansion valve in the reverse order of removal, and note these items:
   - Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the correct O-rings for HFC-134a (R-134a) to avoid leakage.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   - Make sure that there is no air leakage.
   - Charge the system.

Dust and Pollen Filter Replacement

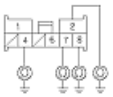
1. Open the glove box. Remove the glove box stop on each side, then let the glove box hang down.
2. Pull out the dust and pollen filter assembly (A) from the blower unit.

3. Remove the filter (A) from the housing (B), and replace the filter.
4. Install the filter in the reverse order of removal. Make sure that there is no air leaking out of the blower unit.



Blower Motor Circuit Troubleshooting

1. Turn the ignition switch to ON (II) and the heater fan switch ON.



Does the blower motor run in each speed?
YES - Go to Step 2 .
NO - Go to Step 16 .

2. Turn the heater fan switch OFF.
3. Make sure the ignition switch is ON (II).

Does the blower motor run?
YES - Go to Step 4 .
NO - Go to Step 9 .

4. Turn the ignition switch to LOCK (0).
5. Disconnect the blower motor 2P connector.
6. Disconnect the blower resistor 4P connector.
7. Disconnect the heater fan switch 8P connector.
8. Check for continuity between the heater fan switch 8P connector No. 2, No. 4, No. 7, and No. 8 terminals and body ground individually.

Is there continuity?
YES - Repair short to body ground in the wires between the blower motor, the blower resistor and the heater fan switch.■
NO - Replace the heater fan switch. ■

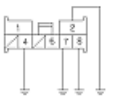
9. Turn the ignition switch to LOCK (0).
10. Disconnect the blower resistor 4P connector.
11. Test the blower resistor.

Is the blower resistor OK?
YES - Go to Step 12 .
NO - Replace the blower resistor.■

12. Reconnect the blower resistor 4P connector.
13. Disconnect the heater fan switch 8P connector.
14. Turn the ignition switch to ON (II).

---

15. Ground each of the heater fan switch 8P connector terminals individually in the following order: No. 4, No. 7, No. 8, and No. 2.



Does the blower motor run at progressively higher speeds?
YES - Replace the heater fan switch. ■
NO - Repair any open or cause of excessive resistance in the appropriate wires between the blower resistor and the heater fan switch.■

16. Turn the heater fan switch OFF and the ignition switch to LOCK (0).
17. Check the No. 57 (30 A) and the No. 10 (7.5 A) fuses in the under-dash fuse/relay box.

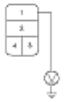
Are the fuses OK?
YES - Go to Step 18 .
NO - Replace the fuses, and recheck. If the fuses blow again, check for a short in the No. 57 (30 A) and No. 10 (7.5 A) fuses circuit.■

18. Remove the blower motor relay from the under-dash fuse/relay box, and test it.

Is the relay OK?
YES - Go to Step 19 .
NO - Replace the blower motor relay .■

---

19. Measure the voltage between the blower motor relay 4P socket No. 1 terminal and body ground.



Is there battery voltage?
YES - Go to Step 20 .
NO - Replace the under-dash fuse/relay box.■

20. Turn the ignition switch to ON (II).

---

21. Measure the voltage between the blower motor relay 4P socket No. 3 terminal and body ground.

Is there battery voltage?

YES - Go to Step 22 .
NO - Replace the under-dash fuse/relay box.■

22. Turn the ignition switch to LOCK (0).

---

23. Check for continuity between the blower motor relay 4P socket No. 4 terminal and body ground.

Is there continuity?
YES - Go to Step 24 .
NO - Check for an open in the wire between the blower motor relay and body ground. If the wire is OK, check for poor ground at G501. ■

---

24. Connect the blower motor 2P connector No. 2 terminal to body ground with a jumper wire.
25. Turn the ignition switch to ON (II).

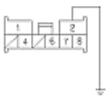
Does the blower motor run?
YES - Go to Step 26 .
NO - Go to Step 34 .

26. Turn the ignition switch to LOCK (0).
27. Disconnect the jumper wire.
28. Disconnect the heater fan switch 8P connector.
29. Test the heater fan switch.

Is the heater fan switch OK?
YES - Go to Step 30 .
NO - Replace the heater fan switch. ■

---

30. Connect the heater fan switch 8P connector No. 2 terminal to body ground with a jumper wire.
31. Turn the ignition switch to ON (II).

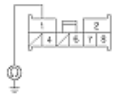


Does the blower motor run?
YES - Go to Step 32 .
NO - Repair open in the wire between the blower motor and the heater fan switch.■

32. Turn the ignition switch to LOCK (0).

---

33. Check for continuity between the heater fan switch 8P connector No. 1 terminal and body ground.



Is there continuity?
YES - Replace the heater fan switch. ■
NO - Check for an open in the wire between the heater fan switch and body ground. If the wire is OK, check for poor ground at G502. ■

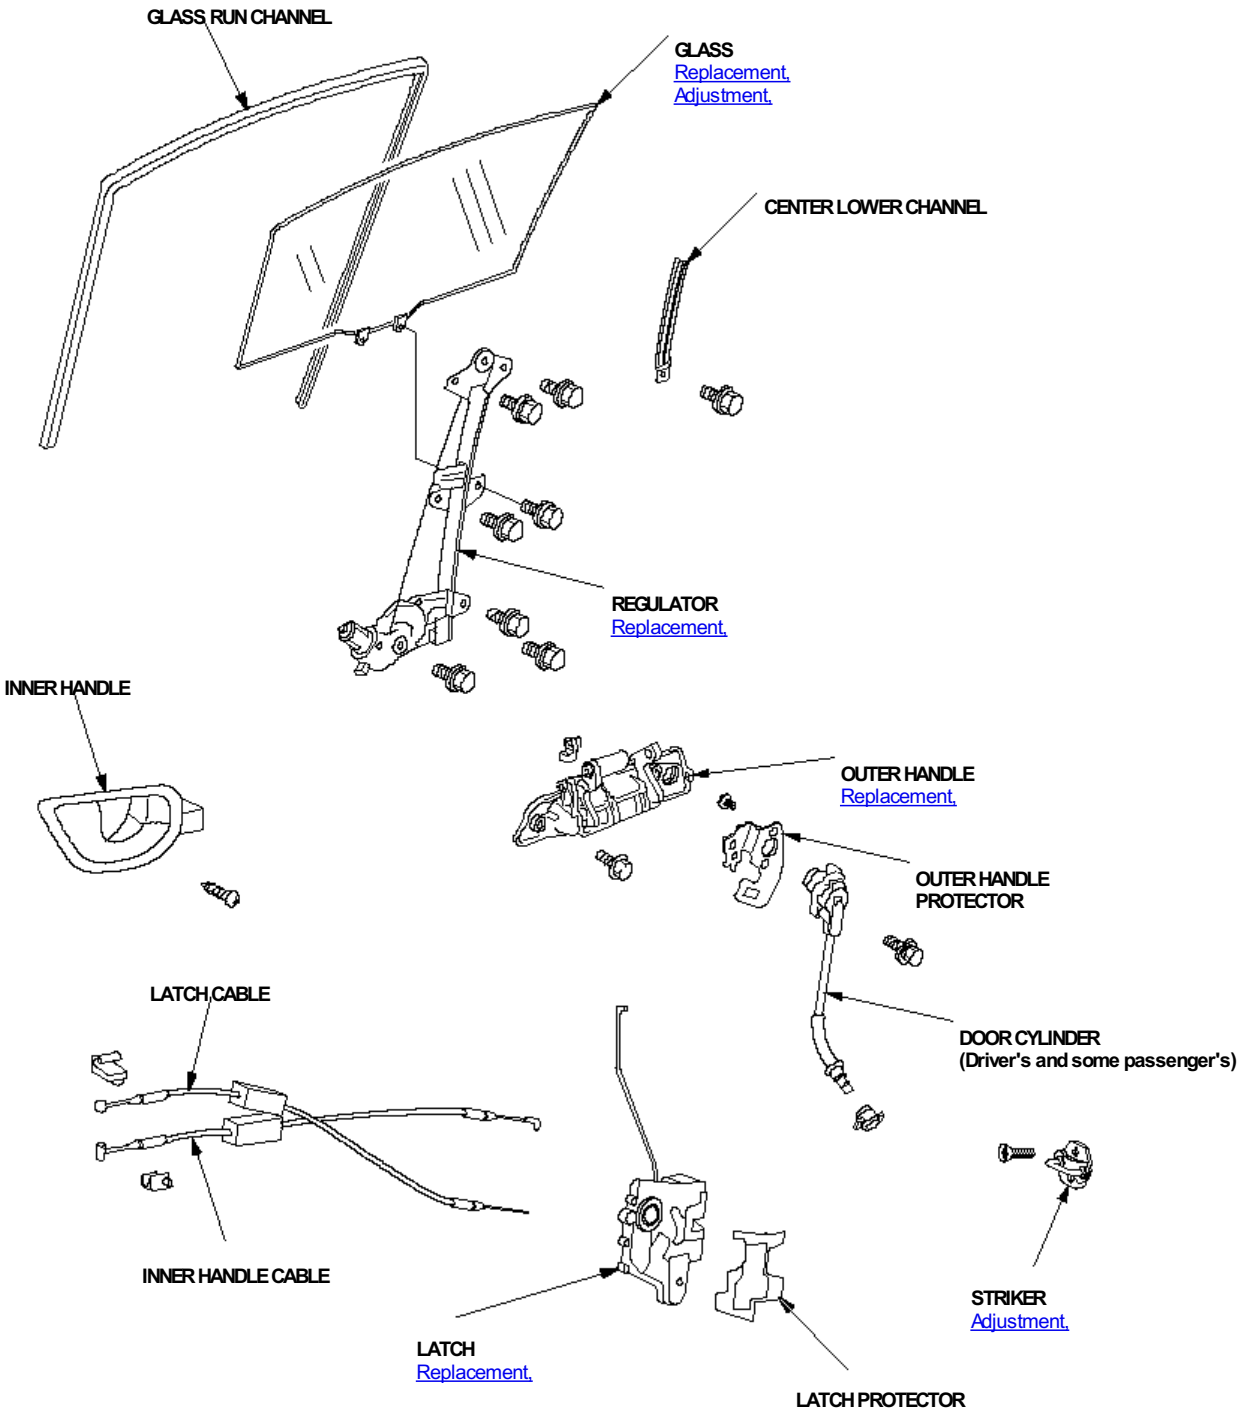
34. Disconnect the jumper wire.
35. Disconnect the blower motor 2P connector.

---

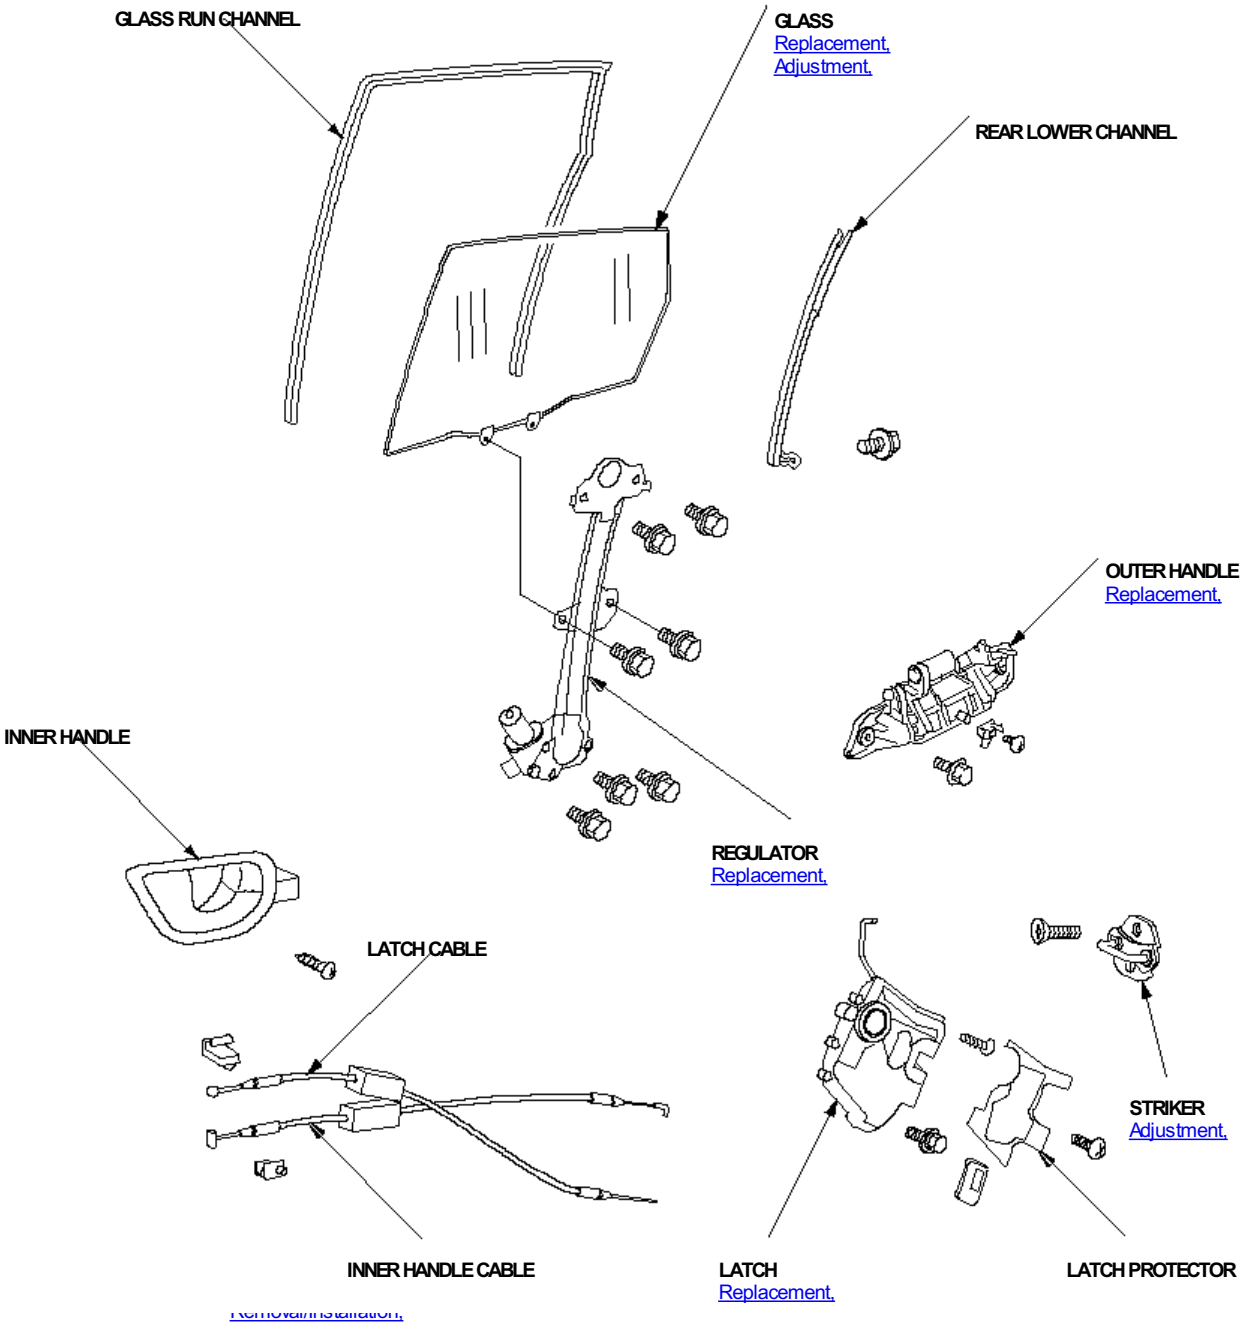
36. Measure the voltage between the blower motor 2P connector No. 1 terminal and body ground.

Is there battery voltage?
YES - Replace the blower motor.■
NO - Check for an open in the wire between the blower motor relay and blower motor.■

Front Door Component Location Index



Rear Door Component Location Index



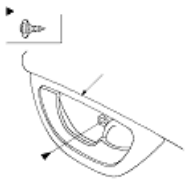
Removal/Installation,

Rear Door Panel Removal/Installation

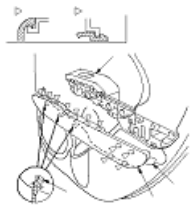
NOTE:

- RHD model is shown; LHD model is symmetrical.
- Take care not to scratch the door and related parts.
- When removing components, use the trim tools or equivalent.

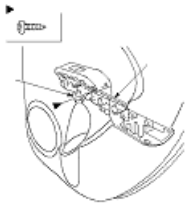
1. Remove the screw securing the inner handle (A).



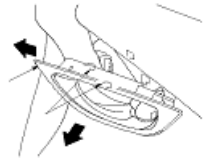
2. Remove the grip cover (A).
   -1. Using a flat-tip screwdriver wrapped with protective tape, pry out the front bottom edge of the cover while pushing up the hooks (B).
   -2. From front to rear, pry out along the edge of the cover to release the hooks (C, D) from the power window switch panel (E).
   -3. Release the rear hook (F), while pulling the cover forward.



3. Disconnect the power window switch connector (A). Remove the screw from the grip base (B).

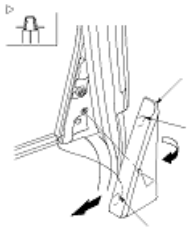


4. Pull the inner handle (A) forward and out half-way to release the hooks (B).

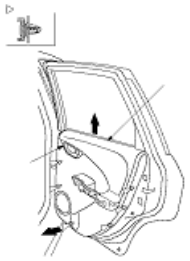


5. Apply protective tape (A) to the door panel (B) as shown.

6. Pull out the rear edge on the quarter inner trim (A) to detach the clip, then remove it by releasing the hooks (B).



7. Remove the door panel (A) with as little bending as possible to avoid creasing or breaking it.
   -1. Start at the bottom edge of the door panel, release the clips with a commercially available trim pad remover.
   -2. Detach the upper clips.
   -3. Starting at the rear, pull the door panel upward.
   NOTE: Do not pull the door panel up too far, or the door panel will be damaged by the inner handle (B).



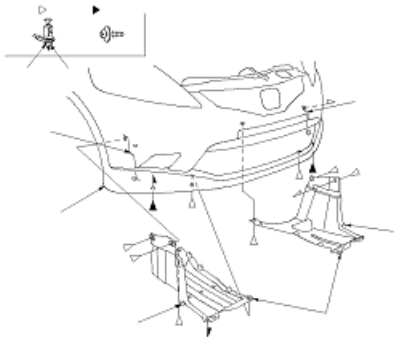
8. Remove the door panel (A) while pulling the inner handle (B) out through the hole in the door panel.

9. Install the door panel in the reverse order of removal, and note these items:
   - If the clips are damaged or stress-whitened, replace them with new ones.
   - Make sure the connector is plugged in properly.

Splash Shield Replacement

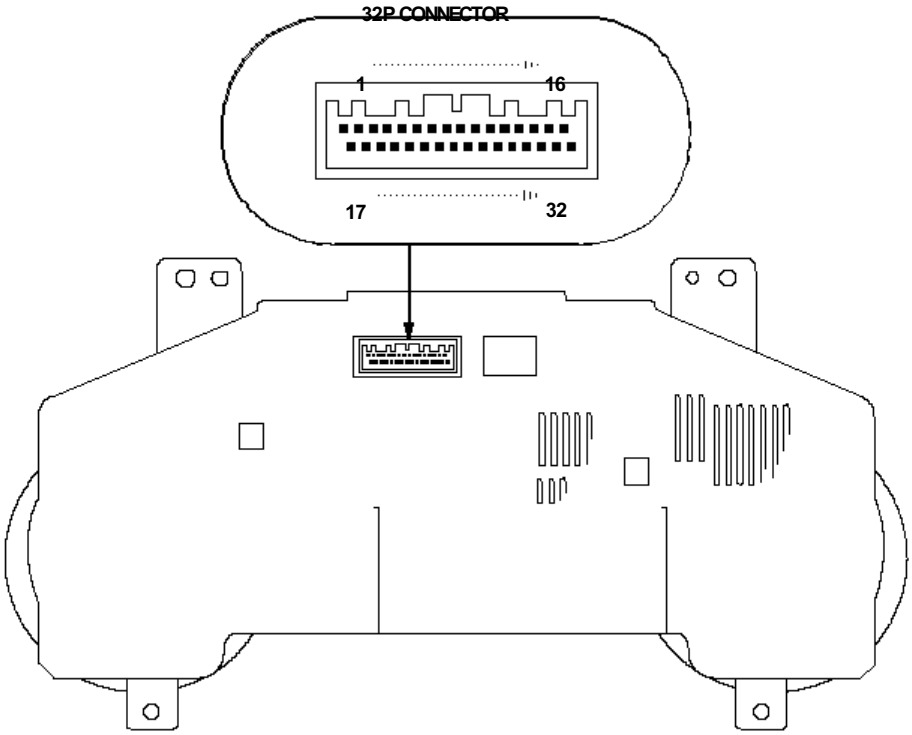
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the body.



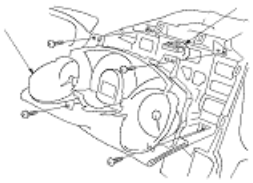
1. Remove the splash shield (A).
   -1. From the wheel arch on both sides, remove the clips (B) securing the front splash shield and the front inner fender (C) to the body, and remove the clips (D) securing the front splash shield to the body.
   -2. From under the front bumper (E), remove the clips (F) and the screws (G).
   -3. From under the body, remove the clips (H).
   -4. Release the hooks (I) of the front splash shield from the front inner fender, then pull the splash shield out.
   NOTE: To remove the clips, pry the inner pin up at the edge near the line (J) on its head.

2. Install the splash shield in the reverse order of removal, and note these items:
   - Check if the clips are damaged or stress-whitened, and if necessary, replace them with new ones.
   - Push the clips and the hooks into place securely.



RHD model is shown, LHD model is similar.

Gauge Control Module Replacement



NOTE: Before replacing the gauge control module, retrieve the ODO value and the maintenance minder information from the gauge control module with the HDS.

1. Remove the instrument panel.
2. Remove the four screws from the gauge control module (A).
3. Disconnect the 32P connector (B) from the gauge control module.
4. Install the gauge control module in the reverse order of removal.
5. Write the ODO value and maintenance minder information to the new gauge control module.

Rewriting the ODO Data and Transferring the Maintenance Minder Data to a New Gauge Control Module

NOTE:

- Obtain a new gauge control module before starting the rewriting process.
- Rewriting is not possible on a gauge control module that will not communicate with the HDS.
- Make sure that the HDS shows the correct VIN for the vehicle you are working on.
- Once you have started this procedure, you must complete it before removing the HDS from the DLC.
- Connect a battery jumper box (not a battery charger) to insure that correct battery voltage will be maintained.

Rewriting and Transferring

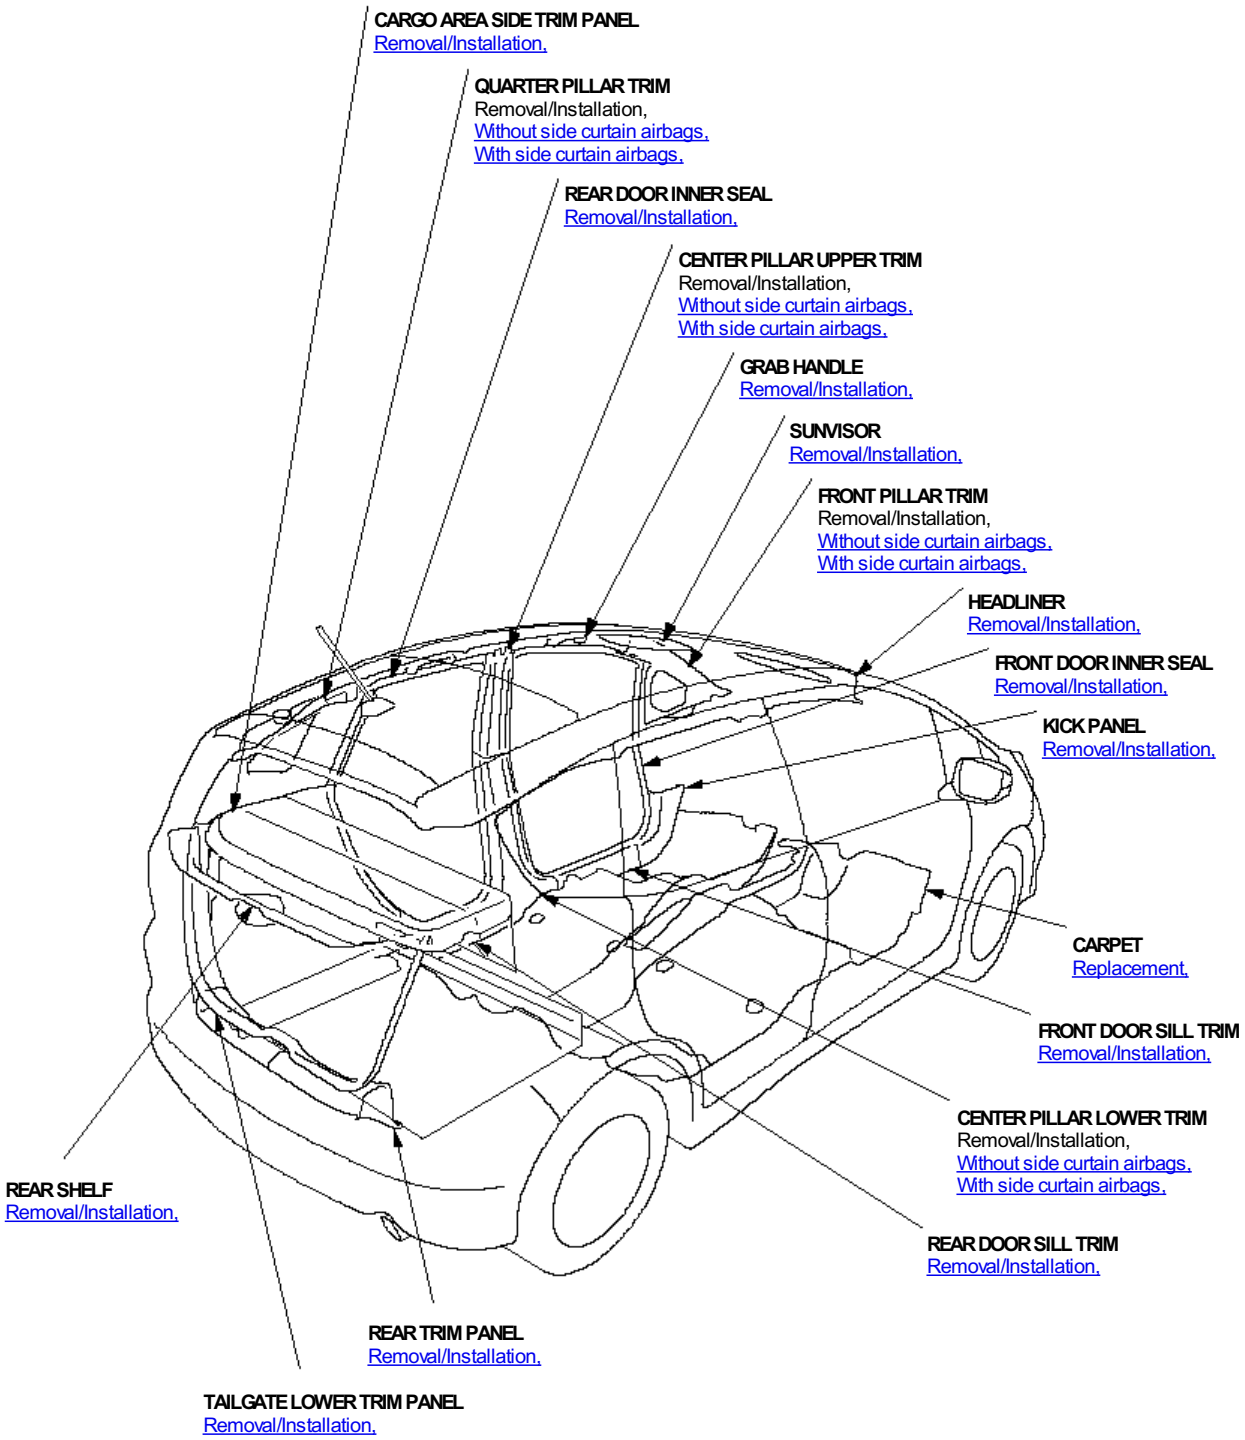
1. Before replacing the gauge control module, connect the HDS.
2. Select GAUGES from the BODY ELECTRICAL system select menu with the HDS.
3. Select Gauge Control Module Replacement (ODO Rewrite) from the ADJUSTMENT menu, and follow the instructions on the display to retrieve the ODO value and the Maintenance Minder Information.
4. Replace the gauge control module.
5. Follow the instructions on the display to write the new ODO value and Maintenance Minder Data to the new gauge control module. If the data transfer fails, refer to the instructions below to release the locked ODO value.

Release Locked odometer mileage to the original gauge control module.

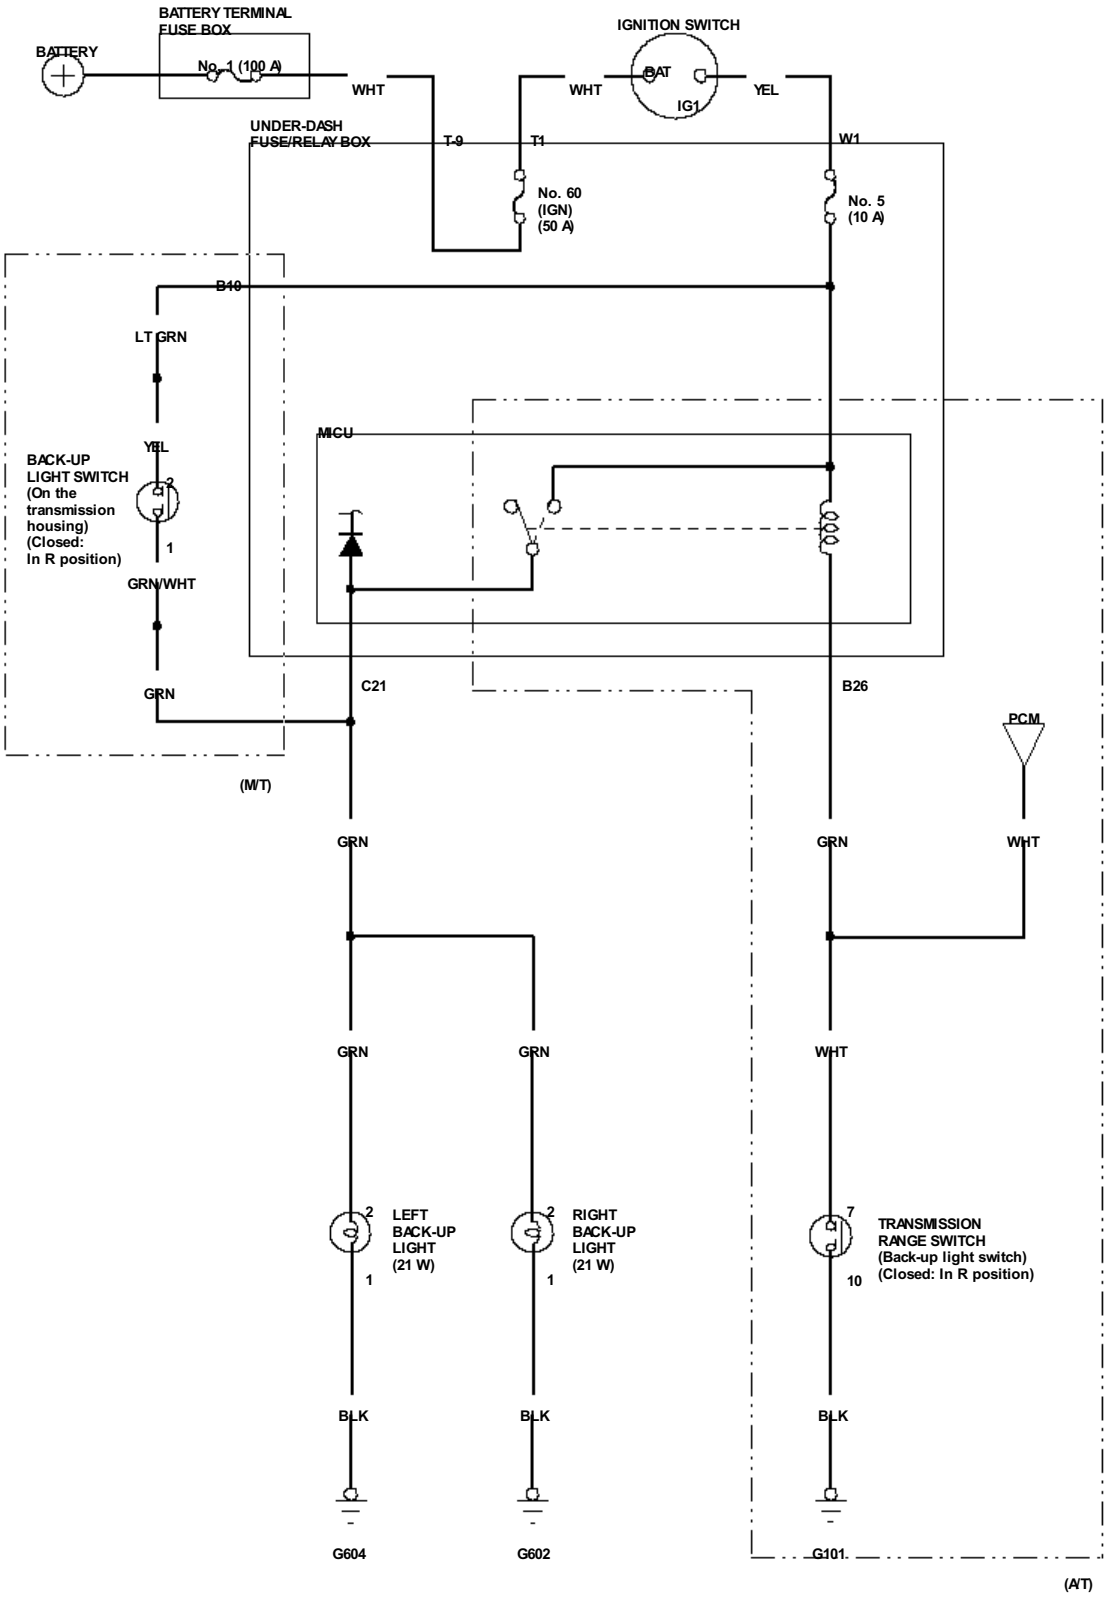
If, after you attempt to transfer mileage, the odometer display has dashes (---), is garbled, or shows an incorrect value, the original gauge control module needs to be unlocked and restored to its original state:

1. Confirm that you have the latest HDS version of software.
2. Make sure that the HDS shows the correct VIN for the vehicle you are working on.
3. With the ignition switch in LOCK (0), reconnect the original gauge control module.
4. Completely re-boot the HDS.
5. Clear any stored DTCs.
6. Navigate to Body Electric/Gauges/Adjustment/Instrument Panel Replacement.
7. Select 3. Releasing Locked ODO Value.
8. Follow the prompts and the odometer mileage will be restored.
9. Start over and make sure the screen prompts are followed.

Interior Trim Component Location Index



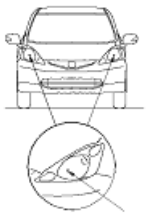
Back-up Lights Circuit Diagram



Headlight Adjustment

⚠CAUTION

Headlights become very hot during use; do not touch them or any attaching hardware immediately after they have been turned off.



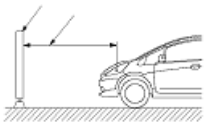
Before adjusting the headlights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's seat.

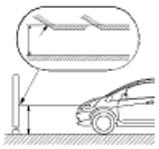
1. Clean the outer lens so that you can see the center (A) of the headlights.

2. Park the vehicle in front of a wall or a screen (A).

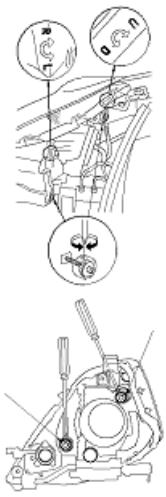
3. Turn the low beams on.



4. Determine if the headlights are aimed properly.
   Vertical adjustment:
   Measure the height of the headlights (A).
   Adjust the cut line (B) to the light's height.



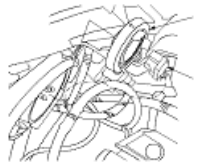
5. If necessary, open the hood and adjust the headlights to local requirements by turning the adjuster.



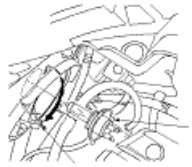
Exterior Light Bulb Replacement

Headlight

1. Disconnect the 3P connector (A), then remove the rubber cap (B) from the headlight.



2. Pull the retaining spring (A) away from the bulb (B), then remove the bulb.
3. Install the bulb in the reverse order of removal.



Front Position Light

1. Disconnect the 2P connector (A) from the front position light.
   Front Position Light: 5 W

2. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb (C) from the headlight housing.
3. Install a new bulb in the reverse order of removal.

Front Turn Signal Light

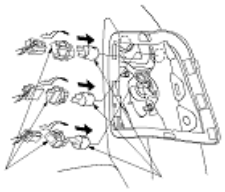
1. Disconnect the 2P connector (A) from the front turn signal light.
   Front Turn Signal Light: 21 W

2. Turn the bulb socket (B) 45 ° counterclockwise to remove the bulb (C) from the headlight housing.
3. Install a new bulb in the reverse order of removal.

Taillights

1. Open the tailgate and remove the maintenance lid (A).

2. Disconnect the connectors from the lights.
   Brake Light/Taillight: 21/5 W
   Rear Turn Signal Light: 21 W
   Back-up Light: 21 W



3. Turn the bulb socket (A) 45 ° counterclockwise to remove the bulb (B).
4. Install new bulb(s) in the reverse order of removal.

Turn Signal/Hazard Warning Lights Circuit Diagram

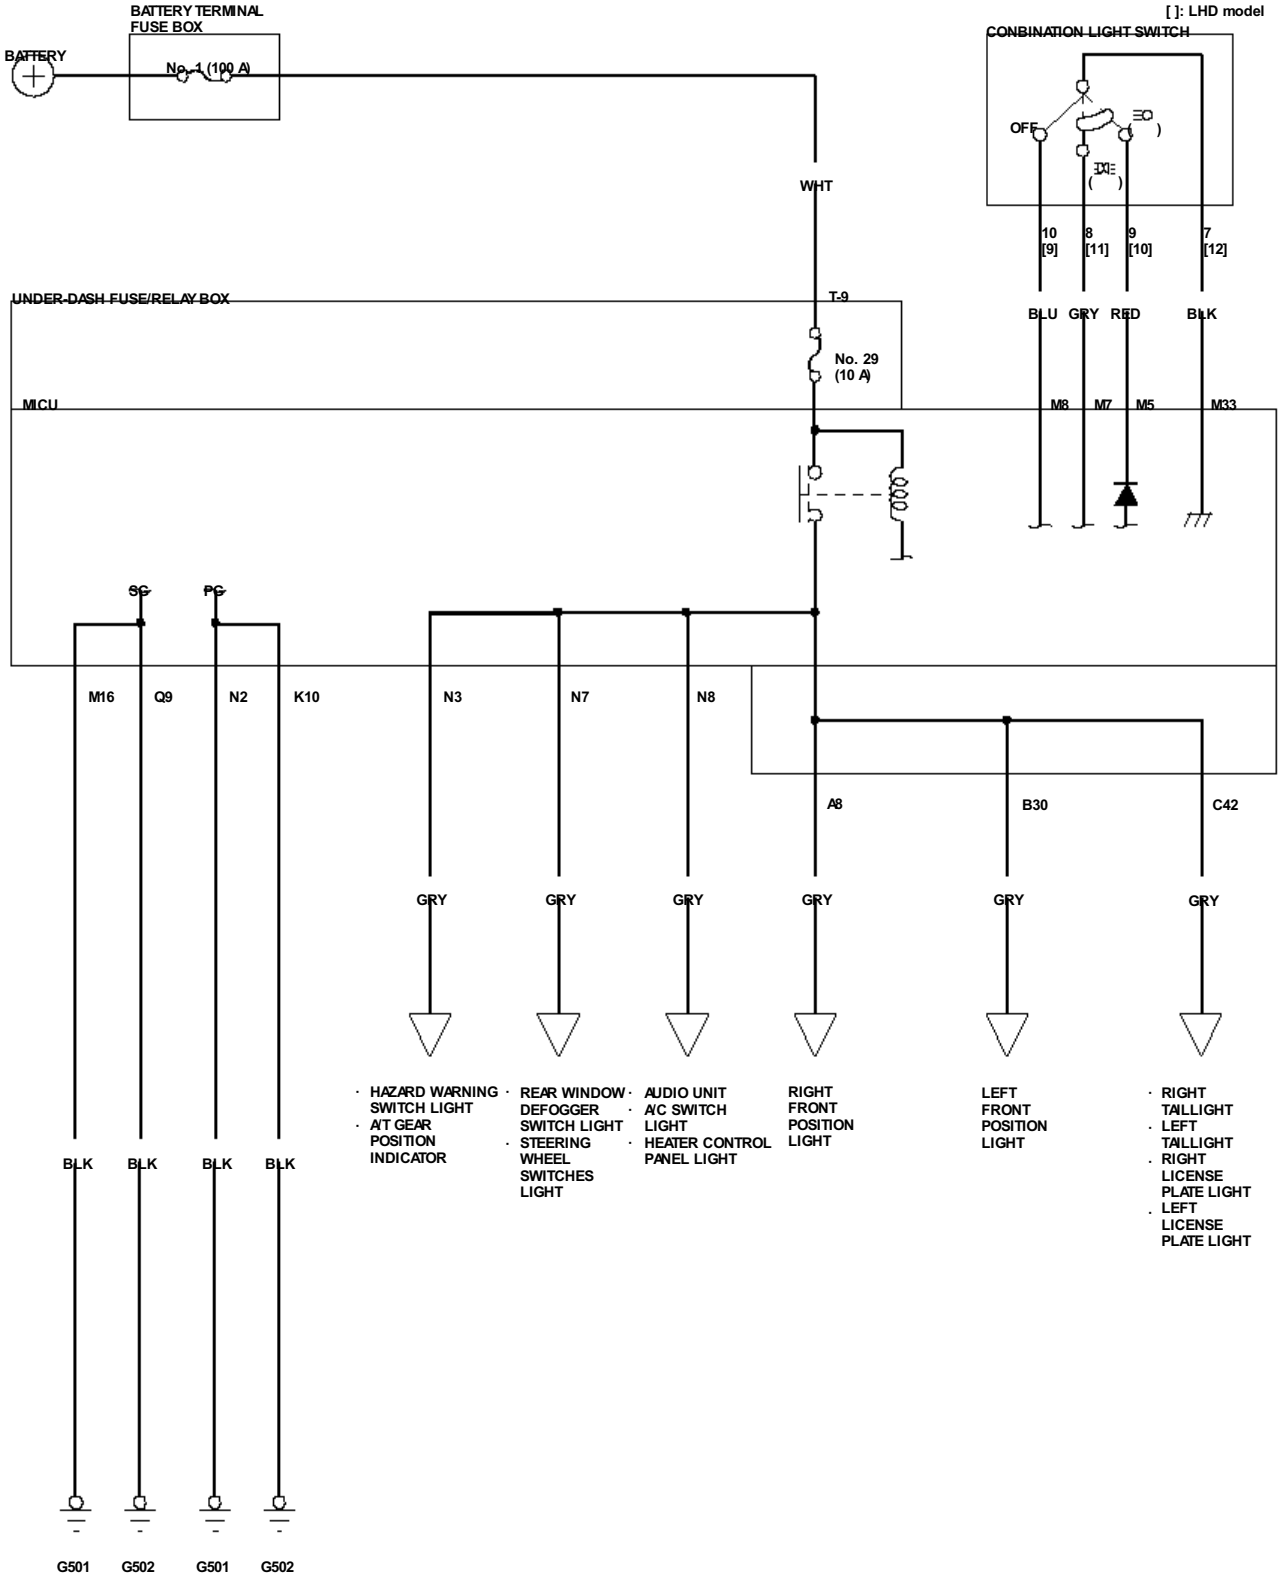
RHD model is shown, LHD model is similar.

Dash Lights Circuit Diagram

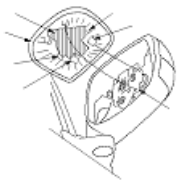


Mirror Holder Replacement

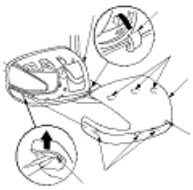
NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the power mirror and related parts.
- RHD model is shown; LHD model is symmetrical.

1. Carefully push on the top edge of the mirror holder (A) by hand.
2. Put a shop towel in the opening between the lower edge of the mirror holder and the mirror housing to prevent scratches, and detach the bottom hooks (B) with a flat-tip screwdriver wrapped with protective tape.



3. Carefully pull out the bottom edge of the mirror holder (A) to separate the adhesive (B), and then release the side clips (C).
4. Separate the mirror holder from the actuator (D) by releasing the hooks (E).



5. If necessary, remove the skull cap (A).
   -1. Remove the tabs (B) from inside the mirror housing (C).
   -2. Release the hook (D), then remove the skull cap.

6. Before reinstalling the mirror holder to the inner holder (A) of the actuator, check the actuator rods (B) and the actuator boots (C):
   - If a rod is out of the actuator hole, insert it securely.
   - Each rod should be covered with a boot. If not, adjust the boot into the proper position.
7. Reattach the hooks of the mirror holder to the actuator, then position the mirror holder on the actuator. Carefully push on the hook portions of the mirror holder until the mirror holder locks into place.
8. Check the actuator operation.

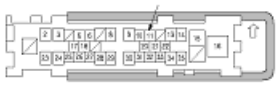
MICS (MICU) Input Test



1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, K, M, N, P, and Q.
   NOTE: All connector views are shown from wire side of female terminals.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 6 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire

			Check for continuity to ground: There should be no continuity.	A short to ground in the wire
Q3	GRN [LT GRN]	Gauge control module 32P connector disconnected	Check for continuity between the Q3 terminal and the gauge control module 32P connector No. 18 terminal: There should be continuity.	An open in the wire
			Check for continuity to ground: There should be no continuity.	A short to ground in the wire

[ ]: LHD model

6. Reconnect the connectors to the under-dash fuse/relay box, and make these input tests at the connector.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, go to Step 7 .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
N1	PNK	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 1 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
M18	PUR	Ignition switch ACC (I)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 14 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
K8	RED	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 20 (15 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
Q8	LT BLU	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 22 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
P2	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 6 (10 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
A32	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 11 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire
B11	PUR	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 11 (7.5 A) fuse in the under-dash fuse/relay box • Faulty under-dash fuse/relay box • An open in the wire

7. If multiple failures are found on more than one control unit, replace the under-dash fuse/relay box (includes the MICU). If input failures are related to a particular control unit, replace the control unit.

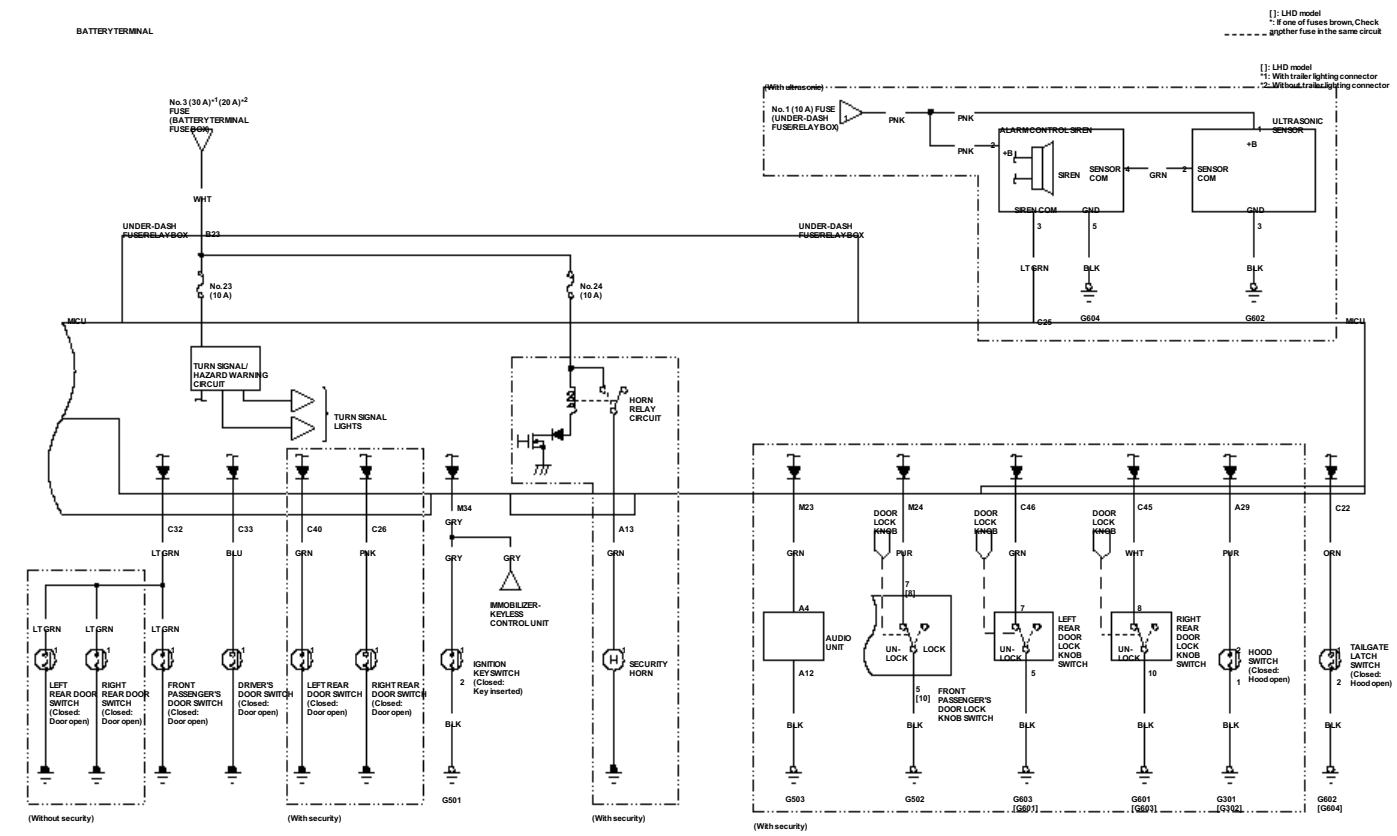
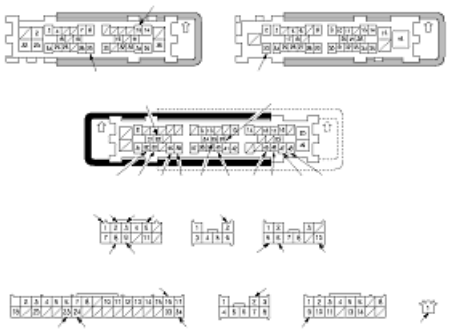
Keyless/Power Door Locks/Security System Circuit Diagram



Keyless/Power Door Locks/Security System (MICU) Input Test



NOTE:

- Before testing, make sure the turn signal/hazard warning lights work properly.
- Before testing, check the No. 1 (10 A), No. 20 (15 A), No. 22 (7.5 A), No. 27 (30 A), No. 35 (10 A), No. 36 (15 A), No. 49 (15 A), No. 50 (15 A), and No. 60 (50 A) fuses in the under-dash fuse/relay box.
- There are two pairs of fuses in the same circuit (No. 35 and No. 49 fuses, No. 36 and No. 50 fuses). If one fuse is brown, make sure to check another fuse in the same circuit. If necessary, replace the damaged fuse(s).

1. Turn the ignition switch to LOCK (0).

2. RHD model: Remove the fuse lid panel , and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.

3. Disconnect under-dash fuse/relay box connectors A, B, C, E, F, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.

4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .

5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained

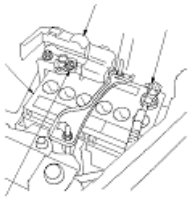
Battery Terminal Disconnection/Reconnection

Disconnection

NOTE: Some system store data in memory is lost when the battery is disconnected. Do the following procedures before disconnecting the battery.

1. Make sure you have the anti-theft code(s) for the audio and/or the navigation system (if equipped), then write down the audio presets.
   NOTE: For some models, it maybe necessary to write down the audio presets (AM and FM), because the audio unit does not retain the presets after the battery is disconnected.
2. Make sure the ignition switch is in LOCK (0).
3. Disconnect and isolate the negative cable from the battery.
   NOTE: Always disconnect the negative cable from the battery first.
4. Disconnect the positive cable from the battery.

Reconnection



NOTE: Some system store data in memory is lost when the battery is disconnected. Do the following procedures to restore the system back to normal operation.

1. Clean the battery terminals.
2. Test the battery.
3. Reconnect the positive cable (A) to the battery (B) first, then reconnect the negative cable (C) to the battery.
   NOTE: Always connect the positive cable to the battery first.
4. Apply multipurpose grease to the terminals to prevent corrosion.
5. Install the terminal cover (D).
6. Enter the anti-theft code(s) for the audio system and/or the navigation system (if equipped).
7. Enter the audio presets (if applicable).
8. Set the clock (for vehicles without navigation).

Battery Terminal Fuse Box Connector Locations

Battery Terminal Fuse Box

Socket	Ref	Terminal	Connects to
T-1	1	———	Battery terminal, Starter

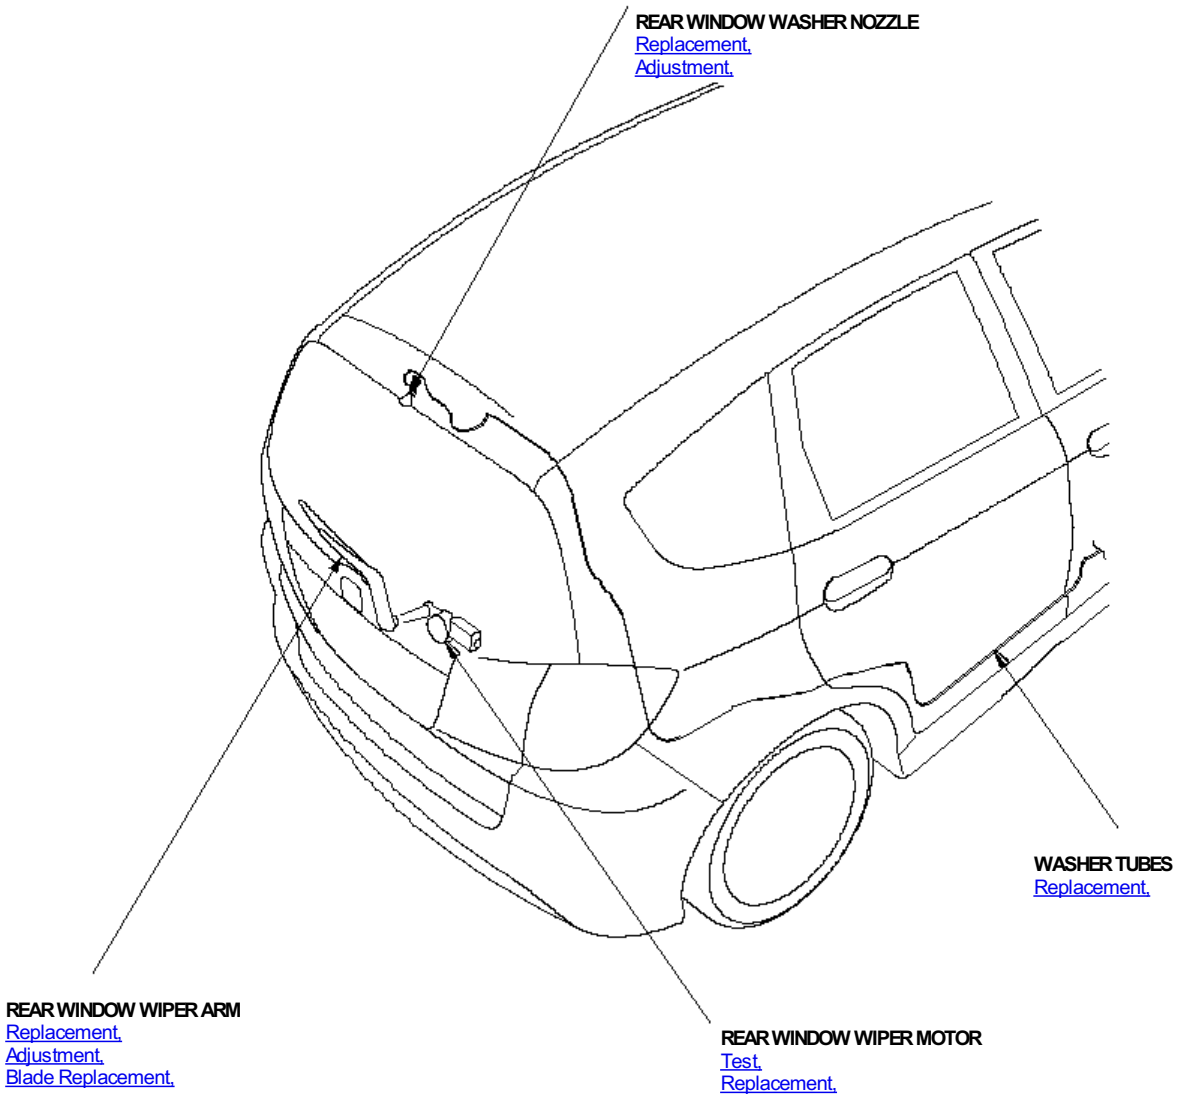
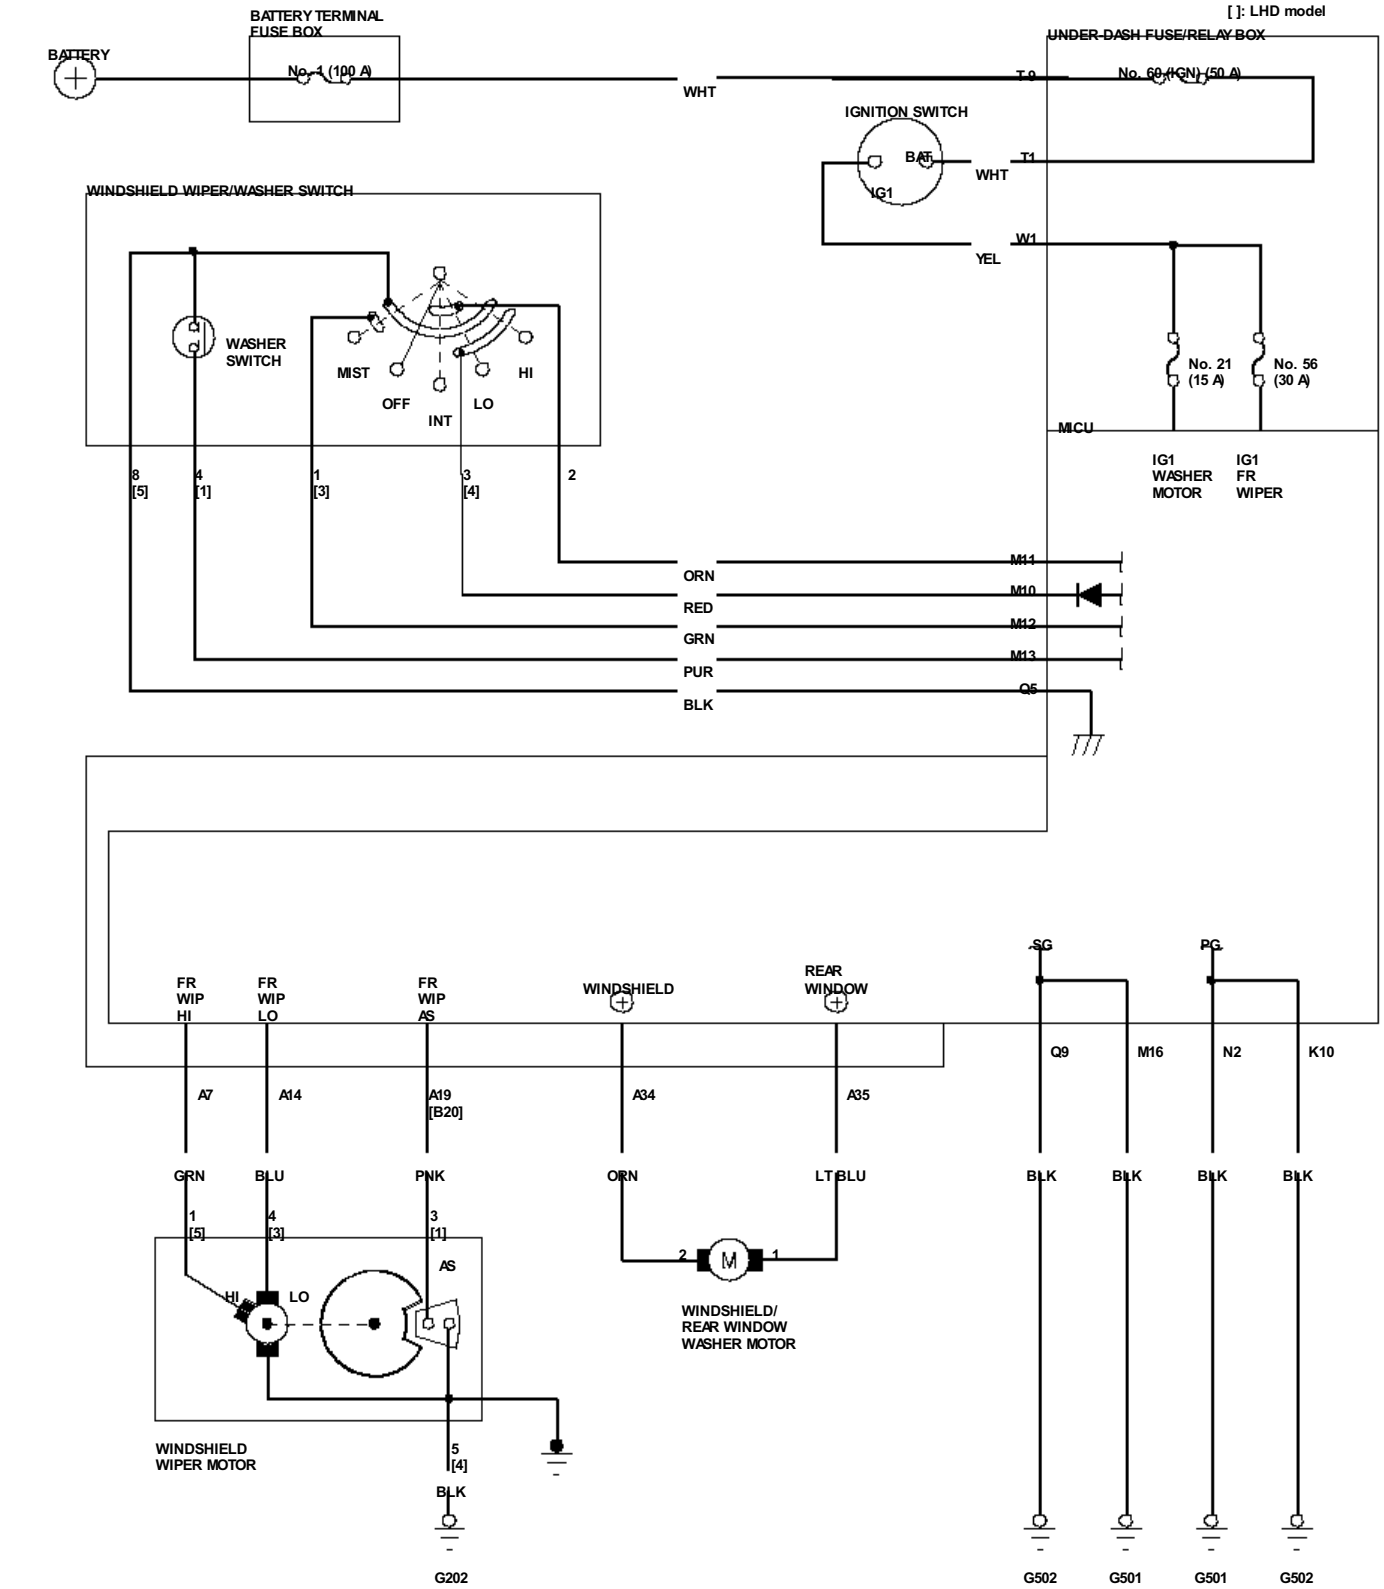
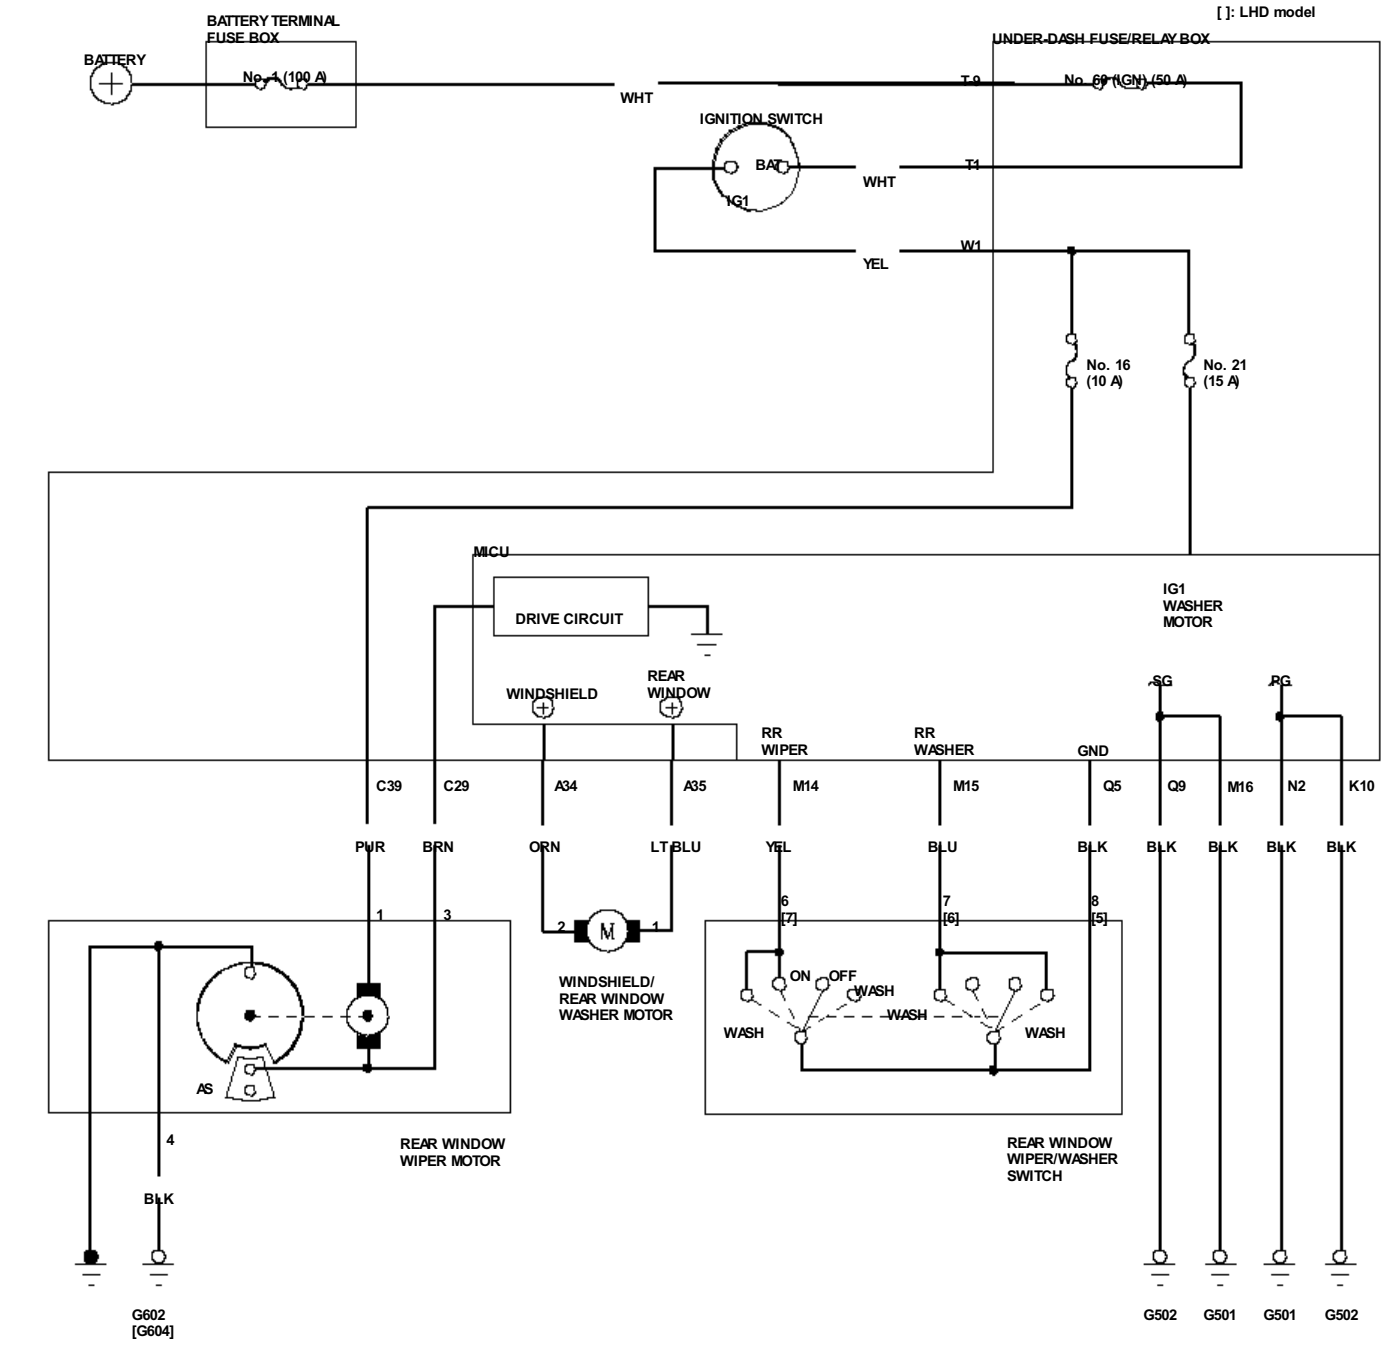
Wipers/Washers Component Location Index



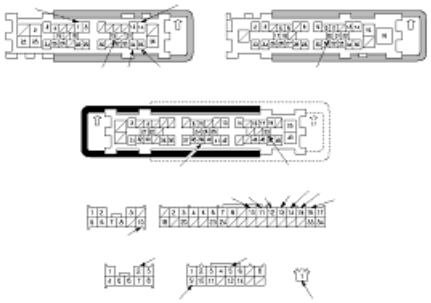
Wipers/Washers Circuit Diagram - Windshield



Wipers/Washers Circuit Diagram - Rear Window



Wipers/Washers (MICU) Input Test



NOTE:

- Before performing the input tests, check the No. 16 (10 A), No. 21 (15 A), and No. 56 (30 A) fuse in the under-dash fuse/relay box.
- If there is malfunction of the rear windshield wiper operation, and no DTCs are detected, check the rear windshield wiper motor and an open in the ground circuit of the rear windshield wiper.

1. Turn the ignition switch to LOCK (0).
2. RHD model: Remove the fuse lid panel, and remove the driver's dashboard lower cover.
   LHD model: Remove the fuse lid panel.
3. Disconnect under-dash fuse/relay box connectors A, B, C, K, M, N, Q, and W.
   NOTE:
   - All connector views are shown from wire side of female terminals.
   - The illustration shows the RHD model and the black portion shows the lock lever. The lock lever for LHD model is shown as the dashed lines.
4. Inspect the connector and socket terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary and recheck the system.
   - If the terminals look OK, go to Step 5 .
5. With the connectors still disconnected, make these input tests at the connectors.
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the MICU must be faulty; replace the under-dash fuse/relay box.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
K10	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
M16	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
N2	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G501) • An open in the wire
Q9	BLK	Under all conditions	Check for continuity to ground: There should be continuity.	• Poor ground (G502) • An open in the wire
W1	YEL	Ignition switch ON (II)	Measure the voltage to ground: There should be battery voltage.	• Blown No. 60 (IGN) (50 A) fuse in the under-dash fuse/relay box • Faulty ignition switch • An open in the wire
A7	GRN	Under all conditions	Connect the A7 terminal to the battery power: The windshield wiper motor should run at high speed.	• Poor ground (G202) • Faulty windshield wiper motor • An open in the wire
A14	BLU	Under all conditions	Connect the A14 terminal to the battery power: The windshield wiper motor should run at low speed.	
A34	ORN	Under all conditions	Connect the A34 terminal to battery power and A35 terminal to body ground:The windshield/rear window washer motor should run.	• Faulty windshield/rear window washer motor • An open in the wire
A35	LT BLU	Under all conditions	Connect the A35 terminal to battery power and A34 terminal to body ground:The windshield/rear window washer motor should run.	• Faulty windshield/rear window washer motor • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
A19[B20]	PNK	The motor stops at auto-stop position.	Check for continuity to ground: There should be continuity.	• Faulty windshield wiper motor • Poor ground (G202) • An open in the wire
		Connect the A14 terminal to the battery power momentarily, and stop the motor operation before the motor reaches the auto-stop position.	Check for continuity to ground: There should be no continuity.	Faulty windshield wiper motor

[ ]: LHD model

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
C39·C29	PUR·BRN	Connect battery power to C39 terminal, then connect C29 terminal to body ground momentarily.	Check rear window wiper motor operation: The rear window wiper motor should run, and the park position.	• Faulty rear window wiper motor • An open in the wire • Poor ground (G602) [G604]
M10·Q5	RED·BLK	Windshield wiper/washer switch (LO or HI) ON	Check for continuity between M10 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M10 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M11·Q5	ORN·BLK	Windshield wiper/washer switch (INT or LO) ON	Check for continuity between M11 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M11 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M12·Q5	GRN·BLK	Windshield wiper/washer switch (MIST) ON	Check for continuity between M12 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wiper/washer switch OFF	Check for continuity between M12 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M13·Q5	PUR·BLK	Windshield wash switch ON	Check for continuity between M13 and Q5 terminals: There should be continuity.	• Faulty windshield wiper/washer switch • An open in the wire
		Windshield wash switch OFF	Check for continuity between M13 and Q5 terminals: There should be no continuity.	Faulty windshield wiper/washer switch
M14·Q5	YEL·BLK	Rear window wiper/washer switch (RR WIPER) ON	Check for continuity between M14 and Q5 terminals: There should be continuity.	• Faulty Rear window wiper/washer switch • An open in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
		Rear window wiper/washer switch OFF	Check for continuity between M14 and Q5 terminals:There should be no continuity.	Faulty Rear window wiper/washer switch
M15-Q5	BLU BLK	Rear window wiper/washer switch (RR WASH) ON	Check for continuity between M15 and Q5 terminals:There should be continuity.	• Faulty Rear window wiper/washer switch • An open in the wire
		Rear window wiper/washer switch OFF	Check for continuity between M15 and Q5 terminals:There should be no continuity.	Faulty Rear window wiper/washer switch

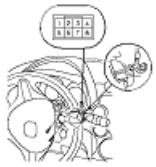
[ ]: LHD model

Wiper/Washer Switch Test/Replacement

1. Remove the steering column covers.
2. Disconnect the dashboard wire harness 8P connector (A) from the wiper/washer switch (B).
3. Remove the two screws, then slide out the wiper/washer switch.
4. Inspect the connector terminals to be sure they are all making good contact.
   - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   - If the terminals look OK, go to Step 5 .

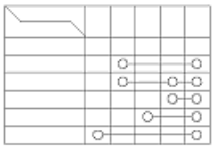
RHD model

LHD model

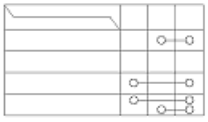


5. Check for continuity between the terminals in each switch position according to the table.
6. If the continuity is not as specified, replace the switch.
7. Install the switch in the reverse order of removal.

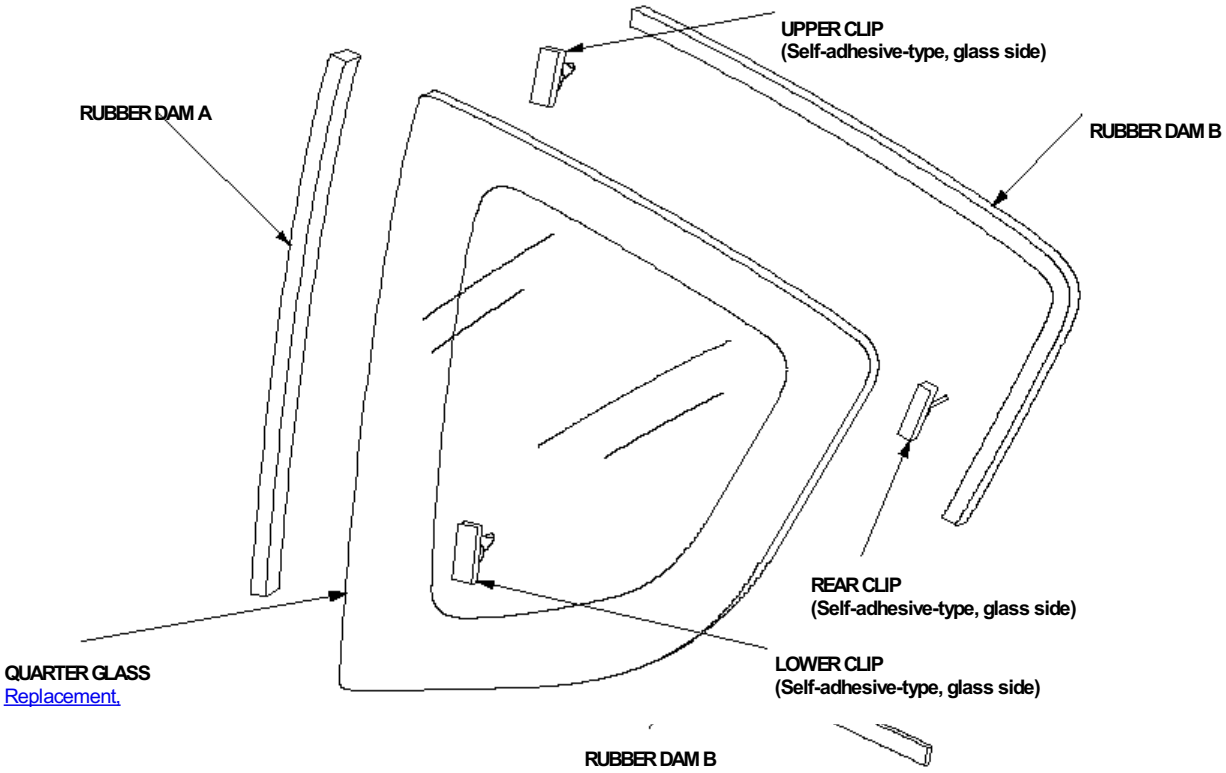
Windshield



Rear window



Glass Component Location Index

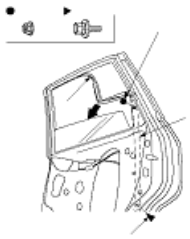


Rear Door Glass and Regulator Replacement

NOTE:

- Put on gloves to protect your hands.
- Take care not to scratch the door and related parts.
- RHD model is shown; LHD model is symmetrical.

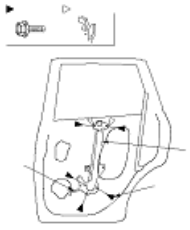
1. Remove the these items:
   - Rear door glass outer weatherstrip
   - Rear door sash trim
   - Rear door panel
2. Detach the harness clip, then disconnect the power door lock actuator connector.
3. Remove the plastic cover, as needed.
4. Carefully raise the glass (A) until you can see the bolts, then remove them. Remove the glass from the regulator (B), and carefully lower the glass.
   NOTE: Take care not to drop the glass inside the door.



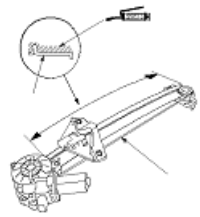
5. Pull the glass run channel (A) away as needed. Loosen the nut, and remove the bolt securing the rear lower channel (B).

6. Release the rear lower channel (A) from the glass (B).
   -1. Pull the channel forward, then remove the nut portion (C) from the door.
   -2. Twist the channel to pass it through the gap between the door panel and the rear sash.
   -3. Pull the channel up to remove it.

7. Carefully remove the glass (A) out through the window slot. Take care not to drop the glass inside the door.



8. Disconnect and detach the connector (A) from the regulator (B).
9. Remove the bolts, pull the regulator up to release the hooks, then remove the regulator through the hole in the door.



10. Apply multipurpose grease to all the sliding surfaces of the regulator (A) where shown.
11. Install the glass and regulator in the reverse order of removal, and note these items:
    - Raise and lower the glass to see if it moves freely without binding.
    - Make sure that there is no clearance between the glass and glass run channel when the glass is closed.
    - Adjust the position of the glass as necessary.
    - Do the power window control unit reset procedure.
    - When reinstalling the door panel, make sure the plastic cover is installed properly and sealed around its outside perimeter to seal out water.
    - Check for water leaks.
    - Test-drive and check for wind noise and rattles.
    - Make sure the power door locks, windows operate properly.

Windshield Replacement

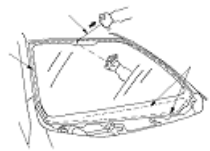
NOTE:

- Put on gloves to protect your hands.
- Wear eye protection while cutting the glass adhesive with a piano wire.
- Use seat covers to avoid damaging the seat.
- When replacing a broken windshield, a commercially available windshield cutter can be efficiently used for cutting the adhesive. For details, follow the instructions of the manufacturer of the tool.
- RHD model is shown; LHD model is symmetrical.

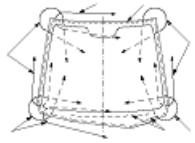
1. Remove these items:
   - Cowl covers
   - Rearview mirror
   - Front pillar trim, both sides:
     - Without side curtain airbags
     - With side curtain airbags
   - Roof moldings, both sides
2. Remove the molding (A) from the edge of the windshield (B). If necessary, cut the molding with a utility knife.
3. If the old windshield is to be reinstalled, make alignment marks across the glass and body with a grease pencil.
4. Pull down the front portion of the headliner. Take care not to bend the headliner excessively, or you may crease or break it.
5. Apply protective tape along the edge of the dashboard and body. Using an awl, make a hole through the rubber dam and adhesive from inside the vehicle at the corner portion of the windshield. Push a piece of piano wire through the hole, and wrap each end around a piece of wood.

---

6. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the windshield (B) as possible to prevent damage to the body and dashboard.
   Carefully cut through the rubber dam and adhesive (C) around the entire windshield.
7. Carefully remove the windshield.
8. With a utility knife, scrape the old adhesive smooth to a thickness of about 2 mm (0.08 in.) on the bonding surface around the entire windshield opening flange:
   - Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.
   - Remove the rubber dams and upper clips from the body.
9. Clean the body bonding surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease and water from getting on the clean surface.
10. If the old windshield is to be reinstalled, use a putty knife to scrape off all of the old adhesive, the upper clips and the rubber dams from the windshield. Clean the inside face and the edge of the windshield with isopropyl alcohol where new adhesive is to be applied. Make sure the bonding surface is kept free of water, oil and grease.



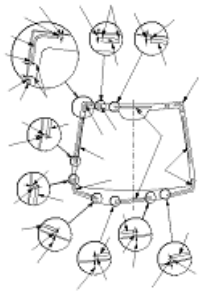
Cutting positions



---

11. Attach the rubber dam A, rubber dam B, rubber dam C, rubber dam D, and the upper clips (E) with adhesive tape to the inside face of the windshield (F) as shown:
    - Be sure the rubber dam and upper clips line up with the alignment marks (G).
    - Be careful not to touch the windshield where adhesive will be applied.

    Rubber dam adhesive tape:
    Thickness 0.16 mm (0.006 in.)
    Width 3 mm (0.118 in.)
    Upper clip adhesive tape:
    Thickness 0.4 mm (0.02 in.)
    Width 13 mm (0.512 in.)



---

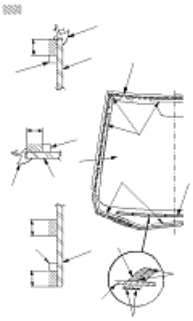
12. Attach the molding (A) with adhesive tape (B) to the edge of the windshield (C):
    - Be sure each corner of the molding lines up with the ones of the windshield.
    - Be careful not to touch the windshield where adhesive will be applied.

    Molding adhesive tape:
    Thickness 0.8 mm (0.03 in.)
    Width 4 mm (0.16 in.)

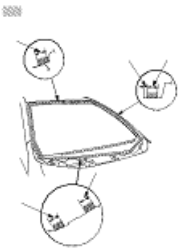
---

13. Set the windshield (A) in the opening, and center it.
    Make alignment marks (B) across the windshield and body with a grease pencil at the four points shown. Make sure the upper clips (C) contact with the edge of the body holes. Be careful not to touch the windshield where adhesive will be applied.
14. Remove the windshield.

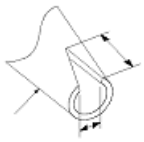
15. With a sponge, apply a light coat of glass primer to the windshield (A) along the edge of the molding (B) and the rubber dams (C) as shown, then lightly wipe it off with gauze or cheesecloth:
    - With the printed dots (D) on the windshield as a guide, apply glass primer to the bottom (E) of the windshield.
    - Apply glass primer to the molding.
    - Do not apply body primer to the windshield, and do not get body and glass primer sponges mixed up.
    - Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the windshield properly, causing a leak after the windshield is installed.
    - Keep water, dust, and abrasive materials away from the primed surface.



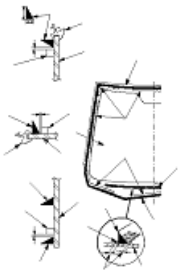
16. With a sponge, carefully apply a light coat of body primer to any exposed paint or metal around the flange where new adhesive will be applied. Let the body primer dry for at least 10 minutes:
    - Do not apply body primer to any remaining original adhesive on the flange.
    - Be careful not to mix up the body and glass primer sponges.
    - Never touch the primed surfaces with your hands.
    - Mask off the dashboard before painting the flange.



17. Cut a “V" in the end of the nozzle (A) on the adhesive cartridge as shown.



18. Pack adhesive into the cartridge without air pockets to ensure continuous delivery. Put the cartridge in a caulking gun, and run a bead of adhesive (A) to the windshield (B) along the edge of the molding (C) and rubber dams (D) as shown. Apply the adhesive within 30 minutes after applying the glass primer. Make a slightly thicker bead at each corner.
    - Apply glass primer to the bottom (E) of the windshield.
    - Apply glass primer to the molding.



19. Use suction cups to hold the windshield over the opening, align it with the alignment marks made in step 13, and set it down on the adhesive. Lightly push on the windshield until its edges are fully seated on the adhesive all the way around.
    NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.

20. Scrape or wipe the excess adhesive off with a putty knife or towel. To remove adhesive from a painted surface or the windshield, wipe with a soft shop towel dampened with isopropyl alcohol.

21. After the adhesive has dried, spray water over the windshield and check for leaks. Mark leaking areas, and let the windshield dry, then seal with sealant:
    - Let the vehicle stand for at least 4 hours after windshield installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.
    - Keep the windshield dry for the first hour after installation.

22. Reinstall all remaining removed parts. Install the rearview mirror after the adhesive has dried thoroughly. Advise the customer not to do the following things for 2 to 3 days:
    - Slam the doors with all the windows rolled up.
    - Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

DTC Troubleshooting: B1150

DTC B1150:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B1150?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1170

DTC B1170:
Gauge Control Module Lost Communication with ABS Modulator-Control Unit (ABS Message)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Is DTC B1170 indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure, the system is OK at this time. Check for loose or poor connections.■
5. Check for ABS system DTCs with the HDS.

   Are any DTCs indicated?
   YES - Go to the indicated DTCs, then recheck.■
   NO - Go to Step 6 .
6. Turn the ignition switch to LOCK (0).
7. Disconnect the gauge control module 32P connector.
8. Disconnect the ABS modulator-control unit 25P connector.
9. Connect the gauge control module 32P connector No. 29 and No. 30 terminals and body ground with jumper wires.

---

10. Check for continuity between the ABS modulator-control unit 25P connector No. 1 and No. 17 terminals and body ground individually.

    Is there continuity?
    YES - Substitute a known-good ABS modulator-control unit, and recheck. If the indication goes away, replace the original ABS modulator-control unit. If the DTC is still present, replace the gauge control module. ■
    NO - Repair an open in the wire.■

DTC Troubleshooting: B1900

DTC B1900:
Communication Bus Line Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

Are DTCs B1000 and B1011 also indicated with DTC B1900?
YES - Go to DTC B1000 troubleshooting.■
NO - Intermittent failure, the system is OK at this time.■

DTC Troubleshooting: B1000

DTC B1000:
Communication Circuit Error (BUS-OFF)

1. Clear the DTCs with the HDS.
2. Turn the ignition switch to LOCK (0), and then back to ON (II).
3. Wait for 6 seconds or more.
4. Check for DTCs with the HDS.

   Are DTCs B1000 and B1011 all indicated?
   YES - Go to Step 5 .
   NO - Intermittent failure. The communication bus line is OK at this time. Check for any worn or shorted wires.■
5. Turn the ignition switch to LOCK (0).
6. Disconnect the appropriate connector at each control unit in the table.

Unit	Connector
MICU	Under-dash fuse/relay box connector Q (16P)
Gauge control module	32P connector
Immobilizer-keyless control unit	7P connector

7. Turn the ignition switch to ON (II).
8. Clear the DTCs with the HDS.
9. Turn the ignition switch to LOCK (0), and then back to ON (II).
10. Wait for 6 seconds.
11. Check for DTCs with the HDS.

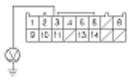
    Are DTCs B1000 and B1011 all indicated?
    YES - Faulty MICU, replace the under-dash fuse/relay box. ■
    NO - Go to Step 12 .
12. Turn the ignition switch to LOCK (0).
13. Check for continuity between under-dash fuse/relay box connector Q (16P) No. 3 terminal and body ground.

    Is there continuity?
    YES - Repair a short to ground in the wire between the under-dash fuse/relay box connector and the affected control unit.■
    NO - Go to Step 14 .
14. Turn the ignition switch to ON (II).

---

15. Measure the voltage between under-dash fuse/relay box connector Q (16P) No. 3 terminal and body ground.

    Is there voltage?
    YES - Repair a short to power in the wire between the under-dash fuse/relay box connector and the affected control unit.■
    NO - Go to Step 16 .



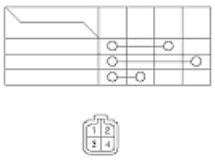
16. Turn the ignition switch to LOCK (0).
17. Reconnect under-dash fuse/relay box connector Q (16P).
18. Reconnect the gauge control module 32P connector.
19. Turn the ignition switch to ON (II).
20. Clear the DTCs with the HDS.
21. Turn the ignition switch to LOCK (0), and then back to ON (II).
22. Wait for 6 seconds or more.
23. Check for DTCs with the HDS.

    Are DTCs B1000 and B1011 all indicated?
    YES - Replace the gauge control module. ■
    NO - Replace the immobilizer-keyless control unit. ■

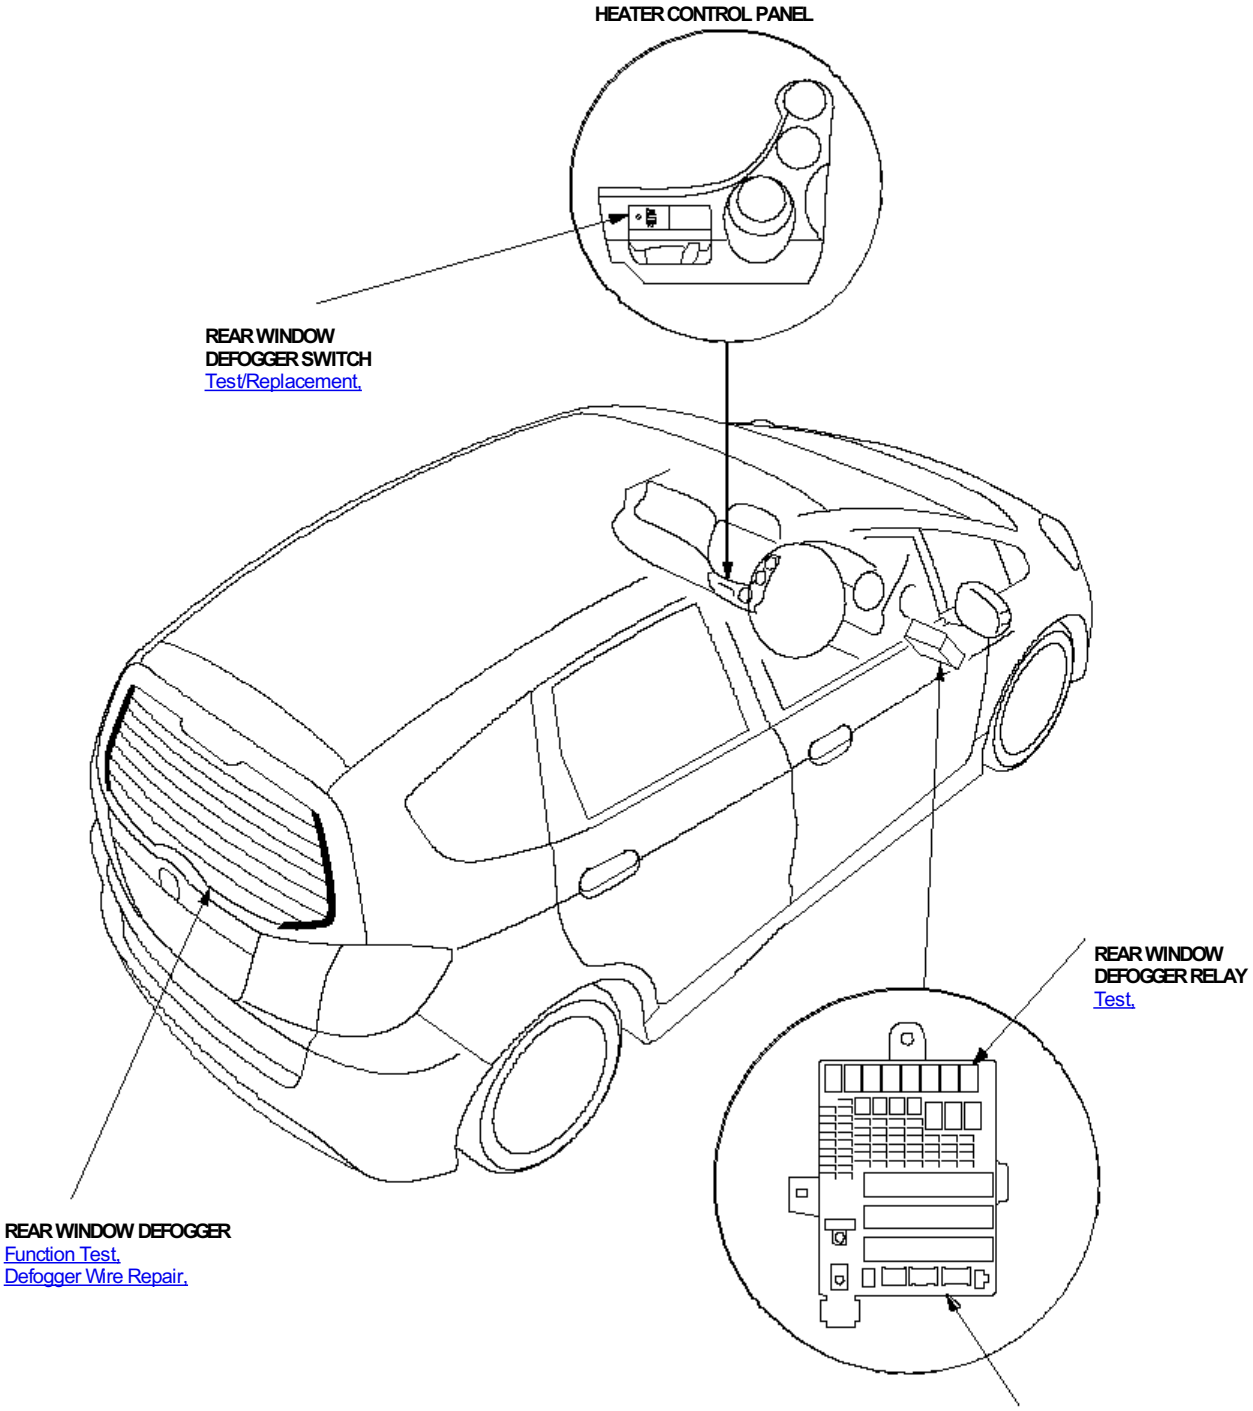
Blower Resistor Test

1. Disconnect the 4P connector (A) from the blower resistor.

2. Measure the resistance between the following terminals of the blower resistor and compare them with the values in the table.
3. If the resistance is not within the specifications, replace the blower resistor.

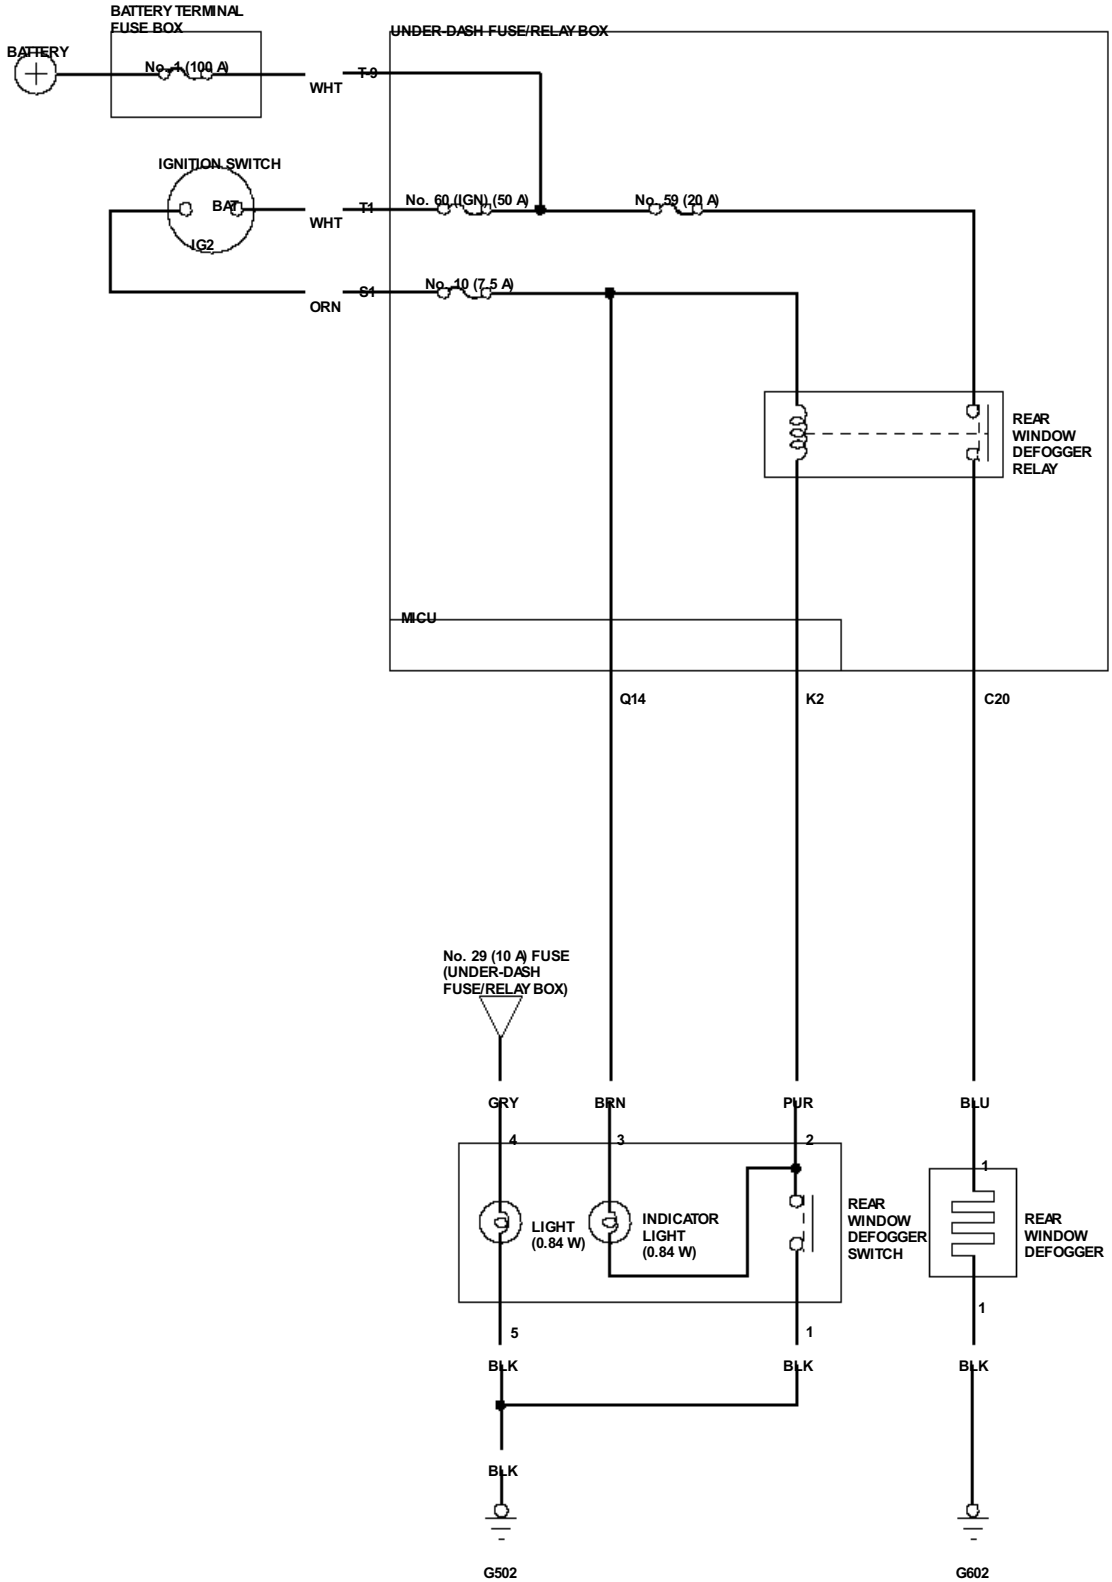


Rear Window Defogger Component Location Index



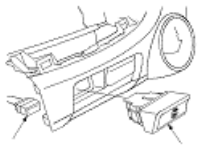
RHD model is shown, LHD model is similar.

Rear Window Defogger Circuit Diagram

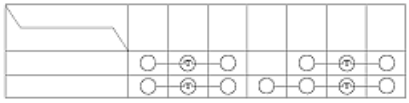


Rear Window Defogger Switch Test/Replacement

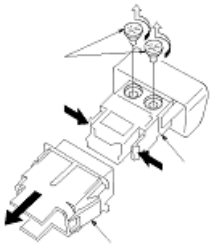
1. Remove the heater control panel.
2. Disconnect the 5P connector (A), and remove the rear window defogger switch (B).



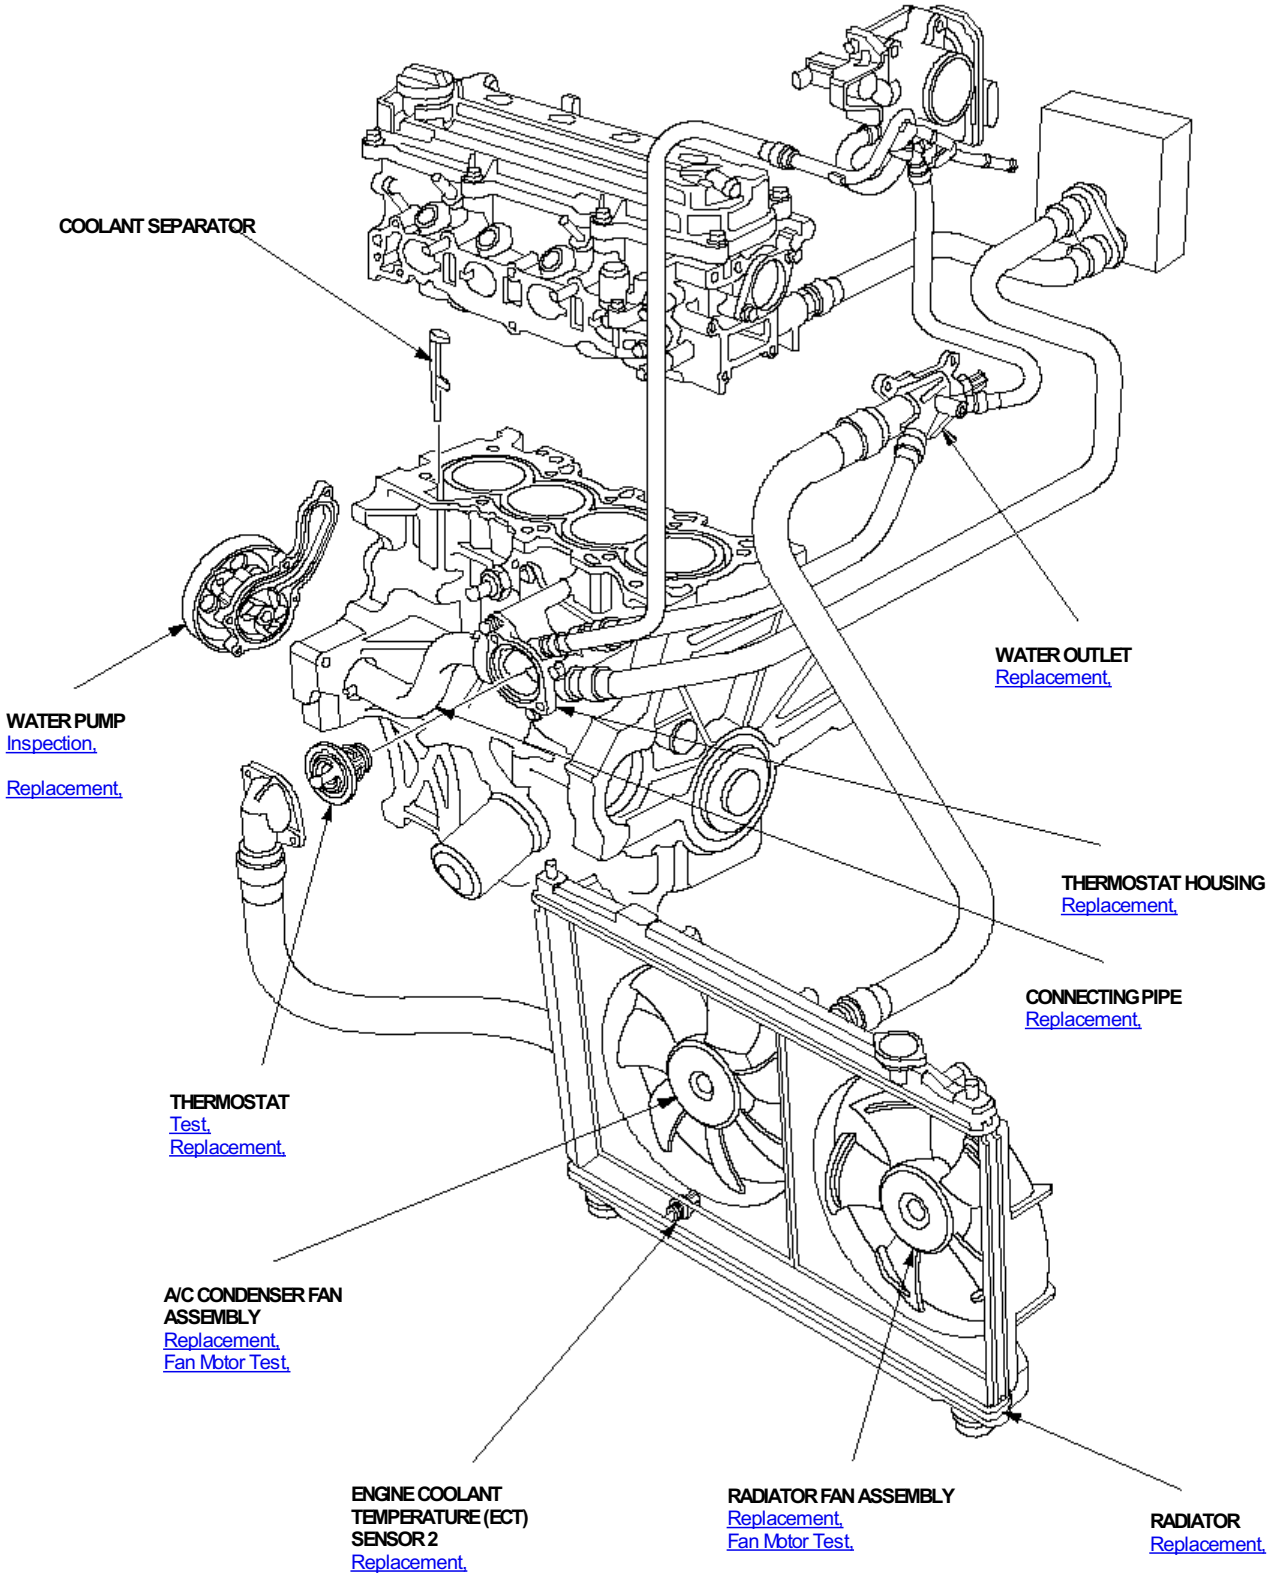
3. Check for continuity between the terminals in each switch position according to the table.



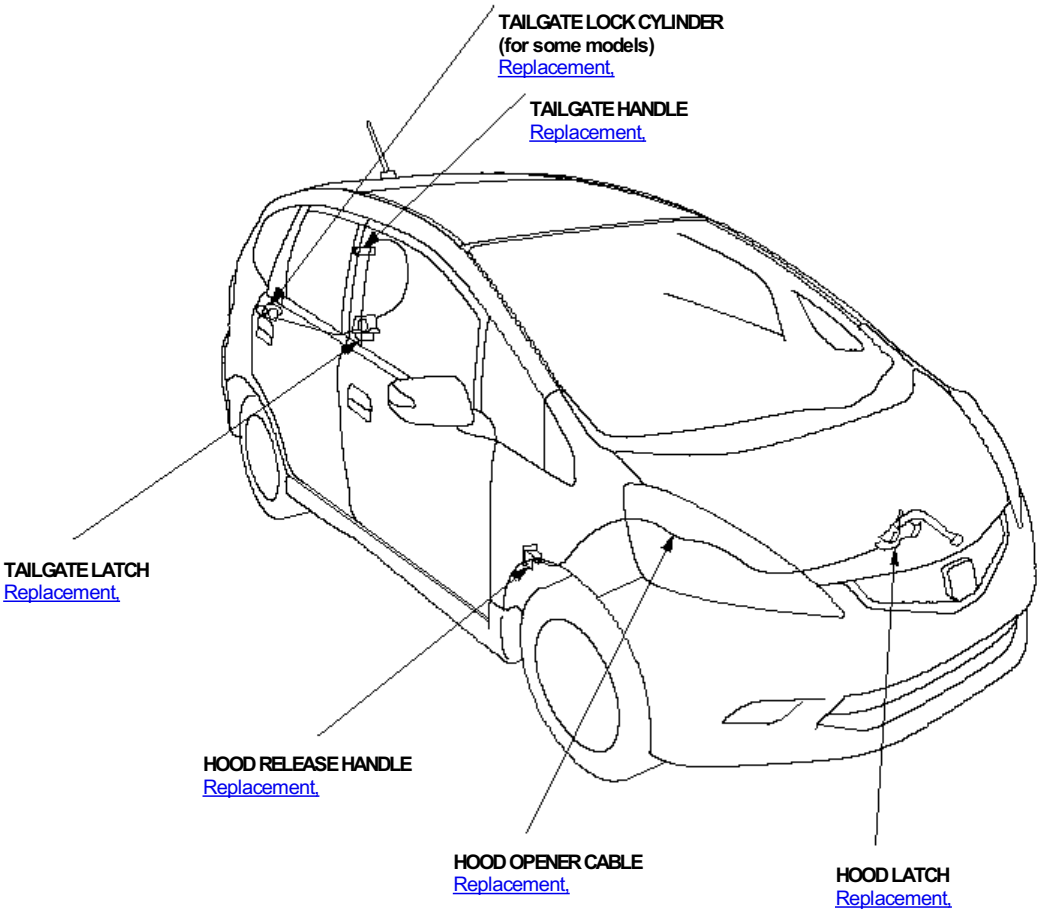
4. If the continuity is not as specified, remove the cover (A), and replace the switch (B) or bulb (C).



Cooling System Component Location Index



Openers Component Location Index



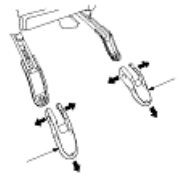
Front Seat Removal/Installation - Without Seat Heater

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

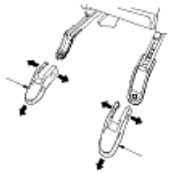
- Put on gloves to protect your hands.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- Take care not to scratch the body or tear the seat covers.
- When removing components, use the trim tools or equivalent.

1. Tilt the steering wheel all the way up, and telescope it all the way in.
2. Slide the front seat all the way forward, then remove the rear inner seat track end covers (A) and rear outer seat track end covers (B) from the rear of both seat tracks.

Passenger's seat

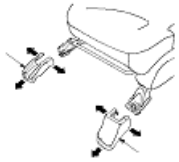


Driver's seat

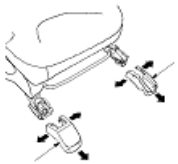


3. Slide the front seat rearward fully, then remove the front inner seat track end covers (A) and front outer seat track end covers (B) from the front of driver's seat tracks.
4. Slide the seat about half way to the rear so you can access the seat mounting bolts. If you remove the manual height adjustable seat, fully raise the seat.

Passenger's seat



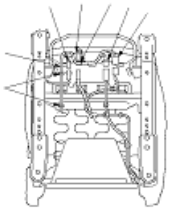
Driver's seat



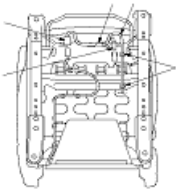
5. Remove the bolts.
6. Do the battery terminal disconnection procedure, then wait at least 3 minutes before removing the seat.

7. Lift up the front seat, then detach the harness clips (A) of the floor wire harness (B), and disconnect the seat belt buckle switch connectors (C) and the side airbag connector (D) (for some models). On passenger's seat, disconnect the sitting switch connector (E) (with front seat belt reminder) and OPDS unit harness connector (F) (for some model).
8. Remove the head restraint.
9. With the help of an assistant, carefully remove the front seat through the front door opening.

Passenger's seat



Driver's seat



10. Install the seat in the reverse order of removal, and note these items:
    - Apply medium strength type liquid thread lock to the seat mounting bolts before reinstallation.
    - Tighten the seat mounting bolts to the specified torque in the sequence shown. Slide the seat all the way back and tighten (1) and (2), then slide it forward and tighten (3) and (4). The driver's seat on RHD model is shown, the passenger's seat on RHD model is symmetrical. The front seats on LHD model are similar.
    - Make sure each connector is plugged in properly.
    - Tighten the bolts by hand first, then tighten them to specification with a torque wrench.
    - Do the battery terminal reconnection procedure.
    - Check for any DTCs that may have been set during repairs, and clear them.

Front Seat Removal/Installation - With Seat Heater

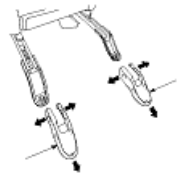
With Seat Heater

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

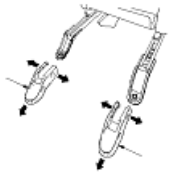
- Put on gloves to protect your hands.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- Take care not to scratch the body or tear the seat covers.
- When removing components, use the trim tools or equivalent.

1. Tilt the steering wheel all the way up, and telescope it all the way in.
2. Slide the front seat all the way forward, then remove the rear inner seat track end covers (A) and rear outer seat track end covers (B) from the rear of both seat tracks.

Driver's seat

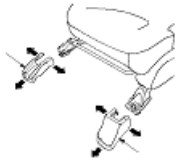


Passenger's seat

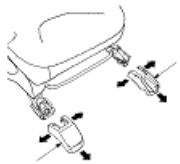


3. Slide the front seat rearward fully, then remove the front inner seat track end covers (A) and front outer seat track end covers (B) from the front of driver's seat tracks.
4. Slide the seat about half way to the rear so you can access the seat mounting bolts. If you remove the manual height adjustable seat, fully raise the seat.

Driver's seat



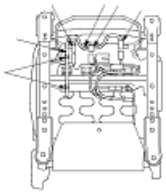
Passenger's seat



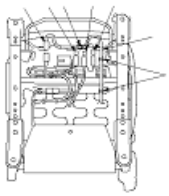
5. Remove the bolts.
6. Do the battery terminal disconnection procedure, then wait at least 3 minutes before removing the seat.

7. Lift up the front seat, then detach the harness clips (A) of the floor wire harness (B), and disconnect the seat belt buckle switch connector (C) and the side airbag connector (D) (for some models) and the seat wire harness connector (E). On passenger's seat, disconnect the sitting switch connector (F) (with front seat belt reminder).
8. Remove the head restraint.
9. With the help of an assistant, carefully remove the front seat through the front door opening.

Driver's seat



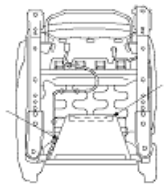
Passenger's seat



10. Install the seat in the reverse order of removal, and note these items:
    - Tighten the seat mounting bolts to the specified torque in the sequence shown. Slide the seat all the way back and tighten (1) and (2), then slide it forward and tighten (3) and (4). The driver's seat on LHD model is shown, the passenger's seat on LHD model is symmetrical. The front seats on RHD model are similar.
    - Make sure each connector is plugged in properly.
    - Tighten the bolts by hand first, then tighten them to specification with a torque wrench.
    - Do the battery terminal reconnection procedure.
    - Check for any DTCs that may have been set during repairs, and clear them.

Front Seat Cushion Cover/Pad Replacement - Without Seat Heater

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

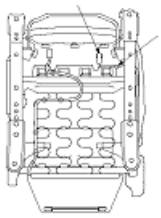


- Put on gloves to protect your hands.
- Take care not to tear the seams or damage the seat covers.
- Do not repair any tear or frayed spots of the seat cover.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is similar.

1. Remove the front seat.
2. Remove the front seat outer cover.
3. From under the seat cushion, release the hook (A) from the seat cushion frame spring. Pull the cushion cover (B) back.

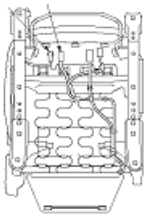
4. From under driver's seat cushion, detach the wire harness clips (A) and seat belt buckle switch connector (B), then pull it to out side of the seat.

Driver's seat

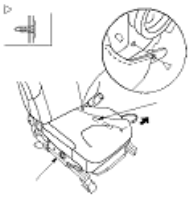


5. From under passenger's seat cushion, detach the seat belt setting switch connector (A) and seat belt buckle switch connector (B) (with seat belt reminder system).

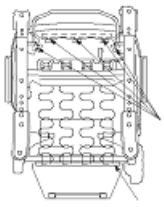
Passenger's seat



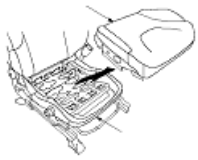
6. Remove the clip, then release the hook strips (A, B) from the seat cushion frame.



7. From under seat cushion, release the hook strips (A, B) from the seat cushion frame.

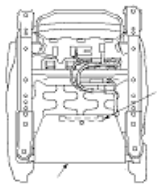


8. Remove the seat cushion cover/pad (A) from the seat frame (B).
9. Install the cover in the reverse order of removal, and note these items:
   - To prevent wrinkles when installing a seat cushion cover, make sure the material is stretched evenly over the pad before securing the hook strips.
   - Check if the clip is damaged or stress-whitened, and if necessary, replace is with new ones.



Front Seat Cushion Cover/Pad Replacement - With Seat Heater

With Seat Heater



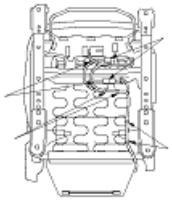
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Put on gloves to protect your hands.
- Take care not to tear the seams or damage the seat covers.
- Do not repair any tear or frayed spots of the seat cover.
- When removing components, use the trim tools or equivalent.
- LHD model is shown; RHD model is similar.

1. Remove the front seat.
2. Remove the front seat outer cover.
3. From under the seat cushion, release the hook (A) from the seat cushion frame spring. Pull the cushion cover (B) back.

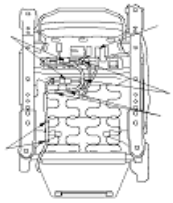
4. From under driver's seat cushion, detach the wire ties (A) and wire harness clips (B) and disconnect the seat heater harness connectors (C), then pull it to out side of the seat.

Driver's seat

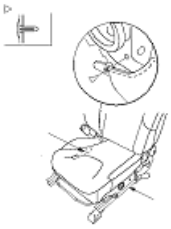


5. From under passenger's seat cushion, detach the wire ties (A) and wire harness clips (B) seat belt setting switch connector (C) and disconnect the seat heater harness connectors (D).

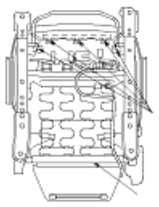
Passenger's seat



6. Remove the clip, then release the hook strips (A, B) from the seat cushion frame.



7. From under seat cushion, release the hook strips (A, B) from the seat cushion frame.

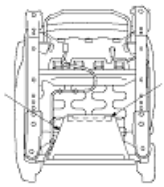


8. Remove the seat cushion cover/pad (A) from the seat frame (B).

9. Install the cover in the reverse order of removal, and note these items:
   - To prevent wrinkles when installing a seat cushion cover, make sure the material is stretched evenly over the pad before securing the hook strips.
   - If the clips are damaged or stress-whitened, replace them with new ones.

Front Seat-back Cover/Pad Replacement - Without Seat Heater

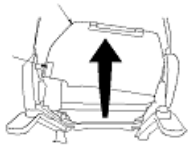
SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:



- Do not repair any tears or frayed spots of the seat-back cover. If necessary, replace the seat-back cover.
- Take care not to tear the seams or damage the seat covers.
- Passenger's seat: Do not touch the OPDS sensor in the seat-back pad, and keep it away from oil.
- Put on gloves to protect your hands.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- When removing components, use the trim tools or equivalent.
- RHD model is shown; LHD model is similar.

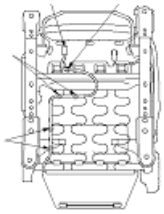
1. Remove the front seat.
2. Driver's seat: Remove the front seat armrest.
3. From under the seat cushion, release the hook (A) from the seat cushion frame spring. Pull the cushion cover back (B).

4. Release the fastener (A) and pull the cushion cover back (B).

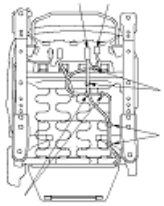


5. From under the seat cushion, remove the wire ties (A) and detach the wire harness clips (B) and connector(s), then pull it to out side of the seat.
   - Driver's seat:
     - For some models: Side airbag connector (C)
   - Passenger's seat:
     - For some models: Side airbag connector (C)
     - For some models: OPDS unit harness connector (D)

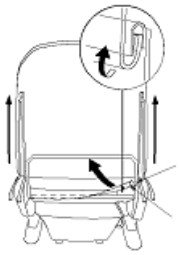
Driver's seat



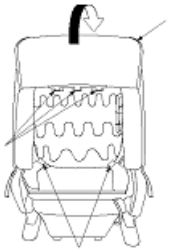
Passenger's seat



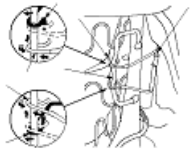
6. From behind the seat-back, release the hook (A), and unzip the seat-cover (B).



7. Pull back the seat-back cover (A), then release the hook strips (B) from the seat-back frame.

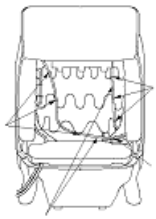


8. Release airbag wire A and airbag wire B from the seat-back frame (C).

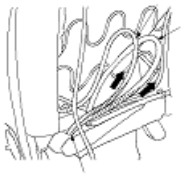


9. Passenger's seat: Remove the OPDS unit cover (A).
   -1. Turn over the seat-back cover and the pad (B) as needed.
   -2. Release the cover from the lower hooks (C).
   -3. Pull the cover upward to release it from the upper hook (D).
10. Passenger's seat: Disconnect the OPDS sensor connectors (E) from the OPDS unit (F).

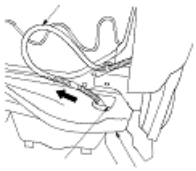
11. Passenger's seat: Remove the wire ties (A), and detach the harness clip (B) fastening the OPDS sensor harnesses(C).



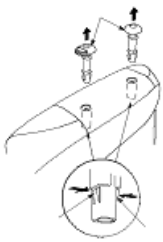
12. Passenger's seat: Pull the side airbag harness (A) and OPDS unit harness (B) out through the harness hole (C) in the seat-back cover.



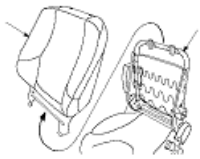
13. Driver's seat: Pull the side airbag harness (A) out through the harness hole (B) in the seat-back cover (C).



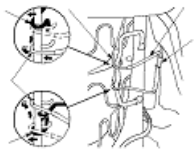
14. Pull out the head restraint guides (A) while pinching the tabs (B) on the end of the guides, and remove them.



15. Remove the seat-back cover/pad (A) from the seat-back frame (B).

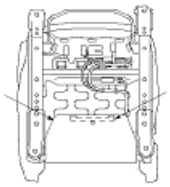


16. Install the cover/pad in the reverse order of removal, and note these items:
    - Reinitialize the OPDS unit.
    - Before installing the seat-back cover/pad, make sure airbag wires (A, B) are installed to the reinforcing cloths (C) correctly, and wire A and wire B are securely assembled.
    - Use only original Honda replacement seat-back cover/pads.
    - Make sure the side airbag harness and the OPDS unit harness (passenger's seat) are routed properly.



Front Seat-back Cover/Pad Replacement - With Seat Heater

With Seat Heater

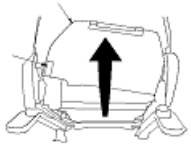


SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
NOTE:

- Do not repair any tears or frayed spots of the seat-back cover. If necessary, replace the seat-back cover.
- Take care not to tear the seams or damage the seat covers.
- Put on gloves to protect your hands.
- When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
- When removing components, use the trim tools or equivalent.
- LHD model is shown; RHD model is similar.

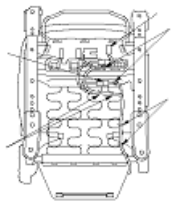
1. Remove the front seat.
2. Driver's seat: Remove the front seat armrest.
3. From under the seat cushion, release the hook (A) from the seat cushion frame spring. Pull the cushion cover back (B).

4. Release the fastener (A) and pull the cushion cover back (B).

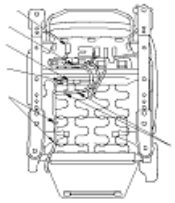


5. From under the seat cushion, remove the wire ties (A) and detach the wire harness clips (B) and connector(s), then pull it to out side of the seat.
   - Driver's seat:
     - For some models: Side airbag connector (C)
     - For some models: Seat heater connector (D)
   - Passenger's seat:
     - For some models: Side airbag connector (C)
     - For some models: Seat heater connector (D)

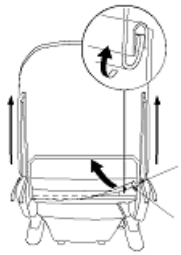
Driver's seat



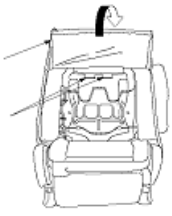
Passenger's seat



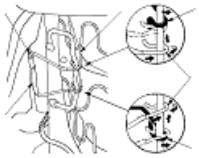
6. From behind the seat-back, release the hook (A), and unzip the seat-cover (B).



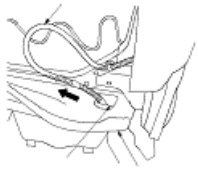
7. Pull back the seat-back cover (A), then release the hook strips (B) from the seat-back frame.



8. Release airbag wire A and airbag wire B from the seat-back frame (C).

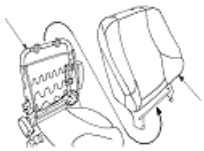


9. Pull the side airbag harness (A) out through the harness hole (B) in the seat-back cover (C).

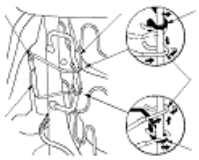


10. Pull out the head restraint guides (A) while pinching the tabs (B) on the end of the guides, and remove them.

11. Remove the seat-back cover/pad (A) from the seat-back frame (B).

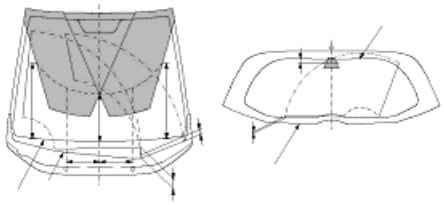


12. Install the cover/pad in the reverse order of removal, and note these items:
    - Before installing the seat-back cover/pad, make sure airbag wires (A, B) are installed to the reinforcing cloths (C) correctly, and wire A and wire B are securely assembled.
    - Use only original Honda replacement seat-back cover/pads.
    - Make sure the side airbag harness are routed properly.



Wiper Arm/Nozzle Adjustment

Wiper arms stop position



1. When the wiper arms stop at the automatic stop position, make sure that they are at the standard position.

Windshield

a: Position at about 76 mm (3.0 in.) from the top of cowl cover (A).
b: Position at about 38 mm (1.5 in.) from the top of cowl cover (A).

Rear window

c: Position at about 10 mm (0.4 in.) from the black ceramic area (D).

Washer nozzle position

2. When you turn on the washers, make sure 50 % or more of the washer fluid lands within the splay area. If the splay area is not within the standard positions, adjust the nozzles.

Windshield

d: Position at about 591 mm (23 in.) from the top of the black ceramic area (B) at the lower windshield.
e: Position at about 386 mm (15 in.) from the top of the black ceramic area (B) at the lower windshield.
f: Position at about 591 mm (23 in.) from the top of the black ceramic area (B) at the lower windshield.
g: Position at about 250 mm (9.8 in.) from the windshield center line (C).
h: Position at about 250 mm (9.8 in.) from the windshield center line (C).

Rear Window

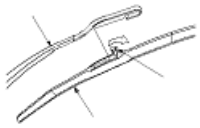
j: Position at about 24.7 mm (1.0 in.) from the top of the black ceramic area (E).

Wiper Blade Replacement

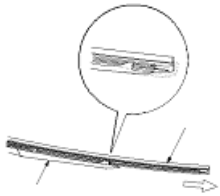
Windshield

NOTE: Always pull up the driver's side wiper blade first.

1. Push the lock (A) of the wiper blade (B), and remove the wiper blade from the wiper arm (C).



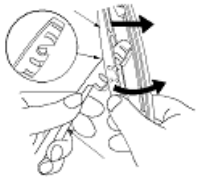
2. Slide the rubber (A) out from the wiper blade (B).



3. Align the groove (A) of the each rail (B) and a new rubber (C), then install a new rubber with the rails into the blade in the reverse order of removal.
4. Install the wiper blades onto the wiper arms in the reverse order of removal.
5. Test the wiper operation. If the blades slip, turn the wiper switch OFF, and reinstall the blades securely.

Rear Window

1. Turn the wiper blade (A), and remove the lock from the wiper arm (B).



2. Pull the rubber (A) up, and slide it out from the wiper blade (B).
3. Install a new rubber in the reverse order of removal.
4. Install the wiper blade onto the wiper arm in the reverse order of removal.
5. Test the wiper operation. If the blades slip, turn the wiper switch OFF, and reinstall the blades securely.

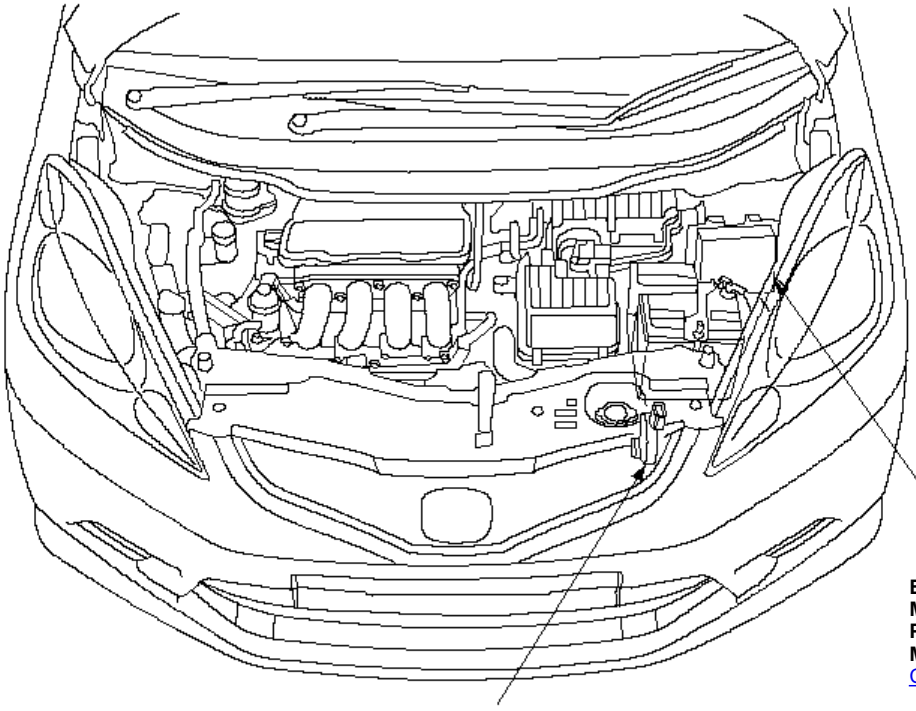
BATTERY
Test,

Drive Belt Removal/Installation

1. Remove the right side splash shield.

2. Move the tensioner (A) with a wrench (B) in the direction shown to relieve tension from the drive belt, then remove the drive belt.
3. Install the new belt in the reverse order of removal.

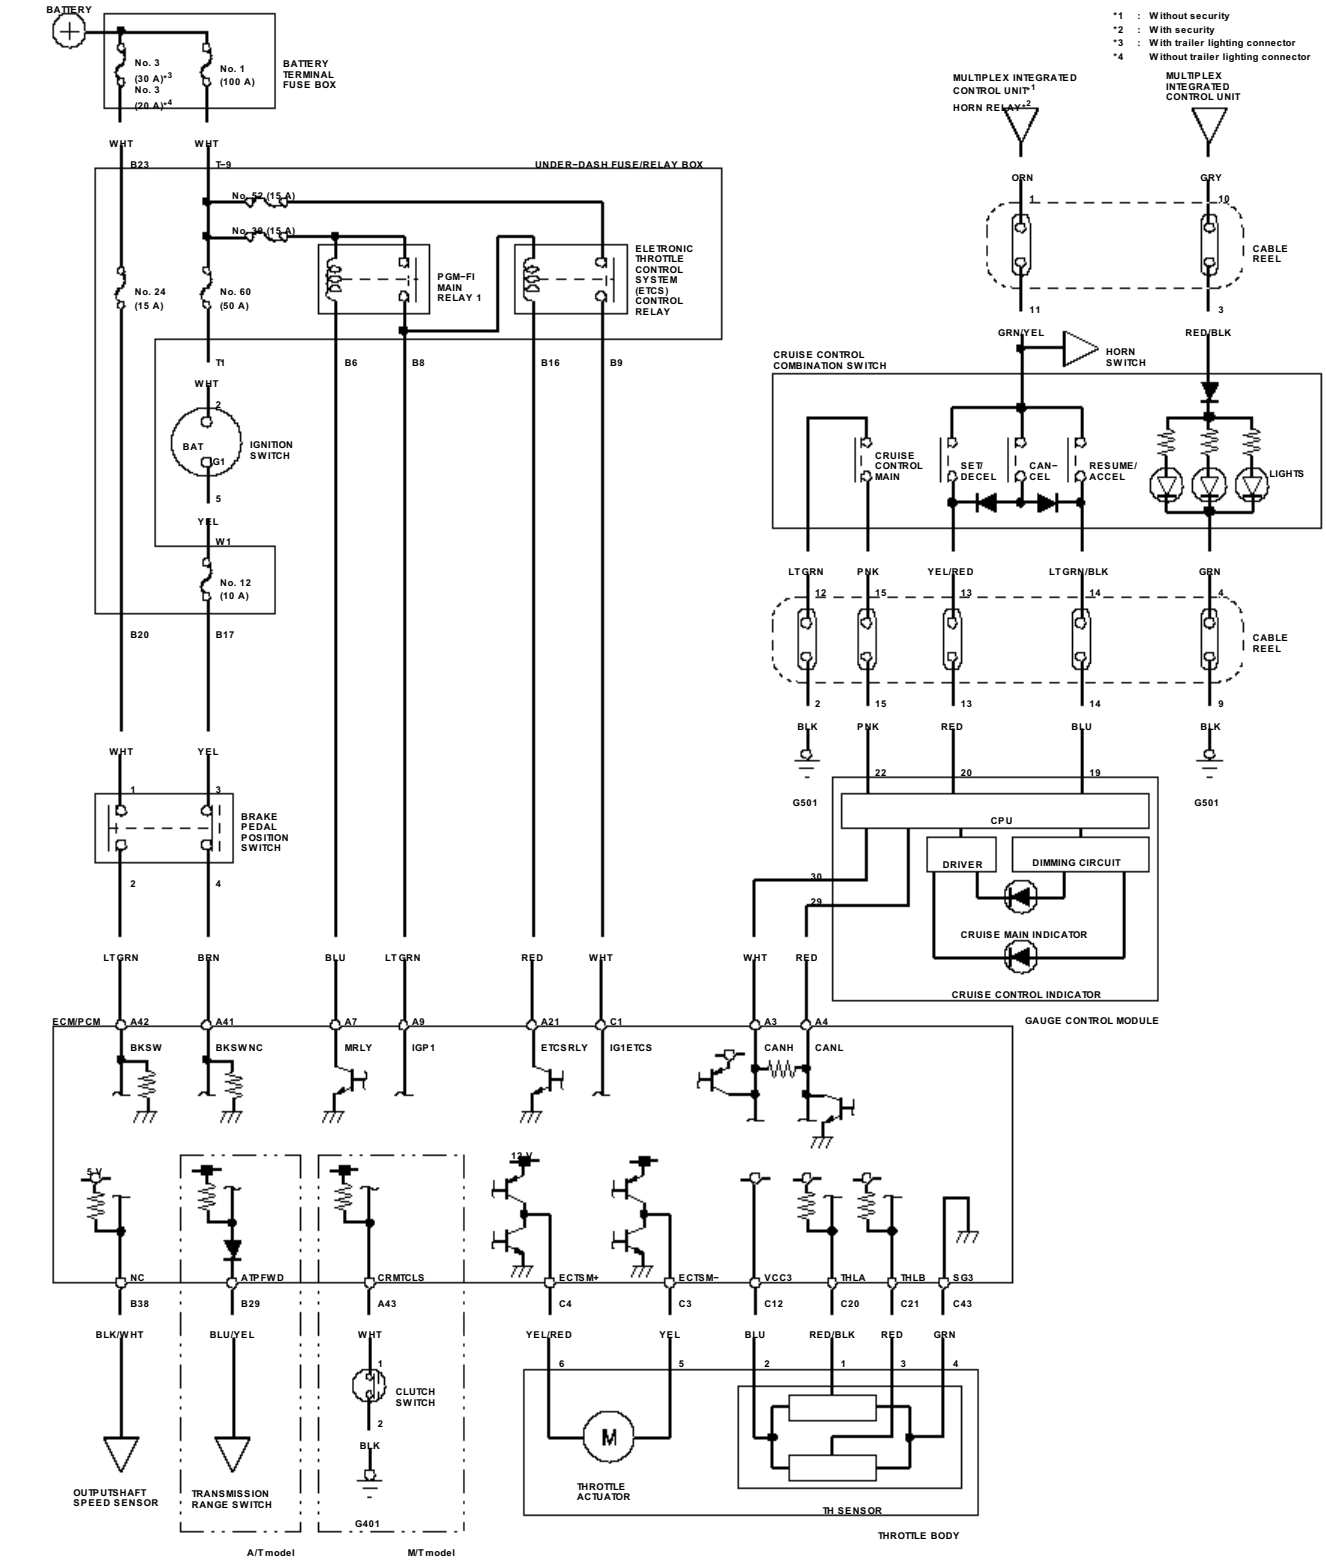
Cruise Control Component Location Index



ENGINE CONTROL MODULE (ECM)/ POWERTRAIN CONTROL MODULE (PCM)
Cruise Control Input Test.

TRANSMISSION RANGE SWITCH (A/T model)
Test.
Replacement.

Cruise Control Circuit Diagram



Cruise control cannot be set

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the No. 24 (10 A) fuse in the under-dash fuse/relay box.
3. Do the cruise control combination switch test.
4. Do the cruise control input test.

Also check for

- Poor ground G101 (A/T model) or G401 (M/T model)

Cruise control can be set, but the cruise main indicator does not come on

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the gauge control module self-diagnostic function procedure.
3. Do the cruise control input test. Test the cruise control main switch signal input.

Also check for

- Faulty gauge control module

Cruise control can be set, but the cruise control indicator does not come on

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the gauge control module self-diagnostic function procedure.
3. Do the cruise control input test. Test the cruise control indicator signal input.

Also check for

- Faulty gauge control module

Vehicle does not decelerate or accelerate accordingly when the set/decel or resume/accel switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control set/decel and resume/accel switch signal input.

Also check for

- Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire

Set speed does not cancel when the brake pedal is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the brake pedal position switch test.
3. Do the cruise control input test. Test the brake pedal position switch signal input.

Also check for

- Short to power on the BRN wire
- Faulty brake pedal position switch

Set speed does not cancel when the cruise control main switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control main switch signal input.

Also check for

- Short to power on the PNK wire

Set speed does not cancel when the cancel switch is pressed

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Do the cruise control combination switch test.
3. Do the cruise control input test. Test the cruise control cancel switch signal input.

Also check for

- Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire

Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the brake pedal position switch adjustment.
3. Do the cruise control combination switch test.
4. Do the cruise control input test. Test the cruise control resume/accel switch signal input. Test the brake pedal position switch signal input.

Also check for

- Faulty brake pedal position switch
- Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire

With the ignition switch in ON (II), and the lighting switch turned on, the cruise control combination switch illumination does not come on

Diagnostic procedure

1. Do the cruise control combination switch test.

Cruise Control Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Cruise control cannot be set	1. Check for PGM-FI DTCs. 2. Check the No. 24 (10 A) fuse in the under-dash fuse/relay box. 3. Do the cruise control combination switch test. 4. Do the cruise control input test.	Poor ground G101 (A/T model) or G401 (M/T model)
Cruise control can be set, but the cruise main indicator does not come on	1. Check for PGM-FI DTCs. 2. Do the gauge control module self-diagnostic function procedure. 3. Do the cruise control input test. Test the cruise control main switch signal input.	Faulty gauge control module
Cruise control can be set, but the cruise control indicator does not come on	1. Check for PGM-FI DTCs. 2. Do the gauge control module self-diagnostic function procedure. 3. Do the cruise control input test. Test the cruise control indicator signal input.	Faulty gauge control module
Vehicle does not decelerate or accelerate accordingly when the set/decel or resume/accel switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control set/decel and resume/accel switch signal input.	Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire
Set speed does not cancel when the brake pedal is pressed	1. Check for PGM-FI DTCs. 2. Do the brake pedal position switch test. 3. Do the cruise control input test. Test the brake pedal position switch signal input.	• Short to power on the BRN wire • Faulty brake pedal position switch
Set speed does not cancel (engine rpm stays high) when the clutch pedal is pressed	1. Check for PGM-FI DTCs. 2. Do the clutch pedal position switch test. 3. Do the cruise control input test. Test the clutch pedal position switch signal input.	• Short to ground on the WHT wire • Faulty clutch pedal position switch
Set speed does not cancel when the cruise control main switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control main switch signal input.	Short to power on the PNK wire
Set speed does not cancel when the cancel switch is pressed	1. Check for PGM-FI DTCs. 2. Do the cruise control combination switch test. 3. Do the cruise control input test. Test the cruise control cancel switch signal input.	Open circuit, loose or disconnected terminals: YEL/RED, RED or LT GRN/BLK, BLU wire
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the brake pedal)	1. Check for PGM-FI DTCs. 2. Check the brake pedal position switch adjustment. 3. Do the cruise control combination switch test. 4. Do the cruise control input test. Test the cruise control resume/accel switch signal input. Test the brake pedal position switch signal input.	• Faulty brake pedal position switch • Open circuit, loose or disconnected terminals: LT GRN/BLK, BLU wire
Set speed will not resume when the resume/accel switch is pressed (with the cruise control main switch turned on, and set speed temporarily canceled by pressing the clutch pedal)	1. Check for PGM-FI DTCs. 2. Check the clutch pedal position switch adjustment. 3. Do the cruise control combination switch test. 4. Do the cruise control input test. Test the cruise control resume/accel switch signal input. Catalytic Converter System Component Location Index

UNDER-FLOOR THREE WAY CATALYTIC CONVERTER (TWC)
Replacement,

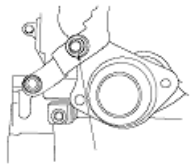
WARM UP THREE WAY CATALYTIC CONVERTER (WU-TWC)
Replacement,

ENGINE CONTROL MODULE (ECM)/ POWERTRAIN CONTROL MODULE (PCM)
General Troubleshooting Information,
Substituting,
Update,
Replacement,

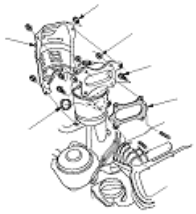
*: This illustration shows RHD model.

TWC (Warm Up) Removal/Installation

1. Lift the vehicle, and support it with jackstands.
2. Remove the bolt (A).
3. Remove the cowl cover and under cowl-cover panel.
4. Remove the A/F sensor (Sensor 1).

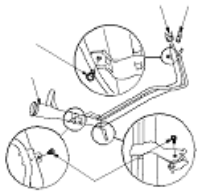


5. Remove the cover (A).
6. Remove the bolts (B) and the nuts (C).
7. Remove the WU-TWC from the gaskets (D).



8. Remove the WU-TWC (A).
9. Install the parts in the reverse order of removal with new gaskets.

Fuel Fill Pipe Removal/Installation

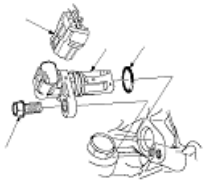


1. Drain the fuel tank.
2. Remove the fuel fill cap.
3. Remove the left rear wheel.
4. Remove the axle beam.
5. Disconnect the fuel fill tube (A) and the breather tube (B) from the fuel fill pipe. Slide back the clamp, then twist the hose as you pull to avoid damaging them.
6. Remove the fuel fill pipe (C).
7. Install the parts in the reverse order of removal.

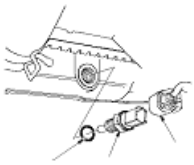
CKP Sensor Replacement

1. Lift the vehicle, and support it with jackstands.
2. Remove the CKP sensor cover (A).

3. Disconnect the CKP sensor connector (A).
4. Remove the CKP sensor (B).
5. Install the parts in the reverse order of removal with a new O-ring (C).
6. Do the CKP pattern clear/CKP pattern learn procedure.



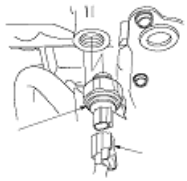
ECT Sensor 2 Replacement



1. Drain the engine coolant.
2. Lift the vehicle, and support it with jackstands.
3. Disconnect the ECT sensor 2 connector (A), then remove ECT sensor 2 (B).
4. Install the parts in the reverse order of removal with a new O-ring (C), then refill the radiator with engine coolant.

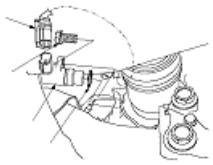
Knock Sensor Replacement

1. Remove the intake manifold.
2. Disconnect the knock sensor 1P connector (A).
3. Remove the knock sensor (B).
4. Install the parts in the reverse order of removal.



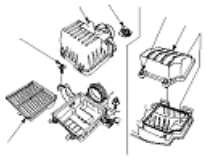
Output Shaft (Countershaft) Speed Sensor Replacement

1. Lift the vehicle, and support it with jackstands.
2. Disconnect the output shaft (countershaft) speed sensor 3P connector (A).
3. Remove the output shaft (countershaft) speed sensor (B).
4. Install the parts in the reverse order of removal with a new O-ring (C).



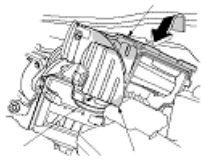
Air Cleaner Removal/Installation

1. Disconnect the MAF sensor/IAT sensor connector(A), then remove the air cleaner cover (B), and the air cleaner element (C).
   NOTE: Be careful not to damage the MAF sensor/IAT sensor on the air cleaner cover.
2. Remove the air cleaner chamber (D).

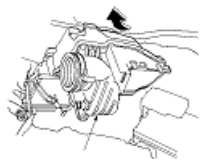


3. Wrap the air cleaner, the cowl cover, and the battery terminal fuse box with the tapes (A) as shown.
4. Remove the battery setting plate, and reposition the battery (B). Reposition the radiator upper hose (C), and the breather pipe (D) as shown.
   NOTE: Do not disconnect the battery terminals.

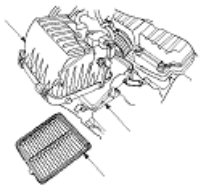
5. Wrap the air cleaner with the tapes (A) as shown.
6. Turn the air cleaner (B) case as shown.



7. Remove the air cleaner case (A) as shown.
8. Install the parts in the reverse order of removal.



Air Cleaner Element Inspection/Replacement



1. Open the air cleaner housing cover (A).
2. Remove the air cleaner element (B) from the air cleaner housing (C).
3. Check the air cleaner element for damage, dirt, or clogging. If it is damage or clogged, replace it.
   NOTE: Do not use compressed air to clean it the air cleaner element.
4. Clean and remove any debris from inside the air cleaner housing.
5. Install the parts in the reverse order of removal.
   - If you did not replace the air cleaner element, this procedure is complete.
   - If you replace the air cleaner element, reset the ECM/PCM with the HDS and do the ECM/PCM idle learn procedure.

Excessive engine oil consumption

Diagnostic procedure

1. Verify that the engine oil filler cap, oil drain bolt, and oil filter are tight.
2. Check for oil leaks.
3. Check for worn valve guide(s) or worn valve stem seal(s).
4. Check for damaged or worn piston ring(s).
5. Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.).

Low oil pressure indicator does not come on with the ignition switch ON (II)

Diagnostic procedure

1. Do the low oil pressure indicator circuit troubleshooting (Open).
2. Test the oil pressure switch.

Also check for

- An open in the wire between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch

Low oil pressure indicator stays on

Diagnostic procedure

1. Check the engine oil level.
2. Do the low oil pressure indicator circuit troubleshooting (Short).
3. Test the oil pressure switch.
4. Check the engine oil pressure.
5. Check the oil filter for clogging.
6. Check the oil screen for clogging.
7. Check the relief valve.
8. Inspect the oil pump.

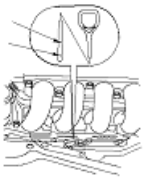
Also check for

- A wire shorted to ground between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch

Engine Lubrication Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Excessive engine oil consumption	1. Verify that the engine oil filler cap, oil drain bolt, and oil filter are tight. 2. Check for oil leaks. 3. Check for worn valve guide(s) or worn valve stem seal(s). 4. Check for damaged or worn piston ring(s). 5. Check for damaged or worn engine internal parts (cylinder wall, pistons, etc.).	
Low oil pressure indicator does not come on with the ignition switch ON (II)	1. Do the low oil pressure indicator circuit troubleshooting (Open). 2. Test the oil pressure switch.	An open in the wire between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch
Low oil pressure indicator stays on	1. Check the engine oil level. 2. Do the low oil pressure indicator circuit troubleshooting (Short). 3. Test the oil pressure switch. 4. Check the engine oil pressure. 5. Check the oil filter for clogging. 6. Check the oil screen for clogging. 7. Check the relief valve. 8. Inspect the oil pump.	A wire shorted to ground between the engine control module (ECM)/powertrain control module (PCM) and the oil pressure switch

Engine Oil Level Check



1. Park the vehicle on level ground, and start the engine. Hold the engine at 3,000 rpm (min^{-1}) with no load (in Neutral) until the radiator fan comes on, then turn off the engine, and wait approximately 3 minutes.
2. Remove the dipstick, and wipe off the dipstick, then reinstall the dipstick.
3. Remove the dipstick, and check the engine oil level. It should be between the upper mark (A) and lower mark (B).
4. If the engine oil level is near or below the lower mark, add engine oil to bring it between the upper and lower marks.

Engine does not start (does not crank)

Diagnostic procedure

1. Check for loose battery terminals or connections.
2. Test the battery for a low state of charge.
3. Check the starter.
4. Check the starter cut relay (A/T model).
5. Check the transmission range switch (A/T model).
6. Check the ignition switch or related circuits.

Also check for

- Poor ground at G101 (A/T model)

Engine cranks, but does not start

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the fuel pressure.
3. Check for a plugged or damaged fuel line.
4. Check for a plugged fuel filter.
5. Check the throttle body.
6. Check for low engine compression.
7. Check for a damaged or broken cam chain.
8. Do the engine control module (ECM)/powertrain control module (PCM) reset function with the Honda Diagnostic System (HDS) to cancel the ALL INJECTORS STOP function.

Engine is hard to start

Diagnostic procedure

1. Check for PGM-FI DTCs.
2. Check the fuel pressure.
3. Check for a plugged or damaged fuel line.
4. Check for a plugged fuel filter.

Engine cranks slowly

Diagnostic procedure

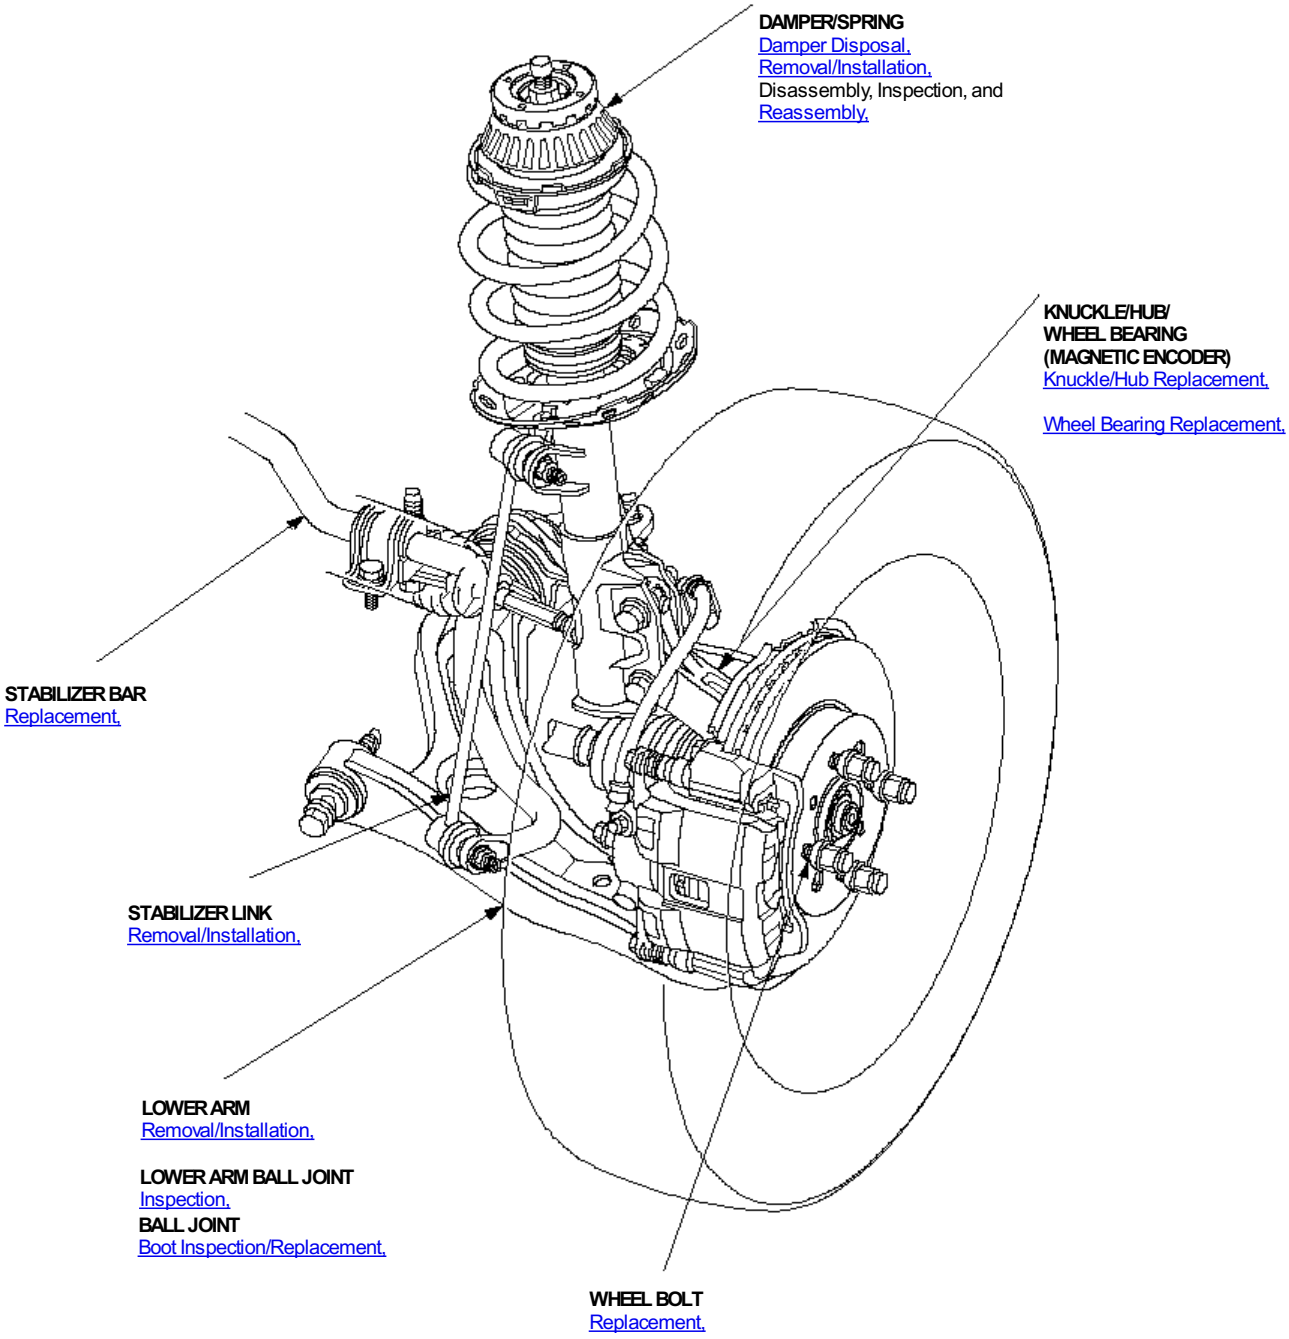
1. Check for loose battery terminals or connections.
2. Test the battery for a low state of charge.
3. Check the starter for binding.
4. Check for excessive drag in the engine.

Starting System Symptom Troubleshooting Index

Symptom	Diagnostic procedure	Also check for
Engine does not start (does not crank)	1. Check for loose battery terminals or connections. 2. Test the battery for a low state of charge. 3. Check the starter. 4. Check the starter cut relay (A/T model). 5. Check the transmission range switch (A/T model). 6. Check the ignition switch or related circuits.	Poor ground at G101 (A/T model)
Engine cranks, but does not start	1. Check for PGM-FI DTCs. 2. Check the fuel pressure. 3. Check for a plugged or damaged fuel line. 4. Check for a plugged fuel filter. 5. Check the throttle body. 6. Check for low engine compression. 7. Check for a damaged or broken cam chain. 8. Do the engine control module (ECM)/powertrain control module (PCM) reset function with the Honda Diagnostic System (HDS) to cancel the ALL INJECTORS STOP function.	
Engine is hard to start	1. Check for PGM-FI DTCs. 2. Check the fuel pressure. 3. Check for a plugged or damaged fuel line. 4. Check for a plugged fuel filter.	
Engine cranks slowly	1. Check for loose battery terminals or connections. 2. Test the battery for a low state of charge. 3. Check the starter for binding. 4. Check for excessive drag in the engine.	

Front Suspension Component Location Index

Front Suspension



Front Lower Arm Removal/Installation

Special Tools Required

Ball joint remover, 28 mm
07MAC-SL00201

NOTICE

Do not remove the lower arm of both sides at the same time.

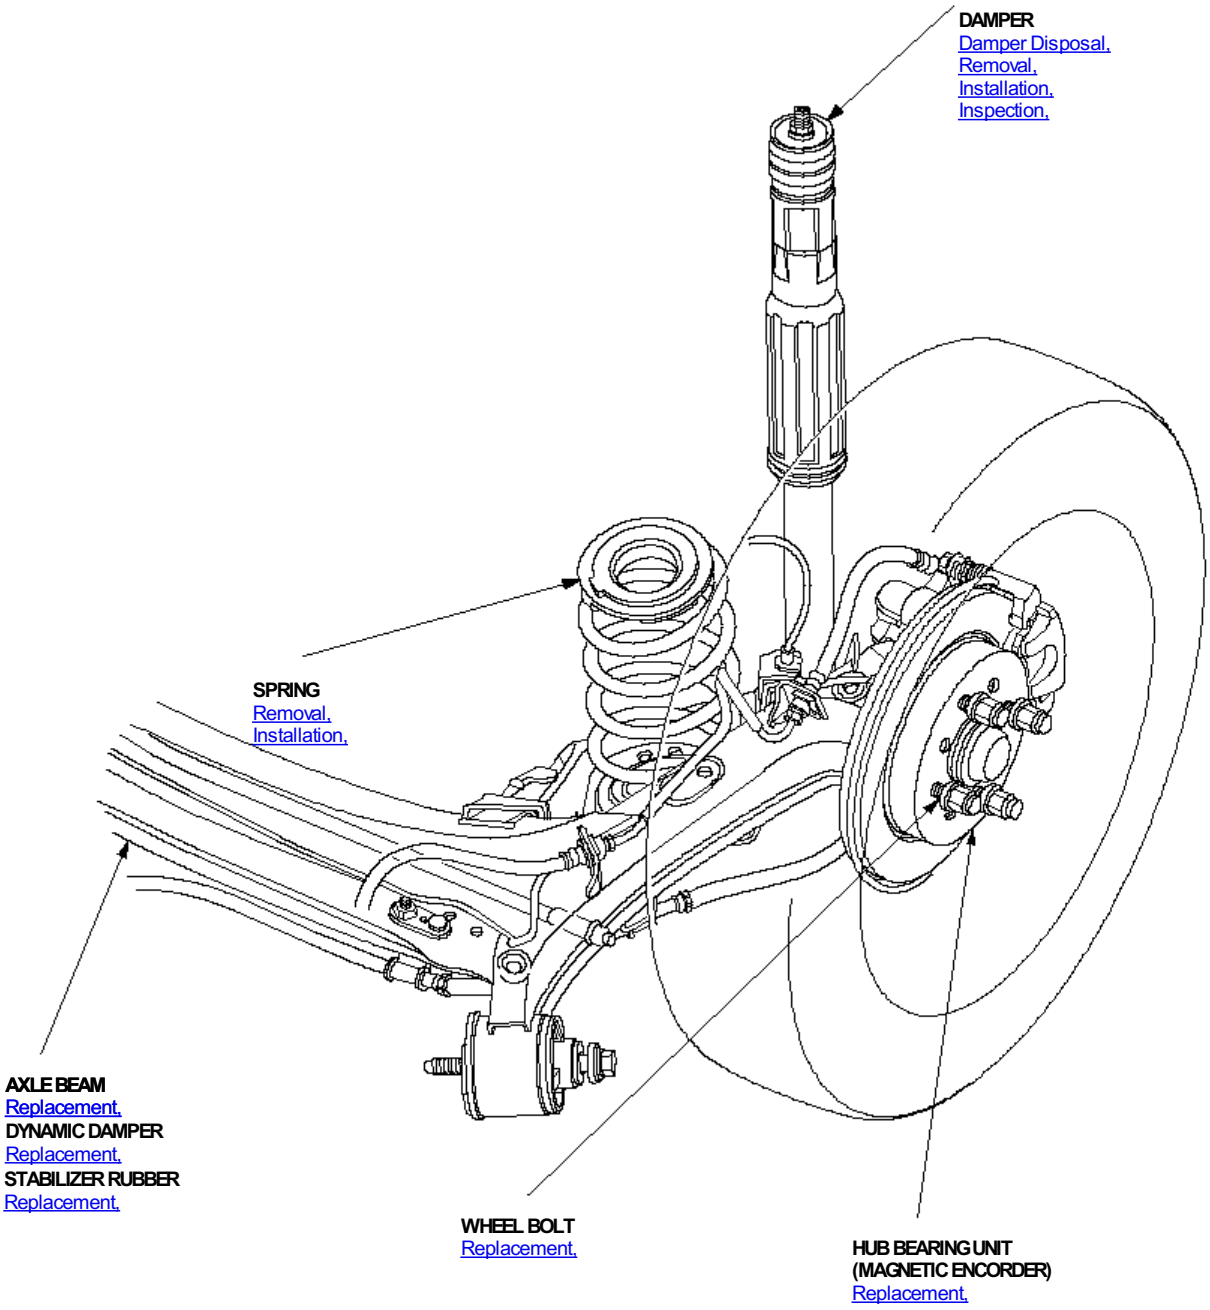
1. Raise the front of the vehicle, and support it with safety stands in the proper locations.
2. Remove the front wheel.
3. Remove the lock pin (A) from the lower arm ball joint, then remove the castle nut (B).
   NOTE: During installation, install the lock pin as shown after tightening the new castle nut.
4. Disconnect the lower ball joint from the knuckle using the ball joint remover.
   NOTE:
   - Be careful not to damage the ball joint boot when installing the remover.
   - Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.

---

5. Remove the lower arm mounting bolts, then remove the lower arm (A) from the front subframe.
   NOTE: Use new lower arm mounting bolts during reassembly.
6. Install the lower arm in the reverse order of removal, and note these items:
   - First install all the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque values. Do not place the jack against the ball joint of the lower arm.
   - Be careful not to damage the ball joint boot when connecting the lower arm to the knuckle.
   - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, and the threaded section and the mating surfaces of the castle nut.
   - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
   - Before installing the wheel, clean the mating surfaces on the brake disc and the inside of the wheel.
7. Check the wheel alignment, and adjust it if necessary.

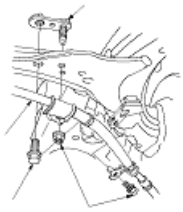
Rear Suspension Component Location Index - Disc Brake type

Rear Suspension

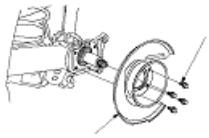


Rear Axle Beam Replacement - Disc Brake type

1. Raise the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the rear spring seat lower cover.
4. Remove the rear hub bearing unit.
5. Remove the parking brake cable bracket (left side) (A), the brake line bracket (right side), and the parking brake cable (B) from the axle beam.

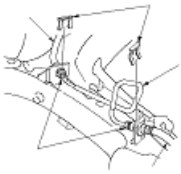


6. Remove the splash guard (A).

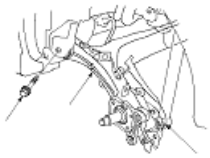


7. Remove the wheel speed sensor (A) and the wheel speed sensor stay (B) from the axle beam (C). Do not disconnect the wheel speed sensor connector.
8. Remove the rear spring.

9. Disconnect the brake hose (A) from both sides of the brake line (B), then remove the brake line by removing the brake hose clip (C).
   NOTE:
   - Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
   - Plug the end of a hose and joints to prevent spilling brake fluid.
   - Use the new brake hose clip during reassembly.



10. Place a floor jack under the lower spring seat (A) on both sides of the axle beam (B), and support it by raising the floor jack. Do not place the floor jack under the center of the axle beam.
11. Remove the axle beam mounting bolts (C) on both sides.
    NOTE: Use new axle beam mounting bolts during reassembly.
12. Lower the jack slowly, then remove the axle beam.
13. Install the axle beam in the reverse order of removal, and note these items:
    - First install all the components, and lightly tighten bolts and the nuts, and place a jack under the lower spring seat of the axle beam on both sides, then raise the suspension to load with the vehicle's weight before fully tightening to the specified torque values.
    - Connect the brake pipe from the vehicle front side first.
    - After installing the brake hose, the brake line, and the parking brake cable, check interference and twisting to other parts.
    - Before installing the brake disc, clean the mating surfaces of the hub bearing unit and the inside of the brake disc.
    - After installing, fill the reservoir with new brake fluid, and bleed the brake system.
    - Check the brake hose and line joint for leaks, and tighten if necessary.
    - Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.
14. Check the wheel alignment, and adjust it if necessary.

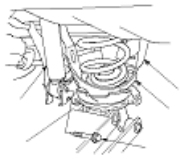


Rear Damper Replacement

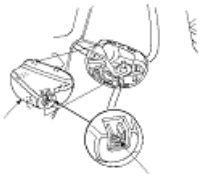
Exploded View

Removal

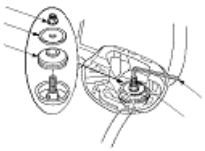
1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the wheel speed sensor stay (A) from both sides of the axle beam.



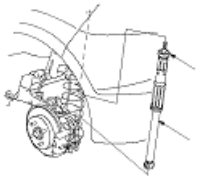
4. Position a floor jack under lower spring seat (A) on both sides of the axle beam (B). Raise the floor jack until the suspension begins to compress.
5. Remove the damper mounting bolt (C) that connects the axle beam and the damper (D) from both sides.



6. Remove the lid (A) from the trunk side trim.
   NOTE: Remove the screw (B) if the lid fixed by it.

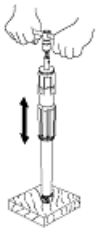


7. Remove the self-locking nut (A) while holding the damper shaft (B) with a hex wrench (C).
8. Remove the damper mounting washer (D) and the damper mounting rubber (E) from the top of the damper.



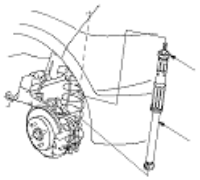
9. Compress the damper unit (A) by hand, and remove it from the vehicle.
   NOTE: Be careful not to damage the body.
10. Remove the damper mounting rubber (B).

Inspection

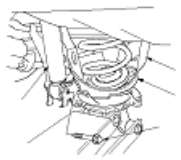


1. Install the flange nut on the damper shaft end, and set the socket wrench and T-handle on the nut.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.
3. Check for oil leaks, abnormal noises, and binding during these tests.

Installation



1. Install the damper mounting rubber (A) onto the damper unit. Position the damper assembly (B) between the body and the axle beam.
   NOTE: Be careful not to damage the body.

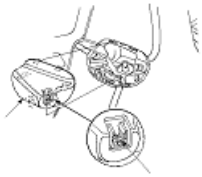


2. Position the floor jack under lower spring seat (A) on both sides of the axle beam (B).
3. Slowly raise the jack until you can align the bolt hole with the holes in the axle beam and the damper (C), and loosely tighten the new damper mounting bolt (D) on both sides.
4. Raise the rear suspension with the jack until the vehicle just lifts off of the safety stands, then tighten the damper mounting bolts to the specified torque value.

5. Install the damper mounting rubber (A), the damper mounting washer (B), and the self-locking nut (C) on the damper shaft (D).
   NOTE: During installation, note the direction of the damper mounting rubber and the damper mounting washer.

6. Tighten the self-locking nut (A) to the specified torque value while holding the damper shaft (B) with a hex wrench (C).

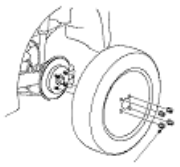
7. Install the lid (A) on the trunk side trim.
   NOTE: Install the screw (B) if the lid fixed by it.



8. Install the wheel speed sensor stay (A) on both sides of the axle beam.
9. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
10. Check the wheel alignment, and adjust if necessary.

Rear Hub Bearing Unit Replacement - Disc Brake type

Exploded View

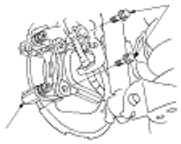


Replacement

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the wheel nuts (A) and the rear wheel.
3. Release the parking brake lever fully.
4. Remove the caliper body and the brake pads from the caliper bracket.
   NOTE: To prevent damage to the caliper body or the brake hose, use a short piece of wire to hang the caliper body from the undercarriage. Do not twist the brake hose excessively.

---

5. Remove the caliper bracket (A) from the axel beam.



---

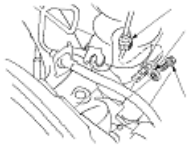
6. Remove the hub cap (A). Raise the stake (B), then remove the spindle nut (C).
7. Remove the rear brake disc.

---

8. Remove the hub bearing unit (A) from the spindle.
9. Check the hub bearing unit for damage and cracks.
10. Install the hub bearing unit in the reverse order of removal, and note these items:
    - Use new a spindle nut and hub cap during reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the spindle.
    - Before installing the brake disc, clean the mating surfaces of the hub bearing unit and the inside of the brake disc.
    - Before installing the wheel, clean the mating surfaces of the brake disc and the inside of the wheel.
11. Check the wheel alignment, and adjust it if necessary.

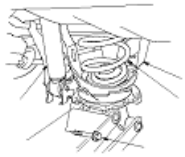
Rear Spring Replacement

Exploded View

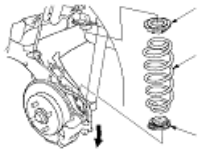


Removal

1. Raise the rear of the vehicle, and support it with safety stands in the proper locations.
2. Remove the rear wheels.
3. Remove the wheel speed sensor (A) and the wheel speed sensor stay (B) from both sides of the axle beam. Do not disconnect the wheel speed sensor connector.



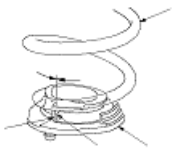
4. Position a floor jack under spring seat (A) on both sides of the axle beam (B). Raise the floor jack until the suspension begins to compress.
5. Remove the damper mounting bolt (C) that connects the axle beam and the damper (D) from both sides.
6. Lower the floor jack gradually.



7. Remove the spring (A), the upper mounting rubber (B), and the lower mounting rubber (C). Do not lower the jack more than necessary.

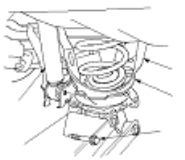
Installation

1. Install the upper mounting rubber (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the upper mounting rubber.



2. Install the lower mounting rubber (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the lower mounting rubber.

3. Install the tab (A) of the lower mounting rubber into the groove (B) of the lower spring seat.
   NOTE:
   - Make sure that the tab of the lower mounting rubber is properly installed into the axle beam (C).
   - Make sure that the spring was installed correctly.

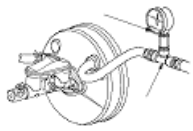


4. Position the floor jack under the lower spring seat (A) on both sides of the axle beam (B).
5. Slowly raise the jack until you can align the bolt hole with the holes in the axle beam and the damper (C), and loosely tighten the new damper mounting bolt (D) on both sides.
6. Raise the rear suspension with the jack until the vehicle just lifts off of the safety stands, then tighten the damper mounting bolts to the specified torque value.

7. Install the wheel speed sensor (A) and the wheel speed sensor stay (B) on both sides of the axle beam.
8. Clean the mating surfaces of the brake disc and the inside of the wheel, then install the rear wheels.
9. Check the wheel alignment, and adjust it if necessary.

Brake Booster Inspection

Special Tools Required



Pressure gauges set
07YAJ-0010410

Vacuum gauge
07YAJ-0010610

Attachments
07410-5790102

Tube joint adapter
07410-5790503

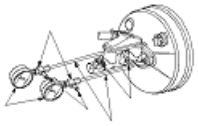
Pressure gauge joint pipes, 10 x 1.0 mm
07510-6340101

Leak Test

1. Install the vacuum gauge (A) between the brake booster and check valve.
2. Start the engine, adjust the engine speed with the accelerator pedal so that the vacuum gauge readings show 66.7 kPa (500 mmHg, 19.7 in.Hg), then stop the engine.
3. Read the vacuum gauge.
   If the vacuum reading decreases 2.7 kPa (20 mmHg, 0.8 in.Hg) or more after 30 seconds, check following parts for leaks.
   - Check valve
   - Vacuum hose, pipe
   - Seals
   - Brake booster
   - Master cylinder

   NOTE: Do not try to disassemble the brake booster. Replace the brake booster as an assembly with a new one.

Function Test



1. Install the vacuum gauge as same as the leak test.
2. Connect the oil pressure gauges (A) to the master cylinder using the attachments pressure gauge joint pipes as shown.
3. Bleed air through the valves (B).
4. Start the engine, and let it idle.

5. Have an assistant depress the brake pedal with a 98 N (10 kgf, 22 lbf) and 196 N (20 kgf, 44 lbf) of pressure measuring with a commercially available pressure gauge (A).
6. The following pressures should be observed at the pressure gauges in each vacuum.

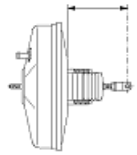
Vacuum booster Vacuum kPa (mmHg, in.Hg)	Brake pedal pressure N (kgf, lbf)	Master cylinder oil pressure kPa (kgf/cm ^{2}, psi)	
0 (0, 0)	98 (10, 22)	0 (0, 0)	
	196 (20, 44)	Except LHD model of M/T	577 (5.9, 84)
		LHD model of M/T	501 (5.1, 73)
66.7 (500, 19.7)	98 (10, 22)	Except LHD model of M/T	4,523 (46.1, 656)
		LHD model of M/T	4,235 (43.2, 614)
	196 (20, 44)	Except LHD model of M/T	9,538 (97.3, 1,383)
		LHD model of M/T	9,468 (96.5, 1,373)

7. Inspect the master cylinder for leaks if the readings do not fall within the limits shown above.

Booster Check Valve Test

1. Disconnect the brake booster vacuum hose (A) at the booster.
   NOTE: If the check valve (B) is faulty, replace the brake booster vacuum hose/check valve as an assembly.
2. Start the engine, and let it idle. There should be vacuum available. If no vacuum is available, the check valve is not working properly. Replace the brake booster vacuum hose and check valve, and retest.

Brake Booster Pushrod Thickness (Reference)



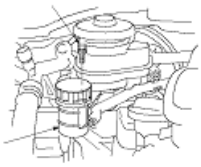
Brake Master Cylinder Replacement

NOTICE

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- Plug the end of a hose and joints to prevent spilling brake fluid.

RHD Model

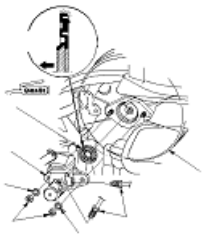
1. Remove the dashboard lid (A).



2. M/T: Remove the clutch reservoir tank (A), and move it aside. Do not disconnect the clutch line from the reservoir tank.
3. Remove the reservoir cap and the brake fluid from the reservoir tank with a syringe.

4. Disconnect the brake fluid level switch connector (A).
5. Remove the reservoir tank (B) and the clip (C) from the bracket (D).

6. Remove the bracket mount bolt (A) and the clip (B).

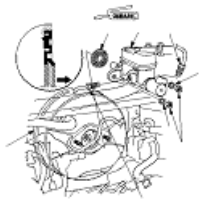


7. Disconnect the brake lines (A) from the master cylinder (B). To prevent spills, cover the hose joints with rags or shop towels.
8. Remove the master cylinder mounting nuts (C) and the washers (D).
9. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the bake lines when removing the master cylinder.
10. Remove the rod seal (F) from the master cylinder.
    NOTE: During installation, set the new rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
11. Install the master cylinder in the reverse order of removal, and note these items:
    - Coat the inner bore lip and the outer circumference of the new rod seal with the silicone grease in the master cylinder set.
    - When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
12. Bleed the brake system.
13. Spin the wheels to check for brake drag.

LHD Model

1. Remove the air cleaner cover, and the air cleaner case.
2. Remove the dashboard lid (A).
3. Remove the reservoir cap, and the brake fluid from the reservoir tank with a syringe.

4. Disconnect the brake fluid level switch connector (A).
5. Remove the reservoir tank mounting bolt (B) from the bracket (C).



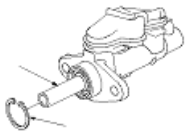
6. Disconnect the brake lines (A) from the master cylinder (B). To prevent spills, cover the hose joints with rags or shop towels.
7. Remove the master cylinder mounting nuts (C) and washers (D).
8. Remove the master cylinder from the brake booster (E). Be careful not to bend or damage the bake lines when removing the master cylinder.
9. Remove the rod seal (F) from the master cylinder.
   NOTE: During installation, set the new rod seal onto the master cylinder with its grooved side (G) toward the master cylinder.
10. Install the master cylinder in the reverse order of removal, and note these items:
    - Coat the inner bore lip and the outer circumference of the new rod seal with the silicone grease in the master cylinder set.
    - When you apply the silicone grease, make sure not to adhere to the terminal part of connectors and surrounding switches. Also do not touch the switches and the terminal part of connector by hands or glove that adheres the silicone grease.
    - Check the brake pedal height and free play after installing the master cylinder, and adjust it if necessary.
11. Bleed the brake system.
12. Spin the wheels to check for brake drag.

Brake Master Cylinder Disassembly

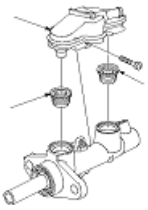
NOTE: The illustrations show RHD model.

1. Remove the rod seal from the master cylinder.
2. Disconnect the reservoir tank hose (A).

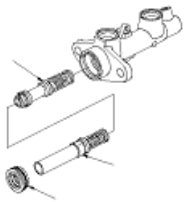
3. Remove the circlip (A) while pushing in the secondary piston (B).



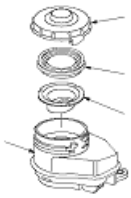
4. Remove the subreservoir (A) and the grommets (B) from the master cylinder.
   NOTE: When subreservoir and master cylinder body are separated, replace the grommets with new ones.



5. Remove the secondary piston (A), primary piston (B) and piston guide (C).



6. Remove the reservoir seal (A) from the reservoir cap (B).
7. Remove the strainer (C) from the reservoir tank (D).



Brake Master Cylinder Reassembly

NOTE:
